Resumen

Esta investigación analizó la influencia del tipo de contrato en los factores que determinan la Calidad de Vida Laboral (CVL) percibida por los empleados del sector financiero en Barranquilla - Colombia. 249 empleados fueron encuestados para evaluar su percepción sobre las condiciones físicas, salariales, subjetivas y vocacionales del trabajo. A partir de la validación del instrumento y el análisis factorial exploratorio por componentes principales y rotación VARIMAX, se obtuvo una estructura de 76 elementos en 11 factores. El análisis discriminante mostró que los factores individuales, del ambiente de trabajo, del trabajo en sí y del entorno socio laboral, determinan la CVL en el sector. Se obtuvo un alto CVL cuando el salario, el contrato y el entorno físico del trabajo generan satisfacción, seguridad y comodidad, respectivamente. Dependiendo del tipo de contrato, la estabilidad y el salario se perciben de manera diferente.

Palabras clave: Calidad de Vida Laboral, contrato laboral, estabilidad laboral, análisis discriminante, satisfacción laboral.

Abstract

This research analyzed the influence of the type of employment contract on the factors that determine Quality of Work Life (QWL) perceived by employees of the financial sector in Barranquilla - Colombia. 249 employees were surveyed to evaluate their perceptions about physical, salary, subjective and vocational conditions of the work. From the validation of the instrument and the exploratory factor analysis by principal components and VARIMAX rotation, a structure of 76 staggered items in 11 factors was obtained. The discriminant analysis shown that individual factors, work environment, work itself and socio-labor environment, determine QWL in the sector. The group of employees studied perceived a high QWL when salary, contract and work's physical environment, generate satisfaction, safety and comfort, respectively. Depending on the type of employment contract, stability and salary are perceived differently.

Keywords*:* Quality of Work Life, Employment Contract, Employment Stability, Discriminant Analysis, Satisfaction.

Introducción

La Calidad de Vida Laboral (CVL) es un término acuñado en la década de los setenta para exigir la mejora de las condiciones que ofrecían los centros de trabajo en Estados Unidos y Europa (Silva, 2006). Este concepto está asociado con la percepción del empleado sobre indicadores individuales, del ambiente de trabajo, de la organización y del entorno socio laboral (Patlán Pérez & J., 2016). Por lo tanto, la CVL es un constructo multidimensional y multifactorial y además, varía en sus dimensiones y factores de acuerdo con el contexto (Kandasamy & Ancheri, 2009). La CVL se refiere a la evaluación que hace cada empleado de su trabajo, del entorno laboral, y del nivel de satisfacción que tiene al respecto (Taher, 2013). Como consecuencia, la variedad de enfoques, cuestionarios y metodologías para determinar la CVL como índice, variable o constructo, es amplia y se ajusta según las necesidades del entorno en el cual se quiera estudiar (Bagtasos, 2011).

Particularmente, son reconocidos dos enfoques para referirse al movimiento de CVL, uno orientado al trabajador y el otro, orientado a la organización (Segurado Torres & Agulló Tomás, 2002). En el primero se busca la humanización del entorno de trabajo abogando por el bienestar y la salud de los trabajadores. En este enfoque toman especial importancia los aspectos psicosociales del trabajo, ya que previniendo los factores de riesgo psicosocial y promocionando la salud es posible aumentar el bienestar y desarrollo integral del trabajador y progresivamente, generar satisfacción laboral en los individuos de la organización (Garrido-Pinzón, Uribe-Rodríguez, & Blanch, 2011; Martínez Gamarra & Ros Mar, 2010). El segundo enfoque tiene que ver con la productividad que logra la empresa al promover que los trabajadores se apropien de los objetivos institucionales y mantener altos sus niveles de satisfacción con las condiciones de trabajo. La CVL es importante de determinar cuando los empleadores o administradores están interesados en lograr que sus empleados se sientan más satisfechos y comprometidos con el trabajo (Argüelles Ma, Garcia, Fajardo, Medina, & Maldonado, 2013; Taher, 2013). En este sentido, estudiar y cuantificar la CVL permite idear políticas de gestión que logren dos objetivos esenciales: incrementar la productividad y mejorar la satisfacción de los empleados (Cruz Velazco, 2018). Se ha encontrado que aquellas empresas con niveles de CVL buenos tienen mayor posibilidad de atraer y mantener empleados cualificados, comprometidos y motivados (Mejbel & Almsafir, 2013).

Ambos enfoques circunscriben diversas variables subjetivas y objetivas para determinar los niveles de CVL experimentados por los empleados. Sin embargo, una variable que se ubica en la interface de ambos enfoques es el contrato laboral, pues a partir de este inicia y termina la relación empleado-organización. La mayoría de los estudios sobre CVL han promulgado la prominente necesidad de intervenir las condiciones salariales que las empresas disponen para sus empleados. Según Mostafizur Rahman (2014), el salario y otras remuneraciones son el primer y más importante requisito para cualquier trabajo, por lo tanto, dicha compensación debe ser apropiada y justa en relación con los requerimientos de desempeño laboral. Adicionalmente, Garrido-Pinzón et al. (2011), reportó que las condiciones laborales de la actualidad no ofrecen beneficios a sus trabajadores de la misma forma en la que las instituciones reciben beneficios de ellos y que, entre otras cosas, la realidad laboral está asociada a un marco de incertidumbre, inestabilidad e injusticia. Lo anterior es similar a las conclusiones de Jairo Guillermo Isaza (2005) en cuanto a que los empresarios colombianos recurren a tres estrategias para enfrentar los costos laborales: (i) aumento de la contratación temporal para sustituir empleados con contrato a término indefinido; (ii) eliminación de beneficios económicos no contemplados en la ley y (iii) estímulos a la productividad laboral.

Garrido-Pinzón et al. (2011), encontraron que anteriormente la sociedad del empleo estaba constituida por la duración de la relación contractual de tipo indefinido, la jornada tiempo completo, la subordinación del empleado, la remuneración fija y sus prestaciones sociales totales; reconfigurándose a otra caracterizada por condiciones precarias para los trabajadores, ingreso masivo de jóvenes y mujeres, flexibilidad laboral y abolición de tipos de contratación estable, originando inestabilidad contractual y baja remuneración.

En este sentido, el trabajador colombiano se enfrenta a un fenómeno de flexibilización laboral en el que priman el trabajo individualizado y sectorizado, la subcontratación y el trabajo temporal, nuevas

normas en el horario laboral, entre otros aspectos (Uribe-Rodríguez, Garrido-Pinzón, & Rodríguez, 2011). Es común en las organizaciones colombianas, mantener un grupo de trabajadores permanentes y un grupo de trabajadores contingentes, como estrategia de contratación (Vesga Rodríguez, 2011). Estos comportamientos organizacionales tienen efectos negativos en la percepción de los empleados sobre los aspectos psicosociales del trabajo, y como resultado afectan la gestión organizacional. El trabajo tiene la posibilidad de ser percibido como positivo o negativo para los empleados a partir de las experiencias que viven en su entorno laboral, entre las que se encuentran las condiciones contractuales y laborales (Vesga Rodríguez, 2011).

Para efectos del presente estudio, es importante definir los tipos de contratación existente en Colombia. La modalidad de contratación según su duración puede ser de tres clases: por obra o labor contratada, a término fijo o a término indefinido. El contrato por obra se pacta de acuerdo con la duración de la labor contratada. El contrato a término fijo debe celebrarse por escrito y su duración no puede ser superior a tres (3) años, aunque son renovables indefinidamente, sin que exista la obligación de convertirlos a término indefinido. Por último, el contrato a término indefinido se produce cuando las partes no especifican una fecha de caducidad en la relación laboral (Legis, 2013). El empleador se obliga a pagar un sueldo, prestaciones sociales legales y hacer los respectivos aportes al Sistema General de Seguridad Social.

Al apuntar a un sistema que brinde calidad de servicio, el talento humano de la organización juega un rol fundamental al crear las estrategias que lograrán crear esa ventaja competitiva a través de una relación personalizada con el cliente por parte de las sociedades financieras, sobre todo en corporaciones bancarias (Brenner & Östberg, 1995), implicando que los directivos propicien condiciones laborales en los que la motivación, personalidad y habilidades de los empleados satisfagan las necesidades de los clientes a favor de los objetivos organizacionales (Argüelles Ma et al., 2013).
Mostafizur Rahman (2014) determinó que factores como la seguridad laboral, claridad del rol de trabajo, comprensión de los supervisores, estrés laboral, acceso a información relevante e instalaciones sociales y de bienestar son adecuados para medir la CVL de trabajadores vinculados a bancos privados y públicos en Bangladesh. También se deben considerar aspectos intrínsecos y extrínsecos de los empleados (Argüelles Ma et al., 2013; Casas, Repullo, Lorenzo, & Cañas, 2002). En virtud de dichos factores, el sector financiero resulta ser llamativo pues el nivel de CVL queda determinado por factores ambientales, sociales, psicológicos y vocacionales del trabajo.

Estos antecedentes ponen en evidencia la necesidad de verificar si existe diferencia en los factores que determinan la CVL según el tipo de contratación en el sector financiero en Barranquilla - Colombia, lo que permitirá comprender un poco más el fenómeno estudiado, establecer mecanismos de planificación y organización del talento humano en el sector y generar propuestas que propendan a optimizar dichas condiciones en las organizaciones.

Metodología

Hipótesis

De acuerdo con los objetivos que persigue esta investigación, se pretende responder a la siguiente pregunta: ¿Existe alguna diferencia entre los factores que determinan la CVL de los trabajadores del sector financiero según su tipo de contratación?

Las hipótesis formuladas para tal fin son:

> **H1:** No existe diferencia significativa en los factores que determinan la CVL entre los trabajadores contratados a término indefinido u otro tipo de contratación (término fijo, por prestación de servicios, ocasional/transitorio o sin contrato).
> **H2:** Existe diferencia significativa en los factores que determinan la CVL entre los trabajadores contratados a término indefinido u otro tipo de contratación (término fijo, por prestación de servicios, ocasional/transitorio o sin contrato).

Se planteó la pregunta y las hipótesis de investigación a partir de los hallazgos de la revisión de literatura, pues no se encontró mayor evidencia teórica o empírica sobre las variaciones que se pueden presentar en los factores determinantes de la CVL de acuerdo con el tipo de contratación. De forma general, se tuvo en cuenta la metodología propuesta por autores como (Jorde Bloom, 1996; Taher, 2013), permitiendo evidenciar diferencias significativas entre grupos categóricos con respecto a la CVL.

Participantes

La Tabla 1 presenta las características demográficas de los participantes. Un total de 249 encuestas se realizaron a empleados vinculados a empresas del sector financiero de la ciudad de Barranquilla - Colombia. Se utilizó un muestreo accidental para la aplicación del cuestionario y se contó con el consentimiento informado de los participantes. La distribución de trabajadores con respecto al sexo fue de 61.4% mujeres y 38.6% hombres. La mayoría de estos trabajadores llevan un tiempo promedio de permanencia en la organización de más de 10 años (28.1%), contratados a término indefinido (73.1%) y en empresas grandes (88.8%).

Tabla 1: Análisis Descriptivo

Variable	*Categoría*	*Frecuencia*	*Porcentaje*
Género	Masculino	96	38,6
	Femenino	153	61,4
Tiempo de servicio	Menos de 1 año	51	20,5
	1-3 años	52	20,9
	3-5 años	29	11,6
	5-10 años	47	18,9
	Más de 10 años	70	28,1
Tipo de contratación	Término Indefinido	182	73,1
	Otro tipo	67	26,9
Tamaño de la empresa	Pyme	6	2,4
	Mediana	22	8,8
	Grande	221	88,8

Instrumento

Se aplicó el instrumento de Condiciones de Trabajo y Calidad de Vida diseñado el cual fue diseñado y validado por Martínez-Buelvas, Oviedo-Trespalacios, & Luna-Amaya (2015), excluyendo la sub-dimensión "Carga Física" dado que no se considera pertinente en el contexto de las empresas del sector financiero.

El cuestionario aplicado tiene cinco secciones, a saber: (i) datos demográficos del encuestado; (ii) Condiciones de Trabajo; (iii) Condiciones Salariales; (iv) Desarrollo Vocacional; y (v) Condiciones Subjetivas. Dentro de cada una de estas secciones se presentaron preguntas agrupadas en categorías, las cuales fueron contestadas por el trabajador a partir de una escala de Likert de 10 niveles. La escala evalúa el grado de acuerdo o desacuerdo que tiene el trabajador, siendo 1 muy en desacuerdo y 10 muy de acuerdo.

Variables De Estudio

El Cuestionario de Condiciones de Trabajo y Calidad de Vida Laboral utilizado en esta investigación permite obtener la percepción de los trabajadores frente a 136 preguntas relacionadas con las condiciones de trabajo y la calidad de vida laboral. Estas preguntas fueron agrupadas en las siguientes categorías:

- Condiciones de Trabajo, la cual permite conocer la percepción del trabajador con respecto a las condiciones ambientales del trabajo, lo que puede sentir y ver, así como las medidas de seguridad y los aspectos psicosociales del trabajo. Esta categoría contiene 38 ítems escalonados en 7 factores: ambiente térmico, ruido, iluminación, carga mental, aspectos psicosociales, seguridad en el trabajo y riesgos laborales.
- Condiciones Salariales. Esta permite centrar la atención en la valoración que hace el empleado frente a la remuneración, estabilidad, y dedicación contractual. Para este estudio, las condiciones salariales son el elemento transversal y contiene 20 ítems distribuidos en 3 factores: salario, estabilidad laboral y horarios.
- Desarrollo vocacional, entendido como las oportunidades que tiene el empleado para aprender y crecer en la organización. Esta categoría determina la percepción del trabajador frente a 14 ítems relacionados con 3 factores: habilidad mental, promoción y carrera, formación e investigación.
- Condiciones subjetivas, las cuales apuntan a aspectos que relacionan al trabajador con la estructura de relaciones interpersonales en la organización. También, toma cuenta de su vida privada y familiar, y su satisfacción con el trabajo. Esta categoría consiste en 64 ítems escalonados en 9 factores: esfera privada y mundo laboral, individuo y actividad laboral, plano organizativo, plano jerárquico, plano técnico, plano social, apoyo y colaboración, función directiva, satisfacción laboral.

Análisis de los datos

Para esta investigación, se llevó a cabo un análisis de fiabilidad para validar la consistencia interna de los datos obtenidos. El análisis tomó como criterio el valor del alfa de Cronbach, que se basa en la correlación entre elementos promedio. Luego, dada la extensión del instrumento aplicado, fue necesario realizar un análisis factorial por componentes principales y rotación VARIMAX. La reducción factorial se llevó a cabo considerando todas las variables, utilizando el criterio del auto valor mayor a uno para la extracción de factores, ya que esto permite asegurar que cada factor considerado aporta varianza significativa a la estructura factorial final (Hair, 2010). Además, se tuvo en cuenta eliminar factores que tuvieran dos variables o menos y aquellas variables con baja carga factorial (menor que 0.5). Las variables latentes resultantes para cada grupo fueron nombradas a criterio de los investigadores a la luz de los ítems contenidos en cada una.

Posteriormente, se llevó a cabo un análisis discriminante para establecer la pertenencia del grupo a dos niveles de CVL (alta o baja). Este análisis determina la pertinencia de cada uno de los factores para

definir el constructo CVL en el sector, mediante el método "Introducir factores por cada paso" considerando el estadístico F de Fisher para la entrada y salida de factores de la función de pertenencia. Finalmente, se hizo el contraste de hipótesis de investigación tomando en cuenta la prueba de hipótesis de diferencia de medias muestrales con el estadístico de t-student. Los análisis mencionados se realizaron con el Paquete Estadístico para Ciencias Sociales (SPSS), versión 24.0 para Windows.

Resultados

Análisis de Fiabilidad

Como resultado del análisis de fiabilidad se encontró que el coeficiente alfa de Cronbach toma un valor de 0,78. Este resultado indica que es buena la consistencia interna de los ítems considerados.

La medida de Kaiser-Meyer-Olkin (KMO) se conoce como un buen criterio para evaluar la adecuación de la muestra (Taher, 2013). En la presente investigación se observó un valor de KMO de 0.931, por lo cual la adecuación de la muestra se considera excelente de acuerdo con el valor admisible (0.60). Además, el test de esfericidad de Bartlett tuvo como resultado un valor de Chi-cuadrado de 15570.021 a un nivel de significancia inferior a 0.05, por lo que la data se considera estadísticamente significativa y adecuada.

Análisis Factorial

El análisis factorial reconoce 72 ítems (de los 136 iniciales) escalonados en 11 factores. De acuerdo con Taher (2013), la pertinencia del análisis factorial depende del tamaño de la muestra, por lo cual, a medida que las comunalidades son mayores a 0,5, son admisibles tamaños de muestra pequeños (inferiores a 300). En la presente investigación se utilizó un tamaño de muestra de 249 y las comunalidades de las variables del análisis factorial son superiores a 0,5 como se muestra en la tercera columna de las Tablas 2 a la 12.

El porcentaje acumulado de varianza explicada es un indicador de monitoreo del sesgo común del método, para el presente análisis, puede no ser un problema debido a que el porcentaje de varianza acumulada fue de 73.512%.

A cada factor que resultó le fue asignado un nombre de acuerdo con los ítems que agrupaba. A continuación, se presentan los factores y su respectiva interpretación:

- F1 - Relación con el jefe: Este factor se compone de 12 preguntas relacionadas con las condiciones subjetivas del entorno laboral. Se observa que el factor se refiere al acompañamiento y retroalimentación permanente hacia el empleado, comunicación clara y abierta al momento de impartir instrucciones y al apoyo irrestricto que el empleado percibe frente al desempeño de sus funciones. En la Tabla 2 se presentan los ítems con las cargas y comunalidades respectivas.
- F2 - Equipo de trabajo: El factor comprende 13 preguntas orientadas a la percepción del empleado sobre el equipo de trabajo; el apoyo y la cooperación en la realización de las tareas, la interacción permanente con los compañeros, la generación de confianza, la participación en la toma de decisiones grupales y el reconocimiento de las habilidades del equipo (ver Tabla 3).
- F3 – Salario: El factor tiene 6 preguntas que hacen alusión a la percepción del empleado sobre el equilibrio que existe entre el salario recibido y el cargo, las funciones, el perfil y el esfuerzo ejecutado. Su suficiencia, pertinencia y competitividad con lo que se paga en el mercado laboral (ver Tabla 4).
- F4 - Estabilidad laboral: El factor contiene 4 preguntas y se refieren a la percepción del empleado sobre la seguridad de su permanencia en la empresa y la tranquilidad y satisfacción que ello le otorga (ver Tabla 5).
- F5 - Salud y seguridad: El factor registra 4 preguntas e indican la percepción del empleado sobre la existencia, aplicación y atención de las normas de higiene y seguridad laboral.

Existencia de instalaciones confortables, seguras e higiénicas, herramientas de trabajo adecuadas y programas de promoción y prevención de salud y seguridad en el trabajo (ver Tabla 6).

- F6 - Equilibrio trabajo y familia: El factor incluye 4 preguntas que señalan la percepción del empleado de que los roles desempeñados en el trabajo no afectan la relación con su familia y del apoyo recibido por parte de esta para el ejercicio de su cargo (ver Tabla 7).
- F7 - Horario: El factor posee 3 preguntas que contemplan la percepción del empleado sobre la pertinencia, razonabilidad y eficacia del horario de trabajo (ver Tabla 8).
- F8 – Ruido: El factor tiene 3 preguntas y establece la percepción del empleado sobre la existencia de fuentes de ruido en su puesto de trabajo y el impacto que generan en su comodidad, bienestar físico-psicosocial y la productividad (ver Tabla 9).
- F9 - Riesgo personal: El factor consta de 3 preguntas que hacen referencia a la percepción del empleado sobre el riesgo físico, ergonómico, psicosocial y demás a los cuales puede enfrentarse en su trabajo (ver Tabla 10).
- Factor 10 - Motivación: El factor está compuesto de 4 preguntas que hacen referencia a la percepción del empleado sobre la motivación con la que lleva a cabo su trabajo, el orgullo, la felicidad y el reconocimiento por hacer lo que le corresponde (ver Tabla 11).
- Factor 11 - Ambiente térmico: El factor se compone de 3 preguntas que hacen referencia a la percepción del empleado sobre las condiciones térmicas de su puesto y entorno de trabajo, así como la interacción con ellas (ver Tabla 12).

Tabla 2: Factor 1 - Relación con el jefe

Pregunta	Carga	Comunalidad
Mi jefe me motiva para hacer mejor mi trabajo.	0,816	0,812
Soy escuchado por mi jefe en un eventual problema laboral.	0,784	0,833
Mi jefe me permite ser proactivo.	0,763	0,807
Tengo comunicación abierta con mi jefe inmediato.	0,756	0,833
Mi jefe tiene en cuenta las sugerencias e ideas innovadoras que tengo sobre el desarrollo de mi trabajo.	0,748	0,782
Siento apoyo y solidaridad por parte de mi jefe.	0,74	0,776
Mi jefe comparte con el equipo los logros de su gestión.	0,737	0,747
Mi jefe me da retroalimentación de las actividades realizadas.	0,736	0,735
Mi jefe inmediato es competente en su trabajo.	0,694	0,685
Conozco claramente la planificación de gestión de mi jefe.	0,637	0,688
La supervisión e instrucciones diarias de mi jefe inmediato me permiten realizar mejor mis actividades.	0,597	0,531
Cuando hago un buen trabajo, recibo el reconocimiento respectivo.	0,58	0,619

Tabla 3: Factor 2 - Relación con los compañeros

Pregunta	Carga	Comunalidad
Existe colaboración entre los miembros del equipo.	0,783	0,838
Siento apoyo y confianza por parte de los compañeros de trabajo	0,767	0,822
Consulto las diferentes opiniones del grupo de trabajo para tomar decisiones.	0,741	0,635
En la organización somos capaces de resolver los problemas en equipos de trabajo.	0,723	0,822
Establezco el compañerismo, la cooperación y la solidaridad con mis compañeros.	0,705	0,723
Reconozco los logros que alcanzan mis compañeros dentro de la empresa.	0,685	0,743
Participo en la toma de decisiones del grupo de trabajo.	0,677	0,687
Me expreso bien de mis compañeros de trabajo.	0,675	0,771
Disfruto de mis compañeros de trabajo.	0,624	0,647

Estoy dispuesto a escuchar y colaborar con cualquier miembro del equipo cuando lo requiera.	0,574	0,721
Existe apoyo de las otras dependencias para la consecución de los objetivos de la organización.	0,56	0,58
Conozco a quién acudir para la solución de conflictos.	0,529	0,635
Siento que me desarrollo como persona en el trabajo.	0,503	0,751

Tabla 4: Factor 3 - Salario

Pregunta	Carga	Comunalidad
Siento que mi salario está acorde a mis responsabilidades laborales.	0,829	0,843
Siento que mi salario está ajustado a mi perfil profesional.	0,787	0,761
Considero que mi salario es suficiente para satisfacer mis necesidades básicas	0,758	0,723
Mi salario es competitivo en el sector.	0,745	0,803
Los incentivos económicos que recibo motivan mi desempeño laboral.	0,565	0,717
Me siento satisfecho con las posibilidades de incrementos salariales.	0,543	0,661

Tabla 5: Factor 4 - Estabilidad laboral

Pregunta	Carga	Comunalidad
Mi tipo de vinculación con la empresa me brinda estabilidad.	0,829	0,829
Siento estabilidad en el cargo que desempeño actualmente.	0,724	0,756
La estabilidad laboral es mi puesto de trabajo es motivo de satisfacción con mi empleo.	0,669	0,777
Recibo beneficios, incentivos o recompensas por el trabajo realizado.	0,553	0,68

Tabla 6: Factor 5 - Salud y seguridad

Pregunta	Carga	Comunalidad
En la empresa existe el reglamento de higiene y seguridad laboral y éste se aplica conforme a lo establecido por Ley.	0,78	0,724
La empresa cuenta con programas de promoción y prevención en temas referentes a seguridad e higiene laboral.	0,749	0,754
Constantemente presto atención a las normas de seguridad establecidas por la empresa.	0,739	0,757
Presto atención a las normas de seguridad y las aplico según lo establecido por la empresa.	0,667	0,73

Tabla 7: Factor 6 - Equilibrio trabajo y familia

Pregunta	Carga	Comunalidad
Tengo buenas relaciones con mi familia.	0,632	0,652
Genero confianza dentro de la organización por las funciones que realizo.	0,628	0,683
Conozco los resultados que debo lograr con mi trabajo.	0,521	0,714
Cuento con el apoyo de mi familia para ejercer mi cargo dentro de la organización.	0,519	0,578

Tabla 8: Factor 7 - Horario		
Pregunta	**Carga**	**Comunalidad**
Los turnos de trabajo programados están dentro de lo establecido por la Ley.	0,779	0,818
Los turnos de trabajo programados son los adecuados.	0,775	0,822
Durante mi horario de trabajo, puedo realizar todas las actividades asignadas sin ninguna presión.	0,589	0,526

Tabla 9: Factor 8 - Ruido		
Pregunta	**Carga**	**Comunalidad**
El ruido generado en el área de trabajo me obliga a mantener niveles de concentración por encima de lo que normalmente requiere el puesto.	0,899	0,855
El ruido generado en el área de trabajo me produce dolores de cabeza, estrés u otras molestias.	0,888	0,845
En mi puesto de trabajo, existen fuentes de ruido, continuas o variables, que me obligan a levantar la voz durante una conversación.	0,842	0,764

Tabla 10: Factor 9 - Riesgo personal		
Pregunta	**Carga**	**Comunalidad**
Mi trabajo es arriesgado.	0,896	0,838
Estoy expuesto a riesgos en el puesto de trabajo.	0,802	0,683
Mi trabajo es peligroso.	0,801	0,744

Tabla 11: Factor 10 - Motivación		
Pregunta	**Carga**	**Comunalidad**
Soy capaz de mantener durante todo el día el entusiasmo con el que inicié las labores.	0,668	0,755
Me siento orgulloso de mi trabajo.	0,544	0,756
Me siento feliz al realizar las actividades que me encomiendan.	0,534	0,776
Me siento cómodo y escuchado cuando expongo mis puntos de vista dentro de la empresa.	0,502	0,704

Tabla 12: Factor 11 - Ambiente térmico		
Pregunta	**Carga**	**Comunalidad**
La temperatura en el área de trabajo es agradable.	0,792	0,756
Los equipos de ventilación y acondicionamiento del aire en el puesto de trabajo son suficientes.	0,787	0,728
La vestimenta que utilizo es adecuada, con relación a la temperatura existente en el puesto de trabajo.	0,737	0,632

Análisis Discriminante

Posterior al análisis factorial, se calculó una variable CVL como la sumatoria de los factores para cada observación. Estos valores fueron agrupados visualmente estableciendo un punto de corte con percentiles iguales de casos explorados, con el fin de obtener una escala de dos niveles. Por lo tanto, para cada sujeto se obtiene un nivel empírico de CVL: alto o bajo, luego se aplicó el método de "Introducir factores por cada paso" para llevar a cabo el análisis discriminante, tomando como variable de clasificación la CVL agrupada y como variables independientes los resultados de los once factores que conforman la estructura factorial presentada anteriormente. Se utilizó el Método de Lambda de Wilks para la inclusión por pasos tomando como criterio el valor F para la entrada (3.84) y salida (2.71) de las variables independientes para la función discriminante.

A partir de un auto valor de 1.360 y una correlación canónica de 0.810 se dice que existe una sola función discriminante que permite de forma significativa (sig. 0,000) clasificar a los sujetos en los dos grupos: CVL alta o CVL baja. Esta función explica el 100% de la varianza de los datos estudiados y el valor lambda de Wilks asociado a la función discriminante es de 0.424 señalando que los factores son significativos y discriminantes (Chi cuadrado: 207.338. gl. 11).

Se presentan los porcentajes de clasificación del análisis discriminante. El 92.0% de los casos originales fueron agrupados correctamente. Además, mediante la validación cruzada se obtuvo un 91.2% de los casos agrupados correctamente. De acuerdo con estos resultados, la validez del análisis discriminante se considera significativa (Ver Tabla 13).

Tabla 13: Resultados de clasificación

			Pertenencia a grupos pronosticada		
		CVL	*Baja*	*Alta*	*Total*
Original	Recuento	Baja	107	17	124
		Alta	3	122	125
	%	Baja	86,3	13,7	100
		Alta	2,4	97,6	100

La función discriminante canónica para determinar el nivel de CVL de los empleados vinculados a empresas del sector financiero en Barranquilla, Colombia; es como sigue:

$$CVL=0{,}473F_1+0{,}279F_2+0{,}551F_3+0{,}635F_4+0{,}394F_5+0{,}253F_6+0{,}348F_7+0{,}511F_8+0{,}498F_9+0{,}489F_10+0{,}502F_11 \quad (1)$$

Dónde: Relación con el jefe (F_1), Equipo de trabajo (F_2), Salario (F_3), Estabilidad laboral (F_4), Salud y seguridad (F_5), Equilibrio trabajo y familia (F_6), Horario (F_7), Ruido (F_8), Riesgo personal (F_9), Motivación (F_10), y Ambiente térmico (F_11). Se evidencia que los factores estabilidad, salario, ruido y ambiente térmico presentan los coeficientes más altos, por lo tanto, los esfuerzos por mejorar la CVL deben atender los requerimientos que estos factores contienen: tipo de contratación, modelo de compensación, temperatura y fuentes de ruido en el puesto de trabajo.

Prueba de hipótesis de diferencias de medias para muestras independientes

De acuerdo con el enunciado de las hipótesis, se tiene que:

$$H_1: \mu_(i,k)=\mu_(i,(k+1)) \quad (2)$$
$$H_2: \mu_(i,k) \neq 〖\mu〗_(i,(k+1)) \quad (3)$$

Dónde: i=1, 2, 3,…, 11, es el indicador de los factores; y k=1 o 0; representa el tipo de contrato de cada empleado que se ha codificado como 1 (contrato indefinido), o 0 (otro tipo de contratación). Por tanto, para cada factor se valida la hipótesis de que la media que toma para el grupo de empleados contratados de manera indefinida es igual a la media que toma el mismo factor para el grupo de empleados contratado de otra forma (término fijo, prestación de servicios, ocasional/transitorio, sin contrato). La hipótesis alternativa comprueba lo contrario.

Se plantea entonces un procedimiento para la prueba de hipótesis de dos muestras independientes donde el estadístico de la prueba se calcula a partir de la distribución de t-student. La prueba t-student es robusta frente a comparaciones de las medias de muestras independientes cuando se cumplen los supuestos de normalidad y homocedasticidad. En el caso de esta investigación, el tamaño de la muestra permite considerar estos supuestos y proceder a analizar los resultados. Se estableció un nivel de significancia de 0.95 para validar la hipótesis nula de dos colas, por lo que el área de rechazo es de 0.25.

Los resultados del contraste F de Snedecor de la prueba de Levene comprueba la hipótesis de la homogeneidad de la varianza considerando la diferencia de medias para cada factor. Además, los resultados de la prueba de t-student para la comparación de medias señala la significancia bilateral para la prueba de hipótesis de que las medias muestrales son diferentes, bien sea con varianza homogénea (prueba de Levene) o varianza no homogénea.

Las Tablas 14 y 15 presentan los hallazgos para el caso de estudio, en donde se puede concluir que no hay asociación entre los factores: Relación con el jefe, Equipo de trabajo, Salud y seguridad, Equilibrio trabajo y familia, Horario, Ruido, Riesgos personales, Motivación y Ambiente térmico con el tipo de contratación, dado que la media de cada uno de estos factores para los empleados contratados a término fijo u otro tipo de contratación no son estadísticamente diferentes a un nivel de significación de 0.05. Adicionalmente, sí existe diferencia significativa entre los factores: Estabilidad laboral y Salario con respecto al tipo de contratación, debido a que las medias de cada uno de estos factores para los empleados contratados a término fijo u otro tipo de contratación son estadísticamente diferentes a un nivel de significación de 0.05, Por lo tanto, se asume que los factores que determinan la CVL de los empleados del sector financiero y muestran diferencias significativas según el tipo de contratación son las condiciones salariales y la estabilidad laboral.

Tabla 14: Resultado de la prueba de muestras independientes

		Prueba de Levene de calidad de varianzas		**prueba t para la igualdad de medias**		
Factor	**Supuesto**	*F*	*Sig.*	*t*	*gl*	*Sig.(bilateral)*
Salario	Se asumen varianzas iguales	0,055	0,814	2,438	247	0,015
	No se asumen varianzas iguales			2,454	119,218	0,016

	D.S.	1,944	1,938	

Discusión

Esta investigación analizó la influencia del tipo de contratación en los factores que determinan la Calidad de Vida Laboral (CVL) percibida por los trabajadores de las empresas del sector financiero en Barranquilla, Colombia. Para ello se aplicó un cuestionario a 249 empleados, se analizó la confiabilidad del instrumento, se llevó a cabo un escalamiento factorial, se determinó una función de pertenencia para discriminar los empleados con CVL alta percibida y CVL baja percibida; y se estableció una prueba de hipótesis para muestras independientes según el nivel de CVL y su relación con los factores.

En las primeras fases de la metodología se encontró que el cuestionario de Condiciones de trabajo y Calidad de Vida (Martínez-Buelvas et al., 2015) es adecuado para ser aplicado en el sector financiero. El escalamiento factorial condujo a definir la CVL en el sector como un constructo multidimensional y multifactorial (Patlán Pérez & J., 2016). Los factores que determinaron el constructo fueron 11 y tienen relación con los aspectos individuales, aspectos del ambiente de trabajo, aspectos del contenido del trabajo, aspectos organizacionales y aspectos socio laborales (Patlán Pérez & J., 2016).

Del análisis discriminante es pertinente mencionar otro hallazgo relacionado con los coeficientes de la función de pertenencia. La estabilidad laboral, el salario, el ruido y el ambiente térmico son los factores que influyen con mayor fuerza en la percepción del nivel de CVL para los empleados del sector. En este sentido, se evidencian dos grandes categorías empíricas para aproximarse al concepto de CVL en el sector financiero: los factores contractuales y los factores ambientales (Chiang Vega & Martínez, 2009; Martínez-Buelvas, Oviedo-Trespalacios, & Luna-Amaya, 2019; Uribe-Rodríguez et al., 2011). No obstante, a partir de la prueba de hipótesis, se encontró que sólo la estabilidad laboral y los salarios tienen puntuaciones promedio diferentes de acuerdo al tipo de contratación de los individuos encuestados.

La estabilidad laboral es un factor importante en aquellas personas contratadas a término indefinido por cuanto el mismo contrato determina, en aquellos que lo poseen, la plena certeza de su vinculación formal a la empresa. Lo anterior atado a resultados, cumplimiento de metas, competencias demostradas y actitudes favorables frente al trabajo. Al identificar la estabilidad laboral como un elemento fundamental de la CVL, el tipo de contratación es un controlador de la percepción que tiene el empleado sobre su nivel de CVL, pues este puede ir en beneficio o detrimento y determina en gran medida las condiciones de trabajo y el trabajo en sí del empleado. La investigación de Uribe-Rodríguez et al. (2011) ratifica estas interpretaciones, pues a mayor estabilidad en el contrato (indefinido), existen mejores condiciones laborales, ambiente social de trabajo y menos efectos colaterales producto de su actividad laboral, para los empleados. En virtud de esto, Herrera-Amaya & Manrique-Abril (2008) comentan que hay mayor promedio de satisfacción en la población contratada a término indefinido que los contratados por tiempo definido. La percepción de estabilidad laboral cambia en los empleados con contratación diferente, sea a término fijo, labor u obra, prestación de servicios o aprendizaje; ya que los empleados están sujetos a un tiempo establecido en su cargo y no hay plena certeza de su permanencia o duración en la compañía.

El derecho a la estabilidad laboral es indispensable para los trabajadores y es uno de los derechos subjetivos públicos (Santos Azuela, 2012) sobre todo en el sector financiero que es determinante para la economía del país y donde los brotes de inestabilidad laboral son cada vez más severos. El sentimiento de inestabilidad y de incertidumbre incide en la percepción de la calidad de vida laboral (Cañón Buitrago

& Galeano Martinez, 2011), afectando al trabajador en su proyecto de vida de mediano y largo plazo, lo que incurre de manera directa en los planes y proyectos que desee emprender y en la misma economía.

El siguiente factor a analizar dados los resultados de la investigación es el salario. Aunque existen autores que consideran que el salario ya no es determinante, ni es el motivo de retención (Argüelles Ma et al., 2013), se observa que los empleados del sector financiero en Barranquilla dan un peso importante a este factor. Se encontró que la valoración que hacen los empleados sobre su salario cambia con los tipos de contratación. Los contratados de forma indefinida valoran el salario asignado por la compañía, porque pueden considerar que es mejor a no obtener ningún tipo de remuneración. Mientras tanto, los contratados a término indefinido no demostraron estar satisfechos con la asignación salarial. Aunque el énfasis en el primero está en la estabilidad, y en los segundos está en el salario recibido; investigaciones relacionadas con satisfacción laboral, demuestran lo contrario. Herrera-Amaya & Manrique-Abril (2008) encontraron que hay mayor satisfacción con el salario o remuneración en empleados contratados indefinidamente, que en otro tipo de contratos. Sin embargo, se consideran convincentes los resultados de la presente investigación debido a las condiciones salariales de los empleados del sector, pues la compensación está ligada al logro de metas personales y organizacionales. Si los empleados sienten que el salario no va a acorde con el esfuerzo que hacen por lograr superarse y hacer que la organización genere ganancias, se puede producir insatisfacción, absentismo, deseos de abandonar la empresa, bajo rendimiento, falta de dedicación, conflicto de intereses, entre otros (Granados, 2014).

Por último, se sugiere realizar investigaciones que apunten a identificar la calidad de vida laboral de acuerdo con diferentes variables demográficas (género, estado civil, años de permanencia en la empresa, nivel de formación de los empleados, entre otros), hacer estudios comparativos entre otras ciudades del Caribe, lo que fortalecería el nivel de conocimiento de dicho fenómeno y su comportamiento lo cual permitirá traducir los resultados de investigación en estrategias de mejoramiento. Además, determinar qué rangos salariales de acuerdo al tipo de contrato influyen positivamente la CVL con el fin de apalancar esta variable a través de un modelo de compensación.

Conclusiones Y Recomendaciones

Los resultados de la investigación sometidos a discusión ponen de manifiesto las principales características de la CVL en el sector financiero, a saber: es un constructo multidimensional y multifactorial que incluye las condiciones físicas, salariales, vocacionales y subjetivas del trabajo.

La estabilidad laboral, los salarios, el entorno térmico y el ruido son los factores que tienen un mayor impacto en el QWL. Los empleados del sector financiero en Barranquilla perciben un alto CVL cuando el salario y las condiciones contractuales generan satisfacción y estabilidad, y las condiciones físicas del ambiente de trabajo son cómodas. Prefieren un contrato de trabajo indefinido y un ambiente de trabajo con temperatura agradable, equipo de ventilación suficiente y código de vestimenta apropiado para el clima tropical de la ciudad de Barranquilla.

De acuerdo con su tipo de contrato de trabajo, los empleados perciben la estabilidad y el salario de manera diferente, aunque esto no necesariamente tiene un impacto negativo en la calidad de su vida laboral. Aun cuando no es posible establecer una correlación directa entre el nivel de CVL y el tipo de contrato, se evidenció que es posible cambiar los niveles de CVL interviniendo los aspectos contractuales como el salario y la estabilidad (duración). Por ejemplo, el tipo de contrato indefinido cambia la percepción de CVL de los empleados por cuanto sienten mayor estabilidad, aunque esto no genere satisfacción con el salario recibido. Mientras tanto, otros tipos de contratación (fijo, obra labor, prestación de servicios, etc.) influyen en que el trabajador se sienta satisfecho con su salario, pero inseguro con su continuidad en la empresa.

Adicionalmente, las siguientes son recomendaciones para las empresas del sector financiero en la ciudad de Barranquilla: (1) Es prioritario reconocer el papel de la gestión de la CVL, dado que es un proceso mediante el cual una organización responde a las necesidades de los empleados mediante el desarrollo de mecanismos que les permitan tomar decisiones en el diseño de sus vidas (Wageeh, 2016). Asimismo, si la CVL es baja habrá insatisfacción, reducción de la productividad, ausentismo, rotación, entre otros

aspectos negativos; mientras que, si la CVL es alta, habrá mayor productividad, sentido de pertenencia, motivación, retención del personal, etc., (Argüelles Ma et al., 2013); (2) Establecer políticas de remuneración e incentivos, claras, justas y equitativas de acuerdo con las responsabilidades, la complejidad, el perfil y las competencias de los trabajadores. Los salarios deben ser competitivos en el sector, tanto para los empleados contratados con contrato de trabajo indefinido, como para aquellos con otros tipos de contratos. Además, el confort térmico en el trabajo debe ser imperativo y estar relacionado con la seguridad laboral.

Abstract

The financial mechanism of higher educational institutions of Ukraine is an important component of state policy, therefore, a comprehensive analysis of its effectiveness in order to identify negative trends and determine the direction of overcoming them is of particular importance.
Given the importance of the problem that is being studied, the article proposes a new approach to the quantitative measurement and comprehensive assessment of the effectiveness of the financial mechanism of higher educational institutions in Ukraine to assess the situation in this area.
The monitoring of the effectiveness of the financial mechanism of higher education institutions in Ukraine was made, which allows assessing the rationality of the reforms being implemented in this area. The conducted analysis shows that the obtained values of the assessments under all characteristics are decreasing (only the effectiveness of educational services remains at the same level with minor fluctuations). The developed system of indicators for evaluating the efficiency of the financial mechanism of higher education institutions in Ukraine allows to create a mechanism that would provide a constant monitoring of the current situation in Ukraine and serve as a basis for a thorough analysis of changes, and would allow to develop appropriate sound measures to correct deformities in education financing.

Keywords: higher education institutions, financing, competitiveness.

Introduction

Having regard to the significance of the financial mechanism of higher education institutions in Ukraine as an important component of the state's policy, a comprehensive analysis of its effectiveness is of particular importance, as it will allow to identify and monitor the negative tendencies and determine the directions of overcoming them.
Taking into account the importance of the studied issue, the article offers a new approach to quantitative measurement and comprehensive assessment of the effectiveness of the financial mechanism of higher education institutions in Ukraine to assess the situation in this area.

The calculated estimates for the groups of characteristics are shown in Table 1.

Table 1: Assessment of the effectiveness of the financial mechanism of higher education institutions in Ukraine by the characteristics of the third level of the hierarchical model

Characteristic	Years						
	2012	2013	2014	2015	2016	2017	2018
Productivity							
Formation of educational potential	1,000	0,925	0,880	0,841	0,776	0,695	0,658
Rationality	1,000	0,948	0,865	0,867	0,703	0,482	0,387
Economy							
Cost of educational services	0,926	0,934	0,923	0,928	0,826	0,693	0,665
Development costs	0,787	0,802	0,756	0,797	0,771	0,876	0,909
Efficiency							
Educational services efficiency	0,898	0,889	0,984	0,997	0,906	0,964	0,929
Realization of educational potential	1,000	0,976	0,923	0,900	0,904	0,904	0,963

Source: compiled according to the authors' calculations

The productivity indices of the studied mechanism show a negative tendency over the last decade. From the point of view of its cost effectiveness, the following situation is observed: along with the rapid deterioration of the situation regarding the educational services cost, there is also a noticeable increase in development costs. It should be noted that development costs play a decisive role in creating favorable conditions for stimulating development and improving the quality of educational services over the medium and long term.

Efficiency characteristics that reflect the situation regarding the educational services efficiency and the realization of educational potential outline better perspectives. The first of these in 2018 shows a significant index increase compared to 2012, due to an increase in professional academic staff. Since 2016, the growth of the sub-index of educational potential efficiency has resumed as a result of the breaking of negative tendencies in this sphere and the emergence of the first signs of improvement.

The results of calculations of the second hierarchy level show a change in the effectiveness of the current financial mechanism during 2012–2018 in terms of its productivity, economy and efficiency (Fig. 2).

Fig. 2: Integral estimate of the effectiveness of the financial mechanism of higher education institutions of Ukraine in 2012–2018

Source: compiled according to the authors' calculations

In a research study by Kalenyuk (2017) in order to determine the influence of the formation and implementation factors of the financial mechanism of higher education institutions, the PEST analysis was performed. PEST analysis is used to evaluate the impact of various aspects on the study area, including political (P – political), economic (E – economic), social (S – social) and technological (T – technological) factors. This takes into account both the degree of factors' influence of and the probability of change in their effect.

Oharenko (2014) the PEST analysis procedure is conventionally divided into stages:

1. Determination of the list of influence factors.
2. Expert assessment of the degree of factors' influence (scale 1-3) and the probability of change in their effect (scale 1-5). Increasing of index under the scale in both cases means an increase in the impact and the probability of change, respectively.
3. Processing of expert assessments of the degree of influence of factors, including:

– calculation of the arithmetic mean value of the i-*th* factor weight (i = 1,…, n):

$$V_i = \frac{\sum_j^m e_j}{m},$$

where e_j is the estimate of the factor' influence on the *j-th* expert (j = 1,…,m);
normalization of the obtained estimates on the scale [0, 1]:

$$W_i = \frac{V_i}{\sum_i^n V_i}$$

4. Generalization of expert estimates of the probability of changes in the factors' effect, which involves the calculation of the arithmetic mean of the obtained expert estimates for each factor:
5.

$$X_i = \frac{\sum_j^m o_j}{m},$$

where o_j is the estimate of the probability of the factor' influence on the *j-th* expert (j = 1,…, m).

5. The calculation of the real values of the influence of factors as a weighted average:

$$X_i = \frac{\sum_j^m o_j}{m},$$

6. PEST-table construction.

Thus, the calculation of estimates is performed in two stages:

– on the first stage the degree of factors' influence in the form of relatively normalized weighing coefficients is determined;

– on the second stage, the estimation of the probability of changes in the factors' effect is weighted by the weighing coefficients obtained.

Lukianenko and Horodnichenko (2002) mentioned that the obtained overall estimates make it possible to compare factors by their level of importance for the formation and implementation of the financial mechanism of higher education institutions.

The results of the PEST analysis of the formation and implementation of the financial mechanism of higher education institutions of Ukraine are shown in Table 2.

Table 2: PEST-analysis of factors of formation and realization of financial mechanism of higher education institutions of Ukraine

Political		**Economic**	
The success of educational integration projects in Ukraine	0,1834	Favorable economic conditions	0,0705
Political stability in the country	0,0705	The level of economic integration of the state into world society	0,1481
Educational reform	0,1270	Stability of the financial system	0,0952
International mobility in higher education	0,1975	Investment attractiveness of the educational industry	0,0617
Competitiveness of the educational sphere	0,0564	Credit sector development	0,0441
Image on the world markets	0,0423	The level of public funding for the education sector	0,0564

Effectiveness of motivational mechanisms of realization of educational potential	0,0952		

Source: compiled according to the authors' calculations

According to the results of calculations made on the basis of expert assessments, the most influential among the political factors of formation and implementation of the financial mechanism of higher

education institutions are the international mobility in higher education (with a score of 0.1975), the success of educational integration projects in Ukraine (with a score of 0.1834) and education reform (with a score of 0.1270).

Among the economic factors, the most influential are the level of economic integration of the state into the world society (0.1481), the participation of employers in personnel training (0.1270), the financial system stability of the state (0.0952).

Among the social factors, the most important is the quality of educational services (0.1411) and the prestige of higher education (0.1146). In technological aspect, the issues of introduction of new educational technologies (0,1376), international cooperation in the field of innovations (0.0882) and the level of innovative development (0.0794) enter into the foreground.

Thus, the monitoring of the effectiveness of the financial mechanism of higher education institutions in Ukraine was made, which allows assessing the rationality of the reforms being implemented in this area. The conducted analysis shows that the obtained values of the assessments under all characteristics are decreasing (only the effectiveness of educational services remains at the same level with minor fluctuations). Thus, a comparison of tendencies that demonstrate the summarizing indices of the second level of the hierarchical scheme confirms the lack of stability of the existing financial mechanism functioning and positive changes in this area in the period from 2012 to 2018.

The developed system of indicators for evaluating the efficiency of the financial mechanism of higher education institutions in Ukraine allows to create a mechanism that would provide a constant monitoring of the current situation in Ukraine and serve as a basis for a thorough analysis of changes, and would allow to develop appropriate sound measures to correct deformities in education financing.

Abstract

Existing approaches to estimation the efficiency of investment projects of companies of energy industry are presented. On the basis of modern data, an analysis of the investment program of the energy enterprise "Lvivoblenergo" was researched with the help of qualitative analysis of project risks. The feasibility of implementing the project is substantiated by net present value and internal rate of return. The main directions of cooperation between Ukraine and the EU in the field of energy efficiency are considered. Using the method of fuzzy logic, the importance of separate economic indicators of the activity of energy companies in different regions of Ukraine was evaluated to achieve a high level of efficiency.

Keywords: Project Risk, Qualitative Analysis, Investment Project, Capital Investment, Discounted Cash Flows , Energy Efficiency, Energy Saving.

Introduction

Estimation the efficiency of energy companies is an extremely important task, first of all, given the need to provide the development of the energy sector as a component of national economics of Ukraine and the importance of the successful implementation of the Association Agreement between Ukraine and the EU, which contains provisions on the development of the energy sector, in particular energy efficiency and energy saving. We think that the providing the high level of efficiency of activity of energy enterprises is one of the directions of achievement of the set goals of economics of the country and its regions in the process of European integration. Our research is dedicated to realization of estimation of their functioning based on the use of information from open-sources industry different regions of Ukraine, and the interpretation of the most important economic indicators.

Existing views of representatives of the scientific sphere and business environment on the question defined above do not differ cardinally, especially with respect to basic positions. However, in most contemporary publications, the authors do not always pay close attention to the analysis and evaluation of investment projects that will be realized by the enterprises of the industry, which further results in the fuzzy adaptation to the real conditions of activity of the enterprises and hinders the process of adaptation of best practices that have proved their rationality in the countries-members of EU. The priority direction for providing of efficiency of activity of enterprises of industry is

realization of acceptable investment projects aimed at achieving high parameters of energy efficiency and energy saving.

Research Results

The important condition of increase of efficiency of activity of enterprises in the modern market economics is to decide on the feasibility of investing investment based on their justification using economic and mathematical models and applying modern methods of evaluating the effeciency of investment projects. Research on the topic of evaluating the efficiency of investment projects was initiated by foreign and Ukrainian scientists [1, p. 52].

The active Agreement "About an Association EU-Ukraine", which lays the legal basis for systemic reforms in various fields, includes Article 388 "Objectives and Directions of Ukraine-EU Cooperation in the Energy Sector", which provides for measures to promote energy efficiency and energy efficiency, development and support for renewable energy, approximation of national energy legislation to EU norms, scientific and technical cooperation and exchange of information with a view to improving technologies in the field of production, transportation and energy consumption [2]. It should be noted that separate positions of energy cooperation are related to other areas such as industrial policy, technical regulation, steady development, etc. The importance and priority of the achievement of the national economics of the above requirements is especially relevant in the context of European integration of our country and implementation of the relevant EU directives. At the regional level, the implementation of investment projects by energy companies is a top step in the direction of achieving these goals.

Development of investment projects is carried out under indefiniteness, which is primarily due to the incompleteness of the information on which the investment project is based. This problem is partially eliminated in the process of working on the project by obtaining additional information and making changes to the investment documentation. Accordingly, as long as the investment calculations are made in the conditions of indefiniteness, there is a likelihood of adverse situations that could lead to a decrease in project efficiency or to additional unforeseen costs.

Therefore, in order to make the right investment decision, it is necessary not only to determine the amount of expected profit, but also to assess the risk of investment decisions by identifying and quantifying project risk, the nature of its impact on the results of implementation of investment projects and the degree of coverage of expected profit anticipated risk. Project risk is associated with the risk that the results of the investment project will be unprofitable and that the investment objective will not be fully achieved [3]. Other scientists under a risk understand an economic category, which may or may not be based on the indefiniteness of a particular economic or other situation and which is caused by the lack of complete information [4, p. 278]. Therefore, the effectiveness of the implementation of investment projects is inextricably linked with the implementation of a comprehensive analysis and justification of management decisions, systematic assessment of the economic benefits and viability of the project, the application of the main ways of comparing the costs and benefits of the project, as well as determining the most optimal investment project on the basis of comparison of its alternatives.

The main task of evaluating the effectiveness of an investment project is to determine its value, which is determined by the difference between positive results and negative consequences. An important stage of economic work is to find out the costs of the project and to determine the results from different positions: the interests of the shareholders (owners); organizations involved in the implementation of the investment project; the external environment in which the project will be realized; economics in general. In calculating the main indicators of project effectiveness, a prerequisite for economic feasibility of its implementation is a positive present value, exceeding the internal rate of return over the project discount rate, and the benefit/cost ratio should be greater than one.

We will consider investment projects on the example of the most illustrative energy supply enterprise of the Western region of Ukraine "Lvivoblenergo", a company that supplies electricity to consumers in the Lviv region and transfers electricity to regional (local) power grids. We take into account that electricity is a special type of product whose properties are determined by physical characteristics, technical characteristics of supply to a certain group of consumers, as well as features related to changes of loading of electroconsumption during the day.

The activity of the researched enterprise was characterized by the following components:

1. Types of sales: sale of electricity to consumers; provision of electricity transit services to electricity suppliers at unregulated tariff; other services.
2. Organization of sales, which occurred in accordance with the geographical location of the corresponding subdivisions [5].

In 2018, Lvivoblenergo sold 3 903 368 thousand kWh to its own customers, electricity in the amount of 7 596 977 thousand UAH (including VAT). As of 01.01.2019, the number of consumers of PRJSC "Lvivoblenergo" was 964 496, including legal entities – 36 412, household consumers – 928 084. In 2018 in the general structure of sale the volume of electricity sold to legal entities (industrial and non-industrial consumers) was 55%, to household consumers – 45% [6].

The investment program of energy enterprise provides for:

- development of applications (mobile applications) for inputting meter readings;
- installation of burglar alarm systems on separate energy objects;
- increase of reliability and capacity of power grids;
- introduction of new transformer capacities to increase the reliability of electricity supply and ensure the annual growth of electricity consumption;
- replacement of technologically outdated meters;
- major overhaul of power grids;
- increasing the reliability of power supply within the program "Safety above all!" (removal of power lines from the territories of schools, kindergartens and hospitals).

The main directions of investment are as follows:

- construction, modernization and reconstruction of electrical networks and equipment - 181 632,49 thousand UAH (70,00% of the total volume);
- measures to reduce non-technical electricity costs – 38 919,30 thousand UAH (15,00%);
- introduction and development of automated systems of dispatching and technological control – 10 015,23 thousand UAH (3,86%);
- introduction and development of information technologies – 5 837,38 thousand UAH (2,25%);
- implementation and development of communication systems – 3 580,57 thousand UAH (1,38%);
- modernization and purchase of wheeled vehicles – 18 776,82 thousand UAH (7,24%).

The discounted cash flows method is used to estimate the effectiveness of cash projects. This method has become widespread in the West because it can take into account future development prospects. In general, cash flow is equal to the amount of net income and amortization minus the increase in net working capital and capital investments. The method is used in cases where it is expected that future levels of cash flow will differ materially from current ones and where the company is a large multifunctional commercial entity. The discounted cash flows method is the best, however, it is very labor-consuming.

The advantages of estimating a business by cash flows discounting are as follows. First, future business profits directly account only for the expected operating costs of production and sale of products, while future investments in maintaining and expanding the production or trading capacity of the business are only partially reflected in the profit forecast due to their current depreciation. Second, the lack of profit (loss) as an indicator in the investment calculations of a business valuation

is also explained by the fact that profit, being an accounting reporting indicator, is prone to considerable manipulation. The declared value depends on the chosen method of accounting for the cost of purchasing resources in the cost of goods sold from the method of accelerated depreciation, on the criterion for the inclusion of products in sales, etc. The obtained results are given in Table 1 and Table 2.

Table 1: capital investment for capital repairs

Cash flows	Initial investment	Years				
		2016	2017	2018	2019	2020
Free cash flows	200000000	199201470	130720850	151158440	17995688	25946200
Discounted cash flows	200000000	168814805	93881679,1	91999693	9281976	11341323

Table 2: integral indicators

Indicator	Indicator Value
Discount Rate (r)%	18
PayBack Period (t), years	1 year
Net Present Value (NPV), thousand UAH.	175319476
Internal Rate of Return (IRR), %	69%
Profitability Index (PI), fractions of units	1,876597381

If the value of the net present value of the NPV is > 0 for the individual project, then the project should be accepted or else rejected. If the internal rate of return of IRR exceeds the discount rate r, then the project is accepted. If the project profitability index is greater than one, then the project is effective and acceptable. Investment investments are considered appropriate if the auxiliary cash flow from the project implementation is sufficient to return the initial amount of capital investment and provide the required return on invested capital [7]. An important criterion for the adoption of this project within the region is the presence of a social component. The enterprise policy is aimed at ensuring the production processes by skilled employees, implementation of the investment project should not lead to job cuts. The analyzed investment project is a clear example of real conditions of functioning of the energy enterprise “Lvivoblenergo”. The calculations show that the project under consideration is appropriate for practical use, as evidenced by the values of the main indicators (NPV and IRR). The profit generated from the implementation of the investment project will be directed to the modernization and re-equipment of the enterprise, as well as to the preparation and implementation of innovations, without which energy efficiency and energy saving cannot be achieved.

For a more detailed consideration of the peculiarities of the functioning of the enterprises of the energy industry (in terms of achievement of efficiency of activity) we have selected ten regional institutions representing the western, eastern, southern and central regions of our country and used the method of fuzzy logic, taking into account the complexity of detection of cause and effect relationships uncertainty (in quality and time) of the results of activity [8].

The input variables are non-current assets (y_1), current assets (y_2), equity (y_3), average number of employees (y_4), output – activity (z), calculated as the arithmetic mean of the cumulative income (y_6), net income from sales of products and services (y_5), net profit (y_7), quantity of sales (y_8). The identified cause and effect relationships between the input and output variables reflect the “tree” of logical inferences (Fig. 1).

Fig. 1: Tree of logical conclusions

The results show that, in order to achieve a high level of performance, priority has a certain basic value of current assets, as opposed to non-current assets. Also, the number of employees to some extent is not as important for the achievement of efficiency as the size of fixed capital, preference is given to medium-high or high quantitative measurement.

Fig. 2: The dependence of the performance of energy companies on the number of employees and the volume of fixed capital

Fig. 3: The dependence of the performance of energy companies on the volume of current and current assets

The analytical results prove the importance of introducing European financial security practices and timely use of the various sources of financial resources available for: 1) updating of current assets that are in constant circulation and are intended for industrial use (sales or consumption), which allows to increase the agility of the enterprise in achieving the set goals; 2) replenishment of fixed capital, which is the long-term fixed assets of the company. Taking into account the identified trends will allow enterprises to successfully use financial resources to achieve their goals, including in the process of implementation of investment projects aimed at improving energy efficiency, energy-savings, providing of steady development.

Conclusions

The approximation of the activities of native energy companies to European standards implies the formation of an effective investment policy, substantiation of a comprehensive approach to the selection of priority and most acceptable investment projects, the formation of a capital budget, which aims not only to maximize profits and reduce investment risk, but also to achieve efficiency criteria and energy savings. The investment policy of energy companies should take into account and reflect the European practice of sector reform, the use of steady development approaches in the context of the further implementation of the provisions of the economic block of the EU-Ukraine Association Agreement.

Educación Financiera En MIPYMES: Percepciones Y Comportamientos De Empresarios De Una Localidad De Bogotá

Salomé del Pilar LÓPEZ-PEÑA

Corporación Universitaria Minuto de Dios, Bogotá, Colombia
splopezp@unal.edu.co

Resumen

Se realizó investigación mixta de tipo trasversal con el objetivo de identificar precepciones y comportamientos relacionados con la educación económica y financiera en MiPyMEs. La población participante se compuso por un grupo de 12 administradores de MiPyMEs de una localidad de Bogotá, los cuales respondieron una entrevista semi estructurada. La muestra de la población se seleccionó a conveniencia del investigador. Los resultados muestran que la mayoría de los administradores tienen la percepción de tener un bajo conocimiento de temas relacionados con la educación económica y financiera. La mayor fuente de financiación de las MiPyMEs son los bancos, seguido de los recursos familiares y propios. Buena parte de los participantes identifican a los bancos como única fuente externa de financiamiento (con diversos productos) a pesar de ser una opción costosa y de alto riego. La mayoría de los entrevistados consideran que realizan aportes al desarrollo económico y social de su localidad al pagar impuesto y generar empleo. Se concluye que, si bien algunos administradores dan cuenta de un buen manejo de los recursos dentro de la empresa, más de la mitad no ha recibido ningún tipo de educación económica o financiera y esto se refleja en las percepciones y comportamientos manifestados. Los resultados invitan a realizar más acciones en pro de la educación económica y financiera en las MiPyMEs para garantizar su permanencia en el mercado en el largo plazo.

Palabras clave: Educación financiera, educación económica, MiPyMEs, comportamientos financieros

Introducción

La educación económica y financiera, en adelante EEF, se considera un aspecto fundamental para el desarrollo económico de los países por estar relacionado con la bancarización y con la buena evaluación financiera de las personas y las empresas. Por su lado, las MiPyMEs, al ser la cara visible del emprendimiento, se han concebido como una excelsa posibilidad y se han incentivado de diversas maneras. De esta manera, la EEF juega un papel fundamental en el desarrollo y mantenimiento en el largo plazo de las MiPyMEs.

La EEF se identifica como uno de los pilares de desarrollo económico de los países, y se le da mayor importancia en los países en vía de desarrollo, por su incidencia sobre la pobreza. Así, se considera que "una política de EEF articulada y bien dirigida facilita la reducción de la pobreza y la desigualdad, permite una mayor efectividad en las acciones de inclusión financiera y de protección al consumidor financiero y contribuye al desarrollo de los sistemas financieros" (Comisión Intersectorial para la Educación Económica y Financiera, 2017), mientras que una baja inclusión financiera implica retrasos en el crecimiento y desarrollo económico, así como afectar los niveles de ahorro y crédito (Cano, et al., 2014).

En Colombia EEF es asumida como principio de protección, derecho del consumidor, práctica de protección, obligación especial de las entidades y como objetivo e instrumento de la intervención del Estado, lo cual advierte la importancia de una información calificada y con componente pedagógico para lograr efectos en el comportamiento de las personas, como base del equilibrio de las relaciones existentes entre los consumidores financieros y las entidades vigiladas y como herramienta para promover el crecimiento económico de los países, así como la estabilidad y la confianza en las

economías nacionales (Arrubla, 2016), teniendo así una amplia responsabilidad tanto con las personas y la sociedad como con las entidades públicas y privadas.

Contando con los avances realizados en relación a la EEF, "las mediciones en la materia evidencian que la población aún carece de los conocimientos y habilidades financieras mínimos requeridos para la toma de decisiones económicas y financieras responsables" (Comisión Intersectorial para la Educación Económica y Financiera, 2017). Por este motivo, existe un consenso sobre la importancia de centrar las acciones y esfuerzos en audiencias o poblaciones específicas, siendo una de estas los microempresarios, para los cuales se determinó como prioritaria la enseñanza en 1) administración de los recursos del hogar y la empresa, 2) el manejo responsable de los préstamos, 3) las condiciones y herramientas para acceder a productos financieros, y 4) la gestión del emprendimiento (Comisión Intersectorial para la Educación Económica y Financiera, 2017).

Un estudio realizado en el año 2015 muestra que "El 67% de las personas y el 55% de los microempresarios tienen al menos un producto financiero. En ambos segmentos, la tenencia de al menos un producto financiero es mayor en los niveles socioeconómicos más altos y en las ciudades" (Banca de las Oportunidades; Superintendencia Financiera de Colombia, 2015). Otro estudio realizado en el 2018 evidenció que la falta de EEF de los microempresarios, "genera la toma de decisiones con enfoque de corto plazo que carece del sustento necesario para minimizar los riesgos y generar valor" (Bravo Geney, 2018). Teniendo en cuenta estos aspectos, se realizó una investigación para estudiar el conocimiento que tienen los dueños o administradores de algunas MiPyMEs sobre temas financieros, dándole prioridad a la autopercepción de conocimiento y a los comportamientos de estas personas frente al sistema financiero.

Metodología

Se realizó un estudio mixto de corte transversal con el objetivo de identificar precepciones y comportamientos relacionados con la educación económica y financiera en MiPyMEs. La muestra seleccionada está compuesta por 12 administradores o empresarios de una localidad de Bogotá, seleccionados a conveniencia de la investigación. La participación de estos fue libre, voluntaria y anónima, procedimiento que se garantizó a través de la firma de un consentimiento informado.

Se aplicó una entrevista semiestructurada a cada uno de los participantes de manera presencial en un punto de venta o vía telefónica en el caso en el que no fuese posible encontrarlos en el punto de venta. Las entrevistas fueron realizadas a lo largo de un mes. Para el análisis de datos se utilizó herramientas de procesamiento de datos cuantitativos y cualitativos.

El análisis de la información recolectada contiene una caracterización de la muestra, tanto de personas como de empresas, una presentación de la autopercepción del conocimiento frente a temas relacionados con EEF, un análisis sobre el manejo de los recursos por parte de los empresarios y por último una sección de opinión sobre el aporte que cada una de estas empresas realiza al desarrollo económico y social. Cada una de los participantes tuvieron la libertad de responder o no las preguntas realizadas, por lo que no todos los análisis cuentan con la misma cantidad de datos.

Resultados

Caracterización de la muestra

Los participantes tienen una distribución similar en sexo y edad. El nivel educativo evidencia que el 58% de los participantes tienen nivel técnico o tecnológico, el 25% completaron la primaria y el porcentaje restante se divide entre una mujer que manifestó no haber finalizado el bachillerato y un hombre que manifestó haber cursado una carrera profesional pero no haberla finalizado.

A pesar de que todas las personas afirmaron ser administradoras, en el desarrollo de la entrevista fueron claras las diferencias entre las funciones de cada uno, pasando de un extremo de ser gerente, fundador

y administrador de una empresa, a ser administrador de un punto de venta porque es la única persona disponible en un punto de venta, quien cumple con todas las labores requeridas dentro de este punto de venta, sin implicar tener un cierto nivel de conocimiento o formación.

Las empresas analizadas son MiPyMEs con menos de 10 empleados en un 83%, el 8,3% corresponde a empresas de entre 11 y 50 empleados, y el restante 8,3% corresponde a una empresa que tiene cerca de 62 empleados. El tiempo que llevan funcionando en el mercado contrasta con las expectativas del estudio, pues 7 de las empresas seleccionadas tienen más de 8 años en el mercado, 3 tienen entre 6 y 8 años y solamente 2 cuentan con menos de dos años de existencia.

La gran mayoría de empresas pertenecen a la categoría de comercio al por mayor y al por menor. En relación al peligro de cierre por quiebra o embargo, solo una de las empresas reconoció haber estado en riesgo, dos han estado en peligro de quiebra, pero no de embargo y 9 no han estado o no manifiesta haber estado en peligro de quiebra o embargo.

Percepción del conocimiento frente a temas relacionados con EEF

Para evaluar la percepción de conocimiento de los participantes sobre educación financiera se le preguntó a cada uno cuánto sabía de ciertos temas evaluando su conocimiento de uno a diez, siendo uno no saber nada y 10 tener un conocimiento suficiente. Los resultados muestran que los aspectos en los que se considera tener más conocimiento son mercadeo con un promedio ponderado de 7,2 seguido por administración e impuestos con 6,3. El promedio ponderado de percepción de conocimiento individual oscila entre 8,1 y 1,6, con una media de 4,8, mostrando una amplia fluctuación que se explica por la variedad de perfiles que fueron entrevistados.

La gráfica radial (Fig. 1) muestra que los demás términos utilizados para medir la percepción de conocimiento económico y financiero tienen una distribución similar, siendo estos: finanzas personales, contabilidad, finanzas empresariales, economía y aspectos jurídicos y legales. Llama la atención que la percepción frente a los conocimientos relacionados con las finanzas empresariales, que podría ser alto dados los cargos entrevistados, tiene uno de los más bajos puntajes, lo que puede indicar que buena parte de las personas que se encargan de administrar MiPyMEs no saben o no creen tener los conocimientos suficientes para llevar un negocio en los relativo a las finanzas.

Fig .1: Percepción de conocimiento en temas económicos y financieros (promedio general)

Frente a esta perspectiva se les preguntó a los participantes si habían recibido, alguna vez, al menos una capacitación sobre EEF y si consideraban necesaria la implementación de un programa de EEF para los trabajadores de la empresa. Casi la totalidad de los empresarios consideran necesaria la implementación de un proceso de capacitación en EEF, y de estos, solamente 4 han recibido capacitaciones relacionadas.

En estos casos, quienes han brindado la capacitación son Instituciones de educación superior (3), entidades estatales (2), y familiares (1). De las personas que no consideran necesario algún tipo de capacitación financiera lo justifican mencionando que por las funciones que cumplen sus empleados no requieren ningún tipo de conocimiento financiero.

Manejo de los recursos por parte de los empresarios

Las fuentes de financiamiento son parte esencial del mantenimiento y crecimiento de una MiPyMEs. Se buscó indagar sobre las fuentes de financiación a las que acuden las empresas cuando requieren recursos adicionales, sin importar si en el momento de la entrevista tuvieran (o no) un crédito vigente. Se encontró que la principal fuente de financiación son los bancos, dato que se contradice con la aversión que mostraron frente a los bancos como se verá más adelante. La suma de los recursos propios y familiares casi equipara los recursos bancarios.

La distribución de rectángulo o treemap (Fig. 3) muestra la repartición de las fuentes de recursos mencionadas por las personas entrevistadas, mostrando que la táctica de búsqueda de recursos menos mencionada son las estrategias de mercadeo y la presión a los empleados. Uno de los empresarios manifestó que cuando necesitaba recursos acudía a sus empleados, impulsándonos a trabajar más o a atraer más clientes, a riesgo de perder sus puestos de trabajo por falta de liquidez de la empresa.

Fig. 2: Fuentes de recursos adicionales

En cuanto a las fuentes actuales de financiación, se encontró que los bancos son la principal fuente de financiación seguida por las cooperativas, que es utilizada por solo uno de los empresarios. Al indagar por las causas del uso de las cooperativas se descubrió que el empresario tenía sus préstamos en una cooperativa financiera que se convirtió en un banco, por lo que los costos aumentaron significativamente y decidió trasladar sus productos financieros a otra cooperativa con costos más bajos y un mejor servicio.

