Abstract

Responsible financial consumption behavior depicts person's self-control in spending, planning for the future, seeking information, education, rational decision- making and solvency. As surveys of financial literacy indicate worryingly low levels of financial skills and knowledge among young adults, the purpose of this paper is to investigate responsible consumption behavior of young adults. Also, the paper investigates the influence of, attitudes and self-efficacy on the responsible financial consumption behavior of young adults. The quantitative research was conducted on the sample of 483 young adults using convenience sample of economics students. The results were analyzed by structural equation modeling, cluster and ANOVA analysis. The PLS-SEM model proved the influence of attitudes, and self-efficacy on responsible behavior. Also, the results indicate that more financially responsible young adults are less financed by allowance and more by scholarship and seek more information on money related issues in media, from friends and in banks when compared to the ones that are less financially responsible.

Keywords: Responsible Financial Consumption Behavior, Self-Efficacy, Attitudes, Young Adults

Introduction

The focus of this paper is the concept of responsible financial consumption behavior that has developed as a way of problematizing personal finance consumption. The culture of consumption advocates that individuals are worthy proportionally to the extent of earning money and spending it on various goods and services. The "dark side" to such a value system, however, is that over-consumption is associated with serious long-term financial problems, lower well-being, poorer quality of life and even worse interpersonal relationships (Belk, 1985; Kasser & Ryan, 1996, Carver & Baird, 1998; Sirgy, 1998). Poor financial habits such as impulsive buying and over-consumption can have severe consequences and often result in over-indebtedness, poverty and financial and social exclusion of individuals and households.

The main purpose of this study was to investigate responsible financial consumption behavior of young adults. Also, the paper investigates the influence of, attitudes and self-efficacy on the responsible financial behavior of young adults. Up to now there are no known published sources that discuss RFCB and its predictors among young adults, therefore this research presents a unique opportunity to address this gap.

Responsible Financial Consumption Behavior Defined

The ability to control consumption significantly determines other dimensions of financial behavior as well as individuals' overall financial behavior. If a person manages money inadequately and spends beyond his or her means, he or she will be unable to participate in saving, investing or insurance (Kimball, 1990). Furthermore, if such behavior persists, a person might even be forced to ask for credit in order to reimburse for a budgetary deficit (Barbić et al. 2019).

The primary question that arises is what is the attribute of "responsible financial consumption behavior"? What are its dimensions, and in what ways can it be understood?

Financial behavior refers to human behavior applicable to money management (Xiao, 2008). Barbić, Lučić and Chen (2019) proposed a comprehensive measure of responsible financial consumption behavior. They defined it through six dimensions: (1) spending self-control, (2) spending self-predictions and planning for the future, (3) seeking consumer information, (4) taking part in consumer education, (5) rational consumer decision-making and (6) solvency. Their measure included responsible decision-making in everyday activities, not just behavior related to the usage of financial products and services. According to Barbić, Lučić and Chen (2019):

"Responsible financial consumption behavior is connected to the psychological theories of Albert Maslow and the related field of Maslowian portfolio theory. Therefore, one way for individuals to achieve responsible consumption and financial progress is to satisfy their needs gradually, starting from the most basic human needs (survival) and then continuing to the upper layers such as status, prestige, and self-actualization. Those who skip the basic layers and proceed immediately to self-gratification might be more susceptible to irresponsible consumption and poor financial performance."

Financial behavior of Young Adults

Desirable and responsible financial behavior may contribute to financial welfare. Previous research showed that responsible financial behaviors are associated with positive financial outcomes (Dew & Xiao, 2011; Xiao et al., 2014). Moreover, a study of credit counseling clients indicated that age is positively linked with many forms of desirable financial behaviors (Xiao et al. 2006).

The ability to make well-informed and operative financial decisions is essential for young. With increasing spending power, young attract the interest of merchants and credit card companies, but at the same time, they have inadequate knowledge about how to make intelligent consumption choices. Evidence suggests that many young lack the financial knowledge to make well-informed decisions, and engage in behaviors harmful to their financial health (Mottola, 2014). Many of them have accumulated substantial debt that may result in poor credit scores and potential economic failure (Todd, 2002; Norvilitis et al., 2003). Jorgensen & Savla (2010) study confirmed previous findings and revealed that many young adults have insufficient financial knowledge, attitudes, and behaviors.

According to Mottola (2014), younger generations are struggling more than older generations to pay their bills and make ends meet. 2012 National Financial Capability Study showed that 23 percent of millennials spend more than they earn, and 31 percent have unpaid debts. Millennials are also less likely to make long-term plans and 33 percent of millennials have rainy day funds and only about four in ten millennials are saving for retirement, also considerably lower than all the other generations (FINRA Investor Education Foundation, 2012).

These deficiencies may result in poor financial habits and undesirable behavior, affecting young's ability to grow into financially secure adults (Martin & Oliva, 2001). Many young people attain elementary financial knowledge through trial and error, yet this may not be sufficient for them to become informed consumers (Lachance & ChoquetteBerneir, 2004; Norvilitis et al., 2003). De Bassa

Scheresberg & Lusardi (2014) concluded that millennials are severely indebted and struggle to meet payments on both short-term and long-term obligations. They use credit cards heavily and expensively, blow their bank accounts and retirement accounts, and depend on alternative financial services. Most young feel good about their financial knowledge, yet data show that they consistently lack the basic skills needed to make savvy financial decisions. They argue that even more troubling fact is their high level of financial engagement which is not harmonized with a correspondingly high level of financial literacy (de Bassa Scheresberg & Lusardi, 2014).

The Role of Attitudes and Self-Efficacy in The Creation of Responsible Financial Consumption Behavior

Individual financial behavior and status are under the influence of various factors, out of which de Bassa Scheresberg & Lusardi (2014) outline preferences, willingness to take risks, and economic circumstances. Perceived financial capability can be observed as financial self-efficacy, an important psychological determinant that influences individuals' behavior (Xiao et al., 2015). The concept of self-efficacy is originated by Bandura (1982), explaining that "perceived self-efficacy is concerned with judgments of how well one can execute courses of action required to deal with prospective situations". Ajzen (1991) integrates self-efficacy is integrated into the theory of planned behavior as an important determinant of individuals' behavior. Self-efficacy is also referred to as confidence in the research literature. Regarding financial behaviour, financial self-efficacy is an important indicator of financial capability (Xiao et al., 2015). Furthermore, Xiao et al. (2015) outline that ageing should increase individuals' financial capability, and subsequently perceived financial self-efficacy or confidence should be improved.

The role of attitudes for financial behavior is investigated by Dowling et al. (2009) and Shime et al. (2009). Mien and Thao (2015) investigate factors affecting financial behavior in Vietnam and indicate that financial attitudes have significant positive impact on financial behavior. Ranta and Salmela-Aro (2018) also take account of self-efficacy as factor contributing to financial well-being.

Methodology and Sample

The research was undertaken on the sample of business economics students at the University of Zagreb Faculty of Economics and Business in April 2018. The questionnaire consisted of three parts: the first one consisted of questions relating to the attitudes towards responsible financial consumption behaviour developed according the Ajzen (1991) and included statements „I consider myself qualified to manage my financial situation and financial decision-making "; „I think it is extremely important to create a financial plan for the future."; „I think it is extremely important to adhere to personal financial budget." Self-efficacy or also referred to behavioural control was measured again with three items developed by Nysveen and others (2005): that included following" I feel free to make my own financial decisions"; „My financial situation is entirely within my control" and „I have the necessary resources and means to achieve financial success." Using the five-point Likert-type scale variable measures perceived control over the performance of financial tasks also known as self-efficacy. The second part consisted of questions related to the responsible financial consumption behaviour the scale developed by Barbić, Lučić & Chen (2019) that consists of following items I live in accordance with my financial possibilities", "I pay my monthly bills before on their due date", "I try to anticipate and plan future financial income and expenses", "In everyday purchases of consumer goods, I am informed to make rational decisions that are in line with my financial possibilities", "I try to be informed and educated in the field of successful management of personal finances" and "When buying an item, the first think I think about is whether I can afford it".The third part consisted of demographical measures. The data was analyzed using SPSS and PLS.-SEM.

The sample consists of 483 individuals out of which 63% were woman and 37% was man. 69% of the samples were 18 to 21 years of age and 25% 21 to 24, whereas the rest was 25-30. Most of the respondents came from Zagreb (43%) and the rest from Velika Gorica, Varaždin, Zadar, Zaprešić, Krapina, Samobor, Karlovac, Čakovec etc.

The sample is predominantly financed by allowance (43%), where only 18% of the sample up to 50% of their "income" receives from a student job. The greatest part of the sample originates from households from 3 to 4 members (56,55%). 16% households' income is from 6 401-11 400kn, 19% 11 401-16 400kn, 13% 16 401-21 400kn, 3% 21 401-26 400kn, 4% 26 401-31 400kn and the rest is either above or below.

78% of the respondents have stated that they inform themselves about financial issues. They were able to select various sources of information that they use and the information is given in the Table 1.

Table 1: Analysis of respondents according to the source of information about financial issues

Friends	Media	Bank	Internet	Other
212	170	74	298	79
44%	35%	15%	62%	16%

Results

The first step in the data analysis was the formation of clusters using a two-step cluster method based on the responsible financial consumption behavior six item scale developed by Barbić, Lučić & Chen (2019). The method produced two clusters – 1 – of more financially responsible respondents that consisted of 304 respondents and 2- less financially responsible respondents that consisted of 179. From the table 2 it can be seen that all six items have higher means in cluster 1 as opposed to cluster 2.

Table 2: The review of responsible financial consumption behavior items in clusters

Report							
Two Step Cluster Number		**Rcb1**	**Rcb2**	**Rcb3**	**Rcb4**	**Rcb5**	**Rcb6**

ANOVA analysis of variance was performed in order to determine if there are significant differences between the two clusters. The results presented in the Table 3 reveal that Cluster of less financially responsible young adults spend predominantly from allowance, whereas the cluster of more financially responsible young adults have significantly more scholarship money available for

spending in their income. More financial responsible statistically significantly seek more information from friends, in media and banks in issues related to finance. Other reported variables did not show to be significantly different between the two groups.

Table 3: ANOVA table for variables Student Job, Allowance, Scholarship, Financial information, Total Income

ANOVA

After that we have performed the PLS-SEM structural equation modeling with the aim to investigate the influence of attitudes and self-efficacy on the Responsible financial consumption behavior of young adults.

The structural model is composed of three first order constructs, where two were reflexive and one formative (RFCB) as defined by the authors of the measures. Before the final results analysis, we need to evaluate the adequacy of the structural model (Hensler et al., 2009).

The analysis of factor loadings in the Figure 1 reveal that all of them are larger than 0,7 (Hair et al., 2014: 103), all average variances extracted are larger than 0.5 (Hair et al., 2014: 103), and all levels of composite reliability and Cronbach alpha are larger than 0.7 (Hensler et al., 2009), all of which indicates that variables in the model are valid and reliable. Moreover, the discriminant validity is proved by the Fornell and Larcker criterion (1981). To ensure the absence of multicollinearity of indicators of the model have VIF lower than 5 (Hair et al., 2014: 430). The model is also confirmed by the overall model fit R^2 for RFCB is 0.273 ensuring the medium strength of determination (Chin, 1998, p. 323).

Fig. 1: PLS-SEM Structural model results

The results reveal that Both attitudes and Self-efficacy significantly predict Responsible financial consumption behaviour (Both p<0,000). Interestingly, attitudes contribute the RCFB more (0,413) when compared to Self-Efficacy (0,200).

Table 3: Statistical significance of PLS-SEM Structural model relations

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
Attitudes-> RFCB	0.413	0.421	0.042	9.933	0.000
Self-Efficacy_ -> RFCB	0.200	0.203	0.047	4.298	0.000

Conclusion and Implications

Responsible financial consumption behavior of young adults presents a contribution to the societal welfare. If one develops poor financial habits such as impulse buying or over-consumption at a young adult age it will most definitely contribute to the creation of serious long-term financial problems later at life. This research contributes to the sources that investigate financial literacy of the young, especially young adults. As positive financial consumption behavior is linked to positive financial outcomes (Dew & Xiao, 2011; Xiao et al., 2014) this investigation represents implicit investigation of their financial well-being.

Unlike other available research (Todd, 2002; Norvilitis et al., 2003; Mottola, 2014), this research has shown that young adults report relatively good responsible financial consumption behavior. When divided into clusters, there are more than half of the sample is classified as more financially responsible. Evidence suggest that young adults that report responsible financial consumption behavior inform themselves more from friends, media and in banks. Also, their available income is comprised more from scholarship and less from parents' allowance than the ones that are considered to be less responsible.

In terms of the influence of attitudes and their self-efficacy. The research has confirmed the importance of plausible financial attitudes as a contributor to the responsible financial consumption behavior of young adults, as it is found in other research done on the sample of general public (Mien & Thao, 2015; Lučić, Barbić and Chen, 2019). Moreover, self-efficacy has also been distinguished as an important predictor of RFCB as found in other research (Xiao et al., 2015; Ranta and Salmela Aro (2018). When compared, attitudes contribute relatively more than self-efficacy. Such results imply that in order to build financial capacity young people should be directed towards building right set of attitudes towards saving and spending as well as their "self-esteem" related to executing responsible financial behavior.

This research contributes to the published literature for both academics and general public. The limitations of the quantitative research arise from the type of the sample and possible bias in self-reported data. The sample is based on economics students therefore biased in terms of knowledge and awareness of the researched subject therefore could be perceived as "more optimistic" than the average. Moreover, people have the tendency to give socially desirable answers when asked about their attitudes and behavior. Future research should be directed towards resolving these limitations.

Acknowledgment

Abstract

Industry is characterized by multilateral supply-production ties with other branches of the economy. As a result of the industry economic activity it affects spatial management and the social and environmental dimensions of sustainability. Therefore, it can be observed multilateral couplings with economic and social development as a result of its strong bonds with the development of science. The Industry development can improve human conditions, although it can has been degrading natural environment. Industry activity is also impacting the social dimension. Hence, it is necessary to strive for sustainable development, where economic development is met without compromising the ability of future generations to meet their environmental and social needs. In many cases, actions for sustainable development in business can bring new business opportunities and provide economic development without degrading the environmental and social dimensions. This study has the objective to present examples of effective implementation of sustainable development practices in the supply chain.

Keywords: Industry, Sustainability, Sustainable development, Logistics.

Introduction

The development of the global economy and people's activities in impacts the social and environmental dimensions of sustainability Considering that much of the unsustainable activity that occurs in the world can be traced to organisations and that most organisations are indifferent or in some cases even opposed (Etzion, 2018). This leads to significant impacts and their effects such as unpredictability of temperature and associated changes in the entire climate system. Raw measurement data also show an increase in the incidence of the strongest storms in most ocean basins.

Economic and technological conditions are also changing. Customers want to receive the ordered goods as soon as possible (Kowalski et al., 2019). The changes on the global economy has caused a significant increase in world production of goods, including food and services, and also a significant, even excessive, increase in consumption. Uncontrollable consumption leads to the necessity of more resources.

Increase in food production is clearly faster than a human population growth. However, improper distribution of products can lead to their waste in highly developed countries and shortages in less developed countries. Wasting food and resources is both an social and environmental problem.

When resources are wasted, they usually become more scarce, and hence the unavailability of non-renewable resources is growing.

The economy is changing. Those changes are being driven by digitization and integration of systems mainly based on the Industry 4.0 using intelligent factories 4.0 (Mrugalska & Wyrwicka, 2017). The idea of intelligent factories assumes that cyber-physical systems control physical processes, create virtual (digital) copies of the real world, and make decentralized decisions without human participation or Cyber Industry Networks (Saniuk et al., 2019).

Manufacturing is experiencing relevant changes under the challenges imposed by the sustainable economic development model (Jasiulewicz-Kaczmarek & Gola, 2019). Many countries have decided to prevent pollution by implementing environmentally friendly policies, for example, Remanufacturing (Saxena et al., 2020), Recycling (Merkisz-Guranowska, 2017), reverse logistics (Zarbakhshnia et al., 2020) or hybrid framework for the modelling and optimisation of decision problems in sustainable supply chain management (Sitek & Wikarek, 2015). Some of them include practices such as recycling, reduction of carbon dioxide or dust emissions into the atmosphere, reduction of fossil fuel extraction, promotion of the green economy, and introduction of closed circulation. The implementation of those practices can foster the creation of Sustainable Supply Chains (SSC).

Introducing a balanced and SSC into industrial activities seems difficult or even impossible. This publication aims to make it clear that, despite the difficulties, it is possible to implement sustainable development practices in supply chain structures. This study has the objective to present examples of effective implementation of sustainable development practices in the supply chain. To achieve the objective of this study we used a literature review of publications using the Web of Science and Scopus databases. The retrieved publications, provided the base fora bibliometric analysis and discussion of the practices.

The cognitive goal of the article is to identify global practical solutions in the context of sustainable supply chains and to present the most interesting solutions. The determined research goal of the work requires answering the following research questions: 1. What are the global experiences of implementing practical solutions based on sustainable development in supply chains over the years?; 2. What areas of knowledge relate to sustainable supply chains and practical solutions?; 3. Which research centers are leading in terms of the studied concept?; 4. What are the most interesting, cognitively, practical experiences of implementing the concept of sustainable development in supply chains?

The structure of work is as follows. Part one discusses the concept of a sustainable supply chain. Part two presents the research method used. The third part contains the results of the bibliometric analysis and examples of successful creation and implementation of Sustainable Supply Chains.

Literature Review

Supply Chain Management (SCM) has developed into a major conceptual approach inside management and business administration (Seuring, 2008). The topic of Sustainable Supply Chain has shown increasing interest in the last two decades both academia and practitioners'. Considering that much of the unsustainable activity that occurs in the world can be traced to organisations and that most organisations are indifferent or in some cases even opposed (Etzion, 2018). Some companies have adopted a certain level of commitment to sustainability practices. Some of these commitments are some-times superficial and non-compulsory, for example including the motto ''Think before you print'' in a company's electronic mail communications.

Sustainability in the Supply Chain is a key component of corporate sustainability – with focus on three aspects of sustainable development – environmental protection, economic growth, and social

equity (Souza & Alves, 2018). Sustainable Supply Chain is the management of raw materials and services from suppliers to manufacturer/service providers to customers and back with social and environmental impacts explicitly considered (Grzybowska, 2012).

In contrast to traditional Supply Chain Management, which typically focuses on economic and financial business performance, Sustainable Supply Chain Management (SSCM) is characterized by explicit integration of the triple-bottom-line with the integration of environmental and social objectives as an extension to the economic objectives (Seuring & Müller, 2008).

Research Methods

In order to accomplish with the objective of investigating examples of effective implementation of sustainable development practices in the supply chain this study used an initial search for relevant publications using a literature review. Two databases have been used: Web of Science and Scopus. This is commensurate with recommendations to use at least two databases (Green et al., 2006).

The literature review was carried out in three steps (Strozzi et al., 2017, 2-3): 1. identifying the scope of the analysis, 2. identifying and locating keywords, type and type of documents, language, databases, 3. selection, assessment and synthesis of the existing set of completed, reviewed and registered in the analysed base of scientific papers, developed by researchers, scientists and practitioners.

The retrieved publications provided the base for a bibliometric analysis and discussion of the practices. A bibliometric analysis was carried out for the purposes of the work. Bibliometric analysis allows observing the development of science on a national and international scale. It provides important information about the structure of science.

The purpose of bibliometric analysis is to answer research questions: 1. where is the source of the idea?; 2. which researchers are the most – scientifically influential – figures in relation to the examined idea?; 3. what areas of knowledge relate to the examined idea?; 4. which research centres are leading in terms of the examined idea?

The method of bibliometric analysis adopted was the Systematic Literature Network Analysis (SLNA) method introduced by Colicchia and Strozzi (2012), which combines Literature Review and analysis and visualization of a bibliographic network. Adopting this approach allows the identification of trends of key issues that affect the development of knowledge in a given field in a more scientific and objective way than descriptive reviews, which are based on subjective criteria for the selection of works and the classification of research input.

It can be observed that the amount of knowledge related to research on supply chains is significantly spreading (Fig. 1). The growing trend of publishing scientific papers can be observed, which indicates that research on the concept of supply chains is still in the spotlight of scientists and researchers.

Fig. 1:Number of publications in the area of supply chain research; August 2019 (own work)

As a result of preliminary literature review, a set of keywords has been identified that were used to collect metadata from the selected scientific databases. As a result of this action, a set of concepts was identified. The basic term "Sustainable Supply Chain" (SSC) has been identified in the collection. A complementary keyword, 'case study' was also used. Keyword identification is a critical stage of the analysis. Its results may change if different keywords are used.

The final search was conducted on August 1, 2019 in the Web of Science database using selected keywords. Scientific publications from 1945–2019 were searched with the term 'Sustainable Supply Chain' in their title, abstract or keywords. The initial search for the defined basic concept of "Sustainable Supply Chain" included 1,114 references, not including supporting words, and identifying the type and type of publication. Then the search was narrowed down to the set of keywords indicated earlier. The total number of searched publications is 205. A local database was created, which was saved on an external computer storage medium and used for further analysis.

Further refinement of search results was narrowed down to selected types of scientific publications. For analysis were selected publications that were subject to the review process: (1) articles from scientific journals, (2) articles as part of conference proceedings and (3) chapters in edited books. Duplicates have also been removed. Subsequent search attempts yielded a total of 201 scientific publications.

Research Results

As a result of the conducted activities, basic statistics related to the created bibliometric database were presented. A total of 201 scientific publications authored by 542 scientists were selected for analysis. They were published in a total of 220 source titles – journal papers, papers in conference proceedings and chapters in edited books. The authors of identified and analysed scientific publications come from 46 countries and represent a total of 274 scientific units from around the world.

An evaluation of changes in researchers' interest was carried out for a set of "Sustainable Supply Chain" and "case study". 201 scientific publications were identified that contained in their title, abstract and / or keywords: "Sustainable Supply Chain" and "case study". As a result, publications on the practical aspect of the Sustainable Supply Chain concept have been identified. After organizing the collection, 172 scientific journal articles (85.57%), 31 publications published as conference materials (15.42%) and 7 chapters from monographic books (3.48%) were specified.

The scientific debate covered the beginning of the 21st century, and the oldest publication presenting a sustainable supply chain case study date back to 2000 (Fig. 2). Figure 2 shows the trend of

published scientific papers. Since 2010, there has been a gradual increase in the number of scientific publications issued on the topic under study. In 2018, 51 (25.37%) were already published and indexed scientific papers. And on the day of the analysis, in August 2019, 28 scientific publications were issued and indexed. The dynamics of published scientific papers from the research area indicates that research on the concept of a sustainable supply chain and presentation of specific cases is entering the stage of maturity. It also shows how important and pressing the problem researchers are trying to solve.

The first scientific publication in the study area was published in 2000. It was published in the conference materials of the 7th International Symposium on Process Systems Engineering. Its authors are: Zhou, Cheng & Hua (2000). Their concept described in the work titled Supply chain optimization of continuous process industries with sustainability considerations. In this study, goal programming (GP) model is proposed to address this multi-objective problem with the integration of non-relaxable constraints and relaxable constraints (Zhou, Cheng, Hua, 2000).

Fig. 2: Trend in publishing scientific papers in the field of supply chain research for the keywords "Sustainable Supply Chain" and "case study"; August 2019 (own work)

Statistics show that for the publication of 172 scientific articles published by scientific journals, six journals have contributed to the publication and attention to a given aspect of research, and one of them explicitly addresses the issue.

The dominant magazine is "Journal of Cleaner Production". A total of 32 found scientific publications were published as part of the journal. It is a prestigious scientific journal about the area of clean production and operations management. The next journal is "International Journal of Production Economics", in which 8 scientific publications were published.

Table 1 shows a list of three distinguished source titles, being a book series or conference materials, in which the identified works appeared. "Computer Aided Chemical Engineering" had the most to promote research on the researched area. A total of 6 scientific publications have been published in this title.

Table 1: Main of book series, which contributed to the publication of scientific papers in the field of supply chain research, for the keywords "Sustainable Supply Chain" and "case study"; August 2019 (own work)

Source Titles	Number of Publications Searched	% of 201
Computer Aided Chemical Engineering	6	2.98%
IFIP Advances in Information and Communication Technology	3	1.49%
International Conference on Industrial Engineering and Engineering Management IEEM	3	1.49%

From the data on the database, it was possible to extract a ranking of researchers, according to the number of published by them scientific papers indexed by the database. Considering the authors and co-authors and the number of their scientific publications, it should be emphasized that research on supply chains, for the keywords "Sustainable Supply Chain" and "case study" was carried out / done by a total of 532 scientists from around the world.

Due to the number of publications among researchers, attention is drawn by Reza Farzipoor Saen, whose scientific achievements include as many as 14 scientific publications from the studied area (Tab. 2). The number of prepared, published and indexed publications on a given topic constitutes 0.22% of the researched research community. His most frequently cited scientific work is "A new fuzzy DEA model for evaluation of efficiency and effectiveness of suppliers in sustainable supply chain management context" published in 2015, in collaboration with other researchers. This paper develops an integrated DEA enhanced Russell measure (ERM) model in fuzzy context to select the best sustainable suppliers. It shows that the proposed model aids decision makers to deal with economic, social, and environmental factors when selecting sustainable suppliers (Azadi et al.,2015). However, 482 scholars, which constitute 91% of the surveyed population, have in their achievements one scientific publication from the studied area.

Fig. 3: Scientific contributions by country and geographical region, for the keywords "Sustainable Supply Chain" and "case study"; August 2019 (own work)

For the examined population of 201 identified scientific publications, statistics show that in the analysed set of scientific papers for the set of keywords "Sustainable Supply Chain" and "case study" dominate researchers from Iran and the United States. It is a leadership that significantly contributes to the development of practical aspects of the concept of Sustainable Supply Chain. They have published a total of 60 scientific papers. This gives a rate of 29.81%.

Table 2: The most popular areas of knowledge for identified scientific papers, for the keywords "Sustainable Supply Chain" and "case study"; August 2019

Areas of Knowledge	Summary number of publications	% of 201
Green Sustainable Science Technology	57	28.36%
Environmental Sciences	50	24.88%
Operations Research Management Science	44	21.89%
Management	41	20.40%
Engineering Environmental	39	19.40%
Engineering Industrial	37	18.41%
Engineering Manufacturing	25	12.44%

It was also possible to analyse the identified scientific publications in terms of types of fields of knowledge (Tab. 2). For the set of keywords "Sustainable Supply Chain" and "case study" a total of 43 areas of knowledge were specified. This shows that the studied topics are characterized by multidisciplinary specificity, which is related to the mutual complementation of issues and concepts from various areas of science. This approach allows you to get a comprehensive approach to research. The area under analysis also has a wide range of studies; draws knowledge about research methodologies, methods and tools from many sciences. Therefore, the studied area cannot be subordinated to any of the sciences according to the classification of sciences. No scientific publication or "one-family" scientific journal was found in the database. It becomes natural that disciplines that differ from each other approach each other. Thus, they create new fields and directions of interest, which can be observed in the case of the SSC concept.

Table 3: A list of selected research centres, including geographical location, for the keywords "Sustainable Supply Chain" and "case study"; August 2019

Name of the Scientific Center	Number of published Scientific works in accordance with affiliation	% of 201
Islamic Azad University; Iran	17	8.46%
Iran University of Science and Technology; Iran	7	3.48%
University of Tehran; Iran	7	3.48%
University of Sheffield; England	5	2.49%
University of Kassel; Germany	4	1.99%

The prepared statement shows that 5, including one significantly, are distinguished in the analysed set of selected scientific papers. These are scientific institutions whose scientists have published above 4 scientific papers indexed in the analysed database and affiliated with a given scientific unit (Tab. 3). It was found that scientists from these distinguished scientific centres published a total of 40 scientific papers, which is 20% of all published papers from the study area. The ranking shows that three of the five research centres are located in Iran.

First discussed article is Zhang et al. (2014) paper about sustainable supply chain optimization, which was made for the Dow Chemical Company. Authors described the mathematical model for the optimization of the tactical planning of a supply chain. They consider the optimization in three dimensions: economy, environmental and social. Authors in their case study consider the supply chain for The Dow Chemical Company. Analysed supply chain consists of: 17 raw material suppliers providing 11 raw materials, 7 production plants producing 270 products, and customers aggregated into 268 customer regions. Authors defined 3 objective functions, one for each of mentioned area in sustainable at supply chain. They defined accordingly performance indicator: for economy aspects – the total costs (including transportation costs, production costs, waste treatment and scale-up), for environmental aspects – the GHG emissions, for responsiveness – the total lead time. The lack of

information for GHG emissions, authors made some quantifications, what they exactly described in paper. They quantified GHG emissions associated with production, with energy consumption, with waste treatment, with transportation and combustion, landfill, wastewater. Treatment. For described case study Zhang and the other formulated MILP problem involving 533093 continuous variables and 529970 binary variables and 1125966 constraints. In first step authors minimise a cost, a GHG emission and a lead time separately. In next step authors made optimization for two and three objectives. For making these optimizations authors used a formal definition of Pareto optimality (which they also described in paper). When authors made a 2 objectives optimisation, they noticed that terms of one objective was optimal, and the rest had bed results. Authors made also solution in which they search optimal solution for 3 objectives simultaneously. For analyses case study, they noticed that "the total cost is slightly higher than the minimum value, but the other two objective functions have been decreased considerably" (Zhang et al, 2014). Authors investigated in their research for this real case, that decreasing a GHG emissions or lead time can be achieved by a small cost increasing. Moreover, authors extended their model and presented that it can be used to solve plant and network expansion problem.

Buyukozkan and Berkol (2011) in their article presents methodology, in which they integrate two decision making techniques for designing sustainable supply chain. In their described methodology they used analytic network process (ANP) integrated QFD, and zero one goal programming (ZOGP). This method is used for determination the design requirements, which are helped in designing the sustainable supply chain. Authors highlight in their consideration the fact that sustainable is interdisciplinary issue, which should be consider in three area: economic, environmental and social. To achieve sustainable development improvements in these three dimensions must be done. Buyukozkan and Berkol (2011) describing in detail their methodology (step by step). They defined nine customer requirements (CRs) and eighteen design requirements (DRs) of sustainable supply chain. Defined CRs: Total cost, Economic benefit, Equity use, Inventory management, Fuel usage, Emissions, Waste creates, Health and security, Laws and regulations. Examples of defined DRs: (DR1) Labour education in subjects like technology use and process, (DR2) Cooperation with suppliers, (DR3) Optimized workflow, (Dr9) Produce using minimum energy and materials, Dr12 (Integration of new technologies). Then the matrix with interdependencies among CRs and DRs was built. For building this matrix the ANP and QFD approaches were used. At the end the most suitable DRs for sustainable supply chain was defined, as results from ANP and zero-one goal programming approach. For describing fuel case study authors present completed HOQ with defined 9 CRs and 18 DRs, what is a step in this methodology. Buyukozkan and Berkol (2011) indicated, as a result of ANP analysis, that the most important design feature is the Labour education in subjects like technology use and process. Finally, based on the ZOGP solution, 11 DRs was selected, as requirements, which should be considered while striving for sustainable supply chain.

Next interesting article is the paper about sustainable supply chain performance measures and metrics (Hassini et al., 2012). Authors made a literature review about sustainable supply chain management research and focused on aspect of performance measures and metrics in this area. After research, they develop and proposed a composite index metric. They also present a case study of metrics for sustainability supply chain in the energy sector, for a major Canadian electric utility company. Hassini et al. (2012) also defined sustainability in supply chain in three dimensions: economy, environment and society. Authors mention 9 factors that influence the pursuit of sustainable development along the supply chain: market forces, policy and regulations, science and technology, product development, process capability, sourcing and operations, transport and logistics, marketing and PR, social issues. Authors pay attention to the fact that nowadays it is necessary for enterprises to make a comparison with other companies, make a benchmark. For making this the unified measures or indicators are necessary. Hassini and other (2012) notice a research gap – there is a scarce research about metrics in supply chain and in about sustainability aspect in SC. Hassini et al. (2012) in their article present a case study, in which company develop a system of metrics for sustainable supply chain. They consider all three dimensions: economic, environment and society. Stakeholders (customers and government) make a pressure for the company that they will take into account the environmental and social aspect during the decision-making process, what contributed to developing the indicators by this company. Finally, four indicators directly addressed supply chain issue were

defined, as: (1) percent of suppliers with an up-to-date sustainable development policy, (2) percent of contracts with Provincial suppliers, (3) percent of purchase orders placed with Aboriginal companies, (4) level of stake-holder trust by category.

Cases studies associated with aspect of sustainable supply chain in various branches of the economy were found in the literature review. Some examples of papers with case study for food supply chain are the papers from Rohmer et al. (2019), Thomas-Francois et al. (2018). Aspect of sustainable supply chain based on case studies on industry are presented on the following papers Kumar (2019), Resat & Unsal (2019), Sopadang et al. (2017).

Discussion of the Results

As a result of the conducted activities, 201 scientific publications from the studied area were identified analysed. They were published as journal papers, papers in conference proceedings and chapters in edited books, in a total of 220 source titles. Considering the authors and their scientific publications, it should be emphasized that research on the Sustainable Supply Chain concept and its practical aspects was carried out by a total of 542 scientists worldwide. The first publication on practical aspects of the Sustainable Supply Chain concept originates from two fields of science: Computer Science Interdisciplinary Applications and Engineering Chemical. However, the number and variety of disciplines indicates the multidisciplinary specificity of the subjects under discussion. As a result of the review in the studied area, it was possible to identify a number of examples of effective application of sustainable development practices in operations and supply chains.

Conclusions

Over the centuries, significant technology changes have been observed in the industry. The technology changes are considered indispensable to meet the humanity needs. Although there are positive impacts resulting in higher standards of living, although they can be also related to many negative impacts. The observed adverse impacts in the environment and social dimensions can take us to the conclusion that industry's development cannot be unconditional and must take into account its social environmental impacts. Considering the results of our theoretical study, it offered an overview of the current knowledge on concepts for a Sustainable Supply Chain. This overview covered also the evolution of state of the art and trends. The results may be available for voting on the subjects covered in technical and economic sciences. The overview can also help researchers to develop additional knowledge in the field of sustainable supply chains.

The topic of Sustainable Supply Chain is becoming more and more popular in the last years, which is confirmed by the evolution of numbers of publications. The theme is interesting for both academics and practitioners. to the description of the case studies on this paper which can help academics and practitioners on their strive for sustainable development and make a benchmark. It is expected a increasement on the impact, extension and pace of development of sustainability in different industries and supply chains. Nowadays, it is important to take into account not only economic aspects but also (or mainly) environmental and social aspects for companies and also for humanity. These three issues are always distinguished in aspects of supply chain sustainability. Future research ideas are the classify trends and development directions of sustainable supply chains. Research is necessary from academic perspective, not only to organize the knowledge but also to identify future research potential.

Abstract

The paper provides an overview of the agricultural economy regarding the development of agriculture and rural space. Prioritizing an action behavior in terms of vulnerabilities favors the orientation of agriculture through more environmentally responsible methods. One of the main objectives in the field of agriculture and rural development is to maintain a low level of greenhouse gas emissions generated by the agricultural sector. The role of research in the field and studies have shown an important factor in the fact that a reduction of the carbon footprint per ton of food produced from organic farming compared to conventional agriculture, in principle, due to the abandonment of the use of chemical fertilizers and pesticides. The purpose of the following . research is to collect data and information on the most efficient management models that will create the premises for the production of production models that will respond in the future to climate change challenges, especially from the perspective of reducing greenhouse gases, in depending on soil quality.During the research we tried to highlight issues that, in our opinion, are important for the development of the agricultural sector as part of the economy. An important role is played by the implementation of best practices in the proper management of the land and the promotion of organic production models can significantly contribute to increasing the carbon absorption in the soil and, at the same time, indicating the possible improvements in their performance.

Keywords: soil, environmental, carbon emissions, performance.

Introduction

The rural society, at the level of the whole country, is currently undergoing a transition process, a direct result of the socio-economic changes produced by the transition to the market economy. Thus, the rural environment knows a dynamic reality, constantly evolving and confronting the urban environment. The concept of "rural" defines the whole of the space in which villages or communes are located, the relations of interdependence created between them, the resident human communities and the related geographical, demographic, ecological and socio-cultural particularities. The rural area is characterized by a low density of housing and population, economic activities mainly carried out in the primary sector (agriculture, forestry, animal husbandry), a strong sense of belonging of the inhabitants to the community and the space of residence, a village cultural identity.

Research and development is important for all academic fields and industries. From this perspective, agriculture as a field is not an exception, having a special relevance starting from tradition article

points out that in scientific research, interdependence should be analyzed with other areas that have the role of improving the quality of research through innovation, so that the agricultural sector's research is complemented by various forms of academic knowledge that have proved to be vital, such as quality soil.

Approaching innovations in terms of methodologies applied in other sciences such as management, mathematics, even correlating soil degradation processes, determining the main pollutants, monitoring and controlling the soil, monitoring the soil quality status are relevant for agriculture. First, the dissemination of information from various fields can make information more efficient. The proper classification of these information resources may entail prioritizing the use of new information on detailed topics, such as performance in land / soil use, that is, which production would lead to higher long-term profit.

Considerations regarding improving the ecological performance of agriculture

Agriculture can significantly contribute to achieving the objectives of reducing the negative effects generated by climate change, not only from the perspective of ensuring the conservation of carbon reservoirs, which are still present in the soil, or by extending their size and favoring humus formation, as indicated. and in some specialized studies (Zhang et al., 2017; Adewale et al., 2019; Huang et al., 2019), but especially by reducing the energy consumption required in agricultural production and the supply of biomass needed for renewable energy production. , much more environmentally friendly. As it is argued in (CES, 2008), agriculture is not only a victim of climate change, but itself contributes to the emission of greenhouse gases. At the same time, (Agovino et al., 2019), they argue that agriculture and climate change are characterized by a complex cause-and-effect relationship and the agricultural sector generates significant amounts of climate-affecting gas emissions.

The change of agricultural paradigms, and the orientation of agriculture towards more environmentally responsible practices, is a current trend, with broad support within the Common Agricultural Policy (CAP). The introduction in 2013 of payments for greening, within the CAP, aimed both to improve the environmental and climate performance of this sector policy, and to provide the premises of a reward mechanism for public goods produced by farmers. Thus, as noted in (Westhoek et al., 2014; Andrei et al., 2015), the payment for greening promoted under the CAP achieves two distinct fundamental objectives: improving the ecological and environmental performance of agriculture, on the one hand. , and supporting the income of farmers, on the other.

Atmospheric greenhouse gas (GHG) emissions

A proper land management analysis can significantly contribute to the increase of soil carbon uptake and also indicate any potential improvements in their performance. As stated by (Yadav & Wang, 2017), agricultural land is a major source of atmospheric greenhouse gas (GHG) emissions and contributes majorly to global climate change, in the context of 20% of total GHGs. is issued from agricultural land.

Starting from these considerations we will analyze influences on soil carbon storage and the importance of nitrates. From this perspective, the promotion of an agricultural model capable of ensuring its own sustainability implies the existence of a set of common values and rules to which to purchase as many producers as possible, with a common objective, namely to reduce emissions effectively greenhouse and promoting an environmentally responsible production model. Although some significant progress has been made in promoting environmentally responsible agriculture, and conditions have been created for the transition to an efficient agrarian economy from the point of view of the use of available resources, the issue of greenhouse gas emissions from numerous agriculture has arisen. academic debates. The transition to a low carbon economy, more environmentally

responsible, in the national agricultural sector can contribute, both to the significant increase of food security, but also to the optimization of the agricultural production structures, which will thus conform much easy to environmental requirements.

The need to reduce carbon emissions and develop their level of absorption at the farm level acts, as noted in some specialized studies (Ramírez et al., 2019; Aznar-Sánchez et al., 2019) as an incentive in promoting the use of biomass as a raw material in the production of different categories of organic products, for the decarbonisation of agricultural production as a whole and the consolidation of carbon reservoirs. In this context, the assessment of the costs and the economic-financial impact of the sequestration of 4% / year of the carbon dioxide at the farm level is an important step in analyzing the possibilities of decarbonisation of agriculture and the promotion of the principles of bioeconomy in agriculture.

Greenhouse Gas Emissions Tend to Emit Forecasts and Targets For EU

Agriculture, in particular intensive farming, exerts a negative impact on the environment and climate. Agriculture, especially intensive agriculture, has a negative impact on the environment and climate. The EU's Common Agricultural Policy has introduced a number of support modalities for farmers to improve environmental and climate performance, such as greening. Introduced in 2015, greening represents a direct payment to farmers to use agricultural practices beneficial to soil quality. It is estimated that the greening policy implemented, however, has led to a change of agricultural practices around 5% of the total EU agricultural land after 2020.

In the literature, several studies have tried to make an assessment of the costs of reducing GHG emissions for different economies, as well as various estimates made in recent years, which vary significantly for example for the entire planet from 1% of GDP, and for the EU from 0.6% only for energy production, to 2.1% of GDP, and for the US from 1% to 4% of GDP, depending on the type of measures and the inclusion of financial costs, as well as of other economic assumptions.

The reduction of agricultural emissions at EU-28 level is mainly due to a decrease in the number of animals, improvements in the level of good agricultural practices, the lower use of nitrogen-based fertilizers, as well as a better management of natural soil fertilizers, the importance of the zootechnical sector and agricultural practices regarding biomassFormatting author affiliations.

Figure 2: Modification of aggregate methane and nitrogen oxide emissions from agriculture (1990-2011)

Source: European Environment Agency

For Romania, the main sources of greenhouse gases are nitrous oxide (N2O) based on soil nitrification and management of natural fertilizers, the resulting methane (CH4) from enteric fermentation of herbivores, mainly cattle, and carbon dioxide (CO2) from from the energy / fuel used by buildings and machines. 50% of agricultural emissions are nitrogen oxide, followed by 45% methane, while only 5% of emissions are based on carbon dioxide.

Carbon sequestration contributes to the overall goal of lowering greenhouse gas concentrations in the atmosphere. The incorporation of the vegetal mass in the soil on the agricultural lands where green crops are established, contributes to carbon sequestration. But the result of this objective will be quantified by monitoring the surfaces on which green crops were established, as well as by quantifying the amount of plant biomass resulting from afforestation. ***Low Carbon Agriculture Sector Analysis***

Romanian farmers rely heavily on organic fertilizers, most of them coming from individual farms. Inadequate management of animal waste, especially in subsistence agriculture, together with the rare wastewater treatment facilities in rural areas contributes to this environmental impact.The process of land abandonment has accelerated in Romania in the past years, resulting in the loss of biodiversity. Uncultivated land has increased by 50% since 2005, and, at 952,000 ha, constitutes 7% of the total agricultural area of the country (2010). The abandonment of agricultural land has far-reaching effects on ecosystem services, such as increased carbon storage, lower soil erosion, better water quality, and loss of traditional cultural landscapes.

These effects often result in a decline in biodiversity. Also, the lack of appropriate knowledge, as a result of problems with the farm consulting system, results in often inadequate agricultural practices, with a negative influence on biodiversity. Even the relatively low yields of feed production, largely determined by improper pasture management, lead to erosion and loss of biodiversity. In the context of climate change, there is a need for a new activity in the agricultural field, which means using natural resources and good practice models to provide observation systems, information management understanding, modeling and analysis of environmental phenomena for evaluation, exploitation and management. natural resources (water soil, climate).In practice, specific environmental and climate practices can be addressed depending on the local agricultural areas.

The sector needs to consider adaptation to a changing and less favorable climate going forward, as well as mitigate Gree House Gas (GHG) emissions. The figure. 3 below shows the greenhouse gas emissions from EU28 in 2017, broken down by main source sectors. Energy accounts for 80.7% of greenhouse gas emissions in the EU28 in 2017, and transport accounts for about one third. Greenhouse gas emissions from agriculture contribute 8.72%, industrial processes and product use by 7.82%, and watse management by 2.75%.

Table 1: ***Greenhouse gas emissions in the EU by sector in 2017***

No	**Factor** of greenhouse gas emissions	**Per continent**
1.	industrial processes	7,82%
2.	agriculture	8.72%
3.	watse management	2.75%
4.	Energy accounts	80.70%

Source CE

Figure 3: Greenhouse gas emissions in the EU by sector in 2017

The climatic changes faced by large commercial agricultural holdings being different from those of subsistence, of very small dimensions. Climate change is expected to affect farmers in the south and south-east region of Romania in general and individually. Given that large farms usually have very specialized production, such as cereals and oilseeds, they are particularly vulnerable to the impact of frequent and long-term droughts, which affect their production and profit. But they are well-informed professionals, have the necessary technical and financial resources and have more options to adapt their agricultural systems to climate change through new technologies and irrigation systems. Smallholder farms, which practice subsistence farming, are very socially and economically vulnerable to adverse climatic events, in agriculture working directly about one third of the population. In some individual cases, farmers are specialized in the production of specific crops, such as onions or potatoes, thus increasing their level of vulnerability. In other cases, some intrinsic resistance can be found in smallholder communities due to the practice of organic farming and resource recycling, low carbon economy, diversity of production, strong social relations and (in some regions) alternative sources of income.

Agricultural production has a positive impact on the environment, but there are other determinants that lead to soil degradation and GHG. The level of GHG emissions from agriculture has decreased by over 20% since 1990, reaching 12% of the total GHG emissions at EU level in 2016, due to the reduction of nitrogen oxide emissions from the management of agricultural soils (mainly the reduction of fertilizer use). and the reduction of enteric fermentation emissions as a result of the overall reduction of livestock.

Achieving the 4% / year carbon dioxide storage objectives at the farm level as well as the possibility of defining economic models for decarbonising agricultural production are issues to be tackled. From a methodological point of view, both descriptive analyzes will be applied to highlight the factual situation of sequestration of a certain percentage of carbon dioxide at the farm level, as well as the interactive method for identifying possible trends, evolutions and perspectives in applying their measures. It will also adapt, calibrate and run in the branch, several models already validated in the literature, which can complete the research, highlighting the role of nitrates in soil, fertilizers and the contribution of nitrogen from organic sources. the emission of greenhouse gases in agriculture.

In the evaluation of the carbon storage methods, on the one hand, an analysis of land use is very

important and on the other hand an analysis of the properties of the land. Therefore, in order to analyze the carbon dioxide storage at the farm level and the environmental requirements at the farm level, an analysis of the soil quality becomes important.

In the agricultural field a main objective of the development of the rural area is to maintain a low level of greenhouse gas emissions generated by the agricultural sector depending on the local characteristics. It is a priority for farmers to keep the soil covered, to use techniques for managing the environment of the land, for example, local agricultural production helps to maintain carbon in the soil.

As a rule, carbon stocks in agricultural soils can be increased by adapting certain agricultural activities. The research analyzes the fact that the carbon absorbers are as important as the emission reduction, being in close interdependence. Thus, a thorough knowledge of the quality of the soil with the maintenance and further improvement of the natural absorbents existing in the soils of agricultural lands may be essential. The analysis addresses the adaptation of fertilization mainly depending on the quality and texture of acid, neuter or alkaline soils. The importance of biologically

fixed nitrogen (Nb) is not revealed based on a predetermined study but by the method of case study by appreciation, thus the amount of nitrogen fixed biologically in the soil, mainly, following the symbiosis between Rhisobium and leguminous plants, depends very much on the species. cultivated, by the production and biomass incorporated in the soil, reaching up to hundreds of kg N / ha. The amount of nitrogen from the previous crops (Nr) assimilably provided by the residues of the previous crop depends on the quantity and its composition depending on the nitrogen content and on the degree of lignification. It also depends on how well they were incorporated into the soil, the time when it was made, and the time elapsed since incorporation.

Loss of nitrogen in the form of gases in the atmosphere (Ng) can occur through various mechanisms, in particular by denitrification and by volatilization of ammonia on the surface of alkaline soils.

In the calculation method regarding the nitrogen inputs from organic sources will be considered the studies that determines the type or types of soil within the farm, as well as the main ones morphological and physico-chemical properties relevant to providing a maximum fertilization efficiencies and to reduce the risk of pollution with nitrates (and possibly phosphorus) of groundwater (slope, texture and soil permeability, degree of saturation in bases). Based on this information correlated with those resulting from agrochemical mapping, the level of soil fertility, the need for possible improvement measures and can be established the most suitable cultivation technologies regarding soil works, date sowing, methods of applying organic and mineral fertilizers and so on. The specific nutrient consumption for each crop is quantified in the form of regression equations specific to culture, established in fields long - term experimental ones, on the basis of which exports of nutrients for each crop, relative to the surface unit. Prioritizing ensuring the conservation of carbon reservoirs, which are still present in the soil, leads to the need to orientate agriculture towards more environmentally responsible practices and why not to designate areas vulnerable to nitrate pollution from agricultural sources. Establishing the nutrition regime of the plants is a prerogative from the perspective of evaluating the doses of fertilizers to ensure an optimal nutrition, growth and development of cultivated plants.

Studying the evolution of policies on decarbonisation of agriculture

Evaluation of carbon storage and land use strategies in functional and competitive market economies.

The researches that will be carried out within this theme will focus on the description of factors through which to exploit the decarbonisation potential of agriculture and to promote an environmentally responsible agricultural model. At the same time, it is envisaged to improve the studies regarding the

interactions determined by promoting the carbon dioxide storage at the farm level and the environmental requirements at the farm level, while analyzing the soil quality.

Table 1: Emissions from agriculture.

	The level	The weight of the functional surface from the viable surface and the economically viable margin for irrigation
2012	18299 Gg CO2	50%.
2020	29882*	70%
2030	20.000GgCO2	90% of the total viable infrastructure

The Impact of Climate Change from The Perspective of Reducing Greenhouse Gas Emissions

The climate characterized by successions of drought years followed by rainy years leads to, during the drought years, the accumulation of nitrates in the unsaturated area between the root layer and the groundwater aquifer, nitrates which are then transferred to the free water in the rainy years (piston effect). In this way, the annual losses of nitrates, even if they are small in the dry years, can lead, by accumulation, to great pollution of the groundwater aquifer in the years with excess precipitation.

Agriculture generates 14% of Romania's total GHG emissions in 2010, while the regional average, as well as the EU -15 and EU-27, was 10% Managing forests to combat climate change Protecting, restoring and promoting the sustainable use of terrestrial ecosystems, sustainable forest management, combating desertification, stopping and repairing soil degradation and stopping biodiversity loss .

The land management for carbon sequestration is highlighted by soil carbon inventory, especially by the form in which it is kept, the capacity, the persistence and bulk density, the textural class of the soil.

Changes in crop management practices that affect soil organic dynamics C are crop selection, high biomass crop rotation, crop residue management, nutrients and water management, use of organic fertilizers and management of organic soils and degraded land (Hutchinson et al., 2007; Petersen et al., 2013; Smith et al., 2012).

The research revealed a difference in soil carbon when the C factors had the effect of applying a management method based on the interdependence between production and crop rotation, soil quality, carbon uptake, climate. At the same time, soil carbon changes are caused by land use changes. The global average concentration of atmospheric CO2 shows a steady increase, and this trend, together with increases in other greenhouse gases (GHGs), such as N2O and CH4, is contributing to climate change, which is considered a major problem (Hartmann). et al., 2013; Petersen et al., 2013).

Globally, soil carbon sequestration could offset GHG emissions of 0.4, which is equivalent to 5% to 15% of global fossil fuel emissions crop residues management, nutrients and water management, use of organic fertilizers, and management of organic soils and degraded land (Hutchinson et al., 2007; Petersen et al., 2013; Smith et al., 2012). The management applied through the modification of some practices of crop management have first and foremost an impact on the organic texture of the soil through the rotation and selection of crops, which can produce biomass by managing crop residues.

Through nutrient and water management, the use of organic fertilizers and the management of organic soils and degraded land as studies have shown (Hutchinson et al., 2007; Petersen et al., 2013; Smith et al., 2012).

Agricultural Practice

It is considered as a good agricultural practice to adapt the fertilization and the timing of its fertilization to the type of agricultural crop and to the characteristics of the soil. The assessment of the nutrient requirement is made according to the nutrient reserve of the soil, the local climatic conditions, as well as the quantity and quality of the predicted production. The hypothesis of carbon storage in the soil could be an option to mitigate climate change for agriculture, by managing the land and changing its use. To estimate all greenhouse gas exchanges. In this study, we will consider the possibility of adapting the methods used to estimate carbon changes in the soil. For large-scale assessment, the schedule CO2 emissions from the soil should be taken into account. The land management for carbon sequestration is highlighted by soil carbon inventory, especially by the form in which it is kept, the capacity, the persistence and bulk density, the textural class of the soil. In certain areas, especially on soils with thin limestone substrate, there is an imminent danger of groundwater pollution. Depending on the local specificity, this danger should always be taken into account when applying organic fertilizers in such high risk areas. Any nitrogenous fertilizer in organic form is mineralized as a result of the activity of bacteria present in the soil, ultimately resulting in nitric and ammoniacal nitrogen. The main evolution factor towards mineral forms of nitrogen is the ratio between carbon and nitrogen in fertilizer (C / N). It may be more or less high and conditions the rate of mineralization. The transition from the organic to the mineral (ammoniacal or nitric) form depends on the value of the C / N ratio.It is difficult to estimate with minimum rigor what quantities of nitrogen or other nutrients from the previous crops can be taken into account in calculating fertilizer doses.In general, it is possible to estimate quantities of 5-10 kg of N per year, higher in situations with intensive industrial activities in the area.

The calculation method regarding the contribution of nitrogen from organic sources

The calculation method regarding the contribution of nitrogen from organic sources is important for the assessment of greenhouse gas emissions from agricultural activities.The nitrogen in the soil is found, almost entirely, in the organic matter, and only a small fraction of it is in an immediately assimilable form for plants. Organic nitrogen can be used by crops only after its passage into an inorganic form through mineralization or gradual decomposition of organic matter from the soil, first in ammoniacal nitrogen and then in nitric nitrogen.

Typically, soil organic matter is made up of fractions that differ by the value of the C / N ratio (carbon: nitrogen). When estimating the level of the planned (planned) crops, the climatic characteristics of the place (in particular the thermal regime and the precipitation, including their annual distribution) must be taken into consideration, considering that they are decisive in the dynamics of the fertilizing elements in the soil and in particular in mineralization of organic matter and in the movement of nutrients in the soil profile, under the rooting zone.

It is undeniable that nitrate losses from the soil are more intense in the seasons with more abundant rainfall, when, as a rule, the soil is deprived of vegetation. Under the specific conditions of our country, after the annual crops, more or less quantities of mineral nitrogen from the previous fertilization remain (about 50% of the applied nitrogen remains unconsumed by the crops) and from the mineralization of the organic matter from the soil.

Mineralization is more intense in autumn, when favorable conditions of temperature and humidity are encountered and when there is also an increased risk of nitrate water pollution. In counteracting this phenomenon, crop rotation plays an essential role. It is recommended to rotate with the main crop a

crop with rapid growth, capable of harnessing the residual nitrogen and that in spring can be used as green fertilizer for spring-summer culture.

Table 5 : The level of nutrients according to crops

Nr. crt.	*Specification of crops*	**N**	*P_2O_5*	*K_2O*
1.	*Autumn wheat straw 1: 1.3*	*26.5*	*13.7*	*16.4*
2.	*grain rye straw 1: 1*	27.5	10.8	22.5
3.	*grain oat straw 1: 1.5*	28.5	11	31.5
4.	*Corn grains: strain 1: 1.6*	27.5	12.5	16.5
5.	*Sugar beet roots: Leaves and parcels 1:1*	4.9	2.0	6.0
6.	*Pea berry berries: 1: 1.5 edges*	61.0	16.6	28.0
7.	*Soybean beans: 1: 1.5 rods*	70.0	22.5	34.0
8.	*natural grass grass fan*	24.0	5.6	18.0
9.	*Natural grassland grass*	6.5	1.4	4.5
10.	*Hemp stems*	10	8.5	17.5

Figure 6 :Specifications of crops

The table above shows that the soil with the richest culture in N is the one with soy, while other relatively more frequent crops are located in the middle area with 1/3 of N, so that for each one the method will be applied of the appropriate nutrient, as in estimating the level of the planned (planned) crops, the climatic characteristics of the place must also be taken into account, since they are decisive in the dynamics of the fertilizing elements in the soil and especially in the mineralization of the organic matter and in the movement of nutrients in the soil. soil profile, below the rooting area. Soil carbon changes due to land use changes.

Captions Nitrogen (N) *

Phosphorus (P2O5)

Potassium (K2O)

The soil is a non-renewable resource that requires constant monitoring to prevent its degradation and to promote efficient management. The soil may degrade depending on many items. Of strategic importance is the type of fertilizer, the age and the technique of applying fertilizers with N, with the amount of nitric nitrogen resulting from mineralization of the organic matter from the soil and other organic residues incorporated into the soil as well as with the amount of nitrogen entering the soil on other ways.

Typically, soil organic matter is made up of fractions that differ by the value of the C / N ratio (carbon: nitrogen).

The fraction, with the value of the C / N ratio of order 8-11, called humus, is a stable fraction, which has reached equilibrium and therefore decomposes more slowly; other fractions with higher values of this ratio are decomposed faster than humus by soil microorganisms, whose activity is more or less intense, depending on the temperature and humidity conditions.

Solid fertilizers can produce pollution only in the case of heavy rains that occur immediately after application.

The prohibition periods for applying fertilizers on the ground are defined by the time interval when the average air temperature drops below 5^0C. This interval corresponds to the period when the requirements of the agricultural crop relative to the nutrients are reduced or when the risk of percolation / leakage to the surface is high.

When using nitrogen fertilizers in a predominantly organic form, it must be borne in mind that nitrogen, before being absorbed by plants, must undergo mineral form through a series of transformations they undergo in the soil. Therefore, these fertilizers are applied with sufficient time before the time of maximum absorption by the crops.

When applying chemical fertilizers it is necessary to take into account the crop specific requirements it is recommended to be applied according to the ratio between nutrients.

For example: those where P2O5 predominates are more suitable for pre-sown grain cereals, those with a nitrogen ratio are suitable for technical crops, etc. Soil properties influence the use of fertilizers: larger quantities of fertilizers can be administered on heavy soils than on light ones; fertilizers with alkaline physiological reaction will be applied on acid soils, and fertilizers with acid physiological reaction will be applied on alkaline soils.

The periods when applying organic fertilizers should be determined according to different conditions, as early as possible, during the crop growth period, to maximize crop nutrient uptake and minimize the risk of pollution.

The application of fertilizers to meadows leads to the following positive effects:

- the increase of production, especially considering the fact that the fields with meadows generally have a lower quality class;

- distribution of production on the seams - on permanent pastures, especially on degraded pastures, after the first harvest, which in some cases exceeds 80% of the annual production, the plants harden what it does to obtain a small number of crops per year and weak quantitative.

On the heavily degraded meadows, only one crop is obtained during the year, and in the case of other meadows two or three harvests, but with the highest weight at the first harvest.

The application of organic fertilizers on permanent pastures (pastures and meadows) is subject to the condition of not exceeding the dose of 170 Kg N ha-1 year-1 and not being applied during the prohibition periods.

For the establishment of the fertilization plan, the export of the elements for each plot according to its mode of operation is considered.

Thus, at a production of hay of 4 t / ha, under the conditions of exploitation as hay, the export of: 8085 Kg N, 25-32 Kg P2O5, 85-100 Kg K2O, 47-50 Kg CaO.

Fertilizers with secondary nutrients and, if the conditions provided for in Article 17 are met, from the fertilizers with main nutrients placed on their markets, shall be expressed as follows:

(a) in the form of oxide (CaO, MgO, Na2 O, SO3) or

(b) in elemental form (Ca, Mg, Na, S) or

(c) in both forms.

For the conversion of calcium oxide, magnesium oxide, sodium oxide and sulfuric anhydride content into calcium, magnesium, sodium and sulfur content, the following factors are used:

(a) calcium (Ca) = calcium oxide (CaO) × 0.715;

(b) magnesium (Mg) = magnesium oxide (MgO) × 0.603;

(c) sodium (Na) = sodium oxide (Na 2 O) × 0.742;

(d) sulfur (S) = sulfuric anhydride (SO3) × 0.400.

The value withheld for the declaration is the value rounded to the nearest decimal place both when the content is expressed as oxides and if it is expressed in elementary form.

acid soils with pH <6.5; • neutral

soils with pH = 6.5 - 7.5;

• alkaline soils with pH> 7.5.

Potentially accessible or mineralizable nitrogen comes from these less stable fractions. For soil conditions in Romania it represents between 1 and 2% of total nitrogen, both in soils. Many studies have evaluated cropland, grassland and marshland, while Schmidt (2008) evaluated the transition from natural land to agricultural land. For example some studies the fact that a change factors from permanent cover to an annual harvest, plus simultaneous factors for the changes of the crop management involves the achievement of a balance between the soil carbon and its kinematic function of the use and degradation of the soil. Not infrequently the concern is to follow the cyclicality of the crops used depending on the texture of the soil. But a technical formula cannot be validated precisely because depending on the periods of maintenance of the soil with fertilizers these techniques have to be controlled according to external factors.

Consideration of soil properties, climate and crop management are vital characteristics from the perspective of emissions. The following scenarios are aimed at the interaction between crop growth, soil carbon, nitrogen needs and climate.

Most agricultural soils contain too little natural nitrogen available to meet the crop requirement during the growing period. As a result, it is necessary to supplement the nitrogen naturally contained in the soil each year. Applying the right amount of nitrogen at the right time is the basic requirement of good

fertilizer management. Each agricultural producer must understand the need for accurate assessment and periodic monitoring of plant nutrient requirements based on realistic forecasts, depending on:

- local technological conditions, tradition ;
- Expected production yield
- sun;
- climate;

These corrections can be made using the following relationship:

$$DN = Nc - (Ns + Na + Nb + Nr) + (Ni + Ng + Nl)$$

in which:

DN is the nitrogen dose from fertilizer (organic + mineral) for the expected harvest, in kg / ha;

Nc is the nitrogen requirement for the expected harvest, in kg / ha;

Ns is the nitrogen available from the soil during the vegetation period, in kg / ha;

Na is nitrogen from irrigation water and from the atmosphere (powders, precipitation), in kg / ha;

Nb is nitrogen from biological fixation, in kg / ha;

There is no nitrogen from the mineralization of the plant residues of the previous crops, in kg / ha

Ni is nitrogen lost by immobilization by soil microorganisms, in kg / ha;

Ng is nitrogen lost through volatilization, including denitrification, in kg / ha;

Nl is nitrogen lost through surface runoff and leaching, in kg / ha.

Nitrate losses in the form of nitrates, with surface runoff and percolation water, are the main diffuse pollutant of the aquatic environment, arising from agricultural activities.

The nitrogen in the soil is found, almost entirely, in the organic matter, and only a small fraction of it is in an immediately assimilable form for plants.

Carbon sequencing is that storage function at the soil level, which highlighted the importance of determining soil quality and interdependence with the climate ecosystem. Soil is defined as a strategic carbon reservoir, which contains more carbon than is found in the atmosphere and in the terrestrial vegetation. These three carbon tanks are constantly changing. In many soils, soil organic matter, which contains about 55-60% carbon by mass, comprises most or all of the carbon stocks current knowledge - and knowledge gaps - about the role of soils in carbon, nitrogen and water cycles. The accumulation of stabilized carbon in the soil requires a control in terms of storage. The quantity and type of residues produced by plants are also influenced by the addition of fertilizers, which are indispensable for sustaining the productivity of plants in agricultural systems. In addition, by their effect on the microbial activity, the carbon contributions of the plants, the climatic factors, such as the temperature solution.

In order to reduce the negative effects of climate change on agriculture, risk management tools need to be implemented to limit the negative effects of natural disasters on agricultural production. Adapting to climate change is not just a challenge and a condition that, in the long term, new methods will be developed, planning new agricultural techniques more environmentally friendly to be applied by farmers in increasing numbers. Accounting for a concept of stepping up processes in the agrienvironment field in order to prefigure the application of greener models in agriculture, while reducing the level of GHG, is not to be neglected.

The quality of the soil is determined by the texture of the soil that must be maintained through the agricultural practices, in order to manage a possible degradation due to the climate or the vegetation. The calcium carbonate content is strongly correlated with the quality influenced by the distribution of clay in soils, the geographical area as well as perhaps the most important of the material residues. Thus, it can be seen that the distribution of nitrogen in the soil is closely related to the organic carbon, vegetation and climate as well as the texture of the soil. Therefore, the use of land, the use of innovative agricultural practices based on a management designed on the basis of local data and adapted to agricultural production can be a factor in improving soil performance.

Acknowledgment

In our opinion, the agricultural lands in general and especially those in Romania have considerable potential for carbon capture and storage. It is vital to have improved agricultural systems that efficiently utilize nutrient resources, increasing not only the amount of carbon in the soil, but also the biodiversity and resistance of agriculture even to climate change. As a rule, carbon stocks in agricultural soils can be increased by adapting certain agricultural activities. Research also shows that carbon absorbers are just as important as reducing emissions. Maintaining and further improving the natural absorbents represented by soils, agricultural land and coastal wetlands are essential. At same time, the paper shows the vital role of green manure can be applied on any type of soil, but they have a higher efficiency on podzolic and sandy soils. The technique is aimed at the depth of incorporation which is between 18-25 cm, depending on soil, humidity, volume of plant mass, etc. For ease of incorporation, the recommendation is when the crop is very rich and the stems are long. It is estimated that in a normal soil 10-15% of nitric nitrogen can be denitrified from the one produced annually by mineralizing the organic matter from the soil and from the one incorporated in the form of chemical fertilizers. These losses may be higher in soils with defective drainage, where the frequency and intensity of the phenomenon are higher.

Whether agriculture can contribute to reducing greenhouse gas emissions remains a question. That is why scientific research has shown that by achieving a successful management, adaptable solutions can be identified in practice on areas of interest, depending on the quality of the soil from the geographical environment. It is known that research and innovation activities and consultancy services can help farmers to adopt production systems that best meet local characteristics. Regarding land use changes and land management, research has revealed that there are uncertainties in the levels of carbon stock changes due to variations in local conditions and lack of reliable land data (Borjesson and Tufvesson, 2011). The role of research in the field and studies have shown an important factor in the fact that a reduction of the carbon footprint per ton of food produced from organic farming compared to conventional agriculture, in principle, due to the abandonment of the use of chemical fertilizers and pesticides. One of the main objectives in the field of agriculture is to maintain a low level of greenhouse gas emissions generated by the agricultural sector. Farmers must continually improve the techniques adapted to the new challenges of keeping the soil covered, to use techniques for managing the environment of the land to help maintain the carbon in the soil.

In conclusion, we can say that, conservation and improvement of the state of natural resources and habitats by encouraging the use of innovative, environmentally friendly agricultural production methods that come to protect the environment, biodiversity conservation and the improvement of water, soil and natural landscape quality are vital. In the field of rural development, agri-food economy, economic environment, we need a clean environment that is based on the rational use of natural resources, increasing competitiveness by identifying the best practices in the field. In part, the need for innovation in agriculture will contribute to the understanding of the economicfinancial impact of the storage of a percentage of carbon dioxide at the farm level and to the definition of the demands imposed by achieving a functional and highly competitive market economy. The role of the research is also the possibility of developing environmentally responsible agricultural production models that will significantly contribute to the decarbonisation of agriculture.

ABSTRACT

The paper aims to explore the relationship between the cost of funds and loan portfolio quality at US community banks. Data was collected from the call reports. It was concluded that: bank locations, assets size, number of employees, and loan quality have a minimal impact on the cost of funds. In addition, it was found that there's a positive relationship between the number of bank employees and total average assets. It was found that there's a negative relationship between loan quality and total average assets. On the other hand, there was an inverse relationship between loan quality and total average assets, which was a key finding of this study.

Keywords: Cost of funds, bank, loan portfolio, Illinois.

Introduction

Banks play an important role. They enable people to save deposits. They provide people with a payment system. They generate profit through charging borrowers (Sylla, 2010). During the last ten years, the number of community banks has been decreasing. 33 community banks in Illinois failed in 2013 (Federal Deposit Insurance Corporation [FDIC], 2013). That is attributed to the slow pace of the US economic recovery, and the rapid technological development (Stiroh & Rumble, 2006). That's also attributed to the great recession of 2008.

Before the financial recession, the lack of regulations at banks led some bankers to approve many loans that are associated with many risks. That led to the failure of many bank. Thus, recovery plans were developed at financial institutions and new acts were set, such as the Dodd Frank and the Consumer Protection Act of 2010 (Kennedy, 2012).

Under the latter act, lenders are obliged to provide the borrowers with a full description of the products being offered. Lenders are also obliged to examine the borrower's ability to repay the loan (The American Bankers Association, 2015). After issuing new acts, community banks increased their operating expenses (American Bankers Association, 2015).

Community banks can significantly affect the economic status of the US. For instance, they provide credit and loan services for small enterprises (FDIC, 2013). There are several factors affecting the

performance of community banks. Such factors include: the new legislations, technological developments, economic recession, and the threats of new entrants, and having substitutes.
Community banks generate profits through lending owners of small enterprises. However, lending is associated with risks (FDIC, 2013). "The *stability of a banking system crucially depends on the quality of its portfolio of loans*"(Ponce and Gomez, 2013.p. 21). There's a positive relationship between bad loans and the amount of non-performing assets. These assets don't generate any profit (www.FDIC.gov).
The number of community banks has been decreasing in the US (FDIC, 2013). Few studies were conducted about the strategies adopted by community banks to maximize their profits. The main objective of the present research to explore the relationship between the cost of funds and loan portfolio quality at US community banks in the state of Illinois. In 2013, 33 community banks failed in the state of Illinois, where the study took place. Illinois is the fourth largest state with number of community banks, according to Illinois Department of Professional Regulations. The study shed light on the important roles community banks play in the US economy and examined the strategies used by community banks to stay viable, and it shall enable banks to set effective short and long term pricing strategies. Which in turn help banks to improve their performance.

2 Review of Literature

Community banks are different from regional banks. The former banks have a lower asset size. The former banks focus on lending owners of small and local enterprises (Suter, 2007). The asset size of community banks enables these banks to achieve a competitive advantage (Suter, 2007). These banks provide financial benefits to the owners of small enterprises. These enterprises play an important role in improving the state's economic status (www.fdic.gov). They also provide twothird of the job opportunities in the market. Thus, the latter banks can affect the national economic status. They provide many job opportunities (Federal Reserve Bank of Kansas City, 2003, p. 25). The loan officers at community banks take several factors into consideration before approving a loan. For instance, they assess the borrower's personality (Federal Reserve Bank of Kansa City, 2003, p.35). However, lending the owners of small enterprises is risky because it requires monitoring their credit constantly (Berger and Udall, 2002).

2.1 Profitability in Community Banking

Due to the great recession in 2008, the performance and profits of community banks in the US declined. In addition, the number of failed banks increased significantly. However, their profits have increased during the past five years. Despite that, the quality of earnings hasn't increased. Banks must generate profits to survive in the business world. In this regard, interest income is a significant source of profits (Regehr and Morris, 2014). The factors affecting the interest rate include: the number of lending opportunities and government policies (Morris & Regehr, 2014). The profits all US banks - including community banks – was affected negatively by recession (Regehr and Morris, 2014).

2.2 Net Interest Incomes at Community Banks

Cash inflows and outflows at banks are affected directly by the interest rate on a loan (Morris & Regehr, 2014, p. 5). There are many factors that affect bank pricing strategies. Such factors include: the change in regulations (Morris & Regehr, 2014). Other factors include: the national economic status and the market rates (Morris & Regehr, 2014).
The impacts of changing the interest rates on the net interest income vary. Such variation is attributed to the pricing strategies (Morris & Regehr, 2014, p. 7). Some banks adopt a strict pricing

strategy (i.e. assets sensitive). Other banks are conservative (i.e. liability sensitive). If there's an increase in market rates, the interest income of the bank will increase. (Morris & Regehr, 2014).

2.3 The Factors influencing the Loan Pricing Strategy at Community Banks:

These factors include: macroeconomics factors, supervision, and regulations. Loan pricing strategy affects economic growth and market activities. Such factors include: regulatory requirements, management styles, taxation system, government policy, market structure, and macroeconomic factors. Other factors include: interest rate risk, deposit growth, loan quality, operating expenses, managerial efficiency, liquidity, bank size, and capitalization. Other factors include: regulatory and government policy, ownership, credit risk, risk aversion and non-interest incomes. The macroeconomic factors include: capital formation, investment, gross national savings, interest rate policies, exchange rate, GDP growth and inflation rate" (Dhal & Ansari, 2005). Many studies were conducted that researched the relationship between interest rates and bank size's. Schwaiger, (2007) study in Austria finds that there's a negative correlation between interest rates and the size of Austrian Banks Demirgüç-Kunt, (2004) study finds there's a positive correlation between interest income and bank size. If the bank has a high amount of capital, it will have a low cost of funds (Dahl & Ansari, 2005). It was found that there's a negative correlation between the interest income and the capitalization at banks. There are important factors that affect the loan pricing strategy, such as: the credit risk and interest rate risk. It was found that there's a negative correlation between profitability and credit risk at banks (Awadeh and Hamadi, 2012). On the other hand, some scholars find that there's a positive relationship between the loan pricing and credit risk (Maudos and Guveara, 2003) and Maudos and Solic, 2009). Loan quality, operational costs and risk aversion can positively affect net interest margin and the loan pricing (Ansari and Dhal, 2005; Doliente, 2003, Mannasoo, 2010 and Hossain, 2010). agreed in their studies that those factors have a positive effect on loan pricing. Liquidity requirements was found to be a major impact on loan pricing since their opportunity cost tend to be high, thus reducing the net interest margin and profitability. Many scholars wrote extensively on competition and their impact on loan pricing. (Ansari and Dhal, 2005). According to Schwaiger & Liebeg (2007), Guevara & Maudos (2003), and Solisc & Maudos (2006), competition positively affects loan pricing (Dhal & Ansari, 2005).
Macroeconomic factors positively affect loan pricing (Dhal & Ansari, 2005). Awadeh & Hamadi (2010), and Schwaiager & Liebeg (2006) suggest that there's a positive correlation between the net interest margin and GDP growth.
Awadeh & Hamadi (2012) suggest there is a negative correlation between profitability and credit risk at banks. Guveara & Maudos (2003) and Solic & Maudos (2009) found that there's a positive relationship between loan pricing & credit risk.

3 Methodology and Outcomes

Data was collected from: the Federal Financial Institutions Examination Council, Federal Deposit Insurance Corporation and the call reports. In addition, the UBPR was used to measure the adequacy of earnings, bank performance, capital, liquidity, growth and asset, & liability management (FFEIC.gov). The researchers shed a light on two fiscal years; 2015 and 2014.

3.1Sample and Population:

The population involves all the community banks located in Illinois which asset size is within the range of $10 and $250 million USD (based on the call report issued the December 31, 2015). Thus, the sample consists from 33 banks.

3.2 Data collection methods:

Secondary data was collected from documents published on several governmental websites.

3.3Validity

Validity was checked through checking the validity of the numbers in the UPPR based on the numbers of the call report.

3.4 Descriptive Statistics - 2015 Data

There are not many differences between the number of location in 2015 and the counterpart numbers in the years 2014 and 2015 jointly. The first location includes a little less than two-thirds of the banks. Based on figures 2 & 1, during the years 2015 and 2015, the distribution of the number of employees is positively skewed

Table (1): Frequency: The Number of Locations during 2015

	Frequency	Percent	Cumulative Percent
1.0	21	63.6	63.6
2.0	4	12.1	75.8
3.0	3	9.1	84.8
4.0	2	6.1	90.9
5.0	2	6.1	97.0
6.0	1	3.0	100.0
Total	33	100.0	

Based on table 1, more than six banks possess a single location only.

Table 2: ***Frequency: The Number of Locations during 2014 & 2015***

	Frequency	Percent	Cumulative Percent
1	42	63.6	63.6
2	9	13.6	77.3
3	6	9.1	86.4

4	5	7.6	93.9
5	2	3.0	97.0
6	2	3.0	100.0
Total	66		100.0

Based on table 2, there isn't any change in the percentages of banks.

Table 3: ***Descriptive Statistics: The Number of Employees during 2015***

N	Valid	33
	Missing	0
Mean		29.33
Median		25.00
Std. Deviation		21.02
Variance		442.04
Skewness		2.58
Kurtosis		9.33
Range		113.0
Minimum		5.0
Maximum		118.0

In in 2015, the average number of employees / per bank is 29. More than half of the bank have more than 25 employees. There's a high deviation in terms of employment during 2015 (*SD* 21). Based on table 3, the distribution of employment during 2015 is skewed to the right (skewness 2.6).

Table 4: ***Descriptive Statistics: Number of Employees during 2015 & 2014***

N	Valid	66
	Missing	0
Mean		29.53
Median		25.00
Std. Deviation		21.992
Variance		483.67
Skewness		2.608
Kurtosis		8.842
Range		123
Minimum		5
Maximum		128
Percentiles	25	16.00
	50	25.00
	75	36.50

The average number of employees / per bank is thirty during 2014 & 2015. One-half of the banks possess less than and one-half employed more than 25 employees. However, there is a high

deviation in terms of employment during 2015. In 2015, the distribution of the number of employees is skewed to the right.

***Figure 1*. The Number of employees in 2014 & 2015**

Based on figure 1, the distribution of employees during 2014 & 2015 is normal. It's positively skewed.

***Figure 2*. Histogram for the number of employees in 2014 & 2015.**

Figure 2 shows that the distribution the number of employees in 2014 and 2015. It's skewed to the right. In terms of the cost of funds' distribution in 2014 and 2015, its average is 0.48. The deviation of the cost of funds is significant (0.28). The total average assets is within the following rage 264,779 -37,322 in 2014& 2015. Table 8 shows that the average of assets in 2014&2015 is $126,525.50.

Based on table 10, the distribution of the data concerning the loan quality in 2014&2015 is highly skewed. The Std. (*SD*=4.047) is greater than the median (*Md*=2.26). Thus, there is a significant spread in the data concerning loan quality.

Table 5: ***Descriptive Statistics: Cost of Funds -2015***

N	Valid	33
	Missing	0
Mean		0.47
Median		0.49
Std. Deviation		0.29
Variance		0.08
Skewness		0.90
Kurtosis		0.47
Range		1.07
Minimum		0.12
Maximum		1.19

Based on table 5, the average cost of funds is 0.47 in 2015. Half of the banks have a cost of fund level, which is greater than .49. However, there is a high deviation in terms of the employment data in 2015.

Table 6 shows that the average cost of funds is 0.48 in 2014 and 2015. There's slightly less deviation in terms of the cost of funds in 2014,& 2015.

Table 6: ***Descriptive Statistics: Cost of Funds – 2014 & 2015***

N	Valid	66
	Missing	0
Mean		0.48
Median		0.49
Std. Deviation		0.282
Variance		0.080
Skewness		0.833
Kurtosis		0.442

Figure 7. **The Loan Quality in 2014 & 2015.**

The deviation in terms of the level of loan quality is presented through figure 7.

Figure 8. **The loan quality in 2015 & 2014**

Figure 8 presents the positive skewness in loan quality level in 2015 and 2014.

The 1st Research Question and the associated Hypotheses

1. a. Is there any statistically significant relationship between the cost of funds, number of employees, and loan quality and average assets in 2015?

H01a: In 2015, there isn't any statistically significant relationship between the cost of funds, number of employees, loan quality and total average assets.

H11a: In 2015, there is a statistically significant relationship between the cost of funds and number of bank employees, loan quality and total average assets.

Based on table (4), the null hypothesis is rejected. Thus, there is a statistically significant relationship in 2015 between the average amount of assets and the number of bank employees. There's a statistically significant relationship between loan quality and the average bank assets in 2015. A positive correlation exists between the total assets and the number of employees (see Fields, 2013, p. 82) (r = 0.551). A negative correlation exists between the total loan quality and the total average bank assets in 2015.

Table 11: *Correlation Matrix for 2015 Variables*

		Cost of Funds	Total Average Assets	Loan Quality
Employ-ees	Pearson Correlation	0.343	0.551**	-0.123
	Sig. (2-tailed)	0.051	0.001	0.503
	N	33	33	32
Cost of Funds	Pearson Correlation		-0.054	0.178
	Sig. (2-tailed)		0.765	0.329
	N		33	32
Total Average Assets	Pearson Correlation			-0.388*
	Sig. (2-tailed)			0.028
	N			32

1. b. Is any statistically significant relationship between cost of funds, number of employees, loan quality and total assets in 2015 and 2014?

H01b: In 2014 and 2015, there isn't any statistically significant relationship between cost of funds, number of employees, loan quality and total assets.
H11b: In 2014 and 2015, there is a statistically significant relationship between cost of funds, number of employees, loan quality and total average assets.
The researcher calculated the Pearson's *r* correlation coefficient for testing the hypothesis. The results are displayed in table 12 at Sig < 0.05 level. The null hypothesis was rejected. Thus, a statistically significant positive relationship exists between the cost of funds and number of employees in 2014 & 2015. There's a statistically significant positive relationship between the total average assets and number of employees. A statistically significant negative relationship exists between the total average bank assets and total loan quality.

Table 12: ***Correlation Matrix for 2014 & 2015 Variables***

		Cost of Funds	Total Average Asset	Loan Quality
Employees	Pearson Correlation	0.329**	0.475**	-0.067
	Sig. (2-tailed)	0.007	0.000	0.599
	N	66	66	64
Cost of Funds	Pearson Correlation		-0.090	0.140
	Sig. (2-tailed)		0.475	0.269
	N		66	64
Total Average Assets	Pearson Correlation			-0.338**
	Sig. (2-tailed)			0.006
	N		64	

The second Question and the associated Hypotheses

2. Is there any statistically significant difference between 2014 and 2015 in terms of the costs of funds, the number of bank employees, loan quality and total average assets?

H02a: There isn't any statistically significant difference between 2014 and 2015 in terms of the number of employees.
H12a: There is a statistically significant difference between 2014 and 2015 in terms of the number of employees.
H02b: There isn't any statistically significant difference between 2014 and 2015 in terms of the cost of funds.
H12b: There is a statistically significant difference between 2014 and 2015 in terms of the cost of funds.
H02c: There is isn't any statistically significant difference between 2014 and 2015 in terms of the total average assets
H12c: There is a statistically significant difference between 2014 and 2015 in terms of the total average assets.
H02d: There isn't any statistically significant difference between 2014 and 2015 in terms of the total loan quality
H12d: There is a statistically significant difference between 2014 and 2015 in terms of the total loan quality.

Figures 9 displays error bar plots of the *cost of* f*unds,* n*umber of employees, total average assets,* and *total average assets* for the *year* (2014/2015). An error bar plot was used prior to the independent samples t-test as a preliminary determination of whether there is no difference in the means and variances between the two groups or years. As for the x-axis, it represents the 2 groups from the independent variable (2014/2015). As for the y-axis, it represents the mean value of the dependent variable.

In each error bar, the dot stands for the mean of the concerned group. The mean is read by placing a horizontal line to the left of the y-axis to read the value of the concerned group. As for the vertical distance existing between the 2 horizontal lines in each error bar is the variance. The closer the means, the more likely the assumption of equal means will prove true when conducting the t-test. The more similar the vertical distance between the horizontal bars for each group, the more likely Levene's test of homogeneity of variance holds true. Based on the error bar plot, it appears that the means were not very different. *Total Loan Quality is excluded.* It also appears that there's a difference between 2014 and 2015 in terms of t*otal loan quality.* It's expected that the independent sample t-test shall indicate that significant differences exist between means and variances in terms of t*otal loan quality*.

***Figure 9*. Error Bar Plot for the Number of Employees per Year.**

Figure 9 shows an error bar plot in terms of the means of the number of employees in 2014 and 2015. These means are similar.

***Figure 10*. Error Bar Plot for Cost of Funds by Year.**

Figure 10 displays an error bar plot where it appears that the mean cost of funds for 2014 and 2015 were similar. The variance levels in cost of funds in 2014 and 2015 are similar..

***Figure 11*. Error Bar Plot for Total Average Assets by Year.**

Figure 11 shows an error bar plot where it appears that the mean total assets for 2014 and 2015 were not very different. It also appeared that the variance in total bank assets for 2014 and 2015 were not different.

Figure 12. Error Bar Plot for Total Loan Quality by Year.

Based on figure 12, it appeared that the means were not very different. *Total Loan Quality* is excepted. It also appeared that the variance for 2014 *Total Loan Quality* might be different from 2015. It's expected that the independent samples t-test shall show significant differences in variances and means for *Total Loan Quality*.

Table 13

Group Descriptive Statistics for Employees, Cost of Funds, and Total Average Assets

YEAR		Employees	Cost of Funds	Total Average Assets
2014	Mean	29.727	0.493	126045.00
N=33	Std. Deviation	23.245	0.280	66734.597
2015	Mean	29.333	0.475	127006.00
N=33	Std. Deviation	21.025	0.289	64917.074
Total	Mean	29.530	0.484	126525.50
N=66	Std. Deviation	21.993	0.283	65325.539

Table 14 shows the results reached through the Levene's test of equal variances. It shows the results reached through the independent sample t-test for testing the null hypothesis. The Levene's test of homogeneity of variance shows that there isn't any significant difference between 2014 and 2015 in the level of variance in terms of the bank employees, the cost of funds and total average assets. Therefore, equal variances were assumed.

From Table 14, the null hypotheses for 2a, 2b, and 2c were accepted. There isn't any statistically significant difference between 2014 and 2015 in terms of the number of bank employees [t(64)=0.072, p=0.943], the cost of funds [t(64)=0.268, p=0.789], nor the total average assets of banks [t(64) =0.059, p=0.953]

Table 14 *Results of the Independent Samples t-Test and Levene's Test*[a]

Levene's Test for Equality of Variances	t-test for Equality of Means

		Sig.	T	Sig.	Mean	ror	Std. Erdf	
				two-tailed	ence	ence	Differ-	Differ-
	Equal variances assumed	0.799	0.072	64	0.943	0.39	5.46	
Employ-ees	Equal variances not assumed		0.072	63.37	0.943	0.39	5.46	
	Equal variances assumed	0.868	0.268	64	0.789	0.02	0.07	
Cost of Funds	Equal		0.268	63.92	0.789	0.02	0.07	

	variances not assumed						
	Equal variances assumed	0.918	0.059	64	0.953	-961.00	16206.75
Total Average Assets	Equal variances not assumed		0.059	63.95	0.953	-961.00	16206.75

Note. a. Dependent Variables: Employees, Cost of Funds, Total Average Assets (by Year)

A summary group descriptive statistics for *Loan Quality* for each year is listed in Table 15 below.

Table 15: ***Group Descriptive Statistics for Loan Quality 2014 and 2015***

	YEAR	N	Mean	Std. Deviation	Std. Error Mean
Loan Quality	2014	32	4.2516	4.58942	.81130
	2015	32	2.8850	3.35439	.59298

Table 16 presents the results from the Levene's test of equal variances and the independent sample t-test for testing the null hypothesis. The Levene's test of homogeneity of variance shows that there isn't any significant difference in terms of the variance level of the number of employees between 2014 and 2015. Therefore, equal variances were assumed.

Based on table 16, the null hypothesis 2d is accepted. There isn't any statistically significant difference between 2014 and 2015 in terms of the *Total Loan Quality*

Table 16: *Independent Samples t-Test and Levene's Test Results for Loan Quality 2014-2015*

		Levene's Test for Equality of Variances	t-test for Equality of Means				
		Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference
Loan Quality	Equal variances assumed	0.469	1.36	62	0.179	1.367	1.005
	Equal variances Not assumed		1.36	56.767	0.179	1.367	1.005

The third Research Question and the associated Hypotheses

3. Is there any statistically significant predictive relationship of cost of funds based on the number of bank employees, loan quality, number of bank locations and total average assets in 2015 and 2014?

H03: In 2015 and 2014, there isn't any statistically significant predictive relationship of cost of funds based on the number of bank employees, loan quality, number of bank locations, and total average assets.

H13. In 2015 and 2014, there is a statistically significant predictive relationship of cost of funds based on the number of bank employees, number of bank locations, loan quality, and total average assets.

To test the hypotheses in question 3, a multiple regression was performed to predict values on the dependent or criterion variable for the 2014 and 2015 cost of funds from a set of independent predictor variables for the number of bank locations, number of bank employees, total average assets, and loan quality.

Table 17: *Descriptive Statistics for Multiple Regression for 2014-2015 with Cost of Funds Dependent Variable*

		Mean	Std. Deviation	N
	Cost of Funds	0.48	0.287	64
	Employees	29.72	22.311	64
	Total Average Assets	128488.89	65356.494	64
	Loan Quality	3.57	4.047	64

The multiple regression model was built using the *Enter* method for entering and removing variables from the equation. The results of this method are displayed in table 18. Table 18: *Multiple Regression: Variables Entered/Removed 2014 through 2015*

Model	Variables Entered	Variables Removed	Method

		Enter
1	Loan Quality, Employees, YEAR, Locations, Total Average Assets[b]	

a. Dependent Variable: Cost of Funds

Table 18 indicates that all the independent variables were employed in the multiple regression model.

Table 19 indicates various diagnostic results for the multiple regression model including the coefficient of determination R^2. The coefficient of determination R^2 demonstrates that 27.6% of the change in the variance of the 2014-2015 cost of funds can be explained by the four 2014-2015 bank predictor variables. The scatter plot in Figure 13 visually demonstrates that the R^2 value is not high.

Table 19: *Multiple Regression Model Summary[b] 2014-2015*

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	R Square Change	Change Statistics F Change	df1	df2	Sig. F Change
1	0.525[a]	0.276	0.213	0.254	0.276	4.413	5	58	0.002

a. Predictors: (Constant), Loan Quality, Employees, YEAR, Locations, Total Average Assets

b. Dependent Variable: Cost of Funds

Based on table 20, the regression model is considered significant. The null hypothesis is rejected.

Table 20: *Multiple Regression ANOVA Table Results[a] 2014-2015*

Model		Sum of Squares	df	Mean Square	F	Sig.
	Regression	1.427	5	0.285	4.413	0.002[b]

1	Residual	3.750	58	0.065
	Total	5.177	63	

Dependent Variable: Cost of Funds

a. Predictors: (Constant), Loan Quality, Employees, YEAR, Locations, Total Average Assets Table 21 presents the significance level and model coefficients for each of the independent variables. The VIF and tolerance values are calculated to detect any multicollinearity problem. The tolerance values are close to 1. There aren't values that are less than 0.01. There wasn't any need to remove any variable from the equation because there isn't any multicollinearity problem. Based on table 21, the significant independent predictor variables are the number of locations and the number of bank employees.

The multiple regression model is:
The c*ost of Funds for 2014-2015* = - 0.065 *Number of Locations* + 0.007 *Number of Bank Employees* -1.158 x 10^{-6} *Total Average Assets* + 0.009 *Loan Quality* - 15.71.
The standardized regression coefficients were employed to represent the relationship existing between the dependent variable and each significant predictor variable. The *Number of Employees* is 0.538. That means that the change of one-unit in the number of employees in 2015 led to an increase of 0.538 units in the cost of funds. An increase in one bank location shall lead to a decrease of .305 units in the cost of funds.

Table 21: *Multiple Regression Coefficients and Multicollinearity Tests*[a] *2014-2015*

Model 1	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	-15.710	130.638		0.120-	0.905		

Locations	-0.065	0.025	-0.305	-2.607	0.012	0.910	1.099
Employees	0.007	0.002	0.538	4.130	0.000	0.735	1.361
Total Average Assets	-1.158E-006	0.000	-0.264	-1.945	0.057	0.677	1.476
Loan Quality	0.009	0.009	0.132	1.071	0.289	0.819	1.221

a. Dependent Variable: Cost of Funds

Table 22 *Multiple Regression: Residuals Statistics for 2014-2015*[a]

	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	0.220	1.040	0.480	0.150	64
Residual	-0.390	0.670	0.000	0.244	64
Std. Predicted Value	-1.712	3.732	0.000	1.000	64
Std. Residual	-1.532	2.636	0.000	0.959	64

a. Dependent Variable: Cost of Funds

A summary of the residuals is presented in table 22 .The predicted value (*M*=0.480, *SD*=0.150) relates to the lower R^2 value and the lack of predictability of cost of funds from loan quality. In fact, the range of values predicted by the model is wide

Figure 13. **Scatter plot of Regression Residuals by Predicted Values of Cost of Funds 2014 and 2015.**

4. Is there any statistically significant predictive relationship of loan quality based on the number of bank locations, cost of funds, number of employees and total average assets during 2014 and 2015?

H04: For the years 2014 and 2015, there isn't any statistically significant predictive relationship of loan quality based on the number of bank locations, total average assets, number of employees, and cost of funds, .

H14: In 2014 and 2015, there is a statistically significant predictive relationship of loan quality based on the number of employees, number of bank locations, total average assets and cost of funds

To test hypothesis 4, a multiple regression was conducted.

Table 23: Descriptive Statistics for Multiple Regression in 2014-2015 with considering the Loan Quality a Dependent Variable.

	Mean	Std. Deviation	N
Loan Quality	3.57	4.047	64
Locations	1.84	1.348	64
Employees	29.72	22.311	64
Cost of Funds	0.48	0.287	64
Total Average Assets	128488.89	65356.494	64

The multiple regression model was developed through the use of the *Enter* method. That latter method was used for removing and entering variables from the equation. The results obtained through this method can be seen through table 24.

Table 24: *Multiple Regression: Variables Removed- Entered*[a] *2014 through 2015*

Model	Variables Entered	Variables Removed	Method
1	Total Average Asset, Cost of Funds, Locations, Employees[b]	None	Enter

a. Dependent Variable: Loan Quality

b. All requested variables entered.

Table 25 presents diagnostic results for the multiple regression model. The coefficient of determination R^2 shows that 16.6% of the change in the variance of the cost of funds in 2014 and 2015 can be attributed to the four bank predictor variables. The scatter plot in figure 14 visually shows that the R^2 value is low.

Table 25: *Multiple Regression Model Summary*[b] *2014-2015*

Model	R	R Square	Adjusted R Square	Std. Error of The Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	0.408[a]	0.166	0.110	3.81803	0.166	2.942	4	59	0.028

a. Predictors: (Constant), Total Average Assets, Cost of Funds, Locations, Employees

b. Dependent Variable: Loan Quality

Table 26 shows that the regression model is considered significant. The null hypothesis is rejected. The independent variables can predict the levels of cost of funds in 2014 and 2015.

Table 26: *Multiple Regression ANOVA Table Results*[a] *2014-2015*

	Model	Sum of Squares	Df	Mean Square	F	Sig.
	Regression	171.572	4	42.893	2.942	0.028[b]
1	Residual	860.065	59	14.577		
	Total	1031.637	63			

a. Dependent Variable: Loan Quality

b. Predictors: (Constant), Total Average Assets, Cost of Funds, Locations, Employees

The significance level and model coefficients for each independent variable are presented in table 27. The VIF and tolerance values are employed as measures for multicollinearity. The values of tolerance are close to 1. Thus, there's no need to remove variables from the equation. That is because there's no multicollinearity problem. From Table 27, the significant independent predictor variables ($p<0.05$) are the total average assets. The model constant is significant

The multiple regression model in *2014/2015 is:*

Loan Quality = 0.610 *Number of Locations* + 0.0001 *Number of Bank Employees* -1.2142 x 10^{-5} *Total Average Assets* + 2.101 *Cost of Funds* + 4.187

The standardized regression coefficients reflects the relationship existing between each dependent variable and significant predictor variable. The beta value for *Total Average Assets* was -0.346 indicates that a one-unit change in the level of the total average assets in 2014 shall led to a decrease by 0.346 units in the overall loan quality.

Table 27: *Multiple Regression Coefficients and Multicollinearity Tests*[a] *2014-2015*

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	4.187	1.629		2.570	0.013		
Locations	0.610	0.386	0.203	1.582	0.119	0.855	1.169
Employees 1	0.000	0.029	-0.001	-0.006	0.995	0.568	1.760
Cost of Funds	2.101	1.952	0.149	1.076	0.286	0.739	1.354
Total Average Assets	-2.142E-005	0.000	-0.346	-2.438	0.018	0.702	1.425

a. Dependent Variable: Loan Quality

A summary of the residuals is presented through table 28. The value of the predicted value (*M*=3.568, *SD*=1.650) is linked to the lower R^2 value and the lack of predictability of loan quality from cost of funds. That's confirmed by the lack of predictability displayed in the scatter plot in Figure 14. In fact, the range of values that is predicted through the model is very wide.

Table 28: *Multiple Regression Residual Statistics Results*[a] *2014-2015*

	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	-0.039	7.066	3.568	1.650	64
Residual	-4.495	18.0392	0.000	3.695	64
Std. Predicted Value	-2.186	2.120	0.000	1.000	64
Std. Residual	-1.177	4.725	0.000	0.968	64

a. Dependent Variable: Loan Quality

Figure 14. Scatter plot of Regression Residuals by Predicted Values of Loan Quality *(*2014 and 2015)

4 Conclusion

In the light of the aforementioned results, the researchers concluded the following:

1. Bank locations, assets size, number of employees, and loan quality have a minimal impact on the cost of funds.
2. There's a positive relationship between total average assets and the number of employees

3. Loan pricing is affected by several factors. These factors include: GDP growth, regulations, employment rates, capital position and liquidity
4. It was found that enacting legislations, economic status, and technological developments affect loan pricing
5. A statistically significant positive relationship exists between the total average assets and the number of employees
6. A statistically significant negative relationship exists between total loan quality and total average bank assets
7. A negative correlation exists between the total loan quality and total average bank assets in 2015.

Recommendations

In the light of the aforementioned results, the researchers recommend the following:

1. Conducting similar studies in other countries and US states
2. Conducting similar studies with shedding a light on other variables.
3. Conducting similar studies with shedding a light on other kinds of banks.
4. Conducting similar studies targeting banks with large assets
5. Conducting studies about the way of setting effective pricing strategies in banks
6. Conducting studies about the challenges facing community banks.
7. Improving the bank policies that concern loans and risks
8. Enacting laws that protect banks and ensure their survival

Abstract

Today's the implement of Industry Revolution 4.0 has given big effect towards learning institutions for sustaining and increasing the quality education system with usage of automation technologies. A successfully learning institutions was depended on academic staffs' readiness on skills and knowledge required for IR 4.0. It is showed that the academic staffs were played very important role in learning institutions to achieve the competitive advantage thereby increasing access towards higher tertiary education level. The purposed of this study is to explore the factors learning, knowledge management and innovation capability influence the readiness of academic staffs for Industrial Revolution 4.0. The quantitative research method has been used to collect the data among the respondents through the questionnaire. The respondents for this research are academic staffs those were Lecturer, Senior Lecturer, Associate Professor and Professor from three faculties at one of the public university in Malaysia. Besides, there is a total of 124 academic staffs with 89 per cent rate from three faculties were answered in this survey. Besides, the finding of research is shown that overall mean score value academic staffs' readiness and learning. Meanwhile, the knowledge management and innovation capability factors are showed average mean score values. Moreover, all the variables' hypothesis is accepted. There is a significant positive relationship between factors which is learning, knowledge management and innovation capability with academic staffs' readiness on IR4.0. Furthermore, the discussion, limitation of study, recommendation is critically discussed follow by conclusion in this study.

Keywords: Industrial Revolution, University, Academic Staff

Introduction

The readiness is about the attitudes, behaviors, beliefs and goals in which points make the employees to be ready and prepare by implementing of new skills and learning in environment of working Industrial Revolution 4.0 in future (Alfonsus Susanto, 2008; Rafferty & Simons, 2006). Moreover, it is also can be defined as a state of mind during process a changes that reflects readiness or acceptance with positive mind by employees in developing and sharpen the skills and knowledge for the expected future perspective in Technology 4.0 (Bernerth, 2004).

Besides, "the connectivity, big data, automation, agents of intelligent, new robotics technology, new learning of machine, artificial intelligence, block chains, sensors, virtual image, 3D printing and augmented reality," is known as mixture of formation on IR 4.0 (Lee et al., 2018). Therefore, it can be said that the advanced new Technology 4.0 is more concentrated on development towards physical world with the high-tech usage on internet of things.

Furthermore, the demand for highly educated workforce has prompted many countries to rethink their educational systems in line with the demands of technological advances so that competitive advantage can be sustained (Agboola, 2006). This may cause many learning institutions are started to focus on the readiness of academic staffs on new revolution 4.0. Therefore, the institutions are expected the academic staffs to be more professional and efficient in handling problem from cross- functional, cultural and ethical perspective and be ready to acquire with the skills and deal with an increasingly globalized, automatized, virtualized, networked and flexible world to sustain their employment in the changes and adaption of Industry Revolution 4.0 (Motyl, Baronio, Uberti, Speranza, & Filippi, 2017). A part from this, the new revolution of Industry 4.0 is created many opportunities by forming more new jobs and increasing growth of education level among institutions.

Problem Statement

The Industrial Revolution 4.0 has been increased the job opportunities but at the same time there is certain low- skilled jobs have been eliminated and required higher level of skill by the companies and learning institutions. (Berger, 2016). Therefore, the issue is needed to take into consideration about how many academic staffs from learning institutions have been prepared very well to overcome the development of new revolution 4.0 in learning, knowledge management, and innovation capability is still remain questionable until today.

Moreover, the previous studies have shown that most of researchers are focused on the readiness among graduate students in particular field of future studies in purpose to improved and developed the skills, explorers in adapting of new knowledge and gained a good job through higher quality of education at learning institution for preparing the adaption or adoption of IR 4.0. (Clark, 2013; Makki, Salleh, Memon, & Harun, 2015; Walker & Campbell, 2013). However, there are no significant statistical results are specified about the factors influence the academic staff's readiness on Revolution 4.0. Based on (Dwesini, 2015), the learning institutions over the world are encouraged rapid developments in new technology 4.0 and achieved their competitive advantage thereby increasing access towards higher tertiary education level. It is showed that the academic staffs as the part of members in an education institutions have to be ready with the learning, knowledge of management and innovation capability to adapt the changes of Industrial Revolution 4.0.

Overall, there are increased about six percent to 10 percent job opportunities over next ten years on Industry Revolution 4.0 in German country which showed (Rubmann et al., 2015) it has been given big challenges especially for low skill workers not only in German country but it is also affected the development country such as Malaysia which slowly adapting the implement of new revolution Industry 4.0. It is needed to consider that the measure of readiness among employees still needed to be evaluate by each of organizations included learning institutions for overcome the fully development of industrial 4.0. Thus, this research is attempted to explore the factors influence on the readiness of academic staffs for Industrial Revolution 4.0 and the future directions of the academic staffs in

institution will be critically analyzed.

Research Questions

1. Does the learning factor influence on the readiness of academic staffs for Industrial Revolution 4.0?
2. Does the knowledge management factor influence on the readiness of academic staffs for Industrial Revolution 4.0?
3. Does the innovation capability factor influence on the readiness of academic staffs for Industrial Revolution 4.0?

Research Objectives

1. To explore the learning factor influence on the readiness of academic staffs for Industrial Revolution 4.0.
2. To explore the knowledge management factor influence on the readiness of academic staffs for Industrial Revolution 4.0.
3. To explore the innovation capability factor influence on the readiness of academic staffs for Industrial Revolution 4.0.

Significance of Study

The significance of studies is divided into three dimension such as academician, industry and government from this research. Firstly, this study is created chances for the academician to improved their knowledge, skill and also created awareness on factors that helped to increase the level of academic staffs' readiness for Technology 4.0. This study is also helped the education industry especially the management of universities able to identify and improvise the academic staff's readiness in term of factors such as learning, knowledge management and innovation capability on Industrial Revolution 4.0. Lastly, this research is assistance government to acknowledge that employee readiness on IR 4.0 is needed in development of country and also able to increase the revenue of national economy.

Scope of the Study

This research aims to explore the factors influence on the readiness of academic staffs for Industrial Revolution 4.0 at learning institution in one of public university in Malaysia. Moreover, this study is attempted to prove the factors such as Learning, Knowledge Management and Innovation Capability influence the readiness of academic staffs on Industrial Revolution 4.0. Furthermore, this research is based on quantitative studies. Therefore, most of collected data has been relevant to the study and recommended is developed based on this research. It is helped the institutions to increase the readiness among academic staffs on Industrial Revolution 4.0.

Literature Review

The readiness theory is a revision and elaboration of Zartman's ripeness theory (Zartman, 2008) but it is different from ripeness theory because it uses variables rather than necessary situations and concentrations on a single party or both parties to a conflict (Cantekin, 2015). The readiness concept is about one party replicated the thoughtful of its leadership with reputed to conflict with the other party and its potency differ within a wide-ranging scale behavior of conciliatory (Pruitt, 2007)**.** The extension of ripeness is better to adjusted the historical cases and became more heuristic, with the ability to included more elements of conflict mediation results and for readiness Pruitt is divided into two components which association in a multiplicative approach: "Motivation to end the conflict and optimism about the outcome of conciliation and negotiation or mediation and Central Coalition

Theory", (Pruitt, 2007). This one of theory is used as readiness theory and implement by many researchers of past studies.

Conceptual Definition of Academic Staffs' Readiness

The readiness of academic staffs in ability to adopt innovative technologies with predictable as a variable, diverse, analytical of individual tendency and also showed an individual's capabilities to know how to use the innovative technology with proper way in management (Caison, Bulman, Pai, & Neville, 2008). On the other hand, academic staffs' readiness is about the extent to which staffs are ready or willing to adopted the changes towards new technology such Industrial 4.0 and at the same time the staffs have their own personal characteristics such ability, attitudes, belief and motivation which measure are they ready or not ready for adapt the changes (Sarina et al., 2016).

Every institution has the responsibility to focused on forming readiness for revolution by minimizing conflict, changing academic staffs by adapting the working environment while shaping a change message that facilitates the adoption of behaviors that are indispensable for the successful implementation for the change in Industrial 4.0 (Maheshwari & Janssen, 2012). Therefore, academic staffs are needed to visualize the current situation of their intuition's organization and compared with future development after adaption of new Technology 4.0 before they prepared themselves by improvising their learning, knowledge management and innovation factors.

Conceptual Definition of Readiness Factors (Learning, Knowledge Management and Innovation Capability)

Learning

The learning can be defined as a behavior changes according to experience or an experience that plans into function of actions (De Houwer, Barnes-Holmes, & Moors, 2013). Many academics have opposed by unsatisfying the definition of learning because the impact of experience on behavior is too wide and includes almost all behavior changes (De Houwer, 2011). On the other hand, the learning is not focused on the change of behavior only but it was included on changes of nervous system and other elements of system performance which can all be useful and practical experimental methods to evaluate whether learning has taken place and also evaluate the readiness among employees themselves (Barron et al., 2015).

Some staffs who do not required or accepted computer training at work which shows they are in threat of existence from the society with full information because every staff at workplaces supposed to master everything such as technical skills and knowledge needed through Industrial 4.0 by self-learning even the staffs do not have any technical background at all in institution (Gripenberg, 2011). It is proved that technical skills are comprised with new technology devices and internet of things which have the strongest connection with the readiness of academic staff in achievement and performance towards the Technology Revolution 4.0 in management(Harun & Mustafa, 2016). Therefore, many institutions are expected their staffs able to adapt the changes of working environment towards Industrial 4.0 through self- direct learning but at same time they still needed to evaluate the readiness of their staffs for achieving the target of their organization of institutions.

Knowledge Management

The knowledge management is known as a device for evaluating quality development and staff's disciplining or capital of organizational (Arab-Rahmatipour & Mohammad-Alipour, 2015; Shannak, Masa'deh, & Akour, 2012). Moreover, knowledge management processes are referred to organizational development that focuses on the enhancement of knowledge retention and reused of knowledge repositories such as in the development of methods, tools, techniques and organizational values that promote the flow of knowledge between individuals and recruitment, processing, and utilization of knowledge in activities of improvement and innovation (Valio Dominguez Gonzalez &

Fernando Martins, 2014). In this way, organizations of intuitions are needed to provide themselves internally so that knowledge can circulate among their academic staffs and can be used in actions that produce some kind of improvement in the organization (Gonzalez & Martins, 2017).

The successful application of knowledge management process readiness is exposed to the proper development of organizational institution' characteristics with the support development on four stages such as acquisition, storage, diffusion, and utilization of knowledge (Durst & Runar Edvardsson, 2012). In addition, the knowledge distribution in process of knowledge management is more about the new information from different sources that is shared which can promote the formation of new knowledge or information such as including the absorptive ability of the institution's organization, proficiency of staffs, aspects in term of motivations (Titi Amayah, 2013) and technology with the skills and knowledge provided for transfer process which ensures the readiness of the staffs in adaption of new technology 4.0 (Valio Dominguez Gonzalez & Fernando Martins, 2014; Yang, 2010). Therefore, most of the majority studies in the knowledge management literature show that knowledge management has a positive impact on performance in the learning readiness of institution organization but only a small number of studies show a negative relationship in which shows the knowledge management strategies readiness do not support competitive strategies meets a negative relationship between certain firm's knowledge and product development performance (Matusik, 2002) towards Industrial Revolution 4.0.

Innovation Capability

The "innovation" is defined as implication of newness in improvement, adaptation of an knowledge and innovative to the implementing organization in the direction of success while the "capabilities" are defines as highlights the strategic management's role in applicably adapting and reconfiguring organizational skills, possessions and functional capabilities to match the necessities of a changing in environment (Rahmani & Mousavi, 2011). The implementation of the innovation capability by the institutions are reacted even faster towards environmental challenges on Technology 4.0 compare to other institutes which is not implemented the innovation capability in their management (Ngamsutti, 2016). The innovation capability is mostly referred to the concept of technology development capability, operation capability, management capability and transaction capability in an organization (Zawislak, Alves, Tello-Gamarra, Barbieux, & Reichert, 2012).

The institutions are needed the ability of innovation to survive in an unpredictable environment by encouraging academic staffs to contribute knowledge within groups and organizations may generated new ideas and created a new approach to learn the skills and knowledge, facilitating innovation capabilities and activities to increase the readiness among staffs towards Industrial 4.0 (Hussein et al., 2016). Therefore, innovation capability readiness among academic staffs are needed to sustain the competency and achieve goals of organization towards New Technology 4.0.

Theoretical Framework

The research model is taken from previous studies about "examining the feasibilities of Industry 4.0 for the hospitality sector with the lens of management practice," which is focused on the exploring Industrial 4.0 issues in the services sector of the hospitality industry with challenges in term of learning, knowledge management and innovation capability to evaluate the management practices by facilitating the technology acceptance such as digital enhancements and implementation of cyber-physical systems (CPS) (Shamim, Cang, Yu, & Li, 2016; Shamim et al., 2017). Moreover, this past study is conducted by email to get permission letter for interview and personal visit with requested employees from 77 hotels as respondents of the research and the result of this study that learning, knowledge management and innovation capabilities are very important elements in management practices towards Industrial Revolution 4.0 (Shamim et al., 2017).

Methodology

This section emphasizes on the research method involved in the study which included research framework, research hypothesis, research design, target population, sampling size, data collection,

measurement of variables, data analysis and measurement model. Finally, it provides a summary of each method and approaches of statistical that has been implied to evaluate the hypotheses of in this research.

Figure 1: Conceptual Framework of the Study

The figure above has shown the conceptual research framework of study regarding topic about the factors influence on the readiness of academic staffs for Industrial Revolution 4.0. The dependent variable of this study is the academic staffs' readiness on Industrial Revolution 4.0. The learning, knowledge management and innovation capability are the factors as independent variable used for measuring the academic staffs' readiness on IR 4. 0.. The elements of "management practices such as organizational structure (Sluis, 2004), leadership style, human resource practices (Chang, Gong, & Shum, 2011) focusing short term innovation and long term capability (Lee & Kelley, 2008) and willingness to abandon investment and knowledge" (Saban, Lanasa, Lackman, & Peace, 2011; Shamim et al., 2017) are eliminated and not implemented in this conceptual framework because it is more related towards management practices needed by employees in organization.

Furthermore, the element of Industrial 4.0 is divided by "uncertain environment and unstable environment," (Shamim et al., 2016) is not implement in this research framework and replaced with academic staffs' readiness on Industrial Revolution 4.0. Besides, the technology acceptance is also excluded from this conceptual framework because it is more focus on "digital enhancements and implementations of Cyber-Physical Systems (CPS) and the learning, knowledge management and innovation capability," (Hwang & Yi, 2002; Shamim et al., 2016) is implemented as readiness factors to explore academic staffs' readiness on IR 4.0.

Research Design

The quantitative research method approach is chosen to collect data in this research because it is the best approach to use when explained the data that is collected among the respondents through questionnaire. Furthermore, the collected data from the questionnaires are analyzed through Statistical Package for the Social Sciences (SPSS) and the current versions is named as IBM SPSS for finding the relationship of predictor variables in this research (Awan, 2012). The SPSS analysis is included descriptive statistics and correlations test for analyzing the data in this study. The means, standard deviations, frequencies, median and mode are under descriptive statistics which used to describe the demographics such as age, gender and education background. Besides, this descriptive statistic able to clear problem statement, specific hypothesis and detailed body of knowledge in this research. Moreover, the reliability analysis, Pearson's correlation coefficient and regression are also applied to conclude the result of the study. Normally, Pearson's correlation is available to derive the relationship strength when the significance level at $p<0.0l$ and $p<0.05$ and the correlation between two random variables measures the degree of linear association between them (Awan, 2012).

Target Population

In this study, the target population is focused on three faculties from one of the public university in Malaysia with the total population of 216 academic staffs. A convenience sampling is utilized to collect the data in this research because this sampling is referred to nonprobability where respondents of the target population that meet certain practical criteria such as easy accessibility, obtainability at a given time, or the readiness to participate which able to access the population that is easily accessible (Etikan, 2016). This sampling technique eases the researcher's works in collecting data of respondents for this study.

The total sample size of this study is 140 respondents which is chosen from table scale of past researchers (Krejcie & Morgan, 1970) to determine the factors influence on the readiness of academic staffs for Industrial Revolution 4.0.

Data Collection

The questionnaire method as primary data is used in this study in order to gather the data with required input which is relatively easy to administer because they are standardized, free from error and efficient to collect data from large number of respondents. Therefore, total 140 sets of questionnaire have been distributed to the academic staffs which is equal with the sample size of respondents in this research. The respondents are required to complete all the questions on given time.

Measurement of Variables

The questionnaire is designed to explore factors influence the readiness of academic staffs on Industrial 4.0. The questionnaire is modified to suit the context of the research and the level of target researchers. The questionnaire consists of close-ended questions. This questionnaire is also used the Likert-Scale which is 1=Strongly Disagree, 2=Disagree, 3=Neutral, 4=Agree and 5=Strongly Agree.

The questions are divided into five sections. The information about the demographic such as gender, age (years old), race or ethnic group, marital status, education level, faculty, working experience and designation are mostly asked to respondents in Section A. Moreover, the questions are constructed into questionnaire for Section B is about the academic staffs' readiness on IR 4.0. as dependent variable has been constructed. While Section C is focused on the learning factor that influence the readiness of academic staff on Industrial Revolution 4.0. Next, Section D is focused on the knowledge management factor that influence the readiness of academic staff on Industrial Revolution 4.0. Lastly, Section E in questionnaire is focused on innovation capability factor that influence the readiness among academic staff on Industrial Revolution 4.0. Moreover, the mean score board of interpretation for attitude readiness is used to measure the factors influence the readiness of academic staffs on IR 4.0. So, the mean score gained from findings of descriptive analysis will be evaluate the level of readiness for academic staffs accordingly such as from 1.00 to 2.33 mean score shows the low level of readiness, 2.34 to 3.66 shows the average level of readiness and lastly 3.67 to 5.00 shows the high level of readiness. Moreover, the past studies in quantitative research especially in Likert Scale is used the mean score board to determine the level of readiness in research which is regarding about " the Teaching in a Digital Era: English Lecturers' Readiness toward the Internet Use in Teaching and Learning at Selected Higher Education Institutions in Indonesia" (Mukminin & Hidayat, 2013).

Table 1: Interpretation for Attitude Readiness

Mean Score	Interpretation
1.00 to 2.33	Low/Negative
2.34 to 3.66	Average/Neutral
3.67 to 5.00	High/ Positive

Data Analysis

Data analysis is about the way of creating differences between processing and cleaning of data which is essential when one needs to identify useful information and assistance in the decision-making process (Mhlanga, 2017). In this research, the Statistical Package for Social Sciences (SPSS) is used to analyze the data of survey from the questionnaire to get the result of the research. Furthermore, the data analysis in this study is used the frequency analysis, descriptive analysis and Pearson's correlation coefficient. Moreover, the descriptive statistics is to analyzed and simplified the larger amount of data in a sensible way and reduce a lots of data into a simpler in form of mode, median, mean, modal summary and frequency distribution (Loeb et al., 2017). The collection of the data is supported with the illustration of tables, and pie chart. Besides, the analysis of reliability is used to design reliable scales of measurement, to improve present scales, and to evaluate the scales in reliability. (Takaki, Taniguchi, & Fujii, 2014). The main objective of using this reliability study is to recognized the accurateness of the data which got from questionnaire that is conducted from the respondents. Therefore, reliability analysis has been presented through Cronbach's Alpha.

Results and Discussion

The data is collected from questionnaire has been discussed with the results from data analysis according to the research objective 1, 2 and 3 in this research. Furthermore, the data collected had been analyzed by Statistical Package for Social Science (SPSS) version 23 which is consists of Reliability Analysis, Demographic Analysis, Descriptive Analysis and Correlation for this study. In this survey, a sample of individuals are selected randomly as respondents rather than the populations of all the academic staffs because of time and cost constraint. The data is obtained from academic staffs in three faculties A sample of individuals are taken by selected randomly as respondents rather than the populations of all the academic staffs because of time and cost constraint. Moreover, the questionnaire is distributed and collected via hard copy questionnaire and Google form questionnaire. All the respondents are needed to answer all the question from Section A until Section E. There were total of 124 academic staffs completed this research survey from required 140 samples which making the rate of completion is 88.57%. At the first, the period of data collection is 2 weeks but it was extended another one more week with total 3 weeks in term to gained more respondents to response and answer the questionnaire.

Reliability Analysis

The result of variables in reliability testing from the actual study is measured with Cronbach' Alpha to know about the consistency of every items from the questionnaires in this study. Therefore, the data collected is used in reliability analysis to measure reliability in both independent variables and dependent variable of this study. Alpha Cronbach is the statistics used to establish data reliability which can be valued from 0 to 1. In addition, the Cronbach's Alpha values closer to 1 means that the reliability of internal consistency is higher.

Reliability Analysis of Independent Variables

The results are showed that the independent variables such as learning, the Cronbach Alpha shows the value of 0.778 which means it is an acceptable result for learning factor is influenced on the readiness of academic staffs for Industrial Revolution 4.0. In measuring knowledge Management, the Cronbach Alpha result is 0.917. It is an excellent result has been showed that the knowledge management factor is influenced the academic staffs' readiness on Industrial Revolution 4.0 compared to other independent variables in this study.

Table 2: The Reliability Coefficient Value of Independent Variables

Independent Variables	Cronbach's Alpha	N of Items
Learning	0.778	7
Knowledge Management	0.917	8
Innovation Capability	0.889	8

Furthermore, the Cronbach Alpha for innovation capability is 0.889 which means the result is good and influenced on the readiness of academic staffs for Industrial Revolution 4.0. The results from base on Cronbach Alpha of each independent variable in this study is still reliable and this statistics data is gathered from the actual test.

Reliability Analysis of Dependent Variable

In measuring the academic staffs' readiness, the dependent variable is influence them when the independent variable has been used. All the questions are used the Likert-Scale form for the question.

Table 3: Reliability Analysis of Academic Staffs' Readiness

Cronbach's Alpha	N of Items
0.895	6

The Cronbach Alpha result is 0.895 which showed the internal consistency is good. Therefore, coefficient obtained from the Likert-Scale is reliable based on coefficient obtained from the final or actual test. In order to know the academic staffs' readiness on industrial revolution 4.0 within themselves are strong or weak, 124 questionnaires are adapting and adopting to match the respondent understanding. This survey is done on the three faculties from one of the public university in Malaysia. Thus, the results gathered are getting impressive responds.

Demographic Analysis

There are out of 124 respondents, 37.1% which is 46 female academic staffs are answered the given survey. Furthermore, around 78 male academic staffs with 62.9% are answered all the questions in this research. The female respondents hold three-fifths of total 124 respondents mainly due to most of the females are worked as academic staffs compared with male academic staffs. Furthermore, there are 6 respondents and 4.8 % from age group in between 21-30 years are answered the questionnaire in this study. On the other hand, the age group from 31-40 years are the majority which are 59 respondents and consist 47.6%. This age group is suitable for time taken to became lecturer position in university. The ages between 41-50 years are total of 52 respondents and 41.9% is become second highest age group of respondents are answered the questionnaire of this research. Meanwhile, the respondents range 51 - 60 years old carry only 4.8 % which is 6 academic staffs were done answering this survey. Moreover, one academic staff who is in age group above 60 years old with 0.8 % are answered the questionnaire in this study. It has been least age group of respondents compared to other age group of respondents.

Table 4: Demographic Analysis

Demographic Profile	Frequency	Percent
Gender		
Male	46	37.1
Female	78	62.9
Age		
21 - 30 years old	6	4.8
31 - 40 years old	59	47.6
41 - 50 years old	52	41.9
51 - 60 years old	6	4.8
above 60 years old	1	.8
Designation		
Lecturer	73	58.9
Senior Lecturer	30	24.2
Associate Professor	19	15.3
Professor	2	1.6
Race or ethnic category		
Malay	114	91.9
Chinese	7	5.6
Indian	3	2.4
Working Experience		
Less than 2 years	16	12.9
2 - 5 years	9	7.3
6 - 10 years	40	32.3
11 - 15 years	46	37.1
More than 15 years	13	10.5

Moreover, there are divided the race or ethnic into three categories such as Malay, Chinese and Indians. In addition, there are 114 respondents are Malays and it is the almost 91.9%, Chinese contributed 7 respondents and it is 5.6% and Indian contributed 3 respondents which is 2.4% in this study. Malay ethnic respondents are majority answered the questionnaire from three faculties.