Se les preguntó a los participantes si tenían conocimiento de ciertos productos financieros a los que una MiPyMEs podría acceder. El 33% reconoció no conocer ninguno de los productos mencionados. De los restantes 8 participantes, todos aceptaron conocer los microcréditos y las tarjetas de crédito empresariales, mientras que solamente uno mencionó que conoce los créditos de redescuento. La figura 3 permite ver la especificidad de las respuestas por producto financiero.

Fig. 3: Conocimiento de productos financieros

Casi la totalidad de los participantes manifestaron su temor a los créditos, las tarjetas de crédito y en general a las entidades bancarias, explicado por los altos costos, la facilidad con la que se pueden adquirir estos productos, la rapidez con la que se gasta el dinero y las dificultades que luego se pueden presentar para pagarlos.

De la totalidad de las empresas, la mitad afirmaron tener un préstamo vigente. De estos, el 83% conocen el plazo del crédito (2 a 5 años), afirma conocer los costos adicionales de tomar un crédito y los beneficios de pagar en un tiempo menor del acordado. El 50% conoce la tasa de interés del crédito y el 100% afirman que se encuentran al día en las obligaciones relacionadas con el préstamo. Únicamente el 50% de estas empresas cuent con un profesional especializado en el manejo de los recursos financieros.

Al revisar los resultados de la totalidad de las empresas, el 92% tienen un presupuesto mensual o semanal, conoce los costos adicionales de toma un crédito y conoce el beneficio de pagar en un menor plazo una responsabilidad financiera (en caso de requerirla). El 67% cuentan con un profesional especializados en el manejo de recursos financieros. Al indagar sobre las inversiones que realizan las empresas, solamente el 25% de las empresas mencionaron que realizan inversiones, dirigidas estas a la modernización, mantenimiento o compra de planta y equipo.

La barrera principal que encuentran las empresas a la hora de financiarse es el temor a no tener recursos con los cuales pagar las responsabilidades financieras adquiridas y el temor al poder de los bancos, que incluye los reportes en las centrales financieras y lo que esto significa para futuras financiaciones de la empresa. Otras barreras mencionadas son los altos costos de los productos financieros, la falta de información, la fluctuación de la economía colombiana, los cambios en el valor del dólar y los largos periodos de recesión. El 42% de los participantes no consideran tener barreras para acceder al sistema financiero, de estos, el 60% ya tienen por lo menos una deuda con el sector financiero.

Aporte Al Desarrollo Económico Y Social

Se les preguntó a los participantes si consideraban que sus empresas aportaban al desarrollo económico y social de la localidad. Solamente uno de los participantes consideró que no genera aportes a la

localidad. De una lista de posibles aportes, los empresarios seleccionaron el pago de impuestos y la generación de empleo, a pesar de reconocer que los impuestos para las MiPyMEs son muy altos y que algunos de sus empleados no son personas de nacionalidad colombiana.

Uno de los empresarios manifestó que había decidido, dado el contexto nacional actual[1], contratar únicamente a colombianos. A pesar de considerar el empleo como un aporte significativo, solamente se encontró una empresa que paga a sus empleados más del salario mínimo legal vigente (254,7[2] dólares a octubre del 2019). Las demás empresas pagan a sus empleados el salario mínimo incluyendo (o no) presentaciones sociales.

Las importaciones, la responsabilidad empresarial y la inclusión de personas en condición de discapacidad fueron también seleccionados, y se mencionaron asuntos como la compra de insumos nacionales exclusivamente y la venta a precios bajos como aspectos que aportan al crecimiento económico y social de la localidad, por ejemplo, a través de ventas de productos de obra a precios bajos para la construcción de un parque en la localidad.

Conclusiones

Las personas participantes mencionaron tener cargo de administradores, sin embargo, sus funciones, capacidades y conocimientos varían ampliamente. Estos consideran tener más conocimientos en mercadeo, seguido de administración general e impuestos. La mayoría de participantes considera como un aspecto favorable para la empresa que sus empleados reciban capacitaciones relacionadas con EEF.

En relación a las fuentes de financiación, se observó que la mayoría de empresas no han estado en riesgo de quiebra o embargo, y la mitad tienen actualmente un préstamo al día con conocimiento de los costos adicionales conexos. La mayoría de empresas tienen un presupuesto mensual o semanal y el 67% cuentan con por lo menos un profesional especializado para el manejo de los recursos financieros.

Se observa que pocas empresas conocen otras formas de financiarse diferentes a los bancos, como por ejemplo las cooperativas y otras entidades del sector solidario que pueden impulsar las empresas de maneras diversas, no solo a través del otorgamiento de créditos a un costo más bajo que el de los bancos, sino también dando capacitaciones, soporte y en general, educación financiera que les permite a las MiPyMEs gestionar de manera más adecuada sus recursos.

La mayoría de empresas consideran que su aporte en términos de pago de impuestos y generación de empleo es significativo para el desarrollo de la localidad. Es cuestionable la posición de las empresas ya que, en la mayoría de los casos, generan empleo no calificado sin posibilidades de ascenso social a través del estudio o económico a través de mejores salarios. Sin embargo, esto no demerita que, a diferencia de otras empresas, las MiPyMEs crean empleos, que se pueden mantener a lo largo del tiempo mientras la empresa guarde vigencia.

Los resultados encontrados a partir de una muestra pequeña de empresas pueden ser validados con otras empresas y localidades. Los resultados pueden variar de acuerdo a las personas y las empresas seleccionadas más allá del cargo que ostentan o el tipo de empresas seleccionadas, por las condiciones particulares de cada empresa y las condiciones macroeconómicas que sobrepasan a la capacidad de control de cada una de estas.

Agradecimientos

Se presenta agradecimiento a la Corporación Universitaria Minuto de Dios UNIMINUTO quien financió el proyecto de investigación “Medición de indicadores de la educación financiera como parte del desarrollo socio económico de las pymes en la localidad de Antonio Nariño en la ciudad de Bogotá” del cual se deriva el presente artículo. A las MiPyMEs de la localidad de Antonio Nariño en la ciudad de Bogotá, quienes participaron activamente en la investigación. A mi familia y amigas, por su apoyo incondicional.

Application of Financial Education In SMES In Bogotá

Salomé del Pilar LÓPEZ-PEÑA

Corporación Universitaria Minuto de Dios, Bogotá, Colombia, splopezp@unal.edu.co

A financial crisis is an awkward situation that no person or company wants to face. In Colombia, it is common to find people and companies that have had financial crises given the low level of financial education.

Most countries implement financial education programs to improve the living conditions of the population and contribute to the nation's economic growth. Government economic policies and economic conditions influence the behavior and financial results of the industry including SMEs.

A quantitative investigation was carried out in small and medium enterprises located in Bogotá. The selected SMEs responded to a survey through their owners or administrators.

The main objective of this study was to evaluate the level of financial knowledge and its correspondence with the current state of SMEs in Bogotá.

The companies that participated in the study are 90% small companies, 41% have more than 8 years in the market, 19% have between 6 and 8 years, 26% have between 3 and 5 years and 14% have less than two years. 62% of Companies correspond to wholesale and retail trade.

The people surveyed are 30% professionals, 32% are technicians and 38% attended high school. 54% are women and 46% are men.

Regarding financial education, 39% of respondents had participated in a financial education program and 81% considered it necessary to implement a financial education program in their companies.

Concerning financial education, 39% of respondents had participated in a financial education program and 81% considered it necessary to implement a financial education program in their companies. Those who received financial education have received it mainly in institutions of higher education followed by colleges and government entities.

Regarding financial knowledge, the participants showed average knowledge in all aspects evaluated, finding the highest score in the category "administration" and the lowest in the categories "economy" and "legal aspects".

Likewise, 30% of the companies have external financing, 95% of the cases with banks, 74% know the credit interest rate, 84% know the credit financing term and 84% are up to date in the Loan payment. The additional bank loan costs are known by 74% of respondents and only 54% of companies have an accountant.

It is concluded that the SMEs of Bogotá have a low knowledge of financial aspects. Although many businesses do not have debts, those who do, have acquired long-term bank commitments without being clear about the costs involved and without having professionals that allow them to a better administration. Finally, it was observed that the financial education received by the participants is low and limits their business.

Acknowledgment

We are grateful to the Corporación Universitaria Minuto de Dios UNIMINUTO who financed the research project "Measuring indicators of financial education as part of the socio-economic development of SMEs in the town of Antonio Nariño in the city of Bogotá" from which this article is derived. To the MSMEs in the city of Bogotá, who participated in the research. To my family and friends, who are always incredibly patient with me.

How Insurance Companies Meet Solvency II Requirements? Evidence from The Polish Non-Life Insurance Market

Marta BORDA

Dorota JASKIEWICZ

Wroclaw University of Economics and Business, Wroclaw, Poland
dorota.jaskiewicz@ue.wroc.pl

Abstract

In the European insurance market, according to Solvency II system, the insurers are obliged to disclose the Solvency and Financial Condition Reports (SFCR), including some Quantitative Reporting Templates (QRT). In the paper, an analysis and evaluation of solvency adequacy for non-life insurance companies operating in Poland is presented. The selected measures such as the Solvency Capital Requirement (SCR) ratio and the Minimum Capital Requirement (MCR) ratio as well as the components of the Solvency Capital Requirement were examined in order to evaluate the solvency positions of the analysed insurers. The conducted research showed that almost all non-life insurance companies in Poland met the obligatory requirements and have had the required coverage of capital requirements by their own funds. It also highlighted the importance of underwriting risk and market risk for non-life insurance sector. The obtained results may be useful for insurance market entities, researchers as well as for customers seeking transparency in the solvency of insurance companies, in particular those whose policy they already have as well as those in which insurance purchases they are considering.

Keywords: Solvency II, non-life insurance, Solvency Capital Requirement (SCR), Minimum Capital Requirement (MCR), Poland

Introduction

Solvency is considered as one of the fundamental principles of the financial management of an insurance company, closely related to the specificity of an insurance service. Insurance business is based on confidence that in the case of a random insurance event an insurer will cover claims, in accordance with the terms of the insurance contract. In other words, the insurer should be solvent at any time. Consequently, the solvency problems are essential not only for the insurance companies, but also for customers and other market participants.

In accordance with the new Solvency II system, implemented on January 1, 2016 in European Union countries, insurance and reinsurance companies are obliged to comply with new capital requirements and to maintain adequate coverage with their own funds. In addition, the new solvency system imposes new, more detailed reporting obligations on solvency and financial condition of insurers. As Rae et al. (2018) note, Solvency II represents one of the most sophisticated insurance regulatory regimes in the world. It is built around the principles of market consistency and embedding strong risk management and governance within insurance companies. As a result, insurance companies face new challenges in developing regulatory financial security measures.

In order to focus on the solvency problem of insurance companies, it is important to mention the evolution and the selected approaches to the solvency concept. In 1984-1985 the Faculty of Actuaries defined the term *solvency* as meeting the obligations that have arisen or may arise in the future, taking into account possible assumptions and a certain degree of probability (Hardie et al 1984-1986).

Benjamin also points out obligations covering, claiming that solvency means "having sufficient financial resources to cover all financial obligations" (Kastelijn 1986). The International Association of Insurance Supervisors (IAIS) calls solvency the ability of insurance companies to fulfil their obligations resulting from all contracts at all times (IAIS 2000). Next, Bijak (2003) formulated the concept of solvency as "the value of assets free from any liabilities towards the insured, defined as a safety buffer". Afterwards, in 2009, this concept was developed as: "the state of dynamic balance between the assets of the insurance company and liabilities resulting from insurance contracts and cash flows generated by assets and liabilities" (Bijak 2009). Supposing that it is a state that guarantees the insurance company with a high probability of liabilities towards insured persons, policyholders or beneficiaries under insurance contracts in changing natural, economic and social conditions. It is a state in which the internal resources, structures and processes of the insurance company and external structures in which the company is located do not systematically affect the decrease in the likelihood of the undertaking fulfilling its obligations (Bijak 2009). Lisowski (2010) drew attention to a different solvency dimension, i.e. from the point of view of the client, the solvency of an insurance company can be considered in two aspects. First, as the ability to meet liabilities, and hence the financial situation, and secondly – as readiness and, therefore, the will to meet them. The legal regulations give the insured the right to pursue claims from an insurance company through legal means – legal guarantees of the feasibility of insurance protection.

In the last few years, the issues related to Solvency II requirements, their practical implementations as well as the models that can be used in risk assessment for the purpose of solvency assessment have been considered broadly in the international scientific literature. Problems related to new solvency capital requirements and risk measures in the solvency assessment were examined, among others, by: Christiansen and Niemeyer (2014), Eling and Pankoke (2014) and Wagner (2014). The analysis of the first effects of Solvency II on the European insurers' balance sheets and solvency, based on the published statistical data, was presented by Kočović et al (2017). With regard to life insurance companies, the components of SCR calibrated based on expected shortfall were examined by Boonen (2017). In the case on non-life insurers, risk modelling and risk allocation from Solvency II perspective have been examined, among others, by: Asimit et al (2016) and Hürlimann (2010).

The purpose of the paper it to analyse and evaluate the selected solvency measures of the non-life insurance companies operating on the Polish market. The analysis included in particular the solvency ratios – the Solvency Capital Requirement ratio (SCR ratio), the Minimum Capital Requirement ratio (MCR ratio) as well as the components of SCR. In the study the following research questions (hypotheses) are examined:

1) Do the insurers operating in non-life sector meet the obligatory solvency requirements and have sufficient own funds to cover the capital requirements?
2) What category of risk is crucial in non-life insurance industry in the context of Solvency II regime?

Analysis of SCR ratio and MCR ratio

The analysis of the solvency ratios of non-life insurance companies operating in Poland was based on published QRT (quantitative data) for 2016 and 2017. The analysis included all active insurers, conducting activity in the form of a joint-stock company or a mutual society. The QRT templates were the main source of data, however for more details the information provided in SFCR reports was also used. The data collection process is time consuming and requires SFCR and QRT analysis for each of the insurance companies separately. At the time of conducting this research, data for 2018 and 2019 has been not compiled yet, so the authors decided to provide an analysis of the 2016 and 2017 data.

At the end of 2016, in Poland there were 34 active non-life insurance companies. Among the domestic insurers, the insurance business was conducted by 33 personal and property insurance companies and 1 reinsurance company. Nationale-Nederlanden TU S.A. obtained the Polish Financial Supervision Authority authorization, but by December 31, 2016, it has not started yet

activity, hence they did not publish Solvency and Financial Condition Report, so it was not included in the study. At the end of 2017, also 33 insurance companies in non-life sector (other personal and property insurance) and 1 reinsurance company were licensed and operating, so they all were included into the analysis.

The Solvency Capital Requirement (SCR), in accordance with the article 103 of Solvency II Directive (RADA, 2009), is calculated as the sum of the following components: the Basic Solvency Capital Requirement (BSCR), the capital requirement for operational risk, adjustments for the capacity of technical provisions and deferred taxes to absorbing losses. The Basic Solvency Capital Requirement (BSCR) consists of the following risk modules: market risk, health underwriting risk, counterparty default risk, life underwriting risk, non-life underwriting risk and intangible assets risk. The SCR ratio can be expressed as the value of covering the SCR requirement by means of own funds, according to the following formula:

$$SCR\ Ratio = \frac{Eligible\ Own\ Funds\ for\ SCR}{SCR}. \quad (1)$$

Insurance companies in the EU member states are obliged to cover their solvency capital requirements, meaning the required by directive level of 100% of SCR ratio. In a situation, that an insurance company do not comply with the coverage requirements, the supervisory authority accepts the action plan of this company in order to restore the level of the own finds to cover the solvency capital requirement or to reduce the risk profile in order to comply with the solvency capital requirement. Every 3 months the insurer submits a report to the supervisory authority which indicates the action taken and the progress made to restore the own funds level or reduce the risk profile to ensure the compliance. In the event of non-compliance with the solvency capital requirement within the period agreed with supervisory authority, the supervisor shall withdraw the insurance or reinsurance authorization to carry out business activity.

In order to have the coverage and be compliant with the requirements, insurance companies have to prepare the projections of MCR and SCR coverage by the own funds in Own Risk and Solvency Assessment (ORSA) report, aiming prove the continuous compliance with solvency capital requirement and minimum capital requirement. The ORSA report is on a yearly basis delivered to the supervisory authority. In Poland, local regulator requires also quarterly reporting on capital requirements in order to monitor the solvency position of all entities.

The MCR (Minimum Capital Requirement), in accordance with Solvency II Directive (RADA, 2009), should guarantee a minimum level, below which insurer`s funds should not decrease. The Minimum Capital Requirement is calculated as follows:

$$MCR = \max(MCR_{combined}; AMCR), \quad (2)$$

where: $MCR_{combined}$ – Minimum Capital Requirement, $AMCR$ - the absolute limit for MCR.

The value of the absolute limit for MCR (AMCR) threshold is established as:

a) EUR 2 200 000 for non-life insurance companies, including related insurance companies, except for taking risks from groups 10-15 (i.e. liability insurance for the use of motor vehicles, third party liability insurance for aircraft, liability insurance for the use of vessels operating in sea and inland navigation, general liability insurance, credit insurance, insurance of sureties), then this threshold amounts to EUR 3 200 000;
b) EUR 3 200 000 for life insurance companies, including related insurance companies;
c) EUR 3 200 000 for reinsurance companies, with the exception of captive reinsurers for which the MCR is at least EUR 1 000 000.

The sum of the amounts listed in a) and b) is considered for insurance companies that simultaneously conduct life insurance and non-life insurance activities.

In Poland, according to new insurance market law regulations the requirements for domestic insurance companies are even more severe (see Act of September 11th, 2015 on insurance and reinsurance activity). The absolute limits for Minimum Capital Requirement are as follows: a) 2 500 000 EUR for non-life insurance companies, which carry out business in 1-9 and 16-18 insurance groups, b) 3 700 000 EUR for non-life companies, which carry out business activity in 10-15 insurance groups (TPL insurance), c) 3 700 000 EUR for life companies and d) 3 600 000 EUR for reinsurance companies.

The MCR ratio is calculated as the value of coverage of the MCR requirement by own funds, what expresses the following formula:

$$MCR\ Ratio = \frac{Eligible\ Own\ Funds\ for\ MCR}{MCR}. \quad (3)$$

Similarly to SCR, according to Solvency II Directive insurers have to cover their minimum capital requirements in 100%. In the event of non-compliance with the minimum capital requirement within the period agreed with supervisory authority, the supervisor shall withdraw the insurance or reinsurance authorization to carry out business activity.

In the first step of the analysis the international comparison of SCR ratio and MCR ratio calculated for the European countries in 2017 and 2018 is presented in Table 1.

Table 1: Solvency ratios for the European countries in 2017 and 2018

Country	Weighted average of SCR ratio in 2017 (in %)	Weighted average of SCR ratio in 2018 (in %)	Weighted average of MCR ratio in 2017 (in %)	Weighted average of MCR ratio in 2018 (in %)

Source: EIOPA Statistics (2018). Solo/Annual/Published 20181113/Data extraction completed 20191108; EIOPA Statistics (2019). Solo/Annual/Published 20190924/Data extracted 20190919.

The weighted average in Table 1 represents the aggregate own funds (sum for all insurers) divided by aggregate SCR or MRC respectively. Data presented in Table 1 shows that in the examined European countries the insurance industry is well capitalized. According to the data published by EIOPA, in 2017 the average value of SCR ratio for all European countries was 239% and average MCR ratio was equal to 648% (EIOPA Statistics, 2018). To compare the results to 2018 data, the average SCR ratio was equal 242% (3% increase since 2017) and average MCR equals 648% (EIOPA Statistics, 2019). The highest values of SCR ratio was recorded in Germany, followed by Malta, Denmark and Austria. In the case of MCR ratio, Germany, Sweden and Austria noted the highest levels in 2017 and 2018. In 2018 the highest SCR ratio level was maintained by above mentioned countries i.e. Germany, followed by Malta, Denmark and Austria.

Figures 1 and 2 present the value of SCR and MCR ratios for the non-life insurers operating in Poland in 2016–2017, respectively. The average value of SCR ratio amounted to 227% in 2017, compared to 200% in the previous year, while MCR ratio in 2017 was 442%, compared to 438% in 2016. It indicates that in general, the examined non-life insurers were sufficiently capitalised. The Polish insurance sector is still dominated by PZU, however SCR and MCR ratios calculated without PZU share would be: SCR – 197% in 2016 and 225% in 2017, and MCR – 414% in 2016 and 422% in 2017, respectively. As comes to the solvency evaluation of individual insurers, in 2016 only one company – TUZ TUW had not enough own funds to cover the Solvency Capital Requirement, having the solvency ratio at the level of 73.60%. The analysis of its SFCR report showed that the company is covered by the Polish Financial Supervision Authority recovery plan to achieve full coverage. In terms of MCR coverage, another company did not meet the capital requirements for MCR - TUW MEDICUM, having only 90.37% of coverage. In 2017 all of the Polish non-life insurers had coverage of the Solvency Capital Requirement and Minimum Capital Requirement above 100%. In particular, mentioned before TUZ TUW's SCR ratio was equal 134% and MCR ratio for TUW MEDICUM was 109%.

Fig. 1: SCR ratio for non-life insurance companies in Poland in 2016-2017

Source: authors' calculations based on Solvency and Financial Conditions Reports.

Fig. 2: MCR ratio for non-life insurance companies in Poland in 2016-2017

Source: authors' calculations based on Solvency and Financial Conditions Reports.

During the analysed period, most insurance companies have a higher MCR ratio than SCR ratio, however there were 6 entities in 2016 and 7 entities in 2017 with a reverse situation compared to

others. These companies have a higher SCR ratio than the MCR ratio. It means those insurers have higher MCR requirement than SCR requirement. The results are summarised in Tables 2 and 3.

Table 2: Solvency ratios for the selected non-life insurance companies in 2016

Insurance Company	SCR [in thousands PLN]	SCR ratio [in %]	MCR [in thousands PLN]	MCR ratio [in %]
TU ZDROWIE S.A.	8 033	171	10 817	127
SIGNAL IDUNA POLSKA TU S.A.	14 022	194	16 009	170
D.A.S. TU OCHRONY PRAWNEJ S.A.	4 615	269	10 817	112
CREDIT AGRISOLE TU S.A.	4 153	497	16 009	129
TUW MEDICUM	7 067	205	16 009	90
PARTNER TUiR S.A.	5 082	384	16 009	122

Source: authors' calculations based on Solvency and Financial Conditions Reports.

Table 3: Solvency ratios for the selected non-life insurance companies in 2017

Insurance Company	SCR [in thousands PLN]	SCR ratio [in %]	MCR [in thousands PLN]	MCR ratio [in %]
TU ZDROWIE S.A.	9 011	179	10 625	152
SIGNAL IDUNA POLSKA TU S.A.	14 449	209	15 724	192
D.A.S. TU OCHRONY PRAWNEJ S.A.	4 960	302	10 625	141
CREDIT AGRISOLE TU S.A.	6 281	325	15 724	130
TUW MEDICUM	4 476	383	15 724	109
PARTNER TUiR S.A.	5 132	406	15 724	132
NATIONALE-NEDERLANDEN TU S.A.	7 080	886	15 724	396

Source: authors' calculations based on Solvency and Financial Conditions Reports.

As one could observe, in terms of Minimum Capital Requirement we are dealing with repeated values. And in fact, value of 10 817 thousands of PLN in 2016 and 10 625 thousands of PLN in 2017 represents AMCR threshold of 2 500 thousands of EUR. Similarly, value of 16 009 thousands of PLN in 2016 and 15 724 thousands of PLN constitutes 3 700 thousand EUR expressed in thousands of PLN.

Analysis of Solvency Capital Requirement components

As mentioned above, the Solvency Capital Requirement (SCR), specifically BSCR, includes the following modules: market risk, insurance risk in health insurance, counterparty default risk, insurance risk in life insurance, insurance risk in other insurance than life and the risk of intangible assets. The comparison of SCR components shows that underwriting risk in non-life insurance is an important component of the capital requirements of all examined companies. From the practical perspective, it is worth mentioning that none of the non-life insurers used the internal model to calculate the capital requirements. All insurance companies have used the standard formula.

As expected, underwriting risk in non-life insurance is the highest risk, amounting to 63.14% in 2017 (increased by 0.74 % in comparison to 2016). However, market risk is strongly represented with 55.33% of overall SCR in 2017. The non-life underwriting risk is the largest module in overall SCR

for all the companies, except PZU, TUW SKOK and TUW ZROWIE. For PZU the highest capital requirement is generated by market risk, while for TUW SKOK and TUW ZROWIE the risk profile is dominated by health underwriting risk. Market risk is the second highest risk for most of the entities. The business model in the non-life insurance sector is short-term, which contributes low interest rate risk. At the same time, market risk is also an important factor in capital requirements. As presented on Fig. 3, insurers with a high SCR ratio also tend to have a higher market risk requirement.

Fig. 3: SCR versus market risk in 2017 in thousand PLN.
Source: authors' calculations based on Solvency and Financial Conditions Reports.

Conclusions

The research aim of the conducted analysis was to provide a clear picture of the solvency positions of all non-life insurance companies operating in Poland in years 2016-2017. The literature review and ratio analysis were used based on quantitative data of the insurance companies provided in QRT templates as well as the information provided in SFCR reports.

The main findings resulted from the study can be formulated as follows:

- All examined insurance companies set the Solvency Capital Requirement using the standard formula.
- In 2016, one insurance company did not have SCR cover with eligible own funds and one insurance company did not have coverage of the MCR with eligible own funds. In 2017 the situation improved and all non-life insurers had SCR and MCR coverage.
- In the analysed period in Poland, there were insurance companies, for which the capital requirement MCR was higher than the level of SCR.
- In non-life insurance sector underwriting risk has the largest impact on the amount of the capital adequacy requirement representing 63.14% of SCR in 2017 (increase by 0.74% since 2016), the next is market risk constituting 55.33% of SCR in 2017 (decrease by 2.13 % since 2016).
- To cover the capital requirements non-life insurers had high-quality own funds in terms of liquidity and the ability to absorb future losses.

Summarizing, the conducted analysis showed that almost all non-life insurance companies in Poland were able to satisfy the new capital requirements resulted from the implementation of Solvency II system and they had the required coverage of capital requirements by the own funds. It also confirmed the fact that in non-life insurance business the underwriting risk and the market risk should be considered as the most important components influencing the solvency level of an insurer.

The directions of further research could include the analysis of the standard formula, identification of factors affecting the increasing or decreasing of capital requirements as well as the possibility of estimating capital requirements. Another interesting issue is an analysis of changes in the standard formula in accordance with Commission Delegated Regulation (EU) 2019/981 of 8 March 2019. The authors also plan to extend the set of data on Polish insurance companies in order to obtain the comprehensive picture of the solvency level of insurance sector in Poland.

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019-2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

Abstract

The paper aim is to assess the concentration level of financial audit market in Poland. Our sample consists of 375 public companies disclosing statutory auditor's report on financial statement for 2018, listed on the Main Market in the Warsaw Stock Exchange (WSE). We have measured the audit market concentration by means of the 4-firm concentration ratio CR_4, Herfindahl-Hirschman index, 'Big Four' and '10KAP' indicators. The research findings reveal that the audit market concentration in Poland is much lower than in other European states. The share of the Big 4 firms in the entire market is close to 35%, and of the 10 most important audit firms - to 53%. The audit firm with the greatest share of the market for statutory audits of annual financial statements of WSE-listed companies is Ernst & Young, which audited 12% enterprises. It is followed by Deloitte, BDO, PricewaterhouseCoopers, UHY ECA, Grant Thornton and KPMG, none of which has a market share greater than 10%. An analysis of the concentration levels in major sectors allows auditors specialising in certain industries to be identified.

Keywords: Audit Market Concentration, Big 4, Financial Auditing, Herfindahl-Hirschman Index

Introduction

Major changes are taking place on the European market for services provided by statutory auditors. They are mainly due to the implementation of new EU regulations which significantly affect the formal aspects of practising the profession, particularly Directive 2014/56/EU and Regulation 537/2014. These texts define, among other things, the role of the statutory auditor, effectively prevent conflicts of interest in the provision of various services and restrict market concentration. The rules of reporting audit work results have also undergone notable changes. In this regard, there has always been a significant problem with the relatively high concentration of the market which inhibits its competitiveness. The dominance of Big 4 firms materially restricts an unbiased selection of an auditor and leads to a systemic risk. It is also a direct driver of the prices of services provided by statutory auditors and the quality of their work. This is because an excessively long relationship between an auditor and their client may limit the objectivity and the professional scepticism of the statutory auditor. This is why new EU regulations have introduced a mandatory rotation of audit firms auditing the financial statements of key operators in every member state. Other new rules require joint audits, which force statutory auditors to cooperate, and ban the provision of certain services to the audited economic operators. All these steps are to make the market more competitive. The above regulations were adopted in June 2016 and each state had the time to transpose them in its national law. In Poland, this was done by the Act of 11 May 2017 on statutory auditors, audit firms and public supervision which came into effect in June 2017.

In the light of the above, the main purpose of this article is to identify the degree of concentration of the audit service market in Poland and assess it with regard to systemic changes introduced by EU regulations. Statutory auditor reports issued about annual financial statements for 2018 executed by companies listed on the main market of the Warsaw Stock Exchange were analysed in detail. Data was

collected manually, and the final sample consists of 375 public companies. The following research questions were formulated:

- Which audit firms conduct the greatest share of audits of annual financial statements of companies listed on the Polish stock exchange?
- What is the concentration level of the market for audit services provided to public companies?
- Which auditors audit the statements of the largest companies on the Polish regulated market?
- Is there any sector specialisation of auditors and what is the concentration level in main industries?

In the Polish context, various analyses have so far suggested a relatively low market concentration compared to other states, but with a growing trend. However, all that research concerned the period prior to the implementation of regulatory changes presented above. The analysis presented here covers the year 2018, i.e. the first whole reporting period in which the new rules applied.

Background and Literature Review

The concentration of the audit services market has been the subject of legal regulations and scientific research for many years. It particularly applies to the services provided to the largest economic operators in each state (Simunic, 1980, pp. 161-190). The market is significantly dominated by the Big 4 audit firms. It is worth noting that significant mergers and acquisitions have occurred in the group of the largest global audit companies, which exacerbated this unfavourable development further. This has been confirmed in the research of, among others, Minyard and Tabor (1991, pp. 79-90), Wootton et al. (1994, pp. 58-74), Choi and Zéghal (1999, pp. 1-21) and Pong (1999, pp. 451-475). First, Peat Marwick Mitchell merged with KMG in 1987. This was followed in 1989 by the Ernst & Whiney merger with Arthur Young and Coopers & Lybrand merger with PriceWaterhouse in 1998. Thus the eight largest global audit companies became the Big 5, and after Arthur Andersen collapsed in 2002, the Big 4. According to global financial figures for 2018, Deloitte has maintained its pole position since 2013, earning a record-breaking $43.2 billion in revenue. PriceWaterhouseCoopers comes second with $41.3 billion of revenue. The following positions are taken by Ernst & Young and KPMG, which generated $34.8 billion and $29.0 billion in revenue, respectively. Next to Big 4, BDO is the fifth largest accounting firm in the world with the revenue of $8.99 billion (Raza et al., 2019, pp. 135–144).

Institutions responsible for the safety of trade have been warning for years that this high concentration may have a negative impact on price competition, the unbiased choice of an auditor and the quality of statutory auditors' work (FRC, 2006; Oxera, 2006, 2007; OECD, 2009). These warnings were particularly loud at the beginning of this century, right after a series of spectacular company collapses initiated by the bankruptcy of Enron in 2001. However, the reforms to the audit services market made then turned out to be ineffectual, as the very same problem reappeared during the 2008 financial crisis. Analyses continued confirming the high concentration of the statutory auditor market and associating it directly with the systemic risk of the financial sector (European Commission, 2010; Oxera, 2011; Treasury Committee, 2008). It was shown that in the United States, the Big 4 firms audited approx. 82% of the overall value of the regulated market calculated as the total capitalisation of companies (US Government Accountability Office, 2008). In the UK, in turn, research showed that the Big 4 audited 99% of FTSE 100 companies and 94% of FTSE 250 ones in 2009.

The most recent figures from the European market show that after the systemic changes made, the aggregated concentration level for the entire EU has not markedly improved. However, changes have been observed in individual states. In those which adopted a rather strict policy on the mandatory auditor rotation, the market share of the Big 4 dropped, particularly in the financial sector. On the contrary, no such trend was observed in countries with a laxer policy. The current research covered the regulated market of all EU member states in 2013–2017, which was overwhelmingly subject to the most recent legislative changes. The concentration level was found to have fallen in over a dozen

member states, but there were also significant rises in some. Generally speaking, relatively low concentration ratios were observed, regardless of the method of their calculation, in Poland, France and Austria. The highest concentration level measured by the Big 4's market share was seen in Italy, Lithuania and Slovakia (European Parliament, 2019).

With regard to Poland, it is worth noting that hitherto analyses have demonstrated a level of concentration definitely lower than in other states, but with a growing trend. The 'Big 4' indicator rose from 34.05% in 2011 to 42.61% in 2016. The '10KAP' indicator, in turn, went up from 53.00% to 57.60% in the same period (Gad, 2018). This is also confirmed by the Herfindahl-Hirschman index (HHI), which grew from 1731 in 2013 to 1875 in 2017 (European Parliament, 2019). However, all the above figures describe the period prior to the regulatory changes. The new law came into effect in June 2017, so the first full period in which the possible effects of the reform could be observed was the year 2018.

In previous scientific research, the concentration of the audit services market was mainly studied from the perspective of various competition factors. In particular, its impact on the price of financial statement audits and the quality of statutory auditors' work was analysed. However, the results of these studies are not unambiguous.

With regard to the changes in auditors' fees, a positive relationship between the value of these fees and the market concentration degree was found (US Government Accountability Office, 2008). Feldman has proven that since the collapse of Arthur Andersen linked to the Enron bankruptcy, both the concentration and the fee level on the American audit market have significantly increased (2006, pp. 193-212). Others have noted higher fees depending on the specialisation of the auditor and high market concentration (Casterella et al., 2014, pp. 123-140) or in the context of different market structures (Eshleman & Lawson, 2017, pp. 57-81). In some studies, however, a negative dependency was found between the concentration level and the prices of audit services (Pearson & Trompeter, 1994, pp. 115-135). This suggests that large audit firms are benefiting from economies of scale while competition simultaneously intensifies in the remaining part of the market, ultimately leading to a price reduction.

Other divergent research results concern the dependence of the service quality on market concentration. In the majority of cases they confirm that as the market gets concentrated, the quality of services provided improves (Francis et al., 2013, pp. 325-355; Huang et al., 2016, pp. 121-145; Eshleman & Lawson, 2017, pp. 57-810). This is because the position of auditors vis-à-vis clients strengthens and they are not afraid of losing orders. This ultimately allows the statutory auditor to focus on the quality of their work. On the other hand, some analyses point to a number of factors causing this quality to deteriorate. The client's limited choice of audit firms makes statutory auditors more confident. This, in turn, may lead to the opposite behaviour, i.e. a less robust approach to the work they do lowering its quality (Boone et al., 2012, pp. 1171-1203).

It is also worth noting that some researchers question the reliability of using classical measures of audit market concentration to assess its competitiveness and employ other tools to analyse this problem (Numann & Willekens, 2012, pp. 450-465). Other publications, in turn, describe barriers to entering this market (Le Vourc'h & Morand, 2011, pp. 131). These mainly include the impossibility of a broad international expansion, poorer reputation of small audit firms than of the Big 4, insufficient knowledge and experience of specific sectors, inability to provide specialists in selected topics, namely complex financial instruments, asset pricing, actuarial estimates and transfer pricing in global transactions. Research also demonstrates unambiguously that companies planning to expand internationally choose one of the Big 4 as their auditors (Carson & Fargher, 2007, pp. 423-446, Maijoor & Schaen, 1997, pp. 155).

Research Method

The aim of the paper is to assess the concentration level of financial audit market in Poland. We have measured the market concentration by means of the four following indicators:

- the 4-firm concentration ratio CR_4,
- the Herfindahl-Hirschman index (HHI),
- the 'Big 4' indicator,
- the '10KAP' indicator.

The first two indicators are the most widely used measures of any market concentration and the last two ones are intended specially for audit market analysis. The m-firm concentration ratio CR_m is defined as the combined market share of the *m* largest firms within the market (Kvålseth, 2018, p. 2) thus CR_4 refers to the four largest audit firms. The Herfindahl-Hirschman index is calculated as the sum of the squared market shares of all firms in the market (Kwiatkowska, 2014, p. 191-192):

$$HHI = \sum_{i=1}^{N} u_i^2$$

where u_i is the market share percentage of audit firm *i* expressed as a whole number, and N is the number of audit firms.

The HHI can range from close to zero (indicating the perfect competition with a great number of very small firms) to 10,000 (indicating the single monopolist).

The 'Big 4' indicator equals the consolidated market share of the Big 4 accounting firms (Deloitee, Ernst & Young, KPMG and PricewaterhouseCoopers) whereas the '10KAP' indicator is calculated as the consolidated market share of the 10 key audit players, i.e. Baker Tilly; BDO; Ernst&Young; Deloitte; Grant Thornton; KPMG; Mazars; Moore Stephens; Nexia, and PricewaterhouseCoopers. The list of 10 key audit players has been identified by the European Audit Inspection Group (European Commission, 2017).

In our study the market share of each audit firm is calculated based on the number of statutory audits of financial statement performed for Polish companies listed on the Main Market of the Warsaw Stock Exchange (WSE). We have taken into account audits of financial statements for 2018 (consolidated if applicable). The data was hand collected from the auditor reports posted on companies'websites.

We have excluded from our initial sample (i.e. active companies listed on the Main Market of the WSE as of 8 January 2020) firms with foreign headquarters (47 companies) and those not having disclosed the auditor report despite the legal obligation (6 companies). The final sample consists of 375 public companies.

In our analysis we have focused on the total sample as well as on the 10 subsamples:
- companies from the WIG20 and WIG30 indices,
- companies from the selected sectors: banking, clothes & cosmetics, construction, energy, IT, machinery, real estate and video games.

WIG20 and WIG30 are price indices of 20 and 30 major and most liquid companies respectively in the WSE Main List. Due to the exclusion of companies with foreign headquarters and ones not having disclosed the auditor report from our initial sample, we have taken into account 19 companies when calculating the audit firms' market shares in the WIG20 subsample and 27 companies when calculating them in the WIG30 one.

Research Results

In total, 56 audit firms provided their services to companies listed on the Polish capital market (cf. Table 1). Among them there are Big 4 accounting firms, eight key audit players (all except Baker Tilly

and Nexia), other auditors belonging to global networks of advisory and accounting firms and smaller domestic audit firms. In Poland there are about 1,600 registered audit firms (European Commission, 2017) thus only a small percentage of them carry out statutory audits for public firms.

The audit firms are diversified in terms of number of audits performed for the sample companies. The average number of audits per audit firm is 6.7 whereas the standard deviation totals 10.2. The coefficient ratio (i.e. the ratio of the standard deviation to the mean) equal to 152% is indicative of significant variability of audit firms. About 44 per cent of analyzed firms provided audit services for solely one company in the sample and only 10 out of 56 firms made auditor report on financial statements for at least ten companies.

Ernst & Young with 46 audits has the largest market share of 12.3 %. This firm dominates not only in the whole Main Market but in the construction, WIG20 and WIG30 subsamples as well with the market shares of 15%, 42% and 41% respectively. Deloitte takes second place (with the market share of 8.27%) slightly outrunning BDO and PricewaterhouseCoopers (both with the market share of 8%). The last of the Big 4 accounting firms – KPMG – holds only seventh position after UHY ECA and Grant Thornton.

Table 1: Market shares of audit firms providing services to Polish listed companies in 2018

Audit firm no.	Audit firm name	No. of audited companies	Market share (%)

55	RSM Poland S.A.	1	0.27
56	Strategia Audit Sp. z o.o.	1	0.27

As far as sector analysis is concerned, we have found UHY ECA to be the largest audit firm in the clothes & cosmetics sector (market share of 21 %) as well as in the machinery sector (26%), Grant Thornton - in the real estate sector (22%) and KPMG - in the banking sector (46%).

A more detailed analysis of the breakdown of firms auditing the financial statements of the largest companies listed on the Warsaw Stock Exchange, i.e. those included in the WIG20 index, shows that the greatest share is held by Ernst & Young (42%), followed by KPMG and Deloitte (21% each), PricewaterhouseCoopers (11%) and Grant Thornton (5%). The same group of firms also audit the statements of WIG30 companies.

Table 2 presents the values of the four concentration market indicators calculated for the Main Market and ten submarkets. In general, financial audit market in Poland is not dominated by the Big 4 as is the case with most Member States. The Big 4 combined market share in the number of statutory audits of public companies listed on the Main Market equals only 35% and is much lower than the figure from the years before the regulations changed. In 2016 this value was for example 43% (Gad, 2018). However 10 key audit players' market position is more noticeable as they account for a little more than a half of performed audits in the Main Market. According to the interpretation of the concentration ratio CR_4 provided in the EC's report (European Commission, 2017, p. 7) the financial audit market is between perfect competition and oligopoly, being placed nearer the latter. Taken into account not only

the largest firms but also all companies, we can conclude, based on the Herfindahl-Hirschman index of 582, that the financial audit market in Poland is rather a competitive marketplace.

Table 2: Concentration market indicators for the audit firms providing services to Polish listed companies in 2018

Sample	Big 4	CR_4	10KAP	HHI
Total	35.21	36.54	53.07	582
Companies from WIG20 index	94.74	94.74	100.00	2 798
Companies from WIG30 index	96.30	96.30	100.00	2 894
Companies from banking sector	92.31	84.62*	100.00	3 018
Companies from clothes & cosmetics sector	15.79	42.11*	31.58	969
Companies from construction sector	39.13	34.78*	52.17	756
Companies from energy sector	88.89	100.00	88.89	2 839
Companies from IT sector	16.00	44.00	32.00	720
Companies from machinery sector	21.74	30.43	60.87	1 304
Companies from real estate sector	31.25	68.75**	68.75	1 035
Companies from video games sector	20.00	60.00*	30.00	1 600

*CR_3 **CR_6

The analysis of the audit market concentration in the selected sectors reveals that there are some differences among them. In five cases due to some firms with the same market share the concentration ratio C_4 has been replaced by CR_3 or CR_6 (cf. Table 2). The Big 4 hold a concentrated oligopoly in the WIG20, WIG30, banking and energy subsamples whereas in the IT, clothes & cosmetics, video games and machinery sectors their consolidated market share ranges from only 15.8% to 21.7%. Audit services for all companies included in the WIG20 and WIG30 indices and commercial banks were provided by the largest audit firms belonging to the group of the '10 key audit players'. Thus these audit firms monopolized three submarkets. In the energy sector the concentration level of the 10KAP is close to 90% and in the real estate sector approaches 70%. In the clothes & cosmetics, IT and video games sectors the firms from the group of 10 key audit players have the much lower consolidated market share of 30%-32%.

The values of the concentration ratio CR_4 (alternatively CR_3 or CR_6) indicate:

- a monopoly in case of the energy sector,
- a market ranging from concentrated oligopoly to monopoly in case of WIG20 and WIG30 indices and the banking sector,
- a oligopoly in case of the video games sector,
- a market ranging from perfect competition to oligopoly in case of IT and machinery sectors.

Based on the values of the Herfindahl-Hirschman index we can distinguish submarkets with:

- low concentration, i.e. clothes & cosmetics, construction and IT sectors,
- moderate concentration, i.e. machinery, real estate and video games sectors,
- very high concentration close to the oligopoly, i.e. WIG20 and WIG30 indices, banking and energy sectors.

Conclusions

The research results presented above answer the key research questions asked in the introduction to this article. The audit firm with the greatest share of the market for statutory audits of annual financial statements of WSE-listed companies is Ernst & Young, which audited 46 enterprises (12%). It is followed by Deloitte, BDO, PricewaterhouseCoopers, UHY ECA, Grant Thornton and KPMG, none of which has a market share greater than 10%. In 2018, the entire aforementioned market was served by altogether 56 audit firms, 25 of which fulfilled only one order. The following four most popular indicators were used to measure the market concentration level: the 4-firm concentration ratio CR4, the Herfindahl-Hirschman index (HHI), the 'Big 4' indicator and the '10KAP' indicator. All indicators have shown that the concentration in Poland is much lower than in other European states and, in addition, fell in 2018 compared to previous years' research results published in the literature. The share of the Big 4 firms in the entire market is close to 35%, and of the 10 most important audit firms - to 53%. The Herfindahl-Hirschman index calculated globally for the research sample also points to relatively good conditions for the competition. An analysis of audits completed for the largest Polish listed companies included in the WIG20 and WIG30 shows a clear dominance of the Big 4 companies, of which Ernst & Young is in the best position. An in-depth analysis of the concentration levels in major sectors allows auditors specialising in certain industries to be identified. The best example here is the banking sector, in which the concentration measured by the Herfindahl-Hirschman index is definitely the greatest, with one undisputed leader - KPMG.

Annotation

It is proved that clusters, regardless of their occurrence circumstances, are an economic and managerial phenomenon. The motivating factors for this phenomenon occurrence, as well as the cyclical and conjunctural ones determining the intensity of cluster development are different. It is proved that public policy can positively or negatively affect the clusters development, but it rarely affects the origin of clusters. It is argued that, despite this, the examples of successful cluster development encourage governments to create clusters. Depending on the approaches used by governments, business activity often begins to take the form of business incubators, technoparks, technopolises and other organizational forms of innovative entrepreneurship, which have certain differences from clusters. The scientific novelty of the study is to identify the features that characterize clusters as an economic and managerial phenomenon. The practical significance of the study's results is the possibility of taking these features into account when making a decision about choosing an innovative entrepreneurship form for a particular region. In future studies, these features

may serve as the basis for designing the multi-criteria optimization models that will allow algorithmizing the decisions related to the choice.

Keywords: cluster, development, entrepreneurship, geographical location, innovation.

Purpose of Research

The study's aim is to identify the main cluster development stages and identify the features that characterize innovative clusters as an economic and managerial phenomenon.

Introduction

There are examples of economically successful cluster development in countries of different continents, what has prompted many scientists to investigate the circumstances of their origin and development. The scientific discussion in which the object of research is the economic category, "cluster" is usually acute and controversial. The reason is in the clusters heterogeneity, and, accordingly, in the variety of the factors determining the effectiveness of their functioning. Up to now, conceptual and analytical attempts to develop a fundamental philosophy that would be equally fair for all clusters without exception have been unsuccessful. This is probably due to the fact that each of the clusters is a phenomenon. Despite this, it should be recognized that a number of world-famous scientists have made a significant contribution to the explanation of the economic and managerial essence of the cluster phenomenon based on a deep analysis of empirical data. These studies may not have reduced the number of the discussion issues in this area, but they clearly confirmed the phenomenality of clusters and strengthened the analytical base for further research of trends and phenomena of the cluster development. This is important from the point of view of designing a science-based cluster paradigm.

Research Results

Clustering as a phenomenon of spontaneous development of entrepreneurship was first noticed in 1980 by A. Marshal. He noted that in some countries, unique business associations of the competing companies located in a certain geographical location have been formed. These companies compete with each other, but this does not prevent them from sharing experience, knowledge, and working together on some projects. A. Marshal argued that these business associations mainly consist of small companies that arose spontaneously and should be studied, since they are one of the significant reasons that explain the the population welfare of a certain geographical location [1]. The experience and knowledge transfer provides companies with sufficient advantages for joint competition in international markets, turns them into strong players, creates jobs and improves the financial condition of the region's population [2]. Moreover, companies that are rapidly developing provide for developing the related industries and are often a part of the same value chain.

The idea of business associations consisting of the companies that are competitors on the domestic market, but have compete together on foreign markets since the 90s, has become a topic of active scientific discussion. The concept of economic clusters is popularized by M. Porter, who transformed it into a scientific one, has been the subject of scientific research and government and private initiatives for two decades. M. Porter's model (also known as "Porter's Diamond") is based on four main factors that contribute to the clusters' emergence and development, namely: available resources, individual company strategies, market conditions, and the availability of related and supporting industries [3]. The first factor takes into account the surplus presence of certain resources, and that creates entrepreneurial advantages and allows young companies to compete on foreign markets. After gaining experience and reputation, the cluster members improve their own strategies by focusing on individual niches and jointly constructing value chains for highly specialized services or products. However, according to M. Porter these processes should take place under certain market circumstances and the presence of supporting industries that create favorable conditions for business activity inside the cluster. M. Porter argued that usually the cluster participants are concentrated on a

certain territory, which allows them jointly to lobby for their own interests, affect the development of infrastructure and communications [4].

Thus, in the early 90's, economists took the cluster as a certain phenomenon inherent in a certain geographical location and a consequence of the presence of favorable economic conditions. A. Marshal and M. Porter consider the environment, in which companies operate, as the basis for the cluster development. Accordingly, entrepreneurial initiative, science, cultural traditions, and religion are ignored. The wrongness of such conclusions logically follows from the fact that there are examples of clusters whose main development drivers are not available resources or government initiatives, namely cultural traditions and entrepreneurial activity of the population. They include textile clusters in Italy (the area of Bologna and Milan) and the United States (Georgia, Dalton), which were not promoted by government programs or the cheap resources availability. The main driving force was the historical traditions inherent in these regions, and they were implemented in a new way, subject to the stability of the economic and political environment.

Since clusters are an example of economic prosperity independent of the government decisions, they have begun to be seen as a basis for improving the people's lives in certain regions. Therefore, the problem of forming a cluster development model has been actively discussed in the scientific literature. The obvious drawbacks of M. Porter's model were generalized and reinterpreted by H. Etzkowitz, who proposed a model of abstracted interaction of three key factors (another name is "Triple Helix Model"): business environment, science and education, and government initiatives. H. Etzkowitz was the first to put forward the idea that an important factor in the clusters emergence and successful development is the support of educational and scientific organizations training skilled staff and delivering knowledge and technology inside the cluster. According to H. Etzkowitz, entrepreneurial environment is conditions of running business without the personal entrepreneurial activity of population in a certain geographical location on whose territory the cluster is located. H. Etzkowitz assigned an important role to government initiatives that aim at financing innovative projects, supporting and developing infrastructure, simplifying business conditions, promoting the development of science and education, and so on. H. Etzkowitz, like his predecessors, denies the historical and cultural circumstances of individual entrepreneurship of the region's population. H. Etzkowitz's achievement is that he concretized the supporting industries, reducing them to the sphere of public administration and scientific and educational centers [5].

The need for detailed scientific ideas and public recognition of the world economic system's shortcomings through the crisis of 2007-2008, leads to the desire to seek new solutions for developing the clusters scientific theory in order to use it for developing economically lagging regions and preserving the market positions of leading industries. The period since 2008 is characterized by the migration of capital, labor, and production capacity from the developed countries to the liberalized depressive centers with cheap labor and cost-effective logistics [6].

According to A. T. Kearney's international research organization's study, in the global equivalent, the share of foreign direct investment falling on the countries of North Africa and the Middle East is more than 50 % [7]. The capital migration process, which began actively in 2008 and was characterized by the movement of business centers from the developed countries to the East Asian ones, has changed the direction due to the economic growth of the latter and the cost rise of labor on their territory. According to this study, the share of investment for other continents is as follows: Asia-19 %, Europe-17 %, America-10 %. Industry (38 %), information technology (9 %), media (9%), and so on are the leading sectors in attracting foreign direct investment. Thus, current trends in capital migration prove that it is possible to create artificial temporary industrial clusters based on foreign investment and import of technologies and production capacities. However, such clusters are not the product of entrepreneurial activity of the region's residents and its cultural and religious traditions, and therefore, cannot be considered as a long-term economic phenomenon.

The change in the vectors of global capital transfer over less than a decade has helped to review the experience of forming clusters and monitoring their development, and has allowed supplying the existing theoretical assumptions with new models. One of them is "the Cluster Initiative Performance

Model (CIPM)" [8], which considers a cluster not as a phenomenon, but as a process of activity in order to ensure its own economic growth, based on correct forming tasks and a favorable environment (social, political, economic). The authors of the model focus on the environment stability as an important factor of the cluster growth. It is difficult to disagree with that. Indeed, the region destabilization (political, economic, or military) leads to changing market conditions that create opportunities for the clusters growth with a different specialization vector. For example, in war conditions, the products of the defense, telecommunications, textile, and food industries, etc., can be characterized by great demand, which contributes to the appropriate clusters' emergence and development.

Model CIPM is based on the following main principles:

- a cluster is characterized by a large number of links between business and the science and education sphere;
- a weight growth on an international scale;
- a high level of achieved goals in the field of new technologies development;
- the cluster development is accompanied by involving other industries and promoting their development;
- a level of business goals' achievement.

Thus, clusters after 2008 are beginning to be considered as one of the ways to ensure safe economic growth. Therefore, scientists ' attention to the causes of their occurrence and growth remains. The model presented above does not take into account the cultural characteristics and the propensity for entrepreneurial activity of the residents of the geographical location where the cluster member enterprises are concentrated. The main driving factors of A. Solvel's model are government initiatives, promotion of business development in the territory, links with the science and education sphere, the level of the financial sector development, interaction with organizations of marketing promotion and media activity [9]. According to this model, ensuring the cluster development is implemented through effective interaction with industries that contribute to strengthening market competitive advantages, and help in finding new markets, improving business processes, and simplifying business conditions. Since 2008, the cluster has no longer been considered as a natural phenomenon, but as a project of a enterprises group or a government program focused on business development in a certain region. The scientific theory of clusters has improved the current government programs for local business development by complementing them with improved strategies of narrowly specialized focus and step-by-step financing for business creation. Model CIPM considers the clusters development not only at the micro level, but also at the macro level, that is, the scientific theory of clusters becomes an element of public administration. This model also highlights the so-called "Porter's Diamond" as a theoretical basis for the scientific explanation of the clusters occurrence and the formation of methods due to their detection.

The above model has found wide support in the scientific community. Thus, one of the well-known researchers of the cluster theory is K. Ketels, comments the model in this way:"...clusters develop over time; they are not a phenomenon that just appears or disappears overnight ... ." K. Ketels defends the position that clusters can be created artificially, for this purpose it is necessary to form a single model that is superimposed on all possible examples of their origin and development. The scientific discussion on this topic is still open [8]. These models contradict each other in many ways, in particular, they exclude or add some of the factors (government initiatives, scientific and educational organizations), the role of cultural and historical circumstances in the clusters' origin and development is controversial. Modern scientific problems in this issue are similar in essence to the search for a "unified theory" or "theory of everything" in physics, which would allow reconciling the existing knowledge of quantum physics and relativity of A. Einstein. Inconsistency of scientific models of the cluster formation and development indicates the need for scientific formalizing the cluster formation process, which does not allow taking into account cultural circumstances and other irrational factors. Therefore, the problem of the cluster formation remains open at the conceptual level. The proposed models reveal the problem under study only at the general level, they do not

delve into the specifics of the origin of individual clusters, which proves that they are not implicit in practice.

In parallel with studying the determinant of the cluster origin, scientists focus on analyzing the process of the cluster formation and development. The scientific research actively begins in the second half of the 90s. Modern trends in economic, social, and demographic development, globalization, increasing social inequality, and the emergence of the theory of creative cities, industries, and class allow reviewing the ideas of M. Porter from a different point of view. Thus, in 1996. A. Malvel, O. Solvel and E. Zander describes the clusters development based on the model of economic agglomeration (accumulation of resources in a certain territory or among a group of economic entities), which occurs in a certain territory and leads to urbanization, the industrial areas formation, the cluster development and innovation [9]. The uniqueness of the economic agglomeration model is that it reflects the process of development of economic relations from innovation to the development of reserves to increase economic efficiency and increase the flexibility of business structures. Urbanization is a logical consequence of the innovations introduction and the entrepreneurial activity growth in the region. However, the model does not take into account the fact that large urban centers of global importance were not created due to innovation. They are mainly formed by historical circumstances and are tied to territories rich in resources. Artificial urbanization of a geographical location is more an exception than a logical and popular process (known in history as the foundation of the city of Constantinople (Istanbul)), which was created artificially and was able to function only under the condition of constructing a system of aqueducts that supplied fresh water). It is also important that the model contrasts the processes of clustering and urbanizing. These processes run in parallel, and clusters acting as a catalyst for innovation, which makes it possible to form industrial areas that cause increased urbanization.

The assumptions made in this theory do not take into account the aspect of the creative economy [10], since its existence was theoretically proved, until 2003, while R. Florida does not begin to promote the ideas of the creative class, creative cities and industries. The theory was finally formed in 2008 [11].

Urbanized economic centers are not always the centers of well-being for their residents. The creative sector of the economy requires certain knowledge and skills, which are not always possible for a part of the population. Hence, the privileged "caste of sorcerers from the valley" (many clusters by analogy to Silicon Valley, also called valleys: Fiber-optic valley in Sweden, Motorsports valley in England, Multimedia valley of Flanders in Belgium, the valley of materials in Germany (the area near the city of Frankfurt am Main)) is characterized by a significantly higher standard of living than the other members of society. This position is key in the criticism of the urbanization and creative economy theories. Clusters among these assumptions should be considered as one of the tools for technological development of the region and its dominance in the global segment. Therefore, the formation of the latter is updated by government programs and international investment projects. The dependence of the dynamics of the clusters' origin and development on investment logically follows from the fact that in the modern world, available finance is a rational substitute for the absence of certain types of resources on a certain territory. This assumption was proved in a study by A. T. Kearney [6], which also provides a forecast of a slowdown in the growth rate of global foreign direct investment in the period 2017-2019, followed by a decrease of 40-50 %. Accordingly, the dynamics of the formation and development of some artificial clusters, for example, "Egypt's Smart Village" or the defense cluster in Saudi Arabia created exclusively with the assistance of the government and international technological and financial investments. From this point of view, the autonomous clusters, originated through the population's entrepreneurial activity and the region cultural characteristics in the conditions of investment activity decline, are characterized by certain competitive advantages.

The dynamics of cluster functioning, the transition from the innovative development to the formation of industrial agglomerations are due to various types of internal and external interaction of the cluster elements. This problem was highlighted in the models of A. Markusen [12]:

1."Marshall" cluster model characterizes the clusters consisting of a large number of similar-sized companies that jointly develop a product, often being part of the same value chain. All these companies compete with each other at each stage of the value chain. It creates a sharp, highly specialized competition inside the cluster and makes its participants more competitive on foreign markets.

2. The model of "hub and speaker". The cluster consists of a large number of small companies and one large one. Most customers and suppliers interact with the cluster through a large company. Small companies are mainly links in the value chain of a large company. This model is also called the "Scottish cluster model".

3. Satellite cluster model. The cluster is an artificial entity consisting mainly of companies of the same specialization and size that compete with each other on foreign markets. Usually these companies are subsidiaries, hence the name of the model. All the companies in this type of cluster have unique value chains that do not overlap.

4. State-centralized cluster model. The cluster consists of a large number of small companies and one large company, which is fully or partially owned by the state. An example of such clusters is the defense sector in the United States, where state-owned enterprises have the majority of manufacturing contracts, but private companies are subcontractors. A similar model can be implemented in Ukraine. "Ukroboronprom" can act as a large state defense concern, and private companies can act as executors. If they are concentrated on a certain geographical location, we can talk about the origin of the cluster.

Models of A. Markusen are an attempt of the detailed description of the dynamics of cluster development. The scientist uses not one, but several models, which means that the cluster formation process is still not fully understandable. All the models describe different scenarios of the cluster origin and development at different concentrations and characteristics of its participants. It is interesting that these models generalize the experience of empirical research of the mentioned scientist, they reflect the solution of the problem as it was observed in one of the several studied clusters. Moreover, the models of A. Markusen are rather a mechanism of interaction between the cluster members, they do not characterize the real reasons for their formation and prosperity.

Therefore, the scientific works that should be recognized as the fundamental ones in studying clusters can be divided into two groups-those that try to explain the nature of the clustering phenomenon in the economy, and those that focus on the cluster development process. This division is conditional, since both the first and second groups identify factors that have a determining influence on clusters. The analysis of these factors is a way to identify the fundamental essential features of clusters. One of them, which is not objectionable, is the geographical location of business activity of entities that are independent economic entities. The other signs for today are debatable. This is due to the phenomenality of the each of the clusters' emergence and development. In the above-analyzed scientific works, almost all the researchers note that the clusters' origin and prosperity occur when favorable conditions arise. The concept "favorable conditions" is interpreted by scientists in different ways, as a combination of all together or separately taken conditions such as: natural features of the region, features of historical circumstances and traditions, the exclusive policy of government, and so on. It should be noted that more and more scientists are focusing on the fact that favorable conditions for the clusters' origin and development can and should form governments, but not all of these scientists have an adequate vision of the common and distinctive features between clusters and other forms of innovative entrepreneurship.

Abstract

Innovative clusters are considered as a dynamic environment in the competitiveness management system. It is proved that this environment creates certain competitive advantages for business entities. Based on the results of the study, the sources of innovative clusters competitiveness are identified and grouped by factors of direct and indirect impact. It is proved that some of them have a particularly significant impact on certain stages of forming and developing innovative clusters. The presented results form a theoretical basis for modeling the competitiveness management system of innovative clusters in order to determine the vectors of its improvement in the future.

Keyword: Innovation Cluster, Competitiveness, Management, Development

Introduction

The companies competing on their own are characterized by less stable market positions than a group of companies in the long term. Entrepreneurship is a natural process, a kind of symbiosis of communication and transfer, which ensures the distribution of resources between market participants. Accordingly, IC is one of the entrepreneurial interaction forms that is characterized by an improved mechanism of market expansion in the global economy. Given this, it is relevant to manage the development of innovative clusters that would be sensitive to the factors affecting the innovative clusters' competitiveness.

The emergence of innovation clusters (IC) is one of the natural economic phenomena formed due to the presence of appropriate circumstances. The main circumstances of increasing the concentration of a certain type enterprises on a certain territory is usually associated with cultural, historical and geographical features and is based on high entrepreneurial activity. The government decisions to a certain extent can only influence the long-term historical process of forming an entrepreneurial culture in the region, since most economic strategies of regional development are focused on a period of up to 5 years, while forming IC can last for decades. An example of the historical circumstances of IC origin is the clusters of the textile industry in Italy (the districts of Bologna and Milan), in which this industry has been dominant for a long time due to its historical and cultural characteristics. As a result, the concentration of entrepreneurs working in this market grew rapidly, which contributed to IC origin. Another example is Silicon valley (a district in California, USA) formed under the influence of new technologies origin and the enthusiasm of young entrepreneurs who were the first to understand the market potential of new technologies. IC is nothing more than a competition evolution product, as the economic development dominant factor, which requires the management on a systematic basis.

Review of previous studies

In the scientific literature, there are quite a lot of studies devoted to analyzing the prerequisites [1] and the emergence features [2] and [3] clusters' development. A number of scientists studied the role of public administration in forming innovative structures [4], by approaches to assessing economic efficiency [5], [6] and the clusters competitiveness level [7]. Despite the large number of scientific papers devoted to the innovative clusters' development, there are still issues that are a constant subject of the discussion, namely the sources and factors for ensuring the innovative clusters' competitiveness, as well as the stages of forming and developing innovative clusters. These issues are crucial in building rational systems for managing the innovation clusters' competitiveness.

Research Results

The scientific world considers the problem of IC development in managing this process as a phenomenon that occurs when several important factors, the list of which is still debatable, interact. It is worth noting that most of the presented models and theories have already been created by IC, so they are more likely to answer the question of the reasons for their successful development than the question of how they were created. These points of view are a generalization of empirical factor analysis. They are versatile, inconsistent, and reflect individual ICs, but do not characterize them as an economic phenomenon in general.

It is almost impossible to apply the above mentioned models in implementing various government and private initiatives, since all these models reflect the main features of the interaction of already the formed system of economic relations inside IC and outside. None of them demonstrates the origin of IC and does not reveal the features of this process. Therefore, designing artificial ICs by copying the" interaction "theoretically described in the models presented above, is nothing more than a "fake" of specific ICs in a certain territory. It seems more likely that the government can create economic zones promoting the high business activity, and then forming ICs will be possible if there are appropriate historical and cultural characteristics, a high level of the local population entrepreneurial activity, and the necessary resources' availability [13]. Artificial forming ICs is a complex, individually creative process that cannot be fully based on one of the existing theories. Therefore, the government initiatives should be aimed at supporting the development of already existing ICs rather than forming them.

Based on the lack of a sufficiently detailed interpretation of the sources of IC competitiveness, it is advisable to present own understanding of what factors play a decisive role in forming ICs, which of them contribute to forming a certain specialization business and increasing its concentration on a certain geographical location. Based on an empirical analysis of the textile cluster emergence in Italy, Silicon valley in the United States, and IT clusters in some cities in Central-Eastern Europe and South Asia, we can say that the origin of ICs is not a random process that depends entirely on historical,

cultural, and political circumstances, since some of the ICs were originated in a not too "friendly" economic and political environment. Most of them were formed due to the development of the latest technologies and unique traditions of a particular region, which explains their location and success, moreover, it also explains the high level of enterprises specialization in ICs.

The local population entrepreneurial activity plays a significant role, since it determines whether the residents of a particular region are able to convert the advantages of their region into wealth. The most important element of small and medium-sized businesses are business founders who believe in the success of their own business, have a significant experience in manufacturing this or that product and have the appropriate skills to sell it. A high proportion of people with these skills is one of the significant competitive advantages of ICs, as it demonstrates whether IC can grow by attracting investment and opening new businesses that will bring new experience, technologies and customers to IC.

In addition to these factors, the state authorities' assistance is also important. The significance of this factor is not decisive, since even in the absence of economic advantages for the enterprises of a certain IC type, its successful economic development is still possible. Analysis of some ICs formation and development experience proves that the indifferent attitude of state regulators usually even more favorably affects the economic state of ICs than the interference in its functioning. However, in conditions of political and economic instability, the economic IC may lose market positions, as the best specialists leave their companies in search for more stable working conditions, companies change their location, and so on. In conditions of acute regulating, the origin of ICs is complicated and the one which will not be characterized by significant competitive advantages in the long term [14]. However, the above done analysis proves that the state regulators' assistance is not decisive in the ICs success, since in the history of economic relations, the formation of globally successful ICs from small and medium-sized businesses is possible only if there are appropriate features of a particular region. The exception is direct investments of the international multinational giants in a certain region with cheap resources. Despite this, such ICs mainly consist of large enterprises that do not contact each other in any way, and therefore, it is unlikely that such economic entities can be called full-fledged ICs. Benefits from their formation are usually received by a small group of people, large investors having sufficient resources to lobby their own interests in public authorities, which creates deficit zones on the territory of a certain country, deepens inequality and leads to the depreciation of the labor force.

Infrastructure also has an important influence on the formation of ICs. Its presence simplifies the business environment and contributes to the entrepreneurial activity growth. Therefore, the access to high-speed Internet, high-quality roads and other factors simplifies the running of small and medium-sized businesses, contributes to its birth and development. An IC with a developed infrastructure is significantly more competitive than a similar IC without it.

It is also worth mentioning that the development of ICs usually takes place in a territory that is characterized by favorable climatic and natural conditions. The example can be a technological IC in Silicon valley located in California (USA), a textile IC in Italy (areas of Bologna and Milan), and many others. Many companies and freelancers working in the field of high technology are moving their own business to Thailand. The communication with the companies' employees of the Lviv IT-cluster shows that some companies from Lviv are planning to move to the " hot lands " (for example, the Ukrainian company" PIPL", the manufacturer of the world-famous Ajax alarm system, have moved some of their offices from Kiev to California (USA)), most of them work in the field of crypto currency. The emergence of some tourist ICs is often based on appropriate natural conditions, which contributes to the ICs promotion and business development on its territory. It is interesting that most economic theories are based on scientific empirical observations, whose authors are business representatives, thus, many factors, whose impact can not be directly analyzed, are often omitted. Therefore, the fact that weather in new York influences on the dynamics of prices on international speculative markets can be considered comical, but this influence exists, although it is not significant, since the person psychological dependence on the weather is scientifically proven. The high psychological state contributes to the risk growth, the depressed state reduces the person activity,

makes it less risky, which affects the investors' decisions, and therefore, affects short-term price fluctuations. The exceptional development of philosophy and science in Ancient Greece was not accidental. One of the reasons was the favorable natural and climatic conditions that allowed the ancient Greeks to focus on their own intellectual development. Human behavior is subject to nature laws, and therefore, it depends on its natural environment, which should be taken into account when conducting scientific research on the IC exceptional success in a particular region.

The generalization of these factors' influence and the process of IC formation and development allows dividing them into certain groups, when analyzing their influence weight and specificity (Fig. 1).

Fig. 1: Factors of direct and indirect influence as sources of IC competitiveness

Symbols: arrows indicate the transition between links of a certain group or process stages, lines indicate that elements belong to a certain logical group; a dashed arrow indicates the special influence of certain factors on some stages of cluster development.

All the identified factors should be divided into factors of direct and indirect influence. This allows explaining the interaction between them and their role in the IC formation. In addition, this allows dividing the tools for regulating the IC development by weight. This approach is especially valuable when analyzing the IC competitiveness, since it indicates the directions of scientific research, allows focusing on certain factors, and forms a theoretical basis for further scientific research. All the

selected factors should not be considered as a system of a single whole, the presence of some can also serve as a sufficient reason for the IC formation and its successful economic development, but if there are similar IC competitors, the advantage is of the one who has a full set of these factors. This approach assumes that the IC formation occurs gradually, and not under the condition of artificial mass concentration of a certain type enterprises on a certain geographical location, which is characterized by cheap resources. Among the process stages of the IC formation and development, first of all, it is necessary to distinguish the growth stage of the small and medium-sized businesses concentration in a certain territory, provided that there are cultural, educational and scientific opportunities for a certain specialization. This contributes to the accumulation of unique experience, knowledge and skills and deepens interaction with educational and scientific institutions, promotes communication inside IC, and forms the basis for the emergence of large companies having sufficient competitive advantages to further enter international markets.

At the stage of increasing the small and medium-sized businesses concentration in a certain territory, the IC is already becoming a strong player in the international arena, there is an abnormal increase in wages for a geographical location, there is a specialization deepening, and business activity increasing. IC begins to attract resources, labor, and technologies, whose cost begins to grow inside IC. Each of the stages of the IC development is the basis for further acceleration of exponential growth. With the transition from one stage to another, the level of competitiveness increases, the weight in the international arena increases, and the market positions of its participants increase. The process of the IC development and formation is a natural exponential process, which organically reflects the nature and society laws in the economy and is the next milestone in the competitiveness growth of its individual players, who gain competitive advantages from interaction with medium and small businesses. IC acquires the features of a revolutionary new link in the structure of global competitiveness enhancement, technology development, narrow specialized products improvement, obtaining new experience and supplying high-quality personnel for the further industry development and its entry to a new level of improving its own competitiveness. It is important that the exponentially growing processes in the economy are characterized by a high risk of "bubbles" and financial crashes [15], [16], however, most ICs compete not by increasing the value of their own assets, but by creating a qualitatively new competitive product that the company cannot generate individually. One feature of the given list of the IC competitiveness sources is the allocation of some factors' significant influence on the stages of its formation and development [17]. These factors include cultural and historical circumstances, as well as education and science. Thus, the inheritance of the developed technical school of the Soviet Union contributed to the IC development in Ukraine, Russia, and Azerbaijan. Cultural and historical circumstances contributed to the textile industry development in Italy. Therefore, it should be noted that the presence of certain cultural and educational features contributes to deepening specialization of enterprises in a particular region [6]. This proves that the presence of these factors is necessary for the IC origin, because if there is no narrow specialization, territories with a high concentration of small and medium-sized businesses can be considered exclusively as an economically developed region, but not as an IC. In this case, it is important to distinguish the IR concept in astronomy and in economics.

Conclusion

It is proved that the classification of innovative clusters' competitiveness sources should take into account all the success factors of clusters by the nature of the impact and the significance level depending on the stage of the cluster's life cycle. Based on the conducted critical analysis, the classification takes into account the factors that were not reflected in the existing models describing the origin and development of innovative clusters. We are talking about cultural, historical, natural and climatic circumstances. These factors should be taken into account, as they affect the development of clusters in the textile industry, tourism, and extractive industries.

Scientific novelty of the study is as follows: allocating the process stages of the emergence and development of innovation clusters; identifying the factors of the direct and indirect influence on the innovative clusters' competitiveness in the context of individual stages of their origin and development.

The future research should be carried out in the direction of building a system-functional model for managing the innovative clusters' competitiveness, which would allow quantitatively parameterizing the values' nature of the identified factors and provide for the choice of alternative solutions to influence these factors and adapt to them.

Learning from Mistakes.
A Study on Maturity and Adaptability to Change

Abstract

Learning culture matters; company culture must support continuous improvement. Organizational learning is a process of identifying and modifying mistakes that result from interactions between co-workers. The article aims to explore the learning power via errors, using the level of organizational maturity as a moderator. Companies need to know how organizational maturity may moderate the adaptability to change via the acceptance of their mistakes. Based on 380 samples gathered from November to December 2019 among Polish employees working in knowledge-driven organizations across various industries, and analyzing the data using PROCESS software, the authors established that employees working in young organizations adapt to changes better than those who work in mature companies. On the other hand, the acceptance of mistakes by mature organizations significantly improves their adaptability to change. The study shows that mature organizations achieve better change adaptability than young organizations when accepting mistakes. The conclusion is that mature organizations may adapt to changes only if they accept errors (learn from their errors). Concerning young organizations' mistakes, their effect on adaptability to change is not significant.

Keywords: Constant Learning Culture, Hierarchy, Organizational Development, Mistakes Acceptance, Change Adaptability, Organizational Learning

Introduction

Peter Senge (2006) claimed that if somebody wants to learn, then he must be ready to be wrong. However, the fact that organizations want to learn does not mean that they accept that their employees make mistakes. It is one of the biggest paradoxes of "learning organizations today." Inspired by this paradox, the authors decided to investigate the learning from errors by organizations in the light of their maturity level. Does experience matter for the acceptance of mistakes and adaptability to change?

The value of learning via mistakes has been lately highlighted by Kucharska and Bedford (2019), but also in earlier works by Anselmann and Mulder (2018), and Debowski, (2001). It is worth noticing that organizational learning is even defined as a process of identifying and modifying mistakes resulting from interactions between co-workers (Argyris and Schön, 1997). Mistakes are controversial. They are invaluable for those who want to improve, but their effectiveness in the learning process is subject to discussion. Some lessons learned from mistakes can be very costly. It is probably the reason why they are not welcome by organizations. This study aims to compare the influence of acceptance of mistakes on the adaptability to change in conditions of low, medium, and high maturity level.

If organizations want to grow, they need to learn and change. Change is not only a major characteristic of today's business environment, but it is also a chief result of learning. That is why making mistakes can foster the adaptability to change. When we learn, we change the perception of things by knowing more. It works for individuals and organizations. Organizational learning and change are interconnected (Argyris, 1982; Watad, 2019). Nadim and Singh (2019) pointed out that change as a phenomenon is tied with continuous learning. Moreover, Garvin et al. (2008) stressed that being a learning organization characterizes openness to make changes when needed, and errors are the essence of organizational learning (Zappa and Robins, 2016). Hence it is good to know how strongly mistakes acceptance fosters change adaptability.

The maturity level combined with experience is expected to be an advantage of any organization involved in business projects (Mullaly, 2014). The latest studies (e.g., Kumar and Shushil, 2020; Marques et al., 2019; Andreasen and Gammelgaard, 2018; Grossman, 2018; Johansson et al., 2019; Muszynska, 2018; Uskarci and Demirors, 2017) and the majority of existing organizational maturity models (e.g., Paulk, 1993; Fischer, 2004; Harmon, 2004; Rosemann and de Bruin, 2005; Gunsberg et al., 2018) focus on communication, knowledge management, technology development, and processes which, if constantly optimized, enable mature organizations to grow. The current study focuses on mistakes as a source of new knowledge, which is desired if an organization wants to learn, improve, and grow. The key question of the study is whether the maturity level moderates the ability to adapt to changes driven by the acceptance of mistakes? The study aims to address this problem.

Conceptual Framework

Company culture matters for learning (Rebelo and Gomes, 2011; 2017) and knowledge sharing (Kucharska, & Bedford, 2019). Knowledge creation is an intense process of human imagination, finding solutions, and learning from errors (Jakubik, 2008). Argyris and Schön (1997), Debowski (2001), Senge (2006), Garvin et al. (2008), and Rebelo and Gomes (2011; 2017) also highlighted that a learning culture must include the acceptance of mistakes to enable people to leave their comfort zone and solve problems by developing new approaches. Hind and Koenigsberger (2008) and Thomas and Brown (2011) also followed this line of thinking and stressed that a higher level of acceptance of mistakes fosters a learning process reflected in the level of the adoption of the inevitable change. Organizational maturity and agility promote adaptability (Gunsberg, 2018). Mainga (2017). Kucharska and Bedford (2020) stressed that constant learning culture must be composed not only of the learning environment but must also accept mistakes. Hence, based on the above the following hypothesis has been formulated:

H1: Maturity level moderates the relationship between the acceptance of mistakes and adaptability to change.

The figure 1 below visualizes the theoretical assumptions.

Fig 1. Theoretical framework

Method

The study used a sample consisted of 380 cases. Respondents were recruited among Polish employees working in knowledge-driven organizations across industries, via a research panel recruited by answeo.com. (Appendix A). The majority of the sample is represented by men (50%) aged 25-34 (43%), working in small and medium companies (56%), in the IT (30%), Sales (12%), Finance (11%), and Production (9%) industry. Data were collected from November to December 2019. To enable the measurement of the level of mistake acceptance and change adaptability, respondents answered questions using a 7-point Likert scales that came from Kucharska & Bedford's (2020) earlier study. After the positive sample and scales assessment, composite variables were created to analyze all the above-hypothesized relationships using the regression PROCESS procedure for SPSS version 3.4 (Hayes, 2018). The maturity level was measured by a declaration to be low, medium, and high at the time of its existence.

Results

The results indicate that young organizations are characterized by high adaptability to change, even with the low level of mistake acceptance. Whereas for organizations with medium and high levels of maturity, the change adaptability grows with the mistake acceptance. However, this effect is significant only for high-mature organizations (p=.0111). In the case of young organizations and organizations with medium maturity levels, the influence of the mistake acceptance on change adaptability is not statistically significant (for more information go to Appendix 1). Figure 2 below illustrates all the above-described effects. Table 1 presents hypothesis verification, and Appendix 1 shows all PROCESS software output details.

Discussion

Referring to Paulk et al.'s (1993) and Terouhid and Ries's (2016) model, optimization is the highest level of maturity that leads to a continuous improvement of processes. Hence, the above findings perfectly respond to these models. Mature organizations develop through constant improvement and, therefore, constant learning from mistakes is a great way to optimize and change. Terouhid and Ries (2016) stressed that organizational maturity concentrates on organizational processes, and organizations with top maturity level may achieve sustainability and leadership. Therefore, it seems vital that mature organizations that want to learn from mistakes need to develop appropriate mechanisms to do so. De Boer et al. (2015) also emphasized that mature organizations usually operate within a complex environment and continuous improvement of operations is the best method for them to grow. A complex environment requires

complex monitoring. In light of what has been said, new errors may be treated as a valuable symptom of change. Namely, in a well-known business environment of a given branch or industry, each new error may be a warning signal that something has changed or is worthy of change. Farnese et al. (2019) stressed that authentic leaders could foster policies and practices to manage errors proactively.

Limitations & implications

One of the limitations of the current study is linking the measurement of a maturity level to the time of its existence. Kumar et al. (2013) proposed a more refined method which, if applied, could have led to more accurate results. Another limitation is the fact that learning from mistakes is a rather non-formal and, therefore, subconscious phenomenon. Consequently, the low R-sq=0.0486 obtained for the entire model does not surprise. Since the process is so specific, perhaps choosing a method different than "a self-report questionnaire" will be better for further exploration of this problem. Moreover, the findings demonstrate the importance of studies on the topic of mistake acceptance as vital for learning organizations and one which should be investigated in more depth. The results of this study are based on a Polish sample, therefore, additional national studies are needed. As Kucharska & Bedford (2019) noted, national culture is vital for knowledge sharing and job satisfaction.

Practical Implications

The most important practical implication from the presented study applies to mature organizations. The acceptance of mistakes allows them to adapt to changes more effectively. Hence, mature organizations need to create mechanisms that support learning from mistakes. As it was noted in the introduction section, errors are commonly perceived as a phenomenon that should be eliminated, and that is why employees often conceal their mistakes. Since everybody makes mistakes, and everybody covers them, it contributes to creating a sort of illusion. The findings of the study encourage mature organizations to "be mature" and develop internal mechanisms that will help them take advantage of the mistakes employees make to transform them through "lessons learned." Mistakes are the best source of new knowledge, which is important if we want to achieve better adaptability to change. The organizations with a low maturity level characterize a high level of change adaptability. It is because they develop mainly by the adaptation to the particular market rules and standards imposed by market leaders (mature organizations). If they want to win the market, they need to offer standards as a minimum and something above these standards. It is why mistakes acceptance gives them the opposite effect on mature organizations. The early stage of development is not a good time to learn via mistakes. It is better to learn by adaptation. It is opposite to mature enterprises. They can't develop by the adjustment to standards they create themselves. They can adapt to business environment changes via learning from mistakes. Summarizing, young organizations develop by adaptation, mature organizations learn from anomalies identified thanks to noted errors.

Conclusions

This article, similarly to Kucharska and Bedford (2020) and Kucharska (2020), exposes the paradox of ignoring mistakes by present-day "learning organizations." The findings show that mature organizations might adapt to changing environments significantly better when learning from mistakes. Also, if they do not accept mistakes, the observed adaptation level is low. It explains why mature (often big and with strong hierarchies) organizations are slower and less agile than non-hierarchical organizations. This study demonstrates that for young organizations to survive and advance in a particular industry, they must adapt quickly, and therefore they must not allow for mistakes to happen. On the other hand, mature organizations, a long time in the game, can only grow by learning from their errors because they set business standards for the whole branch or even industry. The most significant player always dictates terms to its followers. Of course, both young and mature organizations need to adapt to constant technological, societal, cultural, political, and other environmental changes if they want to grow.

However, in the case of mature and experienced organizations, new errors may be a valuable symptom that in a well-known business branch or industry, something has changed or is worth changing.

Abstract

The enterprises undertaking innovation activities in the European Union countries operate in a diverse environment, not always friendly to innovation processes. They are influenced by a number of internal and external factors constituting barriers for the implementation of innovations. As a result of diverse conditions for the development of innovation in the EU countries, the individual barriers to innovation processes may be of different significance for enterprises. The first part of the study presents an overview of the subject literature output focused on the systematics of key factors hampering or preventing the activities aimed at the implementation of innovation (e.g. deterrent and disclosed barriers, internal and external and also economic, knowledge-related, market and institutional ones). The second part discusses the results of empirical research focused on verifying the adopted hypothesis – the key barriers to innovation activities of enterprises in the EU countries create cost factors and their disclosure, along with other barriers, results in the interruption of innovation processes in their implementation phase (high intensity of obstacles to innovation activities is manifested in low values of the aggregate innovation indicator). The European Innovation Scoreboard data and the research results covering innovative enterprises as part of the last edition of the Community Innovation Survey constituted the information basis of the conducted analyses. The research used multi-dimensional statistical analysis methods, with particular emphasis on the classification methods.

Keywords: Innovation Activities, Innovative Enterprises, Barriers to Innovation Processes

Introduction

Technological progress, the dynamically developing international competition and shorter product life cycles exert pressure on enterprises to implement innovations (Ajagbe and Ismail 2014). The capacity for creating and implementing innovations has become the essential success factor, determining the competitive position on the market (Calantone, Cavusgil and Zhao 2002; Jin, Hewitt-Dundas and Thompson 2004; Hult, Hurley and Knight 2004). The enterprises implementing new or significantly improved solutions – product, process, organizational and marketing oriented – achieve better results than the entities not involved in such activities (Crepon, Duguet and Mairesse 1998; Miozzo and Walsh 2006).

The need to intensify innovation activities seems undebatable, however, the research in this area does not follow a clearly defined path. Approaching the achievements of the subject literature in general terms, the factors facilitating and strengthening innovation processes, as well as the ones preventing or hampering these activities, i.e. barriers to innovation, can be analysed. The identification of innovation determinants was attempted in many studies (Montoya-Weiss and Calantone 1994; Cohen 1995; Henard and Szymanski 2001) to specify the driving forces responsible for the intensification of innovation processes and also to discover the existing correlations between them and, e.g., enterprise performance results. Much less attention was paid to the factors which either prevent or hamper innovation activities (Baldwin and Lin 2002; Silva, Leitão and Raposo 2007; Iammarino, Sanna-Randaccio and Savona 2007, Mohnen, Palm, Schim van der Loeff and Tiwari 2008). Such disproportion does not seem

justified. The intensification of innovation oriented processes cannot be limited to seeking innovation-friendly factors or identifying barriers to innovation. The complementarity of these approaches is demonstrated by, e.g., the research results indicating that a barrier for one company can simultaneously turn out an opportunity for another company (Duarte, Madeira, Moura, Carvalho and Moreira 2017).

The presented analyses and considerations address innovation barriers and put forward the following research hypothesis – the key barriers to innovation activities of enterprises in the EU countries create cost factors and their disclosure, along with other barriers, results in the interruption of innovation processes in their implementation phase (high intensity of obstacles to innovation activities is manifested in low values of the aggregate innovation indicator).

Barriers to innovation activities – the subject literature

Any factor resulting in abandoning the innovation oriented processes as well as delaying or distorting their results remains a barrier to innovation activities (Mirow, Hölzle and Gemünden, 2007). It is clear from this definition that barriers to innovations can have different effects. In a positive case, their consequence is a delay in the implementation of innovation, whereas in a negative one – abandoning an innovation activity prior to its commencement, the interruption of an innovation process in its implementation phase, or an incomplete implementation of a new or a significantly improved solution. The spectrum of the aforementioned consequences does not take into account the possibility of overcoming barriers to innovation activities without some detrimental impact on this process (timely and full implementation of innovations despite the existing impediments), which seems to be a serious shortcoming. For this reason, it is worth adopting that barriers to innovations are created by the factors either hampering or preventing the activities aimed at implementing innovations.

The factors hampering or preventing the activities focused on implementing new or significantly improved solutions can be classified in different ways. If the decisions made by enterprises, regarding the implementation of innovation activities, are adopted as the basis for their identification, the deterring and revealed barriers are distinguished (D'Este, Iammarino, Savona and Tunzelmann 2012). The first of them discourage enterprises from engaging in innovation processes. The absence of activities in this area may result from, e.g.: excessive costs of innovations in relation to the financial resources at the disposal and no possibility of obtaining them from external sources, insufficient qualifications of the enterprise employees, difficulties in attracting cooperation partners, or uncertain demand for innovative products or services. It is worth highlighting that these impediments are identified ex ante, prior to commencing the innovation activity and determine its abandoning (Ee Shiang and Nagaraj 2007). The enterprises involved in innovation activities have a different view on barriers to innovation. Among them there are entities identifying and solving specific problems (so-called revealed barriers). Recognizing barriers in due time increases the chance of facing them and overcoming the existing difficulties (Hueske, Endrikat and Guenther 2015). Following an optimistic scenario, one can assume that identifying specific barriers to innovations simultaneously determines the ways of overcoming them (Chen and Hove 2011).

The distinction between the revealed and deterring barriers to innovations is of utmost importance, because the innovating and non-innovating enterprises perceive the importance of individual impediments differently (Arundel 1997, Baldwin and Lin 2002; Galia and Legros 2004). Taking up actions aimed at implementing innovations increases the awareness of impediments that may either hamper or prevent the implementation of new or significantly improved solutions (Galia and Legros 2004). This knowledge is absent in the enterprises deterred by the barriers to innovation activities.

The location of factors hampering or preventing innovations remains yet another criterion for the division of barriers to innovation activities. These factors can be located in an enterprise itself or in its environment, which results in distinguishing internal and external impediments (Hadjimanolis 1999; Mohnen and Rosa 2002; Tourigny and Le 2004; Duarte, Madeira, Moura, Carvalho and Moreira 2017). Enterprises experience internal barriers when, e.g., their own funds for innovation activities are unavailable, they lack adequately qualified personnel or struggle with the organizational rigidities (negative attitude of the management and/or staff to changes). External barriers arise when enterprises

face problems in accessing external finance (bank loans, venture capital, public funding or subsidies), technological information, potential cooperation partners, etc. (Segarra-Blasco, García-Quevedo and Teruel-Carrizosa 2007).

The above mentioned division of barriers to innovations is supplemented by the classifications focused on a comprehensive systematics of the factors hampering or preventing innovation activities. An interesting proposal in this respect was presented by Szultka (2008, pp. 23-24) who identified the factors related to:

- funding innovation activities,
- internal potential of an enterprise,
- investment risk in new technologies,
- demand for new or improved products,
- information flow,
- R&D sphere potential,
- intermediary infrastructure,
- legal provisions and administrative procedures,
- public support.

These factors are substantiated by the, located within them, barriers to innovations. For example, the factors related to the internal potential of an enterprise include as follows: resistance of employees to changes, absence of the adequately qualified staff, insufficient qualifications of the management, lack of strategic planning, etc.

Another, generally known proposal for the systematics of barriers to innovations is presented in the Oslo Manual [OECD/European Communities 2005], which constitutes, among others, the basis for conducting research addressing the factors hampering and preventing innovation activities within the framework of the Community Innovation Survey (CIS). CIS results are presented in the EUROSTAT statistical data resources. According to the statistical nomenclature, the cost barriers (lack of internal finance, lack of external finance – credit or private equity, high costs, difficulties in obtaining public grants or subsidies), the knowledge-related ones (lack of qualified employees within enterprise, lack of cooperating partners) and also the market barriers (uncertain market demand, high competition) are listed among the potential barriers to innovation activities faced by the enterprises involved in the discussed processes.

Information Basis, Research Scope and Method

The statistical data from the latest edition of the Community Innovation Survey (CIS 2016) constitute the information basis of the presented research. The Survey results were provided as part of the official statistics (Eurostat 2019; retrieved on November 29, 2019) and the European Innovation Scoreboard 2017 (The European Innovation Scoreboard 2017 provides statistical information covering 2016).

The comparative analysis of the European Union countries, in terms of barriers to innovation activities, was based on 6 indicators determining the percentage of innovative enterprises indicating high importance of (in a four-point grading scale: 1 – high, 2 – medium, 3 – low, 4 – irrelevant):

– cost barriers (% of innovative enterprises):
–
C_1 – lack of internal finance,
C_2 – lack of external finance (credit or private equity),
C_3 – high costs,
C_4 – difficulties in obtaining public grants or subsidies;
– knowledge-related barriers (% of innovative enterprises):
K_1 – lack of qualified employees within enterprise,
K_2 – lack of collaboration partners;
– market barriers (% of innovative enterprises):

M_1 – uncertain market demand,
M_2 – high competition.

To determine the profiles of developed classes covering the EU countries, the Summary Innovation Index (SII) and 10 indicators describing the dimensions of innovation processes according to the European Innovation Scoreboard 2017 were used: Human resources, Research systems, Innovation-friendly environment, Finance and support, Firm investments, Innovators, Linkages, Intellectual assets, Employment impacts and Sales impacts (*European..., 2017*).

The time range of the research covers 2016 and the spatial scope includes 22 countries of the European Union. Denmark, Ireland, United Kingdom, Sweden, Netherlands, Spain are not included in the research due to the total unavailability of statistical information. In the case of Czechia and France the data were partially unavailable, which was supplemented using the step regression method.

The research was carried out in accordance with the adopted research scheme:
Stage I of the research – detailed analysis of barriers to innovation activities in the individual EU countries.

1. Identification of 3 key barriers to innovation activities within the individual EU countries and seeking general regularities in this respect.
2. Identification of the dominant indications identifying barriers to innovation activities in the cross-section of the EU countries (analysis of the distribution of indicator values regarding the "difficulties" in innovation development).
3. Identification of outliers among the EU countries in terms of the indicated barriers to innovation activities using box plot.

Stage II of the research – identification of the EU countries with similar indications of the innovative enterprises for barriers to innovation activities of high importance.

1. Classification of the EU countries in terms of the revealed barriers to innovation activities. The output statistical information regarding barriers to innovation processes was subjected to classical standardization, the distances between countries were determined using the Euclidean squared distance, then Ward's hierarchical agglomerative clustering method. The criterion of the first clear increase in agglomeration distance was used to determine the number of classes by analysing the dendrogram of connections, the integration distances and the classification stages. The description of classification methods is presented in the following studies: Ward (1963), Johnson (1967), Anderberg (1973), Hartigan (1975), Sneath, Sokal (1973), Aldefender Blashfield (1984), Basiura, Sokołowski (2007).
2. Typology of the developed classes covering the EU countries using the *Summary Innovation Index* (SII) and the indicators representing 10 dimensions of innovation in accordance with the European Innovation Scoreboard 2017 (European ..., 2017) as the profile variables.

Results of Empirical Research

The leading, peripheral and key barriers to innovation activities in the environment of innovative enterprises

Table 1 presents the key barriers to innovation activities, listed at three initial positions, in terms of the highest percentage of indications related to high importance of a specific factor in a given country. In 8 countries only cost barriers were indicated in all positions. In the next group (10 countries), two cost factors were included among the key barriers. In Luxembourg and Malta, among the key barriers only one cost factor was identified, in the second and third position, respectively – lack of internal finance (C_1) and high costs (C_3). In Italy and Lithuania, none of the cost barriers were listed among the three most frequently identified obstacles to innovation activities. Italian enterprises were mainly struggling with external barriers (2 market factors). In turn, in Lithuania, the biggest concerns are raised by the knowledge-related factors (K_1 and K_2).

Table 1: Key factors hampering enterprise innovation activities in the individual EU countries

No.	Types of key barriers to innovation activities	Countries	Ranking position of the key barriers (% of innovative enterprises' indications)		
			1	2	3
1.	Three cost barriers (8 countries)	Bulgaria	C_3 (27,0)	C_4 (23,0)	C_1 (21,1)
		Greece	C_1 (35,9)	C_4 (34,0)	C_2 (32,0)
		France	C_1 (24,7)	C_4 (21,5)	C_3 (18,1)
		Croatia	C_1 (35,5)	C_3 (31,1)	C_4 (29,4)
		Latvia	C_3 (30,0)	C_1 (23,8)	C_4 (21,6)
		Poland	C_3 (26,3)	C_1 (19,3)	C_4 (18,4)
		Romania	C_3 (28,6)	C_1 (24,8)	C_4 (21,6)
		Slovakia	C_1 (29,0)	C_3 (25,9)	C_4 (22,1)
2.	Two cost barriers (10 countries)	Belgium	C_3 (14,1)	K_1 (13,3)	C_1 (11,6)
		Czechia	C_3 (21,3)	C_1 (20,0)	M_2 (17,1)
		Germany	C_3 (19,9)	K_1 (14,2)	C_1 (12,1)
		Estonia	C_3 (19,9)	C_1 (16,5)	K_1 (15,9)
		Cyprus	M_2 (47,3)	C_3 (36,1)	C_1 (35,2)
		Hungary	C_3 (26,8)	C_4 (24,1)	K_1 (22,0)
		Austria	K_1 (25,2)	C_4 (20,4)	C_1 (20,2)
		Portugal	C_3 (30,8)	M_2 (25,3)	C_1 (23,8)
		Slovenia	C_1 (40,1)	K_1 (33,1)	C_3 (30,3)
		Finland	C_1 (14,3)	C_3 (12,2)	K_1 (12,0)
3.	One cost barrier (2 countries)	Luxembourg	M_2 (14,0)	C_1 (12,6)	K_1 (12,5)
		Malta	M_2 (19,8)	K_1 (16,6)	C_3 (14,9)
4.	Non-cost barriers (2 countries)	Italy	M_1 (26,7)	K_1 (21,2)	M_2 (20,2)
		Lithuania	K_2 (30,9)	K_1 (26,6)	M_1 (26,4)

Source: authors' compilation based on the Eurostat database.

Table 2 and Fig. 1 present the distribution of indications identified by the innovative enterprises regarding the individual barriers hampering innovation activity in the EU countries. Their analysis shows that a very high percentage of enterprises – [36,05%; 47,30%) – indicating the same significant barriers refers to individual countries. A different situation is observed in the case of high percentage of indications – [24,8%; 36,05%) – which groups as many as 10 countries under the high costs factor (C_3). In this perspective, it can be adopted that the extensively high costs of innovation activities are – in general – the most often recognized obstacle to innovation in the EU countries.

The identification of outliers among the EU countries regarding the indicated barriers to innovation activities using box plot was the next step of the conducted analysis. Fig. 2 presents the descriptive parameter values of individual indicators determining the percentage of enterprises' indications identifying particular barriers to innovation processes. Lithuania and Cyprus turned out to be the outliers, definitely standing out from the others. As many as 30,90% of the Lithuanian innovative enterprises point to the lack of collaboration partners (K_2) as a highly significant barrier, whereas the median of indications to this factor in the EU countries is only 6,2%, and the minimum value amounts to 2,30% (Finland). In the case of Cyprus, an unusually high percentage of responses (47,30) refers to high competition (M_2). The median for this innovation barrier in the EU countries reaches 19,30% and the minimum value presents the level of 7,60% (Belgium).

Table 2: The distribution of indications to barriers hampering innovation activities of enterprises in the European Union (number and percentage of countries)

No.	% of innovative enterprises' indications	Barriers to innovation activities							
		C_1	C_2	C_3	C_4	K_1	K_2	M_1	M_2
1.	Low [2,3; 13,55)	3 (13,6%)	14 (63,6%)	4 (18,2%)	7 (31,8%)	6 (27,3%)	21 (95,5%)	12 (54,5%)	5 (22,7%)
2.	Medium [13,55; 24,80)	13 (59,1%)	6 (27,3%)	7 (31,8%)	11 (50%)	13 (59,1%)	0 (0%)	8 (36,4%)	13 (59,1%)
3.	High [24,80; 36,05)	5 (22,7%)	2 (9,1%)	10 (45,5%)	4 (18,2%)	3 (13,6%)	1 (4,5%)	2 (9,1%)	3 (13,6%)

The identification of outliers completes the first research stage, simultaneously commencing further analyses addressing the separation of the relatively homogeneous classes covering the EU countries in terms of barriers to innovation activities indicated by the innovative enterprises.

Classification of the European Union countries in terms of barriers to innovation activities of high importance for innovative enterprises

As a result of identifying the outliers regarding the indicated barriers to innovation activities by the innovative enterprises, it was decided that Cyprus and Lithuania will constitute specific one-element classes. Other European Union countries were subject to Ward's classification. Fig. 3 illustrates the results of the hierarchical classification covering 20 EU countries using spanning trees and integration distance diagrams with regard to classification stages. On its basis, a decision was made to separate 3 relatively homogeneous classes of countries.

Fig. 3: Dendrogram of connections, integration distances and classification stages using Ward's method for the EU countries

Table 3: Classification of the European Union countries in terms of the intensity of barriers to innovation activities and class profiles according to the Summary Innovation Index and the dimensions of innovation

Class number	Class characteristics (intensity of barriers to innovation activities)	Class composition	Class profile
1.	Average	Bulgaria, Czechia, France, Italy, Latvia, Hungary, Austria, Poland, Slovakia	The lowest values in Human Resources and Innovators dimensions
2.	High	Greece, Croatia, Slovenia, Portugal, Romania	The lowest value of the Summary Innovation Index (SII)
3.	Low	Belgium, Germany, Estonia, Luxembourg, Malta, Finland	The highest values in all innovation dimensions (except Linkages)
4.	Very high for barriers:	Cyprus	The lowest values in the following

	high competition (M_2) and cost (C_1, C_2, C_3, C_4)		dimensions: Innovation-friendly environment, Finance and support, Firm investments, Linkages, Employment impact
5.	Very high for barriers: lack of collaboration partners (K_2) and lack of qualified employees within enterprise (K_1)	Lithuania	The lowest values in the following dimensions: Research system, Intellectual Assets, Sales impact

Source: authors' compilation based on the Eurostat database.

The intensity of barriers to innovation activities, measured by the percentage of enterprises' indications identifying barriers to high-profile innovation processes, distinguishes three relatively homogeneous classes of countries and two outlier one-element classes. Within the framework of multi-element classes, the best climate for innovation is present in Belgium, Germany, Estonia, Luxembourg, Malta and Finland. The enterprises operating in these countries (class 3) are the least likely to encounter cost, market and knowledge-related difficulties in their activities focused on implementing innovations (reference base – classes 1 and 2; Fig. 4). This situation translates into the highest average value of the Summary Innovation Index in class 3, as well as the components of this indicator (the highest values in all dimensions of innovation in classes 1– 3, and also 1– 5 except Linkages; Fig. 5). Completely different observations refer to Greece, Croatia, Slovenia, Portugal and Romania (class 2). A group of these countries is assigned the lowest average value of the Summary Innovation Index (Fig. 5), and their enterprises most often face the analysed difficulties (reference base – classes 1 and 3, Fig. 4). It can be adopted that these difficulties result in an incomplete implementation of the new or significantly improved solutions, which explains low SII value. The second position in terms of the average Summary Innovation Index value is taken by the countries grouped in class 1 (Bulgaria, Czechia, France, Italy, Latvia, Hungary, Austria, Poland, Slovakia), which seems to result from the average intensity of barriers to innovation activities (Fig. 5) . In this class profile, the lowest values of both Human Resources and Innovators dimensions – SII components are worth highlighting. Cyprus and Lithuania were outside the identified classes (1–3). The specificity of Cyprus (class 4) is manifested in the highest percentage of indications – against the background of other classes (1–3 and 5) – to the factors hampering innovation activities of cost nature and also to high competition barriers (Fig. 4). The aforementioned obstacles definitely have impact on such SII components as innovation-friendly environment as well as finance and support (the lowest values in 1–5 classes). Another peculiarity can be observed in the case of Lithuania (class 5). An unusually high percentage of enterprises indicating knowledge-related barriers to innovation activities should be noted (Fig. 4) while referring Lithuania to other classes, which seems to correlate with the lowest, among the distinguished classes, values of SII components in the dimensions of research system and intellectual assets.

Discussion and conclusions

Summing up the conducted research, it is worth noting that:

- the key barriers to innovation activities, identified based on the percentage of innovative enterprises' indications to high importance of specific barriers (top 3 positions), are associated with cost factors; among the 3 most important barriers to innovation activities, 3 or 2 cost barriers are listed in 8 and 10 EU countries, respectively, and, in addition, the high costs barrier groups as many as 10 countries presenting high indication percentage of all enterprises in the range [24,8%; 36,05%],
- the intensity of revealed barriers to innovation activities, measured by the percentage of enterprises' indications to the specific types of obstacles, translates into the value of the Summary Innovation Index and its components; in general, it can be adopted that the smaller the percentage of enterprises indicating difficulties in innovation activities of cost, market or knowledge-related nature, the higher the value of SII and its components,
- among the EU countries covered by the analysis, in terms of SII, the leading position is taken by the countries grouped in class 1 (Belgium, Germany, Estonia, Luxembourg, Malta, Finland), where the enterprises – generalizing – come across the difficulties in innovation processes the least often,

- the outliers in terms of the distribution of the indications' percentage to individual barriers of innovation activities (Cyprus, Lithuania) are characterised by a similar level of SII as the ones grouped in class 1 (average intensity of difficulties in innovation activities), which seems to be confirmed by their effectiveness in overcoming the revealed barriers to innovations.

The conducted research should be taken into account in the future assumptions of the European Union innovation policy. Their results reveal the key directions of the actions aimed at improving the climate for innovation. The need to reduce the impact of cost factors is of particular importance. Solving this problem may result in the intensification of innovation oriented processes.

Abstract

The identification of barriers to innovation activities is of significant importance in the proper climate development for innovation. In the course of this process, it should be remembered that the perception of factors hampering or preventing the implementation of innovation activities depends on the characteristics of enterprises. The heterogeneity of perception is influenced by, e.g., enterprise size, the history of its operations, development strategy, the entrepreneur's country of origin, the degree of innovation as well as the division into innovative and non-innovative entities. The latter should remain the subject of special interest, because the identified barriers determine their resignation from innovation activities. Therefore, the adopted research goals focused on identifying the key barriers to innovation activities among non-innovative enterprises in the European Union, the classification of countries regarding the similarities of factors determining the resignation from such activities and determining correlations between the indications to these factors and innovation activities in individual countries. This study was focused on verifying the hypothesis adopting that the perception of significant barriers to innovative activity by a wide range of non-innovative enterprises translates into the low intensity of innovative processes. The research results from the Community Innovation Survey (2016) and the European Innovation Scoreboard 2017 served as the information basis for the conducted analyses. The multi-dimensional statistical analysis methods, including data classification methods were used in the research.

Keywords: Innovation Activities, Non-Innovative Enterprises, Barriers to Innovation Processes.

Introduction

Recognizing barriers to innovation activities is of significant importance. Their identification and in-depth analysis allows determining the nature of factors which either hamper or prevent undertaking actions aimed at the implementation of new or significantly improved solutions. Acquiring knowledge about the essence of barriers to innovations helps in defining the group of actions which eliminate or reduce the extent of their impact. Chen and Hove (2011) have adopted that by identifying specific barriers to innovations one can simultaneously learn about the ways to overcome them, however, the potential difficulties have to be recognized in due time in order to increase the chances for solving the occurring problems (Hueske, Endrikat and Guenther 2015).

The activities focused on eliminating or reducing factors preventing or hampering innovation processes should be undertaken by the enterprises and entities responsible for developing the appropriate climate for innovations. This postulate results from the division of barriers – for new or significantly improved solutions – into internal and external ones (Hadjimanolis 1999; Mohnen and Rosa 2002; Tourigny and Le 2004; Duarte, Madeira, Moura, Carvalho and Moreira 2017). The first of them remain within the enterprises themselves and require undertaking appropriate corrective or improving actions (e.g. organisational rigidities within the enterprise: attitude of personnel towards change, attitude of managers towards change). The situation is different in the case of external barriers. Enterprises are not capable of solving problems related to e.g. lack of external finance – credit or private equity, lack of infrastructure or the weakness of property rights. It also happens that joint actions (of enterprises and entities from

their environment) turn out indispensable to overcome certain barriers (e.g. lack qualified personnel: within the enterprise, in the labour market). It should also be remembered that many barriers are of complementary nature (Mohnen and Roller 2005; Galia and Legros 2004). It means that their influence is simultaneous (e.g., insufficiently qualified enterprise staff and internal resistance to change; Mohnen and Rosa 2002), whereas their impact power is not a simple sum, but a synergy of negative factors (Shiang and Nagaraj 2011). In such circumstances, eliminating or reducing individual barriers seems pointless. Systemic actions are required (Mohnen and Roller 2005), because it is only them that can create a favorable climate for innovations. It is also worth highlighting that irrespective of the barrier type, the actual process of their impact elimination or reduction begins with the identification of factors hampering or preventing innovative processes. The experience gained by enterprises remains an invaluable source of information in this respect.

The perception of barriers is correlated – as many studies show – with enterprise characteristics. Among the factors influencing this perception the following, among others, are listed and analyzed:

- enterprise size; e.g. Hyytinen and Toivanen (2005) found that small businesses indicate cost barriers more often than large enterprises; the contrary findings in this regard were presented by Tourigny and Lee (2004) and Iammarino, Sanna-Randaccio and Savona (2007). Their research shows that along with the enterprise size the feeling of financial constraints declines;
- the history of business activity; e.g. Schneider and Veugelers (2008) showed that the enterprises featuring a short history of business activity are more likely to encounter financial barriers than the ones with a longer market presence,
- development strategy; e.g. the companies involved in internal research and development work focused on radical technological innovations usually experience cost barriers which do not pose significant limitations to innovation activities in the case of export-oriented enterprises (Galia and Legros 2004),
- the entrepreneur's country of origin; e.g. Immmarino, Sanna-Randaccio and Savona (2007) noted that foreign corporations (operating in Italy), unlike the Italian ones, are more aware of the encountered barriers,
- the degree of company innovation; e.g. Pihkala, Ylinenpaa and Vesalainen (2002) observed that the companies presenting high innovation level consider market conditions a significant barrier to innovation activity, whereas the companies characterised by low innovation activity point to barriers taking the form of internal knowledge and access to information.

Heterogeneous perception of barriers to innovations – as noted by Hölzl, Janger, Stadler, Reinstaller, Unterlass, Daimer and Stehnken (2010) – is observed among the innovative enterprises, disregarding the non-innovative ones in the research as well as the factors they identify as preventing them from implementing innovative activities. This approach does not seem justified. The need to distinguish between innovative and non-innovative enterprises is highlighted by many authors (Arundel 1997; Baldwin and Lin 2002; Galia and Legros 2004; Hoffman, Parejo and Bessant 1998; Keizer, Dijkstra and Halman 2002; Radas and Božič 2009; Szczepańska-Woszczyna 2014), because the first of them attribute larger importance to the factors hampering innovation activity, whereas the latter show a greater tendency towards pointing to the complementarity of individual impediments (Shiang and Nagaraj, 2011).

These observations seem natural, because overcoming the revealed barriers – as opposed to the deterrents[1]– results in obtaining full knowledge about their nature and impact. It does not mean, however, that the research should focus on the innovative enterprises, which empirically verify the importance of obstacles to innovation. Among them, only the barriers hampering innovation processes can be found, whereas full recognition of the impediments to innovations is also associated with the need to identify factors preventing innovation activities. In other words, among the innovators, the factors impeding success are analyzed, while in the environment of non-innovators, the factors determining failure are investigated. It is also worth remembering that in the future the enterprises and countries capable of breaking conventional solutions will be successful (Lesáková, Gundová, Kráľ, Ondrušová 2017). Therefore, it is necessary to transform the non-innovative enterprises into innovative[2] ones, which cannot be done without identifying factors determining the resignation from innovation activities. The presented

article constitutes a part of this research, focused on identifying the key barriers to innovation activities among non-innovative enterprises in the European Union countries, classifying countries regarding the similarities of factors determining the resignation from innovation activities and identifying correlations between indications to these factors and the innovation activities in individual countries. Two questions were raised within the framework of the aforementioned research goals:

- are the most important barriers to innovation activities, experienced by the non-innovative enterprises, the same or similar in the EU countries or are they diversified (e.g. in some countries the most significant barriers are ingrained in the factors related to knowledge, whereas in others to the market)?
- is there any correlation between the high percentage of non-innovative enterprises' indications to barriers of innovation activities and the actual innovation activities implemented in the analysed countries?

In the light of these questions, a hypothesis was put forward that the perception of significant barriers to innovative activity by a wide range of non-innovative enterprises translates into the low intensity of innovative processes.

Barriers to enterprise innovation activities in the EU countries

Data and Research Method

In the conducted research:

- the statistical data from the latest edition of the Community Innovation Survey (2016) were used, the results of which were provided as part of the official statistics (Eurostat 2019; retrieved on November 29, 2019) as well as the statistical information from the European Innovation Scoreboard 2017 (The European Innovation Scoreboard 2017 provides statistical information covering 2016),
- these European Union countries were included for which either complete or possible to supplement data – using a stepwise regression method – are available in terms of barriers to innovation activities,
- the most important barriers to innovation activities were taken into account (the percentage of enterprises indicating "high" importance of a given barrier in the four-level scale of assessments determining the importance of individual barriers as: 1 - high, 2 - medium, 3 - low, 4 - irrelevant),
- non-innovative enterprises and the potential barriers to their innovation activities identified under CIS and presented in EUROSTAT were taken into consideration, i.e.:
  - cost factors:
    C_1 – lack of internal finance (% of non-innovative enterprises),
    C_2 – lack of external finance – credit or private equity (% of non-innovative enterprises),
    C_3 – high costs (% of non-innovative enterprises),
    C_4 – difficulties in obtaining public grants or subsidies (% of non-innovative enterprises),
  - knowledge-related factors:
    K_1 – lack of qualified employees within enterprise (% of non-innovative enterprises),
    K_2 – lack of collaboration partners (% of non-innovative enterprises),
  - market factors:
    M_1 – uncertain market demand (% of non-innovative enterprises),
    M_2 – high competition (% of non-innovative enterprises),
    M_3 – low market demand (% of non-innovative enterprises),
    M_4 – little market competition (% of non-innovative enterprises),
  - factors related to other reasons for failures in implementing innovation processes:
    O_1 – lack of good ideas (% of non-innovative enterprises),
    O_2 – previous innovations (% of non-innovative enterprises).

The study covered 21 European Union countries. Belgium, Denmark, Ireland, United Kingdom, Netherlands, Spain and Finland were not included due to the total unavailability of data. Statistical information

about France and the Czech Republic was only partly unavailable. In this case, information gaps were filled in using the stepwise regression method.

The following research procedure was used in the study:

1. Selection of the key barriers discouraging or preventing innovation activities of non-innovative enterprises in the individual EU countries. The identified key deterring factors from innovation activities were considered the first three positions with the highest percentage of indications by non-innovative enterprises.
2. Graphic analysis and presentation of the indications' value distribution of non-innovative enterprises regarding barriers to innovation activities.
3. Identification of outliers among the EU countries, based on atypical indications of non-innovative enterprises to barriers deterring innovation activities using box plot.
4. Identification of relatively homogeneous classes of the EU countries in terms of the similar importance of individual barriers deterring enterprises from innovation activities using cluster analysis methods. The classification methods were addressed by, e.g., Ward (1963), Johnson (1967), Anderberg (1973), Hartigan (1975), Sneath, Sokal (1973), Aldefender Blashfield (1984), Basiura, Sokołowski (2007).
   The classification of the EU countries was carried out following the below research steps:
   - classical standardization of variables (barriers C_1- C_4, K_1-K_2, M_1-M_4, O_1-O_2);
   - determining the distance between countries resulting from barriers to innovation activities indicated by enterprises as important, using squared Euclidean distance;
   - separate classification of the EU countries using the hierarchical Ward's method, allowing homogeneity within the identified classes and heterogeneity between classes. The final number of classes was determined using the criterion of the first significant increase in agglomeration distance. For this purpose, the dendrogram of connections, integration distances and classification stages were analysed.
5. Characteristics and presentation of the identified classes of countries using average values of enterprises' indications to barriers acting as deterrents to innovation activities.
6. Defining the profiles of obtained classes for the EU countries. To achieve this goal, the Summary Innovation Index (SII) and the indicators representing all innovation dimensions specified in the European Innovation Scoreboard 2017 (European ..., 2017) were analysed.

Results of Empirical Research

Barriers to innovation process identified by non-innovative enterprises should be perceived in the category of deterrents to the activities aimed at the implementation of new or significantly improved solutions, or factors preventing this activity.

Table 1 lists the deterring barriers – resulting in the resignation from innovation activity even before commencing it – indicated by the largest part of enterprises (three fist positions in terms of the highest percentage of indications) in at least two EU countries.

Table 1: Key factors preventing enterprise innovation activities in the individual EU countries indicated by the non-innovative enterprises

No.	Countries	Barriers (C_1,C_2, …, O_2) and their ranking position (L = 1,2,3) including the percentage of indications by non-innovative enterprises (%)									
		C_1		C_3		M_3		O_1		O_2	
		L	%	L	%	L	%	L	%	L	%

Source: authors' compilation based on the Eurostat database.

Low market demand is the key deterrent barrier to innovation activity. Non-innovative enterprises from 16 EU countries ranked this factor as first among barriers to innovations, in the next three countries it was ranked the second (Czechia, Slovakia) or third (France) in terms of the highest percentage of indications (Tab. 1). Previous innovations were recognized as another significant limitation to the innovation activity. Enterprises from 13 countries identified them as the reason for giving up actions to implement new or significantly improved solutions (2nd place in terms of the highest percentage of indications in 11 EU countries; 1st place – Lithuania; 3rd place – Germany). The list of key deterrents to innovation activities is closed by economic factors – high costs and lack of internal finance, indicated by the enterprises from 12 and 10 countries, respectively. Surprisingly, they are not the top ranked barriers (usually 3rd or 2nd position in terms of the percentage of the total number of enterprises).

The distribution of indications made by non-innovative enterprises into individual barriers to innovation activities of a deterrent nature seems to show a fairly positive picture (Fig. 1). High – [18,8; 28,2) – or very high – [28,2; 36,7] – percentage of the total number of enterprises is grouped by a few factors in individual countries. Usually, a small fraction of non-innovative production or service entities (low percentage of responses) recognize deterrent barriers. Low market demand is the only barrier that clearly stands out from the picture. This factor is indicated by 9,4% up to 18,8% enterprises from 16 countries.

Fig. 1: The histograms of non-innovative enterprises' indications identifying significant barriers to innovation activities in the European Union countries

Source: authors' compilation based on the Eurostat database.

Fig. 2 presents the characteristics of individual indicators determining the percentage of non-innovative enterprises' indications to individual barriers hampering innovation processes. Atypically high indications of barriers deterring innovation activities were recorded in the case of Lithuania and Cyprus. Almost 20% of non-innovative enterprises in Lithuania identified the lack of collaboration partners as the barrier to innovations (K_2). The median of indications to this factor, among the analysed EU countries, was only 3,2%, and the minimum value recorded by Luxembourg enterprises was 0,4%. The enterprises from Cyprus pointed, with an unusually high frequency (24%), to the barrier little market competition (M_4). The median of indications to this market factor in the analysed countries is as low as 4,8%, whereas the minimum value is 1,7% (Malta).

Fig. 2: Box plot for barriers preventing or deterring innovation activities (% of indications to a given barrier by non-innovative enterprises)

Source: authors' compilation based on the Eurostat database.

The next step of the research procedure was the classification of the EU countries using Ward's method. Fig. 3 illustrates the results of the hierarchical classification covering 21 EU countries using spanning trees and integration distance diagrams with regard to classification stages. Based on his analysis, the decision was made to separate five relatively homogeneous classes of the EU countries in terms of 12 deterrents to innovation activities, indicated by the non-innovative enterprises.

Table 2: Classification of the European Union countries in terms of the intensity of barriers deterring innovation activities and class profiles according to the Summary Innovation Index and the dimensions of innovation

Class number	Class characteristics (intensity of barriers deterring innovation activities)	Class composition	Class profile
1.	Average	Bulgaria, Germany, Estonia, Croatia, Latvia, Hungary, Austria, Poland, Portugal, Romania Slovenia, Slovakia, Sweden	Maximum value in the dimension of Firm investments and minimum value in the dimension of Innovators
2.	Low	Luxembourg, Malta,	Maximum value of the Summary Innovation Index (SII) and Research system, Innovation-friendly environment, Innovators, Intellectual Assets and Employment impact
3.	Very low in terms of cost and knowledge-related barriers, and very high regarding low market demand (M_3) and previous innovations (O_2)	Cyprus	Minimum values in the following dimensions: Innovation-friendly environment, Finance and support, Firm investments and Employment impact
4.	High	Czechia, Greece, France, Italy,	The lowest values in Human resources and the highest in Sales impacts
5.	Very high in terms of knowledge-related, high competition (M_2) and previous innovations (O_2) barriers	Lithuania	Minimum values of the Summary Innovation Index (SII) and Research system, Intellectual Assets and Sales impact, and simultaneously maximum values in Human Resources, Innovation-friendly environment and Linkages

Source: authors compilation based on Eurostat data

The intensity of barriers deterring innovation activities – measured by the percentage of non-innovative enterprises' indications to factors discouraging or preventing the activities aimed at implementing innovations – results in identifying three relatively homogeneous classes of countries and two outliers – one-element classes (classes 3 and 5; Tab. 2, Fig. 4). Luxembourg and Malta, co-creating the second class, group the non-innovative enterprises which rarely see barriers to innovation activities of a deterrent nature (except M_3 – the lowest value in Lithuania). This leadership is justified by the highest average value of the Summary Innovation Index (SII), as well as its components in terms of the research system, innovation-friendly environment, innovators, intellectual assets and employment impact (Fig. 5). Class 4 (Czechia, Greece, France, Italy) is at the opposite end. It shows – apart from one-element classes – the highest average values of non-innovative enterprises' indications to barriers hampering innovation activity (except: M_4, O_1; the highest values in class 1), as well as the lowest value referring to human resources and the highest one in sales impacts (SII components). Class 1is characterised by the average intensity of barriers deterring innovation activities (Bulgaria, Germany, Estonia, Croatia, Latvia, Hungary, Austria, Poland, Portugal, Romania, Slovenia, Slovakia, Sweden; Fig. 4). In this case, the average of indications to individual deterrents remains below 10% (except: M_3). In addition, it is distinguished by the maximum value referring to

investment companies and the minimum one in the dimension of innovators (SII components). Cyprus and Lithuania form unusual, one-element classes. The specificity of Cyprus (class 3) is manifested in a very low percentage of indications of non-innovative enterprises to cost and knowledge-related factors (class 2 is the only one with a lower percentage), and also in the highest perception of low market demand and previous innovations as deterrent barriers, comparing to other classes. These observations are surprising against the background of this class profile (e.g. minimum values in the dimensions: innovation-friendly environment and finance and support). Lithuania (class 5), unlike Cyprus and other classes, is characterised by very high indications of knowledge barriers, and also high competition and previous innovations. Some of these barriers seem to be perfectly combined with the profile of this class (Tab. 2).

Discussion and conclusions

The conducted research allows concluding as follows:

- key factors discouraging or preventing innovation activities in the EU countries, identified based on the percentage of indications made by the non-innovative enterprises pointing to high importance of the specific barriers (top 3 positions), include low market demand (first place), previous innovations (second place) and economic factors (high costs and lack of internal finance; third place),
- high – [18,8; 28,2) – or very high – [28,2; 36,7] – percentage of the total number of enterprises are grouped by few deterring barriers in individual countries,
- the lowest frequency of barriers deterring innovation activities, measured by the percentage of non-innovative enterprises' indications to factors either discouraging or preventing actions aimed at implementing innovations, is recorded in Luxembourg and Malta (the class of countries presenting the highest average value of the Summary Innovation Index).
- the majority of the EU countries is characterised by an average intensity of the deterring barriers occurrence, which hamper innovation activities (Bulgaria, Germany, Estonia, Croatia, Latvia, Hungary, Austria, Poland, Portugal, Romania Slovenia, Slovakia, Sweden).

The results of the conducted research prove that the perception of significant barriers to innovative activity by a wide group of non-innovative enterprises translates into the low intensity of innovative processes (Lithuania, Czechia, Greece, France, Italy; Tab. 2).

Summarising the results of the conducted research, it should be highlighted that the vast majority of non-innovative enterprises either do not notice or ignore the barriers to innovation activities (low percentage of indications to highly important deterrents), which may result from their lack of experience. Many factors hampering the efforts aimed at implementing new or significantly improved solutions are detected only in the course of innovation processes. Overcoming them results in gaining full knowledge about various obstacles to innovations. In addition, the experience of running an innovative business can change the approach to the importance of individual barriers. For example, it can be expected that cost barriers will be recognized as the leading ones, and lower weight will be assigned to such factors as low market demand or previous innovations. However, these observations do not undermine the validity of conducting the research focused on identifying barriers to innovation activities among the non-innovative enterprises, because – as it has already been emphasized – among innovators the factors hindering success are investigated, whereas in the environment of non-innovators the factors which determine the failure.

Abstract

The purpose of the article is to study the role of human capital in the development of the electronic services system in Ukraine in order to increase the level of information and communication technologies and implementation of e-governance tasks in Ukraine. There are following methods used in the article: dialectical method - understanding the role of capital in the transition from post-industrial society to information society; scientific abstraction - defining the nature of the interdependence between the human capital and process of the provision of electronic services; systemic analysis - establishing a structural link between executive authorities and enterprises, institutions and organizations operating in human capital sectors; statistical methods (grouping, comparison) - used in the comparative analysis of ranking indicators of innovation activities in Ukraine in terms of human capital compared to the top ten foreign countries in the Global Innovation Index in 2019. Analysis of Ukraine's innovation activities showed that the main problems of the human capital development in Ukraine are related to lax regulatory policies, low level of scientific development and lack of knowledge of the majority of public authorities' staff due to the poor awareness on how to use information and communication technologies. Solving these problems is to level up civil servants' ability to use electronic systems in the structural units regulating the human capital sectors, during the interaction with sectoral public and private institutions in order to control the provision of electronic services. It will provide an opportunity to increase the number of new jobs created, labour productivity and significantly improve living standards of the population.

Keywords: Human Capital, Electronic Services, Information And Communication Technologies, Innovations, Investments

Introduction

In Ukraine the information society development is based on increasing public electronic services, which can be both administrative (registration, licensing, certification, verification, nostrification, legalization, establishing a status) and non-administrative (introduction of information and communication technologies – ICTs in science, education, culture, health care, environmental protection; information security). However, the problem of ICTs development has, to a large extent, the typical problems of a shortage of qualified personnel in public authorities or reporting institutions, who could properly use the certain general (electronic document management system – EDMS, electronic taxpayer office, etc.) or specialized (sectoral) information systems (eHealth, environmental monitoring system, shared environmental information system – SEIS, etc.).

Thus, during the period of the development of legal democratic states, the various governments of the country took steps to create the certain national or local information systems for providing electronic services. Since late 2014, the new Government of Ukraine has been actively pursuing a program of reforms guiding the country through the European integration to an open and transparent democracy. The e-governance has been identified as one of the most important tools for achieving these goals, which is also indicated by the creation of a State Agency for E-Governance of Ukraine under the Ministry of Regional Development, Construction, Housing and Communal Services of Ukraine. However, despite the significant impetus in the development of e-governance and provision of electronic services, the problem has remained an issue for using modern ICTs and would require further clarification.

Analysis of recent research and publications. Recently, there were published research papers by Ukrainian scholars, in particular Panchyshyn, T. V. (Panchyshyn, 2017), Sakhnenko, O. I., Sakhno, I. V. (Sakhnenko and Sakhno, 2019) and foreign researchers, in particular Calkin, S. (Calkin, 2018), Pease, G., Beresford, B., Walker, L (Pease, Beresford and Walker, 2014) trying to place great emphasis on the development of human capital in order to improve the investment climate in the country. These researchers identify the necessity to develop the key sectors of activities, such as social protection, education, culture, health, sports, providing an opportunity to increase the flow of national and foreign investment through investors' awareness of the low level of investment risk which consists in human labor efficiency in relevant sectors and, therefore, responsibility of the recipients for fulfilling all the necessary conditions of the investment contract. However, the question of determining the main impacts on the employee efficiency in public and private enterprises, institutions and organizations operating in the human capital sectors remains to be resolved.

Other Ukrainian researchers such as Vasyltsiv, T. G., Lupak, R. L., Rudkovskyi, O. V. (Vasyltsiv, Lupak and Rudkovskyi, 2019), Kokhan, V. P., Egorova-Lutcenko, T. P. (Kokhan, Egorova-Lutcenko, 2018), Orlova, N., Mokhova, I., Diegtiar, O., Khomutenko, O. (Orlova, Mokhova, Diegtiar and Khomutenko, 2019), and foreign scholars such as Sridhar, V. (Sridhar, 2019), Susanto, H, Leu, F. Y., Chen, C. K., Mohiddin, F. (Susanto, Leu, Chen and Mohiddin, 2019) dedicate their work to the importance of ICTs development in public administration, considering the various electronic systems that should be used by the specialists of public authorities, accountable public institutions and organizations and also private enterprises, performing their official powers in a particular sectoral direction. However, the study of investment in human capital as a major impact on the development of ICTs as the main part of innovation infrastructure in a particular sector of activity was neglected by the scholars.

As for EU countries' experience, some researchers, such as Culpepper, P. D. (Culpepper, 2003) and Feldmann, H. (Feldmann, 2017), have come to the conclusion, that the investment support from foreign countries, in particular the USA, plays a very important role in the formation of any human capital sector, for which due to the investments in innovations there are no defects in the innovation infrastructure development. At their discretion, the state should only act as a supporter of the economic freedom on human capital investment. But, nevertheless, such scholars as Angelopoulos, K., Malley, J. and Philippopoulos, A. (Angelopoulos, Malley and Philippopoulos, 2017), Dukes, R. (Dukes, 2014), Triantafillidou, E. (Triantafillidou, 2020) have made in their researchers a number of

suggestions on how to increase the role of the state as a regulator of the creation of new jobs, having specific features for both high-skilled and low-skilled personnel, while investment should only be made to improve the skills of the workforce. This, in turn, will help the public and private institutions to gain an economic benefit in the future and, therefore, invest large sums of money in the development of innovation infrastructure in human capital sectors.

Thus, taking into account Ukraine's European integration aspirations, the relevance of the research topic reinforces the necessity of using the foreign experience in the development of human capital and ICTs, which will help us to find the middle ground between job growth and skilled workforce increase in sectors whose service to the population has a significant impact on their standard of living. This requires to reform the Ukraine's economic development in terms of investment in human capital and ICTs within the framework of the implementation of the Association Agreement between the European Union and the European Atomic Energy Community and their Member States, of the one part, and Ukraine, of the other part (Supreme Council of Ukraine, 2017).

The purpose of the article is to study the role of human capital in the development of the electronic services system in Ukraine in order to increase the level of ICTs and implementation of e-governance tasks in Ukraine.

The methodological basis of the study is data obtained from the Ministry of Social Policy of Ukraine, Ministry of Education and Science of Ukraine, Ministry of Culture of Ukraine, Ministry of Health of Ukraine, Ministry of Youth and Sports of Ukraine, Analysis: Explore Economy Reports (Global Innovation Index, 2019).

Main Part of Research

As the human capital is an awareness of the crucial role of people in the economic system of social relations, it is increased through the investment by limiting current consumption and has a lasting economic impact. In other words, the investment capital is a set of measures aimed at enhancing human professional competence and work potential to fulfillment of his / her professional duties. Thus, the investment in human capital is an investment in improvement of human labor. This implies that the primary source of investment in human capital is investment in education, as during the study in educational institutions, people begin to realize their role in society and how important is to conduct research activities for making the research and development (R&D) of technical and technological infrastructure, keeping traditions in country of residence for the sake of preserving moral and cultural values, maintaining a healthy lifestyle and sports activities for the sake of maintaining a good health, and adhering to laws in public relations to prevent social imbalances in society.

Based on the above, let us analyze Ukraine's ranking in the Global Innovation Index (2019) by major components of human capital in comparison with the top ten countries of the world (Table 1).

Table 1: Ukraine's ranking in the Global Innovation Index in 2019 in terms of human capital, compared to the top ten countries

No	Country	Innovation level, score/rank								
		Regulatory environment	Institutions	Education	Tertiary education	R&D	Human capital and research	ICTs	Infrastructure	Overall
1	Switzerland	95.9/6	89.1/12	58.8/30	49.2/17	77.9/4	61.9/7	86.5/19	68.2/3	67.2/1
2	Sweden	92.0/13	90.1/9	67.8/6	43.1/28	75.3/6	62.1/6	89.5/12	69.1/2	63.7/2

Source: author's development according to: (Analysis: Explore Economy Reports from the GII, 2019)

Indeed, considering the situation illustrated in Table 1, in 2019 Ukraine ranked 47th and is far behind the top ten most developed countries in the overall index. If Israel ranked 10th and achieved 57.4% of innovation performance, Ukraine fulfilled 37.4% of the innovation plan.

Analyzing each country, it can be seen that in almost all top ten countries, the innovation plan development of regulatory environment, human capital and ICTs had a positive impact on the overall ranking and index of the innovation plan performance. Switzerland ranked in first place with the greatest influence factor in the huge intensity in R&D (4th place), the plan performance of which was 77.9%, that also played a significant role in the formation of the overall ranking of the human capital index (7th place - 61.9%). The main impacts on ranking the 2nd by Sweden were the introduction of innovations in education (6th place - 67.8%) and R&D (6th place - 75.3%), which also took its place in the production of the human capital indicator in a positive direction (6th place - 62.1%). Like Switzerland, Sweden is also proud of the innovation infrastructure development. However, in both countries, the development of ICTs has not proved to be a positive influence on this indicator.

As for such countries as the United States of America, Netherlands, United Kingdom and Denmark, each of them has succeeded in ICTs development, whose indicators have had a significant impact on the corresponding indicators of innovation infrastructure development, and, therefore, the overall ranking and innovation index. Moreover, among all the top ten countries, Denmark is the most harmonious country in human capital and ICTs development, as in innovation plan development of regulatory environment (7th place - 95.3%), the indicator of which significantly influenced the overall index of institutions (6th place - 91.7%), and development of human capital (4th place - 63.1%) and ICTs (2nd place - 93.1%), which significantly influenced the index of innovation infrastructure development (6th place - 65.8%), owing to these results the country achieved great success, ranking 7th and performing 58.4% of innovation plan. At the same time, the rankings of Finland, Singapore and Germany were significantly influenced by the indicators of the innovation plan performance in the field of human capital.

Speaking of Israel, ranked 10th (57.4%), given that by individual components of human capital, including education, which is ahead of Ukraine only by 1 position, and tertiary education, even behind Ukraine by 35 positions, the most impact on the overall ranking of the country was an indicator of R&D (2nd place - 78.2%), becoming a significant factor influencing the ranking of human capital (14th place - 54.5%).

Considering Ukraine's ranking, among all indicators of human capital, the most positive one was the tertiary education, after which the country ranked 37th, fulfilling 40.6% of the innovation plan with a significant lead in the ranking of USA (53th place - 34.6%), Netherlands (59th place - 32.8%) and Israel (72nd place - 29.7%). According to the data of the Global Innovation Index (2019), the country's greatest success in implementing innovation methods of tertiary enrolment was the biggest contributor, ranking 14th with the performance of 65.8% of the innovation plan. The relatively good indicator was also in innovation development in the sector of education (43 positions - 55,1%), which Ukraine ranked ahead of the USA (45th positions - 54,5%) and Singapore (57th place - 50,3%). Here a significant impact was the pupil-teacher ratio, secondary (3rd position - 98.6%). At the same time, Ukraine's ranking of 54th with the performance of 11.2% of the innovation plan in the sector of R&D has spoiled the ranking of the human capital index, by which the country reached only 51st place, fulfilling 35.6% of the innovation plan, while the top ten countries significantly exceed Ukraine by

this index. This situation was most affected by the country's ranking of 67th in gross expenditure on R&D (GERD) in the amount of only 9.5%.

The country's situation with regard to ICTs development leaves much to be desired. Considering the fact that in the innovation infrastructure development Ukraine ranked 97th, fulfilling 36.0% of the corresponding plan, in the ICTs development the country ranked 81st performing 58.0% of the innovation plan, far behind the top ten countries. Here the most negative impact on the situation was the country's ranking of 92nd in government's online service with the performance of 56.9% of the corresponding plan. In addition, Ukraine is also far behind the leading countries in regulatory environment, ranking 78th with the performance of 61.4% of the innovation plan. The most significant factor influencing the situation was the country's ranking of 107th in establishing the rule of law in public and private institutions (Orlova, Mokhova, Diegtiar and Khomutenko, 2019).

Results

The human capital plays a major role in public and social development as one of the main factors in the innovation and knowledge economy development, where the basis of everything is the digital economy. The human capital development in the process of provision of electronic services in Ukraine is shown in Fig. 1.

As can be seen from Fig. 1, the volume of investment in human capital also depends on the effectiveness of qualified personnel in human capital sectors, the development of which has also a significant impact on the volume of investment in these sectors. It provides an opportunity, firstly, to invest in the development of new / improvement of existing electronic systems allowing qualified personnel to provide electronic services to meet the population's needs in their corresponding sectors of activities; secondly, to invest in staff training to use the developed / improved electronic systems, which will allow to receive electronic services at a faster and higher quality level in the future.

Considering the main sectors of human capital, in this case, the comparison with the level of quality of electronic services is an investment in the development of social protection, education, culture, health and sports through the development of ICTs in corresponding sectors.

Indeed, the Ministry of Social Policy, responsible for investing budgetary funds in social protection, contributes to the increase of local budgets aimed at the development of social sphere at the local (district / city / regional) level, and, therefore, improvement of the work of Administrative Services Centers (ASCs), providing state administrative services (the issuance and registration of certificates, licenses; provision of the social assistance, issue of personal documents, registration of legal entities, etc.). In this case, the more citizens will receive the convenient administrative services without a personal visit to the authorities, the more they will have the chance to unite in certain public organizations that would contribute to the investment in the development of social sphere, including the creation of various electronic systems and / or improving existing ones. These are, for example, the products of the state-owned enterprise "Information and Computing Center", with which the executive body, by concluding an agreement, can work on a partnership basis, constantly improving the performance of social workers in corresponding electronic systems, namely: AIS "Processing of pension documentation based on computer technologies", AIS "Our Family", AIS "Unified State Register of Persons Eligible for Benefits", PC "Housing Subsidies", PC "Statistical Monitoring of Poverty", PTC "Keeping a Single Application". At the same time, the more legal entities will receive administrative services (business start-ups, certification and licensing, citizen associations, regulatory policies), the greater will be an opportunity for the population to receive properly non-administrative services (services of education, culture, health care, sports) by increasing the number of public and private enterprises, institutions and organizations and improving the efficiency (pursuit of profit) and effectiveness (level of the population' satisfaction from receiving the services) of their activities.

The Ministry of Education and Science, investing budget funds in the development of education and science, managed by the separate structural units of local executive authorities in the sector of education (departments, divisions), thanks to their efforts in the investment support increases the

amount of local budgets aimed at the development of education and science at the local (district / city / regional) level, and, therefore, improvement of the work of institutions of public and private pre-school, secondary and higher education, investing in the development of distance learning systems (Moodle, Office 365, etc.) through public-private partnerships.

Fig. 1: The development of human capital in the process of provision of electronic services in Ukraine

Source: author's development according to: (Ministry of Culture, 2019; Ministry of Education and Science, 2019; Ministry of Health, 2018; Ministry of Social Policy, 2019; Ministry of Youth and Sports, 2018)

This makes it easier for pupils / students to improve their knowledge while learning a particular discipline, save time while the relevant curriculum, giving the teacher more opportunities to engage in interactive teaching methods (role-playing games, debates, moderation, etc.), and, therefore, improve the quality management system of education in the country.

The Ministry of Culture, investing budget funds in the development of culture in the country, encourages an increase in the volume of local budgets, managed by the separate structural units of

local executive bodies in the sector of culture (departments, divisions). Thanks to their investment support, the accountable public institutions and organizations (libraries, philharmonic societies, theaters, etc.) and private ones investing in the development of ICTs through public-private partnerships, that promote the preservation of cultural and moral values, patriotism and humanism traditions among the population of the country, provide the opportunities to receive high-quality information services through the creation of specialized electronic systems, including a unified information library system "Library-XXI". This system, in turn, covers the whole spectrum of national information resources in economic, scientific, technical, social and national-cultural spheres, aimed at the implementation of the pilot project "Unified Information System of Documentary Heritage" in the future.

The Ministry of Health invests budgetary funds in the development of health care in the country, whereby the separate structural units of local executive bodies in the field of health care (departments, divisions) provide an investment support to the accountable public institutions and organizations (clinical hospitals, clinics, medical centers, polyclinics, etc.) in the health care development. In turn, these institutions cooperating with private ones through public-private partnerships provide for the development of ICTs in the sector of health at creating the new (in particular, the National Health Information Infrastructure – NHII) and improving the existing electronic systems (in particular, eHealth, on the basis of which integrated medical information systems operate to automate the basic processes of health care institutions: Helsi, Medstar, MedCard Plus, Askep.net, Health24, nHealth, Rising Increment, etc.). All of this enables, firstly, to register the patient for medical advice without a prescribed queue; secondly, to receive round-the-clock medical services which the patient is entitled (opening and closing a hospital letter, receiving the medications, maintaining an outpatient card, etc.) from a family physician on the basis of an appeal through the electronic system without an obligatory presence; thirdly, obtaining by a doctor round-the-clock access to a patient's data at any health care facility in the country, which will save time for the transfer of medical data if a person needs medical attention elsewhere.

The Ministry of Youth and Sports, investing budget funds in the development of physical culture and sports, has a huge impact on the volume of the investment support from managed separate structural units of local executive bodies in the sector of physical culture and sports (departments, divisions) to the accountable public institutions and organizations whose activities are aimed at providing the services in physical culture and sports (Olympic centers, gyms, swimming pools, etc.). Cooperating with private ones through public-private partnerships they will contribute to the development of ICTs in the sector of physical culture and sports, namely the creation of information systems that would allow the population to register at sports facilities without having a special queue, obtain a range of physical exercises through the electronic system based on video tutorials, get an information about the free time of a personal trainer, which is fixed in the electronic system, and also interact with other specialized systems, including eHealth, getting an information about the physical health of a person, according to which the provision of services of therapeutic physical training is adjusted.

Based on the above, Ukraine has a number of problems that hinder the pace of innovation development in the human capital sectors and use of ICTs, whose solutions will help public authorities to improve the quality and efficiency of providing the necessary services to the population (Fig. 2).