Moreover, 16 respondents with 12.9% are worked as academic staffs less than two years and around nine respondents with 7.3% in between working from 2- 5 years are answered questionnaire of this research. This is minority group of working from 2-5 years as academic staffs by respondents. Moreover, 40 respondents with 32.3% are worked as academic's staffs from 6- 10 years. There are total of 46 respondents are worked 11-15 years and it occupied 37.1%, which is highest group of working as academic staffs among the respondents. More than 15 years worked as academic staffs by total respondents is 13 with 10.5% in this study. academic staffs are divided by designation had answered the questionnaires which are Lecturer, Senior Lecturer, Associate Professor and Professor. There are highest total 73 Lecturers has been done this survey as respondents with 58.9% and continued by second highest of respondents are 30 Senior Lecturers with 24.2% done this survey from three faculties respectively. On the other hand, the respondents according of designation as Associate Professor are contributed 19 respondents and it consist 15.3%. Meanwhile, only two professors as respondents with 1.6% are answered questionnaire of this research.

Hypothesis Results

The present research is discussed of each variable's correlations with the academic staffs' readiness on IR 4.0 by using the rules of thumb for correlation coefficient size table. The coefficient of correlations is showed the strength of the relationship or direction of the linear relationship in between two variables.

Table below is showed the correlation relationship in between variables which is learning, knowledge management and innovation capability with academic staffs' readiness on IR 4.0.

Table 5: The relationship between academic staffs' readiness and learning

		Academic Staffs' Readiness	**Learning**
Academic Staffs' Readiness	Pearson Correlation	1	.562**
	Sig. (2-tailed)		.000
	N	124	124
Learning	Pearson Correlation	.562**	1
	Sig. (2-tailed)	.000	
	N	124	124
***. Correlation is significant at the 0.01 level (2-tailed).*			

The overall correlation coefficient is 0.562 and the significant figure is 0.00 which showed the academic staffs' readiness and learning factor has a significant positive relationship ($0.5 < r < 1$). So, the level of correlation in between academic staffs' readiness and learning is showed strong positive linear correlation. Hence, there has been a significant positive relationship between learning factor and academic staffs' readiness on IR4.0. with accepted of H_1 in this research.

Table 6: The relationship between academic staffs' readiness and knowledge management

		Academic Staffs' Readiness	Learning
Academic Staffs' Readiness	Pearson Correlation	1	.320**
	Sig. (2-tailed)		.000
	N	124	124
Knowledge Management	Pearson Correlation	.320**	1
	Sig. (2-tailed)	.000	
	N	124	124
**. Correlation is significant at the 0.01 level (2-tailed).			

The overall correlation coefficient is 0.320 and the significant figure is 0.00 which showed the academic staffs' readiness and knowledge management factor has a significant positive relationship ($0< r < 0.5$). However, the level of correlation in between academic staffs' readiness and knowledge management is showed weak positive linear correlation. Hence, there has been a significant positive relationship between knowledge management factor and academic staffs' readiness on IR4.0. with accepted of H_2 in this research.

Table 7: The relationship between academic staffs' readiness and innovation capability

		Academic Staffs' Readiness	Learning
Academic Staffs' Readiness	Pearson Correlation	1	.343**
	Sig. (2-tailed)		.000
	N	124	124
Innovation Capability	Pearson Correlation	.343**	1
	Sig. (2-tailed)	.000	
	N	124	124
**. Correlation is significant at the 0.01 level (2-tailed).			

The overall correlation coefficient is 0.343 and the significant figure is 0.00 which showed the academic staffs' readiness and innovation capability factor has been a significant positive relationship ($0< r < 0.5$). However, the level of correlation in between academic staffs' readiness and innovation capability is showed weak positive linear correlation. Hence, there has been a significant positive relationship between innovation capability factor and academic staffs' readiness on IR4.0. with accepted of H_3 in this research.

Discussion and Conclusions

Results indicated that there is relationship between learning factor and academic staff readiness which is highly specified both variables have a strong positive relationship. Besides, the positive relationships are obtained from this study indicates that the academic staffs are ready by learning the skills and knowledge required for Industrial Revolution 4.0. This findings are agreed with previous research that the learning is important factor to the improvement of the skills needed and prepared the academic staffs to meet the challenges associated with modern worldwide systems of Industrial Revolution 4.0 (Abuassi & Alkorashy, 2016). According to researcher (Saeid & Eslaminejad, 2016) in their past studies are concluded the fact that learning factors influenced the readiness of academic staff not only in the virtual environment but also in their personal achievement and work performance which are helped (Naghsh, 2016) the academic staffs able to meet their needs of learning and reach a point of understanding about Industrial Revolution 4.0. In addition, the learning factor is showed a positive effect towards academic staffs' readiness on Industrial Revolution 4.0 by increased their performance level and achieve the goal of their institutions in the future (Avdal, 2013). Therefore, the learning factor positively influenced the readiness of academic staffs for IR 4.0.

The knowledge management factor has been shown a significant weak positive relationship with 0.320 or 32% coefficient correlation with the academic staffs; readiness on Industrial Revolution 4.0. Thus, H0 (null hypothesis) is rejected and H1 (alternative hypothesis) is accepted even though the relationship is shown weak positive correlation in between the variables. This finding is agreed with previous research that the knowledge management helped improving the organizational functions for productive and beneficial implementation and influenced academic staffs' readiness towards industrial revolution 4.0 in institution (Shirazi, Mortazavi, & Azad, 2011). Moreover, the knowledge management supports educational institutions and make the academic staff to be ready with increasing their ability to collect and share information and knowledge to apply problem solving and support continuous research and improvement in their work towards advanced technology 4.0 (Sangeeta & Dhamdhere, 2015). In addition, some studies are mentioned that the knowledge management factor has been influenced increasing the level of readiness of academic staffs and produce effective management with the design and work of technical and structural procedures that focus on work processes and information processing in order to achieve true purpose of management towards the industrial revolution 4.0(Prieto & Revilla, 2004). Therefore, the knowledge management factor positively

influenced the readiness of academic staffs for Industrial Revolution 4.0.

Furthermore, there is significant positive relationship with weak correlation between innovation factor and the readiness of academic staffs for Industrial Revolution 4.0. The correlation coefficient in Pearson's Correlation analysis between for innovation capability factor and academic staffs' readiness is 0.343 or 34.3%. Even the findings are shown weak positive correlation but the past studies is mentioned that the innovation capabilities factor are influenced by institutional performance and enhance the readiness of academic staff who are able to exploit knowledge acquired and exchange knowledge or systems within the organization towards the Industrial Revolution 4.0 (Wu, 2013). In addition, the innovation capability positively encourage the academic staffs to prepare themselves by generating new ideas and creating a new approach to learn the skills and knowledge towards IR4.0 (Hussein et al., 2016). Therefore, the innovation capability factor positively influenced the readiness of academic staffs for Technology 4.0.

Research Limitation

The research limitation is known as constraint in a distribution of the survey based on correct respondents of academic staffs for this study. We are delivered the survey or questionnaires by printout and Google form. For the hard copy or printout questionnaire collection, we faced the problem to identify the right target respondents during distribution of questionnaire. The right target respondents according to designation such as Lecturer, Senior Lecturer, Associate Professor and Professor are supposed to answer the questionnaire. However, there are few academic staffs' rooms not label with name and also not much able to distribute the hard copy of the questionnaire by face to face for academic staffs due to time constraint. So, some of the questionnaire pinned it in front room of academic staffs which caused there are a few questionnaires are needed to reject due to wrong target respondents other than mention above in this research. This method able to help me to reach the target respondents in the university.

Moreover, this study was used a Likert scale which mean quantitative method to record the level of academic staffs' readiness. The respondents are only able to tick the answer such as strongly disagree, disagree, neutral, agree and strongly agree in the questionnaire. So, it was giving the respondents are only limited choices in term of choosing the answer and they were not able to express their opinion or recommendation regarding the study of topic which is the factors influence on the readiness of academic staffs for Industrial Revolution 4.0 in this study.

Recommendation

From the finding of this research, the academicians are recommended to extend their period of time in completion of study for gaining more target respondents in this research. It is helped the academician able to clarify and explained about the survey more with detail to the respondents while able to increase the validity and reliability of this study. Moreover, the qualitative research method is recommended for academician which may gained or identified other factors that influenced the academic staffs' readiness on IR 4.0 through interview with target respondents. Furthermore, there are some recommendation for education industry especially the management of universities to increase even more training programs and encourage more academic staffs to participate and learn the knowledge and skill required for Industrial Revolution 4.0. Thus, it has been increased the quality and professional academic staffs than quantity in learning institutions. Lastly. the government especially the Education Ministry should enforce the implement training program and exams regarding skills and knowledge of IR 4.0. in every institution by making sure every employee has to attend the program and exam before entering for new employment. It is increased the readiness level not to academic staffs only but also for all the employee in Malaysia. Thus, it can have helped the national economy also through creating a quality and qualify employee for the nation towards advanced technology 4.0.

Conclusions

As conclusion, this study was investigated the factors which are learning, knowledge management and innovation capability that influence on the readiness among academic staffs for Industrial Revolution 4.0. The conceptual framework had built and used it as the mechanisms to analyze from factors that influence the readiness among academic staffs for Industrial Revolution 4.0. Moreover, the research is conducted quantitative survey method and has been collected 124 units" data from the academic staffs from three faculties. Thus, all of these data collection had generated a useful data and information towards in this research study.

Besides, the findings show that the learning factor has a strong positively relationship while knowledge management and innovation capability factors had a weak positively relationship with academic staffs' readiness on IR 4.0. This means that there is a significant relationship between dependent and independent variables and the hypothesis can be accepted, these factors have influenced on the academic staffs' readiness for future advanced technology towards Industrial Revolution 4.0. In addition, there are a lot factors which may adapted or adopted readiness level of academic staffs towards Technology 4.0 and the survey may continue as references or guidance for further studies by the academician. At the same time, this research creates more changes for academician to gain more ideas and information for do further studies in topic which regarding about the academic staffs' readiness on IR 4.0. Moreover, the education industry especially the management of universities can able upgrade their academic staff's quality of work and provide more training and program for academic staffs to be ready in adapting of knowledge and skill required for Industry Revolution 4.0 from this study.

Abstract

Sustainable supply chain (SSC) management has improved company's competitive strategy during last decades. A lot of work has been done using mathematical models to optimise various criteria in the SSC. However, supply chain dynamics, such as uncertainty in production demand and transportation, are not present in most of them. In real systems the influence of random factors is significant. Therefore, the use of computer simulation can be an effective method of presenting various variants. This paper shows the application of a computational tool to support strategic decisions in the sustainable supply chain. The proposed approach combines the techniques of computer simulation modelling and Multiple Criteria Decision Analysis (MCDA) to analyse and evaluate the complex logistic problem. The research carried out allowed to create an accurate model of the real supply chain of a pharmaceutical company. It also identified what are the most important problems in the pharmaceutical chain and which performance criteria are considered to be critical for managers. The methodology used demonstrates the possibilities of creation various scenarios and allowing for their comparison and multi criteria evaluation.

Keywords: pharmaceutical supply chain, computer simulation, multiple criteria decision analysis, support decisions

Introduction

The pharmaceutical industry is one of the most important segments of developed countries' economies. Report (EFPIA, 2019) analysing this sector of the economy indicates that it is one of the main employers in the high-tech industry, generates three to four times more employment indirectly – upstream and downstream – than it does directly

The most frequently identified problems of the entire pharmaceutical supply chain are: outdated sales volume data (purchased from market research companies); demand uncertainty, periodic deliveries, high stock levels, wide and frequently changed assortment, top-down pricing or distribution methods, inconsistent information technology, high cost of inventory, low level of customer service, lack of information flow, lack of clear flow of information and data, bullwhip effect, lack of consistent measurement systems and models, need for environmental requirements, chain formation by legal requirements (DiMasi et al., 2016).

As a result, managing the supply chain in the pharmaceutical industry has become a very complex challenge, with a number of new possible decision-making problems that interact in a complex network of factors, and their relationships are not always obvious and easy to understand (Varma et al., 2007). One way to deal with the problem of management in such complex supply chains is to use simulation modeling that allows to analyse of large and complex stochastic systems. For many years the use of computer simulation has greatly increased, this can partly be attributed to increased competition and tool availability (Jahangirian et al., 2010). A key trend, is the increased use of hybrid modelling methods and optimization algorithms; these new links greatly increase the capability of

computer simulation and provide further benefits for manufacturers and supply chain managers (Negahban and Smith, 2014).

The article uses the results of research of two large pharmaceutical companies in Poland. The results of these studies were used: on the one hand to identify the problems that these companies face, their relationship in the supply chain, and on the other to build a simulation model of the production system and supply chain based on real data. Then authors show the application of a combined methodology of simulation modelling and Multiple Criteria Decision Analysis (MCDA) to support strategic decisions in the pharmaceutical supply chain. The methodology used demonstrates the possibilities of creation various scenarios and allowing for their comparison and multi criteria evaluation.

Theoretical background and Research Gaps

The industrial field of pharmaceutical products has developed at a very fast rate in the last decades. It is a rapidly growing market due to the increased rate of modern century diseases and the raised number of old-age nations. Likewise, the presence of pharmaceutical products as trace pollutants for environment has been firmly established (Weraikat, et al., 2016). The pharmaceutical industry is responsible for researching, developing, producing, and marketing pharmaceutical drugs, vaccines, and treatments for common and rare diseases (Milanesi et. al, 2020). Growing demand or creating demand for drugs and dietary supplements causes numerous problems in complex pharmaceutical supply chains. In recent years there is still a need to implement new strategies to the supply chains, including those based on sustainable development principles. It be defined as series of operations, processes and interaction between organizations in order to discover, develop and produce medications and drugs (Shah, 2004) A Pharmaceutical Supply Chain (PSC) is defined as a combination of processes, organizations and operations involved in the development, design and manufacturing of useful pharmaceutical drugs (Singh et. al, 2016).

An aging world population and improved healthcare systems are driving demand for a pharmaceutical industry that is increasingly aware of the need to pursue sustainable development while delivering a wider range of pharmaceutical products. Therefore, the pharmaceutical industry has been the subject of growing attention for the impact in terms of sustainability of its (Sarkis et. al, 2010). The supply chain of pharmaceutical products is characterized by high complexity, and supply and delivery channels to customers are limited and highly regulated (Merkuryeva et. al. 2019).

The problem of management and decision making in such chains is primarily the choice of the raw material producer and supplier. 80% of the excipients are produced in China and India, of which only 1% of the companies involved in the production of these components have GMP-compliant procedures in place (Saluja and Sekhon, 2016). The design and operation of such chains is also negatively affected by the reduction of production in Europe, due to stricter climate regulations, increased costs in this sector and low competitiveness in relation to companies from the USA or Asia. In such chains, unfortunately, not all logistics and distribution companies comply with good transport or distribution practice. There is no doubt that the main problems of pharmaceutical supply chains include the need to secure each stage of the activities and processes undertaken, the organisation and proper execution of transport processes, and control at each stage of the supply chain. Errors or deviations in transport or storage activities affect the quality and safety of the active substances or drugs themselves. The organisation of supply chains should take into account the specificities of products or raw materials, the need for specialised packaging and storage conditions. These supply chains need to demonstrate a high level of quality and efficiency, despite all the advances and improvements in production, storage, and distribution methods, many pharmaceutical companies are still struggling to satisfy market demand effectively and consistently (Zahiri et. al, 2018).

The specificity of the final product requires maximum availability on the shelves. Such an assumption requires improvement of the chain, and its transparency, as well as appropriate cooperation, as usually vendors or medical facilities do not have large storage space, and ensuring availability is possible by using information flow techniques and ensuring cooperation at a high quality level. In this respect, there is also a need for appropriate data accuracy and IT support, close cooperation between the links is necessary. This product specificity also requires the use of specialist

logistics operators for logistical processes. Statutory regulators play an important role (pharmaceutical law, requirements to be met in order to allow the product to be marketed in a given country). Collaboration in supply chains can be defined as a long-term relationship between entities through sharing resources and knowledge.

The main market stakeholders include: regulators, manufacturers, suppliers of raw material packaging, additives, wholesalers, retailers (pharmacies, hospitals, medical centres), doctors, patients, logistics operators and warehouse infrastructure managers, raw material producers, the pharmaceutical industry itself, distributors, health agents (hospitals, clinics, physicians, insurance health representatives), third party operators, retailers, and customers/patients (Viegas et. al, 2019). PSC brings together thousands of different stakeholders with diverse objectives (Halabi and Gostin, 2015).

The analysis of pharmaceutical supply chains is most often taken into account:

- Primary manufacturers,
- Secondary manufacturers,
- Distribution centres/wholesalers, and
- Retailers (i.e., pharmacies)/hospitals;

all of them have their own specifications, obligations and priorities. Primary manufacturers deal with the production of active ingredients, which will further be processed in downstream stages. Delivered active ingredients to the secondary manufacturers go through laboratory processes and are transformed into the ready-to-use drugs. These drugs are then transported to distribution centres and are distributed to the retailers (i.e., pharmacies) or hospitals. In general, a pharmaceutical supply chain is a 5-tier supply chain which includes primary manufacturers, secondary manufacturers, main and local distribution centres, and destination zones/demand points (e.g., pharmacies, hospitals, clinics, etc.) (Zahiri, et. al. 2017). The original model of the pharmaceutical supply chain is presented in Figure 1.

Fig. 1: Model of the pharmaceutical supply chain

Recent years have also seen new trends in whole processing industries, encouraging the transition from cost-based to sustainable development (Heintz et al., 2014). Supply chain management decisions take into account not only economic objectives but also environmental, security and social aspects (Barbosa-Povoa et al., 2012, Barbosa-Povoa and Pinto, 2018). There is no doubt that pharmaceutical companies and their supply chains have a negative impact on the environment, due to medical waste, which also includes excess drugs as well as inappropriate storage (e.g. overdue drugs) (Masoumi et al., 2012).

Methodology

Critical review of the literature provides a baseline for describing of the problem. The pharmaceutical industry is characterised by the complexity of supplying and distributing pharmaceutical products in both developed countries (Rossetti, Handfield, & Dooley, 2011), as well as developing countries (Prado et al., 2016) and the specific supply market (Brekke et al., 2007; Rossetti et al., 2011). The structure and type of pharmaceutical markets contribute to uncertainty on the demand side and inefficiencies on the supply side (Narayana i in, 2014), its degree depends on the country and market. In this study authors develop a hybrid methodology to answer the outlined logistical problems proposed by combining the techniques of simulation modelling and MCDA. The proposed methodology includes modeling of the entire logistics chain, from ordering, through suppliers, production and distribution to customers taking into account randomness that may interfere with the proper functioning of the chain.

The novelty of the study is the identification of problems in supply chains in the pharmaceutical companies and using of a simulation modelling with multi-criteria methods to test different scenarios and analyse performance of whole supply chain of these companies. The methodology used in the research is shown in Figure 2.

Fig. 2: Practical methodology to analyze performance in the supply chain of pharmaceutical company using simulation modelling and MCDA

The first step in the research presented in the article were in-depth interviews at two large pharmaceutical companies in Poland. The entire logistics chain was analyzed: from the suppliers, through the production to the customers of one dietary supplement, which was identified as key in the production of a given manufacturer. The interview also included the analysis of problems that occur

in such a chain and the most important criteria according to a given manufacturer in assessing the effectiveness of the entire chain. These interviews can be used to build the concept of the supply chain model of the enterprise being analyzed, and at a later stage to create a simulation model and a ranking of efficiency criteria that are most important for a given enterprise. Simulation experiments can test different decision-making alternatives upon more possible foreseeable scenarios, in order to ascertain in advance the level of optimality and robustness of a given strategy. The results of the simulation are then fed into the multi criteria analysis module and finally, as a result, the enterprise gets which strategies or which (random) elements of the supply chain most affect its efficiency.

Computer simulation study of pharmaceutical supply chain

Simulation is most certainly a very powerful approach for gaining insight into supply chain management systems (Thierry et al., 2010). Pharmaceutical supply chains are in need of efficient optimization techniques to improve their performances (Masoumi et al., 2012). There is a need to track and identify products throughout the entire supply chain. Among the techniques supporting a multi-decisional context, as a supply chain is, simulation can undoubtedly play an important role, above all for its main property to provide what-if analysis and to evaluate quantitatively benefits and issues deriving from operating in a co-operative environment rather than playing a pure transaction role with the upstream/downstream tiers (Terzi and Cavalierii, 2004). In this regard, simulation has appeared as a powerful method to investigate and design global strategies for the pharmaceutical companies. Barlas and Gunduz (2011) used simulation modelling with demand forecasting and sharing strategies to reduce fluctuations and the bullwhip effect in supply chains. Coyle et al. (2003) demonstrated that simulation is a strong tool for study both the flexibility and the reactivity of the supply chains in large scope under stochastic conditions. Ding et al. (2004) have developed a simulation-based and optimised tool to design, improve, and support supply chain decision making. There are also some works that associate simulation modeling with MCDA methods. Work Aickelin et al. (2018) present a case study demonstrating how dynamic and uncertain criteria can be incorporated into a multi-criteria analysis with the help of discrete event simulation. Paper Brito et al. (2011) shows usage of a computational tool (computer simulation with MCDA methods) to support strategic decisions about the planning and sizing of the logistics and production elements of a steel plant.
In this paper we use simulation modelling with multiple criteria decision analysis methods to analyse performance of pharmaceutical supply chain under different scenarios with some uncertainties that may interfere with its functioning.

Experimental design for the simulation study

ARENA simulation package from Rockwell Software (version 14.0) was used for modelling the manufacturing system. The experiment design is described in the following section preceding a discussion of results. A fragment of the tested model of supply chain in the Arena environment is shown in figure 3. This environment can simulate any complex system, taking into account the possible uncertainty.

Fig. 3: A fragment of the analysed model of short food supply chain in Arena software

A model of supply chain was created from in-depth interview and analysis of the supply chain of a leading pharmaceutical company in Poland. The simulation model reflects the entire chain of one of the dietary supplement produced by this company. Fixed simulation model input parameters are shown in table 1.

Table 1: Simulation input parameters

Product	One dietary supplement
Number of components needed for the production of the supplement	10
Number of suppliers of components	6
Entrance warehouse	1
Number of processes needed to manufacture the product	8
Output warehouse	1
Number of supply chain links in delivery to the customer	3

In real supply chains, there are many stochastic components. Table 2 represents the scenarios analysed, which take into account random elements that may appear in different places throughout the chain.

Table 2: Simulation experiment - scenarios

	Occurrence of random factors			
Scenario No.	**Uncertainty of demand (L-Large, M-Medium, S-Small)**	**Delays from suppliers (Yes - 1/No -0)**	**Production failures (Yes -1/No - 0)**	**Delays in transport to customers (Yes - 1/No -0)**
1	S	0	0	0
2	S	1	0	0
3	S	0	1	0
4	S	0	0	1
5	S	1	1	0
6	S	1	0	1
7	S	0	1	1
8	S	1	1	1

9	M	0	0	0
10	M	1	0	0
11	M	0	1	0
12	M	0	0	1
13	M	1	1	0
14	M	1	0	1
15	M	0	1	1
16	M	1	1	1
17	L	0	0	0
18	L	1	0	0
19	L	0	1	0
20	L	0	0	1
21	L	1	1	0
22	L	1	0	1
23	L	0	1	1
24	L	1	1	1

In this case random probability distributions are used to represent uncertainty in demand, delays from suppliers and delays in transport to customers (normal and triangular distribution). Normal distribution is a good description of the distribution of demand for fast-selling items (Krzyżaniak, 2009).

According to the accepted parameters in the literature, which ensure reliable results the following simulation runs parameters were determined:

- Warm-up time = 7 days
- Replication length = 12 months
- Number of replications = 7

Model verification and validation

Model verification and validation is an important step in simulation modelling. However, validation of data collected from the interview is difficult. Several verification and validation techniques can be applied to the model, like: internal consistency checks, checking the correctness of the model (check errors), watching animation of process. In this study to validate the model ***a certain number of experiments*** was run with different set of inputs and the calculated output (number of products of a given type sold) was compared with output declared by analysed company.

Multiple Criteria Decision Analysis (MCDA)

The MCDA method involves mapping the different criteria scores onto a comparable scale and then calculates a single overall score based on a weighting scheme provided by the managers from the researched companies. The objective of any multi-criteria decision methodology is not to prescribe the "right" decision to be chosen, but to help decision makers find an alternative that best fits their needs and problem general understanding (Brito, 2011). The performance criteria, considered in this paper, for which managers of two major pharmaceutical companies in Poland were asked are:

- Number of products of a given type sold
- Usage/utilization of resources
- Minimizing inventory at the input warehouse
- Minimization of inventory at the output warehouse
- Short delivery time to the customer (from the moment of ordering)

Table 3 shows the importance classification of the performance criteria and the calculation of the normalized weights associated to each of them.

Table 3: Importance classification of the decision criteria and normalized weights

Performance criteria	Company 1 priority	Company 2 priority	Average value	Rank of criterium	Weight	Normalized weight
Number of products of a given type sold	1	1	1	1	100	0,375
Number of days / hours of production downtime	2	4	3	2	50	0,1875
Minimizing inventory at the entrance	5	3	4	3	33,33333	0,125
Minimization of inventory at the output	3	5	4	3	33,33333	0,125
Short delivery time to the customer (from the moment of ordering)	4	2	3	2	50	0,1875
				SUM	**266,6667**	**1**

Analysis of the Results

The results from all 24 scenarios of simulation experiments are presented in Table 4. It can be seen that random factors that disrupt the supply chain have a significant impact on all performance criteria indicated by the managers of the surveyed pharmaceutical companies.

Table 4: Results obtained from the simulation experiments

Scenario No.	Number of sold products	Utilization of resources (%)	Inventory at the input (average time in hours)	Inventory at the output (average time in hours)	Cycle time (average in hours)
1	174918	98.5%	491.7	22.3	549.6
2	174643	93.5%	1651.2	21.3	1692.1
3	174528	94.7%	491.7	19.0	549.0
4	174916	98.5%	491.7	22.3	50.6
5	174380	88.5%	1651.2	15.7	1690.8
6	174338	93.5%	1651.2	21.3	1692.3
7	174524	94.7%	491.7	14.0	551.6
8	174173	88.5%	1651.2	15.3	1693.4
9	166723	97.6%	491.7	22.3	550.7
10	166697	92.8%	1651.2	23.4	1692.8
11	167205	94.1%	491.7	14.4	550.6
12	166600	97.6%	491.7	22.3	551.5

13	166030	87.5%	1651.2	17.2	1693.3
14	166058	91.8%	1651.2	24.0	1693.5
15	166577	94.1%	491.7	21.2	552.4
16	165987	87.5%	1651.2	17.7	1695.4
17	153467	97.1%	491.7	22.3	553.5
18	151781	91.3%	1651.2	25.3	1694.2
19	152137	92.9%	491.7	14.0	554.9
20	152722	97.1%	491.7	22.3	553.9
21	151139	86.4%	1651.2	17.8	1694.2
22	151781	91.3%	1651.2	25.4	1696.0
23	151998	92.9%	491.7	13.9	555.0
24	150840	86.4%	1651.2	17.9	1696.6

From the results of the conducted experiments, it can be further concluded that the factor that most affects the smaller number of products sold (difference even 13% in the annual number of product units sold) is the uncertainty of demand. However, delays from the suppliers have a very large impact on the extension of the entire cycle time (from order to delivery to the customers). Delays in transport to the customers and breakdowns on the production line have much less impact.

Due to the fact that the results differ significantly for different levels of demand uncertainty, in the MCDA analysis it was decided to compare not all 24 scenarios together, but grouping 8 scenarios due to the level of demand randomness (small - scenarios 1-8, medium - scenarios 9-16, large - scenarios 17-24). The application of the normalized weights considered for each criterion (Table 3), results in a final score result for each scenario. Thus, the scenarios are ranked in Table 5.

Table 5: Scenarios final scores ranking

Scenario No.	Uncertainty of demand - Small	Scenario No.	Uncertainty of demand - Medium	Scenario No.	Uncertainty of demand - Large
1	0,962	9	0,962	17	0,975
2	0,731	10	0,731	18	0,693
3	0,881	11	0,981	19	0,944
4	0,962	12	0,900	20	0,937
5	0,662	13	0,662	21	0,662
6	0,656	14	0,656	22	0,693
7	0,906	15	0,881	23	0,906
8	0,625	16	0,625	24	0,625

Table 5 contains the results of assessments of the effectiveness of a given scenario. The given rating reflects the result of simulation experiments also taking into account the assessment of each criterion according to its importance determined by the managers of pharmaceutical companies.

The results from Table 5 show that the best scenarios are those where there are no random disturbances in the functioning of the chain. This is an obvious conclusion, but it can be seen that scenarios with no delays from suppliers are much better rated, e.g. scenarios 4 and 7 for small

uncertainty of demand. High scores of scenarios 19 and 20 for high uncertainty of demand can also be seen. Thanks to this combination of simulation modeling and the MCDA method, managers get a tool to look more effectively at the supply chain efficiency. As a result, they can focus on eliminating the effects of uncertainty in those areas that most affect the chain's efficiency as a multi-criteria decision.

Discussion and conclusion

Evaluation of supply chain performance is essential for operating and managing of supply chain. The complexity of pharmaceutical supply chains and their specificity, different from other industries, in particular taking into account random factors make it necessary to manage them efficiently.

The simulation modelling and MCDA combined methodology proved to be effective as a complex logistic problem decision-making support. In this paper we have presented theoretical assumptions of this methodology together with case study of supply chain of pharmaceutical company. This analysis tool (simulation modelling with MCDA), with some minor modifications, is applicable to other similar logistics systems evaluation. It can also be extended to other preference functions that can also be evaluated differently.

There is no doubt that the management of pharmaceutical supply chains is challenging. Market requirements and their specificities, but also new trends and the creation of new strategies, including sustainable development, make it necessary to use different methods of monitoring and assessing the chain itself. The complexity and length of chains is also a challenge for managers. Therefore, ways should be sought it is the chains that have been efficient and effective, which will consequently increase their efficiency and competitiveness.

Abstract

The article aims to ascertain the major factors or variables that affect the profitability of companies in Malta. This article will delve on three major performing companies in Malta. The specific objectives are to: 1) identify the five major variables or factors that could affect company's profit; independent variables; 2) assess each of the independent variables on the dependent variable individually; simple regression; and, 3) overall influence of the independent variables on the dependent variable; multiple regression. The research paper concludes with recommendations, which could increase the overall performance of companies in Malta. The research used data from about 80% or even more, of the total number of companies in Malta. Nevertheless, due to limited resources constraints, the researchers decided to limit the study to only three companies for a period of five accounting years.

Keywords: Determinants of Profitability, Company Performance, Stock Exchange, Factors Which Affect the Profit.

Introduction

The core mission of companies is to generate profits for its shareholders. Effective governance structures and flexible decision-making allow companies to create consistent profit margins. The yearly margins for successful companies are better to be compared favorably to their past outcomes and to business procedures. Profitable companies give attention to both revenue and expenditures. They fulfill consumer requirements and produce quality products or services consistently and promptly. From the word go, expenditures are considered actions that decrease profit of companies. However, there are some key expenditure, which are meant to have a long-lasting positive impact on the profit of a company, like research, advertising and other marketing activities.

The sustainable rate of growth is the rate of progress that every company need to pay critical attention to, whenever they consider generating profit in the long term. Being profitable, businesses stand a chance to remain in operation, face competition and enlarge its investments and activities.

Literature Review

In a competitive marketplace, to achieve a satisfactory level of profitability is better to go directly to business owners. The profitability of a company shows a company's ability to generate earnings for a certain period at a rate of sales, assets and certain of capital stock (Margaretha, Supartika, 2016). Profitability is the ratio to measure the performance of the company. Understanding the determinant profitability is the key factors that helps managers in developing an effective profitability strategy for their company (Gitman, Zutter, 2012). According to Yazdanfar (2013), one of the importance preconditions for long-term firm survival and success is firm profitability. The achievement and other financial goals of the firms are significantly affected by the profitability determinant of the firm

(Margaretha, Supartika, 2016). Bahyahi (2010) analyzed factors that influence the competitiveness of cement firms in India from 2001 to 2008. His findings showed that liquidity, operating ratio, inflation, company size and interested rate were the major determinants of cement companies in Indian. Boadi (2013) established a positive correlation between profitability and liquidity. Purcărea and Stancu (2008) revealed the existence of correlation between company performance and intangible assets using several models. Elsiefy (2013) and Moşteanu (2017, 2018) examined the determinants of profitability of industrial banks in Qatar and UAE, and determined evidence of a sturdy relationship between liquidity and profitability for Islamic banks. Innocent et al. (2013) investigated the profitability of companies in the pharmaceutical industry in Nigeria from a 10-year period. Their findings proved an inverse relationship between profitability and each of the independent variables used; total assets turnover ratio, creditor's velocity and debt turnover ratio. Al-Jafari and Alchami (2015) tested the profitability of Syrian banks and their findings showed a significant influence of credit risk, bank size and management efficiency on profitability of banks in Syria. A study by Zaid, Ibrahim and Zulqernain (2014) tested the profitability for companies in Malaysia. Based on their research, they came out with a positive relationship between profitability and liquidity but a negative relationship with capital structure. Al-Jafari and Samman (2015) tested the profitability of companies listed on the Muscat security market from 2006 to 2013. Their research concluded that efficiently managed assets have a positive relationship on profitability of growing firms.

Research Methodology

Theories propounded by researchers in the area of finance over the past years

In the specialized literature, there are five theories of profit. The present work paper will focus on two of them: Frictional Theory of Profit, and Managerial Efficiency Theory of Profits. According to the Frictional Theory of Profit explains the shocks which occurs in each economy where there is changes in product demands. According to this, there exists a normal rate of profit, which is a return on capital that must be paid to the owners, as a reward for saving and investment of their funds rather than to consume all their income or hoard them. In effect, companies in this economy may be faced with a positive or negative profit, as a result of disequilibrium condition. Managerial Efficiency Theory of Profits recognizes that some companies are more efficient than others are, in terms of productive operations management and effectively meeting the wants of consumers.

Methods used in Research Analyses

The research was centered on only three well-performing companies in Malta. The researchers used a 5-year financial data from these companies, which ranges from 2014 to 2018. These financial data were taken from the Malta Financial Services Authority (M.F.S.A), which was duly acknowledged by the researchers. The researchers also employed the use of Excel and Stata 14, which is one of the most powerful statistical software, for its analysis. Regression Analysis or Models were thoroughly used for this project. There were other descriptive statistical tools used to back our findings: Line Graph, Correlation Matrix, Correlation Coefficient and F-Statistics. This study employed the convenient sampling technique to gather data of a total observation of 60. There was a total of six variables executed by the researchers, one dependent variable: Net Profit Before Tax, and the other five independent variables: Revenue, Operational Expense and Sustainable Growth Rate, Retained Earnings and Stockholder's Equity. The authors employed the Regression to determine the influence the independent variables have on the dependent variable, as well as its magnitude in their impact.

The model is as following:

$$Y = a + b_1X_1 + b_2X_2 + b_3X_3 + ... + bnXn + e$$

Where:

Y = dependent variable, A = intercept e = error term
$b_1, b_2, b_3 ... bn$ = coefficients, $X_1, X_2, X_3, ..., Xn$ = independent variables

Hypotheses

In order to find out which factors have a significant impact on company's profitability, the research used the following hypotheses:

Ho: There is no significant difference between Net Profit and Revenue
Ha: There is significant difference between Net Profit and Revenue

Ho: There is no significant difference between Net Profit and Operational Expense
Ha: There is significant difference between Net Profit and Operational Expense

Ho: There is no significant difference between Net Profit and Sustainable Growth Rate
Ha: There is significant difference between Net Profit and Sustainable Growth Rate

Ho: There is no significant difference between Net Profit and Retained Earnings
Ha: There is significant difference between Net Profit and Retained Earnings

Ho: There is no significant difference between Net Profit and Stockholder's Equity
Ha: There is significant difference between Net Profit and Stockholder's Equity

Ho: There is no significant prediction of Net Profit by Revenue, Operational Expenses and Sustainable Growth Rate.

Ha: At least one of the predictive variables; Revenue, Operational Expenses, Retained Earnings or Sustainable Growth Rate, belongs to the model.

Data Analyses

This section thoroughly explores, analyses and reports the financial data collected from the Malta Financial Service Authority regarding three companies in Malta, namely GO Mobile, HSBC Bank and Farson Limited.

From Figure no.1, comparing the profit before tax of the three companies, it could be seen that HSBC Bank recorded the highest over the year followed by GO Mobile and Farson had the least. From 2014 to 2018, Revenue for HSBC Bank decrease consistently over the years whereas both GO Mobile and Farson constantly increased over the period as shown in Figure no.2. Operational Expense was extremely highly and hovered around Euro 12,000,000 for the given period. However, GO Mobile recorded the least among the three companies whereas Farson operational expense fell in between two companies as shown in Figure no.3.

Figure 1: Profit before Tax, during the period 2014-2018, Source: Excel computing data

Figure 2: Revenue movements during the period 2014-2018, Source: Excel computing data

Retained Earnings for HSBC Bank was high as Euro 300,000,000 as at 2014 and maintained it over the four-year period. Meanwhile GO Mobile and Farson were both retained earnings as low as Euro 40,000,000 for the years analyzed, which can be seen in Figure no.4.

Figure 3: Operational expenses during the period 2014-2018, Source: Excel computing data

Figure 4: Retained earning registered during the period 2014-2018, Source: Excel computing data

Figure 5: Stockholder's equity evolution during the period 2014-2018, Source: Excel computing data

HSBC Bank kept a Stockholder's Equity value around Euro 500,000,000 for the 4-year while GO Mobile and Farson both maintained a stockholder's equity around Euro 100,000,000 for the 4-year period from Figure no.5. From the table no.4.2, there is a high correlation between Stockholder's Equity and Retained Earnings. The researchers drop these two variables because of the assumption of multicollinearity when performing the ANOVA test.

Table 4.1: Summary of Descriptive Statistics

Variables	MEAN	MAX	MIN	S.D
Profit before tax	29008800	62221000	6875000	18082173
Revenue	130931200	210468000	78337000	41942692
Operational expenditure	65405000	129243000	6315000	46338211
Retained earnings	133550800	334516000	28155000	134946596

Findings and conclusions

The conducted analyze shows the regression result for Profit before Tax and Revenue (Table no.4.3). It has a p-value of 0.110 which is greater than 0.05 hence the Null Hypothesis failed to be rejected meaning there is no significant difference between Profit before Tax and Revenue. Furthermore, there results showed that there is a negative relationship between Profit Before Tax and Revenue, which means if companies in Malta concentrate on making huge revenue there is a corresponding negative impact (-0.727968) on their Profit Before Tax hence Revenue shouldn't be taken in consideration when a company would like to make profit in Maltese Economy.

Table no.4.4 demonstrates results of a linear regression between dependent variable Profit before Tax and independent variable Operational Expenses. According to the results, a p-value of 0.389 which is greater than 0.05 indicates that the Null Hypothesis failed to be rejected. Therefore, there is no significant difference between Profit before Tax and Operational Expenses. It further proved that there exists a negative relationship between Profit before Tax and Operational Expenses of (-0.6604923).

Table no.4.5 reveals the regression results for Profit before Tax and Retained Earnings. With 5 percent margin of error, there was a p-value of 0.2935 which is obviously greater than 0.05 and hence the Null Hypothesis failed to be rejected whereas the Alternative Hypothesis is rejected. In the results, there was a positive relationship between Profit before Tax and Retained Earnings. Which means that for every additional 1 Euro of Retained Earnings by companies in Malta, there exists an average increase of 0.1988473 of their Profit Before Tax.

Regression Analysis results for Profit before Tax and Stockholder's Equity can be referred to Table no.4.6 where p-value recorded 0.2860, which is greater than the usual 5 percent margin of error. Again, the Null Hypothesis failed to be rejected per the results and there exists a positive correlation between Profit before Tax and Stockholder's Equity.

Table no.4.7 also depicts regression analysis result for Profit before Tax and Sustainable Growth Rate. A p-value of 0.2536 was recorded and a coefficient of 5.05e+07. This result means there is no significant difference between Profit before Tax and Sustainable Growth Rate. However, for every additional unit of Sustainable Growth Rate, there will be 5.05e+07 increase in Profit before Tax.

Finally, Table no.4.8 shows the overall regression analysis with one dependent variable Profit before Tax and three independent variables: Revenue, Operational Expenses and Sustainable Growth Rate. Two of independent variables; Retained Earnings and Stockholder's equity, were eliminated due to multicollinearity.

After all analyses conducted, the research may conclude that, according to the regression analysis, among the six independent variables used, the Sustainable Growth Rate has a better impact on companies' profits in Malta.

Recommendations

After all research conducted and its findings, the authors come with recommendations which may be taken as possible solutions to improve the financial management in order to increase the company's profitability. In this respect, financial managers of Maltese companies are highly recommended to take up activities that will either maintain or expand their company's sustainable growth rate, if they really want to make profit. This is because of the positive relationship between Sustainable growth rate and profit before tax.

The following suggestions may lead to the improving Sustainable growth rate: 1) Maintaining a target capital structure without issuing new equity. Capital Structure is a careful balance between debt and equity which a business uses to finance its activities. Dilution of ownership is what investors dislike, on the other extreme; too much of borrowing also has implications on company's performance. The need to balance both equity and debt is very essential in improving Sustainable growth rate of companies. 2) Increase sales as rapidly as market conditions allow. Managements need to craft a sales strategy that would capitalize on any opportunity that emerges from that market. In effect, companies tend to be market leaders in their specific industries and hence profits are been generated since they then have less competitors. 3) Maintain a target dividend payment ratio. Dividend payment ratio provides a measure on how much money a company is giving to shareholders against amount retained by the company for reinvestment. Managements are supposed to maintain its target dividend payment ratio.

Being aware about the weight of sustainable growth rate is crucial for any financial management. Calculating the sustainable growth rate is important, it has a high impact on company's profitability, and it helps to make decisions regarding investments and the future of its business.

Management Accounting Systems, Task Uncertainty and Managerial Performance in Small and Medium Enterprises

Hamzah AL-MAWALI

Assistant Professor of Accounting, School of Business, The University of Jordan, Amman, Jordan, h.almawali@ju.edu.jo

Abstract

This research examined the mediating role of broad scope management accounting system (MAS) information usage on the direct association between task uncertainty and managerial performance in Jordanian small and medium enterprises (SMEs). Related literatures were reviewed to develop the theoretical framework. Data were collected using survey distributed to managers/owners of Small and Medium Jordanian Enterprises. The collected data were analysed using Smart-PLS to examine the validity and reliability first, then, to examine the research hypotheses. The results support the mediating effect of broad scope MAS information used, and results reported a negative effect for task uncertainty and a positive effect for MAS information usage on managers' performance. This study contributes to the body of knowledge in accounting in the context of developing countries.

Keywords: Management Accounting Systems, Task Uncertainty, Managerial Performance, Small and Medium Enterprises

JEL: M41

Introduction

Small and medium enterprises (SMEs) are currently a subject of interest among academicians and practitioners (Lind, 2013). Indeed, SMEs are increasingly viewed as significant contributors to the worldwide economy while also being significant creators of employment (Curado, 2018; Krishnan & Scullion, 2017). As reported by the SME survey in the UN Global Compact (2004), SMEs comprise more than 90% of businesses and on average account for 50–60% of national employment in the context of developing economies. SMEs in Jordan, for example, make up more than 85% of total firms and nearly three-quarters (76%) of overall employment in the country (USAID, 2017). However, in emerging countries, Tatoglu et al. (2016) stated that SMEs face obstacles in achieving a sustained competitive advantage. Furthermore, Lopez-Nicolas and Soto-Acosta (2010) reported that today's economic environment, which is characterized by competitive intensity, rapid technological change and globalization, has intensified the pressure on SMEs' management. The performance of SMEs is affected by the quality associated with managers' strategic decisions (Zacca, Dayan, & Elbanna, 2017). Meanwhile, the business environment today is dynamic in nature, compelling managers to use numerous instruments in an attempt to improve the performance and effectiveness of the organization (Bureš & Racz, 2016). As an indicator of managers' success in attaining goals, managerial performance is among the most prominent key performance indicators requiring improvement over time (Zenita et al., 2015). Improving managerial performance requires that a sophisticated information system that provides managers with sufficient and important business information be established and implemented (Bouwens & Abernethy, 2000; Chung & Su, 2012; Ghasemi et al., 2016). In this regard, MASs assist managers in their access to and use of the information needed to attain the firm's objectives, which in turn will improve their managerial performance

(Chung & Su, 2012). In general, MASs provide useful information to managers (Novas, Alves, & Sousa, 2017). MASs comprise reports, performance measurement indicators, and other information systems needed, for example, for budgeting, planning, forecasting, and the preparation and review of managerial accounting information (Heidmann, Schäffer, & Strahringer, 2008). As indicated in the work of Chong and Eggleton (2003), the information that MAS provides is of two types: narrow-scope information and broad scope information. Specifically, narrow-scope information comprises historical financial data that are primarily linked to matters within the organization. By contrast, broad scope information may comprise ex-post financial accounting data, market volume, economic indicators, costing data, pricing strategies, customer preferences, and customer levels of satisfaction. The provision of broad scope information commonly generates ex-ante information pertaining to future prospects, such as new technologies and customer needs, which, according to Cheng (2012), may generate a significant effect on the competitiveness of organization and eventually the organization's overall potential performance.

In contemporary business environments, managers need more strategic information; such information is generally ex-ante rather than ex-post (Ghorbel, 2017). In this regard, a number of researches have tested the association between MAS and corporate performance (e.g., Al-Mawali, 2013; Chenhall & Morris, 1986; Gordon & Narayanan, 1984; Mia & Chenhall, 1994). In this study, broad scope MAS has been chosen considering the potential importance reported in the work of Mia and Chenhall (1994, p. 2) of the breadth of the scope in the facilitation of the decision-making process (Chenhall & Morris, 1986; Gordon & Narayanan, 1984; Larcker, 1981; Nguyen et al., 2017). In fact, managers in contemporary business settings, which are usually characterized by levels of uncertainty and complex technology, need more information to grasp certain components of the operating context (Gordon & Narayanan, 1984). The majority of empirical works addressed only one characteristic of MAS, most often the broad scope. Ghasemi et al. (2016) argued that a broad scope was the most vital among the characteristics of MAS.

Furthermore, past works have discussed the primary role of MAS in supporting managerial growth, especially among SMEs, as shown in Garengo and Sharma (2014) and Jardioui, Garengo, and El Alami (2017). However, as reported in Bourne (2005), a considerable number of implementation initiatives have failed. Furthermore, Bouwens and Abernethy (2000) pointed to the inadequacy of awareness about the antecedent conditions impacting MAS information. This is an issue because an MAS requires awareness of the applicable antecedent variables that may lead to certain MAS information within an organization.

Pervious related studies have conceptualized MAS as either a predictor variable (Agbejule, 2005; Chong & Eggleton, 2003; Mia & Patiar, 2001) or a criterion variable (Emsley, 2005). Few studies have examined MAS in terms of its mediating role (Cheng, 2012; Ghasemi et al., 2016). It is thus important to focus on the mediating effect of MAS in more detail in a different context, specifically in the context of SMEs in developing countries. A pertinent question is whether MAS information in reality contributes to understanding the linkage between task uncertainty and managerial performance in SMEs in Jordan. This article progresses as follows. The next section highlights the hypotheses and theoretical framework developed within the context of SMEs. The three ensuing sections provide the details of the research methods. Then, the resulting analysis of the statistical tests is presented, and the findings are discussed. This study concludes by elaborating the implications of the findings. Directions for future research are also highlighted in the last section.

Literature Review and Hypotheses Development

Task Uncertainty, Broad Scope MAS Information and Managerial Performance

Galbraith (2007) noted the prominence of task uncertainty. Galbraith stated that a higher level of task uncertainty requires decision makers to process more information during the execution of a task to attain the sought-after performance level. The task uncertainty level comprises a mixture of output diversity, the

variety of capabilities, and the extent of the target obstacle. As the differing variables become more multifaceted, Dibrell and Miller (2002) mentioned the need to make the applicable information available to decision makers. In support of this, the empirical outcome of Specht (1986) proves that less analysable tasks that are complicated and non-routine require less detailed information and greater information processing (e.g., broad scope MAS information) unlike tasks that are simple and routine.

Bouwens and Abernethy (2000) mentioned the necessity of awareness of the pertinent antecedent variables that may have generated certain MAS information within an organization. Accordingly, there appears a solid relationship between task uncertainty and one dimension of MAS information "aggregation" (Soobaroyen & Poorundersing, 2008). As indicated in the work of Richards et al. (2017), the multifaceted processes with high task uncertainty lead to higher information needs. However, the current study considers task uncertainty to be an independent variable instead of a moderating variable and investigates the potential effects of the level of MAS information usage by managers/owners on the association between task uncertainty and managerial performance.

When managers face a low level of task uncertainty, they need less sophisticated management accounting information for decision-making (Chong, 2004), as the decision environment is fairly simple to interpret. Refined reports released by management accounting can reduce uncertainty and improve decisions, which, according to Gul (1991) and Chong (1996), will eventually improve their managerial performance. As argued in an earlier study by Tushman and Nadler (1978), it is possible to launch and utilize pre-set standards and policies for task execution when task uncertainty is relatively low. Then, through awareness of the set standards and policies, it becomes easier for managers to execute their tasks. In this situation, managers have a lower need to obtain and process extra information. By contrast, managers who utilize more strategic management accounting information such as broad scope MAS information when task uncertainty is relatively low may confront information overload (Zarzycka et al., 2017), which can eventually negatively affect their performance. As stated by many studies (e.g., Chong, 1996; Gul & Chia, 1994), information overload negatively affects managerial performance.

The impact of task uncertainty on performance is a popular management topic. In particular, Kim and Burton (2002) reported that almost all studies have been executed in accordance with contingency theory. As explained in the works of Donaldson (1999) and Lawrence and Lorsch (1986), contingency theory posits that the best manner for organizing hinges on factors including task uncertainty, environmental uncertainty, technology, and size. In regards to the association between task uncertainty and managerial performance, it is likely that managers who are unclear on their role expectations will be hesitant and will not take the initiative because they are uncertain and therefore demonstrate low performance (Kim & Burton, 2002). Thus, the hypotheses below are to be tested;

> **H1a**: A higher level of task uncertainty is positively linked to a higher utilization of broad scope MAS information by managers.
> **H1b**: Higher levels of task uncertainty are associated with declining levels of managerial performance.

Broad Scope MAS Information and Managerial Performance

Management accounting is a crucial area within the management process because it links to the provision and utilization of financial and operational information to the organization's managers for making decisions, planning, and control. MASs that are well constructed and fit help managers to become more effective by supporting decisions. The information provided by MASs helps the survival of organizations within a competitive environment, as the information can be used by the organization in planning, controlling, monitoring and making decisions. Information from MASs helps managers make more good decisions, and in turn, performance will improve (Mia, 1993). The extensive utilization of MAS improves performance, as confirmed by previous research (e.g., Chenhall & Morris, 1995; Ismail, Isa, & Mia, 2018).

The availability of expansive information encourages managers in extreme competition to apply this information to further intensify the ability of their respective organizations to seize on opportunities for success (Wang, 2003). Additionally, information that is fast and frequent facilitates the making of correct decisions by executives, allowing them to seize lucrative opportunities and improve the performance of their firm. The premise is that information that is all-encompassing, predicting, external, non-financial, fast and frequent contributes to the performance of those companies that operate in an environment that is competitive even if not turbulent (Gul, 1991; Mia, 1993; Daoud & Triki, 2013). Chia (1995) has confirmed the association between MAS information's characteristics (including broad scope, timeliness, aggregation, and integration) and managerial performance. This relationship was also investigated by Mia and Chenhall (1994). The proposition, in their study, was that activity differentiation into fields including marketing and production becomes the response of an organization in an uncertain business environment. Their study's results confirmed the impact of broad scope MAS information usage and performance for two groups of managers: marketing managers and production managers (Al-Mawali. 2015;Soobaroyen & Poorundersing, 2008).

As explained by several authors (e.g., Ansari, Bell, & Klammer, 2004; Gordon & Narayanan, 1984; Ismail et al., 2018), broad scope MAS entails ex-ante information with various characteristics including quantitative and qualitative, internal and external, historical and future-orientated, and financial and non-financial data. Among the examples are sales growth, revenues, revenue, cost, capacity usage, wastage, government policy, customer satisfaction, and product quality. Arguably, managers' use of MAS information has a positive linkage to their performance. The information's breadth can provide feedback on a multitude of factors, including wastage, costs, slack resources, set up and processing time, sales growth, and customer satisfaction. These types of data, as mentioned by Balakrishnan, Linsmeier, and Venkatachalam (1996), firms to reach their objectives. As argued by past works, managers utilize MAS information because it improves their decision quality, accelerates the learning process, helps with performance assessment, and helps with the monitoring of the operational environment (Mia, 1993; Mia & Winata, 2008). The core interest of the current research is broad scope MAS information, as it is important for governing and decision-making in SME settings. The business environment today is highly competitive and tumultuous. Hence, managers' performance is dictated by their capacity to make decisions that are both effective and timely. For such an environment, it is more useful to have MAS information with a broader scope. Nevertheless, limited studies have looked into the relationship between the level of usage of broad scope MAS information and manager's performance within the setting of SMEs in developing countries. Thus, hypothesis two addresses the abovementioned relationship.

> **H2**: The higher managers' usage of broad scope MAS information is, the better their managerial performance.

Task Uncertainty, Broad Scope MAS Information and Managerial Performance

High task uncertainty indicates that the information available to complete the task at hand is inadequate. In part, MASs can fill the gap between available and required information by providing information that allows managers to understand the present situation. In turn, managers could achieve the best decisions for the company. A review conducted on MAS shows that traditionally, the fit between task uncertainty and the usefulness of MAS (considering scope only) has a positive effect on performance (Mia & Chenhall, 1994; Chong, 1996, 2004; Chong & Eggleton, 2003). As evidenced by the results, high (low) task uncertainty has a correlation with high (low) scope, leading to better performance.

The direct association between task uncertainty and broad scope MAS and the positive impact of MAS on performance have been discussed earlier in this study. Relevantly, it has been theorised that if task uncertainty has a correlation with MAS, MAS also has a correlation with performance, and then, by way of MAS, task uncertainty impacts performance (Chang & Chang, 2003). Furthermore, Soobaroyen and Poorundersing (2008) reported the direct impact of task uncertainty on MAS and MAS on performance.

The authors also mentioned the presence of an indirect impact of task uncertainty on managerial performance by way of MAS. Additionally, when task uncertainty is high, managers should use more broad scope information as a way to address the complexities of the decision-making environment (Chong & Eggleton, 2003). Hence, based on the above discussion and supported by the assumptions of contingency theory, it can be assumed that the level of broad scope MAS information usage by managers/owners plays an intervening role in the linkage between task uncertainty and managerial performance. Accordingly, H3 is presented;

> **H3**: The level of broad scope MAS information usage mediates the association between task uncertainty and managerial performance.

Methodology

Sample

350 companies operating in Amman and Jordan were invited online to participate in the survey. Owners/managers of these companies were provided with the questionnaire via email, the addresses of these owners/managers having been obtained from the companies' homepages. After the initial email, reminder emails were sent. Ultimately, 129 usable questionnaires (36.8% response rate) were obtained. The questionnaire had a letter attached requiring that the survey be personally completed by the owner/manager only. In other words, no other person should answer it. To prepare the data for initial processing, first, an analysis of missing data was executed, resulting in the elimination of seven cases. In particular, some respondents did not respond to a substantial portion of the survey.

Measures

Task uncertainty: To measure task uncertainty, the current study applied a measurement developed and used by Daft and Macintosh (1981) containing 6 items. For each item, the participants were asked to evaluate the uncertainty level faced by their organizations when tasks are being executed. The scale used is a 7-point Likert scale ranging from 1, which implies "not at all", to 7, which implies "to a great extent". *Broad scope MAS information Usage:* To measure the level of MAS information usage, the current research used a measurement developed by Chenhall and Morris (1986) and Sharma, Jones, and Ratnatunga (2006) containing 6 items (see appendix A). The scale ranged from 1, which implies "never/seldom", to 7, which implies "usually/always".

Managerial performance: This measure is based on Mahoney, Jerdee, and Carroll (1965) and contains 8 sub-items as follows: coordinating, evaluating, investigating, negotiating, planning, representing, staffing, and supervising. The perceived performance of respondents is evaluated with this measure. A 7-point Likert scale is used that ranges from 1, which implies "well below average", to 7, which implies "well above average". In this context, the Cronbach's a value obtained for managerial performance was 0.945, which based on Sekaran and Bougie (2016) is well above the acceptable bound. Past accounting studies have extensively used this measure (Abernethy & Brownell, 1997; Sharma et al., 2006). This measure is thus used to improve the comparability of the outcomes of this study with previous works.

Results

The use of structural equation modelling (SEM) allows the empirical investigation of the associations between theoretical constructs. As explained by Nitzl and Chin (2017), SEM models and estimates the parameters for the linkages between theoretical constructs. In this context, SEM could be used to test theories relating to management accounting (e.g., Al-Mawali et al., 2018). With the use of SEM, it is possible to provide an intuitive graphical representation of theory. In addition, factor analysis, path analysis

and regression represent special cases of SEM (Hair et al., 2014). This study employed SEM to test the proposed research model. For this purpose, partial least squares (PLS) and SMART-PLS software version 3.2.7 were used.

Measurement Model

The measurement model was tested in order to determine the internal consistency reliability, convergent validity and discriminant validity of the constructs. Internal consistency reliability measures the level to which the items function as the measure of the latent constructs (Hair et al., 2014; Ramayah et al., 2016). Meanwhile, composite reliability was assessed as internal consistency measure (Hair et al., 2017). In order to be considered as satisfactory, the model of measurement with composite reliability should have value higher than the threshold value of 0.7, for each construct (Nunnally, 1978; Nunnally & Bernstein, 1994; Richter et al., 2016). Meanwhile, the results obtained in this study show that the composite reliability for each construct is greater than the cut-off value of 0.7. In particular, task uncertainty obtained a value of 0.913, broad scope MAS information obtained a value of 0.959, and managerial performance obtained a value of 0.957. All these values denote high internal consistency of the measures.

Meanwhile, convergent validity provides the measurement of the degree to which a measure is positively correlated with the alternate measures of the same construct (Hair et al., 2017). In convergent validity evaluation, outer loading of items and the average variance extracted (AVE) is checked. For the value of the outer loadings, Avkiran (2017) stated that it should be 0.70 at least, while the score of AVE should be 0.5 to be regarded as satisfactory. Furthermore, in the context of exploratory research, Hair et al. (2014, p. 101-102) stated that acceptable values range between 0.60 and 0.70, while satisfactory to good value ranges between 0.70 and 0.95.

According to Hair et al. (2017), indicators with weaker factor loadings should be retained if other indicators with high loadings can explain at minimum 50% of the variance (AVE=0.50). Accordingly, the outcomes obtained in this study demonstrate that except MP1 (*which was deleted*), the rest of the items demonstrated adequate outer loadings. Also, except MP1, the remainder of the constructs carry adequate AVE as follows: task uncertainty (0.637), broad scope MAS information (0.770) and managerial performance (0.786). All these values obtained confirm the convergent validity of the constructs. Table 1 presents the outcomes from internal consistency reliability and convergent validity tests.

Table 1: Measurement model

Construct	Items	Loadings	Cronbach's Alpha[a]	CR[a]	rho_A[b]	AVE[c]
Task Uncertainty	TU1	0.911	0.878	0.913	0.899	0.637
	TU2	0.903				
	TU3	0.888				
	TU4	0.919				
	TU5	0.895				
	TU6	0.800				
Broad Scope-MAS Information	BS-MAS1	0.851	0.950	0.959	0.958	0.770
	BS-MAS2	0.786				
	BS-MAS3	0.716				
	BS-MAS4	0.809				
	BS-MAS5	0.803				
	BS-MAS6	0.817				
Managerial Performance	MP2	0.894	0.945	0.957	0.955	0.786

	MP3	0.892				
	MP4	0.905				
	MP5	0.876				
	MP6	0.858				
	MP7	0.893				
	MP8	0.822				

Note: [a]CR and Cronbach's alpha values are greater than the recommended threshold value of 0.70 (Hair, Ringle, & Sarstedt, 2013; Henseler, Ringle, & Sinkovics, 2009; Wong, 2013).
rho_A = The most important reliability measure for PLS (Dijkstra & Henseler, 2015).
AVE = average variance extracted.

For the reflective constructs, the discriminant validity was determined using two criteria which are: the Fornell-Larcker criterion and the heterotrait-monotrait (HTMT) ratio (Henseler, Ringle, & Sarstedt, 2015; Voorhees et al., 2016). The criterion of Fornell-Larcker is fulfilled when the AVE square root of each LV is larger when compared to its correlation with other LVs (Hair et al., 2017). Table 2 presents the acceptable discriminant validity based on the Fornell-Larcker criterion. Also, in discriminant validity establishment, based on the suggestion by Henseler et al. (2015), the HTMT ratio should be 0.85 or 0.9 or less. As can be observed in Table 2, all LVs carry values of HTMT lower than 0.85. These demonstrate the tolerability of the constructs' discriminant validity.

Table 2: Discriminant validity based on Fornell-Larcker and HTMT criteria

Fornell-Larcker criterion			
	BS-MAS	MP	TU
BS-MAS	0.798		
MP	0.258	0.877	
TU	0.303	-0.193	0.887
HTMT criterion			
	BS-MAS	MP	TU
BS-MAS			
MP	0.275		
TU	0.303	0.198	

Note: BS-MAS = Broad scope MAS information, MP = Managerial performance, TU = Task uncertainty.

Structural Model

The evaluation of the structural model comprises the analysis of the predictive competencies of the model in addition to the associations between the constructs. In this regard, the structural model was assessed using the following: collinearity assessment, the algebraic symbol, the scale and significance of the structural path coefficients, R^2 values (variance explained), the f^2 effect size, and test of Q^2 (cross-validated redundancy) for predictive relevance (Hair et al., 2017; Roldán & Sanchez-Franco, 2012).

From the outcomes, broad scope MAS information and managerial performance carry significant R2 values of 0.192 and 0.248. The values of R^2 give support to the in-sample predictive power of the model (Sarstedt et al., 2014). Meanwhile, pertaining to the effect sizes f^2 for the relationship of structural model, task uncertainty highlights a respectively small and crucial effect size (0.101 and 0.095 respectively) on broad scope MAS information and managerial performance. Managerial performance shows a medium effect size of broad scope MAS information at 0.160.

In the model evaluation, blindfolding was also applied using the cross-validated redundancy index (Q^2) for the endogenous variables. Accordingly, Chin (2010) mentioned the aptness of this measure in scrutinizing the predictive relevance of a theoretical/structural model. According to Tenenhaus (1999), if Q^2 values obtained are greater than zero, it means that the model has predictive relevance. Accordingly, Table 3 shows that for each endogenous construct, the structural model demonstrates adequate predictive relevance.

The method of bootstrapping (5,000 subsamples, one-tailed significance) used in this study provides estimation of the parameter's statistical significance. Henseler et al. (2016) stated in producing 95% confidence interval, the percentile bootstrapping generated the exact result. Meanwhile, an interval without the value of zero means that its structural path coefficient is considerably distinct from zero, with the level of confidence of 95% (Castro & Roldán, 2015), which shows the significance of the path coefficient. As the results are demonstrating: task uncertainty (H1a, $\beta = 0.303$, $t = 2.869$, $p = 0.004$), and broad scope MAS information (H2, $\beta = 0.349$, $t = 3.399$, $p = 0.001$). These values demonstrate their significant positive linkage with managerial performance. In addition, for task uncertainty the values obtained (H1b, $\beta = -0.299$, $t = 4.484$, $p = 0.000$) shows its significant negative relation to managerial performance. Hence, H1a, H1b and H2 were supported.

Table 3: Hypotheses Testing (direct effects)

Structural path	Path coefficient and (T-Statistics)	Percentile 95% confidence intervals		P-Values (0.05)	Effect size (f^2)	Conclusion
		95% LL	95% UL			
H1a: TU -> MAS	0.303 (2.869)	(0.075 ; 0.480)		0.004	0.101	*Supported*
H1b: TU -> MP	-0.299 (4.484)	(-0.440 ;-0.175)		0.000	0.095	*Supported*
H2: MAS -> MP	0.349 (3.399)	(0.136 ; 0.520)		0.001	0.160	*Supported*
R^2 Broad scope MAS information = 0.192; **Q^2** Broad scope MAS information = 0.147 **R^2** Managerial performance = 0.248; **Q^2** Managerial performance = 0.201						

Mediation Effect

The role of mediating MAS tested via H3, for this purpose, a non-parametric bootstrapping Mediation analysis tested H3 (Broad scope MAS mediates the relationship between task uncertainty and managerial performance). For the purpose, a non-parametric bootstrapping method was applied in order to evaluate the mediating impact particularly with respect to its significance (Hair et al., 2016). Bootstrap confidence interval method was applied replacing the mediation tests of Baron and Kenny (1986) due to its superiority (see Cole, Walter, & Bruch, 2008; Preacher & Kelley, 2008, 2011). Under this approach, the mediated effect is statistically significant if the 95 % confidence intervals do not span zero (Williams et al., 2017). Bootstrapping is the most solid and reasonable method to attain the bounds of confidence for certain indirect effects under nearly all circumstances (Preacher & Kelley, 2008). At the same time, the outcomes generated by the additional analysis of PLS-SEM on the indirect effect of task uncertainty on managerial performance can be observed in Table 4. Nitzl et al. (2016) stated significant indirect effect $a \times b$ as the single mediation requirement. As can be construed by indirect effects outcomes: task uncertainty ($\beta = 0.106$, $t = 2.321$, $p = 0.021 < 0.05$, 95% confidence interval (CI): Lower Level (LL) = 0.012, Upper Level (UL) = -0.194) have significant indirect effects on managerial performance through broad scope MAS information. These attained values demonstrate support to H3.

Table 4: Test of mediation by bootstrapping approach

Hypothesis H3:	Path coeff. (a)	Path coeff. (b)	Path coeff. (a*b)	t-value	95% LL 95% UL	Path coeff.	VAF	Decision
TU->MAS->MP	0.303	0.349	0.106	2.321*	(0.012 ; 0.194)	-0.193	0.55	Partial mediation

Notes: *p < 0.05, TU= Task uncertainty, MAS= Broad scope MAS information, MP= Managerial performance.

VAF determines the extent to which the mediation process explains the dependent variable's variance (Cepeda, Nitzl, & Roldán, 2018).

Conclusion

The subject of management accounting has been popular among academics over the last few decades, but these studies only occasionally address transition economies. In particular, the majority of works focus on the financial accounting domain (Hopper, Tsamenyi, Uddin, & Wickramasinghe, 2009). Apart from that, MAS in the economies under study was less developed. Haldma and Lääts (2002) reported that MAS was still in its infancy at the start of the century, and there has not been much change. Hopper et al. (2009) added that within the context of transition economies as well as in less developed countries, MASs are still not adequately established.

For future work, the study framework can be applied to other domains, such as other companies, countries or even sectors. This will benefit decision makers at SMEs. Additionally, the relationships of the proposed model should be explored deeper. This will enrich understanding of the fundamentals that underpin these relationships while also bringing fresh insights into the knowledge reservoir. Although the current study has contributed to the management accounting area in developing countries, there are a number of limitations that need to be addressed in future research, the first being the survey's response rate, which was rather low. From a statistical perspective, the sample size seems adequate. However, taking into account the nature of the variables and the target respondents, there is an issue regarding generalization of the conclusions drawn. The second limitation pertains to the phenomenon under study; it is not fully or easily measurable even though this study has been able to accurately present the definition and construction of variables in accordance with the extant literature. This means that caution must be practised when making generalizations. Last, the focal point of this study was one aspect of MAS information, which was used to represent MAS information in the context of SMEs. However, it cannot be expected that this aspect represents the complexity of MAS information in its entirety. Hence, other aspects of MAS information should be analysed, as this could extend or relativize the findings of the study.

Nevertheless, despite the limitations discussed, through its scrutiny of the impact of task uncertainty and MAS information usage on managerial performance, the study enriches the present knowledge on MAS in Jordanian SMEs. There are crucial implications of this study for SME owners/managers; their approval of MASs in their firms will increase.

Appendix A

MAS measurement:

Managers' use of broad scope MAS information measure.
The general managers were asked to indicate using the scale the extent to which they used the MAS information for their work-related decision-making.
Please cross one number on the scale below for your answer.
Not at all 1 2 3 4 5 6 7 To a great extent

1. To what extent do you use the MAS information (provided by your organisation's management accounting system) relating to your business unit's budgeted production, costs, wastage, defects, capacity utilisation, sales, inventory levels, and profits?

2- To what extent do you use the MAS information (provided by your organisation's management accounting system) on achievement of your business unit's budgeted production, costs, wastage, defects, capacity utilisation, market share, sales, inventory levels, and profits?

3. To what extent do you use the MAS information (provided by your organisation's management accounting system) related to your business unit's production activities such as output rates, scrap levels, machine efficiency?

4. To what extent do you use the MAS information (provided by your organisation's management accounting system) related to overall actual performance trend of your business unit and the industry?

5. To what extent do you use the MAS information (provided by your organisation's management accounting system) related to your business unit 's product markets such as customer preferences, market size, growth in market share, economic conditions, population growth, technological developments.

6. To what extent do you use the MAS information (provided by your organisation's management accounting system) related to your business unit's employee attitudes, labour relations, attitudes of government and consumer bodies, competitive threats.

The Relevance of Transport Infrastructure, Foreign Direct Investment, And Economic Growth. A Case from Tanzania

Ramadhan KAUZEN and Baiqing SUN*

School of Management, Harbin Institute of Technology - Harbin, 150006, PR China

** Correspondence: baiqingsun@hit.edu.cn, rkauzen@ hit.edu.cn*

Abstract

The paper investigated the relevance of transport infrastructure, foreign direct investment, and economic growth in Tanzania. Employing structural equation modeling (SEM), we observed transport infrastructure is correlated with both foreign direct investment and economic growth, while foreign direct investment is not associated with economic growth. This result implies the correlation between transport infrastructure and economic growth and transport infrastructure and foreign direct investment. Furthermore, the unidirectional rapport between foreign direct investment and economic growth was determined. Moreover, we suggested that for Tanzania to captivate more foreign direct investment and promote economic growth, the enormous development of transport infrastructure is required. Foreign direct investment influences the advancement of both transport infrastructure and economic growth. Likewise, an advanced economy promotes transport infrastructure and captivate extra foreign direct investment in Tanzania.

Keywords: Transport infrastructure; Foreign direct investment; Economic growth; Structural equation modeling (SEM).

Introduction

Infrastructure advancement is fundamental for economy advances. The chance of getting profit from infrastructure investment depends on the level of investment. Infrastructure is divided into two categories, soft infrastructure, and physical infrastructure. Transport infrastructure relies on the physical infrastructure category, which is the critical node of this study. Transport infrastructure like railway, port, airport, and road perform the essential function for the growth of the economy (Deng 2013).

For example, the studies by of Li, Liu, & Peng (2018); Arbués, Baños, & Mayor (2015); Iacono & Levinson (2016) and Lakshmanan (2011) show that road infrastructure is the stimulus for an economy increase and advancement of other social-economic sectors. In addition, the study by Pradhan & Bagchi (2013); Yu, Jiao, Houston, & Peng (2018); Yu et al. (2018) and Banister & Thurstain-Goodwin (2011), considered railway infrastructure to have a relationship with the economic improvement.

Moreover, in case of port infrastructure, studies by Deng, Lu, & Xiao, (2013); Song & Mi (2016); Bottasso, Conti, Costacurta, Porto, & Ferrari (2018), concluded that, port infrastructure support economic advancement, it generates employment and improve trade. Furthermore, the study by Button, Brugnoli, Martini, & Scotti (2015); Button & Yuan (2013); Hakim & Merkert (2016); Heinz & Connell (2013), observed that improved airport infrastructure facilitates air transportation which contributes to an economic growth, it promotes local and international business and grow of market accessibility.

In relating consequences of transport infrastructure on economic growth, previous researches (Song & van Geenhuizen 2014; Yu, Mi, & Walker 2013; Shi, Guo, & Sun, 2017; Fan & Chan-Kang 2008; Pradhan & Bagchi 2013a; Banister & Berechman 2001) concluded that the transport infrastructure, support the region's economic improvement, reduce poverty, support the propensity of industrial activities, generate employment and support economic agglomerations. Moreover, transport

infrastructure enables trade improvement, slash production expenses, improve the connection to the international and local markets, promote the transfer of technology, labor mobility, improve living standards, and increase accessibility. Transport infrastructure influences economic growth, mainly via direct and indirect avenue (Sue Wing, Anderson and Lakshmanan, 2007). The direct channel composes the effects of transport infrastructure over the GDP by giving access to raw materials, reducing the cost of production, and improving purchasing power. Indirect avenue, possess the effects of transport infrastructure by influencing the growth of other social and economic sector like Agriculture, education, and health. Moreover, advanced transport infrastructure ensures safe, reliable, cheap, and comfortable transportation amenities that can devote to industrial productivity (Beyazit, 2015).

In addition, the obligation of transport infrastructure on captivating FDI was discussed with different researchers. For instance, several studies (Pradhan, Norman, Badir, & Samadhan, 2013; Khadaroo & Seetanah, 2009; 2010; and Seetanah & Khadaroo 2009), observed that transport infrastructure attracted FDI in India, China, and Mauritius. They concluded that transport infrastructure is a vital factor for foreign investors to conduct their doings prosperously. Moreover, other studies (for example, Asiedu & Gyimah-brempong 2008; and Asiedu, 2006), found a significant tie between infrastructure and FDI in Africa. Foreign investors intend to maximize profit, and thus, focusing on producing goods at a minimum cost, hence having impoverished transport infrastructure diversely, may increase production cost. Transport infrastructure enhances investment conditions for FDI by reducing production expenses and increasing the rate of return. Thus, the area with improved transport infrastructure entices more FDI compared with other areas.

Moreover, the pertinence between FDI and economic growth was discussed in various studies (for example, Omri & kahouli 2014; Pradhan et al. 2013; Adams, 2009; and Zhao & Du 2007), they noted that FDI has the bidirectional pertinence with economic growth. They argued that FDI conveys new advanced technology, pays high wages, generates employment, and increasing the number of enterprises in local countries. Apart from researches whose results found the pertinence between FDI and economic growth, others researches identified negative linkages (Hermes and Lensink, 2003; Akinlo, 2004; Adamu, Idi and Hajara, 2015; Ahmed, 2016). On another hand, the study by (Hong, 2014; and Zhang, 2001) investigated the repercussion of FDI on promoting economic growth in China and Latin America. They concluded that FDI improves trade, capital formation, expands markets share, and thus promotes economic growth.

However, concentrating on the three last filaments of the research we discussed above, we can observe that the economy requires advanced transport infrastructure to grow. It has also been noted that transport infrastructure is a determinant factor of FDI. FDI is also promoting economic growth. Therefore, it is essential now to study the relevance of these three critical variables together. This study is amid the few studies which research the significance of transport infrastructure, FDI, and economic growth, respectively, and the first study to be conducted in Tanzania.

The linkage between these three variables in this study is very contemptuous. There is a testimony that advanced transport infrastructure, engage more FDI and hence attract FDI and promote economic growth. In addition, FDI depends on an improved transport infrastructure and steady economic growth. From this perspective, therefore, we want to respond to the subsequent research queries (a) Is there any real rapport between transport infrastructure, FDI, and economic growth? (b) Is there any casual pathway associated?. This study aims to investigate the relevance of transport infrastructure, FDI, and economic growth in Tanzania from 1995 to 2018 by using a structural equation modeling approach (SEM).

A review of studies concluded that while the relevance of transport infrastructure, FDI and economic growth has attracted interest from researchers currently, yet this studies put less attention to developing country like Tanzania and other African countries. Therefore, this study attempt to cover this intellectual gap by studying the relevance of transport infrastructure, FDI and economic growth in Tanzania. Tanzania has been selected because it serves as a sample or window to reflect African countries.

Conceptual Framework

Based on preceding literatures we propose the conceptual framework which expected to reveal possible relationship between transport infrastructures and foreign direct investment in relation to economic growth. The research model of this study is presented in Fig. 1. It indicates the relevance of the two variables (transport infrastructure and FDI) on the economic growth of Tanzania. The hobnob of the correlation among variables in the model and the justification for the proposed linkages are expounded below.

Fig. 1: Conceptual framework for the variables hypothesized to have relationship with economic growth.

Transport Infrastructure Has Direct Relationship with Economic Growth.

Many studies indicates that transport infrastructure has close relation with economic growth (Berechman, Ozmen and Ozbay, 2006; Chi, 2015), explained that transport infrastructure can influence the economic growth by switching total demand. For instance transport infrastructure influence trade, generate employment, reduce poverty, facilitate market accessibility, labor mobility, reducing transportation cost and improve living standard. In addition, (Rudra P. Pradhan and Bagchi, 2013), noted that transport infrastructure stimulate development of other economic sector which leads to multiplier effects on economic growth.

Transport Infrastructure in Relation to Foreign Direct Investment

Transport infrastructure is among of the major determinant of foreign direct investment. For example, (Lichao 2011; Pradhan *et al.* 2013; Wekesa, Wawire and Kosimbei 2016; Seetanah and Khadaroo 2009; Khadaroo and Seetanah 2010) investigate the effects of transport infrastructure in attracting foreign direct investment in China, Kenya, India and Africa. They concluded that, transport infrastructure playing the big role in attracting foreign direct investment in these countries. They adding that the area with improved transport infrastructure is more likely to attract more foreign direct investment compared to the area with poor transport infrastructure.

Foreign Direct Investment in Relation to Economic Growth

A number of previous studies assessed the contribution of foreign direct investment on economic growth of the region. Adamu, Idi and Hajara (2015), examine the impact of FDI on economic growth of Nigeria using time series data. They concluded that, FDI has direct relationship with economic growth. In addition, Hong, (2014), evaluated the effects of FDI on economic growth of China. The results found that, FDI exert positive relationship with economic development of China. Pegkas, (2015), found long-run relationship between FDI and economic growth. Cai *et al.* (2011), found that FDI contributed to the China economic growth particularly in industrial sector.

Foreign Direct Investment Trend

FDI is performing an essential function in global economies. In global economies, FDI is a crucial component of foreign flows. Many arguments have been raised with different authors on the significant of FDI inwards in host nations, including employment, trade, transfer of technology, capital formation and improve competitions between rivals (Pradhan et al. 2013; Omri & kahouli 2014; Halaszovich & Lundan 2016; Branstetter & Feenstra 2002). According to the WIR (2018), global FDI flows and outflows declines for 23% and 31.5% respectively in 2017 compared to 2016 (Table 1). Foreign trade investment flows declined to USD 1,429.8 billion in 2017 compared to USD 1867.5 billion detailed in 2016. Furthermore, the foreign direct outflows deteriorated to 1,009.2 billion from 1473.3 billion described in 2016. The deterioration is contrary to variables like Gross domestic product and trade, which showed some advancement in 2017. The decline of the rate of return on FDI for over five years is counted as the reason for the deterioration of global foreign direct investment.

Table 1: Global FDI flows, 2012-2017 (Millions of dollars)

	2012	2013	2014	2015	2016	2017
FDI Inflows (USD millions)	1574712	1425377	1338532	1921306	1867533	1429807
FDI outflows (USD million)	1369508	1380875	1262007	1621890	1473283	1429972
Change in FDI inflows (%)		-9.4	-6.1	43.5	-2.8	-23.4
Change FDI outflows (%)		0.8	-8.6	28.5	-9.2	-31.5

Source: World investment report (2018)

Moreover, FDI to Africa deteriorated from 53.2 billion in 2016 to 41.8 billion in 2017, which is a decrease of 21.5%. The decline is caused by the contrast of FDI inflows in South Africa, instability of oil price, and political instability in the region (Wir. 2018). For example, East Africa countries recorded the lowest FDI of 3.3% in 2017 compared to other African countries. However, FDI outflows increased by 8% to USD 12.1 billion. The increase is attributed to the escalation of FDI outwards/outflows to South Africa and Moroccan firms. Table 2 presents Africa FDI flows and outflow

Table 2: Africa's FDI flows 2012-2017 (millions of dollars)

Source: World investment report, 2018

According to WIR (2018), the FDI flows in Tanzania also declined to 1,180 million dollars from 1,365 million dollars recorded in 2016 in the global trend. However, Tanzania's share in global foreign investment flows endures consistent with 0.1% for five previous years (2012-2017). In the Africa context, Tanzania's shares of FDI inflows increased to 2.8% in 2017 compared to 2.5 recorded in 2016, an increase of 0.3%. This data revealed that despite the fall of FDI in Africa in 2017, Tanzania receives more FDI flows compared to other African nations. Table 3 presents Tanzania flows from 2012 to 2017.

Table 3: Tanzania FDI flows from 2012-2017 (Millions USD)

	2012	2013	2014	2015	2016	2017
Global(USD million)	1574712	1425377	1338532	1921306	1867533	1429807

Data and Methodology

Data source and variables

The annual statistics from 1995 to 2018 was applied in this study. The statistics was gathered from UNCTAD, the Bank of Tanzania (BOT), the Tanzania national bureau of statistics reports (1976-2018), Africa development bank statistics (2012-2017), world development indicators and infrastructure statistics (1960-2018), Tanzania national accounts data, (1995-2018), and the Ministry of Works, communication and transportation in Tanzania. This study combined railway and road lengths to represent other modes of transport infrastructure, the same as what the previous researchers did (see Pradhan & Bagchi 2013a; and Pradhan et al.2013, for example). Moreover, in identifying the relationship between transport infrastructure, FDI and economic growth a number of variables were used; for transport infrastructure variables, passenger volume, freight volume, passenger turnover, freight turnover, rail length and road length were used; for FDI variables such as FDI inflows, FDI stock, real estate and FDI in % of GDP were applied and for economic growth, variables such as gross domestic product (GDP), gross domestic product per capita (GDP/CAP), gross capital formation (GCF) and urban population growth were used. A list of variables applied in this study is presented in Table 4.

Table 4: Descriptive statistics for selected variables.

Construct	N	Min	Max	Mean	Std
Passenger Volume (000 Pax)	24	244	6280	1872.79	1659.552
Freight Volume (000 tons)	24	138	2031	1027.75	556.012
Passengers turnover (000 PAX in Km)	24	244	7863	4015.13	2282.256
Freight turnover (000 tons in Km)	24	1073	9935	4750.21	3066.244
Rail length (km)	24	3682	4582	4323.79	381.673
Road length (km)	24	75645	108946	83418.92	8576.671
FDI inflows (USD)	24	149	4104	1248.42	1324.683
FDI stock	24	620	9712	2665.67	2438.542

N= Number of years

Methodology

The structural equation modeling (SEM) method was employed in this study. Structural equation modeling is essential in projecting the proposed hypothesis and identifying the level of the relationship among variables (Kumari and Sharma, 2017). Structural equation modeling acquires the following merits; (i) the structural equation modeling analyzes many constructs at once; (ii), structural equation modeling allows the combination of different variables, and (iii), the structural equation modeling includes measurement errors into the analysis (Asadi *et al.*, 2019). These merits encourage us to investigate the relevance of transport infrastructure, FDI, and economic growth using this method. In its application, the adopted method includes two stages; first it establishes a structural relationship model based on a hypothesis developed, and second, it checks the model performance vs. the discrepancy of analyzed information (Su *et al.*, 2016).

Furthermore, the estimation of the performance of the model fit indices is determined by using an analysis of the moment structures (AMOS23) program. In addition, the selection of the appropriate measurement is based on the review of Haier et al., who suggested accepted indicators of various levels (Hair et al., 2014). In addition, in estimating the model performance of constructs, we applied goodness–of –fit indices measure as recommended by Sharma et al. (2017); Deng et al. (2013); Kock (2019). The suggested model fit performance indicators are as described hereunder; chi-square (χ^2) statistics are accepted if the value is <0.05, the root mean squared error of approximation (RMSEA) is allowed if the value is <0.05- 0.08, goodness-of-fit index (GFI) is accepted if the value is >0.90. And also, the adjusted goodness -of- fit index (AGFI) is allowed if the value is > 0.90 (Su et al. 2016; Wu & Wang 2005). Moreover, Tucker-Lewis index (TLI), and comparative fit index (CFI) is the best if the value is >0.95 (Li et al. (2018a); Ouyang et al. (2017). Furthermore, Alvarez et al. (2016), suggested that item reliability and Critical ratio values should be greater than 0.5 and 0.7, respectively.

Results

Evaluation of Measurement Model Fit

The prospective study model was figured out by using structural equation modeling (SEM). The model involved 14 observed variables that rely on three latent constructs. Observed variables, passenger volume, fright volume, passenger turnover, freight turnover, railway length, and road length loaded under transport infrastructure constructs. In addition, items like FDI inflows, FDI stock, real estate, FDI % of GDP piled under FDI construct and GDP, GDP per capita, urban population growth, and GCF loaded under economy construct. The measurement model conferred the performance between the data and the projected measurement model.

In determining the performance model indices, we run our proposed model and plaid, the obtained results if it reaches the recommended values. The obtained initial findings are indicated hereunder; chi-square (χ^2/df = 2.627), goodness-of-fit indices (GFI) = 0.639, Adjusted goodness-of-fit indices (AGFI) = 0.448, Tucker-Lewis index (TLI) = 0.448, comparative fit index (CFI) = 0.573 and the root mean squared error of approximation (RMSEA) = 0.266. The obtained findings indicate that the model does not satisfy the recommended values as suggested with different authors because all values are below the thresholds level except the chi-square value. Therefore, based on this ground, the original model required to be improved to meet the accepted values. Squared multiple correlation values will be applied as the average value for item reliability. According to Lu, Lai, & Cheng (2007); MacCallum, Browne, & Sugawara (1996), recommended that squared multiple correlation threshold values should be greater than 0.05. Therefore, the value of the item in which its reliability is below 0.05 is not acceptable in the model. From the initial model variables like freight volume, railway length, and road length and passenger turnover did not meet the recommended value of 0.05.

In improving the initial model, we decided to remove all items, by which the squared multiple correlation values is less than 0.05 as recommended by Lu et al. (2007); Byrne (2001). Thus, an item like freight volume, rail length, road length, and passenger turnover were removed in the reviewed model. Improved structural equation modeling, conferred in Fig. 2 indicates that all constructs meet

the recommended model fit criteria. The result reveals that the given model is capable of demonstrating the relevance of transport infrastructure, FDI, and economic growth. The results described the model fit indices, where the tucker-Lewis index (TLI) = 0.990, comparative fit index (CFI) = 0.995, goodness-of-fit index (GFI) =0.910, and the root mean squared error of approximation (RMSEA) = 0.039. In addition, four correlated routes were determined by the model; transport infrastructure →economy, transport infrastructure → FDI, FDI →economy, and transport infrastructure → FDI →economy.

Fig. 2: The Final structural equation modeling

Table 5. Summarizes various recommended goodness-of-fit indices, where the normed Chi-square (χ^2/df) = 1.034. These estimates provide evidence for the model fit as where the accepted threshold is between 1 and 3. The goodness-of-fit indices (GFI) = 0.912, while adjusted goodness-of-fit indices (AGFI) = 0.90. Both provided an accepted model fit indices. The Tucker-Lewis index (TLI) = 0.990, while the comparative fit index (CFI) = 0.995, the two values exceed the suggested value of 0.95, thus yielding model performance. Moreover, the root means squared error of approximation (RMSEA) = 0.039.

Table 5: The Revised Model Results

Measure	Threshold	Estimate
Normed chi-square (χ^2/df)	Between 1 and 3	1.034
The goodness of fit indices (GFI)	>.90	0.910
Adjusted goodness of fit indices (AGFI)	>.90	0.900
Tucker Lewis index (TLI)	>.95	0.990
Comparative fit index (CFI)	>.95	0.995
The root mean squared error of approximation (RMSEA)	<0.05	0.039
PClose	>0.05	0.492

Convergent Efficacy and Item Accuracy

Convergent efficacy can be determined by evaluating the regression weight, and they're statistical essential via t-values (Lu et al. 2007)**.** The t-values are known as a critical ratio. The critical ratio is calculated by dividing specification estimation and its standard error. According to Shah & Goldstein (2006), recommended that, for the Critical ratio (CR) value to be accepted, it should obtain the value being more than 2.00 or less than -2.00. The bigger the factor loadings, as related to obtained standard errors, the higher the confidence that there is a correlation between observed variables and latent variables. Table 5 shows that all C.R values meet the needed criterion. Therefore, all indices were related to their described items. This shows the significant relationship between constructs and their latent variables (McDonald & Bollen 1990 and Koufteros 1999). In addition, item reliability (R^2), is applicable in measuring the values of observed variables (Koufteros, 1999). The R^2 values above 0.05 are regarded as acceptable reliability (McDonald and Bollen, 1990). Table 6 shows the item reliability of the variables whose value is >0.05 and hence meets the criterion.

Table 6: Factor loadings, critical ratio, and item reliability for the improved model.

Latent variable	Constructs	Unstandardized factor loadings	Standardized factor loading	Standard Error	C.R	R^2
Transport Infrastructure	PSV	1.000	.155	-[a]	-[a]	.524
	FVL	1.141	-.528	1.507	.757	.779
	PST	7.494	.845	9.644	.777	.714
	FLT	6.564	.551	8.639	.760	.503
FDI	INFL	458.525	.204	473.414	.969	.742
	STCK	2541.776	.614	1219.709	2.084	.377
	REST	-3043.968	-.750	1348.746	-2.257	.562
	%GDP	1.000	.438	-[a]	-[a]	.692
Economy	GDP	1.000	.657	-[a]	-[a]	.531
	GDP/CAP	.920	.915	.244	3.772	.837
	UPPN	3.608	.815	1.047	3.445	.665
	GCF	4.346	.949	1.126	3.859	.900

[a]n express the factors fixed at 1.0 at the initial results.

Obtained results: χ^2/df = 1.034, GFI = 0.910, TLI = 0.990 CFI = 0.995, RAMSEA= 0.039, Pclose 0.492

Moreover, Composite reliability is used to measure the interior stability and similarity of constructs. Several scholars (Byrne 2001; Steenkamp & Baumgartner 2000; Shah & Goldstein, 2006), recommended that the composite reliability is the best if the value is higher than 60%. Table. 7 summarizes the composite reliability of the variable, transport infrastructure, FDI, and economic growth. The findings indicate that composite reliability is greater than 0.6, which meets an acceptable recommendation.

Table 7: Illustrative variables and composite reliability for each construct

Variable	Mean	Std. Deviation	Composite reliability
Transport infrastructure	2916.47	1891.016	0.6
Foreign Direct Investment	1686.51	1538.834	0.7
Economic growth	2116.82	2452.976	0.9

Obtained results: χ^2/df = 1.034, GFI = 0.910, TLI = 0.990 CFI = 0.995, RAMSEA= 0.039, Pclose 0.492

Causal Relationship between variables

Table 8 summarizes the identified relationship between transport infrastructure, FDI, and economic growth. The rapport between transport infrastructure and economic growth was found significant, as shown by the Critical ratio (CR= 2.0, p=0.027). The C.R (t-values) is calculated by taking covariance

estimates over its standard error. The critical ratio value above 1.96 is regarded as the significance level of 0.05. In addition, the rapport between transport infrastructure and FDI was determined significant in this study (C.R= 2.522, p=0.012). Moreover, in this study the insignificant linkage between FDI and economic growth was also determined (CR. -0.442, p=0.658).

Table 8: The casual pathway between variables

Aisle	Measure	CR	P-Value	Assertion
Transport infrastructure →Foreign direct investment	0.001	2.522	0.012	Supported
Transport infrastructure →Economy	0.076	2.000	0.027	Supported
FDI→ Economy	-100.158	-0.442	0.658	Not supported

Obtained results: χ^2/df = 1.034, GFI = 0.910, TLI = 0.990 CFI = 0.995, RAMSEA= 0.039, Pclose 0.492

Discussion

With the fast advancement of the transportation industry, the importance of having improved transport infrastructure is increasing. Transport infrastructure performing an essential role in fascinating FDI and shielding economic development (Pradhan *et al.*, 2013). This general goal of this research was to establish the model which we will investigate the relevance of transport infrastructure, FDI, and economic growth, respectively, adopting structural equation modeling. The outcomes consequent from the study shepherded in Tanzania is briefly presented here below.

The correlation between transport infrastructure and economic growth was found significant in this study. These findings recommended that, if the transportation authorities enhance transport infrastructure, the economy will grow briskly. This result is in line with Zou, Zhang, Zhuang, & Song (2008) who they found the positive rapport between transport infrastructure and economic growth . They reported that better transport infrastructure found in East and Central China contributed to the economic advancement rate of the area. The findings indicated that all transport infrastructure components (roads, railway, port, and airport) were all crucial factors for economic growth. Thus, they suggest that, for better economic growth, transportation authorities should focus on improving transportation infrastructure.

The relevance of transport infrastructure and FDI was also determined in this study. These results implied that the advanced transport infrastructure is the primary cause of attracting FDI. The fact is, the area with advanced transport infrastructure is likely to attract more investors compared to the area with poor transport infrastructure. These findings are similar to the findings by Pradhan & Bagchi (2013a) and Khadaroo & Seetanah (2009, 2010). They indicated that transport infrastructure becomes a catalyst for attracting FDI in India and Africa, respectively. These findings provide a lesson to transportation authorities to invest more in transportation system infrastructure to connect all parts of the country to captivate FDI in all parts of the country.

The impact between FDI and economic growth was not supported in this study. These results show that the decline of FDI inflows affects the development of the national economy. FDI improves technology, generates employment, increase capital circulation, and increase the number of foreign enterprises. FDI stimulates innovation and creativity to domestic enterprises through competitions. Therefore, fallen of FDI reduces all the contributions and hence, leading to the decline of the host economy. These results are similar to those by Ahmed (2016) and Akinlo (2004). They identified that there is no correlation between FDI and economic growth. Although there are many economic growth determinants, the benefaction of FDI to the nation's economy is highly needed. Therefore, authorities responsible for investment should improve the investment environment, to fascinate more FDI and hence promoting economic prosperity, and

This study also determines the relevance of transportation infrastructure and economic growth moderated by FDI. These findings explain an interrelation between transport infrastructure, FDI, and economic growth. This study is similar to the study by Pradhan et al. (2013). They found integration rapport between transport infrastructure, FDI, and economic growth.

Conclusion and Policy Implication

The current study applied the structural equation modeling to investigate the relevance of transport infrastructure, FDI, and economic growth for the duration of 1995 to 2018. The obtained results explain the interrelation between transport infrastructure, FDI, and economic growth. In addition, the findings reveal the bidirectional relationship between transport infrastructure and economic growth. The two-way relationship between transport infrastructure and FDI was also determined in this study. Moreover, the unidirectional rapport between FDI and economic growth was defined. Generally, the linkage between transport infrastructure, FDI, and economic growth was found significant.

This study contributes to policy in the way that transport infrastructure can be treated as a significant catalyst for attracting FDI and economic growth in Tanzania. Therefore, policymakers and other authorities responsible for the transportation sector should focus on investing in transport infrastructure (building and maintenance) to enjoy its economic contributions including attracting foreign direct investment.

Abstract

Malaria is a major public health challenge that affects a wider population. The current vector control policies rely mostly on insecticide mosquito nets and indoor residual spray that can be achieved with proper education. This study demonstrates the moderating role of education in the relationship between insecticide mosquito nets and malaria. We used panel data from health-related indicators and malaria indicator survey-based Ethiopia from 2011 to 2015. We used the random effect model to explore the direct effect, and hierarchal regression analysis with model 1 under process macro employed for moderating effect. We analyzed quantitative data using Stata version 13.0. Accordingly, we found a positive relationship between insecticide mosquito nets and malaria ($\beta = 0.28$, $p < 0.05$). Similarly, the researchers reported a significant impact of education in strengthening the relationship between intervention methods and malaria ($\beta = 12$, $p < 0.05$). The findings are potentially useful for health program practitioners in charge of infectious disease prevention and control to incorporate education as vector control indicators for malaria to eliminating. Furthermore, our study concludes that for infectious disease prevention and control, educational attainment strengthened the relationship between strategic interventions and malaria and motivated the utilization of the communities.

Keywords: Malaria, Insecticide mosquito net, Education, Quantitative methods, Random effect model

Introduction

While everyone has the right to live healthy throughout their lifetime, providing adequate health care is a significant challenge (Dalgleish *et al.*, 2007). An estimated 216 million malaria cases occurred globally in 2016, where 90% is in the African region (World Health Organization, 2017). Ethiopia set an objective to have had a community with appropriate knowledge and health-seeking behaviors regarding malaria prevention and control by 2020 (Prevention *et al.*, 2020). Ownership and utilization of insecticide mosquito nets (ITNs), net care, and repair through demand creation and familiarity is the critical point to implement. The cumulative number of ITNs exceeded 65 million, and about 6 million households in malaria-prone areas are sprayed yearly with indoor residual sprays in 2015 (Federal Minstry of Health, 2015). However, malaria continued as a significant public health challenge in Ethiopia (Watiro1 and Awoke2, 2016). Besides, insecticide-treated nets approved as an effective malaria control strategy. But there have been many challenges to ITNs coverage, misconceptions concerning ITNs utilization, and inadequate knowledge when trying to implement large-scale ITN programs (Tayseir T. M. Masaad, Yousif M. Elmosaad, Abd Elbasit Elawad Mohammed, Ahmed Elnadif Elmanssury, Mahmoud Jaber, Mustafa M. Mustafa, 2017). Plasmodium falciparum is the most dominant anopheles borne parasites in Africa that attacks the red blood cells in humans (Liu, 2015).

Prior studies reported the relationship between ITN and malaria (Fuge, Ayanto and Gurmamo, 2015; Mayala *et al.*, 2015; Koenker and Yukich, 2017); however, none of these studies measures the role of education in the relationship. Therefore, the current paper addresses these shortcomings by investigating the moderating effect of education on the relationship between insecticide mosquito nets and malaria. Besides, the study uses national-level aggregate data to recommend the findings as representative as possible.

Research Framework

Fig. 1: Model 1 of moderation

Hypothesis Development

Insecticide-Treated Nets And Malaria

Net distribution is an integral part of a selective vector control strategy for malaria protection. Regular use of bed-net can reduce the overall risk of death for young children by 20% and the number of clinical malaria episodes in that age group by 50% (World health organisation, 2005). ITNs provide proper personal protection and also have a community preventive effect due to the benefits of malaria prevention to individuals beyond those using them (Deressa, Ali and Enqusellassie, 2003). The impressive decline in child mortality reported being due to the implementation of vector control methods use and distribution, such as ITN and IRS(Eckert *et al.*, 2017). For malaria control, ITN and IRS recommended by world health organization as the cornerstone of the strategy (World health organisation, 2015; World Health Organization, 2015). To fight against malaria, Ethiopia implemented selective vector control strategies, such as insecticide mosquito nets, indoor residual spraying, and environmental management (PMI, 2016). Accordingly, malaria morbidity and mortality declined due to the introduction of the vector control intervention method (Alemu *et al.*, 2012). However, malaria remains the leading health problem in the country (EHNRI/EPHI, 2015). Besides, the government works to eradicate malaria providing technical and material support for its protection. But malaria disease is still prevalent in every season of heavy rain relatively in lowland areas of Ethiopia (Dejene, 2016). The cited reasons in a different corner of malaria countries of sub-Saharan Africa mostly linked with a low level of knowledge about malaria and its prevention. This can be achieved with the provision of proper education, and if awareness creation programs implemented sustainably.

Inadequate knowledge about malaria and insecticide mosquito nets identified among participants of the study in different areas (State, Vol and Page, 2018) that challenged the programs' success towards prevention and its control. Though insecticide mosquito net responded as malaria prevention measures, the actual use challenged by a misconception about malaria transmission and its cause (Singh *et al.*, 2014). Regular use of insecticide mosquito nets reported preventing malaria (Alexander Suuk Laar,

Amos Kankponang Laar, 2013), also believed ITN prevents mosquito bites if used regularly. The study stated the use of ITN for other purposes in some study sites, though witnessed as prevention tools against malaria (Doda *et al.*, 2018), weak communication, education, and social support cited as a factor. Therefore, we hypothesized that:

Hypothesis $_1$: Insecticide mosquito nets are positively related to malaria.

Moderating Effect of Education

Effective preventive action is the outcome of public health programs, which resulted in the implementation of community-based health education. Awareness creation about the programs towards prevention and its control measures plays a critical role (Gorgui Diouf Department, Yihua Xu, 2010), which occurred through iterative actions to strengthen the awareness of the population for malaria prevention and control. Sustainable development goal set the objective of ensuring the inclusive and equitable quality of education and promote lifelong learning opportunities for all, to end the epidemic of HIV, TB, and Malaria by 2030 (World Health Organization, 2016). The gross-transformation plan (GTP), reinforces the government of Ethiopia (GOE's) pro-poor spending on essential services—such as education, that are fundamental to achieving SDG targets (Prevention *et al.*, 2020). The world focuses on education towards infectious disease protection since the most educated community can implement intervention methods to prevent and control the disease. However, to achieve the health program in broader society, appropriate education should be in place, which can be achieved if the health education program incorporated into education curricula. The study reported the relationship between education and the willingness to take up the IRS for malaria protection (Wadunde *et al.*, 2018), where the level of education positively impacted the use of the intervention (Boyce *et al.*, 2018). And the school can play a vital role in ensuring the importance and risk of malaria and its prevention for pupils (Nankabirwa *et al.*, 2014). The world health organization suggested increased access to better quality health services delivered by skilled healthcare providers has the potential to reduce maternal mortality ('Levels and Trends of Maternal mortality in the world', no date). The other study reported the positive influence of education on malaria knowledge, where higher school attendants have a better understanding than primary and lower level schooling (Khairy *et al.*, 2017). Besides, educational attainment reported as a factor for the success of the health care system (Nishijima *et al.*, 2018). The study also revealed the need for education regarding malaria(Sood, 2016). The other study reported inadequate knowledge regarding nutrition, even among medical students (Lauren E Ball, 2010). The finding of this study also supports how appropriate health education impacts health practices, particularly for infectious disease-related programs, and in need, focus on being incorporated with education curricula from early stages. The association between knowledge of favor as a sign of malaria and access to ITN and information reported with a level of education attained (Shimaponda-mataa, Tembo-mwase and Gebreslasie, 2017; Chukwuocha *et al.*, 2018). The other study also reported better malaria knowledge associated with education level (Dhawan *et al.*, 2014). The report also shows effective education can immunize young adults against tobacco (States, County and City, 2004). It expresses the idea that appropriate education is not only for malaria prevention, rather strengths the health issues in general. The other study also showed that the significant predictor variables for knowledge on malaria using IRS as a control tool were age, educational level, occupation, and income levels (Munga *et al.*, 2017). Negative attitudes for malaria prevention and control reported, which is maybe due to inadequate education among the study participants (Adibe *et al.*, 2017). Besides, a positive association between ITN ownership and education level testified (Shimaponda-Mataa *et al.*, 2017), where proper health education strengths the better practice. The other study also reported better knowledge of the facts than the myths of malaria among respondents of higher educational status (Su *et al.*, 2014). Therefore, we hypothesized that:

Hypothesis $_2$: Education moderates the strength of the direct relationship between Insecticide-treated nets and malaria. Such that the relationship will be stronger for an advanced community of educational attainment than for those who are low or none educated.

Methods

Data sources

This study based in Ethiopia, and we collected five years' worth of secondary data (2011 to 2015). The source of the data was the Ethiopian Malaria Indicator Survey (EMIS) and health-related indicators, that obtained from the Federal Ministry of Health, Ethiopia. The data contains extensive details about malaria and related indicators on an annual basis. Malaria epidemic regions of the country included in the study and the data are panel data containing 50 observations for final review after condensing as appropriate. All relevant variables for the current study identified. Accordingly, malaria (outcome variable), insecticide mosquito nets (independent variable), education (moderating variable) were selected. Also, household income used as a controlling factor for the current study.

Analysis

Data were analyzed via Stata 13.0 to test the direct relationship of study variables. Hierarchical regression analysis under process macro used to test the moderating effect. Using ITN as an intervention strategy for malaria protection such that education moderates the association, we evaluate malaria as an outcome effect. We followed a two-step approach to conduct the analysis and deduce results — the principal component analysis used to condense variables given by multiple indicators. We used model 1 under process-macro to test hypothesized relationships. Besides, we used a random-effect model to get the direct influence of ITN on malaria. The theoretical framework proved in two steps — first, the linear relationship of the study variables to investigate the immediate effect of the explanatory variable on the outcome variable. Second, the proposed moderator "education" was integrated into the model to test whether the direct and indirect relationship through moderator "education" between ITN and malaria varied accordingly.

Results

Descriptive Statistics

Descriptive details of the data, i.e., number of observations, sum, mean, median, standard deviation, minimum, and maximum, for all dependent, independent, and control variables, are listed in Table 1 as follows.

Table 1: Descriptive statistics of study variables

Variable		Mean	Std. Dev.	Min	Max	Observations
Malaria	overall	9.328151	2.553441	2.3979	13.7181	N = 50
	between		2.04277	5.566182	11.48004	n = 10
	within		1.639451	6.159869	12.62001	T = 5
ITN	overall	11.39936	3.790337	0	15.3455	N = 50
	between		2.938286	5.91212	14.39478	n = 10
	within		2.537303	5.122061	16.25176	T = 5
Household income	overall	2	1.000004	.602273	3.85159	N = 50
	between		.9534741	.8174786	3.30064	n = 10
	within		.4063343	1.15393	2.924026	T = 5
Education	overall	3	1.000002	.02065	3.966804	N = 50
	between		.5038649	2.419005	3.714446	n = 10
	within		.8756988	.4785106	3.903762	T = 5
Education*ITN	overall	35.13299	15.79192	0	57.0071	N = 50
	between		12.21106	17.0835	53.40813	n = 10
	within		10.60409	9.011958	48.85116	T = 5

Correlation Matrix

Correlation analysis measures multicollinearity among independent and control variables and the result provided in **Table 2.** The result shows the significant and positive correlation of ITN, household income, and the moderating value to the dependent variable. An insignificant relationship existed with the education, however, with a positive coefficient, which expresses the indirect relation rather. Our independent and control variables significantly correlated with each other, in such a way that not to cause multicollinearity problems.

Table 2: Correlation matrix

	Malaria	ITN	Household income	Education	Education*ITN
Malaria	1.0000				
ITN	0.5543*	1.0000			
Household income	0.6559*	0.4964*	1.0000		
Education	0.0655	0.2517*	0.4708*	1.0000	
Education-interaction	0.4090*	0.6914*	0.6461*	0.7858*	1.0000

Direct Relationship

The first step is to address the immediate effect of insecticide mosquito nets on malaria. The result provided in **Table 3**. Consistent with the researcher's anticipation of a positive relationship between ITN and malaria, the result found significant ($\beta = 0.28$, $p < 0.05$). The study concluded that ITN has a positive effect on malaria disease. Thus our 1st hypothesis was accepted, revealing a positive relationship between ITN and malaria. Moreover, the study shows a positive impact of the control variable in the relation.

Table 3: Results of a direct relationship

	(1) **Malaria**	(2) **Malaria**
ITN	0.278^{**} (0.0866)	0.205^{*} (0.0809)
Household income		1.255^{***} (0.347)
_cons	6.165^{***} (1.083)	4.481^{***} (1.016)
N	50	50

Standard errors in parentheses
* *p < 0.05,* ** *p < 0.01,* *** *p < 0.001*

Moderating Relationship

Once we found support for the direct effect, the second step was to test for the potential moderation impact. As seen in **Table 4,** the effect of the interaction between insecticide mosquito nets and education on malaria was positive and significant ($\beta = 0.125$, $P < .005$), indicating a moderating influence. The result shows the better outcome of our dependent variables with improved education, where the effect varies as the educational level changed. The finding supports our second hypothesis, which stated a positive impact of education to strengthen the relationship between ITN and malaria.

Fig. 2: Paths of a statistical diagram

Table 4: Results of Moderating relationship

Paths	Coefficient	Se	t	p	LLCI	ULCI
constant	7.7717	1.7513	4.4377	.0001	4.2465	11.2969
ITN ➔ malaria	.1189	.1506	.7891	.4341	-.1843	.4220
Education➔ malaria	-1.4050	.7359	-1.9094	.0625	-2.8863	.0762
Int_1➔malaria	.1245	.0595	2.0937	.0418	.0048	.2442

Discussion

The study proposed and empirically tested a theoretical framework to explain the relationship between insecticide mosquito nets and malaria, premising the positive effect of education on this relationship. The research finding contributes to the study on infectious disease prevention and control, particularly malaria, by proofing the moderating effect of education in strengthening the association between ITN as an intervention method and malaria. Accordingly, the research finding reports a positive and significant influence of ITN on malaria as a direct effect. The study also demonstrates the impact of educational attainment on improving the outcome of malaria disease. Likewise, the study revealed a significant impact of education in strengthening the relationship between ITN and malaria. Corroborated by a study (Kumar *et al.*, 2017), which reported improved use of insecticide mosquito nets among the communities of concurrent health education. Also supported by research (Attu and Adjei, 2018), which revealed the better implementation of intervention methods and identified causes of malaria among the societies with advanced education level. This study has empirically verified its role in investigating the moderating role of education to the relationship between insecticide mosquito nets and malaria supported by various related literature. Likewise, the study revealed the end-user directed education for prevention and control of maria through vector control intervention utilization (Taremwa *et al.*, 2017). Also, it is recommended to encourage health-education regarding the use of insecticide mosquito nets for malaria protection (Liu *et al.*, 2015).

Implications

Despite improving access towards malaria prevention and control methods, policymakers and health planners should recognize that proper education is a significant factor in strengthening the relationship. Furthermore, for infectious disease prevention and control programs to succeed, dimensional observation is crucial.

limitations

Our research has some limitations that offer opportunities for future studies. It would be of great importance to discover the changes to the outcome of malaria if proper health education provided to the public, mainly when it incorporated into the education curricula. Besides, future investigators interested in exploring the impact can discover the differences in the outcome.

Conflict of Interest

On behalf of all authors, I am declaring that authors have seen and approved the final version of the manuscript, and warrant that the article is original work.

Abstract

The paper analyzes the basic aspects of improvement of entity's innovation potential within the framework of the development of risk management systems. The main peculiarities of the innovation potential of the Russian economy are described. Aspects of entity's innovation capacity building and related types of possessory risks are analyzed. Based on the analysis performed, a package of basic governing measures in the innovation capacity building of the Russian economy is suggested and the main components of systems for management of possessory risks related to development and implementation of organizational and managerial innovations.

Keywords: Issue, Development, System, Organizational and Managerial Innovations, Potential, Management, Possessory Risks, Improvement

Introduction

In the environment of changing the technological paradigm, innovations are the most powerful tool for entity's development and a key factor to increase its added value for its owner. However, many owners and managers are afraid of risks characteristic of the innovation development and implementation process, which may affect the success of innovative activities and reduce the entity's potential and prefer to update gradually the existing business processes of the entity instead of implementing radical innovations.

Most owners say that responsible possessory risk management requires a cautious approach to innovations. They say that in the modern context, only startups may afford taking high risks of failure of innovative solution implementation. Major and medium companies are complex structures and focus mostly on establishment and development of possessory risk management systems based on possessor control instruments. Loosening of such control measures to give innovative teams an opportunity of free management may result in unacceptable risks and costs not just for the company but also for different stakeholders.

In the modern context, it is obvious that the operation of any entity involves risks, regardless of place and time. Characteristic features of the place and time of entity's operation are the specificity of risk factors, risk levels and availability of tools to manage that risk.

The knowledge economy era that the world enters conducts to the emergence of many new factors and needs, which a modern entity should consider, and which should be managed if the owner of the entity is committed to the sustainable operation of the entity.

Key Risk Factors of Formation of Knowledge Economy

The knowledge economy era that the world enters conducts to the emergence of many new factors and needs, which a modern entity should consider, and which should be managed if the owner of the entity is committed to the sustainable operation of the entity.

A significant share of factors material for the development of the knowledge economy are united in the management science under the name of innovative activities [2]. It should be noted that the borders of innovative activities of any entity in the environment of changing the technological paradigm are limited only by an understanding of owners and managers of business ethics in a country.

Generally, it is obvious that in the environment of the knowledge economy establishment, the borders of entity's innovative activities may be limited from the perspective of two prerequisites:

- Actual needs of end users and, consequently, needs of companies taking part in such entities' customer value chain;
- Existing need of making profit by the owner from investments in the entity based on the customer value chain.

In view of these two prerequisites, the author finds it necessary to identify three fields of application of possessory risk management systems within the framework of the entity's innovative activities:

a) knowledge management and diagnostics of the entity's innovation potential;
b) innovative activity cost management;
c) innovation management with account of risks.

In the contemporary management science, innovation means any new management or production solution — which is based only to some extent on known models and tools in each of the areas — the implementation of which in business activities results in uncertainty of the internal and external environment [1].

Therefore, carrying out innovative activities should be preceded by an attempt to identify the risk factors that may help reduce the uncertainty of the entity's business environment.

Having determined the main risk factors, owners and managers have an opportunity to establish mechanisms to manage such risks, e.g., using preventive tools and solutions aimed at the identified risk factors due to which the potential of risk release is prevented, or the consequences of such release are mitigated.

Development and implementation of innovations presuppose that the entity has a system of creation of new knowledge and high organizational efficiency.

Evidently, such conditions are impossible without any mechanisms for identification and development of the entity's intellectual capital. Innovations are possible only in the companies where such capital exists and is reflected in competences of the management personnel.

In the current climate, one of the basic tools for development of the entity's intellectual capital and, therefore, of management of possessory risks related to the absence of such capital is the so-called knowledge engineering or data mining [3, 4]. This skill consists in the entity owner possessing tools enabling him to reveal the knowledge contained in different data sources, e.g. in databases, or through stimulating the innovative activities of managers and staff of the entity.

Mechanisms within the Entity Management Model

Evidently, availability of such mechanisms within the entity management model may have a great impact on the owner's decisions on performing the innovation process and determine the ways of its implementation.

Within the context of innovative activities, gaining new knowledge is just one of the aspects of knowledge management within the framework of development of possessory risk management systems. Another aspect to be considered is the ability to evaluate the efficiency of the knowledge through:

1) usefulness for the entity;
2) assessment of risk levels related to potential practical application of the knowledge;
3) evaluation of advantages resulting from the application of the knowledge.

It should be noted that the aforesaid package of skills is a starting point for the innovation process. In this respect, the owner's ability to build innovation capacity of the entity is of key importance, at least, within the framework of the said competences. It is a prerequisite for establishment and development of a system for innovation process management, which should consider that the process is characterized by uncertainty and various risk factors.

From the microeconomic perspective, in present-day conditions it's obvious that the efficiency of possessor management systems measured, say, through market value increase, may be achieved only by entities, which have knowledge management tools in their possessory risk management systems, therefore, the tools for innovation preparation and implementation. It should be noted, that a mere innovative idea is not enough for success, although it is the driver of any innovation project.

Implementation of innovations in practical results seems to be a probability category the same as release of the main types of related possessory risks. The process of innovation implementation involves significant costs. In this respect, one of the key aspects of possessory risk management is innovation cost management.

Discussion

About the entity's innovation cost management, the identification, analysis, estimation, and management of the basic types of possessory risks are performed in two areas:
a) based on the estimation of preliminary (planned) expenses;
b) based on the estimation of the expenses incurred.
To identify these factors, it is required to:
1) determine the cost object complying with the concept of innovation adopted in the entity;
2) determine the cost model that will characterize the informational structure of costs of the innovative enterprise;
3) establish a system for accounting of innovation costs and a system for their control;
4) establish a method for monitoring of innovative activities, its economic performance during the whole period of achievement and materialization of the innovative effect.
The cost object is determined based on:
1) corporate perception of innovations;
2) the ability of the entity management system to classify innovations by type;
3) mechanism for identifying the stages of the innovation process;
4) description of the structure of activities carried out at each stage of the innovation process.
From the microeconomic perspective, innovations are a solution that is suitable for the company and is new, at least, from the perspective of the company launching this solution [4].
The key component of the development of mechanisms for innovation cost management within the context of related possessory risk management is a determination of the distribution model and cost

calculation, through which it will be possible to estimate the cost volume (actual and supposed) allocated to the innovation process.

When considering the innovation cost estimation model, a decision should also be made as to if the expenses on measures implemented while the innovation process will be related to costs indirect for such activities, i.e. with expenses for other activities carried out beyond the innovation process, though their performance determines the entity's potential to perform the innovation process.

Currently, innovation cost management requires comprehensive information on both planned innovation costs and those incurred, just as for any costs in other areas. Besides, innovation cost management should be a continuous management process performed in respect of all activity types within the innovation process. It means that for each activity, it is required to:

1) classify, register, and calculate the expenses;
2) prepare reports on the expenses incurred;
3) identify the factor leading to expenses without added value;
4) develop a business process reengineering design aimed at removal of factors without any added value;
5) develop and implement control measures for economic performance management.
Under modern conditions, it is obvious that the establishment of efficient mechanisms for identification, analysis, assessment of risks related to innovation implementation is the main condition for entity's survival and development in mid-term and long-term.

Conclusion

It should be noted that there are many ways and approaches to innovation systematization and related possessory risk management in an entity. Although it is impossible to ensure the establishment of a uniform universal approach, the author believes it is required to identify the common components for establishment and development of efficient systems for management of possessory risks of entity's innovation programs. They include:

- processes of identification by the owner and the managers of key priority fields to engage ideas and establish mechanisms for interaction in their development and implementation that comply with the entity's strategic purposes, enable the most efficient use of the entity's basic competencies, and contribute significantly to the entity's capacity building;
- mechanisms for search, collection, and implementation of promising ideas, developments and cooperation areas to ensure efficiency of identification, analysis, and estimation of basic types of possessory risks and making management decision in risk management;
- development of a uniform model of the management process regarding possessory risks related to development and implementation of innovations enabling identification and management of risks and opportunities based on mechanisms for management of knowledge creating conditions for stimulation of manager and staff initiatives on formulation and development of management decisions in risk management;
- establishment and development of mechanisms for creation of innovative project teams gathered and guided by managers possessing all the skills required and striving to achieve practical results;
- clear and transparent measurement of costs and benefits related to innovative activities so that the prospective rate of return covered the investments.

Abstract

In present-day realities, financial innovation is a key growth driver for businesses, regions, and the overall economy in Russia as a whole. In practice, innovation characteristics of business entities are described through multiple factors, both internal and external. Internal factors include, inter alia, management factors, managers' focus on current problems, cutting-edge management practices, especially, strategic management and management of financial innovation and risk related thereto.
The paper describes contemporary approaches to the strategic management of financial innovation and related risks and explores the essence and role of strategic financial innovation in the development of corporate management systems (CMS). It also formulates proposals that might contribute to improving decision-making processes in the selection of financial innovation strategies, making sound decisions on the time frame for a company to introduce strategic or enhancing financial innovation, and to applying good solutions based on the strategic financial innovation life cycle within the corporate management system.

Keywords: Features, Present Times, Strategy, Management, Financial Innovation, Risk

Introduction

The economic system in every country consists of a large and dynamically changing number of corporations that may differ in terms of goals and resources required to achieve the goal. Each of these companies operates in a specific external business environment that forms both the overall operating situation of a company in the economic, technology, sociocultural, political, legal, and international dimensions and the target environment covering specific companies or groups, such as competitors, customers, suppliers, strategic allies, or regulators who exert a direct impact on the company [1].

Managers in today's companies are expected to be aware of this business environment, its complexity and ambiguity, its impact on business and related implications produced by such an impact. Consequently, they should take actions aimed at maintaining equilibrium between the company and the business environment, manage all components of the business environment, while paying special attention to those of the most importance for the company's functioning and growth, and promptly respond to changes in any parameters of those components [2, 3].

One of the features of the present-day market economic system is its variability and, in this regard, a business should also change continuously. Changes cannot be random or intuitive, but they should be systemic. The ability and efficiency to elaborate and implement such changes, which are innovative in their nature, become a fundamental precondition for the creation of a present-day CMS. At the same time, while using CMSs, managers should be able to forecast, identify accurately, and even anticipate the slightest changes in the business environment [4, 5].

Therefore, companies should now make a shift from legacy methods of corporate management to cutting-edge techniques, including strategic management, innovation management, and introduction of financial innovation, in order to improve the efficiency of their management systems, because only these methods could ensure business growth, increase competitiveness, and drive value for customers. Systemic innovation and, above all, financial innovation, is critical to capitalizing on market opportunities through new products, innovative services, or process innovation relating to business process funding.

It is obvious that the inadequate pace of development and implementation of comprehensive financial innovation is one of the main reasons for the slow growth of the economy in Russia.

We argue that business revitalization and cooperation with major scientific centers with the view to acquiring, implementing, and integrating strategic financial innovation products into corporate strategic management systems in line with the development of financial innovation risk management systems could be the key financial innovation drivers for companies in Russia.

In this regard, this paper aims to discuss the following issues:

1) Essence of the contemporary strategic approach to financial innovation management in Russia;
2) Essence of strategic innovation and its role in the development of corporate management systems;
3) Characteristics of the financing strategy for innovation of Russian companies depending on their market position and market attractiveness;
4) Approaches to financial innovation risk management;
5) Risk management approach based on the analysis of the financial innovation life cycle.
It can be assumed that a change in the level of awareness of managers, wider use of advanced management techniques, including the innovation and strategic management as well as innovation in IT and decision-making processes, would enable a management system to ensure business sustainability and increase competitiveness through the development and implementation of financial innovation.

Strategic Approach to Financial Innovation and Related Risk Management in Russia

The emergence of the market economy in modern-day Russia was accompanied by three waves of transformations that have changed forever the way people work and live. They include:

- agricultural,
- industrial, and
- information revolutions.