As illustrates Fig. 2, in Ukraine, firstly, there are no laws, the provisions of which would regulate the activity of public authorities and local self-government bodies, including the subordinate public enterprises, institutions and organizations, jointly with legal entities, natural persons - entrepreneurs and individuals. Here, an enormous role is played by amending the Law of Ukraine "On Administrative Services" regarding the introduction of a provision for the obligatory establishment of the electronic system that would provide prompt servicing of ASCs by the population during the provision of administrative services. If the formation of a physical queue does not allow the needy persons to receive administrative services at their convenient time, then the work in the electronic system will provide the provision of services to a large number of persons under the conditions of establishment of the electronic queue and will allow them to immediately receive the corresponding

result of service. Thus, increasing the level of quality of service, the number of served individuals and legal entities will contribute to increase the number of registered public and private enterprises, institutions and organizations, which will be a significant impact on the increase in the number of new jobs created and, consequently, standard of living of the population.

Fig. 2: Problems of the human capital development in Ukraine and ways of their resolving
Source: author's development

Secondly, Ukraine has recently been focusing a lot on improvement of the quality management system of higher education, and also trying to improve the educational process in secondary education institutions by developing new teaching methods, including subjects related to the country's cultural development and physical education. However, despite the enormous educational potential, the development of science in the country remains rather slow due to the small amount of R&D costs. And this, in turn, has a rather negative impact on the development of human capital due to the lack of electronic education systems in the vast majority of educational, cultural, health and physical education institutions, which would allow them to operate more effectively and efficiently, and, accordingly, it will reflect positively on the standard of living of the population. In this case, during the formation of the state budget for the respective year country's government should pay a special attention to the formation of the state budget expenditures for R&D. This, in turn, will allow central and local executive authorities to develop and approve state / local targeted programs aimed at researching and developing technical products with a view to implementing them into sectoral structural units for use in collaboration with public and private enterprises, institutions and organizations through public-private partnerships (Orlova, Mokhova, Diegtiar and Khomutenko, 2019).

Thirdly, the low level of ICTs development in Ukraine is caused by the low level of the provision of electronic services by the executive authorities. This problem concerns not only the lack of budget resources for ICTs development, but also the unwillingness of employees of these authorities to use them. This is indicated by Ukraine's 90th ranking in the use of ICTs with the performance of 39.9% of its innovation plan. Thus, the main disincentives to introduce ICTs into the work process are the low level of awareness of civil servants of pre-retirement age on how to use ICTs and also the unwillingness of newly admitted civil servants to learn to use them. This is indicated by the rather law ranking of Ukraine in establishing access to ICTs (65th place - 66.5%) and the newest ways of online e-participation (73rd place - 68.5%). All of this has a negative impact on the effectiveness of civil servants' performance of their powers, as indicated by Ukraine's low position in the development of general infrastructure (95th place - 26.2%), where the main negative impact was Ukraine's ranking of 99th in gross capital formation with the performance of 28.1% of the respective innovation plan. In addition, Ukraine occupied a very low position in ecological sustainability (120th

place - 23.9%), which was largely influenced by the country's 115th ranking in GDP per unit of energy use with a relatively small percentage of implementation of its innovation plan (4.7%). And this, in turn, is negatively reflected in the standard of living of the population due to the inability to provide the public authorities with quality and prompt service in the absence of sufficient fixed assets and special electronic systems.

The specific training / retraining / advanced training programs for civil servants should include a set of measures aimed at dispelling their doubts about the complexity of the use of ICTs, and also applying to the process of learning effective methods of rapid mastery of common (collectively) and specialized electronic systems (individually). Developing and approving the appropriate programs will enable civil servants to learn how to use ICTs, which will in the long run interact with representatives of other structural units / public authorities / local self-government bodies / private enterprises and citizens through the use of electronic systems, and, therefore, fulfill their official authority in the field of provision of electronic services in more operative, effective and efficient way.

Thus, the novelty of the received results consists in the developed model of human capital development in the process of provision electronic services. It can be applied in central executive bodies, as well as separate structural units of central and local executive bodies regulating the human capital sectors in the process of cooperation with sectoral public and private institutions in order to monitor the provision of the required electronic services to the population in the areas of social protection, education, health care, culture and sports.

Conclusions

Based on the analysis of Ukraine's innovation activity in the context of human capital compared with the top ten countries, the main problems of its development are, firstly, a lax regulatory policies, which consists in the weakness of the legislative framework regulating administrative services; secondly, the low level of scientific development, which is due to the insufficient number of software products related to the work of one or another electronic system implemented in the workflow; thirdly, the vast majority of public authorities are inexperienced due to their lack of awareness on how to use ICTs.

In this case, the improvement of the legal framework governing the provision of administrative services, in terms of the development and implementation of special electronic systems in ASCs, will lead to an increase in the population' living standards, including through the new jobs creation and increased productivity, based on the speed and quality of electronic services. This, in turn, will be an incentive for the state to form expenditures on R&D of quality software products, which will eventually accelerate the development of ICTs, and thus will lead to introduce specific training programs in the process of training / retraining / upgrading the qualifications of civil servants who work in structural units governing the human capital sectors, that would enable civil servants to learn how to own electronic systems and provide effective electronic services to representatives of public authorities / private business and citizens.

Abstract

Justice is a value inherent in all human cultures. Nevertheless, justice is the most debated issue in the redistribution of economic goods and in law. Fair assessment is one of the basic value-based approaches of man to social reality, human behavior, social relations, processes and institutions. One perceives these connections through a culture-shaped sense of justice, which has not only a rational but also a cultural and emotional component. The aim of our paper is to examine the development of justice in the perspective of important legal theorists and philosophers. When processing the paper, the historical method was primarily used. In addition, other scientific research methods such as analysis, synthesis, induction, and transcription have been applied. The main result of this paper is to identify justice within the law. Another result is the confirmation or rejection of the established hypothesis that the historical development has unified the views on justice in the social and ethical aspects.

Keywords: Economic Goods, Ethics, Justice, Law

Introduction

Justice, according to Večeřa (2008), is a tool to satisfy the needs of social subjects without conflicting coexistence and the creation of cooperative social relationships. According to him, justice in the law can be divided into two groups, both as legal justice, and justice under law, where the criterion is law as a measure of justice. The second criterion is the fairness of the law itself, representing the quality of law and the presumption that the material (content) aspect of the legality of the law is fulfilled. For natural law-based concepts of law, the fundamental issue to which the issue of justice in law relates by determining what is a fair law, remains. The result of the answer to this question is then the basis for assessing legal justice. Natural maxims in this sense say that “lex injusta non est lex” (unjust law is not law), or conversely, law is just (fair) law (Burda and Trellova, 2019).

Aim of The Contribution and Methodology

The main aim of our contribution is to examine the historical evolution of justice of law from the perspective of important legal theorists and philosophers. In addition to the main objective, we have also set partial goals as follows:

- identify justice in the law,
- accept or reject the hypothesis that historical evolution has united the views on justice in the law and its social ethical aspects.

Due to the nature of the paper, we apply several scientific methods of knowledge as immanent science, which represents a highly qualified human activity aimed at obtaining scientific knowledge, penetrating from phenomenon to essence. In order to get to know justice in law, it is appropriate to use methods of the science of logic that can be used in all sciences. Furthermore, we will also focus on the use of the logical method, which lays down certain rules of human reasoning, which were created by years of experience. Their observance guarantees the order of thought, its correctness and, under certain conditions, its truthfulness. A necessary method for successful processing of the issue is also a method of logical analysis of and synthesis, which consists of dividing the whole into individual parts and their subsequent connection.

Legal positivism

Consistent legal positivism, based on the principle of legality, has in general considered the question of legal justice as justice on the basis of law and similar to law as a matter of fact. Legal justice laid on the edge of interest. At the same time, it a priori ruled out aspects of fair evaluation other than legalistic in relation to reports. In this respect, Hans Kelsen - a representative of Vienna's Legal Legal Science - characterised legal justice as a positive legality, meaning the procedure in accordance with the allegation of allegation of justice was thus just another expression for legality.

According to Fábry (2007), the law determines what is fair and just is another word for legal or legitimate. Kelsen considered it legally unfair to use a norm in one case and reject it in a completely analogous case. The issue of justice was addressed, among others, by John Rawls (1995, 1997). His theory belongs to the stream of liberal-oriented philosophical tradition and, from the outset, formed a definite framework of moral and political thinking. It is a theory that follows the tradition of Lock, Rousseau and Kant.

Justice is a value inherent to all human cultures that underlies fair assessment, and creates one of man's main attitudes towards social reality, human behaviour, social relations, processes, and institutions. One perceives these connections through a culture-shaped sense of justice, which has not only a rational but also an intuitive and emotional component.

The need for a fair order of things is one of the essential individual needs and it is possible to discover in this need the individual roots of the law. The righteous arguments according to Tomeš (2002) are more convincing. All wars or political upheavals, as well as many personal disputes or hostilities, were waged in exchange for justice and for the unjust. Thus, justice is a tool to satisfy the needs of social subjects implementing social policy.

Harvánek et al. (1995) argue that the reason why fairness in the classification of formal sources of law ranks to the very end is primarily its subjective character. While objectivity is the defining feature of law,

fair assessment is always based on subjective reasoning. Logically, there is a situation where a solution to a legal question is judged fair by someone, while another (usually the one who is in opposition) considers it to be manifestly unfair.

The binding nature of the principles of justice is argumentative. It can be stated that the argument of justice, in terms of its relevance, is disproportionately weaker in comparison with the legal argument or principle of law. It misses not only the support of formal certainty, but mostly also of objectivity. Some authors (Dudic et al., 2018) rightly believe that some principles of fair evaluation can be stated by the majority of society. In some circumstances, these principles can have the attributes of objective nature. The argument based on them can be an essential argument. In general, however, it is not possible to attribute objectivity and not even a high degree of reasoning to justification with some exceptions (Harvánek et al., 2008).

In spite of the weak argument, we can still meet the principles of justice in the law here. They are also referred to as aequitas ie equality, justice and decency. In the definitions of justice, the notion of equality has always been implied in one way or another. This is evidenced by the Irish definition of law as 'ars boni et aegui' t. j. the art of goodness and justice, the Latin word aeguitas, which means equality and justice. At the same time, the perception of justice as equality raises criticism, which can be expressed by the aforementioned words by the prominent German lawyer R. von Ihering (2009), that “equality can be an irregularity of poverty. This means that justice in justice can itself be an expression of social injustice and, possibly, a defence of social injustice.

Socialist view of justice in the law

According to the literature from the socialism, until 1989, the classics of Marxism-Leninism, consistently rejected the idealistic notion of justice, placed justice on a materialistic basis, and did not provide a basis for addressing the question of the nature of the and quality of its relationship to justice. Revealing the patterns of development of society, Marx and Engels explained the conditionality of moral ideas of people in practical relations in which social production takes place, but the exchange for them was a historically conditioned category with two sides; sociological and ethic (Dojčák, 1976).

According to Srebalová et al. (2019), justice, in its sociological sense, is a characteristic of social relations - their compliance with the regularities of social development, their conformity with the development of society. It is then fair to organise social phenomena that aim at maximally satisfying the scientifically justified needs of the further development of productive forces, thus also satisfying the social needs based on the existential needs of a particular person.

According to Dudic et al. (2018) the roles and ideals of a given class can be considered fair only if they express a progressive tendency of social development. The Communist idea of justice was classy in its content. However, due to the fact that the interests of the working class were coincident with the fundamental interests of all workers, coincidentally the self-evident patterns of the development of society, classroom content was associated with omnipotence in this notion. Satisfying human needs was only the starting point for a materialistic solution to the issue of justice. Its basis and essence was the uniform satisfaction of these needs, their distribution according to the principle of true equality.

Essentially, the basic criterion of justice as the value of ideal - justice from an ethical point of view is therefore a criterion of equality. In its ethical aspect, justice appears to be a principle of equally distributing social needs, material ideals and values between subjects who are equal in a certain angle of view. As a constant element of justice, equality can be interpreted in a very diverse way - on the basis of what criteria people understand as equal; which differences between them or the circumstances in which

justice is applied are considered relevant (Fuller, 1998).

According to Kryvinska (2012) the realisation of justice in the life of society was understood by Marxism-Leninism as a process whose every stage is necessary and paves the way for a higher stage. The realisation of the communist ideal of justice is also linked to the realisation of socialist transformations, by its development towards communism. The transition from the first phase of communism to its second phase is a continuous process, in which elements of labor distribution and merit intersect with elements of needs distribution (e.g., health care).

In the field of law, justice is a category of legal consciousness, which is one of the criteria for evaluating the organisation of social relations through the law and the evaluation of the law itself. Justice is facing the creation of the non-realisation of law as an objective, the achievement of which is part of the mission of that right in its sociological and ethical conceptual determination, and is also a criterion for assessing its norms (Kaczor and Kryvinska, 2013).

Justice from the ethical perspective is an ideal based on the principle of equality of all people, it is reflected in the legal consciousness as a criterion for immediate evaluation of the law. It finds its expression as an ideal of the relationship of law and justice, on the basis of which the requirement of equality lies (Rentkova et al. 2018).

Current views on the value of justice

At present, we find different approaches to equality and justice in law. The notion of justice evokes in us the idea formulated by Weinberger (1995) that there is no timeless and absolutely valid content principle of justice. The pursuit of justice is the task of seeking, the task of reason and heart. The need for searching is the need to seek to find the carrier systems for the tolerant coexistence of different human communities, to penetrate the mechanisms of functioning of justice (Fábry, 2003). In the words of Aristoteles (1986), righteousness is a state whereby people are able to do justice, and indeed they do justice, and want what is fair.

As Gluchman (1994) claims, in recent ethics and justice, interest in justice issues has been renewed. This trend is also confirmed by the 20th World Philosophical Congress held in Boston on 10-16 August 1998. The speech by Appel shows the constant relevance and timeliness of justice in law. This is also true at a time when one really stands on the threshold of deep economic problems, which include unemployment in particular Kočišová et al. (2018). Unemployment as an economic phenomenon is profoundly contradictory to our most basic notions of justice, because unemployment means social exclusion even though the unemployed do not starve due to support (Fobel and Fobelová, 1999).

The problem of misery and hunger as a result of the slope between economic areas, but to a rather drastic extent, also occurs within some of the affluent societies. The almost unbounded power of wealth represented by big corporations and other multinational and global economic power holders trampled the value of justice (Močarníková et al. 2018). Ethics, however, in the words of Fobel (2008) must not only be a reflection of the crisis, but should be, above all, an ethics of prevention, prophylaxis of crises. As Novosad (1993) suggests, it is necessary to agree on justice.

According to Gahér et al. (2019), the question of how to approach justice in relation to the economic environment, and which ways of establishing justice are becoming optimal, is coming to the forefront. Is the original state a state in which the true principles of justice would be chosen? To what extent can people realise their role in their original state in a relative and dynamic economic environment? Which principles of justice should be preferred in a market economy and so on. The answers to each of these

questions can be determined on the basis of a fairness analysis through a whole set of relationships that cannot be clarified by one simple rule Milošovičová et al. (2018).

Justice issues always stand in the way of utilities considerations, as Srebalová et al. (2019) states, the ideals of justice interact with utility analyses and normative regulations. In Velek's view (1994), Rawls' theory was generally understood as an attempt to criticise the prevailing utilitarianism in Anglo-Saxon moral and political philosophy on the basis of a procedural reformulation of Kant's moral and political theory. However, Rawls' theory is not only close to Kant's theory. To justify his theory, Panda et al. (2016) uses a specific formal means - the theory of the treaty, which allows him to omit questions of meaning and definition and to advance with the development of some content theory of justice.

According to Panevski at al. (2017) the idea of an agreement or contract as the basis of justice is indeed very old, one of the oldest ways of establishing justice. It can be found in Judaism and consequently in Christianity, the relationship between man and God (and hence the relationship between man and other people) is based on the covenant. Likewise, the ancient tradition is regarded as a key element by the treaties, and in Roman law the theory of contractual relations has become an essential part of it Turčan et al. (2019).

Hayek (1991), in his second volume of Law, Legislation and Freedom, challenges social justice as a term that has no intellectual value (seriousness), it is just a sign of democracy and cheap journalism, and officials should be ashamed to use it. Hayek is an admirer of spontaneous social development, self-regulation, which, if avoided by power interference, results in a complex network of relationships, much more appropriate and acceptable compared to what one might, powerfully and deliberately strive to create, no matter how good the intent was (Vilčeková et al. 2018).

Hayek does not reject Rawls' fairness in its negative definition as a principle that agreed rules must apply to all. But justice understood in this way can only be applied to individual behaviour. Non the mutual behaviour of individuals and never on the cumulative consequences of the actions of several people. It is a sign of immaturity and primitiveness of thinking to demand justice from society, taking it accountable for a particular material position. According to Hayek, society is not at all capable of dealing with any specific purpose, ensuring that everyone receives what belongs to them. Although the way in which the market mechanism divides revenues and burdens appears to be very unfair in a number of cases, this is the traditional proven order of things (Dolobac et al. (2016).

According to Hajduk (2015) as implies from the essence of Hayek's views, the requirement of social justice must be passed on to institutions that are empowered to instruct individuals what to do. This means requiring them to organise the members of society in such a way that it is possible to assign specific shares in a social product to different individuals or groups and to coordinate their efforts to achieve a specific form of distribution that is considered fair (Lackey, 2020). This means insisting that governments set the goal of adopting an acceptable justice-sharing scheme. Being vague, there is a real danger of shifting content corresponding to established interests, which would be truly asocial. In addition, governments will be allowed to decide on the status of different individuals and groups, which is an idea that detracts from the individual's discretion Hajduk (2000).

Conclusion

Based on our research, we can conclude that we have achieved the goal set in the introduction. Using scientific literature, we have analysed and identified the notion of fairness from different points of view. We were unable to find a common view on this concept. Every era, as well as social establishment, brings its view of this concept. We could therefore simply describe justice as a condition that suits us. The

definition of justice is also prevented by the fact that it has more meanings (it is a polysem). Often there is no distinction between justice in terms of legal, moral (ethical), historical (historical justice) and social (social justice), even though it is hard to mention the common denominator. We therefore reject the hypothesis that the historical development has unified the view of justice and its socio - ethical aspects.

In conclusion, however, we consider it necessary to state that justice is now seen as a fundamental value. The concept of the rule of law, to which the Constitution of the Slovak Republic professes, is also based on the restriction of state domination in favour of justice. In contemporary modern-day legal philosophy, we encounter a new kind of justice, so called "iustitia protective". This is a protective justice, designed to prevent arbitrary abuse of power, as we know how dangerous and injustice it can be.

Abstract

The right to information is a fundamental right without which the existence of a genuine democratic establishment is not possible. It allows us to form an opinion on the whole society. Information is also called the oxygen of democracy. Access to truthful, timely and complete information is a prerequisite for making our decisions meaningful. However, our contribution examines the real right to information and public awareness in the period of non-freedom - in the years 1948 to 1989. From the point of view of systematic approach, the contribution is divided into three parts, in addition to the introduction and conclusion. Each of them pays attention to a certain period in the period of non-freedom. We have used several scientific methods for elaboration of the paper, especially description, analysis, synthesis, deduction, logic or comparison. The result of the paper is an evaluation of the overall state of information in Czechoslovakia in the period under review. In the end, we confirm or reject the hypothesis that the right to information was effectively withdrawn in the period under review.

Keywords: Distribution, Govertment Policy, Information

Introduction

According to Gregus and Kryvinska (2015) the right to information is a fundamental right without which the existence of a genuine democratic establishment is not possible. It allows us to form an opinion on the whole society. Information is also called the oxygen of democracy. Access to truthful, timely and complete information is a prerequisite for making our decisions meaningful. However, three years after the end of the Second World War, in time when the economy of the state was in ruins, the right to information was not given as much attention as it is at present. The incoming change of the social system towards the building of socialism in order to create a targeted communist society was fully aware of the power of information. The first steps of the communist regime were directed to dominate the media (Molnár et al. 2014).

The aim of our paper is to review the legislative interventions of the state in order to dominate the media and to critically evaluate the right to information and public awareness during the period of non-freedom, in the years 1948 to 1989. From the systematic point of view, the contribution is divided into three parts in addition to the introduction and conclusion. First part, the years 1948 to

1960, pays attention to informing in the period of purges and terror. In the second part we examine the issue of awareness in the context of the adoption of the new constitution in 1960 until the intervention of the Warsaw Pact troops in 1968.

We have used several scientific methods for thorough elaboration of the paper, especially description, analysis, synthesis, deduction, logic or comparison. The result of the paper is an evaluation of the overall state of information in Czechoslovakia in the period under review. In conclusion, we confirm or reject the hypothesis that the right to information was effectively withdrawn during that period.

Awareness in the years 1948 - 1960

In 1948, the Government of the Czechoslovak Republic, the Ministry of Information and the Corps of Trustees issued a series of resolutions and legal regulations that were to ensure a new order of press matters. These were serious measures in the field of information, publishing, specialisation and concentration of periodicals, paper allocation, advertising and print advertising (Kočišová et al. 2018).

Of decisive importance was the Government Resolution of 12 March 1948 entrusting the Minister of Information and the Minister of Industry with a review of outgoing journals of all kinds, so that the periodical in the future would serve as one of the most important means of information and entertainment for the Czechoslovak People's Democrats. Government resolutions of 23 May and 10 June 1948 reduced paper consumption by approximately one third. The same resolutions for Slovakia were adopted by the commission of commissioners on 22 March and 22 June 1948 (Ševčák and Duhajová, 2009). On the basis of the above-mentioned resolution of the government of the Czechoslovak Republic, 1948, the periodical press was reorganised, which meant its appreciable restriction and reorganisation.

Implementing decrees of the Ministry of Information and the Ministry of Industry have also been issued, under which printing trade operators were only allowed to print newspapers or magazines if they submitted a printing permit issued by the Ministry of Information, or in Slovakia by the Bureau of the Board of Trustees. The obligation to have a certificate from the contingent bearer that a paper supply for printing is ensured has been introduced. Subsequently, on 8 June 1948, the Ministry of Information of the Czechoslovak Republic issued a directive regulating the submission of an application for permission to print periodicals (Dolobač at al. 2016).

Before February 1848, the information commission was operated in Slovakia as part of the commission, but it was temporarily canceled. Its powers passed from 1 April 1848 to the office of the Bureau of the Board of Trustees. Since June 1948, a new Trust of Information and Enlightenment was established and managed by O. Pavlík. By order of 6 November 1848, the new mandate established the Economic Headquarters of the Slovak Publishers of Magazines as its special component. According to Ľalík (2019) this body began its activities on 11 January 1949 as an interest organisation for the publishing houses of periodicals. The task was mainly to address the economic and technical security of the publishing houses.

On 9 May 1948 the National Assembly adopted the new Constitution as a constitutional law of 9 May 1948 no. 150/1948 Coll. Constitution of the Czechoslovak Republic. According to § 96 of the Constitution, the Slovak National Council had legislative power. As Dudic et al. (2018) states, the commission issued legislation in accordance with § 119 of the Constitution. The commissioners themselves were also entitled to issue measures in the form of decrees. The new constitution stated in § 21 paragraph 1 that freedom of the press was guaranteed. However, Article 21 (2) continued with the wording, according to which the law stipulates who has the right to publish newspapers and magazines and under what conditions, especially with regard to the fact that profit is not intended. According to Peráček and Mittelman (2015) the undemocratic nature of this law was rounded off by paragraph 22, determining the State's exclusive right to operate radio, television and film.

On 20 December 1950, a new Press Act published in the Collection of Laws was passed as Act no. 184/1950 Coll. on the publishing of magazines and on the Union of Czechoslovak Journalists. Even to our present conditions, it was very brief, had only 10 paragraphs, which were strictly and cogently regulating conditions for the operation and publishing of the press. For example, Article 8 (1) determined who could be a journalist (Olšovská et al., 2016). To ensure the proper fulfilment of the duties of journalists pursuant to § 1 is imposed on the Union of Czechoslovak Journalists, which unites all professional journalists. As a professional journalist, only one who has been admitted as a member of the Union of Czechoslovak Journalists can be active. Such legislative intervention introduced mandatory membership of the Union of Czechoslovak Journalists. The Act also repealed, in Section 9, the old, still Austro - Hungarian legislation of 1914, as the irreducatory law of 1947.

Decree of the Ministry of Information and Enlightenment of Czechoslovakia of 30 December 1950 issued press regulations of lower legal force. This decree was much more detailed than the Press Act. Resolution of the Government of Czechoslovakia no. 17 of 22 April 1953 created a non-public body - State Press Supervision, which until the end of 1953 cooperated with the government, later the Ministry of Information respectively. Since 1967 it has been replaced by the Central Publication Report, which was canceled in 1968 (Kluknavská and Gábriš, 2017).

Censorship was introduced in Czechoslovakia in 1953. It is interesting that this was only a guideline of the government and not a law. This sub-legal regulation established the Main Press Supervision Report. This was conceived according to the Soviet Directorate General for the Protection of State Secrets in the Press (GLAVLIT). It was incorporated under the Ministry of the Interior of Czechoslovakia. Its activities were governed by the Statute of 1955 and the Staff Regulations of January 1956. Censorship centres have been active in all district towns since the beginning of 1954. Daily reports and reports were sent to Prague and Bratislava through the regional leadership, from which the authority took daily reports for the leaders of the Ministry of the Interior and the Central Committee of the Communist Party of Czechoslovakia. The Special Technical Supervision Department also kept files of interventions against individual editors and persons (Burda and Trellova, 2019). The censorship was expected based on two criteria. Priority was given to protection of the state, professional and economic secrets. The second criterion was the protection of the general interest, which is a very broad term.

The service statute of 1955 then implied that the dissemination of data and facts that are false and otherwise harm the Czechoslovak People's Democratic Republic and its establishment must be prevented. Such information may not be disclosed in the general interest. In particular, at the outset of the formation of the "new socialist culture", the publishers turned to the Ministry of Information and Enlightenment with recommended permits to sell or destroy certain titles. The Church Affairs Office submitted similar information to the Ministry.

According to Kaczor and Kryvinska (2013) Government Decree No. 5/1953 Coll. on the new Government Work Organization, no. 6/1953 Coll., which abolishes and establishes some state administration bodies and regulates their powers and no. 7/1953 Coll., which abolishes and establishes some credentials and regulates their powers, approved several curricula of government orders, which, with the consent of the President, carried out extensive reorganization of the government and Slovak national authorities as a further stage of centralization of state administration. The Trust of Justice and the Trust of Information and Enlightenment have been abolished (Kryvinska and Gregus, 2014).

Central state administration bodies such as the State Committee for the Arts, the State Committee for the Church, exercised their powers in Slovakia through their pendants who were outside the competence of the Board of Commissioners. The Communist Party of Czechoslovakia regularly organized activities with external press officers in the districts, which usually took place at the level of the party's regional committees. Representatives of the Communist Party district committees also attended. As Kryvinska (2012) states from the course of the assets, reports with conclusions were made, which both mapped the situation in the press area and these included also tasks for the future.

Every year, the Censorship Office also prepared information on the evaluation of the control of recipients of titles of publications coming to Czechoslovakia. Some of the prints were discarded due to their "objectionable content". The prints were confiscated because, in the opinion of the censors, they contained articles of emigrants and, in particular, were anti-Marxist and anti-Soviet.

The issue of awareness in the years 1960 - 1968

The new Constitution of the Czechoslovak Republic of 11 July 1960 was adopted as Constitutional Act No. 100/1960 Coll. Not only did it change the name of the Czechoslovak Republic to the Czechoslovak Socialist Republic, but by its diction it interfered with the declared possibility of competition of political parties. The leading force in society and in the state is the vanguard of the working class, the Communist Party of Czechoslovakia, a voluntary battle union of the most active and knowledgeable citizens among workers, peasants and intelligence. This is the announcement of Article 4, which enshrined the leading role of the Communist Party of Czechoslovakia along the lines of the Constitution of the Soviet Union. The leading role of the Communist Party was regulated in Article 6.

Article 28 (1) declared freedom of expression in all areas of social life, in particular freedom of expression. These freedoms were supplemented in the following developing sentence by the statement that their citizens of the Czechoslovak Socialist Republic should use both the development of their personality and their creative efforts, as well as their active participation in the economic and cultural construction of the country (Milošovičová et al. 2018). The following Article 28 (2) (l) stated that these freedoms were safeguarded by making available to the working and their organizations publishing houses, press companies as well as radio, television and other means. They were called material guarantees of these constitutional freedoms. Their feasibility could be verified by every citizen in practice if he decided to publish any opinion or information that was not in accordance with the ideology or politics of the party and government.

According to Panda et al., (2016) the Constitution also defined the constitutional status of the Slovak National Council as the national body of state power and law in Slovakia. It did not return to the characteristics of the Slovak National Council as the national legislative authority in Slovakia. Compared with the systematic Act no. 33/1956 Coll. In addition to the attribute, the National Authority of State Power also added the attribute National Authority of State and Law in Slovakia.

According to some authors (Dudic at al. 2018) in the 1960s, the National Assembly of the Czechoslovak Socialist Republic passed several key laws under which individual means of mass communication were regulated. It further states that, the regulations were as follows: Act No. 17/1964 Coll. about Czechoslovak Radio, Act No. 18/1964 Coll. about Czechoslovak Television, Act No. 123/1965 Coll. about the Czechoslovak Press Office, Act No. 135/1965 Coll. on the competence of the Czechoslovak Press Office in Slovakia, Government Decree no. 13/1962 Coll. about a new organization of Czechoslovak film.

Act No. 81/1966 Coll. on periodical press and other information media was the basic regulation for print media. This law for the first time in our country regulated all means of mass communication called mass information means. The law was prepared in close cooperation with the journalistic community in an atmosphere of the forthcoming liberalization of social conditions. This Act introduced a registration system for publishing periodicals and adjusted the status of the publisher, editor-in-chief, editorial board and editors (Močarníková et al., 2018). The institute for the correction of false and misleading data and the obligation to protect editorial secrecy have been restored. The right to information, the availability of sources of information and the obligation to respond to journalistic criticism have been enacted.

This Act was amended only two years later by Act No. 84/1968 Coll. amending Act no. 81/1966 Coll. on the periodical press and on other mass media dated 26 June 1968, which declared the editors' responsibility not to disclose information containing a matter of public, economic or professional

secrecy and clarified the obligation to publish a press correction. With effectiveness from January 1, 1967, the Main Press Supervision Report changed to the Central Publication Report. The provision of § 17 of this Act also abolished censorship within the Prague Spring. By this measure, censorship was declared inadmissible. The legislature defined it as any interference by state authorities against the freedom of speech. However, its abolition was not absolute, as the possibility of any interference in media freedom was left to the prosecutor's office and the court

Consequences of Warsaw Pact troops intervention

After the intervention of the Warsaw Pact troops in August 1968, Act No. 81/1966 Coll. amended for the second time. The legislator's intervention was a response to the content of the Moscow Protocols. Act no. 127/1968 Coll. on some press measures and other mass media was the first consequence of the normalization in Czechoslovakia. Pursuant to Section 1 (2) of the above mentioned Act, the Press and Information Offices were established to provide uniform guidance and control over the activities of the periodical media and other mass media. Article 3 (1) suspended the first amendment in the part of the prohibition on censorship with the words "§17 of Act no. 81/1966 Coll. as amended by Act no. 84/1968 Coll." Subsequent paragraph 2 allowed the offices of the editors to appoint their plenipotentiaries who were entitled to suspend the publication of information that would be contrary to the important interests of the State's internal and foreign policy (Peráček at al. 2016).

This Act also established the Slovak Press and Information Office, whose existence was one of the consequences of military intervention and was the central body of state administration in the Slovak Socialist Republic (Švec and Madleňák, 2017). Its responsibilities included all issues of management, follow-up and information gathering in Slovakia. The Slovak Office of Press and Information was divided into: section of propaganda, section of evaluation and section of printing.

As is well known, the process of political easing in Czechoslovakia was ended by the subsequent intervention of the Warsaw Pact troops from the night of 20 August to 21 August 1968. Subsequently, the Communist Party was subject to screening. In the field of literature and other works, a program of engaged socialist literature and a socialist realism was established, where the principles of Marxism-Leninism were applied. The management and control of the media and propaganda were entrusted to the competence of the Slovak Press and Information Office, which was the central body of the state administration of the CSF, whose task was mainly to regulate the content and orientation of the media.

On 1 January 1981, Act No. 180/1980 Coll. established by the Federal Press and Information Office. He ensured the protection of important state interests in the media, propose to the government the principles of state media policy, registered periodical press. He also had the authority to decide on the import of foreign periodicals and the dissemination of news from foreign news agencies. After the XIV. Congress of the Communist Party of Czechoslovakia in 1971, the journalist organization continued its activities as a nationwide Czechoslovak Union of Journalists with a territorial unit in the Slovak Socialist Republic, which became the Slovak Union of Journalists (Rentkova and Panevski, 2017).

The Czechoslovak news agency provided news service for press, radio and television. It also promoted Czechoslovakia and other socialist countries. Since 1969, Czechoslovak Radio has been organized on a federal principle. By the provision of § 13 of the Slovak national council Act no. 207/1968 Coll. (Fábry et. al. 2019). The establishment of ministries and other central bodies of the state administration of the CSF also regulated the position of Slovak Television in relation to the national authorities. Television was seen as an ideological-political instrument of the party and government, as a socio-cultural institution. The television broadcasted on two programs.

The main body of Slovak film was the Slovak Film Center managed by the General Director, who managed the work of the Slovak Film Production and the Slovak Film Rental Agency in accordance with the guidelines of the Central Committee of the Communist Party of Czechoslovakia and the

principles of the planned economy. Slovak filmmaking included Fiction and Short Film Studio, which was further divided into News, Animation and Diafilm. The periodical press continued to be published by: PRAVDA - press working for the Communist party KSS, PRÁCA - publishing house of the ROH and SMENA - publishing house of the SÚV SZM.

According to Serafínová and Vartál (2015), professional publishing houses included the Slovak Educational Publishing House, the Publishing House of the Slovak Academy of Sciences VEDA, the Agricultural Publishing House PRÍRODA, the Publishing House of Technical Culture ALFA, the Sports Publishing House ŠPORT and others.

According to Vilčeková et al. (2018) the periodical printing system in Slovakia remained unchanged; however, uniformity prevailed in the context of government policy. After the disappearance of the periodicals Cultural Life in 1968, Literary Life in 1969, Young Work in 1970 began to publish samizdat in the Republic, either in the form of books or periodicals, but for which the publishers were punished.

Samizdat periodicals began to appear in Slovakia since 1948. In the period after the intervention of the troops, in the 1970s a smaller number of such publications were published, in the 1980s their number gradually increased. However, they did not have a regular periodicity or an elaborate treatment. They provided information that was not available in current periodicals. Most were religiously oriented. In 1972 and 1973 four issues of the religious magazine Family, the centre of the cosmos were published. The magazine emphasised the role of the family as a major component of society (Srebalová et al., 2019). In 1981, the first Christian magazine was published in a samizdat called Religion and Present with a two-month periodicity.

Conclusion

The socialist state is theoretically a state which economic and social establishment is socialism and in the government is only one - communist political party. The socialist state is a state serving as an organisational power tool for building socialism. In the context of the people's democratic and, since 1960, socialist Czechoslovakia, it was a state in which the structure of power was diverted from the leading role of the Communist Party as a vanguard of workers, peasants and intelligence. The government had the of to build socialism as a new socio-economic establishment and the state was officially declared a “socialistic" in the Constitution from the 1960s. The basic features in the economic area were the nationalisation of means of production and private property by transfer to social state ownership, central planning of the economy, foreign exchange monopoly or collectivization of land. All these features were immediately reflected in State interventions in the field of public information. However, the public did not perceive the restrictive measures after the end of World War II as it was necessary to rebuild the war-torn economy. However, a fundamental problem occurred at the time of the upcoming Prague Spring. The gradual easing of the situation has brought to people the hope of greater freedom and the democratic establishment. In our opinion, the prohibition of censorship was a fundamental signal of easing the situation, but it did not withstand the intervention of the Warsaw Pact troops. On the basis of our investigation, we can confirm the hypothesis of the offensive withdrawal of the right to information in the years 1948 to 1989.

Abstract

The importance of information and its impact on the state and society was already recognized by ancient statesmen. However, this was a right that was suppressed for a long time, mainly for strategic reasons. It was only three years after the end of Second World War that political will was found to anchor this right in a generally binding international document. This act founded the adoption of other international documents dealing with this area of human rights. Access to truthful, timely and complete information is a prerequisite for the proper functioning of human society and for our decisions to make sense. The aim of our paper is to review selected international documents guaranteeing the right to information. From a systematic point of view, the paper is divided into four parts, in addition to the introduction, the objective with the methodology and the conclusion. Each of them is focused on a selected document in the field of international information law. For the purposes of the paper, we used several scientific methods of research, especially description, analysis, synthesis, deduction, logic or comparison, but also doctrinal interpretation of international documents. The result of our efforts is the identification of the right to access information from the perspective of international law, the analysis of the key international documents conferring the right to information, as well as the answer to the research question, even in the period of freedom since 1948 until 1989, the right to information was guaranteed by international documents.

Keywords: Freedom, Human Rights, Information, International Law

Introduction

International law is a part of law that has been affected by a number of events having a worldwide impact. Such significant events include the creation of a global peace-keeping organization, in the form of the League of Nations, and later in the form of the United Nations, those organizations were a response to the First and Second World War. Just after Second. World War, it was a period of massive increase in the regulation of international law (a period that we call the period of current international law). As stated Rentkova and Panevski (2017), one of the basic documents is the United Nations Charter, in which the Contracting States condemned as a means of resolving international conflicts and established a system of peaceful resolution of international relationships. Legislation about the use of armed forces, human rights or contract law is also booming, especially in the form of codification conventions, which lay down mandatory rules of international law and customary

international law. In the second half of the 20th century, there was a boom in the contractual arrangements, as well as in the new, currently developing law branches. There are large numbers of contracts, so-called establishing, regulating individual international or regional organizations. The right to information ranks theory of law among political rights. As reported by Bajzíkova et al. (2017) it is the second generation of human rights that emerged in the early twentieth century. The emergence of political rights has necessitated the need to protect the population from the threats posed by the post-modern era and post-industrial society.

Purpose of Contribution and Methodology

In the past, the right to information was evaluated controversially and was not universally recognized. Probably also for this reason the issue remained on the brink of interest of international law experts. We try to investigate this problem. The main aim of this paper is to identify the right to information from the perspective of an international law. In addition to the main objective, we have also chosen two sub-objectives:

1. analyze the main international documents conferring the right to information;

2. to answer the main research question, whether in the period of freedom during years 1948 to 1989, the right to information was guaranteed by international documents.

Through international documents as well as scientific literature, we are looking for answers to the set main goals. At the end of the paper, we evaluated and critically pointed out the identified shortcomings of international documents in the realization of the right to information and possibilities of public information by public authorities.

From a systematic point of view, the paper is divided into four chapters, starting with the introduction, methodology, main objectives for the paper and the conclusion. The first chapter focuses on the importance of the Universal Declaration of Human Rights (year 1948) and its impact on the adoption of other documents. The second chapter examines the International Covenant on Civil and Political Rights. The third chapter deals with the importance of the Convention for the Protection of Fundamental Human Rights and Fundamental Freedoms. The importance of the Organization for Security and Cooperation in Europe in the context of the right to information is given in the last chapter.

We have used several scientific methods for elaboration of paper, especially description, analysis, synthesis, deduction, logic or comparison as well as doctrinal interpretation of international documents dealing with the right to information.

Universal Declaration of Human Rights

By its very nature, the Universal Declaration of Human Rights is the most important document guaranteeing human rights worldwide. It was adopted unanimously at session III. United Nations General Assembly in the form of Resolution No. 217 / III on 10 December 1948. Three years after the end of the Second World War, freedom of expression was recognized as one of the fundamental democratic values necessary for peaceful coexistence of nations. Freedom of expression was thus given the highest status in the Universal Declaration of Human Rights by being included in the preamble as one of the four fundamental freedoms. As stated by Nováčková et al. (2018) according to the preamble, human beings have freedom of expression and religion, and freedom from fear and need. This freedom of expression is also expressed in Article Nr. 19, according to which everyone has the right to freedom of expression, that freedom of opinion to seek, receive and disseminate information and ideas through any media and across borders.

The Tehran proclamation on the 20th anniversary of the Universal Declaration, approved by the United Nations General Assembly, stated that the Universal Declaration found a common understanding of the people in the world regarding the inalienable and inviolable rights of all members of the human race and imposed obligations on members of the international community. As Circolo et al. (2018) the issue of the nature and global significance of the Universal Declaration of Human Rights was also discussed by participants in the 1988 in Bangladesh seminar where the Chief Justice of Pakistan declared that as a result the Universal Declaration is now recognized as the Magna Charter of Humanity to be respected by all politicians in the world arena. What has begun there as a simple social endeavor is now recognized both as an authoritative interpretation of the provisions of the United Nations Charter on Human Rights and as an established customary right (Lalik, 2019) forming the core of the comprehensive list of human rights. By expression, the General Declaration is considered binding on all states as part of international customary law. For this reason too, the Slovak Republic, as a member of the United Nations, is obliged to protect and promote the rights presented in the Universal Declaration of Human Rights. Therefore, in the Article Nr. 2 of the International Covenant on Civil and Political Rights, the Slovak Republic safeguards and protects these rights for anyone within its territory and subject to its jurisdiction.

As mentioned above, Article Nr. 19 of the Universal Declaration directly determines the right to freedom of expression and information. As Dudic et al (2018) further states, Article Nr. 20 declares the right to peaceful assembly and association, including the right not to be a member of any association. These rights are limited by Article Nr. 29, which permits restrictions strictly necessary only in the interests of the rights and freedoms of others and the fulfillment of the requirements of morality, public interest and general welfare in a democratic society. In addition, those rights set out in the Universal Declaration of Human Rights shall in no case be exercised contrary to the purposes and principles of the United Nations.

The content of the Universal Declaration has had a huge impact on the adoption of both international documents and national human rights. In fact, all human rights treaties adopted by the United Nations bodies since 1948 elaborate on the principles set out in the Declaration (Kryvinska and Gregus, 2014). The European Convention on Human Rights states in its preamble that it gives effect to the principles set out in the Declaration. Likewise, the States associated in the Organization for Security and Cooperation in Europe have committed themselves in the Helsinki Final Act to act in accordance with the objectives and principles of the Charter of the United Nations and the Universal Declaration. In addition, many countries have adopted and amended their constitutions and laws on the basis of the principles of the Universal Declaration, and national courts have adopted its standards.

International Covenant on Civil and Political Rights

The Universal Declaration of Human Rights was the first step in the formation of the International Charter of Human Rights after its completion in 1976. However, two other important documents were adopted after that. The first was the International Covenant on Civil and Political Rights and the second was the International Covenant on Economic, Social and Cultural Rights. As of 31 December 1994, 128 countries around the world had ratified the International Covenant on Civil and Political Rights. Of these, 80 countries have also ratified the Voluntary Protocol to this Covenant, authorizing individuals to send petitions to the UN Human Rights Commission, which monitors compliance with the Covenant. Of the 48 countries that now make up Western, Central and Eastern Europe, only four have not signed it: the Vatican, Liechtenstein, Monaco and Turkey. The other 44 countries that signed it, in addition to Albania, Greece and Ireland, also joined the voluntary protocol. As the Slovak Republic is a member of the International Covenant on Civil and Political Rights, it is legally bound by its provisions. As stated Milošovičová et al. (2018), Article Nr. 19 confirms the absolute right to have an opinion without restriction and defines a narrow range of circumstances in which freedom of expression and information may be restricted. Its content implies that every person has the right to have their opinion without hindrance. At the same time, every person is granted the right to freedom of expression. According to Kellenbauer at al. (2019) this right includes the freedom to seek, receive and disseminate information and ideas of all kinds, regardless of frontiers, whether

orally, in writing or in the press, through art, or whatever other media of your choice.

The use of rights in Paragraph Nr. 2 of this Article entails specific obligations and responsibilities. Therefore, according to Burdová (2017), it may be subject to certain restrictions, but only to those laid down by law and necessary to respect the rights and obligations of others, the protection of national security, public order, public health or morality.

In our view, it is worth to discuss that the three requirements specified in Paragraph Nr. 3, are very strict. If a Member State imposes certain restrictions on the exercise of freedom of expression, they must not call into question the law itself. As is apparent from the Report of the Human Rights Commission from the 1983 General Assembly of the United Nations, Paragraph Nr. 3 clearly lays down conditions, and restrictions may be imposed only if they are met. These are:

1. restrictions must be required by law,
2. they may be imposed only if one of the conditions laid down are fulfilled,
3. they must be justified as 'necessary' for the Member State for one of these purposes.

Article Nr. 20 of the Pact requires Member States to prohibit by law, although it is not necessary to declare as criminal any promotion of war and any incitement to discrimination, hostility or violence on a national, racial or religious basis. Consequently, according to Kahil-Wolf (2018), any war propaganda is prohibited by law, and also any national, racial or religious hatred that constitutes incitement to discrimination, hostility or violence must also be prohibited by law. Article Nr. 21 protects the right of peaceful assembly. The following Article Nr. 22 governs the protection of the right to freedom of association, including the right to establish and join trade unions.

Convention for the Protection of Fundamental Human Rights and Fundamental Freedoms

The Council of Europe currently has 47 members from all Western European countries, including Central and Eastern European countries, as well as the new Member States of the European Union. According to Panevski et al. (2018) in June 1995, the Parliamentary Assembly of the Council of Europe recommended that the Committee of Ministers also call on countries such as Albania and Moldova to become members of the Council of Europe. This international organization has developed an extensive system of law, legal science and standards regarding freedom of expression, access to information and rights related to freedom of peaceful assembly and association. The Council of Europe's first declaration is the Convention for the Protection of Fundamental Human Rights and Fundamental Freedoms, better known as the European Convention on Human Rights (hereinafter the Convention). Historically, it is one of the oldest of the human rights treaties, and its implementation processes are the most developed (Kaczor and Kryvinska, 2013). The Convention was ratified by all current members of the Council of Europe except the new members who signed it only after their adoption. However, all the new states were expected to ratify the convention within one year of its membership, with a view to modifying their national laws accordingly.

The right to freedom of expression and the right to information are clearly stated in Article Nr. 10 of the Convention and have also been strengthened and further elaborated in the precedent law of the European Court of Human Rights. According to Olšovska et al. (2016) any country wishing to become a member of the Council of Europe or to consider it a modern European democracy must meet these human rights standards and be able to demonstrate the protection and respect for the right to freedom of expression and information in its legal system and practice.

The European Court of Human Rights was established in 1959 to deal with complaints about violations of rights by convention. That court has delivered more than 25 judgments on Article Nr. 10 issues and two more serious judgments concerning Article Nr. 11, the right to freedom of peaceful

assembly and association. Decisions and recommendations of the Committee of Ministers (political and executive hand of the Council of Ministers) add additional directives in particular as regards access to information. As the literature indicates (Bělohlávek and Rozehnalová, 2019) the judgments of the European Court of Human Rights are legally binding only on the Member State against which the complaint was lodged. Despite this, Nosková (2019) points out that, given the authoritative interpretation of the Convention's obligations, the content of these judgments must be respected and enforced by the courts of all Member States of the European Union. They do so whenever issues arise concerning rights under this Convention.

Organization for Security and Cooperation in Europe

After its establishment in 1993, the Slovak Republic became a member of the Organization for Security and Cooperation in Europe. For this reason, it has signed and is obliged to comply with all the organization's provisions relating to the protection of human rights, freedom of expression and media freedom (Molnár et al. 2014). This is in particular the Copenhagen document of the 1990 Conference on the Human Dimension. Already in 1975, representatives of 35 countries attended the Conference on Security and Cooperation in Europe and signed the Helsinki Final Act of 1975. These 35 countries included all European countries except Albania, such as Canada, the Soviet Union and the United States. Since 1991, Albania, Croatia, Slovenia and some former USSR countries have joined.

The Helsinki Final Act and the following conference papers according to Laczko (2017) are only political declarations and not treaties. Frowein (1977) emphasizes that although they are not legally binding in this way, they do not lose their legal significance. Malanczuk (1990) agrees with this view and stresses that in practice the political and moral power of their commitments may be even more important than their precise legal status.

According to Novackova and Vnukova (2019) the Helsinki Final Act contains four 'packages' of promises, of which Package III is the most important for human rights. One of the sections of Package III, entitled Information, calls for an improved flow of information through print, cinematographic and broadcast media. Until the rebuilding of the Organization for Security Cooperation in Europe, the development of human rights protection has not been significantly recorded (Burda and Trelova, 2019).

In the Vienna Final Document, issued in January 1989, the participating States undertook to further facilitate the free and wider dissemination of information of all kinds, to encourage cooperation in the field of information and to improve the working conditions of journalists. Furthermore, it follows from Article 34 that they have declared their commitments in accordance with the International Covenant and the Vienna Declaration to ensure that individuals are free to choose their own sources of information (Peráček and Mittelman, 2015).

According to Peráček at al. (2016) in addition to these declarations, the Vienna Declaration also reflects the efforts of Member States to prevent and or to deny the Member States. Prohibit the possibility of interference with transboundary radio and television broadcasting. While former Soviet Union officials insisted on the right to cancel broadcasting as part of their sovereignty, the Vienna document requires States Parties to ensure that radio services that are operated in accordance with the International Telecommunications Union Radio Regulations can be received directly and normally in other countries (Močarnikova et al. 2018). We are of the opinion that, although the provision of the Vienna Declaration did not explicitly prohibit interference, the consequence, and indeed the intention, was to achieve a ban on interference beyond national borders.

The Human Dimension Conference, held in Copenhagen in June 1990, resulted in a document of great importance for human rights in general. In particular, the Participating States agreed to ensure that any restriction of fundamental rights and freedoms has to be made only by law and in accordance with their obligations under international law. Valuch et al. (2011) points out that they have made a

special commitment to respect the content, in particular with the International Covenant on Civil and Political Rights and their international obligations, in particular the Universal Declaration of Human Rights. They stated that any restrictions on the rights and freedoms in a democratic society must relate to one of the objectives of the applicable law and be strictly proportionate to the objective of that right (Srebalová et al. 2019).

In this context, the literature (Kryvinska, 2012; Duffalova et al. 2019) points to the importance that the above corresponds to the three-component restriction condition set by the European Court of Human Rights. These are legality, legitimacy of purpose and proportionality. In addition, the Participating States have explicitly recognized the Council of Europe's important human rights expertise and welcomed consideration of the means by which the Council could contribute to the human dimension of the Conference on Security and Cooperation in Europe.

As is apparent from Article Nr. 91 of Appendix A in the Copenhagen document, the Participating States also adopted a declaration on the right to freedom of expression, which is closely linked to Article Nr. 10 of the European Convention. The October 1991 meeting of the Moscow Conference on the Human Dimension reaffirmed and further elaborated this standard by affirming the right of the media to collect, communicate and disseminate information, reports and opinions. In particular, we consider it necessary to emphasize that at the Copenhagen meeting the Participating States have clearly recognized the right to freedom of expression, with international standards (Funta, 2018). They also pledged to combat the proclamation of national racial and religious hatred in all its forms. By the Copenhagen meeting, Western delegates had proposed this issue with regard to anti-Semitism in the former Soviet Union. This new interest, however, reflected a serious threat, namely increasing racism, xenophobia and ethnic hatred for the objectives of security and cooperation throughout the new Europe. Thus, according to Kočišová et al. (2018), the participating states have expressed a strong intention to intensify their efforts to combat totalitarianism, racial and ethnic hatred, anti-semitism, xenophobia, and discrimination against anyone. They also pledged to promote understanding and tolerance, to provide protection against any action that constitutes incitement to violence and to recognize the rights of individuals and to remedy.

Conclusion

Based on our research, we found that the Universal Declaration of Human Rights was one of the greatest importance in terms of granting human rights as well as the right to information and freedom of expression. Although it is the oldest document in the modern history of mankind, its content has had and still has a huge impact on the adoption of other international and European documents as well as national human rights regulations. We see the particular importance of this document in the fact that many countries have changed their legal systems to comply with the legal principles of the Universal Declaration of Human Rights.

From the analysis of the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights and the Convention on Civil and Political Rights, we can clearly identify the right to information as a fundamental human right. This is a subjective right of every individual that is inalienable, irrevocable, non-prescriptible and inalienable regardless of nationality. We also found, in each of the documents examined, a commitment by the signatory states to respect and protect these rights. On the other hand, we must state that the real implementation of this commitment was more than questionable during the 'Cold War' period, not only in the Eastern Bloc countries.

In answering the research question, we note that even in the period of freedom between the years 1948 and 1989, the right to information was sufficiently guaranteed by several international documents. In conclusion, we need to point out that even in today's globalized world, the realization of information law is questionable. We believe that effective media control by selected groups degrades the right to information only between some kind of “quasi-law.”

Abstract

Authors in the contribution focus on the area of emergence and development of legal information systems and legal computer science in the context of knowledge management development. Nowadays, in the information age, knowledge in the field of computer science constitutes the background for success of prospective lawyers. On the other hand, this field of expertise is of minimum attention of legal theoreticians. Due to these reasons, we have decided, using selected methods of scientific research and by scientific and doctrinal interpretation, to analyze available resources concerning the area of historical development of legal computer science. We search for answers to the set goal in academic and scientific literature. In conclusion of this contribution, we summarize the results of the scientific work and confirm or reject the hypothesis on inevitability of teachings of legal computer science at universities in the Slovak Republic. Research of the selected area concerning legal systems and legal computer science in conditions of the Slovak Republic represents the main objective of this contribution, which in its substance intervenes with other areas of research. Primarily, it is directed at the area of legal computer science with substantial overlaps in knowledge management and in theory of law.

Keywords: knowledge management, legal computer science, regulation

Introduction

According to Srebalová et al. (2019) legal computer science as a science deals with defining of legal information – defining the concept of legal computer science directly by its concrete expressions in such a way that we can extract legal information (within the multi-meaning context of language) from the general concept of information. It may be stated that it is a science *par excellence,* considering it from the point of view of high specialization and internal content structuring, both on sc*ientific as well as applied level* (viz. legal information systems, databases – operation and maintenance). Legal computer science as well as computer science itself – in contrast to theory of information - does not deal with movement of information per se; canals and nodes through which information passes through, but focuses on questions of construction of automated systems of legal information (ASLI). Theory of information deals with mathematical description and analysis of various systems of connections which may be understood – in a very general sense – as systems for transfer of messages

Purpose of Contribution and Methodology

The primary purpose of the contribution is to analyze historical development of legal systems. Another purpose is to review development of legal computer science as a course taught at law faculties in the Slovak Republic from its initiation until today. Alongside the main purpose, we have chosen a partial goal, that is:

- to confirm or to reject the hypotheses on inevitable need of teachings of legal computer science at law faculties.

The selected goals are going to be reached with the use of legal regulation, academic and scientific literature as well as judicial decisions in Slovakia.

Due to nature of the contribution, we apply scientific methods of research. From scientific methods of cognition, the analytical method is applied with respect to analysis of legal status and legal regulation. With the use of the comparative method, we have attempted to enable access to various opinions on legal regulation and interpretation of concrete concepts. Coming out from scientific knowledge of valid and effective laws and legal science, we have used doctrinal and scientific interpretation as well. Due to the fact that legal computer science is a relatively new branch of law; in Slovakia this topic was analyzed after the year 1989 by authors such as Gregušová, Susko, Chlipala. Their knowledge was published in University course books, academic and scientific articles in the area of legal computer science, theory of law, business law and civil law. The topic of legal commuter science has been analyzed also be several theoreticians in the Czech Republic, such as the academic Knapp, Cvrček or Novák as well as others. A special place as a source of knowledge belongs to the decision practice of Slovak courts.

Emergence and development

Beginnings of legal computer science may be traced to the period of the second half of the fifties and in the period of the turning point between the fifties and the sixties, at the beginning in the Western Europe and later on in the USA. In former Czechoslovakia, the grounds for legal computer science was put by the academic Viktor Knapp (1993). His most famous work was published in 1963 under the name: On the Possibility of Use of Cybernetic Methods in Law. In the seventies, the automated systems of legal information evolved.

The first important project in the beginnings of formation of legal computer science was the project called „Allowances“ – as the first expert system which should have provided a supportive framework for judicial decisions on the amount of allowances. The project had not found support of judges as they were not willing to subject their decision making on the amount of allowances to an expert system. There were several reasons for it. It was the fear of intervention into independence of judiciary and in particular into independent decision-making of judges in court proceedings on determination of the amount of allowances as it should have been subject to computer technology (Kryvinska (2012). As it results from the Resolution of the Highest Court of the Slovak Republic (2012), independence of judges is closely linked to impartiality and professionality (qualification) of the judge and these attributes are conditions of quality of decision-making and its predictability and follow the importance of due fulfillment (provision) of justice. Independence and impartiality are closely related, frequently overlapping and it is not easy to differentiate the former from the latter.

The second project was the project „ASLI“ – automated system of legal information. Its main objective was to gather, execute, maintain and search (on request) with the use of computer technology all legal regulations that were a part of the legal order in Czechoslovakia (Duľová-Spišáková (2017). It should have been able to find an individual provision of legal regulations, judicial decisions and opinions, opinions of other state authorities, selected works from legal theory etc.

The foundations of the ASLI were put in the year 1971 in Slovakia. It was connected to historical events at that time as a research task directed at creation of the first legal information system had been in progress. According to Milošovičová et al. (2018) results of this research task, the solving of which took place with assistance of informaticians as well as legal theoreticians were extremely favorable and socially important. The importance of this research task was expressed in the fact that its elaboration and results in the form of an automated system of legal information (ASLI) were later transferred from Slovakia to Prague (Czech Republic), where together Slovak and Czech creators – informaticians and law theoreticians - contributed to its completion.

In the eighties, in the Department of State and Law of the Czechoslovakian Academy of Sciences, initial formation of the legal information system CS LEGSYS was made, due to close cooperation of Czech and Slovak theoreticians in the area of law and computer science. Database of the legal information system CS LEGSYS was originally focused on purposes of scientific analysis of development of the Czechoslovakian legal order. According to academic sources (Cvrček and Novák, 1992), the main goal of construction of such information system was to form a database, which would in a broad sense of variables (i.e. from the perspective of characteristics of various types of legal regulations) encompass all legal regulations published in the Czechoslovak Republic form the year 1918 until the last (current) period of time. This legal information system represented a perfect system for the area of legislation and was an amazing example of schooling for teachings of students at law faculties and future legislators in the Czechoslovakia. Legal computer science gradually grew into a legal branch (Mura et al. 2019). It may be stated that it currently deals with following areas in general:

1. Analysis of legal documents as carriers of legal information
2. Typology, formal and language structure of legal information
3. Ways of creation of legal documents
4. Communication, interpretation and mutual relations and connections between these documents
5. Institutions which create, process and maintain legal documents
6. Technical measures
7. Ways and methods, i.e. technology of collection, processing, maintaining, searching and distribution of legal information

Legal Information Systems

According to Peráček (2019) beginnings of formation of legal information systems may be set in the time period of the sixties of the last century. Along with development of computer science, libraries had firstly introduced informatized catalogs that enabled search pursuant to different criteria of choice and these criteria could have been combined with each other. Search thus became more precise and faster. In this time period computers were used only in local operations, later on we can talk about huge machine room computers called mainframes.

Similarly, in this period in developed countries of western Europe, different state institutions started to organize databases according to their fields of competence e.g. publishers of collection of laws published electronic registers. Appeal, cassation and highest courts started to register their decisions on computers; notaries, attorneys and commercial lawyers started to use computers, firstly for the evidence of their members, later on clients as well as for other tasks.

Nowadays, the increasing amount of legal regulations is a trend. In the course of last years, the speed of computer technology has multiplied, as well as capacity of memory of computers (Peráček et al., 2019). Databases are growing bigger and bigger. Instead of registers and resumes, they contain texts

of laws and other legal norms as well as texts of judicial decisions in full.

Databases of legal regulations as well as other databases which initially served only for the purposes of their creators (authority, organization etc.) were later transferred to huge computers accessible to a broad number of users.

Already at the beginning of the seventies of the last century, post offices in western Europe delivered to their participants, gratuitously or for a low lease, simple terminals (e.g. MINITEL in France, VIDEOTEX in the Switzerland), that merged three basic parts in one machine: keyboard with a monitor, telecommunication programme and a mode. Their operation was easy and served broad pubic for the purpose of quick access to information, similarly as a telephone list or a traffic schedule

The basic characteristics of legal information systems is their technological side, based on principle or room computers (mainframes). Currently, their capacity of memory reaches several tens of GBs (gigabytes). Their substance resides in broad information technology that uses data networks at distance as well as huge databases which usually have a universal nature. These systems are based on four principles.

According to Gregušová et al. (2005) the first principle is the principle of complexity, which means that they contain all types of legal regulations, so the whole legal order of a state is contained in the database, in all forms. Data openness is the second principle. From technological point of view, it is the capacity to accept their parts to the database of data and from the content point of view, it is, in particular, the condition for continuous completion of legal documents. It is not only the technological capacity to integrate new parts to the databases, but it is the need for continuous completion of them that has to be addressed. New legal texts, historical and other documents have to be added on a continuous basis, especially due to the fact that upon creation of a database, it is not possible to incorporate all the documents and legal regulations at once. Construction of a database begins with inclusion of already existing legal regulations. Afterwards, historical legal documents are added (Mittelman et al. 2016). The third principle represents provision of services at a distance. It means, in particular, constitution of systems in such a way that distance users may use the provided services. The fourth principle is a broad technological base – network interconnectivity**.** They contain legal regulations, judicial decisions, academic literature, as well as other specific legally important documents.

Nowadays each legal information system contains:

1. **Technological base** – computer and software for search of text
2. **Language extension** – enables to manage search in national environment
3. **Legal Extension –** enables to structure legal documents (specific traits of legal documents)
4. **Data part** – processed by experts in their fields

In this connection, reference is also made to the opinion of Leone et al. (2018). InvestigatiOnt is addressed to users which need to model a system concerning the legal domain. The legal field shows a lot of complexities for which InvestigatiOnt can provide a valuable decision support: (i) different legal systems (e.g., common law, civil law), (ii) different jurisdictions (e.g., local, national, international), (iii) complex interactions between norms (e.g., norms that express the obligation to be accomplished if another obligation is violated, or norms that express an exception to an obligation), (iv) the fixed structure of legal texts (e.g., their division in articles, paragraphs, definitions). InvestigatiOnt helps the user to deal with those challenging issues by offering her two types of service: the visualization service displays the information concerning an ontology as a diagram showing its dependencies with the other reused ontologies, while the search service suggests one or more ontologies suitable to meet the user requirements analyzing the answers she provided to a set of

questions. The ontologies proposed to the user by this tool are those for which the ontology is available for download, and we concentrate on the more recently proposed ontologies (5-6 years ago at most).

Basic principles of informatized legal documents

The system of search of documents in databases is the complicated part. It is based on the use of computer capacity to sort out such documents (from high quantity of documents) that correspond to certain criteria. It is naive to think that it is sufficient to ask the computer to search for the word „theft“ and the computer goes through all the texts and selects those that contain the word „theft“- if the search took place in full texts, it would take several dozens of minutes for the computer to screen through the full texts, regardless of how fast and effective it is (Meisner et al., 2014).

Dictionaries, Indexes

A computer does not work with a text file at the beginning. It uses several accessory files that are, in particular, a dictionary and an index (Ključnikov et al. 2019). If the computer receives an instruction to search for a concrete word, it firstly checks if the word is allocated in the dictionary. If it is not found, it sends an error warning and asks for a new formulation of the word. A part of the dictionary is usually a list of words that should be ignored. In languages of the francophone area, these are the articles *la, le etc.;* in the Slovak language, these are empty words such as this, that or these. Subsequently, the computer consults accessory files of indexes. This is an important part of the search program. It is a dictionary that is completed with data where in the text a concrete word can be found. As in each dictionary, an index file is categorized alphabetically, so the search expression is quickly found (Kaczor and Kryvinska, 2013).

Thesaurus

A dictionary that contains a full enumeration of expressions, hierarchically classified, is called a thesaurus. The use of thesaurus precises the choice as with its use we may broaden or reduce the criteria of choice. Elaboration of a thesaurus is a very complicated and difficult job that requires a great amount of knowledge and time. After finding an expression in the text, another part of the program applies that reads the documents and sends the text to the applicant in the form that he/she required (Kočišová et al. 2018).

Structured query language (SQL).

Structured query language (SQL) is used frequently in conditions of work with legal information systems. Query languages represent the most important part of a database system as they serve the most important part of the communication – system – user, the election of information in the information system (Jansa et al, 2018). According to Mucha (2019) the query language is a set of expressions (above a certain alphabet), for which a certain mechanism of assigning of questions for certain expression exists. The mechanism, such as interpret of language for each database (to the relevant scheme above which the question is formulated) calculates an answer, a structured set of values form the database or derived from them.

Language for selection of documents

Nowadays, a common type of interaction is on-line user contact with documentographic information system, as for example electronic collections of laws. A user sees his/her database as a body of documents describing e.g. articles form academic newspapers. At a certain time, the subject of his/her interest will be “the use of computers in documentographic information systems and other information systems.“

Using, the keyboard or a mouse, he/she chooses the expression computer interpreted as "find all descriptors beginning with the sequence computer together with the number of documents, in which it occurs ". The answer is a corresponding table that contains expressions such as computer, computers, techniques, etc. and serves for further precision of the question. The user is interested only in computer, computers, programming, computer software (Dudič et al. 2018).

Another question arises (the system automatically and continually assigns numbers to), where "**,**" (comma) is interpreted as logical "or". The system splits the question into three sub-questions in compliance with gradual application "," and issues a number of relevant documents for the sub-question. According to Pokorný (1989) the user orientates himself similarly in other sources of adequate descriptors, i.e. documentographic information systems and (other) information systems.

Logical Operators

Frequently, in legal databanks, logical operators, logical conjunctions, such as *"and", "or", "not"* are used. The system works with several logical operators, for example *"or"* (is entered as **+**) and *"at the same time"* (is entered as * or as interspace).

If no logical operator is determined, it is automatically used * (and at the same time). Upon entering the operator **+** in the shape of e.g. A+B the computer extracts all information pertaining to the identification sign A and all information pertaining to the identification sign B from the set of information of the relevant folder. Upon entering A * B the computer selects the information that relates to A and to B at the same time. By the use of brackets and principles of elementary logic it is possible to choose a relevant information file for such information that has immediate relation to the solved problem.

A * (B + C) – find all information related to the identification sign A that have a relation to at least one of the identification signs B or C at the same time. This applies to all situations where logical operators may be used.

Relational Operator

Information systems also use *relational operators* – equals to (=), does not equal to (-), higher than A (> A), lower than A (< A). By numerical and date entries, which are from the point of view of legal information systems very significant, these inequalities are analyzed precisely.

According to Gregušová (1992) with the use of alphabetical entries, these are analyzed according to the alphabet, without diacritic. By alphabetical entries, the operator called „*find subsequence ( )"* is also used. This enables search in compound fields. If we do not enter any relational operator, it is automatically considered as " " (subsequence) by alphabetical entries, or " = " by numeric or date entries.

Structure of Legal Texis

Legal texts have rich structuring. Basic structuring of legal texts includes structuring pursuant to a grammatical, a formal-legal as well as a semantic perspective. Basic grammatical structure is represented by a sentence. From a formal point of view, a sentence is a sequence of words form the majuscule at the beginning of the sentence to the full stop, which ends the sentence. The Use of a majuscule does not have to mean the beginning of the sentence as well as the full stop does not have to mean its ending. Regardless of this fact, structuring a text automatically into sentence is natural (Vilčeková et al., 2018).

Formal-legal structure of legal texts comes out of pragmatic structuring according to Act Nr.

400/2015 Coll. on Creation of legal regulations and on Collection of laws of the Slovak Republic and changes and additions of other acts as amended. We know many types of structuring of legal texts depending, in particular, on the type of a legal text (regulation). Basic differences may be seen if comparing an act and its amended version (amendment). According to Dudič et al. (2018) similarly, we cannot compare an act and an international treaty published in the Collection of Acts of the Slovak Republic (See more: Legislative Rules of the Government of the Slovak Republic (approved by decision of the government of the Slovak Republic dated 4. May 2016 Nr. 164).

Formal-legal structure of legal regulation (act)

Legal regulation is divided into: header, preamble, headlines, designated legal blocks (articles, sections, letters etc.), signatures, text annexes, tables and figures.

Header of Legal Regulation

Header of a legal regulation is composed of identification number of the legal regulation, type of regulation (act, regulation, etc.), author of regulation (who published it), date of publication and name of regulation.

Preamble of a legal regulation usually contains sentences following after the header of the legal regulation. The most famous preamble in the legal order of the Slovak Republic is the preamble of the Constitutional Act of Slovak national council Nr. 460/1992 Coll. Constitution of the Slovak Republic as amended. Preamble does not comprise normative sentences (from the subject matter point of view) and it is not a legal block from the formal perspective.

Teaching of Legal Computer Science at Law Faculties

Teaching of legal computer science had begun in the year 1990 at the Law Faculty of the Comenius University in Bratislava. Later on, after change of the form of study (1st level bachelor, 2nd level master studies) it became a part of mandatory courses in the bachelor level of studies at all law faculties in the Slovak Republic. A change in the status of legal computer science as an obligatory course came after incorporating results of the Bologna process into the Act Nr. 131/2002 Coll. on Universities and changes and amendments of other acts as amended. The Bologna process was an initiative of signatory European states with the aim of creating a *European University space*. This aim should have been reached by harmonization of academic titles and character of study of individual courses. A part of it should have been also a guarantee of standards of quality in the Europe as a whole. With effectiveness of the act on universities and its implementary regulations, especially the Regulation of the Ministry of Education of the Slovak Republic Nr. 614/2002 Coll. on Accredited System of Studies, legal computer science became an obligatorily selective course. As implied by designation of the course as obligatorily selective, not every student has to take the course, even though it has an interdisciplinary character. As a result of this change, lack of knowledge of graduates of law faculties in the field of legal computer science has been evident for several years.

Conclusion

The primary goal of teachings of Legal Computer Science is to provide students with knowledge and skills in the area of practical use of legal information systems and to prove their orientation in national legislation as well as in legislation of all member states in the European Union, including legal documents of the European Union.

The achieved level of knowledge should enable the students (by gradual independent improvement) to master the use of legal information systems in such a way that it enables them to work effectively

as future lawyers in any legal profession.

In our opinion, we have managed to reach the goals set in the introduction of the contribution. With the use of available sources of knowledge as well as several scientific methods, we have analyzed development of legal information systems primarily in the Slovak Republic. In addition, we have justified the need for knowledge of work with information legal systems and their databases for every lawyer. To conclude, we confirm the hypotheses on the inevitable need for teachings of legal computer science at universities in the Slovak Republic.

Finally, we remind that knowledge of the law and hence the necessity of the existence of legal information systems for all arises from the legal and irrefutable legal presumption "ignorance of the law does not justify".