The world has witnessed the origination of a new revolution in recent years, which is the innovation or digital revolution.
It is caused by several trends reshaping the world, business environment, and work ecosystem, such as:

- the globalization process and the following regionalization,
- an accelerated pace of technological progress,
- demographic transformations, and
- an increasing global role of emerging economies and their influence on the development of the new economic system.

In that context, the functioning and growth of businesses are increasingly dependent on the systematic creation and implementation of financial innovation. The establishment and maintenance of effective mechanisms for strategic financial innovation management become a key component to competitive success of a company, especially given that the development and implementation of

financial innovation is a long and capital-intensive process that requires better staff training and more effective use of corporate resources ensuring the implementation of the owner's business vision.

General issues of application of financial innovation and derivative financial instruments are discussed in publications by both Russian and foreign scholars, including A. Feldman, J. Finnerty, and J. Hull [6, 7, 8], while V. Antonov, R. Coase, B. Milner, Y. Mirkin, A. Radygin, D. North, O. Williamson, and R. Entov address CMS functioning, including the transaction expenses theory and the concept of conflicts of interest [9, 10, 11, 12, 13, 14, 15, 16].

A detailed examination of publications by the above-mentioned scholars proves that many of them discuss either general characteristics of financial innovation or individual applied issues related to risk modeling, derivative valuation, or the level of effectiveness of innovative tools applied. However, there are no studies, which would describe the specifics of financial innovation within a corporate management system or explore the role and position of financial innovation amongst corporate financial management tools.

The lack of well-elaborated theoretical ideas about mechanisms for the creation and use of financial innovation within a CMS prevents the development of a methodological framework that would help Russian companies to apply them in practice. Fragmentary information about financial innovation practices in Russia precludes highlighting limitations that prevent their widespread and makes it difficult to do financial engineering forecasting within corporate management systems in Russian companies.

Improving Approaches to Financial Innovation and Related Risk Management in Russia

Innovation strategies are a key tool in the present-day strategic management of financial innovation and related risks thereto. The following conditions should underlie these strategies:

1. A longer life cycle of a company's fundamental competitive advantages.
2. An accelerated turnover of product life cycles.
3. Relocation of business operations to lower-cost regions of the world.
4. Wider use of outsourcing modalities by the existing and newly created global companies in emerging countries.
5. More competitive advantages r=created through innovative proposals from employees and expanding the range of a company's competencies.
6. A wider range of new values for customers.
7. Better corporate reputation, in both national and global markets.

A detailed examination of theoretical and empirical literature has revealed the below specific characteristics of financial innovation, which are significant in relation to the goals and objectives of our research:

• Financial innovation has a reverse life cycle, i.e., there is an improvement in the characteristics of an existing service and the buyer demand is then further growing to result in the development of a new service;
• Financial innovation involves a high degree of buyers' engagement;
• Financial innovation is often initiated by users ('open innovation') and presupposes network effects;
• There are no intellectual property rights for financial services, and therefore, a financial innovation product may be potentially reproduced, which creates some challenges for higher innovation in the finance sector.

Owing to these features, a financial innovation product emerges after an increase in the supply efficiency and improvements in existing financial services. Innovative companies generally produce services at the first three stages of the financial innovation life cycle (i.e., implementation, growth, and maturity), while companies that reproduce a developed innovative product tend to enter the

market at the second or third stage of the financial innovation life cycle (i.e., growth and maturity). Therefore, depending on the life cycle stage, the intensity of competition among financial intermediaries' changes, and the share of buyers in the market at the first three stages of the life cycle will show whether the production of financial innovation products is successful or not as compared to financial innovation reproduction.

The innovation activity in Russian companies is attributable not only to supply characteristics but also to features of the demand structure, which may have implications for the comparative profitability of the innovation or imitation strategy in relation to financial innovation. In order to study the essence of the problem, we have built a theoretical model in which two financial intermediaries produce an innovative service, while Hotelling's approach [17] was used as the methodological framework. This approach involves two business entities positioned at the two ends of a unit length line (like the linear city), and the buyers are distributed along the line uniformly. In contrast to basic Hotelling's concept, ours is a dynamic four-period model, with the number of periods corresponding to the number of stages in the reverse financial innovation life cycle model.

The first financial intermediary is the Innovator and it is denoted as 0, while the other is the Imitator denoted as 1. The Innovator invents a new service and bears related costs. The Imitator reproduces this innovation with lower expenses, a slight loss in quality, and some delay in time. At the beginning of the first period, the Innovator incurs C0 costs associated with the creation of a new financial service. The expenses of creating financial innovation form a fixed value because the expenses are determined by factors that are exogenous to our model (e.g., the level of technology maturity and professional expertise of employees [Frame & White, 2009]). As soon as the Innovator has developed a new service, it offers the service to buyers and starts gaining nonnegative profits. Since no intellectual property rights exist in financial markets, every new service can be easily reproduced by the other company (the Imitator) within a fairly short period of time (in our model, it becomes possible in the second period). In this case, the Imitator is assumed to bear lower costs for this service than the Innovator did.

It is plausible to argue that C1 – reproduction costs incurred by the Imitator are quite low as compared with C0, i.e., $C0 > C1 > 0$.

In addition, innovative financial services provided by the companies under study differ in terms of their quality, with services offered by the Innovator being necessarily better, as compared to those by the Imitator.

Other things being equal, buyers prefer a provider who offers services with a higher quality level. The quality of the service provided by the financial intermediary i during the period t is denoted using the variable qit. The difference in the quality of the services provided by the Innovator and the Imitator during the period t will be $\Delta qt = q0t - q1t$ and we suggest that $q0t \geq q1t$ or $\Delta qt \geq 0$, which means that the Imitator will reproduce the service with some deterioration in the quality.

The initial quality of the service produced by the Innovator is $\tilde{q}00$. It is expected that this value is unknown to market participants (the only thing known is its mathematical expectation), and they understand the quality of the innovation not at once (not earlier than at the end of the second period). There are two possible states of the world during the zero period, depending on whether the innovation is successful or not. At the same time, it is still unknown during the zero period, which state of the world has been realized. The quality of financial services will be equal to qH00 if the state of the world is favorable, and not more than qL00 if it is unfavorable.

The maximization of profits is viewed as the core target function for both financial intermediaries in accordance with the idea generally accepted in literature. As a result, the total formula for the profits the financial intermediary i generates from its innovative service will be as follows:

$$\pi_{it} = (p_{it} - c)\, D_i(x;\, p_{0t};\, p_{1t};\, x;\, q_{0t};\, q_{1t};\, s;\, t), \text{– for } i = 0, 1, \qquad (1)$$

where pit is the price that buyers pay to the intermediary i during the period t, c is variable costs of innovation distribution (i.e., advertising, auxiliary services, etc.), and Di is the service demand.

The aggregate profit gained by the Innovator during the four periods of the financial innovation life cycle will be:

$$\Pi_0 = -C_0 + \sum_{t=0}^{3} \frac{1}{(1+r)^t} \pi_0(t), \qquad (2)$$

where $\pi_0(t)$ means the profit gained by the Innovator during the period t, and r is a discount rate.
The aggregate profit gained by the Imitator during the four periods of the financial innovation life cycle will be:

$$\Pi_1 = -\frac{C_1}{(1+r)} + \sum_{t=1}^{3} \frac{1}{(1+r)^t} \pi_1(t), \qquad (3)$$

where $\pi_1(t)$ means the profit gained by the Imitator during the period t, and r is a discount rate.
Let us then discuss the behavior of the buyer of the financial innovation product.

For the buyer at the point x, the usefulness (Uit) of the service is measured using the below formulas:

$U_0t(x) = q_0t - p_0t - sx;$ (4)
$U_1t(x) = q_1t - p_1t - s(1-x);$ (5)

where s denotes the individual buyers' choice of the innovative service provider (like transportation expenses in Hotelling's model).
We rank buyers according to their propensity to acquire innovative financial services, as follows:

Buyers with a high propensity to acquire innovative services
These are buyers (α) who prefer to buy all innovative services as soon as they appear. Our model shows that α <1/2, considering the empirical data obtained by E. Rodgers [E. Rogers, 2003].
Buyers with a moderate propensity to acquire innovative services
These are buyers (β) who would buy innovative services if there is a steady demand for this type of service among the α-buyers within one period.
Buyers with a low propensity to acquire innovative services

These are buyers (γ) who are highly conservative and who would not buy a service unless there is a strong demand among the above groups during the previous two periods.

The financial innovation life cycle within the proposed theoretical model looks as follows.

During the zero period, the Innovator enters the market with a new offering, and the service is being bought by the α-buyers, while the Imitator and the other buyer groups are watching what is happening in the market.

The Imitator arrives in the first period with the original innovation reproduction.

The Innovator and the Imitator begin to compete and there are now (α+β) buyers in the market. However, the buyers get a completely clear awareness of the quality of the financial innovation service not earlier than at the end of that period.

The service will be of lower quality – as compared with the mathematical expectation about the innovation quality by all the participants, with the probability φ in case of an unfavorable state of the world; and the service will be of higher quality in case of a favorable state of the world, which occurs with the probability (1-φ).

During the second period, the Innovator and the Imitator continue to compete. The β-buyers will leave the market if the state of the world is unfavorable and will remain – in a favorable state of the world. This period is crucial in determining whether the innovation or imitation strategy is successful or not, and its outcome will depend on who wins the struggle for the moderately conservative buyers (i.e., the β-buyers).

During the third period, the Innovator leaves the market in accordance with the life cycle model, and the Imitator will satisfy the residual demand among

the α-buyers or (α+β) buyers with a favorable state of the world or will have the entire market if the state of the world is unfavorable, depending on the behavior strategy the conservative buyers (γ) choose.

In general, the theoretical model explores how the demand for a financial innovation service is changing, depending on its structure, and proves that the success of the innovation strategy versus the imitation strategy is dependent on how the moderately conservative majority of buyers will behave at the second stage of the life cycle (maturity), which in turn depends on the initial characteristics of the service.

This leads to the conclusion that the structure of the buyer demand is an important determinant of the financial innovation success because it conditions a competitive advantage of the innovation or imitation strategy with the given characteristics of a service offer.

Conclusion

Thus, we can conclude that in the present-day context the owner and the senior management of a company should shift from legacy management models to strategic orientation, being a special management approach, which will enable them to build such innovative development models that would lead to the goal achievement in accordance with the owner's vision.

This strategic orientation is a general strategic development plan of a company, which must be enhanced with a detailed description of the strategy and implementation methods. The core components of the strategic orientation should include market orientation, entrepreneurial orientation, customer orientation, cost orientation, innovation orientation, competitive orientation, training orientation, employee orientation, and interaction orientation. The direct relationships between strategic orientation, market orientation, and innovation orientation cover three levels of the internal environment of a company, such as organizational culture (including innovation culture) and proactive customer orientation, which consists of strategic orientation on creation of the best value and tactical orientation as a set of cross-functional processes and activities that are also aimed at value creation and customer satisfaction.

In modern times, strategic success requires an efficient combination of management and both internal and external knowledge, including systematic arrangement, renovation, coordination, and socialization of that knowledge (tacit knowledge transferring), since innovation is a result of the mutual influence between tacit knowledge and explicit knowledge.

Model Barriers to Implementation of The Simplified Strategic Cost Accounting in Micro-Entities

Michal BIERNACKI

Associate Professor, PhD Hab., MSc Eng.,
Wroclaw University of Economics and Business,Wroclaw, Poland
michal.biernacki@ue.wroc.pl

Abstract

This article presents a practical approach to identification of the existing barriers to implementation of the simplified strategic cost accounting in Polish micro-entities. The identification of such barriers is an element of a broader research project addressing the micro-entity subset of the services sector in Poland and other countries of the Central and Eastern Europe (Romania, the Czech Republic, Slovakia, Hungary, Serbia, Slovenia, etc.). The task was executed on the basis of empirical findings obtained using the following research methods: questionnaire interview, questionnaire survey, semistructured interview. Some of the key findings allow for a formulation of new hypotheses for future exploration and research: (1) barriers to implementation are related to the awareness of entity owners; (2) knowledge of strategic cost accounting determines a positive approach to their implementation; (3) the specificity of the services sector is a barrier to implementation of strategic cost accounting.

Keywords: Target Costing, Strategic Costing, Strategic Accounting, Activity Based Costing

Introduction

Micro-entities, along with 'small' enterprises, play a key role in many economies. Their role is most pronounced in countries characterised by free-market structure, where this subset of economic entities is particularly well-developed, as evidence by their relative share in national economy. This type of structure offers a sizeable limitation of negative impacts from economic crises and helps boost the pace of economic growth.

The micro-entity segment is often associated with the development of advanced technologies, due to the relative ease in practical implementation of highly innovative solutions (Angowski, 2008, p.237).

In Poland, the development of the studied segment was initiated in the early 1990s, and the process has been linked to the nascent and gradual liberalization of the private sector of the economy. This trend not only improved the operating potential of this type of enterprises, but also stimulated the growing popularity of micro-entities as effective forms of economic involvement (Angowski, 2008, p.238).At present, the segment of micro-entities represents a 99.8% share in Polish enterprises, and the number of new entities grows steadily with time (Raport o stanie sektora małych i średnich…, 2018, p. 12). One of the most pronounced differences between micro-entities and larger companies is the specificity of operation. Owners of micro-entities are in principle more self-reliant and independent. In consequence, they are largely unrestrained in their decisions to introduce and implement innovative and non-conventional solutions, and are equally unconstrained in their choice of methods for testing the effects of such decisions in economic practice.

This article presents a practical approach to identification of the existing barriers to implementation of the simplified strategic cost accounting in Polish micro-entities.

Within the framework of a broader research project, the following research hypothesis was posed: barriers to implementation of the simplified strategic cost accounting in micro-entities of the services sector are only displayed in those entities which lack sufficient financial resources to implement such

solution. For the purpose of verifying the above hypothesis, two research questions were formulated as follows:

- Does the use of strategic cost accounting (be it exhaustive or simplified) bear any significant cost?
- What factors can be identified to further inhibit such entities from employing the strategic cost accounting solution in their practice?
- Are there any incentives that can be used to stimulate such entities to implement the strategic cost accounting solution?

Findings obtained in the course of this study represent a portion of a broader research project addressing the micro-entity subset of the services sector in Poland and other countries of the Central and Eastern Europe.

A Micro-Entrepreneur

National principles of classification of micro-entrepreneurs as economic entities vary from country to country and are founded on varied sets of criteria. For the EU Member States, criteria for the classification of economic entities have been set in the form of EC recommendations; this approach to classification has also been adopted for the purpose of this research.

Based on the above recommendations, a micro-entrepreneur is defined as an entity which – for the last fiscal year or the preceding reporting year – has not exceeded the limits of the following criteria:

- less than 10 employees,
- net turnover or balance sheet total of not more than 2 000 000 euro (Commission Recommendations of May 6, 2003…, art. 2);

In the calculation of the above values, a special attention should be placed upon the independence of the studied reporting entity, as values in this range are typically reported by independent entities but can also be found in affiliated entities and partnership-type entities.

An independent entity is defined as autonomous, i.e. without third-party shares and without shares issued to any such third party. In line with the Commission recommendations, the classification of micro-entities may include partner enterprises and linked enterprises, on the provision of not more than 25% of a) capital or b) voting rights of another enterprise (be it upstream or downstream), taking into consideration the larger of the two categories. In addition, the recommendations provide exceptions to the above rules, allowing for entity classification as autonomous regardless of the above limit values; these exceptions include: universities and non-profit research centres, local authorities with anannual budget of less than EUR 10 million and fewer than 5 000 inhabitants, and venture capital investments (Commission Recommendations of May 6, 2003…,art. 3).

Partner enterprises are all enterprises which are not classified as either linked or autonomous. The first criterion in this case is the value of capital or voting rights of another enterprise. The higher of the two criteria should be kept within the limits of 25% (lower) and 50% (upper). In addition, such entity should not be linked to another enterprise (User guide to the SME definition …, 2015, p.7).

In the recommendations of the European Commission, a linked enterprise is defined as an enterprise which satisfies at least one of the following criteria:

1) an enterprise has a majority of the shareholders' or members' voting rights in another enterprise,
2) an enterprise has the right to appoint or remove a majority of the members of the administrative, management or supervisory body of another enterprise,
3) anenterprisehastherighttoexerciseadominantinfluenceoveranotherenterprisepursuanttoacontractenteredinto withthat enterprise,

4) anenterprise,whichisashareholderinormemberofanotherenterprise,controlsalone,pursuanttoan agreementwithothershareholdersinormembersofthatenterprise,amajorityofshareholders'orme mbers'votingrightsinthatenterprise (User guide to the SME definition …, 2015, p.21).

Over the course of this research, it was assumed that micro-entities are, in their majority, representative of the 'autonomous' category of entities. Consequently, analytical evaluations were conducted with respect to this particular subset of the studied population.

Research of the Conducted Research

The study was conducted between January and July 2019 among micro-entities of the services sector of Polish economy, based on the use of the following research methods: questionnaire interview, questionnaire survey, semi structured interview. The research sample included a total of 1357 entities satisfying the EC criteria of micro-entity classification. Of these, 1249 entities (92%) were ultimately selected for evaluation in regard of their involvement in practical implementation of strategic cost accounting.

For the purpose of the study, it was assumed that strategic cost accounting represents:

- activity-based costing
- calculation of expenditure by type
- Kaizen costing
- life-cycle costing

In the context of strategic cost accounting, 'simplification' (abridgement) is defined as implementation of the basic principles of these models, without the need for any radical changes in the organizational structure or finance/bookkeeping systems.

Micro-entities declaring full implementation of strategic cost accounting (379entities, 30%) reported the following elements:

- simplified methods–370 entities(97%), including:
    - activity-based costing– 4 entities (1%)
    - calculation of expenditure by type – 366 entities (99%)
    - Kaizen costing–0 entities
    - life-cycle costing – 0 entities
- exhaustive methods–9 entities (3%), including:
    - activity-based costing – 3 entities (33%)
    - calculation of expenditure by type – 6 entities (66%)
    - Kaizen costing– 0 entities
    - life-cycle costing – 0 entities

This group was also a source of information on barriers faced by entities in practical implementation of strategic cost accounting:

- cost-intensive – 100 entities (26%)
- lack of sufficient specialist knowledge on the part of the owner – 10 entities (3%)
- lack of satisfactory IT support – 59 entities (14%)
- no barriers – 210 entities (57%)

As many as 870 micro-entities (70% of the studied population) had no strategic cost accounting model in use. In the study, this group of entities identified the following barriers to implementation of such strategic cost accounting solutions:

- lack of knowledge on the availability of such solutions- 700entities (80%),

- lack of awareness of the need to employ them– 800 entities (91%),
- steep cost of implementation - 870entities (100%),
- lack of sufficient knowledge on the part of employees - 870entities (100%),
- lack of awareness of the tangible effects offered by the introduction of such solutions- 803entities (92%),
- reluctance to face the associated challenge of structural reorganization - 870entities (100%).

Entities in this group were also queried with respect to the availability of resources required for the implementation of strategic cost accounting. 850 micro-entities (97%) reported having no resources available for the purpose, before even being aware of the volume of such expense. In a subsequent query, the respondents were asked to provide an estimate of cost involved in implementation of simplified strategic cost accounting:

- 0 – 2000 EUR –10 of 850 entities(1%)
- 2001 – 5000 EUR – 57 of 850 entities(7%)
- 5001 - …EUR – 803 of 850 entities (92%)

After being presented with expert estimates of the associated implementation expenses (in the range of 2001 – 5000 EUR, based on responses from recognized consulting agencies), the respondents were asked to revisit their decision. 560 entities (65%) were adamant in their view that such implementation will be put in effect, with 287 entities (33%) providing a distinctly negative view on the prospect; the remaining responses (3 entities, 2%) were undecided. Entities in this group were also asked if – knowing the realistic estimates – they were ready to reassess the availability of resources needed for the implementation of strategic cost accounting. 821entitiesconfirmed that expense in this range would be fairly acceptable to them.

Evaluation of the Findings

The research hypothesis formulated in the project was rejected in the course of research. As evidenced by the structure of responses, certain barriers to implementation of simplified strategic cost accounting solutions can be identified. These, however, can in no way be attributed to the scarcity of financial resources. Evaluation of the findings provides arguments for conclusion that more effective implementation of the studied solutions can be facilitated through proper education targeting this segment of entities. In particular, stimulation of the process can be effected by proper dissemination of expert knowledge on the estimated cost of such change as well as the specificity and benefits offered by this form of accounting. At the same time, the study revealed two most popular forms of simplified strategic cost accounting in Poland.

Conclusions

Analytical evaluation of findings and conclusions obtained in this stage of research offers prospect for formulation of additional hypotheses deserving our attention at later stages of this project: 1) barriers to implementation are largely related to knowledge and awareness of micro-entrepreneurs; (2) knowledge of strategic cost accounting determines the readiness to implement them in economic practice; (3) the specificity of the services sector constitutes barriers to implementation of strategic cost accounting. It must be emphasised that further research into the studied subject will also address barrier correlations to other countries of the region as well as potential incentives which can be used to stimulate effective implementation of simplified strategic cost accounting by micro-entities

Price Relations between Individual Links in The Production and Distribution Channel of Cereals and Primary Processing Cereal Products on The Example of Poznanska Wheat Flour in Poland In the Years 2004 – 2018

Anna OLSZANSKA

Wroclaw University of Economics and Business, Wroclaw
Poland, anna.olszanska@ue.wroc.pl

Abstract

The production and distribution of most food products with longer shelf life is often carried out in very complex and long marketing channels. The purpose of the study is to analyze and evaluate changes in price relations between individual links in the production and distribution channel of a selected primary processing cereal product. Data from 2004-2019 were taken from the studies of the Institute of Agricultural and Food Economics - National Research Institute - Agricultural Market. Analyses, Trends, Assessments. In the last years of the analysed period, there is a clear tendency to shape retail flour prices regardless of changing grain procurement price and flour sales prices. From 2011, retail prices of flour initially grew steadily and then were kept at a fairly stable level, which, with fluctuating prices at the previous two levels, contributed in total to the stability of achieving a high trading margin. This situation was slightly disturbed by the change in price formation policy of flour companies in 2018.

Keywords: Price Transmission, Wheat, Procurement Price, Producer's Prices, Retail Prices

Introduction

For food products to be on the market, they must go a longer or shorter path in the production and then distribution channel. As emphasized by Tłuczak (2015, 2019) the supply chain combines activities whose primary goal is to ensure buyer satisfaction and profit for enterprises participating in the flow of products and services. In the case of food, it is the supply chain from the sphere of primary agricultural production (farmer) to the consumer. It is characterized by a large diversity of its entities, i.e. producers, suppliers, transport companies, warehouses, wholesale and retailers, service organizations and consumers.

The product must be competitive to find a buyer on the market. As noted by Kowalska, Olszańska, Urban (2015) price is the most important tool for companies to influence the market. Price plays a particularly important role in consumer products of frequent purchase, especially food. As emphasized by Firlej, Kowalska, Piwowar, (2017), competitiveness at the enterprise level is the ability to cope with competition, maintain or increase market share and profits from business activities. Therefore, the competitiveness of the enterprise depends on the competitiveness of individual products and services produced and sold on the market.

The production and distribution of most food products with longer shelf life takes place in often very complex and long marketing channels, frequently covering more than one stage of production within primary and secondary processing. An example of this is the cereal market, where primary processing produces flours and cereals that can subsequently be sold or become a raw material in the bakery, confectionery or other industries as part of secondary processing. Starting from the primary raw material, which is cereal grain, we get a number of different end products at various stages of processing. In most food industries, the main cost is the purchase price of the raw material. Therefore, it should be expected that the prices of the finished product will be correlated with the purchase price

of the basic raw material. In this context, one can follow the price formation process from the supply side of the raw material and the finished product that goes to the market. As noted by Kowalska, Olszańska, Urban (2016), in addition to the element of production costs, when determining the price of a product, a number of other factors are also taken into account, e.g. the brand, competition and its prices, supply situation in the country and on foreign markets. On the other hand, the price of the finished product is influenced by a number of factors on the demand side, including demand for such products, complementary and substitution products, changes in customer preferences and tastes, the structure and types of wholesale and retail trade outlets and their sales and price formation strategies. The price of raw material and the product at various stages of its production is therefore the result of many elements and factors appearing on the market in a given place and time. Hence, the analysis of prices of selected cereal products and price relations between individual links of the marketing channel of their production and distribution seem to be interesting problems. Transferring prices between the various links of the marketing channel - purchase, sale and retail - is called price transmission. In a well-functioning market, it can be expected that the links between prices will occur at all analysed levels. According to the research study by Kettunen (1992) the price margins of individual links reflect the volume of processing and transaction costs, the profits obtained there, as well as the inefficiency of the market system. Research on price transmission was conducted, among others Morkis, Nosecka, Seremak-Bulge (2010), Krawczak (2017). The relationships between prices can be examined, among others, by calculating the correlation coefficients between prices on individual links of the marketing channel.

Purpose, Methods and Data Sources

The study presents data on an exemplary primary wheat processing product - Poznanska flour. For this product, links and relations between the average monthly wheat procurement prices and the sale price of Poznanska wheat flour (producer's price), producer's prices and retail prices as well as wheat procurement prices and Poznanska wheat flour retail prices were analysed using basic methods of statistical data analysis. Data on these products were taken from monthly publications of the Institute of Agricultural and Food Economics - National Research Institute - Agricultural Market. Analyses, Trends, Assessments. The data was collected from the beginning of 2004 to August 2019, hence the entire period of Poland's membership in the European Union was taken into account. The source of the data are the reports prepared for the needs of the Central Statistical Office. It can therefore be assumed that the methodology adopted for calculations was uniform. Due to the changing level of inflation, the proportions between prices were mainly expressed in the form of price relations.

The purpose of the study is to analyze and evaluate changes in price relations between individual links in the production and distribution channel of a selected primary processing cereal product.

Research Results and Discussion

In the years 2004 - 2018, the procurement of wheat in Poland, both for consumption and feed purposes, fluctuated considerably and ranged from 3 005.6 thousand tonnes in 2007 to 6,604.2 thousand tonnes in 2017 (Fig.1). In the analysed period, large purchase fluctuations were visible and three, 5-6-year periods of fluctuations in this phenomenon can be indicated. Assuming that the cycle will be the periods between the minimum purchase volumes, the first of them lasted until 2007, with the maximum volume in 2005. The next cycle took place until 2013 with the maximum volume of purchases in 2011 and 2012. During the subsequent cycle, the maximum was recorded in 2017. The cyclicality of purchase volume is associated with the wheat supply changing over time, but also with the market demand for animal feed purposes.

During this period, the production of Poznanska wheat flour was definitely more stable. The minimum production volume was recorded in 2008 (1,317.9 thousand tonnes) and the maximum in 2018 (1,769.7 thousand tonnes). In the period between 2004 and 2010, considerable fluctuations in production were visible. Since 2011, its gradual and quite systematic growth has been noticeable. Flour, unlike cereal grains, is a product with a limited storage time and its production is usually planned for specific market needs.

Fig. 1: Wheat procurement and industrial production of wheat flour in Poland in 2004-2018 (thousand tonnes); Source: own study based on: Agricultural Market. Analyses, Trends, Assessments. Monthly bulletins of IERiGŻ-PIB, 2004-2019

In turn, throughout the year, the purchase of wheat is subject to large seasonal fluctuations (Fig.2). The largest purchase is carried out, as expected, after the harvest in July and August, although its size in these months can be very different in relation to the volume of purchase in a given year. For example, an exceptionally high purchase after harvest was recorded in August 2017 and in the next two years it was more than a half smaller. Against this background, flour production is definitely more even throughout the year. However, also in this case, the periods of slightly larger and smaller production are noted. Over the course of the year, the flour production usually takes place from August to November (autumn season and pre-Christmas period) and around March (before Easter). Smaller flour production is recorded between April and June.

Fig. 2: Wheat procurement and industrial production of wheat flour in Poland in 2004-2018 (thousand tonnes, monthly data); Source: own study based on: Agricultural Market. Analyses, Trends, Assessments. Monthly bulletins of IERiGŻ-PIB, 2004-2019

Against this background, data on average procurement prices of wheat, producer's prices of Poznanska wheat flour and retail prices of this product are of particular interest (Fig. 3).

Fig. 3: Monthly wheat procurement prices, producer's prices and retail prices of Poznanska wheat flour in Poland in 2004-2019 (PLN / kg); Source: own study based on: Agricultural Market. Analyses, Trends, Assessments. Monthly bulletins of IERiGŻ-PIB, 2004-2019

When assessing these data, two significant periods can be distinguished. The first of them lasts from the beginning of the analysed period until the harvest in 2011. During this period, relatively comparable price trends on individual markets continued. The retail prices of flour fluctuated significantly, following the changing sales prices of flour and the procurement prices of wheat. At the end of this period, there was a visible tendency to increase the trade margin in the retail price of wheat flour.

From the fourth quarter of 2011 to the end of the third quarter of 2018, relatively stable and reasonably low levels of producer's margins were kept. Producers' prices would rise and fall along with the changing wheat procurement prices. The flour trade policy began to take shape in a different way. In the first months of this period, average retail prices began to increase, but this was "justified" by the increase in flour sales prices. At the same time, the trade margin for the product was gradually increasing. In the following months from August 2014, the retail prices of flour only slightly fluctuated, in the range of 2.48-2.53 PLN / kg. These fluctuations were observed on a much smaller scale than in the case of flour sales prices and wheat procurement prices, and the trade margins reached the highest levels in the entire analysed period.

Another change was visible from the fourth quarter of 2018, it is difficult, however, to judge on the basis of such a short period whether this will continue as a constant trend. It was a period when wheat purchasing prices initially increased significantly, and then, from the second quarter of 2019, they began to decline gradually. Initially, flour producers in the period significantly increased the selling prices of their product, to a greater extent than it would result from the increase in raw material prices, and then only slightly decreased them (despite a clear drop in the procurement prices of wheat during this period). Traders, on the other hand, reacted with an increase in the retail prices. It seems, therefore, that following a change in the policy of shaping trade margins for this relatively cheap product, also the producers decided to make the prices of their product independent from the raw material purchase prices. This applies especially to periods when the prices of the basic raw material fall. The growth periods of wheat prices are still used to increase producer's prices and retail prices of Poznanska wheat flour. Wheat procurement prices were the most variable (coefficient of variation 25.08%). The coefficient of variation of wheat flour sales prices was 21.86%. The lowest variation was recorded for retail prices of flour - 18.12%. This gives a certain picture of who has earned the most important

position, plays a decisive role and has the greatest freedom in shaping price policy throughout the marketing channel.

Fig. 4 presents the dynamics of the analysed prices. This is the dynamics with a fixed basis for which January 2004 was adopted. In addition to confirming previously made observations, it can be added that in several months the prices considered were unfavourable as despite the progressing, although relatively low inflation, the prices at individual links were lower than the price level at the beginning of the period under consideration. The least favourable situation was in the cereal market and in the case of flour producers. Until the harvest in 2011, only in the period between the harvest in 2007 and the next harvest in 2008, the purchase and sales prices of flour were higher than the prices from January 2004. However, the retail prices of flour were lower than those from January 2004 only in the marketing year 2006/2007.In the remaining months these prices were higher. After the harvest in 2011, for about two years, wheat and flour sale prices were at a higher level than in January 2004, but then there was a long period of their stabilization at the level from the beginning of the analysed period. The price situation for both links slightly improved after the 2018 harvest, but only in the case of flour producers it remained until the end of the discussed period. At that time, retail prices were initially rising and then, from 2013, they remained stable at the level of approximately 160% of the January 2004 price. The post-harvest period after 2018 was once again used by the trade entities to increase flour retail prices. The maximum level of retail prices of wheat flour was reached in the final months of the studied period when they reached 178.4% of the prices from January 2004. Therefore, there are numerous indications that in the case of the analysed products, the prices in the long term are most favourable for traders. Wheat procurement prices and the prices of flour producers are variable over time and in most months these products were relatively cheaper than at the beginning of the analysed period.

Fig. 4: Dynamics of monthly wheat procurement prices, producer's prices and retail prices of Poznanska wheat flour in Poland in 2004-2019 (%, January 2004 = 100); Source: own study based on: Agricultural Market. Analyses, Trends, Assessments. Monthly bulletins of IERiGŻ-PIB, 2004-2019

The next stage of the analysis was to indicate the share of individual links in shaping the retail price of wheat flour (Fig.5). The problem arises as how to analyze and calculate the level of margins at the individual stages of flour production. Economic practice and the data cited in subsequent publications by Jurga (1994), Jurga (2003)and Kołożyn-Krajewska, D. Sikora T. (1999) indicate that an average of 1.429 kg of grain is used to obtain 1 kg of flour. Grain is almost entirely processed in mills, except for the highest quality flour, other products of lower value are also obtained. Assuming that 1.429 kg of cereal grain is used to produce flour, flour producers' margins are significantly reduced. Incidentally, there were even months when raw material prices were higher than flour sales prices. In cereal processing, however, it is normal to stock up on raw materials, usually at times of more favourable prices. It is also difficult to estimate the value of other obtained products. Considering this, the prices

of 1 kg of wheat and 1 kg of other products were taken into account, but ultimately it should be assumed that the producers' margins were slightly lower.

Fig. 5: Share of individual links in the Poznanska wheat flour production chain in the retail price of the finished product in the context of changes in wheat procurement prices (%, PLN / kg); Source: own study based on: Agricultural Market. Analyses, Trends, Assessments. Monthly bulletins of IERiGŻ-PIB, 2004-2019

The shares of the raw material in the retail price as well as the producer's and trade margins in the subsequent months of the researched period fluctuated significantly. In a changing market situation, individual links in the marketing channel increased or decreased their share in the retail price. The most stable situation regarding the share of the margin in the final price was recorded in the case of trade margins. Their share ranged from 26.14 to 61.6%. The trade sector undoubtedly had the largest share in the retail price of flour in most months, while in some cases the trade margin consisted of wholesale and retail margins. In the case of large retail chains, this margin entirely related to one economic entity. Trade margins decreased during periods of high cereal prices. These relations are shown in Fig. 6

Fig. 6: The value of the trade margin and wheat procurement prices in Poland in 2004-2019 (PLN; PLN / kg); Source: own study based on: Agricultural Market. Analyses, Trends, Assessments. Monthly bulletins of IERiGŻ-PIB, 2004-2019

For cereal producers, these shares ranged from 22.46 to 47.57%. However, high shares in the retail price were only possible for a short time, usually in individual months. In most months they were between 20 and 30%. The share of producer's margins in the retail price reached the lowest levels - from 12 to 34.4%. Obviously, millers could buy grain earlier, at better prices. Flour is also not the only milling product.

An indication of the reaction to price changes on individual links of the marketing channel can be obtained by analysing the annual values of correlation coefficients (Table 1). The presented calculations indicate that in the considered years the strongest relationships occurred between wheat procurement prices and flour producers' prices. Such strong relationships can be indicated in most of the years from the 2004–2014 period. From 2015, these relationships were significantly weakening, and from 2017 a weak negative correlation appeared. But already in 2018, there was again a strong link between prices at this level. For the entire analysed period of fifteen years, only four years can be indicated as those of weaker relationships between cereal procurement prices and flour sales prices.
.

Table 1: Annual correlation coefficients between individual price levels for the period 2004-2018

years	wheat procurement prices; prices of flour producers	prices of flour producers; retail prices of flour	wheat procurement prices; retail prices of flour
2004	*0.91*	-0.18	0.10
2005	*0.85*	*0.70*	*0.87*
2006	*0.93*	*0.88*	*0.94*
2007	*1.00*	*0.82*	*0.83*
2008	*0.94*	-0.12	-0.37
2009	0.11	0.37	*0.55*
2010	*0.97*	*0.80*	*0.82*
2011	*0.90*	-0.26	-0.38
2012	*0.94*	*0.77*	*0.71*
2013	*0.95*	**-0.77**	**-0.80**
2014	*0.81*	0.56	0.32
2015	0.21	0.38	0.12
2016	0.60	-0.28	-0.56
2017	-0.25	-0.19	-0.02
2018	0.91	0.50	0.61

Source: own study based on: Agricultural Market. Analyses, Trends, Assessments. Monthly bulletins of IERiGŻ-PIB, 2004-2019

When analysing the relationship between flour sales prices and its retail prices, the correlation coefficients are quite different. A high positive correlation between the prices of flour producers and its retail prices occurred only in five out of the fifteen discussed years. These were the years 2005-2007, 2010 and 2012. In the remaining years, there was a weak positive or negative correlation. In 2013, a high negative correlation was noted. In the same years, there were also relatively strong relationships between procurement prices of wheat and retail prices of the analysed flour. The occurrence of a strong negative correlation value is associated with its higher values than in the case of previously analysed relations. Significantly higher negative correlations can be found in the four of the years researched (2008, 2011, 2013 and 2016). The presented calculations show a progressive decrease in the strength of price relations between the sphere of production and trade and confirm the earlier observations.

Conclusion

The procurement of wheat for consumption and feed purposes in the analysed years changed cyclically with a general tendency to increase at a rate of approx. 217 thousand tonnes per year. In the case of wheat procurement, strong seasonal fluctuations are also typical. In the early years of the analysed period, flour production fluctuated. The growing production trend has been dominating since 2011. In this market, there are also noticeable slight seasonal fluctuations in the production volume, associated mainly with periodic fluctuations in demand.

The price of raw material and the price of finished products at various stages of its production and distribution result from numerous elements and factors appearing on the market in a given place and time. Purchase prices of wheat fluctuated significantly, often reaching the levels lower than at the beginning of the period under review. The sales prices of flour were most closely related to wheat procurement prices. In the last years of the analysed period, there was a clear tendency to shape retail flour prices regardless of changing cereal procurement price and flour sales prices. From 2011, retail prices of flour initially grew steadily and then were kept at a fairly stable level, which, with fluctuating prices at the previous two levels, contributed in total to the stability of achieving a high trading margin. This situation was slightly disturbed by the change in price formation policy of flour companies in 2018.
In the entire analysed period of fifteen years, it is possible to identify 11 years of very strong relationships between procurement prices of wheat and the prices of flour producers. Three years of weaker relationships were 2015-2017. There was a strong positive correlation between the flour producers' prices and their retail prices only in five years, mainly the initial ones. A similar situation occurred also in the case of correlation between retail prices of flour and wheat procurement prices. Noteworthy is the significant change in mutual relations in price formation policy that took place in 2013. It was the only year when there was such a strong negative correlation between retail prices of flour and the prices on other links in the marketing channel.

Trends in Beef Production in Selected European Union in 2004-2018

Anna OLSZANSKA

Wroclaw University of Economics and Business, Wroclaw, Poland
anna.olszanska@ue.wroc.pl

Abstract

The goal is to analyse changes in beef production in the European Union over a period of fifteen years (from 2004 to 2018). The analyses concern, inter alia, trends in production volume changes, cyclical and seasonal fluctuations. The study uses data from the Eurostat database and extensions of the Institute of Agricultural and Food Economics - National Research Institute. Detailed analysis looked into the data on the volume of production throughout the EU and in the areas of available solutions in this area. France, Germany, Great Britain and Poland were selected for analysis (first three and sixth place in terms of production volume in the EU). The share of these countries in the total volume of beef production in the EU-28 in 2018 was over 50%. In the analysed period, beef production in the EU fluctuated cyclically with a general downward trend. There were also significant changes in the structure of this production. Seasonal fluctuations (during a year) in the various categories studied are significantly different from the point of view of their use compatibility, hence their extraction across the EU is somewhat difficult. Analysis of monthly data on the volume of beef production in the analysed countries points to repeated systematically changes in these values on an annual scale.

Keywords: Beef Production, European Union, Seasonality.

Introduction

Agribusiness is the largest production sector in the European Union, taking into account both the value of turnover and the creation of added value, as well as the size of employment. In this context, according to Firlej, Kowalska, Piwowar, (2017) the food industry deserves special mention. A significant development impulse for the food industry in Poland was accession to the European Union in 2004. In particular, the first four years of membership in the European Union were a period of rapid growth in the turnover of Polish international trade in agricultural and food products. Kowalska (2014) emphasizes that the agricultural and food production sector is one of the few in the Polish national economy that has a positive balance in trade.

Alongside pork and poultry, beef is one of the basic types of meat consumed in the European Union. The European Union constitutes also an important part of the global beef market, both on the supply and demand side. Beef is considered to be one of the most valuable types of meat, valued due to its taste qualities. The price of good-quality beef is relatively high compared to other meat types. This is the reason for its low consumption, e.g. in Poland. In December 2018, the world's cattle population was estimated at 987 million heads. There are visible important structural changes occurring in this production sector. Brazil's cattle population is growing, strongly supported by government programs. In China is also increasing. As ASF disease develops in Asia, the demand for this type of meat will increase there. Cattle population in the United States is also growing. Against this background, the cattle heads in the Union slightly decreased, mainly among the largest producers in the EU-15 group.

Purpose, Methods and Data Sources

The aim of the study is to analyse changes occurring in beef production in the European Union over a period of fifteen years (from 2004 to 2018). The analyses concerned, inter alia, trends in the changes of production volume, cyclical and seasonal fluctuations. The study uses data from the Eurostat database and publications of the Institute of Agricultural and Food Economics - National Research

Institute. The data on the production volume in the entire Union and in the countries with the greatest potential in this respect were subjected to a detailed analysis. France, Germany, Great Britain and Poland (countries occupying respectively the first three and the seventh place in terms of EU production volume) were selected for detailed analysis. Their share in the overall volume of beef production in the EU-28 in 2018 was over 50%. The study uses a multiplicative analysis model of time series data analysis described by several authors, including Aczel (2000), Kowalewski (2005) and Lira (2011) . The attempts focused on isolating the component of seasonal fluctuations. The coefficients extracted in this way include seasonal and random fluctuations with lower potency. This method was described by Luszniewicz (1987) and Pułaska - Turyna (2008).

As described by Kamiński (1965) and Shepherd (1963) seasonality may be defined as fluctuations occurring and recurring as part of subsequent annual periods. As described by Roosen, Hennessy, Hennessy (2004) they occur under the influence of natural and social factors, technological and organizational progress. Seasonality is a relatively predictable phenomenon in terms of its course, but not the scale of fluctuations. It can be a negative phenomenon if it causes accumulation or shortages of supply in certain periods of the year, but it can also result from mutual adaptation of live cattle producers and processing plants to changing demand. Seasonality in the production of live bovine cattle results from the traditionally shaped production cycle (the most favourable breeding periods, the use of periods of abundance of green feed). These factors are important primarily for the small-scale economy. Large-scale farms distribute production more evenly throughout the year. According to the book Animal husbandry (1996) the sales of animals spread over the year, in addition to the benefits associated with the possibility of achieving higher revenues during periods of seasonal price increases (associated with a decrease in supply), also gives additional benefits associated with the rational use of infrastructure related to animal husbandry, an even distribution of labour demand, the rhythm of income and expenses on the farm, risk reduction.

Research Results and Discussion

Beef production in the European Union in the analysed period of fifteen years changed cyclically with the general tendency to decrease at an average rate of about 48,000 tonnes per year (Fig.1). The maximum production for this period was recorded in 2004 and it amounted to 8 349.76 thousand tonnes, while the minimum in 2013 - 7 267.96 thousand tonnes, i.e. it was lower by 13%. In 2018, beef production in the Union represented 95% of its volume from 2004. In subsequent years, when production reached maximum values in the production cycle, the production volumes were lower than in 2004. It can be assumed that this will be minor, but quite stable trend of reducing this production within the Union. Potential reasons include those related to the reduction in demand as well as the growing concern for the state of the environment.

Fig.1: Beef production in the European Union in the years 2004 - 2018 (thousand tonnes of slaughter weight)

Source: study based on Eurostat database

France is the largest beef producer in the EU (Fig.2). Its share in the total beef production in the Union in 2004 was 18.9%. By 2018, this share had slightly decreased to 18.4%. In 2013, the year previously indicated as the period of minimum production, the share of France was higher and amounted to 19.3%. Another very large beef producer is Germany with a 13.9% share in 2018. The share of Germany in the analysed period decreased from 15.1% in 2004 and 15.2% in 2013. The next country in the ranking is Great Britain (with a growing share in the overall beef production, from 8.7 to 11.6%). Italy also has a significant position. The share of this country in subsequent years decreased and amounted to 13.8% in 2004, 11.8% in 2013 and 10.2% in the final year of the analysis. The next two places in the ranking were taken by Spain and Ireland (with shares in 2018 8.4 and 7.8%, respectively). Against this background, beef production in Poland was characterized by dynamic growth. The share of Poland in its overall EU volume increased from 3.6% in 2004 through 4.7% in 2013 to 7.1% in 2018. According to the research study by Olszańska (2012) in Poland, a new quality cattle herd with meat or milk-oriented breeds was still being built in this period. These activities were initiated after marketization of the economy and brought great benefits in the form of a significant increase in cow milk yield and a large improvement in meat quality.

Fig.2: Production volume of major beef producers in the European Union in 2004-2018 (thousand tonnes of slaughter weight)

Source: study based on Eurostat database

The share of the first three countries (in 2018) in the total beef production in the EU in 2004 was 46.2%. In 2013, it increased to 46.2% and in 2018 it fell to 43.9%. Taking into account also the previously quoted data, it means that during periods of decreasing production, it usually decreased to a much greater extent in the countries with lower production. Considering the seven countries discussed earlier,

their share in the total beef production in the Union was respectively: in 2004 - 75.4%, in 2013 - 77.8%, in 2018 - 77.5%.

Fig.3 presents the dynamics of production volume of the seven largest beef producers in the EU. Dynamics based on a constant basis were calculated, taking as a starting point the volume of production in 2004. The presented calculations confirm previous general observations regarding changes in these volumes. Poland stands out from the rest of the countries. In 2013, the production volume accounted for 113.7% of the 2004 figure. After 2013, the volume of beef production definitely and systematically increased, to the level of 189.4% in 2018. Greater dynamics, as compared to other countries, was also found in the case of Great Britain. In 2007, it reached approximately 120.7% of the production volume from 2004. After a slight decrease, another local maximum was recorded in 2011 - 128.1%. In 2018, the level of this production reached 126.3% of the 2004 volume. The largest falls were recorded in Italy.

Fig. 3: Dynamics of beef production volume of the seven largest producers in the European Union (2004 = 100%)

Source: study based on Eurostat database

The remaining part of the study is limited to the analyses of four countries indicated in the introduction: France, Germany, Great Britain and Poland. From the time series containing monthly data for individual countries and the entire European Union covering 180 months from 2004-2018, seasonal components and random fluctuations with lower potency were separated. All of the drawings were consciously prepared in the same scale so that the differences in the scale of seasonality of the studied phenomenon between countries were visible. The results of the analyses are presented in the following figures (Fig.4 – 8).

Seasonal fluctuations in beef production throughout the Union are the resultant of the production levels achieved in individual countries (Fig.4). They are relatively small (only sporadically go beyond the range of +/- 10% and a number of irregularities of this phenomenon can be indicated during the analysed fifteen years. Such an equalization of production throughout the Union should be considered beneficial in terms of satisfying internal demand for beef and its products. In all the analysed years, production below the twelve-month centred moving average occurred in February. In most years, lower-than-average production also occurred in July and, on a much smaller scale, in June. In none of

the analysed months it can be indicated that beef production in each of the years was higher than the average, but most often it reached the highest levels in March. Generally, production levels higher than average occurred as well from August to January.

Fig. 4: Seasonal fluctuations and random fluctuations with smaller potency in beef production in the European Union in the years 2004 -2018 (%)

Source: own calculations based on Eurostat database

In the case of the largest beef producer - France, the scale of fluctuations was similar to that in the whole Union and the month when it was the smallest was also February (Fig. 5). However, greater regularity occurred in other months. From April to August, the volume of production was below the 12-month centred moving average and only sporadically the values higher than the average were achieved in these months. From September to November, the production was the highest in the year. There were many irregularities in December, January and March, but in most years production volume in March and December was above the average.

Fig. 5: Seasonal fluctuations and random fluctuations with smaller potency in beef production in France in the years 2004 -2018 (%)

Source: own calculations based on Eurostat database

Germany was the next market studied (Fig. 6). Deviations from the moving average centred on this market were definitely larger than in the case of France, occasionally reaching over twenty percent. Production reached its highest levels in November. From September to November it was higher than

average. High production was also usually recorded in March. From April to July and in February its volume was much lower than average. In most years, low values were also recorded in August. In December and January, production values in the following years were variable and no sustained trend of changes in these volumes relative to the moving average of 12 months could be indicated.

Fig. 6: Seasonal fluctuations and random fluctuations with smaller potency in beef production in Germany in the years 2004 -2018 (%)

Source: own calculations based on Eurostat database

The next analysed country was the United Kingdom (Fig.7). In this case, it can also be stated that the analysed seasonal fluctuations are significant, and simultaneously - that they recur in the subsequent years very systematically. Interestingly, the periods of high production occur very regularly every three months. A slight exception are the production volumes in November, when they are usually consistent with the level of the twelve-month moving average. Production values higher than the average occurred in January, April, July and October. Out of the analysed months, the highest level of production was recorded in October (in many years higher by over 20% than the average) while the lowest in July. In the remaining months (except November), the production volume was lower than the average, with the lowest values recorded in August.

Fig. 7: Seasonal fluctuations and random fluctuations with smaller potency in beef production in the United Kingdom in the years 2004 -2018 (%)

Source: own calculations based on Eurostat database

Compared to the countries discussed earlier, the Polish market is very unstable (Fig.8). With few exceptional months, it has been difficult to indicate regular patterns. It is also a market with very high fluctuations in some years, reaching even +38.1% (March 2006) and on the other hand -25.8% in February 2012. Production lower than the average usually took place in January, February, August and

December while higher in March, May, September and October. In the remaining months, production volume fluctuated significantly in subsequent years, above and below the average value.

Fig. 8: Seasonal fluctuations and random fluctuations with smaller potency in beef production in Poland in the years 2004 -2018 (%)

Source: own calculations based on Eurostat database

Fig. 9 presents the so-called pure (cleared of random fluctuations) average seasonal fluctuations of beef production in the analysed countries and in general throughout the EU-28 for the entire analysed period of 15 years. Fluctuations in the EU-28, as previously noted, are usually lower, or on average, compared to the other countries studied. It should also be noted that due to the large share of the countries surveyed in the overall EU beef production, fluctuations in these countries had a large impact on the overall level of fluctuations. However, some regularities can be found in all analysed countries and throughout the EU-28. Production below the average occurred in all cases in February, August and December. In addition, in July only in the United Kingdom it was slightly higher than the average, while in other countries it was deviated by min. -5% from the average (in Germany up to 14%). In none of the months did the situation occur that the average deviations in all countries were simultaneously higher than the average, although in the entire Union such a situation took place in January, March, October and November. In January, the production lower than average occurred in Poland; in March the level of production slightly lower than the average occurred in the United Kingdom, in October in France and in November in France and Poland. In April, May, June and September, the production in the Union is close to the average which is the result of, sometimes even significant, fluctuations in production in individual countries.

Fig. 9: Pure seasonal fluctuations in beef production in analysed countries in the years 2004 - 2018 (%)

Source: own calculations based on Eurostat database

Conclusions

In 2004-2018, beef production in the European Union was characterized by a slight downward trend. This state of affairs was caused by various trends of changes in these volumes among its largest producers: a slight decrease in production in France, Germany and Spain, a fairly significant decrease in Italy, a slight increase in Ireland, a slightly higher in Great Britain and a very fast increase in beef production in Poland after 2013.

Seasonality in agricultural production is an objectively occurring phenomenon. It can cause some problems with resource management during periods of abundance and the need for storage for periods when there are shortages. Climate diversity, as well as other factors shaping production in individual countries, mean that fluctuations between months across the EU are not large. They are also largely correlated with changes in demand for meat products (larger in the pre-Christmas periods, smaller in the summer and shortly after Christmas). The individually analysed countries differ in terms of periods of production higher and lower than average, but also of the scale of fluctuations and their regularity. The French market experiences the smallest fluctuations. In addition to the months when the production was constantly higher or lower than the average, there were also months when the situation changed in subsequent years. However, in the situation of small fluctuations in the market, these situations might be expected. Beef markets in Germany and the United Kingdom are very predictable, although they differ in terms of fluctuation distributions. These are also countries where seasonal fluctuations occur on a much larger scale. The Polish market is the least predictable, but it also shows some regularities. Incidentally, there were very high fluctuations in beef production on the Polish market.

Abstract

The article is devoted to the presentation of the state of organic farming in the enlarged EU. The study uses statistical materials published by FIBL, IFOAM and in the Eurostat database. The subject of the analysis were data on organic farming in the EU. The analysis was made both in terms of the division into the old and the new EU, as well as individual EU countries. The basic time range of data covers the years 2000-2017. The area under organic cultivation, the share of organic cultivation area in the total utilized agricultural area and the number of organic farms were analysed. The article uses the basic methods of statistical analysis of data, i.e. Pearson's correlation, trend lines, dynamics indicators, arithmetic mean, standard deviation and cluster analysis. Over the period under review, there were changes in the EU countries in both the area and the number of organic food producers. In 2017, Austria and Estonia had the largest share (over 20%) of the fully transformed ecological zone in the UAA in EU Member States. The share in these countries is as much as 3 standard deviations from the EU average. In 2000-2017, the number of organic farms in the 28 EU Member States doubled, their area increased almost three times, while the number of processors of this type of food increased over 55 times. There is a large variation in the size of organic utilised agricultural land and the number of organic farms in individual countries. In 2000-2017, the largest area of organic farming among EU countries was recorded in Spain, Italy, Germany and France. The article emphasizes also the dynamic development of this way of farming in the countries of the new EU. The directions of changes in organic farming in the new EU countries were presented, the impulse for which were the benefits of EU membership.

Keywords: Organic Farming, Organic Food, European Union, Development

Introduction

Agriculture, despite the fact that its share in the Gross Domestic Product (GDP) tends to decrease along with the economic development of the country, belongs to one of the most important sectors of the national economy. The share of agriculture in GDP in highly developed countries does not exceed 2%, while in developing countries it is at the level of 3-5%. Despite this, according to Ziętara (2008), its role as the most important element in the country's food chain is indisputable. Lockeretz (2007) emphasizes that the problems caused by industrial agriculture, i.e. deteriorating natural resources, reduced food quality and reduced viability of rural areas have contributed to a different view on agriculture, which resulted in the introduction of the principle of sustainable development by governments of many countries. According to Żelezik (2009), proceeding according to the assumptions developed then contributed to the emergence of new farming methods in agriculture, i.e. organic farming.

According to Kowalska (2015), organic farming aims at sustainable food, i.e. taking into account local ecological, social and economic conditions. Kowalska (2011) understands organic farming as an agricultural system that through activating natural mechanisms (the use of natural, technologically unprocessed natural resources) ensures sustainable soil fertility and animal health, does not poison the environment, and at the same time allows farmers to produce healthy, high-quality agricultural products - organic food. Organic farming includes the four principles of 'health', 'ecology', 'integrity' and 'care' expressing the contribution to sustainable development and underpinning its development. IFOAM (2014) and Brzezina, et al. (2017) emphasize in their studies that the principles mentioned above should be interpreted as follows: the environment is protected, farmers and employees have fair access to the means of production while receiving fair remuneration, while consumers have access to healthy diet consisting of high-quality food that they can trust and buy at attractive prices.

Due to the growing demand for organic products, especially among the richer part of the world, in the European Union countries, as well as all over the world, an interest in organic farming is growing despite increasingly restrictive requirements regarding running this type of business. Ligenzowska (2014) notes that this trend does not only apply to highly developed countries inhabited by wealthy societies, but also to many developing countries (in which favourable conditions for this type of crops are found), which perceive this industry as a prospect for development. As noted by Stolze and Lampkin (2009), in order to support the development of this way of farming, national and then EU policy makers have introduced a wide range of support measures. These include legislative instruments (e.g. EU Council Regulation 2092/91 and its subsequent versions), financial tools (e.g. Direct payments to conversions and recognized organic producers) and communication policy instruments (e.g. Information and research activities) as well as action plans for the development of organic farming. The purpose of this article is to present the results of a comparative analysis of changes in organic farming in 28 European Union countries.

Material and Methods

The study uses statistical materials published by FIBL, IFOAM and in the Eurostat database. The subject of the analysis were data on organic farming in all European Union countries. The analysis was made both in terms of the division into the old and the new EU, as well as regarding individual countries constituting the Community nowadays. The basic time range of data covers the years 2000-2017. The analysis covered the acreage of organic cultivation, an average size of an organic holding, the share of organic cultivation area in the total utilized agricultural area and the number of organic farms. The article uses the basic methods of statistical data analysis, i.e. Pearson's correlation, trend lines, dynamics indicators and cluster analysis. To compare changes over time, with a changing share of ecological area to the total utilised agricultural area and average crop area per farm, the article, after Olszańska (2012), uses standard deviation (S(x)) in relation to the average value ($\bar{x}$) as a measure of the diversity of the analyzed values between countries. The obtained results were sorted in order to identify the European Union countries that are distinguished by the largest and smallest share of organic farming area and significantly differ in the average area of farms throughout the entire analysed period. The number of separate groups in a given year depends on the variability of the studied phenomenon. To find similar countries in terms of the development of organic farming, agglomerative Ward's method using Euclidean distance, as in Kowalska and Tarnowska (2017; 2018), was used. In this method, variance analysis is used to estimate the distance between clusters.

Results and Discussion

Organic farming in the European Union develops dynamically. In 2017, the area of organic farming in the Community countries was 12.82 million ha, of which almost 80% (10.17 million ha) was located in the EU-15 countries, and only 20% (2.65 million ha) in EU-13 (Fig. 1). In the years 2000-2017, the area of organic farming in the European Union increased by over 8.43 million ha (from about 4.38 million ha to almost 12.82 million ha, i.e. two-fold), including the increase in the EU-15 by over 6.12 million ha (from almost 4.05 million ha to about 10.17 million ha, i.e. 1.5 times), and in the EU-13 by over 2.3 million ha (from over 0.33 million ha to almost 2.65 million ha, i.e. almost 7-fold).

Fig.1: Changes in the area of organic farming in the European Union in total and divided into EU-15 and EU-13 (million ha); Source: own study based on https://statistics.fibl.org (12.12.2019)

The average annual increase in the area of organic farming in the Community countries in the period under consideration is almost 0.47 million ha, including 0.32 million ha in the EU-15 countries, and 0.15 million ha in the EU-13. For both the EU-28, EU-15 and EU-13 countries, the fit of the trend line was above 0.96. A very good fit and growing trend may indicate that this tendency will continue in the subsequent years.

Similarly to the area of organic farming, the number of organic farms in the European Union also increased. In 2017, there were over 343.3 thousand organic producers in the Community and over 2/3 of them were farms located in the old EU countries while less than 1/3 in the new Member States (Fig. 2). Over 18 years, the number of organic farms in the European Union increased by almost 170 thousand (that is, 1.25 times): in the EU-15 it was an increase by 85%, while in the EU-13 their number grew more than 5.5 times. In the case of both the entire Community and in the division into the countries of the old and the new European Union, the trend is positive, with a very good fit (R^2>0.91). In the European Union, during the period under review, ecological activities were undertaken by an annual average of almost 10.29 thousand new organic producers. In the EU-15 countries, as many as almost 6.06 thousand of them came every year, while in the EU-13 it was an increase by over 4.38 thousand.

Fig. 2: Changes in the number of organic farms in the European Union and divided into EU-15 and EU-13 (thousand); Source: own study based on https://statistics.fibl.org (12.12.2019)

Analysis of data regarding the area of crops and the number of organic producers showed significant differences between individual EU countries (Table 1). In 2017, Spain (2.082 million ha), Italy (1.908 million ha), France (1.744 million ha) and Germany (1.373 million ha) had the largest areas of organic farming. Austria, Sweden, the Czech Republic, the United Kingdom and Poland also showed the utilised organic area above the European Union average, while the countries with the smallest organic cultivation area included Malta, Cyprus and Luxembourg. However, the largest dynamics of changes

during the period under review was recorded in Croatia, where the area increased over 74.3 thousand times over 18-year period, and the average annual growth rate in the studied period is 5437.5 ha, with the trend line fit at the level of 0.81. Great Britain was the only country that showed a negative growth rate (-14%) in the analysed years, the average annual of organic farming area in this period decreased by 10.686 thousand ha, (with an average trend line fit (R^2 =0.45).

The analysis of organic farms in individual EU countries showed that in 2017 Italy had the biggest number of them, as many as 66,773. A large number of farms were also found in Spain, France, Germany, Austria, Poland and Greece. Croatia showed the highest growth dynamics in the number of farms over 18 years, similarly as in the case of the area of organic crops. In this country, the number of organic producers increased almost 670 times. Every year, it was a growth by 216 organic producers (R2 = 0.83). The number of organic producers in the countries of the new European Union i.e. Bulgaria or Romania increased significantly. Malta and Luxembourg were the countries with the lowest number of organic producers in 2017. The countries that showed a negative dynamics of change in the examined years included Finland (-10.7%) and Great Britain (2.4%).

Table 1: The number of organic farms and the area of crops in individual European Union countries in the years 2000 - 2017 - dynamics of changes, average annual change, fit of the trend line

Source: own study based on https://statistics.fibl.org(12.12.2019)

The correlation coefficient of the area of organic crops and the number of producers, in 2000-2017, was the highest ($r \geq 0.99$) in the case of Germany, Poland, Croatia and France (Fig. 3).

Fig. 3: Pearson's correlation coefficient between the number of organic farms and the area of crops in individual European Union countries in 2000-2017; Source: own study based on https://statistics.fibl.org (12.12.2019)

This means that in the case of these countries, the number of organic farms increased proportionally to the growing area of organic farming. Negative correlation, although weak, occurred in Finland. In this country, the growing number of organic farms was accompanied by a decreasing area of land utilised for organic farming.

The share of organic farming area in relation to the total utilised agricultural area was also considered. Similarly to the area of organic crops, the share of this area in relation to the total agricultural area also gradually increased (Fig. 4). In 2017, this share in the European Union represented 8.2% of the total utilised agricultural area, and over 18 years it increased by 5.8 pp.

Fig. 4: Dynamics of changes in the share of the fully transformed ecological zone in the UAE in the EU Member States in 2000–2017, in total and by old and new Community countries (%); Source: own study based on https://statistics.fibl.org (12.12.2019)

On average, it was an annual increase of 0.32% with very good trend line fit ($R^2 = 0.995$). Countries of the old European Union showed a much larger share of organic farming area. In 2017, this share in the EU-15 was 8.8%, while in the EU-13 it was 7.6%.However, during the period under review, the growth dynamics was lower for EU-15 countries than for EU-13 countries. The share of ecological crops area in the EU-15 countries (in the years 2000-2017) increased by 5.0 pp, with an average annual increase by 0.26% (R^2 =0.98), while in the EU-13 by 6.8 pp, with annual average growth by 0.40% ($R^2 = 0.995$). The growing share of ecological area especially in the EU-13 countries was caused by the accession of these countries to the Community, and thus the possibility of obtaining subsidies that encouraged farmers in these countries to transform their farms to ecological holdings.

European Union countries where the share of organic farming area in 2017 was the largest were Austria (24.0%) and Estonia (20.5%) (Fig. 5). High share of ecological area in 2017, above the average in the

European Union, was also shown by: Sweden (18.8%), Italy (15.4%), Latvia (14.8%), Czech Republic (12.2%), Finland (11.4%), Slovakia (10%), Slovenia (9.5%), Spain (8.9%) and Denmark (8.7%), while the lowest was recorded in Malta (0.4%), Ireland (1.5%), Romania (2.0%) and the United Kingdom (2.9%). It is positively surprising that the large share of ecological space, above the EU average, is recorded in the new countries of the community. As many as 5 countries out of 11 whose share of ecological area in 2017 was above the average in the European Union, were the new Community countries, i.e. Estonia, Latvia, the Czech Republic, Slovakia and Slovenia.

Fig. 5: Organic crop area in the EU Member States, 2017 (as % of total UAA); Source: own study based on https://statistics.fibl.org (12.12.2019)

In order to check how in individual countries, in the years 2000 - 2017, the share of the area designated for organic farming changed, the arithmetic average and standard deviation were used. The analysis showed significant discrepancies in this respect in individual EU countries (Table 2).

Source: own study based onhttps://statistics.fibl.org (12.12.2019)

Over 18 years, there was a visible reduction in stratification between countries regarding the share of organic farming area in the total crop area (from 4 to -2). In the entire analysed period, the highest share of organic farming area, within the range of 3 or even 4 standard deviations from the average, was recorded in Austria. It was joined in 2016 by Estonia, gradually increasing the area for organic farming. This is especially visible after the country's accession to the European Union. The second group of countries in which the share of organic farming area, in a part of the examined period with an upward trend, was two standard deviations above the European Union average, consisted of Sweden and Italy. Latvia also joined this group, since it systematically develops its organic farming similarly to Estonia.

A very large number of Community countries were classified in the third group, in which the share of ecological area, in the majority of the discussed period, exceeded the European Union average by 1 standard deviation. These countries included: the Czech Republic, Finland, Slovakia, Slovenia, Spain, Denmark, and until 2011 also Germany, which since 2012 fell into the fourth group. Another group of countries in which the share of organic farming area in the entire analysed period was below the European Union average to -1 standard deviation were: Belgium, Cyprus, France, Greece, Hungary, Luxembourg, the Netherlands and Poland as well as the countries which in recent years fell into this group i.e. Lithuania, Germany, Portugal and Lithuania, Germany, Portugal and UK. Croatia promoted to this group in 2009, and Bulgaria in 2015. The last group of countries in which the share of organic farming area was, in the last considered years, two standard deviations below the average in the European Union (-2)consisted of: Malta, Ireland and Romania.

The average size of organic farms was also subject to analysis (Fig. 6). In the years 2000-2017, the average area of an organic farm increased by 9.7 ha (from over 32.5 ha to almost 42 ha), in the EU-15 it was an increase by over 11 ha, while in the case of EU-13 the average farm size decreased by over 44 ha, i.e. over 50% (from 87.2 ha to about 43 ha).

Fig. 6: Dynamics of changes in the average area of organic farms in the European Union in the years 2000–2017 and divided into countries of the old and new European Union (ha / farm); Source: own study based on https://statistics.fibl.org (12.12.2019)

In 2017, the largest organic farms were located in Slovakia (Fig. 7). Their average area was over 430 ha. Large farms (however much smaller than those in the case of Slovakia) were located in Great Britain (143.1 ha), Estonia (104 ha), Sweden (99.4 ha), Czech Republic (98.6 ha) and Lithuania (94.5 ha). The smallest ones were in Malta (3.34 ha) and Cyprus (4.78 ha).

Fig. 7: Average area of an organic farm in individual EU countries in 2017 (ha); Source: own study based on https://statistics.fibl.org (12.12.2019)

An analysis of the average farm area in individual Member States using the arithmetic average and standard deviation showed that the largest areas of organic farms are in Slovakia (Table 3).

Table 3: Differentiation in the size of organic farms between EU-28 countries in the years 2000 ÷ 2017

Country	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017

Source: own study based on https://statistics.fibl.org(12.12.2019)

In this country, in 2000-2017, the average farm area exceeded by 5 or even 6 standard deviations the EU -28 average. The second group included Great Britain, in which, in almost the entire period under

consideration, the average farm area was two standard deviations over the EU-28 average. The third group included the Czech Republic. In the case of this country, a gradual decrease in the average area of farms is visible - from 3 standard deviations (in 2000-2007) to one deviation above the EU-28 average (in 2010-2012 and 2015-2017). Another group of countries in which the average farm area was one standard deviation above the EU-28 average in most of the period studied included: Portugal, Estonia, Denmark, Hungary, Germany, Sweden, France, Luxembourg, Spain, Lithuania and Latvia, and since 2012 also Ireland. The last group included countries with the lowest average area of organic farms, i.e. by one standard deviation lower than the EU-28 average (in most of the analysed period). These countries included the Netherlands, Italy, Austria, Poland, Croatia, Greece, Slovenia, Cyprus and Malta. Romania, Belgium and Bulgaria belonged to this group as well.

Figure 8 presents a tree diagram showing four clusters of similar countries in terms of the development of organic farming (the analysis covered the size of the area for organic farming, average farm area, share of organic farming area to the total agricultural area and the number of organic producers). The first cluster consists of six European Union countries. In 2017, these countries showed, above all, a large share of ecological area to the utilised agricultural area and a large average farm area. The second group included Slovakia (which is the first to join the first group of countries. It stands out significantly among the other European Union countries with its average area of organic farms (over 430 ha).

Fig. 8: Classification of EU-28 countries in terms of organic farming development in 2017; Source: own study based on https://statistics.fibl.org (12.12.2019)

The third group is the largest. It consists of 17 European Union countries. These countries, in contrast to the countries in the first group, showed a relatively small share of organic farming area. The Italy, Germany, Spain and France cluster was the last to join the rest. These four countries have the largest organic crop area (above 1.37 million ha) and the biggest number of organic producers (above 29.76 thousand entities).

Conclusions

Since the beginning of the 21st century, there has been a growing interest in organic farming in the world, also in the European Union. This is confirmed by both the growing area of organic utilised agricultural area and the increasing number of organic farms. Analysis of data on the level and dynamics of organic farming development in the enlarged European Union confirmed the growing

importance of this method of agricultural production in almost all its Member States. Particularly noteworthy is the great interest in this way of farming among new members of the Community.These countries, despite a small share in the European area of organic farming, were characterized by high growth dynamics in the area of organic farming and the number of organic farms, which weakens the level of organic farming concentration in the European Union. This result was influenced by both the administrative and political situation in these countries, high fragmentation of farms, favorable climate and growing global demand for organic crops. The huge potential for the implementation of organic crops on a mass scale was caused by aid programs in new EU countries and from the EU itself, which supported the transition to organic farming. Also the subsidization of farmers and producers of organic food increased the popularity of this type of farming. In addition, during the transition to organic farming, farmers receive financial support from specially prepared, i.e. SAPARD, RDP.

Changes also occurred in the size of organic farms. Large organic farms have decreased and the smallest have increased their area. In 2017, the average size of organic farms in the old and new EU countries was similar. The changes in the size of farms are supported by economic considerations. As Komorowska (2012) indicates, the smallest farms (up to 10 ha of UAA) show the highest level of productivity of land and capital resources. With the increase in the size of organic farms, their productivity (land and capital resources) deteriorates. It is related with organization of production (especially plant production), prices of organic products, as well as a decrease in production intensity (level of material costs per 1 ha of UAA). In smaller organic farms, the structure of arable land has a larger share of crops (i.e. vegetables, fruit, edible potatoes) for which farmers are able to obtain relatively higher prices compared to conventional products and this translates into the production and economic results of organic farms.

Clear advantage of the leaders i.e. Italy, Germany, Spain, and France, in the development of this mode of agricultural production over the remaining countries has decreased, especially in relation to newly admitted countries, whose membership in the Community guarantees more stable financial and legal conditions and provides new outlets.

Organic farming has great development opportunities in the new EU countries, including:

- low pollution level of natural environment,
- delay in relation to Western ways of farming (i.e. smaller specialization and concentration, traditional technologies),
- a large number of regions with conditions conducive to the development of organic farming (low level of industrialization),
- low consumption of chemicals (mineral fertilizers and pesticides).

The above-mentioned advantages give the EU-13 countries an advantage in the field of organic farming over the majority of EU-15 countries. Financial resources from the programs are an important stimulus encouraging farmers to switch their farms to organic. Despite this, in some EU-13 countries there is still a lack of a coherent development strategy and agricultural policy in the field of organic farming. For example, the NIK report (2019) shows that an inconsistent strategy and constant changes in regulations regarding procedures and rules for providing assistance to organic food producers, may cause delays in issuing decisions on granting subsidies (so-called ecological payments) and payments of money to producers, and in consequence contributed to the resignation of many farmers from running organic farms. Producers of organic products observe the changes in both subsidies and demand for individual products, adjusting production or introducing changes depending on the market situation and changing regulations and the amount of subsidies granted by the Institutions established in their countries.

Abstract

The aim of the study was to assess organic farming in the Visegrad Group countries after the accession of these countries to the European Union. Statistical materials published by FIBL and IFOAM and in the Eurostat database were used in the study. The subject of the analysis was the data on organic farming in the countries of the Visegrad Group. The basic time range of data covers the years 2004-2018.The article uses basic methods of statistical analysis of data, i.e. Pearson's correlation, trend lines and dynamics indicators. Analyses showed changes in both the area and the number of producers and processors of organic food in the countries of the Visegrad Group. However, these changes in individual countries of the Group were different. Despite a significant increase in the area of organic farming in Poland, the share of the area of these crops in relation to the total area of agricultural crops in the country is small. The country that develops very dynamically in this respect is the Czech Republic, where organic farming accounted for almost 15% of the arable land in 2018. A systematic decrease in the average area of organic farms is visible especially in the Czech Republic, but also in Slovakia. In the Czech Republic, the area of organic farms decreases annually by almost 14 ha. Poland is a country where the trend was different in this respect. In Poland, since 2014, a downward trend has been visible both in terms of crop area and the number of organic producers. On the other hand, organic food processing industry is developing, although for many years it was a bottleneck in the country's organic food distribution channel. In all countries of the Group, the first place takes the cultivation of organic cereals, followed by dry legumes and high-protein crops for the production of grain and oil seeds.

Keywords: Organic Farming; The Visegrad Group; Development;

Introduction

Agriculture has been the main source of livelihood for people over thousands of years. Nowadays the world is developing very rapidly. Population is increasing. According to the Food and Agriculture Organization (FAO), global food production should rise (Palaniappan, Annadurai, 2018). Otherwise we will have to face with a serious hunger problem. Therefore, such things as environmental safety and sustainable development are the subjects of research of scientists, politicians and environmentalists. They consider organic farming as a solution to prevent the disaster.

Organic farming is an agricultural system that through activating natural mechanisms, i.e. the use of natural, technologically unprocessed natural resources, ensures lasting soil fertility and animal health, does not poison the environment and at the same time allows farmers to produce high-quality, healthy agricultural products - organic food (Kowalska, 2011). Organic farming aims for sustainable food, i.e. taking into account local ecological, social and economic conditions (Kowalska, 2015). Conventional

agriculture can pose a significant burden to the environment, especially in a situation of increasing concentration as well as specialization and regionalization of production. Particular attention is paid to animal production (Olszańska, 2012). When it comes to plant production, there is an example of Polish potato. To improve the situation of this vegetable, the Ministry of Agriculture and Rural Development has developed a special Polish Potato Program. Its main goal is to help in the professionalization of this traditionally important in Poland, vegetable cultivation sector (Kowalska A.S., Gurkowa K., 2019).

Although there are many individual definitions of organic agriculture, the one seems to be the most comprehensive. The version given by Lampkin (1990) enclose all the important features. In reference to this description, organic agriculture is a specific system of production, which partly or even completely, avoids the use of pesticides, growth regulators and synthetic compound fertilisers. Moreover, organic farming does not involve substitutes of any chemical inputs with organic inputs.

However it is not easy to meet all conditions of organic farming, it is still worth to do it. The European Union requires quality, sanitary and veterinary standards to be done, so that the agri-food industry enterprises can be defined as ecology friendly. Aiming to maintain the balance of the ecosystem and minimize the negative impact on human health, the agri-food industry is one of the most important sectors of agribusiness in many countries. That kind of policy brings many advantages. It decides of a qualitative and quantitative volume of food production (Firlej, Kubala, 2018). Furthermore it helps to ensure food safety for all citizens. All things considered, organic farming is becoming more and more popular all around the world.

As an area of research the Visegrad Group countries were selected in the presented study. Also known as The Visegrad Four, it has been a regional form of co-operation of four of Central and Eastern Europe countries since 15 February 1991. Poland, Slovakia, Hungary and the Czech Republic as neighboring countries with the similar tradition, culture, values, geopolitical conditions and shared history work together in a number of fields of common interest within the all-European integration. These countries them were on the east side of the Iron Curtain, which means under the influence of the Soviet Union (Kowalska, Kovarnic, 2017). The encouragement for V4 was to intensify the co-operation in the common transformation (Ministry of Foreign Affairs, 2016). Moreover the development of free market economy as well as, in a longer term, partnership in a complex but progressive process of European integration.

There are plenty of research and analyses concerning the conditions, categories and level of value of agri-food products. All of them have been managed for a long period of time. In Poland we have detailed data from experts from the Institute of Agricultural Economics and Food Economy in Warsaw, National Research Institute and others. Among the authors we can cite: Urban and Mroczek (2011), Pawlak (2014), Kuźniar (2017), Firlej (2017), Bigos (2017), Kułyk and Gąsiorek- Kowalewicz (2018). The aim of the study was to assess organic farming in the Visegrad Group countries after their accession to the European Union.

Material and Methods

Statistical materials published in the form of FIBL and IFOAM reports were used in the study. Data from the FIBL and Eurostat database were also taken. The subject of the analysis included data on organic farming from Poland, the Czech Republic, Hungary and Slovakia. The basic time range of data covers the years 2004-2018 (some analyses, due to lack of data, end in 2017).The article uses the basic methods of statistical analysis of data, i.e. Pearson's correlation, trend lines and dynamics indicators. Time series of the number of organic farms, their area and the share of the area of organic farms to the total agricultural area were presented for the countries of the Visegrad Group. A trend function line and a determination coefficient R^2 were determined for them. It was assumed that for $R^2 \geq 0.70$ the fit of functions to empirical data is very strong.

Results and Discussion

Organic farming in the Visegrad countries, after their accession to the European Union, began to develop. However, in each of these countries this development was more or less intense. The analysis of the area of ecological crops indicates that it developed most dynamically in Poland, but the organic crop area was the largest (for the most part of the studied period) in the Czech Republic (Fig. 1).

Fig.1: Area of organic farming in the Visegrad Group countries in the years 2004-2018 (thousand ha)

Source: own study based on https://www.fibl.org; https://ec.europa.eu/eurostat/data/database (14.11.2019)

In Poland, in 2004-2018, the area of organic farming increased by almost 486 thousand ha, however, the largest increase by almost 700% (from 82.7 thousand ha to almost 658 thousand ha) was recorded in the years 2004 - 2014. After this period, there was a decrease in the area of organic cultivation in Poland (by over 26% in the last 4 years, i.e. from 658 thousand to 485 thousand ha) and this trend continues. Despite the decrease in the area of organic farming in Poland after 2014, the average annual growth rate throughout the entire period studied was the highest compared to other countries of the Group. In Poland, on average, in 2004-2018 the area for organic farming increased annually by over 34 thousand ha, with a good fit at $R^2 = 0.61$.

Poland is the only country in the Group in which the crop area has decreased so much. Other countries of the Group recorded an increase or slight fluctuations in the area of organic crops throughout the entire period studied. The area of organic farming in the Czech Republic increased very intensively. During the analysed period, the area of organic farming in this country doubled (from 260 thousand ha to over 209 thousand ha). In the case of the Czech Republic, the average annual increase in area during the period under consideration is almost 21 thousand ha, with a very good fit ($R^2 = 0.89$).

Slovakia also showed a very good fit of the trend line (R2 = 0,81) over the period considered. In the case of this country, the area of organic farming has increased since 2004 by almost 270% (from over 51 thousand ha to almost 189 thousand ha). Despite the growing tendency, the average annual growth of organic farming area in Slovakia in 2004-2018 amounted to about 8.15 thousand ha. The area of organic farming in Slovakia was the lowest among the countries surveyed in both 2004 and 2018. Hungary was the country showing the lowest growth dynamics in organic farming. In the analysed period, the area of crops in this country increased by only 57.4% (from 133 thousand ha to over 209 thousand ha). The average annual growth rate was about 4.9 thousand ha, however, the trend line fit in this case was moderate (R 2 did not exceed 0.5).

The share of the area occupied by organic crops in the total agricultural area was also assessed (Fig. 2). The obtained data shows that Poland has the largest total agricultural area. In 2018, the area of arable

land in Poland was over 14.5 million ha, while in Hungary the area was three times smaller, in the Czech Republic five times smaller and in Slovakia over 7 times smaller. Although Poland has the largest total agricultural crop area, it had the lowest share of organic farming in the total crop area among the Visegrad countries in the last two years.

The Czech Republic had the largest share of the area used for organic farming in the entire period studied. In this country, in 2018, the area for organic farming accounted for almost 15% of the total crop area. During the analysed period, this share increased by 7.56 percentage points, and the average annual growth rate (in 2004-2018) of the ecological area was about 0.61%. The area of organic farming in Slovakia also increased intensively. In this country, during the examined period, its share in the total crop area increased to 7.25 percentage points and in 2018 it accounted for almost 10% of total arable land. The average annual growth rate of the share of ecological area in the total agricultural area in this country is 0.43%. In both the Czech Republic and Slovakia, the trend line fit was very good ($R^2 = 0.89$ and $R^2 = 0.82$ respectively). The share of organic farming area in the total agricultural area in Poland and Hungary was much lower. In these countries, the area for organic farming in 2018 amounted to 3.3 and 3.9% respectively. In the period under review, it increased in Poland by 2.8 pp, while in Hungary by 1.62 pp. The average annual growth rate for these countries (in 2004-2018) was respectively 0.25% and 0.11%, with a good fit of the trend line ($R^2 = 0.64$ and $R^2 = 0.62$).

Fig. 2: Area under organic farming in the Visegrad Group countries in the years 2004-2018 (% of utilised agricultural area (UAA))

Source: own study based on https://statistics.fibl.org/europe.html; https://ec.europa.eu/ eurostat/data/database (14.11.2019)

The analysis of farms that undertook the cultivation of organic food in each of the countries discussed was varied (Fig. 3). The largest number of organic producers in the entire examined period was observed in Poland. In 2018, the country had 19,207 organic farms, while during the greatest popularity of converting farms to organic farming, the number of producers amounted to 26,598 (their number has decreased since 2013 by 7,391 farms). Since 2004, the number of organic farms in this country has increased four times. In the case of other countries, the number of organic producers was much lower than in Poland. In 2018, the number of organic farms in these countries was: 4,500 - Czech Republic, 3,929 - Hungary and 535 - Slovakia. The Czech Republic (among the countries of the Visegrad Group) showed the highest growth dynamics in the number of organic farms in the researched years. Their number in the Czech Republic has increased in recent 15 years by over 438% (annually, on average by almost 300 farms), in Poland by about 411% (annual average amounts to 1,245 farms), in Slovakia by over 357% (annually on average by about 142 farms) and in Hungary, by less than 127% (average

annual is around 21 farms). A very good trend line fit is visible in Slovakia and the Czech Republic, while in the case of Poland and Hungary it is good.

** no data on organic food processing product in 2018*

Fig. 3: Number of organic producers in the Visegrad Group countries in the years 2004-2018 (pcs)

Source: own study based on https://statistics.fibl.org/europe.html; https://ec.europa.eu/eurostat/data/ database (14.11.2019)

The subject of analysis covered also the changes in the number of processors of organic products in the countries discussed (Fig. 3). In the years 2004-2017, the number of organic processing plants in the Czech Republic and Poland increased significantly. During the period under review, their number increased almost 13.5 times in Poland (from 55 in 2004 to 795 in 2017) and in the Czech Republic more than 4.5 times (from 116 in 2004 to 539 in 2017). On average, their number increased annually in Poland by 50 processing plants ($R^2 = 0.90$), while in the Czech Republic by almost 40 ($R^2 = 0.79$). In Hungary, the number of organic processing plants fluctuated significantly over the period considered. Over the last 14 years, their number increased by 75%. Despite the upward trend, on average by about 7 processing plants on an annual basis, it cannot be assumed that this trend will continue, as the fit in this case was very weak. The increase in the number of processing plants is also visible in Slovakia. In this country, their number increased fivefold in 14 years, which means that three new organic processing plants were established there every year. The trend line fit in this case was on the moderate level.

An analysis of the average size of organic farm in the surveyed countries showed that Slovakia was the leader in this issue throughout the whole period (Fig. 4). In 2018, the average size of organic farms in this country was over 323 ha, they were over three times larger than in the Czech Republic (115.5 ha / farm), over 6.5 times larger than in Hungary (53.3 ha / farm) and almost 14 times larger than in Poland (25.2 ha / farm). The largest average area of an organic farm in Slovakia was over 460 ha / farm and it was recorded in 2005.

Fig. 4: Average organic farm area per farm in the Visegrad Group countries in the years 2004-2018 (ha/producer)

Source: own study based on https://statistics.fibl.org/europe.html, https://ec.europa.eu/ eurostat/data/database (14.11.2019)

Over the past 15 years, the average area of an organic farm in this country has decreased by 84.2 ha, annually on average by about 2.33 ha / farm (trend line fit was very weak $R^2 = 0.12$). The country where the average farm area decreased the most was the Czech Republic. In this country, in the15-year period, the average area of an organic farm decreased by almost 196 ha. On average, it was annually by almost 14 ha / farm, with a very good trend line fit at the level of $R^2 = 0.72$. The average area of an organic farm in Hungary also decreased, although not as much as in the case of the Czech Republic. In the analysed period, the average area of an organic farm decreased by over 23.5 ha, the average annual was 1.85 ha / farm ($R^2 = 0.52$). Poland is the only country in which the average farm area increased in the analysed period. This country had the smallest average area of farms in the whole period under study, compared to other countries of the Group. The average farm size in Poland ranged from 17.9 ha in 2006 to 26.5 ha in 2014. In 2004-2018, the average area of an organic farm in this country increased by 3.2 ha, which gives average annual growth by 0.34 ha ($R^2 = 0.41$).

Using the Pearson correlation coefficients, the average area of organic farming and the number of organic farms in the analysed countries were also assessed (Fig. 5). Analysis of the relationship between the average area of organic crops and the number of organic farms in 2004-2018 showed in Poland a strong positive correlation ($r = 0.72$). This indicates that both the average crop area and the number of organic farms are increasing. The opposite was true for the Czech Republic and Hungary, which showed a strong negative correlation during this period ($r > -0.92$). This means that in these countries the number of organic farms grew faster than their average area. From the above, it can be concluded that in Poland during the period under study new organic food farms were created and expanded their acreage. On the other hand, in the case of the Czech Republic and Hungary, the tendency to create farms with ever smaller organic farming area prevailed. Also in Slovakia ecological farms with smaller and smaller area are established; however, in this country, there was an average negative correlation between the analysed variables ($r = - 0.49$).

Fig. 5: Correlation between comprehensive ecological services and the area covering cultivation in the Visegrad Groups countries in 2004-2018 (number, ha/producer)

Source: own study based on https://statistics.fibl.org/europe.html; https://ec.europa.eu/eurostat/data/database (14.11.2019)

Analysis of data on organic crops cultivated in the Visegrad countries showed the leading position of cereals in terms of the crop area (Table 1). Poland had the largest area for cereal cultivation, both in 2009 and 2017. In Poland, there was also the largest increase in the area for cereal cultivation. Within 9 years, this area increased by almost 50% (from approx. 77.5 thousand ha to approx. 116.1 thousand ha). In the case of other countries, there was also an increase in the area for cereal cultivation, but it was not as significant as in the case of Poland.

Tab. 1: Organic area for selected crops in cultivation in the Visegrad Group countries in 2009-2017 (ha,%)

Selected crops	Czech Republik			Slovakia			Poland			Hungary		
	2009	2017	change	2009	2017	change	2009	2017	change	2009	2017	change

**for the production of grain*
Source: own study based on https://statistics.fibl.org/europe.html; https://ec.europa.eu/eurostat/data/ database (14.11.2019)

In Poland, there is also a visible increase in the area for growing grapes (by almost 1967%), legumes and high-protein crops for grain production (by over 986%) as well as vegetables (by over 804%). However, there was a decrease in the area of nut cultivation (by almost 93%) and root crops (-1.1%). In the Czech Republic, as in Slovakia, the area for nut cultivation increased significantly (by over 231% and 858%, respectively), similarly to legumes and high-protein crops for grain production (by over 136% and 621%, respectively) and decreased in the case of vegetable cultivation (by more than 50% and 86%, respectively). In the Czech Republic, the area for berry production has also decreased (5.5%) and in Slovakia there was a drop in the area for cultivation of temperate climate fruit (by over 22%), root crops (by 3.8%) and oil seeds (by 3.5%). Hungary is the only country in which the area of all these crops increased in the analysed period. The highest increase in the area of organic farming in this country occurred in the case of temperate climate fruit (by almost 222%) and root crops (by 116%), while the smallest in the case of cereals (9.5%) and oil seeds (by over 11%).

Conclusions

A number of detailed conclusions can be drawn from the analyses.

- The countries of the Visegrad Group have very good conditions for switching their farms to organic farming. Chemization and mechanization in rural areas of these countries took place to a much lesser extent in contrast to the countries of the old European Union. Therefore, most of the land available in these areas can be quickly and easily adapted to the requirements of organic farming.

- In the years analysed in the study, in the countries of the Visegrad Group, both the crop area and the number of organic producers and processors increased, while in Poland in 2014 both the area and the number of organic producers began to decrease systematically. This phenomenon should be perceived as a consequence of i.a. continuous changes in provisions on the procedure and rules for providing assistance to organic food producers (in 2014-2018 they were changed seven times, even without prior market analysis). Constant changes in the regulations, which contributed to delays in issuing decisions regarding the granting of subsidies (so-called ecological payments) and payment of money to producers, were one of the reasons why farmers resigned from running organic farms. Another problem was the requirement for yields obtained as part of the vegetable, herb and orchard agricultural packages, which obliged organic producers to sell or process at least 80% of what they produced. Such exorbitant obligations meant that, on the one hand, farmers had nothing to feed their own animals, and on the other hand, that lots of them had a problem with selling their products on the growing eco-food market.

- Despite a significant increase in the area of organic farming in Poland, the share of the area of these crops in relation to the total area of agricultural crops in the country is small. In this respect, organic farming is developing very dynamically in the Czech Republic, where organic farming accounted for almost 15% of the agricultural area in 2018.

- The calculated correlation between the number of organic producers and the average size of an organic farm has shown that countries with a large average farm area are gradually limiting it. The

largest farms (in 2018 that was on average 350 ha) were in Slovakia, but a significant reduction in the average size of a farm took place mainly in the Czech Republic. In the Czech Republic, the area of organic farms decreases annually by almost 14 ha. Due to the requirements for organic farms, among others regarding biodiversity, the right proportions between plant and animal production, as well as the lack of chemical fertilizers and limitation of mechanization makes smaller farms easier to manage.

- In Poland, however, since 2014, a downward trend has been visible both in terms of crop area and the number of organic producers. On the other hand, organic food processing industry is developing although for many years it was a bottleneck in the country's organic food distribution channel.

- Organic producers observe carefully the changes in demand for their products, as well as regulations and subsidies in their countries, and then adapt their production or introduce changes depending on the market situation. In the Visegrad countries, the largest areas of organic farming are covered by cereals, legumes and high-protein plants for grain production and oil seeds.

Analysis of Changes in The Volume of Fish Production and Consumption in The World - Selected Problems

Joanna SZYMAŃSKA

Wroclaw University of Economics and Business, Wroclaw, Poland
joanna.szymanska@ue.wroc.pl

Abstract

The dynamic increase in the production of fish and other aquatic organisms in the world, which occurred in the years 1950-2019, is positively correlated with the growth of the world's population. The changing consumption model has a large impact on the increase in the analysed production. Fish is an increasingly appreciated source of wholesome, easily digestible proteins, minerals and vitamins. However, a disturbing phenomenon is the fact that more and more global fish stocks are being overfished. In the context of these problems, attention should be paid to the role of sustainable fishing. In the analysed years, the structure of fish production in the world, considered according to various criteria, changed significantly. The share of fish and other aquatic organisms obtained from fishing decreased, while the share of fish produced in aquaculture increased. This should be assessed as a very favourable phenomenon in the context of sustainable production. In the geographical structure of fish production, the importance of the Indian Ocean as a source of fish is growing, while the significance of the Atlantic Ocean, especially the North East Atlantic Ocean, is decreasing. This is related to the introduction of increasingly stringent catch limits in the European Union. The world's largest producer of fish and other aquatic organisms is China. Indonesia and India also belong to the top three. The Asian region (Asian inland waters and the Northwest Pacific) has dominated the world fish and other aquatic organisms production. The production of aquaculture fish is becoming increasingly important there. In the situation of the further, expected by FAO, increase in the consumption of fish and other aquatic organisms, and the increasing risk of significant loss of stock of some fish species, it is necessary to extend the acquisition of fish and other aquatic organisms from aquaculture, tightening catch limits (European Union), greater control of catches, in order to eliminate illegal fishing.

Keywords: Fish Catches, Aquaculture, Sustainable Fishing, Fish Consumption.

Introduction

According to historical sources, people started fishing about 10-12 thousand years BC. At the same time, fish have been one of nutrients since the earliest times. The material evidence of this phenomenon, from different geological eras, is provided by numerous excavations. They are located on all continents and contain, among others, the remains of fishing gear and the eaten fish debris.

Fish is of great economic importance. They provide valuable and tasty meat and caviar. The nutritional value of meat of fish and slaughter animals is very similar. The content of full-value, easily digestible protein in fish meat ranges between 8-20% (in meat of slaughter animals, it is respectively 15-20%). Fish contain minerals important for the human body, such as phosphorus and calcium, as well as vitamins, including group B vitamins. In the meat of marine fish, iodine and fat-soluble vitamins A and D are also found. Fish are also a raw material for the production of medicinal products (e.g. fish oil), fertilizers, glues and animal feeds (Kurien, 2005; Carpenter, Kleinjans, 2017).

The global production of fish and other aquatic organisms includes their supply both from fishing (oceans, seas, rivers, lakes and other water reservoirs) and from aquaculture (both salt and fresh water). The global production of aquatic organisms obtained from aquaculture has been growing dynamically (FAO, 2016; FAO, 2017; FAO, 2018).

Climate warming becomes a growing threat to many species of fish and other aquatic organisms, according to the Report of the International Union for the Conservation of Nature (IUCN) presented at the UN Climate Summit in Madrid COP 25. The consequence of this warming and the penetration of waters by artificial fertilizers (excessive algae growth) is the progressive process of oxygen reduction in the oceans, by 2% in 1960-2010. There are currently 700 areas with oxygen deficiency in the Atlantic Ocean, while in the 1960s there were only 45 such places, which was observed by IUCN experts (Gazeta prawna pl., 2019).

The purpose of this study is to assess changes in the volume of fish production and consumption in the world. The time horizon of the research covers the years 2010-2019. In some cases, this horizon has a much wider range and concerns the years 1950-2019. To prepare this article, different descriptive, comparative, analytical, mathematical and statistical research methods were used.

Fish Production in the World

In the structure of the supply of fish and other marine organisms, the share of catches decreased in 2010-2019, and the acquisition of fish and other marine organisms from aquaculture is becoming more and more important (Fig. 1).

Fig. 1: Structure of fish and other marine organisms production (excluding aquatic plants, marine mammals, sponges, corals, etc.) in the world in 2010-2019 with the volume estimated for 2018 and the forecast volume for 2019 (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

According to the forecasts, the share of aquaculture in 2019 may amount to 48.7% of the total world supply of fish and other marine organisms (the remaining percentage will come from catches). For comparison, in the 1950s the share of aquaculture in the total production of fish and other marine organisms (excluding aquatic plants, marine mammals, sponges, corals, etc.) was only 4.4% (average annual for 1950-1959) and increased dynamically in subsequent periods, especially since the mid-1980s, according to FAO data (Fig. 2).

Fig. 2: Average annual structure of fish and other marine organisms production (excluding aquatic plants, marine mammals, sponges, corals, etc.) in the world in the years 1950-2019 (%)

Source: own study based on: Hryszko, Kuzebski, Lirski. 2014; Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

On average, in the years 1980–1989, aquaculture already accounted for 12.5% of the total supply. In the next decade, it was almost twice as much (24%), while in the last analysed years 2010-2019 (including the amounts forecast for 2019), the average annual share of aquaculture production may be slightly over 10 times higher than the corresponding share in 1950 -1959. Over the past two decades, global aquaculture production has increased dramatically and now exceeds beef production (Jennings et al., 2016).

In the context of this analysis, attention should be paid to the phenomenon of drop in deep-sea catches conducted by numerous countries around the world (in total, from 7-9 million tonnes in the 1970s and 1980s to 5 million tonnes in the mid-1990s). Initially, these catches were, in many cases, overexploitation (uncontrolled exploitation of fish resources by the countries that did not directly border with the fisheries used). In the subsequent decade, a global process of appropriation of fisheries by coastal states (protection of the own economic interests of coastal states) began, started in the 1970s and legally sanctioned by the Convention on the Law of the Sea (UNCLOS) in 1982. (protecting fish stocks and ensuring access to them for coastal states) (Fish market, 2004; Fish market, 2007; Portal INFOR pl., 2019).

Changes in the structure of fish and aquatic organisms production were accompanied by an increase in their global production volume, according to FAO estimates. In 2019, this production is forecast to amount to 177.8 million tonnes and is to be higher, by 20.1% than in 2010 (Fig. 3).

Fig.3: Structure of fish and other marine organisms production (excluding aquatic plants, marine mammals, sponges, corals, etc.) in the world in 2010-2019 with the volume estimated for 2018 and the forecast volume for 2019 (million tonnes)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

The shaped upward trend in the examined range (equation of the upward trend line: y = 3.157x + 1148.13) was affected by the increase in:

- catches, up to 91.3 million tonnes in 2019 (by 2.6% more than in 2010;
- aquaculture production, up to 86.5 million tonnes in 2019 (46.6% more than in 2010). Catches in 2010-2019 - the equation of the upward trend line: y = 0.1812x + 91.173. Aquaculture production in 2010-2019 - equation of the upward trend line: y = 2.9758x + 56.953.

The total global supply of fish and other marine organisms in 2019 may be 6.5 times higher than the average annual supply for 1950-1959, while the supply from catches alone is to increase 3.5 times, while from aquaculture as much as 72.1 fold.

As results from the calculations carried out, the increase in the volume of fish and other marine organisms production is positively correlated with the growth of the world population (correlation coefficient r = 0.9914 for 1950-2019) (Fig. 4).

Fig. 4: Production of fish and other marine organisms (excluding aquatic plants, marine mammals, sponges, corals, etc.) in the world in 1950-2019 (million tonnes) and the world's population (billion)

Source: own study based on: Hryszko, Kuzebski, Lirski. 2014; Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

Analysing the structure of production of fish and other marine organisms in the world in 2010-2017, according to production areas, it should be stated that Asian inland waters have a relatively largest share in this production in quantitative terms (annual average 30.9%). The next position is occupied by the Northwest Pacific (23.2%, respectively). The list of top three largest producers of fish and other marine organisms in the world includes also the Midwestern Pacific (9.1%). A smaller share, ranked in descending order, have: Indian Ocean (7.6%), North-East Atlantic (6.5%), South-East Pacific (6.4%), Middle-East Atlantic and African inland waters (2,7% each). The remaining areas account for a total of 10.8% of the total production of fish and other marine organisms in the world (Fig. 5).

Fig. 5: Structure of fish and other aquatic organisms production in the world for 2010-2017 by areas of this production (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

The Asian region (Asian inland waters and the Northwest Pacific) has dominated the world fish and other aquatic organisms production. In the analysed years, the average annual share of this region, in quantitative terms, exceeded half of the production (54.2%).

However, a disturbing phenomenon is the fact that more and more global fish stocks are being overfished. This currently applies, according to the FAO report, to over 33% of fish stocks, which is 3 times more than in the 1970s. Overfishing occurs especially in the Mediterranean and Black Sea areas (62.2%), the Southeast Pacific (61.5%) and the Southwest Atlantic (58.8%). According to the World Wide Fund for Nature (WWF), overfishing is caused by excessively high catch limits set each year by EU fisheries ministers, overcapacity of the fishing fleet and illegal (unreported) fishing. According to WWF specialists, as much as 60% of the world's fish stocks are exploited at the highest possible level (WWF. pl., 2019). In the context of these problems, attention should be paid to the role played by sustainable fisheries (minimization of uncontrolled and accidental catches of aquatic organisms, i.e. minimization of by-catches, thus protecting not only fish stocks, but also protected species of birds and marine mammals). The Sustainable Fishing Certificate (MSC) is currently held by 35 countries in the world (320 fisheries), and over 80 countries have applied for this certificate and are in the process of evaluation (FAO, 2019).

Considering the type of aquatic environment from which the fish originate, it should be stated that the largest in the global production is the share of sea fish (annual average 42.3%). Freshwater and bi-environmental fish account for 35.2%, respectively. The share of molluscs (13.9%) and crustaceans (8.2%) is definitely smaller, and the smallest is the share of other organisms (0.4%) (Fig. 6).

Fig. 6: Structure of fish production in the world in 2010-2017 by type of aquatic environment and other aquatic organisms (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

Over the years, the share of the production of marine fish in the total production of fish and other aquatic organisms in the world decreases, while the share of freshwater and bi-environmental fish in particular increases.

The analysis of catches of the most important fish species in the world indicates that the largest share in this production have Peruvian anchovies (annual average 5.1%), followed by pollock (3.5%) and striped tuna (bonito) (3.1%). The lower share have, ranging in descending order: Atlantic herring (1.9%), Pacific mackerel (1.7%), yellowfin tunas, silver scabbardfish and Atlantic cod (1.4% each) as well as European sardines (1.3%) (Fig. 7).

Fig. 7: Structure of catches of the most important fish species and aquatic organisms in the world in 2010-2017 (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

In the analysed years, there was an upward trend regarding the catches of the following fish species: pollock (increase to 3,488 thousand tonnes in 2017, by 23.3% compared to 2010), striped tuna (bonito) (increase to 2,828 thousand tonnes, by 8.6%), yellowfin tunas (increase to 1,477 thousand tonnes, by 21.5%), European sardines (increase to 1,428 thousand tonnes, by 14.6%), Atlantic cod (y = 44.119x + 1055.5; increase by 37%, to 1,304 thousand tonnes), Equations of the outlined upward trend line: pollock (y = 74.452x + 2932.2), striped tuna (bonito) (y = 25.19x + 2711.1), yellowfin tuna (y = 38.214x + 1161.5), European sardine (y = 38.369x + 999, 6), Atlantic cod (y = 44.119x + 1055.5). (Fig. 8).

Fig. 8: Estimated catches of the most important fish and aquatic organisms worldwide in the years 2010-2017 (thousand tonnes)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

A downward trend was observed in the catches of fish species such as: Peruvian anchovies (decrease to 3923 thousand tonnes in 2017, by 6.7% compared to 2010), Atlantic herring (decrease to 1815 thousand tonnes, by 17, 6%), Pacific mackerel (decrease to 1511 thousand tonnes, by 7.5%), silver scabbardfish (decrease to 1217 thousand tonnes, by 9.3%). Equations of the outlined decreasing trend line: Peruvian anchovies ($y = - 372.67x + 6,359.3$), Atlantic herring ($y = - 53.738x + 2018.6$), Pacific mackerel ($y = - 21.512 + 1628.7$), silver scabbardfish ($y = - 8.6905x + 1306.9$).

Extremely dangerous phenomena sometimes occur in the population of certain fish species, belonging to the most important fish species caught in the world. This situation currently (2019) applies to Atlantic cod caught in the eastern Baltic Sea and largely concerns Polish fishermen. The increase in catches of this species of fish, and above all the pressure of the anthropogenic environment, have made the present situation of Atlantic cod critical as it may be concluded from the statement of the EU Commissioner for the Environment, Maritime Affairs and Fisheries. There was a loss of their stock in the eastern Baltic Sea, which should be considered a very worrying phenomenon. In mid-October 2019, EU ministers responsible for fisheries agreed almost a total ban on cod fishing in the eastern Baltic Sea, important for Polish fishermen. This is to help rebuild the cod stocks (Portalspozywczy. pl, 2019).

Due to the fact that Poland is a member of the European Union (since May 1, 2004), Polish fisheries are covered by the Common Fisheries Policy, just like other European Union countries. This policy aims to achieve sustainable exploitation of fisheries and stabilize the fish market, and consists in providing food products of the highest quality and at the right price, while simultaneously ensuring profits for producers, in accordance with the principle of maintaining a balance between fisheries resources and fishing potential. The problem areas of the Common Fisheries Policy included:

1. Conservation of fish stocks (the basic instrument for managing sea fisheries in the European Union are the annual catch limits (quotas) - Total Allowable Catches (TAC);

2. Structural policy (infrastructure adaptation: fleet, port facilities, factories and organization of the production process and management of their development in the fishing industry);
3. Common market organization (balancing the needs of the Community market and the interests of EU fishermen, and ensuring *fair play* competitiveness rules by creating a common market within the Community and matching production volume and demand;
4. External fisheries policy (obtaining rights to use non-European fisheries for EU trawlers) (EUR-Leks. eu., 2019; Szymańska, 2006; EC. Europa. eu., 2019; Szymańska, 2010; The European Union and fishing subsidies. Raport, 2019).

A contentious problem turned out to be the European Commission's proposal (December 2019) regarding financial aid for fishermen affected by the closure of fishing for Atlantic cod in the Eastern Baltic Sea. This financial support is intended for the permanent decommissioning of fishing vessels. The Commission is also proposing to tighten fishermen's controls. From 2020, vessels fishing for cod in the Eastern Baltic Sea are to be equipped with a satellite monitoring system or other electronic monitoring system. In addition, at least 20% of these vessels should take observers on board. However, as experts estimate, the eastern cod stock will not be able to rebuild before 2024, even in the total absence of catches, which should be considered a very unfavourable phenomenon (Portalspozywczy. pl, 2019).

The world's largest producer of fish and other aquatic organisms is China. In the analysed years, Chinese average annual share in this production was almost 37% (for comparison, the average annual in 1950-1959 was definitely smaller - 8%). Indonesia (6.2%, annual average in 1950-1959 - 2.2%) and India (5.9%, 3.3% respectively) are among the top three largest producers of fish and other aquatic organisms in the world. (Fig. 9).

Fig. 9: Structure of fish and aquatic organisms production in the world in 2010-2017 by largest producers (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

Asian countries have dominated the production of fish and aquatic organisms worldwide. Their total average annual share (excluding Russia) exceeded 64% in the period considered. Russia accounted for

2.8% of the analysed production (while on average in the years 1950-1959 its share was definitely higher - 8.4%). The United States is a major global producer of fish and aquatic organisms (3.3%, with annual average much higher in 1950-1959 - 8.4%). This group also includes Peru (3.1%, annual average lower in 1950-1959 - 1,5%) and Chile (2%, in 1950-1959 the annual average was lower and amounted to 0,7%). The average annual share of Peru in the global production of fish and aquatic organisms, in the years 1960-1969, was 15.2% and was the highest among the largest producers of fish and aquatic organisms in the world. In the following decades, this share decreased. The average annual share of Chile in the global production of fish and aquatic organisms increased in the following decades (until 1999), then began to decrease (Hryszko, Kuzebski, Lirski, 2014). Among European countries (excluding Russia), Norway is an important global producer of fish and aquatic organisms (2.2%). In total, however, the remaining countries account for just over one-fifth of all the production.

In the analysed years 2010-2017, the total supply of fish and aquatic organisms in the world obtained from their largest producers increased (to 172.7 million tonnes in 2017, by 16.5% compared to 2010). The production of aquaculture fish is becoming increasingly important there.

An upward trend was recorded for the following countries, ranking the dynamics of change in decreasing order: Indonesia (up to 12.8 million tonnes, by 66.2%), Vietnam (up to 7.1 million tonnes, by 39.2%, respectively), Bangladesh (up to 4.1 million tonnes, by 36.7%), India (up to 11.6 million tonnes, by 36.5%), Russia (up to 5.1 million tonnes, by 21.4%), China (up to 62 , 2 million tonnes, by 19.2%) and the United States (up to 5.5 million tonnes, by 12.2%). Equations for the outlined upward trend lines: Indonesia (y = 0.7131x + 6.9036), Vietnam (y = 0.2429x + 4.8821), Bangladesh (y = 0.148 x + 2.8036), India (y = 0.4464x + 7.6786), Russia (y = 0.1071x + 4.0929), China (y = 1.8655x + 51.593), United States (y = 0.0357x + 5.2643). Equation for the outlined upward trend line for Norway (y = 0.0107x + 3.4893). Equations for the outlined upward trend lines: Indonesia (y = 0.7131x + 6.9036), Vietnam (y = 0.2429x + 4.8821), Bangladesh (y = 0.148 x + 2.8036), India (y = 0.4464x + 7.6786), Russia (y = 0.1071x + 4.0929), China (y = 1.8655x + 51.593), United States (y = 0.0357x + 5.2643) (Fig. 10).

Fig. 10: Volume of fish and aquatic organisms production in the world in 2010-2017 by major producers (million tonnes)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

There was no change in production volume in the case of Norway, for which the upward trend in the examined respect developed also in the years 2010-2017. Equation for the outlined upward trend line for Norway (y = 0.0107x + 3.4893). The downward trend in the analysed range concerned such countries as: Peru (decrease to 4.3 million tonnes, by 2.3%), Chile (to 3.1 million tonnes, by 8.8%, respectively), South Korea (to 1.9 million tonnes, by 13.6%), Myanmar (up to 3.2 million tonnes, by 17.9%), Philippines (up to 2.7 million tonnes, by 20.6%), Japan (up to 3.8 million tonnes, by 20.8%), Thailand (up to 2.4 million tonnes, by 22.6%). Equations for the outlined downward trend lines: Peru (y = - 0.2976x + 6.3893), Chile (y = - 0.1357x + 3.8107), South Korea (y = - 0.05x + 2.325), Myanmar (y = - 0.1702x + 4.2036), Philippines (y = - 0.083x + 3.375), Japan (y = - 0.1107x + 4.7357), Thailand (y = - 0.11119x + 3.2286). For other countries, there was an upward trend (overall increase to 39.2 million tonnes, by 16.3%). Equation for the outlined upward trend line for all other countries y = 0.781x + 32.386. Very dynamic (upward) changes are noticed in the analysed range when the average annual production volume for 2010-2017 is compared with the corresponding values for 1950-1959 (Fig. 11).

Fig. 11: Volume of fish and aquatic organisms production in the world in 1950-2017 by major producers (million tonnes)

Source: own study based on: Hryszko, Kuzebski, Lirski, 2014; Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

Considering the relative increase in the production volume of fish and aquatic organisms, according to the most important countries in the world in this respect, for the compared time intervals (average annual production volume in 2010-2017 compared to the corresponding values for 1950-1959), these countries can be ordered in the following series: Vietnam (29.9-fold increase, on average annually to 6 million tonnes in 2010-2017), China (27.3-fold, up to 60 million tonnes, respectively), Myanmar (17.2-fold, up to 3.4 million tonnes), Indonesia (16.9 times, up to 10.1 million tonnes), Chile (16 times, up to 3.2 million tonnes), Peru (12.6 times, up to 5.1 million tonnes), India (10.8 times, 9.7 million tonnes), Philippines (7.5 times up to 3 million tonnes), United States (2 times, up to 5.4 million tonnes), Russia (2 times, up to 4.6 million tonnes), Japan (0.9 times, up to 4.2 million tonnes). In total, for other countries, the volume of fish and aquatic organisms production annually averaged 47.8 million tonnes in 2010-2017 and increased 3.8-fold compared to the corresponding average annual for 1950-1959. In the analysed wide time horizon, Asian countries dominate in the production of fish and other aquatic organisms in the world. The supply of aquatic organisms obtained from aquaculture in these regions of

the world is especially high and constantly growing, which should be assessed favourably in the context of the idea of sustainable fishing.

Intended use of fish and marine organisms – for consumption and non-consumption purposes

The vast majority of fish and marine organisms caught in the world are intended for consumption. In the analysed 2010-2019 period, it was on average 87.4% (the remaining percentage is used for non-consumption purposes) (Fig. 12).

Fig. 12: The structure of use of fish and other marine organisms caught (without aquatic plants, marine mammals, sponges, corals, etc.) in the world in 2010-2019 with an estimated value for 2018 and forecast for 2019 (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

In the analysed years 2010-2019, the size of catches of fish and other marine organisms (excluding aquatic plants, marine mammals, sponges, corals, etc.) that were intended for consumption increased (there was an upward trend that can be described by the equation for the outlined upward trend line: $y = 3.3685 + 126.03$). According to forecasts, in 2019, 158.2 million fish and other marine organisms can be allocated for consumption purposes (Fig. 13).

Fig. 13: The volume of fish and other marine organisms caught (without aquatic plants, marine mammals, sponges, corals, etc.) in the world in 2010-2019, taking into account the volume estimated for 2018 and forecast for 2019 by purpose (million tonnes)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

Compared to 2010 it will an increase by 23.6%. However, multidirectional fluctuations (increase-decrease type) occurred in terms of the volume of fish and other marine organisms caught for non-consumption purposes. In 2019, 19.6 million tonnes of fish and other marine organisms might be allocated for these purposes, i.e. 2% less than in 2010. As a result, a downward trend took place regarding the volume of fish and other marine organisms caught for non-consumption purposes (equation for the outlined trend line: $y = - 0.2115x + 22.093$).

The observed increase in the overall volume of fish and other marine organisms production is positively correlated with the increase in catches of those organisms intended for consumption (correlation coefficient $r = 0.99$), and negatively correlated with the volume of catches for non-consumption purposes (correlation coefficient $r = - 0.3164$).

According to the Marine Stewardship Council (MSC) report Working Together for Thriving Oceans 2018-2019, the demand for fish and seafood from sustainable fishing is increasing. Over the past 5 years, this was an increase by 34% (11.8 million tonnes of certified catches of aquatic organisms worldwide in 2018; 361 sustainable fisheries in 41 countries in 2019). MSC research also shows that 83% of global fish and seafood consumers agree that seas and oceans must be protected for future generations (MSC Annual Report 2018-2019, 2019). This should be assessed as a very favourable socio-economic and environmental (ecological) phenomenon.

It is estimated that the market for certified fish and seafood products (marked with the blue MSC sign). The MSC program is the only wild fisheries and eco-labeled program that meets the Food and Agriculture Organization of the United Nations (FAO) guidelines on the ecological labeling of fish and seafood products. As the only one, it is also compliant with the International Social and Environmental Accreditation and Labeling Alliance (ISEAL) of an independent global association that monitors the maintenance of best social, environmental and best practices as well as standards. It is also the world's first fish and seafood certification program that has been recognized by the Global Sustainable Seafood Initiative (GSSI) as meeting international credibility and rigor requirements is worth worldwide around $ 10 billion annually (MSC Annual Report 2018-2019, 2019).

The consumption share of fish and other marine organisms (excluding aquatic plants, marine mammals, sponges, corals, etc.) obtained from aquaculture increases worldwide, while the consumption share of these products from catches decreases. In 2019, according to FAO forecasts, the consumption of these organisms from aquaculture will account for 54.6% of the total consumption of fish and other marine organisms (by 8.4 pp more than in 2010) (Fig. 14).

Fig. 14: The structure of consumption of fish and other marine organisms (without aquatic plants, marine mammals, sponges, corals, etc.) in the world in 2010-2019 with an estimated value for 2018 and forecast for 2019 (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

According to the MSC report Working Together for Thriving Oceans 2018-2019, the highest demand for fish and seafood from sustainable fisheries is recorded in Northern Europe (Germany, the Netherlands, the United Kingdom). However, a dynamic increase of this demand is observed in China, Japan and also in Poland.

The consumption of fish and other marine organisms in the world in the long term has increased (in relation to the average annual consumption for the analysed decades, an upward trend from 1960-1969 to 2010-2019, the equation for the outlined upward trend line: $y = 1.9657x + 7.1533$). On average, for 2010-2019, this consumption can reach the level of 19.8 kg per capita and increase by 10.1 kg per capita, compared to the corresponding consumption for 1960-1969. The upward trend in the consumption of fish and other marine organisms (excluding aquatic plants, marine mammals, sponges, corals, etc.) for 2010-2019 can be described by the following equation for the outlined trend line: $y = 0.2133x + 18.627$. According to FAO forecasts, in 2019 this consumption may amount to 20.5 kg per capita and may be higher by 10.2% than in 2010. (Fig. 15).

Fig. 15. The volume of consumption of fish and other marine organisms (without aquatic plants, marine mammals, sponges, corals, etc.) in the world in 1960-2019 with an estimated value for 2018 and forecast for 2019 (kg/person)

Source: own study based on: Hryszko, Kuzebski, Lirski, 2014; Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

The consumption of fish and other marine organisms in the world, which are obtained from aquaculture, increased relatively dynamically (up to 11.2 kg per capita, by 30.2% compared to 2010). The upward trend in this area can be described by the following equation for the outlined trend line: $y = 0.277x + 8.5667$ (Fig. 16).

Fig. 16: The volume of consumption of fish and other marine organisms (without aquatic plants, marine mammals, sponges, corals, etc.) in the world in 2010-2019 with an estimated value for 2018 and forecast for 2019 (kg/person)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

However, the consumption of fish and other marine organisms from catches decreased globally to 9.3 kg per capita (by 7% compared to 2010) (FAO Newsroom, 2016). The downward trend in this range can be described by the following equation: $y = - 0.0655x + 10.06$.

According to the FAO report, the growth rate of global consumption of fish and seafood exceeds the growth rate of the world's population (FAO Newsroom 2016. Global per capita fish consumption rises above 20 kilograms a year, 2019).

According to the European Market Observatory for Fisheries and Aquaculture Products, an average European citizen consumes 22.7 kg of fish and other aquatic organisms per year, i.e. 16% less than the global average. From among the European Union countries, the consumption of fish is the highest in Portugal (55.3 kg), then in Spain (46.2 kg) and Lithuania (44.7 kg). In Poland, the consumption is definitely smaller and amounts to 13 kg. The smallest consumption of fish and other aquatic organisms is recorded in Hungary (3.6 kg) (Fig.17).

Fig. 17: Average annual consumption of fish and other aquatic organisms in the European Union (kg / capita / year) in 2014

Source: own study based on: European Market Observatory for Fisheries and Aquaculture Products, 2019.

However, relatively large disparities in fish consumption are observed worldwide. Two-thirds of the fish harvested are consumed in Asian countries, which is where they are obtained mostly from aquaculture. China is the leader in this region in terms of consumption of fish and other aquatic organisms. Europe accounts for over 12% of their world consumption, most of it in the European Union (Hryszko, Kuzebski, Lirski, 2014).

Fish is also of great non-consumption importance. They are a raw material for the production of medicines (e.g. fish oil), fertilizers, glues and animal feed (fishmeal), fish oils (compound feed used in aquaculture) (Kurien, 2005; Carpenter, G., Kleinjans, 2017).

Peru is the largest producer of fishmeal in the world (average annual share in total production for 2010-2018 - 21.5%). The top three list in this respect includes also the European Union (10.3%) and Chile (9.5% respectively). The subsequent places among the world's ten largest producers of fish meal are occupied by: China and Thailand (8.8% each), USA (6.3%), Japan (4%), Russia (3.2%), Iceland (2.9 %) and Ecuador (2.7%). The remaining countries together account for 22.1% (Fig. 18).

Fig. 18: Average annual structure of fishmeal production for 2010-2018 according to the largest producers in the world (%)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

The global production of fishmeal is decreasing. In 2018, its production was at the level of 4.928 million tonnes and was lower, by 18%, than in 2000 (Fig. 19).

Fig. 19: Production of fishmeal in the world (thousand tonnes)

Source: own study based on: Fish market, 2014; Fish market, 2017; Fish market, 2018; Fish market, 2019.

In 2018, compared to 2000, the production of fish meal, in descending order, was as follows:

- decrease in: Thailand (to 280 thousand tonnes, by 41.3%), Peru (to 1120 thousand tonnes, by 36.7%), Chile (to 357 thousand tonnes, by 28.6%) and in the USA (to 258,000 tonnes, by 15.4%);
- growth in: China (up to 425 thousand tonnes, by 24.3%), Iceland (up to 145 thousand tonnes, by 18.5%), Russia (up to 160 thousand tonnes, by 18.5%), Ecuador (up to 115 thousand tonnes, by 4.5%), the European Union (up to 520 thousand tonnes, by 4%) and in Japan (up to 185 thousand tonnes, by 1.1%).

The dynamic increase in fishmeal production in total took place in other countries of the world (up to 1363 thousand tonnes, i.e. 2.3 times).

Water plants are also important in the non-consumption use of aquatic organisms (dyes, cosmetics and others) (Hryszko, Kuzebski, Lirski, 2014).

Conclusion

Based on the analysis carried out, it should be stated that in the examined years:

1. The production of fish and other aquatic organisms in the world has grown dynamically. This increase proved to be faster than the increase in the world's population. This should be associated with the growing demand for fish and fish products.
2. Aquaculture is becoming increasingly important in the global production of fish and other aquatic organisms. Currently, almost half of these organisms are obtained from this source.
3. More and more fish and other aquatic organisms in the world are currently being used for consumption purposes, while the volume used for non-consumption purposes is systematically decreasing.
4. The worldwide consumption of fish and other aquatic organisms, as a source of wholesome and easily digestible animal protein, increased. This is significantly influenced by the growing incomes of the population, in connection with the changing consumption model observed in many countries of the world (among others, the impact of global processes).
5. There are relatively large disparities in the consumption of fish and other aquatic organisms worldwide. They are observed between highly economically developed and developing countries. The relatively high consumption of these organisms in economically developed countries should be associated with the average high incomes of the population that inhabits them, the changing consumption pattern and the wide market availability of various species of fish and other aquatic organisms.
6. More than two-thirds of fish and other aquatic organisms are consumed in Asian countries, mostly in China. In Europe, the consumption amounts to 12% of the global volume, the majority of which is recorded European Union countries. However, there are quite significant disparities in the consumption of fish and other aquatic organisms between European Union countries. Most of them are consumed in Portugal, relatively much in Spain and Lithuania, and the smallest amounts in Hungary, which is associated with the consumption model.
7. The growing demand for fish and other aquatic organisms is conducive to the negative phenomenon of maximizing catches of certain species of fish and illegal fishing. In the absence of sustainable fishing, this threatens the population of these organisms. Countries belonging to the European Union are covered by a common fisheries policy that "protects" rational fishing, while in many other parts of the world there are no such solutions, which should be critically assessed. Although FAO developed (1995) The Code of Responsible Fisheries, it is based on voluntary principles. Lack of sanctions in the analysed area jeopardizes maintaining the balance.

Diagnosis of Agricultural Land Resources in The European Union

Joanna SZYMAŃSKA

Economic University Wrocław, Wrocław, Poland
joanna.szymanska@ue.wroc.pl

Abstract

Europe belongs to continents with relatively high agricultural land use. Agricultural land covers over half of the continent's area. Agricultural land resources in the Member States of the European Union are very diverse in terms of qualitative and quantitative features. The terrain relief, soil quality and agro-climatic conditions are different. The area of countries in the European Union, the place of agriculture in the economy of a given country, traditions or agricultural culture also differ. In the analysed years, the total area of agricultural utilised land in the European Union decreased. It was a consequence of allocating agricultural land to communication, housing estate, industrial or commercial and service purposes. Part of the farmland excluded from production consisted of the soils very good and good in terms of agriculture. Such a phenomenon should be critically assessed in relation to the relatively small resources of these soils. Afforestation of agriculturally weak soils is, in turn, a rational solution. This is conducive to the implementation of the idea of sustainable development of rural areas and multifunctionality of villages (Common Agricultural Policy of the European Union). As a result, the Common Agricultural Policy of the European Union indirectly affects the formation of agricultural land resources. National policies of the Member States of the European Union regulate the protection of agricultural land. There is no uniform model for shaping agricultural land resources in the European Union.

Keywords: Agricultural Land, Forests, European Union.

Introduction

Agricultural land covers over half of the Europe's area. However, European agriculture has worse natural and agroclimatic conditions for food production than its most important global competitors (Matuszczak, 2013).

The Common Agricultural Policy of the European Union influences the shaping of agricultural land resources in the member countries, but this is done indirectly (Szymańska, 2006; Rural development, 2019). The dual model of European agriculture includes both the intensive and sustainable agriculture model. The intensive agriculture model is closely related to the increase in labour productivity and the intensity of production resource management in agriculture. Soil quality and agro-climatic conditions are of crucial significance for this model as they determine yields, prices and income from land. The sustainable agriculture model takes into account environmental and health requirements to a greater extent than the intensive agriculture model. Soil quality and agro-climatic conditions are relatively insignificant in this model, because low-yielding lands can bring high income. This is related to the growing demand for "services" offered by these lands, namely: the use of a unique landscape, better residential and generally living conditions as well as better conditions for rest and recreation (Baldock, 2009; Baldock et.al., 2010; Cardwell, 2004; Cooper et al., 2009; Woś, 2005; Zegar, 2010). The author's own observations show that prices of real estate located in the vicinity of national parks and landscape parks, for example in Great Britain and Poland, are definitely higher than in rural areas which are not adjacent to such valuable natural and landscape areas.

It seems justified to agree with Matuszczak that land as the most immobile factor in agricultural production - which has virtually no other significant agricultural applications other than food production - compared to factors such as labour and capital, by creating demand for ecological and landscape "services", gains in mobility (Matuszczak, 2013). This means that there are alternative (new) uses for agricultural land that generate income.

The proposal for new solutions for the future CAP (CAP 2020+) has been submitted, among others, by one of the most influential think-tanks in the European Union - RISE Foundation, cooperating with the European Landowners Organization (ELO). The structure of CAP2020 + proposed by RISE consists of three components, focusing on financial support: holistic risk management in the agricultural sector, integrated management of agricultural land resources and support for investment in agriculture and for rural development. Integrated Land Management was proposed as a system to replace direct payments. The project is embedded in the theory of public goods, it is a concept of pro-environmental management of land resources. The essence of the proposed solution is a layered system, consisting of four types of payments for the delivery of public goods by farmers. These payments are proposed to be offered under co-financed multi-annual programs, prepared at regional level, focused on strategic goals and needs identified in the regions or at local level, compatible with the framework scope defined at EU level. Farmers could apply for payments under various titles on the basis of multi-annual contracts, which would significantly reduce transaction costs. Both on the farmers and administration side (Buckwell A., et.al., 2017; Future of CAP post 2020-Consilium, 2019).

The aim of this study is to assess the state of agricultural land resources in the member states of the European Union. The time horizon of the research covers the years 2005-2016. In some cases, this horizon has a slightly different scope due to the availability of statistical data. To prepare this article, different descriptive, comparative, analytical, mathematical and statistical research methods were used.

Share of utilised agricultural land and forests in the total area of the European Union countries

The share of forests in the total area of the European Union is growing. At the end of 2016, it was already slightly higher (41%) than the share of utilised agricultural land (40%) (Fig. 1). However, the structure of the use of the overall area in the European Union member states is very diverse.

Fig. 1: Structure of the use of the total area of the European Union (EU-27) in 2016 (%); Source: own study based on: Environment, 2019; Eurostat, 2019

Among the European Union (EU-27) countries, the highest share of the arable land in the total area of the country is recorded in Great Britain (71.7%), and the lowest in Sweden (7.9%). The top five, ranked

in descending order, consists of: Ireland (64.3%), Denmark (62.8%), Romania (62.3%) and Hungary (60.9%).

A share of arable land in the total area of the country exceeding the average for the entire European Union (EU-27) have: Spain (59.1%), the Czech Republic (55%), the Netherlands (54.7%), France (53, 3%), Luxembourg (50.8%), Lithuania (49.4%), Germany (48.8%), Bulgaria (48.3%), Poland (47.4%), Italy (44.9%)), Bulgaria (44.2%), Portugal (44%) and Slovakia (40.8%). In other EU countries (Malta, Austria, Latvia, Slovenia, Estonia, Greece, Cyprus) the share of it is already smaller (Environmental, 2019; Eurostat, 2019).

An analysis of data for the years 2006-2015 revealed that in 2015, compared to 2006, the share of arable land in the total area increased in such European Union countries as: the Czech Republic (increase by 8.8 percentage points), Spain (respectively by 8.3 percentage points), Estonia (6.7 percentage points), Slovenia (6.3 percentage points), Lithuania (4.9 percentage points), Latvia (3.5 percentage points),Portugal (2.8 percentage points), Great Britain (2.1 percentage points), Ireland (1.8 percentage points), Finland (0.9 percentage points), Bulgaria, Luxembourg and Slovakia (0.5 pp each), Romania (0.3 pp) and Sweden (0.1 pp). The share of these lands in the geodetic area of Germany did not change. On the other hand, the share of arable land decreased in the total area of Austria (decrease by 5.8 percentage points), Italy (by 5.1 percentage point, respectively), Poland (5 percentage point), Hungary (4.1 percentage points), the Netherlands (2.2 percentage points), Cyprus (1.6 percentage points), Belgium (1.5 percentage points), Denmark (1.3 percentage points), France (1.2 percentage points) and Greece (0.3 percentage points) (Fig. 2).

Fig. 2: Changes in the share of utilised agricultural land in the total land area of EU Member States (EU-27) in 2015 compared to 2006 (percentage points); Source: own study based on: Environment, 2019; Eurostat, 2019

Changes in the share of agricultural land area were caused by various factors. Afforestation of some of these lands continued, it concerned mainly low-quality agricultural soils. Such activities should be assessed as a favourable phenomenon for both ecological and economic reasons (effective management of agriculturally weak soils). Part of the arable land was also allocated for purposes other than agricultural or forestry. In Central European countries that accessed the European Union in 2004, built-up areas, housing, transport, and commercial and service infrastructure developed relatively intensively (Szymańska, 2012).

The observed changes in the share of agricultural land in the total area of certain European Union countries were accompanied by changes in the share of forests and forestry land in this area.

Finland (73.1%) has the largest share of forests and forestry land in its total area among the European Union countries, while in Malta this share is the lowest (1.1%). Sweden (68.4%) and Latvia (54%) are also classified among the top three. Estonia (49.3%) and Austria (46.9%) also have a larger share of forests and wooded areas than the average share for the European Union. In other EU-27 countries it is smaller, ranking in decreasing order: Slovakia (40.3%), Spain 36.9%, Portugal (35.3%), Bulgaria (35.2%), Lithuania (34.8%), Czech Republic (34.5%), Luxembourg (35.5%), Germany (32.8%), Italy (31.6%), France (31%), Poland (30.8%), Greece (30.3%), Romania (29.8%), Belgium (22.6%), Hungary (22.2%), Cyprus (18.7%), Denmark (14.4%), United Kingdom (13%), The Netherlands (11.1%), Ireland (10.9%) (Environment, 2018; Eurostat, 2019). In the analysed years 2005-2016, the share of forests and forestry land increased in the following countries, ranking in decreasing order: Sweden (increase by 10.9 percentage points), Latvia (by 7.4 percentage points, respectively), Austria (6.8 pp), Denmark (2.9 pp), Hungary (2.4 pp), France (2.3 pp), Belgium (2.2 pp), Lithuania (1.3 pp), Germany (1.2 pp), Ireland and Finland (1.1 pp each), Cyprus (0.9 pp), the Netherlands (0.8 pp), Bulgaria (0.7 pp), Poland (0.6 pp), Romania (0.5 pp), Great Britain (0.4 pp), the Czech Republic (0.3 pp) and Malta (0.1 pp). On the other hand, the share of forests and forestry land decreased in: Greece (decrease by 0.4 percentage point), Portugal (by 1 pp, respectively), Spain (1.1 pp), Slovakia (1.4 pp), Luxembourg (1.6 pp), Slovenia (1.7 pp), Italy (3 pp) and Estonia (4.6 pp) (Fig. 3).

Fig. 3: Changes in the share of utilised agricultural land in the total land area of EU Member States (EU-27) in 2015 compared to 2006 (percentage points); Source: own study based on: Environment, 2019; Eurostat, 2019

Sweden has the largest share in the total forested area in the European Union (16.8% in 2015). The subsequent places are taken by Spain (15.2%, respectively) and Finland (12.7%). The share of other member countries is already significantly lower, one-digit (Agriculture, forestry and fishery statistics, 2018. Eurostat, 2019).

According to specialist analyses, the increase in forest cover in the European Union is more dynamic than the increase in excluded forest lands, which are then allocated to urban development and technical infrastructure (e.g. roads). The development of forest areas in many member states is the result of afforestation of agricultural land, earlier not cultivated. This applies to low-quality agricultural soils

(The EU Forest Action Plan 2007 – 2011, European Commission, Agriculture and Rural Development, 2019).

Such solutions should be assessed as a favourable phenomenon for the surrounding natural environment (especially, as an improvement of climatic conditions) and for socio-economic reasons (more friendly landscape, greater possibilities of obtaining additional income for the population living in such areas, e.g. through the development of agritourism or tourism and recreation).

Agricultural Land Quality

Land allocation for agricultural purposes is determined by many factors, among which the most important are: topography, location of areas associated with climatic properties and soil type.

Due to the land relief, in Europe, northern parts of the British Isles, the Iberian, Balkan and Apennine Peninsulas as well as the Alps and the Carpathians are used for agriculture only to a limited extent.

The location of parts of Europe in the polar and moderate cold climate zone (countries of the Scandinavian Peninsula) is not conducive to agricultural production, especially plant production. However, most of Europe is located in the temperate zone, with the following types of climate: distinct oceanic and oceanic, transitional, intermediate, continental and dry continental.

The types of soil in Europe are relatively diversified. They are characterized by a mosaic layout. There are four soil and climate zones on the European continent:

- Polar (occurs on a relatively small area of the northern coast of Europe and the Scandinavian Mountains with associating tundra soils).
- Boreal (characteristic for most of Northern Europe - the Scandinavian Peninsula, Russia, dominated by podzolic, turfy and grey forest soils).
- Subboreal (occurs in a humid part of western Europe, in the area from France to the Balkan Peninsula, with dominant brown soils; the eastern dry part extends through Ukraine, southern Russia and the Hungarian Plain, where very fertile chernozems occur). In Central Europe there are complex of podzolic and brown soils.
- Subtropical (covers the southern part of Europe, including the Mediterranean, mainly cinnamon soil) (Majchrzak, 2015).

In addition, there are astrephic soils in Europe, which are typical for the valleys of large rivers, coasts and mountainous areas (among others, such soils include marches, initial mountain soils, rendzinas).

While conducting a comparative analysis of the terrain, climatic conditions and soil types of the European Union member states, one should agree with Majchrzak that comparing the natural conditions of the agricultural sector between these countries proves to be very difficult (Majchrzak, 2015). It can be assumed after Matuszczak that in western Europe there are fertile brown soils, in the central part of this continent - weak podzolic soils, while eastern Europe is dominated by very fertile chernozems (Matuszczak, 2010). Soil quality in Europe shows relatively large variations.

Utilised Agricultural Area and its Changes

Europe belongs to continents with a relatively high agricultural land use. Agricultural land covers over half of the continent's area. Arable lands amount to two thirds of its acreage.

The utilized agricultural area of the individual countries making up the European Union is diversified. France has relatively the largest area (29.01 million hectares, annual average in 2005-2016). The top five, in the analysed respect, rank in descending order, include: Spain (27.39 million hectares, respectively), Great Britain (17.29 million hectares), Germany (16.8 million hectares) and Poland (14.94 million hectares) (Fig. 4).

Fig. 4: Average annual utilised agricultural area in the European Union (EU 27) in 2005-2016 (million hectares); Source: own study based on: Environment, 2008; Environment, 2019; Eurostat, 2019

A relatively large area of utilised agricultural land is also available to Romania (13.79 million hectares, annual average in 2005-2016) and Italy (13.56 million hectares). In other European Union countries, the area of this land is definitely smaller, the smallest in Malta (0.01 million hectares).

In the analysed years 2005-2016, the area of utilised agricultural land in most EU-27 countries was subject to multidirectional changes. Its increase took place in: Great Britain (by 0.3 million ha), Ireland, Lithuania, Estonia and Latvia (0.2 million ha each) and Slovenia (0.1 million ha). The area of agricultural land h did not change in such member countries as: Belgium, Denmark, Finland, Luxemburg, Malta and Slovakia. On the other hand, their area decreased in the Netherlands, Cyprus and Portugal (0.1 million ha each), Sweden (0.2 million ha), Bulgaria and Germany (0.3 million ha each), Austria and Hungary (0.6 million ha each), the Czech Republic (by 0.8 million ha), France (0.9 million ha), Romania (1 million ha), Poland (1.5 million ha), Italy (2 million ha), Greece (2.3 million ha) and in Spain (2.7 million ha) (Fig. 5).

Fig. 5: Change in utilised agricultural area in the European Union (EU-27) countries in 2016 compared to 2005 (million ha); Source: own study based on: Environment, 2008; Environment, 2019; Eurostat, 2019

France has the largest share of agricultural land in the total area of these lands in the European Union (16%). In this respect, the top five, ranked in descending order, includes also: Spain (14.6%), Great Britain (9.6%), Germany (9.3%) and Poland (8%). Romania (7.5%) and Italy (7%) still have a relatively large area of this land. In other EU countries, this area is definitely smaller (Fig. 6).

Fig. 6: Structure of utilization of agricultural area in the European Union by member countries (%); Source: own study based on: Environment, 2019; Eurostat, 2019

In the analysed years 2005-2016, there was a downward trend in the utilised agricultural area of lands that were used for agricultural purposes. This concerned both the countries where this area was the largest and large, as well as some other EU-27 countries. Trend lines in the analysed range for France, Spain, Great Britain, Germany and Poland, that is for the countries whose total area of utilised agricultural area accounts for more than half of the total area of these lands in the European Union, are presented in Fig. 7. Equations for these trend lines are also presented. Trend line equations for changes in utilized agricultural area in 2005-2016: France (y = - 0.086x +29.592), Spain (y = - 0.2343x +28.956), United Kingdom (y = - 0.0126x +17.365), Germany (y = - 0.0374x +17.068), Poland (y = - 0.15x +15.933). Trend line equations for changes in agricultural land used for agricultural purposes in 2005-2016: Austria (y = - 0.0505x +3.3545), Belgium (y = - 0.0087x +1.4152), Bulgaria (y = - 0.0231x +5.2333), Cyprus (y = - 0.0094x +0.1864), Czech Republic (y = - 0.0339x +4.3788), Denmark (y = - 0.0042x +2.6439), Greece (y = - 0.0458x +8.0061), Hungary (y = - 0.065x +5.9394), Italy (y = - 0.1402x +14.553), Netherlands (y = - 0.0126x +1.9318), Romania (y = - 0.029x +14.014), Sweden (y = - 0.0192x +3.2). Trend line equations for changes in utilized agricultural area in 2005-2016: France (y = - 0.086x +29.592), Spain (y = - 0.2343x +28.956), United Kingdom (y = - 0.0126x +17.365), Germany (y = - 0.0374x +17.068), Poland (y = - 0.15x +15.933). A downward trend in the area of utilised agricultural area in 2005-2016 occurred also in: Austria, Belgium, Bulgaria, Cyprus, the Czech Republic, Denmark, Greece, Hungary, Italy, the Netherlands, Romania and Sweden. Trend line equations for changes in agricultural land used for agricultural purposes in 2005-2016: Austria (y = - 0.0505x +3.3545), Belgium (y = - 0.0087x +1.4152), Bulgaria (y = - 0.0231x +5.2333), Cyprus (y = - 0.0094x +0.1864), Czech Republic (y = - 0.0339x +4.3788), Denmark (y = - 0.0042x +2.6439), Greece (y = - 0.0458x +8.0061), Hungary (y = - 0.065x +5.9394), Italy (y = - 0.1402x +14.553), Netherlands (y = - 0.0126x +1.9318), Romania (y = - 0.029x +14.014), Sweden (y = - 0.0192x +3.2).

The utilised agricultural area did not change during the considered period in Finland, Luxembourg, Malta and Slovakia.

Fig. 7: Area of agricultural land used for agricultural purposes in France, Spain, Great Britain, Germany and Poland in 2005-2016 (million ha); Source: own study based on: Statistical Yearbook of Agriculture and Rural Areas, 2019; Statistical Yearbook of Agriculture, 2019.

An upward trend in the area of arable land used for agriculture was observed in Ireland, Lithuania, Latvia, Estonia, Portugal and Slovenia (Fig. 8). Changes in this area are described by given equations. Trend line equations for changes in utilized agricultural area in 2005-2016: Ireland (y = 0.0269x +4.2), Lithuania (y = 0.0255x +2.6591), Latvia (y = 0.015x +1.7273), Estonia (y = 0.0234x +0.7561), Portugal (y = 0.0063x +3.5924), Slovenia (y = 0.0112x +0.4773).

Upward trends in the area of utilised agricultural land concerned those countries that have a relatively minor and rather small utilised agricultural area (Slovenia, Estonia, Latvia, Lithuania, Portugal, Ireland).

Fig. 8: Agricultural area utilized for farming purposes in Ireland, Lithuania, Latvia, Estonia, Portugal and Slovenia in 2005-2016 (million ha); Source: own study based on: Statistical Yearbook of Agriculture and Rural Areas, 2019; Statistical Yearbook of Agriculture, 2019.

As a consequence, the area of agricultural land per capita in most EU member states changed. This area increased, descending these changes, in the areas of: Lithuania (increase to 0.74 ha, by 0.19 ha), Latvia (to 0.65 ha, by 0.17 ha, respectively), Bulgaria (to 0.49 ha, by 0.08 ha), Estonia (to 0.53 ha, by 0.08 ha) and Denmark (to 0.42 ha, by 0.01 ha). It did not change in Germany, Ireland, Malta, the Netherlands, Romania and Great Britain (Fig. 9).

Legend: 1-Austria, 2-Belgium, 3-Bulgaria, 4-Cyprus, 5-Czech Republic, 6-Denmark, 7-Estonia, 8-Finland, 9-France, 10-Germany, 11-Greece, 12-Hungary, 13-Ireland, 14-Italy, 15-Latvia, 16-Lithuania, 17-Luxembourg, 18-Malta,19-Netherlands, 20-Poland, 21-Portugal, 22-Romania, 23-Slovakia, 24-Slovenia, 25-Spain, 26-Sweden, 27-United Kingdom.

Fig. 9: Change in agricultural land per capita in EU-27 countries in 2016 compared to 2005 (ha); Source: own study based on: Statistical Yearbook of Agriculture and Rural Areas, 2019; Statistical Yearbook of Agriculture, 2019.

On the other hand, the area of arable land per 1 inhabitant decreased, ranking these changes in descending order; in Cyprus (a decrease to 0.07 ha, by 0.05 ha), in the Czech Republic (to 0.24 ha, by 0.05 ha, respectively), Spain (to 0.27 ha, by 0.05 ha), Greece (to 0.19 ha, by 0.04 ha), Poland (to 0.28 ha, by 0.04 ha), Sweden (to 0.26 ha, by 0.04 ha), Portugal (up to 0.09 ha, by 0.03 ha), Austria (to 0.15 ha, by 0.02 ha), France (to 0.28 ha, by 0.02 ha), in Hungary (to 0.44 ha, by 0.02 ha), in Italy (to 0.11 ha, by 0.02 ha), in Luxembourg (to 0.11 ha, by 0, 02 ha), in Belgium (to 0.07 ha, by 0.01 ha), Finland (to 0.41 ha, by 0.01 ha), Slovakia (to 0.25 ha, by 0.01 ha) and Slovenia (to 0.09 ha, by 0.01 ha).

Changes in the analysed indicator were also affected by the growing population of Europe. This is caused, according to analysts, by the birth rate and net (positive) balance of net migration. At the same time, European society is aging due to the increase in life expectancy and fewer births (Eurostat, 2019).

Agricultural Land Turnover

Agricultural Holding Structure: Agricultural Land Prices

In the context of these changes, attention should be paid to legal provisions regarding agricultural land trade. There is no uniform model for shaping agricultural land resources in the European Union. The national policies of these countries regulate the protection of agricultural land. Germany and France, and from 1 May 2016 also Poland, are characterized by a relatively high degree of state interference in the trade in agricultural land. In France, such transactions are coordinated by local state-owned companies (*Societes d'Amenagement Forcier et d' Etablissement Rural - SAFER*). In Germany (within the former German Democratic Republic), *Bodenverwertungs und verwaltungs Gmbh (BVVG)* performs this function. The company deals in the distribution of agricultural land, which was previously

subject to collectivization. The owners of these lands have the right to buy it at preferential market prices. In addition, restrictions on the purchase of agricultural land apply in Hungary, Bulgaria and Lithuania, and from May 1, 2016. a relatively large degree of state interference in the trade in agricultural land began to apply in Poland (Agricultural Land Market, 2018).

According to Eurostat data, relatively small changes in the area of land that were used for agriculture in the European Union in 2005-2016 were accompanied by a deep decline in the number of farms (Eurostat, 2019).

In 2016, there were 10.33 million farms in the European Union (EU-27) in total. Most of these farms were in Romania (33%), relatively many in Poland (14%) and Italy (11%), and less in Spain (9%), Greece (7%) and other countries.

In the analysed years 2005-2016, the number of farms in the European Union decreased by 3.86 million. Apart from Ireland, where their number increased (to 137.6 thousand, by 3.5%) in other EU-27 countries a decrease was recorded (Table 1). The number of farms in Poland dropped most dynamically (to 1.41 million in 2016, by 1.06 million compared to 2005), i.e. where there were relatively many of them among the European Union countries (EU-27). In Romania, which is the leader in terms of the number of farms, this decline also proved to be relatively high (up to 3.42 million, by 0.70 million, respectively). In Italy, i.e. in the third EU country, due to the number of these holdings, a similar situation was recorded (decrease to 1.15 million, by 0.58 million) (Table 1).

Table 1: Number of agricultural holdings in the Member States of the European Union (EU-27) in 2005 and 2016 (thousand)

Specification	2005	2016	Difference	Specification	2005	2016	Difference

Source: own study based on: Statistical Yearbook of Agriculture, 2019; Eurostat, 2019

The three-digit decline in the number of farms took place, in descending order, in: Bulgaria (by 318.3 thousand), Hungary (232 thousand), Greece (143.1 thousand), Spain (118 thousand), Germany (112.9 thousand), France (105.5 thousand) and Lithuania (102.7 thousand).

A two-digit decrease in the number of analysed farms occurred in: Portugal (by 64 thousand), Great Britain (by 62.9 thousand), Latvia (58.1 thousand), Slovakia (40.7 thousand), Austria (37.5 thousand), the Netherlands (24.7 thousand), Finland (20.6 thousand), Denmark (16.2 thousand), Czech Republic

(14.7 thousand), Belgium (13.7 thousand), Sweden (12.1 thousand), Estonia (11 thousand) and Cyprus (10 thousand).

A one-digit decrease in the number of farms took place in Slovenia (by 7.2 thousand), Malta (1.7 thousand) and Luxembourg (0.4 thousand).

The consequence of the changes in the number of farms in the European Union in 2005-2016 turned out to be favourable transformations in the structure of these farms, due to the size of the agricultural area they have (Fig. 10).

Fig. 10: Farm structure in the European Union in 2005 and in 2016 by farm size (%); Source: own study based on: Statistical Yearbook of Agriculture, 2019; Eurostat, 2019

The percentage of agricultural holdings with up to 5 ha of agricultural land decreased to 65.6% (a decrease by 5.3 percentage points). However, the percentage of farms that have agricultural land in the following ranges increased:

- from 5 ha to 20 ha - up to 20.4% (increase by 2 percentage points),
- from 20 ha to 50 ha - up to 7.1% (by 1.3 percentage points respectively),
- 50 ha and more - up to 6.9% (by 2 percentage points).

The observed changes should be considered a favourable phenomenon. Farmers strive to expand farms to maintain and improve market competitiveness.

At the same time, a rise in agricultural land prices is observed in most member countries. In the analysed years, relatively the most dynamically average prices of arable land increased in Slovakia (5.6 times). The top five in this respect included: the Czech Republic (a 5.4-fold increase), Estonia (4.7-fold, respectively), Bulgaria (4.4-fold) and Poland-the private market (4.1-fold). Organizing the analysed EU member states in a decreasing order, we receive the following series: Lithuania (3.9-fold increase in average agricultural land prices), Romania (3.7-fold, respectively), Hungary (2.8), Germany in total (2.7), Latvia (2.5), Netherlands (1.9), United Kingdom (1.6), France (1.5), Finland (1.4), Belgium and Italy (1.3 each), Denmark (1.0). Relatively the most dynamic price changes were observed in the countries of Central and Eastern Europe that joined the European Union structures only in the mid-2000s. A drop in the average prices of agricultural land was recorded, among the analysed countries, only in Ireland (by 62.6%) and a slight decrease in Spain (by 3.1%) (Fig. 11).

Fig. 11: Average prices of agricultural land in selected European Union countries in the years 2006-2017 (Euro per 1 hectare); Source: own study based on: database Eurostat, 2019; Agricultural Land Market, 2019.

Trend line equations for the analysed countries can be presented, with an upward trend in average agricultural land prices: Netherlands (y = 2486x + 32272), Germany in general (y = 1411x + 5794.6), Belgium (y = 722.53x + 24548), United Kingdom (y = 967.61x + 11518), Poland - private market (y = 674.34x + 982.11), Czech Republic (y = 539.98x + 192.86), Italy (y = 438.78x + 15899), Slovakia (y = 420.24x-265.05), Romania (y = 343.22x + 261.48), Bulgaria (y = 321.81x + 190.95), Finland (y = 274.68x + 5680), Estonia (y = 226.69x + 172.13), Hungary (y = 225.55x + 856.62), Lithuania (y = 223.55x + 116.68), France (y = 165.45x + 4,360), Latvia (y = 130.16x + 1018.2). The downward trend in the analysed range concerned average agricultural land prices in Ireland (y = - 2974.6x +49844), Denmark (y = - 226.6x +25266) and Spain (y = - 94.755x +1096). The increase in average agricultural land prices in the surveyed countries resulted from the current economic situation in agriculture and the impact of the mechanisms of the European Union's common agricultural policy (direct payments and other subsidies), in a situation of decreasing geodetic area of farmland, and completed, in some of these countries (the countries Central and Eastern Europe), grace periods for the sale of agricultural land to foreigners. The growing demand for land also has a definite impact on the increase in the prices, in the aspect of the progressing greening of agriculture, which makes it possible to predict a further increase in agricultural land prices in the European Union (Szymańska, 2019; Agricultural land market, 2018).

The prices of agricultural land in individual European Union countries, however, vary widely. The highest of them were recorded (2017) in the Netherlands (about 60,000 euros per hectare), and the lowest in Latvia and Lithuania (about 2,800 euros). Relatively high average prices of arable land were also observed, ranked in descending order, in: Belgium (35.7 thousand euros per 1 hectare), in total in Germany (24.1 thousand euros, respectively), Denmark (23.8 thousand euros), Ireland (22.4 thousand euros), Great Britain (21.1 thousand euros) and Italy (20.3 thousand euros). Lower prices occurred mainly in the countries of Central and Eastern Europe (average prices of agricultural land in the countries of Central and Eastern Europe that belong to the European Union: Poland - private market (EUR 9.7 thousand per hectare), Czech Republic (EUR 8.7 thousand, respectively), Slovakia (EUR 5.7 thousand), Bulgaria (EUR 4.5 thousand), Romania and Hungary (EUR 4.4 thousand each), Estonia

(EUR 2.9 thousand) and in Spain (EUR 10.1 thousand), Finland (EUR 8.3 thousand) and France (about EUR 6 thousand).

One should agree with Zadura (Zadura, 2005) that the relatively high level of agricultural land prices in the countries of the "old Union" reflected not only the productive value of land, but also its added value, which resulted from the very title of ownership and use of land. This title makes it possible to benefit from agricultural support instruments under the common agricultural policy of the European Union and annuity from investment in agricultural property.

Conclusion

The comparative analysis shows that:

- Europe belongs to continents with a relatively high agricultural land use. Agricultural land covers over half of the continent's area. Arable lands amount to two thirds of its acreage. Soil quality in Europe shows relatively large variations. As a result, comparing the natural conditions of the agricultural sector between EU Member States should be considered very difficult.
- The member states of the European Union (EU-27) differ significantly in the share of agricultural land in the total area. These utilised agricultural lands have the largest share in the total area of Great Britain (69.4%), relatively high in: Ireland, Denmark, Romania and Hungary, and small in Sweden and Finland (6.8%). Finland and Sweden are the only member countries dominated by wooded areas belonging to agricultural holdings.
- The area of agricultural land used for agricultural purposes in the European Union decreased relatively slightly in the years 2005-2016. This is a favourable phenomenon, both for socio-economic and ecological reasons.
- There is no common policy on agricultural land trading in the European Union. National policies are implemented in this respect, varying from relatively restrictive ones (Germany, France, Poland, Hungary, Bulgaria, Lithuania) to liberal (e.g. Denmark).
- The structure of farms in the European Union changed favourably. The number of larger and very large farms increased, while the number of the smallest farms, running their activities on agricultural area up to 5 ha decreased. This reflects the desire of agricultural producers to maintain competitiveness on the market.
- It can be expected that there will be a further increase in agricultural land prices in the European Union, especially in the countries of Central and Eastern Europe, in connection with the economic situation in agriculture and the impact of the mechanisms of the common agricultural policy of the European Union, associated with growing requirements in the field of land management, in terms of the progressing greening of European Union agriculture.

Abstract

Modern web applications are now expected to provide a user experience as simple and efficient as desktoplike web interfaces. JavaScript frameworks emerged as front-end technology for advanced web application features. However, there is uncertainty on their complexity of development and maintenance. The aim of this design science study was to analyse the requirements of user interfaces in modern web applications and provide an evaluation of JavaScript frameworks to meet these requirements. The literature indicated JavaScript frameworks are necessary to simplify Ajax development due to the complexity of Ajax programming using JavaScript. We evaluated a number of open-source Javascript frameworks, and selected a framework for this study to prototype and analyse the outcome. We analysed how it improved development, maintenance efficiency and examined the ability to implement advanced web interfaces. Although the Javascript framework did not provide a performance improvement, the main outcome is that the prototyping showed JavaScript frameworks provide reduced complexity on Ajax application development and significantly increased ease of maintainability.

Keywords

User interfaces, Web applications, Design Science, Ajax, Javascript.

Introduction

The internet has matured and web applications are expected to provide advanced user interfaces that traditional web applications were unable to do. Ajax emerged as a working solution to implement rich internet applications (Domański, Domańska & Chmiel, 2014). However Ajax application implementation is relatively complex, as Ajax is a set of old technologies and requires a large amount of JavaScript coding. Usability is an output from good user interfaces, and user interfaces are important to build high-quality applications. In modern applications, close collaboration is required between user interface designers, architects and UI implementers for the realisation of applications (Cruz Segura *et al*., 2019; Tanikella *et al*., 2007). Desktop-like interfaces are a very common requirement in modern applications. Modern applications are expected to communicate with back-end applications without page reloading - the basic feature of Ajax applications. In a traditional web application, if users wish to perform any action on the screen, the application processes the request on the server and sends the result back to the browser. Therefore multiple pages were required for a single business function. However today a single page interface is common and popular.

Traditional internet applications require a page refresh for every user action; this results in much redundant data being passed, increasing wait times (Gaddale & Parimala, 2019; Shah, Shah & Irfan, 2018; Farrell & Nezlek, 2007). Application users did not appreciate this and the style was not acceptable to some timesensitive applications such as in the financial sector. As such the Rich Internet Approach (RIA) was introduced to resolve the problems mentioned above. RIA provides interaction features for example desktop applications, and is able to completely eliminate full page refreshing. Ajax is currently the most popular technical solution for RIA and relies in turn on JavaScript and XML. Developers used to place flow control into server applications but now flow control is placed in front-end applications using JavaScript. However, this trend makes development and maintenance difficult because of its unfamiliarity to developers.

Due to Ajax's complexity, developers wanted to simplify Ajax application development. JavaScript frameworks have been developed to reduce the amount of effort developers must spend for Ajax application development (Peguero, Zhang & Cheng, 2018). Here, we examine how a JavaScript framework assists coders reduce the amount of effort for Ajax application development. We will evaluate development efficiency by analysing a learning curve as well as code complexity. We will also see how JavaScript

frameworks provide desktop-like user interfaces through prototyping. We will also measure the response time improvement through performance testing.

User Advances in Modern Applications

As web technologies gain more advanced features, requirements that used to be hardly possible are now available to software developers and end users, such as conducting activities "in the cloud" (HosseinianFar, Ramachandran & Slack, 2017; Fisher, 2018; Rodden, Hutchinson, and Fu, 2010). Tanikella et al., (2007) concluded in their study that the user interface (UI) has a significant impact on the quality of applications. The importance of planning the UI architecture can be explained by the benefit of close collaboration between user interface designers, architects, and UI implementers in the realization of applications. Liu and Ma (2010) introduced the 7 Seconds Law, where users make the decision whether they like the interface within the first seven seconds upon seeing it, for the visual elements of the webpage interface determines the users' preferences. Therefore, visual design is a very important influencing factor in webpage interface design and naturally this trend continues in smartphone interface design today (Xu, 2020). Efficient interfaces are also able to reduce a learning curve for a new application and minimise navigation time to locate functions users wish to employ. Urbieta et al. (2007) suggest a design approach should deal with applications, combining navigation with advanced interface behaviours. Thus, the application should contain the basic information or behaviours of itself; this allows users to easily learn where to go and what to do through given navigations. Finally, in modern applications the latest features of Ajax technology enable users to experience desktop-like user interfaces and fast response times with a minimum number of clicks; which in turn minimises network traffic between web browsers and the server. The last point has the added benefit of helping enterprises with old network infrastructure reduce their network bottleneck problems.

Motivation and Method

The motivation for this project came from the development goal of a company (a car retailer, parts supplier and service provider). It has 21 branches throughout the greater Sydney area. There is a small IT department in the company with 30 staff. The IT section has a development team with application developers, business analysts and testers. There is also an IT support team who maintain old applications and support devices and network issues. The company was planning to train staff in IT support to be able to support new applications later. Therefore, the other critical factor of the development project was that the application architecture had to be simple with a minimal learning curve. The network infrastructure in some of branches is not as good as other branches. An upgrade to network infrastructure is planned, but some branches may suffer before the upgrade is done - if new applications generate heavy traffic. Therefore network traffic needs to be minimised. The company was also planning to upgrade its old mainframe-based applications to modern web-based applications. Current mainframe applications have relied on old technologies and have been operating for more than three decades. Terminal-based screens of mainframes are not user-friendly and unsuitable for modern user interface requirements. Additionally, end-users wish to improve current business processes through new web-based applications.

The methodology adopted for this project used a design science approach (Dresch, Lacerda & Antunes, 2015; Recker, 2013), where the key outcome was an 'instantiation', that is to say an implemented or prototyped system that could be put to use. In line with design science there was a focus on providing "novelty of the demonstrated utility of an artefact; a positive difference of the utility of an artefact in comparison to existing work; and a thorough evaluation that provides decisive evidence for superior utility of an artefact" (Recker, 2013 p. 108).

User Interface Technology Trends

Traditional internet applications relied on the server for processing, requiring a page refresh for every user action. This behaviour consumed more server resources and network bandwidth, as a result of much redundant data being passed with less than satisfactory wait times, particularly for time-critical financial and medical domains (Farrell & Nezlek, 2007). Web applications thus tended to have slower performance and limited interactivity, compared to typical desktop applications (Aljraiwi, 2017; Paulson, 2005). Bozzon et al., (2006) found in web applications less compatible with desktop interfaces, responsiveness was lower due to network overheads and unnecessary round-trip server access, while disconnected usage was not supported. As a result new technologies to address these issues emerged. According to Paulson (2005), the

internet matured with more responsive user interfaces from rich web applications. However, this added richness has not surprisingly made web interfaces more complex (Bardin et al., 2011).

Paulson (2005) suggested Ajax (a set of technologies mostly developed in the 1990s), could be a key technology for web applications, in order to look and act more like desktop applications. Rodden, Hutchinson and Fu (2010) also noted more recent user interface technologies mostly focused on web-based applications as further business applications are deployed on the web. Wright (2009) noted web developers routinely use sophisticated scripting languages and other active client-side technologies to provide users with rich experiences that approximate the performance of desktop applications, including features like drag and-drop, keyboard shortcuts, and other desktop-like affordances that have become commonplace.

Rich Internet Application (RIA) Technologies

Both the HyperText Transfer Protocol and Markup Language (HTTP/HTML) have been key technologies for web applications to communicate through user interfaces. In modern web applications however there are extra technologies to implement front-end user interfaces. Such technologies have different roles in web application development.

> In web development, a web page, whose layout is defined with HTML (Hyper Text Markup Language), is represented with the Document Object Model (DOM). All client-side interactions are realized with JavaScript modifications of the DOM and the presentation of the web page is usually defined with CSS (Cascading Style Sheets); HTML code that defines the structure and the layout of the page, CSS code that defines the style and the presentation; and JavaScript code that is responsible for executing client-side business logic and interactive layout manipulation. Based on their mutual interactions and resources such as images, the browser engine renders the web page (Maras, Štula and Carlson, 2010 p. 502-503).

Farrell and Nezlek (2007) proposed three distinct types of RIA. The *first* type is a plugin-based RIA which relies on a dedicated platform and environment and is deployed as an embedded solution or standalone application launched from the browser. Adobe's Flex is a good example of an embedded solution of the first type. Flex uses an XML-based mark-up language called MXML to declaratively create Flash based applications. These can then be embedded on HTML pages using standard HTML tags. Java Web Start is the stand-alone approach of this first type; it uses the Java Network Launch Protocol (JNLP) to launch a defined java application from the browser. By doing this from the browser, developers can ensure the specified version is always available. The approach of the first type provides the simplicity of development which is generally known as the Sandbox approach. The second type of RIA is an application based on Ajax technology. These applications employ a combination of technologies typically including XHTML/HTML, CSS, DOM, and JavaScript. The idea is to use CSS and HTML to style and present the interface, use JavaScript to make an asynchronous request to the server, and finally use DOM Scripting to perform 'on-the-fly' rendering. Ajax is a technology for a web application to be able to send or receive data asynchronously so the user can view or update live data with low latency (Dong, Cheng and Zhou, 2011). The third type of RIA is browser-based; this generally incorporates a user interface language such as XUL from the Mozilla Foundation (mozilla.org). The user interface language is mostly built on XML which is a platform independent standard supported by W3C, therefore this approach is available on most platforms.

As many researchers observed in their studies including Lawton (2008), RIAs feature responsive user interfaces and interactive capabilities; this makes Internet-based programs easier to use and more functional, and also overcomes problems with traditional web applications such as slow performance and limited interactivity. However, rich internet applications put pressure on designers to understand modern front-end technologies and often design work requires collaboration with web developers. Another early survey by Myers (2008) revealed 86% of web designers had difficulties prototyping the look of user interfaces and 78% of web designers needed collaboration with developers in order to design the behaviours. In spite of these issues in design and development, users today can experience impressive RIAs such as Google Maps (maps.google.com.au/) and Gmail (mail.google.com/). Among three types of RIA, Ajax became the most common technology to implement RIAs. At that time, Lawton (2008) reasoned that free development Ajax toolkits such as Google Web Toolkit (GWT gwtproject.org/) had influenced Ajax's popularity, which is still in use today.

Asynchronous JavaScript (Ajax) and eXtensible Markup Language (XML)

Ajax is a technology for a web application to be able to send or receive data asynchronously so users can view or update live data with low latency. "Ajax uses asynchronous JavaScript, which an HTML page can use to make calls asynchronously to the server from which it was loaded to fetch XML documents. This capability lets an application make a server call, retrieve new data, and simultaneously update the web page without having to reload all the contents, all while the user continues interacting with the program" (Paulson, 2005 p.15). Paulson (2005) further noted Ajax applications can update or retrieve data immediately allowing users to perform various behaviours without page reloading. AJAX enables web developers to create web applications based on a single-page interface model in which the client/server interaction is based merely on state changes. The communication between client and server can take place asynchronously, which substantially differs from the classic synchronous request-wait-for-a-response-andthen-continue model, changing the way developers develop the architecture of web design (Mesbah and van Deursen, 2007).

There are however several known problems with Ajax technology as it heavily relies on JavaScript running on a browser. Zhang (2012) explained that Ajax web applications mostly stay at the initially given URL, and this URL does not change until the user opens other pages. Mesbah, Bozdag and van Deursen (2008) pointed out that this particular property of Ajax causes the following problems: *searchability* - that is ensuring AJAX sites are indexed by the general search engines, instead of (as is currently often the case) being ignored by them because of the use of client-side scripting and dynamic state changes in the DOM; *testability* - in systematically exercising dynamic user interface (UI) elements and states of AJAX to find abnormalities and errors; and finally *accessibility* - in examining whether all states of an AJAX site meet certain accessibility requirements.

Research has been carried out into solutions. In order to make Ajax applications searchable, search engines must support the execution of a client-side scripting language such as JavaScript. However, most search engines including Google currently do not have support for JavaScript execution due to security issues. It is also believed that if a search engine has the ability to execute JavaScript "some websites may use dirty tricks like cloaking to try to rank higher" (Zhang, 2012 p. 1199). Salva and Laurencot (2009) proposed using automatic Ajax application testing by a random approach using some predefined values and also adopt purpose-based testing for verifying specific properties.

JavaScript frameworks

JavaScript became the most popular script language for front-end programming even though such applications incorporate a learning curve as developers adopt new development styles. A client-side languages survey showed 89.5% of websites used JavaScript as their front-end programming language (W3 Techs, 2013). Due to the complexity of Ajax programming using JavaScript, Farrell and Nezlek (2007) note the necessity of a JavaScript framework to simplify Ajax development, for which a number of JavaScript frameworks exist on the market. As such it is crucial for developers to choose the framework that better matches their needs, provides high maintainability and good performance (Gizas, Christodoulou, and Papatheodorou, 2012).

Javascript Framework Evaluation

In line with a design science approach, the question we sought to answer in this study was "how useful is a prototype of a JavaScript framework for AJAX application development and maintenance?" JavaScript framework evaluations were conducted through *prototyping* and *performance testing*. *Prototyping* was implemented to validate the efficiency and functionality of JavaScript frameworks. The main purpose of prototyping was to determine the extent of usability improvement through advanced user interface features mentioned in earlier sections. We also expected to be able to examine development efficiencies through this prototyping. *Performance testing* was performed to prove performance improvement compared to web applications implemented through traditional technologies such as JSP/Servlet. Apache JMeter (jmeter.apache.org) was adopted to load-test functional behaviour and measure performance. Currently available open source JavaScript frameworks were also examined, where AngularJS (angularjs.org) was ultimately chosen for this prototyping. AngularJS is widely used today due to its stable architecture and functionalities (it is managed by dedicated programmers from Google and has a large community which share developers' experiences and provide feedback to AngularJS).

Evaluation Factors and Methodology

There were three evaluation factors in this study; *development efficiency*, *functionality* and *performance improvement* (table 1 below). Even though there are a few other previous studies proposing software selection criteria, they are for specific commercial or product-based software. We found no studies suggesting the selection criteria of a software development framework. Belyk and Feist (2002) did however propose a selection criteria for software. As this previous study was also for product-based software and the main criteria chosen from the user's point of view, we added development efficiency as the main evaluation factor of this study. The main evaluation factor was *development efficiency* is the most important requirement from a developer's point of view. This evaluation factor is critical to judge whether the JavaScript framework is usable because developers will not use inefficient frameworks even if they provide standard usability. *Functionality* is also an important factor to see whether these frameworks are able to provide advanced user interface features for functional requirements such as auto-complete and drag & drop. *Performance* is the last evaluation factor which is especially important for business applications; it is measured to ensure web applications built on the JavaScript framework provide a fast response time.

Table. 1. JavaScript Framework Evaluation Factors

Factors	To be examined	Methodology
Development efficiency	Learning curve	• Analyse prerequisites • Examine how much time is required to produce an output for the first time
	Code complexity	• See how easy it is to understand the program • Compare the program to the one with the traditional ajax approach
Functionality	Ability to provide advanced features	• Include advanced user interfaces (e.g. auto complete) in the prototyping
Performance improvement	Response Time	• Measure response times of the prototyping and traditional approach using a testing tool

Functionality

The design of a user interface affects the amount of effort the user must expend to provide input for the system as well as to interpret the output of the system and how much effort it takes to learn how to do this, although findings in this regard can often be mixed (Longo and Dondio, 2015). Usability is the degree to which the design of a particular user interface considers the human psychology and physiology of the users, and makes the process of using the system effective, efficient and satisfying (Mishra and Mishra, 2007). We wished to know if the JavaScript framework easily supported the development of advanced user interface features. The following interface features were expected to be provided: an ability to exchange minimal data between the server and client; ability of data update or retrieval without page reloading; and whether advanced dynamic functionalities such as drag & drop and dynamic layout change (e.g. table row creation) existed.

Performance Improvement

The user interface provides users with a first impression and the response time lets users decide whether to use the application or not. This performance has to be reviewed to evaluate any types of software. In this study, we also measured the response time of the prototype application and compared the result to a traditional Ajax application.

Prototyping: JavaScript Framework Selection for prototyping

Considering 10 Javascript frameworks most commonly used in the market, we selected the top 3 frameworks (table 2). Eventually, we decided to use AngularJS (angularjs.org) for the prototyping. Again, AngularJS is a framework provided by Google, its architecture is stable and it supports many features. More importantly we were able to easily use plugins and built-in components.

Table 2: JavaScript Framework Comparison

Framework	Data Bindings	Composed Views	MVC	Plugins
AngularJS	✓	✓	✓	✓
EmberJS	✓	✓	✓	✓
KnockoutJS	✓		✓	✓
BackboneJS			✓	✓
GWT		✓		
D3JS	✓	✓		✓
SammyJS			✓	✓
SpineJS			✓	✓
Cappuccino	✓	✓		
BatmanJS	✓		✓	✓

In order to effectively compare a variety of frameworks, a few key criteria were used. *Data binding* is an established technique to couple user interface (UI) elements and data objects in back-end (Heinrich & Gaedke, 2011). When data is changed, the change will be reflected to the other side automatically; this requires configurations to pair user interfaces and the business logic, however generally the configuration requires relatively little effort. The *composed view* is an important feature to be able to re-use user interface components; this was originally an application design pattern but today it is widely used to create reusable user interface components. Apache Tiles (tiles.apache.org; Cosmina, 2015) is a very good example utilising this design approach exceptionally and is employed to create pages having a similar structure, however each section in the page could have a very different look and content. *Model-View-Controller* (MVC) represents a design approach widely used in modern web applications, where this allows applications to separate their view (representation of information) from their model (business data) and the controller (a user's interaction). One of the great advantages of the Model-View-Controller pattern, is the ability to reuse the application's logic (which is implemented in the model) when implementing a different view (WikiBooks, 2013). The easy utilisation of *plugins* or external components is also crucial for developers to re-use provided components without having to create their own components. These home-grown components often cause problems due to unproven functionalities.

Development scope and requirements

We implemented a simple business application prototype assisting business users to create orders and invoices (figure 1 below); this was chosen as the application requires simple data creation and retrieval as well as more advanced features such as auto-complete. Through this implementation, we were able to evaluate the development and maintenance efficiency. More importantly we intended to determine usability improvement through advanced user interfaces provided by the JavaScript framework.

Requirements

Users will use this application to view pending orders and finalise them. The application provides a function to help users search pending orders by customer name or order status. A simple parts enquiry function was also required as it is frequently used. We implemented the application with the following user requirements: see the active order list; filter active orders by status, customer name or sales person's name; search parts through typing partial part numbers (auto complete support); add line items and modify prices; and add extra information such as 'deposit', 'delivery' and 'insurance'.

Application Architecture

The prototyping application was developed on AngularJS using the Model-View-Controller (MVC) design pattern to decouple the code and to separate layers. In this prototyping, AngularJS was mostly used to build the user-interface layer and to communicate with back-end modules as shown in figure 2. The front-end and back-end applications communicate using JavaScript Object Notation (JSON) on RESTful services. We also intended to divide this application into the front-end and back-end; they run on different Java virtual machines, so that the back-end application was able to be reused by the traditional application in performance testing, which will be discussed shortly.

Fig. 1 Application scope and requirements **Fig. 2 Application architecture for prototyping.**

AngularJS supports the MVC model which is a very common application architecture. MVC allows developers separate the application's business flow from the screen and this JavaScript framework also supports two-way data binding. If a user updates data on the screen, AngularJS automatically updates the data model without extra effort. In the traditional approach this process requires excessive JavaScript code.

Development methodology

The incremental development methodology was used in the prototyping presented here to minimise development risk. In using such a methodology, we adopted an iterative [requirements analysis, application design, development and testing] development lifecycle. We then evaluated development outputs from each development cycle and used it to improve development in the next cycle. We focused on learning how to use AngularJS in the first iteration, rather than spending much time on details. Gradually the focus moved on to details, especially for the page design and quality of user interfaces. Three iterations to complete the development were planned where two weeks were allocated to each iteration, bringing the total development period to 6 weeks.

Performance Testing

Testing was performed using the prototyping implementation. In order to compare this to a traditional web application, we implemented a web application providing the same functions based on the jQuery library. This jQuery application shared the same back-end modules, for we had developed the back-end application to be a standalone application. Hence our jQuery application was used to build front-end modules only (figure 3 below); this allowed us to focus only on front-end modules (AngularJS vs. jQuery).

Fig. 3 Performance Testing Structure

JMeter (Jha & Popli, 2017) was used to produce massive concurrent requests to both applications. The number of thread and loop counts are configurable in JMeter. We created three test cases, which had different numbers of requests (table 3 and figure 4). We expected these cases would make the result more accurate because different thread counts and loop counts would produce results in various runtime environments.

Table. 3 Test cases

Configuration	1st Test	2nd Test	3rd Test
Number of Threads	100	200	300
Loop Count	10	20	30
Total Request	1000	4000	9000

Fig. 4: Thread Group Configuration Example in JMeter

Results

A JavaScript frameworks evaluation was conducted by prototyping and performance testing. As expected, the selected JavaScript framework assisted us to reduce our effort on Ajax application development, and code produced in this prototype is much simpler than in the traditional Ajax development approach. However, the prototyping application's response time did not show any improvement compared to the traditional approach. Table 4 below shows a brief summary of the performance testing. One of the results is that developers do not have to understand how Ajax technology works, as JavaScript frameworks hide most of the complex logic from the implementation. However developers definitely should understand Ajax technology in order to utilise advanced Ajax features, but this is not required for basic Ajax features.

Table 4: Summary of performance testing results

Factors	Parameters	Results
Development efficiency	Learning curve	• Knowledge of HTML and JavaScript required • @12 hours to install to produce first interface
	Code complexity	• Program code very simple compared to JavaScript Ajax or jQuery
Functionality	Ability to provide advanced features	• Easy – many UI components provided.
Performance improvement	Response Time	• Not much difference in performance.

Roughly 12 hours was required to install the AngularJS framework, to experiment with samples, and then successfully produce the first interface using it. This is considered a relatively short period of time to produce an output using a new technology for developers.

Code complexity

Using a traditional Ajax application programming style produced a large amount of JavaScript code, which in turn included a lot of redundant code to send and receive requests from the back-end server. JavaScript frameworks provide a wrapper to make this simple and eliminate redundant and complex code from the program. The example program code below is an AngularJS Controller processing user interaction on the client-side and communicating with the back-end server to send user requests and receive data to display. This controller code processes all front-end logic for the Active Order page in the prototype. The controller sends a RESTful web service request to the back-end server and receives application data in JSON format; this also handles all filtering requests requiring communication between the browser and back-end application. Therefore, every user action on the browser is able to communicate with the back-end server and re-fresh data without having to reload the page.

```
function ActiveOrderCtrl($scope, $http) {
  $scope.status = 'all';
  $http.get('http://localhost:8080/restapi/activeOrder').success(function(data) {
    $scope.orders = data;
  });

  $scope.changeStatus = function (status) {
    $scope.status = status;
  };

  $scope.filterByText = function(order) {
if($scope.searchText == null) return true;            return
(order.customer.toUpperCase().indexOf($scope.searchText.toUpperCase()) > -1
          ||
order.salesPerson.toUpperCase().indexOf($scope.searchText.toUpperCase()) > -1);
};
}
```

Functionality

Most JavaScript frameworks allow developers to utilise external components and plugins. AngularJS also provides this utilisation (see: http://docs.angularjs.org/guide/bootstrap) with a number of components for advanced interface features such as on desktop applications, for example auto-complete, drag & drop, date picker and dynamic dropdown boxes. The benefit of these components is that developers are able to reduce the amount of time required to develop these advanced interfaces and they can use proven user interface components.

Response Time

As planned, three test cases (table 5) were used to send concurrent requests to both applications.

Table 5: Actual performance results

Application	(1K Requests)	(4K Requests)	(9K Requests)
AngularJS Framework	18,837tx/min Avg **7ms** Avg **10ms**	40,509tx/min Avg **79ms**	32,244tx/min With
With jQuery Library	18,662tx/min Avg **8ms**	43,907tx/min Avg **10ms**	36,458tx/min Avg **82ms**

JMeter showed results with various options. Initially, we expected performance benefits from an AngularJS approach, however as table 5 indicates there was no performance benefit. Even jQuery showed slightly better performance when it processed 9000 requests.

Discussion

After trialling the new look and feel over recent months, the dynamic interfaces were very appealing to the Sydney area staff and the amount of code to produce these advanced interfaces satisfied the IT team of 30 personnel. However, the development team was still concerned with the learning curve of the new technology and the stability of the open source framework, as they suffered from instability and inconsistency especially when the open source product is upgraded without providing backward compatibility. We decided to incrementally apply this technology to the company's new applications. The company was planning a number of projects to upgrade their old mainframe-based applications. They chose a simple application as the first candidate, but the first implementation would be a page requiring many dynamic interfaces according to user's requirements; this approach is expected to prove whether this technology is able to fulfil their user interface requirements. The company now understands such technology is clearly able to improve user interfaces, as they saw from the demonstration. However at this stage their greatest concerns are "how easily can users adapt to the new interfaces?" and "how easily can developers produce outputs utilising this new technology?"

Conclusion

We analysed the significance and characteristics of user interfaces in modern applications. The user interface has played a key role in modern applications and is becoming increasingly important as application user's expectations increase; it is also one of key elements of quality in an application. Ajax is regarded as a solution to resolving problems with regard to user interfaces of traditional web applications. However, due to its complexity, there have been limitations in widely using the Ajax development environment. A large number of Ajax JavaScript frameworks have been developed and are now available to developers to reduce such complexity. In this design science study, we evaluated JavaScript frameworks by conducting prototyping and performance testing. We concluded that Ajax application development requires great effort but the JavaScript framework is able to reduce the amount of effort developers must spend on it. The JavaScript framework hides the complexity of Ajax programming from developers and generally supports easy UI plugins for advanced features, nonetheless there is no performance benefit. JavaScript frameworks provide development and maintenance efficiency. Lastly utilisation of these frameworks allow developers to place much less effort on Ajax development, therefore we highly recommend utilising a JavaScript framework for Ajax application development.

Abstract

The Provincial Government of Aklan, aiming to improve rather than just maintain its active economy, has assigned its Management Information System Division to produce software solutions for process improvement to help uphold such goals. In addition, the analysis and design helps the division furnish a decision-making support tool fully meeting the requirements of the local chief executive. Since this project serves as groundwork for analysis and design, not all elements of the Structured Systems Analysis and Design Method were implemented. However vital parts of the model were covered to ensure a broad conceptualization of the projected information system for the intended user. A template based on the Bootstrap framework was used to build a web application interface for a prototype of the system. Different components of the application were imported through a text editor using HyperText Markup Language, Cascading Stylesheets and JavaScript. Along with the prototype, a fully-documented Systems Analysis and Design was generated as a foundation for implementation.

Keywords

Aklan, Philippines, EIS, Software Engineering, HTML, SSADM.

Introduction

The objective here of providing information systems is to permit government officials to generate appropriate, sensible and truthful reports which in turn equips them for appropriate planning and decisionmaking. The Executive Information System (EIS) is part of the list of information systems to be established for different Philippine government departments. This EIS affects the Provincial Development & Physical Framework Plan in many ways, such as efficient allocation of resources and effective governance empowered through transparency. Although EISs have lost some of their popularity in recent years, they are still considered valuable in certain domains (Anon., 2019). The establishment of an EIS will save much time and effort in the acquisition and preparation of reports from departments. Furthermore the Provincial Governor can not only keep an eye on where diverse projects stand but also track income gained by the province from its revenue-generating aspects. Generally speaking, Management Information Systems (MIS) were deemed to be integrated user machine systems providing relevant data through operations and management support, as well as decision support in an organization (Cooper, 1988). Such systems are still in use today in a variety of disciplines ranging from town planning (Grifoni, D'Onofrio & Sargolini, 2018), environmental management (Renatus & Gelderman, 2016), farming (Fountas et al., 2015) and so on.

Aklan, Philippines

The Provincial Government of Aklan (PGA) aims to improve the delivery of services to its clients especially to its people through more proficient operations under a supportive top management providing effective executive governance. The Philippines is classified into three main geographical divisions namely Luzon, Visayas and Mindanao (Roces, 2013). According to the National Statistical Coordination Board (2014), these islands are categorized into 17 regions, 81 provinces, 144 cities, 1,490 municipalities, and 42,029 barangays. The Province of Aklan is situated in the middle island of Visayas. Regarded as the country's oldest province, Aklan is believed to have been founded by foreigners from Borneo sometime in 1200's (Philippine Department of Tourism, 2015). The province has become famous for the exquisiteness nature has imparted to it and has made its mark in luring tourists. As noted by the Philippine Department of Tourism (2015), Aklan's claim to fame is Boracay - an island approximately one kilometre from the northwestern tip of the province (Anon., 2018).

Provincial Government of Aklan – Governor's Office

The Provincial Government of Aklan (hereafter PGA) constitutes 19 departments each with an appointed department head (Vargas, Rentillo & Rubio 2012). The entirety of the Provincial Government is administered by the Provincial Governor's Office (PGO) to which all departments are subordinate. The PGO's major function is the general management and jurisdiction over all programs, projects, services, ventures, plans and activities of the PGA. As outlined in the Information Systems Strategic Plan (ISSP), the Office of the Provincial Governor's critical management, operating and business systems include: ensuring the delivery of basic services, initiating and maximizing the generation of resources and revenues and applying the same to the implementation of development plans, program objectives and priorities; and enforcing all laws and ordinances relative to the governance of the province and the exercise of appropriate corporate powers (Vargas, Rentillo & Rubio, 2012). To uphold the aspirations of the governor for the provincial government to have well-developed income-generating means with seamless operation, the Management Information System Division (MISD) was and is assigned to build information systems for various government offices (Vargas, Rentillo & Rubio 2012). The division exists as a branch under the Provincial Governor's Office operates as the main provider of software solutions for PGA to continuously improve their processes. Several information systems were built in-house for some departments.

Approach

This project is deemed as an initial take on the systems analysis and design of one of the many information systems to be developed for PGA. The main features of the actual system will be simulated into a prototype to provide a preliminary look and feel. This Business Process Review (Lemańska-Majdzik & Okręglicka, 2015) has been developed for use in PGA for the Management Information System Division's efforts in developing an Executive Information System (EIS). The scope of the current process as well as its deficiencies are identified in table 1 and figure 1.

Table 1: Current business processes

System	Manual Business Process	
Purpose	How the agency operates as well as how the local chief executive performs specific functions is described. Problems associated with the current environment are identified and what the new system can resolve.	
Scope	The process here only encompasses an existing manual process with regard to how the local chief executive obtains reports necessary for decision-making.	
Preconditions	The process input is the governor's need for specific information from a particular department under his administration.	
Boundaries	The activities immediately following the process input and immediately preceding the process output define the boundaries here. The starting boundary is defined by the governor requesting a detailed report from the appropriate providing department reporting directly to him. The process's ending boundary is defined by the governor receiving the report asked for.	
End Conditions	The process output is the specific report for the governor, from a particular department under his administration.	
Process Flow	**Step**	**Action**
	1	The governor asks an assistant or available staff member to contact the department head for a report (perhaps through a phone call or sends someone to the department concerned).
	2	The assistant or staff member talks to the department head or a representative (asst. deputy head/acting deputy head) to take the call in case the department head is not available.
	3	On behalf of the governor, the assistant requests a certain report.
	4	The department head or representative agrees and proceeds with the preparation of the report.

	5	The department head or representative asks appropriate personnel to produce a report which are all paper-based. The reports will still be printed out for the governor.
	6	Once ready, the report will be brought to the governor's office either by the department head, assistant department head/acting department head or authorized personnel.
	7	The report is listed into the incoming documents logbook.
	8	The report is handed over to the governor or his assistant.
Alternative Flows	**Step**	**Branching Action**
	1	In some cases the Governor has access to the information systems of a few departments.
	7	In some cases, the report does not require being listed into the incoming documents log – in which case proceed directly to step 8.
	8	In some cases the report is not only handed to the Governor, but also explained in person.
Control Points and Measurements	**Step**	**Branching Action**
	6	The person delivering the report is aware of the sensitivity of the report requested.

Figure 1: Business Process Flow Diagram

Reports are traditionally prepared manually and consolidation takes time and effort. The governor has to actively request preparation and submission of reports from appropriate departments. However for detailed and faster reports, he requests information directly from the centre responsible. The Provincial Governor uses reports from several information systems already in place to monitor the efficacy of operations and service-delivery. On the other hand it is impractical for reports to be generated by the governor personally, hence he may request someone else - perhaps an assistant of any available staff member, to print reports as required. It is proposed the EIS integrate established information systems for the purpose of acquiring necessary reports with appropriate user account permissions. This manual process basically applies to any report the governor requires from other departments, be it a map from the Geographical Information System (GIS) (Sexton, 2019) or Human Resource Management reports from HRMIS (Boon, den Hartog & Lepak, 2019). The EIS proposed will provide access to relevant information from various sources to provide

government officials with relevant, timely and accurate reports allowing them to make plans and decisions as appropriate.

The focus of the development of EIS is for the immediate information the governor requires which can be viewed immediately on the system. In cases when explanation is called for, the governor can communicate with the appropriate department heads after he has reviewed necessary information using the system. The EIS automates the sharing of information without having to rely on phone calls or face-to-face encounters, unnecessary paper-based reports and time-consuming processes of communication and report preparation.

With an EIS, the governor can check the system directly and reports are displayed as shown in figure 2. Printing hard copies may still be done according to the governor's preference or if the need arises. The proposed EIS will be primarily touch-based to provide easy navigation and a user-friendly interface to the Provincial Governor; it will also be intranet-enabled with an option for remote access.

Figure 2. Required System Data Flow Model

The EIS will be a web application accessed by the governor via touch-screen desktop machine, which will aid with responsiveness and mobility. The web application contains various modules enabling connection to various databases (figure 3). The EIS will have no database of its own and no importing or extractions of tables will occur either - only linking. The EIS will be integrated into existing systems. Linking will be performed to a mirror database NOT the live database. Backup and restore scripts will run at 1:00am daily. There is no one to one relationship between the database tables and reports produced. The server will send a response and be rendered to the web page. Figures 3 and 4 below illustrate the different information systems of the Provincial Government of Aklan, including the Executive Information System to be developed.

The EIS will contain a custom-made GIS Web Application interface for project updates and geographical illustrations. The sole user will be the governor, thus session and authentication will be code-driven. Also, the EIS will strictly only have query or read access to the databases used by the relevant information systems. No `Create`, `Delete` and `Update` access are provided. An event in the dashboard will trigger a query request sent through http to the database server. The final form of the EIS is projected to be a web application interface using C#.NET. The in-house software developers use a licensed version of Visual Studio 2012. The backend will run on Microsoft Windows Server 2012 with an Open Government License. The web application will be hosted using the IIS7 Web Server; as this is a web application, data communication will be through http.

Document Tracking Reports

The Management Information System Division (MISD) was also tasked with developing a system of tracking purchase requests and disbursement vouchers as they pass through one department to another. Gathering inputs through interviews, experiences and existing procedures, the MISD developed the Document Tracking System (DTS) to address the tracking and monitoring requirements of Purchase Requests and Disbursement Vouchers. The Tracking of Purchase Requests (PR) and Disbursement Vouchers (DV) starts with the receipt of complete documents from their respective departments being the Provincial General Services Office (PGSO) for the PRs and Provincial Budget Office (PBO) for the DVs. The tracking system records the receipt and release of the documents as it goes through the transaction process. The duration is system measured and generated. Once a cheque is issued, the Provincial Treasurer's Office closes the transaction. The tracking shows the number of pending, processed, sent out, received and closed documents per department.

Figure 3. Conceptual Framework

(source: Vargas, Rentillo and Rubio, 2012 - permission granted to reproduce).

Revenue Collection Reports

The Provincial Government of Aklan maintains a plethora of enterprises such as government hospitals, ports and terminals, construction development and quarrying services, provincial tourism operations as well as academic centres. As such, the Economic Enterprise Development Department (EEDD) has legal authority to collect non-tax revenues such as regulatory fees and business and service income accruing; in addition it also collects tax and non-tax revenues such as that from real property tax accruing to the General Fund.

Figure 4. Information System Layout

(source: Vargas, Rentillo and Rubio, 2012 - permission granted to reproduce).

All EEDD local government revenues are collected at source while those accruing to the General Fund are collected through field collectors from the Collection Division of the Provincial Treasurer's office. All cash

and non-cash collections together with collection reports are remitted to the Treasurer's Office at least daily. Traditionally these are prepared manually and consolidation of such reports takes time and effort. The governor has to actively request preparation and submission of revenue collection reports from the Provincial Treasurer's Office (PTO). However for detailed and quickly-prepared reports, he requests information directly from the concerned responsibility centre.

The Provincial Government of Aklan adopted the Enhanced Tax Revenue Collection and Assessment System (ETRACS) in July 2014. ETRACS is a computerized system made for Local Government Units (LGU) to fully automate operations of and between Treasury and the Assessor, and is composed of three

(3) core modules: a Tax Collection Module, a Business Permit Assessment Module and a Real Property Assessment Module.

Human Resource Management Information

The Provincial Government of Aklan adopted the Human Resource Management Information System (HRMIS) from the Department of Science and Technology (DOST). Using LAMP (Linux, Apache, MySQL and PHP), the system was customized and tailored for use of the LGU. The HRMIS incorporates the following features: Attendance Monitoring, Leave Management, Personnel Information Management, and Certification Issuance.

Project Monitoring and Status Reports

The Provincial Government of Aklan implements (hard and soft) projects, which are funded from various sources. These include Local Funded Projects including the 20% Development Fund, National Funded Projects, Foreign-Funded Projects, and National Government Organisation-Funded Projects. Consequently, maps are also critical to the governor's decision-making as information on geographical location, land area and property accessibility are needed for particular projects. The Provincial Governor uses reports from the Document Tracking System to monitor the efficiency in document processing. However, it is impractical for him to generate the reports himself or request someone else to print the reports for his use. In addition, the knowledge that the governor has easy access to reports through a tabletop has a psychological effect for departments concerned, in as much as there is some increased pressure to perform. It is proposed the EIS integrate with the DTS to obtain such reports.

At present, ETRACS has been operational and implemented in the Office of the Treasurer, the Assessor's Office and the Dr. Rafael S. Tumbokon Memorial Hospital (DRSTMH). ETRACS will be rolled out to cover all revenue collection centres of the province in the future. One of the features of this system is automatic report generation along with online transaction capability. It is proposed the EIS will integrate with ETRACS to obtain these revenue reports. Human resources is most important asset of the LGU and also its greatest expense. It is important the governor have regular status updates on the quality of his or her workforce; this includes attendance levels, tardiness, age profiles, skill profiles, job status and gender. It is proposed the EIS will integrate in to the HRMIS to obtain such reports.

As the number of projects implemented is extensive, the governor faces difficulty keeping track of the status of these projects. The MISD proposes a solution based on a Geographical Information System (GIS) for accessibility and manageability. Project Monitoring Teams were established to gather status updates regularly. In order to provide an efficient reporting tool, it is proposed a web application where status reports will be developed, are encoded and linked to the ArcGIS Server of the PGA. Hence the EIS will include a customized GIS Web Application interface to provide project updates as well as make maps accessible to the governor. Session and authentication will be hard-coded as only the governor will have access. Furthermore the EIS will have query or read access to the ETRACS, DTS and HRMIS MySQL database. It will not incorporate `create`, `delete` and `update` access. Necessary user account permissions for the EIS will be provided, therefore the user will be unable to add new reports, nor modify or remove any existing reports on the system. The user will only be able to access and view the reports for his/her liking.

A prototype must be developed in accordance with expectations of users as determined in the systems analysis and design lifecycle (Dennis, Wixom & Roth, 2008; Shoval, 1995). Familiarity with tools was performed at this stage and these were accordingly employed. The prototype is seen to provide an initial conceptualization, thus the interface is designed with fixed content. For this reason a web application with static web pages was created, as the initial contents incorporated into the prototype need not be updated. The prototype developed incorporated static web pages, where each webpage was stationary using Bootstrap (getbootstrap.com) while the text editor utilized Sublime Text 2 (sublimetext.com). A free responsive multiple skin admin template with pre-designed webpage or set of HTML webpages was

downloaded. With the use of a website template, custom content such as text and images may be plugged in or imported.

Prototype Development

Bootstrap is the most popular HTML, CSS, and JS framework for developing responsive, mobile first projects on the web. Bootstrap enables quicker and easier front-end web development for developers of all skill levels, devices of all shapes and projects of all sizes. The values of the classes are all from the framework. A template was employed in order to minimize redundant work. The template used was a full scale, high quality, HTML5 backend based on Bootstrap 3. The template was already equipped with numerous plug-ins and elements for the user interface for a simpler development of the prototype. The template is compatible with all commonly used browsers and can be optimized in case of a change of platform to perhaps a tablet or a phone. This open source admin template can be downloaded for free and is licensed under Apache License V2.0. With the template, one need no longer build and edit the theme as it is already pre-coded with pre-compiled framework components. The relevant information to be shown on the application were incorporated in the template. For every webpage, the corresponding components are imported. There are several different themes to choose from to suit the required interface format for the intended user and for the type of application developed. JavaScript (Kienle, 2010; Martinsen, Grahn & Isberg, 2013) was used mainly for the login option for inputting the username and password, as well as the disclaimer in case the entered login information was invalid (figure 5).

Figure 5. Login Option

Although it is only the governor who has access to the EIS, a login page is still necessary to restrict anyone from accessing the content of the system and to restrict other people from gaining access to the system and viewing reports not allowable to others. The governor may not always be on his or her workstation and if left open, the risk of illegal access is likely, thus a login page was setup for the system. The main homepage shows the different report categories available. The report categories are interactive when the mouse pointer hovers over their respective links before clicking to select; in this way the user is able to recognize which option is about to be chosen to ensure the correct option is clicked. This scenario is of minimal effect but can still yield shorter cycle times for the user to access and view reports.

Document Tracking Reports

The Document Tracking Reports include Purchase Requests and Disbursement Vouchers. Each report will show the department involved, date submitted, date required and its status.

Purchase Request

A Purchase Request is a document issued by a certain department to notify the purchasing department of items needed, along with corresponding quantities and estimated unit prices. The purchasing department for PGA is the Provincial Goods and Services Office. Such a document is intended to maintain internal financial controls within the organization. The Provincial Accounting Office (PACCO) established a purchase request process to effectively oversee requisitions for purchases. Requests to execute purchasing of goods and services are all put on record and cross-checked against internal departmental budgets before endorsement for approval within the organization which are then brought to PACCO. The accounting department usually has specific employees handling all purchase requests. The signatories for this document are only the head of the department filing the request and the governor approving requests.

Disbursement Voucher

A Disbursement Voucher is a form used to make payments to an individual, usually a non-employee or resident, a business establishment or private organization for merchandise sold or services rendered. For government employees or organizations, a disbursement voucher is generally used for expenses incurred during government functions. An unsigned disbursement voucher implies the check will also not be signed. There are a couple of signatories for this form. The respective heads of the Accounting and Treasurer's Office are to certify requests for payment before the governor grants approval. The recipient of the payment or an authorized representative can affix their signature, signifying acceptance of the check.

Revenue Collection Reports

Revenue Collection Reports are divided into three categories - namely Total Revenue, Tax and Non-Tax Revenue. The Total Revenue reports are laid out according to the Economic Enterprise that is the source of such revenues, while the Tax and Non-Tax revenues are laid our according to sub categories. The Economic Enterprises refer to the income-generating branches of government such as hospitals - both town and provincial, or tourism operations such as jetty ports and airports. Non-Tax Revenues are subcategorized between Regulatory Fees and Business and Service Income. On the other hand there are three subcategories for Tax Revenue sources, namely Real Property Tax, Special Education Tax and other Local Taxes.

Human Resource Management Information

Due to the lack of data, the specific HR reports are not incorporated into the EIS prototype; HR reports are however temporarily linked to the actual HRMIS.

Project Monitoring and Status Reports and Map

No specific reports on Project Monitoring and Project Status were acquired from the organization during the project. Thus the GIS Web Application interface to be created for the EIS is not included in the prototype.

Evaluation

Different phases and corresponding tasks were formulated based on structured systems analysis and design methodology (SSADM) principles (Ashworth, 1988; Verma, 2012). The feasibility study phase included investigation of the current environment concerning how the agency currently operates to formulate software requirements. The Systems Analysis and Design phase focused on establishing requirements for a new system addressing inadequacies uncovered in current business practices (Al-Hothali and Al-Zubaidi, 2012; Ishtiaq *et al.,* 2012). The Implementation Phase included building a prototype. The projected final form of the EIS is of a web application interface. A web application is perceived to be the best solution meeting user requirements, particularly through cross-platform capability. The prototype only includes static rather than dynamic pages, as static pages were adequate to depict the concept developed for the EIS.

Findings

There are many methods stated in the province's Information Systems Strategic Plan (ISSP) which are potentially chosen when developing information systems (Vargas, Rentillo & Rubio, 2012). However, the waterfall model was preferred as the guide for the entire software development process. As the waterfall model upholds administrative control, it was considered the most appropriate for a government organization. The objectives of the feasibility study were to identify not only the scope of the existing system but also its deficiencies. The Business Process Review detailed such information to establish an evaluation of a new system addressing the deficiencies of the current business process. For this evaluation, the Systems Analysis and Design phase focused on developing a new set of system specifications which were communicated through generating the Required System Description supported with a Data Flow Model as well as Functional and Non-functional Requirements. Furthermore, Logical System Specifications were embodied in the Technical System and Logical Design Descriptions while the Physical System Specifications included select content for the EIS. The Implementation Phase included building a prototype according to the existing government interface. The EIS envisioned is a web application with fixed content as a prototype.

A web application was agreed upon as government users may not always be at their workstations, rather underway as part of their day to day business. The technical capabilities of the average public sector employee were considered. Other assumptions were taken from the user's work dynamics. The local chief executive or governor is known to be very busy and not continually at his workstation. The creation of the EIS in itself is beneficial for saving time for those preparing requested reports. A non-complicated interface

is ideal to save much of the governor's time, better spent undertaking more pressing tasks. The interface is to be straightforward in that it will be easy for the user to navigate options quickly and seamlessly to locate whichever reports are needed. The local chief executive should be able to access the final EIS web application from any platform other than a desktop computer. The system may be via a phone, tablet or laptop to allow the user access to reports regardless of location. The governor may be in an important meeting in a venue away from his workstation when the need for a report arises. This multi-platform compatibility of a web application interface allows the governor to obtain such reports.

As the web application will include static web pages, only simple HTML, CSS and JavaScript need be employed. PHP and MySQL are to be employed as a backend for prototyping for eventual dynamic web application production. PHP is Open Source Software (OSS) (Noruzi, 2007; Tasić, Stanimirović & Pepić, 2011). MySQL has become the world's most popular open source database system due to its consistently fast performance, high reliability and ease of use. Besides being freeware, MySQL offers a wide range of possibilities (Tasić, Stanimirović & Pepić, 2011, p. 2429).

Conclusion

This Systems Analysis and Design project is intended for the Provincial Government of Aklan in the Philippines and is to start with the Executive Information System planned for the governor's use. The lack of documented analysis and design is one of the competency gaps of the MIS division, as there is no System Analyst on the roster; this project helps to fill that gap. To further understand the background of the project, the province of Aklan and its governing body was introduced. The province is rich in many aspects with many unique products. Business opportunities and tourist attractions are the underlying factors for the provincial government's desire to implement projects supporting improvements to income-generation.

The current business process was discovered to be manual using not only excessive paper but the cycle time is also long. Through requirements analysis, the required system to address deficiencies in existing processes is being produced (Ishtiaq *et al.*, 2012; Wellsandt, Hribernik & Thoben, 2014). The specific approaches into how the system will be developed were also provided. In addition, the logical designs of enquiry processing and system dialogues are laid out. A web application is the most ideal interface for EIS which will not have any database of its own. Instead the governor's workstation will have linking access to the databases used by the MIS Division. The physical data and process design are formulated. The governor will only have access to view reports needed from the EIS and will not be able to add new reports or modify or remove any reports. A prototype will be developed from the concept formed throughout the Feasibility and Systems Analysis and Design Phases. Similarly a web application is currently being built using an admin template adopting the Bootstrap framework. The Sublime Text 2 editor is being used to incorporate custom components into different pages. Languages used are HTML, CSS and JavaScript (Kienle, 2010; Martinsen, Grahn & Isberg, 2013).

Although it will only be the Governor who has access to the EIS, a Login Page is still necessary to restrict other people from gaining access to the system along with viewing reports otherwise not accessible. The content of the application is carefully selected according to what is primarily significant. Content selection is based on the most common reports requested by the user to effectively deliver services. The user interface is designed to be minimalistic and user-friendly to cater to the technical proficiency of the sole user - being the local chief executive. More so, the decision to make a web application for the EIS arises from users residing in different locations, perhaps attending meetings or public functions to which the cross-platform capability of a web application comes in handy. The automation of the reports request of the EIS in itself is beneficial to save time for those preparing reports. To yield greater productivity, an interface that is easy to navigate through touch screen compatibility of devices is deemed best for the user, which will in turn accumulate more savings on the governor's valuable time which can be disseminated to other important tasks.

Future Work

This project was deemed an initial software development attempt at an EIS. Prioritized tasks were taken to formulate a conceptualization and plan what the EIS could do, how it would look and what it could offer. Based on communication with users, stakeholders, sponsors and developers, the actual execution is expected to be two years to be fully accomplished. Other SAD methods will be explored in future. Joint Application Development (JAD), Rapid Application Development (RAD), the Spiral Model and the synch and stabilize approach are alternatives to the Waterfall Model, with the build and fix approach also

mentioned in the Provincial Government's ISSP. Hence there are other approaches to Systems Analysis and Design to be considered.

Environmental Protection: The Method of Mineral Separation According to Useful Component Density

Natalia V. GORODNOVA

Ural Federal University, Ekaterinburg, Russia, n.v.gorodnova@urfu.ru

Vasily I. GORODNOV

Ekaterinburg, Russia, v.gorodnov@yandex.ru

Abstract

The implementation of the Smart City concept means creating a system including such basic elements as digital economy development, integrated breakthrough IT technologies, Smart human capital formation providing a fundamental merger of information, nano-, bio- and socio-humanistic technologies through the mediation of digital systems, as well as the presence and development of the Smart Ecology system based on the principles of natural resources saving and environmental improvement. In this context, the development of efficient methods to process technology-related materials is becoming all the more exigent. The article's author, building on the systematized experience, has conducted comprehensive scientific research and laboratory tests that led to the invention of a patented method of mineral separation according to useful component density, and of a plant unit to embody the invention. The conclusion has been made that the unit is highly efficient due to its continuous work, low metal content, minimal time and labor input needed for its assembling and disassembling; it also needs minimum time and labor input to prepare and equip a site for its operation, which may lead to economic effect and improved ecological situation in the area. The article may be of interest for government authority officials as well as for specialists implementing priority innovative environmental projects.

Keywords: Environmental Protection, Smart City, Mineral Components, Ecology, Efficiency

Introduction

Significant problems that create obstacles to the widespread use of Smart-technologies in the Russian Federation include the lack of investment in social and human capital, the gap in the socio-economic development of the Russian regions, the lack of the necessary resources, the presence of infrastructure problems, the emergence of unfair competition and company struggles for its special segment of the new market, identifying the problems of interaction between developers, municipal authorities, legislative structures, developers and other specialists, as well as serious environmental problems (Ruzheinikov, V., 2017; Velikiy, D., (2016).

The concept of "Smart City" should become an integral part of the innovation strategy of our state. This, in turn, requires the development, successful implementation and evaluation of the interaction of a whole range of priority investment projects aimed at the use of Smart-technologies. As a result, a significant synergistic effect is expected in all areas of the city's life and urban infrastructure, including improving the quality of life and the level of safety of citizens, the construction of educational and social centers, and solving environmental problems. (Schneps-Shneppe, M., 2016).

The Smart City concept is a global urban space management system based on an information approach and innovative technologies, the use of new nanotechnological materials, implementing the principles of energy saving and energy efficiency, which allows creating a comfortable living environment and infrastructure for residents. to increase the efficiency of the functioning of the city

as a whole, significantly improve the environmental situation, increase the efficiency of public and private transport, predict and minimize the negative consequences of risk events, and also obtain significant savings in resources, which will increase the investment attractiveness and competitiveness of the city. (Gomonov, K., Berezin, A., Matyushok, V., Balashova, S., 2017).

Timelyness. Statistically, 1 ton of coal, depending on the processing equipment, fuel preparation conditions and specific combustion modes, produces 140 to 25 kg of solid ash content. (Radomskaya, V., Yusupov, D., Pavlova and ets., 2018), Ash content is mineral stock rich in aluminum oxide (15-25%), ferrous oxide (6-15%), and silicon oxide (40-60%). It also contains, as microadditives, 50 elements of Mendeleevs' periodic table. (Glushkov, D., Zakharevich, A., Strizhak, P., Syrody, S., 2018; Prokhorov, K., Alexandrova, T., (2017).

Combined heat and power plants waste, as regards its complex and multicomponent material composition, equals to technology-related deposits, now possible to process using the accepted mineral separation methods allowing to extract valuable components and use the obtained products for the needs of national economy**.**

The main problem with CHP waste dumps reclamation is that Russia lacks advanced non-waste technologies of the kind used, for instance, in Germany where all plant ash and slag is 100% processed, which requires no additional areas for its storage.

In present-day Russia, there have been developed, however with limited use, such ash and slag processing technologies as wet magnetic separation and flotation. These technologies allow to efficiently extract aluminum oxides, ferrous oxides, and unburned carbon. This has led to ecology-and-economic effect due to the realization of additional marketable products and reducing solid waste placement costs amounting to 72 319,79 thousand rubles and 74 970, 10 thousand rubles annually (the data is for CHP-11 and N-Irkutsk CHP correspondingly).

Presently, there are 172 coal-fueled CHP-plants in Russia. Their waste dumps contain about 1.5bln tons of ash and slag (AaS) (Gorodnov, V. and ets. (2015).

According to the information from ZAO "APBE", ash and slag dumps' area is as large as 28 thousand hectares. Just up to 8% (1,5-2,1 million tons) of the annual yield (about 30 million tons) of ash and slag is utilized and used. If the trend persists, by 2020 the volume of the accumulated AaS may reach 1,8 bln tons.

According to expert estimation, the cost of storage of 1 ton of AaS is 400 to 700 rubles, or 5-7% of a coal-powered CHP energy and heat production costs. Investment needed to reconstruct one ash and slag dump may be up to 1bln rubles, while the construction costs of a new dump are 2-4bln rubles.

In 3 to 5 years the overfilling of AaS dumps will reach mass proportions, this process is already underway.

There looms a risk of coal generation losing its power and place in the energy balance. According to Russian Statistic Agency, Ekibastuz coal production costs are 410 rubles net of VAT, its ash content is 40-48%, while that of Kuznetsk coal is 15-40%. The Reftinskay Regional Power Plant has a closed-circuit hydraulic system of ash removal. The ash is stored at AaS dump 2, 4,5km off the plant, its area being 992 hectares. The plant's annual yield of ash and slag is 5 m tons. AaS dump 1, of 450 hectares, is filled to capacity and withdrawn from service. Works to reclaim it are underway. (Gudzenko, V., Varenichev, A., Gromova, M., 2018).

The main purposes of the development of a new method for mineral separation and a unit for its implementation are:

- the development of a mineral separation unit, simple in design and operation, with no stringent requirements for the purity of water;

- making it highly efficient through its continuous operation (minimum time and labor input for the withdrawal of the useful component as it must take place during the separation process, without having to stop the unit's operation);

- low metal content, minimal time and labor input needed for its assembling and disassembling, which gives more opportunities for a quick point-of-use change (mobility);

- minimum time and labor input to prepare and equip a site for the separation unit's assemblage, thereby increasing its economic effectiveness.

To achieve the abovementioned goals, the following tasks were set and completed in the course of the research:

- modern technologies and principles of mineral separation units' operation were systematized;

- the requirements for mineral stock preparation and its transportation to separation plants were studied;

- global experience in mineral separation was generalized;

- analysis was carried out of negative consequences inherent in mineral separation technologies and units, debugging of which may call for considerable changes to the design of a separation unit;

- analyzed was the specific nature of mineral deposits formation (precious metals, alluvial formations), as well river hydrography;

- studied were the specific nature of two-phase flows, as well as swash channels formation in rivers.

Within the scientific research conducted by the article's author, that resulted in the development of an innovative mineral separation unit (The method of mineral separation according to useful component density and a unit for its implementation. Gorodnov V. I., Gorodnova N. V., Berezin A. E, patent of invention RUS 2601791 25.08.2015) additional tasks were set, including the study of hydrotransport, hydraulic calculation of pressurized hydrotransport systems, and solid particles behavior within its curved sections.

Resulting from the study and analysis of the entire relevant information (Varenichev, A., Gromova, M., Potapov, I., 2017), delineated was the following way to attain the abovementioned goals:

To use the physical processes taking place in pressurized hydrotransport extensively employed in modern separation technologies to transport mineral raw materials, while paying special attention to the physical processes in pulp moving in its curved sections. In a pulp pipe's curved section, due to the presence of a secondary transverse flow, the trajectory of the pulp's solid particles changes so that they, depending on their density, move along the lateral surface of a given segment's inside radius.

Methodology

The method of mineral separation according to useful component density and a unit for its implementation

The method of mineral separation according to useful component density is based on the use on physical processes taking place in pulp flowing through a curved section of the pipe. (Prokhorov, K., Alexandrova, T., 2017).

The mechanism of the flow's action upon a solid-phase particle of pulp transported through a straight segment of the pulp pipe is as described below. With the flow acting upon a solid-phase particle, depending on its size, density and mean flow velocity higher than critical velocity, three types of this particle's movement are possible (Gorodnov, V., Gorodnova, N., Berezin, A., 2015):

- rolling or sliding (dragging) of the particle along the pulp pipe's lower wall;

- the particle's separation from the pulp line's lower wall – its suspension in reverse dip flow (leap transference);

- steady fluence of particles in suspended state.

This research focuses upon the first type of pulp's solid-phase particles movement that forms a moving bed of such particles upon the pulp pipe's lower wall. The height of this bed moving along the pipe line's lower wall depends on mean flow velocity, size and density of solid-phase particles, and on the pulp's thickness.

The carrying capacity of pressurized hydrotransport is connected with the notion of critical velocity. Pulp movement's critical velocity (Vcr[m/s]) is the lowest speed V of pulp which causes the flow along the pipe's bottom to stop, starting the precipitation of solid-phase particles from the flow body. This leads to the silting of the pulp pipe. To prevent (or minimize) silting, pressurized transport speed modes are set to be higher than critical velocity.

Proceeding from the granulometric analysis of pulp's solid-phase particles, they could be divided into two groups differing by near-mesh grain. One group of solid-phase particles smaller than near-mesh grain, mixed with water, form a suspended mixture that transports the particles of the other group, larger than near-mesh grain.

This is exemplified in Figure 1 presenting the segment of a pulp pipe featuring:

- the moving bed of solid-phase particles on the pipe's lower wall;

- the pulp velocity profile curve and its maximum velocity;

- the dynamic radius.

Fig. 1 shows a certain asymmetry of the pulp velocity curve. This asymmetry increases with the decrease of mean flow velocity and increase of pulp thickness. Mean velocity rate is the more important factor to influence the asymmetry of pulp flow. The asymmetry of the velocity field is best shown with pulp mean flow velocity approaching critical velocity.

The degree of asymmetry can be expresses as the exceedance of the flow's dynamical axis of the pipe's centerline. The dynamical axis of the flow is understood to be the locus of points within pulp flowing at maximum speed.

The dynamic radius is a distance from the pipe's lower wall to the dynamical axis of the flow.

a) The pulp velocity curve, the moving bed of solid-phase particles and maximum velocity of the pulp along the dynamical axis of the flow

b) The moving bed on the pulp pipe's lower wall and its height

Fig. 1: The flow of pulp in the pipe

It is noteworthy that the higher the dynamical axis of the flow, the more upward-and-forward elongated becomes the mean velocity curve along the direction of the flow.

Lower, more saturated pulp layers moving at lower speed compared to that of the upper ones, decelerate movement in that area because of the presence of a moving bed of solid-phase particles upon the pipeline's lower wall.

Results of the Questionnaire Survey

In Table 1 below presented are figures for pulp mean velocity, maximum velocity, critical velocity, the dynamic radius and height of the solid-phase moving bed, for pulp pipes of various diameters. This data is obtained experimentally.

Table 1: Functional connection of pulp velocity and height of the moving bed of solid-phase particles

Mean velocity, V_{mean} m/sec	Maximum velocity, V_{max}, m/sec	Critical velocity, V_{cr}, m/sec	Dynamic radius size D, rd, m	Moving bed height, h, mm
D =100 mm, pulp thickness 1,2				
2,62	3,64	2,4	0,065	1,07
D = 200 mm, density pulp thickness 1,1				
3,28	4,40	2,60	0,126	3,56
D=300mm, /pulp thickness 1,1				
3,28	4,68	3,00	0,192	6,75

Specific properties of pulp flow in a pipeline's curved segment (analysis of physical processes)

In a pipeline's curved segment, the centrifugal force of inertia of a fluid's particles following curved trajectories cause velocity and pressure redistribution in flow sections: the velocity of the fluid's particles decreases with the increase of the dynamic radius according to the hyperbolic law, while the pressure grows (Fig. 2, a). The pressure at the pipeline's outer wall grows $p_{outer} - p > 0$, while that at the inner wall falls $p_{inner} - p < 0$.

Hence, when pulp enters a pipeline's curved segment it forms a converging area (velocity increase and pressure decrease) at its inner wall, and a diverging area at the outer one (velocity decrease and pressure increase). Vice versa, when pulp flow leaves a pipeline's curved segment to enter a straight one, a diverging area forms at its inner wall, and a converging area – at the outer wall. When pulp flows in a pipe's curved segment, the centrifugal force of inertia of the particles moving at high speed in the central part of the flow's normal section considerably exceed the centrifugal force of inertia of the particles moving at slow speed along the walls. Unbalanced centrifugal forces in the flow section plane cause secondary pulp flows with a spiral movement, directed in the section's central part from the inner towards the outer wall, while at the side walls – from the outer towards the inner wall. Thus, a vortex pair formed thereby, superimposed on the pulp linear motion, causes two spiral flows. (Osipov, D., Zhukov, V., 2017).

a) pressure and velocity curves; *b*) vortex pair
3 – low-pressure area; 4 – high-pressure area.

Fig. 2: Formation of a secondary flow (vortex pair) in pulp flowing through the pipe's curved segment: 1-2 and 5-6 are velocity curves, correspondingly at the points of entry and exit of a curved segment of the pipe

Through changing mean velocity of pulp flow in the pulp pipe and using the appropriate radius of curvature of its curved segment it becomes possible to adjust the separation unit's operation to specific densities of useful component contained in the pulp.

Fig. 3: Transference of the moving bed, acted upon by secondary flow, onto the side wall of the inside radius of the pipe's curved segment

In the pulp pipe's curved segment, due to secondary flow (pair vortex) superimposed upon the pulp's linear movement changing the trajectories of the moving bed's solid-phase particles, these particles, depending on their density, move in a specific way along the side wall of this pipeline segment's inside radius. Fig. 4 features symmetry axis vertical section of the pulp pipe's curved segment.

Fig. 4: Functional connection of trajectories and density of solid-phase particles resulting from secondary flow within the pulp pipe's curved segment (solid-phase particles' densities $\rho_1 >> \rho_2 > \rho_3$)

The trajectory type of solid-phase particles moving along the inner side of the pulp pipe's curved segment depends on their density, the lower the density of a particle, the higher its trajectory with respect to the pipe's lower wall.

Useful component's ρ_1 density solid-phase particles get into the receiving tank through the output slit (marked by a dot line in Fig. 4) in the inner side wall of the pulp pipe's curved segment.

Description of the Unit

The proposed method is embodied in a vortex turbulence concentrator having a pulp pressurizer-connected inlet pipe that feeds pulp into the pipe's curved segment that is in communication with a receiving tank for useful component's solid-phase particles of specified density separated from pulp (Gorodnov, V., and ets., 2015).

The unit's distinctive feature is that pulp is fed into a curved segment of the pipe. In the pulp pipe's curved segment, due to secondary flow acting upon the pulp's linear movement changing the trajectories of the moving bed's solid-phase particles, these particles, depending on their density, move in a specific way along the side wall of this pipeline segment's inside radius; the lower the density of a particle, the higher its trajectory with respect to the pipe's lower wall. The pipe's curved segment, through its outlet slit, is in communication with a receiving tank for useful component's solid-phase particles of specified density.

The design of the vortex turbulence concentrator and the principles of its operation are clarified in the following drawings:

Fig. 5 – general view of the vortex turbulence concentrator, Fig. 6 – a curved segment of the pipe,

The vortex turbulence concentrator has pressurizer 1 connected through inlet pipe 2 with the pulp pipe's curved segment 3, connected through output slit with sealed receiving tank 4 equipped with industrial water inlet pipe with tap and tap for air release.

The vortex turbulence concentrator operates in the following way:

Pulp 7, through pipe 6, is fed into pressurizer 1 that creates, within inlet pipe 2, the flow of pulp moving at a speed higher than critical velocity for hydrotransport. From inlet pipe 2, the pulp (moving bed) enters the pipe's curved segment 3 where, due to secondary flow, useful component's solid-phase particles change their trajectories and become separated according to density, then solid-phase particles of specified density move, through output slit), into sealed receiving tank 4. Stop valves 5 and 8 allow for the emptying of the receiving tank from useful component while the vortex turbulence concentrator keeps operating without stopping.

Fig. 5: General view of the vortex turbulence concentrator

Fig. 6: Curved segment of the pipe

When the pulp flows through the pipe's curved segment 3, with stop valve 5 being open and stop valve 8 and taps and closed, useful component moves, through output slit, into receiving tank 4. Receiving tank 4 is prefilled with water.

The release of useful component from the receiving tank is performed with closed stop valve 5 and open stop valve 8. The release process does not require stopping the operation of the vortex turbulence concentrator.

After receiving tank is emptied, stop valve is closed, while taps and are opened to let water into the receiving tank; when water starts coming through tap, taps are closed. Receiving tank 4 is filled with water and ready to receive useful component. There are no stringent requirements for the purity of water to fill the receiving tank.

Conclusions

The analysis of the experience around the world shows that the problem of making the economy of a country or an industry more efficient is becoming even more exigent in the context of mineral-wealth depletion, the greenhouse effect and humanity's evergrowing need in energy supply. The expert community sees the integration of digital economy and information technology in the framework of the implementation of Smart City concept as one of the most exigent objectives for the Russian Federation among other countries.

The issue of processing and utilization of Russian industries' technology-related waste is not just that of environmental protection. The formation of this kind of waste is also indicative of inefficient use of natural resources being on the verge of exhaustion. In this respect, the problem of technology-related waste utilization is an important ecological-and-economic objective.

A set of innovative measures and actions proposed in the article makes it possible to reduce negative ecological impact with the use of new technologies and alternative methods. Its author's method allows to address the pressing issue of CHP-plants' waste dumps processing using a wasteless method.

The unit described in the article belongs to the group of inventions in the field of ore pulp minerals separation; it can be used to process and separate mineral raw materials containing nonferrous, rare and noble metals, non-metal materials, to purify effluent water from solid components, other heavy pollutants and oil. The mentioned designer technologies allow to efficiently extract aluminum oxide,

ferrous oxides, and unburned carbon. This has led to the ecological-and-economic effect through the realization of additional marketable products and reducing costs for solid waste placement.

Abstract

Ethical behavior has been an important subject for business and has been studied in various fields. Due to the fact that banking sectors has recorded a high number of fraud makes studying ethical behavior is more important in this sector. This study aims to analyze the influence of love of money, religiosity, and pay satisfaction on ethical behavior. The study involved surveys to 300 Muslim employee respondents worked at banking sectors in Indonesia. Structural equation model (SEM) using LISREL 8.8 was used to analyze the data. This study found that love of money negatively influenced ethical behavior, while religiosity positively influenced ethical behavior. However, in this study it was discovered that pay satisfaction had no influence on ethical behavior.

Keywords: Love of money, religiosity, pay satisfaction, ethical behavior

Introduction

Ethical behavior has been discussed in various fields, for example in discussions on white-collar employees in Hong Kong (Tang & Chiu, 2003), marketing managers (Singhapakdi, Vitell, Lee, Nisius, & Yu, 2013), business and psychology students (Tang & Chen, 2008), and other fields. However, there is still very little research that examines the factors that influence ethical behavior in banking. In fact, the banking industry is the sector with the highest level of fraud in the world when compared to 22 other industry categories according to a study conducted by the Association of Certified Fraud Examiners in 2014, 2016, and 2018. As it occurs in other countries, the phenomenon of unethical behavior also occurs in banks in Indonesia. According to a press release from the Financial Services Authority (OJK) in November 2016, it was discovered that banking crimes in 2014 until the third quarter of 2016 reached 108 cases, which occurred in all types of banks, both conventional banking and Islamic banking. The press release also explained that based on the statistics of the banking crimes handled by the OJK, the types of banking criminal cases that occurred from 2014 to the third quarter of 2016 were credit cases (55%), engineering records (21%), fund embezzlement (15%), fund transfers (5%), and asset procurement (4%) (Financial Services Authority, 2016).

This needs to be a concern, because banking plays a large role for the community. Banking responsibility is not only to customers, but also to the government, shareholders, employees, and the community (Green, 1989). With the increasing number of unethical behaviors in the banking environment, the impact will be even greater. Unethical behaviors by employees can have material or non-material impacts detrimental to the company. Material impacts can be in the form of financial losses, while non-material impacts can, among others, include the damage to the company's reputation, the relationships with consumers and other stakeholders, and the company's sustainability (Singh & Twalo, 2015).

Based on these major impacts, the researchers tried to examine the root causes of ethical behavior in banking. Several previous studies which tried to examine ethical behavior from various fields found that love of money (Singhapakdi et al., 2013; Tang & Chen, 2008; Tang & Chiu, 2003), religiosity (de Soto, Tajalli, Pino, & Smith, 2018; Giorgi & Marsh, 1990; Singhapakdi et al., 2013), and pay satisfaction (Greenberg, 1993; Tang & Chiu, 2003) are factors that influence ethical behavior. To explain the variable of religiosity, the researchers do not use measures of religiosity in general, but focusing on just one religion (i.e. Islamic religiosity) because each religion must have teachings and commands that are not completely the same. Also, Indonesia's population was dominated by Muslims, around 87.18% of the total population according to the 2010 population census data conducted by the Central Statistics Agency. Therefore, focusing the study on Muslim employees seemed relevant to examine whether religiosity brought impact to their ethical behavior. The purpose of this research is to examine the influence of love of money, religiosity, and pay satisfaction towards ethical behavior of Muslim employees in the banking industry in Indonesia.

Literature Review

The Relationship between Love of Money and Ethical Behavior

The relationship between love of money and ethical behavior has been demonstrated by numerous previous research conducted across industries and countries. Tang and Chiu (2003) found that the root cause of unethical behavior that occurs in employees in Hong Kong is the employees' love of money. Tang and Chen (2008) also found that love of money has influences the unethical behavior of business school students. Singhapakdi, Vitell, Lee, Nisius, and Yu (2013) also conducted the same research on different subjects, namely the marketing department manager and found that when the level of love of money the marketing manager was high, the manager tended to behave unethically and have unethical intention. These studies indicate that love of money has a negative influence on ethical behavior, meaning that when someone has a high level of love of money, then that person tends to be less ethical in his behavior, and vice versa. Based on these arguments, we propose the following:

Hypothesis 1*: "Love of money has a negative influence on the ethical behavior of Muslim employees in the banking sector"*

The Relationship between Religiosity and Ethical Behavior

There are a number from previous studies showing the relationship between religiosity and ethical behavior. According to Giorgi and Marsh (1990) a person's level of religiosity has a positive influence on one's ethics at work. Weaver and Agle (2002) claims that each role of religiosity is expected to have a role in one or more ethical processes, ranging from the awareness towards ethics, judgment, intention, to ethical behavior. Singhapakdi et al. (2013) also found that religiosity has a positive influence on the ethical intentions of marketing managers. In addition, in de Soto, Tajalli, Pino, and Smith (2018), it was discovered that someone with a high level of religiosity would tend to have a higher level of ethical behavior.

In addition to these studies, in Islamic teachings, the relationship between religiosity and ethical behavior of a person has also been explained in the Koran in the 29th surah verse 45 and from the hadith quotation in Shahih al-Bukhori number 32. The 29th surah verse 45 is as follows: "Read what has been revealed to you, namely the Holy Book (Al-Qur'an) and establish prayer! In fact, the prayer prevents cruel and unjust (acts). And indeed remembrance of Allah is greater (superiority than other worship services). And Allah knows what you are doing. "In addition, there are also traditions that show the relationship of religiosity with ethical behavior in the form of maintaining trust, namely; "From Abu Hurairah from the Prophet *sallallaahu 'alaihi wa sallam*, he said," There are three hypocritical signs: if you speak a lie, if you deny a promise, and if betraying the mandate given."" (Shahih al-Bukhari no.32 quoted from Ath-Thaybi, 2011). Based on the verse in the Koran and the hadith quotation, Muslims are instructed to worship so that they can avoid bad deeds, and illustrates the negative relationship between religiosity and unethical behavior, which means the higher one's

religiosity, the more likely it is for that person to avoid unethical behavior, and vice versa. Based on these arguments, we propose the following:

***Hypothesis 2**: "Religiosity has a positive influence on the ethical behavior of Muslim employees in the banking sector."*

The Relationship between Pay Satisfaction and Ethical Behavior

The relationship between pay satisfaction and ethical behavior has been demonstrated by numerous studies conducted across industries and countries. According to Hollinger and Clark (1983) cited in Greenberg (1993) one form of reaction from low salaries and salary inequality can lead to deviant behavior such as vandalism and theft (Greenberg, 1993, p.82). Greenberg (1993) also said that it is very reasonable that dissatisfaction with salary can directly make someone take actions that are not in accordance with the applicable ethics. A few years later, Tang and Chiu (2003) later found that employees with high levels of pay satisfaction tended not to engage in vile and unethical behavior in organizations. These findings indicate that pay satisfaction has a positive influence on ethical behavior, which means that when the pay satisfaction of an employee rises, the employee will tend to behave more in accordance with ethics. Based on these arguments, we propose the following:

***Hypothesis 3**: "Satisfaction of salaries has a positive influence on ethical behavior in Muslim employees in the banking sector".*

Method

In this research, three main independent variables were used to measure ethical behavior, namely love of money, religiosity and pay satisfaction. Figure 1 draws the model used in this research.

Figure 1: Conceptual model of this research

In a previous study conducted by Tang and Chiu (2003), it was learned that love of money had a positive influence on unethical behavior, while pay satisfaction had a negative effect on unethical behavior. In this study, religiosity was also used in explaining ethical behavior. Studies have found that religiosity was a factor that influenced ethical intention (e.g. Sinhapakdi et al, 2013)

Sample and procedure

In this research, the data were collected with purposive sampling method, from Muslim employees in banking sector. The survey was administered through papers and online questionnaire from February to March 2019. In total, 300 questionnaires were collected from Muslim employees in banking sector.

Survey Instrument

The survey instrument consisted of six parts: (1) screening questions; (2) love of money questionnaire; (3) religiosity questionnaire; (4) pay satisfaction questionnaire; (5) ethical behavior questionnaire; and (6) demographic information. All items for love of money, religiosity, pay satisfaction, and ethical

behavior were rated on seven-point Likert scales ranging from '1 = strongly disagree' to '7 = strongly agree'. Love of money was measured using the scale developed by Tang and Chiu (2003), religiosity was measured using the scale developed by Alam, Mohd, and Hisham (2011) and Khraim (2010) which specifically based on Islamic teaching, pay satisfaction was measured using the scale developed by Heneman and Schwab (1985), and ethical behavior was measured using the scale used by Fraedrich (1993).

Results

The respondents were dominated by women (53.67%), while the rest were men (46.33%). This study was dominated by respondents in the 26-35-year-old age group (67%), while the age group with the least percentage was the age group of 56 years old (0.67%). The majority of respondents are S1 graduates (80%). The percentage of respondents working in conventional banks and Islamic banks is the same, which is 50%, with the percentage of working time in the same bank that is mostly for 3-7 years (62.67%) and is dominated by employees who have never changed jobs before (40%). The most dominant respondent's income is in the salary range of IDR. 5,000,001 to IDR. 10,000,000 (40%).

Step 1: Confirmatory Factor Analysis of All Measures

Step 1: Confirmatory Factor Analysis of All Measures

Confirmatory factor analysis was used to evaluate the relationship between variable indicators and their constructs (Hair, Black, Babin, & Anderson, 2014). Table 1 explains the results of the confirmatory factor analysis test, which consists of a reliability test, a validity test, and a model compatibility test. Of the 47 statement indicators, there were 2 indicators (LOM14 and PE1) which were not valid because the SLF is less than 0.50 (Igrabia et al., 1998 in Wijanto, 2008) although the t-value is greater than 1.65 (Rigdon & Ferguson, 1991 in Wijanto, 2008). These two indicators were then removed from the model. In addition, the LOM and R variables have extracted variance (VE) values under the provisions based on Hair et al. (2014), which is 0.5. However, based on the criteria of Fornell and Larcker (1981), this condition was allowed, because the value of construct reliability (CR) on the LOM and R variables showed results above 0.6. Thus, all variables can be said to be reliable.

Table 1: Confirmatory factor analysis result

Variables' Indicator	T-value ≥1,65	SLF≥0,5	Error	CR≥0,7	VE≥ 50%	Conclusion
Love of Money (LOM)				0,93	46%	Reliable**

** Reliable based on Fornell and Larcker (1981)						

Step 2: Testing the Model using SEM

Structural model analysis is used to explain the relationships that exist between latent variables (Wijanto, 2008). In general, structural model fit test consists of two stages, namely structural model fit test and causal relationship analysis.

Figure 2: Structural model result

Figure 2 illustrates the t-value and structural model coefficient values, indicated by the left figure which is the t-value while the right handwritten number is the coefficient. Based on Figure 2, it is known that love of money (-3.99) and religiosity (2.90) significantly influenced ethical behavior because its t-value is $\leq$1.645 or $\geq$1.645, while pay satisfaction (1.03) did not significantly influence ethical behavior because the t-value did not meet the specified criteria. Love of money negatively affected ethical behavior, meaning that when the level of love of money of Muslim employees in the banking sector increased, the tendency for ethical behavior would decrease. On the other hand, religiosity positively influenced ethical behavior, meaning that when the level of religiosity increased, the tendency for ethical behavior would increased.

One interesting aspect that needs attention is the comparison of the magnitude of the significant coefficients of the variables that significantly influence ethical behavior which were love of money and religiosity. The coefficient of love of money (0.25) on ethical behavior is greater than the coefficient of religiosity (0.19) on ethical behavior, indicating that love of money had a greater role in influencing one's tendency to behave according to ethics than with religiosity.

Discussion

Love of money significantly influenced ethical behavior negatively. A high level of love of money would reduce the tendency to behave ethically. The results of this study was in accordance with Tang and Chiu (2003) who examined the effect of love of money on unethical behavior among employees in Hong Kong and Singhapakdi et al. (2013) who examined the influence of love of money on the intentions of ethical behavior in marketing managers. The results of this study were also similar to the results of previous studies conducted by Tang and Chen (2008) on business school students, who indicated that love of money had an influence on unethical behavior.

Religiosity had a significant and positive effect to Muslim employees in the banking sector. The results of this study was in line with one of the commands in the Koran *surah* (i.e. chapter) 29 *verse* 45, which contains instructions for Muslims to worship so that they can avoid themselves from bad deeds, which at the same time illustrates the positive relationship between religiosity and ethical behavior. The results of this study was similar to Singhapakdi et al. (2013) who found that intrinsic religiosity influenced the ethical intentions of marketing managers. In addition, the result of this study was similar to de Soto et Satisfaction of salary did not have a significant effect on ethical behavior, thus H3 is rejected. The result of this study was different from Tang and Chiu's study (2003) on white-collar employees in Hong Kong, which found that someone with a low level of pay satisfaction would tend to behave ethically or in other words pay satisfaction had a negative effect on ethical behavior. However, in research conducted by Vitell and Davis (1990) on professional information management systems, it was found that there was no relationship between pay satisfaction and ethical considerations.

Conclusion

Love of money and religiosity significantly influenced ethical behavior, while pay satisfaction is found to not influence ethical behavior. Love of money negatively influenced ethical behavior, meaning that when the level of love of money of Muslim employees in the banking sector increases, the tendency for ethical behavior would decrease. On the other hand, religiosity positively influenced ethical behavior, meaning that when the level of religiosity increased, the tendency for ethical behavior would increase. In this study sample, it is found that the contribution of love of money to ethical behavior is greater than religiosity.

Limitations and Suggestion for Future study

In this study, research respondents were limited to Muslim employees. Future studies can expand the scope of research subjects without restrictions on certain religions. For this reason, the religiosity variable used must be more general that can be used by all religions. In addition, another limitation is that the indicators of ethical behavior used in this study were consisted of general questions and not specifically for a study in banking sectors. In the future, researchers could develop specific measurements of ethical behavior that contained related aspects in the banking sectors. The measurement of ethical behavior also only reflects intentions, not actual behavior. This is because no individual would publicly indulge in unethical behavior that they do. Future study could use an experiment method using some scenarios or involve an in depth interview to capture specific unethical behavior and the reasons why an employee do such behavior.

Abstract

Following the model of school as leaning organization (SLO) proposed by Kools & Stoll and OECD – UNICEF, the paper explores and debates the extent to which the key features of learning organizations already exist at the Romanian pre-university education level. Theoretical researches showed that at schools' level there is a need for their re-conceptualization using the SLO model. The characterization of the SLO model dimensions for the case of Romanian schools was developed based on the identified national performance indicators and descriptors that have being correlated with dimensions and key characteristics of the considered SLO model. In this context, the presented approach based on a sample of 238 urban and rural schools highlights that the minimum levels of incidence of several key-characteristics of SLO's varying between 30.67% and 73.10%. Means that, without explicitly and intentionally introducing the SLO model, certain key-characteristics specific to it are identifiable at schools level.

Keywords: Pre-University Education, School, Learning Organization (LO), External - Internal Evaluation.

Introduction

In the early 1990s, there have been developed models to explain and support continuous learning (the continuous development of skills required in the labor market), among which the "learning organization" (LO). The concept has been widely recognized due to the reference work of Senge (1990). Recently, the concept has been strongly debated and it becomes more actual due to the last synthesis published by Baldwin (2016), Gould (2016) and Örtenblad (2018, 2019) that underlined the strong relation between learning organization and organizational learning, being agreed that the core value is human capital. Furthermore, as highlighted Longworth (2019), the concept becomes more valuable in the actual increasing importance of continuous learning and vocational learning and, as highlighted Snihur (2018) and Chou and Ramser (2019), the concept becomes more powerful not from the theoretical perspective, but mostly from the practical perspective. Thus, the model of the LO has known many applications for business organizations (public or private), non-profit organizations (health care organizations, public administration institutions, public schools and universities, libraries).

In the case of schools as LO, the recent approach of Kools and Stoll (2017) proposes a model for re-conceptualizing them as learning organizations based on seven action-oriented "dimensions": (1) developing and sharing a vision centered on the learning of all students; (2) creating and sustaining lifelong learning opportunities for all staff; (3) promoting team learning and collaboration among all staff; (4) establishing a culture of research, innovation and exploration; (5) systems of incorporation for the collection and exchange of knowledge and learning; (6) learning with and from the external environment and with a higher learning system; (7) shaping and increasing learning leadership. Their approach was supplemented with key features for each of the seven directions of action, as described

in the OECD-UNICEF Guide (2016). Thus, the model of Schools as Learning Organizations (SLO) complemented by the provisions of the guide offers the possibility of carrying out evaluations (measurements) to characterize the dynamics of these organizations.

To understand the context of the present research, it is useful to look at some phenomena that have occurred in the last 10 years in the case of Romania pre-university education. In general, there was a decrease in the school population (by 17% until 2016, compared to 2006), the transfer of the last year of kindergarten to primary education (along with reshaping both their curriculum) and the gradual transformation of the arts and crafts schools into the technological high schools, followed in 2014, by a strong return to the professional schools. The school network has been massively reorganized (many public schools lose their decision-making and administrative independence, being transformed into structures of other schools and destroying or changing the organizational culture) and on the background of the international economic crisis of 2008 – 2015 there was a constant decrease of public spending on education (from 5.76% of total expenditures in 2009, to 3.76% of total expenditures in 2017). The dynamics of the educational environment was described by "A study of the evolution of educational efficiency: the Romanian case" which targeted a representative sample of 2956 schools. The study developed by Paraschiva, Farkas, Jitarel and Draghici (2018) highlighted, among other things, that for the period 2014-2017, 64.7% of the schools in Romania registered a negative trend of evolution of the efficiency index, 15.6% had a constant evolution and only 19.7% had positive evolutions of efficiency index.

Furthermore, because in the last 10 years pressures on pre-university education organizations have been increasingly high, especially for correlating the expected learning outcomes with explicit labor market demands and with requirements that the companies are constantly and rapidly changing, initially proposed models for SLO (focused on mutual learning and collaboration between teachers in the same school) were expanded, including networking and collaboration across school boundaries, as well as the orientation towards strategic leadership as a condition for creating an organizational culture of learning and to encourage LO.

Therefore, finding solutions to help increase the efficiency of school organizations is more than needed at Romanian national level and we considered that the approach of SLO at the educational system is appropriate and represents a feasible solution. In the view of the SLO model proposed by Kools & Stoll (2017), this article presents the results of an experimental research developed on a sample of 238 rural and urban schools, in order to characterize these organizations as SLO. Some key features specific to the model will be highlighted as they are identified through the research carried out. Thus, the research demonstrates that the theoretical level on the SLO model is exceeded and establishes the existence of reliable starting points for its implementation in the case of the Romanian schools.

A Literature Review on Schools as Learning Organizations

Schools as Learning Organizations

Although the concept of the "learning organization" has been introduced by Bob Garratt since 1987 when he published the work "The Learning Organization and the Need for Directors Who Think", it is unanimously accepted that the concept (and model) gained widespread recognition in 1990 when Peter M. Senge published the work "The Fifth Discipline: The Art and Practice of the Learning Organization". Since the moment of widespread recognition, the evolution of the concept and model over the course of almost three decades undergoes developments, either in the direction of learning at all levels (individual, team, organizational), as suggested by Marsick and Watkins (2003), or in the direction of management practices and organizational policies in defining the learning strategy, such as those proposed by Goh (1998) and by Garvin, Edmondson and Gino (2008).

In Figure 1 there are presented the advantages for the implementation of LO concept and/or model, according to Sarder (2016, p. 10), together with relevant conclusions on causes of the modest progresses on implementation, considering both the theoretical and practical perspective.

Fig. 1: Internet Usage & E-government access

However, in a society quite different from the one in which the initial concept was generated, is it still relevant and has a possible future? The current relevance of the concept, the level of interest and the need for its implementation are analyzed and discussed by Hoe (2019). Analyzing the views on the usefulness of the concept today, from critics' side and supporters' side, it is concluded that both categories recognize its relevance for improving organizational performance, organizational culture and innovation capacity, but enlargements/ developments/ improvements are necessary. The current level of interest identified remains strong in Europe, Asia and the Middle East, but is declining in North America, with a focus on medical and educational organizations (focus explained as being generated by the specific nature of these organizations, which requires individuals and groups to work together in a complex ecosystem, with a large number of stakeholders and for which profit is not the only indicator of success).

The researches and debates on SLO model have been of high intensity in the last 5 years, due to general concern on increasing the learning process efficiency and effectiveness; as could be seen to Baráth (2015), Wang (2016), Ertürk and Nartgün (2019) and Field (2019), the approaches have been related to educational organizations in order to generate continuous improvements of the teaching staff and to perform better schools' leadership; or, the approaches focused on educational effectiveness and improvement as presented by Chapman et al. (2015). Also, when reviewing the LO literature, whether in a school context or not, in many studies there have been recognized the importance of having a shared vision to shape the organization and give it a sense of direction; in this respect, we find useful for the present research on SLO the views of Senge et al. (2012).

Much more, from Kools and Stoll (2017) perspective, a focus on schools in general and on classroom management, in particular, could lead on increasing attendance and enhancing the learning of all students. That is way, they designed and integrated a SLO model based on the LO literature, but also from other fields of sciences like organizational behavior, knowledge management, learning sciences, school improvement and effectiveness, and professional learning literatures. Thus, a knowledge gap has been fulfilled towards a general understanding of the SLO by all actors (stakeholders) involved (e.g., education practitioners, school leaders, policy makers, parents etc.). The SLO integrated model proposed by Kools and Stoll (2017) defines a school as a LO in which the collective effort is focused on main dimensions as: the developing and sharing a vision centered on the learning of all students; the creation and sustaining lifelong learning opportunities for all staff; promoting team learning and collaboration among all staff; creating a culture of research, innovation and exploration; becoming a

system of incorporation for the collection and exchange of knowledge and learning; learning with and from the external environment and with a higher learning system; modeling and increasing learning leadership. Thus, a SLO will have the capacity to change and adapt continuously to the new generations of students and to the new demands of the external environment.

Details on Romanian Context of Appling SLO

In Romania, the debate on LO approaches have few applications that exceed the theoretical level, using a specific assessment methodology and measurement tools in order to determine incidence of certain key-characteristics, but none of them directed towards schools in pre-university level, but none of them have debate the state or the developments for schools in pre-university education level. Some relevant contributions to the Romanian are presented in the following.

An exploratory study developed by Giura (2012) on 26 County Councils (out of 41) for diagnosing the current state of art in relation to a LO, using the model and instrument proposed by Garvin, Edmondson and Gino (2008). According to the research results, the studied organizations are LO only in terms of leadership that encourages learning (for "learning environment" and "learning processes", the findings revealed that the County Councils act like learning organizations in a very small degree). Another study, developed by Bordeianu, Hapenciuc, Bejinaru, and Burciu (2014) was referred to business organizations. This was a survey on 20 large pharmaceutical companies controlling about 80% of the Romanian sales market and six small and medium size pharmaceutical enterprises (SMEs), over the elements (dimensions) that define a LO, using Senge's (2009) model and the instrument developed and improved by Marsick and Watkins (2003). The study results underlined that large companies achieved higher scores on most LO dimensions ("systems thinking", "shared vision", "organizational culture and learning environment" and "knowledge transfer") while some dimensions (such as "teamwork and collaboration" and "leadership and employee empowerment") have slightly higher scores in case of SMEs.

In case of applying the SLO model proposed by Kools & Stoll (2017) for Romania it was considered this an opportunity to put more emphasis on students and completing the national project CRED ("Relevant curriculum, open education for all" funded by the European Structural Funds to support the current school curricula reform). In addition, as Paraschiva, Draghici and Mihaila (2019) showed in their research, the application of the SLO model could be based on the existing database of national indicators and descriptors used to evaluate the schools' performance which have been identified as being correlated with the key dimensions and characteristics provided by the OECD - the UNICEF guide (2016). It should be noted that the 43 national performance indicators (including descriptors) for quality assessment and quality assurance in pre-university education are provided in the Romanian Government Decision no. 1534 (2008) and are used for both types of assessments, external and internal (self-evaluation).