Abstract

In a modern society, the constitutional right to information is a fundamental right without which the existence of a genuine democratic establishment is not possible. It allows all subjects to form an opinion to the state as well as the whole society. Information is also called the oxygen of democracy. Access to truthful, timely and complete information is a prerequisite for making our decisions meaningful. The aim of our contribution is a thorough review of the constitutionally guaranteed right to information. In terms of systematic approach, the contribution is divided into three parts in addition to the introduction and conclusion. Each of them focuses on a certain aspect of the constitutional right to information. For the thorough elaboration of the paper we used several scientific methods of investigation, especially description, analysis, synthesis, deduction, logic or comparison but also doctrinal interpretation. The result of the paper is an evaluation of the current constitutional status of the implementation of the right to information in the Slovak Republic. At the end of the paper we confirm or reject the hypothesis that the current law is sufficient without the need for further adjustments.

Keywords: Constitution, Freedom, Government Policy, Information, Law

Introduction

The right to information is according to the theory of law among political rights. As reported by Fábry et al. (2019) it is the second generation of human rights that emerged in the early twentieth century. The emergence of political rights has necessitated the need to protect the population from the threats posed by the post-modern era and post-industrial society. In international discussions, even in the context of globalisation, some political rights are evaluated controversially and are not universally recognised. In today's world, their enforcement is quite difficult. Probably for this reason too, this issue remains on the brink of interest in legal theory. Our aim is to review it. We focus primarily on the constitutional aspects of this right. Through scientific and doctrinal interpretation, we examine selected articles of the Constitution of the Slovak Republic relating to the issue of the right of information. The aim of our contribution is a comprehensive review of the constitutional level of the right to information in the conditions of the Slovak Republic in comparison with periods of freedom - 1948 to 1989. We also criticise the identified shortcomings in the execution of the right to information and the possibility of public information by public authorities.

From the systematic point of view, the contribution is divided into four sections, in addition to the introduction and conclusion. The first focuses on the gradual introduction of the right to information into the legal order of the former Czechoslovakia. The second focal point examines this right of animal aspects, including the use of the case law of the Constitutional Court of the Slovak Republic. The third section deals with its constitutional and legal constraints. A brief analysis of the positive discrimination against national minorities is contained in the fourth section. The last fifth section deals with of the right to environmental information.

For the thorough elaboration of the paper we used several scientific methods of investigation, especially description, analysis, synthesis, deduction, logic or comparison as well as doctrinal interpretation of legal norms. The result of the paper is an evaluation of the current constitutional status of the implementation of the right to information in the Slovak Republic. At the end of the paper we confirm or reject the hypothesis that the current law adjustment is sufficient without the need for further adjustments.

Sequence of introducing the right to information into the legal order

As a member state of the United Nations, Czechoslovakia participated in the approval of the Universal Declaration of Human Rights in New York on 10 December 1948. Along with other Eastern European states, Saudi Arabia and South Africa, the vote was abstained, which was not surprising given the country's upcoming political regime. The Declaration was not legally binding, it was merely a recommendation de lege ferenda as an inspiration for future legislative changes. It contained a catalog of human rights that every person has, whether or not a particular state recognises these rights. In addition to traditional human and political rights, social rights were also included. According to Vačok (2016), the international legal significance of the Declaration is that it describes a certain area within which the United Nations bodies can address human rights issues without exposing themselves to interfering with the Member States' internal affairs. It has narrowed considerably in the area of human rights.

After the necessary ratification procedures, another United Nations document establishing the right to information - the International Covenant on Civil and Political Rights of 1966 - became a part of Czechoslovak national law, in the Constitution of the Czechoslovak Republic in 1948, or in the Constitution of the Czechoslovak Socialist Republic in 1960.

As Lalík (2018) states, the right to information was only marginally enshrined in Act No. 81/1966 Coll. on the periodical press and on other mass media, which was effective for 42 years with the amendments. However, according to § 1 of this Act, citizens could use the periodical press and other mass media only to obtain information and publicly express their opinions. However, it was not possible to realise this right in practice.

The right to information was enshrined in legislation only after political and social changes in 1989. Such an important step took place in 1990 when the Constitutional Act - the Constitutional Charter of Fundamental Rights and Freedoms - was adopted. Further, Burda and Trellova (2019) say the above-mentioned document was published in the Collection of Laws as Constitutional Act of the Federal Assembly of the Czech and Slovak Federative Republic No. 23/1991 introducing the Charter of Fundamental Rights and Freedoms. This document is still part of the legal order of the Slovak Republic. The charter became a complete model for creating the II. part of the Constitution, entitled 'Fundamental Rights and Freedoms’. In our opinion, this is an unnecessary duplication of constitutional legislation.

The Charter thus enshrined freedom of expression, the right to information and the right to seek, receive and disseminate information freely, these rights being 'self-enforcing'. In practice, this means that they can be directly applied and implemented without the implementing law. The charter is based on the principles of the rule of law, which means that it is primarily the supremacy of the law. In practice, this means that the sphere of freedom of the individual is primordial, and the state can

intervene in it only on the basis of the law, and in the manner prescribed by law. According to Ľalík (2019), the priority is therefore a human citizen who can do everything that the law does not prohibit.

Constitutional Right to Information and Freedom of Expression in General

According to Brestovanská at al. (2019) the basic legal regulation establishing freedom of expression and right to information is the Constitution of the Slovak Republic adopted as Constitutional Act of the Slovak National Council no. 460/1992 Coll. ("the Constitution"). The latter provides in Article 26 (1) that freedom of expression and the right to information are guaranteed.

By comparing the constitutional arrangements for freedom of expression and the right to information, we can conclude that in principle there are two models of freedom of expression and the right to information. In the first model, the right to information is guaranteed within the framework of freedom of expression. The second model distinguishes between freedom of expression and the right to information, with different purposes and content. According to Olšovská et al. 2016), such a concept is explicitly laid down, for example, by the Swedish Constitution.

In addition to the provisions of Article 26 (1) to (4) of the Constitution of the Slovak Republic, which apply both to freedom of expression and to the right to information, the set of constitutional standards is more extensive in the right to information. The source of the law is also Article 26 paragraph 5 of the Constitution of the Slovak Republic, according to which state authorities and territorial self-governing bodies are obliged to provide information on their activities in the state language in an appropriate manner (Majerčáková et al. 2016). The conditions and method of execution are laid down in the Implementing Act. In its view of the purpose and content of this amendment, the Constitutional Court of the Slovak Republic stated that the prerequisite for the democratic exercise of power in modern society is to inform individual citizens about matters of public interest. Article 26 (5) of the Constitution does not restrict the access of persons to information in the sense that citizens do not have the right to information from authorities other than state authorities and local and regional authorities. Article 26 (1) of the Constitution guarantees the right to information without restriction according to public authorities. All authorities are obliged to behave in such a way as not to undermine the right of citizens guaranteed in Article 26 (1) and (2) of the Constitution. Article 26 (5) guarantees a higher quality of the right to information, as the Constitution imposes an obligation on state and territorial self-governing bodies within the scope of the Act to disseminate and provide information on the adoption activity in the state language. This obligation is not imposed on other public authorities.

The constitution according to Košičiarová et al. (2015) creates, through the right to information, three groups of information. The first is information that the state authorities and the authorities of the territorial self-government have to submit to the authorised persons. The second group consists of information that the authorities or other public authorities do not have to submit to the beneficiaries, but they have to withhold access if the beneficiaries exercise their right to information. The third group of information consists of information that cannot be disclosed because it is information subject to Article 26 (4) of the Constitution.

As follows from this finding no. I.ÚS 10/1999 of 16 May 1999 published in the Collection of Findings and Resolutions of the Constitutional Court of 1999, the Constitution of the Slovak Republic does not restrict the right to information in terms of the subject of this right. This means that it does not provide for a positive calculation of the information that an authorised person can search, receive and disseminate, nor does it provide for a negative calculation that cannot be searched, received and disseminated. All information may be the subject of the right to information, unless it is subject to the restriction under Article 26 (4) of the Constitution. Article 26 (2) of the Constitution grants the right to receive and disseminate information. In exercising this right, the Constitution protects not only the right to receive information to disseminate information, but also the cumulated possibility to further disseminate the information received.

Alongside the above-mentioned provisions of paragraphs 1 to 4 of Article 26 of the Constitution, which apply both to freedom of expression and to the right to information, the set of constitutional standards for the right to information is more numerous. The source of the law is also Article 26 (5), which includes the obligation of public authorities to provide information on their activities in the state language in an appropriate manner. Under Article 26 (1) of the Constitution of the Slovak Republic, freedom of expression and the right to information are guaranteed. The following paragraph 2 guarantees everyone the right to express their views in words, letters, print, pictures or otherwise, as well as freely seek, receive and disseminate ideas and information regardless of national borders. The complexity of the constitutional regulation is also complemented by paragraph 5, which also explicitly introduces the obligations of public authorities to adequately provide information on their activities in the state language.

In its rulings, the Constitutional Court of the Slovak Republic confirmed that Article 26 of the Constitution implies everyone the right to access information that is available to state authorities and public authorities. If someone exercises their right to information, the public authority is obliged to make access to specific information; the information must be available to the person who asked for it.

General implementing legislation - Act no. 211/2000 Coll. on Free Access to Information and on Amendments to Certain Acts (Freedom of Information Act), as amended, however, does not exhaust the entire content of the constitutional right to information. It only regulates the right of access to information which is already in some way stored (e.g., recorded on an information medium) and is therefore already available. Another aspect of the constitutional right to information is the right to receive and record information from ongoing and unrepeatable events in which information is immediately generated and will be irretrievably lost without recording. In particular, it is the right to make audio or video recordings from the activities of public authorities (Dolobac et al. 2016).

Reasons for Limiting the Right to Information

The literature (Panda et al. 2016) also points out that the right to information cannot be understood absolutely. These are cases where it is necessary in a democratic society to protect the rights and freedoms of others, the security of the state, public order, the protection of public health and morality. However, the specific reasons and the manner in which access to information is refused must be determined only by a lawful regulation. As Gregušová et al. (2016) states, the right to information can be restricted if one formal and two material conditions are met, consistent with the conditions under which the Constitution permits restrictions on freedom of expression. In relation to the right to information, the protection of classified information, which constitutes a conflicting public interest to the right protected right to receive information, is of particular importance (Rentkova et al. 2017). The source of the law is Act no. 241/2001 Coll. the protection of classified information, as amended. Pursuant to Section 2 of this Act, Classified Information is an information or thing listed in the list of Classified Information which, due to the interest of the Slovak Republic, must be protected from disclosure, misuse, damage, destruction, loss or theft.

According to Kaczor and Kryvinska (2013) conflicts of public interest in the protection of classified information and public interest in access to information in a democratic and legal state cannot be resolved by denying the right to information. The protection of classified information cannot be based on a method of broader interpretation of the law. The subject of protection is only those information that has the rarely specified properties of classified information, not all materials containing classified information (Peráček, 2019).

The requirement to establish a fair balance between the two public interests protected by the rule of law implies some conclusion. According to it, if the object to which the person entitled asserts the right of access to the information contains classified information, the public authority cannot refuse access to the whole object, but only to the part containing the classified information (Peráček and Mittelman, 2015). Similarly, the disclosure of an object containing classified information shall mean that only classified information is protected from disclosure and not the whole thing in which the

classified information is located. For example, if a document contains classified information, according to Mittelman et al. (2016), the state authority may protect it by blackening or otherwise making the classified information inaccessible to the public, but it cannot refuse to disclose everything else mentioned in the document.

In the context of constitutional possibilities to limit the right to information, a special place is held by Article 51 (2) of the Constitution. It directly allows the restriction of fundamental rights and freedoms at the time of war, emergency and emergency situations on the basis of Constitutional Act no. 227/2002 Coll. dealing with state security at the time of war, state of war, and state of emergency. This constitutional act has repealed Constitutional Act no. 10/1969 Coll. on the State Defence Council as amended by later constitutional laws. As is clear from Article 2 (3) point i) at times of War, the right to freely seek and disseminate information irrespective of national borders and freedom of expression is restricted. Under the terms of point j) it is also possible, in times of war, to make the publishing of the press subject to authorisation, the content of the press and the broadcasting of radio and television to be subject to censorship. The same restrictions can be introduced also during the time of war, emergency and emergency in the whole territory of the Slovak Republic.

Particular Rights of National Minorities

Members of national minorities who are citizens of the Slovak Republic are granted special rights by the Constitution of Article 34 (1-3). According to Dudic et al. (2018) as is clear from Article 4 of the Council of Europe Framework Convention for the Protection of National Minorities, the aim is to promote full and effective equality between persons belonging to a national minority and the majority population, and these measures cannot be regarded as discrimination against the majority. Such an advantage is characterised as positive discrimination. Only national minorities are entitled to rights, as they are generally considered to be disadvantaged. By virtue of Article 34 (1) to (3) of the Constitution, these rights are to be understood as individual meaning they belong to specific persons, not to the minority as a whole. According to Srebalová et al. (2019), the rights granted in this way allow members of national minorities and ethnic groups to develop universally, in particular their own culture, the right to receive and disseminate information in their mother tongue, associate with national associations and the like. National minorities as well as ethnic groups, in addition to the right to have a command of the state language under Article 34 (1), are guaranteed, according to the following paragraph 2 of the Constitution, the right to education in their mother tongue. Vačok (2018) stresses that the use of the language of national minorities and ethnic groups in official communication is regulated directly by Act No. 184/1999 Coll. on the use of languages by national minorities. The exercise of these rights is limited, the border being the protection of the sovereignty and territorial integrity of the Slovak Republic and the rest of the population (Panevski et al. 2018).

Informing on The State of The Environment

According to Kryvinska (2012) article 45 of the Constitution of the Slovak Republic specifically lays down the right of everyone to timely and complete information on the state of the environment and on the causes and consequences of this state. It allows to enforce these rights only within the limits of the implementing laws. The right to environmental information is identical to the general right to information in that it confers on everyone the same forms of exercising that right - to seek, receive and disseminate information to the environment but which, unlike the general right to information, must be timely and complete. The subject of information is three components, the state of the environment, the causes of the state of the environment and the consequences of the state of the environment. As Švec and Madleňák (2017) claims, if the information provided is timely but incomplete, its quality contradicts Article 45 of the Constitution, just as when complete information is provided late. Horvath et al. (2017) state that it is only possible to claim the right to environmental information on the basis of the Implementing Act, which is Act no. 211/2000 Coll. on Free Access to Information and on Amendments to Certain Acts (Freedom of Information Act) as amended. By its provision § 23 abolished lex specialis - Act no. 171/1998 Coll. on access to environmental

information. It follows that the same law applies to the exercise of the rights referred to in Article 26 (1) and Article 45 of the Constitution. This deficiency was partially remedied by Act No. 205/2004 Coll. on collecting, storing and disseminating environmental information and amending certain laws.

Conclusion

In contrast to the past, the constitutional right to information can be understood as an instrument of promoting the principle of transparency, which in a legal and democratic state is one of the general principles governing the activities of public authorities. As a result of our research, we can conclude that its other function is the function of a universal means of enforcing the rule of law in the activity of public authority holders. It therefore has a special position in the legal guarantee system. The right to information enables a person to obtain data that he/she can subsequently claim using another legal means of protection, such as the rights of national minorities or ethnic groups. This is one of the reasons why we can consider the constitutional right to information to be crucial in ensuring the values of the rule of law and democracy. Another, in our opinion, also undeniable significance of the subjective and thus enforceable right to information is its control function in relation to the functioning of public power. Sufficiently extensive, simple and quick access to information also has a positive impact on citizens' confidence in democratic institutions and their willingness to participate in public life.

We are confident that we have managed to achieve the main goal of the paper. We have examined all aspects of the constitutional right to information. We believe that this constitutional right, like other fundamental human rights and freedoms, is a natural right of every person, even without a possible positive grounding in the constitution or other legislation. The protection provided by several laws, including the application of sanctions, directly constitutes the constitutional right to information. In our opinion, it is a right guaranteed by the constitution and other legislation to a sufficient extent without the need for further legislative intervention.

Abstract

Purpose. The aim of the presented study is to report the research in progress on heterarchical coordination within an inter-organizational network in the tourism sector. **Design/methodology/approach.** Due to relative novelty of phenomena examined and a lack of empirical studies in the field, the study follows the qualitative approach and the case study research design, suggested for explorative studies. **Findings.** The study is in progress and first findings have been reported. The results have shown that heterarchy is a proper form of coordination for distributed inter-firm network with the high presence of SME's operating in a tourism sector. **Research implications.** Further empirical studies are required including both next in-depth case studies and also cross sectoral large-n quantitative research. Based on the study, some interesting research streams might be developed e.g.: evolution of coordination mechanisms over time and the role of interpersonal ties in network functioning.

Keywords: Inter-organizational network, Heterarchy, Coordination.

Introduction

The growing body of research on inter-organizational networks (ION's) confirms the significance of this research field. Systematic literature reviews on interfirm networks (see e.g.: Battista *et al.,* 2011; Bergenholtz and Waldstrøm, 2011; Zaheer *et al.,* 2010) show the increasing number of topic-related studies, both qualitative and quantitative, concerning various aspects of network development and functioning, e.g.: determinants and types of interfirm relationships, access to resources, trust, power and network dynamics, knowledge management, and network adaptive capabilities (see e.g.: Ahuja, 2000; Andersen *et al.,* 2019; Battista *et al.,* 2011; Gulati *et al*., 2000; Najafian and Colabi, 2014; Oliver and Ebers, 1998). However, the research on ION's is still limited and fragmentary, and little attention has been paid to coordination mechanisms within networks. It constitutes an interesting research gap, since coordination is regarded as a salient factor affecting efficiency of business activities (Hedlund, 1986; Miles *et al.,* 1992; Mintzberg, 1979, 1992; Ritala *et al*., 2012). Specifically, there is a lack of empirical evidence of coordination mechanisms in distributed networks.

Consequently, the aim of the paper is to report the study in progress on heterarchical coordination. The research is being conducted in the regional inter-organizational network operating in a tourism sector.

Due to the novelty of phenomena examined, the research is based upon a qualitative approach and the case study research design (Eisenhardt, 1989; Yin, 2009). This approach is a highly recommended method in the field of IONs (Halinen and Törnroos, 2005) due to the vital role of the context. The authors attention has been paid to complex and dynamic nature of heterarchy, and also strengths and

weaknesses of heterarchical coordination. The selection of the tourism sector was purposive and based on the set of premises presented in the methodological section.

The study contributes to ION's literature in several ways. First, it examines and describes heterarchy as coordination mechanism. Second, it provides insights into role of heterarchy in inter-organizational networks activities, and allows to identify the strengths and weaknesses of heterarchical coordination. Thus, it recommends the longitudinal case studies to examine network phenomena and its consequences.

The paper is organized as follows. The next section provides the theoretical background of intra-organizational networks and evolution of coordination mechanisms. Then, the research method has been described and justified. The fourth section highlights the initial results of the study as an announcement of wider and deeper findings. In the last section the results have been discussed as well as the study limitations and future research directions have been depicted.

Theoretical Background

Inter-organizational Network and its Need for Coordination

Inter-organizational networks have turned to be one of the fastest-developing fields in management for last decades since it is proved that focusing attention on a single company does not enable to understand the business processes (Johnston, 1981) and a wider perspective is requested. The networks' operations need to be coordinated and researchers underline that the network coordination differs from traditional forms: hierarchy and market (Powell, 1990; Stephenson, 2009; Thorelli, 1986). The coordination is interrelated to many different areas, e.g. development of long-term cooperative relationships between partners (Ferreira *et al.*2017), value creation (Hastings *et al*., 2016) information exchange and knowledge transfer (Caridi *et al*., 2017), and trust building (Akrout and Diallo, 2017). It is also worth noting that the coordination requirements within the inter-organizational network is dependent on a network type, e.g. its centrality degree (Provan *et al*., 2007), power distribution (e.g. Jensen *et al*., 2014), or existence of coopetitive relationships (e.g. Dagnino *et al*., 2012). In centralized, star-type networks the coordination is close to the hierarchical one, due to the power asymmetry and broker-satellite type dependencies. The other types of networks, i.e. "federations" and distributed networks need a different coordination mechanisms (de Almeida Moraes, 2017; Grandori and Soda, 1995; Wall and van der Knaap, 2011). The high power dispersion imposes coordination different than hierarchical, and the competition within the cooperative frameworks, resulting in the development of coopetition (Bengtsson and Kock, 2000; Dagnino *et al*., 2012; Luo, 2004), requires a non-hierarchical coordination.

Summarizing, proper inter-organizational coordination might become one of the success factor for distributed networks (see Moch *et al.,* 2014). Nonetheless, decentralised networks need further research on coordination since even if it might lead to effective and efficient operations in distributed networks, it involves difficulties in selecting coordination kinds and scope (Rauch *et al.,* 2017). However, the aforementioned conditions, i.e. low centrality degree, power dispersion, and internal coopetition, trigger the need for non-hierarchical coordination mechanisms within ION's, and the answer to this challenge might be a heterarchy.

Evolution of Coordination Mechanisms: From Hierarchy to Heterarchy

For decades the dominating coordination form of business activities has been the hierarchy. Although hierarchies are often criticized and numerous scholars predict their decline in favour of fluid structures (see e.g. Handy, 1994; Peters, 1989), hierarchies are still strong (Leavitt, 2005). At the same time the high-velocity environment requires more decentralized and fluid forms of coordination both at intra- and inter-organizational level. Some researchers suggest that traditional hierarchy is being replaced by networks and heterarchies gradually (see: Kellogg *et al*., 2006; Stephenson, 2009; Wang, 2010).

The concept of heterarchy was developed by McCulloch (1965). First research on heterarchy in management field refers to complex relationships and power dispersion among divisions of multinational corporations (Birkinshaw and Morrison, 1995; Hedlund, 1986). The latter studies on the heterarchy apply also to other topics, e.g. knowledge management (Hedlund, 1994), strategy formulation (Chakravarthy and Henderson, 2007), creativity of interdisciplinary teams (Aime *et al*., 2014), or coordination within project-based organizations (Lichtarski, 2018). So, the concept of heterarchy can be incorporated at inter-, meso- as well as intra-organizational levels.

Hedlund (1986) defines heterarchy as a multiplicity and transitivity of power. In a similar way, Fairtlough (2007) describes heterarchy as a multiple and balanced power and he strongly distinguishes it from singular and stable hierarchy. The author explains the balance in executing power in heterarchical systems using analogy to the paper, scissors, and stone game, where none of elements is dominant from the nature. Stephenson (2009, p. 6) stresses that "heterarchy consists of at least three (or more) separate hierarchies, each with their own *raison d'être*, but which, in turn, must collaborate with each other to accomplish a collective good more complex than any one hierarchy can manage on its own." What is important, heterarchy can be permeated and developed in different fields, including hierarchical, social, and market (or quasi-market) mechanisms. It should not be perceived as the contradiction of hierarchy but rather as its more sophisticated and multifaceted equivalent.

Some scholars locate network coordination and heterarchy between hierarchy and market (Powell, 1990; Stephenson, 2009; Thorelli *et al*., 1986) or a complex combination of hierarchical, market, and social mechanisms (Joshi and Campbell, 2003). While a network and heterarchy are not synonyms those two terms are strictly interrelated. For instance, the concept of heterarchy understood as a multiple and balanced power can be applied to integrate and coordinate activities in some types of inter-organizational networks.

Research Design

The study follows the case study research design suggested for explorative and descriptive studies embedded in an inductive field study in management sciences (Eisenhardt, 1989; Flyvberg, 2006; Yin, 2009), According to Halinen and Törnroos (2005), the case study research in network studies is not only possible one, yet the highly recommended method due to the vital role of the context and uniqueness of networks.

The network in a given study was selected intentionally and reveals the following hallmarks: a) it is distributed, b) it is composed of differentiated but co-localized nodes with relatively equal status, and c) it encompasses independent SME's having complementary resources. In turn, the investigated nodes were selected with a purposive sampling technique in compliance with the guidelines for case selection (Gerring, 2007), and preceded with the short preliminary interview.

As well as this, the tourism sector selection was purposive and based on the following premises: (1) the tourism sector is recommended to conduct research on inter-firm cooperation due to high decomposition of value chain and multidirectional ties (Czernek and Czakon, 2016; Wang and Krakover, 2008), (2) tourism destination is a unit of analysis with a shared goal, co-location, cultural proximity, and interconnection (Kylänen and Mariani, 2012); (3) the tourism sector is not concentrated therefore various types of dispersed networks of SME's are dominated; (4) a tourism sector plays a vital role for many countries' economies in terms of GDP, employment, etc.

The empirical data gathering process was based on triangulation and included the following techniques: (1) semi-structured in-depth individual interviews (IDI); (2) documentary analysis, (3) comparative analysis of network members' offers (websites, reservation portals), and (4) analysis of statistical data of the region, articles from local press, local authorities' websites. The interview questionnaire included open and multi-choice questions. At the respondents' behest, the names of companies and the region were not disclosed. The scope of the empirical study covers network actors of the regional cooperative network form the Sudety mountains region (Poland). The empirical data

has been collected since 06.2017 until now, following the literature studies on heterarchy and inter-organizational networks.

Initial results of the study

The results presented in this section are fragmentary as the study is in progress. However, at this preliminary stage of research we can observe many interesting phenomena, draw some conclusions and contribute to ION's literature. For better understanding of coordination mechanisms in the studied network some general information are presented first.

The regional cooperative network operates in the Sudety mountains region for about fifteen years, and since a year 2010 continuous and dynamic development of the network cooperation has been observed. Regarding the size and scope, the network is still small and regional, including around forty co-localized small and medium enterprises of the tourism sector, i.e.: hotels, apartments, SPA centers, restaurants, catering companies, museums, tourist attractions, agritourist inn, ski and sport centers, transport companies, and others. The network can be classified as: (1) informal, based on social ties and affective trust (Provan *et al*., 2007; Ring and Van de Ven, 1994); (2) symmetric and distributed (Ahuja, 2000; Burt, 1992); (3) multidimensional (Moller *et al*., 2005) and (4) dynamic one (Miles *et al*., 1992).

The exemplary common activities conducted by the depicted network are: (1) annual music festival; (2) classical music concert; (3) conferences, congresses and symposia for institutional clients; (4) common marketing activities; (5) and other actions organized *ad hoc*, e.g. environmental activities, charity events, etc. In the foreseeable future it is planned to undertake joint activities in order to train professional staff for hotels and gastronomy in the region. The idea was incubated at the last meeting of network members' representatives as the response to a lack of qualified staff in the region.

The first interviews conducted show that there are not a dominating broker and stable power centers in the studied network. All the actors have the same status regardless of their size, owned resources, or history. The network is distributed and emergent one. According to respondents' opinions, just the equality of nodes and partnership builds the success and longevity of the studied network. Inter-firm cooperation is discontinuous, activated temporarily when common projects or activities are undertaken. Nevertheless, the relationships are maintained due to the interpersonal ties between companies owners'. The level of trust is high, and according to Akrout and Diallo (2017), it can be classified as affective one. Written contracts are rarely used and for the external purpose, i.e. to assure that the other partners' resources are available.

Each commonly conducted activity has a temporary leader (a network member, the role is transitive) who organizes the whole project. The leader's tasks mainly involve representing the network in contacts with the client, "doing all the paperwork", and taking care of client's satisfaction. After completing the event, a temporary configuration disintegrates and all nodes return to their own autonomic activities. At the same time few different common projects are being conducted, as long as unused resources remains. Multiple projects conducted simultaneously result in the multiplicity of power centers, namely there are few leaders and few temporary configurations at the same time.

Coopetitive relationships between partners are the natural part of the network existence as many network members are competitors linked with horizontal cooperative ties. It is the example of complex network coopetition since it involves numerous partners, different areas, and several levels of value chain. The coopetition seems to be an emergent strategy in this case, in contradiction to deliberate processes identified by Wang and Krakover (2008) in tourism destinations. Analyzing competition strategies it is worth highlighting that network partners do not use cost leadership strategy, and arguing their choice, underline that everybody knows that this type of competition may lead to the decrease of profitability in a long-time perspective.

The results from the first interviews reveals also some strengths and weaknesses of heterarchical coordination. One of the advantages is free and multidirectional exchange of information and

knowledge amongst network actors, in contrary to centralized and hierarchically coordinated networks. The next advantage concerns the mechanism of positive selection within the network. The actors who contribute at most to the joint projects develop more dyadic relationships, and as a result, are engaged in further projects. What is important, due to respondents the mechanism protects from opportunism, favours the high level of actors' commitment and guarantees the high level of quality. Thus, heterarchical coordination seems to involve low costs. For instance, the transaction costs are low within the network as the network actors know and trust each other and there is no need to keep institutionalized and expensive hierarchical coordination.

On the other hand, there are some weaknesses of heterarchical coordination, more or less noticed by investigated respondents, but very salient for network operating. First, the lack of standards in communication and cooperation patterns lowers the effectiveness of cooperation and can be a potential source of tensions between network members. Some arrangements are recorded in written contracts, while others have only a verbal form. For some projects a separate bank account has been created, while in the others settlements are done on "leader's" account, or in cash (hand-to-hand). Not only does the lack of standards and routines rise uncertainty, yet according to Jap and Ganesan (2000) it may also increase costs of internal transactions. A majority of respondents is aware of the mentioned negative side and perceive it as the most visible barrier for further development of the network. Second, the presented heterarchical coordination leads to unification of offers and loss of enterprises' identity. Comparing offers over time we can observe that the standard of services are relatively equal and all members include exactly the same attractions (the same events, the same trips, no original offers). The respondents are aware that year after year it is harder to differentiate the offer on the local market. Nonetheless, in comparison with similar regions they observe the increase of the whole destination attractiveness.

The presented strengths and weaknesses of heterarchical coordination do not exhaust the phenomenon. However, their short summary highlights that the described form of coordination can be perceived and judged differently in many respects.

Discussion and Conclusions

The field study yields a more precise and deeper understanding of heterarchical coordination in inter-organizational networks.

On the basis of the results it might be concluded that heterarchical coordination is suggested for cooperative business networks in many tourism destination from different countries. Taking into account the specificity and differences in network architecture, the mechanism of coordination seems to be universal. Wherever distributed networks of SME's with equal status are involved, a heterarchy can be implemented as the main mechanism of integrating and coordinating activities. Finally, the discussion on advantages and disadvantages of the heterarchical coordination approved that not only does it show positive sides of heterarchical coordination, but also possible weaknesses and threats. This research logic seems to be appealing since most researchers focus only on positive facets of networking, while dark sides of network cooperation are not a common research topic.

The presented study makes contributions both to theory and practice. First, the in-depth case study of dynamic inter-organizational network shows the complexity and methodological challenges what indeed calls for further studies. Second, the studied case provides useful guidelines for company owners and managers concerning network relationships development. Specifically, as it has been emphasized, the study identifies and discusses not only strengths of network cooperation what is a dominating stream in the management literature, but also weaknesses and threats. Our study has a methodological contribution as well. It shows that repetitive interviews are required to identify many interesting network phenomena, e.g. weaknesses of network cooperation, latent motives or conflicts. As the first research interview meeting is rather formal and there is the distance between a respondent and a researcher, the next few meetings allow to reveal "the real story" due to the increase of trust and less formal communication. On that basis, longitudinal studies are suggested.

Taking into consideration the aim of the study and its exploratory nature, the selected research design and method (explorative-descriptive case study) seem to be the most appropriate. However, we are aware of possible limitations of the case study research design concerning external validity, case selection problems, or researcher's subjectivity (see: Bennett and Elman, 2006; Gerring, 2007; Yin, 2009).

The study reveals some new fields of exploration and further research directions, concerning e.g. (1) the evolution of coordination mechanisms over time within ION's, (2) the role of interpersonal ties in network functioning and development, and (3) the role of communication channels and tools in coordinating network activities. All the aforementioned research topics seems to be appealing and important as well, both for theory development and managerial practice.

Abstract

The broad scope of defining innovation is related to the multitude of scientific disciplines interested in its effects. The category of innovation becomes an object of research not only in economic sciences, but also in social sciences, as it undoubtedly influences the broadly understood social and economic context of the country. The degree of innovativeness of the state and above all of a given enterprise contributes to the achievement of a competitive position on the market and increases production capabilities, as it is based on new, improved solutions and affects the quality of the created product. Hence, the aspect of innovation undertaken in the article, taking into account the parameters characteristic for the Polish financial sector and new guidelines for the regulation of innovation in the European Union. The aim of the article is to analyse the innovativeness of Poland in comparison with other European countries. The publication was created in connection with the use of analysis of existing data, including a literature study, analysis of the content of the European Innovation Scoreboard 2019, the Central Statistical Office, the Polish Agency for Enterprise Development and OECD.

Keywords: Innovation, Financial Innovation, Law, European Union.

Introduction

The dynamically changing environment and the development of the new technology sector has led to the formulation of a new factor of economic growth which is undoubtedly innovation. The very concept of innovation is understood ambiguously. It is usually defined as a radical change, invention or novelty, especially in the context of a product, as well as technology or methods of managing a business entity.

The rich literary knowledge is not clearly translated into the actual presentation of the broadly understood dimension of innovation. Consequently, this article is a discussion of various definitions of innovation with particular emphasis on financial innovation. The main research objective is to analyse the innovativeness of Poland against the background of selected EU countries. The publication was created in connection with the use of the analysis of existing data, including a broad study of the position of literature. As a result of the research, the necessity of introducing regulations in the aspect of financial innovations was indicated.

The Concept of Innovation

The concept of innovation is not clear. On the one hand, it may refer to improvements in manufacturing, on the other hand, it may also have a social dimension... According to Joseph Alois Schumpeter, who was the first to use the term, innovation (Latin innovatio, renewal) is a set of activities aimed at producing new and better products, technological processes and/or organisational systems. Therefore, innovation can take the form of a new product, a new production method, the discovery of a new

market, the acquisition of previously unknown raw materials or the reorganisation of the existing state (Schumpeter 1934 za Alves and others 2017, pp. 236).

According to Philip Kotler, an innovation may have a marquetry dimension as an idea, product or element of technology developed, implemented and presented to customers who perceive it as new or innovative (Krówczyński 2019, pp. 114). Peter Drucker described innovation "...as a specific tool of entrepreneurs, by means of which changes make it an opportunity to start a new business or to provide new services". In this perspective, the concept of innovation is more related to the economic and social aspect than to the technical one, (Piperopoulos 2016, pp. 24). Innovation can also be seen as the introduction of a new idea into business. In this sense, innovation acquires the characteristics of a public good, as it can be used simultaneously by many organisations, which can contribute to a significant economic growth of the country. Such a consideration of the concept in question indicates the existence of a process of collective learning, within the framework of interaction between different actors. In this context, innovation is not only related to the commercial activity of the private sector, (promoting economic growth), but also to the public sector, in the framework of increasing the learning capacity of enterprises (therefore the effectiveness of solving problems such as social exclusion or unemployment), (Bencheva and others 2017, pp. 95).

One of the most frequently cited definitions of innovation is that proposed by the Organisation for Economic Co-operation and Development (OECD), which divides innovation into four types, namely innovation (OECD):

-product - related to the creation of an innovative product or a significant improvement of an existing product on the market;
-process - implementation of a new or improved manufacturing method;
-organisation - implementation of new management methods aimed at improving work organisation and/or relations with the environment;
-marketing - implementation of a new marketing method, related to key changes in design, packaging, distribution, pricing strategy or promotion.

A wide range of scientific disciplines related to innovation complicates the unambiguous definition of this concept, hence the literature contains a classification of innovation according to selected criteria (Fig. 1).

Fig. 1: Selected innovation classifications

Source: Own elaboration based on Białoń L., Zarządzanie działalnością innowacyjną, Wydawnictwo Placet, Warszawa 2010, s. 21-22.

The changing environment has led to the extension of the types of innovation proposed by the OECD to social and financial innovation. Social innovations are new solutions that both respond to social demand and bring about a lasting positive change in the social groups concerned, (Bencheva and others 2017, pp. 95).

Financial innovations are characterized by new financial services related to the improvement of financial instruments, introduction of changes in organizational structures of financial organizations, and the introduction of modern techniques and computerization, (Stachera-Włodarczyk 2015, pp. 64).

According to the Oslo Manual (the international methodological manual for statistical research on innovation recommended in OECD and EU countries), it can be considered in terms of the scale of changes (as new or significantly improved products and/or services), within a given enterprise, market or on a global scale the so-called absolute innovations, (Wielgórka, Idasiak 2017, pp. 540).

In the context of the degree of originality of the offered changes in the literature, one can find creative innovations (innovative), imitating (modelled on previously developed solutions from other markets) and apparent (resulting from the introduction of only minor improvements), (Zastempkowski 2010, pp. 61).

Within the effects of the introduction of innovations, one can distinguish between linked innovations (whose changes in one branch of the economy affect further changes in other, related sectors), and isolated ones, whose effects are concentrated in the original area. In the area of the environment, innovations may be oriented towards the development of ecology, be neutral or have a negative impact on the natural environment, (Griffin 2017, pp. 428).

Christopher Freeman additionally divides innovations into autonomous (when the proposed solution did not result from the search for a solution to an existing problem) and induced (resulting from research resulting from the need for changes), (Freeman 1994, pp. 463).

Christopher Freeman additionally divides innovations into autonomous (when the proposed solution did not result from the search for a solution to an existing problem) and induced (resulting from research resulting from the need for change), (Freeman 1994, pp. 463).

According to the presented definitions, the sources of innovation may include impulses and causes related to the activity of an enterprise (in the external and internal perspective), sector or economy, and groups of people (creating new technological knowledge), as well as demographic, social and moral changes.

Conditions for Innovation of the Polish Economy

According to the World Bank's latest ranking (2020 edition), which indicates ease of doing business, Poland has recorded further declines compared to the previous year and is ranked 40th in OECD countries. Such results were influenced by, among others, insufficient ease of setting up a business and registering property. At the same time, the World Bank suggests greater stability in the area of economic law. New Zealand, Singapore and Hong Kong are among the leaders of this list.

According to the World Economic Forum (2019 edition), Poland is ranked 37th among 148 countries surveyed in terms of competitiveness. Singapore, the United States and Hong Kong scored best in the whole ranking.

Fig. 2: European innovation scoreboard 2019

Source: Own elaboration based on European innovation scoreboard 2019, https://ec.europa.eu/docsroom/documents/36084, (Access: 20.01.2020).

Poland has been experiencing systematic increases in economic growth, as well as low inflation and debt dynamics. The rating of Poland as a moderate innovator has increased since 2011 (Fig. 2.). In 2019, Polish scientific publications and access to electricity were evaluated positively. The country's competitiveness is hampered by an insufficient labour force base, significant tax burdens, independence of the courts or the creativity of entrepreneurs. In the same group of innovation (as Poland according to the discussed ranking), there are also Lithuania, Hungary and Italy[i].

According to the information of the Local Data Bank, government spending on research and development in Poland is growing year by year (Table 1.) and currently amounts to about 1.21% of GDP (EU average - 2.07% of GDP). For comparison, in 2017 it was 1.03% and in 2016 0.97% respectively (Ministry of Development).

Table 1: Internal expenditure on research and development (in million PLN) in Poland and the size of staff over the years 2011-2018

	2010	2011	2012	2013	2014	2015	2016	2017	2018
Internal R&D expenditure (GERD)	10416	11687	14353	14424	16168	18061	18060	17943	25600
Internal R & D investment per 1 inhabitant (in PLN)	270	303	372	375	420	470	466	535	667

Poland has been positively evaluated among the EU countries in the category of friendly environment for innovation, due to the positive assessment of Internet access and the perceived inborn creativity and entrepreneurship of Poles.

Fig. 3: Percentage of innovative companies broken down four types of innovation company size

**Statistically significant results (confidence level 95%)*

Sources: Own elaboration based on Monitoring innowacyjności polskich przedsiębiorstw –II edycja 2019, https://www.parp.gov.pl/storage/publications/pdf/Raport-2019---II-edycja-Monitoring-innowacyjnoci-polskich-przedsibiorstw.pdf, (Acess: 21.01.2020).

The worst case scenario for Poland is in the category of the SME sector's share in innovations (Fig. 3.) and attractiveness of the research system (which operates only due to the quotability of studies). According to data from the Polish Agency for Enterprise Development, domestic business entities focus their innovations in the area of products and processes. The innovativeness of the indicated areas increases with the growth of employment. Only 16.4% of micro-businesses have derecognised themselves for product innovations, as compared to 32% of medium and 36% of medium and large business entities. Microenterprises, to a comparable extent to small enterprises, continue to introduce underestimated innovations in the field of marketing. We also have a lot to do in the context of Linkages and improvement of human resources skills adjusted to the changing labour market.

Voivodeship	Millennium Index	Work productivity	Expenses for R&D	Post-secondary education	Working in R&D	Number of Patents
mazowieckie	99	100	97	100	100	100
małopolskie	82	66	100	97	73	77
dolnośląskie	72	86	49	89	52	84
pomorskie	62	78	59	77	46	49

Fig. 4: Ranking of innovativeness of Polish regions according to five Millennium criteria

Sources: Own elaboration based on Indeks Innowacyjności Millennium, https://www.bankmillennium.pl/documents/10184/27565853/Indeks+Millennium+2019.pdf, (Acess: 21.01.2020).

According to the Milennium Innovation Index data, trust and cooperation is a soft indicator, key to improving the effectiveness of innovation. Regions where the highest percentage of enterprises work together for innovation achieve relatively better results in terms of innovation, (Fig. 4.). This is confirmed by the cases of Podkarpackie (where the Aviation Valley is developing strongly) and Lubelskie, where the percentage of cooperating entities is the highest and the potential for innovation is higher than would result from the strictly economic position of these regions (Millennium Innovation Index).

The cooperation in the regions has a positive impact on the effectiveness of resource use, and this translates into a reduction of the innovation distance in comparison to the leader, which is undoubtedly the Mazowieckie Voivodeship in Poland.

The factor determining the region's innovativeness is primarily human capital. This is confirmed by high ratings of areas with large academic centres. In these areas universities adapt their policy to the needs of the labour markets, and thus more entities locate their headquarters and thus financial resources.

In order to overcome barriers to innovation in regions with lower ratings, it would be necessary to first adjust the academic offer to the needs of the local economy. The aim is not to catch up with the leaders, but to make optimal use of the resources available to a given region, (Millennium Innovation Index).

Fig. 5: Expenditure on various types of innovative activities in 2018 company size by number of employees

Sources: Own elaboration based on Monitoring innowacyjności polskich przedsiębiorstw –II edycja 2019, https://www.parp.gov.pl/storage/publications/pdf/Raport-2019---II-edycja-Monitoring-innowacyjnoci-polskich-przedsibiorstw.pdf, (Acess: 21.01.2020).

According to the Monitoring of Enterprise Innovation, in 2016-2018, 32.4% of Polish host entities introduced at least one innovation and 35.8% remained actively innovative. The percentage of innovative and actively innovative entities is significantly correlated with the size of the enterprise - the bigger the entity, the higher the percentage of enterprises is classified as innovative or actively innovative.

Product (17.9% of all enterprises) and process innovations (16.3%) continue to be the most frequently introduced type of innovations, (Fig. 5.). Usually, these are innovations imitating (within a given sub-motor) than breakthrough ones for the whole sector and they include investment expenditures on fixed assets such as: machines and technical devices, means of transport, tools, instruments, movables and equipment, as well as training of personnel directly related to the introduction of product or process innovations (29% of the total number of innovatively active companies) or purchase of software related

to the implementation of product and process innovations (21% of the total number of innovatively active entities), (Monitoring of innovativeness of enterprises 2019, pp. 55).

Financial Innovation - Opportunities and Threats

According to the European Innovation Ranking, Poland is a moderately innovative country. However, taking into account only financial innovations, we are the leader. According to Deloitte's analysis, 40% of the fintech market in Central and Eastern Europe is located in Poland[ii].

Fintech is an economic sector that relies on modern technologies (such as Big Data (A term indicating a large number of variables and various data sets, whose processing and analysis is, due to its size, complicated, but at the same time may lead to the acquisition of new knowledge), blockchain (A decentralised and distributed open source database on a web-based network, used to record individual transactions, payments or accounting records), artificial intelligence and automation) to support financial services. Financial innovations give the opportunity to make a transaction or use a financial service in a modern, convenient (from the consumer's point of view) and safe way (Schueffel 2016, pp. 33) convenient[iii] (from the consumer's point of view) and safe way (Schueffel 2016, pp. 33)

It is estimated that over 25 million people in Poland use the solutions proposed by Fintech. They include virtual wallets (such as Apple Pay or Google Pay), BLIK mobile payments, online shopping, car sharing or mobile bank applications applications[iv].

According to many observers, the year 2020 may become a breakthrough for new trends in the financial sector. What is more, there is talk of the negative phenomenon of deepfake (a technique of image processing based on the use of artificial intelligence, which makes it possible to combine images of human faces, creating the possibility of manipulation[v]) and the growing interest in voicebots and chatbots to automate customer interaction, as well as the PSD2 (Payment Service Directive 2, introduced in the previous year, the main aim of which is, among other things, to increase consumer security and better protect consumers against non-cash fraud by introducing a double authentication procedure)[vi].

Artificial intelligence is becoming a significant technical solution used in the financial sector. So far used to predict traffic in stores or optimize employment, it is increasingly used to analyze millions of users' activities simultaneously, in real time, which is an ideal support for banks and other service companies whose competitiveness depends on the ability to present an individual offer to a potential customer (Płoszajski 2016, pp. 17).

In recent years, the importance of Blockchain has also been growing, both in the context of its application in business and implementation in the context of ensuring the security of data storage and transmission, (crypted). The use of Blockchain is gradually expanded by Amazon (Amazon Managed Blockchain[vii]), Revolut[viii] or Samsung[ix]. In turn, Facebook is still working on the introduction of its own cryptovalute called Libra, designed for fast payments on a social networking site, (Taskinsoy 2019).

Financial innovations are also the subject of work of the Polish Financial Supervision Authority and the National Depository for Securities, which in 2019 signed an agreement on creating a blockchain platform for the capital market, enabling the process of preparing and making available to issuers the list of persons entitled to participate in the general meeting, as well as remote voting at general meetings[x].

According to the data of the report "Final report of the Expert Group on Regulatory Obstalces to Financial Innovation: 30 recommendations on regulation, innovation and finance" published at the end of December 2019 by a group of experts at the EU Commission, the implementation of financial innovations, including in particular artificial intelligence to the financial sector, will allow for the automation of such areas as, among others, the following:

- legal alerts and compliance monitoring;
- voice assistants and text reading plus processing;
- creation of legal information;
- financial modelling and risk or credit rating;
- investment advice.

In this context, it becomes important to create an appropriate legal framework for the algorithms to be used in the financial sector, which may be important for claims, e.g. in a situation of creditworthiness assessment (according to Article 105a(1a) of the Banking Law - right to clarify how and on what basis a creditworthiness assessment should be carried out in automated systems)[xi].

The solutions from the borderline of the Internet of Things -IoT (carrying out transactions, e.g. using smartphones instead of debit cards) or installing readers to automatically identify customers are becoming more and more frequently considered in financial innovations. These solutions may increase the sales capabilities of financial institutions, but they are associated with numerous previously unregulated threats, e.g. in the context of cyber security of risk management or personal data protection[xii].

The potential, but also the threat of financial innovation is beginning to be regulated in Polish legislation. An example can be the designation of requirements for digital alumni to the Act on Counteracting Money Laundering and Financing of Terrorism, (Journal of Laws 2018, item 723), but there is a lack of more decisive actions such as regulating the status of crypto-assets (e.g. tokens) as a kind of financial instruments. A significant subject is also the regulation of the rights of entities that can offer services in the field of digital currency trading[xiii].

Conclusions

Poland's innovativeness is mainly perceived through the prism of large business entities, due to the larger resources that can be allocated to research and development, as well as higher qualifications, human capital associated with a more matched offer of large academic centres operating in areas with higher potential. In addition, the persistence of the innovation stereotype understood as breakthrough changes, often important not only for a given entity but for the whole sector, makes innovative actions

in the small and medium-sized enterprise sector deserve to be called hidden.

In the Innovation Scoreboard Ranking (2019 edition), Poland was evaluated as a moderate innovator, due to the satisfactory level of economic growth, as well as low inflation or debt dynamics. The Polish scientific publication and access to electricity were also evaluated positively. Further changes in the ease of doing business are recommended, as well as a reduction in the complexity of the Polish law, combined with a high level of education may reduce the distance between Poland and innovation leaders. This is indicated by the increase in expenditures on R&D activity over the years.

According to the Monitoring of innovativeness of enterprises, in recent years almost every third Polish entrepreneur has introduced at least one innovation. Unfortunately, in most cases large entities are still interested in innovations.

The most frequently introduced type of innovation is still product and process innovation, in the scope of implementation of already used solutions in other entities or sectors. They include in particular investment expenditures on fixed assets such as: machines and technical devices, means of transport, tools, instruments, movables and equipment, as well as staff training, purchase of software directly related to the introduction of product or process innovations.

Considering only the Fintech market and related financial innovations, Poland is a leader among European countries. Therefore, it is important for the Polish innovation rating to convince SME sector entities to introduce innovations to their business operations. Lack of innovative development of the

SME sector may pose a serious threat in the situation of growing global competition and growing sales areas of global market players.

Organization Security in The Context of The ISO 9001:2015 Standard Requirements - Limiting or Opportunity for Development

Małgorzata DĄBROWSKA–ŚWIDER

Military University of Technology in Warsaw, Warsaw, Poland
malgorzata.dabrowska-swider@wat.edu.pl

Abstract

The purpose of the article is to present, based on selected areas of organization security according to ISO standards, how an organization can achieve an appropriate level of development based on the implemented quality management system in accordance with the requirements of ISO 9001: 2015 standard. These selected areas are customer orientation, building trust and credibility of the organization based on the implemented standard, risk analysis and the competencies of top management and at the same time, on the other hand, meeting the requirements that are a specific type of signpost can be a significant limitation to the development of modern management methods, especially when achieving an ideal state as part of meeting the requirements can become an end in itself and cease to serve the good of the organization. The article uses available results of statistical surveys.

Keywords: Organization Security, ISO 9001:2015, Risk Analysis, ISO Standard Requirements, Organization Development.

Introduction

The last two decades have brought about many important changes in the development of organizations, especially in terms of thinking about the needs and expectations of stakeholders. This is evidenced by the fact that it was becoming increasingly easier for organizations to implement ISO 9001. This is largely due to the fact that companies operating on a global market and making a number of purchase transactions are beginning to demand that their business partners have the standard implemented. This is a response to the need to increase the security of an organization's operations in the face of increasing globalization and the many significant environmental changes whose multiplicity and lack of predictability pose a serious threat. The history of human development, which includes examples of many spectacular projects, situates the introduction of the ISO 9000 family of standards alongside projects such as: invention of a computer, sending the first man into space, constructing an atomic submarine, or digging a tunnel under the English Channel (Pawlak 2006). The cited examples indicate that these were projects of great political, scientific, economic and military significance. Assigning such a high rank to the standards of the ISO family proves that the application of standards aimed at improving the quality of products (products, services) based on the organization's own standards and procedures needed to achieve these standards, has gained the title of undertakings raising the development of our civilization to a higher level. The reason for this type of action was the enormous pressure of the organization's environment, which demanded the repetition of processes, as a result of which products or services of the highest quality were to be created. This was the result of the PDCA (Plan-Do-Check-Act) cycle, which, as it soon turned out, could be applied to all processes and to the quality management system as a whole. The essence of the versatility of such solutions and the possibility to use them in various sectors: military, aviation, automotive, health care has caused great popularity. The advantages resulting from the application of ISO 9001 requirements were very quickly implemented in various types of organizations and became the main pillar of safety of their operation and increased competitiveness on the market. An additional advantage of applying the requirements of quality standards in various fields of business is quite a lot of ease and assimilability of such solutions. This article aims to present several selected areas of application of the standard. In the first chapter, statistical data are

presented, which allow a comparison of how the formation of new companies in Poland translates into the number of certificates issued. The second chapter talks about the benefits for organizations that result from having an implemented standard in the field of customer orientation. The next chapter presents the advantages of the organization resulting from building trust and credibility as part of meeting the requirements of the standard, the fifth chapter says that the requirement to prepare a risk analysis by the organization largely increases operational security, and the last chapter indicates how the powers of the top management have influence on building position and development of the whole organization.

Presentation of Statistical Data

Many companies in Poland which currently do not have implemented ISO standards are not aware of the fact that the activities developed by the company and used on a daily basis, as well as solutions concerning the organization of various processes, are nothing more than a form of application of system solutions with the quality standards requirements. It is sufficient to write them down skillfully, disseminate them among employees as part of training and monitor the effects of their application in order to make continuous improvements. Despite the voluntary application of quality standards, it should be remembered that the constantly changing environment of the organizations and the development of the level of organizational culture cause a constantly growing need to improve the quality of services and products offered, which are the basis of international business. The literature contained in the monographs functioning on the publishing market, the Polish Standard PN-EN ISO 9001, reports of the Polish Accreditation Center publishing the results of activity reports for particular years and available statistical research results published on the website of the Central Business Information Center have been used to prepare this article. The aim of the considerations undertaken on selected areas of ISO 9001 requirements is to formulate a research problem: In what areas of application of ISO 9001 requirements can they be effectively used to achieve the development of an organization, and which of them are not keeping up with the contemporary changes and may thus affect the limitation of development and even the growing maladjustment of a given organization to the changing environment? The analysis and drawing conclusions at the level of the initial assessment of the source materials allowed for the following hypothesis: The dynamic development and challenges that constitute the environment of contemporary organizations may in the future lead to the abandonment of the need to implement and maintain a voluntary quality management system in accordance with the requirements of ISO 9001 in favor of seeking own solutions for which there will be no limitations in this respect. The hypothesis formulated and the research problem indicated, as well as the great complexity of the undertaken problem, filled with challenges and threats, have made it necessary to apply various methods: analyses (in particular, analyses in the scope of assessing the adjustment of particular requirements to the actual possibilities of their application in the organization, comparative analysis), synthesis, generalizations and inference. In the case of using empirical methods, there is a problem consisting mainly in the lack of statistical research, which would first of all allow to assess how many organizations on the Polish market have implemented quality management systems. Secondly, access to such statistics is very difficult. From the point of view of certification bodies, which carry out market analyses of the number of companies using their services for their own needs but hide behind commercial confidentiality, they do not provide such data. The annual reports published by the Polish Accreditation Center, in turn, provide data on the total number of valid accreditations in our country (as at 31 December 2018, 1,596 valid accreditations are indicated). It is worth mentioning here that not all organizations have implemented systems based on PCA accreditation, as there is no such requirement. Thus, such data do not reflect the facts as a whole. The group of 1,596 valid accreditations includes all areas and standards and it is difficult to deduce how many ISO 9001 accreditations are in this number, and what is more, how many organizations are covered by this number (Report on the implementation of the 2019 Action Plan). Taking into account the comparative analysis of the PCA statistical reports over the period 2017-2005 in terms of the number of accreditations issued, which is presented as follows: 2017 – 1575, 2016 – 1550, 2015 – 1493, 2014 – 1471, 2013 – 1437, 2012 – 1406, 2011 – 1345, 2010 – 1289, 2009 – 1202, 2008 – 1077, 2007 – 925, 2006 – 873, 2005 – 744 accreditations issued, a certain upward trend can be seen on this basis, but it should still be remembered that this number also includes accredited laboratories and all

systems including those dealing with product certification. Below are the statistics of new company registrations in Poland, with the results for 2019 being broken down into subsequent months to better illustrate the reality. New companies in Poland in 2019 (January - September) - 330,544. The statistics on the registration of new companies in Poland in 2013-2018 are as follows: 2018 - 377,885 companies, 2017 - 359,583 companies, 2016 - 347,425 companies, 2015 - 287,754 companies, 2014-343,214 companies, and in 2013 - 354,593 companies were established. Analyzing the creation of new companies from a geographical point of view, most of the individual business activities are created in Masovian Voivodeship 16.2%, Silesia Voivodeship 10.12% and Greater Poland Voivodeship 9.81%. In the case of companies registered in the National Court Register, 50% of all entities are established in three provinces: in Masovian Voivodeship 34.65% of all companies are registered, Greater Poland Voivodeship 11.26%, Silesia Voivodeship 9.3%. If we compare the indicators of company registration statistics (Central Business Information Center 2019) (there are about 1,000 of them in Poland every day) with the number of accreditations, we can conclude that the potential market of interested customers is huge, but this does not translate into an increase in the number of accreditations. Of course, there can be many reasons for this.

Analysis of selected areas of ISO 9001:2015 standard - Customer Orientation

Polish managers with an increasing ease make decisions about introducing their companies or those they manage into the world of quality, while their foreign colleagues do not have the slightest problem with this, which results in such a change in behavior. It is certainly an effect of the driving force that is a customer and their ever higher demands, and the whole environment accompanying the customer service related to the care of their satisfaction, and thus thinking also about how to create an effect in which the customer will come back to us. The focus of every organization's efforts is therefore directed towards ensuring that every contact with the customer is not an episodic phenomenon. An important element related to having an implemented quality management system is the organization's confirmation of meeting the legal requirements and existing regulations, which should be strictly defined and understood. Such an approach follows directly from section 5.1.2 of this standard (Polish Committee for Standardization: PN-EN ISO 9001:2015). In other words, there is another pillar to increase confidence in an organization, and in the event of a litigation in court, this is another major asset that will ensure that it complies with the law, which in turn increases its ability to defend itself regardless of whether the issue concerns liability for a product or service. In this aspect of the organization's operations it is another element increasing its safety in functioning on the market. The organization should continuously evaluate customer satisfaction in the form of feedback on the products and services provided in the form of questionnaires, documents confirming meetings with customers, compliments or complaints, all kinds of reports on commercial matters closely related to the conduct of market activity and all market analyses carried out. Such records are a documented form confirming the implementation of continuous contact with the market and customers and have an impact on strengthening credibility, as well as allow for active response to changes arising from the environment of the organization. Meeting this requirement of the standard seems to be an important element aimed at continuous development and improvement of the organization. It also serves as a basis for making appropriate reflections and conclusions about the future of the organization.

Building trust and Reliability

Having a quality management system certificate is treated as a serious element of competitiveness in relation to other entities operating on the market. Each of us has certainly met with certificates placed by companies in a clearly visible place and often at high magnification. But here, too, there is a serious risk that having a quality management system in place is much more than just a nice certificate on the wall. Behind this there is hard work and a lot of responsibility. However, the problem is how to check the reliability of the document held by the organization. For a consumer, client or stakeholder, a message in form of a certificate on the wall and trust in what lies behind it is enough. For an organization this is undoubtedly an asset, but there is a concern whether all that is in the content of the certificate is surely a reliable message of the values actually held by the organization. And here again, the ISO 9001 standard, which ensures the security of the organization's

activities, comes to the aid with the whole range of tools that are contained in point 9 of this standard (Polish Committee for Standardization: PN-EN ISO 9001:2015). These are activities related to monitoring, measurement, analysis and evaluation processes. A very important element of these activities is to carry out internal audits, planned at a certain frequency, and in the case of sensitive areas with the likelihood of an increased number of irregularities, to make appropriate corrections and corrective actions. Such activities are confirmed by appropriate reports, stored as evidence of the implementation of audit results and the audit program. Internal audits are an area that is thoroughly assessed not only by the organization's top management, but also by external auditors. The essence of such activities is that internal auditors should be people who are not in any way connected with the area covered by the audit in order to ensure impartiality. A threat to the organization's operations remains the fact whether these activities are carried out in accordance with the principles of impartiality and whether there is no pressure from people who may have an impact on the audit results. An important form of implementation of activities related to maintaining an adequate level of functioning of the organization is the management review by the top management. The openness of such an undertaking is closely related to the assessment of the organization's effectiveness. Achievements and failures shown in the course of a reliable management review, confirmed by an appropriate report, serve to ensure constant compliance with the objectives and set out the directions of activities related to meeting the requirements and increasing customer satisfaction. The level of higher confidence in an organization having a quality management system is additionally confirmed by the obligation to undergo an external audit carried out by independent external auditors, who are randomly selected by the audit organization. But, as in any case, there are also significant threats here, not so much from the existing system solutions, but from the area related to the honesty of people participating in such activities. It may happen that the internal audit will be carried out in an unreliable manner, first of all because of significant competence deficiencies of the employee selected for this type of undertaking and maybe it is not the greatest threat, much worse is the case when there is pressure on positive audit result from the superior of the employee conducting the audit, an even worse dimension of this phenomenon appears when it may happen that the highest management may influence the audit result in order to cover up the existing gross irregularities. It is difficult to establish the existence of such cases unequivocally, all the more so as the documented information produced on this basis does not confirm any infringements. Another barrier to the objective detection of irregularities is the fact of the very design of audit activities, because the essence of the audit is to take and evaluate samples. This means that on the basis of a correct sample obtained during the audit, we consider that the organization has a properly implemented and maintained quality management system. As can be seen, sampling is one of the areas that pose a risk of making an erroneous assessment of the process under investigation. In the case of external audits, there is also a threat resulting from the external auditor's actions and it is not a lack of competence, as these are confirmed by the certification body and the audited entity may always demand their presentation. A much greater risk may be to obtain positive audit results on the basis of an agreement with an external auditor in exchange for obtaining material or other non-material benefits (job offer in the organization for a member of the auditor's family). Such situations are very difficult to catch, and the effect of such a "positive" audit passed by the organization may be a confirmation of malfunctioning of the business entity and growing irregularities in it, which instead of being removed or corrected cause piling up of issues and, as a consequence, may lead to the occurrence of phenomena of a negative nature difficult to predict. Another threat may be the phenomenon of familiarity, which means that the organization becomes attached to the auditor, who in turn, in recognition of the fact that they know all the organization’s secrets so well, falls into a routine and, as a result, may fail to notice any irregularities in the functioning of the system (Dąbrowska-Świder 2018). The presented tools building the credibility of the organization's functioning are a form of protection against undesirable phenomena, but as it results from the analysis of the presented cases of irregularities that may occur, it is very difficult to fight against them. All the more so because the mere possession of the implemented quality management system in accordance with the requirements of ISO 9001 is of a voluntary nature (until 1993 the application of the Polish Standards was obligatory) and this is how it differs significantly from the management systems, the possession of which by organizations is a legal requirement (e.g. the obligation to apply certain Polish Standards in construction, communication, labor protection, recycler audit). The voluntariness also determines that an external audit body (this applies only to certification bodies having accreditation) Polish

Accreditation Center - a national accreditation body authorized to accredit conformity assessment bodies under the Act of 13.04.2016 on conformity assessment systems and market surveillance (consolidated text Journal of Laws of 2019, item 544) is not a police authority and does not have any authority to draw legal consequences for organizations having a management system in accordance with the requirements of ISO 9001. Having a PCA accreditation by a certification body can be a strengthening in building trust and increase the credibility of an organization that holds such a certificate. All the more so since the PCA's mission is to act for the economic development of Poland by ensuring the protection of public interests, such as health and safety, environmental protection and public safety (Report on the implementation of the 2019 Action Plan).

Risk Analysis

The need for risk analysis was reflected in the latest amendment to ISO 9001:2015, which entered into force on 15 September 2018. From the point of view of the application of the requirements of this standard, we can speak of an innovative solution, because until now such a requirement has not been included in it. This is another important element on the way to increasing the security of each organization's operations and is a new look at the action related to risks and opportunities (section 6.1 of this standard)(Polish Committee for Standardization: PN-EN ISO 9001:2015.). When analyzing the concept of risk, it is worth quoting the definition of *The EFQM Framework for Risk Management* - according to which: *risk is a combination of the possibility of occurrence of any event and its consequences* (The EFQM Framework for Risk Management 2005). The requirement of the standard does not specify how to meet it, but draws attention to the fact that any perceived risk related to the operator's activities may, in addition to triggering prevention activities, also lead to the detection of a worrying phenomenon. On this basis, the business entity may, at a later stage of the proceedings, implement elements of action leading to the elimination of the source of risk, and if it considers that this cannot be stopped, it may implement such elements of its action as: searching for new partners, changing the profile of manufactured products or services, acquiring new customers or changing the technologies used. Sometimes it can be a conscious decision to acknowledge the existence of such a risk and not to take any action in the hope that this risk is a permanent element of our organization's functioning.

Table 1: Classification of factors influencing risk (Szyłkowska 2019)

	External risk	**Internal risk**	**Time horizon**	**Variations in the environment**
Shaping Factors	Political	Management	Strategic	Static
	Social	Organization	Operational	Dynamic
	Legal	Human capital and resources	-	Permanent
	Economic	Financial	-	Variable

The risk phenomenon comes from the external environment, i.e. the external environment of the organization as well as its interior. The enormous variability of external factors remains outside the sphere of influence of the organization, but it is worth looking very carefully at the internal risks that can be controlled and over which the organization has great influence. The more hazards of this type can be identified, the better for the functioning of the organization. Many economic operators have a very enigmatic approach to the issue of risk, as part of audit activities, one could be confronted with a risk analysis presented in the form of an A4 sheet-size table. However, there are such organizations as Silesia Coal Holding, which, due to its specific activity, has identified several thousand risks (Silesia Coal Holding 2019). Unfortunately, it is not customary in our organizational culture to share knowledge, so it becomes virtually impossible to reach the resources of individual organizations to create a common database. When analyzing the standard's provision on risk, it should be noted that this is precisely the provision that guarantees the organization's safe development, especially when top management approaches this area with a great deal of responsibility and due attention.

Competence of Top Management

The requirements of ISO 9001 in point 5 and 7.2 (Polish Committee for Standardization: PN-EN ISO 9001:2015-10, Warsaw) determine what role the so-called top management has to play in the organization, behind this dry statement there is a huge area related to the competences and skills of the management. For many years, Polish managers were struggling with the problem of functioning on the domestic market, where the dominant management method was one that differed significantly from that prevailing in the most developed economies. Openness to international markets is not one of the strengths of the Polish economy, and the possibility of entering international markets is the best way to develop the company and its management. Thanks to the research conducted by Think Tank Poland, Go Global!, it turns out that out of ten Polish enterprises, only four are operating abroad, with 85% doing so from offices in Poland. Companies that have managed to win foreign customers are limited to selling them their products and do not create their own structures in foreign markets. Polish managers are very highly regarded, but many of them cannot free themselves from complexes towards their Western colleagues, and strong family ties still stand in the way of an international career. Instead of appreciating the opportunity to work abroad, which should be treated as a life opportunity or a great honor, many managers prefer to give up such an opportunity and change their job in order to remain in the country. The acquisition of additional skills resulting from competing in the global market is a driving force for innovative activities within companies, and those who decide to do business abroad are much more open to introducing new solutions. The stage of transforming knowledge into managerial decisions requires the involvement of the most competent managers, responsible and decision-making, who, acting with the right commitment and equipped with the right tools, are not only responsible for the decisions made, but are also able to assess the value of the innovative ideas of their most competent employees in the right way. Meanwhile, many managers who should focus on strategic decisions, deal with minor issues and solve problems that should be delegated to lower-level managers or officers. Unfortunately, a manager is not the owner of his or her working time and should be skillful in demarcating and prioritizing the problems to be solved. Meanwhile, incompetent managers are able to spend the whole day on these insignificant ones by neglecting the process of making strategic decisions. They do it out of ignorance or fear of responsibility. A huge obstacle in the operation of the managerial staff is the tenure of office binding e.g. in state-owned companies. The result of this state of affairs is an unwillingness to introduce long-term innovative solutions for fear that the next term may belong to the next president. In this situation, it is not worth investing in long-term undertakings which would be beneficial for the development of the company, but unfortunately, from the point of view of the particular interests of the current-term president, they become completely unprofitable. Another important element that distinguishes an average manager from an outstanding and creative one is having a skill called strategic imagination (Modern Management systems 2018). ISO 9001 standard requires an order natural for a human being and providing harmony to an organization operating according to these requirements and to develop everything according to a specific structure. These types of actions are extremely effective, but they work well in a stable environment. Meanwhile, today's constantly changing environment does not guarantee the stability of the organization, but requires constant dynamic adjustments. This approach is guaranteed by visual thinking combined with two elements: an insightful image of the present and the ability to predict the future. Nowadays, a creative manager is able to create a picture of a new reality out of scraps of information, various kinds of conjectures and speculation, which allows to create a new image of the world and imagine a new reality. Such skills are not acquired through learning and it is even difficult to imagine how they could be taught if they are related to the sphere of intuition, visualization and conjecture. On this basis, the image of the future manager appears, i.e. a person who builds the image of the company from seemingly insignificant elements and is able to translate it into a professional strategy of the company through thorough analysis. In addition, they can build a team of people whom they are is able to convince to follow their own ideas. In this situation, one can consider that there appears to be a manager who is absolutely different from the image of ISO 9001 requirements, who creatively seeks niche opportunities for the development of the company based on skills that are the complete opposite of a systematically ordered manager, guarding the order of processes implemented in the organization. No record of the standard is able to provide a description of a manager who should be open-minded and above-average. The image of "*top management"* according to the ISO standard is a group of people

who are the guardians rather than creators of the future of building a modern strategy of the organization (Rothery 1999).

Summary

The article does not fully address the subject of the human factor, which is of key importance in the process of maintaining the quality management system as it is the main carrier of threats. It is also about involving the management, presenting the attitude of the auditor as well as people employed in organizations. Furthermore, new management trends and the level of development of the management staff, as well as instruments to strengthen market competitiveness were not fully addressed. On the basis of the presented comparison of statistical data, it can be concluded that the hypothesis set at the beginning of this article indicating that the influence of dynamic development and challenges constituting the environment of contemporary organizations may in the future lead the organization and organization security to move away from the need to implement and maintain a voluntary quality management system in accordance with the requirements of ISO 9001 in favor of seeking own solutions for which there will be no limitations in this respect has been partially confirmed. However, the complexity of this issue requires a number of additional analyses and consideration of many different factors and available statistical research results related to the organizations areas of operation. Due to the extensive subject of the article, it is very difficult to refer to all aspects, especially since the introduction of the new edition of this ISO 9001 standard requires additional research over the next years of its validity, i.e. from September 2018. The mere fact of implementing a new system is a great challenge and commitment for employees who are often afraid of change. It is not known if such problems will affect the number of certificates issued.