Research Methodology

The Data Collection and the Research Sample

The data collection process relies in 238 public reports from the first semester of the 2018-2019 school year regarding the level of educational services provided and they could be analyzed at http://beta.aracip.eu/ , on section devoted to schools. The distribution of these 238 schools by type of services provided (post-secondary schools - 1, colleges and high schools -54, gymnasium schools - 139, primary schools - 2, kindergartens -30, school sports clubs -3, clubs for children -5 and education centers – 4) and by residence area (124 organizations being from the urban area and 114 organizations being from rural area) do not reflect the situation at national level, their list being generated by the County Schools Inspectorates (due to the fact that they never went through a regular external evaluation process).

The Measurement Process

Both types of assessments (external and internal) are carried out on the same descriptors and indicators and on the same five-steps orderly quality scale, in order to process the data being realized their equivalence on a quantitative scale, with points: 0-Unsatisfactory (means that the minimum/ basic requirements are not met), 1-Satisfactory (means that the minimum/ basic requirements are met), 2-Good (means that at least one performance descriptor is reached), 3-Very Good (means that all performance descriptors are reached), 4-Excellent (means that the organization has proven to achieve all performance descriptors and in addition has developed its own descriptors, in line with the context in which it operates and the specificity of its educational services, own descriptors which are shown to have been achieved).

For the first level of the analysis, they were determined for ten performance indicators developed at national level the following: (1) the average external assessment scores (as a simple arithmetic mean of the results obtained by the 238 schools in the external evaluation), (2) the average internal assessment scores (as a simple arithmetic mean of the results provided by the 238 schools in the external evaluation) and (3) the average score's differences between internal and external prospects, to see to what extent these two are close for the ten targeted performance indicators; positive values mean that the result of self-evaluation is higher than the external evaluation (so school organizations have been overrated) and negative values mean that the result of self-evaluation is lower than that of external evaluation (so school organizations have been underestimated).

In the second level of the analysis, were introduced: (1) the dispersion for each set of values (self-evaluation and external evaluation) and for each of performance indicators (as a synthetic indicator of variance, which provides information on the degree of scattering of the elements relative's to the average, considered as a central trend) and (2) the Z parameter test (two-tail) for comparing the averages of sample values (self-evaluation and external evaluation) per indicator. Therefore, parametric bilateral tests were performed to compare the means of the sample values (238 sample values for self-evaluation and 238 sample values for external evaluation), having as background: the hypothesis H0 (or the null hypothesis) - the values compared do not differ between them (in other words, the difference in the mean of the two sample values, internal and external evaluation, is not significantly different from zero); the H1 hypothesis (or the alternative hypothesis) - the values compared differ between them (in other words, the difference in the mean of the two sample values, internal and external evaluation, is significantly different from zero). In this way the reconciliation between the two evaluation processes (internal and external) can be considered and the results of the previous level of analysis can be validated.

The Research Results

Considering the previous quantitative scale (with points), were obtained average scores per indicator with values between 2 and 3 (Table 1 presents the results of the first level of the analysis) and a general over-valuation tendency on the part of school organizations (for a single descriptor the two perspectives - external and internal - are identical). The average scores show that the performance is situated between "good" and "very good".

Table 1: First level of the analysis - research results

Performance indicators	Average assessment score		
	external	internal	internal - external
I01 - The existence, the structure and the content of the projective documents (development plan and implementation plan)	2.550	2.689	+0.138655
I03 - The existence and functioning of the internal and external communication system	2.706	2.706	0.000000

I28 - Evaluation of pupils' school results	2.517	2.676	+0.159664
I30 - Scientific activity of teachers	2.340	2.361	+0.021008
I31 - Methodological activity of teachers	2.752	2.727	-0.025210
I32 - Setting up the school budget	2.677	2.727	+0.050420
I34 - Existence and implementation of institutional self-evaluation procedures	2.475	2.500	+0.025210
I36 - Professional development of staff	2.630	2.656	+0.025210
I37 - Revision of the educational offer and of the development plan	2.525	2.630	+0.105042
I39 - Teaching staff evaluation	2.689	2.710	+0.021008

Therefore, a second level of analysis is mandatory and the results of the bilateral parametric tests outlined in Table 2 led to the identification of two indicators for which the values of the parameters belong to the critical region (therefore, in their case, the null hypothesis is rejected), there being a significant difference between the average of the evaluation internal results and the average of the external evaluation results. These differences were expected, and they reflect a national reality.

Table 2: Second level of the analysis - research results

Performance indicators	Dispersion value		Z Test value
	external	internal	
I01 -The existence, the structure and the content of the projective documents (development plan and implementation plan)	0.390	0.281	-2.60
I28 - Evaluation of pupils' school results	0.309	0.295	-3.16
I30 - Scientific activity of teachers	0.577	0.449	-0.32
I31 - Methodological activity of teachers	0.271	0.257	0.53
I32 - Setting up the school budget	0.311	0.308	-0.99
I34 - Existence and implementation of institutional self-evaluation procedures	0.375	0.351	-0.45
I36 - Professional development of staff	0.300	0.276	-0.51
I37 - Revision of the educational offer and of the development plan	0.392	0.309	-1.93
I39 - Teaching staff evaluation	0.307	0.248	-0.43

As can be seen in Table 2, for the indicator I01, the differences are determined by different perspectives regarding the projective documents: (a) the external assessment (objective) analyzes the degree to which a school organization's plan is original (non-duplicated), adapted to the context in which it operates, responding to real community needs and realistic (having associated measurable indicators); (b) the internal assessment (subjective) is particularly concerned by the existence of the document itself (respecting a certain format), although the content (targets, indicators etc.) are not always realistic and / or adapted to the context in which the organization operates or the community it serves. For the indicator I28, the differences are determined by different perspectives regarding focus of the teaching path (design, realization, evaluation) on the development of the practical - applicative side of the competences, on the students (as subject of the educational approach) and on the learning outcomes: (a) the external assessment (objective) analyzes insurance / failure to develop the practical-applicative side of the competences (starting from the design of the curriculum, continuing with its realization - the development of the didactic activities - and ending with the assessment of the learning outcomes) and the systematic application / non-application of student-centered teaching methodologies; (b) the internal assessment (subjective) is particularly concerned by the designing of the new curriculum without taking into account that the overpopulation of certain student groups (as a result of the constant decrease of public expenditure in education) and the absence of new teaching practices (correlated with the new curricula) has led to an insufficient development of the practical -

applicative side of competences, with effects on the participation rate and on the national exam results. Consequently, due to the significant differences identified, these two performance indicators and their tracked descriptors were further excluded from the analysis.

However, it must be considered that in national standards each performance indicator has several subsequent descriptors and only some of them were find (at a theoretical level) as being correlated with key- characteristics of SLO's organizations. Therefore, at this time, with this kind of data and this type of analysis only the minimum level of incidence of the tracked issues can be determined, by calculating the percentage of schools that have met all the requirements (all descriptors), including those that are correlated with key characteristics of SLO's organizations. Table 3 presents for each performance indicator, the number of issues tracked by this research (out of the total number of issues tracked by the national standards) and the number of schools that have fulfilled all the descriptors in national standards. In this way, at sample level, the minimum levels of incidence of several key-characteristics of SLO's were determined, these varying between 30.67% and 73.10% as can be seen in Table 4.

Table 3: Number of issues tracked (out of the total number of issues tracked by the national standards) and number of schools that have fulfilled all the descriptors in national standards

Performance indicators	No. of tracked issues out of the total no. of descriptors in national standards	No. of schools that have fulfilled all the descriptors in national standards (percentage)
I03 - The existence and functioning of the internal and external communication system	1, out of 2	171 (71.84%)
I30 - Scientific activity of teachers	2, out of 2	110 (46.21%)
I31 - Methodological activity of teachers	2, out of 2	174 (73.10%)
I32 - Setting up the school budget	1, out of 2	171 (71.84%)
I34 - Existence and implementation of institutional self-evaluation procedures	2, out of 8	123 (51.68%)
I36 - Professional development of staff	3, out of 4	158 (66.38%)
I37 - Revision of the educational offer and of the development plan	2, out of 2	73 (30.67%)
I39 - Teaching staff evaluation	2, out of 4	171 (71.84%)

Table 4: The minimum levels of incidence of several key characteristics of Romanian SLO (a sample level analysis)

Key characteristics of 2nd dimension	Tracked issues (descriptors) in national standards and the minimum level of incidence
Professional learning connects work-based learning and external expertise	• Teachers participation in the scientific research activity carried out by the school or at local, regional, national or international level it has grown in number and percentage – 46.21% • Teachers participation in the methodological activities carried out at territorial level - with demonstration activities, presentations etc. - it has grown in number and percentage – 73.10% • The application in teaching activities of the participation's results in continuous training and professional development programs is systematically monitored – 66.38% • The application in teaching activities of the participation's results in methodological and scientific activities is systematically monitored – 66.38%
Professional learning is based on assessment and feedback	• Observing the current activity and the feedback received from the relevant beneficiaries are used for the review of the professional development plans -66.38% • The assessment of the teaching staff is based on feedback from relevant stakeholders and – 71.84% • The assessment of the teaching staff includes recommendations for further development – 71.84%
Key characteristics of 5th dimension	**Tracked issues (descriptors) in national standards and the minimum level of incidence**
The school development plan is evidence-informed, based on learning from self-assessment, and updated regularly	• The benchmarking is used to optimize the educational offer and the development plan – 30.67% • The staff and relevant stakeholders are involved in reviewing the educational offer and the development plan -30.67%
The school regularly evaluates its actions, amending and updating them as necessary	• The results of self-evaluation and external evaluation are used to plan, carry out and review the quality assurance and improvement activities and procedures – 51.68%
Key characteristics of 6th dimension	**Tracked issues (descriptors) in national standards and the minimum level of incidence**
The school is an open system, welcoming approaches for collaborations	• The school systematically communicates with parents and other stakeholders - 71.84%
The school collaborates with parents and the community	• The school ensures the involvement of community partners and relevant stakeholders in budget planning – 71.84% • The self-evaluation procedures are carried out with the participation of relevant stakeholders – 51.68%
Staff collaborate, learn and exchange knowledge with peers in other schools	• Teachers capitalize on teaching the results of the scientific research activity carried out at local, regional, national or international level – 46.21% • Teachers capitalize on teaching the results of the methodological activities carried out at local level -73.10%

Conclusions and Further Developments

This research provides a preliminary overview on the state of the Romanian educational system level from the perspective of the SLO model developed by Kools & Stoll (2017), together with the analysis of key – characteristics identified with the support of the OECD-UNICEF guide (2016).

From an experimental point of view, resulted that the minimum levels of incidence of several key characteristics of SLO could be identified, these varying between 30.67% and 73.10%, but only for three action-oriented dimensions – "creating and supporting continuous learning opportunities for all staff", "embedding systems for collecting and exchanging knowledge and learning" and "learning with and from the external environment and larger learning system". Means that, the organizational culture of schools in the considered sample develop an optimal climate only for cooperation and collaboration inside and outside their own boundaries and for supporting continuous learning opportunities for all staff. At this point, it cannot be determined whether these schools act fully or not as learning organizations, but the results highlight that in some respects they already develop key features of SLO; this exceeds the theoretical threshold and may be the foundation for a smooth implementation of the model at national level.

First of all, these results will be further used in order to deepen the analysis on technical and vocational education and training (TVET) schools, much more willing to collaborate and keen to learn and adapt, and therefore, more likely to develop elements specific to the concept of learning organizations. The minimum levels of incidence of several key-characteristics of SLO's at TVET schools will be determined and compared with those of general education schools.

Secondly, using Hofstede's cultural dimensions theory (2010) same issues will be followed, in order to correlate the national and organizational culture (defined through six dimensions - power distance, individualism/ collectivism, masculinity, uncertainty avoidance, long-term versus short-term orientation and indulgence versus restraint) and the learning organization characteristics.

The limitation of this paper is given by the fact that the data were collected from the external and internal evaluation of 238 schools (in order to determine the level of educational services offered), means not specifically devoted on identifying SLO characteristics. However, another in-depth analysis, staff dedicated and focused on all action-oriented "dimensions" is scheduled and will be provided in the next period.

Acknowledgment

The paper is linked with the research activities related to the project: "Teaching and Educating for Sustainability" (TeachSUS_2018-1-RO01-KA204-049253), founded with support of the European Commission. Abstract

The article studies theory and practical implementation of strategies used by multinational companies (MNC) which invest in Russian milk processing sphere. Dairy business is socially important, and its development in Russia has good prospects. Per capita dairy under-consumption still persists in our country. Focus is made on conceptual comprehension of transnationalization process of economies with a developing market. The article has also studied the history of foreign direct investment in the country's dairy industry; penetration strategies used by PepsiCo and Danone companies; a framework of Russian business pre-market preparations; the changes in competitive environment of dairy industry, which is connected with MNC arrival. The research methodology is based on a synthesis of transnationalization theories and the practice of foreign companies' penetration into the economy of an emerging market country. The following methods were used: historical, comparative, statistical and content analysis. The academic novelty of the study is to identify the long-term effects of the penetration of MNC into the Russian dairy market. We made a conclusion about the realization of a glocalization paradigm and about the high effectiveness of marketing strategies, which are used by MNC on the Russian dairy market. Finally, their usage has led to the changes in effects of MNC presence: i.e., from national business supplement to its replacement. Anti-Russian sanctions, imposed in 2014, and ruble devaluation in general stimulate foreign industrial companies' localization on the territory of Russia.

Keywords: Transnationalization, Dairy Market, Multinational Companies, Implementation, International Trade

Introduction

For multinational companies (MNC) it's typical to expand their business through their industrial activity transferring in different countries. That is why, MNCs are the main actors of foreign direct investment (FDI). The most important reasons for capital transfer are: extending the life of a product, that was produced in a donor country (Vernon, 1979); economies achievement through the scale economies (Krugman, 1979); the wish to hand out the advantages which the company has to foreign markets; market control establishment in more than one country (Hymer, 1990); market risks decreasing through the commodity and geographical diversification; the search of costly effective geographical location and positive effects, caused by the innovations internationalization in one company frames; an establishment of controlled intra-corporate market, where transfer prices are used, intra-corporate loans and other tools, the price of which differs from external market level (Buckley and Casson, 2009) – internationalization concept. According to monopolistic advantages theory, all risks, that are caused by external investment, are compensated by the financial profitability.

According to Porter (Porter, 1987), the main determinants for the company competitive advantages achievement are: the corporate strategy, competitive structure and its level; industrial elements conditions (suggestion); demand conditions; the presence of accompanying and supporting industries (clusters); and also the state financial, fiscal, commercial, exchange-rate FDI-policies and unexpected

case factor. Geographically assembled companies' units "are looking for" the components of their competitive advantages in other countries (competitive advantages theory by M. Porter).

International trade geography is not identified by the institutional comparative advantage concept or the differences in supply of inputs, but the strategy is aimed at multinational corporations. "The new economic geography" (Krugman, 1991) and the global chains of added cost development take place (OECD, WTO, World Bank Group, 2014). Such aspects definitely decrease the national sovereignty of the recipient countries.

The main reasons for MNC involvement are: lack of internal investment in natural resources management and the maintaining of expanded reproduction; an access to the new techniques, technologies and knowledge, the transferring of which to the national industry stimulates the creation of the higher culture of production and the labor productivity, the new (for receptive countries) goods and branches, it stimulates employment, state taxes, export volumes and gold and currency incomes. In conditions of emerging economies such chain of positive consequences is only possible when the list of conditions is observed, where the most important one is the selective state FDI- policy (Ivanova, 2013).

The widespread forms of FDI advent are mergers and acquisitions (M&A - brownfield) and building from scratch (greenfield). M&A transactions are the way of unlimited company growth through integrations of different companies' capital (Ivanova, 2016). International M&A are a widespread MNC strategy, directed to increasing its market capitalization and total income. The cost for such strategy of investment realization is lower than the cost for realization of greenfield strategy. At the same time merging gives important industrial power (including infrastructure), and intangible assets (the brand of company), and the share on the market.

Since 1990s, the stimulation of the foreign direct investment flow (FDI) has become the global trend and the most important element of post-Soviet countries' policy. The core document in Russia that regulates foreign multinational companies' arrival is Federal law no. 160-FZ of July 9, 1999 on Foreign Investment in the Russian Federation (www.consultant.ru, 1999), that has been subject to certain amendments. According to this document, FDI is "direct foreign investment – acquisition by the investor of no less than 10 per cent of the share or shares (of deposit) in the registered (pooled) capital of a commercial organization, that was founded or is reestablished on the territory of the Russian Federation, having a business partnership or community format according to the Russian Federation civil law; investment of capital into major funds of foreign entity's affiliate, that has been founded on the territory of the Russian Federation; financial lease of equipment in the Russian Federation by a foreign investor as lessor, that was mentioned in chapters XVI and XVII of the unified Nomenclature of the foreign economic activities of the Customs Union within the EurAsEc (hereinafter referred to as "the Customs Union"), with the custom value of no less than 1 mln rubles" (Article 2).

The main FDI carriers are multinational companies (MNC). Active non-residents' arrival into "dairy" part of food industry was characterized by a number of features. Unlike foreign direct investment (FDI), that was made into the confectionery and brewery industries, the foreign "dairies" arrival occurred in the "greenfield" mode, i.e. as a rule, the new enterprises were constructed without investment or with fewer national capital. This is how the French multinational company Danone – Danone-Industries (Chekhov city, Moscow region, 2000) and Danone-Volga (Tolyatti city, Samara region, 1995) units appeared in the Russian dairy market, which have entered the dairy manufacturers top-group. In 2019 the company celebrated its 25th anniversary in Russia.

The history of global American company PepsiCo presence started in 1938, when Pepsi-Cola trade mark was registered. In 1974, the first franchising line of PepsiCo was opened (www.pepsico.ru, 2019).

The main aim of the article is to identify features of marketing strategies and positions of foreign MNC in the Russian dairy industry market, as a socially important part in the industrial society provision. The leading companies' strategies, the consequences and perspectives of their presence in the mentioned market are being analyzed for these purposes.

The research relevance is enhanced by the dairy under-consumption persisting among Russian inhabitants: 225.5 kg a year per person (2018), when the amount of 325 kg is recommended by the Russian Ministry of Health. Significant opportunities of dairy market expansion are limited by the raw milk level, the increasing dairy production cost and the decreasing real population income. In Russia, approximately 13% of population (19 mln inhabitants) have income lower than the cost of living.

Methodology

The author proceeded from the position that the logic of globalization of world economic relations leads to a gradual transition from a system of interconnected national economies to a system of interdependent cross-border business units and individuals, to a network economy. However, the peculiarity of the current situation is that large countries have their own concepts of national security and geopolitical interests.

The research methodology includes a synthesis of existing transnationalization theories. Despite a certain eclecticism of judgments, such a generalization allows us to understand the motivation and methods for achieving strategic competitive advantages at a global level.

The historical approach allowed us to trace the genesis of the arrival of Danone French company and PepsiCo American company on the Russian market.

The methods used comprised the study of changes in the competitive environment of the country receiving FDI, including the calculation of the shares of MNC unit products in the market of the recipient country. A content analysis of the media was conducted, in particular, magazines on business practices of transnational corporations, as well as corporate sites. The methods of comparative and statistical analysis are applied.

Results

M&A: Danone and UNIMILK

We can definitely say that Danone French global company is well-known all over the world. This is a global leader in yoghurt industry.

LLC UniMilk Company was established in 2002. It came from the food holding company, Management Planet, which was owned by Roman Abramovich. After the dairy holding's assets had been purchased by the company's management (MBO – management buy-out), UniMilk Company started to increase its presence on Russian and Ukrainian markets.

From 2002 to 2005, a dozen best enterprises of local level were combined into the "dairy" holding. The main goal is to achieve the logistical cover of the most populated regions in the country. In 2005 – 2007 the focus on brand portfolio optimization takes place as well as geographical presence expansion. In 2008, the main part of enterprises consolidated into the unified company, LLC UNIMILK, with its main owner being the Cyprus company UNIMILK HOLDINGS (CYPRUS) LIMITED - UNC). Establishment of this company in Cyprus makes it possible to minimize taxes and predicts undesirable company restructuring by the State and other third parties. In 2008, JSC UniMilk Company, which is the main structure of the eponymous holding company, increased the authorized capital by 47%, to complete the consolidation of its businesses and to raise funds for the promotion of brands. One of the purposes of the additional issue is reducing the company's debt burden. The ratio of debt/EBITDA is 7,6, while for the nearest competitor, WBD, it equals 1,5.

Successful operation of the milk processing plant is impossible without high-quality raw materials base. In 2003, Verbilovskoe dairy complex was annexed as part of the Lipetsk dairy plant acquisition. In 2009, this non-core agricultural asset (1500 heads of dairy cattle) was given to Russian Farms group of companies for the purpose of its further sale. It was supposed to join Verbilovskoe dairy complex and Belgorod Dairy Farms and to establish the management capacity of 8000 heads of dairy cattle on the area of 60 thousand hectares. The main form of Unimilk assistance to cattle breeding is to advance procurement of raw milk. In 2009, about 1 billion rubles was spent for this purpose.

By the beginning of 2010, the company was the second player by the volume of sales in the dairy market in Russia, Ukraine and Kazakhstan. The company has 32 production sites in its assets. The largest enterprises of the Holding are JSC Petmol (St. Petersburg). UniMilk product range features about 550 commodity items. In accordance with a rating of MPP Consulting Ukrainian consulting company, in 2010 Prostokvashino brand was the sixth on the list and the first by value among brands of dairy industry in the country. Its cost was estimated at 790 million dollars, Chudo brand's cost was 498 million dollars, Domik V Derevne cost – 422 million dollars.

In June 18, 2010, Danone and UniMilk representatives signed an agreement on the merger of the dairy business in Russia and the CIS. In the new company 57,5% of shares were under Danone control, and 42,5% of shares were under UniMilk. Transaction was carried out, mainly by bringing in assets. A part of the shares was purchased by Danone directly and paid for in cash. Another part was taken over by the French side gradually through the mechanism of "put", options granted to shareholders of UniMilk. Until 2012, this financial instrument let Danone enlarge its shares in the new company to 100%. In this case, Danone sold the previously bought stake for a total of 470 million dollars to WBD company, and completely left out the capital of this company.

On October 15, 2010 the Federal Antimonopoly Service (FAS) of the Russian Federation endorsed the consolidation of Danone and UniMilk. It was taken into account while making decision that UniMilk has an employment license for work with opportunistic pathogenic bacteria, such as fermented ones. Such specialization is taken into the Inventory of Activities, that have strategic significance (http://base.garant.ru, 2008). The merger is extended to companies' activity in Russia, Ukraine, Kazakhstan and Belarus.

Franck Riboud, Chairman of the Board and the President of Danone, and Andrey Beskhmelnitsky, General Director of UniMilk company emphasized the complementarity of companies, namely geography, product, sales, production (https://www.rbc.ru, 2010). Danone is moving to the east of Russia, expanding its product portfolio and branding, and is being complemented by the distribution in shops "within reach". All these factors let the new company extract the positive synergies effect of M&A.

Using the common M&A classification, the deal mentioned above can be characterized as the merger with further acquisitions by the French capital of the Russian company (with the Cypriot capital). The acquisition is international, friendly, industrial, horizontal with the extension of market. Despite the fact that the object of sale is a manufacturing business, the essence of the transaction is mainly financial incentives. Unimilk company owners resold the previously bought business as a bargain.

After the Deal, Danone strengthened its position in the global yogurt market, increasing its share to 17%. It is interesting that in the future, according to Euromonitor, the global demand for dairy yogurt will stabilize, and for dairy-free yogurt will grow by 5% per year and by 2027 will reach 7.4 billion dollars (www.vedomosti.ru, 2018). This is a prerequisite for the expansion of the Danone yogurt line in Russia with dairy-free products. In the first half of 2019, growth in sales of the main Danone dairy products in the CIS countries slowed down, due to a decrease in solvent demand. Consumption of baby products remained stable (www.danone.com, 2019).

In 2019, the nominees for the Best Brands Russia international award included Danone in the Best Foreign Corporate Brand category and Prostokvashino brand in the Best Russian Food Brand category (www.danone.ru, 2019)

M&A: PepsiCo and WBD

An American multinational company PepsiCo is a global player in the world beverage market. Its second activity is the production of food (snacks, nuts, dry cereal).

The main competitive advantages of the corporation are, first of all, the production and sales scale that gives market power, the go-to-market powerful system, whereby products are widely penetrating into retail channels; the different variety of goods – from premium brands to those that have affordable price; efficient raw materials (sugar, grain) that are increasing in price; strong brands and

advertisement; management united actions; the focus on further company development (Voronina, 2009).

JSC Wimm-Bill-Dann (WBD) was founded in 1992, when mass production of packaged juice was first started on the leased line technology at Lianozovo Dairy Plant, the largest in the USSR. In 1993, the company started yoghurt production, which was quite a new product for the Russian market which featured traditional kefir, soured milk and sour cream. Since 1998, WBD starts its movement into regions, absorbing the most liquid dairy assets. In 2000, the company business left Russian boundaries. In fact, WBD has become the Russian multinational company.

Despite the diversification, WBD retains priority for dairy, which takes 70% of all sales. In the Russian market of milk and dairy products WBD leads with a share of 28,2%.

The company produces 1100 types of dairy products and 150 types of drinks. The most famous federal brands of WBD are Domik V Derevne and Vesyoly Molochnik. About 70% of the revenue comes from milk and dairy products. The company had 38 manufacturing facilities in Russia, Ukraine and Central Asia.

In 2005, Wimm-Bill-Dann became the first company, that got the Resolution of the European Commission to export its products to the European Union. Wimm-Bill-Dann has built a strong distribution system of chilled products and a platform for the research, development and innovation. In 2010, Standard & Poor's confirmed GAMMA-7+ corporate governance rating of Wimm-Bill-Dann which is the highest rating among Russian companies and testifies to high standards of corporate governance.

In December 2010, PepsiCo reached an agreement with the major shareholders of Wimm-Bill-Dann, the leading Russian manufacturer of dairy products and beverages, to acquire the company, which was estimated at $5.8 billion. PepsiCo firstly acquired 66% of the shares of WBD in eight major shareholders and two subsidiaries of Russian companies for $ 3.8 billion, and after receiving the necessary approvals from the regulatory authorities and the closing of the transaction made an offer to buy out another 33% from the other shareholders. As a result, it will run six of the top 20 food brands of the country and 49 manufacturing plants, including 38 WBD factories. Such popular Wimm-Bill-Dann brands in the country, like Vesyoly Molochnik, Domik V Derevne, and others are preserved.

As a result of M&A, PepsiCo company has become the leader of three Russian markets: milk and dairy products, juices and baby food. It has a dominant position in the juices market. The last one was divided between the two American companies: PepsiCo and Coca-Cola (Ivanova, 2011).

In this regard, the Federal Antimonopoly Service of Russia has put forward a number of requirements to PepsiCo. In particular, to provide the FAS with information on the purchasing prices for raw and powdered milk every six months, and in the regions, where the structure of WBD accounts for more than 35% of the raw material procurement market, the service should be reported on changes in procurement prices of raw milk amounting to more than 7% from the average price for six months. WBD should inform the FAS in detail about selling prices for all dairy products. The failure to fulfill the requirements is the basis for the submission by the antimonopoly authority of a claim for recognition of the acquisition transaction invalid.

Note that PepsiCo modernized a number of purchased industries. In particular, in 2019, an investment project was completed at the site of the Rubtsovsky Dairy Plant (Altai Territory). It implements measures to increase the production of cheese (www.dairynews.ru, 2019) and the processing of whey (Coyne, 2018). The obtained whey protein concentrate can be used for the production of modern dairy and functional products. At the same time, this will contribute to the expansion of non-waste production.

Changes in Market Conditions

Prior to the international M&A transactions, products of three largest companies of the industry prevailed on the Russian federal dairy market: Wimm-Bill-Dann Foods (WBD), Unimilk and Danone

with the share of sales correspondingly: 22.4%, 15.1%, 11.5% (by the criteria of cost) and 22.1%, 16.0%, 5.3% (by the criteria of quantity.)

Table 1 demonstrates that 56.7% of the entire yoghurt production of Russian companies accounted for foreign capital, including Danone. As for the whole-milk products, Russian companies vastly prevailed.

Table 1: Share of company groups in the production of whole-milk products and yoghurt (by the criteria of cost), given in percentage, 2007.

	Whole-milk products		Yoghurt	
	In top 20	**In the Russian Federation**	**In top 20**	**In the Russian Federation**
Russian companies with foreign capital*	20.6	6.0	63.8	56.7
Wimm-Bill-Dann Foods	42.5	12.3	27.4	24.4
Unimilk	24.4	7.1	4.4	3.9
Others	12.4	3.6	4.4	3.9
Top 20	100	29.0	100.0	89.0

**given the share purchase of the open joint-stock company "Ostankino Dairy Plant" from a Ukranian company, a unit of a Dutch company Milkiland B.V.*

Starting from 1999, local holdings – WBD, followed by Unimilk – were aggressively purchasing more or less liquid production bases throughout Russia and partly in The Commonwealth of Independent States, underscoring the geographical diversification. The strategy for the further position reinforcement of the companies by the French capital was mostly based on adding new taste lines and sorts of yoghurt, yoghurt-based drinks, "tvorozhok" (cottage-cheese-based dessert), and other sweet dairy products. The companies conducted work on the product packaging and promotion on the Russian market. A portion of products was exported abroad. New enterprises were not created, old Soviet ones were not being purchased. Danone acquired 18.4% of WBD shares in 2002, which led to growth of its market capitalization – however, the crucial block of shares remained in the possession of WBD shareholders. Danone-WBD may be called a potential merger that did not take place as such, but it clearly indicated the direction in which French-capital-based companies were to move: purchasing fully formed local dairy productions with a wide geographical coverage (Ivanova, 2013).

By means of international M&A mechanisms hosted in Russian companies WBD and Unimilk in 2010, the previous strategy of TNC (transnational corporations) collapsed: from building new facilities for production of new, relatively exotic products for Russian market, to mass purchase of high-quality objects, producing wide range of traditional dairy products.

Importantly, milk industry is not a part of high-tech production processes, yet it plays a significant social role. The tendency to be noticed is the replacement of local capital with the foreign one, without substantial creation of new production facilities. By the year 2012, Danone-Unimilk became the largest acquirer of raw milk (1.7 million tons per year) and the leader of the dairy production in Russia, with an approximate 30% share (by the criteria of cost.) It is followed by the American company WBD, German Ehrmann and Dutch Campina. The total production share of foreign companies in Russia took no less than 60% of the Russian dairy production market.

According to the Dairy Intelligence Agency (DIA, 2020), in 2018 Danon and PepsiCo owned the largest milk processing plants in Russia. Their share in the total milk processed in Russia amounted to 7.48% and 7.23%, respectively. Compared to 2017, PepsiCo slightly reduced investments in the dairy section of its business. This is connected with a decrease in solvent demand for dairy products. Danone is more concentrated on the production of dairy products and their vegan alternatives. The new product lines take into account local tastes, traditions and raw materials. For example, Danon uses Siberian berries such as cranberries, cloudberries, sea buckthorn as yogurt additives.

Apart from Danone, a French company, Savencia Fromage & Dairy, has been introduced on the Russian market. This company is due to invest 3 billion rubles into the construction of a new cheese factory in Bashkiria in 2019. At the end of 2017 Belebeyevsky Dairy Plant' controlling interest of shares was purchased by them from a local group Neral (https://eadaily.com, 2019). The Vietnamese company TH True Milk, the main Asian investor in the Russian dairy product industry, plans the construction of milk-processing factories as well.

One of the factors in the consolidation of foreign capital in the dairy industry is the creation of vertically integrated industries. Thus, the largest producer of raw milk in Russia, EkoNiva - APK agricultural holding (a division of the German company Ekosem-agrar GmbH, CEO Stefan Dürr) plans to start milk processing by 2025-2030.

The highest concentration of dairy producers characterizes the Moscow Region (population of 6.7 million people). The quantity of milk processed in this area in 2016, by companies:

Lianozovsky dairy plant – 32.63%;

Danone industry Ltd. – 22.78%;

Ostankinsky dairy plant, open joint-stock company – 10.09%,

Campina Ltd. – 6.12%,

Others – 20.25%.

Accordingly, almost 80% of milk processed in Moscow Oblast accounts for foreign invested enterprises. This share did not decrease in 2019.

The priority investments of Danone in Russia remain focused on: expansion and renovation of the current production potentials; bringing them into line with high international standards of food quality and environmental safety of Danone brand; development of the product line and introduction of new products on the market.

Currently, PepsiCo continues the development strategy of the dairy division in Russia. It corresponds to the ideology of the transition from "products for pleasure" to products "for health".

It is important to note that, starting from 2014, Russia has experienced the policy of import substitution. Anti-Russian sanctions and ruble devaluation have been generally stimulating localization of foreign production companies. The revenue of Russian division of PepsiCo and Danone has been increasing. According to this criterion, PepsiCo has firmly held a position among top 10 foreign production companies in Russian Federation, Danone – among top 20 (www.forbes.ru, 2018).

Conclusion

In terms of interests of the studied multinational corporations, their investments in the Russian dairy industry must be recognized as effective. High business profitability has been achieved, its position has been reinforced on the growing Russian market and the market of The Commonwealth of Independent States, which is particularly relevant in the circumstances of "sanction war" between Russia on the one hand, and the European Union and the United States on the other.

Multinational companies have been emerging through both greenfield and brownfield investments. Initially, the effect of complementing Russian food market with new dairy products was achieved. The M&A value mechanism enabled the effect of substitution of the local processors with the foreign ones.

The acquired Russian private companies were those mostly formed as a result of privatization of large Soviet production units. Their further destiny was decided through steps directed towards creation of environment attractive for foreign investments. As for tax optimization – they opted for offshore accounts. Low-cost loan funds, among which those of foreign banks, enabled the production modernization, geographical and product diversification, as well as the opportunity to export branded goods. The consolidation of capital and IPO (Initial Public Offering) launch allowed the companies to acquire the status of backbone enterprises, entitled to governmental support. The business leading the

inner market became the goal of the foreign multinational corporations. Their acquisition led to increasing trend of market monopolization, and an increased dependency on foreign capital. Nevertheless, for the final consumer these changes have been latent due to preservation of familiar brands and the product line extension. The foreign multinational corporations introduced the Russian dairy market to the process of glocalization.

Abstract

Digital technologies are changing the methods of organizing work and managing human capital, which significantly improves the company's competitive position in the market, reduces the number of expenses and directly affects the amount of profit and the number of attracted customers. The formation of intelligent and digital network systems in the future will create self-organizing and self-governing organizations in which equipment, machines, employees and products interact and collaborate directly with each other. Such an intelligent connection will make management more flexible and efficient. Of great importance in the management of human capital begins to acquire "digital thinking." Enterprises around the world invest millions of rubles a year on the selection, development, and retention of personnel, assessment, and training. But the main attention is paid to the selection of personnel, which in the digital era can be called digital recruiting. Digital recruitment is the process of leveraging digital technology to the source, attraction, assess, select and hire candidates for vacant positions. This includes leveraging job boards, career websites, mobile recruiting, online assessments, and social recruiting. According to Forbes, about 40% of companies in the US use HCM, ERP, and other recruitment management cloud solutions.

Keywords: Digital Technologies, Human Capital Management, Digitalization, Digital Recruiting, Staff Selection.

Introduction

A fundamental factor in the success of digitalization is the availability of competent personnel capable of developing and implementing digital technologies. Digital skills are becoming critical (Sharipova 2019). This is recognized both at the business level and at the state level. For example, in Russia, the federal project “Personnel for the Digital Economy” is currently being actively implemented, which is being implemented as part of the national program “Digital Economy of the Russian Federation” (Masyuk, Zhao and Vasyukova 2019). The implementation of the project is transforming the labor market, which means that the tools and channels for finding candidates are changing. Now the recruiting system is undergoing automation as much as possible: there is a system for tracking resumes, evaluating applications online, chatbots for an initial interview, evaluating candidates through video interviews and more, and almost all digital products have mobile applications.

For many years, enterprises have increased their efficiency by hiring workers whose knowledge and experience have copied the most successful employees. Now the analytical capabilities of HR software give a clearer picture of the hidden potential of candidates, the systems help to find people with the required qualifications, assess their personality and development potential within the company, reveal the talents of current employees, etc. (Nonka, Borisova 2019). Top 20 software for recruitment is shown in table 1 (Recruitment Software 2018).

For companies that have thousands or even tens of thousands of employees, staffing is always an urgent problem (Applicant Tracking System 2020). 2017 was a breakthrough in this direction, thanks to the attraction of machine learning technologies, both in the field of recruitment and in the organization of its work. In recent years, software using artificial intelligence has become a key tool for the search and pre-selection of candidates (Lebedeva, Lazutina and Tsar'kov 2018). According to a Jobvite study, 43% of recruiters consider the contribution of artificial intelligence to their daily work to be significant. A recent Global Recruiting survey found that a US recruiter on average processes applications from 91 candidates daily. At the same time, the quantity/quality indicators of candidates remain stable over the past decade. But the involvement of machine learning technologies in the hiring process allowed for the first time in a long time to seriously improve the labor costs for attracting one new employee.

Table 1: TOP-20 software for staff recruitment

#	Name of HR Soft	#	Name of HR Soft
1	ZipRecruiter	11	Workday Human Capital
2	BambooHR	12	iCIMS Recruit
3	ApplicantStack	13	Lever
4	Breezy HR	14	ApplicantPro
5	Built for Teams	15	Bullhorn
6	JobDiva	16	Betterteam
7	Vincere	17	CEIPAL TalentHire
8	Zoho Recruit	18	Ultipro
9	LinkedIn	19	WebHR
10	Greenhouse	20	JazzHR

Intelligent automation can improve the efficiency of recruiters by taking on the functions of the pre-selection of candidates through a total database scan and selection of the necessary profiles according to specified criteria. Employment managers were able to pay less attention to working with the primary funnel, and more to optimize conversion rates and reduce hiring time (Kuznetsova 2019). The use of artificial intelligence is also positively evaluated by candidates. With large volumes of recruiting, candidates previously received a minimum of time for an interview, since managers were constantly in a time pressure state. The massive use of chatbots for initial contact allows you to make the interview more detailed and informative. Applicants can ask questions to the robot, and he will give them detailed answers, tell more about the tasks, position and rules of the company, career prospects and corporate culture of the company.

As Alexa, Siri, and Google Home, Chatbot's recruiting system uses artificial intelligence to understand questions and answer correctly. Companies can set up their chatbots to respond to emails or conduct conversations through instant messengers. At the same time, chatbots themselves analyze the answers of candidates, put up an assessment of their literacy, language proficiency, level of competencies and work experience, then to enter data into a common table for a comparative analysis of the candidate's potential.

According to a recent Allegis poll, most candidates are positive about talking with the bot in the early stages of the application process. 66% of the candidates noted that they had prepared in advance for

the interview with the chatbot, although most still prefer to work with a human recruiter (Matveeva and Zolotaryuk 2018).

Method and Methodology

The main digital recruiting method is the recruitment funnel, which came to HR from sales. This is an analytics tool that reflects the results of each stage of recruiting in quantitative terms. The model has stood the test of time but is still gradually becoming obsolete.

To begin with, we note that there is no single method for constructing a staffing funnel. The number and composition of stages depending on the industry of the company and the nature of the vacancy: for example, some employers separately pass the passage of the probationary period, while others have a special department open to adapt the staff, and therefore everything ends with hiring. Models will also vary greatly when looking for qualified personnel and mass selection.

However, a typical type of funnel still exists. We will consider it in more detail (Fig. 1). The selection of personnel begins with a preparatory, zero stage. It includes drawing up a portrait of the ideal candidate and determining the search sources, that is, the placements of the ads. Although the stage is not displayed in the classic funnel, it is an important part of the recruiting process. The first step to being included in the funnel is to attract candidates, and this is the widest part. Here the employer announces a vacancy, publishes a resume at various sites. The second stage is engagement, which includes the processing of incoming responses, the initial acquaintance of candidates with the company, corporate culture, and brand of the employer. The recruiter makes contact, talks about the benefits of work. This is a key point, because it “sells” vacancies, especially with spot selection. The third stage of the funnel is evaluation and selection. The HR manager works with the incoming "warm" stream of applicants who are already involved to some extent, are interested in the position. Screening is carried out based on the results of interviews and assignments, starting, for example, with small tests and ending with final interviews with experts or managers of the employing company. When evaluating and selecting, the main narrowing of the funnel occurs. Next, an offer is made to the final candidates. The last step is to get the final result: for most companies, this is hiring an employee. The final stage is the narrowest part of the funnel: you can see a hundred applicants, but more than three offers for one position are rarely put up. However, again, it all depends on the specifics of the vacancy, the company and the market as a whole.

Fig. 1: Recruiting Funnel

The model of the “recruiting funnel” describes the stages of interaction between the recruiter and applicants when closing a vacancy, each of which is digitized and subsequently makes it possible to evaluate at what stage the potential candidate is screened out and where the malfunction occurs.

Results

Digitization of the funnel may look as follows (Fig. 2). The funnel is clear and transparent, it shows the conversion at each stage of selection, and allows you to formulate new solutions. From this figure, it can be seen that the largest conversion is observed at the first stage. Further, this indicator is significantly reduced. There is a misconception that with an artificial increase in the first stage of the funnel, that is, the incoming flow of applicants, the effectiveness of recruiting increases. In the case of mass selection, this can really work, but for a targeted qualified search, this method will not work - it will only lead to financial and temporary losses.

The HR brand has a positive effect on the effectiveness of the recruitment funnel, and the technology brand for the IT industry. There is another option - the creation of a corporate university. So the employer will be able to increase the initial pool of candidates and rely on individual qualities and soft skills, developing other competencies already in the process of work. Various metrics can be used to evaluate the effectiveness of the recruitment funnel. There are no unified indicators, but they often use the time of filling a vacancy, that is, the number of days required to close it, or the time of hiring - the number of days between the final approval of the candidate and his exit to work. An offer acceptance ratio may also be used. Another advantage of the funnel: it can be shown to the client or manager so that he sees how much work is really behind the selection (Tikhonov, Fedotov and Chekan 2019). It happens that the personnel selection system fails. Using a funnel, you can determine where the problem arose - for example, at the stage of involvement. But involvement is a lot of steps, and it is not clear what exactly to look for the cause. Maybe it's a matter of negative reputation and negative reviews of employees? Or the reason is an illiterate search map: the recruiter posted a vacancy for mass selection on LinkedIn. Perhaps the requirements for the applicant do not match the prevailing market? There may be many options.

This is the main drawback of the funnel: to solve the problem, it is not enough to detect it. The funnel is not able to help identify the causes. She misses the relationship with other business processes and only indicates the presence of a “bottleneck”, a clear discrepancy between the dry numbers and the expected intermediate results. This is a "litmus test" with which it is necessary to conduct further work.

There is another important problem: the funnel model does not take into account market changes. The funnel works only if we place ads in as many sources as possible, from which the stream of applicants comes to us. But the situation is changing: the candidate market is transforming into a job market. In pharmaceuticals, IT, and knowledge-intensive industries, more and more specialized specialists are required at the junction of professional fields. Companies are fighting for candidates who are not even in search. How to take all this into account in the funnel - is a big question (Nagibina 2017).

Fig.2 : Digitization of a recruiting funnel

Discussion

The main goal of the maximum automation of recruiting is to reduce the burden on HR specialists in the mass hiring and training of personnel, as well as a higher KPI. To achieve these goals, several HR digitalization tools were allocated: The Applicant Tracking System (ATS 2020) and the LMS Learning Management System (E-learning 2020). These systems interact with employees and candidates using mobile applications, social networks and cloud technologies (Kuprevich 2018). Before the interview, the applicant is asked to fill out not a paper form, but an electronic one. It is difficult and not habitual for a modern person to write a lot with a pen, it's much simpler, more familiar and faster to check and electronic questionnaire. The employer gets the opportunity to process the received data faster and more efficiently. Such automation is introduced at all stages of hiring and training:

- instead of a group presentation, a video presentation is being introduced;
- instead of numerous interviews, assessments and other assessments of competencies, the candidate is invited to go through a quest in which he has the opportunity to demonstrate his skills;
- all employees undergo training through special portals that systematize training (Sharapova, Sharapova and Shvetsova 2017).

The introduction of digitalization in HR technology gives good results. The load on recruiters and recruiters is reduced, the selection funnel is improved, and staff turnover is reduced. An international study by McKinsey consulting company, conducted at the end of 2018, revealed that the digitalization of recruiting processes allows 26% to increase the productivity of recruiters. The contribution of these measures to the financial performance of the company was also calculated - their profit increases by 14%. Using a chatbot (voice robot) for mass selection, which makes preliminary screening of inappropriate calls and applications, allows up to 30% of calls not to be brought to recruiters, thereby saving their time and reducing the cost of staff recruitment by two to three times (. Thanks to the automation of staff recruitment, the term for closing vacancies, including in remote territories, was reduced from 30-40 days to one week (Strelnikova and Lembrikova 2019).

Digital and economics analysts predict the enormous impact of digitalization on the labor market. McKinsey Global Institute estimates that up to 50% of workflows will be automated in the world by 2036. As a result, up to 12.5 million of the employed population can be freed up and jobs will be reduced. A trend will begin to increase the difference in wage levels, which will result from the stratification of society by income level, and unemployment will increase (Masyuk, Vasyukova and Kiryanov 2018). Existing jobs will be replaced by high-paying jobs that require the skills to create and apply digital technologies, and low-paying jobs in cases where automation is not economically feasible. Thus, the impact of digitalization will lead to the emergence of new professions, and, as a result, to a shortage of sought-after personnel. But at the same time, it can be assumed that a high level of income in scarce professions will provide an incentive for potential employees to learn new skills and competencies. As a result, digitalization can be seen both as a threat and as the emergence of new opportunities.

The key competency of the digital age is the ability to analyze a large array of data. The introduction of digital technology leads to changes in staffing requirements and professional requirements. More and more noticeably, we are seeing a decrease in demand for professions related to formalized, repetitive operations. The life cycle of professions is reduced due to the rapid change of technology (Avdeeva, Andreeva and Afanasyev 2019). There is a transformation of positions, there are risk analytics, HR analytics, marketing analysts in connection with the automation of business processes. New professions are emerging. The requirements for flexibility and adaptability of staff, for the manifestation of "soft skills" - "soft skills" associated with social and emotional intelligence that distinguish a person from a machine are increasing. There is a growing demand for specialists with "digital dexterity" - the ability to implement new technologies in order to increase the efficiency of enterprises and businesses as a whole.

One cannot but say that advanced digital technologies have a positive impact on the labor market. Firstly, the use of modern digital work portals enables potential candidates to expand their professional and career opportunities through wide access to the databases of current vacancies (Kostikova, Skiter and Tarasova 2019). For example, on the Russian platform hh.ru already posted more than 25 million resumes, the number of which is constantly growing. Secondly, digital platforms directly affect the increase in labor productivity, as they contribute to the selection of the most accurate profile of the applicant for the proposed vacancy. All this reduces unemployment. Thirdly, the digital revolution will contribute to the emergence of new professions and jobs that did not exist before. Fourth, thanks to modern technologies, it is possible to remotely work remotely, which makes it possible to increase the efficiency of employment of specialists from regions where there is a limited local demand for them. Finally, digital technologies enable workers to acquire new knowledge and skills using distance e-learning in order to improve their skills, master new professions or acquire new competencies. The widespread use of online education systems provides an opportunity for employees to develop additional competencies necessary for creating a career path in the digital era (Masyuk and Pankova 2019).

Conclusion

The era of digital technology transforms the minds of managers and dictates the need to search for new and adapt existing tools for managing human capital. Digitalization shows that a number of business processes are most efficiently done by the machine: conducting initial interviews and screenings that do not meet the requirements of candidates, psychometric characteristics of personnel recruiting according to his profiles and preferences in social networks, all this requires rapid changes in the HR field. Digital technologies increase the effectiveness of management decisions: automated recruiting, switching to virtual workplaces, personalization in management and creating for each employee a special environment for self-realization and development, engagement management, HR analytics, and performance management. However, no matter what digital technologies are used, it is human capital and its potential that is the main generator and manager of all changes.

Abstract

In multidimensional scaling (MDS) applied to a metric data matrix (interval, ratio) or interval-valued data table three approaches can be distinguished: classic-to-classic – for metric data, symbolic-to-classic) and symbolic-to-symbolic – for interval-valued data. The article presents the `mdsOpt` package, which helps to solve the problem of choosing the optimal MDS procedure. It uses two criteria for selecting the optimal MDS procedure: Kruskal's $Stress$-1 fit measure (I-$Stress$ in the case of the symbolic-to-symbolic approach) and Hirschman-Herfindahl HHI index, calculated using Stress per point values (interval stress per box in the case of the symbolic-to-symbolic approach). In the first part three possible approaches are described, including the theoretical background of the methods and the relationships between the `mdsOpt` package and existing `R` packages. The second part explains the procedure and criteria for selecting the optimal MDS procedure for metric and interval-valued data. The last part contains details on how to use the package and applications to real data sets.

Keywords: Multidimensional Scaling, Metric And Interval-Valued Data, Tourist Attractiveness, `Mdsopt`

Introduction

The article proposes a solution for choosing the optimal MDS procedure according to various scenarios. The novelty of the study presented in this article is related to a family of algorithms for selecting the optimal MDS procedure implemented in the `mdsOpt` package of the R program. The effectiveness of the algorithms is demonstrated using real data sets.

The Aim of Multidimensional Scaling

Classical MDS is a method that represents (dis)similarity in the data as distances in a low-dimensional space (typically 2 or 3 dimensions) in order to enable data exploration by means of visualization (Borg and Groenen (2005), p. 3). Classical MDS requires that each entry of dissimilarity matrix be a single numerical value. Dissimilarity between object i and object k can be fuzzy (Groenen *et al*. (2006)), p. 361). The fuzzy dissimilarity is represented by an interval and $n \times n$ dissimilarity matrix is an interval of values $[\delta_{ik}^{l}; \delta_{ik}^{u}]$, where δ_{ik}^{l} (δ_{ik}^{u}) denotes the lower (upper) bound of the dissimilarity of objects i and k in m-dimensional space. MDS of interval dissimilarities represents the lower and upper bounds of dissimilarities as distances between hypercubes (rectangles in a two-dimensional space and cubes in a three-dimensional space). The dimensions are not directly observable. They can be treated as latent variables. MDS makes it possible to explain the similarities and differences between the analyzed objects.

MDS is a widely used technique in many areas, including psychology (Takane (2007)), sociology (Pinkley *et al.* (2005)), linguistics (Embleton *et al.* (2013)), marketing research (Cooper (1983)), tourism (Marcussen (2014)), musicology (McAdams *et al.* (1995)).

The approaches in multidimensional scaling using the `mdsOpt` package

When MDS is applied to a metric data matrix (interval, ratio) or interval-valued data table by means of the `mdsOpt` package, three approaches can be distinguished:

1. Classic-to-classic – for metric data:

$$\mathbf{X} = \left[x_{ij}\right]_{n\times m} \rightarrow \mathbf{Z} = \left[z_{ij}\right]_{n\times m} \rightarrow [\delta_{ik}(\mathbf{Z})]_{nxn} \rightarrow \\ \rightarrow f\colon [\ \delta_{ik}(\mathbf{Z}) \rightarrow d_{ik}(\mathbf{V})] \rightarrow\ \mathbf{V} = [v_{ij}]_{nxq}, \tag{1}$$

where: x_{ij} (z_{ij}) – the value (the normalized value) of the *j*-th variable for the *i*-th object, $i, k = 1, \dots, n$ – the number of the object, $j = 1, \dots, m$ – the number of variable, $[\delta_{ik}(\mathbf{Z})]_{n\times m}$ – a distance matrix (dissimilarities) between objects in an *m*-dimensional space (distances are calculated using e.g. city-block, Euclidean, Chebyshev, squared Euclidean), $[d_{ik}(\mathbf{V})]$ – a distance matrix in a *q*-dimensional space $(q < m)$, f – function which maps distances in an *m*-dimensional space $\delta_{ik}(\mathbf{Z})$ into corresponding distances $d_{ik}(\mathbf{V})$ in a *q*-dimensional space, $\mathbf{V} = [v_{ij}]_{nxq}$ – data matrix in a *q*-dimensional space.

The starting point of MDS in the classic-to-classic approach is a metric data matrix $\mathbf{X} = \left[x_{ij}\right]_{n\times m}$, for which observations are obtained from secondary data sources. It is a typical situation in socio-economic research. Methods of determining the distance matrix $[\delta_{ik}]$ can be divided into direct methods (typically results from similarity ratings on pairs of objects, from rankings, or from card-sorting tasks) and indirect (see (1)) methods (see e.g. Borg and Groenen (2005), pp. 111-133).

2. Symbolic-to-classic – for interval-valued data:

$$\mathbf{X} = \left[x_{ij}^{l}, x_{ij}^{u}\right]_{n\times m} \rightarrow \mathbf{Z} = \left[z_{ij}^{l}, z_{ij}^{u}\right]_{n\times m} \rightarrow [\delta_{ik}(\mathbf{Z})]_{nxn} \rightarrow \\ \rightarrow f\colon [\ \delta_{ik}(\mathbf{Z}) \rightarrow d_{ik}(\mathbf{V})] \rightarrow\ \mathbf{V} = [v_{ij}]_{nxq}, \tag{2}$$

where: $[x_{ij}^{l}, x_{ij}^{u}]$ – the observation of the *j*-th interval-valued variable for the *i*-th object $(x_{ij}^{l} \leq x_{ij}^{u})$, x_{ij}^{l} (x_{ij}^{u}) – the lower (upper) bound of interval, $\mathbf{Z} = \left[z_{ij}^{l}, z_{ij}^{u}\right]$ – the normalized interval-valued data table in an *m*-dimensional space, $[\delta_{ik}(\mathbf{Z})]$ – a distance matrix (dissimilarities) in an *m*-dimensional space (distances are calculated using distance measures for interval-valued data – see Table 3).

3. Symbolic-to-symbolic – for interval-valued data:

$$\mathbf{X} = \left[x_{ij}^{l}, x_{ij}^{u}\right]_{n\times m} \rightarrow \mathbf{Z} = \left[z_{ij}^{l}, z_{ij}^{u}\right]_{n\times m} \rightarrow \left[\delta_{ik}^{l}, \delta_{ik}^{u}\right] \rightarrow \\ \rightarrow f\colon \left(\left[\delta_{ik}^{l}, \delta_{ik}^{u}\right] \rightarrow \left[d_{ik}^{l}, d_{ik}^{u}\right]\right) \rightarrow\ \mathbf{V} = [v_{ij}^{l}, v_{ij}^{u}]_{n\times q}, \tag{3}$$

where: δ_{ik}^{l} (δ_{ik}^{u}) $[d_{ik}^{l}$ $(d_{ik}^{u})]$ – the lower (upper) bound of the dissimilarity of objects *i* and *k* in an *m*-dimensional [*q*-dimensional] space, f – function which represents the lower and upper bounds of the dissimilarities by minimum and maximum distances between rectangles (cubes in a three-dimensional space) as well as possible distances in the sense of least-squares (Groenen *et al*. (2006), p. 363), $\mathbf{V} = [v_{ij}^{l}, v_{ij}^{u}]$ – an interval-valued data table in *q*-dimensional space.

In the symbolic-to-classic and symbolic-to-symbolic approaches the starting point of MDS is a data table $\mathbf{X} = \left[x_{ij}^{l}; x_{ij}^{u}\right]$ $(x_{ij}^{l} \leq x_{ij}^{u})$. Gioia and Lauro (2006, p. 344) provide different real examples of interval data:

- financial data (e.g. opening and closing value in a session),
- customer satisfaction data (expected or perceived characteristics of the quality of a product),
- tolerance limits in quality control,
- confidence intervals of estimates from sample surveys,
- database queries.

Additional examples of real life interval-valued data can be found in Brito *et al*. (2015):

- high–low intervals of financial prices,
- some questions in questionnaire surveys (e.g. age, income, time spent).

Interval-valued data can be obtained by generalizing classical single-valued variables into interval-valued variables (see e.g. Bock (2000), pp. 43-44).

The main idea of the `mdsOpt` package

The authors of the monograph (Borg *et al*. (2018), chapter 7) point out typical mistakes made by MDS users. One frequent mistake consists in evaluating Stress manually (rejecting an MDS solution on the grounds that its value seems "too high"). According to the authors (Borg *et al*. (2018), pp. 85-86), "The Stress value is, however, merely a technical index, a target criterion for an optimization algorithm. An MDS solution can be robust and replicable, even if its Stress value is high" and "Stress is a *summative* index for *all* proximities. It does not inform the user how well a *particular* proximity value is represented in the given MDS space (...) The least one can do is to take a look at the Stress-per-point values". Considering that we should take into account stress per point values (Borg and Mair (2017)) and Shepard diagram (Mair *et al*. (2016); De Leeuw and Mair (2015)) for classic-to-classic and symbolic-to-classic approaches or the $I\text{-}Stresss$ per box index (*ispb*) and the $I\text{-}dist$ diagram for the symbolic-to-symbolic approach.

Criteria for selecting the optimal MDS procedure

To solve the problem of choosing the optimal MDS procedure, two criteria are implemented in the `mdsOpt` package (Walesiak and Dudek (2019b)):

- in the classic-to-classic and symbolic-to-classic approaches: Kruskal's $Strees\text{-}1$ (standardized residual sum of squares) fit measure and the Hirschman-Herfindahl HHI index, calculated from Stress per point values (*spp*).
- in the symbolic-to-symbolic approach: $I\text{-}Stress$ fit measure and HHI index, calculated from $I\text{-}Stress$ per box index values (*ispb*).

Package `mdsOpt` versus other packages

The algorithms implemented in the `mdsOpt` package has not been used in other `R` packages so far and can be treated as a complementary package for well-known libraries `smacof` (Mair *et al*. (2019); De Leeuw and Mair (2009)) and `smds` (Terada and Groenen (2015)), extending theirs possibilities. The relationships between `mdsOpt` and other `R` packages are presented in Table 1.

Additionally, the `mdsOpt` package contains functions for calculating the $I\text{-}Stress$ per box index (*ispb*) and charting the $I\text{-}dist$ diagram for interval-valued data.

Selection of the optimal multidimensional scaling procedure

The article proposes a solution for selecting the optimal MDS procedure depending on whether metric and interval-valued data are used.

Basic Decision Problems

For the purpose of the classic-to-classic and symbolic-to-classic approaches exemplified in the study, the `smacofSym` function from the `smacof` package was used. In the `smacofSym` function, the user has to choose the following attributes:

– the normalization method (18 normalization methods are available – see Table 2),
– the distance measure: 5 for metric data (Manhattan, Euclidean, Chebyshev, squared Euclidean, GDM1 – see e.g. Everitt *et al*. (2011), pp. 49-50; Jajuga *et al.* (2003)) and 4 for interval-valued data (see Table 3),
– the MDS model (3 MDS models are available: ratio, interval, polynomial).

For the purpose of the symbolic-to-symbolic approach exemplified in the study, the `IMDS` function from the `smds` package was used. The following attributes need to be selected in the `IMDS` function:
– the normalization method – 18 normalization methods are available,
– the optimization method – 2 methods are available: the majorization-minimization algorithm "MM" (Groenen *et al.* (2006), p. 366); the quasi-Newton method "BFGS" (Nash (1990)).

Table 1: Relationships between `mdsOpt` and other `R` packages

MDS approach		
Classic-to-classic	Symbolic-to-classic	Symbolic-to-symbolic
Type of data		
metric	interval-valued	interval-valued
Functions of `mdsOpt` package

Table 2 presents normalization methods, given by linear formula (4), which were used to select the optimal MDS procedure (see Jajuga and Walesiak (2000), pp. 106-107):

$$z_{ij} = b_j x_{ij} + a_j = \frac{x_{ij} - A_j}{B_j} = \frac{1}{B_j} x_{ij} - \frac{A_j}{B_j} \, (b_j > 0), \tag{4}$$

where: x_{ij} (z_{ij}) – the value (the normalized value) of *j*-th variable for the *i*-th object, A_j – shift parameter to arbitrary zero, B_j – scale parameter.

The variables describing the analyzed objects are normalized when they are metric or interval-valued. The purpose of normalization is to achieve comparability of variables (Milligan and Cooper (1988)).

For classical metric data an observation on the *j*-th variable for the *i*-th object in a data matrix $\mathbf{X} = [x_{ij}]_{n \times m}$ is expressed as one real number. Column 1 in Table 2 presents the type of normalization method selected in the `data.Normalization` function from the `clusterSim` package (Walesiak and Dudek (2019a)). A similar data normalization procedure is available in the `scale` function of the `base` package. In this function the user defines parameters A_j and B_j.

For interval-valued variables each cell x_{ij} in a data table represents the interval $x_{ij} = [x_{ij}^l; x_{ij}^u]$ ($x_{ij}^l \leq x_{ij}^u$). Interval-valued data require a special normalization approach. The lower and upper bound of the interval of the *j*-th variable for n objects are combined into one vector containing $2n$ observations. This approach makes it possible to apply normalization methods used for classical metric data. After normalization, observations on each variable from 1 to n are the lower bounds of intervals while observations from $n + 1$ to $2n$ are the upper bounds. In the study the data were normalized using the `interval_normalization` function from the `clusterSim` package.

Table 2: Normalization methods

Type	Method	Parameter	
		B_j	A_j
n1	Standardization	s_j	$\bar{x}_j$
n2	Positional standardization	mad_j	med_j
n3	Unitization	r_j	$\bar{x}_j$
n3a	Positional unitization	r_j	med_j
n4	Unitization with zero minimum	r_j	$\min_i\{x_{ij}\}$
n5	Normalization in range [–1; 1]	$\max_i\lvert x_{ij}-\bar{x}_j\rvert$	$\bar{x}_j$
n5a	Positional normalization in range [–1; 1]	$\max_i\lvert x_{ij}-med_j\rvert$	med_j
n6	Quotient transformations	s_j	0
n6a		mad_j	0
n7		r_j	0
n8		$\max_i\{x_{ij}\}$	0
n9		$\bar{x}_j$	0
n9a		med_j	0
n10		$\sum_{i=1}^{n} x_{ij}$	0
n11		$\sqrt{\sum_{i=1}^{n} x_{ij}^2}$	0
n12	Normalization	$\sqrt{\sum_{i=1}^{n}\left(x_{ij}-\bar{x}_j\right)^2}$	$\bar{x}_j$
n12a	Positional normalization	$\sqrt{\sum_{i=1}^{n}\left(x_{ij}-med_j\right)^2}$	med_j
n13	Normalization with zero being the central point	$r_j/2$	m_j

$\bar{x}_j$ (s_j, r_j)– mean (standard deviation, range) for the *j*-th variable, $m_j = \left(\max_i\{x_{ij}\} + \min_i\{x_{ij}\}\right)/2$ – mid-range for the *j*-th variable, $med_j = \underset{i}{med}\left(x_{ij}\right)$ – median for the *j*-th variable, $mad_j = \underset{i}{mad}\left(x_{ij}\right)$ – median absolute deviation for the *j*-th variable.

Stages in selecting the optimal procedure for MDS

The starting point in applying the `smacofSym` function is to determine e.g. the following values of arguments (all parameters can be changed by the user):

- initial configuration ("torgerson" classical scaling starting solution),
- convergence criterion (eps=1e-06),
- maximum number of iterations (itmax=1000).

The first step in applying the `IMDS` function from the `smds` package is to determine e.g. the following values of arguments (all parameters can be changed by the user):

- initial configuration (the hyper-rectangles with centers assigned as a result of classical multi-dimensional scaling of primary space interval centers and vertices located at unit distance from the centers),
- convergence criterion (eps=1e-5),
- maximum number of iterations (maxit=1000).

Selecting the optimal procedure for MDS takes place in several stages:

1. Set the number of dimensions in MDS to two (ndim=2).

2. Take into account the following options, depending on the approach:

   - In the classic-to-classic approach – 10 normalization methods, 5 distance measures and 4 MDS models (mspline model – polynomial function of second and third degree), yield a total of 200 MDS procedures.

Since the normalization methods listed in groups A, B, C and D (see Table 4) yield identical MDS results, only the first method listed in each groups (n1, n2, n3, n9), plus the other methods (n5, n5a, n8, n9a, n11, n12a) are used in further analysis.

- In the symbolic-to-classic approach – 18 normalization methods, 4 distance measures for interval-valued data and 4 MDS models yield a total of 288 MDS procedures.
- In the symbolic-to-symbolic approach – 18 normalization methods and 2 optimization methods, yield a total of 36 MDS procedures.

Table 4: Groups of normalization methods resulting in identical distance matrices

Groups of normalization methods	Normalization methods	
	GDM1 distance	**Minkowski distances, squared Euclidean distance***
A	n1, n6, n12	n1, n6, n12
B	n2, n6a	n2, n6a
C	n3, n3a, n4, n7, n13	n3, n3a, n4, n7, n13
D	n9, n10	n9, n10

** after dividing distances in each distance matrix by the maximum value.*
Source: Walesiak and Dudek (2017).

3. Perform MDS for each procedure separately. The procedures are ordered by increasing values of:

   - $Stress\text{-}1$ fit measure in the classic-to-classic and symbolic-to-classic approaches (see e.g. Borg *et al*. (2018), p. 32):

$$Stress\text{-}1_p = \sqrt{\sum_{i<k}\left[d_{ik}(\mathbf{V}) - \hat{d}_{ik}\right]^2 / \sum_{i<k} d_{ik}^2(\mathbf{V})}, \tag{5}$$

where: p – MDS procedure number, $\hat{d}_{ik}$ – d-hats, disparities, target distances or pseudo distances (see Borg and Groenen (2005), p. 199), $\hat{d}_{ik} = f(\delta_{ik})$ by defining f in different ways (ratio, interval, polynomial MDS).

   - $I\text{-}Stress$ fit measure in the symbolic-to-symbolic approach (Groenen *et al.* 2006, p. 363):

$$I\text{-}Stress_p = \frac{\sum_{i<k}^{n} w_{ik}\left[\delta_{ik}^u - d_{ik}^u\right]^2 + \sum_{i<k}^{n} w_{ik}\left[\delta_{ik}^l - d_{ik}^l\right]^2}{\sum_{i<k}^{n} w_{ik}\left[\delta_{ik}^u\right]^2 + \sum_{i<k}^{n} w_{ik}\left[\delta_{ik}^l\right]^2}, \tag{6}$$

where: $\delta_{ik}^l, \delta_{ik}^u$ (d_{ik}^l, d_{ik}^u) – the lower and upper bound of the dissimilarity in *m*-dimensional space (*q*-dimensional space), w_{ik} – nonnegative weight (in general $w_{ik} = 1$).

4. Calculate the Hirschman-Herfindahl index (Herfindahl (1950); Hirschman (1964)) using Stress per point (*spp*) values (Stress contribution in percentages) in the classic-to-classic and symbolic-to-classic approaches:

$$HHI_p = \sum_{i=1}^{n} spp_{pi}^2, \tag{7}$$

where: $i, k = 1, \dots, n$ – object number.

In the symbolic-to-symbolic approach, the Hirschman-Herfindahl index is calculated on the basis of Interval stress per box (*ispb*) values (Interval Stress contribution in percentages),:

$$HHI_p = \sum_{i=1}^{n} ispb_{pi}^2, \tag{8}$$

where: $ispb_i = \frac{\left(\sum_{k=1}^{n} w_{ik}\left[\delta_{ik}^u - d_{ik}^u\right]^2 + \sum_{k=1}^{n} w_{ik}\left[\delta_{ik}^l - d_{ik}^l\right]^2\right)/n}{\sum_{i=1}^{n}\left[\left(\sum_{k=1}^{n} w_{ik}\left[\delta_{ik}^u - d_{ik}^u\right]^2 + \sum_{k=1}^{n} w_{ik}\left[\delta_{ik}^l - d_{ik}^l\right]^2\right)/n\right]} \cdot 100\%.$

The HHI_p index takes values in the interval $\left[\frac{10{,}000}{n}; 10{,}000\right]$. The value $\frac{10{,}000}{n}$ means that the distribution of errors for individual objects is uniform. The maximum value appears when the summary fit measure ($Stress\text{-}1$, $I\text{-}Stress$) is the result of loss assigned only to one object. For other objects, the loss function will be equal to zero. The optimal situation for an MDS procedure is the minimum value of the HHI_p index.

5. Draw a chart with $Stress\text{-}1_p$ ($I\text{-}Stress_p$) fit measure values on the *x*-axis and HHI_p index values on the *y*-axis for *p* procedures of MDS.

6. Use the maximum acceptable value of $Stress\text{-}1$ ($I\text{-}Stress$) as cs (it may be calculated as a mid-range or median of $Stress\text{-}1$ ($I\text{-}Stress$)). For all MDS, for which $Stress\text{-}1_p \leq cs$ ($I\text{-}Stress_p \leq cs$), we choose one where $\min_p\{HHI_p\}$.

7. Perform MDS for the selected procedure and check if interpretation results are acceptable. The correctness of the model scaling is evaluated using the Shepard diagram ($I\text{-}dist$ diagram) and $Stress$ ($I\text{-}Stress$) plot,. If the results are acceptable, the procedure ends, otherwise it returns to step 1 and MDS for three dimensions is performed (ndim=3).

Evaluation of tourism attractiveness of districts in Dolnoslaskie province (the classic-to-classic approach)

In the first application, we find the optimal solution for the classic-to-classic MDS approach. The `mdsOpt` package contains a dataset called `data_lower_silesian` containing 16 metric variables that describe tourism attractiveness of 31 objects (29 districts in Dolnoslaskie – Lower Silesia prov-

ince, plus the pattern and anti-pattern object). Variables x1-x3, x7, x8, x10-x16 are stimulants (where higher values are preferable), variables x4, x5 and x6 are destimulants (where lower values are preferable), and x9 is a nominant (preferable values lie within a certain range – 50% level was adopted as the optimal one). Variable x9 was transformed into a stimulant. The coordinates of the pattern object correspond to the most optimum values of the preference variable (the maximum for a stimulant, the minimum for a destimulant). The coordinates of the anti-pattern object correspond to the least optimum values of the preference variable (the minimum for a stimulant, the maximum for a destimulant).

Ten normalizations methods, five distance measures and 4 MDS models are used for selecting the optimal MDS procedure (see Script 1 in the Appendix).
Figure 1 shows the dependency between $Stress$-1 and HHI index with the best solution marked by the red circle. In the end we choose the MDS solution that satisfies condition $Stress$-1 $\leq cs$ and minimizes HHI.

Fig. 1: The values of *Stress*-1 fit measure and *HHI* index for *p* MDS procedures (the best solution marked by the red circle)

The results of the optimal MDS procedure (117: n12a normalization method, Euclidean distance and interval MDS model), obtained by applying Script 2 from the Appendix, for 31 objects described in terms of tourism attractiveness are presented in Figure 2.

Figure 2 (a configuration plot with bubbles) shows the share of each object in total error, which is indicated by the radius of the circle around each object. The Shepard diagram and the Stress plot confirm the correctness of the selected scaling model. Figure 2 (a configuration plot with bubbles) includes the set axis, i.e. the shortest connection between the pattern and anti-pattern object. It indicates the level of tourism attractiveness of the districts. The objects located closer to the pattern object are rated higher in terms of tourism attractiveness.

For comparison with the best MDS procedure (117), we also include results from one of the worst procedures (13): n9a normalization method, mspline of third degree model, Chebyshev distance. These results can be obtained by running Script 3 from the Appendix, with changes in lines 3-5 in relation to script 2 and in the Shepard diagram.

Fig. 2: The results of MDS (procedure 117) for 31 objects in terms of tourism attractiveness

The results of MDS for procedure 13 are presented in Figure 3.

Overall Stress for procedure 13 (0.0381) is much better than for procedure 117 (0.1322). Figure 3 (Stress plot) shows that objects Jeleniogorski (3), the anti-pattern (31) and Zgorzelecki (7) contribute most to the overall Stress (56.62%). It also shows (see the Shepard Diagram – in the lower left-hand corner) that two points (distance between Jeleniogorski (3) and the anti-pattern object (31); Jeleniogorski (3) and Zgorzelecki (7)) are outliers. These outliers contribute over-proportionally to total Stress. MDS configuration (Figure 3 – a configuration plot with bubbles) does not represent all proximities equally well. Jeleniogorski (3) is one of most highly rated districts in the province in terms of tourism attractiveness. In the configuration plot with bubbles, this district lies near the anti-pattern object (the worst object). As the value of the HHI_p index increases, the ability of multidimensional scaling to represent real relationships between objects deteriorates.

Fig. 3: The results of MDS (procedure 13) of 31 objects in terms of tourism attractiveness

Evaluation of tourism attractiveness of Polish provinces (symbolic-to-symbolic approach)

In the second application we find the optimal solution for the symbolic-to-symbolic MDS approach. The dataset `data_symbolic_interval_polish_voivodships` comes from the `clusterSim` package. Tourism attractiveness of Polish provinces in 2016 is evaluated using a dataset obtained in two steps.

Step 1. A dataset containing 9 metric variables describing tourism attractiveness for 380 districts was created. Three variables x4, x5 i x6 can be treated as destimulants. All other variables are stimulants.

Step 2. The data for districts were aggregated at province level yielding a set of interval-valued data. The lower bound of the interval for each variable was obtained by calculating the first quartile based on district data. The upper bound of the interval was calculating the third quartile. The final dataset contains data about 18 objects (16 provinces, plus the pattern and anti-pattern objects) described by 9 interval-valued variables.

18 normalizations methods (see Table 2) and two optimization methods (`"MM","BFGS"`) are used for selecting the optimal MDS procedure (with $I\text{-}scal$ algorithm). The results of the optimal MDS

procedure (5: n2 normalization method, "MM" optimization method), obtained by means of Script 4 from the Appendix, for 18 objects ranked in terms of tourism attractiveness are presented on Figure 4.

Fig. 4: The results of multidimensional scaling (procedure 5) of 18 objects in terms of tourism attractiveness

Figure 4 ($I\text{-}dist$ diagram and $I\text{-}Stress$ plot) confirms the correctness of the MDS results (Configuration plot). Objects located closer to the pattern of development are characterized by a higher level of tourism attractiveness.

For comparison with the best MDS procedure (5), we include the results from one of the worst procedures (12), in terms of the HHI index. These results can be obtained by running Script 5 from the Appendix, with changes in lines 3-5 in relation to script 4 and in the $I\text{-}dist$ diagram.

The results of multidimensional scaling for procedure 12 are presented in Figure 5.

Fig. 5: The results of multidimensional scaling (procedure 5) of 18 objects in terms of tourism attractiveness

Figure 5 ($I\text{-}Stress$ plot) shows that Lubuskie (4), the pattern object (17) and Zachodniopomorskie (16) contribute most to overall $I\text{-}Stress$ (57.68%). It also shows (see Figure 5 – $I\text{-}dist$ diagram) that some points (upper distances between Zachodniopomorskie (16) and the pattern object (17); the pattern object (17) and Lubuskie (4); the lower distance between Zachodniopomorskie (16) and Podkarpackie (9)) are outliers. These outliers contribute over-proportionally to total $I\text{-}Stress$. MDS configuration (Figure 5 – Configuration plot) does not represent all proximities equally well. Zachodniopomorskie (16) is the most highly rated province in terms of tourist attractiveness. However, in Figure 5 (Configuration plot) it lies further away from the pattern object than Lubuskie (4). As the value of the HHI_p index increases, the ability of multidimensional scaling to represent real relationships between objects deteriorates.

Summary

The article proposes a method for selecting the optimal MDS procedure for classical metric and interval-valued data. In the classic-to-classic approach the best MDS procedure is selected by choosing an optimal combination of normalization methods, distance measures and scaling models based on the metric data matrix. In the symbolic-to-classic approach the best MDS procedure is selected by choosing an optimal combination of normalization methods, distance measures for interval-valued

data and scaling models based on an interval-valued data table. In the symbolic-to-symbolic approach the best MDS procedure is selected by choosing an optimal combination of normalization and optimization methods carried out on the basis of the interval-valued data table.

The optimal MDS procedure was selected by applying two criteria implemented in the `mdsOpt` package: Kruskal's $Stress$-1 fit measure and the Hirschman-Herfindahl HHI index (in the classic-to-classic and symbolic-to-classic approaches) and the $I\text{-}Stress$ fit measure and the HHI index (in the symbolic-to-symbolic approach).

In step 6 the maximum acceptable value of the fit measures $Stress$-1 and $I\text{-}Stress$ were arbitrarily chosen. It is not determined how much the error distribution for each object may deviate from the uniform distribution. In the case of MDS procedures for which $Stress\text{-}1 \leq cs$ ($I\text{-}Stress \leq cs$) the one with $min\{HHI_p\}$ is selected. This constraint does not essentially limit the presented proposal, as additional acceptability criteria, such as the Shepard diagram (De Leeuw and Mair (2015)) and Stress plot or $I\text{-}dist$ diagram and $I\text{-}Stress$ plot confirm the correctness of the MDS results.

Abstract

One of the stages in cluster analysis, carried out on the basis of metric data (interval, ratio), is the choice of variable normalization method. This paper presents the proposal of two procedures (for clustering algorithms based on distance matrix and data matrix), which allows for the isolation of the groups of normalization methods that lead to similar clustering results. The proposal can reduce the problem of choosing the normalization method in cluster analysis. The results are illustrated via simulation study and empirical example with application of clusterSim package and R program.

Keywords: Normalization of Variables, Cluster Analysis, Real Estate Market, Clustersim

Introduction

The normalization of variables in the statistical multivariate analysis is carried out when the variables describing the analyzed objects are measured on metric scales (interval or ratio). The characteristics of measurement scales were discussed e.g. in the studies by (Stevens (1946); Walesiak (2011), pp. 13-16). The purpose of normalization is to achieve the comparability of variables.

The comparison of normalization methods can be analyzed from the perspective of a particular statistical method application in a multivariate analysis. In a situation where methods of cluster analysis, multidimensional scaling, linear ordering based on aggregate measures are used in empirical studies, metric variables must be brought to comparability through normalization transformations. Other methods of statistical multivariate analysis do not require prior normalization transformation.

For the purposes of cluster analysis Milligan and Cooper (1988) conducted simulation studies discussing the influence of variable normalization method choice on exploring class structure (6 normalization methods from Table 1 were used: n1, n4, n6, n7, n8, n10). Similar studies, based on real data sets, were carried out by Schaffer and Green (1996).

The presented article follows a different approach. The study covers 18 variable normalization methods available in the `data.Normalization` function of `clusterSim` package (Walesiak and Dudek (2019)). The overview of variable normalization methods is presented in the study by Walesiak (2014). Two research procedures were suggested, which allows for the isolation of the groups of normalization methods that lead to similar clustering results. The presented proposals can reduce the problem of choosing the normalization method in cluster analysis.

Cluster Analysis For Metric Data – General Procedure

The general procedure used in cluster analysis of the set of objects is as follows (see e.g. Milligan (1996), pp. 342-343; Walesiak (2004)):

a) based on metric data and distance matrix:

$$P \rightarrow A \rightarrow X \rightarrow [x_{ij}] \rightarrow N \rightarrow D \rightarrow K \rightarrow NC \rightarrow V \rightarrow I, \quad (1)$$

where: P – choice of research problem in cluster analysis,
A – selection of objects to cluster,
X – selection of variables,
$[x_{ij}]$ – collecting data and the construction of data matrix (x_{ij} – value for *j*-th variable for *i*-th object),
N – choice of variable normalization method (z_{ij} – normalized value for *j*-th variable for *i*-th object),
D – selection of distance measure and the construction of distance matrix $[d_{ik}]$,
K – selection of clustering method,
NC – determining the number of clusters,
V – validation of clustering results,
I – interpretation and profiling of clusters.

b) based on metric data and normalized data matrix:

$$P \rightarrow A \rightarrow X \rightarrow [x_{ij}] \rightarrow N \rightarrow K \rightarrow NC \rightarrow V \rightarrow I, \quad (2)$$

Among the basic cluster analysis methods, based on distance matrix, the following are included: agglomerative and deglomerative hierarchical methods, *k*-medoids method (pam), spectral clustering method and *k*-means method for the data matrix based methods. The characteristics of the above-mentioned methods is provided e.g. in the studies by Anderberg (1973), Kaufman and Rousseeuw (1990), Gordon (1999), Ng, Jordan and Weiss (2002), Everitt *et al.* (2011). These methods are available in the following packages: `cluster` (Maechler *et al.* (2019)) – functions: `agnes`, `diana` and `pam`; `stats` (R Core Team (2019)) – functions `kmeans` and `hclust`; `clusterSim` (Walesiak and Dudek (2019)) – function `speccl`; `kernlab` (Karatzoglou, Smola and Hornik (2019)) – function `specc`.

Normalization of variables

The choice of variable normalization method remains one of the cluster analysis stages carried out based on metric data. The purpose of variable normalization is their comparability by means of depriving the measurement results of values and unifying their orders of magnitude. The first aim of normalization is unequivocal. It constitutes the sine qua non condition of normalization. The second aim is not unequivocal, hence it allows various solutions in this matter. The unification of magnitude orders is obtained e.g. by the unification of all variable values in terms of variability measured by standard deviation (median absolute deviation for positional measures) or by means of ensuring range stability for the normalized values of variables. In general terms, the unification of magnitude orders is obtained by introducing the uniformly specified zero value for all variables (A_j parameter in formula (3)), to be followed by rescaling variable values (B_j in formula (3)).

Table 1 presents the normalization methods of linear transformation (see e.g. Jajuga and Walesiak (2000), pp. 106-107; Zelias (2002), p. 792):

$$z_{ij} = b_j x_{ij} + a_j = \frac{x_{ij} - A_j}{B_j} \; (b_j > 0), \quad (3)$$

where: x_{ij} – value for *j*-th variable for *i*-th object, z_{ij} – normalized value for *j*-th variable for *i*-th object, A_j – shift parameter to arbitrary zero for *j*-th variable, B_j – scale parameter for *j*-th variable, $a_j = -A_j/B_j$, $b_j = 1/B_j$ – parameters for *j*-th variable presented in Table 1.

Column 1 in Table 1 presents the type of normalization method adopted as the function `data.Normalization` of `clusterSim` package (Walesiak and Dudek (2019)):

```
data.Normalization(x,type="n0",normalization="column")
```

where: `x` – vector, matrix or dataset,
`type` – type of normalization (see column 1 in Table 1),
`"n0"` – without normalization, `"column"` – normalization by variable, `"row"` – normalization by object.

Table 1: Normalization methods

Type	Method of normalization	Parameter		Measurement scale	
		b_j	a_j	before normalization	after normalization
n1	Standardization	$1/s_j$	$-\bar{x}_j/s_j$	ratio or interval	interval
n2	Positional standardization	$1/mad_j$	$-med_j/mad_j$	ratio or interval	interval
n3	Unitization	$1/r_j$	$-\bar{x}_j/r_j$	ratio or interval	interval
n3a	Positional unitization	$1/r_j$	$-med_j/r_j$	ratio or interval	interval
n4	Unitization with zero minimum	$1/r_j$	$\min_i\{x_{ij}\}/r_j$	ratio or interval	interval
n5	Normalization in range $[-1;1]$	$\frac{1}{\max_i\lvert x_{ij}-\bar{x}_j\rvert}$	$\frac{-\bar{x}_j}{\max_i\lvert x_{ij}-\bar{x}_j\rvert}$	ratio or interval	interval
n5a	Positional normalization in range $[-1;1]$	$\frac{1}{\max_i\lvert x_{ij}-med_j\rvert}$	$\frac{-med_j}{\max_i\lvert x_{ij}-med_j\rvert}$	ratio or interval	interval
n6	Quotient transformations	$1/s_j$	0	ratio	ratio
n6a		$1/mad_j$	0	ratio	ratio
n7		$1/r_j$	0	ratio	ratio
n8		$1/\max_i\{x_{ij}\}$	0	ratio	ratio
n9		$1/\bar{x}_j$	0	ratio	ratio
n9a		$1/med_j$	0	ratio	ratio
n10		$1\Big/\sum_{i=1}^{n} x_{ij}$	0	ratio	ratio
n11		$1\Big/\sqrt{\sum_{i=1}^{n} x_{ij}^2}$	0	ratio	ratio
n12	Normalization	$\frac{1}{\sqrt{\sum_{i=1}^{n}\left(x_{ij}-\bar{x}_j\right)^2}}$	$\frac{-\bar{x}_j}{\sqrt{\sum_{i=1}^{n}\left(x_{ij}-\bar{x}_j\right)^2}}$	ratio or interval	interval
n12a	Positional normalization	$\frac{1}{\sqrt{\sum_{i=1}^{n}\left(x_{ij}-med_j\right)^2}}$	$\frac{-med_j}{\sqrt{\sum_{i=1}^{n}\left(x_{ij}-med_j\right)^2}}$	ratio or interval	interval

`n13`	Normalization with zero being the central point	$\frac{1}{r_j/2}$	$-\frac{m_j}{r_j/2}$	ratio or interval	interval

$\bar{x}_j$ – mean for *j*-th variable, s_j – standard deviation for *j*-th variable, r_j – range for *j*-th variable, $m_j = \left(\max_i\{x_{ij}\} + \min_i\{x_{ij}\}\right)/2$ – mid-range for *j*-th variable, $med_j = \underset{i}{med}(x_{ij})$ – median for *j*-th variable, $mad_j = \underset{i}{mad}(x_{ij})$ – median absolute deviation for *j*-th variable.

Source: authors' compilation based on the studies by: Anderberg (1973); Borys (1978); Grabinski (1992), pp. 35-38; Jajuga (1981); Jajuga and Walesiak (2000); Milligan and Cooper (1988); Mlodak (2006); Rybaczuk (2002), p. 147; Walesiak (2002), p. 19; Walesiak (2014), pp. 364-365; Walesiak (2018).

Table 1 presents the normalization formulas according to variables. Analogical formulas can be presented for normalization by objects. Normalization by objects is founded when all variables are expressed in the same unit of measurement. It is true in case of e.g. structural studies. Further discussion will refer to the normalization by variables.

All the discussed normalization methods, being linear transformations of each variable (separately), retain the skewness and kurtosis of the distribution of variables. In addition, for each pair of variables all normalization methods retain the value of Pearson product-moment correlation coefficient (see Jajuga and Walesiak (2000), p. 111).

Research procedure allowing the isolation of the groups of normalization methods leading to similar clustering results of the set of objects

In the cluster analysis, carried out on the basis of distance matrix, the research procedure which allows isolating the groups of variable normalization methods that lead to similar clustering results of the set of objects covers the following steps:

1. The following stages are carried out in accordance with the general cluster analysis procedure $P \to A \to X \to [x_{ij}] \to N$. All acceptable methods presented in Table 1 are used in the normalization of variables (18 normalization methods are possible for ratio variables, whereas for interval variables – 10 normalization methods).

Table 2: Distance measures for metric (interval, ratio) data

Name	Distance d_{ik}	Range	Allowed normalization	Package (function)
Minkowski $p \geq 1$	$\sqrt[p]{\sum_{j=1}^{m} \lvert z_{ij} - z_{kj} \rvert^p}$	$[0; \infty]$	n1-n13	`stats` (`dist`)
Manhattan $p = 1$	$\sum_{j=1}^{m} \lvert z_{ij} - z_{kj} \rvert$	$[0; \infty]$	n1-n13	`stats` (`dist`)
Euclidean $p = 2$	$\sqrt{\sum_{j=1}^{m} (z_{ij} - z_{kj})^2}$	$[0; \infty]$	n1-n13	`stats` (`dist`)
Chebyshev (maximum) $p \to \infty$	$\max_j \lvert z_{ij} - z_{kj} \rvert$	$[0; \infty]$	n1-n13	`stats` (`dist`)
GDM1 Walesiak (2002); Jajuga, Walesiak and Bak (2003)	$\frac{1}{2} - \frac{\sum_{j=1}^{m} a_{ikj} b_{kij} + \sum_{j=1}^{m} \sum_{\substack{l=1 \\ l \neq i,k}}^{n} a_{ilj} b_{klj}}{2\left[\sum_{j=1}^{m} \sum_{l=1}^{n} a_{ilj}^2 \cdot \sum_{j=1}^{m} \sum_{l=1}^{n} b_{klj}^2\right]^{0,5}}$ $a_{ipj} = x_{ij} - x_{pj}$ for $p = k, l$ $b_{krj} = x_{kj} - x_{rj}$ for $r = i, l$	$[0; 1]$	n1-n13	`clusterSim` (`dist.GDM`)

Bray-Curtis Bray and Curtis (1957); Cormack (1971), p. 367	$\frac{\sum_{j=1}^{m}\lvert z_{ij}-z_{kj}\rvert}{\sum_{j=1}^{m}\lvert z_{ij}+z_{kj}\rvert}$	[0; 1]	n6-n11	`clusterSim` (`dist.BC`)
Canberra Lance and Williams (1966)	$\sum_{j=1}^{m}\frac{\lvert z_{ij}-z_{kj}\rvert}{\lvert z_{ij}+z_{kj}\rvert}=\sum_{j=1}^{m}\frac{\lvert x_{ij}-x_{kj}\rvert}{\lvert x_{ij}+x_{kj}\rvert}$	[0; 1]	n6-n11	`stats` (`dist`)

$i, k, l = 1 \dots, n$ – object number, n – number of objects, $j = 1, \dots, m$ – variable number, m – number of variables, $z_{ij}(z_{kj}, z_{lj})$ – normalized value for j-th variable for i-th (k-th, l-th) object.
Source: authors' compilation.

2. For all normalized data matrices $[z_{ij}^{r}]$ distances between objects are calculated (see e.g. distance measures in Table 2) and grouped in distance matrices $[d_{ik}^{r}]$ (r – number of normalization method). 18 distance matrices are obtained for ratio variables and 10 distance matrices for interval variables. Canberra distance measure does not depend on B_j scale parameter (Pawelek (2008), p. 94). Therefore, the acceptable normalization methods n6-n11 do not change this distance value. Canberra distance will not be discussed further in the article.

3. Cluster analysis is carried out for each distance matrix $[d_{ik}^{r}]$ in the clustering from 2 to u classes (maximum u is $n-1$). One of many classification methods based on distance matrix can be applied in this case (see e.g. Everitt *et al.* (2011)). Next the compatibility of clustering results, obtained for different normalization methods using the adjusted Rand index is compared in pairs for the same number of clusters (Hubert and Arabie (1985), p. 198):

$$R_{rs,c}=\frac{\sum_{p,q}\binom{n_{pq}}{2}-\sum_{p}\binom{n_{\cdot p}}{2}\sum_{q}\binom{n_{q\cdot}}{2}/\binom{n}{2}}{\frac{1}{2}\left[\sum_{p}\binom{n_{\cdot p}}{2}+\sum_{q}\binom{n_{q\cdot}}{2}\right]-\sum_{p}\binom{n_{\cdot p}}{2}\sum_{q}\binom{n_{q\cdot}}{2}/\binom{n}{2}} \tag{4}$$

where: r, s – numbers of normalization methods,

$c = 2, \dots, u$, c – number of classes, n – number of classified objects,
C_{rc}, C_{sc}– clustering of A set of objects into c classes for r and s normalization method,
$p = 1, \dots, c$ – class number in C_{rc} clustering, $q = 1, \dots, c$ – class number in C_{sc} clustering,
n_{pq} – number of objects covered by p and q classes simultaneously in C_{rc} and C_{sc} clusterings,
$n_{\cdot p}$ – number of objects in p class for C_{rc} clustering,
$n_{q\cdot}$ – number of objects in q class for C_{sc} clustering.

The adjusted Rand index $R_{rs,c}$ takes values in the interval $[-\infty; 1]$. The comparison results are averaged for the clustering results from 2 to u classes:

$$\bar{R}_{rs}=\frac{\sum_{c=2}^{u}R_{rs,c}}{u-1} \tag{5}$$

The adjusted Rand index is available in `classAgreement` function of `e1071` library (Meyer et al. (2019)).

4. For the cluster analysis purposes the averaged values of adjusted Rand index are transformed into distances:

$$d_{rs}=1-\bar{R}_{rs} \tag{6}$$

Cluster analysis (using the same classification method as in step 3) is carried out on the basis of distance matrix $[d_{rs}]$, which allows isolating the groups of variable normalization methods that lead to similar clustering results. Due to the possibility of graphic presentation of the normalization methods' classification results in a dendrogram form, agglomeration hierarchical methods are used in the article (`hclust` function of `stats` package).

The observations regarding normalization methods for GDM1 distance measure and Bray-Curtis distance are presented in Table 3.

Table 3: Groups of normalization methods resulting in identical distances in the distance matrix determined using GDM1 distance and Bray-Curtis distance

Groups of normalization methods	Normalization methods	
	GDM1 distance	Bray-Curtis distance
A	n1, n6, n12	–
B	n2, n6a	–
C	n3, n3a, n4, n7, n13	–
D	n9, n10	n9, n10

Source: authors' compilation.

The identical distance matrices for A, B, C and D groups of methods result from the fact that GDM1 measure does not depend on the shift parameter A_j applied in normalization methods. Moreover, multiplying the normalized values by the constant changes neither GDM1 nor Bray-Curtis distance.

It was demonstrated in the study of Pawelek (2008), p. 94 that the values of Minkowski distance measures (Manhattan, Euclidean, Chebyshev) do not depend on A_j shift parameter applied in the normalization methods. Therefore, identical distance matrices are obtained for the groups of normalization methods presented in Table 4.

Table 4: The groups of normalization methods resulting in identical distance matrices for Minkowski distances

Groups of normalization methods	Normalization methods	
	N1	N2
A	n1, n6	n1, n6, n12*
B	n2, n6a	n2, n6a
C	n3, n3a, n4, n7	n3, n3a, n4, n7, n13*
D	–	n9, n10*

** – for this normalization method distance matrix is multiplied by a constant.*
N2 – after dividing distances in each distance matrix by the maximum value.

In the cluster analysis, carried out on the basis of distance matrix, the research procedure, which allows isolating the groups of variable normalization methods that lead to similar clustering results of the set of objects, covers the below presented steps:

1. The following stages are carried out in accordance with the general cluster analysis procedure $P \rightarrow A \rightarrow X \rightarrow [x_{ij}] \rightarrow N$. All acceptable methods presented in Table 1 are used in the normalization of variables (18 normalization methods are possible for ratio variables, whereas for interval variables – 10 normalization methods).

2. For each normalized data matrix $[z_{ij}^r]$ cluster analysis is carried out (e.g. using k-means method) from 2 to u classes (maximum u is $n-1$). Next the compatibility of classification results, obtained for different normalization methods using the adjusted Rand index $R_{rs,c}$, is compared in pairs according to formula (4). The comparison results are averaged for the clustering results from 2 to u classes in accordance with (5).

3. For the cluster analysis purposes the averaged values of adjusted Rand index are transformed into distances according to formula (6). Cluster analysis (using classification methods based on dis-

tance matrix) is conducted on the basis of distance matrix $[d_{rs}]$, which allows isolating the groups of variable normalization methods leading to similar clustering results of the set of objects. Due to the possibility of graphic presentation of the normalization method classification results in a dendrogram form the agglomeration hierarchical methods are used in the article.

For the *k*-means classification method the identical results of the clustering results of the set of objects are obtained for the groups of normalization methods presented in Table 5.

Table 5: Groups of normalization methods leading to identical clustering results of the set of objects for *k*-means method

Groups of normalization methods	Normalization methods
A	n1, n6, n12
B	n2, n6a
C	n3, n3a, n4, n7, n13
D	n9, n10

Source: authors' compilation.

In case of *k*-means method the identical clustering results of the set of objects for the groups of A, B, C and D normalization methods result from applying the criterion of minimizing the inter-class covariance matrix trace (see formula 5.9 in the study by Everitt *et al.* (2011), p. 114).

An application to Boston data

The set of data covering the real estate market in Boston is accessible at UCI Machine Learning Repository: Housing Data Set. Moreover, the set of data is available in `MASS` (Ripley (2019)) package. The set covers 14 variables. The study uses 12 metric variables. The left out variables are the second ZN (proportion of residential land zoned for lots over 25,000 sq. ft.) and the fourth one CHAS (Charles River dummy variable, 1 if tract bounds river; 0 otherwise):

CRIM – per capita crime rate by town,
INDUS – proportion of non-retail business acres per town,
NOX – nitric oxides concentration (parts per 10 million),
RM – average number of rooms per dwelling,
AGE – proportion of owner-occupied units built prior to 1940,
DIS – weighted distances to five Boston employment centers,
RAD – index of accessibility to radial highways,
TAX – full-value property-tax rate per $10,000,
PTRATIO – pupil-teacher ratio by town,
B – $1000(B_k - 0.63)^2$ where B_k is the proportion of blacks by town,
LSTAT – % lower status of the population,
MEDV – median value of owner-occupied homes in $1000's.

The research procedure from part 4 was used in the article (cluster analysis carried out based on the normalized data matrix using *k*-means method – see script from Appendix) allowing to isolate the groups of variable normalization methods leading to similar clustering results of the set of objects.

The measurement of variables on a ratio scale allows the application of all normalization methods (hence the study covered 18 methods). Due to the fact that the groups of A, B, C and D normalization methods give, for *k*-means method, identical clustering results of the set of objects (see Table 5) further analysis covers the first methods of the groups indicated (n1, n2, n3, n9), as well as the other methods (n5, n5a, n8, n9a, n11, n12a).

The groups of variable normalization methods leading to similar clustering results of the set of objects are presented by means of a dendrogram on Figure 1.

Fig. 1: The dendrogram of normalization methods similarity in cluster analysis of 506 real estates in Boston using *k*-means method

Source: authors' compilation using R program.

Five groups of normalization methods were isolated on the basis of the dendrogram, which lead to similar clustering results of the set of objects (normalization methods giving identical cluster analysis results are presented in brackets):

group 1 (3 methods): (n2, n6a), n9a
group 2 (3 methods): (n9, n10), n11
group 3 (4 methods): (n1, n6, n12), n12a
group 4 (1 method): n8
group 5 (7 methods): (n3, n3a, n4, n7, n13), n5, 5a

The indices for determining the relevant number of clusters in a data set presented in packages `nbClust` (Charrad *et al.* (2014); Charrad *et al.* (2015)) and `clusterSim` (Walesiak and Dudek (2019)) can be used in the selection of the number of clusters.

In the analyzed case the significant differences between cluster analysis results occur in case of normalization methods from different groups. The presented proposal allows reducing the problem of variable normalization method choice.

The results of simulation analyses

Data sets are generated in nine different scenarios (see Table 6) using R program and packages: `clusterSim` (Walesiak and Dudek (2019)), `clusterGeneration` (Qiu and Joe (2015)), `sn` (Azzalini (2019)), `cluster` (R Core Team (2019)). Simulation models differ in the number of clusters, the number of objects, the number of outliers, the number of variables, the number of noisy (irrelevant) variables, and the density and shape of clusters (data are generated from different distributions).

The research procedure discussed in section 4 (cluster analysis carried out based on the normalized data matrix using k-means method) was used in simulation analyses for each model from Table 6:

1. Normalization of variables was carried out using 10 methods: n1, n2, n3, n5, n5a, n8, n9, n9a, n11, n12a.

2. For each normalized data matrix $\left[z_{ij}^{r}\right]$ (r – the number of normalization method) cluster analysis is carried out using k-means method from 2 to u cluster ($u = 3\sqrt{n}$). Next the compatibility of clustering results, obtained for different normalization methods, using the adjusted Rand index $R_{rs,c}$ is compared in pairs according to formula (4). The comparison results are averaged for the clustering results from 2 to $u = 3\sqrt{n}$ clusters in accordance with (5).

3. For the cluster analysis purposes the averaged values of adjusted Rand index are transformed into distances according to formula (6).

4. Steps 1 – 3 are repeated 20 times (twenty realizations were generated from each model). Results of twenty matrices $[d_{rs}]$ are averaged $\left[\bar{d}_{rs}\right]$.

5. Cluster analysis (using the group average method) is carried out on the basis of distance matrix $\left[\bar{d}_{rs}\right]$, which allows for the isolation of the groups of variable normalization methods that lead to similar clustering results.

Table 6: Characteristics of data sets used in simulations

No.	Name	Distribution	*nc*	*no*	*o*	*v*	*nv*	Parameters	R package (function)
1	sM	Multivariate normal	5	*A*	0	2	1	Centroid of clusters: (10; 10), (10; 20), (15; 15), (20; 10), (20; 20), $\Sigma = \begin{bmatrix} 0.5 & 0.3 \\ 0.2 & 0.5 \end{bmatrix}$	clusterSim (cluster.Gen)
2	eM	Multivariate normal	3	*B*	10	3	1	Centroid of clusters: (1.5, 6; –3), (3; 12; –6), (4.5; 18; –9), Σ: $\sigma_{jj} = 1 (1 \leq j \leq 3)$ $\sigma_{12} = \sigma_{13} = -0.9$, $\sigma_{23} = 0.9$	clusterSim (cluster.Gen)
3	fM	Multivariate normal	4	*C*	20	2	1	Centroid of clusters: (10; 10), (15; 19), (25; 10), (15; 1), $\Sigma_1 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$, $\Sigma_2 = \begin{bmatrix} 1 & -1 \\ -1 & 1 \end{bmatrix}$, $\Sigma_3 = \begin{bmatrix} 1 & 0.33 \\ 0.33 & 1 \end{bmatrix}$, $\Sigma_4 = \begin{bmatrix} 1 & 0.22 \\ 0.22 & 1 \end{bmatrix}$	clusterSim (cluster.Gen)
4	bDS	Multivariate normal	4	*D*	15	3	1	Degree of separation = 0.93 (Qiu and Joe (2006))	clusterGeneration (genRandomClust)
5	sDS	Multivariate normal	5	*E*	0	5	0	Degree of separation = 0.36 (Qiu and Joe (2006))	clusterGeneration (genRandomClust)
6	sT	Multivariate skew-*t* distribution	3	*F*	0	2	0	Ω ($\omega_{jj} = 1$, $\omega_{jl} = 0.5$), $\alpha = 0.5$, 6 degrees of freedom	sn (rmst)
7	sC	Skew Cauchy distribution	3	*G*	0	2	0	Ω ($\omega_{jj} = 1$, $\omega_{jl} = 0.3$), $\alpha = 0.2$, 7 degrees of freedom	sn (rmsc)
8	u	Uniform distribution	3	*H*	0	3	0	Uniform distribution in ranges (-3,-5,-6) ÷ (-2,-1,-4); (0,-3,1) ÷ (2,6,3); (3,2.5,2) ÷ (7, 4.5, 8)	stats (runif)
9	eC	Mixed distributions	11	*I*	0	2	0	Four clusters from multivariate normal distribution, two "bulls-eye", three elongated clusters from multivariate normal distribution, two "worms" clusters	clusterSim (cluster.Gen, shapes.bulls.eye, shapes.worms)

nc – the number of clusters, no – the number of objects, o – the number of outliers, v – the number of variables, nv – the number of noisy variables, Σ – covariance matrix, Ω – a symmetric positive-definite matrix of dimension (d, d)*;* α *– a numeric vector of length* d *which regulates the slant of the density,* $d = length(alpha)$*;* $A = (40, 40, 40, 40, 40)$*;* $B = (50, 50, 50)$*;* $C = (35, 40, 45, 50)$*;* $D = (20, 30, 40, 65)$*;* $E = (35, 35, 35, 35, 35)$*;* $F = (100, 100, 100)$*;* $G = H = (100, 100, 100)$*;* $I = (15, 15, 15, 15, 160, 160, 15, 15, 15, 40, 40)$*. Models: sM – simpleMultivariate, eM – elongatedMultivariate, fM – fancyMulivariate, bDS – bigDegreeOfSeparation, sDS – smallDegreeOfSeparation, sT – skewT, sC – skewCauchy, u – uniff, eC – elevenClusters.*
Source: authors' compilation.

The groups of variable normalization methods leading to similar clustering results of the set of objects are presented by dendrograms on Figures 2 and 3 (for data sets generated via nine models from Table 6 and average model).

Fig. 2: Dendrograms of variable normalization methods leading to similar clustering results for data sets generated via models 1 6 from Table 6

Source: authors' compilation using R program

Fig. 3: Dendrograms of variable normalization methods leading to similar clustering results for data sets generated via models 7 9 from Table 6 and average model
Source: authors' compilation using R program

The following conclusions can be drawn from the results presented on Figures 2 and 3:

- we can isolate three groups of normalization methods, based on dendrogram for data set "all", which lead to similar clustering results of the set of objects: (n1, n3, n5, n5a, 12a); (n8, n9, n9a, n11); (n2),
- similar clustering results of the set of objects for data sets generated for nine models from Table 6 we receive for normalization methods n1 and n12a,
- similar clustering results of the set of objects for data sets generated for nine models from Table 6 we receive for normalization methods n3, n5 and n5a,
- for normalization method n2 we obtain significantly different cluster analysis results.

Final Remarks

The article presents the proposal of two research procedures which allow reducing the problem of variable normalization method choice in cluster analysis carried out on the basis of distance matrix and normalized data matrix.

The normalization methods were identified for GDM1 and Bray-Curtis distance measures, which give identical distance matrices and thus identical clustering results of the set of objects. Analogical observations were presented for Minkowski distance measures (Manhattan, Euclidean, Chebyshev).

The groups of normalization methods, leading to identical clustering results of the set of objects, were identified for the k-means method.

In practice, without taking into account the proposed procedures, making a choice of normalization method of variables in cluster analysis for metric data we had the list of 18 methods to choose from (see Table 1). Considerations included in Table 3, 4 and 5 reduce this number to 10 methods of normalization.

The choice still becomes arbitrary and difficult to justify. The proposed approach does not solve the problem completely, but it can reduce the possibilities of choosing the normalization method. De facto we can choose as many normalization methods, as there are separate groups of them (normalization methods located in the same groups give identical or similar clustering results).

The proposed reduction of normalization methods used in simulation studies could have large impact of complexity of simulations studies eliminating redundant paths. It also explains why sometimes for various normalization methods could give identical results

The research results were illustrated by simulation study and two empirical examples using the proposed R program scripts.

Abstract

This article substantiates importance of public health information policy in the conditions of forming and implementing the state information policy in the society through informatization of medical services. In addition, the need in reforming current health care system by introducing an effective information policy to improve the accessibility and quality of health care in Ukraine was proved. The purpose of the article is to determine the prospects for the development of public information policy in health care system of Ukraine through informatization. The methodological basis of the study is data obtained from the World Health Organization, Global Observatory on eHealth, Stanford University Medical Center, National Health Service of Ukraine, Ministry of Health of Ukraine, State Statistics Service of Ukraine. It was proved that Ukraine has one of the worst indicators among health care systems in the European region countries due to low life expectancy, high mortality rate, low GDP per capita, insufficient public funding for health care. The main targets of developing public information policy in health care of Ukraine were defined: electronic prescription, verification of the central database of the electronic health care system, online dashboard, visualized information, stats cards, electronic medical cards. The optimal ways of informing the Ukrainian healthcare sector were proposed: introduction of electronic patient register; equipping workplaces with electronic information systems, development of information technology infrastructure in medicine, organization of effective electronic data exchange, integration of information systems of health care facilities with each other, with other information products and systems, improving information support of management activities in health care facilities.

Keywords: Public Information Policy, Health Care Sector, Informatization, E-Medicine, Ehealth

Introduction

The peculiarities of social development in the conditions of globalization processes and features of the information space require the strengthening of the role of a state in providing objective, reliable information guaranteeing the protection of the national information space. The state provides these functions through the conduct of public information policy. The public information policy provides a reasonable conceptual framework for examining issues at the national and regional levels. The effectiveness of information policy depends on the determined strategic country goals; the political, economic and defence situation in countries depend on the system of public administration that manages the information space. Ukraine is in dire need of further reform of the health care system and the reorientation of approaches to public administration and industry funding in order to improve the accessibility and quality of health care in the country through the implementation of effective information policies.

Analysis of recent research and publications. The issue of information technologies in the health care system has been subject to reserch in the scientific works of foreign researchers such as: Nik Azliza Nik Ariffin, Alwi Mohd Yunus and Dr. Zuhaida Che Embi (Azliza, Ariffin, Alwi Mohd Yunus and Zuhaida Che Embi, 2008), AizhanTursunbayevaab, MassimoFrancoa, ClaudiaPagliarib (Tursunbayevaab, Francoa and Pagliarib, 2017), Chaban, O. and Boyko, O. A. (Chaban and Boyko, 2019), Stepanov, V. Yu. (Stepanov, 2016) and others. The role of effective investment in the economic development of the country and the health sector are in particular devoted to the works of Orlova N., Marukhlenko O. (Orlova and Marukhlenko, 2018, Orlova and Kharlamova, 2014).

Marius Schönberger and Andrejs Čirjevskis identify information technology and information systems as an important economic factor for health care and highlight the most important success factors for health information projects (Schönberger and Čirjevskis, 2017).

Muhammad Anshari and Mohammad Nabil Almunawar's research focuses on e-health relationship management strategies that will help healthcare organizations improve their engagement with customers, avoid potential conflicts, and promote healthcare (Anshari and Mohammad Nabil Almunawar, 2012).

Patrik Pucer, Boštjan Žvanut and Damjan Vavpotič analyse the use of information technology in healthcare curricula, including e-learning. The best practices presented in scientific research prove that the use of modern information and communication technologies should be considered in the future as an important component of health education curricula (Pucer, Žvanut and Damjan Vavpotič, 2016).

The main features of modern economic modelling of health care and assessment of information and communication technologies, prospects of their development are presented in the works of Janneke P.C. Grutters, Tim Govers, Jorte Nijboer, Marcia Tummers, Gert Jan van der Wilt, Maroeska M. Rovers (Grutters, Govers, Nijboer, Tummers, Gert Jan van der Wilt, Rovers, 2019).

However, a significant number of problems related to peculiarities of the national model of public health policy remain sufficiently uncovered and are of great importance for the sustainable development of the country.

The purpose of the article is to determine the prospects for the development of public information policy in health care system of Ukraine through informatization.

The methodological basis of the study is data from the World Health Organization, Global Observatory on eHealth, Stanford University Medical Center, National Health Service of Ukraine, Ministry of Health of Ukraine, State Statistics Service of Ukraine.

Main Part of Research

The public health information policy aims at shaping the absolute priority of the value of human health and life in society. The public health information policy is to promote: a healthy lifestyle; proactive information and communication support for the development and implementation of the public health policy, changes in health care; the availability of information on the activities of health care entities, except for information with restricted access (Steliga, Semchuk, Roshak, Semkiv, Lelyuk-Wind and Ivanulak, 2011). The public health policy is implemented on the basis of the following principles: legality, cooperation, parity, openness, publicity, transparency and public opinion, historical continuity, sustainable development, objectivity, efficiency, accountability.

The public health information policy provides for the implementation and appliance of mechanisms:

- placement in the media of materials on social promotion of health, healthy lifestyles, development and implementation of the government health policy;
- regulation of the promotion of goods, services and conduct that adversely affect health;
- observance of objectivity and impartiality of information on health care and medical care (Verkhovna Rada of Ukraine, 2019).

National Health System is a set of human, financial, logistical, informational, educational and scientific resources aimed at preserving, restoring and strengthening health and preventing diseases, as well as a system of measures implemented on the territory of Ukraine by health care entities in accordance with their competence and authorities, determined by law, with the aim of preserving and restoring physiological and psychological functions, optimal performance and social activity of a person with the maximum biologically possible individual life expectancy.

Ukraine has one of the worst health systems in the European region. Ukraine ranks second in the European region in terms of mortality, which increased by 12.7%, while in the European Union, this figure fell by 6.7%. One of the key factors in this situation is the low economic development of the country. Ukraine's GDP is much lower per capita than even the lowest in the European Union (Fig.1). Given the economic crisis and the military conflict, the situation in 2015-2018 worsened.

Fig.1: GDP of Ukraine in 2015-2018, UAH

Source: (State Statistics Service of Ukraine, 2019)

Another major cause of underperformance is the fundamental shortcomings accumulated in the healthcare system. Healthcare expenditures accounted for an average of 51% of the total (about 4% of GDP). Private health expenditures in Ukraine in relation to public health were one of the highest in the EU and in Eastern Europe. The overwhelming majority of these expenditures (95%) were paid by households, and only 5% were from insurance payments, donor and international assistance. Budget expenditures mainly consisted of health care expenditures on salaries and utilities (about 75%) (Fig.2).

Fig.2: Health care expenditures in 2015-2018

Source: (Ministry of Health of Ukraine, 2019)

In such circumstances, there is very little financial capacity to actually provided services, that is, to treat patients, to purchase medicines and supplies, to upgrade technology funds, etc.

During 2015-2018, overall health care expenditures in Ukraine averaged 9% of GDP per year (approximately 5.9% from the state budget and about 2.4% from the private sector, mainly household expenditures), which is really not much different from the global and European trend. In the European region, overall health care spending is 8.9%, and in the world as a whole - 8.6%. However, due to low GDP, this per capita cost is only around US $ 200, which is significantly lower than the US average of US $ 3.340, which also includes Poland - US $ 809, Bulgaria - 612 US $ and Romania - US $ 476 (Ministry of Health of Ukraine, 2019).

The health budget is the lowest in comparison to other social sectors. The expenditures of the Ministry of Social Policy are two and a half times higher than the expenditures of the Ministry of Health (Fig. 3).

Fig. 3: Health expenditures in terms of other social spheres in 2015-2018, billion UAH

Source: (Ministry of Health of Ukraine, 2019)

Two-thirds of these expenditures are retirement benefits. The expenditures of the Ministry of Education and Science of Ukraine also exceed the expenditures of the Ministry of Health.

Thus, the Ukrainian health care system has the following characteristics:

- significant lag behind European countries in terms of life expectancy and mortality: in 2018, the difference in life expectancy in Ukraine and the European Union was almost ten years - 71.8 and 83.8, respectively;

- low GDP per capita, which does not provide the necessary level of health care expenditures and leaves patients without vital medical services and medicines;
- obsolescence and inefficiency of the health care system with rigid centralized management and funding procedures, which has led to a high level of corruption in all areas of the health care system, including procurement, education, attestation and employment of physicians, medical assistance for lack of a transparent state-guaranteed package of medical services.

International Experience in the Development of Health Information Policy

Developed countries (USA, Europe, Japan, Canada, and Australia) have integrated (nationwide) programs to inform their health systems. The main idea behind such programs is to integrate, in the final analysis, all of their components (information systems (ISs) of individual medical institutions, and further urban, district and regional - Regional Health Information Networks, Regional Health Information Organizations, Regional Health Information Management Systems) into a single IS of the whole country's health system, the so-called National Health Information Infrastructure, or the National Health Information Network. There are not many successful precedents of such IS in the world, because such a task is extremely difficult not only in technical, but also in organizational and financial terms, not to mention the complexity of creating medical information systems across the country.

Despite this, the number of projects in the field of Health Information Technologies (HIT) in the world is constantly increasing. In recent years, the field of development and implementation of IS medical facilities in the world has evolved. European organizations and commissions for information and communication technologies, which aim to integrate all national health information networks of EU countries and to provide for the population of these countries the action of a unified electronic health register (EHR) throughout the current European Union with national programs the only European Union e-health program that fulfils such priority tasks as standardization, provision of insurance coverage regardless of location, processing of medical information about the patient using information technology. EU investment in the e-health program, without relevant national programs, has already reached hundreds of millions of Euros (Chaban and Boyko, 2019).

A lot of work has been carried on creating common international standards in terms of storage, sharing and prompt access to medical data. ISO 13606-1: 2008 Health informatics has already been adopted: Electronic health record communication. Part 1: Reference model - Reference model for the transmission of electronic medical records. There is an active work on standardization of personal computer media of medical data (on smart cards, etc.). Therefore, medical information systems should also provide for the exchange of sensitive information using modern telecommunications.

An example of such a system, which accumulates modern IS design approaches and standards, is the Stanford Translational Research Integrated Database Environment (STRIDE) project, which aims to create a single centralized bank of biological and medical data used by physicians and researchers at Stanford University, its Stanford University Medical Center (SUMC), and the clinics and laboratories that are essential for its medical school (Eco Health of Ukraine, 2019). The project is based on current standards of modern IT. The main base of the project is the Stanford Center for Clinical Informatics, which belongs to the Stanford University School of Medicine's Office of Information Resources and Technology (IRT) (Chaban and Boyko, 2019).

In addition to building national information systems, the global community has experience in creating information systems internationally: Global Atlas and HealthMapper, which have been used by the World Health Organization (WHO) since the 1990s. The HealthMapper information system (containing demographic and health information, education data, community locations, roads, access to safe water) is used to monitor a range of infectious diseases in over 60 countries in all WHO regions.

WHO interprets e-Health as a cost-effective and reliable form of use of information and communication technologies in the interests of health and related industries, including health care

services, medical supervision, medical literature, medical education, health knowledge and research. E-Health will help address some of the important challenges facing health systems at national and regional levels due to demographic, epidemiological and socio-cultural changes.

Canadian health care system is one of the most effective in the world. The Canadian health care system requires that every Canadian, including children, have a special Health Card, which can at the same time be the identity card of their bearer. The introduction of a national electronic medical system involved the development of the Electronic Health Record - the process of collecting, storing and accessing an electronic patient card, in fact, the electronic health system of Canada. Citizens have a number of rights to receive information about any use of their data, the purpose of processing, and to challenge the methods of such processing.

Europe is the world leader in eHealth. Currently, almost all the EU Member States have developed eHealth strategies with defined goals and action plans, and there are already some developments in policy implementation. Leaders in the development of a regulatory framework adapted to the use of eHealth include such countries as the United Kingdom, Denmark, Estonia, Norway, Slovakia. Finland, France, Scotland, Sweden.

More than half of the UK clinics operate an electronic system that provides to any specialist within the system access to medical information. The Electronic Prescription Service in the UK is also being implemented as part of the Medicines Leave.

Denmark has developed an electronic patient record system. In France, a citizen's electronic medical card contains information about insurance and chronic illnesses. The patient's medical history and diagnostic results are stored in computer by the family doctor.

Health care in Sweden is decentralized, the laws are passed at the federal level, money is distributed only at the regional and municipal levels. Sweden spends only 2-3% of the budget allocated to health care to develop the IT solutions in medicine.

Since 2016, the introduction of electronic services in the medical field began in Germany. The patient records are stored electronically and in paper form. Family doctors have access to them. For these purposes, authorized persons (doctors) require secure access to patients' data, so they must be electronically identified using a special e-Arztausweis card.

The implementation of the national plan for the implementation of eHealth in Poland is vested in the Center for Health Information Systems, which reports to the Ministry of Health of Poland. All registers of existing health care establishments, pharmacies, laboratories, pharmaceutical companies, the central register of pharmacists, the register of doctors, nurses, other specialists in the medical field and medicines are collected on a single Platform of medical registers rejestrymedyczne.csioz.gov.pl

In most countries, it is possible to choose how to keep a record of your health (electronic or paper). Only in some countries, for example, in Finland, an electronic copy of the medical record is required. In Belgium, France, Italy, Spain, Switzerland the patient's consent to an electronic record of his or her health is required.

The analysis of the situation regarding confidentiality and protection of personal data in the EU countries and the European Economic Community concludes that in many countries the electronic health care system is managed by general law, including patient rights and data protection laws. Leaders who develop a regulatory framework adapted to the use of eHealth include the United Kingdom, Denmark, Estonia, Norway, Slovakia, Finland, France, Scotland, and Sweden (Stepanov, 2016).
In order to monitor the impact of IT on public health, WHO has initiated the creation of a Global Observatory on eHealth. One of its goals is to help improve healthcare by providing countries with strategic information on effective eHealth policies, organizations and standards, and promising investment directions. A series of publications by the Global Observatory address the question of

whether regulatory systems in the WHO Member States meet the requirements of protecting patient health information in the WHO.

According to the Global Observatory, 69% of countries have implemented, at least partially an electronic information system for registering births, deaths and causes of death: 58% of countries have initiated at least one eHealth initiative for monitoring and surveillance (using PS technology) of patients who require paediatric care; 42% of countries have developed a national health information policy or strategy (Stepanov, 2016).

Results

The main direction of modern information policy improvement in the context of integration into the world community is the transition of the state to online services, which will allow bringing services closer to the population, to ensure the democracy of the information society, to establish cooperation with electronic and print media. To achieve this goal, it is necessary to ensure efficient use of information resources in all spheres of activity, to modernize national information resources, to create the necessary conditions for the information and telecommunications infrastructure and technologies development.

At present, there is a set of issues to address the problems related to the implementation of information technology in medicine, which allows solving the most urgent ones concerning the practical medicine within the existing medical infrastructure and limited funding. Under current conditions, it is possible to use local medical informatics projects, and for a more global application, it is necessary to comply with unified requirements based on the application of world standards for the collection, storage, processing and exchange of the electronic version of medical information.

In order to keep up-to-date and accurate all the data stored in the central database of the electronic health care system, the National Health Service of Ukraine (NHSU) regularly takes steps to verify them. These processes are constantly being improved and new ones are being developed. In fact, the accuracy of the data in the system is a guarantee of the targeted use of public funds when paid to healthcare institutions under the contract with the NHSU. Regular verification of data is organized through several processes:

1. Deactivation of data on deceased patients, medical specialists, and other users in the system occurs according to the data of the State Register of Civil Status Acts of citizens in the last working week of each month. The Ministry of Justice's official data is uploaded to the electronic health system, verified with the CDB registry data and automatically deactivated according to a specific algorithm. As of 25.04.2019 191.595 such records were deactivated in the system according to this algorithm. Deactivation of data on medical specialists is made after approval by the Ministry of Health as the administrator of this register.

2. Online and offline deduplication prevents duplicate data from appearing in the system, detects and deactivates existing duplicate patient records, declarations, health professionals and specialists, as well as medical facilities. Online deduplication occurs in real time (24/7) when creating a new entry on the system. Offline deduplication of patient data and declarations is done using the automatic duplicate search and deactivation module. As of 25.04.2019, 450.537 such records were detected and deactivated in the electronic system. According to the results of the NHSU verification, the reports of medical providers and the recalculation of payments under the contract are refined.

3. Regularly, in accordance with the law, requests for action on the system data from identifiable applicants are reviewed. If necessary, data is deactivated, activated or deducted. Periodic decisions are also taken occasionally to take action on the data in the system based on the results of monitoring the implementation of contracts concluded with partner institutions. As of 25.04.2019, 2090 records have been deactivated in this electronic system. According to the verification results, payments were also recalculated (National Health Service of Ukraine, 2019).

Since April 2019, an updated API version 2.0, a system of interaction between the central database and medical information systems, to create a physician's electoral declaration has been functional. Advantages of API version 2.0 are the following:

- when creating and searching for a declaration, it is obligatory to indicate the individual tax number of the patient (if such a patient has a tax identification number (Individual tax ID);
- declarations for patients under 14 years old are optional, but may be specified for greater accuracy. If the Individual tax ID is not indicated, the appropriate marking (Individual tax ID is not indicated) is given and the series and number of the birth certificate are obligatory;
- for filing declarations of adults without Individual tax ID, an appropriate mark is affixed (Individual tax ID is missing) and it is obligatory to upload scanned documents with a mark that a person can take actions without Individual tax ID.

The list of data verification measures in the system is not exhaustive. At this time, the process of developing functionality to deactivate data created on the system during its testing, with errors, to prevent fraud (antifrod), etc., is on-going.

These measures are in the process of elaboration and are constantly being improved. Models and tools used for verification are also being reviewed.

Verification efforts are on-going to integrate the system with other state registers, which will allow data to be obtained from such registers.

The National Health Service of Ukraine pays great attention to the accuracy and relevance of all data in the system. An online dashboard has been launched by the National Health Service to help educate citizens about the scope of e-services to help analyse the dynamics of health care reform. The dashboard contains information about primary health care locations: an electronic location map with addresses and contact telephones, the distribution of facilities by region, the number of declarations of every physician in medical establishment, a distribution of declarations by age groups and doctor's specialties. Currently, the NHSU has 7 dashboards with real dynamic impersonal data, which are regularly updated and is a guarantee of transparency of the NHSU activities (National Health Service of Ukraine, 2019).

On September 25, 2015, the UN Member States approved at the UN Summit the Sustainable Development Goals 2016-2030, which are adhered to by all countries, setting their own development indicators. The document includes 17 goals and 169 specific objectives. One of the global development goals is "Strong health and well-being", aimed at ensuring a healthy lifestyle and promoting well-being for all at any age. E-medicine is a relatively new term for health care with the support of electronic processes and communications, which defines the activity of using electronic information resources in the field of health care and providing prompt access to healthcare professionals and patients.

The main areas of developing e-services in the field of health care include introduction of automated information industry systems, which, in particular, make it possible to switch to the electronic medical records; development of telemedicine; improving health monitoring system of the population; creation and introduction of new computer technologies of disease prevention, diagnostics, maintenance of medical processes; creation of publicly available electronic medical resources.

The key benefits of implementing e-medicine are improving the effectiveness and quality of treatment; speeding up the transfer of information on the results of examinations between different specialized clinics without transporting the patient (especially in critical situations); carrying out remote consultations by narrow specialists in territorially remote medical institutions; conducting medical consultations with specialists of medical institutions regardless of their location; reducing the time of patient examination.

E-medicine is relatively new term for Ukraine as well. On April 1, 2019, the government's Affordable Medicines Program was given to the National Health Service of Ukraine (NHSU). The NHSU concludes contracts with pharmacy establishments and is the sole payer of the program. During 2 years of the operation of the Affordable Medicines Program, over 35 million drug prescriptions were issued (for over 6.6 million people). Both communal and private pharmacies in the country have joined the project. As of April 8, 2019, 5383 pharmacies and chemists in Ukraine, both communal and private, took part in the government's Affordable Medicines program. The number of declarations stored in the eHealth system is to become 28.4 million. In 2018, the number of drugs prescriptions amounted to 18 million, for a sum of UAH 1 billion. In 2019, amount of prescriptions increased by 7 million, of which more than 80% (5.8 million) were received.

Electronic prescriptions are most actively prescribed for "Available medicines" in Dnipro (141.05 thousand), Kharkiv (82.3 thousand) and Kyiv (77.2 thousand) (National Health Service of Ukraine, 2019).

Modern information systems allow to simultaneously keep medical records, information sharing, in the process of analysing patient data included in personal electronic medical records, using formalized rules and algorithms based on evidence, and provide the healthcare worker with interactive guidance on follow-up, medical interventions, and warnings about critical factors (for example, individual intolerance or incompatibility of medicines). The main directions of informatization of the health care system are summarized in Table 1.

Table 1: Directions of public health information policy

Information technology	Description
An electronic prescription	Digital analogue of prescription on paper forms. The electronic prescription is intended to eliminate the need to prescribe to a doctor in written, to reduce the number of errors, to save working hours, to provide an opportunity to track medical prescriptions, the pass of patient's medications for treatment.
Verification of the central electronic health system database	In order to keep up-to-date and accurate all the data stored in the central database of the electronic health care system, the NHSU regularly takes steps to verify them. Regular verification of data occurs through several processes: deactivation of data on deceased patients, medical specialists, and other users in the system can be seen according to the data of the State Register of Civil Status Acts of citizens in the last working week of each month; online and offline deduplication prevents duplicate data from appearing in the system, detects and deactivates existing duplicate patient records, declarations, health professionals and specialists, as well as medical facilities; consideration of requests for action on system data from identifiable applicants.
Online dashboard	In order to raise awareness of the public in the field of e-services provision, the National Health Service has launched an online dashboard to help analyze the dynamics of medical reform, as well as outline measures to promote transparency in the activities of the National Health Service of Ukraine. The dashboard contains information about primary health care locations: an electronic location map with addresses and contact telephones, the distribution of facilities by region, the number of declarations of a physician at each medical institution.
Visualized information	Medical imaging is one of the areas for which, due to large amounts of data and specific quality requirements, interoperability standards have long been established, both at the hardware level and when integrated into an electronic health record or electronic medical record. Other types of specific medical data are at different stages of similar processes.
Statistical charts	Those "statistical charts" that do not carry the medical information, but are conducted for the sole purpose of calculating statistics, completely lose their meaning, provided that it can be automated on the basis of information available in the databases. The

	essence of filling in such forms - not so much duplication of medical information from primary medical forms, but its coding, classification (for example, a clinical diagnosis, which may comprise in the medical history half page of medical terms of arbitrary content when filling in the form 66 has to be formulated in terms ICD-10). When statistical charts are rejected, such encoding ha to be performed at another level (obviously presented in the corresponding Minimum data sets).
Electronic medical charts	Outpatient (inpatient) medical records are the most comprehensive, complex documents that have information (for the doctor) and even legal (for the prosecutor) consideration. Their modern duplicates are electronic medical (or health) records (EMR, EHR). EMR is usually understood as a local record at a healthcare institution; EHR means more generalized, aggregated information on patient that integrates different aspects and episodes of healthcare provision.

Ministry of Health plans to launch a patient's personal office in the future. The data on the electronic medical card are collected through the MIS established in healthcare institutions and sent to the Central database. With centralized data storage:

- the Ministry of Health of Ukraine and the NHSU can process impersonal data to effectively manage the health care system;
- the NHSU can analyse data to manage the quality of health care services;
- the data is guaranteed to be accessible to the patient and the physician who treats this person. Access to centralized data exists regardless of whether the servers, from which the information enters into the system, are in the medical establishment or if there is an Internet connection, etc;
- health care facilities can move from one MIS to another without losing key data, as these data are stored in a centralized system (Ministry of Health of Ukraine, 2019).

The need for health care reform is underlined on the one hand, by impossibility of ensuring adequate public funding of the system, under the current conditions, and, on the other, the introduction of effective schemes for full competition in healthcare market.

Structural reform of health financing provides an opportunity for rapid information as it involves the use of electronic tools (submission of declarations on the choice of primary care physicians; conclusion of contracts between healthcare institutions and the NHS; reporting; prescribing and redemption of electronic prescriptions; keeping electronic medical records; electronic referrals, etc.), i.e. healthcare institutions have effective financial incentives for the rapid implementation of information systems and investments it in the ICT.

Increasing government spending without changing infrastructure will not solve existing problems. Efforts must be made to reallocate existing resources and improve system efficiency. In order to overcome the economic crisis in the short term, the Government of Ukraine should propose a set of tough measures. This will have a significant impact on the availability of health care, so measures to increase budgetary efficiency should be at the heart of industry financing reform.

Additional funding sources and new organizational models of pooling of funds (such as insurance) should only be considered after the transition is properly prepared. The bulk of the funding should remain general tax revenue, with a gradual decrease in patients' cash payments. Targeted taxes on alcohol (tobacco) and health-threatening products should be offered as an additional source of cash, primarily for the reimbursement of medicines and the development of primary care.

The new financing model should be based on the following principles: financial protection, fair access to care, honesty, openness, transparency and accountability, efficiency, competition of providers, predictability of the funding for medical services in the state budget.

Therefore, when designing the healthcare information space of Ukraine, the question arises of the formation of a single electronic medical space, which must be solved by the intensive use of

information technologies. Along with this there is a problem of volumes growth of information flows. Therefore, it is necessary to improve public mechanisms for the acquisition and use of medical information, its rational collection and analysis (National Health Service of Ukraine, 2019).

Conclusions

In order to formulate a national eHealth action plan, it is necessary to: engage with stakeholders; develop eHealth activities and a comprehensive action plan; determine maximum resource requirements; adjust the plan in the light of financial constraints; determine the stages of implementation. Considering the international experience, it is possible to determine the optimal ways of informing the healthcare sector of Ukraine, namely:

- implementation of an electronic patient registry;
- equipping physicians' workplaces with electronic clinical decision support systems, means of generating and maintaining electronic case histories, and means of electronic medicine prescription;
- development of information technology infrastructure in medicine, including the interaction of health care facilities with regional and national data centers;
- organization of effective electronic data exchange at all levels – inside the medical establishment, between medical institutions on the one hand, and controlling bodies – on the other;
- integration of information systems of health care institutions with each other, with other information products and systems, as well as with information networks of other agencies and organizations;
- improving information support for management activities in health care settings, including quality control, statistics generation, information transfer and decision control.

The driving factors for active health informatization in this case will be to create a favourable investment climate, to make eHealth a priority area, and, as the next step, to provide legal and regulatory standards and to approve the necessary standards for eHealth services. Comprehensive information about healthcare facilities will allow to: provide quick access to current, most complete and accurate information; to improve the quality and accessibility of services provided by healthcare facilities to patients; reduce the time spent on patient care and health care management by completely automating operations.

Abstract

This research aimed to investigate emotional intelligence of entrepreneurs and creativity. This research consists of variables represented by emotional intelligence factors (self-awareness, self-regulation, self-motivation, social awareness, and social skills) and variables are represented by creativity. All Jordanian and non-Jordanian entrepreneurs' startups were targeted in this research. This research contributes to the academic and practical knowledge as being one of the first attempts to investigate the relationship of emotional intelligence factors and entrepreneurs' creativity. In addition to recognizing the emotional intelligence factors in entrepreneurship to improve the creativity, this research integrates, refines and extends the empirical work conducted in the field of entrepreneurial impact in Jordan. It raises many implications for startup founders, such as considering the importance of influence by emotional intelligence on creativity. This research provides useful guidelines for further and future research possibilities such as exploring why arts/humanities individuals don't become entrepreneurs, as they experience the world differently, in comparison to more scientifically-minded people, who tend to be more logical than those in humanities or arts for instance. The outcome of this study provides essential suggestions for policy-makers, entrepreneurs, and those wishing to support and enhance entrepreneurship in Jordan.

Keywords: Emotional Intelligence, Creativity, Entrepreneurship, Jordan.

Introduction

Entrepreneurship has been a critical topic in recent years, due to its importance to both academics and politicians, as it has been conclusively linked to both economic and personal growth. McGuire, (2003) stated that entrepreneurship is the conversion of innovation (no matter what the origin) into a new product, services, or business to take advantage of a market opportunity. Moreover, entrepreneurship has a prominent role in creating jobs that can develop economies (Prabhu, 2012). Jordan's economy has been affected in many different ways since the Arab Spring, and thus entrepreneurship, closely related to the economy, the environs, and the social makeup of the country, has also been affected (Abuhashesh, 2019a). Further, unemployment and low salaries have been increasingly problematic, and there is a need for this to change to avoid further social unrest. Furthermore, the economic ecosystem in Jordan has been structured in recent years to develop the entrepreneurial abilities of youths and policymakers, through improving the educational background, and training of individuals and businessmen. Shedding light on entrepreneurial factors, Emotional Intelligence (EI) is essential in linking to entrepreneurship and creativity. EI was first popularized by Daniel Goleman (1995), with the term EI referring to competencies related to self-awareness, self-management, social awareness, and relationship management (Brotheridge, 2002), EI enables people to understand and manage their

own and others' emotions in social interactions. These abilities are the basis for good leadership, creativity and, importantly, can also be learned (Mckee, 2008). These competencies help us create healthy working environments that support people in becoming their very best. EI is critical to creativity because emotions are linked to our ability to think clearly, make good decisions, and focus on tasks. This research focuses on the impact of EI on creativity among Jordanian entrepreneurs. In order to gain a research focus, this study chooses the individual entrepreneur as a unit of analysis. It seeks to offer a new perspective and a fresh insight on the matter in hand by looking at it from the standpoint of how EI inherently shapes individual entrepreneurial behaviors.

Importance of the Research

The research focused on the impact of EI on creativity of Jordanian entrepreneurs. It identified the factors affecting entrepreneurial performance, an important metric that shows the development of creativity and how it adds to entrepreneurs' success. A positive contribution introduced in understanding how EI factors influence the performance aspects is related to creativity. This work sought to overcome the limitations it encountered in the literature by soundly applying a new EI prism through which to analyze these issues as it relates to the Jordanian market. It is hoped that it will be a starting point for future research and discussion, over time encouraging other researchers to engage in more studies regarding EI factors in Jordanian entrepreneurship. It is also hoped that such efforts will improve the relationships between the political institutions, organizations, managers, and customers (Abuhashesh, 2019c). The aim was that a better understanding of EI and entrepreneurship in Jordan, will lead to enhanced support for entrepreneurship thus ultimately having a positive effect on the economy and social environment of Jordan.

Literature Review

There has been a growing recognition of the role of EI in entrepreneurship in recent years. This reflects on the previous studies that are related to entrepreneurship, EI and creativity.

Entrepreneurship

Many scholars (Luthje &Franke, 2004; Liñan & Chen, 2009) have investigated entrepreneurship as an essential factor in successfully leading businesses and have defined it as a driving force in developing the economy of a country, creating job vacancies in the labor market. Researchers agree about the critical role entrepreneurship plays in creating an innovative society, providing opportunities for personal development and fulfillment, and importantly, providing opportunities for social empowerment (Mehtap, S., 2014). Entrepreneurship is also related to the overall economic situation of the country, having an ability to stimulate and improve the economy. To power entrepreneurship, various factors are necessary, since initiating a business can be a risky endeavor. Potential entrepreneurs require education and training, mentors who can provide advice and guidance, financial or government incentives must be offered, they need the knowledge and skills to exploit a gap in the market (Mehtap, S., 2014). Most importantly, entrepreneurs need to be creative, to develop and to utilize an original idea for which there is a market demand.

In the last ten years, it is clear that policy planners and makers have concentrated on supporting ambitious projects in both developed and developing countries. At the same time, there has been an increase in academic studies focusing on the personal traits of businesspeople, goals, and aims of a business and its environment. With the current trend in support for entrepreneurs, there is an additional requirement for business education and training courses (European Commission, 2003, 2010). With the current state of the economy in the Arab World, many in politics and businesses emphasize that now is the time for an entrepreneurship revolution, to provide stimulus for the economy, and employment for the populace. The World Bank (2013) highlighted the case of Jordan, demonstrating how Jordan could overcome and whether the harsh political storm which

has shattered the surrounding Arab States, Syria in particular. Notably, Jordan is still suffering from challenges in population and environment both within and without the country. Suffering from a severe lack of natural resources, Jordan is used to depending on foreign grants and aid. The vast flow of refugees into Jordan recently, mainly as a result of the Syrian civil war, has been consuming the domestic resources of the country, with the resultant impact on the economy. Besides, there is growing public outrage with increasingly apparent corruption, economic austerity, and political reforms which are perceived to have done nothing to counter these issues. (World Bank, 2013). Facing the challenge of a rising young and dynamic generation, a significant target for the Kingdom of Jordan is to increase the availability of higher education and to create a nation that relies on knowledge bases. It is believed that the human capital of Jordan, united with businesses undertakings and activities will be the road to evolution and wealth in Jordan and the region overall. The information and communication technology sector and the business sector have allied to encourage and support start-ups and entrepreneurs, with initiatives such as the Zain Innovation Campus (ZINC). This can also be applied to other sectors, achieving success for all Jordanians.

Emotional Intelligence

The increasing academic knowledge of emotions and the developing understanding of the part they play in both businesses and life is due to ever more research into feelings and specifically (EI), over the last decade. The desire for knowledge of EI can be traced back to Binet and Charles Darwin, who noted the second type of insight, 'Social Knowledge' or 'Down to earth Knowledge' (Sternberg, 1985). Nonetheless, Edward Thorndike was the first to characterize social insight in 1920 (McCleskey, 2014). In 1983, Gardner discussed the interrelationship between various insights, two of which are the intrapersonal and relational insights. The term (EI) as presented by Salovey and Mayer in 1990, revolves around the ability to reason about feelings, and that feelings improve consideration ability and consciousness (Sadri, 2012). For them, EI is a mental capacity, which is the ability to comprehend, perceive and assess the importance of feelings to reason and tackle issues (Mayer et al., 1999). The idea of EI hypothesizes that the two various mental procedures, which are thinking and feeling, really cooperate (Kerr et al., 2006).

Salovey and Mayer's (1990) research developed the ability model, now widely acknowledged by scholars. It incorporates four unique abilities. Specifically, the ability to (1) perceive feelings or emotions, (2) use emotions to encourage contemplation, (3) understand emotions, and (4) manage emotions. EI was popularized when Daniel Goleman in 1995 distributed his book 'EI: why it can matter more than IQ.'

Goleman (1998) characterized passionate skill as "a scholarly ability dependent on an enthusiastic insight that becomes apparent in extraordinary execution at work" (p.4). His model is an execution based one, in light of five aptitudes: mindfulness, self-control, inspiration, compassion, and social abilities. The first three aptitudes identify with individual abilities and the last two to social ones. Another model fundamentally the same as Goleman's is Bar-On's model, known as the non-cognitive or emotional–social intelligence model. It covers five wide zones of capabilities: (1) the intrapersonal skills, (2) the interpersonal skills, (3) stress management, (4) adaptability and (5) general mood (Bar-On, 1997). The two models (Goleman's and Bar-On's) are known as the Mixed models since they incorporate a mix of mental capacities, identity, and character attitudes. Another imperative EI model is the appropriate methodology by Petrides. It is an emotion related disposition and self-learning strategy that centers around self-adequacy and self-recognition (Petrides et al., 2007). These various phases of our comprehension of EI are known as its three streams. The primary stream characterizes EI as many interrelated capacities, which are estimated through capacity, based tests (Mayer and Salovey, 1997). The second stream estimates EI through self-evaluations and reports on capacities and EI conduct (Mayer and Salovey, 1997). The third stream characterized EI as a variety of inclinations, skills, and observations on overseeing feelings (Bar-On, 2000; Goleman, 2000) which are estimated through the Passionate Fitness Stock and Enthusiastic Remainder Stock (Ashkanasy and Daus, 2005). In spite of the consideration and approving reactions it received from insightful sources, numerous

researchers question the passing of EI (Ashkanasy and Daus, 2005). In any case, as indicated by numerous researchers, it is essential to consider EI that it enhances individuals' abilities to execute activities (Berkovich and Eyal, 2017) and their dedication (Bhalerao and Kumar, 2016). Individuals that have high EI perform better in life over individuals with lower EI (Bar-On, 1997). They can better comprehend themselves and other individuals, mingle and impart more, and adapt to any troublesome evolving circumstances (Bar-On and Parker, 2000). When EI is high, it enhances the physical and mental strength of individuals, prompting better scholastic and work execution (Bar-On &Parker, 2000). Besides, EI connects negatively with work and work-related pressure (Nikolau and Tsaousis, 2002). Consequently, numerous researchers contend that EI is a crucial segment of effective leadership (Sadri, 2012) as "it speaks to a critical competency for compelling authority and group execution in associations today" (Melita Prati et al., 2003, p.21)

Theories of EI

In this section, we will briefly shed light on the three theories that have generated the most interest in terms of research and applications, specifically the hypotheses of Bar-On (1988, 2000), Salovey and Mayer (1997), and Goleman (1998).

The first of the three noteworthy speculations to rise was that of Bar-On (1988). He instituted the expression "emotional quotient" (EQ), as a comparison to the Intelligence Quotient (IQ). Bar-On (1997) characterized his model regarding five primary social and passionate capacities including intrapersonal skills, interpersonal skills, flexibility, stress management, and mood which together impact an individual's ability to adapt viably to ecological requirements. His model in this manner encircled EI with regards to identity hypothesis and is best seen as a general model of mental prosperity and adjustment (Goleman, 2000).

Salovey and Mayer (1997) then again farmed EI inside a model of intelligence. Their inspiration to build a hypothesis of EI originated from an acknowledgment that customary proportions of insight neglected to gauge singular contrasts in the capacity to see, process and viably oversee feelings. In like manner, they developed a model that has a psychological center, sketching out the explicit mental aptitudes for perceiving and marshaling feelings (Goleman, 2000).

What distinguishes Goleman's (1998) research from that of Bar-On (1988) and Salovey and Mayer (1997) is his endeavor to ground his hypothesis explicitly with regards to skills necessary for work execution.

Empirical studies of EI

There is a growing accumulation of data that document the importance of EI abilities for effective performance at work. McClelland (1998) discusses data from more than thirty different organizations, which demonstrated that those workers who performed best had a wide range of EI competencies relating to social awareness, social skills, and self-motivation, while those with poorer performance lacked EI abilities in these areas. Previous studies indicate that possessing EI abilities is associated with higher levels of satisfaction in work, more ability to deal with stress, better ability to deal with changes, and more significant commitment to the organization. EI to hold genuinely steady overall execution areas, including work, gathering and scholastic execution. (Vakola et al., 2004). These discoveries agree with those of (Watkin, 2000) whose exploration depicts EI as an essential factor for unrivaled execution at each dimension from section level employment to top official positions. Bar-On and Parker (2000) also discover EI capabilities as the basis for reliable performance in many jobs, and Goleman (1998) also notes that that 67 percent of the abilities which are fundamental for performing well at work are EI abilities. There are blended discoveries for instance concerning the connection between age and EI. While a few investigations propose that age does not significantly affect EI (Cakan, 2005), Bar-On (2000) found that more seasoned companions will in general score higher on his measure of EI, recommending that EI is learned through life experience. Fatt (2002) likewise recommends that EI

will, in general, obtain more significance as people advance in the organization. Also, (Goleman 1998) proposes that the higher the representative's situation in the company, the more EI is a vital component.

The connection between EI and gender has correspondingly received some consideration lately. Mandell and Pherwani (2003) for instance found a remarkable contrast in the EI scores of male and female supervisors where females scored higher overall than males. Their discoveries indicate that females possess greater EI strengths in some regards than do males. These discoveries support the results of (Mayer and Geher 1996), which revealed higher scores for females on various proportions of EI. This is as opposed to (Goleman, 1998) who hinted that there are no distinctions in the general EI scores of males and females. Another clarification for the contrasting discoveries relating to gender is that while both males and females may have a similar standard dimension of EI, they do vary for various EI abilities. Females may score higher on mindfulness (or self-awareness) and compassion while males may self-manage better. (The Bar-On 1997) Research demonstrates that females are increasingly mindful of feelings, exhibit more sympathy and relate better relationally while men are progressively skilled at overseeing and directing feelings. In an examination surveying EI factors of college undergraduates in Singapore, (Fatt, 2002) found that males scored higher on specific proportions of EI, for example, distinguishing and utilizing feelings while no distinction was observed in different estimates, for instance, comprehension and managing emotions. (Morand, 2001) Work demonstrated that females were bound to see diverse feelings (Petrides and Furnham, 2007), then again, found that there was no significant distinction between the aggregate score for estimated EI for the two genders, yet males were increasingly inclined to fall into self-serving inclinations in revealing higher EI scores, with a partner self-disdainful predisposition in ladies. Nikolaou and Tsaousis (2002) found no noteworthy contrasts among males and females as far as estimated by the overall EI score. Cakan, 2005 revealed a non-significant gender impact on EI scores in their example of Turkish adult teachers. We trust that these fundamental discoveries are to a significant degree fascinating and merit further consideration and have in this way interpreted our investigation to address the impacts of age, administrative dimension and gender on EI in the working environment and to draw critical business-related perceptions and suggestions.

There have been many studies which demonstrated that creative behavior is enhanced when employees are more motivated. Thus, without self-motivation, individuals are less confident, thus decreasing their levels of creativity. This information provides us with a solution for enhancing creativity and knowledge creation, since employees must be invested in the outcome they are working towards, enabling them to develop creative solutions to problems, and allowing them to achieve the results they are working towards. Thus, motivation serves to direct the attention that employees devote to the heuristic issues of creative tasks (Woodman et al., 1993). Additional studies have been demonstrated the effect of motivation on creativity. Motivation is conducive to creativity, while extrinsic motivation is in most cases harmful (Amabile, 1983). Intrinsically motivated employees tend to take higher risks. Other studies related to motivation and (indirectly) to creativity investigate the attention of control, constraints and goal establishment tasks. In the case of setting targets, it is assumed that more self-regulation results in more self-motivation and creativity (Kanfer & Ackerman, 1989; Amabile, 1983, 2001). Individuals who are extrinsically motivated find creative work more stressful than individuals who are intrinsically motivated find creativity as challenge and enjoyment (Ceci & Kumar, 2016).

Self-motivation directly enhances creativity (Griffin et al., 2007). Consequently, when employees are intrinsically motivated, they will be more excited and thus increase their creativity (Shalley et al., 2004)

Creativity

Creativity is inherent in all sectors and disciplines, from industry, business, trade, and commerce, to education, science, arts, engineering, including even areas such as international relations. Humans have always been passionate about pursuing creativity. Thus, there is a requirement for provision of methods or training which can provide individuals with the ability to solve problems more creatively. (Zhu et al., 2011). Since creativity is closely intertwined with the operations, functions, and mechanisms of the

mind, it has been the subject of extensive studies (Weisberg 2006). Researchers have investigated the factors which can contribute to creativity, since humans are considered as creative beings, and there is a desire to provide methods for developing creativity (Zhu et al., 2011). It can be challenging to predict the occurrence of creative ideas. However, three key components which are closely associated with human creativity have been identified by Teresa Amabile (Amabile 1998;). These include (1) expertise, (2) creative-thinking skills, and (3) motivation.

Expertise is defined as technical, procedural, and intellectual knowledge (Harvard Business School 2003), and plays a critical role in creativity. It is evident that those who are exceptionally creative, or who have a high level of creativity, such as artists, scientists, engineers, and others, have a great deal of knowledge of their specific fields. Creative thinking skills can be defined as the methods by which people deal with, and develop, creative solutions to problems. Specific essential thinking skills for creativity have been identified, such as combination (Boden, 2004; Kanaan et al., 2020), generalization (Yan 1998), analogy (Itkonen 2005; Gomes et al., 2006), divergent thinking (Csikszentmihalyi 1997; Simonton, 1999), and others. Motivation is identified as the passion, interest, or incentives which influence people, enabling them to be dedicated to developing and exploring highly creative solutions to address problems.

Relationship between EI and Creativity

There is an increasing desire to understanding the relationship between EI and work-related outcomes, such as motivation, organizational commitment and creativity, among others, particularly from both practitioners and academics (Weng et al., 2013).

Emotional expression has been examined by scholars of management, as being one component of the overall work experience, with the finding that emotions are significantly related to job satisfaction, job behavior and job resourcefulness (Dulewicz et al., 2005; Hayajneh et al., 2020). For this reason, it is critical to developing a greater understanding of how strong EI enables individuals to both controls and manage their emotions, and enable them to deal with others. Higher levels of EI provide an individual with a significant advantage, as it allows them to perform better in the decision-making process since it will enable them to understand better how others feel and behave. The study of EI has benefitted from literature and research on leadership and group dynamics (Taylor et al., 2008), while research in psychology has increasingly highlighted the importance of EI, and the effect it has on success in life (BarOn, 1997). Additional research indicates that individuals with high levels of EI tend to be more efficient and exhibit higher group performance (Rice, 1999).

A study by (Silva et al., 2018) focused on the impact of EI on creativity, the mediating role of worker attitudes and the moderating effects of individual success. The objective of this work was to understand the influence of EI on creativity, considering the mediating roles of job resourcefulness, self-motivation and organizational commitment moderated by individual success. Their investigation was based on data collected from 519 questionnaires from a sample of Portuguese workers. Structural equation modeling was used with multi-group analysis. The results of their work indicated that EI had a positive effect on creativity and other behavioral variables, and individual success appeared to moderate most of the presented relationships. The sample used in their study, however, made a generalization of the results difficult. Importantly, their study identified several work-related outcomes of EI, indicating new potential subjects for training programs, mainly related to soft skills. The research was innovative as it analyzed the mediating effects of different variables, like job resourcefulness, on emotional intelligence's relationship with creativity, moderated by individual success.

Oldham and Cummings (1996) argued that creativity involves associating creative ideas with practical implications. It has also been defined as 'the production, conceptualization, or development of novel and useful ideas, processes, or procedures' (Shalley et al., 2004, 215; Elsbach, 2006).

Today, creativity as a concept is viewed as an essential and valuable resource (O'Neill, 2011), which reflects varying characteristics concerning the environment in which it appears. Thus, academics

studying the relationship between emotional intelligence, leadership, and creativity argued that leaders feel EI as their primary source of leadership to awaken employees' creativity (Antonakis et al., 2009). 'A key determinant of creativity is personal style and individual preferences in processing information about [one's] environment. It can, therefore, be argued that individuals with high levels of creativity are a significant asset to any organization or endeavor, as creativity has been proven to aid performance. It is thus a skill with both relevance and importance at the individual in addition to the organizational level. Boren (2010) suggests 'EI promotes the integration rather than the separation of reasoning and logic to emotions and feelings.' EI allows cognitive ability to be improved through the use of emotional information, providing individuals with the ability to adjust inform their thoughts. Those who are more creative also tend to be more inherently motivated (Chang & Teng, 2017).

A study of the impact of EI on creativity revealed some of the outcomes that emotional strategies can have on stress at work, job satisfaction and service performance (Johnson & Spector, 2007; Groth et al., 2009; Abuhashesh, 2019b). The results show that EI positively affects employee creativity. According to Parke, Seo, and Sherf (2015), 'emotional intelligence can predict different markers of creativity.' 'Individuals with the aptitude to practice equally positive and negative emotions do account being extra creative. It has also been found that creativity is generated by emotions' (Boren, 2010). The investigation into the connection between EI and creativity was carried out by (Castro et al., 2012). The research was conducted by exploring an association between leaders' EI and their followers' creative output. Also, an association between six sub-dimensions of EI stated by (Rego et al., 2012); empathy and emotional contagion, understanding of other people's emotions, self-control against criticism, use of emotions (self-encouragement), emotional self-control (emotions regulation), and understanding of one's emotions and creativity, as well as a mediating role of climate in the link between EI and creativity, were explored. Two questionnaires, one for leaders and one for employees, were used to collect data in a hospital. Sixty-six usable leader-employee pairs were collected. The findings confirmed a positive relationship between leaders' EI and employees' creativity. At an EI's sub-dimensional level, an association between creativity on one hand and self-encouragement and understanding of one's own emotions, on the other hand, became apparent. Finally, no mediating effect coming from climate was observed. The absence of a mediating effect from this aspect is intriguing, since it suggests a direct link between leaders' EI and employees' creativity, regardless of the climate. This is important since it calls attention to the paramount role of leaders in shaping individual and organizational behaviors as far as creativity is concerned. The authors also discussed the implications for management and practice.

Moradpour et al., (2018) developed the idea of EI having a positive impact on frontline employees' creative performance, in which they examined the elements of EI on frontline employees' creativity and the mediating role of environmental uncertainty (EU) as an explanatory mechanism to understand the relationship between EI and creative performance (CP) relationship. Moreover, they tested for the interaction of the elements of EI and cultural intelligence (CI) on frontline employees' creativity. Their findings also confirmed the mediating role of (EU) in the relationship between EI and CP. Regression analyses showed that CI strengthens the impact of EI on CP, although in addition to a marginal increment in explanatory power.

Conclusions

This research has examined the relationship between EI and Creativity in entrepreneurs in Jordan. While many studies examining the impact between EI and creativity have been carried out, this is the first study of its kind to be conducted in Jordan.

EI is of vital importance, as it enquires into the deeper reasons for our choices. Taking any action requires an emotional and mental balance to ensure the correct decision is made at the right time. Possession of a high level of EI enables us to learn, consider, and understand clearly. Introspection and self-analysis require courage, yet doing so is highly beneficial, allowing us to understand our feelings and reactions when interacting with both the internal and external world.

As humans, our emotions can control us; scholars observed that the human mind is composed of two entities, the conscious mind, and the subconscious mind. The latter commands us more, as it is affected by our emotions, while the conscious mind understands logic. We react and are moved by our feelings more so than by logic, thus balancing both of these require us to be aware of and understand our emotions, in both our business and personal lives.

Having the capability and the tools to perform introspection and self-analysis can provide us with significant benefits, allowing us to know ourselves better, understand ourselves and others more deeply, thus enabling us to react more effectively.

Policy Implications and Recommendations

Many interesting avenues for further research are opened up due to the findings of this study. Likewise, there are many important implications for policymakers. This section will examine the opportunities for further research, before discussing the recommendations for policymakers.

Policy Implications

As the first study of this kind in Jordan, this research has raised many important issues which would benefit from consideration by policy-makers. Entrepreneurship can bring significant advantages to the economy, and the results of this study indicate various means by which policymakers could support entrepreneurs and promote entrepreneurship in Jordan.

Given the difficulties in reaching a broad cross-section of entrepreneurs, it is apparent that there is no centralized hub for entrepreneurs in Jordan. It is recommended that the provision of such a hub would enable entrepreneurs to network and exchange critical information and advice.

The results of the research indicated that entrepreneurs appear to have deficits in several leadership skills across several areas, including self-motivation (uncertainty, find ways to do better/set goals), self-awareness (reward people's strengths/understand needs), and social-skills (lead as needed). Since leadership skills are crucial to entrepreneurs, we would strongly recommend that policy-makers and incubators consider that provision of training in leadership skills and abilities would benefit entrepreneurs, assisting them to succeed in their endeavors. Additionally, the study results show that entrepreneurs do not consider themselves to have strengths in Self-Regulation. As a result, we would recommend that entrepreneurs could benefit from training and support to develop these skills.

The outcome of providing training and workshops for entrepreneurs to provide them with the skills they lack will be a net benefit for the economy, and for Jordan, as entrepreneurs with strong capabilities across all researched areas will have higher chances of being successful.

The profile of entrepreneurs reached by this study indicates that there appear to be more entrepreneurs from science/business backgrounds, and there appear to be more male entrepreneurs than female. It is recommended that policy-makers may wish to consider providing additional support to encourage women and those from a humanities/arts background to become entrepreneurs.

Recommendations for Further Research

There are many important questions raised for further research while conducting this study. It was noted that there were two biases in the study respondents; that is, a gender imbalance is apparent, and an imbalance in the educational background is also evident. Therefore, the author recommends that further research should be conducted into the relationship between gender and entrepreneurship in Jordan. It is necessary to identify whether this accurately reflects the gender balance of entrepreneurs in Jordan. If that is the case, research should be carried out into why more males than females become entrepreneurs. Additionally, there are many further relationships which should be investigated, including the relationships between gender, entrepreneurial success, creativity, and EI.

To further understand entrepreneurs and success in Jordan, it would be beneficial to understand the relationship between educational background (sciences/business versus arts/humanities) and the decision to become an entrepreneur, as well as the relationship between educational background and gender.

Abstract

The paper proposes to present the legislative context of transgenic food production and consumer perception in the Republic of Moldova. In Moldova the status of genetically modified organisms is regulated by law no. 755/2001 on biosecurity, amended and supplemented by the law enforcement regulation 2003. The National Agency for Food Safety has the responsibility to control transgenic products, but the human and technical resources, equipment and control procedures of the agency are insufficient.The cultivation and use of GMOs in Moldova has been officially banned since 2003, but the authorities have not yet succeeded in developing a system for monitoring the import, production and distribution of GMOs in the country. According to local feed producers, 30 to 50% of total feed production imported from Turkey, Ukraine, Hungary, Romania and Slovakia contains GMOs. Although genetic crops are not allowed in Moldova, insufficient legislation, lack of specialized institutions or advanced technical means of border control could allow the importation, transit, cultivation or consumption of GMO foods on the national territory. The study shows that the authorities should take the necessary legislative measures to regulate these issues on the national food market.

Keywords: Republic of Moldova, GMOs, safety, control.

Introduction

The Republic of Moldova is a country with a long tradition of agriculture. The main natural resources of the country, with a significant agro-food potential, are fertile soils and aquatic basins for the fisheries sector. Approximately 75% of the land resources are used in agriculture. Of the crop plants, soybean seeds are some of the most concerned about genetic modification due to an optimal combination of valuable chemicals, justifying their use in human food or feeding animals. At the international level, much of the marketed soy is genetically modified, and it is estimated that about 82% of the 111 million hectares allocated to the soybean were occupied by transgenic tolerant herbicide varieties (Badea, 2016). In addition, soybean crops have positive environmental effects, crop rotation being an important practice for maintaining soil fertility with maximum production potential. At the national level, a number of livestock farmers have turned to importing soy or grain seed used as animal feed, given the registered demand and the shortage of the domestic production. In view of increasing the share of genetically modified agricultural products and the European policy, based on precaution in the cultivation of transgenic plants, a national legislative basis regulating this sector is strongly needed.

At present, the requirements for obtaining, testing and commercializing genetically modified organisms (GMOs) in the Republic of Moldova are regulated by Law 755/2001, on the biological safety of crops. According to this legal document, it is possible to foresee the ban on the import of plant organisms and the control of the authorities in the monitoring, surveillance and fight against genetically modified organisms. Legislation is strict, in line with European norms, but the qualifications of control bodies and the facilities of the GMO-specialized laboratories are precarious, indicating that a series of products, mainly imported from Ukraine, especially soybean, are suspected of genetic engineering (Agent Green., 2018).

The paper seeks to examine the impact of incidents of the occurrence of genetically modified organisms on the agricultural commercial flow, using both the international flow and the annual statistical data of the country.

Short literature Review

According to Sanchez (2014), the Moldovan legislation on GMOs is limited to the two stated legal acts mentioned earlier – the 2001 Law on Biological Security and Government Decision No. 1153 of 25 September 2003, regarding the approval of a Regulation on the authorization for obtaining, testing, use and marketing of genetically modified organisms. No other more specific provisions e.g.on the issue of threshold for the unavoidable presence of GMOs are at present in force in Moldova Republic. Genetically modified organisms can affect the natural ecosystems' biodiversity of The Republic of Moldova and is a potential threat for the ecosystems' stability. The risk of illicit penetration of genetically modified organisms into Moldova is quite highThe GMOs have already been found in agro-food products of soy-beans and corn (CBD/UNEP, 2016). Large quantities of food are imported into the Republic of Moldova from Ukraine, a country where cultivation is out of control, according to Agentgreen.ro (2018). Moldova takes one of the first places among the BSEC countries in terms of national bio-security framework development. In 2001 Moldova adopted a law on bio-security and ratified the Cartagena Protocol in 2002. Legislative framework of the Republic of Moldova on the regulation of import, export and cultivation of genetically modified organisms are mostly based on Seeds Law No 659 dated 29 October 1999 and the Law on Biosafety № 755 of December 21, 2000, with subsequent amendments. Furthermore, in 2003-2004, the government passed several resolutions and Minister of Environment issued an order, whereby provisions on risk assessment procedures were approved, National Committee for Biological Security established, and procedures for public involvement in decision-making in the field of GMO determined. National Committee for Biological Security set-up by the government of Moldova is authorized to take decisions and give permissions to the activities related to GMO utilization. Regulations for licensing activities related to testing, production, utilization and obtaining of genetically modified organisms were adopted by the government as a reference document for implementation of the national law on biosecurity. This legislation specifies rules for GMO utilization in closed systems, their propagation in the environment, and placing on the market, as well as GMO import and export. The National Test Center was established by mutual decision of the Ministry of Environment and Natural Resources and Ministry of Education. The Center's terms of reference cover determination of GMO in the samples, and, if necessary, running additional tests for biological security and assessment of the GMO risk for environment and human health. Republic of Moldova has not imported the seeds of genetically modified crops, therefore, they are not grown genetically (Goguadze, 2011). There are signals that almost 50% of Moldovan food contains GMOs. The development of soybean crops in the Republic of Moldova has already been over 100 years old (Dima, 2015). At the level of the Republic there are specialized structures for the creation and adaptation of a variety of plants adapted to local conditions. The research institutes Bălți (The research Institute of Field Crops "Selecția) and Chișinău (The Institute of Physiology), which tested more than 10 varieties of plants lately amid soaring European soybean demand.

Material and Methods

The research carried out in this paper has used relevant information from the national statistical database (National Bureau of Statistics) and international (FAO) database on the import of soy products. The data has been collected, worked and properly ordered. The obtained results were compared with information provided by the recognized scientific institutions (Ministry of Agriculture, Regional Development and Environment). This information was selected to complete the research.

Official data on the cultivation of the soy in the Republic of Moldova

Official data shows that genetically modified crops are not cultivated on the territory of the Republic of Moldova. Law no. 112 of 02.07.2014 establishes the powers of the authorities responsible for controlling the placing on the market of GMOs through the cross-border circuit at the stages of marketing of products, especially food and feed, which may have adverse effects on the conservation and the sustainable use of biological diversity and on the population health. There are no laboratories in the Republic of Moldova to determine the content of GMOs in food, and about half of the products could contain transgenic soy, corn and rape components (Sputnik.md, 2018).

According to the publication, in 2001, a rather progressive law was adopted in Moldova regulating the application of genetically modified organisms but it was not fully observed. Genetically modified and illegally harvested genetically modified seeds are mixed with local ones, and, at least half of the soybean is currently being modified in the fields, and at least half of the corn is modified due to pollination and pollution. As a result, in Moldova there are no laboratories that determine the content of GMOs in food, and almost half of the products could contain transgenic soy, corn and rapeseed components.

Commercial cultivation of Genetically Modified Crops

Biotechnology involves a wide range of technologies for improving and conserving the genetic resources of different plant varieties in order to increase the efficiency in various diseases and pests and to increase productivity. One of these biotechnologies is genetic modification, which is widely used throughout the globe to produce GMOs. The production of genetically modified crops is growing in both developed and developing countries. With the rapid advances in biotechnology, there have been a number of modified crops (soy, corn, cotton, fruit trees, potatoes, pumpkins, tomatoes) developed and launched for the commercial agricultural production. Food labels may include relative indicators that confirm the probability of GMO content in that product. If the product was produced in the US and includes soy, corn, rape or potato, it most likely contains genetically modified components. Most soy-based products can be transgenic. Soybeans is ranked first in total genetically modified crops, followed by corn and cotton. Soy is the most popular GMO, globally, due to the biotechnological properties it contains. The commercial cultivation of transgenic crops has begun since the 1990s with the aim of increasing crop resistance to herbicides. Among the largest genetically modified soy and corn producers are: USA, Brazil, Argentina, India, Canada, China (Figure 2). According to the FAO, 29 countries have planted soybeans, genetically modified corn, and 30 other countries have approved the import of these crops. Genetically modified plants are accepted for cultivation and import being used in animal feed in 59 countries of the world. Although genetically modified crops are not planted in the Republic of Moldova, herbicide-tolerant soybean (NK603) and insect-resistant corn (MON810) have been approved to be imported.

Fig. 1: GMOs crops by countries

Genetically Modified Organisms are a potential threat to the stability of the natural ecosystems of the Republic of Moldova. The risk of GMO penetration in the Republic of Moldova is quite high, especially since the GMOs have already been found in agri-food products obtained from soybeans and corn. Ensuring an effective biosecurity system in line with the international requirements requires a continued development of institutional capacity to prevent the adverse risks to the sustainable development of the natural biological resources and to human health. At present, GM plants are not officially cultivated in the Republic of Moldova. However, the introduction of these products on the Moldovan markets is inevitable due to the import transit routes from Ukraine and the European Union.

Fig. 2: Imported soy from Ukraine

In 9 out of the 25 regions of Ukraine, GMO-infested rape, soybean and corn field were found. At the same time, officially, neither on Moldovan lands nor in Ukraine are there and cannot be GMOs, because their import and growth are forbidden. The data we have show that, in reality, the ratio between infested and pure crops is 50:50. However, the weight shall be higher, because the lack of order in this field shall lead to a later crossing and infestation. Based on a lack of clear regulations and a weak control, many seed production farms are not checked, which may lead to wider contamination of other crops. For this, it is quite important to take into consideration a series of preventive measures for the economic and ecological security of the productions. Certified seed must be obtained, under the supervision of agricultural experts and legal authorities, through a series of inspections and controls during their production.

According to the law no. 96/2018, in the Republic of Moldova authorisation was received only for the import of genetically modified soybean meal for use as food and ingredients and as animal feed, by the Decisions of the European Union and for which there is a risk assessment carried out by the European Food Safety Agency (EFSA).

Importing soybean meal from soybeans with the genetically modified lines MON 40-3-2 (MON 04032-6), MON 89788 (89788-1) and MON 87701 (MON 87701-2) under strict compliance with the regulations of the National Food Safety Authority, which has determined that this type of imported variety does not affect human health, animals or the environment and are as safe as genetically unmodified soy. The detailed evaluation through a series of analyses of this production allows the import of soybean meal to poultry farms on the territory of the Republic of Moldova.

Table 1: Analysis of soy meal imported from the European Union

Parameter	Methods	Limits		Results
		Min.	Max	
Oil content	SR EN ISO 734-1	-	3.0	2.68
Protein	SR EN ISO 5983-2	-	-	47.19
Humidity	ISO 771	- 12.5		12.15
Fibre	NIR Method	-	7.0	2.95

Currently, the National Agency for Public Health of the Republic of Moldova does not have well-grounded scientific data on the impact of GMOs on human, animal and environmental health which would regulate the restriction of the use of genetically modified organisms. Due to the lack of legal rules governing the authorisation, testing and notification, Moldova approved Law 755/2001 concerning the biosafety in biotechnology that shall stop some research on the use of GMOs for scientific purposes. Moreover, the Law no. 1005/2003 on Consumer Protection, the Law no. 231/2010 on Domestic Trade and Customs Code 1149/2000 does not prohibit the import and trade of genetically modified products, crops and goods.

Results and Discussion

The potential GMO contamination of the food in the country, raised by environmental organizations and the media led to the study of the State University of Medicine and Pharmacy "Nicolae Testemițanu" in Chișinau (USMF) on GMO and on the biosecurity measures required in the country (survey and statistical processing, 2017). The research of the academics aimed at preparing questionnaires and enforcement scheme to assess the situation of GMOs at the national level, analysing the current information on the GMO creation, testing, cultivation and the legal framework and national biosecurity world. The results of the study should mention the risks and undesirable effects caused by transgenic organisms, such as:

- The actual inclusion of non-human DNA into the human one;
- Synthesis of new transgenic proteins that can be toxic and / or allergic to the human body;
- GMOs have marker genes that confer resistance to antibiotics in the human body;
- Genes of interest may attack the immune system;
- GMO - danger for damage to existing natural gene pool;
- GMO - impact "-" on the environment (insects, microflora of air and soil etc.)

The survey on the population's attitude towards GMO was conducted on a representative sample of 150 respondents, including students, medical staff or patients in university clinic (Figure 3) and included testing using a questionnaire composed of 30 questions regarding the consumption of GMOs, and the

health risks of GMO consumption. Of the 150 interviewees, 48% were women, the remaining 52% being men.

Fig. 3: Features of the batch of interviewees

Considering the age category, 18% of participants were students aged 15-19 years, 39% USMF students, aged 20-29 years, MIA patients aged 30-70 years (figure 5). For the category of education, more people with higher education (79%) participated in the survey, and 11% had uncompleted secondary education.

Fig. 4: Characteristic of the batch of interviewees by age and education category

Considering the content of the questionnaire (heard about GMO / know what GMO is), the respondents demonstrated that they know what the genetically modified products are, especially the students of USMF, where the percentage ratio represents 100/78%.

Fig. 5: Percentage share between heard what is GMO / I know what is GMO.

When questioned whether they are GMO consumers, in all the batches analysed, uncertainty prevails, except for the students of USMF.

Fig. 6: Characteristic of batch of interviewees on GMO consumption.

Following the interview, many respondents are not aware of the risks and undesirable effects caused by GMOs. The batches analysed underlined that the USMF students (100%) know the risks of genetically modified products to human health.

Fig.8: Health risks of GMO consumption

To the question "What should inform us about the nature of the product (presence or absence of GMO), the persons with higher education, the students of the USMF and the Medical staff of the MIA Hospital answered. They have presented the most answers about what GMOs are, and what risks they pose to humanity.

Fig. 9: The presence or absence of GMOs in a product

The survey has shown that many consumers do not know what GMOs are and what negative effects they could have on the natural environment and human health. Unfortunately, in the Republic of Moldova, there is no institution that can inform us about what we have on the shelves of the shops of the commercial networks. Consumers in the Republic of Moldova are not even in a position to choose a genetically modified product against an unmodified one. It is regrettable that 38% of the secondary education students, 20% of higher education students and 29% of the workers have shown indifference, considering that these issues should be handled by the competent bodies and institutions and the fifth part of the students (20%) and a third of the 39-70 year-olds (29%) do not have a concrete decision in this respect.

Conclusion

The industrial use of transgenic plants may offer additional competitiveness to the native agriculture, but the long-term effects on the human genome are not very clear. The lack of scientific arguments for genetically modified organisms slows agricultural progress and limits the cultivation of these crops, which favours national dependence on imports. Strict control of seed and food trade is necessary to protect the national food market from GMO foods. These problems can be solved, but national food policy measures from the Ministry of Agriculture and consumer education are needed.

Strategy Characteristics and Implementation Obstacles in Creative Industries

Joanna RADOMSKA

Wrocław University of Economics and Business, Wrocław, Poland
joanna.radomska@ue.wroc.pl

Abstract

Creative industries receive lot of growing attention from both – policy-makers and researchers due to special characteristics that are observed in that industry, but also the creative output that is provided. However, in most cases the macro perspective is introduced and the research focused on managerial practice is still scarce. To address this research gap this paper is aimed at investigating the differences between strategy characteristics and implementation obstacles between three different representatives of creative industries – informatics, media and telecommunications. The research results did not reveal significant differences but in case of telecommunication and technological companies, we may observe more stable environment. Therefore lower impact of strategy implementation obstacles was reported in that industry.

Keywords: Creative Industries, Strategy Implementation, Strategic Goals.

Introduction

As the creative industries are perceived as a tool that fosters the innovation development, an increased attention may be observed in national policies (Tafel-Viia et al., 2014) and research approaches (Rozentale, Lavanga, 2014). However, still the theoretical foundations and deep empirical research that would allow to identify the managerial practices in creative industries are scarce (Markusen & Gadwa, 2010). Having that in mind, this paper investigates the characteristics of enterprises that operate in this sector. As there is no universally accepted definition, companies, that are labelled as creative, may have totally different nature. Therefore, the main goal of this paper is the identify if we may provide any generalizations, or rather identify some idiosyncrasies that are specific for particular types of activity.

Theoretical Background

Although the theoretical perspective of creative industries definition is differentiated, the term is usually used to describe the traditional arts sectors, copyrightable cultural industries and new creative businesses (KEA, 2006; Throsby, 2008). Their competitive advantage is based on creativity, skill and talent delivered by their employees and therefore the intellectual capital is their primary production input (DCMS, 1998; Throsby, 2001). At the same time, the market conditions are specific as a higher demand uncertainty, strong volatility and higher risks are reported. (Townley, Beech, 2010). To deal with those tensions, it is required to constantly deliver high levels of novelty (Cooke & Lazzeretti, 2008). While analysing the industry specifics, we have to mention its structure which is considered as polarized, with a few large corporations (often multinational) but dominated by small and micro businesses with a high number of self-employed, one-person enterprises. It is called an example of a long-tale hypothesis (Brynjolfsson, Hu, & Simester, 2011). In case of the larger ones higher vertical integration and mass production involvement is observed (Caves, 2000; Scott, 2005; Towse, 2010). On the other hand, SMEs are more focused on specialisation on niche markets (Birch, 2008) instead of growing scale and scope (Hartley et al., 2013). Analyzing the strategies implemented by creative industries is crucial as their linkages to other industries result in contribution to innovation in the whole economy (Foord, 2009; Müller, Rammer, & Trüby, 2009; Potts, 2009).

Based on the industry characteristics provided, we may argue that the managerial practice and strategy characteristics are worth investigating. The challenges reported in managing creative employees are focused on dealing with the tensions that arise based on the dual goals of simultaneous profit and effectiveness increase and fostering the creativeness at the same time (De Fillippie et al. 2007). Therefore, the efficiency exploitation is contrasted with exploration and value capture (Eikhof, Haunschild, 2007). As revealed by Perretti and Negro (2007) some mangers both standardize and craft new practices rather than choosing one strategy.

Although we may find some results examining the influence of entrepreneurial orientation in creative industries on company's performance in terms of achieving competitive advantage (Parkman et al., 2012), deep research is still scarce. Most research on the creative industries are either exploring the micro-level of analysis, like the motivations of individual entrepreneurs (Fillis, 2002; de Bruin, 2005; Boorsma, 2006) or investigating the macro-level like the impact of the creative industries on local and regional development (Foord, 2009; Caves, 2002). Therefore, it is recommended that further research should be focused on the firm-level approach (Hill, 2001;Rentschler, 2001; Fillis and Rentschler, 2005). This is the research gap we want to address in this paper.

The research was aimed to answer the following research questions: are there any differences in strategy characteristics observed in creative industries? May we report any differences in strategy implementation obstacles observed in creative industries? To address the research questions, detailed analyses were performed aimed at comparing the constructs investigated in three groups of companies that are classified as creative.

Research Design

The main research sample contained 150 firms listed on the Warsaw Stock Exchange main market and on the alternative New Connect market. The entities differed in size and industry. This differentiated sample enabled us to investigate strategy characteristics that are observed among the companies representing creative industries. Therefore, for further analysis we have selected companies that are classified in media, informatics and technology industries. Finally, in our research sample we had 29 companies. The respondents (CEOs, owners, strategy managers and board members) were responsible for strategy formulation and execution. A stratified-random method was used to select the sample according to industry sector (defined according to the classification introduced at Warsaw Stock Exchange) and the company's size.

The study was conducted with a direct questionnaire interview, and the survey was carried out by using the paper-and-pencil interviewing method. The main part of the survey investigated the importance of given factors for the strategy execution process. A five-point Likert-type scale was used to measure the impact and probability of their occurrence - (1) very low (5%); (2) low (25%); (3) medium (50%); (4) high (75%); (5) very high (more than 90%). The data collection enabled the perception of respondents to be studied, which could be considered a limitation of the study. These latent variables represent qualities that are not directly measured (Tabachnick and Fidell, 2001) and the constructs according to the subjective perspective of individuals (Borsboom et al., 2003).

A new measurement scale was developed based on the EFQM concept (Fundamental Concepts of Excellence, 2013) - 6 areas of operational (intra-organizational) risk were identified – leadership, strategy, employees, resources, processes, and measures. Within those areas, the scale items were formulated based on the perspectives derived from the literature review and qualitative interviews with 10 experts (CEOs responsible for strategy execution). The list of scale items is presented in the appendix. Measurement reliability analysis was performed using Cronbach's alpha coefficient. Moreover, based on Reeves et al. (2015), a short self-assessment was used to assess the fit between company's environment, intended approach to strategy, and strategic practices.

Results and Discussion

As mentioned above, the first part of investigation was based on exploring the strategic approach that is observed among creative industries representatives. In the part based on investigating the current strategizing practices we may point two most popular environmental drivers – P2 (We strive to realize an imagined end state, and we react flexibly to obstacles that we encounter along the way), which is reported in majority of companies in telecommunication and technology (T) – 67%. Second driver was P3 (We identify opportunities to reduce costs and preserve capital, guided by detailed plans, so that we can eventually identify a new path to growth), observed in informatics (54%). What is interesting, in companies operating in media industry, both answers are observed. Other approaches were not highly ranked.

In the part aimed at investigating the perceived business environment, technological companies reported the answer P4 (Our industry has a stable, predictable pattern of demand and competitive structure) – 67%. Among media as well as informatics representatives, two answers were pointed - P2 (Our industry is ripe for disruption by an imaginative new player) and P3 (Our industry is marked by a high degree of dynamism and unpredictability, driven by shifting customer demand, technologies, or competitive structure). Therefore, we may observe some differences among the companies classified in the same creative industry but facing different environmental challenges.

Last part of the first investigation was aimed at exploring the intended approach to strategy. In that area, majority of companies from industries described, reported answer P1 (We continuously renew our competitive edge, leveraging our agility and flexibility) which confirms the high level of flexibility as the core basis of competitive advantage that is reported by other studies.

Analysing the financial data, we may find the common features, as more than half of companies from media, informatics and technology industries, reported similar results. The revenue dynamics is quite stable (between 3%-15%), the revenues are more than 0.5 billion PLN and the profit is reported. However, we may observe some differences in other strategic issues that were further investigated. In case of informatics and technology industries, the market share is low (less than 10%), however companies representing media are divided into smaller (less than 10%) and higher shares (more than 70%), which confirms the long tale hypothesis. That is also manifested by the level of strategic goals achievement which is lower in case of smaller companies (25-50%) and higher in case of larger organizations (50-74%). In the group of companies from informatics, 85% reports that level as higher than 50% (with 46% confirm even more than 75%). The same level may be observed in the telecommunication representatives. Large majority of companies from all industries investigated state that their strategic goals were only slightly modified compared to the basic strategic assumptions.

Further analysis was performed to investigate the differences between the three industries represented by different obstacles to strategy implementation. First analysis was aimed at exploring the probability of each obstacle. The results are presented in Table 1.

Table 1: Strategy implementation obstacles – probability

		Total			I			M			T		
		Mean	Median	SD	Mean	Median	SD	Mean	Median	SD	Mean	Median	SD

	P5	2,35	2,00	1,26	1,71	1,50	,83	1,60	1,00	,87	2,00	2,00	,87
	M1	2,19	2,00	1,23	1,64	1,00	,93	2,20	3,00	1,07	2,33	3,00	1,01
	M2	2,12	2,00	,94	2,00	2,00	,96	2,60	3,00	1,11	1,33	1,00	,50
	M3	2,20	2,00	,98	1,64	1,50	,75	2,40	3,00	,87	2,00	1,00	1,51
	M4	2,17	2,00	1,14	1,71	2,00	,73	2,00	2,00	,97	2,67	2,00	1,81
	M5	2,27	2,00	1,18	1,71	1,00	1,00	2,00	2,00	,97	1,33	1,00	,50

As we can observe, no significant differences were reported between the companies representing informatics (I), media (M) or telecommunication and technology (T).

However, we may point some idiosyncrasies in case of representatives of telecommunication and technology when analysing the impact of particular obstacles on strategy implementation. Detailed results are presented in table 2.

Table 2: Strategy implementation obstacles – impact

		Total			I			M			T		
		Mean	Median	SD	Mean	Median	SD	Mean	Median	SD	Mean	Median	SD

	E5	3,47	4,00	1,27	3,71	4,00	1,27	3,80	4,00	,44	1,33	1,00	,50
	R1	3,49	4,00	1,17	3,50	4,00	1,29	3,40	4,00	,87	2,33	1,00	2,01
	R2	3,40	4,00	1,16	3,57	4,00	1,29	3,80	4,00	1,27	2,33	2,00	1,33
	R3	3,27	3,00	1,17	3,64	4,00	1,22	2,80	2,00	1,07	1,33	1,00	,50
	R4	3,30	3,00	1,17	3,36	4,00	1,22	3,80	4,00	,44	1,33	1,00	,50
	R5	3,57	4,00	1,20	3,57	4,00	1,16	4,20	4,00	,44	1,67	1,00	1,01
	P1	3,51	4,00	1,16	3,64	4,00	1,09	3,40	3,00	,53	2,33	2,00	1,33
	P2	3,30	3,00	1,17	3,86	4,00	1,03	3,80	4,00	,81	1,33	1,00	,50
	P3	3,39	3,00	1,26	3,71	4,00	1,27	3,80	4,00	,81	1,33	1,00	,50
	P4	3,47	4,00	1,18	3,64	4,00	,85	3,60	4,00	,53	2,33	1,00	2,01
	P5	3,52	4,00	1,17	3,64	4,00	,93	4,00	4,00	,69	1,67	1,00	1,01
	M1	3,61	4,00	1,08	3,57	4,00	1,40	3,60	4,00	1,11	2,00	2,00	,87
	M2	3,30	4,00	1,20	3,71	4,00	1,33	3,00	3,00	,69	1,00	1,00	0,00
	M3	3,27	3,00	1,17	3,43	4,00	,85	3,80	4,00	,81	1,67	2,00	,50
	M4	3,59	4,00	1,13	3,57	4,00	1,16	3,80	4,00	,44	2,33	1,00	2,01
	M5	3,51	4,00	1,26	3,50	4,00	,94	3,80	4,00	,44	2,33	2,00	1,33

As presented in the table, we may observe that in case of telecommunication and technological companies, the impact of particular obstacles is lower than in case of other creative industries. To check whether such idiosyncrasies are also observed in case of aggregated constructs, further analysis was performed. The details are presented in table 3.

Table 3: Strategy implementation obstacles (aggregated constructs) – probability and impact

		Total			I			M			T		
		Mean	Median	SD	Mean	Median	SD	Mean	Median	SD	Mean	Median	SD
Probability	Leadership	1,92	2,00	,87	1,57	1,00	,85	1,80	1,00	1,07	1,67	1,00	1,01
	Strategy content	2,06	2,00	,84	1,50	1,50	,52	1,40	1,00	,53	2,00	2,00	,87
	Employees	2,25	2,00	,93	1,79	1,50	1,05	1,80	1,00	1,07	2,33	2,00	,50
	Resources	2,15	2,00	,84	1,71	2,00	,73	1,60	1,00	,87	2,00	2,00	,87
	Processes	2,15	2,00	,89	1,64	1,50	,75	2,00	2,00	,97	2,00	2,00	,87
	Measures	2,22	2,00	,83	1,86	2,00	,87	2,20	3,00	1,07	2,00	2,00	,87
Impact	Leadership	3,44	3,00	1,13	3,86	4,00	1,03	3,20	3,00	,81	1,67	1,00	1,01
	Strategy content	3,37	3,00	1,01	3,57	4,00	1,02	3,60	4,00	,53	2,00	2,00	,87
	Employees	3,50	4,00	1,04	3,86	4,00	,95	3,60	4,00	,53	2,00	2,00	,87
	Resources	3,38	3,00	,93	3,50	4,00	1,10	3,60	4,00	,53	1,67	1,00	1,01
	Processes	3,37	3,00	,99	3,57	4,00	1,02	3,80	4,00	,44	1,67	1,00	1,01
	Measures	3,40	3,00	,82	3,29	4,00	1,00	3,60	4,00	,53	2,00	2,00	,87

Analysis performed on aggregated data revealed the same regularities. In case of impact of particular constructs, we may observe lower level in the sample of technological and telecommunication (T) companies.

Conclusions and Further Research

The research results did not reveal significant differences in the strategy characteristics observed in creative industries. However, in case of telecommunication and technological companies, the environment where they operate was reported as more stable with predictable pattern of demand and competitive structure. That may be reflected in different impact of strategy implementation obstacles observed in that industry which was reported as lower compared to the other two types. At the same time, the level of strategic goals achievement is high (more than 75%) which demonstrates that the lower level of environmental volatility reported positively influences the possibility of strategy execution. Further research could focus on other representatives of creative industries to explore whether any idiosyncrasies may also be observed. Moreover, further investigation could be aimed at exploring the differences between creative industries and other types of industries having different strategic characteristics and environmental challenges.

Appendix

Construct	Symbol	Items
Leadership	L1	Managers do not identify themselves with company's strategic goals.
	L2	Managers do not provide information about the strategy and the process of its execution to other employees.
	L3	Managers are not engaged in relations with company's stakeholders (employees, clients, suppliers, institutions, etc.).
	L4	Managers do not execute the tasks assigned.
	L5	Managers have a low tendency to modify the strategy developed.
Strategy content	S1	Strategy did not include the influence of external factors (changes in the industry, competitive situation, stakeholders' expectations).

	S2	Strategy did not include the strengths and weaknesses of the organization (mainly the performance results and development potential).
	S3	Strategy is not precise enough (it does not clearly describe development directions and strategic goals).
	S4	Strategy is excessively formalized or inflexible.
	S5	Strategy is difficult to measure and transpose for tactical and operational goals.
Employees	**E1**	Employees do not have knowledge about the strategy (vision / mission / strategic goals) and the process of its execution.
	E2	Employees do not understand the relationship between the strategy and their everyday activities.
	E3	Employees are not included in the strategy execution process (by having decision-making power and active participation).
	E4	Employees are not motivated to implement the strategy.
	E5	Employees do not have sufficient knowledge and competences to implement the strategy effectively.
Resources	**R1**	The organization has too small resource potential (human resources, materials, technology) to execute the strategic plans.
	R2	The organization has too small financial potential to execute the strategic plans.
	R3	The resources are hardly flexible and difficult to modify.
	R4	There are difficulties with obtaining the information and knowledge about the resources necessary to implement the strategy.
	R5	There are difficulties with increasing the available resource potential according to strategic intentions.
Processes	**P1**	The strategy communication process is ineffective.
	P2	The motivating process does not consider the effects of strategy execution.
	P3	The task delegating process is ineffective.
	P4	The process of controlling the level of strategy execution and identifying the deviations is ineffective.
	P5	The process of reaction to observed deviations (making necessary corrections and modifications) is ineffective.
Measures	**M1**	A set of specific financial and non-financial measures used to strategy execution measurement has not been created.
	M2	The measures of strategy execution process do not reflect all strategic goals.
	M3	Measures of strategy execution process are not related to other measures of company's performance.

	M4	There is no regular strategy execution measurement process.
	M5	The system of measures is not modified during the strategy execution (if necessary).

Acknowledgements

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

Abstract

Empirical research proves that decision-makers are aware of the role of intuition in decision-making processes and, striving to make effective decisions, they try to combine rational and intuitive approaches. However, the question arises whether the use of intuition has a real impact on the effectiveness of the decision-making process.
This article aims at determining the relationship between the approach to decision making used in practice (proving that a certain degree of intuition is used) and the effectiveness, perceived by decision-makers, of decisions made in the professional sphere. The article consists of three parts. The first one is theoretical and attempts to define the concept of intuition and its role in management, especially in the decision-making process. Next, the research method of empirical research is presented. The last part of the article is devoted to the presentation of the cognitive results obtained by the author (quantitative surveys were carried out using the CATI method, which resulted in 300 correctly completed questionnaires).

Keywords: Intuition, Decision-Making Process, Effectiveness.

Introduction

Modern organisation and management sciences are interdisciplinary in nature. They use the achievements of many sciences, such as economics, computer science, cybernetics, statistics, finance, psychology, sociology, cognitive science, heuristics and neuroscience. Concepts that are currently characterized by the highest dynamics of development are those related to the behavioural trend. The behavioural trend affects both macroeconomic areas and the behaviour of enterprises, including their internal decision-making processes (Jędrzejczyk, 2013, p. 9). Due to the variability of the environment in which modern enterprises operate and more and more often the excess than lack of information, with which decision-makers deal, the rational process of cognition and decision-making is no longer the only and sufficient one. Managers are looking for new ways to obtain and interpret information. Intuition begins to play a significant role because not all phenomena and processes can be predicted and planned in a rational way by referring to logical thought processes and previous algorithms of operation (Goldberg, 2000, pp. 51-86).

The analysis of literature on management helps to reveal a specific paradox. The notion of intuition is often used in the theoretical approach when, for example, we define management, the theory of decision making, or paradigms of management. However, there is practically no research and analysis on intuition in organisational practice. The category of intuition is increasingly appreciated by management theoreticians, but its perception is still often pejorative.

Empirical research proves that decision-makers are aware of the role of intuition in decision-making processes and, striving to make effective decisions, they try to combine rational and intuitive

approaches (Malewska, 2018, pp. 189, 192). However, the question arises whether the use of intuition has a real impact on the effectiveness of the decision-making process.

This article aims at determining the relationship between the approach to decision making used in practice (proving that a certain degree of intuition is used1) and the effectiveness, perceived by decision-makers, of decisions made in the professional sphere. The article consists of three parts. The first one is theoretical and attempts to define the concept of intuition and its role in management, especially in the decision-making process. Next, the research method of empirical research is presented. The last part of the article is devoted to the presentation of the cognitive results obtained by the author.

The Concept of Intuition

Intuition is a concept that is not fully recognized and defined because it is one of the properties of the human mind, which still has many secrets concealed from researchers. Scientists agree that intuition exists and is an ability that plays an important role in the process of cognition and decision making. However, when it comes to its essence and its real influence on decision-making processes and practical usefulness, opinions differ (Fields, 2003).

Today's understanding of the word intuition comes from the Latin word "intuitio", meaning persuasion, a hunch. An analysis of dictionaries shows that intuition is most often defined as a hunch, brainwave, feeling, the process of direct acquisition of knowledge, confidence in a specific issue without conscious reasoning and inference (Kopaliński, 2001, p. 235). Intuition is therefore a way of acquiring knowledge and is at the same time the opposite of other types of cognition, especially discursive cognition. This understanding of intuition was advanced and popularised by H. Bergson, according to whom intuition meant the ability to present reality directly and comprehensively. According to the author, this is a more complex ability than thinking and perceiving. He described it as the so-called conscious instinct. It is assumed that the instinct acts unconsciously and is a natural biological phenomenon, and its level depends on a particular organism. According to H. Bergson, the opposite of intuition is the intellect. There is one main difference between intuition and the intellect, namely intuition represents reality as it is, while the intellect distorts it by translating it into its "language" (Dobrołowicz, 1995, pp. 46-47). It is worth noting that the author considered intuitive cognition to be more perfect than intellectual cognition, describing it as the only true cognition. C.G. Jung, who represented a similar view of intuition, understood it as an instinctive understanding of phenomena, things and processes without the need to explain them.

Representatives of management sciences disagree on the areas in which intuition operates. Some argue that intuition is an alogical thought process within the subconscious (Barnard, 1997; Goldberg, 2000; Hogarth, 2001). Others, however, regard intuition as a process of rational decision making (Agor, 1998; Westcott, 1968; Simon, 1987), while the final solution to a decision problem is generated on the basis of a relatively smaller amount of information than in the case of an analytical process. What distinguishes an intuitive decision-making process from a rational one is the assumption that the decision is based on objective data and information as well as on the feelings and emotions experienced by the decision-maker. Still another group of researchers is of the opinion that intuition is knowledge which is obtained in a direct way, without the involvement of the processes of reasoning and inference. However, they stress that it is not a denial of a rational process nor is it of a random character characteristic of guesswork (Sinclair, Ashkanasy, 2002).

[1] The present study assumed that five potential decision-making approaches are used in practice, indicating the relationship between intuitive and rational approaches, i.e. rational, quasi-rational, balanced, quasi-intuitive, and intuitive approaches.

Fig. 1: Areas of intuition

However, authors who study intuition (Sinclair, Ashkanasy, 2005; Csikszentmihalyi, 1996; Klein, 2004) agree that it has several characteristics, namely it:

- is a derivative of the experience gained over many years of practice,
- is a complex phenomenon (it is not sequential),
- is based on a thorough understanding of the situation,
- it draws on classified information resources,
- is a thought process (the result of a sudden brainwave),
- is an unexpected process that cannot be controlled.

A decision-maker, using intuition, integrates a lot of information from different sources. It is both the information stemming from a specific decision situation and the feelings of the decision-maker and the reactions of his or her body. It should be stressed that all sources of information are considered by the decision-maker to be equivalent (Bechara, Damasio, Tranel & Damasio, 1997). Since intuitive decisions are generated on the borderline of consciousness and subconsciousness (Heintzelmann, Trent & King, 2013), the decision-maker is not able to logically justify his or her choice. This means that he or she has knowledge, but does not know where this knowledge comes from, and yet the basis for making a decision is his or her inner conviction as to the rightness of a given choice (Zander-Schellenberg, Remmers, Zimmermann, Thommen&Lieb, 2019).

Intuition is an ability that can and should be used in the organisation's decision-making processes. Assuming that the amount of information is a key factor in the effectiveness of a decision, it is right to say that the usefulness of intuition lies primarily in the fact that it activates the resources of latent knowledge stored in the brain of the decision-maker. This knowledge enriches the resources of information gathered in a rational way and gives a chance for a more effective solution to the problem which requires making a decision.

The Role of Intuition in The Decision-Making Process

Intuition is seen today as a mental ability that can be used in managing organizations, especially in the decision-making process. Many practitioners consider it an important source of cognition. Intuition helps not only to acquire, but also to create new knowledge. Researchers dealing with this issue postulate that it is not an irrational or illogical phenomenon, because it results from many years of practice and experience (Jędrzejczyk, 2013, p. 184). Many authors have proved that intuition is regularly used in business (Parikh, 1994; Agor, 1998; Fields, 2003; Jędrzejczyk, 2013; Malewska 2018).

Intuition is a mental ability that should be used with the greatest intensity by top managers because action at this level requires a response to complex, unique and inimitable situations. Factors taken into account in strategic decisions are very often immeasurable and qualitative. Additionally, the environment in which contemporary organizations operate is dynamic and unpredictable, which translates into a high level of uncertainty. The above factors make it difficult or even impossible to make decisions based on a rational approach where complete information must be taken into account (Buchanan, O'Connell, 2012; Hackbarth, 2008). Therefore, the rational approach is complemented by an intuitive approach. Among the situations in which intuition is most frequently used one can mention:

- a high degree of uncertainty,
- few or no previous precedents,
- many possible solutions to the decision-making problem without a clear selection criterion,
- the pressure of time,
- the variables analysed are poorly predictable in a scientific manner,
- the available data and facts are of little use.

(Agor 1998; Bieniok, Halama and Ingram, 2006, p. 92).

The results of empirical studies prove that the role of intuition in the decision-making process boils down to initiating and completing the decision-making process. In the first case, it involves the formulation of innovative solutions, the generation of which would not be possible with the use of analytical thinking or previously applied methods of action. The second one integrates intuition with rational analysis (Moxley, Ericsson, Charness, Krampe, 2012, pp. 72-78). Analysis enables identification of possible solutions, but its role is primarily to assign weights to decision criteria, while the use of intuition makes it possible to make the final choice. The awareness that intuition exists and is used is a necessary condition for the effective use of intuition. The decision-maker is then open to the possibilities offered by intuition, but also knows in what situations to limit its impact by using rational thinking. Only by juxtaposing intuition with acquired information and facts can the decision-maker act more effectively (Myers, 2004, p. 216-217).

To sum up, one can say that intuition is an essential element of the work of a modern manager, but it should not be the only basis for his or her choices. Management theorists show that decision-makers who manage solely on the basis of intuition make many wrong decisions. However, it should be emphasized that without the use of intuition it is impossible to generate a creative, abstract solution, but each such solution should be verified by making a rational assessment (Bolesta-Kukułka, 2003, p. 259).

Thus, the question arises whether the use of intuition translates into the effectiveness of decisions made. An analysis of the literature on management helps to notice a research gap in this area. Although first publications on the use of intuition in decision-making processes have been published in recent years, they lack systematization and a holistic approach to the issue of intuition in management. This situation suggests that research into the problem is presently at the initial stage. In the previous deliberations, attention of authors writing about the problem in question has focused primarily on defining the concept of intuition, identifying its use in decision-making processes, and defining its types, relations between intuition and experience, situations in which it is applied and the determinants of its effective use (Agor, 1984; Epstein, 1985, 1994; Parikh, 1994; Klein, 1998; Slovic,

2004; Lipshitz and Shulimovitz, 2007; Woiceshyn, 2009, 2011; Dane and Pratt, 2009; Kahneman and Klein, 2009; Salas, 2010; Hensman and Sadler-Smith, 2011; La Pira, 2011; Kowalewski, 2012; Jędrzejczyk, 2013; Malewska, 2018, s. 107). However, there is a cognitive gap in research on the impact of the use of intuition (as regards the diagnosis of the degree to which intuition is used) on the effectiveness of the decision-making process. Research on similar topics was conducted by N. Khatri and H.A. Ng (Khatri, Ng, 2000). The authors sought to determine the importance of intuition in making strategic decisions. This research was the first to investigate the relationship between the use of intuition and the efficiency of an organization's functioning. The key findings of the study on the effectiveness of intuition are as follows:

- intuitive decision making is effective in an unstable environment,
- intuitive decision making is ineffective in a stable environment.

However, the question arises as to the extent to which intuition is used with reference to which the above conclusions are true. Are they valid for both intuitive and quasi-intuitive and balanced decision-making processes? All of these decision-making methods are characterized by the use of intuition, with the difference that it (the intuition) is applied with different intensity.

S. Tokarski is another author dealing with the issue of intuition and its effectiveness. Within the framework of empirical research he aimed at identifying the relationship between economic results of an enterprise and intuitive decision-making (Tokarski, 2006, pp. 275-293). In his research, Tokarski proved the hypothesis that in enterprises achieving better economic results, managers more often admit to making intuitive decisions. There was one limitation of his study, namely it referred only to the respondents' opinions on the use of intuition. As in the case of the study carried out by N. Khatri's team, there was no diagnosis of the way in which decisions were made, proving a certain degree of using intuition and rational analysis. A similar study aimed at determining the impact of intuition on the functioning of organisations in various areas was also conducted by the following researchers: Sadler-Smith (2004) in the area of small enterprises; Houghl and Ogilvie (2005) in the area of preferences in strategic decision making; Leybourne and Sadler-Smith (2006) in the area of project management; Ritchie (2007) in the area of non-profit organisations; Elbane and Child (2007) in the area of effectiveness of strategic decisions (Malewska, 2018, p. 114). However, these studies did not address the issue of identifying the extent to which intuition is used and its impact on the effectiveness of decisions made.

The Research Method of The Empirical Study

The study assumed that intuitive potential and the use of intuition in the decision-making process are two separate concepts. The first one results from personality traits, abilities and predispositions predisposing the decision-maker to use the intuition in decision-making processes. The second one, on the other hand, shows the actual degree of using intuition in decision-making processes. This means that the decision-maker may have a high intuitive potential, but may not use it in practice. Ultimately, the level of intuition use in decision-making is determined by both internal (e.g. preferred way of obtaining and processing information, style of thinking, experience, type of personality) and external factors (e.g. structure of the decision-making problem, organizational culture of the organization or decision-making conditions) (Malewska, 2018, p. 148). Achieving the goal of determining the impact of intuitive decision-making on the effectiveness of decision-making processes required the author to develop a tool for determining the level of intuitive potential of the decision-maker and the extent to which intuition is used in the practice of decision making (questionnaire). The starting point for the formulation of a part of the questionnaire that aimed at diagnosing the level of intuitive potential was the description of an intuitive manager proposed in the literature, and the questions contained therein were intended to determine the degree to which the respondents possessed the features, abilities and predispositions attributed to an intuitive decision-maker. This part of the questionnaire included 12 closed questions. The respondents could choose between two potential answers, one of which testified to the superiority of the intuitive potential and the other to the superiority of the analytical potential. The part of the questionnaire which aimed at determining the level of intuition use in decision-making processes was formulated based on the

description of two extreme approaches used in decision-making: rational and intuitive. The analysis and critical evaluation of Polish and foreign studies allowed the author to identify aspects of the decision-making process that were taken into account in order to diagnose the extent to which intuition was used in decision-making (the relation between rational analysis and intuition). These aspects were at the same time the criteria for operationalisation and differentiation of intuition and rational analysis. They included location of the decision problem, the way of solving the problem, evaluation of other decision variants, approach to risk and uncertainty, use of information source, application of information processing procedures, documenting the decision process, involvement of the decision-maker in the decision process, logic of thinking, awareness in action, the ability to present the decision process. In this way, 12 closed questions were created, which the respondent could answer by choosing one of the two possible answers. This choice, in the case of each of the questions, clearly indicated the use of one of the two approaches to making decisions: rational (analytical) or intuitive in a given aspect of the decision-making process.

The research procedure was based on the cognitive theory of the continuum, according to which analytical and intuitive approaches to decision making coexist in management practice. These are two opposing approaches to making choices. In practice, there are rarely "pure" variations of these decision-making styles. Most often decision-makers represent combinations of these two ways of cognition and thinking, namely quasi-intuitive (the advantage of intuitive approach over analytical approach), balanced (balancing both approaches), or quasi-rational (again meaning the advantage of analytical approach over intuitive approach).

The classification of individual decision-making methods was based on the following assumptions:

- 11-12 answers given by the respondent for intuition meant using the intuitive approach,
- 8-10 answers given by the respondent for intuition meant using a quasi-intuitive approach,
- 6-7 responses given for analysis or intuition meant using a balanced approach,
- 8-10 responses given for analysis meant using a quasi-rational approach,
- 11-12 answers given by the respondent for analysis meant using a rational approach.

In order to measure the effectiveness of decisions made by the respondents, self-assessment was used. Respondents were asked to evaluate, on a scale from 1 to 5, the effectiveness of their professional decisions (1 meant ineffective decisions, 2 – little effective, 3 - average effective, 4 - effective, 5 - optimal). In the future, the author plans to use a more complex approach to the issue of the effectiveness of decision-making processes. It can be assumed that the application of the experiment technique would provide interesting information on the impact of intuition on the effectiveness of decision-making processes. However, the results obtained in this way would constitute only individual exemplifications. They would not be a basis for drawing general conclusions.

In order to identify the correctness between the decision-making approach used by the respondents and the assessment of the effectiveness of the decision-making process, a one-way analysis of variance for independent groups - the so-called Kruskal-Wallis test - was used. This decision was motivated by the fact that the use of this test does not require meeting a number of assumptions (compared to the ANOVA analysis). The only necessary conditions for its application are the following two assumptions:

- the dependent variable should be measured on at least an orderly scale (it can also be measured on a quantitative scale),
- observations in the analysed groups should be independent of each other, which means that a person in one group should not be a member of another group under comparison (King and Minium, 2009, p. 573).

The author is aware that the use of the questionnaire in an empirical study, especially in relation to such a complex phenomenon as intuition, has its limitations. The basic ones result from the fact that the answers obtained in this way are burdened with a certain degree of subjectivity of the respondents' assessments, which may represent their opinions to a greater extent than the reality

which they are supposed to describe. In order to reduce this risk, pilot studies were carried out and the reliability of the tool was analysed by verifying its internal consistency (the questions that significantly reduced its consistency were removed).

Quantitative surveys were carried out using the CATI method, which resulted in 300 correctly completed questionnaires.

Results of The Empirical Study

Table 1: Verification of the equality of the distribution of the variable "intuitive potential" depending on the self-assessment of the effectiveness of decisions taken in the professional sphere

Zero hypothesis	Test	Significance	Decision
Distribution: Level of intuitive potential - the values are the same for the variable category: evaluation of decision effectiveness (on a scale of 1-5)	Kruskal-Wallis test for independent samples	0.788	No grounds for rejection of the zero hypothesis
Asymptotic significance is presented. The level of significance is 0.05.			

The result of the test shows that there are no grounds for the rejection of the zero hypothesis, assuming no significant differences in the distribution of variables under analysis, in favour of an alternative hypothesis ($p>0.05$). This means that there are no differences in the distribution of the variable "level of intuitive potential depending on the assessment of decision effectiveness".
Despite the lack of statistically significant differences in the distribution of these variables, their analysis was carried out by comparing the size of the groups of decision-makers surveyed who were diagnosed as decision-makers with a predominance of intuitive, analytical or balanced potential with assessments of the effectiveness of their decisions. We see that the highest percentage of respondents (20%) who evaluated the effectiveness of their decisions came from a group of decision-makers who predominantly use the intuitive potential. Similarly, in a group which predominantly used the analytical potential, the percentage was 16%, whereas in a group with balanced intuitive and analytical potential it was only 4%.

Table 2: Structure of respondents characterized by the predominance of intuitive, balanced and analytical potential, including self-assessment of the effectiveness of decisions taken in the professional sphere

	Assessment of the effectiveness of decisions taken in the professional sphere					
Approach to decision making	Score 1 (number)	Score 2 (number)	Score 3 (number)	Score 4 (number)	Score 5 (number)	Total
Superiority of intuitive potential	-	-	8	75	21	104
Balancing the intuitive and analytical potential	-	2	5	39	2	48
Superiority of analytical potential	-	-	7	118	24	149

Table 3: Verification of the equality of the distribution of the variable "method of decision making" depending on the self-assessment of the effectiveness of decisions made in the professional sphere

Zero hypothesis	Test	Significance	Decision
Distribution: Method of decision making - values are the same for the variable category: evaluation of decision effectiveness (on a scale of 1-5)	Kruskal-Wallis test for independent samples	0.117	No grounds for the rejection of the zero hypothesis
Asymptotic significance is presented. The level of significance is 0.05.			

The test probability is greater than the standard value of 0.05 ($p > 0.05$). Therefore, it can be concluded that there are no grounds for the rejection of the zero hypothesis stating that there are no differences in the distribution of the variable "method of decision making" depending on the assessment of the effectiveness of decisions taken by decision-makers in the professional sphere.

Table 4 presents the results of the empirical study into the structure of respondents representing particular approaches to decision making, taking into account the level of effectiveness of decisions assessed by the decision-makers.

Table 4: Structure of respondents representing particular approaches to decision making including self-assessment of the effectiveness of decisions made in the professional sphere

	Assessment of the effectiveness of decisions taken in the professional sphere					
Approach to decision making	Score 1 (number)	Score 2 (number)	Score 3 (number)	Score 4 (number)	Score 5 (number)	Total
Intuitive and quasi-intuitive	-	2	2	28	15	47
Balanced	-	-	13	127	13	153
Rational and quasi-rational	-	-	4	77	19	100

On the basis of the data obtained, we can conclude that regardless of the approach to decision making used, the vast majority of the decision-makers surveyed assess their decisions as effective (77%) or even optimal (16%). Only 6% of the respondents assessed the level of effectiveness of their decisions as average. None of the analysed managers chose the "ineffective" option, and only 1% considered their decisions to be little effective. This may be caused by a phenomenon of succumbing to the factor of social approval (meaning a change of behaviour, opinion or feelings as a result of the influence of other people, in this case it may be manifested in the respondents' motivation to present correct, appropriate behaviour in the eyes of the researcher and to present a professional image of oneself (Tyszka, 2000)).

As regards the approach to decision making where the respondents treated the effectiveness of their decisions (optimal decisions) as most important, we see that the highest percentage of responses indicating the choice of the highest effectiveness rating (score 5) was observed in the case of decision-makers representing intuitive and quasi-intuitive styles (32%). The second place was taken by a group of decision-makers using a rational and quasi-rational approach. Out of this group, 19% of decision-makers assessed their decisions as optimal. In the case of decision-makers using the balanced style, the percentage of assessments with the highest effectiveness rating was only 9%.

Conclusion

Globalization, technical and technological changes, development of knowledge-based economy, high dynamics of changes, as well as economic and financial crises are the conditions for the functioning of modern enterprises. It is difficult to deal with these challenges in a rational way. That is why today's managers more and more often use their intuition in decision-making processes. On the one hand, intuition fills the information gap in case of the necessity to make decisions in conditions of insufficient information, on the other hand, it acts as a kind of filter in the situation of information noise. It is also an invaluable source of innovative and creative decision-making solutions. More and more often, intuition appears on the lists of desirable managerial competences. Unfortunately, the results of empirical research (Malewska, 2018) indicate that the dominant potential among managers is analytical potential (49% of managers surveyed). Intuitive potential outweighs analytical potential only in 35% of the decision-makers surveyed. Despite the predominance of analytical potential, the most frequently used approach to decision making is a balanced approach combining intuitive and analytical approach (51% of respondents). The second place was taken by a quasi-rational approach (29% of the managers analysed). In 15% of the management staff analysed, the use of a quasi-intuitive approach was identified. It can be noted that having a certain potential is not the same as using it in practice. This means that the use of intuition in decision-making depends not only on the potential (intuitive or analytical), but also on external factors related to the environment in which decisions are made and internal factors related to the characteristics of the decision-maker (his or her traits and personality type, predispositions, preferred way of obtaining and processing information, etc.). The fact that intuition is more and more often used in the practice of making business decisions, balancing, supplementing or dominating over rational analysis remains unchanged. This raises the question about the effectiveness of decisions made with the use of intuition. In the empirical studies conducted by us, it was not possible to prove the existence of statistically significant relationships between the potential of the decision-maker (intuitive, balanced or analytical) and the effectiveness of decisions made in the professional sphere. Similarly, there were statistically significant relationships between the approach to decision making used in practice and the evaluation of its effectiveness. This could have been caused by too small a research sample (300 top-level managers were surveyed). Despite the lack of differences in the distribution of variables analysed, certain tendencies can be observed, namely:

- the highest percentage of respondents (20%) who assessed the effectiveness of their decisions as most important came from the group of decision-makers who predominantly resorted to the intuitive potential,
- the highest percentage of responses indicating that effectiveness was chosen as most important (score 5) was recorded for decision-makers representing intuitive and quasi-intuitive styles (32%).

This means that decision-makers who predominantly use the intuitive potential and those who were diagnosed as using intuitive or quasi-intuitive approaches will give the highest ratings to the effectiveness of their business decisions.

In order to confirm the existence of statistically significant relationships between the use of intuition and the effectiveness of decisions taken, it seems justified to conduct a similar study on a larger sample. It is also desirable to develop an objective tool for measuring the effectiveness of decisions, as the presented surveys referred only to the subjective assessment of respondents. Interesting information could also be obtained by comparing the way in which decisions are made and their effectiveness with the factors determining the degree to which intuition is used.

Acknowledgment

This study in the area of intuition was conducted within the research project “The impact of managerial intuitive potential on the effectiveness of decision making processes”, financed by the

National Science Centre, Poland (funds allocated on the basis of decision No. DEC-2014/13/D/HS4/01750).

Abstract

The Dynamic Capabilities View considers the specific category of capabilities which enable companies to change their resource base aimed at adapting to business environment changes and achieving a long-term competitive advantage. In turn, dominant logic is perceived as the manner in which managers conceptualize business reality; thus it is connected with the issue of how organizations develop and choose their own path of development. The aim of this article is to discuss dominant logic as a micro-foundation of dynamic capabilities. The results presented are a part of a wider project on the dynamic capabilities of Polish enterprises. This study finds that regional airports differ in relation to their dominant logic and thereby attitudes to shaping dynamic capabilities. The research findings contribute to the scientific discussion on dynamic capabilities micro-foundations and the dominant logic concept. The results also give an overview on airport management issues.

Keywords: Dominant Logic, Dynamic Capabilities, Airport Management.

Introduction

The Dynamic Capabilities View introduced by the research team of Teece (1997; 1994) is discussed mainly in line with two fundamental articles: the work of Teece's team (1997) – cited according to the Scopus Database (accessed: 19.01.2020) more than 12,600 times; and an article by Eisenhardt and Martin (2000) – with more than 6,200 citations . The Dynamic Capabilities View acknowledges the significant role of combining both internal and external perspectives relating to a firm's performance: its resource-base and the environmental changes it copes with. 'Dynamic capabilities' are competences which enable organizations to modify their resource base over time since these shape an ability to face or even create a dynamically changing business environment (Helfat et al., 2007; Teece et al., 1997).

The research team of Teece (1997, 1994) distinguishes three categories of micro-foundations for dynamic capabilities: resources and skills, processes and procedures, and path dependency. This part of the research examines dominant logic as a micro-foundation; understood as a mind-set, an organizational filter that is used in the decision-making processes and which guides strategic action (Bettis and Prahalad, 1995; Obłój and Pratt, 2005). Dominant logic provides an overview of how managers/entrepreneurs think. Research on dominant logic suggests that it shapes the decision making processes and is built over time (Obloj et al., 2010).

Through conducting direct interviews with the top managers of four Polish regional airports, this qualitative study shows the dominant logic category to be one of the micro-foundations which constitute the process of shaping dynamic capabilities. The contribution of this article is not to recommend optimum resource reconfiguration, but to examine areas which could be considered

during a study on dominant logic as a crucial micro-foundation in the process of shaping dynamic capabilities.

The paper is organized as follows. Section 2 presents the theoretical framework of the Dynamic Capabilities View and the concept of dominant logic. Section 3 presents the research sample and methodology, and Section 4 presents the research findings. In the last section the research limitations and recommendations for further research are given.

Dynamic Capabilities and The Dominant Logic Concept

There is a scientific discussion regarding the influence of dynamic capabilities on company performance. On the one hand there is an assumption that competitive advantage should be considered through the dynamic capabilities perspective (Teece and Pisano, 1994), since dynamic capabilities can improve organizational effectiveness (Zollo and Winter, 2002) and enable a company to achieve excellent resource orchestration which, in turn, facilitates implementing innovations, capturing value and finally achieving long term financial profit (Teece, 2007). Thus the Dynamic Capabilities View perceives these competencies as factors of competitive advantage (Helfat and Peteraf, 2009).

But on the other hand there is a more sceptical point of view, with greater significance for company performance being ascribed to resource reconfiguration, not dynamic capabilities (Eisenhardt and Martin, 2000). Moreover, there is a criticism regarding the ambiguity and tautology of the dynamic capabilities category (Arend and Bromiley, 2009); however, these objections are considered and rebuffed by dynamic capabilities researchers (Helfat et al., 2007; Kuuluvainen, 2012).

Within the Dynamic Capabilities View it is highlighted that dynamic capabilities are embedded in organizational processes (Wang and Ahmed, 2007) and shaped by organizations (Makadok, 2001; Teece and Pisano, 1994). Teece (2007) disaggregates dynamic capabilities into three categories: sensing (and shaping) new opportunities, seizing opportunities, and reconfiguring capabilities; thanks to which an organization can build and maintain a competitive advantage. So far no appropriate methodology has been established for analysing dynamic capabilities. Nevertheless, researchers highlight that applying the dynamic capabilities perspective facilitates explanations of different business performances and therefore, more studies are necessary (Barreto, 2010).

Dynamic capabilities are analysed in the context of innovations capabilities (Ren et al., 2016; Wall et al., 2010; Zahra and George, 2002b); knowledge creation, including an absorptive capacity (Zahra and George, 2002a); and organizational routines (Zahra et al., 2006). The studies on dynamic capabilities are also related to dynamic managerial capabilities (Adner and Helfat, 2003; Martin, 2011), which are defined as 'the capabilities with which managers build, integrate and reconfigure organizational resources and competences' (Adner and Helfat, 2003, p. 1012). This line of analysis considers individuals in the perspective, which according to Felin and Foss (2005) is crucial in understanding organizational routines, capabilities and analysing the whole organization. Research on the Dynamic Capabilities View also comprises the concept of dominant logic (Kor and Mesko, 2013), which appears to provide interesting and important additional information regarding shaping dynamic capabilities and their nature.

Dominant logic is a construct which links the perspectives of diversification and business performance. It is argued that the success of business diversification rests in the quality of management. In particular, Bettis and Prahald note that abilities to learn and acquire new skills are crucial aspects in business success or failure (Prahalad and Bettis, 1986). Bettis and Prahald distinguish two types of 'logic' in organizations: the dominant general management logic, which they define as 'the way in which managers conceptualize the business and make critical resource allocation decision'; and dominant logic, perceived 'both as a knowledge structure and set of elicited management processes' (Prahalad and Bettis, 1986, p. 490).

During research deliberations Bettis and Prahald developed their thinking on dominant logic. They went from a diversification-oriented attitude to analysing dominant logic in terms of environmentally-driven changes (Bettis and Prahalad, 1995). Kor and Mesko suggest that at the very start of a business, the dominant logic of an organization is consistent with the dominant logic of its manager. They argue, in line with Felin and Foss (2005), that the perspective of individuals matters. The same assumption is made by Krogh and Roos (1996) who consider dominant logic as it relates to managers' perspectives as well.

Dominant logic is also related to knowledge management processes, and so the way managers perceive external changes (Brännback and Wiklund, 2001). The literature assumes that 'the manager's knowledge is closely related to his observations of a business environment' (Krogh and Roos, 1996, p. 732), therefore this highlights that a given manager's logic is developed through the interactions between a particular business and its environment (Kor and Mesko, 2013), which suggests that contextual aspects need to be considered when studying dominant logic.

Dominant logic is embedded in routines and organizational procedures as well as resources. It provides managers with certain mental schemas with which they monitor and interpret their business reality (Kor and Mesko, 2013). It is suggested that dominant logic delivers solutions to overcome the threat of information overload and ambiguity. But on the other hand it is pointed out that dominant logic can also supply a limited schema, within which organizational decisions and actions can get stuck.

Based on the concept of Adner and Helfat (2003), Kor and Mesko (2013) argue that a manager's dominant logic is shaped through the three constituencies of managerial capabilities: managerial cognition, social capital and human capital. Managerial cognition determines how a manager thinks, perceives and interprets the world in relation to his/her experience (successes as well as failures). The human capital of a manager relates to the heuristics and assumptions which he/she uses during the decision making process. These heuristics are shaped by specific knowledge and managerial skills, as well as by the business context. The networking of a manager defines his/her social capital. In turn, the relationships and interactions of colleague are used for filtering information and helping managers make assumptions.

The effect of the dominant logic that exists in a given organization is pervasive, as it permeates the whole organization (Bettis and Prahalad, 1995). This insight can lead to the conclusion that any certainty in pinpointing dominant logic can be difficult to achieve by a researcher. Dominant logic is criticized because of its limited applicability both in management practice and academic research (Grant, 1988). Therefore, it can be concluded that the concept of dominant logic should be enriched with the operationalization of its characteristics. The questions arises, how to operationalize the intangible 'resource' which permeates so many organizational phenomena. Obloj et al. (2010) propose an operationalization of dominant logic into four categories (proactiveness, external opportunities orientation, learning, and codification of routines). They suggest that dominant logic is a useful concept for examining the differences in firms' performance and success; however, more research is necessary to refine the dominant logic concept.

The Research Sample and Methodology

The air transport market is assumed to be important for the economic growth of a region and so of a country and its regional attractiveness (Huderek-Glapska, 2019). With a view to understanding the characteristics of the air transport sector one may note and take into consideration its highly regulated legal nature. In the case of Poland it is necessary to add that all airports are under public ownership, with the shares held by the Polish Airports State Enterprise or the local/regional authorities.

The air transport literature (Doganis, 2005; Graham, 2008) highlights that in recent years the way of perceiving an airport has evolved. An airport was traditionally seen as a public utility whose main goal was to serve society in providing transport for passengers and cargos, but nowadays the economic aspects of airport activities are emphasized. The process of liberalization and the increasing

activity of low cost carriers has forced airports to find new ways of competing to meet on the one hand, customers' needs; and on the other hand, to respect the legal regulations (Dobruszkes and Graham, 2016; Forsyth, 2012). Therefore, the research on capabilities which enable an airport to perform effectively in the market has gained the attention of airport researchers (Graham, 2008).

According to the data of the Polish Civil Aviation Authority in 2018 fourteen airports handled commercial passenger traffic, the total number carried (regular and charter, both national and international) being estimated at 45.7mln. Nevertheless, it should be highlighted that Warsaw Chopin Airport, which is the central airport of Poland, has about 29% (17.7mln) of this. The passenger traffic of other airports is much lower. Only six airports (Krakow, Gdansk, Katowice, Wroclaw, Warsaw/Modlin and Poznan) exceeded 1mln passengers (in fact each of them carried more than 2mln in 2018), while the other seven (Rzeszow, Szczecin, Lublin, Bydgoszcz, Lodz, Olsztyn and Zielona-Gora) handled less than 1mln. It should be highlighted that Radom Airport is also registered as a commercial airport, but in recent years it has met problems to find contractors – regular airlines to operate in market regularly. It should be mentioned that each Polish regional airport has its own characteristics, which are not discussed in this article. Because of its totally different scope of activity the central airport of Warsaw Chopin was excluded from the research procedure.

The research procedure is based on the assumptions of Cyfert and Krzakiewicz (2017), who indicate five phases in the dynamic capabilities shaping process: opportunities searching, learning, configuring and reconfiguring, coordinating, and adaptation. The aim of the research was to identify the dominant logic(s) of regional airports in Poland in the context of shaping the dynamic capabilities process. This aim was supported by two operational questions:

1) What are the differences in the dominant logic of regional airports from a shaping dynamic capabilities point of view?
2) How does dominant logic affect the process of shaping dynamic capabilities at regional airports?
The part of the research discussed comprises four in-depth interviews conducted in February 2019, with top managers (a director or a CEO) who were aware of the strategic management of an airport. Two interviews were carried out with the managers of small airports (having less than 1mln passengers yearly) and two with managers of large airports (having more than 1mln passengers yearly). The researchers have undertaken not to reveal the names of the airports examined, thus they are called as follows: the small as S1 and S2, and the large B1 and B2. The aspects considered regarding dominant logic are presented in Table 1.

Table 1: Aspects of dominant logic

Perspective	Characteristics
Openness to environment	-What are airports' attitudes to sensing new opportunities? -What kinds of activities are taken by airports to follow environmental changes? -How do airports perceive environmental dynamism? -How are airports engaged in shaping relationships with their stakeholders?
Internal circumstances	- What are the overall attitudes to implement new solutions? - What are the workers attitudes to changes?
Organizational structure	-What are the characteristics of organizational structure at an airport? - What kinds of communications exist at an airport? -How often do airports change their organizational structure?
Customer orientation	-Who are the customers of airports? -How do airports care for their customers? -How do airports follow their customers' needs?
Learning processes	-How do airports learn? -What are the organized learning processes at airports like? -What are the employees' attitudes to learning?

Safety and security vs. implementing new ideas	-What are airports' attitudes to implementing new ideas in term of safety and security regulations?
Business model	-How often do airports change their business model? -Why do airports change their business model?

Source: Authors' own work.

It should be noted that the airports chosen for interview have been operating in market for more than 10 years, so it can be assumed that their dominant logic has been established over the years, which is important for comparing individual dominant logics (Obloj, Obloj and Pratt 2010).

Results and Conclusions

The following Tables (2-7) present the result of this dominant logic case study. The data gathered cannot be generalized because of the small sample; however, they give a brief overview of the emerging dominant logics of regional airports.

Table 2: Perspective of the approach to environmental changes

Airport	Approach to environmental changes
S1	The airport is pro-activity oriented. In particular it focuses on scanning the environment. Most changes in an airport's environment are legally determined, which requires an ability to anticipate and interpret them. In addition, the airport attempts to follow the development of the region in which it operates. Airports seek business partners to deliver investments in the region and it takes an active part in shaping relationships with its stakeholders.
S2	The airport is highly opportunities-searching oriented and takes into consideration the external circumstances of the business environment. It is involved in cooperation with local entities. Each new idea undergoes comprehensive analysis, since all the time the must airport stay focused on sensing and seizing new opportunities which they can benefit from.
B1	The airport follows and even anticipates environmental changes and in the opinion of the CEO it succeeds. According to the CEO of the airport there is an atmosphere favourable to seeking and analysing new solutions. Opportunities searching as well as anticipating competitors' activities are vital for an airport's competitive advantage.
B2	The airport needs to be oriented in particular to observing and anticipating changes in the legal regulations, while they very often carry out the requirements of technological infrastructure adjustments. Most regulations deal with safety and security adjustments, so there is a need for planning and coordinating activities to meet all mandatory requirements.

Source: Authors' own work.

Table 3: Internal approach to implementing new ideas

Airport	Internal approach to implementing new ideas
S1	Implementing new ideas is greatly limited by legal regulations. Airport activities have to be documented and reported, thus it is hard to implement something new very quickly. The number of employees is purposely limited to optimize the fixed costs. In addition, the workers need to be multi-task oriented and have a wide knowledge regarding airport activities.
S2	All new ideas are welcome but undergo a more comprehensive analysis. The airport reduces the formalization of activities to the legally required level. Nevertheless, the airport suffers from shortages of financial and to some extent human resources, thus it attempts to optimize resource use.
B1	The safety and security dimension is highly formalized and standardized; however, the

	safety criteria should not be an excuse for seeking new solutions.
B2	The issue of safety in the passenger flow precedes most of the delivered changes. There is a little space for creativity and implementing an outstanding new idea.

Source: Authors' own work.

Table 4: Organizational structure

Airport	Internal approach to implementing new ideas
S1	The airport is relatively small, thus its organizational structure is quite simple though highly centralized. The airport CEO decides about the configuration of the organizational structure which is divided into two main perspectives: operational and administrative. The operational part comprises the majority of employees and its activities are more formalized than in the administrative part. The airport takes advantage of outsourcing HR services and other administrative tasks, which in the opinion of the CEO enables the fixed costs to be optimized.
S2	Since airport activities are greatly dependent on legal regulations, many activities need to be formalized; however, the airport attempts to reduce the level of bureaucracy. There are few organizational divisions; e.g. financial, commercial and operational; nevertheless there is an objective to improve internal flexibility.
B1	The organizational structure follows current needs and it is changed two or three times a year. Although the airport's activities are relatively formalized in nature, the CEO encourages employees to cooperate and communicate horizontally, and expects managers to take responsibility for their actions; however, they are not especially keen to fulfil these expectations.
B2	The organizational structure is highly rigid. Communication and performed activities are formalized. Some projects are delivered through project teams, but in general each organizational post has got its own set of duties and official channels of communication exist.

Source: Authors' own work.

Table 5: Orientation to customers' needs

Airport	Orientation to customers' needs
S1	The airport considers customer-passenger needs; however, customers are not only perceived as passengers, but also in terms of an airline or society in general. Thus the airport seeks new directions of development, such as involvement in new projects like cargo-based delivery. This activity is important not only for airlines which transport cargo, but also for society in the sense of e-commerce business development. As for passenger needs, a small airport that has low convenience for the business and tourist industry markets, is not an attractive partner for airlines. Therefore, the number of offered destinations is low which has an influence on passengers' opinions about the airport.
S2	The CEO of S2 declares a customer-oriented approach; however, a small airport offers a limited number of destinations and flights, therefore it can be assessed as not being attractive for some passengers. From a customer-airline approach, it attempts to be a flexible and active partner in shaping a connection network.
B1	In opinion of the CEO the airport meets and even anticipates passenger expectations, in particular from a resource-based point of view. The CEO encourages the workers to fly on business trips, to experience the role of a passenger and observe all the areas which require improvement. The airport is also active in meeting airlines' expectations.
B2	The CEO of B2 declares that the airport is focused on passenger needs. The airport attempts to meet all the requirements regarding passenger comfort and security. Therefore they endeavour to minimize and control inconveniencies. It is also focused on meeting the needs of airlines.

Table 6: Orientation to learning

Airport	Orientation to learning
S1	The fundamental issue of learning is knowledge of the legal regulation. At the operational dimension knowledge regarding procedures is critical for safety and security, and know-how of airport operations. Each worker needs to meet the learning requirements (determined by law) as knowledge management is rather based on legal regulations. The crucial issue is employee awareness that learning matters. From an organizational viewpoint the airport is based on benchmarking, and seeking possibilities on how to earn apart from aeronautical activity.
S2	A relatively high level of awareness of learning processes exists within the airport. The workers are focused on learning and they eagerly participate in training. However, knowledge management and learning are generally rather intuitional. The airport uses some benchmarks, and observes its competitors. There is a lack of deeper cooperation in knowledge sharing within the sector because airports compete with each other, so 'know-how' is a strategic resource.
B1	The airport attempts to learn from others, but is relatively similar (regarding scale and business model) to its competitors. In general, learning processes are constituted by legal regulations. There is no internal system of learning, rather it is learning from current situations.
B2	Learning processes are not persistent in all dimensions of airport activity. As for technological solutions the airport managers participate in external training to familiarize themselves with a given functionality. There are no procedures for knowledge management. The airport observes its competitors using benchmarks, but it is hard to characterize the airport as a 'learning organization'.

Table 7: Business model

Airport	Business model
S1	The business model of airport S1 has not changed significantly over time. The airport is focused on delivering safe and undisturbed passenger flow.
S2	The business model has not been changed significantly over the years; however, the airport attempts to anticipate and follow environmental changes.
B1	The business model of airport B1 follows environmental circumstances. The airport is focused on economic effectiveness.
B2	The airport attempts to adjust its business model to market circumstances. Since the air transport market is dominated by the activities of low cost carriers that generate passenger flow, the airport needs to follow such expectations.

Source: Authors' own work.

During the research it was observed that the regional airports analysed had certain commonalities in their dominant logic; however, different ways of thinking by managers was also noticed. The case study analysis suggests that dominant logic is embedded in organizational processes, which is highlighted in the literature (Obloj et al. 2010) and therefore it does not appear to be simply a metal schema of managers.

In all cases it is highlighted that learning processes are based on legal requirements which are then formalized. But learning as proactive attitude appears to be intuitional, dependent on individuals. The next commonality is the rigidity of organizational structure, which hinders vertical communication and organizational flexibility. Nevertheless, in two cases (B1 and S2) the respondent suggested efforts to reduce redundant (unnecessary) bureaucracy.

From a shaping dynamic capabilities perspective an observation can be formed that regional airports are oriented to searching for and anticipating opportunities; however, they meet external and internal

barriers that hinder their adjustment and development. The process of shaping dynamic capabilities requires an orientation to learning. This article suggests that airport managers should pay attention to internal processes, particularly learning processes and flexible attitudes to shaping the resource base of airports aimed at economic effectiveness and airport development from a long term perspective. Taking into consideration the dominant logic aspect this could be a useful tool for analysing airport business, including for practitioners.

Research limitations and further directions

A few research limitations should be mentioned. Firstly, dominant logic is an intangible asset, complex in nature (Bettis and Prahalad 1995), which makes it difficult to capture and characterize. Thus the analysis presented does not show all of its important constituents. Secondly, personal interviews are influenced by subjective opinions, and this presents the second limitation. On one hand respondents could decide not to share all the important information because of its strategic significance, on the other hand they could present a more positive depiction of their business reality. Thirdly, the sample was small and the results cannot be generalized; however, they can be a starting point for future research in the area of dominant logic.

In line with the assumption that dominant logic is determined by the environmental context (Kor and Mesko 2013), it should be mentioned that the dominant logic of Polish airports is influenced by local public-ownership strategies (regional, local authorities, Polish Airports Enterprise) as well as central government strategies and legal regulations, both national and international. This suggests that studies on dominant logic also need to include other stakeholders' points of view and more research is necessary.

Moreover, airport activities comprise different entities (such as holding agents), whose points of view have not been analysed during the research. Nevertheless, it could be an interesting area of research as to how the goals of different stakeholders shape dominant logic.

Acknowledgment

The results presented are a part of a wider project on the dynamic capabilities of Polish enterprises. The research project no. DEC-2013/11/B/HS4/00697 financed by the National Science Centre Poland.

Abstract

The innovativeness, as a characteristic of an innovative enterprise, has not, also, a synthetic indicator. In the references, there are many various approaches to the innovativeness measurement process. The objective of the paper is to present the logit models for assessment of the enterprise innovativeness.

Keywords: binomial logit model, innovation, level of innovation**,** manufacturing enterprise**.**

Introduction

The manufacturing enterprises, to survive, must develop uninterruptedly. The enterprise development is often connected with the innovativeness. "The innovativeness and innovations are the notions that are not equivalent by strictly interconnected with each other. It is since the innovativeness is measured by the number of created and implemented innovations and the outlays intended by the enterprise involved for this scope" [Gałganek-Napierała, 2011]. At the present state of the knowledge, there no systematised meters for assessment of the innovativeness level of the enterprises acting in the common market. The innovativeness, as a characteristic of an innovative enterprise, has not, also, a synthetic indicator. In the references, there are many various approaches to the innovativeness measurement process. The objective of the paper is to present the logit models for assessment of the enterprise innovativeness.

Innovation – a Definition

In the references of the subject matter, the best known definitions of the innovations have been worked out by J.A. Schumpeter and P.F. Drucker. The first of the creators has defined the innovations as "launching, into production, of the new products or improvement of the existing ones, improvement or implementation of a new production process (process innovation), development of a new product distribution way, opening of a new market, application of new materials, raw materials

for production, introduction of a new production organisation" [Schumpeter, 1960]. The other author, in 1992, defined the innovations as "systematic actions that consist in an active identification of changes in the surrounding and in a systematic analysis of their possibilities of use for creation of subsequent innovations" [Drucker, 1992]. The contemporary definitions of innovations, in the references, are described, in a narrow perspective, as a commercial launching of a novelty [Freeman, 1986], [Griffin, 1996], [Oslo Manual, 2005] or, widely, as a multistage, purposeful process or its effect, which is an advantageous change [Lee, Olson, Trimi, 2012], [Schippers, West, Dawson, 2012], [Tavassoli, Karlsson, 2015]. At this place, it should be agreed with the sentence presented by J. Robinson - "it is easier to show what an innovation is than to define it" [Robinson, 1983].

Innovative Enterprise

In the subject matter references, the innovative activity is defined as the entirety of the scientific, technical, organisational, financial and commercial actions that lead or have, in a further perspective, to lead to implementation of innovations. Into the innovative activity, the research and development (R + D) is also included, that is not directly connected with creation of a specific innovation [Oslo Manual, 2005], [Tiwari, 2008], [Statistics Finland, 2016]. In Poland, this definition is used by the Main Statistical Office (Główny Urząd Statystyczny) in their publications [GUS Szczecin, 2014]. Somewhat differently, the innovative activity problem is defined in the Polish legislation. In the article 2 of the Act dated 30 May 2008, concerning some forms of supporting of the innovative activity (Journal of Laws Dz.U. nr 116, poz. (item) 730), by an innovative activity, it is called "the activity consisting in development of a new technology and starting, on its basis, to manufacture new or significantly improved goods, processes or services" [Ustawa, 2008]. When analysing the innovative activity definitions occurring in the references, for the most important factor characterising the notion, it may be considered each activity of the enterprise that contributes to create the innovation. Basically, there are no big discrepancies between the definitions of the problem.

Contemporary enterprises develop through implementation of an innovation management model. The model is based on the delivery, to the market, an attractive offer that makes use of the qualitative development factors. The development is based, at a high degree, on the intellectual resources of the enterprise. The possession, by the firm, of the resources is one of the features of an innovative enterprise. „The basic definition of an innovative firm says that it is an enterprise that has implemented, in a given time, at least one innovation while an innovative firm in the product or technology sphere has been defined as a firm that has implemented an innovation within the scope of a product or within the scope of a technology. It may happen that, in the period under consideration, firms conduct the innovative activity but they do not do an actual implementation of innovations. Any and all activities connected with working out or implementation of innovations, including the implementations foreseen in the future, are encountered in the innovative activity" [Oslo Manual, 2005]. The innovative activity conducted in the period under investigation may be of the following character:

a) a successful activity, i.e. such finished with a success, a successful implementation of an innovation (there is no requirement that it is a commercial success at the same time),
b) an activity in progress, i.e. the activities pending, that have not resulted in implementation of the innovation yet,
c) an activity abandoned prior implementation of the innovation [Oslo Manual, 2005].

When analysing an innovative enterprise definition, an implementation of at least one innovation in a given time period may be assumed as the most important factor characterising this notion.

Logit Model

The logit models found their applications in, among others, banks, for the credit risk assessment. They are also one of the tools used for the insurance risk assessment. In the life insurances, the logit model makes it possible to evaluate the probability of death in dependence of the demographic characteristics or the medical questionnaire results, appended to the insurance request [Kowerski,

Bielak, Długosz, 2006]. In the present paper, an application of the logit models for evaluation of the innovativeness of a manufacturing enterprise has been proposed.

The logit models (logistic regression models) are applied for explanation of qualitative variables in dependence of the exogenous qualitative or quantitative variables [Gatnar, Walesiak, 2011], [Gruszczyński, 2012]. The logistic regression finds its important application in, among others, modelling the risk of assuming of a certain state by the unit under investigation. If the variable being explained accepts the two states: the phenomenon under investigation has happened or has not happened, than the model is called the binomial logit one. The logit model is a specific case of the generalised linear model [Gatnar, Walesiak, 2011], [Agresti, 2007].

In a binomial logit model, it is assumed that there is some hidden variable y^*, the value of which is not possible for observing. This, what may be observed, may be defined in the following way [Gatnar, Walesiak, 2011]:

$$y_i = \begin{cases} 1, & \text{if } y_i^* > 0 \\ 0, & \text{if } y_i^* \leq 0 \end{cases}, \tag{1}$$

where y_i is a binary response for i-th observation, $i = 1, 2, \dots, n$.

The variable y_i^* represents some type of inclination of the given observation unit to undertake decisions or accepting the state corresponding to the value $y_i = 1$. In the y^*model for y^*, the explanatory variables (predictors) $x_1, x_2, \dots, x_m$ should explain this inclination [Gatnar, Walesiak, 2011], [Gruszczyński, 2012]:

$$y_i^* = b_0 + b_1 x_{i1} + \cdots + b_m x_{im} + \varepsilon_i = x_i^T b + \varepsilon_i \tag{2}$$

where:

x_{ij} – j-th predictor variable measured for i-th observation;

$b = [b_0, b_1, \dots, b_m]^T$ – the parameter vector;

$x_i = [1, x_{i1}, \dots, x_{im}]^T$ – the vector of explanatory variables for i-th observation;

ε_i – i-th random error,

$i = 1, 2, \dots, n$ and $j = 1, 2, \dots, m$.

The main assumptions for the errors in the logistic regression model (2) is that the ε_i have the standard logistic distribution. Also the ε_i should be independent of each other.

In a logit model, the probability of accepting, by the variable y_i, one of the two possible values is a function of $x_i^T b$ [Gatnar, Walesiak, 2011], [Gruszczyński, 2012]:

$$P_i = P(y_i = 1) = F(x_i^T b) = \frac{1}{1 + \exp(-x_i^T b)} = \frac{\exp(x_i^T b)}{1 + \exp(x_i^T b)}, \tag{3}$$

where F – the cumulative distribution function for a logistic distribution. All values of P_i are included in the interval (0,1).

The values of the function inverse to F, for this model, are called logits. The logistic regression model has linear form for the logit of the probability of success for any given observation:

$$logit\ (P_i) = F^{-1}(P_i) = ln\frac{P_i}{1-P_i} = x_i^T b \tag{4}$$

The left hand side of the model is the logarithm of the quotient of the chances to accept or not to accept the value of 1 by the variable y_i. If the chances are the same, i.e. $P_i = 0{,}5$, then the logit equals to zero. For $P_i > 0{,}5$ ($P_i \leq 0{,}5$), the logit is negative (positive).

For interpretation of the logit model parameters, it should undergo after assessment of the parameters b_j. The estimators $\widehat{b_j}$ of unknown parameters are defined by the maximum likelihood method.

Then, it is to find an answer to the question in what way the explaining variable values have an effect upon the probability values of belonging to either of the groups. In the references of the subject matter, the two ways of interpretations that will make it possible to answer this question may be found [Gatnar, Walesiak, 2011], [Gruszczyński, 2012]:

a) the interpretation in the probability categories, where the logit model structural parameter interpretation is similar to the interpretation known for the linear model: the parameter sign determines the direction of the dependence between the variables under consideration,
b) the interpretation with use of the odds: $\frac{P_i}{1-P_i}$, or more often with use the odds ratio (OR) for comparing two subject (observations) one with explanatory vector parameters x_1 and second with x_2 then $OR = \exp\left((x_1 - x_2)^T b\right)$

After fitting model to data, it should be evaluate the goodness of fit. One possibility to evaluate a logit model is to determine the following fit measures:

a) R^2 – the square of the correlation coefficient between the empiric values, y_i, and the theoretical ones, $\widehat{y_i}$,
b) The R^2 measure of Efron,
c) The R^2 measure of Nagelkerke,
d) The R^2 measure of McFadden.

The problems were described more widely in the publications [McFadden, 1974], [Faraway, 2006], [Gatnar, Walesiak, 2011], [Gruszczyński, 2012], [Agresti, 2007].

The logit model has a wide application not only for binary variable modeling. The generalizations of these models are known in the literature for multinomial logit models in which the modeled explanatory variable can use more than 2 categories. A practical example of the use of a larger logit model in case there are interactions between explanatory variables can be found in the publication [Świadek, Wojciech, 2015].

The prediction on the basis of binomial models may refer to the following:

a) units (observations) located in the sample,
b) units outside the sample in the case that the numerical data concerning the explanatory variable is known.

On the basis of the models, the prediction may be determined:

a) of the probability of success P_i for any given observation (symbol: $\widehat{P_i}$) $\widehat{P_i} = \hat{P}(y_i = 1)$ – such predicted probability values may be determined when the vector x_i is given,
b) of the value y_i ($\widehat{y_i} = 1$ or $\widehat{y_i} = 0$) i.e. the prediction of the variable being explained for the i-th observation.
c) estimation of the odds ratio, when the explanatory variables x_j increase by unit (ceteris paribus) ($OR = \exp(\widehat{b_j})$) where $\widehat{b_j}$ is the maximum likelihood estimator for b_j.