Abstract

The authors have presented the research of the conceptual foundations and key priorities of the Arctic policy of circumpolar states in the paper. The relevance of the research is determined by the geopolitical and economic significance of the Arctic. At the same time, there is no any unified international legal center that establishes legal and normative standards of activities in the Arctic. Circumpolar states together and individually develop legal framework of a country, taking into account the following: firstly, their priorities; secondly, the existing legal status of land, water and air spaces of the Arctic; thirdly, global interests of the present and future of the planet. In the presented paper, the authors have revealed some key priorities of the state Arctic policies of circumpolar countries on the base of the analysis of political and programmatic documents. The analysis of political and programmatic documents has shown that the state Arctic policies of the circumpolar countries are focused on expanding of external interaction in the Arctic and maintaining the sustainable development of their own Arctic territories. Certain of main disadvantages of the circumpolar countries' Arctic strategies have been determined. According to the analysis of the conceptual framework and key priorities of the Arctic policies of the circumpolar countries, the conclusion concerning declarative nature of national Arctic strategies has been drawn. It has been shown that main institutions for the practical realization of Arctic policies are regional strategies for socio-economic development. National priorities and regional opportunities is the basis for the development of regional strategies.

Keywords: Arctic Policy, Development Priorities, Circumpolar States.

Introduction

The relevance of the research is determined by the following: in recent decades, the so-called "polar fever" i.e. the activities of some states in the use of arctic natural resources and territories has intensified in the Arctic. The fact is that large reserves of oil, natural gas, coal, and other hydrocarbon resources have been discovered in some arctic seas and on the continental shelf of the Arctic countries. Arctic waters are rich in animal resources, including marine animals, fish, shellfish

and other commercial species (Jorgensen, 1990; Larchenko et al, 2019; Sachs and Warner, 2001; Skufina et al, 2019a).

Owing to global warming and ice cap displacement to higher latitudes, some new opportunities of the Northern Sea Route are being revealed. One of them is a new transport route that can connect Russia, the USA, China, Japan, the EU countries, opening up global economic opportunities. The authors will illustrate the efficiency of this transport highway use with two examples: the distance from the port of St. Petersburg to the port of Vladivostok along the Northern Sea Route is 7559 nautical miles (NM), and the alternative route through the Suez Canal is 1.64 times greater – 12419 NM; the distance from the port of Yokohama to the port of Murmansk on the Northern Sea Route is 5770 NM, and through the Suez Canal it is 2.2 times greater – 12840 NM.

One cannot ignore the Arctic's substantial military potential. Some of circumpolar countries' borders pass along the Arctic Ocean. In the Arctic, there are enterprises of defense-industrial sector, land, air and sea military bases, airfields, and other military infrastructure of the circumpolar states (Killaby, 2006; Skufina et al, 2015).

At the same time, there is no any unified international legal center that lays down legal norms and rules of activity in the Arctic. Circumpolar states in common and each individually develop legal framework of countries, taking into account, firstly, their priorities; secondly, the existing legal status of the Arctic's land, water and air spaces; thirdly, global interests of the present and future of the planet.

The purpose of the research is to reveal some conceptual foundations and key priorities of the circumpolar states' Arctic policies.

In order to achieve this goal based on the analysis of political and programmatic documents, it is necessary to solve the following problems::

- to reveal the key priorities of state Arctic policies of the circumpolar countries;
- to identify main drawbacks of the Arctic strategies of the circumpolar countries;
- to reveal the nature of the relationship between national and regional Arctic strategies for the socio-economic development of the circumpolar states.

Materials and Methods

Representing the methods by which the problems and purpose of the research can be solved, first of all, the authors would like to pay attention to the object of the research. The legal regime of a territory depends on the determination of its borders and components. In the scientific community and in legal literature, the Arctic is considered the northern polar region of the Earth, which includes the North Pole and is limited by the 66th northern parallel, the so-called "Arctic Circle" (Raspotnik, 2018; Jensen and Hønneland, 2015). The Arctic includes significant land areas, parts of the Arctic, Pacific and Atlantic oceans and extensive airspace.

Circumpolar states are otherwise called subarctic ones (Skufina et al, 2019b). The list of the circumpolar states was approved at the meeting of ministers and plenipotentiaries of states in 1996 in Ottawa (Canada), as a result of which the "Declaration on the Establishment of the Arctic Council" was signed (Declaration on the Establishment ..., 1996). The same document was established by the Arctic Council, which, in addition to the circumpolar states, included representatives of small northern peoples. The Arctic Council has a special mechanism for coordinating international cooperation among states concerning the Arctic's issues (Overpeck et al, 2005).

The circumpolar states have their own territories outside of the Arctic Circle, legal borders recognized by international community (Kefferpütz, 2010; Steinberg et al, 2018;). Six circumpolar

countries (Denmark, Iceland, Canada, Norway, Russia and the USA) have direct access to the polar seas, inland maritime Arctic zones. Such circumpolar states as Finland and Sweden do not have maritime territories in the Arctic; therefore, they are not among the states claiming to divide the continental Arctic sea shelf. Iceland, locating on the periphery of the Arctic, is considered an island located mainly in the Atlantic Ocean. Therefore, it also does not participate in the solution of problems within responsibility zone of the states located on the Arctic Ocean coast (Nordquist et al, 2010; Hassan and Karim, 2018).

The characteristics of the circumpolar countries as of 2018 are presented in the table.

Table: Characteristics of the circumpolar countries as of 2018 (based on the materials from the United Nations Population Fund (The United..., 2018) and The World Bank (The World..., 2019)

Circumpolar countries	**Area**		**Population**		**GDP**	
	Index, thousand km^2	World ranking	Index, million population	World ranking	Index, $ billion	World ranking
USA	9363	4	331,43	3	20494,10	1
Canada	9976	2	37,83	39	1712,51	10
Russia	17075	1	146,78	9	1,657,55	11
Sweden	450	54	10,31	89	551,03	22
Norway	324	66	5,48	117	434,75	29
Denmark	43	129	5,76	114	352,06	38
Finland	337	63	5,53	116	273,96	44
Iceland	103	106	0,36	184	25,88	108
Total	37671		543,48		23844,29	

The entire area of the Earth's surface is equal to 510 million km^2 including land area almost of 148.9 million km2. The total area of the eight circumpolar states' territory is 37.7 million km^2. Thus, the circumpolar states accounted for 4.39 percent of the Earth's surface or 25,32% of the Earth's land area. The total population of the Earth at the end of 2018 is 7678,17 million people. 543, 48 million or 7, 08 % of the world population lived in the Arctic circumpolar countries (Samarina et al, 2018; Samarina et al., 2019). In 2018 according to the estimation of the World Bank the total GDP of all countries of the world was 5784,42 trillion $. The total GDP of the circumpolar countries was 23, 84 $ trillion or 0.41% of the world GDP.

The research focused on the political-programmatic and legal documents of the circumpolar states.

The research methods are directly related to the object, subject, aim and problems of the research which is based on general scientific methods. The authors will not dwell on them because of their predetermination in any research. Among interdisciplinary methods the authors shall note sociological one, involving the research of the Arctic policies of the circumpolar states from the standpoint of regulation of social interaction on the basis of specific facts, phenomena and processes taking place in the society between groups of people as subjects of law. In addition to this the authors shall note a concrete historical method that will make it possible to study the Arctic policy of the circumpolar states in the process of development over time, accompanied by changes and improvement. As special methods, the authors will use a dogmatic method, which will make it possible to study the process of formation and realizing of the Arctic policy of the circumpolar states in logical order using special legal terms and constructions. It is also supposed to apply a comparative legal method, which provides a systematic and comprehensive research and comparison of legal features of different countries.

The research has carried out a comparative analysis of the conceptual foundations and key priorities of the Russian Federation's Arctic policy and the policies of other circumpolar countries based on the analysis and comparison of their national Arctic strategies and other political and programmatic documents used as research materials.

Results and Discussion

The Arctic's land area is for the most part under the sovereignty of one or another circumpolar state. The water area outside the sovereignty of the circumpolar countries is regulated by general international legislation.

All eight circumpolar countries are parts of the international organization "The Arctic Council". The declarations adopted by the Arctic Council present the results of the circumpolar countries' basic agreements on the cooperation in the Arctic (Spence, 2014). In addition, each of the countries with national priorities in the Arctic realizes its own arctic policy enshrined in the political and programmatic documents.

Russia has the largest Arctic territory, the longest border, passing through the Arctic's territory and the longest sea coast in the Arctic Ocean. The priority of the Arctic for Russia will be expressed in the creation of a special object of public management of the Russian Federation's Arctic Zone (AZRF). The analysis of such main documents for management of the Russian Arctic as "The Basics of the Russian Federation's State Policy in the Arctic for the Period up to 2020 and the Future" (The Basics of the Russian..., 2008),"Russia's Arctic Zone Development and National Security Strategy for 2020"(Russia's Arctic..., 2013), State Program of the Russian Federation "Social and Economic Development of the Arctic Zone of the Russian Federation" (State Program of the Russian Federation..., 2019) and others has shown that the foundation of Russia's modern Arctic policy is the increased exploitation of natural resources for the development of the rest of the country. The Arctic is seen, first of all as a platform for the distribution of productive forces and government policy is aimed primarily at creating the optimal configuration of the main factors of industrial production.

The analysis of conceptual foundations and key policy priorities of the Arctic in the circumpolar countries has shown that their national Arctic policies are focused on the expansion of external interaction in the Arctic and sustainable development of their own Arctic territories.

In Sweden (Sweden's..., 2015) and Finland (Finland's Strategy..., 2013) the basis of the realization of the Arctic policy is so-called knowledge-based economy; in Denmark (Kingdom of Denmark Strategy..., 2011) and Iceland (Parliamentary Resolution..., 2011) it is green economy. The European Union's Arctic policy determines these countries' key priorities (EU Arctic policy, 2016) which are realized at the expense of regional EU funds. In Canada, Norway and Alaska (USA) Arctic policy's key priorities are the ecosystem approach to the exploitation of mineral and biological resources and stream of rental income to the social development of the Arctic territories. The object of Norway's modern Arctic strategy (Norway's Arctic Strategy, 2017) is the Arctic sector as a "sustainable region" where government, business and communities can cooperate together to achieve economic, environmental and social sustainability of the Arctic territories. The United States' key priority of its new Arctic strategy is strengthening of its presence in the Arctic space (DoD Arctic Strategy..., 2019).

The analysis of political and programmatic documents has shown that the significant disadvantage of the circumpolar countries' Arctic policies is the lack of a detailed elaboration of an economic-organizing mechanism of their realization (realization steps, responsible persons, specific activities, target indicators and indices, volumes and sources of financing). According to the analysis of the conceptual basis and key policy priorities of the Arctic circumpolar countries the authors have drawn the conclusion concerning declarative character of the national Arctic strategies, whose key priorities act as intentions. The main institutions of the practical realization of Arctic policies are regional strategies of socio-economic development.

In Russia such regional strategies, for example, are the following: "The Strategy of Socio-Economic Development of the Nenets Autonomous Region for the Future until 2030" (The strategy..., 2010) "Murmansk Region's Socio-Economic Development Strategy until 2020 and until 2025" (Murmansk Region's..., 2013), "Yamalo-Nenets Autonomous Region's Socio-Economic Development Strategy until 2020" (Yamalo-Nenets..., 2011), "The Strategy of Socio-Economic Development of the Chukchi Autonomous Region until 2030" (The Strategy..., 2016) and others. Regional strategies are developed taking into account regional opportunities based on national priorities.

In Norway, for example, such regional strategies, are the following: "International strategies for Finnmark" (International strategies..., 2015), which provide for the development of international cooperation of Finnmark County in the Barents region with the North-West of the Russian Federation, especially with the Arkhangelsk region; "FoU-strategy for Nordland 2013-2025" (FoU-strategi..., 2012), which provides for the increase in the activity of R & D in the development and cooperation of business, public sector and research institutions on the territory of Nordland County; "SNU-Strategy" (SNU-Strategi..., 2018), concerning the management of industrial development in Tromsø County etc.

In Finland such regional strategies are the following: "Pohjois-Pohjanmaan maakuntaohjelma 2018-2021" (Pohjois-Pohjanmaan..., 2017), which provides for the sustainable development of remote Northern territories (Lapin..., 2012), aimed at ensuring of sustainable industrial growth etc.

In Denmark such a regional strategy is "The Programming document for the sustainable development of Greenland 2014-2020" (Programming..., 2014). The document determines general directions of cooperation between the European Commission and the Government of Greenland with the aim of sustainable development etc. In Sweden the regional strategy is "Regional utvecklingsstrategi 2030 - Region Norrbotten" (Regional..., 2018); its priorities are: social, environmental and economic sustainability of Norrbotten County.

In the USA the regional strategy is "The Northern Opportunity: Alaska's Economic Strategy" (Northern... Opportunity, 2016); its priorities are: business development, finance and investment, infrastructure, socio-economic development, entrepreneurship and innovation, increasing of economic potential, quality of life.

Conclusions

The carried out research made it possible to draw the following conclusions:

1. The analysis of the political and programmatic documents has shown that the state Arctic policies in the circumpolar countries are different. The key priority of Russia's Arctic policy is the exploitation of natural resources based on the establishment of the optimal configuration of the main factors of industrial production. Public policies of other Arctic circumpolar countries are focused on expanding external interaction in the Arctic and maintenance of sustainable development of their own Arctic territories.

2. The essential drawback of the circumpolar countries' Arctic policies is the lack of a detailed elaboration of the economic-organizing mechanism of their realization. The main disadvantage of the Russian Arctic's strategy is the positioning of the Arctic territories as a resource base that ensures socio-economic development of the country, where against the background of the dominance of large corporations' interests, which include Arctic mining companies, some problems of the Arctic regions' social development are poorly taken into account.

3. According to the results of the analysis of conceptual framework and key priorities of the circumpolar countries' Arctic policies, the authors have come to the conclusion that the national Arctic strategies, whose key priorities operate as intentions have predominantly declarative nature. The regional strategies for socio-economic development, whose elaboration is based on national

priorities and regional opportunities, are the main institutions for the practical realization of Arctic policies.

Abstract

Social and economic development requires financial resources which are impossible to provide without the investment attractiveness evaluation. The distribution of investments across the territory is highly uneven. The sustainability of the investment distribution between regions allows us to claim the laws of the territorial organization of investment activity and the existing investment climate of the regions. The investment attractiveness assessment is the point of interest to authorities, investors and local business communities. The ratings of the investment attractiveness and the investment climate of the regions are worked out by different researches, consultors and agencies. The results of these studies are very contradictory. The article is devoted to the comparison and analysis of the region investment attractiveness, to the problems of a conceptual formation. The paper consider the general principles and individual issues of the carried studies as well as the approaches and methods of the assessments.

Keywords: Region, Investment, Investment Attractiveness, Regional Investment Policy

Introduction

Investment attractiveness is an essential characteristics of the region economy due to the fact that it's assessment is necessary for the resources supply of the social economic developments of the territories. The assessments of the investment attractiveness of the regions are diverse. The investment attractiveness of all participants of the investment process, including investors, authorities, local communities are very specific. The assessment of investment attractiveness allows determining the effectiveness of investments and ensuring the social economic development of the regions for the authorities. Investors need fair assessments of the business conditions and the protection guarantees in the future. For local communities, including business communities, the assessments of investment attractiveness is the issue of interest related with changes in conditions and quality of life, with increase in the purchase power as well as with the possibility of expanding and diversifying the business. The investment attractiveness representation of the regions, methods of measuring it and practice have undergone significant changes. The current conditions of socio-economic development require a more detailed consideration of the concepts, improvement of the methodology for evaluating and ensuring the targeting of investment policy measures formed on this basis.

Data and Methods

The uneven distribution of factors and the investment conditions does not allow forming a universal scale for assessing the territorial investment attractiveness. However, there is approach seems to be justifiable, which includes considering the regions in the institutional framework of the national economies and forming the national ratings of the investment attractiveness (Belenov, 2016). The estimation of the investment attractiveness allows getting some ideas about how successful regions realize opportunities available to them. This approach is based on the analysis of the already attracted investments volumes and is narrowly functional (Kuznetsova, 2015). However the approach, which involves an analysis of the conditions and factors for attracting investment is more common. A number of some categorizes, for example "investment potential", "risk investment" and "investment climate" and others, became essential for the estimation of the investment appeal (Chistik, Krivtsov, 2005). The first studies based on this approach date back to the 60s of XX century. They have been based on the inflation data, political stability, elaboration of normative legal basis and the capital export opportunities (Stobaugh, 1969). The following studies were associated with specifying the number of indicators assessing investment areas, methods for their calculation and generalized (Rybalko, 2014; Riabinin and Hudorenko, 2016). The assessments of some consulting: The Economist, Fortune, Euromoney, etc are the most famous. They monitor the investment activity and prepare the investment attractiveness ratings of countries and regions. Also they attempted to estimate the regional investment within Russia in the beginning of the Russian reforms period (Nagaev and Wörgötter, 1995). Nowadays the foreign companies more often consider this issue on the scale of the interstate comparisons. The following rating agencies: RAEX (RAEKS Analytics), Agency for Strategic Initiatives, National Rating Agency as well as RIA Ranking and others are most interesting within the estimation of the Russian regional policy. They try to work out their own methods and ratings of the regional appeals. (Scherbakov, 2017). The methodological support of the assessing investment attractiveness is a popular study subject (Bakieva, 2008; Burtseva 2013). The comparing of the individual groups of regions appeal (Myakshin, 2013) is demand highly as well as the issues of the direct foreign investments attraction (Matraeva 2013; Bunich 2015), the investment in the innovative development (Granberg, 2006; Islankina, 2016), the investment in the real economy (Soboleva and Popova, 2014). The application of the approaches and the methods of investment attractiveness assessment depends on the general state of the economy. Meanwhile these approaches are being transformed.

Results

The investments into the non-financial assets, especially to the fixed capital, should be paid special attention. The determining investments methodology in fixed assets is constantly being improved, at the same time, the volumes of their attraction are being clarified. The investment into fixed capital has been growing for the last few years. They are increased from 97,7 to 99,1% of the total investment in non-financial assets. Its volume in actual prices has increased more than 15 times from 1165,2 billion rubles in 2000 up to 17595,0 billion rubles in 2018 (figure 1). This index changes allow to find out the rides and the recession of the investment activity. So, we can fix the reduction in 2002 and 2005, which was caused by many reasons, for example, the changes in the tax system of Russia (Nikolaev and Shulga, 2002; Makolov, 2007). Negative values of 2009 and 2015 are caused in the first case by the consequences of the global financial crisis, in the second by the introduction of anti-Russian sanctions (Risovany, 2011; Nureyev, 2017).

Compiled by: Investments in Russia. Rosstat, 2017; Russia in numbers. Rosstat, 2019.

The dynamics of the company's financial investments is monitored in the actual prices, which complicates their consideration in dynamics (Fig. 2). However there is a possibility to notice the change of growth pace, which is correlated with the dynamics of the investment volume in fixed assets.

Fig. 2: Financial investments of organizations at actual prices (2000-2018).

Compiled by: Investments in Russia. Rosstat, 2017; Russia in numbers. Rosstat, 2019.

The dynamics of the foreign direct investment is very significant in the issue of the investment attractiveness of the country in the global economy (Fig. 3).

Figure 3: Foreign direct investment in the Russian Federation, billion dollars (2000-2018)

Compiled by: Direct investment. Bank of Russia. URL: https://www.cbr.ru/statistics/macro_itm/svs/ (accessed 08.08.2019); What are the trends talking about. Bank of Russia, 2019.

Some slump numbers came after recovery after the 2008. They were the result of the global financial crisis and the anti-Russia 's sanctions. The actions of the authorities have not led to the positive dynamics of this indicator yet (Bulatov, 2018). The data shows us the sustainable investment distribution between the regions. It has not changed during periods of rise and fall in the investment activity. Figure 1 shows a positive trend in 2007 and the reduction due to the financial crisis 2009, than the restoring position in 2011 and its decline in 2015. However, the distribution of investments in fixed assets between regions in those years, as in 2000, shows us the same 7 top regions each year (Table 1).

The positions in the outsiders group is equally stable. There are the same 10 regions in these years among the 15 regions with the smallest volume of the investment (Table. 2). According to the data of the company's financial investment regions are distributed in the same way. Leaders in 2015 were ranked between the 1 and 12 positions. Among the 15 regions with the lowest index of financial investments, there are 10 outsiders of the fixed capital volume investments. According to the foreign

direct investment data (Regions of Russia. Rosstat, 2018) in 2015, the leaders have occupied the first 13 place, the exception was the Khanty-Mansiysk Autonomous Okrug (31 place). Most of the outsiders ranked from 78th to 85th. Higher places were occupied by the Chukotka Autonomous Region (40th place), the Jewish Autonomous Region (55th place), the Republic of Tyva (66th place) and the Pskov Region (67th place). Similar differences are in the region distribution during the more prosperous 2011. Then Khanty-Mansiysk Autonomous Okrug (53rd place) did not take place in leader group. The Republic of Tatarstan moved from 37th place in 2011 to 13th place in 2015. Mentioned above regions went out from outsiders group in 2011. In addition, Republic of Adygea took the higher position: 55th place against 78th in 2015.

RAEX (RAEKS Analytics), National rating Agency and the Agency of the Strategic Initiatives study systematically the region investment appeal. The most famous and discussed investment attractiveness rating is being worked out by RAEX agency (RAEX Analytics) since 1996 till now. There are 9 components which form the investment potential: natural resource, production, consumer, infrastructural, innovative, institutional, financial and tourism. The components of investment risk are economic, social, financial, managerial, environmental and criminal. All these issues have been changed over the time. The most numerous is the group of regions with moderate risk (rating B): 61 regions in 2000, 55 in 2007, 64 in 2009, 59 in 2011 and 56 in 2015. The number of regions with high and extreme risk (C and D ratings) is gradually decreased from 26 regions in 2000 to 18 in 2015. At the same time, the number of regions with minimal risk is increased (rating A) from 2 in 2000 to 11 in 2015. The changes in the regions position is a consequence of the reassessment of investment risks. The changes in the rating RAEX (RAEKS Analytics) positions in the regional leaders and outsiders groups in terms of the volume of fixed capitals investment are very enlightening (Table. 3). The rating of the Yamalo-Nenetskiy Autonomous district has been changed: from 17 in 2007 to 44 in 2009. Moscow rank was changed from minimal to moderate due to this fact it changed position from 1 to 12. All leading regions have the rating changed over the years. On the contrary outsider regions are considered in another way. Pskov region (3B2), the Republic of North Ossetia-Alania and the Karachay-Cherkess Republic (3C2), the Republic of Ingushetia (3D) have not placed after 2000.

Compiled by: Rating of investment attractiveness of Russian regions of the company "RAEKS Analytics". URL: https://raex-a.ru/project/regcongress/2019/regcongress (accessed August 1, 2019); Rating of investment attractiveness of constituent entities of the Russian Federation. Remote. National Rating Agency. URL: http://www.ra-national.ru/ru/ratings/provinces?type=rating (accessed 08.08.2019).

The rating of the region investment appeal is formed by the National Rating Agency from December 2014[5]. Each region is characterized by a certain set of statistical parameters:n natural resources and geographical position; labour force; infrastructure; domestic market; the production potential of the economy; social political stability; the financial stability of the regional budget and enterprises of the region. During the generalizing of the statistics three groups are indicated: with high level of

investment appeal (IC1-IC3), medium (IC4-IC6) and moderate (IC7-IC9). In addition, three subgroups are separated in each group. The leaders in terms of investment in fixed assets predictably were in the group of regions with a high level of investment attractiveness (Table 3). All leaders have stayed in the subgroups of this category, except the Krasnodar Region, which data slightly fell after the Olympic Games in Sochi. The position in the ranking of outsiders is more dynamic, although 6 out of ten regions for four years of observation have retained their position in the subgroups. This is the Chukotka Autonomous Okrug (IC4) as well as the Kabardino-Balkarian Republic, the Republic of North Ossetia-Alania, the Republic of Ingushetia, Karachay-Cherkess Republic, the Republic of Tyva (all of them are in subgroup IC9). Four regions have changed their position in the ranking. So the place of the Pskov region decreased, it has moved from subgroup IC7 to subgroup IC8. The position of the Republic of Adygea slightly decreased: from IC6 to IC7, but it recovered in November 2018. The position of the Altai Republic has significantly improved, which has moved from subgroup IC9 to subgroup IC7. However, the decline of the Jewish Autonomous Region rating from IC6 to IC8 in December 2015 has not been restored since then.

Currently the Government of the Russian Federation launched the work on the formation of National rating of the investment climate in the regions of the Russian Federation. The Autonomous Non-Profit Organization Agency for Strategic Initiatives to Promote New Projects, established by Order of the Government of the Russian Federation in August 11, 2011 No. 1393-r is the main active participant of the launching. All regions have been included in the national rating and the best 20 regions are represented on the official website of the Agency. Special attention should be paid to the significant change in the position of regions in the rating (Table 4).

Table 4: Leader places in terms of investment in fixed assets in the National rated investment climate

Region	2016 year	2017 year	2018 year	2019 year
Moscow	10	3	2	1
Republic of Tatarstan	1	1	3	2
St. Petersburg	22	17	4	5

Krasnodar region	7	7	6	13
Khanty-Mansi Autonomous Okrug - Ugra	9	30	14	17
Yamal-Nenets Autonomous Okrug	18	-	-	-

Compiled by: Improving the investment climate. National rating. Agency for Strategic Initiatives to Promote New Projects. URL: https://asi.ru/investclimate/rating/ (accessed 08.08.2019).

The Khanty-Mansi Autonomous Okrug has changed its place from 9 in 2016 to 30 in 2017 (-21st position). However in 2018 this region was on the 14th place, and in 2019": on the 17th line. The Yamalo-Nenets Autonomous Okrug was in 18 place in 206, but in subsequent years did not take place in top 20 group. The agency studies the promotion of best investment practices. The Regional investment standard, which is mandatory for implementation in all regions in response to orders of the President of the Russian Federation was worked out by the Agency. Also the investment climate is considered in terms of the quality of government work. The national rating is based on 44 indicators, grouped in four lists: "Regulatory environment", "Institutes for business", "Infrastructure and resources", "Support of small business". The revision of the 2019 methodology provides 31 extra indicators out of the rating for the preparation of future changes in the assessment methodology [9].

Discussion and Conclusions

During the study of investment attractiveness a conceptual and terminological apparatus was formed where various concepts are often used as synonyms. Meanwhile during the comparing of concepts

"investment appeal" and "investment climate" more narrow content of first state and wider of the second is considered. While the climate characterization more often means the existing investors stable ideas about the possibility of working in the region, in the case of determining investment attractiveness assessment associate with specific views of investors in specific time period and the intensification of investment processes (Litvinova, 2013). The components of investment attractiveness are “investment potential”, objects are attractive to the investor, conditions and circumstances for work, as well as “investment risk” is everything that can prevent an investor from realizing his interests (Shcherbakov, 2017). “Investment resources” means individual components of investment potential and “investment activity” acts as a characteristic of the degree of their involvement in the investment processes (Bakieva, 2008). Concepts such as "competitive" and "creditworthiness" of the regions can be filled with different contents: for comparing individual investment conditions (Golovihin and Nezhivenko, 2017), for determining the unambiguous estimates, i.e. "for" or "against" during making decions by the banks (Kozhina, 2005). The results of research by rating agencies reflect the development of investment processes from various points. Research Agency RAEX (RAEKS Analytics) are guided by the interests of large strategic investors. The ratings of this agency has an aim to form ideas about changes in investment activity in the future. However, the agency rates can vary greatly in the short time period and this limits their use in long-term forecasting. The results of studies of the National Rating Agency are stable and correlate with the volumes of attracting investments in fixed assets. They allow us to use the rating as a rating of the investment climate in the regions. It is significant for an objective assessment of the investment state sphere in the regions. Almost all authors note an excessive number of methods for the assessing investment attractiveness. Thus, the problem is not the lack of the studies, but their abundance and diversity (Grishina, 2001; Litvinova, 2013). A comparison of these studies (Grishina, 2001; Batchaev, 2002) allows us to identify common features and individual characteristics of the applied approaches, methods and results. Firstly, the investment attractiveness, being a relative characteristic, is determined by comparison. The research results are presented on a base of the comparison of regions among themselves and the rating formation. Secondly, each study involves the presentation of the regional economy in the form of a socio-economic system, the components of which are involved in the investment process. This allows to identify those components that may attract the investor and may also be critical to his work. Thirdly, depending on whose interests are presented in the base of the formed ratings, the idea of the regional economy and its components can change. This circumstance is one of the main reasons for the differences in the results of research on the region investment attractiveness. Fourth, investment attractiveness is a complexly measurable issue, which is formed either by statistical data or by expert assessments. Thus, the rating of regions are formed by summarizing their “rankings” compiled on the individual indicators characterizing the state of investment activity (Karminsky, 2005; Karpuzov, 2006). Fifthly, the indicators characterizing the investment attractiveness of the regions have different units of measurement. According to the authors they have a different contribution to the overall assessment of investment attractiveness. A variety of research results are due to the use of the summarizing the rankings various methods. The researching of the regions investment attractiveness has multidirectional characteristics. *A separate direction* is studies carried out by the ratings agencies. The results of these studies are used for various purposes: in order to substance the estimation of the financial and economic activity results as well as for the formation of a positive image of the region. Rating agencies are independent and claim to form an unbiased assessment. These services are demand highly, including by authorities in order to justify decisions made. Rating agencies constantly adjust and modernize the methods of assessment in order to rise the justice of the results got. *Studies related to the perfection of its assessment methodology of the investment attractiveness (*Grishina, 2001; Burtseva, 2013) can be take into account separately. Numerous scientific publications have been devoted to this issue, including monographs and dissertation studies, etc., which offer solutions to improve the quality of assessing the investment attractiveness of regions. The third direction has a narrowly functional purpose. This is a *study of the investment attractiveness for the specific types of activities and economy sectors*. Among them studies dedicated the assessment of the effectiveness of the authorities’ activities responsible for the implementation of the investment policy are essential. There are numerous studies about the region prospects for investors who specialize in a certain area (sector) of the economy related to marketing, promotion of goods and services, determining the parameters of the competitive environment and etc.

Abstract

This article emphasises the need to develop techniques and disseminate practices for assessing the loyalty of a company's stakeholders. Loyalty assessments can be instrumental in integrating risks into organisations' strategies. The authors underline the importance of shareholders' loyalty and readiness to take business risks and stress the need to take measures for preventing disloyalty-caused damages, to fund these measures, and to organise the monitoring of their results. The article describes the possibilities of system dynamics models and big data technology in establishing causal relations between the level of stakeholder loyalty and a company's performance.

Keywords: Strategic Management, Risk, Stakeholders, Loyalty.

Introduction

Shareholders have different and sometimes conflicting needs and expectations. They build their relations with organisations at different paces and at different participation levels. It is important to both identify the stakeholders and create conditions for efficient long-term cooperation with them, i.e. to establish a stakeholder relationship management (SRM) system. ISO 9001:2015, ISO 14001:2015, OMG Essence, SEBoK, and other standards list the most common groups of stakeholders.

The stakeholder circles of modern companies have been described by James E. Post, Lee E. Preston and Sybille Sachs (2002), Aubrey L. Mendelow (1991), Max B. E. Clarkson (1995), Grant T. Savage, Timothy W. Nix, Carlton J. Whitehead, John D. Blair and others (1991).

Arkady V. Trachuk, Natalya V. Linder (2016b) emphasize three different approaches to understanding the category of stakeholders:
– normative approach, submitted by Archie B. Carroll and Kareem M. Shabana (2010), according to which management must strive to ensure that the company's values are in the interests of stakeholders;
– descriptive approach that requires attention to individual stakeholders and their role in achieving goals and increasing competitiveness, which are developed by Patricia Crifo, Marc-Arthur Diaye, Sanja Pekovic (2013);
– strategic approach of Dorina Popa, Victoria Bogdan and Diana Balaciu (2012), according to which stakeholders are strong participants in economic relations, capable of both positively and negatively affecting the existence of an organization.

A key indicator of perception by different stakeholder categories is loyalty, which measures favourable attitudes to a company and its products.

We believe that stakeholder loyalty is an indicator of the efficiency of a company's strategic management as well as a tool to overcome risk management being divorced from planning and management decision-making. The problem of coordinating risk management with strategy, corporate management, stakeholder engagement, and business performance management was formulated in the new COSO ERM – Enterprise Risk Management. Integrating with Strategy and Performance by the Committee of Sponsoring Organizations of the Treadway Commission (2017).

Theory

The wavering loyalty of any stakeholder category (customers, staff, owners, shareholders, contractors, the state, investors and underwriters) hinders the achievement of strategic and business goals as well as undermines company efficiency.

A disloyal customer will not buy again and will discourage others from purchasing the product. Bernard Marr (2012) leads a famous rule that on average 60 people will learn about the unsuccessful experience of one client, and information about the product or company of satisfied customers becomes available only to 30 people.

Disloyal staff is prone to embezzlement, negligence, cover-ups, and abuse of power. Reduced loyalty of suppliers translates into disadvantageous trade-credit conditions and makes postponed payments impossible. Disloyal shareholders avoid risks and display 'deviant' behaviour how it determines Victor I. Sigov, Alexander L. Slobodskoi, and Anna O. Evstigneeva (2017). In Russia, this behaviour usually manifests itself in rejecting interested party transactions; the absence of quorum during supervisory body elections; shareholders exercising their right to require the company to buy all or any of their shares at not less than the market price; reputation losses and litigation fees ensuing from the restoration of shareholders' rights, from challenging transactions, or from contesting general meeting's resolutions.

The above evokes Frederick Herzberg's (1968) dual-factor theory. When loyalty is insufficient or wavering, stakeholders show their dissatisfaction with actions threatening the company, just as it happens in the motivation theory when hygiene factors are at play.

A company should include response measures to stakeholder disloyalty (particularly, those for preventing disloyalty-caused damage) in its SRM system, bear the costs of these measures, and monitor their efficiency. These include access systems for physical objects and information, fines and reimbursement systems at the expense of perpetrators, marketing loyalty programs with discount cards, bonuses and gifts, the creation of IR-units to build relationships with investors.

Arkady V. Trachuk, Natalya V. Linder (2016a) note: «E-business strategies make it easier to create the effect of customer «locking», i. e. the creation of various loyalty programs, the deepening of customization through the use of Big Data tools, consisting in the initial data analysis. The results of the latter determine the problems and opportunities to improve offers for customers».

Recommendations

In practice, there are established metrics for the loyalty of customers and staff, who are considered as stakeholders. These are the Net Promoter Score (NPS) and the employee Net Promoter Score (eNPS).

As to the loyalty of owners and shareholders, their needs and expectations cannot be reduced to stable profitability, transparency, or corporate social responsibility. The measure of owners' loyalty is their desire, or the absence thereof, to sell the company in the next one-two years, five years, or ten years. The indicator of shareholders' loyalty is their inclination to recommend the company's shares for investment. A survey of the management of seventy Russian private companies, conducted by Sergey V. Kuznetsov, Yuliya I. Rastova and Natalia V. Suscheva (2018), shows that business is interested in investing in the earning assets of other organisations in order to receive dividends.

For long-term strategic changes, it is important to ensure the quality of data, calculations, and result interpretation. Particularly, there is a need to compute the threshold values of loyalty indices for different stakeholder categories and attain the levels achieved by the leading companies. The findings of Yuliya I. Rastova and Miron Rastov (2018) suggest that most companies have not fully formed such an attribute of strategic management as the controlled variation of strategic management processes and their parameters; nor have they identified the causes of this variation.

To solve the above problems, organisations should conduct industry-specific surveys of controllers, minority shareholders, holders of voting and non-voting shares, etc. To track trends and avoid incorrect forecasts, companies should carry out online polls.

Prospects

An acute problem in strategic management and risk management–strategy integration is the insufficient use of mathematical modelling, which makes it possible to express quantitatively the causal relation between strategic goals and indicators and to measure dynamic changes in final results with lag and gain parameters taken into account. The research results of Jay W. Forrester (1958), John D. Sterman (2000), Kim D. Warren (2008), Marina I. Barabanova and the team of authors (2018) demonstrate the possibilities of using the tools of system dynamics (SD) in overcoming the extreme complexity of making decisions. Models of system dynamics will allow based on the results of monitoring factors and the level of loyalty of stakeholders, to timely and rationally respond to changes in their mood. It is important to establish what sample size and structure ensure representative results and how to leverage the power of end-to-end digital big data technology.

Abstract

Employee performance is perhaps one of the most researched phenomenon in management research. To date, a plethora of factors that may either prompt or impede employees' performance have been identified. The aim of this conceptual paper, however, is to draw researchers' attention towards a relatively less researched determinant of employees' performance i.e., harmonious work passion Particularly, this paper proposes a tentative conditional process model to explicate how harmonious work passion might affect job performance and what role certain factors might play in it. The model we propose suggests that one way via which employees' work passion might affect or relate to their job performance is through work effort. Further, it is also theorized that the passion–work effort and passion–performance relationships would be moderated by work centrality – the extent to which one considers work as central part of his/her life. The paper concludes with suggestions for future empirical research.

Keywords: Work Passion, Job Performance, Work Effort, Work-Centrality, Conceptual Framework.

Introduction and Background

Employee performance is critical to overall functioning and success of any organization. The performance of teams, work units, and the organization, largely depends upon individual performance (Campbell & Wiernik, 2015). Since its conceptualization (late 1980s) to the present day, a plethora of studies on myriad aspects of 'employee performance' (e.g., performance models, measurement, antecedents, and consequences) have been conducted. However, there still exist some 'gaps' in this body of knowledge. For instance, whilst research has shown that harmonious work passion impacts performance (Astakhova & Porter, 2015; Burke et al., 2015; Dubreuil et al., 2014; Ho et al. 2011), little is known about the processes via which the former impacts the latter (e.g., Astakhova & Porter, 2015; Dubreuil et al. 2014; Ho et al. 2011). Similarly, research has yet to explore the moderating role of certain attitudinal factors in the passion–performance relationship. With this in mind, the current paper proposes a conceptual model which suggests that (1) one way via which harmonious work passion impacts performance is through its positive influence on work effort, and (2) work centrality might moderate harmonious work passion's positive relationships with work effort and job performance. This paper is unique in that it is the pioneer in introducing the mediating and moderating mechanisms of work effort and work centrality in the passion–performance link.

This paper is structured in three main sections: introduction, conceptual framework, and conclusion and future research direction. The definitions of constructs, arguments on their interplay, and a

schematized representation of proposed relationships are presented in the conceptual framework. Whereas, the last section provides guidelines for future research.

Conceptual Framework

The term 'passion' connotes an individual's strong inclination towards an activity – something that an individual likes, find important, and willing to expand the energy resources at (Vallerand et al., 2003, p. 757). Based on how that activity is 'internalized' in one's core-self, passion can be classified into two main types: the harmonious passion and the obsessive passion, where the first results from an autonomous internalization of the activity to one's core-self and the latter from controlled internalization. The first type of internalization ensues when one freely accepts the activity, without attaching any contingencies to it. Such an internalization thus motivates one to perform or engage in the activity willingly and freely, in harmony with other aspects of one's life. The latter internalization, on the other hand, stems from interpersonal and intra-personal pressures, implying that certain contingencies such as social pressure and self-esteem, are attached to engaging in or performing the activity. That is, although an individual likes an activity but his/her engagement in it is pressurized or compelled (i.e., lack of control). Due to this, engagement in the activity can conflate with other activities in one's life (Vallerand et al., 2003). In sum, whilst the two types of passion (i.e., harmonious and obsessive) are similar in that both represent a 'motivational force' which derives individuals to engage in or perform an activity, they differ on the basis of the internalization processes that underlie each. Harmoniously passionate individuals perform a job because they chose to do so, not because they are pressurized or compelled (e.g., social approval). On the contrary, however, obsessively passionate individuals view a job as important due to certain pressures and thus feel bound to perform it even when it conflates with other aspects of their lives. It is possible that individuals may have one type of passion but not the other (for a discussion, see Ho et al. 2011).

Turning to job passion, which has been referred to as "*a job attitude which entails affective and cognitive elements that embody one's inclination towards his/her job*" (Ho et al., 2011, p. 28). While the affective element of job passion signifies one's intense liking for the job, its cognitive element captures the perceived significance of the job. For an individual to have job passion, one should have strong linking for the job and consider it personally important. The combination of affective and cognitive orientations sets the job passion construct apart from related constructs which do not capture both elements simultaneously with examples including intrinsic and extrinsic motivation, organizational commitment and job involvement. Although passion and intrinsic motivation are closely related, the latter construct, however, does not include the internalization of an activity as personally important. Similarly, job passion is different from extrinsic motivation in that it entail liking of an activity, which may not necessarily be the case in extrinsic motivation. Job passion also differs from job satisfaction in that it encompasses an element of identification, which the latter construct lacks. Further, job passion is conceptually distinct from organization commitment on the grounds that it is a job related attitude, whereas the latter attitude pertains to the organization i.e., the extent to which an individual is committed to his/her organization. It is likely that an individual might show high commitment for his/her organization (e.g., due to long tenure) but may not be passionate for one's job. The affective component of job passion demarcates it from job involvement, which is purely cognitive (see Ho et al. 2011).

Concurrent with the dualistic model of passion (for a review, see Vallerand et al. 2003), Ho et al. (2011, p. 30-31) contended that job passion can be distinguished in two forms: harmonious job passion and obsessive job passion. To explain, these author quoted an example of two software engineers, who may have different reasons to like their job. One may like the job because he/she enjoys keeping up with the advancements in the programming field (harmonious job passion), the other may do so because of a sense of superiority that he/she derives from being the one that others in the company may turn to for help in solving relevant problems (obsessive job passion). The quest to endure this sense of superiority may thus lead the latter to learn new programming languages in personal time and think about the ways to debug issues even when he/she is away from the work. The job may thus become an obsession for him/her (Ho et al. 2011).

This paper takes into account only one form of job passion, that is, harmonious job passion, and attempts to develop rationale for its relationship with job performance via the hitherto unexplored mediating role of work-effort. Moreover, this paper also suggests that harmonious work passion's relationships with job performance and work effort will be moderated by work-centrality. One plausible reason for not taking into account the obsessive passion is its non-significant relationship with job-performance (for a review, see Astakhova & Porter, 2015; Burke et al., 2015; Ho et al., 2011). Before we develop arguments and propose hypotheses/propositions thereon, a brief delineation of the constructs (i.e., job performance, work-effort, and work centrality) is necessary. According to Campbell et al. (1990), performance consists of those observable job-related behaviors that are relevant to organizational goals. In simple words, what one does in a given role to achieve/support organizational goals and objectives, can be referred to as job/individual performance (Campbell & Wiernik, 2015). Whereas work effort is the constellation of three motivational outcomes: direction (an individual's choice of behavior); intensity (the degree to which an individual works hard); and persistence (the extent to which an individual persistently performs the chosen behavior) (De Cooman et al. 2010); work-centrality, which is generally referred to as an attitude, captures the importance of work in one's life (Paullay et al., 1994).

Having defined all constructs, let us now turn to harmonious job passion's relationship with work effort and job performance. For this we draw upon the work passion model (Zigarmi et al. 2009), attitude–behavior model (Ajzen & Fishbein, 1977), and existing empirical evidence. Particularly, we posit that harmoniously passionate employees will expend more effort and perform well. We first delineate harmonious work passion's relationship with job performance. Several empirical works have shown positive association between harmonious passion and job performance. The study by Ho et al. (2011), for example, has demonstrated a positive correlation between harmonious job passion and work performance. Similar findings were obtained by Astakhova and Porter (2015), Burke et al. (2015), and Dubreuil et al. (2014). The work passion model posits that employees' work passion is an emotionally positive and persistent state which stems from cognitive and affective appraisals of several factors and results in constructive/ positive attitudes behaviors that contribute to the organization (Zigarmi et al. 2009, p. 310). The attitude–behavior model also suggests that individuals' behavior is the function of attitude – the way one feels/thinks toward a behavior (either positive or negative) (Ajzen & Fishbein, 1977). In keeping with these theoretical underpinnings and aforementioned empirical findings, a positive relationship is expected between harmonious work passion – an attitude/motivational force that derives one to work (Ho et al. 2011) – and job performance, which is an observable behavior (Campbell et al. (1990). Hence, the following is proposed:

Proposition One: *Harmonious work passion would be positively associated with job performance.*

Extending similar theoretical reasons (i.e., attitudes may predict behaviors), we predict that the effort level of harmoniously passionate employees would be higher, that is, the higher the level of harmonious work passion, the greater the effort. We are aware of no prior study which has empirically validated or theoretically explained the link between these constructs. One plausible reason for why we predict a positive association between these construct is a theoretical link i.e., harmonious work passion is a '*motivational force'* (Vallerand et al., 2003) and 'motivation' has been asserted to be an important determinant of work effort (De Cooman et al. 2010). This leads us to assume a positive relationship between the two. Hence, it is proposed that:

Proposition Two: *Harmonious work passion would be positively associated with job performance.*

A positive relationship is also predicted between work effort and job performance. The effort to job performance link has already been established and several empirical studies have reported a positive association between the very constructs (see, for example Brown & Leigh, 1996; Christen et al., 2006; Lloyd, 2008; Wheeler et al., 2012). Taking insights from these empirical studies, as well as Campbell's (1990) and De Cooman et al.'s (2010) assertion that performance is a function of employees' effort, the two are expected to be positively associated. Obviously, when people commit to work (direction), put their energies into the chosen task (intensity), and stay consistent in

whatsoever they chose to perform (persistence), their performance is likely to improve/increase; hence, we posit that:

Proposition Three: *work-effort would be positively associated with job performance.*

Further, we theorize that work effort will mediate the harmonious work passion–job performance relationship. We are of the view that passion without effort may not produce favorable results (i.e., good/high performance). More precicesly, we assert that harmonious work passion will result into greater work effort which will then determine performance. There are studies which have shown that work effort mediates the relationships between attitudes and behaviors. For instance, the study by Wheeler et al. (2012) demonstrated that work effort significantly mediated the relationship between organizational job-embeddedness – a psychological force which emneshes workers into their organization – and job performance. Brown and Leigh's (1996) investigation also revealed a significant mediation effect of effort on the relationship between job involvement and job performance. Consistent with our theorization, and taking insights from previous empirical works, we postulate that:

Proposition Four: *The positive relationship between harmonious work passion and work effort would be mediated by work effort.*

Finally, it is expected that harmonious work passion's relationships with work effort and job performance would be moderated by work-centrality. We argue this based on work-centrality's promising implications for work-related attitudes and behaviors (see, for example Bal & Kooij, 2011; Hirschfeld & Feild, 2000; Ziegler & Schlett, 2016), and its previously established moderating role in the attitude–behvaior link (Ziegler & Schlett, 2016). Particularly, it is predicted that the strength of (1) harmonius work passion–work effort, and (2) harmonius work passion–job performance relationships would be stronger when work-centrality is high. For this, we mainly draw upon Ziegler and Schlett (2016), who demonstrated that high work centrality rendered job satisfcation as more powerful attitude in predicting in-role and extra-role behaviors. Concurent with Ziegler and Schlett (2016), we also anticipate that high work-centrality would invigorate/strengthen harmonious work passion's (an attitude) effects on work effort and job perfromance (behaviors). Thus, we propose:

Proposition Five: *Work-centrality would moderate the positive relationship between harmonious work passion and work effort.*

Proposition Six: *Work-centrality would moderate the positive relationship between harmonious work passion and job performance.*

Propositions four and five lead us to anticipate a moderated-mediation effect (Preacher et al., 2007); that is, harmonious work passion's indirect relationship with job performance would be moderated by work-centrality such that this relationship would be stronger when work-centrality is high than when it is low. Therefore, the following is proposed:

Proposition Seven: *Harmonious work passion's indirect relationship with job performance would be moderated by work-centrality.*

The proposed relationships are schematized in the following diagram:

Fig. 1 : The Conceptual Model

Conclusion and Future Research Directions

This paper suggests a tentative conditional-process model for testing. The model we propose is novel in that it suggests the hitherto explored: (1) relationship of harmonious work passion and work effort, (2) the mediating role of work effort in the harmonious work passion–job performance relationship, and (3) the moderating role of work-centrality in the direct and indirect relationships of harmonious work passion with work effort and job performance, respectively. Hence, we believe that the empirical test of the proposed model can significantly advance the relevant literature. Future researchers are therefore strongly encouraged to validate the model empirically. Measurement scales for all the variables are also readily available (see Bal & Kooij, 2011; DeCooman et al. 2010; Vallerand et al., 2003; Williams & Anderson 1991). Researchers may thus easily collect empirical data and determine the extent to which it supports the model.

Information Quality in The Analysis of Multiple-Choice Questions on An Example of Assessing the Importance of The European Union

Agnieszka STANIMIR

Wroclaw University of Economics and Business, Poland
agnieszka.stanimir@ue.wroc.pl

Abstract

The article presents the results of research aimed at indicating a useful set of statistical methods in the analysis of multiple-choice questions and the possibility of choosing many variants of answers (conjunctive cafeteria). The problem is considered due to the quality of information accrue from the analyses of this type of data. The article presents the definitions of questions with conjunctive cafeteria of answers and the most important problems associated with data collection and analysis. Five questions from the Standard Eurobarometer were used to illustrate the problem. For the analysis of conjunctive questions, category frequency, correspondence analysis and parallel plot were proposed. In the study, methods of analysis in the case of data collection errors were depicted. As a result, the proposed methods proved to be appropriate for solving the research problem.

Keywords: Data Vs. Information, Multiple Choice Questions, Conjunctive Cafeteria, Frequency, Correspondence Analysis, Parallel Plot.

Introduction

Often, the terms of information and data are used interchangeably (Wang, 1998), but it should be noted that they are completely separate from the point of many fields of science views. According to Wang and Strong (1996), it should be stated that the quality of information and the satisfaction of the recipient of information or the principal of the study are a key aspect of the information system. The quality of the data, in turn, affects the quality of the information.

In Wang (1998) and then in Kahn, Strong and Wang (2002) and Pipino, Lee and Wang (2002) sixteen dimensions of information quality were indicated. The dimensions that are highlighted in the article are the appropriate amount of information, free-of-error, understandability and value-added. The article also draws attention to the method of collecting data, because in the process of assessing the quality of information, an important element is also assessing the quality of data (Ballou, Wang, Pazer, and Kumar.Tayi, 1998).

In the article, the quality of information concerns the assessment of the preparation for use of the conclusions of a correctly planned study, in which the data was collected in accordance with the assumptions and the methods of analysis appropriate for the type of data collected were used.

Correct connection of data and analysis methods influence the properly conducted inference process (e.g. Babbie, 2013) and therefore also on the quality of information. This statement was the basis for formulating the purpose of the analyses, i.e. determining the issue of multiple choice questions, indicating the types of multiple responses and related analytical problems, and finally proposing a set of analytical methods useful in solving the problem. This goal is part of the methodological function of scientific research (Apanowicz, 2002). It can also be pointed out, like Walesiak (1996), that the choice of variables/data depends on the type of statistical method to be used in the analysis.

An indication of the location of the problem associated with the appearance of multiple choice questions, as an element implying further action, must be preceded by the recognition of problems to

be faced from the first stages of the study. For this reason, before the presentation of selected analysis methods the definition of questions with multiple answers and stages of the study were presented. So it was easier to indicate the difficulties arising from the introduction of questions of the indicated type into the study and to assess the impact of improper analysis on the inference and correctness of the study. The choice of measurement instruments is an action that ultimately influences the substantive selection of variables, the analysis of which is in turn linked to the analytical methods used. In this case, it should be concluded that the substantive selection of variables is the basis for the study.

Walesiak (1996, p. 25) states that "the selection of variables in multivariate data analysis is one of the most important and the most difficult issues". In the case of variables with multiple choice of answers, the problem concerns both one- and multidimensional analysis.

Sagan (2016, p. 48) indicates that "the variables are the basic unit in a research project". At the same time, he indicates the ways of defining variables and perceiving their significance and roles performed in conducted analyses. So, the problem of the variable presented in this way further emphasizes the problem faced by the researcher in the case of variable analysis with the possibility of making multiple selections. Therefore, it is important to indicate the correctness of the conceptualisation and operationalization of the research problem (Sagan, 2004).

Information must be useful and add value (Kahn, Strong and Wang, 2002) in the solution of the research problem, in the analysed case to assess the satisfaction of Europeans with the functioning of the EU. The Standard Eurobarometer survey is conducted twice a year. Therefore, an extremely important problem is finding analytical instruments to assess changes in the indicated area and repeatable in subsequent periods.

Presentation of the Problem

Each scientific research is a multi-stage process. Multiple choice questions appear during the construction of the questionnaire, and therefore at the stage of creating the measurement instrument. The problem posed in the article should not be analyse only within the preparation of the questionnaire, but the impact of the question structure in earlier and later stages of the scientific research should be also considered. This is in one with Apanowicz (2002) definition of scientific research in a broad and narrow sense. According to Łobocki (1975), it should be stated that the questionnaire survey requires careful preparation.

Stages of conducting scientific research can be indicated detailed as Wright (1983) did and in short version in accordance with Stanimir (2003). Wright (1983) also pointed out the mistakes made in all stages. Attention should be paid to errors made during preparing for data collection and measurement errors. However, if these errors appear, the research goal will not be achieved, and the conclusions (information) obtained from the study will not make it possible to assess the truthfulness of the research hypotheses.

At the stage of the measurement instrument construction, there is again the possibility of errors resulting in incorrect analysis of the research problem. Errors that are related to the problem being analysed include:

- structural errors (e.g. failure to use the cafeteria's possibilities, inseparability of the cafeteria, indefinite requirement of completeness, inseparable number of alternatives);
- technical errors (carry forward questions to the next page, too long cafeterias).

The multiple choice questions presented in the article are in practice called cafeterias. Within these questions, a following types of cafeteria are distinguished (Apanowicz, 2002; Churchill, 2002; Kaczmarczyk, 2002; Kauf and Tłuczak, 2013; Mazurek-Łopacińska ed., 1996; Sagan, 2004):

- closed-ended;
- disjunctive;

- conjunctive;
- semi closed-ended question.

The problem of choosing the method of analysis presented in the article concerns the case of conjunctive cafeteria (closed or semi-open), which can be used in one of the following forms (Apanowicz, 2002; Sagan, 2004):

1) the possibility to choose one or any number of variants (minimal request of completeness);
2) selection of all variants that the respondent considers as important (maximum request of completeness);
3) selection of up to *k* variants (limited request of completeness);
4) selection of a given number of responses (limited request of completeness);
5) selection with rank order answers (limited request of completeness);
6) without indicating the number and rank of responses chosen (indefinite request of completeness).

Conjunctive cafeteria makes it possible to learn the attitudes and opinions of respondents to a greater extent than disjunctive cafeteria but at the same time causes analytical problems. Most often categories in conjunctive cafeteria do not correspond to any measuring scale. In addition, these types of questions are very difficult to code, so it's not so easy to apply analytical methods. As Sagan (2004) indicates, in conjunctive questions the claim of completeness (maximum, minimum or limited) should be included, because only such a procedure facilitates the method of coding and analysing data. Few authors take up the issue of recommendations for the construction of conjunctive questions and how to analyse them. Sagan (2004) indicates that the cafeteria should not be longer than 6-8 variants, and in the case of long cafeterias he suggests dividing it into lists. Churchill (2002) points to another problem. Questions with multiple answers may be biased by the order in which they are given. Therefore, it is often recommended that the interviewer should rotate the answers to the question if it is possible. This solution is desirable when the answers to the question can be given with an indication of the hierarchy. First, the respondent indicates the most important variant and then the next. When indicating subsequent variants, they should be presented in a changed order.

To sum up, conjunctive cafeteria must be consciously introduced to the measuring instrument by the researcher due to difficulties in coding the answers, assigning answers to the measuring scale and choosing the method of analysis. Apanowicz (2002, p. 75) emphasizes that "the correct application of quantitative (statistical) methods requires an understanding of their essence, assumptions and limitations". In addition, two structural requirements for the construction of closed-ended questions should be noted (Babbie, 2013). The proposed categories should be completed and categories should be separable. If the first condition is not met, the semi-open question should be entered. Incorrect wording of the questions (in terms of technique and content) prevents the chance to obtain true answers and reliable data (Apanowicz, 2002).

In the analysis of the cafeteria, a data pre-processing stage is also necessary, i.e. data cleaning, integration, transformation, reduction (Han and Kamber, 2006). This action is focused on help to improve the quality of the data, increasing the precision and efficiency of the decision-making process.

Data used in the Analysis

To illustrate the problem of data collection and analysis based on conjunctive questions, data from the Standard Eurobarometer, 2018, autumn wave, were used (European Commission, 2018). Five questions were selected from the questionnaire. In addition, gender and country of residence were also taken into account. This was dictated by the implementation of the goal of the study, i.e. not only an indication of the method of analysis but also a method that will allow the analysis of data in connection with other variables and the recognition of errors made during the data collection process. The study retained the numbering of questions from the original questionnaire.

In the QA10 question, the respondents could choose any number of the most important answers from the 16 categories provided. So, this is an example of conjunctive cafeteria with a maximum request of completeness. The literal question is given below.

QA10: What does the EU mean to you personally?

1. Peace
2. Economic prosperity
3. Democracy
4. Social protection
5. Freedom to travel, study and work anywhere in the EU
6. Cultural diversity
7. Stronger say in the world
8. Euro
9. Unemployment
10. Bureaucracy
11. Waste of money
12. Loss of our cultural identity
13. More crime
14. Not enough control at external borders
15. Other
16. Don't Know

In the questions QA3a, QA4a, QA5, the respondents could only choose two answers from 16 (18) categories given. So this is an example of conjunctive cafeteria with limited request of completeness. The literal question is given below.

QA3a (QA4a, QA5): What do you think are the two most important issues facing (OUR COUNTRY) at the moment? (personally, European Union) (the same first six issues in all)?

	1.Crime 2.Economic situation 3.Rising prices\ inflation\ cost of living 4.Taxation 5.Unemployment 6.Terrorism	
QA3a – Country	QA4a – personally	QA5 – European Union
7.Housing 8.Government debt 9.Immigration 10.Health and social security 11.The education system 12.Pensions 13.The environment, climate and energy issues 14.Other 15.None 16.DK	7.Housing 8.The financial situation of your household 9.Immigration 10.Health and social security 11.The education system 12.The environment, climate and energy issues 13.Pensions 14.Working conditions 15.Living conditions 16.Other 17.None 18.DK	7.EU's influence in the world 8.The state of Member States' public finances 9.Immigration 10.Pensions 11.The environment 12.Energy supply 13.Climate change 14.Other 15.None 16.DK

In question QD4a (QD4b), respondents could choose from 11 (and 9 in the second place) given categories one most important, and then two categories of lower importance. So this is an example of a

combination of disjunctive cafeteria and conjunctive cafeteria with a limited request of completeness. The literal question is given below.

QD4a: Which of the following do you think is the most positive result of the EU? Firstly? (QD4b And then?)?

1. Peace among the Member States of the EU
2. The free movement of people, goods and services within the EU
3. The euro
4. Student exchange programmes such as ERASMUS
5. The Common Agricultural Policy
6. The economic power of the EU
7. The political and diplomatic influence of the EU in the rest of the world
8. The level of social welfare (healthcare, education, pensions) in the EU
9. Other
10. None
11. DK

The problem in question AQ10 was that the maximum number of choices that respondents could make was not known, so there were both single categories in the answers to the question or several categories. In the questions QA3a, QA4a, QA5, respondents should indicate two categories, but this condition was not met by many people and only one category appeared in the answer (of course, apart from those who indicated the answers None and Don't know, in this case two answers could not be expected). In question QD4a, respondents should indicate one most important category, and then indicate two other important categories. Unfortunately, the respondents in the second choice indicated either one or two categories.

Analysis in the case of conjunctive cafeteria with the possibility to indicate multiple answers or a maximum of *k* answers

In order to illustrate the possibility of analysing conjunctive cafeteria with a maximum or limited request of completeness, the answers given by the respondents to question QA10 were selected. Additionally, the variable was analysed in association with the gender.

Frequency calculation is most often used in analysing conjunctive questions. This can be done in two ways. The first refers to the number of respondents (*N*) and the second refers to the number of options selected by all respondents. Łobocki (1975) indicates that calculating the frequencies of answers for this type of question allows to indicate the hierarchy of these answers. The frequencies for each category in the first and second case, marked as p_i and p'_i, respectively, are calculated as follows:

$$p_i = \frac{n_i}{N} 100 \qquad (1)$$

$$p'_i = \frac{n_i}{\sum_{i=1}^{I} n_i} 100 \qquad (2)$$

where: *i* is the category number ($i = 1, \dots, I$); n_i – the number of *i*-th category choices *i*, *N* – the number of respondents, $\sum_{i=1}^{I} n_i$ – the number of all choices made by respondents (if maximum *k* categories can be selected, then $\sum_{i=1}^{I} n_i = kN$).

Table 1: The average, median and dominant number of chosen categories in total (T) and by men (M) and women (W)

	N	$\sum_{1=1}^{I} n_i$	*Average* *Median* *Dominant*
T	6289	22151	3.5 3

			2
W	2812	10205	3.63 2
M	3477	11946	3.43 2

Source: Own study based on European Commission (2018) data, using the IBM SPSS program.

In the analysed example, the respondents didn't have the indicated number of categories they should choose in response to the QA10 question. Frequencies for the categories are presented in Figure 1.

Fig. 1: Frequency of answers in QA10 question depending on the number of references, broken down by gender

Source: Own study based on European Commission (2018) data.

Based on the data presented in Table 1, it should be stated that women chose slightly more categories as answers to QA10 than men. However, choice of two categories dominated for men and women. Figure 1 shows the results of the calculated frequencies according to formulas (1) and (2). The calculation results can be presented in the table, however the graphic presentation shows in a more contrasted way, than tabular, the differences in the frequencies of choices made by women and men. Regardless how the frequencies of answer categories choices were calculated (p_i or p'_i), the importance of variants remains unchanged.

Table 2: Frequencies of choosing a specified number of categories

number of selected answers	number of respondents	*%N*
1	1093	17.4
2	1403	22.3
3	1144	18.2
4	907	14.4
5	633	10.1
6	462	7.3
7	284	4.5
8	185	2.9

9	86	1.4
10	48	0.8
11	20	0.3
12	10	0.2
13	5	0.1
14	7	0.1
15	2	0.0
Total	6289	100.0

Source: Own study based on European Commission (2018) data.

Table 2 presents the choices made by respondents, indicating how many of them chose only one, how many two, and how many fifteen categories. Respondents most often chose combinations of two or three categories or individual answers (Table 2). From the perspective of the recipient of the study results, it should be important to check the structure of these choices. The easiest way to check this is to select individual categories (Fig. 2).

Fig. 2: Frequencies of choosing one category (%), broken down by gender

Source: Own study based on European Commission (2018) data.

The presentation of individual choices in comparison with the analysis of all choices made by all reviewers shows whether the categories most often chosen by all respondents coincide (have a strong position) with the choices made by respondents with very specific views. In the analysed cases, the categories most commonly chosen in determining the importance of the EU are freedom to travel, study and work anywhere in the EU, and a common currency. However, in the third place among the respondents who made a single choice is the Don't know answer. This category is last, taking into account all choices made by respondents (Figure 1).

According to the results presented in Table 2, respondents most often chose two categories. Table 3 presents the most common two-element links of the categories.

Table 3: Most common two-element links of the categories

categories in a pair		%N
Travel, study and work	Euro	9.2
Travel, study and work	Cultural diversity	8
Travel, study and work	Economic prosperity	5.6
Travel, study and work	Stronger say in the world	4.9
Travel, study and work	Peace	3.8
Travel, study and work	Democracy	3.3

Source: own study based on European Commission (2018) data, using the IBM SPSS program.

Fig. 3: Frequencies of choosing answers to QA10 in pairs variants
Source: Own study based on European Commission (2018) data, using the IBM SPSS program.

Figure 3 presents the frequencies of choices of respondents in two categories of responses. Although this group of respondents was the largest, the frequencies of the two categories are usually lower than the selection of only one category, or the lack of selection of both categories considered in pair.

Analysis of the frequencies of occurrences of subsequent multi-element combinations of categories presented in Table 2 is increasingly difficult and less readable. Therefore, an analytical method should be indicated that will allow clear presentation of choices made by respondents. To this end, it is possible to use correspondence analysis. This method enables to consider relationships between categories of many nominal or ordinal variables, taking into account the reduction of multidimensionality with the highest possible representation of the observed real relationships. An additional advantage of this method is the ability to graphically presentation the results of the analysis in a lower-dimensional space. This method is discussed in detail in Greenacre (1993), Blasius (2001), and in polish literature by Stanimir (2005). For this reason, the article does not focus on presenting a detailed algorithm used in this method, but only approximates how to prepare data.

In the case of analysis of two variables, in the correspondence analysis, a contingency table is constructed, thus determining the simultaneous number of occurrences of the two categories belonging to different variables. In the case of multi-variable analysis, a Burt matrix is constructed. It is a symmetrical block matrix: on the main diagonal there are diagonal matrices containing numbers of

occurrences of the categories of the following variables, and beyond the diagonal there are contingency tables of the pairs of variables.

If the answers to the questions are conjunctive cafeteria, it is not possible to use any of these approaches. In order to analyse these types of questions, the correspondence analysis should be carried out on the basis of an indicator matrix (for a detailed description of the structure of such a matrix, see Stanimir (2005)). An example of its construction is presented in Table 4.

Table 4: Example of indicator matrix

r. n.	Q10				Gender		Country		
	1	2	…	14	W	M	EU15	EU 2004	EU 2007
1	1	0	…	0	1	0	1	0	1
2	0	0	…	1	1	0	0	1	0
3	1	1	…	1	0	1	0	0	0
4	1	1	…	0	0	1	1	0	0

Source: Own elaboration.

Table 4 presents the situation for four respondents (respondent number – *r.n.*). If the respondent has chosen the category of a specific variable, then 1 appears in the row in the appropriate column. The correspondence analysis of such a matrix is carried out according to the classical approach, i.e. as for the contingency table, using the singular matrix decomposition. The full space for analysing the relationships of the variable categories is *K*-dimensional: $K = \min(r-1; c-1)$, where r is the number of rows, c is the number of columns. In the conducted analysis, three variables were taken into account, with the variable *Q10* having 14 categories (the Other and Don't know answers were not taken into account), gender – two, and the country – three categories (EU15 – countries of the original EU, EU2004 – countries that joined the EU in 2004, EU2007 – countries that joined in 2007 and later). Thus, the full space for projecting relationships between categories of variables is eighteen-dimensional ($K = 19 - 1 = 18$). In assessing the quality of display of categories relationships in the low dimension the Cattel test is very often used. It presents eigenvalues in non-ascending order. In the analysed example (Fig. 4), the graph flattens among the highest eigenvalues twice: for the second and sixth eigenvalues. Therefore, the presentation can be made in two- and six-dimensional space. In the first case, 22% of information about relationships of variable categories will be retained, and graphical presentation of these relationships will be possible (Fig. 5). In the second case, however, the quality of the presentation will be 52%. Graphic presentation is not possible, and the co-occurrences of variable categories are indicated using a hierarchical classification based on projection coordinates of points illustrating the categories of variables in space R^6. After applying the Ward classification, five classes of variable categories relationships were indicated (the Silhouette Index was 0.65, indicating an important structure of classes). The first class contain the positive aspects of EU membership (Peace, Economic prosperity, Democracy, Social protection, Freedom to travel, study and work anywhere in the EU, Cultural diversity, Stronger say in the world, Euro), which are important for both women and men and residents of the EU15. The second group include Unemployment and Bureaucracy. In the third there are attributes such as Waste of money, Loss of our cultural identity, More crime, Not enough control at external borders. In fourth group are residents of the countries which participate in EU since 2004. In the last group are residents of the countries that joined the EU at the latest. Analysing the average coordinate values in these classes, it cannot be indicated that any of these classes in space R^6 are similar to each other.

Fig. 4: Eigenvalues – Cattel test

Source: Own study based on European Commission (2018) data, using the Statistica program.

Fig. 5: The result of correspondence analysis in two-dimensional space

Source: Own study based on European Commission (2018) data, using the Statistica program.

The result of correspondence analysis presented in R^2 (Fig. 5) largely coincides with the result obtained after taking into account the coordinates in R^6. Here, too, the positive categories are located at a considerable distance from the negative categories. Positive categories characterize the inhabitants of EU15 more than other countries, and negative categories are most characteristic for EU2004. The views of the resident of EU2007 are undefined.

Analysis of answers to conjunctive cafeteria questions with the option of indicating *k* answers

To illustrate this problem, the answers to questions AQ3a, QA4a, QA5 were used. Respondents could choose two answers in each question. The questions contain very similar sets of answers. The authors of these questions could divide them so that the implementation of the same issues could be assessed by respondents in three areas. Interviewers gathering answers to questions, allowed respondents to make a mistake during answering. Some of them chose only one answer (Table 5).

Table 5: Frequencies of questions answering AQ3a, QA4a, QA5 (%)

	QA3a	QA4a	QA5
one category selection	7.5	21.3	21.3
two categories selection	92.5	78.7	78.7

Source: Own study based on European Commission (2018) data.

In this situation, the analysis can be performed by calculating the frequencies in accordance with formulas (1) and (2), indicating $k = 2$. The result obtained for the question QA3a is presented in Table 6. One category selection

Table 6: Frequencies of categories choices to QA3a (%) and number of respondents choosing categories (n_i)

	n_i	p_i	p'_i $k = 2$	p'_i	missed opportunities
qa3a.1	596	9	5	5	0.19
qa3a.2	1132	18	9	9	0.35
qa3a.3	1701	27	14	14	0.53
qa3a.4	670	11	5	6	0.21
qa3a.5	1427	23	11	12	0.44
qa3a.6	299	5	2	2	0.09
qa3a.7	831	13	7	7	0.26
qa3a.8	596	9	5	5	0.19
qa3a.9	1051	17	8	9	0.33
qa3a.10	1402	22	11	12	0.44
qa3a.11	780	12	6	6	0.24
qa3a.12	627	10	5	5	0.20
qa3a.13	807	13	6	7	0.25
qa3a.14	120	2	1	1	0.04
qa3a.15	17	0	0	0	
qa3a.16	48	1	0	0	

Source: Own study based on European Commission (2018) data.

Table 6 in the missed opportunities column indicates the differences in percentage points between the results obtained by assuming *k*=2 in formula (2) and without making that assumption in formula (2). This is an error of measurement made during data collection. Of course, the amount of missed opportunities cannot be calculated for categories: None and Don't know.

In analysing questions with a conjunctive cafeteria with a limited request of completeness, the analysis of correspondence is helpful. Again, it should be preceded by the preparation of data according to the example shown in Table 4.

In Figures 6-8, it can be seen that the quality of display in R^2 of the real relations of categories slightly exceeds 12%. In such a situation, it should be used again the Cattel test, determine the best projection space and classify the categories of variables based on coordinates. However, significant differences in the perception of individual problems of respondents, problems of the country and EU problems are already visible in the R^2 space. Also in this analysis, variables for groups of member countries and

gender were introduced. If only one criterion is selected (Fig. 8) in each of the three questions, the points illustrating the categories of most answers are located very close to the projection centre, which means that they do not significantly differentiate the analysed respondents' groups.