In this case, described in section b, the following rule is applied commonly:

- $\widehat{y_i} = 1$, when $\widehat{P_i} > 0{,}5$ (5)
- $\widehat{y_i} = 0$, when $\widehat{P_i} \leq 0{,}5$.

The rule is a proper one in the case of a balanced sample. In the case of an unbalanced sample, the rule rises some reservations [Gatnar, Walesiak, 2011], [Gruszczyński, 2012]. Hence, in this case, the following rule should be applied:

- $\widehat{y_i} = 1$, when $\widehat{P_i} > \alpha$ (6)
- $\widehat{y_i} = 0$, when $\widehat{P_i} \leq \alpha$,

where α is a per cent of ones in the sample.

The Digit Model in The Enterprise Innovativeness Assessment

The manufacturing enterprise innovativeness assessment procedure based on the binomial logit models ($y_i = 1$ for innovation and $y_i = 0$ for non-innovation) should follow the 6 steps (Figure 1.

Figure 1: The manufacturing enterprise innovativeness assessment procedure based on the binomial logit model theory

(source: own work)

In step 1, necessary is define research problem to perform the questionnaire investigation in a representative group of the manufacturing enterprises similar e.g. due to the activity run. Next, in step 2, it's time to collect data for the model. The results should be analysed and the variable to be explained (the variable determining the innovativeness) should be defined, as well as the variables to be explained (the factors of influence upon the innovativeness). The selection should be done taking into consideration the statistic relationships, e.g. the correlations happening and, what is important, in agreement with your own experience. This means that, for the model, it is possible to select the variables that, from the point of view of the statistical point of view, are not significant but, for instance, the given parameter is commonly applied for assessment of enterprises of a given branch. In the next step, commence determination of the proper logit model. For the model parameter assessment, you may use the statistic package R which is distributed on the open source licence (GPL) [R Core Team, 2014]. Other applications of the package R for the statistical analysis are presented e.g. in the paper [Skrzypek, Dąbrowski, Wojciech, Kłos, 2016] [Świadek, Wojciech, 2015]. In step 4, you should check the logit model goodness of fit measures. The higher is the computed coefficient value, the model is better matched to the empiric data. In step 5, after determination of the appropriate model, you should pass to the model parameter interpretation, applying the interpretation in the probability categories or the interpretation with use of the chance quotient, respectively. In the

last step, you may make the predictions on the basis of the logit model being determined, i.e. check if the given manufacturing enterprise, in the sample or outside it, is an innovative one.

Conclusion and Future Work

The investigation of the manufacturing enterprise innovativeness becomes significant from the viewpoint of the strategic management and is determined by, among others, the recommendations of the European Commission in the context of granting funds for development. There is no one recommended methodology for calculation of the firm innovativeness level. The binomial logit models are used for computing the probability of occurrence of some phenomenon/state concerning the variable that is under observation. In this case, this is the innovativeness level. The authors of the paper indicated a procedure of proceeding how to assess the innovativeness level of the investigated manufacturing enterprise with use of the method indicated. An extension of the indicated procedure are the application possibilities, tested by the team of the authors, in determination of the firm innovativeness level, multinomial logit models, that will make it possible to obtain more precise data based on occurrence of intermediate states [Luce, 1959], [Hosmer, Leme, Show, Sturdivant, 2013]. By the intermediate states, it is understood the enterprise assessment not in the scale 0 or 1, where it is assumed that 0 means a non-innovative enterprise, and 0 – an innovative one. The surveyed firm can be rated as: moderate innovator, modest innovator or innovator.

Abstract

The purpose of this study is to examine the relationship between corporate governance principle and corporate strategy in Abu Dhabi Accountability and Authority. This research targeted executive managers, senior manager and strategic consultants in the UAE government organizations. The research was focused in Abu Dhabi Emirate; a sample size of 423 was selected to participate in this study using convenience sampling technique. A five-point Likert scale questionnaire was used to determine the relationship between corporate governance principle and corporate strategy. A two-step structural equation modelling (SEM) approach is followed in the present study. The results showed that there is a significant positive impact of Corporate Governance Principle (CGP) on Corporate Strategy (CS) ($p<0.05$), result also indicated that there is a significant positive impact of Organizational Culture (OC) on Corporate Strategy (CS) ($P<0.05$), and there is a significant positive impact of interaction of Corporate Governance Principle and Organization culture (CGP_OC) on Corporate Strategy (CS).

Keywords: Corporate Strategy, Abu Dhabi Accountability and Authority, Corporate Governance, Organizational Culture

Introduction

The Abu Dhabi Accountability Authority (ADAA) established in late 2008 as an independent body reporting to His Highness the Crown Prince of Abu Dhabi. ADAA is an independent body that responds to the Crown Prince is intended to perform the financial audit on public entity funds and have to make sure that the funds are managed efficiently and in compliance with investment guidelines. In this regard, the concept of corporate governance in developed countries has been explained using various perspectives. Similarly, the stakeholder theory which is based on this research also plays an essential role in explaining governance structures because companies are made aware of all stakeholders rather than only the shareholders. There is also a belief that the stakeholder theory can help to maximize firm performance and also the combined benefits of all stakeholders by considering the interests of all stakeholders, this view is supported by Donaldson and Preston (1995). The purpose of implementing corporate governance is to provide guidelines on the structure and processes that can be used on good corporate governance practices in business practices. Corporate governance codes are generally a set of voluntary principles, standards or best practices related to the internal governance of business (Adebayo et al, 2014). Indeed, the need for governance structure and transparency in the governance of corporate organizations has been one of the huge concerns for standard setters all over the world. This need spurred renewed interest in the corporate governance of modern corporations, particularly in relation to accountability and performance. On the other hand,

corporate strategy (CS) is the progressively most significant strategic plan arrangement of the organization, which characterizes the worldwide objectives and methods for their accomplishing within strategic management (Puranam, 2016). Corporate Strategy adopts a portfolio strategy to key basic decision making by viewing over the majority of organizations to decide how to make the greatest value to the organization (Ravi Fernando, 2012; Schmidt & Redler, 2018).

There are a few essential parts and tasks of corporate strategy that top management in organizations can take attention on, these task of CS are, allocation of resources (AR), organizational design (OD), portfolio management (PM), and Strategic trade-offs (ST) (Mendes & Santos, 2016). Strategic planning (SP) in government organization is an administration tool that assistances an organisation to concentrate in its liveliness, confirm that the organisation team are operational on the way to the same aims, and assist and change the organisation's route in reaction to a changing environment (Bryson, 2011). In short, strategic planning is a well-organized strength to create essential decisions and engagements that contour and monitor what an organisation is, what it does, and why it does it, with a concentration on the future (Bryson, 2011). Strategic planning (SP) has come to be dominant in all measures of the world; on the other hand, practices in the field show that the strategy development process itself has become frightening., by generating an unclear strategy, a government can end up wasting money and resources on an effort that will not provide anticipated results. Alternatively, if the government focuses on generating a more focused strategy; successive increases should result in stimulating and moving the organisation toward its mission goals, creating an integrated system by which the strategic plan becomes a reference to measure progress and a system of accountability. In this perception, we examine the effect of corporate governance principles and organizational culture on corporate strategy on Abu Dhabi Accountability Authority (ADAA). It provides an overview of how ADAA a government organisation in the Abu Dhabi Emirate developed its corporate strategy, and how corporate governance principles and organizational culture can affect its corporate strategy. The UAE has accomplished various extraordinary triumphs authorize by key worldwide reports and markers. The Country positioned 23rd universally in the Corruptions Perceptions Index issued by Transparency International in 2015 though it positioned 35th in 2008, which mirrors the incredible accomplishment in this regard. The UAE achieved the top four positionings in various markers in the Global Competitiveness Report issued by the World Economic Forum. The UAE has likewise positioned the most joyful Arab Country and the twentieth internationally in the World Happiness report distributed by the United Nations. Further, the Country was positioned first locally in the "Simplicity of working together" classification as indicated by a report issued by the World Bank.

The Relationship between Corporate Governance Principles and Corporate Strategy

This section seeks to explore the relationship if any between corporate governance and corporate strategy to analyse the impact or influence of corporate governance on a corporation's corporate strategy. In the context of the private sector, the strengthening of corporate governance and business ethic within global corporations will ensure that stakeholders' interests will be prioritized and simultaneously influencing the structure of corporate strategy by corporations (Said et al, 2008). Duh (2017:53) contextualizes in noting that *"numerous research studies in the corporate governance (CG) field are based on a universal model outlined by principal-agent theory where the central premise is that shareholders and managers have different objectives and different access to firm-specific information."* Implicit in Said et al (2008) and Duh (2017) articulations is the coalescing indirectly around nexus between how the OECD Principles of Corporate Governance and the universal construct of corporate strategy. Ndung'u (2015: 14; Ahmad *et al.,* 2009) remarked most appropriately that "research literature suggests that corporate governance improves corporate strategy, creates positive corporate reputation, results to competitive advantage and intensifies corporate performance."

Aoki (2017) in article Corporate Governance Affects Corporate Strategy on the Japanese Stewardship Code, which was released in 2014 as a code of conduct and the amendment of the Companies Act; cautiously reflects on how to strengthen corporate governance structures within Japanese companies in order to protect institutional investors has impacted positively on the corporate strategy. Similarly,

in Al-Azzam, Al-Qura'an and Al-Mohameed, (2015) publication on; How The Corporate Governance Affects Organizational Strategy: Lessons from Jordan Environment; the authors articulate make the link between corporate governance and corporate strategy or they called the governance-link strategy. Al-Azzam, Al-Qura'an, and Al-Mohameed, (2015) concluded that Once the governance-strategy is being recognized by the management the new possibilities open up for senior managers and boards to incorporate governance issues directly into corporate planning. Here, the corporate strategy is a fundamental point that will include all strategic initiatives with the core business that being delivered together. An effective collaborative management system will help the organization to determine and manage its core processes on all levels and divisions to meet requirements of disclosure, transparency and accountability, giving optimum consideration to the interest of all stakeholders (Al-Azzam, Al-Qura'an & Al-Mohameed, 2015:59). Existing corporate governance principles aimed at increasing shareholder value demand greater transparency and better public disclosure (Denoncourt, 2015). This is taken further by Ahmed and Gábor (2012) note that the corporate governance system will ensure that it is adequate and appropriate internal control systems operate in a company. This will ensure that the company is well managed for the interests of the shareholders and other stakeholders. Here, they need to balance corporate governance mechanisms with a performance by adopting strategic decision and risk management with the efficient utilization of the organization's resources.

Organizational culture will moderate the relationship between CGP and CS

A substantive body of corporate governance literature shows the pervasiveness or the appetite of scholars to confine their research on the relationship between corporate governance and the performance of the corporate entity. AL-Rashed (2010: 146) explains how most studies focus on one specific aspect of governance such as ownership structure, board composition or executive compensation, and relate this to performance. Other research publications include: Abadi (2012) investigated the relationship between corporate governance, organizational learning and strategic planning effectiveness. Adawi, & Rwegasira (2012) researched the Influence of Patterns of Ownership Structure on Transparency in Corporate Governance (Evidence From United Arab Emirates Listed Companies), Alqisie, (2014). ―Do Corporate Governance Indicators Lead the Firm to Adopt High/Low Level of Financial Leverage? However, there is a gap in research as it relates to the triangulation of organizational culture, corporate governance principles and corporate strategies. As noted in rubric 3.5 organizational culture is a pattern of basic assumptions that a group has invented, discounted, or developed (Pfister, 2009:2). Thus, this section explores the interactions/intertwining between organizational cultures; corporate governance principles and corporate strategy, how organizational culture moderates/influences or not the effectiveness of internal control and corporate strategy. This implies also that corporate governance principles and corporate strategy can moderate or influence organizational culture. It is in part that for this reason Pfisher (2009) indicates that there is a two-way relationship between control and culture and that the understanding of how all these concepts influence each other is of tremendous importance.

Methodology

A sample size of 423 was selected to participate in this study using a convenience sampling technique. A five-point Likert scale questionnaire was used to determine the relationship between corporate governance principle and corporate strategy. A two-step structural equation modeling (SEM) approach is followed in the present study. At first, relationships among latent constructs and indicators are validated using confirmatory factor analysis (CFA). Then, in the second step, the structural model is evaluated to test the direction and strength of hypothesized relationships among latent constructs.

The main objective of this study is to examine the relationship between corporate governance principle and corporate strategy in Abu Dhabi public organization. This study highlights the theoretical relationship between the corporate governance principle and corporate strategy. The sample of this research was collected from ADAA in Abu Dhabi Emirate; the research targeted

executive managers, senior managers and strategic consultants. The research was focused in ADAA government organizations, 423 samples have participated in this study, where 142 was completed the questionnaire giving a response rate of 86.1%. The structural equation modeling (SEM), AMOS, was used to test the hypotheses shown in the conceptual model of the study. In order to achieve our research objective a designed questionnaire was used as an instrument to measure the relationship between corporate governance principle and corporate strategy.

Result and Discussion

The measurement model derived from EFA comprised of 54 measurement items (indicators) related to eleven latent constructs which are: The role of Board (CG), The right of shareholders (RS), Disclosures and transparency (DT), The responsibility of the board of Directors (RB), Organizational culture (OC), Allocation of Resources (AOR), Strategic trade-offs (STO), Organizational Design (OD) and Portfolio Management (PFM) Figure 1.

Figure 1: Measurement Model

Path Analysis (Null Hypothesis testing)

After establishing an acceptable structural model, the statistical significance of the parameter estimates from SEM is evaluated by examining path estimates and critical ratio (C.R) or t-value. The parameter estimate is considered statistically significant, only when the C.R value is greater than ±1.96 at 0.05 level of significance (Hair et al., 2013). Below this level, the parameter can be considered unimportant to the model. Furthermore, to determine the magnitude and type (positive or negative) of the hypothesized path effect, standardized path coefficients or standardized regression

weights (β)) are examined as per the recommendations of Cohen (1988). According to Cohen, a standardized path coefficient with an absolute value of less than 0.10 might indicate a small effect, a value around 0.30 a medium one, and a value around 0.50 indicates a large effect.

Figure 2: Path Analyses (Hypothesis Testing)

Hypothesis:

Hypothesis (H1)	There is a significant positive impact of Shareholders' rights (RS) on Corporate Strategy (CS).
Hypothesis (H2)	There is a significant positive impact of Disclosures and transparency (DT) on Corporate Strategy (CS)
Hypothesis (H3)	There is a significant positive impact of the Board of Director's responsibilities (RB) on Corporate Strategy (CS)
Hypothesis (H4)	There is a significant positive impact of the role of Board (CG) on Corporate Strategy (CS)

Table 1: Parameter value for model fit measures with SPSS Amos

Causal Path			Unstandardized Estimate	Standardized Estimate (β)	S.E.	C.R.	Sig (P)	Hypothesis validation
RS	→	CS	.205	.433	.024	8.575	***	Supported
DT	→	CS	.185	.469	.020	9.086	***	Supported
RB	→	CS	.059	.210	.013	4.642	***	Supported
CG	→	CS	.071	.243	.013	5.306	***	Supported

P-Value shows the significance of the estimation. If the P-value is less than 0.05 then, we support the hypothesis and we conclude there is a significant effect of the independent variable on the dependent variable. The P-Value *** indicates 0.000 which is less than 0.05. So, we support the hypothesis Table above. Hypothesis (H1) There is a significant positive impact on Shareholders' rights (RS) on Corporate Strategy (CS). The Critical Ratio (CR) is 8.575 which is greater than 1.96 and P-Value is less than 0.05. The Standardized estimation 0.433 is the impact of the Responsibilities of Board Directors on Corporate strategy. Hypothesis (H2) There is a significant positive impact of Disclosures and Transparency (DT) on Corporate Strategy (CS). The Critical Ratio (CR) is 9.086

which is greater than 1.96 and P-Value is less than 0.05. The Standardized estimation 0.469 is the impact of Disclosures and Transparency on Corporate strategy. Hypothesis (H3) There is a significant positive impact of the Rights of Share Holders (RS) on Corporate Strategy (CS). The Critical Ratio (CR) is 4.642 which is greater than 1.96 and P-Value is less than 0.05. The Standardized estimation 0.210 is the impact of the Rights of Share Holders on Corporate strategy.

Hypothesis (H4) There is a significant positive impact of the Role of Board (CG) on Corporate Strategy (CS). The Critical Ratio (CR) is 5.306 which is greater than 1.96 and P-Value is less than 0.05. The Standardized estimation 0.243 is the impact of the Role of the Board on Corporate strategy. Among the four factors Disclosures and Transparency has the highest impact of 0.469 on Corporate Strategy and Responsibilities of the Board of Directors has the least impact on 0.210 on Corporate Strategy.

Moderation Effect

A moderator is a variable either it is a qualitative or quantitative that can be used to find an affects into the direction and/or strength of the relation between an independent or predictor variable and a dependent or criterion variable (Baron, R. M., & Kenny, D. A. 1986). Moderator is also a variable that specifies conditions under which a given Independent variable (IV) Corporate Governance Principle is related to a Dependent variable (DV) Corporate Strategy. A moderation effect could be (a) Enhancing, where increasing the moderator would increase the effect of the Corporate Governance Principle (IV) on the Corporate Strategy (DV); (b) Buffering, where increasing the moderator would decrease the effect of the Corporate Governance Principle (IV) on the Corporate Strategy (DV); or (c) Antagonistic, where increasing the moderator would reverse the effect of the Corporate Governance Principle (IV) on the Corporate Strategy (DV). The Corporate Governance Principle (CGP) variable is computed using the mean of "the role of Board" (CG), "The rights of Shareholders" (RS), "Disclosures and transparency" (DT), "The responsibility of the board of Directors" (RB) variables. The "Corporate Strategy" (CS) variable is computed using the mean of "Allocation of Resources" (AOR), "Strategic trade-off" (STO), "Organization Design" (OD) and "Portfolio Management" (PFM) variables. The interaction of the Corporate Governance Principle & Organization culture (CGP_OC) variable is computed by multiplying the "Corporate Governance Principle" (CGP) and "Organizational Culture" (OC) variable using in SPSS statistics 25 version software. SPSS Amos is used to assessing the effects of a moderating variable Organizational Culture. To test moderation, we will in particular be looking at the interaction effect Corporate Governance Principle Organization Culture (CGP_OC) between Corporate Governance Principle (CGP) and Corporate Strategy (CS) and whether or not such an effect is significant in predicting Corporate Strategy Figure 3.

Figure 3: Moderating Effect (Hypothesis Testing)

The following hypothesis will be tested in Moderation effect Model:

Hypothesis (H5)	There is a significant positive impact on the Corporate Governance principle (CGP) on Corporate Strategy (CS).
Hypothesis (H6)	There is a significant positive impact on Organization culture (OC) on Corporate Strategy (CS).
Hypothesis (H7)	There is a significant positive impact of the interaction of Corporate Governance Principle and Organization culture (CGP_OC) on corporate strategy (CS).
Hypothesis (H8)	Organizational culture (OC) moderates the relationship between the Corporate Governance Principles (CGP) and the corporate strategy (CS)**.**

Table 2: Parameter value for model fit measures with SPSS Amos

Causal Path			Unstandardized Estimate	Standardized Estimate (β)	S.E.	C.R.	Sig (P)	Hypothesis validation
CGP	→	CS	.918	1.012	.143	6.427	***	Supported
OC	→	CS	.792	1.052	.124	6.378	***	Supported
CGP_OC	→	CS	.143	1.059	.038	3.777	***	Supported

The following Research Objectives will be achieved with the above Hypothesis:

1. To examine the relationship of corporate governance with the corporate strategy in Abu Dhabi public organization.
2. To examine the relationship between corporate culture with the corporate strategy in Abu Dhabi public organization.
3. To investigate the moderation effect of organization culture on the corporate governance principles with the corporate strategy in Abu Dhabi public organization.

P-Value shows the significance of the estimation. If the P-value is less than 0.05 then, we support the hypothesis and we conclude there is a significant effect of the independent variable on the dependent variable. The P-Value *** indicates 0.000 which is less than 0.05. So, we support the hypothesis.

Figure 4: Moderating Effect (Hypothesis Testing)

Hypothesis (H5) There is a significant positive impact of the Corporate Governance Principle (CGP) on Corporate Strategy (CS). The Critical Ratio (CR) is 6.427 which is greater than 1.96 and P-Value is less than 0.05. The Standardized estimation 1.012 is the impact of the Corporate Governance Principle (CGP) on corporate strategy.

Hypothesis (H6) There is a significant positive impact of Organizational Culture (OC) on Corporate Strategy (CS). The Critical Ratio (CR) is 6.378 which is greater than 1.96 and P-Value is less than 0.05. The Standardized estimation 1.052 is the impact of Organizational Culture (OC) on corporate strategy. Hypothesis (H7) There is a significant positive impact of the interaction of Corporate Governance Principle and Organization culture (CGP_OC) on Corporate Strategy (CS). The Critical Ratio (CR) is 3.777 which is greater than 1.96 and P-Value is less than 0.05. The Standardized estimation 1.059 is the impact of the interaction of Corporate Governance Principle and Organization culture (CGP_OC) on corporate strategy. Hypothesis (H8): Organization culture (OC) moderates the relationship between the Corporate Governance Principles (CGP) and the corporate strategy (CS)

To test the hypothesis that the Organizational Culture Moderates the relationship between the Corporate Governance Principles and Corporate Strategy. The impact of Corporate Governance Principles, Corporate Strategy, and Interaction both on Corporate Strategy is studied in Figure 5. All three are having a significant positive impact on Corporate Strategy.

Figure 5: Interaction Plot

Figure 5 represents the examination of the interaction plot which is showed an enhancing effect that as Corporate Governance Principle and Organization Culture increased, Corporate Strategy increased. At low CGP, Low Organization Culture (OC) the Corporate Strategy (CS) is Low and as CGP and OC Increasing CS also increased. We can conclude that Organizational Culture strengthens the positive relationship between Corporate Governance Principles and Corporate Strategy.

Conclusion

This study has evaluated the relationship between corporate governance principle and corporate strategy in one of the UAE public organizations. The analysis has shown that there is a significant positive impact of Corporate Governance Principle (CGP) on Corporate Strategy (CS) ($p<0.05$), the result also indicated that there is a significant positive impact of Organizational Culture (OC) on Corporate Strategy (CS) ($P<0.05$), and there is a significant positive impact of the interaction of Corporate Governance Principle and Organization culture (CGP_OC) on Corporate Strategy (CS). In a recommendation to future research the study should include more sample size and more organizations should be included in the future study government and private and compare between them.

Abstract

Corporate governance has become a topical issue among the academics, analysts and accounting practitioners as a result of accounting scandals and business failures across the globe. The burning issue of bank loan defaulters in Nigerian banking system which led to the establishment of the asset management corporation of Nigeria (AMCON) afforded a unique opportunity to investigate the quality of corporate governance in troubled, non-listed companies in Nigeria. Our sample consists of eighty (80) non-listed firms drawn from the list of 98 non-listed firms (AMCON debtors), using Slovin 1960 sampling size formula. Copies of questionnaire were administered on 240 chief financial officers (CFOs) and other financial officers. Two hundred and four (204) copies of questionnaire representing 85.0% response rate were found suitable for data analysis. Exploring descriptive statistical tools (means and standard deviations) the study revealed executive and non-executive directors' imbalance, weakness in board financial expertise and gender imbalance. Weaknesses in the independence of audit committee and functioning of corporate governance committee were also observed. Using multiple linear regression analysis, further finding revealed a weak negative effect of corporate governance quality on earnings management. The study concludes that corporate governance quality in troubled, non-listed companies in Nigeria is very weak and needs to be enhanced. Consequently, a synergy between Financial Reporting Council of Nigeria (FRCN) and Security and other relevant regulatory agencies is recommended for synthesis of an abridged, east-to-implement corporate governance code for non-listed companies in Nigeria to curb fraudulent earnings management practices.

Keywords: Corporate governance quality; earnings management; troubled non-listed companies.

Introduction

Earnings management has received renewed attention in recent years from academics, analysts and regulators. This research attention continues due to the wave of corporate scandals across the globe. These scandals have made reliability and credibility of financial statements doubtful. Within the last twenty years, several shocking corporate scandals occurred around the world. In 2001, collapse of Enron in the United States (US) was traced to hidden of financial difficulties through off-balance sheet financing in multiple special purpose Entities (SPEs). In 2002, Worldcom in US also inflated its assets by 11 billion dollars. In 2009, Satyam in India boosted its revenues by 1.5 billion dollars (Tutino & Merlo, 2019). More recently, Security and Exchange Commission in US investigated aggressive accounting practices of General Electric in 2018 and its 22 billion dollar non-cash charge in connection with acquisitions came under searchlight. Empirically, Markmann and Ghanni (2019) documented positive discretionary accrual behaviour of General Electric. This empirical evidence may lend credence to the suspicion of fraudulent accounting practices in the company. From developing economies, Cadbury Nigeria Plc. overstated its assets by 13 billion naira and had to adjust

its accounts to reflect an operating loss of 2 billion naira in the year 2006 while African Petroleum (Now Zenon Oil) was alleged to be hiding a loss of 9.7 billion naira in 2009 (Chukwunedu & Okafor, 2011).

Moreover, aggressive earnings management in troubled companies should be of particular interest to all stakeholders that rely on firm's annual financial statements to make economic decisions. A troubled firm may progress into financial distress whereby it may be unable to meet its contractual obligations. In such a situation, the top management may put the managers under pressure to make decisions to avoid or postpone the impending bankruptcy. Such managers may resort to using tools such as earnings management techniques to disguise the actual financial performance of the company. Empirically, upward manipulation of financial statements with the aim of obtaining credit facilities from commercial banks by failing firms has been documented (Bisogno & De-Luca, 2015).

Research attention has been focused on corporate governance as a potent mechanism to constrain earnings management in quoted companies in both advanced and developing economies (Abbadi, Hijazi & Al-Rahahleh, 2016; Waweru & Riro, 2013). For an instance, Abbadi *et al.* (2016) observed that corporate governance quality has increased over time among Jordanian listed companies. However, in developing economies, private companies are usually higher in number than public companies. Private companies may also engage in earnings management more than public companies because they are less monitored by regulatory bodies. Therefore, more attention is needed in this research area in developing economies.

Literature Review and Hypothesis Development

Effects of corporate governance on earnings management have been presented in various forms; including negative (Bala & Kumai, 2015; Obigbemi, Omolehinwa, Mukoro and Obamiro, 2016; Shehu & Abubakar, 2012; Udiale, 2012; Usman & Yero, 2012; Uwuigbe, Peter & Oyeniyi, 2014), positive (Nofarah, 2017; Obigbemi, Omolehinwa, Mukoro, Ben-Caleb & Olusanmi, 2016) and neutral (Juhmani, 2017). Cornnet, Mcnutt and Tehranian (2009) explored a sample of large-scale listed banks in the United States to examine the link between corporate governance quality and earnings management and found out that more independent boards constraints earnings management. Moreover, other contemporary studies that revealed inverse relationships in this context include Abbadi *et al.* (2016) from Jordan; Abed, Al-Attar and Suwaidan (2012) also from Jordan; Bayk and Ramezanahmadi (2016) from Iran; Idris, Abu-Siam and Nassar (2017) from Jordan; Kang, Leung, Morris and Gray (2013) from Australia and Mahdi, Mahdi, Seyed and Masomeh (2012) from Iran.

In Nigeria, Udiale (2012) and Uwuigbe *et al.* (2014) employed different samples of listed firms from different sectors of the economy to advance knowledge on this research area. Udiale (2012) found that board composition significantly reduced earnings management practices. This is a negative relationship in which increase in corporate governance quality leads to a significance decrease in earnings management. In a similar vein, Uwuigbe *et al.* (2014) found that size and independence of the board exert significant negative effect. Nevertheless, Bala and Kumai (2015), Obigbemi *et al.* 2016), Shehu and Abubakar (2012) and Usman and Yero (2012) also documented significant negative effect. The implication of these findings is that corporate governance quality is effective in curbing earnings management among corporate entities in Nigeria.

However, the study of Nofarah (2017) from Malaysia on a sample of non-listed companies provided a contrary evidence of positive significant relationship. This outcome implies that board independence might not be effective in controlling earnings management in private companies. Similarly, Obigbemi *et al.* (2016), in a study of some listed companies from Nigeria, provided additional evidence of positive relationship. The study of Juhmani (2017) from Bahrain, on the other hand, revealed a non-significant relationship.

Moreover, firm size and firm leverage were considered as control variables in this study. Recent empirical studies on the relationships between these control variables and earnings management include Abubakar and Oladele (2018), Alareeni (2018), Ghani, Mohd-Azemi and Puspitasari (2019) and Uwuigbe, Uwuigbe and Okorie (2015). Ghani *et al.* (2019) examined the relationship between firm characteristics and earnings management practices in some selected listed firms in Malaysia.

The study revealed a significant positive effect of firm size. However, while Abubakar and Oladele (2018), Alareeni (2018) and Mahdi, Mahdi, Seyed and Masomeh (2012) reported no significant effect of firm size, Uwuigbe *et al.* (2015) revealed a significant positive impact. In an earlier study from Chile, Iturriaga and Hoffmann (2005) provided evidence that firm leverage reduces discretionary earnings management behaviour which is an indication of a negative relationship. Contemporary studies including Shahzad, Rauf, Rheman, Saeed and Al-Barghouthi (2017) and Vakilifard and Mortazavi (2016) also reinforced the evidence of this negative association. However, the study of Nikhil and Sunil (2018) from India revealed no significant effect of leverage. Consequent upon the mixed outcomes and concentration of previous studies on listed companies, the current study tested the following hypothesis stated in the null form:

Corporate governance quality has no significant effect on earnings management in troubled, non-listed companies in Nigeria.

Methodology

The study adopted descriptive research design, exploring survey methodology because the study involved obtaining subjective opinion of respondents on variables of interest in order to draw a conclusion on the entire population. It involved studying samples derived from the population using questionnaire (Table 5) as research instrument because secondary data of non-listed companies in Nigeria is not readily available. Population of the study consists of 98 non-listed companies described as chronic AMCON debtors as contained in the list of AMCON debtors published by the corporation. These debtors cut across all the sectors of the economy. Sample size was determined scientifically by exploring Slovin (1960) sampling size formula. The computation produced 79 non-listed firms as adequate sample size for the study. However, 80 non-listed firms (Table 6) were finally sampled to further enhance sufficient representation of the population of the study. The computation of the sample size is as shown below:

$$n = \frac{\mathrm{N}}{1 + \mathrm{Ne}^2}$$

Where: n = Sample Size; N = Study Population; e = Significant Level

$n = \frac{98}{1+(98 \text{ x } 0.05^2)}$ = 79 Firms

Subsequently, stratified sampling technique was adopted because there was a need to obtain proportional sample of troubled, non-listed firms across all the sectors of the economy. This was followed by simple random sampling technique by balloting to select samples from each sector. Primary data were collected by administering structured questionnaire to the CFOs and two other Financial Officers in each of the selected troubled, non-listed companies through referral approach. This approach was adopted to avoid resistance from the respondents that might be skeptical of giving information about their companies to an outsider. Section A covers the items on firm attributes namely profitability, firm size and firm leverage. Section B contains the self-developed corporate governance quality index derived from code of corporate governance for public companies in Nigeria. Section C comprises the items involving change of accounting methods and real operating activities explored for earnings management purposes as adapted from the study of King (2015). The questionnaire was administered on two hundred and forty (240) CFOs and other financial officers. Out of two hundred and forty (240) copies of questionnaire administered, two hundred and nineteen (219) copies were returned. Fifteen (15) copies were not completely filled and were excluded from data analysis. Two hundred and four (204) copies of the questionnaire were subsequently used for data analysis. Thus, a response rate of 85.00% was recorded.

Validity and reliability of research instrument were carried out by conducting confirmatory factor analysis (CFA) using AMOS SPSS. The benchmark for CFA loading as specified by Biggs, Brough, and Barbour (2014) was strictly observed in order to ensure the validity and reliability of the items on the research instrument. It was discovered that the factor loadings exceed the minimum 0.70

benchmark. Composite reliability and average variance extracted estimates (AVE) of all the constructs were above 0.80 and 0.50 benchmarks respectively (Tables 7a, 7b & 7c). The model of the study captured the effect of corporate governance quality on earning management from the combined data of change of accounting methods and real earnings management with firm size and financial leverage as control variables.

Model:

$$\mathbf{EM_{CAM,\ REM} = \alpha_0 + \alpha_1 CGQ + \alpha_2 FSIZE + \alpha 3 FLEV + \varepsilon} \quad \mathbf{(1)}$$

Where: EM - Earnings management (CAM & REM); CAM – Change of accounting methods (King, 2015); REM – Real earnings management (King, 2015); CGQ – Corporate governance quality index (self-developed from the provisions of Nigerian SEC Code of Corporate Governance for Public Companies (Security and Exchange Commission, 2014); FSIZE – Firm size (small, medium or large); FLEV – Firm leverage (low, moderate or high); α_0 – Intercept; α_1, α_2, α_3 – Coefficients; ε – Error term.

Findings and Discussion

Data analysis includes descriptive statistics and hypothesis testing. Descriptive statistics involves computation of means of responses on variables of the study. Hypothesis of the study was tested with multiple regression analysis.

Descriptive Statistics

Table 1 reveals that earnings management has a mean score of 3.81 while change of accounting methods and real earnings management have mean scores of 3.71 and 3.91 respectively. This outcome suggests that the CFOs in the sampled companies exhibit earnings management behaviour to a high extent. Corporate governance quality has a mean score of 2.23 which is an indication of weakness in corporate governance. However, separation of roles of chairman and CEO (mean = 3.13) as well as the regularity of board meeting (mean = 3.29) were moderate. Weaknesses were observed in executive and non-executive balance on the board (mean = 1.87), gender balance on the board (mean =1.92), presence of financial experts on the board (mean = 1.15), independence of audit committee (2.21) and functional corporate governance committee (mean = 2.01).

The control variables, firm size and firm leverage, have mean scores of 3.37 and 4.21 respectively. These findings suggest that the sampled non-listed companies are of medium size and are highly leveraged.

Table 1: Descriptive Statistics

Variables	Min.	Max.	Mean	Std. Deviation
Corporate Governance Quality:	1	5	2.2274	.88788
- Separation of roles of chairman and CEO	1	5	3.1275	.88874
- Executive and non-executive balance on the board	1	5	1.8714	.93742
- Gender balance on the board	1	5	1.9194	.78917
- Financial experts on the board	1	5	1.1524	.96169
- Independence of Audit Committee	1	5	2.2154	.98784
- Regularity of board meeting	1	5	3.2943	.87213
- Functional corporate governance committee	1	5	2.0117	.77818

Change of Accounting Methods	1	5	3.7120	.83767
Real Earnings Management	1	5	3.9103	.95906
Earnings Management	1	5	3.8112	.89837
Firm Size	1	5	3.3770	.78174
Firm Leverage	1	5	4.2105	.93125

Source: Field Survey (2019)

Test of Hypothesis

The regression output comprises of three tables: Model Summary (Table 2), Model Fitness/ANOVA (Table 3) and Model Coefficients (Table 4). Table 2 reveals a significant relationship (R = 0.768). The model also shows the R^2 value of 0.590 (59.0%). This is an indication that 59.0% of the variance in earnings management can be explained by the variance in corporate governance quality. This result reinforces that a significant relationship exist with the implication that a unit increase in corporate governance quality will lead to a significant change in earnings management.

Table 2: Model Summary

Model	R	R^2	Adj. R^2	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.768	.590	.581	.42425	.590	97.195	4	199	.002
a. Predictors: (Constant), CGQ, FSIZE, LEV; b. Dependent Variable: Earnings_Mgt									

Source: Field Survey (2019)

Table 3 contains the F-test output. Field (2000) advanced that a good model should have a large F-value. In this study, F value is 97.195 which is significant at $p<0.05$, Sig. = .002. Therefore, the F-Test is statistically significant and conclusion can be drawn that the fitness of the model is good.

Table 3: Model Fitness (ANOVA[a])

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	6.488	4	2.595	97.195	.002[b]
	Residual	14.255	199	.065		
	Total	20.743	203			
a. Dependent Variable: Earnings_Mgt; b. Predictors: (Constant), CGQ, FSIZE, LEV						

Source: Field Survey (2019)

Furthermore, multicollinearity problem among the variables was examined with variance inflation factor (VIF) and tolerance value. As displayed in Table 4, all the VIFs are less than 3 while all the tolerance values are greater than 0.4. It has been observed that VIF that is less than 10 (Belsely, 1991; Field, 2000) and tolerance value that is greater than 0.2 (Mernard, 1993) are indicators of no multicollinearity problem among the explanatory variables. Therefore, the outcomes of our study can be reliably interpreted. Moreover, the coefficients of the model and the t-value are also shown in Table 4. The regression coefficients reflected a positive significant effect of firm size (beta=.525, t =

12.529, P<.01, Sig=.000) and a positive but non-significant effect of firm leverage (beta=.087, t= .723, P>.05, Sig=.195). These findings imply that the larger the firm size, the higher the earnings management while the influence of firm leverage remains unclear. However, a weak negative effect of corporate governance quality, which needs to be strengthened, was discovered from the co-efficient table (beta=-.136, P<.10, Sig=.056). Hence, the null hypothesis was accepted and it can therefore be inferred that corporate governance quality has no significant effect on earnings management in troubled, non-listed companies in Nigeria. The model of the study can now be redefined as shown below:

$$\mathbf{EM_{(CAM,\ REM)} = 9.103 - .136CGQ + .525FSIZE + .087FLEV} \qquad \mathbf{(2)}$$

Table 4: Summary of Regression Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.	VIF	Tolerance Value
		B	Std. Error	Beta				
1	(Constant)	9.103	.367		10.568	.000		
	CGQ	-.136	.105	-.149	-1.869	.056	2.153	.425
	FSIZE	.525	.137	.643	12.529	.000	2.235	.455

Discussion of Results

The outcome of this study revealed negative, non-significant relationship between corporate governance quality and earnings management in the sampled non-listed companies. This outcome derived support from the findings of Juhmani (2017) which posited that earnings management was not significantly associated with audit committees' characteristics. Further support was derived from the findings of Obigbemi *et al.* (2016) which revealed positive, non-significant relationship. However, the outcome of this study is contrary to the findings of Abbadi *et al.* (2016), Abed *et al.* (2012), Bala and Kumai (2015), Mahdi et al. (2012), Shehu and Abubakar (2012) and Uwuigbe *et al.* (2014) that corporate governance characteristics have a significant negative relationship with earnings management. The difference between our outcome and the findings of this group of studies might be attributed to the fact that while we focused on non-listed companies with less regulatory monitoring, the other studies focused on listed companies that have robust corporate governance code to observe.

Conclusion and Recommendations

Conclusion

The main objective of this study is to examine the relationship between corporate governance quality and earnings management in troubled, non-listed companies in Nigeria. The study observed high level corporate earnings management as reflected by strong tendency for changing accounting methods to report earnings as well as high possibility of engaging in real earnings management. The outcome of the study also revealed weak negative relationship between corporate governance quality and earnings management. Consequently, we concluded that corporate governance quality has weak effect on earnings management in troubled, non-listed companies in Nigeria.

Recommendations and Suggestions for Further Studies

As a result of the observed weakness in corporate governance quality in the non-listed companies sampled for this study, a synergy between Financial Reporting Council of Nigeria (FRCN) and Security and Exchange Commission (SEC) is recommended for synthesis of an abridged, east-to-implement corporate governance code for non-listed companies in Nigeria. This would go a long way to curb fraudulent earnings management practices in non-listed companies in Nigeria. Future studies may make non-listed companies in the various states of the country their subjects of observation in order to extend the current study. Further studies may also consider other upper echelons in an organization such as board chairmen, audit committee's chairmen and chief executive officers (CEOs) as participants.

Appendixes

Table 5: Sample Questionnaire

Consent: Do you wish to participate voluntarily in this research work? Yes [ ] No [ ]

Section A: Firm Attributes
Instructions: Please tick (✓) the option that correctly depict your choice.

1. How would you rate your firm in relation to the following attributes in the last three years?

S/N	Item	Very Low				Very High
a	Leverage	1	2	3	4	5
b	Firm Size	1	2	3	4	5

Section B: Corporate Governance Quality
Instructions: Please tick (✓) the option that correctly depict your choice.

2. To what extent does your organization implement the following corporate governance mechanisms?

S/N	Elements	Very Low				Very High
A	Separation of the roles of board chairman and CEO	1	2	3	4	5
B	Executive and non-executive directors balance on the board of directors.	1	2	3	4	5
C	Gender balance on the board of directors.	1	2	3	4	5
d	Presence of financial experts on the board of directors	1	2	3	4	5
e	Independent Audit Committee	1	2	3	4	5
f	Regular board meeting	1	2	3	4	5
g	Functional Corporate Governance Committee	1	2	3	4	5

Section C: Corporate Financial Reporting Quality
Instructions: Please tick (✓) the option that correctly depict your choice.

3. To what extent do you agree that your firm would make the following accounting adjustments/choices to boost reported earnings given that each adjustment is in compliance with financial reporting regulations?

S/N	Item	Strongly Agree				Strongly Disagree
a	Modify bad debt expense projections	1	2	3	4	5
b	Adjust obsolescence estimates for inventories	1	2	3	4	5
c	Alter assets depreciation policy	1	2	3	4	5
d	Refine impairment measurement policy	1	2	3	4	5
e	Change estimates for deferred tax	1	2	3	4	5
f	Modify valuation of retirement plan liabilities	1	2	3	4	5
g	Change property, plant and equipment valuation model	1	2	3	4	5
h	Change financial assets valuation model	1	2	3	4	5
i	Change goodwill valuation model	1	2	3	4	5
j	Change software cost valuation model	1	2	3	4	5

4. To what extent would your firm carry out the following real operating activities to boost reported earnings, given that each activity is in compliance with financial reporting regulations?

S/N	Item	Very Unlikely				Very Likely
a	Ease payment terms for more sales	1	2	3	4	5
b	Offer price discount to attract more sales	1	2	3	4	5
c	Cut maintenance expenditures	1	2	3	4	5
d	Cut research and development expenditures	1	2	3	4	5
e	Cut advertising expenditures	1	2	3	4	5
f	Cut employees training budget	1	2	3	4	5
g	Cut travel and entertainment budget	1	2	3	4	5
h	Postpone new project	1	2	3	4	5
i	Increase production to lower cost of goods produced	1	2	3	4	5
j	Dispose old non-current assets	1	2	3	4	5

Abstract

The article discusses using long-term care insurance to valuate and finance the care needs of the elderly. Particular emphasis is placed on the cost of insurance protection, which considers both the point in life at which the decision was made and the sum insured. For this purpose, the following factors important in calculating the sum insured are discussed:

- The scenario of regarding the development of care needs (for instance, in relation to what the social security system provides, which determines whether the insurance product is to be alternative, substitute, or complementary)
- Life expectancy, which translates into technically used life tables.
- When there is awareness of the need to consider such protection, and whether this can be a silver insurance product
- The moment at which such insurance is purchased (risk-premium factors and household wealth level). The discussion is illustrated with numerical examples (analysis of various scenarios) from selected EU countries. The main findings show that:
- the problem is particularly important for women (feminisation in old-age) - the premium at 60 is higher than their income
- research indicates that the risk and premium allocation in insurance budgets increases between the ages of 35-45, and significantly increases from 45. The optimal time is between the ages of 25-35.
- the increased costs of care significantly increase the pension gap, which should be analysed as a variable over time and not just at the moment of retirement.

Keywords: Silver Insurance, Long-Term Care, Personal Finance Management, Insurance.

Introduction and Motivation

An analysis of the economic circumstances of older people emphasises extended life expectancy, orphanhood due to the migration of adult children or the professional activation of women who traditionally take care of elderly family members, inadequate income to provide pension protection systems, and decreasing replacement rates in mandatory public pension in the context of rising maintenance costs, including care costs. Increased life expectancy and low fertility rates means that the old-age dependency ratio is currently extremely high in developed countries, including those in Europe.

An accurate picture of the aging population is given by the old-age-dependency ratio (proportion of those aged 65 or over per the working age population aged between 15 and 64). In 2018, this ratio was

31% in the EU, 32% in the Euro area, 28% in OECD countries, and 27% in high income countries (worldbank.org). Available forecasts indicate that in some countries it may double by 2060, including in Poland, and possibly reach as high as 70% (Błędowski et al., 2012). World Bank data show that global life expectancy at birth has risen from 52 in 1960 to 72 in 2017 (54 to 74 for women and 50 to 70 for men). For high income countries, life expectancy at birth in 2017 was over 80 (OECD 80, EU 81).

These demographic trends are crucial as functional limitations usually appear in old age. The results of the Polish survey "Polsenior", which was based on social and medical interviews with seniors aged 65+ from a representative sample of the older population, and the Survey of Health, Ageing and Retirement in Europe (SHARE) indicate a high level of functional restrictions among Polish older people, similar to those observed in south European countries such as Italy and Spain (Balzi, 2010) and in other Eastern European countries. Such functional limitations increase with age, especially for women. The critical age for significant change was 85 years as only around 20% of the 85+ seniors surveyed were fully dependent (Wizner et al., 2013).

Traditionally, care needs have been met by the family. However, research and market analysis indicate that socio-demographic changes are taking place, the crucial drivers of which are migration, increased professionalisation of women, decreasing fertility rates or even childless households, and the loosening of family ties (e.g., Eitner et. al. 2011; Błedowski et al., 2012). According to the Polish Central Statistical Office - almost half (49.3%) of all older people in Poland remain in single-generation households. The reality somewhat converges with the expectations of older people, 66% of whom are willing to live in their own house and only occasionally asking their family and friends for help (Błędowski et al., 2012). Such attitudes also corroborate research on the quality of life among older people (van Leeuwen et al., 2019) which shows that many older adults strive to live at home or in the community for as long as possible and prefer to adapt the home environment rather than move. Being single in old age was identified by Reinprecht and Rossbacher (2014) as a trend in developed countries (large cities). Based on an analysis of the older population in Wien from 2002-2014, they found that the absolute number and proportion of two-person households remain relatively constant, whereas singularisation (one-person households) increases rapidly in later stages of life, especially very old age, and in all social classes. This trend is independent of social status and education. The authors predict that the proportion of childless elderly will increase significantly in the next decades, forming a new category of singles. Being childless also means fewer resources with regard to care.

The above trends will increase the demand for external care services which, amplified by the need for specialised devices, will result in an increase in the costs of such care (Błedowski et al., 2012). These also need to be compared with the pension gap that will soon affect the level of funds available in elderly households and the fact that care services are not usually part of social security systems (private nursing insurance, for example, is compulsory in Germany). According to the McKinsey report (Binder et al., 2018) the net replacement rate for nonvoluntary pensions in large European countries decreased in 2005-2014 by 31% in France, 26% in Sweden, 16% in Poland, 9% in the UK, 10% in Switzerland, and 8% in Germany The average decrease for OECD countries in this period was 10%. Research on the gender pension gap confirms that the position is worse for women (Samek Lodovici, 2016, European Commission, 2013). It is therefore important find a means of financing external services or compensating for lost earnings to offset the reduced quality of life experienced by family members taking over these functions.

Against this background, problems arise when considering what form of product should be applied or proposed. To address this, the authors used the concept of LTC insurance as a product which is (or could be treated) as silver insurance in nature – dedicated to the special purpose of meeting old-age care needs. The main consideration is how needs shape over time and what the product structure should be - one-time or periodic payments (annuity), increasing or permanent, a lump sum according to needs (non-indemnity /indemnity), indexed/not indexed. For this purpose, the following factors relevant to calculating the sum insured are analysed:

1. Scenario of development of care needs (for instance, in relation to what the social security system provides, which determines whether the insurance product is to be alternative, substitute, or complementary)
2. The length of life, which translates into technically used life tables
3. Increasing awareness of the need for such security and whether this can be a silver insurance product
4. The point at which such insurance is purchased (risk-premium factors and the level of household wealth).

The discussion is illustrated by numerical examples (analysis of various scenarios) from selected EU countries.

Long Term Care (LTC) Insurance

Although numerous definitions of long-term care can be found in the literature, it is generally defined as the scope of services required by people with a reduced level of functional abilities (physical or cognitive) who are therefore dependent on long-term external help for basic everyday activities or so-called instrumental everyday activities (e.g., help at home or with organisation and administration) (see WHO, 2001; OECD, 2011; European Commission, 2015). It therefore pertains to the broad range of supportive medical, personal and social services needed by people who are unable to meet their basic living needs for an extended period of time due to accident, illness or frailty. According to the WHO (2002), the main goal of LTC systems is "to ensure that an individual who is not fully capable of long-term self-care can maintain the best possible quality of life, with the greatest possible degree of independence, autonomy, participation, personal fulfilment and human dignity".

LTC system solutions differ across countries. Private LTC services are part of the benefits received from social security systems, private solutions such as LTC insurance, or out-of-pocket financing. LTC insurance does not play an important role in financing long-term care in any OECD country. In most systems, own-pocket payments dominate (e.g. Switzerland - 60%, Portugal - 45%, Spain - 30%, the United States - 22%) (World Bank, 2015). In Central and Eastern Europe, private payment for long-term care services is common.

In Poland, the care of dependent people is enshrined in a variety of laws; thus, there are no uniform, comprehensive solutions. Although the authors in this research focus on LTC insurance, the results can also be interpreted in the context of system solutions (estimating the amount of necessary contributions depending on income and scope of care) and in estimating the amounts that need to be collected in the form of out-of-pocket payments as part of savings for future care. Different types of LTC insurance are therefore presented to further describe the chosen option, the assumptions made, and the methodology used.

There are two main types of LTC insurance:

- **non-indemnity insurance** - this consists of a strictly defined payment (benefits may take the form of single or repeated payments). The most common form is that of the pension, usually with an annual frequency; however, there are also products with built-in daily payments system Thus, insurance will not cover the direct costs of long-term care,
- **indemnity insurance** - this cover the actual costs of long-term care. To reduce the costs borne by the insurance, certain restrictions are used – such as the upper limit of the amount of benefits or a maximum period of benefit.

In LTC insurance, the insurance event is defined as multi-state according to selected scales, the two most common of which are ADL (Activities of Daily Living), and IADL (Instrumental Activities of Daily Living) – as described in Table 1. (for other scales used in determining the degree of disability and/or dependence see the Report "Definition of dependency, degrees of dependency evaluation criteria and standards of care and assistance services", 2017).

Table 1: ADL/IADL measures for assessing dependency

• bathing, • dressing, • walking / moving assisted from bed to wheelchair • feeding • morbidity • continence	• housework • money management • medication adherence • shopping • getting around outside the house

Source: Sigma 5/2014 SwissRe

Multi-state models are used in risk modelling for the analysis and calculation of premiums and reserves for LTC insurance products. Unlike life insurance, where only 2 conditions are possible (1-live, 2-dead), and thus for calculation only information about the probability of death or survival is sufficient, in LTC there are a larger number of conditions and more complicated and demanding models are required to handle the amount of information. In LTC modelling, there are a minimum of 3 possible states: alive and not infirm, alive infirm, and dead. In many publications and data sets (Jacobzone et al, 2000, Eurostat data) 5 states exist due to the introduction of 3 degrees of infirmity: little, moderate and severe. These are based on a different number of activities in the ADL or IADL scales (or their combinations) for which the insured requires assistance. LTC modelling is usually based on Markov or semi Markov processes (see, e.g., Haberman & Pitacco, 1999; Pritchard, 2006; Brown & Warshawsky, 2013). For these it is necessary to use the probabilities of transition from state to state, which are dependent on age, sex, and time spent in a given state (e.g., Czado & Rudolph, 2002; Fuino & Wagner, 2018). This therefore requires the use of extremely detailed data.

Assumptions

In this article, a product is proposed based on scenarios for the development of assistance with the needs of older people. This is insurance for which coverage begins when the insured person reaches 65 years, while the scope of support is based on the health of the insured at a given moment and the scope of services assigned to that state. For our calculations we use economic and demographic data on Polish society and selected countries (Czech Republic, Germany, and Portugal).

The first factor needed to analyse the proposed product is probabilities of infirmity. Based on data from Synak (2002), the probability of being in one of three conditions related to infirmity depending on age and sex is determined (Figure 1).

Figure 1: Probabilities of infirmity for people in Poland

Source: own work based on Synak (2002)

Another factor is the scenario of needs reported by people in individual states of dependence. Two scenarios are adopted: the first is based on the draft of the Commentary and explanations of the draft law on assistance to dependent persons (2013), which were designed to provide support to the elderly,

1) first degree dependence – the need to be looked after every day and assisted for a minimum of 6 hours (assistance in 5-6 types of activities – ADL)
2) second degree dependence – the need to receive care for a minimum of 4 hours day (3-4 types of activities – ADL)
3) third degree dependence – care is required at least once a day for 1-2 types of activities (ADL) for a minimum of 1.5 hours (according to the state of the project in May 2013, in later proposals third degree dependence is defined as "less than four hours").

In the opinion of the authors, this is a minimum project, which is why broader support has been proposed that, as the calculations illustrate, is more expensive (variant 2). These variants propose a higher number of hours of care per day depending on the needs of the elderly person (see Table 2).

Table 2 : The number of hours of medical care per day depending on the state of health of the elderly

	Severe infirmity	Moderate infirmity	Little infirmity	Not infirm
Variant 1 – minimum	6	4	1,5	0
Variant 2	8	6	4	0

Source: Commentary and explanations of the draft law on assistance to dependent persons (2013) Authors' own assumptions

It is also necessary to refer to assumptions regarding the form of assistance provided to the elderly by the product in question. For instance, Więckowska (2008) analysed the possibilities of using the insurance method to manage the risk of senile infirmity. However, this work focused on medical and nursing insurance in which help is provided by qualified medical personnel. By contrast, our approach focuses on insurance in the form of assistance, which is based on a demand for more logistic and organisational help and support with transport, shopping, and so on. Therefore, the average hourly rate for a person employed as an "elderly person's assistant" is adopted for the valuation (Table 3).

Table 3: Average rates per hour of work for an elderly assistant in selected countries

	Poland	Germany	Czech Republic	Portugal
Costs of care [EUR/h]	4,4	14	6,7	6

Source: https://www.salaryexpert.com/

This is insurance in the form of indemnity; thus, irrespective of whether the scope of the benefit is determined for a person in a specific condition, the benefit takes the form of an annuity with a fixed real value for a given state (indexed by inflation rate). By determining the scope of care needed and the costs of implementing such care, we obtain information about the sum insured (the proper policy limit). The annual premiums for such a product are then determined depending on the age of the insured person at the time the premiums begin. These premiums are also compared to the average wage in selected countries to show the amount of statistical income a resident requires to buy such a product. We calculate net single premium - present value (moment "0" = the age of 65) of the costs of care multiplied by the probabilities of being in a specific state in a different age category. We assume that these costs rise over time by inflation, that the discount rate = inflation rate, and we use life tables for each country (www.mortality.org). We then calculate the average total value of costs a 65-year-old needs for the rest of their life. Finally, we calculate net annual premium for 2 variants: constant nominal premium, constant real premium (inflation-indexed), for different age categories.

Results and Discussion

First, the amount of insurance sums in both variants are calculated separately for women and men depending on the country of origin. The authors are aware that in the EU there is no differentiation of insurance premiums based on sex allowed (The European Court of Justice ruled on 1 March 2011 that differences in insurance pricing based purely on a person's sex are discriminatory, MEMO/11/123). This distinction was therefore introduced simply to show the scale of the problem for women, and due to one possible interpretation of the results, which concerns the amounts that would have to be accumulated in the form of savings for future care expenses. The results are presented in Table 4. This shows that, due to their higher life expectancy, women must accumulate a higher amount to ensure they are provided with care in old age. In fact, the values for women are almost twice as high. This is also influenced by the fact that women not only live longer, they do so with worse health conditions (Eurostat, 2019) which means they are more likely to require additional support

Table 4 : Average total value of costs a 65-year-old needs for the rest of their life [in EUR]

Country	Variant 1		Variant 2	
	men	women	men	women
Poland	15 220	30 763	27 596	52 843
Germany	57 267	104 670	103 430	179 539
Czech Republic	23 357	44 694	42 404	76 921
Portugal	24 484	45 852	44 249	78 634

Source: own calculations

In the next step, net annual premiums are determined, the insurance sums for which are presented in Table 5 and are dependent on the age of the insured at the beginning of the premium payment. Life expectancy tables for each population from the countries concerned are used for this purpose (data for 2017 from mortality.org). These values to refer the average annual salary in individual countries. This comparison shows what percentage of average income should be allocated to the purchase of such insurance.

Source: own calculations

A comparison of the level of premium required based on the average annual salary shows that, after the age of 50, the premium increases drastically and it is too late to buy such insurance. In extreme cases it is not possible for a woman aged 60 to pay a premium for a fuller version (variant 2) because the premium exceeds the adopted income base (the average salary).

Conclusions

As shown by the results (Tables 5), it would be optimal for household finances to start paying premiums for private LTC insurance early; the optimal age is between 25-35. However, this is not the age when people think about retirement security - here it is worth referring to the results of the McKinsey (Binder et al., 2018) study, which shows that LTC insurance before 35 years of age is only considered by 60% of respondents. According to our calculations, the women's premium would be 7 and 10% in variant 1 and between 13 and 17% in variant 2, depending on the country. Among people aged 45, awareness of the need for such a product increases to over 80% but by then the contributions are already 16-17% for variant 1 and 27-30% for variant 2, depending on the country.

The prohibition on differentiating insurance premiums based on sex, currently in force in EU countries, means that insurers will compensate for the higher risk for women by applying higher than calculated from the insurance premiums for men. The authors intentionally conducted calculations by gender to show the significant risk of dependence for women. It is important to emphasise that the problem of providing care for old age is especially pertinent to women (feminisation of old age) due to their longer life span. It should also be noted that in extreme cases, when a woman waits to purchase LTC insurance (or the start of saving) up to 60 years of age, her theoretical premium at age 60 is higher than her income.

Longer life for women does not translate into a longer, healthy life. Therefore, women live longer as dependent people. Extra years of life spent in an unhealthy state (restrictions on functioning or disability) are likely to create additional needs for health care or long-term care services. Across the EU-28 in 2017, women aged 65 years, on average, could expect to live for 10.2 years (47.7%) of their remaining lifespan in a healthy condition (the comparable figure for older men was lower at 9.8 years -54.1 % of their remaining lifespan). Indeed, a Polish study on family care for the elderly - the AZER

study (Wóycicka & Rurarz, 2007) - shows that women not only constitute the majority of caregivers, they are also the main recipients of care.

The issues discussed also confirm the data on the use of institutionalised care. In 2011, 3.8 % of older women (aged 65 years or more) in the EU-28 were living in an institutional household. This was twice as high as the corresponding share for older men (1.9%) reflecting, at least in part, the increased longevity of women. The risk of dependence for women increases when an economic analysis of the level of pensions for women is added to demographic trends. In 2016, the average gender pay gap in the EU was 39.6%.

The consequences of lower earnings and shorter total seniority among women are lower pensions.
The very old are more likely to be frail and therefore require services such as those provided within institutional households. Although most healthcare costs in the EU are covered by social protection systems, long-term social care is usually treated differently. Consequently, this means that the responsibility for financing institutional care often resides with the older person needing such care, which may impose a burden on their family if they have insufficient funds.

Given the extent of family and society involvement in caring for older generations, it makes sense to discuss the introduction of compulsory LTC insurance as a supplement to social security systems, even at a minimum level. This is especially important now that social attitudes are changing and children are less likely to undertake independent care of their parents and instead assign this to institutions and commissioned care (Eitner et al., 2011, Błędowski et al, 2012). This is associated not only with weaker family ties but also with living in other cities – a result of emigration or staying in a larger city after studying and not returning to the hometown.

Acknowledgment

The project was financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19. The total funding amount was 10 721 040,00 PLN.

Reporting Tax Schemes – A Need or A Policy According to Accountants?

Anna FUKS, MSc.
Wroclaw University of Economics and Business, Wroclaw, Poland,
anna.fuks@ue.wroc.pl

Abstract

The goal of this article is to present the impact of introducing the obligation to report tax schemes as an example of changes in tax law on the opinions and reactions of accountants. The intended goal was achieved as a result of research using the following research methods: a survey and an interview questionnaire. The research was conducted mainly among accountants employed in the accounting departments of enterprises and in accounting offices located throughout Poland. Key research results have allowed the formulation of new research hypotheses, which will be verified in subsequent stages of the research, namely as a result of introduced changes in tax law: (1) the desire to use aggressive and normal tax optimization, as well as the use of services of specialised entities; (2) on the tax and legal advisory market, the provision of services in the field of tax planning or support in creating structures increasing the level of effectiveness of tax settlements is being abandoned.

Keywords: MDR, tax reporting, tax law, tax optimisation

Introduction

Recent years have seen a number of activities of international organisations, mainly the Organization for Economic Cooperation and Development (OECD), aimed at combating the activities of entities benefiting from imperfections in tax law. One of the reasons for the activities of these organisations may be the fact that entities use gaps in agreements to avoid double taxation, in which case the above-mentioned entities tax their income not in the country where it was earned, but in which the conditions for its taxation are much more favourable. An element of the OECD's activities in this area was the creation of a plan consisting of 15 points as part of the *Base Erosion and Profit Shifting*.

The idea behind these activities is mainly to encourage Member States to apply consistent regulations on transactions between Member States and to improve the transparency and quality of tax law [BEPS]. The answer to these foundations was the creation of an obligatory system of informing tax authorities about tax planning mechanisms, the so-called *Mandatory Disclosure Rules* – MDR.

This article is an attempt to show the impact of introducing the obligation to report tax schemes as an example of changes in tax law on the opinions and reactions of accountants. It is a pilot study conducted in December 2019, i.e. almost one year after the introduction of extended MDR regulations in Poland.

As a hypothesis, it was assumed that the provisions introducing the reporting obligation and explanations to them are unclear and raise a number of interpretation doubts, causing fear and negative assessment of the legislator's actions by accountants. In order to verify the hypothesis, the following research questions were asked in the questionnaire sheet:

- Do you know the provisions of the so-called MDR directives introduced into the Tax Code?
- Do you know how to fulfil in practice the obligation to report the tax scheme in case it occurs?
- In your opinion, what is the purpose of introducing the obligation to report tax schemes?
- What is your attitude towards the recent and planned changes in Polish tax law?

The presented results form part of the research on the reactions of various types of entities in Poland towards changes in tax law introduced by the legislator.

Mandatory Disclosure Rules

The obligation to report information on tax schemes to tax authorities results from the implementation of the provisions of Council Directive (EU) 2018/822 of May 25, 2018, the so-called MDR directives. The Polish legislator, introducing the obligation to report cross-border schemes to the Tax Code as of January 1, 2019, extended it to include the obligation to report Polish national schemes and to include arrangements for VAT.

National arrangements concern taxpayers who meet the so-called qualified beneficiary criterion. The main assumption of the MDR directive was that taxpayers and the advisers supporting them were obliged to inform the national tax authorities about the development, access or implementation of arrangements aimed at obtaining tax benefits, having a specific set of so-called recognition features.

The obligation to provide information on tax schemes may apply to three categories of entities: promoter, beneficiary, and supporter. In order for this obligation to arise, the agreement must meet the definition of a tax scheme resulting from the Polish Tax Code, namely:

- must meet the main benefit criterion and have a general recognition feature,
- must possess a special distinctive feature, or
- must possess another special distinctive feature [Act of August 29, 1997 ...].

The entity responsible for reporting the provision or implementation of the tax scheme is, in the first place, the promoter. The relevant provisions specify the scope of information to be submitted to the Head of the National Tax Administration. This range varies depending on whether the scheme is standardised or non-standardised. Additionally, the Tax Code sets out the rules related to the mode of submitting information and regulates the manner of acting in this respect by the Head of the National Tax Administration.

According to the assumptions, the purpose of MDR is to provide the tax administration with information that will be used by tax authorities to improve the quality of the tax system. This information is supposed to enable a quick response in the form of possible legislative changes. These assumptions are also directed at enabling quick access of the tax administration to information on potentially aggressive planning or fraud related to tax planning, as well as information on promoters and those using tax schemes. To a certain extent, these provisions also discourage taxpayers and their advisers from implementing arrangements that may constitute tax avoidance.

Results of the Conducted Research

The pilot study was conducted in December 2019 among Polish accountants from around the country. The total research sample (based on the return of fully completed questionnaires) was 184 people. Almost half of the respondents (49.5%) were employed in accounting positions in accounting departments of enterprises. Another group of people surveyed were accountants employed in accounting offices (39.7%). The remaining surveyed group were also people professionally connected with accounting in various forms. The following research methods were used: survey questionnaire and interview questionnaire.

Based on the questionnaires completed by the surveyed group, and the answers obtained from the interview questionnaire. The following results were obtained:

Table 1: Results of the research

Do you know the provisions of the so-called MDR directives introduced into the Tax Code?			
• yes – 18.5%	• partly – 70.6%	• no – 10.9%	
At what level do you assess your knowledge about tax schemes?			
• very good – 6.5%	• good – 37.5%	• sufficient – 40.2%	• insufficient – 15.8%
Do you know how to fulfil in practice the obligation to report the tax scheme in the event of its occurrence?			
• yes – 9.2%	• partly – 56.0%	• no – 34.8%	
Do you intend to broaden your knowledge of tax schemes and their reporting?			
• yes – 81.5%	• no – 8.2%	• I have no opinion – 10.3%	
In your opinion, what is the purpose of introducing the obligation to report tax schemes?			
• improving the quality of the tax system - 8.2% • quick access of the tax administration to information on only aggressive tax optimisation - 15.0% • quick access to entities using tax schemes - 10.8% • discouraging taxpayers and their advisers from implementing arrangements that may constitute tax avoidance - 32.1% • limiting the use of normal tax optimization solutions by taxpayers - 33.9%			
What is your attitude towards the legislator's extension of EU regulations to include reporting on national schemes?			
• positive - 12.0%	• negative - 45.7%	• I have no opinion – 42.3%	
What is your attitude towards the recent and planned changes in Polish tax law?			
• positive - 7.6%	• negative - 82.6%	• I have no opinion – 9.8%	
How do you assess the impact of the legislator's actions on the possibilities for entrepreneurs to use normal tax optimisation?			
• positive - 10,9%	• negative - 52,7%	• I have no opinion – 36,4%	

Assessment of the Value of the Findings

The hypothesis has been positively verified in the course of the conducted research. The provisions introducing the reporting obligation and explanations to them are unclear and raise a number of interpretation doubts, causing fear and negative assessment of the legislator's actions by accountants.

The vast majority of the surveyed group negatively assess their knowledge of MDR regulations, tax schemes themselves, and fulfilling their reporting obligations in practice. The fact that accountants have a negative assessment of the legislator's activities is also important; only 7.6% of respondents positively assess the recent and planned changes in tax law. Similarly, the respondents assess the legislator's intentions in connection with the introduction of this reporting obligation negatively. In addition, the largest percentage of respondents indicates a limitation of taxpayers' use of normal tax optimisation solutions as the legislator's goal in this respect.

A significant number of respondents negatively assessed the legislative activities of the legislator. This is primarily due to the fact that national MDR regulations are, in the eyes of recipients, imprecise and unclear. At the moment, there is no practice nor even more official guidelines as to the practical application of MDR principles and reporting of national schemes. With the entry into force of the new provisions, there arose doubts and interpretation difficulties which, despite the provisions being in force for almost a year, have not gone away. In addition, the fact of not complying with obligations in the field of reporting tax schemes, which is associated with severe fines, and in extreme cases, where the court has the right to impose a criminal measure in the form of a ban on conducting specific business activities, additionally does not favour a positive reception of changes in tax law.

A measure of the legislative quality of tax law provisions is their development, adoption and publication in accordance with the principles of so-called decent legislation. If subsequent changes to

the regulations are ad hoc, occasional or accidental, their effect is the creation of tax law based on numerous normative acts, which are illegible and inconsistent and lack rationality in the eyes of the recipients of said regulations [*Polski system* ... 2010, p. 128-134].

Conclusion

As a consequence of the analysis of the first part of the obtained research results, and as a consequence of the conclusions drawn from it, it is possible to make further hypotheses that will be verified in the next stages of the research: (1) as a result of changes in tax law, the desire to use aggressive and normal tax optimisation significantly decreases, as does the use of services of specialised entities for this purpose; (2) as a result of introduced changes in tax law on the tax and legal advisory market, the provision of services in the field of tax planning or support in creating structures increasing the efficiency of tax settlements is being abandoned.

It should be emphasized that these results constitute only part of the research on the reactions of various types of entities to changes in tax law introduced by the legislator. At the stage of further research, individual research groups will be analysed separately, and more attention will be paid to the dependence of the responses of individual groups subject to the study on the duration of given provisions in tax law as well as their transparency or ease of interpretation in the eyes of the respondents.

Abstract

Implementation of advanced technologies related to the Industry 4.0 concept, application of mobile networking and adjustment of the company offer to current customer's demands are necessary to gain a competitive advantage on the market. Currently, customers expect personalized products tailored to their individual needs, tastes and lifestyle. However, they want to pay a similar price to mass production. For these market trends, there is a growing need to introduce completely new approach that enable the implementation of mass customization. The reconciliation of conflicting low-price requirements and the rapid manufacturing of personalized products are possible only through the use of advanced digitization, wireless and mobile networking, ensuring rapid improvement of mobility, flexibility and efficiency. The article presents a new approach to mass customization manufacturing which bases on the results of research conducted in industrial enterprises. The main aim of research was to develop an operating procedure for mass customization. The implementation of the proposed approach in practice should allow the rapid manufacturing of personalized products using wireless and mobile networking that increases mobility, flexibility and production efficiency to be ensured. Particular attention has been paid to the benefits of modern mobile technologies and networking, digitization and advanced manufacturing systems.

Keywords: operation management, operating procedure, business model, Industry 4.0, mass customization strategy.

Introduction

Nowadays, advances in the areas of smart device-embedded systems and technological solutions is very high and leads to an inevitability of a development an appropriate level of digitalization (Modrak et al, 2017; Russo et al, 2015). Previously used business models are no longer staggering due to a need to apply the Internet of Things, digitalization and mobile networking, etc. (Dalenogare et al, 2018; Dregger et al, 2016; Wang et al, 2015; Lasi et al, 2014; Grabowska et al, 2020). Technological and financial resources are already insufficient for organizations to succeed on the market. Innovation advanced technologies create growing potential that can give groundbreaking changes in business models. New, innovative business models are needed which a reconciliation of conflicting low-price requirements and the rapid manufacturing of personalized products, and also allow new leadership and a new type of value to be built through rapid improvement of mobility, flexibility and efficiency (Dalenogare et al, 2018; Dregger et al, 2016; Wang, Törngren & Onori 2015).

Customers expect products that are unique, tailored to their personal preferences, tastes, needs and lifestyle. They want to configure the purchased products and also pay a price similar to mass products. Mass production does not fit turbulent markets, growing product variety and technological opportunities (Stojanova et al, 2013).The production paradigm is changed and manufacturing becomes closer, more responsive to customer requirements and faster (Wang et al, 2017). Strong

competition causes that production companies are still looking for new strategies and solutions to meet these challenges and gain a competitive advantage on the market and sustainable industrial development. These trends mean increased pressure on mass customization (MC) and has driven the new line of research which concentrates on introduce completely new business models (Moeuf et al, 2017), which enable a real transformation and the implementation of mass customization strategy and the Industry 4.0 in practice.

The article presents a new approach to mass customization manufacturing which bases on the results of research conducted in industrial enterprises. The main aim of research was to develop an operating procedure for mass customization strategy. The implementation of the proposed approach in practice should allow the rapid manufacturing of personalized products using wireless and mobile networking that increases significantly mobility, flexibility and production efficiency to be ensured.

Particular attention has been paid to the benefits of connection mobile technologies and networking, technologies of the Industry 4.0 with advanced manufacturing systems. The proposed operating procedure was developed on the basis of qualitative and quantitative research carried out in 12 medium and big production enterprises in Poland and among their customers.

Theoretical Framework

Mass Customization Production (MCP) and Mass Personalization Production (MPP)

A manufacturing strategy of mass customization (MC) is a combination of the features of two types of production: the production of engineering to order, which means adapting products to the individual customer's requirements, with features of mass production such as low price and short delivery cycle. MC means flexible production with large varieties, high productivity and low cost and began to gain popularity in the late 1980s (Wang et al, 2017; Pine, 1993).

The competitive advantage of an enterprise in mass customization strategy can be achieved on the basis of a cost-based competition strategy and a product differentiation strategy (Silveira et al, 2001).This strategy based on numerically controlled machines (NC), computer integrated systems (CIM), flexible manufacturing systems (FMS) and introduced manufacturing management systems such as enterprise resource planning (ERP), product life management (PLM) and manufacturing executive system (MES). According to this strategy, cheap mass-produced products, creating value from economies of scale were produced and more expensive customized products (Samolejova et al, 2012; Pine, 1993; Pine, Victor & Boynton, 1994; Gregor et al, 2017; Jakubowski & Wozniak, 2016).

The idea of delivering the customized products to customers within a very short time (e.g. a few days) turned out to be very difficult to implement in practice due to the high cost and organizational difficulties (Silveira et al, 2001,) and success depended on a type of product. For example, Toyota (car's manufacturer) has abandoned an ambitious car delivery plan with a set of options selected by the customer within 3 days. However, at Dell company (computer's manufacturer) this idea has been successfully implemented (Silveira et al, 2001).

In the 2010s customer's expectations were changed. The consumers want not only a product tailored to their needs, but at a price similar to a mass product and also to have influence to create product themselves. The production model has changed to the manufacturing model driven by the customer orders (Zhang et al, 2019). At the same time, many very advanced technologies have developed and a generation has appeared on the market, which commonly uses social networks as well as wireless and mobile networking. Communication and information technologies have influence on people life and business (Wang et al, 2017). In this situation, the Industry 4.0 concept has developed and a trend in which companies is focused on customer demand more than company's value (Martin, 2010; Grabowska et al, 2020).

These new technologies give possibilities to create new forms of MCP. Some authors called this strategy as a new form of mass customization and others as a mass personalization production (MPP). MPP allows a demand diversification, large-scale manufacturing with the advantages of quality, flexibility, cost, time, and variety (Wang et al, 2017) using wireless and mobile networking. The mass personalization production strategy is based on connections with the Industry 4.0 concept and related technologies using them together and connected with a global communication, wireless and mobile networks.

Types of Customization

There are four distinct approaches to customization depending on the scope of the customer's influence on the final product (Gilmore & Pine, 1997):

- collaborative - the most difficult to realize, changes are implemented based on conducted dialogue with the consumer to help him articulate his needs and concern the actual product, elements of the extended product or additional benefits that the customer obtains;
- adaptive - one standard, but customizable product which is designed in such a way that the user can alter it himself;
- cosmetic - standard product differently to different customers;
- transparent - changes in the product are introduced by the manufacturer based on observation of customer behavior and preferences.

A very important issue in the selection of applied customization type is the possibility of achieving production efficiency comparable to mass production. Another customization typology is connected with forms of modularity in various phases of value stream creation and the customer degree involvement. There are several kinds of collaborative customization (Duray, 2002; Bednarz, 2010):

- fabrications - the customer has an influence on the design and production of ingredients phase; it is possible to create new specific components compliant with the client's requirements;
- involvers - the customer has an influence on the design and production of ingredients phase, but without creation specific new components;
- assemblers - the product is assigned to the customer in the assembly phase and use of product, but it is possible only to add or replace common modules;
- modularizers - the product is assigned to the customer in the assembly phase and use of product and but it is possible to add new modules better to meet the specific requirements of the consumer.

Technological Challenges for Mass Customization in the Industry 4.0 Environment

One of the significant problem in mass customization is the level of product individualization. Mass customization can mean products in which the customer has a choice of several different variants, but also can mean customer co-design of product. The range in which products can be customized plays a key role (Stojanova et al, 2013). There are some key problems and limitations to mass customization:

- usually customers do not participate in the design phase, because it is time consuming, difficult to organize and difficult to return product;
- much easier is that potential combinations are determined by designers (Wang, Ma, Yang & Wang, 2017);
- short time of delivery and low cost is often more important for the consumer than a satisfaction from each individual requirement.

The Industry 4.0 standard gives new opportunity for mass customization connected with using many innovation technologies together such as: Cyber-Physical Systems (CPS) which integrated

networking, computing and physical processes, Internet of Things (IoT), Internet of Services (IoS), Big Data Analytics, Cloud Computing, Additive Manufacturing, Simulation, System Integration, Augmented Reality, etc. with industrial automation. This concept can allow manufacturing to a different dimension of mobility, flexibility and efficiency to be moved (Wan & Xia, 2017). The conflict between product diversification and large-scale manufacturing can be solved. It may be particularly useful to take advantage of the possibilities of using mobile and wireless networks whose number of users and availability is growing rapidly. New technologies will enable enterprises to manufacture customized products with shorter cycle-times and lower costs than mass production and standardization with the advantages of cost, quality, time, flexibility and variety (Wang et al, 2017; Jasiulewicz-Kaczmarek & Gola, 2019; Gregor et al, 2017).

The Internet of Things (IoT) is a network of machines, smart devices and physical objects connected to a central or a cloud-based server which have built-in wireless connectivity, sensors and other mechanism collected and transmitted information and have the capability to monitor and control all elements of the network (Shelby & Bormann, 2009; Caganova et al, 2017). They have their own unique Internet protocol (IP) addresses which helps them to communicate and exchange information (Bawa at al, 2015; Pawar, 2015). IoT connects devices, humans and systems to capture and monitor real-time object information and to achieve recognition, optimization and management in company (Liu et al., 2017). This technology is using to ensure a resource identification, communication, interaction, data fusion and integration. A development of IoT-based applications is also extremely important (Liu et al., 2017).The machine-to-machine (M2M) communication capability generates a more human free manufacturing environment (Oztemel & Gursev, 2018).

The decision about implementation of advanced IoT technology should be treated as a positive response to the changing environment and a trend towards to gain competitive advantage (Li, Hou, Liu & Liu, 2012). Electronic sensors, microchips can create today greater amounts of new types high-quality information and give completely new possibilities. Using sensors and software to feed into big data, machines, people, vehicles, production lines, logistics networks, etc. can be linked in real-time. Warehouses can be fully automatic, orders can be automatically pass to suppliers, etc. and enterprise receives new dimension of mobility, flexibility and efficiency (Russo et al, 2015).

Whereas Cyber-Physical Systems (CPS) are more self-behaving and give autonomy for production system. Sensors, actuators and other physical objects make easier communication capability between machines and brings more agile, robust and consistent manufacturing systems with intelligent capabilities (Oztemel & Gursev, 2018). CPS ingrate networking, computation and physical processes. A typical example of the CPS is RFID system. RFID technology helps data of manufacturing production processes such as material consumptions, machine statuses, order progress or workstation status to be sensed and captured in the real-time (Zhong, Dai, Qu, Hu & Huang, 2013). Then, the manufacturing data can be transferred to the Manufacturing Execution System (MES) for processing (Wang et al, 2017).

Due to rapidly growing an amount of data related to the IoT concept, Cloud Computing technology is gaining importance (Pape & Rannenberg, 2019). The Cloud Computing is a model in which servers, applications, networks and another elements are made available to IT and end users via the Internet. There are three types of cloud service: infrastructure as a service (IaaS), platform as a service (PaaS) and software as a service (SaaS). Cloud computing is computing model, not a technology.

The Big Data (BD) technology helps to analyze data from production and makes a production system flexible and self-controlling. This technology has the ability to collect, store and analyze a huge amount of data in real time. The Big Data analytics allow precisely expectations, needs and requirements of clients to be identified, customer's segments according to different criteria to be created, advertising and marketing activities much more effectively to be adjusted, and also much better conversion rate to be achieved. In the area of production, BD is used for device diagnostics, identification of inefficient resources and processes, production bottlenecks, optimization of production quality, energy saving, service improvement and after-sales services. In the context of the

Industry 4.0, collecting and comprehensively assessing data from a wide range of sources - devices and production systems, as well as enterprise and customer management systems - will become a standard to support real-time decision making (Meerja et al, 2019).

The clients' requirements are related to fast and high quality service. Customers want to have continuous access to information about the status of their orders. It is observed that the e-commerce platforms are increasingly used to conduct a professional customer service. The use of the e-commerce platform enables multi-level sales ensuring automatic generation of information about orders, returns, complaints and their status. The flow of information is very fast. A main benefit of using these platforms is a new order based on the Internet which becomes the main form of current economic activities (Wu et al, 2019; Saniuk & Grabowska, 2019; Akter & Wamba, 2016).

Research Aim and Methods

Research Aim

A new approach to mass customization manufacturing based on the results of research conducted in industrial enterprises is presented. The main aim of research was to develop an operating procedure for mass customization strategy (OPMC). This procedure contains a proposition of an organization of significant processes which allows the rapid manufacturing of personalized products using modern mobile technologies, digitalization, wireless and mobile networking. Otherwise, the implementation of this procedure in practice should help to increase a mobility, a flexibility and a production efficiency.

Literature Review

Based on the analysis of the literature, the main features of mass customization and personalization, the types of mass customization and the possibilities of its development in the Industry 4.0 environment related to the use of modern technologies were identified. The need to build new solutions which help to create new business models is highlighted.

Observations in Production Enterprises and Survey Research of their Customers

The research in the form of observations was conducted for a purposely selected group of medium and large production companies in Poland. The survey research was carried out among customers of intentionally selected enterprises. Based on the surveys, the following questions were sought:

- Which customer requirements should be included in the operating procedure for mass customization strategy?
- What should be the average maximum time from placing the order to delivering the product to the customer?

On the basis of the observations, the following questions were sought:

- What processes should involve the operating procedure?
- What Industry 4.0 technologies, solutions and systems should be used to ensure increase in mobility, and flexibility and a production efficiency and customers' requirements?
- What operating procedure could quickly produce personalized products and support the management of industrial enterprises in mass customization manufacturing?

Building the Operating Procedure for Mass Customization (OPMC)

Building an Operating Procedure for Mass Customization (OPMC), which allows the rapid manufacturing of personalized products using wireless and mobile networking and help to increase a mobility, flexibility and production efficiency.

Research Results

Results of Observations in Enterprises and Survey Research of their Customers

From among a group of randomly selected 120 medium and large production enterprises (MLE) which conduct business activity on Polish territory, a group of 12 companies was deliberately selected in which quality research was conducted. Then, a quantitative research was made among the clients of these companies in the form of questionnaire surveys. 296 people (24%) from 1232 clients of the surveyed companies took part. The main purposes of the survey research were:

1) to identify the needs and requirements of current clients of deliberately selected enterprises in the field of mass customization, which will help in the construction of an operating procedure for mass customization strategy;
2) determining the average maximum time from order submitting to delivering the product to the customer which is expected by the customers.

The results of quantitative research are presented in the Figure 1 and the Figure 2. The most important requirements and needs of customers which are the basis for building the operating procedure for mass customization strategy are presented in the Figure 1.

Fig. 1: Customer's requirements and needs - survey results

(source: own study)

The customers' expectations about the maximum length of time from order submitting to delivering the product to the customer are a key aspect in the building of the operating procedure for mass customization strategy. This information depends on what processes manufacturers are able to implement only after receiving the order and which they must prepare in advance. This information also affects the profitability of order fulfillment. Well-planned execution of orders can significantly reduce the costs of frozen capital. The customers' expectations about the average maximum time from order submitting to delivering the product to the customer are illustrated in the Figure 2.

Fig. 2: The average maximum time from order submitting to delivering the product to the customer- survey research results

(source: own study)

The qualitative research was conducted in 2019 using the method of observation in deliberately selected 12 MLE in Poland. Their goal was to answer the following questions:

- What processes should involve the operating procedure?
- What Industry 4.0 technologies, solutions and systems should be used to ensure increase in mobility, and flexibility and a production efficiency and customers' requirements?
- What operating procedure could quickly manufacture personalized products and support the management of industrial enterprises in mass customization manufacturing?

Based on the research results observations and analysis, 6 main processes were identified whose organization must be changed using the mass customization strategy. The proposed operating procedure OPMC should contain a proposal of technologies, solutions and systems dedicated to the following processes: 1) Product Design, 2) Order Processing, 3) Production Planning, 4) Manufacturing and Assembly, 5) Quality Management, 6) Storing and Shipment. Then, the possibilities of new technologies, the benefits that can be obtained and the limitations of production systems were analyzed and technologies, solutions and systems were selected and proposed for the operating procedure for mass customization strategy.

The Operating Procedure for Mass Customization Strategy

On the basis of the qualitative and quantitative research, the Operating Procedure for Mass Customization (OPMC) is developed, the main task of which is to apply new Industry 4.0 solutions designed to manufacture products quickly and in accordance with the requirements and needs of customers, what is shown in the Figure 3.

Fig. 3: The Operating Procedure for Mass Customization Strategy

(source: own study)

This is a solution for the B2B2C (Business-to-Business-to-Consumer) model. It is assumed that the network of manufacturing companies belonging to the Cyber Industry Network (CIN) jointly produces the product and delivers the product to the customer through distribution companies. The operating procedure defines the solutions and systems that are used to generate for mass customization strategy to facilitate the flow of information. The key issue in the construction of the operating procedure is the selection of solutions and technologies that will enable quick manufacturing and increase mobility, flexibility and efficiency. The proposed operating procedure consists of six stages.

The survey research has shown that as much as 84% of surveyed respondents prefer personalized product in which customer can select many options and determines a product variant (see the Figure 1), and only 6% respondents would like to design the product themselves. For this reason, an operating procedure is built for an adaptive type of mass customization. This means that the customer makes the product specification based on the available set of options. To shorten the delivery time, each product configuration with available options is previously designed by the manufacturer's employees. It is assumed that surveys are systematically conducted regarding changing customer needs and analyze sales data in order to add new options for product variants and remove or change existing ones.

Stage 1. Product Design. In the first stage, the employees of enterprises creating the Cyber Industry Network define a finite number of product variants that can be configured by customers based on cost analysis, material availability and time-consuming product manufacturing processes. Then every possible variant is designed. Such a solution significantly shortens the time of order fulfillment and facilitates a production organization. Unfortunately, it does not allow to produce a collaborative type of mass customization. Proposed technologies and solutions: Computer-Aided Design (CAD), Computer-Aided Manufacturing (CAM), 3D Printing, spatial scanning, modeling.

Stage 2. Order Processing. In the second stage, the customer configures a personalized product based on the options provided by the manufacturer. To increase the quality of customer service, e-commerce platform has been used that allows: quickly information about orders to be obtained, customer about the status of his order to be systematically informed, the variant of the product to be

visualized and the price to be calculated, and various promotional activities to specific customer segments to be applied. The use of e-commerce platform enables meeting several requirements and expectations of customers identified on the basis of surveys: continuous access to information about the order status, generating the variant price in real-time, generating visualization of the variant of the configured product, the possibility of automatic payment. Proposed technologies and solutions: E-commerce Platform (ECP).

Stage 3. Production Planning. In the third stage the Cyber Industry Network the load of partners' resources are planned. At this stage, the production process is generated and the required resources are determined. Planning and production of products is realized in the Cyber Industry Network (CIN) platform planning, which is a proprietary solution of the authors of the article and has been published among others in (Saniuk, Saniuk, & Caganova, 2019). Proposed technologies and solutions: Internet of Things (IoT), Big Data (BD), Manufacturing Execution System (MES), Advanced Planning and Scheduling (APS), Enterprise Resource Planning (ERP).

Stage 4. Manufacturing and Assembly. In the fourth stage, the order is completed - a personalized product is manufactured by companies belonging to the Cyber Industry Network. RFID sensors identify materials and products. Sensors, biosensors, actuators and other physical objects read information in the real time from machines, robots and devices, etc., using IoT technology and then transmit it to the Manufacturing Execution System (MES). Using Big Data technology, the collected data is analyzed to save energy, detect upcoming downtime, breakdowns, optimize bottlenecks, etc. Inspections are automated. Data is collected and stored using Cloud Computing (CC), which ensures the availability of data from various mobile devices in Anytime, Anywhere, Anydevice mode, free access to the data of authorized employees and the possibility of using remote work. The use of CC reduces the risk of data loss and lack of access to data caused by hardware failure. Proposed technologies and solutions: Cyber Physical System (CPS), RFID, Internet of Things (IoT), Big Data (BD), Manufacturing Execution System (MES), Enterprise Resource Planning (ERP), Predictive Maintenance (PM).

Stage 5. Quality Management. The fifth stage relies on quality management. The following activities are made in this stage: suppliers are assessed, the quality of raw materials and packaging is controlled, complaints are handled and analyzed, the correctness of processes, the quality of document flow, data archiving and access and secure data are controlled. Using RFID sensors, IoT technology and BD analytics, upcoming failures are detected and their causes automatically removed. This stage also examines the quality of customer service and after-sales services. Proposed technologies and solutions: Cyber Physical System (CPS), RFID, Internet of Things (IoT), Big Data (BD), Manufacturing Execution System (MES), Enterprise Resource Planning (ERP).

Stage 6. Storing and Shipment. The sixth stage involves processes related to storage, packaging, preparation of products for shipment and shipment of products to the customer. RFID sensors are also used here. An interesting solution is a blockchain technology (BC). This technology enables a very accurate and reliable tracking of the product route along the entire supply chain with the possibility to precisely determine the time of individual locations. It can be especially useful for products of high value. There is a possibility of using various sensors and biosensors to continuously measure various parameters during transport and storage in real time, which can significantly increase the quality of transported products. For professional process management, SCM and DSC are proposed to use at this stage to extend logistics efficiency (Hurka & Wyrwicka, 2019; Straka et al., 2017). Proposed technologies and solutions: Supply Chain Management (SCM), Digital Supply Chain (DSC), blockchains (BC), Cyber Physical System (CPS),RFID, Cloud Computing (CC), Internet of Things (IoT), Big Data (BD).

Conclusions and Future Research

As the main effect of the conducted research is an operating procedure for mass customization strategy dedicated for medium and large production enterprises. The quantitative research has shown

that the customer expects personalized products that he would like to configure himself/herself, but not necessarily design himself/herself. This means in practice that product design can be done even before the customer's order is submitted based on pre-defined options for selecting the defined product features, which significantly shortens the time of order completion and facilitates a production organization and planning. Also important for the customer is a short order processing time of 4-5 days and information about the date of product delivery, continuous access to information about order status and the possibility of purchasing products from mobile devices. On the basis of qualitative research in the form of observations conducted in manufacturing enterprises in Poland, six stages are identified that are important from the point of view of mass customization manufacturing. Based on analysis and many observations, technologies, solutions and systems have been proposed that increase mobility, flexibility and production efficiency.

The future research will be conducted in a form of the experiments. Moreover, it is planned to verify possibility to use in practice the proposed operating procedure OPMC in condition of specific industry.

Abstract

Entrepreneurship is a significant and still up-to-date research topic both because of its theoretical complexity and the importance for the social practice, especially the economic one. The authors assume that the study of entrepreneurship needs to take into consideration different perspectives: psychological, organisational, economic and cultural. The aim of the article is to diagnose the perception of entrepreneurship and its conditioning in the perception of Polish, Belarusian and Ukrainian students. The opinions of young people studying management - potential future entrepreneurs representing different national cultures - have been found cognitively interesting. The study involved a group of 312 students from Bialystok University of Technology, Grodno State University and the Poltava National Technical Yuri Kondratyuk University. With regard to a gradual character of evaluation (5-point Likert scale) and a large number of groups, the analysis of the obtained results was based on the Kruskal-Wallis test. The U Mann-Whitney test was used for identifying groups with considerable differences.

Keywords: Entrepreneurship; Diagnose the Perception of Entrepreneurship

Introduction

Entrepreneurial attitudes of young people are an important and current research topic both on account of its theoretical complexity as well as significance to economic practice (Veciana, Aponte and Urbano, 2005; Pruett and Şeşen, 2017; Fellnhofer, 2018; Shahid, Imran and Shehryar, 2018). The authors share the view that studies on attitudes towards entrepreneurship among young people require the consideration of numerous, differing perspectives: psychological, organisational, economic and cultural (Hockerts, 2018; Audretsch, 2007). Entrepreneurial attitudes have a greater chance for development in societies where entrepreneurship is anchored in the culture and is not only allowed but also socially supported (Fellnhofer and Mueller, 2018; Borasi and Finnigan, 2010). Appropriate legal regulations, access to technologies and resources needed to finance a business rarely suffice people to display entrepreneurial mindsets (activate their business competencies). The right cultural foundation, i.e. the one that allows people to perceive and take advantage of emerging opportunities, is also essential (Yemini and Oplatka, 2014).

The article aims to diagnose the manner in which entrepreneurship is perceived by students of Polish, Belarusian and Ukrainian universities. The comparison of opinions expressed by young business students (management or economics faculties) - potential future entrepreneurs representing varying national cultures - has been deemed to be cognitively interesting. Considering the fact that the respondents (312 people) represent only three universities (the Faculty of Engineering Management of

Bialystok University of Technology in Poland, the Faculty of Economics and Management of the Yanka Kupala State University of Grodno in Belarus and the Faculty of Technical Management of the Poltava National Technical Yuriy Kondratyuk University in Ukraine), the research is considered to be fragmentary. Any conclusions drawn from the results can become a starting point for the development of more detailed research hypotheses and a basis for further, more in-depth scientific studies.

Conditions of Entrepreneurship – Theoretical Background

Entrepreneurship is both an interdisciplinary as well as complex issue which results in varying manners of defining it and a differing distribution of emphasis concerning its conditions and expressions. The only element of entrepreneurship which is beyond question is its fundamental significance to economic and social development. Entrepreneurship can be considered, among other things, through the methodological perspective of economics, management sciences, legal theory, sociology or psychology (Carsrud, Brännback, Elfving and Brandt, 2009). It can be analysed as a process leading to the establishment of businesses and their development but also as a personality trait of a particular person (Littunen, 2000). It can be treated as an element of social capital with reference to the mentality and the resulting attitudes of a given group. It is also studied as an aspect of culture and civilization. At the same time, it is a dynamic category: the role of entrepreneurship within social life is changing, where such changes affect the philosophy of entrepreneurship as well as the notion of an entrepreneur itself (Zhao, Seibert and Lumpkin, 2010).

Studies into entrepreneurship are conventionally divided into two trends: psychological and economic (Gorgievski and Stephan, 2016). The former relates entrepreneurship to an entrepreneur or, more broadly, a man of business. It describes entrepreneurship as a set of character traits, skills and behaviours which are a form of expressing entrepreneurial traits and abilities (Leutner, Gorkan, Akhtar and Chamorro-Premuzic, 2014). The same approach was declared by Xenophon a long time ago. In portraying a good governor, a synonym of a contemporary businessman, he stressed the role of being engaged in and love toward one's work, judged to be more important than professional knowledge. In psychology, entrepreneurship is examined with the use of such categories as personality, talent, creativity, or even creative drive (Pinho, Sampaio de Sá, 2014). Such understood entrepreneurship is closely related to creativity, initiative, active mind, innovativeness and an expression of one's individuality (Baluku, Matagi, Musanje, Kikooma and Otto, 2019; Cardon, Wincent, Singh and Drnovsek, 2009). Nevertheless, there remains a question whether entrepreneurship is an inherited psychological predisposition or an attitude learned in the process of education and development (Schlaegel and Koenig, 2014). Advocates of an inherited character of entrepreneurship treat it as a critical talent which rarely occurs but, at the same time, seems to be of key significance with regard to the functioning of a given community. There is also a search for correlations between entrepreneurship and a genetically conditioned inclination toward "thrill seeking" (Nicolaou, Shane, Cherkas and Spector, 2008; Nicolaou and Shane, 2009).

Many contemporary studies and concepts of entrepreneurship often question genetic roots of entrepreneurship, highlighting a significant role of environmental factors, especially cultural, social, political and economic, in its development (Stephan and Uhlaner, 2010; Hartung, 2002; Wasilczuk and Zięba, 2008). The definition of entrepreneurship as a process dominates economic sciences (including management science). Economic perspective draws attention to the structural, legal and business conditions of entrepreneurship and the quantitative aspects of this phenomenon (Brazeal and Herbert, 1999). An entrepreneur searches for change, reacts to it and uses it as an opportunity, while entrepreneurship is an activity leading to the development and creation of a new value (Lee, Florida and Acs, 2004). If the identification of opportunities takes place on the path of discovery, it is dubbed "traditional entrepreneurship". However, if it occurs at the creation stage, it is termed "intellectual entrepreneurship". It is mainly incorporated in businesses, although it is worth mentioning that sometimes it does occur in various organisations or even households. In economic sciences, to display entrepreneurship means to have an idea, a concept, to recognise the opportunity in the course of its

execution, to foresee its results, assess the chances for the execution of an idea and, on this basis, formulate aims and tasks. The process is, therefore, dominated by a praxeological approach to an entrepreneur as a person who establishes goals and ensures that it is efficiently (and effectively) executed (Garcia-Cabrera and Garcia-Soto, 2008).

An attempt to combine the psychological and the organisational research perspectives is visible in the interpretation of the essence of entrepreneurship through the theory of competencies (Wasilczuk, 2000). Entrepreneurship is at times treated as a single skill belonging to the group of key competencies, or those which are the most important to a given organisation or a particular person (Scuotto and Morellato, 2013; Schmitt-Rodermund, 2004). However, on the basis of an analysis of factors conditioning entrepreneurial activity, one could risk a conclusion that defining entrepreneurship as a separate, single competency is a simplification that goes a bit too far (Schlaegel and Koenig, 2014). For this reason entrepreneurship is defined as a group of competencies affecting effective identification and achievement of organisational goals in conditions of risk or uncertainty (Pan, 2017). At the same time, it must also be stated that competencies are understood as all characteristics and rights of people and organisations which, utilised and developed, serve to achieve organisational aims as well as all personal employee goals which fit them. This definition allows for broad classification of competencies. It stresses the fact that they concern not only certain employees but the organisation as well. The characterisation of entrepreneurship as a group of competencies allows for accepting the fact that entrepreneurship can be used to describe a particular person, team or - if it is led by enterprising management - employees and contributors who support entrepreneurship, i.e. the entire organisation (Ismail and Zulihar, 2015).

Entrepreneurial attitudes – Bibliometric Analysis

The authors used a standard bibliometric analysis of scientific literature from Scopus database in order to characterise issues on entrepreneurship attitudes. Figure 1 illustrates the existence of key terms subject to a three-stage analysis.

Figure 1: Stages of bibliometric analysis

In the course of the analysis the number of articles was reduced down to 429. The authors focused on such areas as: Business, Management and Accounting, Social Sciences, Economics, Econometrics and Finance, Decision Sciences, Psychology. A tool used in data ordering and presentation was VOSviewer programme. This software is particularly useful in working on extensive volume of data. It is a tool for creating and visualising bibliometric networks that use an advanced layout and clustering techniques in order to illustrate existing references between keywords characterising articles from scientific databases. The software draws attention to the frequency and co-existence of keywords that appear in the network (Gudanowska, 2017; Glińska, Siemieniako, 2018; Siderska, Jadda, 2018). In the second phase the authors determined such analysis parameters as a minimum number of keyword occurrences which equalled 5. As a result, the number of keywords to select from is 60. Cleaning the database from redundant phrases allowed for removing such repetitive words as names of countries and phrases that failed to be thematically coherent. This fostered the creation of a map of research trends on entrepreneurial attitudes (figure 2).

Figure 2: Map of research trends based on the co-occurrence of the authors' keywords in publications referring to entrepreneurial attitudes

(own study based on the VOSviewer software)

With regard to the areas of scientific research identified in Scopus database, it can be stated that entrepreneurial attitudes are associated with education, innovations, intentions, values, personality, industry, opportunities and development. There appear many interesting areas that deserve further exploration. The future direction of research might be broadening of bibliometric analysis through the use of other databases of scientific publications, such as Web of Science, Elsevier, Emerald or EBSCO.

Methodology of the Present Study

The study was conducted in 2018. It was executed with the use of the PAPI (Paper and Pen Personal Interview) method on a sample of 312 students: 112 from the Faculty of Management of Engineering of Bialystok University of Technology (constituting 36% of all respondents), 100 from the Faculty of

Economics and Management of the Yanka Kupala State University of Grodno in Belarus (32% of the sample) and 100 from the Faculty of Technical Management of the Poltava National Technical Yuriy Kondratyuk University in Ukraine (32% of all participants). Gender divisions within the group were as follows: the group of respondents from Poland was comprised of 61% women and 39% men, students from Belarus consisted of 59% women and 41% men, while the female / male percentage with regard to the group from Ukraine 62% and 38% respectively.

The following research problems were formulated:

- Are there differences (and if so, what are they) in the perception of the essence and conditionings of entrepreneurship of students from Poland, Belarus and Ukraine?
- What are the entrepreneurial plans and motivations of the participating students?
- How do the study's respondents perceive success factors and main obstacles to the development of entrepreneurship in their own countries?

A survey questionnaire prepared in the native languages of the participating students was a tool used to carry out the study. With regard to a gradual character of evaluation (5-point Likert scale) and a large number of groups, the analysis of the obtained results was based on the Kruskal-Wallis test. The U Mann-Whitney test was used for identifying groups with considerable differences.

Perception of Entrepreneurship by Polish, Belarussian and Ukrainian Students – Analysis of Study Results

The study was an attempt to discover the students' opinions regarding the conditionings of entrepreneurial attitudes with special focus on the role of innate and environmental factors in the shaping of entrepreneurial attitudes (see Table 1).

Table 1: Opinions of students with regard to personality and the environment as a determinant of entrepreneurship

Answer category	Answers submitted by Polish respondents	Answers submitted by Belarussian respondents	Answers submitted by Ukrainian respondents
No answer	13%	35%	14%
Entrepreneurship is equally dependent on innate and acquired characteristics	25%	15%	21%
Entrepreneurship is an attitude that can be learnt	61%	42%	66%
Entrepreneurship is a personality trait	1%	8%	0%

Nationality significantly differentiates the perception of the essence and conditionings of entrepreneurship of the participating students (see Table 1). There is greater similarity between Poles and Ukrainians and problems are seen differently by the citizens of Belarus. Belarussian students (35%) more often than those from the other two countries show a greater inclination to treat entrepreneurship as an innate personality trait. The difference in the assessment of entrepreneurship as an attitude which can be learned during one's education and at the university is also significant. The opinion that entrepreneurship is an attitude is supported by 25% of Polish, 21% of Ukrainian and only 15% of Belarussian respondents. It must also be emphasised that 8% of Belarussian students did not provide an answer to this question.

A critical assessment of being able to learn entrepreneurship skills expressed by students from Belarus correlates to their low opinion regarding their studies as an element of preparing them for the role of an entrepreneur (see Table 2).

Table 2: University's preparation of students for the role of an entrepreneur

Answer category	Answers submitted by Polish respondents	Answers submitted by Belarussian respondents	Answers submitted by Ukrainian respondents
Definitely yes	6%	5%	32%
Rather yes	54%	11%	30%
To an average degree	30%	43%	21%
Rather not	7%	19%	3%
Definitely not	0%	11%	14%
Difficult to judge	3%	11%	0%
Arithmetic mean	3.62	2.78	3.63
Standard deviation	0.5	0.9	1.3

The results of the Kruskal-Wallis test ($\chi 2 = 75.31$ df (3) < 0.01p) showed that in the evaluation of the university share in preparing students for the role of an entrepreneur there appear significant statistical discrepancies. These are differences between Ukrainians (M = 3.63; SD = 1.3) and Belarussians (M = 2.78; SD = 0.9), U = 267.5 $p < 0.01$, as well as Poles (M = 3.62; SD = 0.5) and Belarussians (M = 2.78; SD = 0.9), U = 258 $p< 0.01$.

Respondents from Poland and Ukraine positively assess their educational process with respect to preparing them to become businessmen. The difference involved greater determination of students from Ukraine, where 32% of them stated that the faculty chosen by them appropriately prepares them to become entrepreneurs, while only 6% of Polish participants were as certain. A positive answer to this question, although without the same degree of certainty, was also given by 54% of Polish students and 30% of Ukrainian respondents. Among Belarussian students, only 5% believed that the university appropriately shapes and develops their entrepreneurship skills, while another 11% evaluated this aspect as quite good. 30% of Polish, 21% of Ukrainian and as many as 43% of Belarussian students were satisfied with their education to an average degree. Lack of satisfaction was expressed by 7% of Polish, 3% of Ukrainian and as many as 30% of Belarussian students (with 11% marking a "very dissatisfied" option). Distinctive is the fact that a relatively large number of students from Ukraine and Belarus (14% and 11% respectively) - countries where the right to freely express one's opinions is limited - showed reluctance to assess their countries' educational system.

The result of an individual's education is arousing his/her motivation to undertake entrepreneurship measures, the emergence of entrepreneurial intentions as well as his/her perception of market opportunities, which determines the creation of a new enterprise in a form of sole proprietorship. Each country that wishes to develop dynamically must encourage its citizens to strengthen entrepreneurial attitudes as well as create proper conditions that allow them to behave in an entrepreneurial manner both in professional circumstances (expressed in an aptitude for establishing and conducting business activity) as well as a personal sphere. Expectations of some respondents are far from reality. Relevant statistical discrepancies may result from a diversified level of economic growth of a given country and the following system of education.

The shaping of a young person by the contents of specific subjects may lead to developing or limiting his/her aspirations. Educational processes should to a greater extent prepare young people to understand contemporary and future tendencies of civilizational development. In this scope one should create opportunities to arouse all the higher aspirations and constructing all the more ambitious plans for life that will allow for mastering skills of searching for their place in economic, social, cultural and political activity. Therefore, it became significant to explore whether the respondents perceive the

representatives of their nations as equipped with entrepreneurial skills. Their opinions are presented in Table 3.

Table 3: National traits and entrepreneurship

Answer category	Answers submitted by Polish respondents	Answers submitted by Belarussian respondents	Answers submitted by Ukrainian respondents
Definitely yes	13%	11%	12%
Rather yes	48%	15%	36%
To an average degree	39%	41%	47%
Rather not	0%	13%	3%
Definitely not	0%	10%	0%
I can't judge it	0%	10%	2%
Arithmetic mean	3.78	3.04	3.58
Standard deviation	0.7	1.1	0.8

The majority of participants ascertained that the representatives of their countries are average entrepreneurs. This opinion was expressed by 47% of Ukrainians, 41% of Belarussians and 39% of Poles. Most negative assessments regarding the entrepreneurship of their policy makers were provided by Belarussians (as high as 23% of which 10% were very negative). A significant difference also concerned the positive assessment of the entrepreneurship of citizens in a given country. Polish students were much more enthusiastic in relating national traits to entrepreneurship (48%) than respondents from Ukraine (36%) or Belarus (26%).

The assessment of the significance of national traits as entrepreneurship determinants is relevantly statistically different among the compared groups. This is confirmed by the results of the Kruskal-Wallis test ($\chi 2 = 58.09$ df (3) < 0.05p). These differences become visible when the comparison involves answers provided by students from Ukraine (M = 3.58; SD = 0.8) and Belarus (M = 3.04; SD = 1.1) U = 274 $p < 0.05$, as well as Polish (M = 3.78; SD = 0.7) and Belarussian students (M = 3.04; SD = 1.1), U = 246 $p < 0.05$.

One of the study's goals included the identification of traits and abilities which are associated with enterprising people by the representatives of nations participating in the research. Their freely given answers were mapped, which allowed for the identification of the most frequently used phrases (see Figures 3-5).

Figure 3: Characteristics of entrepreneurial people in the opinion of Polish students

Figure 4: Characteristics of entrepreneurial people in the opinion of students from Ukraine

Figure 5: Characteristics of entrepreneurial people in the opinion of students from Belarus

The respondents also defined the characteristics of entrepreneurial people. Students from Poland and Ukraine responded in a similar manner. They most often mentioned such features as ingenuity, courage, resourcefulness, consistency in achieving goals, charisma, intelligence, willingness to constantly improve, action, risk-taking, creativity, ease in establishing contacts. Students from Belarus claimed that the most important factor is resistance to stress and communicativeness. They also attached great importance to good organisation and business knowledge.

One of the key indications of entrepreneurship is the creation and management of a company. In terms of students this relates only to plans for developing their own business which in literature is defined as entrepreneurial intent (Fayolle and Gailly, 2013) or entrepreneurial intentions (Fellnhofer and Mueller, 2017).

Table 4: Entrepreneurial intentions of students participating in the study

Answer category	Answers submitted by Polish respondents	Answers submitted by Belarussian respondents	Answers submitted by Ukrainian respondents
Definitely yes	14%	7%	42%
Rather yes	36%	10%	30%
To an average degree	25%	25%	22%
Rather not	25%	31%	3%
Definitely not	0%	27%	0%
I can't judge it	0%	0%	3%
Arithmetic mean	3.62	2.78	3.63
Standard deviation	0.8	1.2	1.2

Study results (see Table 4) indicate that students from Belarus show the least interest in starting their own business (17% have such plans but only 7% declare them as definite). This results from numerous economic and political conditions. In Belarus a career at a state institution is considered to be the most valuable and research conducted by other authors (Kola-Bezka, 2015) shows a relatively low level of entrepreneurial climate within this country.

The analysis of the results with the uses of the Kruskal-Wallis test ($\chi 2 = 69.22$ df (3) < 0.001p) pointed to significant differences in the scope of students' entrepreneurial intentions. They appeared between Poles (M = 3.62; SD = 0.8) and Belarussians (M = 2.78; SD = 1.2), test U = 234 $p< 0.001$, as well as Poles (M= 3.62; SD = 0.8) and Ukrainians (M = 3.63; SD = 1.2), test U = 288.5 $p< 0.01$ and between Ukrainians (M = 3.63; SD = 1.2) and Belarussians (M = 2.78; SD = 1.2) test U = 246 $p< 0.001$.
The highest level of readiness to run their own business was declared by students from Ukraine (as many as 72% with 30% indicating strong intent). It also turned out that 3% of respondents from this country already run their own company. With respect to students from Poland, activity concerning running their own business in the future was declared by 50% of study participants, where 14.3% indicated a strong intent to do so. When asked about plans for their own business, similarly to students from Belarus, a significant share of respondents from Poland (25%) marked the "Not sure yet" response. One in four participating students from Poland as well as 58% of students from Belarus do not consider running their own business in the future.

The study concerned with entrepreneurial plans of students also involved the identification of the type of business being planned. The most popular types of businesses identified by Ukrainian students included: tourist services, farm tourism, food services, banking services, general sales, new or second-hand clothing sales, food and alcoholic beverages sales, a language school, a photography studio, a fitness club, a gym, a car wash, automotive services, furniture sales, cultivation of plants and herbs, a pharmacy, a widely understood field of commerce, radio and TV services, advertising and other (unspecified) services. Students from Poland associated their plans for future business activity mainly with services concerning: food, accounting, transport, construction and remodelling, security, computer, geodetic, senior (care). These were connected with organising events, cultural animation, culture-related workshops (music, dance, photo and film), training or translation. There were also ideas for opening a gym or a beauty salon, creating games, drawing portraits and producing logos. Students from Belarus declaring willingness to establish their own business mainly associated their plans with commerce (a store) or tourism (a travel office), food services, health and beauty services (hair, make-up or fashion) or computer services. They were also interested in running cleaning businesses and teaching foreign languages.

Students who were planning to open their own company were asked to define the conditions for the success of a business established by a young person in their country. Freely given answers to this question are categorised and presented in Table 5.

Table 5: Factors conditioning the success of an enterprise in the perception of students taking part in the study

Answer category	Answers submitted by Polish respondents	Answers submitted by Belarussian respondents	Answers submitted by Ukrainian respondents
Competencies of a young entrepreneur (knowledge and skills of the person establishing the business, personality traits such as passion, creativity, the ability to think rationally)	51.5%	64.7%	56.9%
Access to sources of financing	53.9%	58.8%	52.8%
The ability to see the market demand of a given product	37.9%	23.5%	20.8%
Assistance of family	16.7%	58.8%	26.4%
Economic and political situation of the country of residence	10.6%	47%	43.1%
Knowing influential people	7.6%	35.3%	30.5%
Assistance of the state	9.1%	17.6%	12.5%
Access to qualified employees	18.2%	5.8%	8.3%
Luck	5.5%	5.8%	6.9%

The majority of students participating in the study (over 50% regardless of the sub-group or nationality) who declared the intent to establish and run their own business point to the abilities of an entrepreneur as a key factor, with these competencies being understood by them as knowledge, skills and individual entrepreneurial predispositions. The participants also stress the importance of having access to sources of business financing. The nationality of the participating students is a variable which significantly impacts their perception of nearly all other factors conditioning the success of a business. Students from Poland mainly stress the ability to see and occupy a market niche as well as access to employees with the right professional qualifications. They rely on the assistance of state institutions, their families or influential backers to a significantly lower degree than students from Ukraine or Belarus. They also connect their potential success with the economic and political situation of their country to the smallest degree (10.6%), a factor which is strongly stressed by respondents from Belarus (47%) and Ukraine (43.1%). In comparison with their counterparts from Poland and Ukraine, students from Belarus strongly condition their business success on the help of their family (58/8%) and the state (17.6%). A quality which characterises both Ukrainians and Belarussians is their strong conviction (exceeding 30% in both of these groups) that knowing the right people is a determining factor in the success of a business.

Students declaring entrepreneurial intentions were also asked to identify potential barriers which could hinder the execution of their plans. Their answers are presented in Table 6.

Table 6: Barriers to the establishment and development of a business in the perception of students taking part in the study

Answer category	Answers submitted by Polish respondents	Answers submitted by Belarussian respondents	Answers submitted by Ukrainian respondents
Lack of initial capital	62.1%	58.8%	52.8%
Lack of entrepreneurial competencies (knowledge and skills as well as entrepreneurial predispositions)	45.4%	52.9%	50.0%
Lack of experience in running a company	28.8%	35.3%	40.3%
Unstable political situation	6.1%	70.6%	81.9%
Corruption	3.0%	18.2%	33.3%
Low earnings of potential customers	3.0%	76.5%	52.8%
High competition	33.3%	29.4%	33.3%
Bureaucracy related to opening a business	15.1%	52.9%	34.7%
Lack of necessary connections and influential backers	16.7%	47.0%	41.7%
Lack of state support for small and medium businesses	6.1%	52.9%	52.8%
Lack of equality in respect to opportunities available to men and women	0%	5.9%	2.8%

It was possible to identify universal barriers to the development of entrepreneurship seen by students from all participating countries. These include: lack of initial capital, lack of entrepreneurial competencies and lack of experience in running a company as well as a high level of competition. There were also significant differences in the opinions of respondents regarding potential barriers which could be encountered by beginning entrepreneurs of the subject countries with the level of development of the market economy as well as the political situation within the country where they live rather than their national affiliation being the differentiating variable. This means that there are significant similarities in the diagnoses of some barriers to entrepreneurship provided by students from Belarus and Ukraine. A vast majority of respondents from these two countries (Belarus – 70.6%, Ukraine – 81.9%) pointed to the instability of the political situation in their countries and its negative consequences to the development of business there.

More than half of respondents from Belarus and Ukraine also drew attention to the lack of state support for the small and medium business sector which is further complicated by extensive bureaucracy connected to establishing a company (Belarus 0 52.9%, Ukraine – 34.7%) and corruption (Belarus – 18.2%, Ukraine – 33.3%). Once again students from countries which were formerly republics of the Soviet Union stressed the importance of knowing the right people, the lack of which is treated as a significant barrier to the execution of their business plans. This confirms the fact that an active policy of state intervention into business is a problem in both Ukraine as well as Belarus. In literature this phenomenon has been dubbed "political entrepreneurship" (Chukhray, 2013). It occurs when entrepreneurs supported by the ruling party are given preferential treatment. Another problem is relative poverty of the society which translates into a potential lack of product demand. This barrier is expressed by as many as 76.5% of Belarussians and 52.8% of Ukrainians who declared their intent to start a business.

Summary

Studies involving students from Ukraine, Belarus and Poland have shown that nationality is a variable which significantly differentiates the understanding of the essence and conditionings of entrepreneurship as well as impacts entrepreneurial plans of young people. Belarussians connect entrepreneurship with a figure of an entrepreneur to the greatest extent and treat it mainly as a personality trait. They are sceptical towards the ability to learn "to be enterprising" and among the nationalities under study have the most critical attitude toward their system of education with regard to preparing students for the role of an entrepreneur. They assess the entrepreneurship of their compatriots much lower than Poles or Ukrainians and least often declare their own entrepreneurial intentions. Ukrainians most positively assess their education as an element of preparing them for the role of an entrepreneur and most often declare their readiness to establish their own business.

One thing which is common in the perception of entrepreneurship of all students participating in the study is a set of personality traits of an entrepreneur. Additionally, most students who declare having business plans (over 50% in all sub-groups regardless of nationality) name the competencies of an entrepreneur, them being knowledge, skills and psychological predispositions as well as access to sources of financing a business as key factors of success.

The analysis of the study's results also allows for the formulation of the conclusion that the greater the level of market economy development, the greater the focus of respondents on elements independent of a political situation. Ukrainians and Belarussians much more frequently than Poles connect the likelihood of their success with the socio-political situation within their country. Students from countries which are former Soviet Union republics point to the need of knowing the right people as one of the main factors affecting the success of a business. They also, much more often than students from Poland, consider corruption and extensive bureaucracy as well as lack of state support for the small and medium business sector to be real barriers to the development of entrepreneurship.

"Employer Branding - Effective Building of The Employer Brand"

Bogna Konodyba-Rorat
Czestochowa University of Technology, Poland
b.konodyba-rorat@pcz.pl

Abstract

It is possible to successfully build a company's image as an attractive employer by implementing in the organisation coherent employer branding activities that are based on a common strategy. The aim of the paper is to present the subject of employer branding as a necessary tool for building a credible employer brand so the organisation can become more competitive in the dynamically developing labour market.

Keywords: Employer Branding, Corporate Image, Labour Market, Generations

Introduction

The aim of this paper is to present the essence of the concept of employer branding.

The paper will draw upon available sources that investigate the subject of successfully building an employer image in the labour market. By carefully analysing the available sources and studies, the subject will be presented in a thorough and reliable way. All the publications used in this paper are listed in the reference list.

The paper consists of three parts.

The first part introduces to and defines the concept of employer branding.

The second part is concerned with the needs and expectations of the generations that are currently present in the labour market. They include Baby Boomers, Generation X, Generation Y, and the youngest generation that is currently entering the labour market - Generation Z. With the dynamic technological development and changes occurring in the present labour markets, organisations become more interested in creating a credible corporate image.

The third part focuses on the division of employer branding into activities undertaken either within or outside of an organisation. These activities enhance the employer image and portray the organisation as a good place to work, in which employees can develop and their needs are listened to. The aim of such activities is to retain talented employees in the organisation.

The labour market has never been more challenging for employers. The ability to attract candidates' attention is becoming a key competitive advantage and a serious task for the marketing, human resource and communication areas. It is particularly important for organisations to increase their awareness and react quickly to the changing environment by implementing effective employer branding activities.

Defining Employer Branding

The idea of creating a desirable corporate image is not new. Nor was it born overnight. Employers had been building the image of their organisations as focused on highly qualified employees who would allow them to create their competitive advantage long before the term e*mployer branding* was introduced. Although the term is relatively new, the literature indicates at least several dates when it

originated. The forerunners of employer branding (EB) are thought to be Simon Barrow and Tim Ambler, who published the paper entitled "The Employer Brand" in 1996 (Ambler and Barrow,1996). The term is also credited to the company McKinsey and dated to 2001 (Filpkiewicz,2008). In his book, Kozłowski (2016) defines EB as "all the activities undertaken by a company and directed at its current and potential employees that are designed to build its image as an attractive employer and support its strategic business goals. Oleksyn (2017) notes that EB is building the image of an employer and organisation for which people want to work. In the book entitled Effective recruitment which is collective work, published by INFOR PL SA, 2019, the term is defined as "the activities undertaken by a company that seeks to be perceived as an attractive employer by its current and potential employees." Thus, the main aim of employer branding efforts is not to create a well-known brand, but an engaging brand. This is a brand "with which current and potential employees can identify, seeing in it an attractive environment for career development. It is also a brand that can respond to their expectations and aspirations." (Collective work, INFOR PL SA, 2019,p 34). Table 1 presents selected definitions of the employer branding concept.

Table 1: Selected definitions of the employer branding concept according own work based on: Lloyd (2002); Sullivan (http://www.ere.net/2004/02/23/the-8-elements-of-a successful-employment-brand(08.10.2010)); Backhaus, Tikoo (2004); Mayo (2001); Dell, Ainspan (2001); Minchington (2006); Rosethorn (2009)

Author	Date of creation	Employer branding is:
S. Lloyd	2002	Any communication activities that an organisation undertakes in the internal and external labour market to be perceived as a desirable workplace.
J. Sullivan	2004	Targeted, long-term strategy to manage the awareness and perceptions of employees, potential employees and other stakeholders.
K.Backhaus, S. Tikoo	2004	The process of building a recognisable and unique identity of an organisation as an employer which differentiates the company from its competitors.
A.Mayo	2001	All that is communicated (whether consciously or not) to all the current or potential employees.
D.Dell, N. Ainspan	2001	Defines the identity of a company as an employer.
B.Minchington	2006	The image of an organisation as a great workplace. This image is created by current employees and key external stakeholders.
H.Rosethorn	2009	A two-way deal between an organisation and its members; the reason the people choose to become members of an organisation and stay in it.

The employer branding term is increasingly used in the media today. In the Polish market, there is growing interest among organisations in building a good corporate image. However, in order to understand the popularity of this concept, it is necessary to look closely at the dynamically developing business environment as well as the needs and expectations of the generations currently present in the labour market. They include Baby Boomers, Generation X, Generation Y, and the youngest generation that is just entering the labour market - Generation Z. Thus, the increasing interest in the employer brand is simply an organisation's response to the changes that are currently occurring in the labour market. For an organisation to be effective, it needs to unite its employees representing different generations. Those employees differ in many ways, with the most important differences in professional experience and age. Employing people at different ages and with different experience is necessary for an organisation to achieve above average results. Every generation has different attitude to work and different expectations. As Kozłowski (2016) notes, the task of employer branding is thus to understand the needs, way of thinking and changes in society, which

sometimes occur over decades and sometimes over a few years. Such activities will enable effective communication and efficient actions aimed at building a company's image.

Characteristics of the Generations in the Labour Market

Baby boomers (BB)

Baby boomers (BB) - a group of people born between 1944 and 1964.Szymczyk(2018) notes that it is a generation with the biggest experience in the labour market. Such persons were born after World War II during the baby boom. In 2020, the eldest representatives of this group will reach the age of 74, while the youngest ones - 54. With experience gathered over a long period of time, they have become authority figures to the young generations. The most important thing for the representatives of BB is the sense of stability. People from this generation fear job loss, therefore they often work without complaining, even if the atmosphere at the company does not meet their expectations. Work is important to them. It makes them feel needed. They are committed, hard working and loyal towards the employer (Szymczyk, 2018). According to Kozłowski (2016), work is at the centre of this generation's value system, whereas other important elements of life such as family or friends are given less priority. This generation is motivated by finances and the fear of job loss.

Generation X

Generation X – is a group of people born during a period of demographic peak between 1965 and 1979. In Poland, it is accepted that these are people born in the period of the Polish People's Republic. In 2020, the eldest members of this group will reach the age of 55, while the youngest ones - 41. They are strongly represented in the current labour market. Szymczyk (2018) notes that Generation X members, especially those growing up in Poland, were brought up in a period of huge economic transformations which saw strikes, food shortages in shops, a change of the political system, overthrow of communism and the collapse of the USSR. This generation was characterised by uncertainty of future. That’s why it is referred to as X, which signifies an unknown. Typical of the representatives of this group is struggle and difficulty to find a job, find one's place in the new reality and fear of loneliness as well as questions about the sense of existence (Coupland,1998). For Generation X, stabilisation and security is important. Its members are loyal and show respect to their superiors. They are satisfied with non-financial benefits offered by their organisations, but the main incentive is money.

Generation Y

Generation Y – is a group of people born between 1980 and 1994. In 2020, the eldest representatives of this group will reach the age of 40, while the youngest ones - 26. It is a generation that entered adulthood at the turn of the century. Therefore another name for it is Millennium Generation, and its representatives are referred to as Millennials. In the English-language literature, for instance, generation Y members are characterised as rulers of the Internet and personal computers. They are also called: Generation WWW, Digital Generation, Nintendo Generation (Maddux and Johmson,2006,p176). Kozłowski (2016) notes that "it is the first generation whose representatives are similar across most countries. The reason for this similarity is wide access to the Internet and highly advanced communication network that allowed them to exchange their ideas and thoughts about the world in which they would like to live. Representatives of this generation are task-oriented. They like work that is challenging. They are mobile and ready to compete in the labour market. They are able to move from company to company, from city to city, or from country to country. Generation Y representatives are also less loyal to their employers than their older colleagues (Świątek-Barylska, 2008,p 553). They like working, but they are called whY not without a reason. Representatives of this generation engage in work only if they know why they do it. It is a very well-educated generation. Student exchange programmes enabled them to study abroad, and knowledge of foreign languages allowed them to work in the international arena. Most important for this generation is personal development. They value their time and don't like being bored. Work as a value in life does not

occupy the highest position in their hierarchy of values and is placed below social life (Chester,2006,p 44-45). Generation Y representatives do not live to work, but they work to live (Petroulas and Brown,2010,p 228). Changing a job is not a problem for them. Apart from challenges at work, they are also motivated by a good atmosphere at workplace. They appreciate work that offers them places where they can enjoy rest and entertainment during breaks. They use social media. It is a generation that expects constant praises, preferably public, and continuous feedback. Generation Y is usually ambitious, resourceful, objective- and teamwork-oriented, ethical and able to multitask. All these characteristics are desirable from the perspective of an employer (Remisiewicz,2008 ,no 5)

Generation Z

Generation Z - is a group of people born between 1995 and 2015. In 2020, the eldest representatives of this group will reach the age of 25, while the youngest ones - 5. It is a generation that is gradually entering the labour market. According to Kozłowski (2016), it is a generation for which staying in touch with friends was much easier thanks to access to the Internet via a range of modern devices such as notebooks, smartphones or iPads. This generation is also termed Digital Natives, as it was growing up in times of rapid technological advance (Schmidt and Hawkins,2008). Growing up in an environment dominated by technology, members of this generation developed multitasking and became focused on constant interaction. They watch TV while writing SMSs, are online and socialise on social media while talking to their friends in the real world at the same time. Generation Z wants to work in a place that will offer interesting tasks and continuous development. Unless an employer makes sure that a Generation Z employee can learn new things and move forward, it will be difficult to make him/her stay in one company (Szymczyk,2018). This generation is focused on challenges and continuous interaction. It is also important for Generation Z members to receive feedback. However, their lack of patience poses a huge challenge to today's enterprises. It is estimated that in 2020 this generation will make up one third of the workforce.

Table 2 presents a short description of the generations present in today's labour market.

Table 2: Characteristics of the generations that are present in today's labour market according own work

GENERATION	**BABY BOOMERS** - (generation of a double demographic peak)	**GENERATION X** - (dedicated to work)	**GENERATION Y** - (brought up in the affluence)	**GENERATION Z** - (generation of the virtual world)
BORN IN	1944	1965	1980	1995
	1964	1979	1994	2015
TECHNOLOGICAL PRODUCT	TV set	personal computer	Tablet	Smartphone
MEANS OF COMMUNICATION	Phone	e-mail/SMS	e-mail/SMS/social media	hand-held communication devices/social media
SHORT DESCRIPTION	stabilisation at work, loyalty	stabilisation, security, loyalty	task-orientation, work has to be a challenge,	generation focused on challenges, continuous

	towards the employer, an authority figure to young generations	towards the employer	well-educated, expecting feedback, mobile - changing a job is not a problem to them	interaction, multi-functional, expecting feedback, with little patience, flexible, mobile, changing a job is not a problem to them
MOTIVATION AT WORK	money/fear of losing a job	money/non-financial benefits	challenges/good atmosphere at workplace/praise	challenges/good atmosphere at workplace/praise

Division of Employer Branding

Employer branding is a result of the evolution of organisational and management studies. This concept draws upon findings in at least two disciplines: human resource management and marketing. The centre of interest of modern human resources management and marketing is a human being or, more precisely, all the stakeholders of an organisation. Human resource management and marketing are both oriented towards shaping long-term relations with the internal and external stakeholder. (Wojtaszczyk,2012). The main aim of employer branding is to build a coherent and positive image of a company as an employer in the minds of the company's employees, key candidates in the labour market as well as business partners and customers. Thus, employer branding efforts can be divided into two types depending on which group they are directed at: internal employer branding and external employer branding.

Internal Employer Branding

Internal employer branding is directed at an organisation's current employees. Its target group encompasses all those to whom the organisation is the employer (Wojtaszczyk, 2012). The main task of internal employer branding is to create a friendly atmosphere at workplace and to provide the company's employees with the possibility of development. Moreover, such activities are designed to integrate, engage and motivate employees in order to make them reluctant to leave the company (Collective work, INFOR PL SA ,2019,p 35). Motivating employees is crucial. Committed and motivated employees become the company's ambassadors. According to Kozłowski (2016), a loss of an employee costs the company an equivalent of his/her 12 to 24 salaries, if we take into account the period when the employee already lost his/her willingness to work, his/her payoff, the cost of onboarding of a new employee and, above all, negative opinions about the employer that could have appeared in the labour market. Employees' job satisfaction and positive opinions may increase the interest in the employer among potential candidates (Collective work, INFOR PL SA ,2019). A company's image is determined by how the employees perceive the company as the employer (Mosley, 2014,p.9).

A company needs to focus not only on its existing employees but also new hires. One of the activities that allow it to do so is onboarding. It is a practice of offering new hires a cycle of training courses and support at the start of their career in an organisation. An employee is under the care of a person who has been working in the company for a while and knows the corporate culture as well as its rules and atmosphere. Such induction of an employee into the organisation will reduce his/her stress and give him/her an opportunity to learn about the company and its principles and values (Kozłowski,2016). A large number of the leading employers understand that they will benefit more from onboarding an employee in a systematic way than from organising one-day, long and tedious training to quickly induct an employee into the organisation (Richard Mosley, 2014,p.250).

Internal employer branding efforts also include a recruitment process, healthcare, benefits offered by a company, organisation of team-building trips, publication of corporate magazines, brochures,

bulletins, newsletters and investment in human capital, e.g. by providing internal and external training courses.

The human capital of a given organisation is a key element of its competitiveness. Employees should be able to express their opinions. Thus, a company should take efforts to be perceived as an organisation to which not merely profits, but an individual, i.e. the employee, matters. It should introduce employee satisfaction surveys. By doing so, it will portray itself as a democratic and modern employer (Kozłowski,2016,p.54). One of the tasks of the people responsible for employer branding is to build an organisation's image as one that listens to its employees. Giving time and attention to employees leads to improvement in their engagement and performance. Engagement, in turn, is related to productivity and satisfaction level (Kozłowski,2016,p.64). An important part in the internal processes of employer branding in a company is also played by managers. They should regularly inform employees about the issues connected with the company. A good manager knows his/her team members and knows how to motivate them. He/she is a link that coordinates and co-creates activities; a key element in creating the image among new hires (Schwan and Seipel,1995). A good communication with the manager has a significant impact on employees' motivation.

External Employer Branding

External employer branding is directed at a company's potential employees. The main aim is to build the company's image as an attractive and credible employer, and to attract and retain talented employees in the organisation. A positive corporate image, strong brand and good reputation attract the best candidates-talents. Such employees determine a company's competitiveness in the market (Collective work,INFOR PL SA ,2019). External employer branding efforts can be divided into two categories: image- and recruitment-related. Image-related efforts are those that raise the awareness of the employer brand and inform the market about the benefits of working for it (Kozłowski,2016). They include, among other things, participation in job fairs, active promotion of the company at universities and active participation in social networking sites, e.g. on Facebook.

Recruitment-related efforts are designed to reach selected candidates, and their aim is to cause a candidate to apply for a job. They include, among other things, active promotion of the company in services for posting job ads and making sure that a job ad is effective and suited to the target group.

Figure 1: Division of external employer branding according own work

Conclusions

Nowadays, in the labour market there is growing interest in the subject of employer branding. This interest in building an image of a desirable, credible and attractive employer is not just a fad. Rather, it is an organisation's response to the changes that occur in the present labour market and are unavoidable. Of huge importance is here evaluation of a company's environment and fast reaction to the needs and expectations of different generations. The most represented generations are: Baby Boomers, Generation X, Generation Y, and the youngest generation that is currently entering the labour force - Generation Z. Any employer branding efforts also have to respond to continuously developing technology and the opportunities it creates.

Employer branding is vital and should play an important part in employers' activities. A robust and established image, friendly atmosphere at workplace as well as the possibilities of employee development will enable the achievement of the main aim, which is to attract talented employees to the organisation and retain them in it, and thereby enhance the company's competitiveness in the market.

As at the centre of interest of modern human resource management and marketing is a human being, an organisation that engages in employer branding activities should allow its employees to express their opinions. It should cultivate corporate image as an organisation to which not merely profits but an individual, i.e. the employee, matters. It is also important to bear in mind that building a company's image as an attractive employer is not a one-off project or activity with a specified time frame. It is a continuous and to a large extent a long-term process.

Training Professional Competence of Physical Culture and Sports Managers

Nataliia PAVLENCHYK, Svitlana KRYSHTANOVYCH, Anatolii PAVLENCHYK, Miroslav KRYSHTANOVYCH , Olha ROMANCHUK

Abstract

An important requirement for the development of professional competence of managers in the field of physical culture and sports is, first of all, the pedagogical principles of its formation. The analysed scientific researches in the field of physical culture and sports reveal and substantiate the generalization, specifics and certain subjectivism of each author, reflecting his/her philosophical position regarding the principles of forming the professional competence. The analysis of scientific papers made it possible to distinguish the following groups of principles: basic, regulating the adaptive process of managers study in higher educational institutions; key principles that facilitate the adaptation of these students to interpersonal, interactive, technology training in the context of personality-oriented adaptive learning; the principle of the determining role of self-adaptation; the principle of spiritual comfort in the conditions of open interaction among subjects of the educational process and general didactic principles, which regulate the educational process of an educational institution with the purpose to master disciplinary, interdisciplinary and general knowledge, skills and determine the abilities of professional managers in the field of sports to apply them in practice. It has been established that any of these principles becomes meaningful only in relation with others. A consistent and integral interaction of these principles at each stage of the learning process of future managers in the field of sports will guarantee the acquisition of professional competence, taking into account the needs of the labor market.

Keywords: Principles, Physical Culture, Sport, Manager, Professional Competence.

UDC: 005.336.2:796.075

Introduction

The principles of professional training of managers of physical culture and sports is not a random set of wording, but a reflection of holistic functioning principles that influence the formation of professional competence of these specialists. The modern theory and practice of training managers in the field of sport is based on methodological, general pedagogical, didactic and psychological principles, depending on the directions, goals and tasks of their further activities. The set of principles, on which the professional competence of these specialists should be based, can be considered as a system. Taken together pedagogical principles should be seen as a methodological component in the process of training managers of physical culture and sports.

Various aspects of managers training for physical culture and sports field in the countries with highly developed market economies have been reflected in the researches of such scientists as M. Mamford (2006), D. Data (2006), Fr. Jacobs (2013), L. Ferkins (2012), M. Hughes, I. Franks. (2008), J. Maxcy (2013), Marcy R. Maurer, Pat J. Jordan (2006), Ebrahim Hasan Al Khajeh (2018), A. Munir, Nur Eli Shafira Fairuz and all (2018).

A number of problems related to the study of management theory, methodology, practice and development, in market conditions, were reflected in multiply scholars publications (Batishev, 1997; Kan'kovsky, 2015; Svatyev, 2011; Sushchenko, 2003; Maslov, 2007; Karpyuk, 2010; Yagupov,

2003, Protsenko U., 2016 and others). However, in our opinion, there is not yet a single approach to understanding the essence of pedagogical principles in the formation of professional competence of future managers, taking into account the specifics of the field of physical culture and sports. The current state of human resourcing in the field of physical culture and sports requires adoption of measures of regulatory, organizational and socio-economic nature, aimed at achieving structural changes, internal balance and optimization both in the this sphere as a whole and in its individual subsystems (O. Mozolev, 2019).

It should be also noted that in many countries, the models of the physical education and sports manager's professional competence development are interrelated and interdependent. Their most important points are as follow:

-university (academic) training of sports managers implies a combination of fundamental theoretical education and professional practice at different stages of studies;
-sports managers training is carried out with the priority of special humanities disciplines over the natural sciences ones;
- multilevel training of managers in physical culture and sports implies the presence of basic and specialized stages, the content of which differ methodologically and methodologically;
-basic training includes mastering the entire range of disciplines that are directly related to future professional activity, including the disciplines of organizational, managerial and economic;
- specialized training is free of auxiliary disciplines (not directly related to future professional activity) studies
-university (academic) training of sports managers implies a combination of fundamental theoretical education and professional practice at different stages of studies.

Purpose of the Research

To analyse scientists views and approaches regarding the understanding of pedagogical principles and to identify those that will contribute to the professional competence of future managers in the field of physical culture and sports.

Materials and Methods

To achieve this goal, theoretical methods of scientific research were used. With the help of empirical method, the analysis of theoretical positions regarding pedagogical principles in the field of physical culture and sports was conducted. Using content analysis, we managed to establish the semantic content of pedagogical principles with regards to the formation of professional competence of future specialists. Applying the logical method we found out that pedagogical principles can be classified into three groups: basic principles that regulate the adaptive learning process in higher educational establishments; key principles which facilitate adaptation of these students to interpersonal, interactive technologies of professional training; general-pedagogical principles that govern the educational process in sports educational institutions and form the ability to apply them in practice by sports managers.

Results

The acute necessity of sports management is determined by the peculiarities of the industry, for example, there is a need for a simultaneous solution of sports, financial, psychological issues during the sports process organisation, as well as the direct participation of subjects and objects in the sports industry. Sports management is a purposeful formation of relations between managers, subjects and objects of sports industry, using principles and methods of managerial nature, aimed at ensuring the organisational process to provide physical education and sports services. (N. Pavlenchyk, 2017). Management as a managerial activity is focused on improving economic relations on the basis of coordination, directing the employees, uses a system of tools and methods of economic, normative, regulatory and stimulating character.

The main task of sportsmen, judges, officials, physical educators is to carry out their professional activities according to high standards and the managers must administer and assist them, combining their actions with professional situation into single harmonious unit, using different methods and means. The complexity of solving this task is caused by the peculiarities of management in sport, connected with the flexibility and diversity of physical education forms, sports, physical training and physical recreation.

The scientific literature presents various variants of principles formulation, and their number is different. For some scholars, the main source of justification of pedagogical principles is the experience, and for others - either the theory of knowledge, or the patterns of learning. For instance, V. Maslov (2007) characterizes the definition of principles as a component of a holistic theory of competence-oriented management of professional training in higher educational institution, which provides the relationship between the theory and practice of managing the professional training of these specialists through the submission of requirements and rules for their adequate implementation. The system of principles outlined by the author reflects their basic properties, reveals the factors influencing the formation of professional competence of future high school students. Having analysed the formation process of the professional competence of future specialists were specifies the principles that ensure the balance in the development of modern education system, when the controllability of the system depends on the quality of an informational connection between its sources and the addressees in dialogical unity. The essence of such a process is to ensure optimal communication between the pedagogical leadership and future specialists S. Kryshtanovych (2017).

The classification of principles, presented E. Yakovlev (2002) in a study devoted to the quality management of education at a higher educational institution, deserves separate attention. According to the author, each of the identified approaches to the formation of the professional competence must comply with a set of principles. He distinguishes three subsystems for defining principles in accordance with systemic, synergistic and qualitative approaches. The first subsystem reflects a systematic approach and contains principles of integrity, purposefulness, stability, manageability. The second subsystem displays a synergistic approach and includes the principles of control parameters, self-organization, irreversibility, informational character and forward-looking response to information. The third subsystem reflects the qualimetric approach and includes the principles of informativity, optimality, accuracy, productivity, uniformity, accessibility.

Among the main pedagogical principles of forming the professional competence of future specialists defines humanization, differentiation, integration. Their realization is aimed at the formation of a creative person after completing the learning process. This process should create the most favourable conditions for the development of student abilities.

Among all pedagogical principles of forming the professional competence of future specialists, can be distinguishes the principle of modeling of professional activity in the educational process. Under activity simulation in the learning process he understands the identification of typical tasks, the choice of organizational forms of the educational process and teaching methods. With the help of this principle, you can get predictable information to substantiate the main goals, means and methods of teaching, to develop professionally-qualified characteristics of future specialists, curricula, programs and textbooks.

By justifying the principle of determinism in the educational process, Z. Razumovsky (2013), suggests multilevelness, multiprofile, multi-functionality in the work with future specialists. This principle, in his opinion, will further liberalize the process of maximum individualization of each person, increasing his/her opportunities for self-determination and self-realization.
The researchers pay close attention to the principle of determinism (Karpyuk, 2010). By defining the essence of this principle, the factors, that will promote the development of new models of educational process and improve the students training, are formed. The philosophical categories like "cause" and "consequences" are fundamental in implementing the principle of determinism.

The researchers suggest including the following principles of professional training that will form the competence of future professionals: scientific knowledge; humanization; vocational training; regularity and consistency; connection of theory with practice; differentiated learning; optimization; apparency (Zhyhir & Chernega, 2012).

The researcher I. Vasiliev (2005) offers to divide all formational principles of professional competence in the process of vocational training into two groups: general-didactic and specific. He refers to the following principles as general-didactic: scientific knowledge; regularity and consistency; connection of theory with practice; consciousness and creative activity; accessibility and appearance; taking into account individual peculiarities; development of thinking; strength of knowledge, skills and abilities acquisition. The group of specific principles includes the following notions: professional orientation of general education disciplines; technological sequence of teaching material; mobility and modularity of professional training; modeling of professional activity in the educational process. Applying these principles involves the use of psychological and educational achievements and experience, which is characterized by the objective character of the professional competence of a specialist. The realization of these principles makes it possible for students to develop new skills.

An application of scientific knowledge principle involves the study of scientific provisions and the use of methods, close to a certain branch science. It helps to reveal causal relationships of phenomena, events and processes; to demonstrate the achievements of science and human knowledge, to familiarize with the methods of knowledge; to penetrate the essence of events and phenomena; to focus on interdisciplinary scientific connections; to reveal the history of the science development, the struggle of contradictions. Therefore, the knowledge, facts, regulations and laws used in the learning process should be scientifically correct.

The principle of concreteness is based on deduction, induction, integration, syncretization methods. The principle of concreteness reflects the interrelation of all aspects of the professional training of future professionals and the formation of their professional competence; the selection of certain principles of the educational process, in particular, students level of professional training, the definition and implementation of special psychological and pedagogical conditions.

The principle of historicism allows us to move from the empirical description of the facts to their theoretical generalization and to reveal the evolution of scientific representations and views on the content and the essential characteristics of professional competence of future specialists.

The principle of integrity is a regular feature of teaching in higher education establishments. For example, the unified presentation of teaching material and its assimilation in the learning process is a characteristic of integrity. Finally, a combination of educational, developmental and educational functions is considered for a specific professional practice. Therefore, the principle of integrity should be regarded as the achievement of unity and interdependence of all components in the educational process.

The principle of integration is actively used in the educational process to establish links between certain disciplines and their assimilation. After all, interdisciplinary connections accelerate the assimilation, deepening, systematization and consolidation of knowledge. New integrated programs are developed, through which it is possible to combine different subjects and guarantee the versatile development of students. The training of a future specialist is guaranteed by a complex system, based on generally accepted principles, namely:

- ✓ integration (planning of a continuous training process);
- ✓ continuity of education (combining basic and further preparation for professional activity into a coherent process, which will contribute to the formation of motivation and improvement of skills and abilities);

- ✓ fundamentalization (the thoroughness and scale of subjects, which will promote the professional mobility of a specialist and extend his professional competence);
- ✓ humanization (not focusing on the means of vocational training, but on a subject of professional training - a student);
- ✓ taking into account personal goals of students (the application of effective forms and methods of learning, where knowledge is obtained through finding our the truth, expressing and discussing thoughts and views, critical attitude of the student to himself);
- ✓ independence (self-regulation of students in obtaining the profession).

Having analysed educational programs and teaching methods, our scientists (Kan'kovsky, 2015; Polyakova, 2010; Svatyev, 2011; Sushchenko, 2003) distinguish the following principles of formation of professional competence in preparing future professionals:

- the principle of combining training and practice, which enables future professionals to take an active part in professional activities;
- the principle of practice-oriented assessment, where student's activity is evaluated in real actions and projects;
- the principle of adapting the training process and curricula to the conditions and needs of the country, region, city;
- the principle of optimal use of educational institution's potential.

In practice identified such principles of learning: apparency; systematicity; consciousness; availability; sequence; the strength of the acquired knowledge; graduality; timeliness; organicity; stability of knowledge acquisition; constancy; independence; correctness; lack of excessive tension and excessive ease; consciousness and learning activity; strength of knowledge and skills; sequence; apparency. All of these principles are crucial in the process of forming the professional competence of future sports managers.

The pedagogical principles discussed above are, to some extent, realized in the process of preparing future managers of physical culture and sports. However, in our opinion, the decisive role is played by those pedagogical principles that directly determine the formation peculiarities of their professional competence.

Let us discuss in more detail the formation principles of professional competence of future managers of physical culture and sports. To distinguish these principles, we should consider them as fundamental, theoretically substantiated and practically verified, that have a real objective nature, and show steady trends and patterns in the educational process. In particular, the principle of objectivity is of utmost importance in principles hierarchy of forming professional competence of future managers of physical culture and sports. It is expressed in the consideration of the factors that determine the requirements for their formation of professional competence and development; an adequacy of research approaches and means.

In the study of future sports manager personality, an objectivity as a way of influencing it becomes one of the most important indicators. The principle of objectivity points out that the formation of the professional competence of future sports managers should be considered in the appropriate socio-cultural context, within certain ideological orientations. The organization of the professional competence forming process of these specialists should be carried out in accordance with the logic of students professional training at faculties of sporting profile.

The principle of scientific knowledge is important for the formation of professional competence of future managers of physical culture and sports, which involves the development of their skills and abilities in scientific research, continuous improvement of teaching methods and ways of their actualization, scientific substantiation of sports managers positions on the individual acquisition of professional knowledge.

The concept of training is quite broad as it includes the whole system of educational activities, which reflects everything that students and teachers are engaged into during the academic year (Fig. 1).

Fig.1: Directions and means of student's theoretical knowledge and practical skills developing

Based on the principle of determinism, the causal relationship between the application of an innovative methodology in the preparation of future sports managers and the formation of their professional competence is revealed. It involves the definition and implementation of well-defined psychological and pedagogical conditions that create the optimal learning environment for more effective training. The principle of historicism is used to determine the logical connections of the formation process and formation development of professional competence of sports managers, the systematization of scientific knowledge in retrospect.

We consider the following principles as important in the process of forming the professional competence of future managers of physical culture and sports:

- ✓ the principle of using the results of scientific research for the development and implementation of physical culture and sports program, and to identify and eliminate the main factors hindering the development of this process;
- ✓ the principle of improving the system of higher education in the preparation of future sports managers;
- ✓ the principle of an individual approach in the organization of the educational process, taking into account the future demand of a sports manager;
- ✓ the principle of consideration of sports interests of the population;
- ✓ the principle of using international cooperation experience in order to develop the best approaches to problem solving;
- ✓ the principle of professional orientation makes it possible to find out the content and methods of teaching disciplines, which should take into account everything that may be useful to the future sports manager. The essence of this principle is the use of pedagogical means, which provide students of higher educational sports institutions with the acquisition of knowledge, skills, experience of creative activity. As a result, they should find an interest in the chosen profession and the development of professional qualities.

The principle of availability of vocational training involves the organization of an educational process forming professional competence of future physical culture and sports managers so that they can easily learn the necessary training material. This principle is taken into account in determining the necessary knowledge obtained in the process of studying specialized disciplines, as well as the defining content of courses, the volume and complexity of the choice, the necessary teaching material and in general the training program for these specialists.

As a means of optimizing the educational process, which involves raising the competence of the sports manager, the principle of interdisciplinary connections in education is used, which enables, without additional time, to fulfil the tasks set for their professional competence. The principle of the implementation of interdisciplinary connections is aimed at using professional knowledge and experience, obtained during the learning process, the integration and continuity of knowledge and skills from different disciplines, and the formation of the harmonious personality of the future sports manager - a graduate of sports universities of Ukraine. The development of interpersonal relationships can enhance the motivation of these students, deepen and broaden their knowledge of future professional activities. The realization of this principle will undoubtedly help increase the level of their professional competence.

An important role in our study is devoted to the principle of interdisciplinarity, which is aimed at using facts and events from other subjects, which affects the intellectual and spiritual and moral development of sports manager personality. The use of professional knowledge and experience obtained during the training process, the integration and continuity of knowledge and skills from different disciplines will contribute to the formation of the harmonious personality of the future manager of physical culture and sports. During practical training students of sports universities will be able to use the knowledge acquired not only from humanitarian subjects, but also from special pedagogically oriented disciplines.

The principle of innovative training guarantees a high level of professional competence of future sports managers. Due to the innovative technologies used in the educational process, it motivates them to self-development and self-improvement.

The application of the principle of competence in the training of a future manager of physical culture and sport means identifying the competencies that he must possess. Its realization makes it possible to regulate the content of professional competence, methods of its formation, criteria and formation levels of professional competence of sports managers. The professional competence is a level of awareness, an authority of a manager of physical culture and sports, that allows him to solve professional tasks effectively. The use of this principle in the formation of professional competence is based on the awareness of an optional application of other universal principles to the training of various professionals, appropriate for their peculiar pedagogical situations. The psychological basis for the professional competence of sports managers is their willingness to continually improve their qualifications, mobility of professional functions, flexibility and critical thinking. As a result of the implementation of competence principle sports managers should become highly skilled and competitive, functionally prepared for constant changes in technology.

In the process of forming the professional competence of future managers of physical culture and sport an important role is played by the educational-information principle, aimed at forming: the ability to work independently with various sources of information; the ability to use modern technical means and communication technologies to receive and use information in their professional activities.

A successful solution to the formation of professional competence of sports managers is possible through a combination of methodological principles specific to them. In particular, the choice of optimal principles for the formation of their professional competence provides proper working conditions for teachers, giving them the opportunity to choose forms, methods and techniques of working with future managers of physical culture and sports.

In our opinion, it is advisable to distinguish the following groups of principles in forming the professional competence of future sports managers: basic, regulating the adaptive process of managers studies in higher educational institutions; key, facilitating the adaptation of these students to interpersonal, interactive, technology training; and general-didactic principles, which regulate the educational process of mastering the subject, interdisciplinary and general knowledge, skills and abilities and make it possible to apply them in practice.

It is important to classify these principles according to the following features. In particular, the basic principles include the principles of adaptive training for sports managers: the principle of an adaptive function of teaching professional disciplines; the principle of individualisation of an adaptive development of a student's personality when obtaining a sports manager's profession; the principle of adaptive-guided learning; the training principle aimed at developing the professional competence of the future manager of physical culture and sports.

Regarding the key principles of adaptive training of future managers of physical culture and sports, they include the principle of optimal combination of direct and indirect education; the principle of the priority use of methods and means of indirect interaction (student - content - teacher - student) in the context of personality-oriented adaptive learning; the principle of the determining role of self-adaptation; the principle of spiritual comfort in the conditions of open interaction among subjects of the educational process.

Among modern definitions of general-didactic principles of forming the professional competence of managers in the sports industry, we believe that the proposed by V. Yagupov (2003) directions about "regulatory requirements for the organization and conduct of the didactic process, which are characterised by general guidance, rules and norms" appear to be significant.

The analysis of pedagogical and scientific works allows us to highlight the general-pedagogical principles, that are guiding in forming professional competence of future managers of physical culture and sports in higher educational institutions, namely: scientific knowledge; systemicity; education; connection of learning process with the environment; reality; individualisation; activity; apparency. These principles are subordinated to goals and objectives of training managers in the field of sports, manage the process of developing methods, tools, techniques, forms of productive feedback communication between teachers and students as subjects of the educational process.

The specificity of the general-didactic principles of training future managers of physical culture and sports is determined by such dominant principles of studying at universities as: the formation of highly skilled, professionally mobile sports managers, which will be competitive in the labor market. The process of their training is concentrated on education, upbringing and personality development. According to these principles, professionally directed training, development and upbringing of future sports managers take place on the basis of knowledge and skills formed during their training.

Basic, key, and general-didactic principles of adaptive learning become a system if, on the one hand, serve as the basic requirements for an interaction between teachers and students. On the other hand, their adequate observance acquires the status of didactic and psychological conditions for qualitative implementation of adaptive functions in the process of professional training of future managers of physical culture and sports to their professional activities. The outlined general-didactic principles provide the opportunity to build the best system of traditional and innovative methods, tools, techniques and forms of organization, correction and realization of training and self-improvement of students in higher educational institutions.

Taking into the consideration aforementioned principles, favourable conditions are created for the organization of a scientific-knowledge array, which facilitates the consolidation and verification of acquired professional competence in the process of preparing students at universities that train specialists in the field of sports.

Conclusions

Thus, the pedagogical principles of forming the professional competence of future managers of physical culture and sports testify that in a real learning process they should interact with each other and function as an integral system of professional training. It should be emphasized that each of these principles acquires significance only in conjunction with others. This is characteristic for each stage of the educational process of future sports managers. We propose the following groups of principles that will ensure an effective process of forming the professional competence of future managers in

the field of physical culture and sports, namely: basic, regulating the adaptive process of managers study in higher educational institutions (the principle of an adaptive function of teaching professional disciplines; the principle of individualisation of an adaptive development of a student's personality when obtaining a sports manager's profession; the principle of adaptive-guided learning; the training principle aimed at developing the professional competence of the future manager of physical culture and sports); key principles that facilitate the adaptation of these students to interpersonal, interactive, technology training (the principle of optimal combination of direct and indirect education; the principle of the priority use of methods and means of indirect interaction (student - content - teacher - student) in the context of personality-oriented adaptive learning; the principle of the determining role of self-adaptation; the principle of spiritual comfort in the conditions of open interaction among subjects of the educational process) and general-didactic principles (scientific knowledge; systemicity; education; connection of learning process with the environment; reality; individualisation; activity; apparency).

It is worth pointing out that in a real pedagogical process the principles of professional competence formation are realized in close connection and are mutually interconnected; none of them can be involved separately. Only the cumulative influence of pedagogical principles in vocational training guarantees the correct definition of tasks, determines a proper selection of content and methods for forming the professional competence of managers in the field of sports. All this defines an objective need for further research into the efficiency of complex use of above-mentioned pedagogical principles, that will provide diversity, versatility and alternative ways of development and introduction of the author's concept in the process of professional training of future managers of physical culture and sports.

Using basic management principles such as systematicity, optimality, motivation, economy, satisfaction of the participants needs and interests, sports management will provide purposeful modernization and diversification of relations in physical education and sports field. All this leads to the objective need for further studies of management in sports based on generalized approach to evaluation and justification of its expediency, as a means of implementing management decisions aimed at regulating professional relationships.

Conflicts of Interest: No conflicts of interest exist.

Abstract

The management of empty container movement is a complex process that involves numerous containers coming in and going out of a terminal or off-dock depot sorted by different types of transport, such as trains or trucks. This study focuses mainly on the landside empty containers (off-dock depot/ODD), where the trucks represent the primary function in the container supply chain management. For this purpose, simulation models are widely used in the analysis and design of port operations, as it has been proven that the simulation model is a very practical and reliable decision medium in the port. This study presents empty container practice and develops 3D simulation model based on a case study at two ODD companies. It can be concluded that the proposed development model using a 3D platform provides better visibility of operational flow and can be used as a potential platform for achieving the desired improvement, especially in the context of bottlenecks in the future.

Keywords: Container Supply Chain Management, Off-Dock Depot, Simulation, Bottlenecks.

Introduction

In today's business, manufacturing execution cannot succeed without logistics support or activities. Moreover, the gradual increase in the manufacturing sector also induced the demand of empty containers for the purposes of goods movement. Lambert et al. (1998) noted that containers are widely used in international logistics, especially when waterways are part of the transport networks. As reported by Yun and Choi (1999), for global shipment, 90% of cargo is transported by ocean shipping, in which over 8% of cargo is shipped with containers. Accordingly, containers are moved between container depots, customers, ports and vessels (Gudelj, 2010). In 2013, world container port throughput increased by an estimated 5.6% to 651.1 million TEU (twenty-foot equivalent unit). The share of port throughput for developing countries increased by an estimated 7.2% in 2013, which is higher than the 5.2% increase estimated for the previous year. Asian ports also continue to dominate the league table for port throughput and terminal efficiency. In Malaysia, there is about 22.7 million TEU container throughput in 2014 (UNCTAD, 2015), and more than 80% of Malaysia's international trade is being carried through the oceans *via* its international seaports (the lifeblood of its economy). In addition, Malaysia's maritime economy contribution to the GDP is about 20%, especially since marine and coastal tourism has become a significant revenue earner (Tang et al., 2011). Owing to the rapid economic growth of economies, the demands of empty containers have tremendously increased (Rodrigue, 2017). Thus, many container depots in seaport and hinterland have been encouraged to grow (Zachrisson & Naperotti, 2017).

Dulebenets (2016) supports that the advanced simulation model serves as an efficient planning tool for operators at terminal containers and is able to improve equipment performance, including the container truck movements. Accordingly, a study by Dulebenets (2016) developed 3D simulation models that focus on operations at the seaports. Additionally, Yi (2017) conducts studies on the efficiency of truck

operations and container handling at port terminals. Doubtlessly, the smooth flow of supply chain and container logistics is a very important factor in providing high-quality service to customers (Kaleappan, 2006). Although container movements in terminals have been studied previously, only few studies focus on bottleneck issues at the off-dock depot (ODD), especially in Malaysia. Therefore, the development of simulation models focused on the ODD is also a major gap in this study. The situation will become more critical if the problem is not addressed as it may affect the depot industry. The failure of a depot to properly manage container operations will prevent Malaysian ports from operating efficiently. Hence, this study aims to investigate the empty container practice at ODD in Port Klang, Malaysia and visualise the bottleneck situation, thus affecting the container truck efficiency throughout several operations starting from the arrival at the main gate, to the pick-up or drop-off of containers, to the departure of truckers from the premise. Port Klang, comprising Northport and Westports, has become a logistics centre by providing more efficient transport links and extensive storage space (Idris, 2011). This study will focus more on the development model of the ODD practices as a way to increase awareness of the stakeholders regarding the truck bottleneck problem.

Research Methodology

This study focuses on the identification of the empty container practice at the ODD and the development of the 3D simulation model. A case study was conducted at two companies, namely, A and D, which involved depot owners, managers and executive as respondents (two respondents from company A, named as respondents R10 and R11, and two respondents from company D, named as respondents R9 and R25). Background information of the respondents is shown in Table 1.

Table 1: Background information of the respondents

Respondent ID	Position	Work Experience (Year)	Work field (party)
Company A			
R10	Managing director	> 20	Depot
R11	Manager	11-20	Depot
Company D			
R9	Executive	11-20	Haulier
R25	Executive	11-20	Shipping line

Qualitative case study methodology provides tools for researchers to study complex phenomena within their contexts (Baxter & Jack, 2008). Yin (2009) defines case study as an empirical inquiry that investigates a contemporary phenomenon in depth and within its real-life context, especially when the boundaries between phenomenon and context are not clearly evident. To obtain this level of understanding, a researcher must collect various forms of data, such as interviews, observations, documents, artefacts or audio visual materials (Creswell, 2013). The semi-structured interview method was conducted during the site visit to obtain information regarding empty container practice. Evidently, majority of the respondents (see Table 1) have more than 10 years of experience in container management and are willing to share their information on container handling operations more deeply. In addition, observation method was also conducted by the researchers to see the movement of empty container trucks at the premises as well as the pick-up time of trucks and operations at each station. During the interview, the respondents further explained things related to empty container practices and other information that may help develop the bottleneck model of the depot. The respondents also provided an initial description of the depot layout. Observation was done to give the researchers a comprehensive idea about the container operation.

Practically, simulation is frequently used in solving landside problems, such as bottleneck, waiting time and idling resources. A previous DES (Discrete-Event Simulation) model to reduce empty truck trips by implementing coordinated truck appointments was proposed by Schulte et al. (2015). In this study, the methodology employed (to develop the simulation model) is based on the observation carried out at companies A and D. Furthermore, DES tool/software (FlexTerm CT) is employed to implement the model through simulation software. The motivation for adopting the simulation tool for the study is the distinct advantage of FlexTerm CT software that comes with a library specifically designed for simulation container yard operation. Nonetheless, it is difficult to predict the actual events, such as the arrival times of trucks and the actual number of arrivals. Remarkably, simulation is very effective in doing such predictions. The development of the simulation model in this study is expected to provide visuals or animations to the depot on the problem concerning empty container truck queue starting from the depot gate entry until out of the depot. However, this study does not reveal the performance analysis. The development of this model is an early platform, especially in the context of bottleneck occurring in the ODD. However, in the future, it is very important to study the 'what if' scenarios in order to make the right decisions in the short term and long term.

The basic function of container terminals is to provide berth facilities, planning area, storage planning and logistics planning in container operations (Ramani, 1996). Such operations are appropriately analysed using computer simulations. Progress in today's simulation technology has increased awareness among industry practitioners. The development of simulation models is outlined in Law and Kelton (1991), Chung (2003), Law (2007) and Banks et al. (2009), whereas:

a. Conceptualization: defining systems and objectives, modelling concepts and data collection;
b. Development of simulation, verification and validity models;
c. Analysis: run simulation and analysis.

This study focuses more on (a) and (b) to illustrate the development of virtual models (companies A and D) on empty container movement. The development of these models illustrates the overall process flow starting from the arrival of container trucks, the process of picking up or delivering the containers out of the premises. In addition, this simulation model proves the occurrence of bottleneck in the ODD. Thus, with the development of the model, the depot firms are expected to improve their performance in the future (to ensure efficiency and zero waiting time in the operation flow). In this phase, the 3D simulation model is developed through the FlexTerm CT version 2.5 simulation software. FlexTerm CT is an additional FlexSim software, which supplies additional items and functions to facilitate imitation and operational analysis for modern and traditional terminal containers. Through FlexTerm CT, terminal container simulation models can be developed quickly and easily in the Windows Graphic User Interface (GUI). The simulation model built into FlexTerm CT can be potentially used to improve many aspects of container terminal operations. In general, one of the advantages of FlexTerm CT is the ability to increase the utilization of equipment and reduce waiting time and turnaround time (Moghadam et al., 2011). Furthermore, through FlexTerm CT, users can analyse various operations at container terminals, for example, container arrangement and container segregation, crane allocation, terminal equipment allocation, ship scheduling and ship berth allocation and traffic bottleneck. Additionally, the results of each simulation can be analysed graphically through the 3D simulation model by providing statistical and graphical reports (FlexTerm User Manual, 2014). The process of the implementation of the 3D simulation model is based on the process flow set by companies A and D. The concept and development of 3D animation models will be described in more detail in the next section.

Research Findings

Empty container depot outside the seaport or the ODD is an important logistics chain for smoothing storage and delivering empty activities to the customers (consignees/manufacturers). The smooth flow of port operations depends on the efficiency of the depot or port. This is because the depot is the main hub for stakeholders before cargo delivery is carried out by the shipping side. Out of 30 ODD companies or depots near Port Klang, Malaysia, only two were selected for the development of the 3D simulation model. This section will describe in detail the company's background, including the ODD

practice, depot layout and development of the simulation model for the selected companies.

Company A

Company A, which was established in 2009, has a major mission of fulfilling customer requirements through various types of service offerings. The depot facility provided has a full concrete floor, and the space is around 10 acres (40468.56 square meters) with a capacity of 7500 TEU. It is also equipped with a safety system and operates seven days per week. The depot consists of five units of empty container handler (only two or three units can be used; the remaining unit is under maintenance) and one forklift unit to ensure the stacking or storage process runs smoothly. The main services offered by company A are storage of containers, pick-up and drop-off of containers, container inspection, maintenance, container delivery services to customer premises, container washing and others. Company A has an online depot management system to record and share container information with the shipping and port, so the container status can be known in real time.

Empty container practice at company A

Respondent R11 observed that the flow of the pick-up and delivery of containers between the depots is not much different, but it also depends on the planning of each company. From the container handling aspect, the driver will submit the consignment note and booking confirmation to the shipping counter. The depot workers will review all container information, cargo types and so on. All information will be input in the electronic system developed by company A. Upon confirmation of the document, the container will undergo maintenance service. Next, the driver will move to the recommended block for the container dropping process. Containers are classified according to the type of shipping operator, and damaged containers are stored in certain block storage. Container handling time at company A is estimated to not exceed 30 min, but if trucks are too many at a particular time, the process (container pick-up or drop-off) will exceed 30 min (respondent R10). Respondent R10 noted that, *"In fact, most drivers begin to arrive at nine or ten o'clock in the morning at depot, but during the off-peak hours, more than 40 container trucks arrive at the same time. So, the depot can be crowded and many drivers are still waiting out there."* Meanwhile, in the process of container pick-up, the driver will submit the document to the main counter. Upon obtaining document verification, the truck driver will proceed to the operating site through a specific driving lane/route. Forklift operators will also receive instructions regarding the container from the customer (according to grade, container serial number and type of shipping operator). Then, the forklift operator will locate the container to be lifted onto the truck. Containers will be taken to the inspection and cleaning site. In this situation, depot workers will physically inspect the container, and the status of the container will be recorded in the outgoing slip. Container grades and conditions will be checked, as well as whether perforation, leakage, damaged doors, oily and other problems have occurred. Finally, the driver will submit the slip to the outgoing counter before leaving the depot. Figure 1 briefly shows a developed depot layout at company A. In part A, the layout of the depot area consists of the container block storage and the vehicle lane separating the blocks. At least two container trucks can pass through the driving lane at the same time. Section B indicates the area for container maintenance, washing and inspection. A good practice of company A is washing the containers that have been delivered before being stored in blocks so that retrieval of containers would not take long. On average, the moving-in and moving-out of the container truck of company A is 200–500 units per day. However, the estimated movement of container trucks will increase during particular seasons (e.g. festive seasons). Respondent R11 supports that container operations in company A are running smoothly.

Figure 1: Layout Company A

Company D

Company D was established in 2010, and the main mission is to meet the current logistics requirements by providing fast response to customers. Company D aims to provide empty container storage, lift-on and lift-off of containers, normal or chemical liquid washing and container maintenance. The company is also located near Westports, Port Klang, Malaysia. The container capacity of company D is 10,000 units TEU with an area of 8 acres (32374.85 square meters). Company D has 20 employees and operates 6 days per week. Based on observation, this depot does not have concrete floors but has three container handling units and one forklift unit. The stacking of container as high as seven to eight levels or stacks, and the strategy of segregating is also not according to the type of shipping operator and container grade.

Empty container practice at Company D

According to respondent R25, for the container move-in process, the driver will submit the document or container information to the counter. The container will be checked and cleaned upon confirmation. The container is then dropped off by the forklift before the drivers leave the depot. Meanwhile, for the container pick-up process, the driver will submit the documents to the counter and then immediately proceed to the container block storage upon confirmation. Container loading operations will be carried out by depot operators. Container inspection will be conducted to repair minor damages, if any. The container will also undergo cleaning operations at the same time. Finally, final inspection of the container and the documents will be carried out before the driver leaves the depot. According to respondent R9, the minimum duration of container move-in and move-out process is estimated to not exceed 30 min, as stated by respondents from company A. Company D has a total of 15 shipping operators. Owing to the space limitation, the container yard is occupied with large container units. Additionally, the depot area is filled with truck drivers during peak times, which can cause bottleneck. Problems are increasingly difficult to handle if container specifications still do not meet customer requirements, and it needs to be changed or repaired by the depot. Therefore, the expected time for container delivery and pick-up may exceed 1 h (respondent R9). Respondent R25 claimed that, "*The standard pick-up process is 30 minutes, but in such cases it can take up to an hour. Therefore, the appropriate hours of operation have not been reached yet. Bottleneck is quite difficult to overcome if occurring frequently. Therefore, shipping companies and depots need to find solution to the problems.*"

Figure 2: Layout Company D

Figure 2 briefly shows a developed depot layout at company D. Based on Fig. 2, Section A represents the container block storage and driving lanes between blocks, whereas Section B represents the washing space, container inspection site, counters and administrative offices. For the container handling process, the truck driver will go through the document review process at the counter and then proceed to the container cleaning operation. If truck queuing occurs at the counter and the washing area, the trucks will stay and wait in front of the entrance because there is no parking space available in the depot area. Since only one door/gate is available, the depot often experiences long truck queues.

Development of 3D Simulation Model

The development of the 3D simulation model (Figs. 3 and 4) illustrates the activities that occur in companies A and D. Meanwhile, the 3D simulation model in each substation is also shown clearly (Figs. 5 and 6), which represent all processes involved in the system. The model is developed based on the actual layout (Figs. 1 and 2) through interviews and observation approaches, and the flow of the container movement is almost the same for each selected company.

Figure 3: 3D Simulation model Company A

Figure 4: 3D Simulation model Company D

Figure 5: 3D Simulation model (sub-station) Company

Figure 6: 3D Simulation model (sub-station) Company

In this study, observation (by researcher) approach also proves that company D is experiencing long truck queues due to the limited space and insufficient resources (especially during truck arrival at peak times). Based on the interview with respondent R10, company A has sufficient staff (3-4 people) for the processing of the document at the counter, resulting in a smooth-running process despite being busy during mid-morning and evening. However, company D only has one employee (at the counter) who handles the documentation process. Apart from machine breakdown and simultaneous arrival of trucks, there are some other conditions that cause the slow process of container pick-up and drop-off, such as truck drivers using the wrong lanes, reshuffle processes or containers needing to be located or repaired. Additionally, high container stacking (seven or eight levels) also caused delays in container handling at company D. In addition, company A practises a five-stacking containers compared with company D. Based on observation, company A is able to manage container pick-up more efficiently and securely than company D. In addition, company D does not practise the arrangement of containers according to grade and type of shipping operator, so the handling operations are slow in tracing the container needed by the customer. Furthermore, long waiting hours for inspection and cleaning activities are also influenced by the arrival of many trucks. Most containers will be cleaned before being kept in block storage and sorted according to grade or specification (this has been consistently practised by company A). Based on 3D animation movements, company D (Fig. 6) is exposed to long queues or longer waiting time, whereas company A has a smoother-running process. For the container move-in and move-out process, the final step is the submission of the document to the counter by the driver before leaving the depot. If the document is incomplete, the driver must return to the container block storage and do the needful (respondent R11).

In the case of container defect (newly identified by the manufacturer), the depot will offer a repair service at the manufacturer's premises, but if major problems occur after the container is received, the truck driver will return the original container to the depot and have it replaced with another one with a similar grade. For the drop-off process of used containers, the truck driver will proceed to the 'container delivery block' (after inspection and cleaning) and exit the depot upon completion of the operation. Based on the 3D simulation model (see Figs. 3 and 4), the truck check-in process takes place at the counter or in the FlexTerm CT called as gate process 39. The movement of pick-up and drop-off trucks can be seen at the node (node black point), which is used as a driving lane by the truck and forklift (top loader) to move towards the container. Subsequently, the trucks that will take the containers will pass through the driving lanes and move to the container block arrangement. Container inspection and cleaning operations are conducted at Gate Process 47, or the washing and inspection areas. Meanwhile, Gate Queue 46 is a container trucking queue, which refers to where the flow item is waiting to be processed by the processor. If there is no queue, then the trucks going towards the processor will be processed automatically. Top loader is the machine used in container handling to lift-on, lift-off and reshuffle the container. When the truck arrives at the container block storage, the top loader will lift off the container from the truck and stack it up the block. The container will remain in the block until it is picked up by another truck carrier. The operations in the ODD have been depicted in the depot area, which involves the process of check-in counters, container handling process (container lift-on and lift-off), container inspection and cleaning. In conclusion, most practices in container storage are the same in most ODDs in Malaysia. Further, the flow of container handling operations is also outlined by Yu et al. (2016). They focus more on the development of animation for container operations, i.e. loading, unloading, stacking and container reshuffling. Their models are not utilized with all operations as developed in this study, for example, inspection or container operation and process at the counter or gate. Potential models developed in their studies evaluate the effects of reshuffle operations, as well as the impact of the number of internal truck and yard cranes on terminal operating efficiency which become a major advantage in their study.

Equally important, Azab and Eltawil (2016) aim to study the waiting time of container trucks. Their study suggests how container operators can reduce queue times at the gate terminal without affecting productivity and suggests the arrival patterns of trucks at container terminals. Azab and Eltawil (2016) developed 3D models through the FlexTerm CT software at container terminals, such as quay ports, terminal areas and gates. A simple model (one gate, one container block, one yard crane and one vessel) was constructed to examine the impact of arrival patterns on the truck turnaround time and bottleneck at the gate. Their studies emphasize the truck pattern suitable for overcoming bottleneck or long queues

at the port gate. Huynh and Walton (2011) suggest that there are two main steps taken by terminal operators to reduce the truck's turnaround time at the terminal: increasing the number of yard crane and using an appointment system. The main issue in this study is whether it is appropriate or not to increase the number of cranes. As such, activities that occur in the system are modelled by the type of process and movement of the truck through the road network. Their studies put more emphasis on operation problems at port terminals compared with depots. Spoel et al. (2016) developed a simulation model based on bottleneck and data without bottleneck, modifying the number of trucks that arrived within a certain period of time. The terminal will be congested if one or more queues have a higher inflow than outflow. Given that the capacity (entrance and exit) can process about 20–25 trucks per hour, then for congested data sets, the number of trucks that arrive every hour must be greater than 25, and not exceeding 20 for a non-congested data set. The simulation will run for 1000 h to ensure the system reaches the bottleneck state. Esmer et al. (2010) conducted a study to determine the optimum number of trucks in the Turkish Port based on lean and green concepts (i.e. by minimizing environmental damage due to port operations). Their study found that truck reductions allocated from five to two were able to cope with environmental pollution without affecting Quay Crane's productivity.

This study focuses more on depots located outside of the Malaysian port. The 3D platforms that are visualized are more obvious to represent the real system, but it can also give stakeholders a serious picture regarding the bottleneck problem that occurs during the incoming or outgoing of empty container truck, and potentially to affect the inefficiency of the container supply chain. As a matter of fact, this 3D simulation model consists of several processes before the truck driver comes out of the depot in a practical context in Malaysia. The FlexTerm CT object is used to realize the depot operation or the complex problem of bottleneck in the ODD. FlexSim or FlexTerm CT is a specialized software for developing operations at port terminals. FlexTerm CT provides a complete object to enable the modeller to save time in building container terminal operations and to plan ahead (Azab & Eltawil, 2016). The 3D simulation model developed in this study looks at some aspects of the truck's movement at the terminal, as stated by Spoel et al. (2016), which are the start time, when the truck enters the first terminal queue; end time, when the truck leaves the last terminal queue; loads, whether the truck is loading or unloading; and bottleneck problems. Bottleneck illustrates how many truck queues along the driving lanes, and turnaround times will increase as traffic bottleneck increases (Spoel et al., 2016).

Finally, this study has examined every activity that took place at the beginning of the operation until the end. However, the 3D simulation model developed in this study is only utilized to demonstrate the ODD operations (in the context of bottleneck) without testing or analysing the model. Operational or bottleneck behaviours occurring in companies A and D are illustrated based on interviews and observation methods and existing data provided by the companies. Based on the case study, company A was found to have smoother-running operations than company D. Company D was described as having the worse performance or taking long processing time for container retrieval and delivery. In comparison with the 3D simulation model developed in this study, the illustration of operations in the most congested part can be clearly shown to the stakeholders. However, the main drawback of the 3D simulation model in this study is that it does not look at the overall container activity at the port and focuses only on the ODD. Finally, one of the valuable things of the 3D simulation model is the ability of FlexTerm CT to illustrate the operation flows, and it could indirectly indicate which processes or substation causes bottleneck. For example, idle time or busy counters and washing process can be viewed virtually in those models. In the future, if analysis of this simulation model is carried out, it could analyse bottleneck which is caused by inefficient or inadequate resources, and the average time of the truck movement can be measured for each process starting from the gate until the truck leaves the depot area. Consequently, processes which involve long service hours and long waiting time can be determined. Moreover, the number of successfully or unsuccessfully processed trucks in the system can also be determined, as well as which part of the substation or process needs to be developed to reduce bottleneck

Conclusions

Based on the case studies and the container movement practices, some of the major obstacles during the operations of selected ODD companies have been identified in this section. Case studies have

successfully illustrated the process behaviour in the context of bottleneck through the development of the 3D simulation model. This model has been successful compared with the models developed by previous researchers. This model is revised by experts in the logistics container field, including academicians to determine the 3D platform generated is similar to the behaviour of real systems. In the form of simple animation or model simulation, it is easy for depot planners to directly visualize the traffic bottleneck at the ODD. Apart from the animation, if this model is fully analysed, it will allow the depot to plan ahead to reduce waiting time or service time (empty container pick-up and transport by truck drivers). It is worth noting that the development of the 3D simulation model is the main contribution in this study. In conclusion, in order to meet the growing demand for empty containers with capacity constraints (e.g. limited land area and high-cost infrastructure and equipment), it is necessary to increase awareness of all stakeholders about the improvement of their performance at the ODD in Malaysia in the future.

Abstract

The main directions of the social and economic state policy of Russia are enshrined in the May Decrees of the President of the Russian Federation that state that solving problems in the healthcare sector, along with education and demography in the context of the digital economy is one of the priority tasks. Particular emphasis is placed on developing IT and applying them in medicine, thus allowing to expand the possibility and accessibility of the medical services for the population of our country. In this regard, the problem of human health and its adaptation to the conditions of a rapidly changing environment becomes even more urgent in the digitized world. The use of IT and telemedicine is aimed at improving the quality of life of the population and the environmental situation in cities, which has a significant impact not only on the general level of health and life expectancy of citizens of the country but also on their psychological state. One of the positive consequences of including a person in the digital environment is the possibility of establishing communication with a medical institution, receiving medical advice in remote access, as well as using robots in diagnosing various diseases. The development of communication networks and the digitization of medical services have led to the emergence of cross-border medicine. All of the above indicates the relevance of the research. The purpose of the research is to identify the system of economic and legal problems of telemedicine regulation in the Russian Federation, as well as to develop practical proposals for its improvement. During the study, the authors reviewed the federal laws in the field of telemedicine, revealed the main problems of regulating telemedicine services, explored the prospects and opportunities for deep transformation of the healthcare sector and active longevity, studied the economic and legal risks of introducing telemedicine services, on the basis of which recommendations are developed to improve the provision of innovative medical services (telemedicine), which in the course of the study were brought to practical application. It is concluded that the obvious advantages of telemedicine are independence from the geographical location, time factor, and the ability to access remote information in real-time or promptly if necessary. The introduction of such type of medical service as telemedicine requires changes in the regulatory framework and in the practice of providing medical care in many states, including the Russian Federation. The main theoretical provisions and recommendations of practical importance have been brought to the level of specific proposals that can be implemented by medical institutions of the Russian Federation in order to increase the effectiveness of developing telemedicine and using intellectual property in their activities

Keywords: Digitalization, Medical Services, Innovations, Cross-Border Medicine, Telemedicine, Telepresence Systems, IT, Smart Technologies, Robots, Efficiency.

Introduction

The importance of the health of a citizen of the country, as well as the health of the whole society, cannot be overestimated. The current national and social strategy of our state is enshrined in the May Decrees of the President of the Russian Federation, where it is noted that solving problems in healthcare, education, and the environment in the framework of the digital economy is the primary task of the Russian state and society (Gnezdova, 2014).

Today, the state puts special emphasis on the development and application of IT in medicine, which makes it possible to expand the possibility and accessibility of medical services for the population of our country. In this regard, the problem of each person and society as a whole adapting to the conditions of a rapidly changing external world, uncertainty, and risk, becomes even more urgent in a digitized environment.

Implementing the digital economy concept and applying IT and telemedicine are aimed at improving the comfort of people's living environment, the quality of their life, and the efficient use of natural resources, which ultimately improves the environmental situation in cities significantly affecting not only the general level of health and life expectancy of citizens of the country but also the psychological state of a person (Servis press-relizov, 2012).

Introducing the new so-called smart and information technologies when implementing the strategy of the Russian state to digitize all the knowledge and information available to mankind allows expecting positive consequences, however, the problem of adapting certain sectors of the national economy (including medicine) in the context of digitalization economics is even more important.

The expected positive consequences include the wide possibilities of the population with access to a personal computer or a smartphone to establish contacts with any other individual on the planet, any organization, enterprise or medical institution, and also to receive almost any information that does not represent commercial, state, or personal secret, as well as to expect probable prospects for using robots and automated services and terminals in diagnosing various diseases.

The development of communication networks and the digitization of medical services delivery processes have led to the emergence of such a phenomenon as cross-border medicine. Cross-border medicine should be understood as a combination of medical services, the provision of which, the transfer of patient information, as well as the work of Internet providers, are carried out across the borders of several states . The experts note that in the global world, the volume of medical services provided cross-border will increase in an avalanche-like manner. For example, the global volumes of telemedicine and medical tourism services in 2019 are USD 33 billion and USD 36 billion, respectively .

The significant advantages of telemedicine are independence from the geographical location of patients and the medical institution, the time factor, and the ability to access remote information in real-time. The introduction of such type of medical services as telemedicine requires changes both in the regulatory framework and in the practice of providing medical care in many states, including the Russian Federation. Vivid examples are such areas as teleradiology, processing by international corporations of large databases of a particular country's medical data, and the possibility of holding international medical consultations. There are great opportunities and prospects for interaction with Russian medical organizations, corporations, clinicians, and IT professionals. Operational access to information, innovative technologies, experts and specialists on a global scale receives a new impetus for development in the form of cross-border telemedicine. At the same time, a real-time user system for managing the routes of global medicine users is created, and technologies for finding adequate solutions are implemented to provide high-tech services in comfortable conditions . In this regard, the Russian Federation adopted the Law on Telemedicine that became effective on January 1, 2018, and does not have a wide established practice of applying.

Analyzing the theoretical and applied value of currently available scientific research, it should be noted that scientific approaches and research relating to the provision of medical services using new technologies and innovations are not exhaustive and do not allow an objective assessment of the structure of the Russian market in terms of the volume of innovative medical services provided, their types or quality, with the use of intellectual property (telemedicine) (Primenko, 2017). Until now, questions of researching regional markets, in particular telemedicine, as well as evaluating the effectiveness of managing the intellectual property of a medical institution in terms of their qualitative characteristics, remain unexplored (Shulgin et al., 2016). The above circumstances make it relevant to study the main aspects of introducing telemedicine as an innovative sphere of providing medical services, which served as the basis for choosing the purpose and objectives of this research.

The purpose of the research is to identify the list of problems of economic and legal regulation of telemedicine in the Russian Federation and to develop practical proposals for its improvement.

To achieve this purpose, the following tasks were set and solved: the federal laws on telemedicine are reviewed; a list of economic and legal problems of introducing telemedicine in the conditions of cross-border relations is defined, and the recommendations are developed to improve the effectiveness of telemedicine in modern Russian conditions.

The methodological basis for writing the thesis is general scientific methods of cognition, in particular, methods of economic analysis of private law, logical analysis, a systematic approach, and a comparative legal method. The theoretical basis of the study was the scientific works of foreign and Russian authors on the current issues of telemedicine services.

The object of the research is social relations associated with the introduction of telemedicine in the process of providing medical services to citizens of the Russian Federation.

The subject of the research is medical services, the laws of the Russian Federation, and the practice of legal regulation of relations in the field of telemedicine.

The theoretical and practical significance of the research lies in the fact that the authors developed recommendations to improve the effectiveness of telemedicine regulation, and also developed an organizational and methodological mechanism for implementing practical recommendations.

The main theoretical provisions and recommendations of practical importance have been brought to the level of specific proposals that can be used by medical institutions of the Russian Federation in order to increase the effectiveness of introducing telemedicine and telepresence systems in their activities.

Deep Transformation of Medical Services in The Context of Digitalization of The Russian Economy

Providing medical services using innovative technologies (telemedicine) refers to the field of deep transformation services in the process of digitizing the socio-economic environment of Russian society (Fedkina, 2018). In this regard, the innovation of the healthcare sector and the implementation of the principles of active longevity is becoming one of the priority tasks of the Russian state, the solution of which will entail a profound transformation of both the healthcare system and related areas.

According to the authors of the research, the transformation of medical services and the introduction of an innovative strategy for the medical sector can be accelerated only in conditions of economic growth, macroeconomic stabilization, and commercialization of innovative technologies in the healthcare sector. Innovative solutions that are currently being implemented in the medical services sector allow personalizing and radically increasing the effectiveness of the proposed medical

treatment, minimizing the risks of deviating patients from their usual lifestyle, taking into account the efforts of patients, doctors who provide treatment, and patients' relatives in the system of a new paradigm for creating a comfortable "patient-oriented (friendly) environment ", as well as to develop an organizational and methodological mechanism for the effective management of innovations when providing medical services. For example, the implementation of the "Smart Region" concept (the "Public Health Protection" section) in the Urals Federal District will allow using such information technologies as the creation of an electronic registry, a patient's personal account, and the introduction of electronic medical records. These services should be implemented with the assistance of the administration of the region (a municipality).

As an example of applying innovative technologies for medical purposes, the information should also be given on the possibility of implementing an automated pre-trip medical examination should also be given (Fedkina, 2018). The main positive characteristics of such an inspection are the reliability of the results, the absence of queues, and a fairly low amount of capital investment when acquiring an automated terminal (about 60 thousand rubles), while the cost of one pre-trip inspection is thirty-five (35) rubles or more.

The table below shows the transformation of the medical services sector in the Russian Federation, the application of new management decisions, as well as business models implemented in the field of health and active longevity.

Table: Transformation of services in the field of public health and active longevity

New Management Technologies	New Business Models	New Market Leaders
1. Internet of Things Services; 2. Block-chain; 3. Artificial intelligence and context recognition algorithms (Rolinson et al., 2018); 4. Robots: adaptive, intelligent, and telepresence.	1. Online monitoring of the patient's condition and the quality of the doctor's prescription; 2. Online clinics and providers of information solutions for patients and clinics; 3. Companies that manage the treatment process, purchase of drugs and supplies; 4. Small network and franchised high-tech clinics.	Google, Avella, Sanofi, Doc +

It should be noted that robots are self-learning automatic devices that operate according to their program, receive information about the outside world from sensors, and perform independent operations complementing human actions.

Today, the following generations of robots are distinguished:

• Programmed robots are robots with a rigidly defined program of actions (cyclogram);

• Adaptive robots are robots that can be automatically reprogrammed (adapted) depending on the external conditions of activity and the environment. A basic program of action is initially installed in such robots.

• Intelligent robots are robots, the program of actions and tasks of which are carried out in a common (basic) form. A robot has the ability to plan its actions and make decisions in the uncertain conditions it recognizes.

• Telepresence robots are robots whose functional feature is to enable the device operator to receive various kinds of sensory information (in particular, video, sound, tactile and other information) from a remote point using installed sensors .

According to experts, the market share of telepresence robots is now rather small taking about USD 200 million. This allows healthcare companies to enter a market with a potential of over USD 4 billion .

In the field of telepresence robots, a number of legal issues related to the interaction of humans and robots must be solved (Lebedev et al., 2019). For example, in the United States, a telepresence robot operator must obtain a special license from the state (Trese, et al., 2014). Recently adopted legislation on cross-border medical licensing addresses this issue.

Overview of the Federal Telemedicine Laws

Experts note that the modern structures of contractual forms of regulating the relations on the provision of medical services using digital technologies for their remote provision and telemedicine services (Bazaron, Borbonov, 2016; Vladzimirskiy, Shaderkin, 2015) are very interesting to research. In the indicated aspect, the problems of contractual funds aimed at minimizing the risks of patients in connection with the receipt of such services deserve special attention. The economic and legal risks of participants in such medical services, of course, increase.

Remote provision of medical services is one of the fast-growing high-tech areas of healthcare. It is widely recognized and applied in the global healthcare industry and is gradually becoming a new model of medical care, where the legal regulation of distance healthcare is reflected in the regulatory acts of the Government and is recognized by the medical community and patients.

Let us analyze the main novelties of the mentioned Russian law on telemedicine. In particular, it is possible to provide medical care using “telemedicine” technologies through consultations and medical consultations, as well as remote medical monitoring of the patient’s health (Barwig, 2008). The use of consultations applying "telemedicine" technologies is a right of both the doctor and the patient, and should not limit patients to receive medical care in person. The procedure for the provision of medical care using telemedicine technologies has been determined (Repin, 2017).

In addition, the law provides for the possibility of issuing electronic prescriptions for medicines, including for those containing narcotic drugs or psychotropic substances from January 1, 2019. Electronic prescriptions will be sent directly to pharmacies.

The law allows the execution of a number of medical documents in electronic form, for example, consent to, or refusal from, a medical intervention, a medical assessment report, a certificate or an extract from medical records. At the same time, the procedure for information support has been improved, which provides for the creation of a Unified State Information System in the field of healthcare, which provides the opportunity to provide medical services to Russian citizens in electronic mode on a single portal of public services.

Economic and legal problems of introducing telemedicine in conditions of cross-border relations

The modern life of society is closely connected with the use of information technology, the movement of information affects all spheres of human activity, in particular, the medical services are undergoing major changes today (it also includes information and Smart technologies). According to the BBC Research, the current market for telemedicine services consumers in 2019 is about USD 43.400 billion (Vladzimirskiy, Shaderkin, 2015).

The main achievements of telemedicine today include increasing the availability of medical diagnostics (Baranov, 2015); increasing the efficiency of medical care; unloading of medical hospitals; solving the problem of the shortage of medical specialists; significant cost savings; reduction of time for medical diagnostics and assistance; the opportunity to consult with the best world experts (Zaytseva, Shiryaeva, 2016).

However, it should be noted that in the process of developing telemedicine in Russia a number of questions and problems arise that require immediate resolution, such as: who is the holder of the registry? who certifies the signature? who will confirm the credentials of the doctor? who will be responsible for the diagnosis?

In addition to the aforementioned federal law on telemedicine, the fundamental legislative acts should also include the Order of the Ministry of Health of the Russian Federation No. 344 signed in 2001, according to which the Concept for the Development of Telemedicine Technologies in the Russian Federation and its Implementation Plan has been developed.

According to experts, telemedicine is becoming a separate type of work in medical informatics (Panov, 2016). In this regard, the imperfection of the Russian legal framework may entail the following risks: inadequate technical equipment, which may lead to a distortion of the information received and transmitted; violation of confidentiality and disclosure of medical confidentiality; lack of direct examination of the patient, which may lead to an erroneous diagnosis; insufficient information; occurrence of false information; financial and economic problems associated with the current taxation of medical services; economic and other risks associated with liability for the provision of services outside the medical licensing facility; and the risk of providing services outside established medical facilities and standards.

By creating the Eurasian Economic Union, Russia has become a member of a large community where issues of cross-border interaction are especially relevant (Zaytseva, Shiryaeva, 2016). In this regard, by 2025, the Russian legislation should be brought into line with the legislative framework of the Eurasian Union (Panov, 2016). It should be noted that this is primarily due to the field of healthcare and the provision of medical care to the population of Russia. However, the legislation of the Eurasian Economic Union is at the formation stage. For this reason, Russia needs to take the initiative to create a unified Law on Telemedicine for the Eurasian Economic Union, taking into account national characteristics, problems, and difficulties of cross-border telemedicine.

Drawing up the recommendations for improving the development of telemedicine in Russia

The authors believe that special attention should be paid to economic and legal regulation of the following areas:

1. Improving the management of medical consultation on remote treatment. For example, in the People's Republic of China, on January 4, 1999, the Ministry of Health of the People's Republic of China published a "Notification of strengthening the management of the consilium for remote treatment". Remote treatment refers to a form of medical care that involves the use of electronic means of communication for medical consultations in other places, this is a medical action that must be carried out in a medical institution that has received a license from the state (Gzanka, 2006).

2. Developing guidelines for the promotion of telemedicine services (Shvets, 2017). For example, in the PRC on August 21, 2014, the National Health and Family Planning Commission adopted the "Recommendations on promoting the provision of remote treatment services by medical institutions". Medical institutions, using information technology in their activities, provide medical services to patients outside medical institutions (Shvets, 2017).

Remote patient care services include remote pathological diagnosis; remote diagnostics of medical imaging (including imaging, ultrasound, nuclear medicine, electrocardiogram, electromyogram, encephalogram, etc.); remote monitoring, remote medical consultation, remote ambulatory reception, distance discussions, etc. (Rogach, 2014).

3. Developing the federal legislation on the prevention of infectious diseases, the law on practicing doctors, the law on maternal and child health care, the law on liability for violation of the law, as well as the general norms of civil law, the rules for nurses, the rules for the formation of the medical history of medical institutions and other sources providing for the implementation of telemedicine standards on the confidentiality of information and personal data of patients. This means that patient confidentiality should be legally protected, including in the process of providing medical services using remote treatment, including the specifics of the patient's location and the location of the invited medical institution.

It should be noted that in the case of using electronic medical records and the diversity of informed subjects in the remote provision of medical services, "the risks of violating a patient's confidentiality and the difficulties of state supervision of privacy violations" increase. A generalization of the analysis of medical practice and social studies show that the violation of "patient confidentiality remains one of the issues that need to be urgently addressed".

Using a remote form of treating patients using telepresence robots requires an immediate discussion by an expert and professional community on establishing legal relations between the circle of subjects and the grounds for the emergence of these relations (Borisov, Ivanov, 2017). The specified form of treatment generates certain above-mentioned legal, economic, and other risks. In this regard, the legal mechanisms that are aimed at minimizing these risks must be elaborated. With remote treatment, there may be a case in which only one of the medical institutions provides remote services, while the other participants carry out traditional medical activities. Legal regulation of such a situation is quite simple, by analogy with the classical form of medical services. Meanwhile, remote diagnostics and treatment using providers or telepresence systems suggest the formation of two types of distance medical activity, namely, medical consultation of distance treatment and general distance treatment.

Covering the practice of applying new laws of the Russian Federation and the PRC on the remote provision of medical services (telemedicine services) indicates the duality of legal relations that may arise in the provision of such services. Using the terminology of the legislative practice of the PRC, it can be noted that telemedicine is the provision of medical services for general distance treatment and the holding of a consultation of distance treatment. Chinese medical practice of providing services in a remote format has faced the need to redistribute the burden of responsibility between the medical institutions participating in the consultation (inviting and invited medical institutions), in particular, for reasons of harm to the health of patients in the case of providing poor quality medical services.

In this regard, various scientific approaches to solving this problem have now been identified.

The first scientific approach assumes that the participants in the consultation (both inviting and invited medical institutions) are, in these cases, jointly responding to the patient. In our opinion, from the point of view of effective protection of the violated rights of patients in providing remote treatment consultation services such legal structure, in which the burden of responsibility rests with the medical institution that is in the binding relations with a patient and invites other medical institutions to conduct the consultation in remote form, is preferable.

However, the burden of responsibility may also be put on the invited medical institution in recourse, provided that the inviting medical institution bears the proof of guilt of this participant in the consultation. In this case, the guilt of the invited medical institution and the classification of medical risks within the standards of medical services acceptable by medical practice must be elaborated. In

addition, such a legal position is based on the judgment that the patient is the so-called “weak” side of legal relations.

Today, the legal regime for remote treatment and telemedicine services in the Russian Federation is at an early age and is likely to receive an impetus for further development. The process of providing services using remote technologies and telepresence systems requires the adoption of a number of special regulations and directives of the executive bodies of the Russian Federation aimed at minimizing legal risks for patients. Among the main problems of legal regulation of telemedicine services identified at present, the following areas for further legal research should be noted:

1. Creating a legal regime for the protection of confidential information about patients, their state of health, and other personal data. Information in the electronic interaction mode is circulating in nature, which, obviously, leads to its distribution among a wider range of participants compared to the traditional form of providing medical services (Tihon, 2017). For this reason, blocking the availability of patient information is one of the main tasks of developing telemedicine.

2. Elaborating contractual relationships between the inviting and invited medical institutions. There is currently no uniform scientific point of view on the issue of assessing the legal qualifications of these relations, which have already taken shape in Russian medical practice.

Based on the results of the research, in order to develop an organizational and methodological mechanism for implementing practical recommendations for introducing telemedicine services, the authors developed recommendations for the implementation of information and communication technologies in the healthcare sector.

During the writing of the article, the main theoretical and applied provisions and recommendations have been brought to the level of specific proposals that can be implemented in the activities of medical institutions in order to increase the effectiveness of the development of telemedicine.

The authors of the study provide the following statistical data (Telecomtimes, 2018):

From March to October 2018, residents from the Central Federal District most often resorted to telemedicine services – 25% of the total. The absolute leader in the number of applications to the Central Federal District was the Moscow region (Moscow and the Moscow region). The residents of the capital and the Moscow region accounted for 54% of the total number of applications in the district. Together with Moscow, the five regions where telemedicine was most in demand included: Lipetsk region (6% of calls), as well as Bryansk, Voronezh, Tula and Yaroslavl regions (4% of calls each).

In the Volga Federal District, experts recorded 20% of calls to online medicine. Telemedicine was most popular in the Volga Federal District with residents of the Perm Territory (21% of all applications from the district), Samara Region (14%), Nizhny Novgorod Region and the Republic of Bashkortostan (11% each), the Republic of Udmurtia (10%).

In another 16% of cases, users from the Siberian Federal District applied for telemedicine consultations. The most active were residents of the Irkutsk Region (30%), Krasnoyarsk Territory (15%), Altai Territory (14%), Novosibirsk (13%) and Kemerovo Regions (11%).

Conclusions

In conclusion, it should be noted that creating cross-border medical services and telemedicine can entail such positive effects as the provision of highly specialized medical care, medical services in border areas, and medical care for foreign patients.

Promising areas for further scientific research are as follows:

1. Based on the comparative legal analysis of the legislative framework of the two countries (the Russian Federation and the People's Republic of China) and law application practice in the field of telemedicine, a conclusion can be made that there are similar gaps in legal regulation, as well as identical trends in reforming the healthcare system at the present stage.

The main areas of solving systemic problems in the provision of telemedicine services include creating an effective legal regime aimed at ensuring the high quality of the services provided; building a legal model for implementing an independent assessment of the quality of services; optimizing a single information platform in this area; as well as the modernizing mechanisms for the economic and legal protection of patients.

2. Promising areas of further scientific research are the development of scientific and applied recommendations on the above problems at the level of integration associations of countries, as well as the creation of model options for legal regulation in the form of by-laws.

It is noted that the most obvious advantages of introducing telemedicine into the life of Russian society are its independence from the geographical location and time factor, the ability to access remote information in real-time or, if necessary, promptly. In addition, the inclusion of this type of medical services in medical practice in various countries, including Russia, requires immediate amendments to the regulatory framework for the regulation of the process of providing remote medical care.

The implementation of the telemedicine concept in Russia will be hampered by the following problems:

1) low availability of modern technologies to the population;

2) unresolved issues of security of the use of personal data;

3) the unwillingness of Russian doctors to work in the framework of telemedicine;

4) a low level of patient confidence in telemedicine.

Abstract

This research aims to investigate various intentions that influence borrowers in using a technology that focuses on the peer to peer lending platform as a growing financial services business in Indonesia. We use a survey by distributing online questionnaires and collect data from 183 borrower through peer to peer lending. The linear regression results that have been done show that trust, perceived risk, utilitarian value, and perceived cost have a significant effect on intention to borrow through peer to peer lending whereas ease of use shows insignificant results. The limitations of this study emphasize the first ten peer to peer lending companies registered with the OJK. Also, this study consisted of five factors measured against intention to borrow through peer to peer lending.

Abstract

This research aims to investigate various intentions that influence borrowers in using a technology that focuses on the peer to peer lending platform as a growing financial services business in Indonesia. We use a survey by distributing online questionnaires and collect data from 183 borrower through peer to peer lending. The linear regression results that have been done show that trust, perceived risk, utilitarian value, and perceived cost have a significant effect on intention to borrow through peer to peer lending whereas ease of use shows insignificant results. The limitations of this study emphasize the first ten peer to peer lending companies registered with the OJK. Also, this study consisted of five factors measured against intention to borrow through peer to peer lending.

Keywords: Financial technology, Peer to peer lending, Technology acceptance model, Digital funding, Indonesia

Introduction

The existence of a business with a financial technology (FinTech) model as a form of adaptation from a technology-based business. Romānova & Kudinska (2016), FinTech can be perceived as a form of integration between finance and technology where the process from the new technology base will replace traditional financial structures. This certainly presents its own important role in the field of financial services in Indonesia, where this business is a form of innovation in financial services that is

able to provide convenience and effectiveness in dealing with financial products and services. According to a summary of Bank Indonesia Regulation No.19 / 12 / PBI / 2017 concerning Financial Technology Implementation accessed from the website of Bank Indonesia (2017) FinTech consists of 5 categories. Through these regulations it is explained that the five categories of Financial Technology Organizers are payment systems; market support; investment management and risk management; loans, financing, and capital providers; and other financial services. Each of these categories has different uses of financial transactions according to the needs of the community. The first category, namely the payment system (payment, settlement, and clearing) includes authorization, clearing, final settlement, and payment execution. In addition, the second category is market support (market support or market aggregator) which is used in terms of providing information facilities to the public more quickly and cheaply about financial products or services such as investment, insurance, credit, deposits, or even savings products. The third category is investment and risk management where financial technology providers are able to provide forms of online investment products and online insurance. For the fourth category, namely loans (lending), financing (financing or funding), and capital providers (capital rising) as a financial technology management that provides information technology (peer to peer lending) and lending or fund-based services. And the latter category is another financial service which is the implementation of financial technology passed by the four categories described earlier.

Based on information obtained from the Lokadata website (2018), it is known that the types of FinTech that are widely registered with Bank Indonesia and the Financial Services Authority (Otoritas Jasa Keuangan, OJK) as of August 2018 are FinTech which provides services in the form of loans, financing, and provision with a total of 64 companies. Furthermore, as many as 24 registered companies offer FinTech types in the form of payment systems. For the types of Market Supporters and Supporting Organizers consisting of 7 and 3 companies that have been registered. This shows that the community's need for access to funding is in great demand, where the existence of this type of FinTech is able to reach the search for capital that can be used for business activities, especially for SMEs. Based on information obtained from the website (OJK, 2019) until February 1, 2019 there are 99 companies that have been registered with the OJK. FinTech, which is registered in the OJK, is experiencing annual growth. Where, in 2017 there were as many as 24 companies that had been registered with the OJK and in the following year increased to 64 companies.

FinTech can help in overcoming the problems that arise in buying and selling transaction activities and payments. The role of Fintech is in the payment system based on the presentation on the Bank Indonesia website (n.d.) which is providing the market for business actors; Become a tool for payment transactions, open / settlement and clearing; Helping in implementing more efficient investments; Risk mitigation for conventional payment systems; and Helping parties who need to save, borrow funds and invest in capital. Financial Technology is also able to provide benefits to consumers, namely allowing consumers to get better services and the availability of more choices; for FinTech players, namely helping in simplifying the transaction chain, being able to reduce operational costs, and capital costs; and for the State that can encourage the transmission of economic policy, help increase the speed of the velocity of money.

FinTech applications in Indonesia are also increasing, this can be seen by the increasing number of industries from Information Technology-Based Loan and Loan Services, commonly known as Peer-To-Peer Lending. Peer to peer lending as a technology-based innovation business that can bring together and facilitate online lending activities between lenders and loan recipients (borrowers). One company such as Investree seeks to attract prospective users to borrow online by offering lenders (lenders) some attractive returns, measurable risks, and ease of transactions. Also, the offer given to the borrower (the borrower) is an easy and fast process; there are transparent and cost-friendly transactions. The advantage obtained by the borrower is that it can facilitate the transaction process as revealed by Liebana-Cabanillas et al., 2014; Zhou, 2013a; Ondrus and Pigneur, (2009) in (Teo, Tan, Hew, & Yew, 2015) that cellular payment users can complete a payment transaction more safely, quickly, and comfortably because it can be accessed anytime and anywhere. So this makes it possible for borrowers to obtain funding which can later be used for business capital and various other investment needs.

OJK through its publication on its website (OJK, 2019) describes the total Fintech registered and licensed operators as 99 companies and there are 182 entities that are still not registered and without permission to operate in Indonesia. In this case, OJK acts as an institution that regulates transaction activities from information technology-based online loan services. With the small number of Fintech registered in OJK, it shows that there are still many companies that do not have permission to operate. So that it allows a high risk to use a peer to peer lending service in order to make loan transactions. Risk becomes an aspect that can influence the borrower's decision to use the peer to peer platform to find loan funds as stated on several platforms such as Modalku and Investree that attach information about risks that may be borne by the user.

The aim of this research is to analyze various determinations such as trust, perceived risk, utilitarian value, ease of use, and perceived cost that influence the intention to make loans for funding through peer to peer lending. Various previous studies also discussed the various motivations that underlie users to use online transactions such as cellular payments, one of which is to use the technology acceptance model or commonly called (technology acceptance model). Therefore, in this study we will discuss what will affect borrowers in conducting the intensity of borrowing through the peer to peer lending platform as a financial services business that has increased in Indonesia.

This research will be continued into several sections of the discussion consisting of literature reviews relating to this research, followed by the methodology section used to collect data, the fourth part will discuss the data obtained and analyze the results, and the last part will be completed with conclusions from the research.

Literature Review

FinTech and P2P Lending

FinTech is defined as the use of modern innovative technology software by a company which functions as a provider of financial services (Romānova & Kudinska, 2016). According to Arner, Barberis, & Buckley (2015) and Hochstein (2015) in Romānova & Kudinska (2016), FinTech can be perceived as a form of integration between finance and technology where the process from the new technology base will replace traditional financial structures. According to Stern, Makinen, & Qian (2017), peer to peer lending is a form of innovative loans offered by FinTech or often referred to as marketplace lending to interact with prospective borrowers who have the potential to conduct loan searches that apply using the peer platform to peer lending that is connected to an internet connection. In the research of Vives (2017), it is explained that the peer to peer lending (P2P) platform provides credit without bank intermediaries as a place for individuals and companies to invest in small businesses. Peer-to-peer lending activities can be carried out through non-profit online platforms for lending and borrowing activities where traditional financial institutions do not become intermediaries in the ongoing process as expressed by (Loureiro & Gonzalez, 2015).

TAM (Technology Acceptance Model)

Intention to Borrow

The intention of users to be able to continue using a mobile payment will be influenced by vulnerability to an increase in the perceived risk of the user and the uncertainty that arises after adopting it (Cao, Yu, Gong, & Adeel, 2018). Continuance intention is the intention of the user to continue using cellular payments after initial adoption (Bhattacherjee, 2001). Compared to offline and online payment methods, Mobile Payment involves large uncertainties and risks (Zhou T. , 2013). Research from Lu, Yang, Chau, & Cao, , (2011) shows that Mobile Payment services that create risk perceptions for users will negatively affect consumers' intentions to adopt and use these services (Lu, Yang, Chau, & Cao, 2011).

The model used in adopting technology proposed by Davis (1989) is the Technology Acceptance

Model or commonly referred to as TAM. The Technology Acceptance Model is one of the most widely used theories in conducting research on the information system Mortenson & Vidgen (2016) . The research conducted by Davis (1989) to test the variables in the form of perceived usefulness and variables perceived ease of use as a determining factor for a person's tendency to use or not even use information technology in the process of petrified work done. According to the article Davis (1989) the definition of Perceived usefulness (U) is the level of trust of someone that one's work performance will increase by utilizing a system or can be said to be able to use its benefits and Perceived ease of use (EOU) is the level of trust of a user that in using the system can be free from business as expected.

Trust to platform

According to Yousafzai et al. (2003), the involvement of the level of risk possessed on a financial transaction is a function that can describe the trust. Based on the presentation of previous research described in Teoh, Chong, Lin, & Chua (2013) explained that trust has a significant influence to lead to positive intentions to adopt online services. As stated (Zhou, 2011) that there is significance arising from the influence of the user's initial trust in his intention to use based on research from Chinese mobile phone users. Based on previous studies, we develop the following hypothesis:
(H1) : Trust to platform affect positively to intention to borrow through P2P lending

Perceived Risk

The results of the research conducted by Yang, Liu, Li, & Yu (2015) show that financial risk is the strongest factor in which the results of the tests conducted indicate that the relationship is significantly negative. According to Kovács & David (2016) ,with the advancing technology that is increasingly fast it can become a threat from the security side and also allows for fraud to occur which will affect users to use mobile payment. Some of the risks associated with mobile payment are the potential for errors in the payment transaction process, records of transactions and payments that are lacking, or that fraudulent transactions are disclosed by (Mallat, 2007) and (Hui et al., 2002) as quoted in (Ozturk, Bilgihan, Salehi-Esfahani, & Hua, 2017). Based on previous studies, we develop the following hypothesis:
H2: Perceived risk affect negatively to intention to borrow through P2P lending

Utilitarian Value

Utilitarian values have been defined as an assessment of the instrumental value of a functional attribute (Batra, 1991). In addition, Park and Yang (2006) as quoted in Ozturk, Bilgihan, Salehi-Esfahani, & Hua (2017) state that consumers will be directed to the utilitarian value that is felt in the context of using mobile devices because of the possibility of doing things quickly, anytime, anywhere, which in turn will reduce the effort needed. Also, in his research Arvidsson (2014) states that the benefits of a product or service can be felt when the user begins to compare a consideration as an important factor that can influence users to adopt a technology. This factor can be perceived usefulness consisting of quality and performance as expressed in research (Davis, 1989). Based on previous studies, we develop the following hypothesis:

H3: Utilitarian value affect positively to intention to borrow through P2P lending

Ease of Use

The ease will affect the tendency towards the use of the mobile payment service for its users Arvidsson (2014). Based on research from (Guriting and Ndubisi, 2006) as quoted in (Teoh, Chong, Lin, & Chua, 2013) found that user perceptions of convenience have a significant positive effect on the intention to use online banking services for Malaysia. Based on previous studies, we develop the following hypothesis:

H4: Ease of use affect positively to intention to borrow through P2P lending

Perceived Cost

The types of fees that will be charged to users in the form of fixed costs such as fees that will be charged

when installing software from mobile payment; and transaction costs which will be charged by the user every time they make a business transaction on mobile payment (Chou et al., 2004) as quoted in (Teoh, Chong, Lin, & Chua, 2013). Some studies state that the fees that will be charged by users will be taken into consideration for adopting or even using a mobile payment service. Based on previous studies, we develop the following hypothesis:

H5: Perceived cost affect negatively to intention to borrow through P2P lending

Methods

Data and Survey Instrument

This research will be conducted by collecting data to be obtained from questionnaire survey activities. The research uses survey data which consists of 32 statements on research variables consisting of trust to platform, perceived risk, utilitarian value, ease of use, perceived cost, and intention to borrow. Some questionnaire questions will be submitted to respondents using a 5-scale Likert scale which is from 1 which means strongly disagree to 5 which means strongly agree.

The population size (N) of respondents in this study is unknown. So this study will collect data from large research samples using the Lemeshow Formula. Using the formula above, the minimum number of samples obtained is that in this study 164 respondents who met the specifications made loans using the peer to peer lending platform.

Table 1: Survey Questionnaire

Items		Questions
Variables	Notation	
Trust to platform	TR1	I believe my personal data will not be submitted to other parties
	TR2	I believe the potential for fraudulent transactions is low.
	TR3	I believe the peer to peer lending platform will use my information wisely.
	TR4	I believe the peer to peer platform that has been registered with the OJK is safe from the possibility of fraud.
	TR5	I believe my important information such as credit history, KTP, KK, salary slips and others are not disseminated.
	TR6	I believe the peer to peer lending platform provides accurate loan information.
Percieved Risk	PR1	I can accept the loan interest rate
	PR2	Old loan period
	PR3	Low interest loans
	PR4	There is no guarantee that the loan funds that I submit will be fulfilled.
	PR5	The operational system works well.
	PR6	There were no charges that I did not know that were not informed beforehand.
	PR7	The risk of tapping personal data is low
Utilitarian Value	UV1	easy to get a loan source
	UV2	No guarantee required
	UV3	Submission of a loan does not go through a long process.
	UV4	Loan funds can be obtained in a short time.
	UV5	Does not require a complicated process
	UV6	The peer to peer lending platform makes me comfortable in making loans
Ease of Use	EU1	The peer to peer lending platform is easy to understand.
	EU2	The peer to peer lending platform is easy to use.
	EU3	Information on the loan approval process can be accessed at any time.
	EU4	The loan application procedure is very simple.
	EU5	Easy loan withdrawal.
	EU6	Easily check installment on loans that have been paid.
Percieved Cost	PC1	Low late fees
	PC2	Low administration costs
	PC3	Low interest fees charged
Intention to Borrow	IB1	I am interested in making loans through peer to peer lending
	IB2	I plan to make a loan on the peer to peer lending platform in the near future
	IB3	I will continue to use the peer to peer lending platform to borrow
	IB4	I consider all loan transactions I will use the peer to peer lending platform

Result and Discussion

Validity and Reliability Test Results
Validity and reliability test result provided in table 2 below.

Table 2: Validity and Reliability Test for Variables

Variables	Items	KMO	Conclusion	Cronbach's Alpha	Conclusion
Trust	6	0,886	Valid	0,898	Reliable
Perceived Risk	7	0.812	Valid	0.800	Reliable
Utilitarian Value	6	0.872	Valid	0.875	Reliable
Ease of Use	6	0.876	Valid	0.902	Reliable
Perceived Cost	3	0.746	Valid	0.921	Reliable
Intention to Borrow	4	0.783	Valid	0.866	Reliable

The results obtained as presented in Table 2 indicate that the KMO value is greater than 0.5 for each variables. Thus, we conclude that questionnaire used to measure variables of trusts, perceived risks, utilitarian values, ease of use, perceived costs, and intention to borrow are valid measurements. Then, reliability analysis of all variables show that the Cronbach's Alpha results exceed 0.5 for each. Thus we conclude that each variables are reliable or would have consistently high results if periodic measurements are made.

Goodness of Fit
It is necessary to test the classic assumption of ordinary least square (OLS) regression, consists of autocorrelation, heteroscedasticity, and multicollinearity tests. Table 3 shows the result of statistical and goodness of fit test for the regression model. We conclude that the model is able to use for analysis.

Table 3: Statistical test and goodness of fit

Type of test	
Multicollinearity	
Trust	VIF = 1.979
Perceived risk	VIF = 2.646
Utilitarian Value	VIF = 2.730
Ease of Use	VIF = 2.953
Percieved Cost	VIF = 1.892
Autocorrelation	DW = 2.004
Heteroscedasticity	Graph plot
Goodness of fit	
F-test	F-value = 25,910, sig = 0,000
R-squared	0.423
adj R-squared	0.406

Regression Results

From the five independent variables used in this regression, it can be seen that the ease of use variable is not significant, this can be seen from the probability of the significance obtained, which is 0.607, where the value is greater than 0.05 while other variables have significant positive values at 0.05. Thus, the values of 0.247, 0.283, 0.332, and 0.151 of the Trust variable, Perceived Risk, Utilitarian Value, Perceived Cost indicate that the greater the value of the significant variable it will increase the intention

to borrow using the peer to peer database peer lending for borrowers. In an effort to increase intention to borrow, these variables must be able to be improved by the peer to peer lending company platform.

Table 4: Regression Result

Model	Unstandardized Coefficients		t	Sig.	conclusion
	B	Std. Error			
(Constant)	-0.015	0.344	-0.044	0.965	
Trust	0.247	0.092	2.694	0.008	Accept H1
Perceived Risk	0.283	0.117	2.425	0.016	Accept H2
Utilitarian Value	0.332	0.123	2.708	0.007	Accept H3
Ease of Use	-0.073	0.141	-0.051	0.607	Do not reject H4
Perceived cost	0.151	0.070	2.156	0.032	Accept H5

Based on the table above, the results for the regression analysis of the five independent variables statistically significant at the 0.05 significance level. Thus obtained a hypothesis which explains that there are two hypotheses accepted namely H1 and H3. Where the other three hypotheses that are rejected are H2, H4, H5.

Based on research conducted by Zhou T. (2014) it is revealed that users will get a positive utility that will lead to the use of mobile payments in the future if they have trust; and Phonthanukitithaworn, Sellitto, & Fong (2016) also prove that trust is a factor that can affect the user's intention to adopt a mobile payment service. Both of these studies indicate that trusts have a significantly positive relationship with the intention to adopt. This significant relationship explains that when trusts from users who act as borrowers change, then intention to borrow through peer to peer LEDs will also change. The positive relationship of the results of this study explains that when the level of trust (trust) of the borrower on the peer to peer lending platform increases, the intention to borrow them will also increase. This very minimal trust can potentially influence basic things so that there can be a rejection in giving personal information and various other important information to the peer to peer lending service providers. Where with trust, users feel that risk can be minimized and can influence individuals to use a service (Phonthanukitithaworn, Sellitto, & Fong, 2016).

Perceived risk variables in this study show results in the opposite direction to the research conducted by Wu, Liu, & Huang (2017) wherein the study explained that the risk has a negative relationship with intention to receive WeChat payment. However, the regression results produced in this study show that perceived risk has a relationship with a positive direction towards intention to borrow through peer to peer lending. Borrowers who do not meet the criteria or due to incomplete requirements to do loans through the formal financial sector, can try alternative loans through peer to peer lending, which is able to offer benefits such as having a relatively simple registration process and risk not being a barrier for users to have the intention to be involved in making a loan.

The data shows that Utilitarian value has a significant relationship to intention to borrow through peer to peer lending. This is consistent with previous research conducted by Ozturk, Bilgihan, Salehi-Esfahani, & Hua (2017) where the findings related to the user's intention to use NFC-Mobile Payment are influenced by Utilitarian values that have a significant positive value As stated by Chiu (2014) the intention to do online shopping as a positive effect of perceived utilitarian value which will lead to repeat purchase transactions. The use of a peer to peer lending platform can provide benefits for its users because it will lead to a fast transaction loan settlement process.

Furthermore, the ease of use variable shows that there is no significant influence on intention to borrow through peer to peer lending. Based on research conducted by Phonthanukitithaworn, Sellitto, & Fong (2016). It is mentioned that there are reasons underlying the findings of the study, namely stating that payment using a mobile payment is not considered an easy-to-use payment method compared to other

payment methods in the form of cash or credit payments. The connection with this study is that users of the peer to peer lending platform assume that loan transactions carried out are not considered as a device that provides added value in terms of providing ease of use based on other types of loan transactions. So that it cannot be proven that there is a significant positive effect on intention to borrow through peer to peer lending.

The variable Perceived cost in this study shows that there is a significant positive relationship to intention to borrow through peer to peer lending. Perceived cost in peer to peer loan transactions is considered not to reduce the intention of the user in obtaining a loan. As explained by Phonthanukitithaworn, Sellitto, & Fong (2016) the involvement of the perceived cost of intention to use mobile payment is not a problem for service users in Thailand. According to Phonthanukitithaworn, Sellitto, & Fong (2016) this can be related to the demographic profile of the respondents used in the study. The job classification of respondents is dominated by private employees as much as 50.82%. This shows that the fees charged are not a barrier to their intention to make loans. Where in general, those who work as private employees have relatively more stable income every month. So that this makes users who borrow through peer to peer lending do not pay too much attention to the fees charged due to sufficient financial resources for the income received.

Building trust between non-users, prospective users, or even service users becomes a matter of concern to improve the experience of users. Greater insecurity will arise for individuals who do not have experience in using peer to peer lending services where the process of lending and borrowing transactions takes place online. This can include an entity in the process such as from financial institutions, as well as various parties that have a focus on security issues. In addition, financial institutions and peer to peer service providers need to take the role of initiative in developing and using policies on user privacy in the practice of their business performance (business code of ethics). This can be useful to strengthen the message as well as a step in introducing a modern and safe service from peer to peer lending. So that the impact will affect the increase of trust among peer to peer lending users in Indonesia.

Implications in developing peer to peer lending need to pay attention to the utilitarian aspects of the perceived value of the user. Where when a user feels a utilitarian value in using peer to peer lending as a platform for seeking funding, it will form a more practical achievement orientation perceived by the user. Based on perceived value as well as consideration of faster service and efficiency formation when using the peer to peer platform, it makes users interested and have the intention to use it. Users can take advantage of the use of peer to peer lending to obtain funding with minimal effort and a fast process.

Conclusion

This study explains the determination of the factors that influence intention to borrow through peer to peer lending so that the conclusion is that there are two factors that can affect the user's intention to use this loan service, namely trust and utilitarian value. Where Trust and utilitarian value have a significant positive effect on intention to borrow, it can be explained that the user's intention in terms of making loans through peer to peer lending has a relationship that is in harmony with perceived trust and utilitarian value. Perceived risk and perceived cost show a positive significant relationship to the intention of peer to peer lending users. This condition illustrates that users have a high tendency to make loans by utilizing peer to peer lending, even though there is a consequence of a high enough risk and the existence of a fee charged when making a loan transaction. Ease of use in this study shows a relationship that is not significant to the intention to borrow. Users of the peer to peer lending platform assume that this online loan service does not provide added value in terms of providing ease of use compared to other loan transactions.

Abstract

In this study, we analyze factors influencing the intention to invest in mutual funds in e-commerce or online marketplace. We built a model based on the trust transfer theory to examine whether perceived similarity with other digital products – such as mobile payment product- affects investor's trust. This assists in investigating the investor's intention in mutual funds through an online marketplace using financial literacy as a mediating variable. Using Likert' scale to collect data and regression model for the analysis, we collect the sample of 195 Indonesian respondents, familiar with purchasing in the online marketplace. We found that similarity with other digital products and the inventors' trust in conventional mutual fund systems influence trust in e-commerce mutual fund and investor's intention in mutual fund through an online marketplace. However, we found that financial literacy is weak in these relationships.

Keywords: Fintech, e-investing, Trust Transfer Theory, Financial Literacy, Intention to Invest

1 Introduction

A rise in smartphones users in Indonesia recently boosts an online transaction in various markets, including financial technology market or fintech. In 2018, the Indonesian population was 265 million and people under 35 adopt technology than other age groups. Being ranked sixth in the world in term of internet usage, Indonesia is a big country for fintech market.

Fintech is a combination of financial services and technology, moderating a conventional business model and facilitate long-distance transactions within a short time. Currently, peer to peer financing leads in fintech market in Indonesia. However, the Financial Services Authority (OJK) data showed that fintech financing experienced a significant increase in bad loans ratio, from 0.99% in December 2017 to 1.28% in January 2019. The high risk of investing in fintech financing makes fintech mutual funds worth consideration for portfolio diversification.

Mutual funds recorded a good performance in 2018. Referring to OJK data, the net assets of the mutual fund industry rose from Rp 457.5 trillion at the end of 2017 to 9.2% to Rp 499.5 trillion in November 2018. Based on the OJK data, the number of mutual fund investors, on November 16, 2018, was over 930,000, up 50.15% higher than that of 619,380 in December 2017. However, mutual fund investors in Indonesia are still low when compared with the total population.

Initially, public access to mutual funds product is limited. In mutual funds, investors must visit investment companies or banks that have mutual fund investment products. In 2000, the minimum purchase and sale of mutual fund investments ranged from Rp. 25 M to Rp. 50 million (about USD 1.700-3.500), which was out of reach of middle-to-low income groups. With technological advancements, the mutual fund products are offered in online marketplace platforms and the minimum purchase and sale of mutual fund units reduce to approximately Rp 100,000-Rp 250,000 (USD 5-15) through online transaction. In 2018, DailySocial report showed that the popular investment platforms in mutual funds were BukaReksa (49%) owned by Bukalapak, Tokopedia Reksa Dana (44%), and followed by Bareksa (26%).

This study aims to analyze the factors influencing the intention of investors to invest in mutual funds. We follow the trust transfer theory previously conducted by Cao, et al. (2018) and Zhou, et al. (2018).

The rest of the paper is structured as follows: Section 2 presents the literature review focusing on mutual fund, e-commerce, and trust transfer theory, which is followed by hypothesis development. In Section 3, we describe the methods to generate and analyse the data. In Section 4, we provide results and discussion, and Section 5 concludes the paper.

2 Literature Review and Hypothesis Development

E-Commerce has a unique feature as compared with the traditional brick-and-mortar, namely technology-based strategic decisions, direct responses that increase competitiveness, 24-hour operating time, and users to control interaction through technology intermediaries (Rayport et al, 2001). E-commerce has three aspects that can influence the banking and financial sector, namely banks and financial companies can use technology and e-commerce to market their products, provide new products and services, and offer potential innovation in banking and financial institutions (Heng, 2001). The development of internet technology in finance facilitates online transactions (Sun et al., 2014). Online finance consists of third-party financial payments, peer-to-peer lending, crowdfunding, online financial portal/e-commerce finance, innovative online financial products, and other financial services (Xia & Hou, 2016).

2.1 Mutual Funds

Mutual funds are the alternative investment tailored for investors who do not have time and expertise to calculate the investment risks (Rustendi, 2017). Each mutual fund has different investment objectives, such as appreciation of asset value, more stable income, and income from money markets (Reilly & Brown, 2011). In essence, the mutual fund distribution channels are through salespeople (intermediary brokers, banks, and commission-based planners) and direct purchases from investment companies (Reilly & Brown, 2011). Investors are charged a fee to compensate the brokers, whereas the direct purchase is free or offers lower costs. Purchase of mutual funds can also be carried out directly through e-mail, telephone, or at investment company offices. Rajalakshmi (2018) stated that cooperation between e-commerce and the investment industry such as Alibaba facilitates mutual funds growth. Amazon has developed a business by attracting minority ownership to the bankbazaar.com company that provides financial products in India.

2.2 E-commerce

According to Rofiq and Mula (2010), e-commerce is the activity of buying and selling goods or services through the internet. In recent years, e-commerce has undergone a significant change, marked by an increase in the number of users and internet usage, increase sales profits owing to a rise in online transactions (Li et al, 2012). E-commerce is four types: First, business-to-business, which is that purchasing and procurement activities, inventory management, channel management, sales activities, management of payments that arise between two organizations. Second, business-to-consumer refers to transactions carried out between business and customers. Third, consumer-to-consumer is a type of e-commerce whose transactions occur between customers, with no third party involvement. Fourth, consumer-to-business refers to a business model in which customers provide products or services used by organizations (Rayport et al., 2001).

2.3 Trust

Trust is the willingness of someone to take risks for other parties because of the expectation that the parties will take certain actions if the trust is unfulfilled, regardless of the ability of the party to monitor and control the actions of trusted parties (Mayer, Davis, & Schoorman, 1995). Trust is an important variable in maintaining long-term relationships between business entities and their customers (Berry and Parasuraman, 2004) in (Zhou et al., 2018). Trust can increase efficiency in decision making through simplification of acquisition and interpretation of information (McEvily, Perrone, & Zaheer, 2003).

2.4 Trust Transfer Theory

Transfer theory is a cognitive process where a trustor (individual, group, or organization) transfers or shifts its trust to another entity (Stewart, 2003). The process of transferring trust is applicable in e-commerce, and the process involves three parties: trustor, trustee, and third parties (Chen, et al. 2015). Trustor is a party that assesses whether another party can be trusted; a trustee is a party valued by the trustor based on its past trust history, and a third party acts as an intermediary. The underlying logic is that when the trustor trusts a third party, the close relationship between the trustee, the third party, and the trustor's trust will be transferred to the trustee. Thus, third parties are the sources of transfer of trust and trustees as the targets of trust transfer (Wang et al., 2013). Based on

previous studies, perceived similarity and trust in cross-channel are two representative factors to determine the relationship between sources and targets (Cao et al., 2018).

2.4.1 Perceived Similarity

The perceived similarity (Cao et al., 2018) is defined as the degree of similarity between mobile and pc-based online payments observed from several dimensions, such as functions and operations. The anonymous nature of online identity causes users to face difficulty in assessing the quality of information and motives of the information providers listed for online reviews. As a result, users may look for similar social characteristics for evaluation (Racherla, Mandviwalla, & Connolly, 2012). In this study, the perceived similarity is the level of similarity perceived by users between the mutual fund investment products using a conventional system and e-commerce purchases. Perceived similarity can help users to identify goods or services personally, to reduce interpersonal barriers, increase comfort, and ultimately contribute to the trust formation (Coulter & Coulter, 2002).

Thus, variables perceived similarity is used to evaluate whether there are similarities between digital e-commerce product transactions and the purchase of mutual fund investment products online. When users have confidence in digital product transactions and perceive that mutual fund investment is similar, trust can be transferred to the mutual fund via e-commerce. However, people tend to believe in mobile payment because of their trust in online payments (Cao et al., 2018). A previous study on e-services and e-finance found that perceived similarity had a positive influence on the trust of e-retailing systems (Walczuch, Lundgren, & Management, 2004). We develop the following hypothesis:

H1: Perceived similarity has a positive influence on trust in e-commerce's mutual fund product

2.4.2 Trust in Direct Mutual Fund

Trust in investment companies has not received much attention in academic literature (Kostovetsky, 2015). Trust has a strong impact on investors and facilitates online trading. Ming-Chi (2009) in Abroud et al. (2013) states that trust affects investor behavior. In e-finance, trust is important because online applications and the nature of financial services carry some uncertainties and risks (Zhou et al., 2018). E-finance is defined as the provision of financial services and markets using electronic and computing communication (Allen, McAndrews, & Strahan, 2002). Thus, mutual funds marketed through e-commerce are categorized as e-finance (Zhou et al., 2018).

The trust in direct mutual fund variable is the willingness of investors to invest in mutual funds using conventional systems such as interacting directly with investment managers. Delgado-Baleester & Hernandez-Espallardo (2008) in Cao et al. (2018) states that trust initially formed through regular use of the previous system; then, this is used to evaluate the same services. We develop the following hypothesis:

H2: Trust in a direct mutual fund has a positive influence on trust in e-commerce's mutual fund.

2.4.3 Trust in e-commerce

According to Cao et al. (2018), trust in e-commerce is the willingness of users to conduct transactions through an e-commerce portal and expect the portal to fulfill its obligations, regardless of the user's ability to monitor and control e-commerce actions. Although e-commerce has emerged over the last 10 years, the characteristics of uncertainty in the online environment make many users reluctant to perform online transactions, especially by customers who are used to the conventional method. However, trust can mitigate this problem (Racherla et al., 2012). Trust performs an important role in the online system, given that start-up brands are relatively unfamiliar with many customers (Reynolds, 2000). Previous studies (Gefen, 2002; Lie et al, 2006; Lim et al., 2006; Fang et al., 2014) in Zhou et al. (2018) states that trust becomes a significant variable for online purchases, both the initial and subsequent purchases. In the context of e-finance, trust facilitates safe transactions between parties and prevent financial losses to users.

However, investors face risks and uncertainties using e-commerce for investment. To overcome this problem, e-commerce serves as an investment portal that builds trust to reduce investment risks, to facilitate long-term relationships, and to increase the willingness of investors to invest. Trust will use these features continuously rather than moving to other parties (Cao et al., 2018). We develop the following hypothesis:

H3: Trust in mutual fund product has a positive influence on the propensity to invest in a mutual fund through e-commerce

2.5 Financial Literacy

Financial literacy is the ability to use knowledge and expertise in managing financial resources for financial well-being or long-term financial security (Hsiao & Tsai, 2017). A study conducted by Van Rooij, Lusardi, & Alessie (2011) states that financial literacy influences financial decision. Contrarily, people with low financial literacy will be more dependent on family and friends as the main source of financial advice. Besides, this category of

people will desist from investing in the capital market. According to Lusardi (2019), universal concepts for making financial decisions are (1) numeracy skills related to interest rate calculations and compound interest, (2) understanding inflation, (3) understanding risk diversification. Lusardi & Mitchell (2014) offered four principles to measure financial literacy. First, simplicity, which involves exploring basic knowledge to make decisions. Second, the relevant relationship with financial decisions. Third, conciseness, where the number of questions must be concise and widely adopted. Fourth, the capacity to distinguish and the level of financial knowledge of each person.

Overall, financial literacy influences long-term financial decisions of individuals and organizations (Lusardi, 2019). Financial literacy can help investors reduce the costs of collection and processing of financial information. This information cost will influence the intention of investors to invest when compared to the benefits obtained from investing in risky financial products (Hsiao & Tsai, 2017). Regression results from Mouna & Anis (2017) study revealed that the financial literacy and economic education variables have a strong influence on investor behavior in making a financial decision. Conversely, low financial literacy makes investors reluctant to invest in the capital market. We develop the following hypothesis:

H4: Financial literacy moderates the relationship between trust in e-commerce's mutual fund product and intention to invest in the mutual fund using e-commerce platform

3 Methods

3.1 Research Framework

We divide the model into two parts: The first model consists of two exogenous variables with perceived similarity and trust in a direct mutual fund towards an endogenous variable trust in e-commerce's mutual fund. The second model is the trust in e-commerce mutual fund product, which is an exogenous variable towards the endogenous variable intention to invest in the mutual fund using e-commerce and moderated by financial literacy variables. Using SPSS version 22, we used the multivariate regression and path analysis to test the feasibility of the model. This method can capture the influence of each exogenous variable on endogenous variables and test whether the trust in e-commerce's mutual fund mediates the relationship of two exogenous variables. This shows the perceived similarity and trust in a direct mutual fund towards endogenous variables intention to invest in the mutual fund.

Figure 1. Research Framework

3.2 Data

In this study, we use the Google form to collect data and distribute the form through social media and e-mail. The criterion is that respondents must understand the investment features in e-commerce. Valid data collected from respondents were 195. A mutual fund offered through e-commerce is still relatively new in Indonesia. Therefore, the researchers selected respondents who were aware of mutual fund investments at Bukalapak and Tokopedia. This assists the researchers to capture the interest of investment through e-commerce, given that the average users of Bukalapak and Tokopedia in the first quarter of 2019 were 115.25 million visitors per month and 137.2 million visitors per month according to iPrice research in CNBC Indonesia news.

3.3. Questionnaire Instrument

We refer to Cao et al., (2018), Zhou et al., (2018), and (Mouna & Anis, 2017) to develop the questionnaire variables with a little adjustment to adapt Indonesian context. The designed questionnaire consisted of one variable

on perceived similarity, one variable on trust in a direct mutual fund, one variable on trust in e-commerce mutual fund product, one variable in financial literacy, and one variable on the intention to invest in the mutual fund in e-commerce. Each indicator except the indicator of the financial literacy variable has an interval data type, measured by a 6-interval Likert scale, namely 1 (Strongly Disagree), 2 (Disagree), 3 (Somewhat Disagree), 4 (Somewhat Agree), 5 (Agree), and 6 (Strongly Agree). Financial literacy variables use multiple choices that have true or false values, categorized as dichotomous data types.

4 Results and Discussion

4.1 Validity, Reliability and Statistical Test Results

The measurement model uses test reliability and validity. Reliability test was measured through Cronbach's Alpha coefficient with a value of ≥ 0.6, and the validity test was measured through Kaiser-Meyer-Olkin coefficient, factor loading (component matrix), and anti-image correlation matrix. Each with a criterion of ≥ 0.5 (Malhotra et al., 2010).

Table 1. Validity and Reliability Test

Construct	Item	Cronabach's Alpha	*Kaiser-Meyer-Olkin measures*	*Factor Loading*	*Anti-image Matrix*
Perceived Similarity	PS1	0,758	0,706	0,785	0,800
	PS2			0,882	0,653
	PS3			0,816	0,673
	PS4			0,558	0,807
Trust in Direct Mutual Fund	TDM1	0,818	0,706	0,884	0,668
	TDM2			0,860	0,701
	TDM3			0,827	0,763
Trust in E-commerce's Mutual Fund Product	TOM1	0,851	0,750	0,665	0,891
	TOM2			0,906	0,702
	TOM3			0,865	0,721
	TOM4			0,871	0,812
Intention to Invest Mutual Fund in E-commerce	INT1	0,865	0,795	0,908	0,728
	INT2			0,841	0,830
	INT3			0,769	0,896
	INT4			0,856	0,781

To determine that the model in the study has a correct estimator or Best Linear Unbiased Estimator (BLUE), we use to test the classic assumption of ordinary least square regression, consist of normality, autocorrelation, heteroscedasticity, and multicollinearity tests. Our test shows that both models are pass the BLUE test. Then we assess goodness of fit of models using F-test and adjusted r-squared.

The F test results show that the regression model, both model 1 and model 2, have a significant value of 0,000. This value is lower than 0.05, interpreted that the regression model is suitable and feasible for this study. Adjusted R^2 in model 1 is 0.449. This shows that exogenous variables perceived similarity and trust in direct mutual funds can explain the endogenous variable trust in e-commerce's mutual fund product by 44.9%, whereas the remaining 55.1% are influenced by other variables outside the research model. In model 2, its adjusted value of R^2 is 0.267 since the financial literacy variable acts as a moderator variable. This can be interpreted that the endogenous trust in e-commerce's mutual fund product variable influences the endogenous variable intention to invest in the mutual fund in e-commerce. This is moderated by the financial literacy variable of 26.7%, whereas the remaining 73.3% is the influence of other variables not included in the research model.

4.2. Regression Results

The following table summary the result of regression.

Table 2. Results of Regression

			Coefficient in regression					
			IV → DV	IV → M	IV + M → DV			
IV	M	DV			IV	M	Mediating	Moderating
PS	TOM	INT	0.257***	0.610***	0,266***	0,336***	Partial	
TDM	TOM	INT	0.022	0.112*	0.093	0.475***	Full	
FL		INT	-0.141*					Weakens
TOM		INT	0.608***					

Notes : PS (Perceived similarity), TDM (Trust in direct mutual fund), TOM (Trust in e-commerce's mutual fund product), FL (Financial literacy), INT (Intention to invest mutual fund in e-commerce). The mediating effects are tested by using Baron & Kenny (1986) regression method.

Model 1 which has a mediating relationship between TOM variables (trust in e-commerce's mutual fund product) and between exogenous variable PS (perceived similarity) and TDM (trust in a direct mutual fund) variables towards endogenous variable INT (intention to invest the mutual fund in e-commerce). This indicates that in the exogenous variable, PS has a significant value of 0,000, below 0.05 (5% confidence level). Therefore, H_1 is accepted, which means that PS has a positive influence on TOM with a 95% confidence level. While the TDM variable has a significant value of 0.022, which is above 0.10. Therefore, H_2 is accepted, which means that the TDM variable has a positive effect on TOM with a 90% confidence level. Positive influence is remarked from the positive beta coefficients of each variable.

Model 2: This is where the FL variable (financial literacy) acts as a variable that moderates the relationship between TOM variables (trust in e-commerce's mutual fund product) and INT variables (intention to invest the mutual fund in e-commerce). The regression results show that the TOM exogenous variable has a significance value of 0,000, below 0.05. Thus, H_3 is accepted, revealing that TOM has a positive influence on INT with a 95% confidence level. Since the influential FL variable, as a moderator variable, has a significance value of 0.090, H_4 is accepted, which means that FL has a moderating effect that weakens the relationship between TOM variables and INT with a 90% confidence level. The effect of moderation that weakens or strengthens the relationship is revealed if the beta value is negative. Thus, the effect is to weaken the relationship between exogenous variables and endogenous variables, and vice versa.

Figure 2. Results of Model Regression

4.3 Discussions

This research aims to find the empirical evidence behind the intention of investors to invest in mutual funds using the e-commerce platform and trust transfer theory for the analysis. We found several interesting findings. First, similarity perceptions have an influence on trust in mutual fund products in e-commerce, the result is consistent with Cao et al., (2018), Stewart and Zhang (2003), (Stewart, 2003) and (Wang et al., 2013). Second, trust in conventional mutual fund systems has an influence on trust in e-commerce mutual fund., the result is consistent with Cao et al., (2018), Lu et al., (2011), and Yang et al., (2008). Third, trust in e-commerce mutual fund influences an intention to invest in mutual funds, the result is consistent with Cao et al. (2018), Lu et al., (2011), Wang et al., (2013), and (Yang et al., 2008).

We also found that financial literacy has a moderating effect to weakens the relationship between trust in mutual fund products with the intention to invest in e-commerce mutual funds. This result supported Van Rooij et al., (2011) research, stating that many families with limited knowledge of stocks will avoid the capital market. Thus, they choose distribution channels that offer financial consulting services (Müller and Weber, 2010). Therefore, it is concluded that someone with higher financial literacy will participate in the capital market because this helps to minimize the cost of investment (Hsiao et al., 2018).

E-commerce companies are more flexible in presenting mutual fund investment features on their platforms owing to the regulation of Circular Letter of OJK No. 7 of 2014 concerning Receipt of Mutual Fund Securities Holders through Electronic Account Opening and Procedures for Electronic Subscription and Redemption of Investment Fund Securities. The implication of this research is that e-commerce players must be careful when choosing partner investment companies because the investor confidence in mutual funds is determined by the trust of conventional mutual fund systems. It is important for e-commerce players to work with reputable investment companies that have credibility and transparency, thereby increasing trust in e-commerce.

To regulators, we recommended regulating this market. The high number of e-commerce users in Indonesia has enhanced 78% growth in e-commerce trade value in 2019 based on the Ministry of Communication and Information. This is a great opportunity for investment companies to work with e-commerce and reach potential investors with low financial literacy. Many mutual fund products offered by e-commerce in Indonesia, namely Tokopedia and Bukalapak, only revolve around money market mutual funds. They provide digital features easier for people to invest with less risk. The implication of this study is that investment companies need to select e-commerce that has a large number of users and present a system familiar to potential investors. Thus, the perception of similarity plays an important role in the propensity of investors to invest in mutual funds via e-commerce.

5 Conclusion

In this research, we found that the trust transfer theory explains how an investor would behave regarding investment in an online mutual fund platform. Two aspects of trust transfer theory and trust in the original product (here conventional mutual fund product) are perceived similar. Similarity perception has a positive relationship to trust in an online mutual fund product, which effects investors intention to invest. We also found that financial literacy has a mediating effect on the relationship between trust in online mutual fund and intention to invest negatively, showing that an investor with low financial literacy is more likely to invest in an online mutual fund as compared with an investor with high financial literacy.

However, the literature on fintech investment is limited, especially on mutual funds offered through e-commerce since these features have recently been launched, namely Tokopedia in 2018 and Bukalapak in 2017. Thus, many respondents are unaware of these features. In addition, many respondents possess low financial literacy in the Indonesians capital market. Thus, they were unable to answer questionnaires with certainty, indicate that the financial literacy measure should be adjusted. Future research should be conducted to examine the comparability of other investment products, such as Gold, in e-commerce.

Acknowledgment

This research was conducted with the support of Universitas Indonesia through the PITMA-B Program 2019.
We thank all contributing parties who assisted in the completion of this research.

Abstract

Intrinsic motivation to learn is a significant role for millennial on their accomplishment, proficiency and academic learning. Through intrinsic motivation to learn, it is involving an inherent gratification prompted by feeling that learning is interesting and enjoyable among millennial in educational sector. However, there are only a few studies that focus on millennial intrinsic motivation that can be found. Thus, this study aims to determine the relationship between harmonious passion, obsessive passion and self-efficacy towards intrinsic motivation to learn among millennial. Data collection was based on questionnaire. The sample size included 215 students from six faculties in Universiti Teknologi MARA (UiTM) Puncak Alam. All questions were designed to be close ended for easy analysis of the feedback and Likert scale was used to ascertain the level of agreement and disagreement. The replies have been analysed for reliability analysis, correlation analysis and regression analysis using IBM SPSS Version 23. The outcomes of this study indicated that harmonious passion, obsessive passion and self-efficacy show positive relationship with intrinsic motivation to learn among millennial.