Figures 6 and 7 show a greater diversification of respondent characteristics. The location of the points is very similar, which means that the general perception of Europeans of the analysed questions categories is not significantly affected by assessments made not in accordance with the rule of choosing a specific number of answers set out in the questions. Figures 6 and 7 show interesting assessments made by respondents, e.g. points depicting unemployment as a personal situation, the national problem and the EU problem are located close to each other, similarly the economic situation and price increase/inflation, cost of living.

Analysis of answers to conjunctive questions with the rank order answers

The analysis of the next problem used the answers of the respondents to the QD4a question. First, they pointed out the most important effect of EU membership. Then they gave two of the other variants, which were coded as QD4b question. The choices made first by the respondents are shown in Table 7.

Table 7: Frequencies of QD4a categories selections (%) and number of respondents who chose the categories

	n_i	p_i
QD4.1	1513	24.1
QD4.2	2171	34.5
QD4.3	598	9.5
QD4.4	527	8.4
QD4.5	135	2.1
QD4.6	406	6.5
QD4.7	280	4.5
QD4.8	358	5.7
QD4.9	60	1.0
QD4.10	135	2.1
QD4.11	106	1.7
QD4.12	6289	100.0

Source: Own study based on European Commission (2018) data.

Table 8 presents the significant effects of EU membership selected by respondents in the second place.

Table 8. Frequencies of QD4b categories selected in the second place (%) and number of respondents choosing categories (n_i)

number of categories selected in second place	n_i	%
1	2104	34.8
2	3944	65.2
Total	6048	100.0

Source: Own study based on European Commission (2018) data.

In the second turn the indication of the effects of EU membership was not followed by those who chose firstly the None and Don't know. Approximately one -third of respondents chose only one category in the second turn.

Fig. 9: Frequencies of categories choices by respondents: the most important and subsequent ones

Source: Own study based on European Commission (2018) data.

In Figure 9 *Second choice 1* means that one category was selected in the second order, *Second choice 2* – two categories were selected in the second place.

Based on Figure 9, it should be stated that the validity of the two effects of EU policy, i.e. the Free movement of people, goods and services, and Peace among countries, significantly exceeds the importance of the other categories, regardless of the order in which they were chosen.

For a group of people who chose only one category in the second selection, it is possible to perform an analysis using a parallel coordinates chart (parallel plot). These charts are created based on the frequencies of the number of respondents making categories selections in subsequent variables. In this analysis, it is important to indicate the order of variables in tracking subsequent categories choices made by respondents due to subsequent variables. Figure 10 contains parallel coordinates determined for four variables, in order of: group of countries (1 – EU15, 2 – EU2004 without Poland, 3 – EU2007, 4 – Poland), D10 – gender (1 – male, 2 – female), QD4a – the most important effect of membership in the EU (without None and Don't know), QD4b – the second most important result of EU membership.

Fig. 10: Parallel plot for four groups of countries, gender and variables QD4a, QD4b – only one category selected in the second order

Source: Own study based on European Commission (2018) data, using the Parallel Sets V2.1 program.

Fig. 11: Parallel plot for Poland by gender and variables QD4a, QD4b – only one category selected in the second order

Source: Own study based on European Commission (2018) data, using the Parallel Sets V2.1 program.

In Figures 10 and 11, the path from top to bottom must be traced. In Figure 10, the first variable dividing the sample is a group of countries, then gender, an indication of the first most important effect of EU membership and finally an indication of the second most important effect of EU membership. In the EU15 group, women first indicated Peace among the Member States of the EU and then the Euro, while men first chose Free movement of people, goods and services within the EU and secondly, with the same frequency, Peace among the Member States of the EU and then the Euro.

Women and men from the countries that joined the EU in 2004 indicated the Free movement of people, goods and services within the EU as the most important effect of the EU and then Student exchange programs such as ERASMUS. The first choice of women and men from the countries that joined the EU at the latest was Free movement of people, goods and services within the EU and then Peace among the Member States of the EU.

The choices of Poles presented in Figure 11 are similar to those of EU15 residents. They are shaped as follows: women first indicate Peace among the Member States of the EU and then the Euro, while men first Free movement of people, goods and services within the EU and secondly Peace among the Member States of the EU.

It is important for the study how the answers given by the respondents were shaped at all. For this purpose, the correspondence analysis may be used again (observations should be written as an indicator matrix). Figure 12 shows the configuration of the points which present categories of answers to the questions QD4A and QD4b.

Fig. 12: The result of the correspondence analysis of QD4a and QD4b questions in two-dimensional space

Source: Own study based on European Commission (2018) data, using the Statistica program.

Figure 12 shows the effects of EU membership selected as the most important (in green), followed by the chosen in the second turn (the black ones). It can be seen that the farthest from the projection centre are the points depicting in the first and second choice the Peace among the Member States of the EU, the Free movement of people, goods and services within the EU and Student exchange programs such as ERASMUS. These are the categories of variables that most affect the indication of relationships between response options. Points showing the same effects but selected in the first and second place cannot be located close to each other. Analysing the proximity of the location of the categories chosen in the first and second place can be concluded as, e.g.

- first choice of Peace among the Member States of the EU implies the second choice of Free movement of people, goods and services within the EU;
- indication of the EU's economic power as the most important effect of the EU is associated with the indication next of the Common Agricultural Policy.

Conclusions

In accordance with the postulate of Apanowicz (2002), the study (the results of which were presented in the article) was aimed at using analytical methods to present the scientific problem as accurately as possible. The conducted activities presented a way of analysing questions with conjunctive cafeteria.
The presented analysis techniques and methods of interpreting the results indicate the usefulness of these methods. They give the opportunity to analyse conjunctive cafeteria questions not only when

respondents correctly answer the questions asked, but also when they act differently than the author of the question assumed. To sum up the problems met during the analysis of selected questions from the Standard Eurobarometer survey should be divided into two groups: regarding respondents and authors of questions.

Questions should be constructed in such a way, that analysis and deduction on ground used methods will give the possibility to:

- recognize the difficulties that comes from a measurement instrument with conjunctive cafeteria;
- adapt the structure of questions to the skills and time to be devoted to analysis (the aspect of time is also discussed in Apanowicz (2002));
- in the analysis do not ignore answers that do not meet the assumptions as e.g. in questions QA3a, QA4a and QA5;
- do not create too complex cafeterias, because the respondents can evasively answer the questions or avoid answers.

The problem of respondent group is as in the Standard Eurobarometer. It is a panel survey and respondents consciously decide to answer, so they should indicate the answers in accordance with the instructions in the questionnaire.

For some conjunctive cafeteria questions, creating blocks or lists so that the number of answers is not too high, should also be considered. For example, in questions QA3a, QA4a and QA5 it was possible to carry out the study in a way that was more interesting for both the respondents and author, and predict the possibilities of further analysis. It was possible to create one list of factors compared in three areas (personal, national and EU) and the rest of the answers contained in the original wording of the questions should be included in subsequent lists.

The construction of cafeteria questions with the possibility of ranking a certain number of answers is very interesting. Such questions with multiple answers give the opportunity to use both correspondence analysis, parallel charts but also basket analysis.

It should also be remembered that preparing data for the proposed analysis is very complicated and time-consuming.

Finally, we would like to note that the own contribution is indication of useful set of methods for analysing multiple choice questions, a detailed presentation of the proposed methods, an indication of how to prepare data for analysis and the correct way of inference. We've thoroughly analysed and systematized the cafeterias definitions. We've pointed out possible mistakes that can be caused by improper use of cafeteria questions.

Abstract

Small and medium-sized enterprises and family businesses are an important element of any prosperous economy. The Slovak economy is made up of up to 90% of small and medium-sized enterprises. The content of the paper is to define family businesses and their usage of marketing. Small and medium-sized enterprises also include family enterprises, which are not defined in Slovak legislation. The paper emphasizes the importance of using marketing communication in family businesses, especially in the current turbulent competitive environment. The use of marketing theory in the process offering products to customers also plays an important role. In particular, family businesses in the early stages of business must apply elements of effective marketing communication. The aim of the paper is to emphasize and point out the importance of applying marketing theory in small and medium-sized enterprises and especially family businesses. The importance of the paper consists on the characteristics of the already used tools of marketing communication in family businesses.

Keywords: Family Businesses, Marketing, Small and Medium-Sized Enterprises

Introduction

The first significant steps in the development of business in our territory were made in the 17th century, when the position of crafts in the world economy was significantly strengthened. In order to produce more efficiently and to save energy, in the 19th century, the production was transferred to manufacturing, crafts are completely repealed by Industrial law. In 1930, Slovakia had more than 98,000 trades, employing more than 322,000 employees (Nosková, 2019). Most of them were manufacturing trades. Trade, financial intermediation and insurance accounted for 43.6% of trade, transport trades 2.7%, culture and sports activities 0.5% and health care 22.2%. After World War II, companies were gradually nationalized and, in 1965, the Trade law ceased to exist with the publication of the act. No. 65/1965 Col. Labor Code (Pawera and Jančíková, 2017). It was only in 1989, after the fall of socialism that in Czechoslovakia the directive-oriented economy was reoriented to the market economy. This step required a change in relationships and, in particular, new rules for economic life. As part of these changes, it was also necessary to create conditions for the functioning of small and medium-sized enterprises, which was implemented by the adopted Act on Small Business. According to Mura et al. (2019), over the years, there has been a high expansion of small and medium-sized enterprises created to fill the slits on the market. While the directive-created and more-favored giants

were still declining, the development of small and medium-sized enterprises was evident by a multiple increase in the number of small and medium-sized enterprises between 1988 and the present.

The Aim of The Paper and Methodology

The aim of the paper is to emphasize and point out the importance of applying marketing theory in small and medium-sized and especially family businesses. The importance of the paper lies in the characteristics of the already used tools of marketing communication in family businesses.

We want to achieve the selected goals mainly by means of legislation and scientific literature. Based on our research, we also want to fill the gap in family business. From the scientific methods of knowledge we used the analytical method to analyze the legal status and regulation. Based on the scientific knowledge of valid and effective legal and legal sciences we used in some parts of the work synthesis, deduction and doctrinal interpretation.

Small and medium enterprise, development and significance, European Charter and initiative

The importance of SMEs in the Slovak Republic is beginning to be considered more importantly after 1990 in connection with privatization and transformation of the economy. The rapid development of small and medium-sized enterprises in our conditions was recorded in 1991/1992, and their genesis was conditioned by several facts (Dolodac et al. 2016). We can mention some of them:

- the gradual break-up of large state-owned enterprises in the first wave of large-scale privatization and the emergence of more SMEs;
- return of property to citizens within the framework of the restitution,
- liberalization of trade relations and the emergence of more SMEs with foreign equity participation;
- motivation to start a micro business (Rentkova and Panevski, 2017).

The particularities of the development of SMEs in Slovak conditions are also different in the way that small enterprises are created mainly by the progressive process of creation and growth of private ownership, while medium-sized enterprises are often created as a result of a decrease in the number of structural changes of state enterprises (Mucha et al., 2019). Recently, they have also been created as a result of a qualitative transfer of sole traders as natural persons among entrepreneurs registered in the Commercial Register, or the transformation into commercial companies (Močarníková et al. 2018. This is often the result of efforts to expand their activities.

Economic theory (Kljucnikov et al. 2019) confers several functions on small and medium-sized enterprises. SMEs are characterized by the possibility of increasing employment and SMEs act as a source of job creation. SMEs provide numerous employment opportunities, thus also solving social problems. They make it possible to use local labor resources or employ people with reduced working capacity. According to Havierniková et al. (2017), the importance of SMEs is reflected in flexibility. The importance of SMEs can also be seen in building personal relationships with customers, suppliers, employees - they have immediate and constant contact with individual partners, what is a great marketing advantage. Peráček (2019) claims that, SMEs have simple management structures and do not use bureaucratic management practices, making it more flexible inside and outside the company. They have the prerequisites for flexibly responding to demand fluctuations (Mucha, 2019). Finally SMEs are independent. Their owners have great freedom, which supports their motivation.

Attention to small and medium - sized entrepreneurs in Slovakia began to be paid after 1971, when the Bolton Report was created, which defined SMEs in general, with the following features:

1) SMEs have a relatively small market share and practically cannot have any significant effect on the market in any way;

2) SMEs are managed by owners, entrepreneurs, families, owners or co-owners, and not indirectly through a formal management structure;

3) SMEs are independent enterprises, not part of another larger enterprise (Olšovská et al. 2016).

The viability of SMEs has steadily increased, and SMEs have been credited with significant characteristics, given that they have become the most powerful engine of any market economy by their flexibility (Mucha et al. 2018). This is evidenced by the fact that in Europe the majority of all enterprises are small and medium-sized enterprises, employing more than half of the total working population. Their share in gross domestic product formation is also significant, reaching between 50% and 70% in different countries. They have the same meaning in the Slovak economy as in the European economy. According to Duľová Spišáková et al. (2017), the characteristics, SMEs can be defined on the basis of quantitative characteristics as well as on the basis of qualitative characteristics. In quantitative terms, the concept of small and medium-sized enterprises encompasses all sectors unless they exceed a certain size. Size is measured by the number of employees. Statistical determination of the size of a company raises problems, so a suitable size indicator is discussed.

Within individual countries, a greater number of indicators have been defined for example size of profit, investments, individual types of capital, market share, production volume (Mucha et al. 2019). In practice, it is pointed out that, with the same number of employees, sales in the same sector may fluctuate considerably in individual companies. This may be due to differences in the order structure, but also to the quality of management, the size of capacities, capital and wage demands, or labor productivity. These differences will be even greater if they are classified according to different sectors (Koslakova et al. 2015). Over time, the number of employees began to be used as an indicator for the division of SMEs by size as well as for simplicity and compatibility. For practical reasons, the size of sales began to be used as a characteristic. In 1996, the European Union unified quantitative criteria for determining the size of small and medium-sized enterprises and defined them uniformly. As a quantitative upper limit, small and medium enterprises have less than 250 employees, annual turnover of up to 40 million EUR, may have a balance sheet of not more than EUR 27 million (Mittelman et al., 2016).

Within this classification they began to distinguish between the smallest or micro enterprises (1 to 9 employees), small businesses (10 to 49 employees), medium-sized enterprises (50 to 249 employees), large enterprises (more than 250 employees). Neither were these quantitative criteria definitive (Milošovičová et al., 2018). The definitions by quality characteristics are based on an explanation of the nature of the characteristics of SMEs. Small and medium-sized enterprises are the most important element of national economies.

- SMEs are highly adaptable to the marketing requirements of the market and especially to demand,
- SMEs have an innovative function,
- SMEs satisfy even the most demanding customer requirements, marketing strategy is applied,
- SMEs create new jobs and thus have a significant impact on employment developments. They are credited with many other positive characteristics.

According to Benesova et al. (2018) the particularities of the development of SMEs in our conditions are different in that small enterprises are created mainly by the progressive process of creation and growth of private ownership, while medium-sized enterprises are often created as a result of a decrease in the number and structural changes of state enterprises. Recently, they have also been created as a result of a qualitative transfer of sole traders as natural persons registered as entrepreneurs in the Commercial Register, or by transformation into companies. This is often the result of efforts to expand their activities. The development of SMEs is also related to the fact that increasing sales of consumer goods and services can be achieved by SMEs without major investments. In addition, they can exploit local sources of raw materials as well as large-scale waste (Mucha, 2019).

Marketing in small and medium enterprise and family businesses

According to Peráček et al. (2019), marketing is more than any area of business based on customer relationships. Creating customer value and satisfying customers and their needs and wishes is the real foundation of modern marketing thinking and practice. The goal of marketing is also to find new customers with the promise of gaining added value and retaining existing customers by satisfying their needs and at the same time generating profit (Srebalová et al. 2019). Customer satisfaction depends on the extent to which their desire or expectation is fulfilled. Successful businesses strive not only to meet customer expectations, but also to be pleasantly surprised. They also want the customer to be faithful to the business and repeat their purchase. In a marketing campaign, prudent businesses promise only what they can do. So that the customer is not disappointed. Vilčeková et al. (2018) does that, the customer expectations are based on previous experience with the business and its products, on the opinions of their friends, on the information of marketing specialists, competitors and their promises. It depends very much on how the customer's expectations are met by the company's products. If it is not possible, the company may lose the customer as well as potential customers. The quality of the product has an important place at the customer as well for Slovak people (Kubickova et al. 2018).

Quality also has a direct impact on product performance. It is closely connected with the customer and their expectations. Especially family businesses expect the customer to be of higher quality than non-family businesses (Nosková et al. 2017). The definition of quality is based on the assertion that the quality of the product starts with the customer's needs and ends with his satisfaction. The ultimate goal of all the current effort for absolute quality is to fully satisfy the customer's needs and wishes. In a broader marketing concept, a transaction is also relationship marketing between customers or business partners when certain conditions are set. In addition to short-term or one-off transactions, marketing specialists also need to establish long-term relationships with important customers, distributors, dealers, suppliers (Nosková and Peráček, 2019). They strive to establish strong economic and social ties through the promise of delivering high quality products at affordable prices. In addition to trying to win new customers and enter into individual transactions with them, the goal is also to win customers and enable them to grow with the business. To start a good relationship, the customer can provide exceptional added value. Marketing can be defined as a social and managerial process through which the needs of individuals and groups are met. The endeavor of the enterprise is a product. The product may be goods or services. The product is the result of an enterprise trying to produce something that will satisfy the customer. It can also be as follows: information, idea and experience.

For family businesses, the product is also added to the product. Added value, which can be as follows: tradition that delivers higher quality, family know-how, claim security and references of family members (eg advertising of the Austrian family business Rauch).

Everyone knows world-famous brands such as Monini, William Grant and Sons, Dr. Oetker Deichmann, Llyold, Raymond Weil, Tissot, Swarovski, Ford, Heinz, Lewis, Hilton, IKEA, Bata, Ferrero, Versace, Rauch and many others. They are family businesses, which have become widely known mainly because they have survived politically and economically for several generations, and have influenced both local and global markets significantly by operation and innovation. In many cases, they have entered history forever not only for business success, but often also for significant political and social influence (Majerčáková et al. 2016; Gahér et al. 2019). Many German family businesses have so far been confronted with their political past. It is not only for these reasons that family business deserves more attention. In particular, national governments should promote, through appropriate instruments, the creation of new and maintenance of existing family businesses and their sustainable development conditional on further education, a favorable business environment and available expert advice and tutoring. Supporting local small and medium-sized businesses has undeniable advantages for all interested groups, and the state will undoubtedly pay off (Adamišin et al., 2018). The economy is built by people who live in that country. Here they pay taxes, create jobs and build value. Regions are developing significantly, saving resources for various social programs, increasing the purchasing power of a wider population and, undoubtedly, education. There is a shrinking group of people out of work and hence crime. Not to mention the long-term sustainable development, the stability of the business environment and the loyalty of companies to their own country. After all, running a trade does

not necessarily mean a huge profit, but in many cases only an adequate amount of resources for a dignified and peaceful life. With reasonable state support, family businesses will not pack and leave when the tax holiday period expires or labor costs no longer create a competitive advantage (Koscielnak et al., 2017).

Marketing features of family enterprises, in general

In general, the marketing features of family businesses include product packaging as the main marketing support tool for sales. In addition to product protection, it has other features. Family businesses use it as a marketing tool. As reported by Benda-Prokeinova et al. (2017), as a general rule, shall place on the packaging:

- Handwritten signature of the founder of the family business (Monini, William Grant and Sons, Dr. Oetker)
- Year of incorporation (e.g. Seit / Since 1820) - the older the date, the more product quality and proficiency in production,
- Photograph of the founder or family members
- Family business logo - which has a long tradition.

Accordind to Petru et al. (2019) marketing in the period of development of internet and social networks. As a result of new technologies, businesses are undergoing vigorous changes. The Internet and social networking are bringing fundamental changes in relationships with customers or potential customers. New customer thinking also brings new changes in marketing communications. There are ongoing discussions about how much the Internet, for example, in-store sales will affect whether it will exist or not.

Marketing in small and medium-sized and family businesses

Many businesses use e-marketing to promote their products. Promoting sales via facebook, YouTube and Instagram or online sales is very popular (Grancay et al., 2015). Many businesses combine these marketing tools. Family businesses use selected tools to enhance their image and encourage the sale of their products:

1. facebook - appropriate response of the public and customers,
2. YouTube - advertising by family members,
3. own website - e.g. Dajana Rodriquez,
4. online advertising - banners,
5. television advertising.

Small and medium-sized enterprises as well as family businesses use a great deal of money for online advertising. Overall, the use of these tools can be called e-marketing, whose technological development is growing rapidly (Lazíková and Števček, 2012). New technologies have no limits, and the business can literally win customers from the other side of the globe. E-commerce is beneficial for both parties. It provides the buyer with convenience and privacy when buying and offers easier access to products and a wider choice (Kočišová et al. 2018; Anyim et al. 2018). Also, a wide range of information as well as a quick comparison of products, not just the company. According to Tomčík and Rosenlacher (2018) e-commerce is interactive, the customer has more control over the purchasing process. For the seller it is a powerful tool for creating customer relationships. Sales speed and efficiency are increased, and sales costs are reduced. It also provides greater flexibility and access to global markets.

Conclusion

This paper has a valuable contribution as it shows how the small and medium enterprises and family businesses use marketing theory in practice. With the development of the business process in Slovakia, the competitive environment is growing and businesses have to be distinguished from others. For this purpose, it is marketing and marketing communication. The use of marketing theory in practice is particularly important in family businesses, where they urgently need to use appropriate marketing communications when selling their products. Properly selected marketing communication tools can greatly help businesses to increase sales. Also in family businesses, customer satisfaction with their products is important, followed by the quality of the product and the subsequent customer loyalty to the products of the company.

The results of the research about family entrepreneurs in Slovak republic showed that the family companies at Slovak republic do not have a separate marketing department for financial reasons. All marketing activities are carried out by the owner himself and they often have no marketing theoretical basis. The solution is to focus on the existing foreign family businesses. However, at present, the economy is progressing and the market and customers have started to search for products of family businesses and it is a chance for these types of businesses to promote their product through various marketing communication tools.

Within the years 2018 and 2020 a marketing survey for family businesses was carried out at Slovak republic in cooperation with the EUBA Faculty of Business and Faculty of Management - Comenius University. These results are also based on this article. Scientific methods:

A questionnaire survey was carried out on a sample of 128 family businesses in Slovakia, including small and medium-sized enterprises, since the term family business is not defined in legislative. Publishing activity on marketing in family businesses is not almost generally developed, because it is still a new and unexplored form of entrepreneurship. The author of this article was the first author of the book Marketing in small, medium and family business in Slovak republic. Questions in the questionnaire were also open to multiple choice, focused on san and the use of marketing in family businesses in Slovakia. In Slovakia we do not have publishing activities related to family business, so we have taken all recommendations from foreign family businesses.

Wroclaw University of Economics and Business
Wroclaw, Poland
Email address: pawel.brusilo@ue.wroc.pl

Abstract

In this following paper, the author presents a review of composing contentions of New Structural Economics and a comparison with Polish *Strategy for the Responsible Development by 2020 (with 2030 perspective).* New Structural Economics is a modern economic development doctrine, which combines the postulates of neoclassical and structural economics. This theoretical model accentuate the importance of the role of public institutions in reshaping industries and turning hidden comparative advantages into competitive advantages. This paper aims to identify respective NSE assumptions in the most up to date Polish strategy of development. The discussed controversial strategy SRD 2020/2030 is supposed to make a significant contribution to Polish economic and social development as well as set priorities for public institutions for the coming years. The author, by using an analysis and criticism of available publications, literature and relevant statistical data reviews *Strategy for the Responsible Development,* evaluate its objectives and presents achievements in implementation of 'flag projects' over the period 2017-2019 with appropriate criticism.

Keywords

development, Poland, strategy, new structural economics

Introduction

"(…) New Structural Economics may be described as a new economic doctrine which points out the traps faced by developing countries as they gradually approach the status of developed countries. Even more importantly, NSE indicates solutions and methods enabling middle-income countries to overcome the difficulties inherent in this specific stage of growth and to really catch up with the wealthiest countries. Polish response to that doctrine is found in the form of the Strategy for Responsible Development."

~ Mateusz Morawiecki, Prime Minister of Poland, 2017

Polish economy is currently in a process of a rapid transition caused by various social and economic changes. From governmental perspective, one of the most important objectives is to set priorities for next years and accelerate country's catching up process towards much more developed economies (Poskrobko, 2012). The quotation above (from Polish Prime Minister's preface to one of NSE publications) clearly shows which doctrine was an inspiration to establish new roadmap for the future development in this country (Nowak, Lin 2017). This paper aims to provide significant information about *Strategy for Responsible Development by 2020 (with 2030 perspective)*, hereinafter referred as SRD 2020/2030, and the role of New Structural Economics in shaping Polish economic development in the coming years.

The paper is organised as follows. The first part develops the theoretical background for a better understanding of New Structural Economics assumptions. The next section discusses the methodological issues and data collection procedure used in the research. The third section provides analysis of SRD 2020/2030 postulates with its background and current, the most significant, achievements. The final part of the paper discusses the results and presents policy recommendations.

Literature review

New Structural Economics is a modern economic development doctrine, which combines the assumptions of well-known structural economics and neoclassical economics (Lin, 2012). It was founded and recounted, among others, by Professor Justin Yifu Lin – Dean of Institute for New Structural Economics at Peking University and former Chief Economist of the World Bank.
This economic strategy was designed to stimulate and accelerate the caching-up process of middle-income countries. The NSE postulates are based on these crucial assumptions. First of all, economic development is perceived as a process of constant structural change in the economy (Lin, 2011). The income and labour productivity is increased by technological innovations, while transaction costs are decreased by improvements in infrastructure (Bruno et al, 2015). The industrial and economic structure is endogenous regarding its endowment structure (Woźniak et al., 2018).

Secondly, the government has an important role in shaping economic development, mostly by seeking comparative advantages and - by using industrial policy - trying to turn them into competitive advantages (Nowak, Lin, 2017). Finally, a government of a middle-income country, ought to categorise the nation's sectors and industries: by their importance to the country's economy, distance to foreign developed economies, competitiveness and hidden comparative and competitive advantages. After the review, NSE also recommends various industrial or fiscal policies towards those industries and forms of governmental support, such as special economic zones, incubation programs, industrial parks, corporate income tax holidays or R&D grants (Lin, 2010). In the literature, we can find the description of specific types of economic development policies matching different kinds of industries (Nowak, Lin, 2017).
This crucial assumption is related with neoclassical economics theory of comparative costs and advantages which was widely presented and discussed by Krugman and Obstfeld (2018). Recommended by NSE dominant role of authorities in shaping economic development requires responsible and involved politicians with the ability to recognize comparative advantages and turn them into competitive advantages. This approach means that the success of middle-income countries is strictly related to introduced strategy and endowment of the national economy. The summary and review of industrial polices with matched industries is placed below.

Picture 1. 5 types of industries and matching industrial policies based on NSE assumptions. Source: Own elaboration based on: Lin J. Y., Nowak A. Z. (2017) New Structural Economics for less advanced countries. p. 16.Warsaw: University of Warsaw Faculty of Management Press.

Methods and data collection

This study seeks to make contribution, by addressing the following research questions: *What are the specific aims and expectations on a field of 'Reindustrialization' in SRD 2020/2030? How were the strategic industries chosen and what was the impact of NSE assumptions on this process? What are the 'flag projects' in SRD 2020/2030? What is a current progression in the implementation of SRD 2020/2030 on a field of 'Reindustrialisation'?* This study on *Strategy for Responsible Development* was conducted by using a textual criticism as well as analysis and comparison of available regulations, literature, reports and data about the projects included in SRD 2020/2030. Data used in the evaluation derives from sources like Central Statistical Office (GUS/ Statistics Poland), Eurostat, official publications of Council of Ministers (especially from former Ministry of Development and current counterparts), National Centre for Research and Development, European Commission "Innovation Union Scoreboard' (2004-2019) report and trade magazines.

Results and discussion

New Structural Economics was established less than ten years ago and has already gained popularity among economists and politicians across the world. Due to the fact, that this economic doctrine is devoted to middle-income countries (with a catching-up economy), Polish government, among others, decided to implement NSE postulates and follows its recommendations towards its industrial policy.

The Polish parliament, on the 14th of February 2017, passed a bill and officially introduced widely discussed and criticised *Strategy for Responsible Development by 2020 (with 2030 perspective).* SRD 2020/2030 constitutes the desire to accelerate the economic development, increase the standard of living in Poland, implement rules of sustainable economic growth and strengthen the Polish position within the European Union and global economy.

The government officials acknowledged the fact, that SRD 2020/2030 is also a response to challenges that Poland faces nowadays - such as economic inequality, climate crisis and demographic change, many times. SRD 2020/2030 is an attempt to implement NSE assumptions in a comprehensive

development strategy together with an analysis of the current situation of the Polish economy and society.

Such development strategy was necessary, mostly because Poland became a signatory to many international treaties and agreements, such as:

- *Transforming our world: the 2030 Agenda for Sustainable Development, 2015, United Nations,*
- *Europe 2020: the European Union strategy for growth and employment,*
- *European Union climate and energy package,*
- *European Council 2030 climate & energy framework,*
- *Paris agreement, 2015, United Nations.*

Implementation of the postulates, included in those treaties, required broaden and complex strategy of social and economic development based on eco-friendly solutions.

Regarding previous Polish development strategies, SRD 2020/2030 accentuates the most the role of central authorities in industrial development policy. Undoubtedly, Polish accession to the European Union in 2004 was one of the most important and strategic moments in modern history of this country.

Since that moment, Poland has achieved a lot in the field of economic convergence, mostly because of foreign direct investments, positive balance of foreign trade, access to the EU markets and structural funds, public sector investments, demographic and social changes as well as increase of Polish citizens' living standard.

Polish society and economy still have to lead the charge to adjust the difference to the top EU countries, mainly on a field of innovation . Annual reports, published by European Commission, called *European Innovation Scoreboard*, point out that Poland has nearly the lowest in the EU innovation rate every year. The 2019 results can be found below (Picture 2).

Picture 2. Innovation of EU member states in 2018. Source: European Innovation Scoreboard 2019, p. 7. Accessed online: www.ec.europa.eu (25.02.2020)

Strategy for Responsible Development by 2020 (with 2030 perspective) defines new vision and mission of Polish development, which should be based on several assumptions – stable public finances and spendings, a constant increasement of citizens' living standard, protection of the natural environment, as well as, concern to raise competitiveness of Polish enterprises. A significant part of SRD 2020/2030 was also devoted to equal redistribution of profits coming from economic growth to avoid social and territorial exclusion. Authors of the strategy point out six major 'development challenges' which may impact and inhibit potential economic growth (Picture 3).

Picture 3. Development challenges of Polish economy by 2030. Source: Own elaboration based on Strategy of Responsible Development by 2020 (with 2030 perspective)

SRD 2020/2030, not only diagnoses the external threats and challenges, but also aims to eradicate impediments to sustainable and responsible growth. Moreover, over last years, Polish enterprises have been basing their competitiveness on cost factors, such as low labour cost instead of high quality of goods or innovative products and services (Zdyb, 2018). To overcome the mentioned threats and challenges authors of the strategy established three main goals:

I. *Permanent economic and industrial growth based on knowledge, data and organizational perfection*

II. *Social development which is responsive and territorially sustainable*

III. *Effective public institutions which serve social inclusion*

Since the author of this paper is essentially focused on economic growth and development only the first general aim was considered during the analysis because it includes specific goals titled: *Reindustrialization, development of innovative enterprises and small and medium enterprises* (SRD).

Role of New Structural Economics in reindustrialization in Poland by 2030

New Structural Economics advices the authorities to discover hidden comparative advantages within national sectors and implement specific strategies to turn them into competitive advantages. Authors of the strategy made a review of Polish current economic situation and a selection of twelve trades and industries which may become crucial for future development or are strategically important at the moment. Those twelve areas of operation were developed into flagship programmes, which are supposed to be the 'game changers' in the national economy (Table 1.)

FLAG PROJECTS AND EXAMPLE OF NSE IMPLEMENTATION in STRATEGY FOR RESPONSIBLE DEVELOPMENT BY 2020 (WITH 2030 PERSPECTIVE)

NAME OF THE FLAG PROJECT	PROJECT BRIEF SUMMARY	TYPE OF THE INDUSTRY REGARDING NSE ASSUMPTIONS	REMARKS RELATED WITH CURRENT IMPLEMENTATION (2019)
POLISH MEDICAL PRODUCTS AND PHARMACEUTICALS	Development of this sector combined with grants and subsidies for innovative R&D projects mainly related to 3D tissue printing, constructing medical robots, devices supporting people with disabilities	'Catching up industry', with very strong potential because of leading pharmaceutical companies such as Polpharma, TZMO and Aflofarm.	The main activity in this field is related to Polish Pharmaceutical Policy (introduced in 2018).
TELEMEDICINE	Support for projects which combine medicine and IT solutions in the diagnostic treatment process.	'Catching up industry' Currently, there is no sufficient infrastructure and leading firms	16,3 million EUR – the budget for the project – covers introducing 7 new procedures of telemedicine – for example - in cardiology, diabetology, palliative care, geriatrics and psychiatry.
CENTRE FOR BIOTECHNOLOGICAL DEVELOPMENT	The project which focuses on development of new genetic pharmaceuticals and process of their commercialization. Authorities plan to develop existing research centres and establish new institutions in this field and also increase the value of public procurements.	'Leading Edge Industries', Polish companies may become frontiers in this rapidly growing field.	Four types of support: · Bio-med R&D grant (up to 40 mln EUR), · INNOMED Program (subsidies up to 2 mln EUR), · 0% CIT within *Special Economic Zones,* · 0% property tax for biomedical companies.
POLISH FURNITURE	Support for Polish furniture producers who offer modern design and high quality products.	'Catching up industry', in this field Poland potentially has a hidden comparative advantage due to low labour cost and high quality of exported products.	*Polish-Design Furniture* Program – a diverse and complex programme promoting export and supporting creative and innovative companies.
LUXTORPEDA 2.0	The project named after Polish high-speed train from 1930's, which is a complex program of railway infrastructure improvement and modern high-speed trains production.	'Corner overtaking' industries, Polish high-speed trains industry has a potential but requires significant governmental support	Established in 2017 business cluster "Forum for Responsible Development – Luxtorpeda 2.0'. Program INNO-PKP together with National Centre of Research and Development (NCBiR) - public procurements of 80 high-speed trains, modernization of 9000 km railway and 230 smaller projects (by 2019) (Madrjas, 2018)

E-BUS	Enhancement of the usage of electric public vehicles in Polish cities.	'Catching up industry' with hidden comparative advantage because of a very high number of Li-Io batteries production and strong local companies like IKARIUS.	Polish E-BUS Consortium together with NCBiR, established in 2018, aims to produce 1000 electric buses for public transportation by 2023 for Polish cities.
ELECTRIC CAR	Similar to the previous project, but in this case, the purpose is to increase the number of electric vehicles on Polish roads and accessibility to the infrastructure such as public chargers.	'Catching up industry'. Very challenging because there is no Polish electric car producer. Poland also has almost the lowest number of such cars 'on the roads' in the EU and poor infrastructure in this matter.	Initially, one million electric cars were supposed to be produced by 2020, but neither new producers appeared, nor the number of cars significantly increased. Government from 2020 only offers 30% public subsidy for new electric cars (original retail price cannot exceed 29 000 EUR).
CYBER-PARK CENTRE	The project postulates opening new national centre with mainly IT technologies, which might be developed in a field of cyber-defence.	'Strategic' industry which is marked up with high importance for national cyber-defence.	Established in 2017 CYBER-PARK ENIGMA – the project developing solutions in fields such as Internet of Things (5G), Industry 4.0 and Artificial Intelligence.
ŻWIRKO I WIGURA	Project named after two Polish aviation pioneers from the beginning of XX century, which aims to encourage and support the aeronautic industry - mostly drones and unmanned planes.	'Catching up industry', but the project also aims to adjust the law and regulations to increasing usage of drones in the Polish aerospace.	In 2018, NCBiR established project INNOSBZ (Innovative Drones and Unmanned Planes) with R&D subsidies. National air traffic control and landing system for drones are in the hopper.
BATORY	An attempt to stimulate the growth of yachting and innovative ferry industry (Batory was first Polish transatlantic liner).	'Comparative advantage-losing industry'. This sector used to be very competitive, but due to structural change its importance has decreased.	The aim fulfilled by four main projects: · Building proms and ferries by Polish Marine Cluster, · INNOship (Smart Ship Technologies), · I-Offshore (Innovative offshore platform), · Ship scrapping/Ship recycling.
INTELLIGENT MINING SYSTEM	Supporting a development of enterprises producing mining machinery and modern coordinating systems.	'Comparative advantage-losing industry'. Despite the international agreements and EU decarbonization process, the Polish government aims to increase the lost competitiveness of the mining industry.	3.99 billion PLN (nearly 1 billion EUR) budget of the project will be spent on modernization and development of security and coordination systems in Polish mines mostly in Silesia region.
ECO-FRIENDLY CONSTRUCTION INDUSTRY	The project aims to put more eco-friendly or energy-efficient constructions on the map.	'Corner overtaking' industry (constructing zero-emission buildings and log houses)	Ministry of Environment constituted Polish Wooden Houses Co-partnership which works on the popularisation of this building construction technology.

Table 1. Flag projects of Strategy for Responsible Development 2020 (with 2030 perspective). Source: Own elaboration based on SRD 2020/2030 and relevant publications.

As shown in table 1, SRD 2020/2030 projects are related to very diverse sectors of the Polish economy. Despite those twelve flag programs, there are also 173 strategic projects which fortify SRD 2020/2030 with varied actions and efforts to achieve the objectives. Indubitably, a substantial amount of money and resources is required to conduct such complex operations. The government assumed that between 2016 and 2020 public sector will channel nearly 1 494,5 billion PLN (346,8 billion EUR) to projects related to SRD 2020/2030. Regarding the tentative calculation placed in the strategy, resources are supposed to come from: local and regional authorities (33,98%), European Union funds and programmes (15,81%), national budget (43,04%) and Polish Development Fund (7,17%). However, authors of the SRD 2020/2030 plan to attract the attention of the private sector and convince individual entrepreneurs and institutions from the financial sector to spend on those projects 670 billion PLN (155,45 billion EUR) by 2020. Initial analysis of the projects shows that the strategy is a very complex program that aims to develop crucial sectors of the Polish economy (Ryć, 2017). Closer studies on specific flag and strategic projects (which are supposed to lead up to a significant shift in an economic and social situation in Poland) show that each of them is modelled on New Structural assumptions. The actions planned within the SRD 2020/2030 projects correspond to postulates related to mentioned in the introduction six categories of catching-up sectors/industries.

(…) This strategy slipped past the fact that the most important development barrier is a significantly low rate of private savings (it is a very unpopular opinion in Polish society which foregrounds individual consumerist aspirations even on account). The strategy also omits another problem – how much very low tendency of Polish enterprises to internationalize and be innovative is caused by low social capital, lack of ability to cooperate and teamwork? (…)

~ Professor Witold Orłowski
Opinion about SRD, National Development Council

The review of specific actions within each flag programme shows that industrial policies were allocated correctly to each industry. Authors of the strategy emphasise the fact that the chosen sectors are not only playing a key role in future Polish economic and social development but, first of all, may turn hidden comparative advantages into competitive advantages. SRD 2020/2030, matching categories and implemented industrial policy are shown in the table above.

Since the first presentation of SRD 2020/2030 initial conception in 2016 Deputy Prime Minister Mateusz Morawiecki (current Prime Minister) in Ministry of Development has been facing dissenting voices and criticism from entrepreneurs, representants of local governments, academic society and even National Development Council in Office of the President of the Republic of Poland. This council was raising the voice against the strategy mostly in the field of shortcomings in the legislative standards and missing essential required elements such as lack of so-called roadmap with described milestones (referencing to the Parliament regulation from 2006 - *About a development strategy conduction*) Regarding the legitimatise criticism related with a form of the strategy, experts raise the fact that statutory law from 2006 established legal requirements for strategies on the national, sectoral and regional level, so those missing sections undermine SRD 2020/2030 credibility.

(…) The objectives of the Strategy for Responsible Development largely respond to the needs existing at the current stage of Poland's development. Its main goal is to create conditions for increasing Poles' incomes while improving social, economic and territorial cohesion. The effects of the implementation of the new idea of Poland's socio-economic development will be possible to asses after several years of implementation (…)

~ Professor Alojzy Z. Nowak
'New Structural Economics and dilemmas of the economic development', University of Warsaw, 2017

Council emphasise that the goals and strategic catching-up sectors are undoubtedly defined properly but the description of the individual projects (including flag projects) is not sufficiently elaborated, which may cause problems with implementation. Last but not least, arguments raised by the National Development Council state that such tremendous planned resources require much more comprehensive arrangements and description (i.e. with an explanation of how local authorities will be able to cover one-third of public spendings on SRD 2020/2030). Experts from Polish Economic Association also criticised the lack of adjustment to European Union directives related with decarbonisation of the economy, decrease of green-house gases emission and protection of the natural environment (Bukowski, Olko, Stefanowicz, 2016). The next argument of PEA against the strategy is considerably fundamental – there is no cost-benefit analysis in SRD 2020/2030 which is a substantial element of every strategy. Such studies might clearly present what are the project future cash flows or net benefits. Despite these concerns, some economics tried to show potential befits of SRD 2020/2030 implementation. All those arguments mentioned above make an evaluation of SRD 2020/2030 complex. However, some of the statistical data show that possibly the strategy has a positive impact already – between 2015 and 2018 the adjusted gross disposable income of households per capita in PPS in Poland increased from 15,135 up to 16,251 (Eurostat). On one hand, this document does not face critical requirements of a legal definition of 'strategy' due to missing parts, but despite this - thesis and goals are correctly formulated and their implementation may accelerate Polish economic development. The following results of my research show, that implementation of the strategy after nearly four years is neither effective, nor successful.

Conclusions

Conducted research and analysis proved that New Structural Economics was instrumental in the process of shaping postulates of Polish Strategy for Responsible Development by 2020 (with 2030 perspective). Authors of SRD 2020/2030 had not only accurately chosen significant industries, but also allocated suitable policies and actions relevant to NSE assumptions. Evaluation of 'flag projects' and the strategy itself was important because this document and current central authorities shape future conditions in Poland – but is it the best path or go-to option? Changes in economic and social structure are incredibly important, but to implement any distinct improvements, Polish situation requires an effective, authentic leaders and a complex, refined strategy.

The assumptions of New Structural Economics are undoubtedly an interesting point of view at the development of less advanced countries and catching-up economies. An example of SRD 2020/2030 shows that the implementation of them is possible in countries like Poland. What clearly brings out from the study is the fact that the theoretical background of the strategy is absolutely correct, while the problem lies with thesis deployment and implementation of investments. I hope that the

results of my research may shed some light on the matter of SRD 2020/2030 and the role of New Structural Economics in shaping middle-income countries, such as Poland.

Acknowledgments

The publication of the research results is financially supported by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" INTEREKON 2019 – 2022, project number 015/RID/2018/19 (total programme funding amount: 10 721 040,00 PLN) and thanks to Wroclaw University of Economics and Business.

Atmosphere at The Point of Sale as A Marketing Instrument Affecting Women's Purchasing Decisions

Anna MURAWSKA

UTP University of Science and Technology in Bydgoszcz, Faculty of Management,
Department of Economics and Marketing, Bydgoszcz, Poland
anna.murawska@utp.edu.pl

Abstract

Atmosphere of the point of sale is one of the factors that shape the image of a store and affect customers' purchasing decisions. Properly designed atmospherics at the point of sale arouse buyers' specific feelings and behaviours and increase the probability of making purchases by visitors to the space in question. In practice, buying decisions are made by women and men alike; however, it is women who have dominated the area of shopping within all branches of trade. Adjusting marketing activities to the specificity of women's behaviours during shopping may be key to the success of trading companies. Therefore, the objective of this study was to discover women's opinions on elements of point-of-sale atmospherics and their role in purchasing decision-making. The study was conducted as an opinion poll using a questionnaire on a group of women selected by quota sampling. This pilot study has led to a number of conclusions. A majority of the surveyed women were of the opinion that the impact of gender on purchasing decisions is significant. At the same time, women are relatively more likely to fulfil the role of decision-maker in a household than men. When making purchasing decisions, women pay attention to appearance of the point of sale, and specifically to its atmosphere. Of special import for women are visual and olfactory sensations. The results also indicate that the atmosphere at the point of sale plays a significant role during women's purchasing decision-making.

Keywords: Purchasing Decisions, Women, Atmosphere, Point of Sale, Marketing

Introduction

Research on consumer behaviour and on buying decisions made by consumers entails observation of the impact of a variety of determining factors, which may be classified as internal or external. Among internal factors, of note are psychological, demographic, and economic factors. The literature on the subject often emphasises a significant influence of demographic factors, identified as age, education, lifestyle, family lifecycle stage, and gender, which predisposes to strictly specified market behaviours (Bashar, Ahmad & Wasiq, 2013) (Kumar, 2014). External factors may be subdivided into macroeconomic, microeconomic, socio-cultural, and environmental factors. The strongest influence during purchase has been indicated to be exerted by price, product quality, product offer, promotional activities, shopping location and comfort, appearance of the point of sale, in particular the atmosphere in the store, and informal communication (Kaczmarczyk, 2011) (Rudnicki, 2012) (Kieżel, 2012).

While making purchasing decisions, consumers pay attention to appearance of the point of sale, store surroundings, image of the point of sale, and display of goods; these aspects are analysed by means of visual merchandising known as point-of-sale marketing, which focuses on arrangement and atmospherics of spaces (Kotler, 1973-1974) (Bitner, 1992) (Turley & Milliman, 2000) (Witek, 2006) (Zalewska, 2014) (Binsztok & Zuzański, 2013) (Gigoła, 2013) (Grzybowska-Brzezińska & Rudzewicz, 2013). Consumers tend to evaluate point-of-sale atmosphere by looking at characteristics of the space in question, namely categories such as the interior and its layout, aesthetics, style, image, unproblematic spatial orientation, room and stand organisation, equipment, lighting, cleanliness, temperature, ventilation, display of goods, interior decoration, so-called props, technical devices, or employees' clothing (Gieracz 2011) (Rudnicki, 2012). Point-of-sale atmosphere falls within the range of issues connected with aesthetics in marketing (Schmitt & Simonson, 1997). Point-of-sale atmosphere, conveyed to customers through vision, hearing, sense of touch and smell, is aimed at

evoking emotions which, in consequence, are supposed to trigger consumer's responses anticipated by the company (Verhoef et al., 2009). (Bas, 2015). Aesthetic appearance of the store, the music, and the smell have an impact on how long customers will stay at the point of sale and whether or not they are going to come back (Kotler, 1973-1974). Influence of point-of-sale atmosphere on customers is an attempt to interfere with the subconscious and with the emotional condition of customers in order to engender conditions conducive to making a purchasing decision (Bałoń, 2011) (Bohl, 2012)

On one hand, the course of customer's decision-making process may result from the atmosphere present in the store but on the other hand, it may result from gender character (Jerzakowska-Synoradzka, 2010), (Piotrowska, 2011) (Małysa-Kaleta, 2012) (Das, 2014). These differences pertain to, *inter alia*, time spent on individual actions during shopping, such as comparison of alternatives, choosing from many options, interval between first touching the product and completing the purchase, time devoted to shopping for individual categories of goods (Jurowczyk 2013) (Gender Factor, 2015). Differences in behaviour between women and men may be explained based on functional analysis of the left and right brain hemisphere, both of which are responsible for diverse components of the thinking process. While the left hemisphere identifies details, the right hemisphere perceives the whole and so it is holistic. Right hemisphere function is connected with intuitions and instincts, concentrated on emotionality, whereas left hemisphere function is geared toward logical, analytical, precise thinking. The right hemisphere is more active in performance of tasks that require imagination and visualisation, where colours, music, forms, metaphors, and analogies are being perceived (Pawlikowska & Poleszak 2011). Research shows that men's brains operate in a concentrated, localised manner, which means that a specialised brain area is responsible for a given task; however, in women this operation is more dispersed, integrating and combining areas responsible for different functions. Thereby, women are inclined towards holistic thinking combining more details from fundamentally different sources (Barletta, 2006) (Cunningham & Roberts, 2012). In case of women, senses such as vision, touch, hearing, taste, or smell function with greater intensity than in men (Elliot & Maier, 2014) (Bohl, 2012) (Piprek, 2016). Women receive and recognise diverse sensory information better than men perceive entire spectra of signals and, additionally, women are more capable of combining them and drawing conclusions from them, and of integrating information from various sources (Moir & Jessel, 2014). Women often rely on experiential motivations and sensory qualities when making purchasing decisions. This is associated with their view of shopping as an activity that is supposed to give pleasure (Cebula, 2016).

Development of women's market is currently one of the most recent trends occurring in societies and economies of various countries, especially given the increasing role of the service sector and women's growing wealth (Silverstein & Sayre, 2009). Research shows that the greater the decision-making and purchasing power of women, the greater the economic success of the country (Rosin 2010). Women have had and will have a significant impact on changes in trade and marketing, reflecting their lifestyle and preference trends (Underhill, 2007). Nevertheless, even if manufacturers and service providers address their offer to women, they are still doing it ineffectively in terms of developing the product presented to women itself and in terms of successful marketing activities.

Method

The objective of this study was to discover women's opinions on elements of point-of-sale atmospherics and their role in purchasing decision-making in various types of shops. In addition, the study attempted to gather information on the effects of gender on purchasing decisions, women's role as decision-makers in households and their paying attention to the image of shopping venues, and particularly the role of atmosphere and its individual features. The paper employs two research methods – desk research and survey. Following completion of a literature review and analysis of secondary-source information, a survey was conducted to obtain primary data. The survey, which has been pilot in nature, was conducted in 2019 among 150 women in the city of Bydgoszcz located in the Kuyavia-Pomerania Province, Poland. The survey was conducted as an opinion poll using a questionnaire on a quasi-representative sample selected by quota sampling. The questionnaire included 13 substantive questions and 5 questions on the women's socio-demographic characteristics. A five-level Likert scale was used in questions where the respondents were supposed to provide a

value judgment. The survey was conducted with the use of the PAPI method and analyses were performed in Microsoft Excel and STATISTICA.

Results

Evaluation of elements creating the atmosphere at the point of sale as a marketing instrument affecting purchasing decisions was studied among women. Out of the sample of 150 surveyed respondents, the majority were women living in a city (63.3%), within the working age group (70.0%) and employed (56.0%), with secondary (36.0%) and higher education (28.0%), with household net income per capita within the range of PLN 1,001-2,500 (48.0%).

Results of the study reveal that shopping is the domain of women, as 68.0% confirmed that they fulfil the role of decision-maker in their household. The majority of the surveyed women (88.0%) were of the opinion that gender is a factor that has an effect on consumer behaviour and purchasing decisions. Most of the surveyed women represent the model female style of making shopping decisions. The overwhelming majority of respondents claimed that, when shopping, they are relying on sensory qualities and experiential motivations (95.3%), imagine ways of using the product in daily life (92.7%), are submitting to emotions (90.7%), and are taking a number of detailed features of the product into consideration instead of just the basic elements (89.3%). For most of the surveyed women (88.7%), shopping is a way of spending their free time, a leisure and recreational activity, and something that gives pleasure.

While making purchasing decisions, women pay attention to characteristics of the point of sale. This opinion has been confirmed by 82.0% of the women participating in the study. Among individual categories characterising a point of sale, attributes of the offered products received the highest rating from the respondents, followed by point-of-sale atmosphere, personnel, convenience and comfort of shopping. Features such as location, opinion, and reputation of the point of sale received lower ratings.

A vast majority of the respondents agreed that atmosphere at the point of sale affects their purchasing decisions; thus, it can be recognised as a marketing instrument of influence. The women were usually expressing the opinion that the atmosphere may affect the duration of their stay in the store and evaluation of the quality of products and service, that it improves satisfaction from shopping and the likelihood of purchasing any product at all or a product in larger quantities. Such are the indirect or direct effects of the influence of atmosphere at the point of sale. This instrument also aroused interest in the offer and affected women's perception of the store, its offered products as well as remembering and recognition of the point of sale in question.

Point-of-sale atmosphere may constitute an element directly triggering consumer response. Such perception of atmosphere was indicated by 31.3% of the surveyed respondents. In such an event, the atmosphere is a situational factor which convinces the consumer, in a peculiar way, to make a purchase. The atmosphere may also uniquely serve the purpose of conveying information, communication to consumers. The point of sale may be sending a message, communicating something. It may also suggest the addressee of the offer and help consumers recognise distinguishing features. Perception of the point-of-sale atmosphere as a carrier of information was indicated by the smallest group of surveyed respondents – 23.3%. Thirdly, the atmosphere may constitute an element directly triggering a response – this answer was chosen by 45.3% of the surveyed women. From this viewpoint, the atmosphere is a situational factor convincing women, in a peculiar way, to make purchasing decisions (Fig. 1).

Fig. 1: Perception of the impact of point-of-sale atmosphere on women's purchasing decisions [%]

Source: author's own study

In their evaluation of atmosphere at the point of sale, women make use of their vision, hearing, sense of smell or touch yielding visual, auditory, olfactory, or tactile sensations. The strongest impact on purchasing decisions was exerted by visual sensations (grade 4.48 on a five-grade scale), followed by olfactory sensations (4.15), auditory sensations (3.41), and finally tactile sensations (2.97). Degree of impact of visual sensations subsides with women's age. The older the respondents, the less susceptible they are to the influence of this component of atmosphere.

Fig. 1: Women's perception of elements creating the point-of-sale atmosphere as confronted with the influence of these elements on their purchasing decisions

Source: author's own study

Among the elements shaping the point-of-sale atmosphere, women most often perceive the visual way of presenting goods, aesthetics and interior decoration, store style and image as well as the colour scheme. They also take note of items such as mood, music volume and intensity, and odour intensity. However, in their opinion, visual way of presenting goods as well as music and smell intensity are the only elements affecting their purchasing decisions. Such elements of atmosphere as lighting, physical equipment, and room layout are perceived by women less frequently. Similarly, these components of atmospherics also affect women's purchasing decisions less often.

Conclusion

This study has shown that point-of-sale atmosphere is important to women and may be used as a marketing instrument of impact on women. While shopping, women pay particular attention to the visual way of presenting goods, aesthetics, interior decoration and colour scheme as well as style and

image of the shop. Well-kept and aesthetic points of sale give women the feeling of comfort and good mood. As women instinctively evaluate their environment, emotions related to this environment translate into behaviours that are positive or negative from the viewpoint of the company. It has been revealed that elements often neglected by companies help women assess the situation and make a purchasing decision. Information on the impact of elements creating an atmosphere at the point of sale on consumers' purchasing decisions may be used in the process of marketing planning and implementation. This knowledge may be applied to actions related to the product itself and used in the context of marketing communication and creating point-of-sale image. A study concerned with the impact of elements creating an atmosphere at the point of sale on purchasing decisions of both women and men on a representative sample of respondents has been planned for 2020.

E-mail: tomasz.grodzicki@umk.pl

Abstract

The Visegrad Group is an alliance of the four Central European countries: the Czech Republic, Hungary, Poland and Slovakia. One of the main aims of Visegrad Group is to advance economic cooperation. This paper is to analyze selected economic conditions of the Visegrad countries: sectors and structures of economies, economic growth, international trade. The pace of economic growth is higher than the EU average. However, one should note that they are still in the catching-up process with the EU average in terms of economic performance measured by GDP per capita. Concerning international trade, over 70 % of the Visegrad countries' trade is done with the EU countries. Germany remains as the top trading partner for the Visegrad countries with a share of at least 19 % of total trade for each Visegrad economy. It seems that the trade potential within the Visegrad Group has not been fully used. The Visegrad countries shall use their alliance in the form of the Visegrad Group to further enhance their economic cooperation resulting in the higher level of their economic growth.

Keywords: the Visegrad countries (V4), economic growth, international trade

JELcodes: F43, F15, F63.

An Overview of The Visegrad Economies: Sectors and Structure

The Visegrad Group was initially named as the Visegrad Triangle. It was established in 1991 by three Central European countries: Czechoslovakia, Poland and Hungary. Since 1993 as a result of the break-up of Czechoslovakia, the Czech Republic and Slovakia became members of the Visegrad Triangle so that it changed its name to the Visegrad Group. The main aim of the Group was cooperation with the European Union and NATO in the perspective of joining into their structures. Since this aim was accomplished, now this group is working on the following activities implemented through financial support for promotion and development: cultural cooperation, scientific exchange, research and cooperation in the field of education, youth exchanges, cross-border cooperation, and tourism. The Visegrad Group works closely for the purposes of developing cultural, economic, energy and military cooperation.

The analysis starts with describing economic sectors of the Visegrad countries (table 1). Services are the dominant sector of the Visegrad economies according to value added, then industry and finally agriculture in the analysed countries and groups of countries. The value of services in the Visegrad countries reached a similar level between 54.2 and 56.1 % of GDP, while the EU average was 66.0 % of GDP in 2017. In industry, the disparities were greater than 26.4 % in Hungary to 33,5 % in the Czech Republic, while the EU average was 22 % of GDP in 2017. Agriculture reached 2.2 % in the Czech Republic to 3.3 % in Hungary and Slovakia, with the EU average of 1.5 % of GDP in 2017.

Table 1: Economic sectors by value added as a share of GDP in the Visegrad countries against the background of the EU and the World

	Agriculture	Industry	Services
	% GDP	% GDP	% GDP
	2017	2017	2017
World	3,5*	25,4*	65,0*
EU	1,5	21,9	66,0
The Czech Rep.	2,2	33,5	54,2
Poland	2,8	28,9	56,1
Slovakia	3,3	31,0	55,9
Hungary	3,3	26,4	54,9

*Explanation: * - data from 2016 due to a lack of data from 2017.*
Source: Own study based on data from the World Bank

Figure 1 shows in detail the individual share of certain economic activities in the total gross value added (GVA) output method. Industry, including energy, has a dominant share in each of the Visegrad countries, it amounted to less than 32 % of the total value added in the Czech Republic in 2017, in other countries it was at the level of 26 - 27 %. Then the ranking included trade, transport and catering services. In Poland it was of the greatest importance - only 0.8 % smaller than industry, then in Slovakia with a little over 20 % of GVA and in other countries with over 18 % of GVA. The third largest activity is public administration, defense, education, health and social work with a two-digit share within the range of 14.5 - 17.5 % of the total gross value added in the Visegrad countries. Other activities accounted for less than 10 % of the total GVA in 2017.

Source: Own study based on data from OECD (2018)

Economic Growth of The Visegrad Countries

In terms of GDP expressed in USD billion (table 2), the Visegrad countries are above average compared to neighboring countries. The Visegrad Group is mostly surrounded by the countries of Central and Eastern Europe, most of them have a lower GDP than the Visegrad countries. Therefore, the V4 should

be compared to neighboring countries of Western Europe, namely Austria and Germany. Austria's GDP is lower than Poland's, at least due to the fact that the Polish population is more than 4 times higher than the Austrian population. In contrast, the Czech Republic and Hungary, despite their larger population, have a much lower GDP compared to Austria. Considering Austria's GDP and its population, it should be noted that in this respect they are using human capital much better to fuel economic growth. There is a concept of the quality of human capital, which, among others confirms that there is a positive relationship between education and economic growth (Altinok 2007; Castelló-Climent 2019; Hanushek and Woessmann 2015). In addition, Kubík (2013) notes that years of education have a greater positive impact on economic growth in countries with higher quality education. It is worth noting that the total GDP of the Visegrad Group is over 3.5 times lower than Germany's GDP and it accounts for around 5.6% of the European Union's GDP. Among the Visegrad countries, Poland has the largest GDP value of over USD 0.5 billion, which is also the largest country in terms of population, followed by the Czech Republic, Hungary and finally Slovakia. From a practical point of view, the strength of the economy is, among others its human capital, which effectively managed contributes to economic growth (Barro 1999). The Visegrad countries do have potential in human capital but the question is if they use it in the most efficient way. It seems that they need to work on that as well (Grodzicki 2018).

To compare economies, GDP per capita is used. It allows comparing the condition of the economy in relation to the number of inhabitants. In terms of GDP per capita according to exchange rates (table 2), the Visegrad countries do not perform as impressive compared to their neighbors from Central and Eastern Europe as in the previous statistics. In the Visegrad Group alone, the Czech Republic was ahead in terms of GDP per capita according to exchange rates with a result of over USD 20,000 followed by Slovakia, Hungary and Poland, which was lagging behind with a value of just over USD 13,800 in 2017. Among the countries included in the table, Austria was the best in this statistic with a score of over 47,000. USD, before Germany (over USD 44,000) and Slovenia (over USD 23,000) in 2017. It should be emphasized that the value of this statistics for the EU is over USD 33,000 which indicates that the Visegrad countries still have a lot of work to do to catch up with the EU average.

The last group of indicators in Table 2 are data on GDP and GDP per capita by purchasing power parity (PPP). Due to the fact that the average level of market prices in the countries of Central and Eastern Europe is lower than in Western Europe, the Visegrad countries and their eastern neighbors perform much better in this indicator. According to this statistics, the Visegrad Group generated GDP of Int $ 1,934 billion in 2017, which accounted for about 9.2 % of the European Union's GDP and about 46.2 % of Germany's GDP. The order of the Visegrad countries according to the value of PPP GDP is the same as for GDP according to exchange rates, but what is important, the proportions of values for individual countries were different. GDP according to exchange rates for Poland, the Czech Republic, Hungary and Slovakia accounted for: 3.0 %, 1.2 % 0.8 % and 0.6 % of EU GDP, respectively, while according to PPP, in the same order: 5.2 % , 1.8 %, 1.3 % and 0.8 % of EU GDP. The situation is similar with GDP per capita according to PPP, the Visegrad countries were relatively better than relative to GDP per capita at exchange rates. However, there was a slight difference that after the Czech Republic (over Int $ 36,000) and Slovakia, Poland is ahead of Hungary (over Int $ 28,000), and not after Hungary, as it was the case with GDP per capita statistics at exchange rates. The distance between individual Visegrad countries and the EU, with a value of GDP per capita PPP over 41 Int $, was smaller than in the case of GDP per capita at exchange rates.

Table 2: Area, population and GDP of the Visegrad Group and neighboring countries in 2017

The economic growth rate in the Visegrad countries in 2013 - 2017 was higher than the EU average (except for the Czech economy in 2013). In 2017, Poland achieved the highest economic growth rate of 4.81 %, the Czech Republic also achieved over 4 % economic growth, Hungary less than 4 % and Slovakia 3.40 %.

Table 3: Economic growth in the Visegrad countries, the EU and the World

Apart from the undoubted advantages of using GDP as an indicator of economic growth and development, there are many words of criticism. The so-called Stiglitz report, which addresses many of the shortcomings and weaknesses of GDP as an indicator such as: it does not consider the degree of depreciation of capital goods, there is no estimated value of public goods such as education and health care, it does not consider the state of the environment and the degree of its pollution and degradation as well as the exploitation of natural resources, it does not include the quality and standard of living of society (E. Stiglitz et al. 2009). Therefore, Ivanová and Masárová (2018) assess the Visegrad economies using three alternative measures that supplement GDP: Human Development Index (HDI),

Global Competitiveness Index (GCI) and the Index of Economic Freedom (IEF). However, none of the above-mentioned indexes are perfect. HDI has been criticized for its components and structure (Noorbakhsh 1998; Chowdhury and Squire 2006; Kelley 1991) and the fact that it does not take into consideration a global perspective but it is limited only to national rankings (Sagar and Najam 1998). Global Competitiveness Index has also been questioned due to its methodology because it assumes that markets are efficient and does not consider the role which government plays in favoring particular activities over other (Lall 2001; Bhawsar and Chattopadhyay 2015). It has also been argued that IEF does not rely on true assumption. Sachs (2006) has proved that there is no correlation between a country IEF's ratings and its GDP. It means that economic openness does not necessarily result in better growth. Moreover, Karlsson (2005) also questions the IEF's methodological issues: what should be included in the index (how *economic freedom* is defined) and the way how the weights are assigned.

International Trade of the Visegrad Countries

The V4 during transformation in the 1990s started to open their economies. Due to the fact that the geographical distance to the European Community countries was rather small, trade was also becoming quite intense. Bröcker (1998) underlines that economic integration reduces barriers to trade between countries. As the European integration process continued, the trade relations were gradually increasing with and within the EU (Toporowski 2017). The advantage of the old EU member states was production of capital-intensive goods whereas the V4 mainly produced labour-intensive goods, and that was their point of departure when starting economies opening process (Kawecka-Wyrzykowska 2009). As from the 1990s, in the V4 a technological gap was notable and the level of industrialization was rather high (Aturupane et al. 1999).

This paper focuses on the trade analysis from perspective of years: 2007 and 2017. Table 3 presents data on foreign trade of the Visegrad countries in comparison to the EU and the World in 2007 and 2017. Among the Visegrad countries, the Czech Republic and Hungary obtained a positive trade balance three years after joining the European Union - in 2007. It seems surprising that in 2017 all Visegrad countries achieved a positive trade balance. Imports of the Visegrad Group accounted for about 7.3 % and 8.5 % of EU ones, while exports about 7.0 % and 8.4 %, respectively in 2007 and 2017. Thus, the share of both imports and exports of the Visegrad Group in EU's imports and exports increased after ten years. The indicator of the share of exports in GDP is an important measure of the openness of the economy. In the analyzed period, the share of exports in GDP increased in the Visegrad coutries. In 2017, the highest value of this indicator was recorded in Slovakia (96.3 % in exports and 92.9 % in imports), followed by Hungary (82.3 % in imports and 90.1 % in exports), the Czech Republic (respectively 72.2% and 79.5 %) and finally Poland (49.4 % in imports and 53.4 % in exports).

Thanks to the EU single market, the European countries are the most important partners for the Visegrad countries. It is worth noting that all Visegrad countries had over 70 % share of imports and exports in EU imports and exports in 2017. The most related EU country in terms of imports in 2007 was the Czech Republic with over 80 % share, while Slovakia was in relation to exports with over 87 % share. Ten years later, Slovakia out of V4 had the highest share of both imports and exports in EU imports and exports, respectively 79.8 % and 85.7 %.

Table 3: The share of the Visegrad Group trade with the EU countries

Country	Import		Eksport	
	2007	2017	2007	2017
The Czech Rep.	80,2 %	78,0 %	85,8 %	83,9 %
Poland	73,4 %	71,7 %	79,2 %	80,0 %
Slovakia	74,8 %	79,8 %	87,2 %	85,7 %
Hungary	69,8 %	76,1 %	80,4 %	81,2 %

Source: Own study based on Eurostat data

Data on foreign trade proved that Germany was the main partner in terms of imports and exports for each of the Visegrad countries, constituting at least 19 % of the import and export of the Visegrad countries in both 2007 and 2017 (table 4). An important fact is that to a large extent the Visegrad countries trade with each other, often being among the 'top five' trading partners. It might be surprising that the Czech Republic did not appear in the top five trading partners in the Hungarian imports and exports, and vice versa the Czech Republic did not have Hungary in this statistics. In turn, only the Czech Republic appeared in Polish exports, while in imports, Poland did not have any Visegrad country among the top five trading partners. Only Slovakia maintained relatively large trade relations with all partners of the Visegrad Group.

Table 4: International trade structure of the Visegrad countries by main trading partner countries

Conclusion

The Visegrad economies need to catch up with their western neighbours as well as the EU's average in terms of their economic welfare measured by GDP per capita. Although, the Visegrad economies had higher level of economic growth than the EU's average. It shows that these countries do have potential to be above the EU's average in terms of GDP per capita. Nevertheless, there is still a long way for them to economically converge with the EU's average. Majority of the international trade (over 70 %) of the Visegrad countries is done within the EU countries. The Visegrad countries very much depend on the trade with Germany as the number one trading partner. In general, the trade among the Visegrad Countries is vital, however, it could be increased in its volume and share.

In the analysed data there were quite high disparities among the Visegrad countries. It could be a wise move from the economic policy standpoint to start working together towards the same direction so that the whole Visegrad Group could benefit from it. Therefore, the Visegrad Group shall work much more intensive in order to focus on the economic aspects of their alliance. Further research on this topic might include economic policy analysis of the Visegrad Group in order to find some common goals that could be comprehensively addressed and established at the level of the Visegrad Group.

Abstract

Out of many other options to increase sustainable production of foods to feed its teeming population, Nigerian academics now focus on the possibility of motivating the youths into action in a labour intensive drive; finding reasons why Nigerian youths are not taking to farming. It is well known that a lot of young college and university graduates left the shores of Nigeria only to be engaged by strangers in cultivating plantations in foreign lands as a mean of livelihood. The shame of their discovery and the inability to raise adequate funds with which they would return home eventually keep them in long servitude abroad. Moreover, a lot of studies have ensued in regard of this, but none has been done or reported on Ekiti youths. This study fills the gap. A sample of 300 respondents from the population of youths was drawn using multistage sampling method. Five focal questions were raised in the study and two hypotheses were generated and tested using the binary probit regression analysis. Data were collected using a well-structured questionnaire; the research design could be described as a descriptive

survey. Study unveiled that the identified socio-economic determinants youth participation in agriculture are gender, age, marital status, religion, household size and their personal pleasure derivable from agricultural activities. It was also discovered that other things youths also need in Ekiti to encourage them in taking on agriculture include finance, awareness, training, fertile land, loan facility, power supply, loan facility, power supply, improved seedlings, fertilizer/agrochemicals availability, and machinery among others.

Keywords: Agriculture; Youth; Agribusiness; Farming

Introduction

Out of many other options to increase sustainable production of foods to feed its teeming population, Nigerian academics now focus on the possibility of motivating the youths into action in a labour intensive drive; finding reasons why Nigerian youths are not taking to farming. Youth has been defined by Djurfeldt et al (2019) as young people that have not attained adulthood and independence. In the words of Rasak et al (2019), the International Fund for Agricultural Development (2013) recognizes the fact that this group of people constitute a large share of the population in many less developed countries. Yet, only few of this huge proportion partake in agriculture (Essiet, 2014). Despite the fact that many of these young people were trained with money earned via farm practice, many of them after graduation detest farming. Some see it as very degrading. Some that take to if complain of the low rate of returns accruable from farming. They fail to see how rewarding cash cropping and agro-business could be.

It disheartens that a lot of young college and university graduates left the shores of Nigeria only to be engaged by strangers in cultivating plantations in foreign lands as a mean of livelihood. The shame of their discovery and the inability to raise adequate funds with which they would return home eventually keep them in long servitude abroad. Conversely, expatriates are here establishing agro allied ventures and making their million dollar rewards fast here in Nigeria. Hence, correcting the anomaly is so imperative.

For Africa to develop agriculture, the youth must be dully recognised and given adequate attention (Kelly, Singh and Zvenyika, 2017). They are catalysts in developing countries. It is well known that African youth are very talented, energetic and passionate in their commitments. If these attributes are diverted to agriculture, the youth can surmount whatever problems facing agriculture and thereby achieve food security. Kelly et al (2017) asserts that the youth is critical to agriculture development and must be accorded special attention.

Moreover, a lot of studies have ensued in regard of this, but none has been done or reported on Ekiti youths. This study fills the gap. There is dearth of empirical data on the determinants of youths` participation in agriculture in Ekiti State, Nigeria. Yet, agricultural development remains one of the most powerful trappings to end poverty and boost prosperity (World Bank, 2016). Moreover, Ekiti State comprises about 151 communities in 16 local government council areas. The economy enjoys tropical climate with substantial rainfalls every year. Moreover, the land yields bountifully in agricultural resources with a lot of food and cash crops. It is well known that Ekiti land constituted over 40% of the cocoa products of the famous old Western Region. Food crops like yam, cassava, and grains are grown in large qualities. Other notable crops such as kola-nuts and various fruits are also cultivated in commercial quantities. The State, which was created in 1996, has a total population of about 2.4 million (2006 Population Census) and covers a land area of about 6,353KM2. The state has a per capita income of US$1,169.

Nnadi and Akwiwu (2008) investigate the rate of youth's participation in agriculture, agro ventures participated in and the factors that determine their participation in Imo State, Nigeria.
Data were generated from 230 youths from the three agricultural zones of the state using questionnaire and interview schedule. These were analysed with the aid of frequency tables, simple percentage counts and logit regression model. The results show about 84% participation in land clearing, planting,

fertilizer application, collection of fodder for livestock etc. The participation was determined by their ages, education, marital status, parents` income, parents` occupation, household size and youths` dependence status. Study recommends institutional support services to the youths in agriculture and intervention strategies for youths` agricultural activities to be guided.

Nwaogwugwu and Obele (2017) studied the factors that limit youth's participation in agro-allied ventures in Eleme local government area of Niger Delta, Nigeria. Data were collected from a sample size of 112 respondents selected from a population of 1,895 (one thousand, eight hundred and ninety-five) youths in the 17 registered youth associations in the study area using 2-stage random sampling technique. 64% of the respondents are males; about 39.0% falls within the age of 26 and 30 years; about 54.0% of them are single. Data analysis was by the use of frequency, percentage, mean and factor analysis. The predominant Agrico based activities identified in the study area includes: crop farming, livestock farming, fish farming, fuel wood gathering and sales, farm labour services, agriculture product processing. Factor analysis result showed seven major factors that limit youth participation in agriculture as poor social values, poor agriculture support services, environment related land degradation factors, poor agricultural policies, industrialization, inadequate arable land and poor health conditions. The study recommends that credit facilities should be made available through micro-credit agencies and banks to whichever capable youth that wants to take on agriculture.

Prosper et al (2015) finds that age, sex, marital status, education level, family background, availability of rural credit facilities, land, agricultural knowledge, lack of job alternatives and perceptions are important factors associated with rural youth's participation in agricultural activities. The study set out to find the role played by agriculture to rural youth socioeconomic needs, types of agricultural activities which are engaged by rural youth and the factors which influence youth's participation in agriculture. Data were collected through questionnaires and interviews. Study found that majority of the respondents were attracted to invest more in their own farms rather than being employed as labour or involved in family farms. The study also reveals that rural youth in Kahe are provided with their socioeconomic needs through their participation in agriculture.

Cheteni (2016) uses a binary logistic model to analyse the determinants of youth participation in agriculture in the Nkonkobe Municipality, South Africa. A total of 140 youth were purposively selected for the study to complete a survey. The results show that the variables; youth programmes, programme availability, and resources were statistically significant in explaining the factors that affect youth participation in agricultural activities. Based on the study findings, it is recommended that in order to influence youth participation, they should be provided with youth programmes and resources.

Study Objectives

To investigate reasons for low participation in agriculture by youths in Ekiti
To identify the determinants of youth participation in agriculture in Ekiti
To investigate the possibility of reversing the trend

Research Methods

This study employed the primary method of data collection. The study was conducted in Ekiti State, Nigeria. To address the specific objectives of the study, three local government council areas were selected at random from the existing 16 local government council areas that make the State. Using Cochran's (1977) formula for selecting sample size, a sample of 100 respondents was decided and selected from the youths' population in each of the local government council areas that the study covers. Data were collected with copies of a well-structured questionnaire.

Three local government council areas (Oye, Ido/Osi, and Moba local government) of the state were selected for this study. It was believed that this would enable a rich harvest of the inherent peculiarities of the target population relative to agriculture. Cogent focal research questions were raised in the study and two hypotheses were generated and tested at 0.05 level of significance. The study adopts table and percentages to describe the socio-economic characteristics of Ekiti state youths and their level of

participation in agriculture. Also, econometrics analysis was adopted using binary regression to estimate the level of impact of each of the identified socio-economic factors on youth participation in agriculture.

Econometric model

$$Y\text{-}AGRIC = \alpha + \beta_1 GEN + \beta_2 AGE + \beta_3 MAR + \beta_4 OCC + \beta_5 REL + \beta_6 EDU + \beta_7 HHS + \beta_8 EMP + \beta_9 INC + \beta_{10} WIS + \beta_{11} ENJ + \mu$$

Table 1: Binary Regression Variable Description and their Measurements

Variable	Variable Description	Variable Structure On Questionnaire	Response Categories and their codes
Y-AGRIC	Youth participation in agriculture	Have you engaged yourself in agriculture/agriculture related activities before?	1=If engaging in agriculture, 0= If otherwise
GEN	Gender	Gender	1= If male, 0= If otherwise

Source: Authors' Computation, 2020

Age

Age is a crucial factor to reckon with in farming. Labour intensive farming requires vigour and vitality; such that are found in African youths. In the words of Djurfeldt, et al. (2019), youths are perceived within the villages to be hardworking, capable, strong, and eager to improve their farms. Even when grown, the 'older farmers are expected to make sound farming decisions, ensuring sustainability of their projects; forecasting and guarding against risks' (Douglas et al, 2017). Ekiti State can be described as a growing economy. As Table 3 above indicates, 67% of responses classifies under age 20. Study found the highest frequency between 15 and 20 years old. The remaining 31% constitute the youth. Only 2% is above 55 years of age. Also, the regression result in Table 2 above shows that the age is one of the statistically significant socio-economic determinants of agricultural participation. Hence there is well over 100 percent probability that a randomly selected individual from among the respondents will not engage in agriculture as they reach certain age.

The perception of the population regarding the embrace of agriculture by the youth and the elderly was also revealed in Table 3 above. Out of the 250 that responded to the question on if agriculture should be left for the aged people alone, 201 did not support the idea of leaving farming to the aged people alone. African youths are very energetic and could therefore execute labour intensive farming practice that the system promotes. This figure represents over 80% of the respondents. Precisely, 84.56% responded to affirm that agriculture could make them self-employed, while 91% of the respondents believe that agriculture could turn around the nation Nigeria's fortune.

Education

Table 3 above also shows the level of literacy of Ekiti youths. Out of 285 respondents to the question, only 7 (2.46%) did not obtain or complete formal education. Probably, these seven respondents took to trade apprenticeship very early in life; or that they attended Islamic schools. The table shows that the youths in Ekiti are of the elite class. Approximately 80% attended higher institutions, with 67% already with their certificates obtained. This is out of the entire population of 285 respondents, 97% of which has formal education. It should be noted that despite their chosen professions and mandatory education, the tendency is very high that these personalities still practice farming. They are better enlightened on

modern farm technology that improves production. This is contrary to the opinion of Ahaibwe et al (2013) that the agriculture sector employs the least educated labour force.

Gender

Data collected on the gender balance of respondents and their religious affiliations are also revealed in Table 3 above. Even though male youths are more energetic in the fields, Ekiti women are known for animal husbandry, bees and poultry keeping. Among the 295 respondents, 153 (51.87%) are male, while 142 (48.14%) are female. Out of these, 249 (83.56%) are not married. Even though there are Muslim youths and youths from other religions, Christian youths dominate the survey. 238 (80.13%) Christian youths partook in the survey. While 16.50% were Muslims, 8% were traditional worshipers; and others atheists. Religion has nothing to influence Ekiti youths' participation in agriculture. The youths were seen to be more concerned with their economic relevance to their households and the society at large rather than to religious affiliations. In their common parlance, affluence propels a gratifying heart. In the same vein, the regression result shown in Table 1 above reveals that there is about 83 percent probability that a selected youth engaging in agriculture in Ekiti state will be male as again 17 per cent probability for female.

Marital status

Moreover, majority of the respondents were not yet married. This is shown in Table 3. Out of 298 respondents, only 36 (i.e. 12.08%) were married. What a growing population Ekiti has. This is an indicant of a bright future for food security in Ekiti, if the youths' conscience could be captured now and convinced to take up lucrative career in agriculture. It can also be established in the econometric result that there is also higher probability that youth engaging in agriculture in the state will be married.

Social economic factors of influence

In consideration of the key social economic factors that we believe could influence youth participation in agriculture; we put forth a question on what youths really need most that could encourage them to engage in agriculture. The responses obtained are as presented in Table 3 above.

The factors as shown in the table include youths' awareness of government backing them up to involve themselves in agriculture. Others include special trainings organised to enlighten them on various modern techniques to handle the different areas of farming; availability of fertile land that they could cultivate; finance; power supply; provision of improved seedlings; provision of fertilizers and other agro-chemicals; and the provision of requisite machinery and other farm implements that can make agriculture less risky and more appealing to take up as a career. 293 respondents attended the question, among whom 84 (i.e. 28.67%) affirm that the awareness that government want them in agriculture would boost youth partaking in agriculture.

As shown in the table, 23.55% responses chose that trainings (organised) are needed to boost their interest in agriculture. Trainings in this regard have to do with being able to read the reasons for planting and for harvesting profitably. It involves being trained to efficiently handle each crop and the farm implements with which the crops are produced.

Next to this is the issue of agriculture finance. The unwillingness of banks and finance houses to advance credits to farmers is on the increase due to the inherent risks involved. The youths in Ekiti, as shown in the collated data, preferred that adequate provision of agriculture loans would grossly encourage them to go into agriculture. Such funds could be used to go into agro-business, purchase fertile lands, purchase the necessary farm implements and obtain requisite agro-chemicals.

The relevance of fertile land to farming, as preferred by the respondents, is further stressed by 39 respondents that chose fertile land as the most needed factor to engage the youths in agriculture. That is 13.31% of the 293 respondents. The other influential factors include the provision of requisite machinery to aid cultivation, weeding, and harvesting. 21 (7.71%) respondents desired this. Then, is

the provision of improved seedlings, fertilizers, and agro-chemicals, which the respondents believed could be bought individually if they have the means. The provision of electricity to farms they believed would enhance farm settlements, and promote irrigation systems on the farms.

Challenges faced by youths in farming

The study traced out the problems that Ekiti youths face in agriculture to include paucity of funds and non-profitability of farming, others include lack of access to fertile lands and inherent stressfulness of farming; dirtiness and low market demand for farm produce. Equally added to these is the fact that they lack the financial capability to possess modern machinery and poor farm yield. All these are captured as reported in Table 3. These claims are further buttressed in the same Table 3.

As shown in Table 3, from 292 responses to youths' impediment to agriculture, 90 responses indicate lack of finance. That is about 31% of the total responses. 22.26% claims no access to land, and about 23% responses claim lack of interest in farming. Only 5% of the respondents claimed low profitability as their challenge in farming.

Conclusion

With the above results, one could conclude that Ekiti youths can improve involvement in agriculture if some factors are properly considered and appropriately taken care of by the right quarters. Ekiti youths need to be encouraged by the government. Socio-economic factors that pose challenges to them are not insurmountable. It seems that paucity of funds and access to arable lands poses great challenges to the youths. This reveals that successive government in Ekiti have not been really determined to assist in driving youths to agriculture. Equally, it can be deduced from the study that no financial institution has been drifted to assist in financing agriculture in Ekiti. Neither is any forum put in place to promote this among the youths.

Recommendations

Study found out that what youths really need most in Ekiti to encourage their taking on agriculture include finance, training, and fertile land. Added to these are improved seedlings, fertilizer, agrochemicals, modern farm equipment, and regular supply of electricity to power their gadgets. In view of this, we would recommend that government should design the appropriate policies and create such structures that can contain all the identified challenges.

A well standardized market structure could be arraigned by the state and the local governments tailored towards buying agricultural produce in huge quantities from farmers. Not only buying them for standardized storage, the state government could harness these products and process them for industrial consumption and for exportation if found excessive. Doing this would not only encourage more production, it would improve industrial growth, create more jobs, and generate progressive employment. Moreover, in the words of Rybakowa (2013), as cited by Bednaríkov a et al. (2016) government support is not enough to motivate people to agriculture (Rybakowa, 2013)

Moreover, we acknowledge the finance approved for publishing this article, which Landmark University, Nigeria supplied. It is our hope that tertiary institutions in and around Nigeria will emulate and adopt the laudable gesture.

Different Presentation Formats of Corporate Financial and Non-Financial Environmental Information and Judgment Accuracy

Justyna GODAWSKA

AGH University of Science and Technology, Cracow, Poland
jgodawska@zarz.agh.edu.pl

Abstract

Information presentation format can influence decision-maker behaviour. The aim of the paper is to compare different information presentation formats in terms of accuracy of judgment on corporate environmental performance. Altogether five presentation formats have been examined: tabular, textual, graphical in form of line and bar graphs and mixed. Subjects of an experiment have been provided with financial and non-financial environmental information on four companies. Judgment accuracy has been measured as the percentage of correct responses to total possible responses of the subjects. The research findings reveal that judgment accuracy can be worsened by using the mixed information presentation format as compared to other homogenous presentation formats. The tabular, textual and two graphical formats do not differ significantly from each other in terms of influence on judgment accuracy.

Keywords: Environmental Information, Information Presentation Format, Cognitive Fit Theory

Introduction

According to the findings in the psychology and economics research the way in which a problem is presented or framed affects the decision makers' perception of the problem and their preferences. This effect is called a framing effect. For example, people may make different choices depending on how possible outcomes of a gamble are pictured: as gains or losses (cf. Tversky and Kahneman, 1981). The influence of the information presentation format on information users is another example of framing effects in a broad sense. Information presentation format is the method used to disseminate information to users (Kelton et al., 2010, p. 79). In the case of corporate financial and non-financial reporting the following presentation formats can be distsinguished: textual, tabular, graphical, audio file and video formats. These different presentation formats of information may affect decision-makers'search behaviour, affective responses, decision accuracy, cognitive effort, functional fixation and satisfaction, persuasion and recall (Ghani et al., 2009, p. 185). Choosing the proper format of presenting corporate good (or bad) performance in order to make stakeholders perceive positively a company may be a part of a company's disclosure strategy, i.e. impression management (Beattie and Jones 2000, Jones 2011). The aim of the paper is to compare different information presentation formats in terms of accuracy of judgment on corporate environmental performance. Altogether five presentation formats have been examined: tabular, textual, graphical in form of line and bar graphs and mixed. The following hypothesis was formulated: The accuracy of answers to questions on corporate environmental performance depends on presentation format of information provided.

The rest of paper is organized as follows: the second section presents the literature review, the research method is described in the third section; research findings are discussed in the fourth section. The last section contains concluding remarks.

Literature Review

Early accounting behavioural research focused primarily on content of financial information and disregarded presentation format and its linkages to decision-making performance (Ghani et al., 2009,

p. 185). With time this issue has gained growing interest among accounting and psychological researchers, among others due to the development of new forms of information presentation like interactive data visualization. For example Dull et al. (2003) in an experimental research explored the effect of hypertext links on users' judgment processes on the example of one large and one small test companies. Their findings indicate significant differences in predictions, the amount of information accessed, and the time to make decisions when using financial statements prepared with or without hypertext links for the small company and no differences for the large company. Hyperlinked financial information was compared to paper-based financial information in the study of Kelton and Pennington (2012) as well. According to their research results, hyperlink users used less effort on the investment-related judgments and decisions than users of paper-based information. Perdana et al. (2019) examined the appropriateness of interactive data visualisation for non-professional investors' use when they access accounting information. They found that this presentation format mitigates subjects' restricted investment capabilities by presenting more salient information, thus reducing their cognitive effort. The influence of graphical and color-enhanced information presentation on decision making was examined by Benbasat and Dexter (1985). According to their research results, color influences decision-making quality especially of the people who exhibit so called field dependence i.e. their cognitive style consists in relying more on external cues rather than internal cues.

Many studies examine effects of alternative presentations of tables versus graphs on understanding, perception, judgment, decision usefulness, confidence and other aspects of decision making (e.g. Cardinaels (2008), Coll (1992), Davis (1989), Hard and Vanecek (1991), Harvey and Bolger (1996), Jatiningsih and Solihin (2011), MacKay and Villarreal (1987), Mertins and White (2016), Remus (1984), Schulz and Booth (1995), So and Smith (2004), Strong and Portz (2003), Volkov and Laing (2012)).

One of the theories explaining how different presentation formats affect decision-making performance, concerning especially tabular versus graphical format problem, is Vessey's cognitive fit theory. This theory assumes that if the information emphasized in the representation type and that required by the task type match, task performance will be improved in terms of speed and accuracy of problem-solving. Vessey (1991) distinguishes graphical and tabular representations that present the same information in different ways; i.e. graphical representations emphasize spatial information (figurative information), while tables emphasize symbolic information (discrete data values). Analogously tasks can be differentiated into into spatial and symbolic ones, depending on the type of information that facilitates their solution. The link between representation and task is provided by the perceptual and analytical processes (or strategies). Using perceptual processes enables solving spatial tasks as they require perceiving the problem as a whole and the relationships in data or comparing two or more values. Analytical processes are useful in solving symbolic tasks because they involve extracting or analyzing discrete data values or decomposing data into separable elements.The cognitive fit theory may be relevant to judgment strategies because they can be characterized as the particular combination of elementary information-processing tasks that are employed to arrive at a judgment (Tuttle, Kershaw, 1998, p. 2). Holistic strategies tend to use elementary information-processing tasks that are spatial in nature, whereas analytical strategies tend to emphasize elementary information-processing tasks that are symbolic (Tuttle, Kershaw, 1998, p. 4). Table 1 presents information presentation formats appropriate for the two judgment strategies and corresponding elementary information processing tasks. According to cognitive fit theory, when information emphasized in the representation type and that required by the task type do not match (i.e. graphs versus symbolic tasks or tables versus spatial tasks), an additional cognitive effort is required to reach a conclusion and decision accuracy can be lower and/or decision speed can be higher. For example, under tabular format in order to identify the highest value (spatial task) several pairwise comparisons are needed until the highest value is obtained. In contrast, the answer can be found directly from e.g. a bar graph (Tuttle, Kershaw, 1998, p. 3).

The results of studies aiming at validating cognitive fit theory have been conflicting therefore researchers began to examine other variables, in addition to presentation format and task, which may influence decision-making effectiveness such as motivation, experience or accounting knowledge (Strong and Portz, 2003).

Table 1: Judgment strategies, elementary information processing tasks and information presentation format

Judgment strategy	Information processes emphasized in strategy	Typical elementary information processing tasks	Information presentation format
Holistic	Spatial	Thinking about the data as a whole Comparing multiple pieces of information Identifying relationships among the data Looking at multiple values simultaneously	Graphical
Analytic	Symbolic	Extracting or analyzing discrete data values Decomposing data into separable elements Using the data to perform computations	Tabular

Source: B. M. Tuttle, R. Kershaw (1998). Information Presentation and Judgment Strategy from a Cognitive Fit Perspective. Journal of Information Systems, 12(1), p. 5.

Studies on effects of information presentation format often explore judgment (decision) accuracy, i.e. making an incisive judgment (decision). The general inference from these studies indicates that judgment accuracy can be (depending on some circumstances like e.g. information and task complexity or decision-maker's experience) enhanced by using the proper information presentation format (Amer (1991), Dull and Tegarden (1999), Hard and Vanecek (1991), Hirsch et al. (2015), MacKay and Villarreal (1987), Sithole (2016), Speier (2006), Stock and Watson (1984)).

The influence of presentation format on decision making has been examined with regard to the time taken to make decisions as well. The importance of this issue results from the fact that 'even small improvements in decision-making time can, in a broader perspective, result in significant resource savings' (Amer, 1991, p. 26). The study conducted by Tuttle and Kershaw (1998) showed that with an analytic strategy judgment time was significantly greater for graphs than for tables but with a holistic strategy judgment time did not differ statistically between the two presentation formats. Tuttle and Kershaw suggest that in the first case different amounts of time were exerted to achieve similar levels of judgment accuracy under the two presentation formats. (1991) examined the amount of time subjects took to complete integrative and selective tasks: determining the bond rating of firms and assessing the debt covenant violations of firms. According to his findings, the form in which the financial accounting information was displayed, influenced the total time taken to make decisions. The numerical display took the shortest time, followed by the polygon display, the bar graph, and the face graph. In the experiment performed by Hirsch et al. (2015) subjects were required to evaluate eight different business units based on four equally valued targets (sales, profit margin, first pass yield and delivery reliability). The information provided to them was either presented as tables only, or in tables and graphs. The empirical results show that supplementary graphs improve decision quality without an increase in decision time. On the contrary to these studies, Benbasat and Dexter (1985) did not find significant differences for decision time among analyzed presentation formats i.e. tabular, graphical, unicolored and many-colored.

Research Method

The aim of the experiment was to compare different information presentation formats in terms of judgment accuracy. The experiment was conducted in 2019 and a total of 150 students from AGH University of Science and Technology took part in it. Participants were randomly assigned to one of five groups of 30 persons each. They were requested to answer the following questions concerning

environmental performance of four companies (power plants): Alpha Inc., Beta Inc., Theta Inc. and Gamma Inc.:

1. In which firm (or firms) was the NOx emission intensity in 2018 higher than in 2016?
2. In which firm (or firms) was the CO_2 emission intensity in 2018 higher than in 2016?
3. Which firm was the best in terms of SO_2 emission intensity in 2018?
4. Which firm was the worst in terms of NOx emission intensity in 2016 ?
5. Which firm held second position in terms of CO_2 emission intensity in 2017?
6. Which firm held second position in terms of dust emission intensity in 2018?
7. In which firm (or firms) did the environmental charges exceed 800,000 EUR in any year?
8. In which firm (or firms) was the decline of environmental charges continuous in 2016-2018 ?
9. In which firm (or firms) was the growth of waste recycling and recovery level continuous in 2016-2018 ?
10. Which firm spent the most on the environmental protection in terms of the relation of environmental capital expenditures to total capital expenditures in 2018?
11. Which firm was the best in terms of overall environmental performance in 2018?
12. Which firm was the worst in terms of overall environmental performance in 2018?

The allotted time for responses was seven minutes. Subjects were explained that:

- the best (worst) firm in terms of emission intensity means the firm with the lowest (highest) emission intensity,
- the lower SO_2, NOx, dust, CO_2 emission intensity and environmental charges, the better environmental performance of a company.
- the higher level of waste recycled or recovered and environmental capital expenditures, the better environmental performance of a company.

Group 1 received information on four companies in the mixed format:

- the information on Alpha Inc. was presented in tabular format (cf. Tables 2 and 3),
- the information on Beta Inc. was presented in textual form,
- the information on Theta Inc. was presented in form of line graphs (cf. Figures 1-5),
- the information on Gamma Inc. was presented in form of bar graphs (cf. Figures 6-10).

With regard to Beta Inc. subjects in group 1 were provided with the following text:

„The emission intensity ratios for Beta Inc. totaled in 2016-2018 as follows:
- SO_2 (in tonne per MWh): 0.241 in 2016, 0.235 in 2017 and 0.229 in 2018
- NO_X (in tonne per MWh): 0.342 in 2016, 0.347 in 2017 and 0.343 in 2018,
- dust (in tonne per MWh): 0.019 in 2016, 0.018 in 2017 and 0.018 in 2018,
- CO_2 (in tonne per kWh): 0.652 in 2016, 0.649 in 2017 and 0.645 in 2018.

The level of waste recycled or recovered (as percentage of total waste generated) amounted to 69% in 2016, 72% in 2017 and 74% in 2018.

The Company was obliged to pay environmental charges: 289.20 thous. EUR in 2016, 274.58 thous. EUR in 2017 and 255.51 thous. EUR in 2018. Capital expenditures on environmental protection amounted to 21.080 mln EUR in 2016, 22.800 mln EUR in 2017 and 20.600 mln EUR in 2018 whereas total capital expenditures came to 76.701 mln EUR, 98.880 mln EUR and 71.470 in these years respectively".

Group 2 was provided with information on all companies only in textual format, i.e. companies Alpha Inc., Theta Inc. and Gamma Inc. were presented in the similar way as Beta Inc. in group 1. Subjects in group 3 and 4 had all infomation set out only in form of line graphs and bar graphs as in Figures 1-5 and 6-10 respectively. Environmental information only in tabular format was provided to subjects in group 5.

Judgment accuracy was measured as the percentage of correct responses to total possible responses. Subjects were asked to answer the question concerning the perceived difficulty to complete the task (i.e. environmental performance judgment): 'How do you assess the difficulty of answering the questions on the basis of information provided?'. The possible responses were on the 5-point Likert scale (1- definitely easy, 2- rather easy, 3- neither easy, nor difficult, 4 – rather difficult, 5 – definitely difficult).

Table 2: SO_2, NOx, dust and CO_2 emission intensity and waste recycled or recovered – Alpha Inc

Specification	Unit	2016	2017	2018
SO_2 emission	tonne/MWh	0.747	0.659	0.649
NOx emission	tonne/MWh	0.924	0.677	0.670
Dust emission	tonne/MWh	0.022	0.022	0.022
CO_2 emission	tonne/kWh	0.871	0.862	0.854
Waste recycled or recovered	% of total waste generated	48	53	50

Table 3: Environmental charges and environmental and total capital expenditures – Alpha Inc.

Specification	Unit	2016	2017	2018
Environmental charges	thous. EUR	723.00	686.85	618.17
Environmental capital expenditures	mln EUR	6.578	5.240	5.896
Total capital expenditures	mln EUR	54.400	78.500	62.300

Fig. 8: Waste recycled or recovered (in % of total waste generated) - Gamma Inc.

Fig. 9: Environmental charges (in thous. EUR) – Gamma Inc.

Fig. 10: Environmental and total capital expenditures (in mln EUR) – Gamma Inc.

Research Results

Table 4 presents descriptive statistics for judgment accuracy regarding environmental performance in five analyzed information presentation formats. On average the participants who were provided with environmental information in form of tables achieved the highest score on judgment accuracy (88.1%), followed by the participants using the information in forms of bar and line graphs and these using textual information (84.4%, 83.1% and 81.1% respectively). The lowest average score was observed in the group provided with environmental information in mixed presentation format (65.8%). The two most difficult questions, i.e. with the lowest judgment accuracy score, were these concerning the best firm and the worst one in terms of overall environmental performance in 2018.

The Shapiro-Wilk normality test (cf. Table 4) showed that the the assumption of normality of judgment accuracy scores for different presentation formats had not been met so one-factor ANOVA test for independent measures is not suitable for comparing these formats. Therefore the non-parametric equivalent to ANOVA - the Kruskal-Wallis test - was used in order to evaluate differences between samples.

The p-value corresponing to the H-statistic of Kruskal Wallis test (H =24.4182) is .00007, suggesting at the .05 level of significance that the one or more presentation formats are significantly different. In order to identify which of the pairs of presentation formats are significantly different from each other Bonferroni multiple comparison post-hoc test was used. All possible pairs for simultaneous comparison has been considered. According to the results of the Bonferroni test (cf. Table 5) that significant differences have been observed only for four presentation format pairs (at the level of significance of .05):
- mixed versus textual,
- mixed versus graphical (line graphs),
- mixed versus graphical (bar graphs),
- mixed versus tabular.

This means that judgment accuracy can be worsened by using the mixed information presentation format as compared to other homogenous presentation formats. The tabular, textual and two graphical formats do not differ significantly from each other in terms of influence on judgment accuracy. Thus the formulated hypothesis is thus partially confirmed.

Table 4: Descriptive statistics for judgment accuracy in different information presentation formats

Presentation format	Mean	Median	Min	Max	SD	Shapiro-Wilk test	
						W-statistic	p-value
Mixed (n=30)	65.84	58.33	25.00	100.00	19.48	0.9223	0.0309
Textual (n=30)	81.11	83.33	50.00	100.00	17.47	0.9215	0.0293
Tabular (n=30)	88.06	91.67	50.00	100.00	12.51	0.8292	0.0002
Graphical (line graphs) (n=30)	83.61	87.50	41.67	100.00	15.24	0.8892	0.0046
Graphical (bar graphs) (n=30)	84.44	83.33	50.00	100.00	14.14	0.8982	0.0076

Table 5: Results of Bonferroni multiple comparison test for judgment accuracy in different information presentation formats

Presentation format pairs	Bonferroni t-statistic	Bonferroni p-value	Bonferroni significance
Mixed vs textual	3.8646	0.0017	significant (p <0.005)
Mixed vs graphical (line graphs)	4.5143	0.0001	significant (p <0.005)
Mixed vs graphical (bar graphs)	4.7084	0.0001	significant (p <0.005)
Mixed vs tabular	5.6366	0.0000	significant (p <0.005)
Textual vs graphical (line graphs)	0.6497	1.0000	insignificant
Textual vs graphical (bar graphs)	0.8438	1.0000	insignificant
Textual vs tabular	1.7720	0.7850	insignificant
Graphical (line graphs) vs graphical (bar graphs)	0.1941	1.0000	insignificant
Graphical (line graphs) vs tabular	1.1223	1.0000	insignificant
Graphical (bar graphs) vs tabular	0.9282	1.0000	insignificant

Table 6 shows subjects' assessment of task difficulty in different information presentation formats. Answering the questions on the basis of given information has been the most difficult, on average, for the subjects provided with environmental information in textual presentation format (the mean equals 3.37) and subjects provided with that information in mixed presentation format (the mean equals 3.33). Intergroup differences were assessed by the Kruskal-Wallis test due to lack of normal distribution assessed by the Shapiro-Wilk test (cf. Table 6). The results of the Kruskal Wallis test (H= 12.2639, p-value = .01549) suggest at the .05 level of significance that the one or more presentation formats are significantly different (in terms of task difficulty assessment).

Table 6: Descriptive statistics for the assessment of task difficulty in different information presentation formats

Presentation format	Mean	Median	Min	Max	SD	Shapiro-Wilk test	
						W-statistic	p-value
Mixed (n=30)	3.33	4.00	1.00	5.00	1.21	0.8298	0.0002
Textual (n=30)	3.37	3.50	1.00	5.00	1.35	0.8899	0.0047
Tabular (n=30)	2.43	2.00	1.00	5.00	1.36	0.8662	0.0014
Graphical (line graphs) (n=30)	2.63	2.50	1.00	5.00	1.33	0.8813	0.0030
Graphical (bar graphs) (n=30)	2.57	3.00	1.00	5.00	1.45	0.8218	0.0002

Table 7: Results of Bonferroni multiple comparison test for the assessment of task difficulty in different information presentation formats

Presentation format pairs	Bonferroni t-statistic	Bonferroni p-value	Bonferroni significance
Mixed vs textual	0.0962	1.0000	insignificant
Mixed vs graphical (line graphs)	2.0194	0.4528	insignificant
Mixed vs graphical (bar graphs)	2.2118	0.2855	insignificant
Mixed vs tabular	2.5964	0.1039	insignificant
Textual vs graphical (line graphs)	2.1156	0.3609	insignificant
Textual vs graphical (bar graphs)	2.3079	0.2242	insignificant
Textual vs tabular	2.6926	0.0793	insignificant
Graphical (line graphs) vs graphical (bar graphs)	0.1923	1.0000	insignificant
Graphical (line graphs) vs tabular	0.5770	1.0000	insignificant
Graphical (bar graphs) vs tabular	0.3847	1.0000	insignificant

The Bonferroni multiple comparison post-hoc test was used in order to find out which of the pairs of presentation formats are significantly different from each other. All possible pairs for simultaneous comparison has been considered. The results of the Bonferroni test (cf. Table 7) indicate that assessments of task difficulty among subjects do not differ significantly (regardless of information presentation format).

Conclusions

Corporate social responsibility (CSR) reports are growing in popularity (Jones 2011, Kim et al. 2019). They contain social and environmental information disclosed primarily on a voluntary basis in terms of the information content and presentation format. The latter means that CSR report users when comparing corporate environmental performance of several firms may encounter the information on e.g. their CO_2 emission in quite different presentation formats: as a text disclosure, as a table or a bar graph. The research results described in the preceding section suggest that using the mixed information presentation format can worsen judgment accuracy in comparison with only homogenous presentation formats. Presumably decision makers have to invest more cognitive effort to reach a conclusion if they are provided with information emphasized in dissimilar representation types. In the case of homogenous presentation formats even if the judgment tasks do not match exactly the representation type of information, the repeated exposure to a given presentation format may make decision makers gain experience using this format and consequently make them put less cognitive effort in problem solving. Judgment tasks performed by the subjects have been mostly spatial and according to the cognitive fit theory, graphical presentation formats should outperform tabular ones with regard to judgment accuracy. However the research results do not support this assumption.

Abstract

The purpose of the article is to identify the trends and scenarios for the organization of research based on analysis of the world foresights, as well as to highlight the main further challenges of research in Ukraine. The article substantiates the need to use foresight methodology to identify trends and scenarios for the development of research space. The results of research on foresight studies of future conducted by Elsevier, the International Scientific Council and other organizations were analysed in the Article. As a result, the research drivers and trends, which have developed in the international research space to date, were identified. The basic tendencies in organization of the world scientific activity were defined: research and formation of new knowledge are becoming globalized; socio-economic inequality between the countries with limited and strong scientific potential is increasing; co-ordination efforts to ensure the openness of science worldwide is required; the ways of research and transfer of new knowledge are altering; the new requirements for substantiating scientific knowledge are being introduced, the boundaries between the basic and applied scientific research are being blurred; the impact of integration processes on scientific institutions and the business sector of the economy is increasing; there is a growing need to introduce new governance models of scientific development that go beyond the traditional state ones. Due to the research conducted, it is possible to identify the main challenges facing Ukrainian science. It is noteworthy, that discrepancy between the state of science development in Ukraine and the general international tendencies, necessitates revision of the existing model of scientific activity management in the country and development of the concept of science development.

Keywords: Organization of Scientific Researches, Research Space, Foresight, Research Space Development Tendencies, Scenarios.

Introduction

Currently, all the countries in the world are facing global challenges relating to the transformation of traditional industries, the emergence of new markets, innovative technologies and products. In addition, the intensity and nature of knowledge transfer, human resources, capital, technology between science

and business, economic sectors and countries are changing. All this determines the prospect of scientific and technological development to ensure the economic growth of the countries in the world within the context of current and future global changes.

Many world researchers, in particular, Ipsos Morey, World Market Specialist and Public Opinion Research, and Alexander van Bottler, Vice President of Elsevie (Mori, 2019), have noted that such rapid and profound changes, as in the last few years, are rarely seen in the history of science, technology and medicine. The research space has changed a lot in the last decades. Requirements for the level and quality of scientific results are increasing, the structure of scientific research customers is changing, and the scope of scientific knowledge is expanding. Advances in technology, pressure on the funding, political uncertainty, changes in population structure, societal challenges on a global scale - all the above factors combine and transform the means of generating and sharing information on research, changing the nature of scientific output, influencing the formation of the scientific research organizational model.

The ability of the research community to be competitive in the new world depends on understanding of the opportunities and challenges that these changes offer and the steps to be taken now. The ability of researchers from the particular countries of the world to adapt to current and future changes in the organization of scientific activity determines formation and use of scientific potential, as well as ensuring a high level of competitiveness of national economic systems.

In this context, the relevance of the request for justification and increase of the evidence-based science and technology policy and innovation policy, substantiation of the areas of scientific research in the long-term horizon, which sets a certain framework in the implementation of new approaches to the management of science and technology. One of such approaches is a foresight methodology, which is a modern effective tool that ensures the achievement of scientific and technological development goals through the foresight of future.

Analysis of recent researches and publications. In the world practice of determining future trends and scenarios of the development of particular socio-economic spheres, foresight studies have been carried out by foreign scientists for several decades. For instance, researches on the foresight methods and their results are described in the scientific works of O. Berzle (Berze, 2016), M. Kinan, and R. Popper (Popper, Georghiou, Miles, and Keenan, 2010) and others. Among Ukrainain scientists, M. Zgurovsky (Zgurovsky, 2015), C. Kvitka (Kvitka, 2016), M. Kyzym, I. Matyushenko (Kyzym, Matyushenko, 2015) and others are well-known for their surveys of the foresight. Existing surveys emphasize that foresight was established as an effective tool for selecting priorities for the development of science and technology, as well as a basis for solving a wide range of socio-economic development problems. Miles I. (Miles, 2008) defines foresight as a kind of prediction that, along with other fields of application, is used to predict the state of the science, technology and innovation system, including the nature of scientific activity. But most of the foresights are dedicated to identifying areas of technological development and research on priority topics (Reshetnyak, 2019). Research of the trends and scenarios of scientific organization of surveys is devoted to the foresights of O. van Bottler, I. Mori (2019), I. Miles (Miles, 2008), International Scientific Council (ISC, 2019), VERA project (Gesellschaft and Daimer, 2014). But complexity of determining the future of domestic science, the need to ensure its competitiveness and integration into the global research environment, require more detailed definition of the world trends and scenarios for organization of scientific research in order to compare them with the national realities.

The purpose of the article. The purpose of this article is to analyse the tendencies and scenarios of the organization of research based on the world foresights, as well as to identify the further challenges of research in Ukraine.

In the view of the above, the tasks of the present article are as follows:

- to determine, on the basis of literary sources and modern surveys of the world foresights, the existing tendencies and scenarios of the world scientific researches organization;

– to highlight the main challenges of organizing future research activities in Ukraine.

Research Materials and Results

There are several ways to identify future trends in science and research that underlie the foresight methodology. Thus, in early 2019, a large-scale foresight study was presented by Elsevier, which resulted in identifying the major drivers of scientific research in future and identifying possible scenarios of the development of research field (Mori, 2019). The main focus of the above study was not on the key scientific topics, which would be explored in 10 years, but on how such research would be conducted, how the findings would be presented, as well as what would constitute the research space. The study identifies 19 drivers of research development, grouped into six topics, namely: funding of future researches, ways to discover the science, changes in the working processes of researchers, research technologies: revolution or evolution, development of the future research information system, academic science and science beyond. In addition, on the basis of the identified trends, mentioned above, results of the questionnaires results and expert opinions, three scenarios have been developed to explore how the research ecosystem might look in decades. These scenarios have been dubbed the "Brave open world" (the main tendency is open science, which aligns the interests of many stakeholders), the "Technical titans" (the dominant force is the large technical corporations that are the main customers of scientific research), and the "Eastern rise" (China becomes the main research area) (Fig. 1).

The foresights aimed at exploring the future of scientific field at the regional level are being developed, as well. For instance, the well-known project VERA was created, on the one hand, to provide appropriate strategic intelligence to identify priorities within the EU research, technology, development and innovation system (RTDI) and the future governance in this field, on the other hand, to adapt science, technology and innovation policy to the changing global environment and future socio-economic challenges. To this end, the VERA project carried out an in-depth analysis and summary of RTDI prospective research activities (Gesellschaft and Daimer, 2014).

The project explored key challenges and opportunities for ERA development. It was determined that research and the generation of new knowledge are becoming globalized, requiring coordination and collaboration to ensure the openness of science around the world. At the same time, the specialization of forming and using scientific knowledge is increasing, what in its turn strengthens requirements for improving the quality of research in the future. Changes in the ways of research and transfer of new knowledge, changes in values and lifestyles also give rise to new societal expectations of research and innovation. Changes in economic and institutional content introduce the new requirements for substantiating scientific knowledge. The boundaries between basic and applied research, users and producers of innovation and scientific knowledge are being blurred. A range of scientific developments require introduction of new governance models, going beyond the traditional state governance model of scientific development. In particular, it is related to financial support of R&D and the involvement of non-state sources of funding. Scientific research is based on harmonization of interests of the state, society, scientists and business - the integration processes in the field of scientific research are increasing. The need to modernize the existing education system in Europe has been identified, which should contribute to sustainability, innovation and training, according to the emergence of new professions, as well as to develop the scientific potential of the EU countries (Gesellschaft and Daimer, 2014).

Based on the trends in international research space, the International Scientific Council (ISC, 2019) has identified four scenarios for the development of international science by 2031: Scenario 1 – “The Triumph of Globalism”, Scenario 2 – “Science for National Needs”, Scenario 3 - “Science for Product Competitiveness in the Global Market”, Scenario 4 - “Growing Aggressive Nationalism”. A brief comparative description of the above scenarios is provided in Table 1.

In general, according to the researcher of the International Scientific Council (ISC, 2019), surveys, scientific organizations, and scientists themselves must constantly adapt to changes in knowledge, technology, and social norms. Scientific systems should be open, flexible and regulated in a way that

protects scientific freedom and enhances scientific accountability, stringency and relevance. Traditional research systems that generate useful knowledge for innovation and transformation of society must now respond to trends in enhanced interdisciplinary collaboration, scientific migration, explosion of digital technologies, as well as the need to ensure gender equality in research and open access to the research results. The need for changes in scientific systems, in particular, reform of academic incentives, funding systems, scientific publication processes, and private sector norms, is increasing, as well.

Despite the possibility to implement different scenarios for the development of international science, generalizing existing foresight studies (Mori, 2019; Gesellschaft and Daimer, 2014; ISC, 2019; Publications Office of the European Union, 2009), eventual major trends in scientific space and challenges facing the national science due to its current state were identified (Astakhova, Reshetnyak and Ilchenko, 2019; Kyzym, Khaustova, Reshetnuk and Danko, 2019; Matyushenko, Khaustova and Knyazev, 2017):

1. Influence of the advantages of the developed countries on the state of international science in future is increasing. In the developed world, there is a significant increase in cost of research, almost 80% of all the scientific achievements come from the developed world (the EU countries, the USA, Japan, Canada), which impacts the scientific activity worldwide. Meanwhile, during almost 30 years of existence of independent Ukraine, the scientific potential has been significantly reduced (the number of organizations carrying out research activities in Ukraine in 2018 has decreased by 1.57 times compared to 1991, the number of researchers decreased by 52,7 times); the share of FDI financing from GDP in Ukraine in 2017 was only 0.45%, while in the developed - 2.33%; the share of scientific publications and patents from the total number of scientific results worldwide is reducing, in future it may lead to a permanent loss of national science positions in international scientific space.

Fig.1: Drivers and scenarios of the development of scientific space by 2029

Source: drafted by the authors, according to (Mori, 2019)

Table 1: Scenario of the development of international science by 2031

Features	Scenarios			
	Scenario 1 – Triumph of globalism	**Scenario 2 - Science for national needs**	**Scenario 3 - Science for product competitiveness in the global market**	**Scenario 4 – Growing aggressive nationalism**
1	2	3	4	5
General characteristics	Socio-economic challenges do not recognize national boundaries and are best addressed jointly. Global management of socio-economic development is gaining a new model of life that anticipates significant impact of industrialized countries. The impact of global civil society, together with international NGOs (such as the United Nations), are playing an increasing role in shaping the new networks, addressing global issues	A number of major global economic crises have led to public discontent with globalization, creating a strong impetus for new, localized growth patterns. A common feature for all the countries is that domestic socio-economic needs strongly influence scientific programs and, in general, the development of science, which is more focused on solving local problems. The notion of scientific integrity has expanded, more significant social role played by scientists. The socio-economic gap between countries with strong and limited scientific potential is widening.	Influence of the business sector, led by large international corporations, is increasing. Thousands of multinational companies are contributing to the spread of globalization. New scientific discoveries and technological developments are creating new industries that affect the development of economies in the advanced countries of the world and several countries that are rapidly developing due to their competitiveness in international markets. Globalization is spreading to universities. E-learning is becoming an important and less expensive means of education. The global accessibility of education is hampering the development of traditional higher education and related scientific opportunities, and contributes to further "brain drain" to economically developed countries. Various anti-globalist movements emerge, based on religious fundamentalism and extreme forms of nationalism. They are hostile to science and its achievements.	With the emergence of new, actively developing countries, the struggle for global leadership and resources continues, creating great uncertainty and instability in international state system. The unresolved problems of sustainable development and competition for scarce resources are a potential factor for hostilities. National states are key actors in an uncertain geopolitical environment. Economic leaders, including the United States, Germany and a number of industrialized nations, are dominant in international decision-making. Due to increased international tension, the economies of the leading powers are largely driven by the national military and industrial complexes.

1	2	3	4	5
Purpose of science development	Science acts as a global stabilizing agent in this new global order, is an integral part of functioning of global society and helps to guide global political agendas. Scientific development and scientific achievements play a decisive role in shaping world views and promoting the important role of science.	The main objective is to strive for science to be more self-sufficient, to increase local production in domestic and regional markets, and to improve the quality of life and the satisfaction of society, rather than to ensure socio-economic and environmental growth.	Maintains the needs of large corporations.	The needs of the military and industrial complex prevail
Organization of scientific research	Science is conducted in short-term, rapidly changing epistemic configurations. The international network is becoming the dominant model of science. Research is increasingly conducted with large-scale networks of decentralized entities that are organized to address pressing global problems. National barriers to collaboration are decreasing and researchers' mobility is increasing. ICTs are playing an increasingly prominent role. This allows the developing countries to participate more actively in global science. International harmonized data standards are an important element of the new science organization, and global data collection, while the monitoring systems are powerful drivers for international research.	Efforts to create effective global governance structures are largely unsuccessful, and complex national and supranational regional alliances are emerging between the states, businesses and community groups to address urgent problems. A variety of national and regional solutions thrive in a broad experimental society. Various national scientific and innovation systems are being created in response to specific concerns about employment, energy and food security, aging and health care. In the absence of large-scale global cooperation, bilateral and regional alliances are strong players in the international scientific arena. There is no global governance of science at the intergovernmental level, although various non-governmental organizations seek to link different national and regional efforts.	In the global governance structures, business and economic interests prevail. It is difficult for intergovernmental and non-governmental organizations to support independent missions, given the lack of public funding and a significant share of private funding. International scientific cooperation is shrinking as a result of using its own international coordination mechanisms to establish a global science program for business groups and private foundations. The societies in advanced economies are hyper-consumers, and much of their consumption is focused on improving health and lifestyles, to which science contributes significantly. Thus, the association of society with science is mediated through its consumer behaviour. But access is restricted for those who cannot pay for these products. This widens the gap between the rich and the poor.	Less developed countries are isolated from any scientific efforts, and support for the universality of science is a major challenge to the freedom and mobility of scientists. International coordination and global sources of funding are limited, and the willingness to join forces to tackle global sustainable development issues is almost gone. There is a culture of secrecy and a lack of transparency and openness that affect all spheres of life, including the scientific field. Countries are establishing difficult barriers to international knowledge sharing, making parallel research efforts thrive in the strong national science. The relationship of society to science is largely mediated through the state, so that science remains distant from the public. In an atmosphere of tension and competition, some countries, such as China, are beginning to promote the use of national languages for scientific communication.

				Researchers' and students' mobility has decreased, and countries rely largely on their own educational resources to train the next generation. The most economically powerful countries prevail in international structures of science management. There are a large number of non-governmental organizations involved in science, but most of them are not truly independent, but serve as tools for the global ambitions of individual countries.
The nature of scientific research	Integration of the natural and social sciences is crucial to solving problems in society. New remuneration structures and online interdisciplinary journals provide impetus for the prosperity of interdisciplinary science. The spirit of cooperation and global solidarity is also reflected at the non-governmental level, with academies and funding agencies demanding creation of a single strong organization representing the independent voice of world science.	There are local research solutions designed to respond to current public challenges in individual countries. Science is becoming more widespread and socially embedded activity and is increasingly practiced outside the traditional institutes of state research systems. This partially undermines some science institutes, including the reviews and publications. The balance between "social" role of universities and the "continuous generation of knowledge" is disturbed. Studies of the "blue sky" (basic research) are diminished due to organized social pressure. In general, there is less scope for interesting research without clear short-term benefits to society.	The countries specialize in specific areas of research. In the leading scientific centres of the state, most of their funding is concentrated on research that is beneficial to the leading technology firms. Research that leads to creation of the new basic knowledge is rarely done. In more peripheral countries, multinationals are pushing governments to meet their research needs.	The state creates a less complex landscape for scientific programmes, dominated by national political needs. Guided by the geopolitical situation, the military sector is a particularly strong research centre.
Financing of scientific activity	Both global and national sources of funding are available, and investment in science is increasing in industries of high public interest.	Research is funded by local investors - national and supranational regional alliances, individual investors seeking to solve local problems	Countries are specializing in supply of only certain types of products to global markets, but are still increasingly competing for investments. These	National investment in science and technology is growing in economic centres, but other countries are lagging behind.

	A global strategic funding body is being created to address the global challenges, providing 2% of GDP to government funding of research.		investments include funding for research activities. Funding is more widely spread among the developed and developing countries, than in previous times. The ability of states to support state research systems is diminished, due to an aging society, tax evasion by multinational companies. Public sector research systems are dependent on their private funding.	

Source: drafted by the authors, according to (ISC, 2019)

2. 2. The socio-economic inequality between the countries with limited and strong scientific potential is increasing. According to the study, countries with strong scientific potential have high levels of GDP per capita. Further reduction of Ukraine's scientific potential may lead to increased dependence on countries with strong scientific potential and worsen the country's socio-economic status.

3. The impact on scientific space of international relations, globalization trends and non-state sector of the economy is increasing. For example, since 2014, there have been a number of milestones in European integration, including involvement in the European Research Area through Ukraine's participation in the EU's programme “Horizon 2020” and other international research projects. But the share of such projects remains small. Only in cooperation with other countries, by means of knowledge transfer and joint work, can the development of national science be ensured, and the sources of funding for scientific activity expanded. However, globalization trends in the development of science increase requirements for the quality of scientific research and production of relevant scientific results. Unfortunately, not all the scientific institutions, according to the existing scientific potential, can provide such quality.

4. Influence of international organizations (such as the UN, the European Commission) and society as a whole on shaping the research landscape is increasing. Thus, the UN's Sustainable Development Goals determine the direction of scientific development in many countries of the world, in particular, they influence selection of scientific projects that will receive public funding. These trends must also be taken into account when substantiating the directions of scientific activity in Ukraine - science is becoming a major driving force in solving global problems of humanity. On the other hand, the European Commission prefers to fund such domestic scientific projects that develop the benefits of the EU countries, rather than local projects, in which Ukraine is interested.

5. The importance of scientific education and general educational level of the population in relation to science and building confidence in it is increasing. Due to this tendency, Ukraine needs to pay more attention to training of highly qualified scientific personnel, as well as to enhance the low image of national science that during the recent years has developed in the country.

6. Influence of private and military structures on forming scientific landscape and the share of scientific research conducted in non-academic conditions are increasing, as well. The private sector and military science are becoming the dominant driving force for the development of science. This trend necessitates involvement of the business sector in financing of scientific activities. Thus, in 2017, 73.09% of the NTRs in the US and 65.79% - in the EU were financed from the business sector, whereas in Ukraine the latter sector financed only 34.49% of the NTRs. It is necessary to create conditions for raising interest of the business sector in innovation activities, which will increase the number of orders for scientific development and increase the total volume of financing research and development.

7. The importance of access to scientific data and information to ensure scientific progress, both at the national and supranational levels, is increasing. The general tendency of open scientific knowledge in the world may contribute to the improvement of quality and relevance of domestic research, however, simultaneously the restrictions on fluency in English (the main language of the scientific community) reduce the opportunities for exchange of scientific data between the domestic scientists and international scientific space, making Ukrainian science local.

8. Ensuring scientific integrity is of increasing importance for building societal confidence and confidence in science. This tendency is very important for Ukrainian scientific community - building confidence in society for national science is one of the basic conditions for its development.

9. The spatial organization of science is changing, and the influence of new countries with strong scientific potential is enhancing. In recent years, the impact of China, South Korea, Japan, and India on the world science has increased significantly. Therefore, Ukraine should consider not only the European scientific space, but also the countries that are rapidly developing their scientific potential as a possible area of international cooperation.

10. In addition, the joint research infrastructure is altering: the share of international research projects is increasing. Over the past 10 years, the number of international research projects in Ukraine has increased by 20%. But Ukrainian science is still detached from the global science, the level of scientific results remains low compared to the results of the leading countries of the world, Ukrainian researchers are poorly known in international circles, this is due to the existing problems in funding (inability to present the results of their scientific achievements at the well-known international conferences, or to be published in journals indexed in international science databases (Scopus, Web of science), or to obtain international patents, etc.).

11. The epistemic organization and management of science is also subject to changes (instead of traditional research, a consortium of researchers, companies, or other new hybrid institutions (integration structures) that unite different stakeholders in scientific activity is formed in the universities and scientific institutions). Organization of scientific activity in Ukraine is still going by traditional models - the level of integration of Ukrainian scientific institutions with the business sector remains very low, while attempts at the legislative level to ensure formation of scientific and innovation parks have not received support in the business environment. Addressing this problem will allow to transfer Ukrainian science to a higher level through increasing the volume of financing, and will create the basis for development of an innovative model of the Ukrainian economy.

12. The nature of access, importance and structure of scientific publications are altering. Requirements for forms of scientific results presentation, including the quality of publications, are increasing worldwide. Ukrainian researchers need to pay more attention to this issue, which may also increase opportunities for Ukrainian scientists to become involved in the global scientific community.

13. Connection between science and society is increasing and scientific research is directed towards solving global problems of humanity. Society, in general, and individual countries, in particular, Ukraine, play a significant role in the development of science. Therefore, the mission of scientific knowledge in solving global problems of humanity is especially important. Ukrainian scientists need to be involved in this process. That will allow them to gain international recognition.

14. Traditional ways of science education are changing due to increasing impact of the new organizations, businesses and communications technologies. The nature of what students are studying, the balance of disciplinary and interdisciplinary courses and the importance of theoretical and applied experience. These trends are more related to the development of university science, which in Ukraine is far behind academic. More attention should be paid to the development of university science, since implementation of its results determines the quality of scientific training, formation of scientific potential in the future and, consequently, the overall level of scientific, technological and socio-economic status of the country in the future.

15. The nature of "scientific career" is changing due to the change in the epistemic organization of science, the processes of scientific education and the direction of science. Traditional models of academic careers will evolve with new ways of evaluating scientists and evaluating research. This necessitates revision of existing systems of organization of scientific research in Ukraine, increasing the requirements for scientific personnel and the results of their scientific activity. However, the low level of remuneration in the field of science without raising the quality of scientific staff makes the field unattractive for young people. The problem of outflow of scientists from the country to countries, where the level of remuneration for scientific activity is higher, remains urgent. Introduction of new ways of evaluating scientists and evaluating their research in Ukraine should be accompanied by a means of stimulating creative and scientific activity of scientists, which needs to solve a number of existing problems, in particular, problems related to the lack of funding for scientific activities.

In the light of the above, if Ukraine intends to ensure in future its economic safety and realize transfer to the innovative economy development model, in order to remain competitive in the particular fields of economy, the research organization in the country must comply with the modern international trends. This necessitates review of the current model of managing scientific activities in Ukraine, development

of science development concept, attention to the scientific research areas, increasing of research funding through involvement of non-state sources, optimization of processes of the resources allocation, ensuring the high level of scientific training and other important issues.

Conclusions

Thus, the conducted research confirms inevitable changes of the research space, that have been observed in the last decades, and raises the requirements for the level and quality of scientific results, changes the structure of scientific research clients, broadens the scope of scientific knowledge, transforms the means of creation and exchange of information about scientific research, transforms the nature of obtaining scientific results, which influence formation of the organizational model of scientific research.

Due to the research, the general trends in the development of scientific space were identified and the main challenges facing the national science were characterized. Discrepancy between the general trends in international science and the state of development of science in Ukraine necessitates revision of the existing model of managing scientific activity in the country and development of the concept of science development.

Abstract

Numerous specificities characterize the construction industry with respect to participants, dynamics, lifetime, the value of investments, and other segments. The main participants in the construction industry are also manufacturers – most frequently entrepreneurial businesses - micro- or small enterprises – operating according to the seasonal principle. Numerous occupational risks often appear in the construction industry, and such risks must be anticipated and eliminated. In that sense, the probability of the realization of such risks, or that of potential occupational injuries or the occurrence of occupational diseases, need be reduced.The broader subject matter of the research conducted in the manuscript whose topic addresses the protection and safety of employees in the construction industry is primarily research in the scientific and professional knowledge of employees' protection at work and occupational safety, and the analysis of regulations, standards, practice. Within the framework of the narrower subject matter of the study , the perception of the possible aspects of occupational risk and how to manage them has been researched., as Also, the perception of the main occupational risks, risk management and the specificities of care for the protection and safety of employees within the framework of the construction industry, especially so with respect to construction works done in the railway sector, has been researched and analyzed in details. When referring to methods used in the paper, the method of observation (with and without participation) is applied in the primary research. Secondary research is also used in completing the study. This manuscript sets the central hypothesis indicating that employees' occupational safety and security are a very important segment of business doing and that they are paid great attention to. The hypothesis will be tested through primary and secondary research studies. Apart from that, the focus of this paper is on the improvement of the existing measures by implementing preventive measures and other means of raising employees' safety to a higher level. The paper is descriptive and analytical.

Keywords: Occupational Safety And Health, Construction Industry, Occupational Risks, Human Resources Management, Railway Sector.

Introduction

One of the major challenges for all national economies is finding out a solution and a way how to solve employment problems. For that reason, it is very often the case that, due to a large number of employees in this activity, the development and active role of construction are connected with the creation of new workplaces. Beside that, in the last two centuries, the construction industry has been one of the main factors for the stimulation of economic growth. [9]
There are mortalities every day as a consequence of an occupational accident or work-related diseases – more than 2.78 million mortalities in one year. Additionally, there are also 374 million injuries that do not result in a fatal outcome and diseases every year, many of which result in long-term absence from work. The cost of these everyday accidents is huge and represents an economic burden because of poor occupational safety and health, and the same is estimated at 3.94% of the world's gross domestic product (GDP) every year [3].

Structure of the Paper

In the first chapter, the construction industry is analyzed based on secondary research through a perception of the available reference literature on this field and the current legislation. The characteristics of the construction industry are presented, and the participants in construction works are also mentioned.

In the second chapter, which relates to employees' protection at work and occupational safety and a reference to the industry and the enterprise type, international and national regulations on occupational safety and health are introduced as well. After that, occupational risks and the measures of employees' occupational safety and health are addressed.

Chapter three is a presentation of the occupational safety and health of employees in the construction industry in light of works done in the railway sector. At the end of the paper, the conclusive considerations and analyses are presented.

Enterprises must ensure that employees have a healthy and safe work environment, first of all, because physical and mental health does undoubtedly influence the final result of an organization. Secondly, laws prescribe the safety levels that must be maintained in a work environment. The activities of an organization that are directed towards the preservation of health and ensuring the safety of the personnel are marked as the maintenance activities.

Construction Industry

In practice, the construction industry can be observed as a large number of the markets overlapping with one another, which define a certain service. These markets can be divided based on the geographic separation and based on the size, type, and complexity of the work. The separation of markets in the construction industry enables construction companies to focus their activities, adapt to dynamic changes, and stay sufficiently flexible to achieve competitiveness in different submarkets. The construction industry implies a whole spectrum of economic activities uniting into one and ending on some building, not only implying the production of a construction material and construction equipment, but also a broader notion, including constructing itself. The construction industry is a highly accumulative and exporting economic branch, and these are the attributes pertaining to it. Actually, the construction industry can be said to encompass work on new or existing commercial, industrial or domestic buildings or facilities [18].

When choosing technological processes within the framework of certain construction stages, one must consider that these are standardized, systematized, and complementary parts of overally engaged resources. This is only achieved through a detailed analysis of all possible methods for all types of works within a technological process and the creation of a technological map, i.e. a flowchart of the performance of those works. The fact which should never forget is that the choice of a construction

method and the definition of a construction technological process are tightly connected and interdependent, and that they are also connected and conditioned by the location on which a building is being constructed and the capacity of available resources, too. [27]

Participants in the construction works, i.e. construction workers, are employees in the construction industry, and they mainly work on the construction sites – performing all jobs related to construction, designing, and final works on a particular building. Construction workers may be both unqualified physical workers and highly-qualified professionals, such as electricians, plumbers, carpenters, and so on. [18]

The mentioned law bids that the construction of a building (performance of works) can be performed by a company, another legal entity, or an entrepreneur named by the law as the contractor, which/who is registered for constructing buildings, i.e. for performing construction works, and which/who possesses the needed decision on the fulfilment of the conditions for performing works on the type of buildings on which that person/entity is performing works. Suchlike a natural person or legal entity also needs to have the employees who have a license for the contractor in charge and appropriate professional results. Construction sites must be labelled properly.

A contractor may engage another company, or another legal entity, or another entrepreneur for certain works, and they are named by the law as subcontractors. A subcontractor must also meet the conditions prescribed by the Law on Planning and Construction, or the regulations promulgated based on the said law, for the performance of that type of works for which the subcontractor is engaged. In accordance with this law, the contractor is the one to determine the contractor in charge who is responsible for the management of the construction of a building, i.e. the performance of works.

The financier that the law [18] differs from the investor is "the person that, based on the concluded and verified agreement with the investor, finances, or co-finances construction, extension, reconstruction, adaptation, rehabilitation or the performance of other construction, or investment, works envisaged by this law, and, based on that agreement, acquires certain rights and obligations envisaged by this law for the investor in compliance with that agreement, except for the acquiring of the property rights on the building which is the object of such construction." Other participants in construction works are, first of all, a project manager and a project team. The project manager is the person responsible for bringing the project to completion. The project manager does not work on the implementation of the project, but is in charge of ensuring that the project is finished in the best possible manner. He/she manages a team of people who are entrusted with the task of coordinating the work of the project participants and running the works in a way that enables them to bring the project to completion. [7]

Occupational Safety and Health, Regulations and the Practice of Human Resources Management

International Regulations on Occupational Safety and Health and Republic of Serbia's Regulations

The International Labor Organization has the aim to create the awareness of the dimensions and consequences of occupational diseases and injuries and internationally address the issues of all employees' safety and health so as to stimulate and support practical actions at all levels. With respect to the institutional care of employees' protection at work and occupational safety, the International Labor Organization has greatly contributed to the improvement of the position of workers in enterprises at the international level through its activities. The International Labor Organization has promulgated about 180 conventions and over 190 recommendations that ensure a certain minimum of labor-legal and social protection of workers, also including their occupational security and safety [28].

The Law on Labor [21], the Law on Occupational Safety and Health [22], as well as the Rulebook on the Manner and Procedure of Assessing Risk in the Workplace and the Work Environment [23], regulate the implementation and improvement of the occupational safety and health of the persons taking

part in work processes, as well as the persons who happen to be in the work environment, in order to prevent occupational injuries, occupational diseases, and labor-related diseases. For the purpose of performing certain works of the State Administration in the field of occupational safety and health, this law enables the establishment of the Occupational Safety and Health Administration as the administrative authority within the Ministry of Labor, Employment and Social Policy, and stipulates its competence.

This law also makes a mention of the preventive measures for achieving occupational safety and health, which are ensured by the application of contemporary technical, health, educational, social, organizational, and other measures for and means of the elimination of risks of being injured and impairing the health of employees. This law also regulates the employer's obligations, which are simultaneously the rights of employees related to the implementation of the measures of occupational safety and health. Prior to commencing his/her work, the employee also has the obligation and the right to become familiar with the measures of occupational safety and health on the jobs or in the workplace, which he/she is assigned to, and also to train him-/herself in their implementation.

When the occupational safety and health of employees in railway traffic are concerned, the same are also the subject matter of the consideration of Law on Safety in Railway Traffic [24] and the Law on the Railway System Interoperability, too [25].

Occupational Risks

Risk management is defined as the ability to identify, analyze, and react to risk factors for the duration of the project and is in the best interest of its goals. The risk of some business can be defined as any possible event that may negatively affect the sustainability of the project. Risk represents the possibility of achieving unpredicted and unwanted events and is in connection with uncertainty. The danger arises from the possibility that unfavorable events will happen and that unwanted consequences will also happen. Risk management consists of the prediction of unexpected situations at the beginning of the project, which appear and are beyond the project manager's control. These situations can seriously impair the success of the project. Generally observed, from the manager's point of view, the risk management process includes answers to the following questions [12]:

- What will happen, and with which probability will it happen (a probability and an influence)?
- What can be done to minimize the probability of influence of these events?
- Which signs will signalize the need for such an action (i.e. which traces should actively be looked for)?
- What are the probable outcomes of these problems, and which are the expected reactions?

Project risk is based on a simple equation [13]:

Risk = (the probability of an event) x (the consequences of an event)

In other words, all risks must be assessed in the sense of two different elements: the probability that an event will happen, as well as the consequences, or effects of its occurrence. Therefore, in the project environment, it would be suitable to develop mitigation strategies so as to solve this risk, given the great probability of the occurrence of the same and the negative consequences that the risk would cause [17].

Different industries in which parent organizations exist are faced with numerous risks that can be transferred to their projects as well. In e-banking, for example, all risks represent a danger for the financial institution and by no means must they be neglected, but each one of them should be paid attention to. These risks are existent both in a microenvironment and in the organization's broader environment. Project managers, as well as executives, must undertake risk management measures to reduce risk both at the operational and at the strategic levels [14].

Risk identification implies determining the risks that can negatively impact the goals of the project and assessing which potential influences of each risk might happen should such risks occur. The assessment of each risk implies the determination of the probability that a risk event will appear and the degree of the impact that the event will have on the project goal, and ultimately risk prioritization [17].

The most frequent occupational risks are related to the very activity of the enterprise and the way in which jobs are organized, and to the work tasks that employees must perform. Risks within the framework of the construction industry can be numerous since a risky activity is concerned, since employees might suffer an injury, or their health might be threatened. Many incidents might happen on the construction site, in numerous stages of the construction of a building. It is exactly these potential possibilities of being injured that oblige enterprises to make plans and additional programs of protection. The Rulebook on the Manner and Procedure of Risk Assessment in the Workplace and in the Work Environment defines potential risks in the workplace and in the work environment and offers models for overcoming them [22].

Measures for Ensuring Employees' Safety and Health in the Work Environment

Managers and supervisors have the responsibility for the health and safety of the employed in the organization. The personnel specialist or the specialist in protection at work should help examine the circumstances due to which occupational accidents happen, participate in the creation of the deeds related to employees' health protection and occupational safety, and conduct training courses in connection with these activities. Department supervisors and managers have the main role in the maintenance of safety conditions at work and employees' health. A supervisor in a factory has several responsibilities in connection with the personnel's health and safety. For example, he/she reminds employees that they must wear their protective equipment, checks the cleanliness of the workplace, watches the employees so as to see if some of them is intoxicated or on drugs or have some other problems that might affect his/her work performance, and gives recommendations to specialists in the organization for the use of the equipment.

Supervisors and managers have the main role in the maintenance of secure conditions at work and employees' health. A supervisor in a factory has more responsibilities related to the personnel's health and safety. For example, he/she reminds the employees that they must wear safety glasses, checks the cleanliness of the workplace, watches the employees in order to see if some of them are intoxicated or on drugs or have some other problems that might affect their work performance, and also gives recommendations to specialists in the organization for equipment replacement.

The employer is required to promulgate rulebooks on protection at work, which comply with the law and match job requirements. The law determines the standards with respect to the equipment used at work and in the work environment. The employer is obliged to ensure a safe and healthy work environment, and also to inform employees about the occupational rules. A specialist in protection at work has other protection-related responsibilities: he takes care of the application of the laws pertaining to employees' health and safety, coordinates the training of the newly-employed in relation to these issues, assists supervisors in examining the circumstances under which occupational accidents have happened, develops a program of protection at work throughout the organization and participates in the preparation of a rulebook on protection at work and other materials in connection with the same. The link between the supervisor and the personnel specialist is of crucial importance in the coordination of the activities directed towards the protection of employees' health and safety. With respect to occupational accidents that might have happened, many more problems arise from employees' negligence than from machines or employers. For some time, the workers who were not satisfied with their job were considered to have a higher rate of occupational injuries. Studies have shown that young and inexperienced workers are injured more. There are some differences in the traits between the people who have never been injured at work and those who have been injured at work several times.

The engineering approach to health and safety is such that certain accidents can be prevented by designing machines, pieces of equipment and workplaces in such a way that the workers who are sometimes psychically absent or who perform mechanical jobs cannot injure themselves or injure

others, either. This engineering approach tries to prevent occupational accidents with the help of designing such a work environment in which it is difficult for employees to be injured. Installing safety equipment and protective parts on machines and plants, and installing the signalization indicating a danger makes that occupational accidents can be prevented in that way.

Occupational Safety and Health as a Part of Human Resources Management

Human resources management is a subsystem of enterprise management and falls within the competence of the managerial team leading the enterprise. Human resources management, the management of their potentials and their behavior in the work process, is a very responsible and dynamic process which helps the organization to come to the people possessing the needed abilities, qualities, and possibilities, on the one hand; it also helps the management of the organization to ensure the achievement of desired results and projected goals through influencing the behavior of individuals and groups, on the other. The successful management of human resources helps ensure for each workplace capable and responsible personnel and enable every individual and team to achieve the maximum results. [1]

Human resources management can be defined as a strategic and coherent approach to the management of the precious assets of an organization – the people working in it, who both individually and collectively contribute to the achievement of its goals. [11]Human resources management is a subsystem of enterprise management and falls within the competence of the managerial team leading the enterprise. Human resources management, i.e. the management of their potentials and their behavior in the work process, is a very responsible and dynamic process which helps the organization to come to the people possessing the expected abilities, qualities, and possibilities, on the one hand; it also helps the management of the organization to ensure the achievement of desired results and projected goals through influencing the behavior of individuals and groups, on the other. The successful management of human resources helps ensure for each workplace capable and responsible personnel and enable every individual and team to achieve the maximum results.

Human resources management can be defined as a strategic and coherent approach to the management of the precious assets of a labor organization – the people working in it, who both individually and collectively contribute to the achievement of its goals. [11] ‘’ The average employee’s mindset is focused on personal expertise at work, so the employees are trying to apply their skills at the best possible ways. It is found that, although the employees weren’t satisfied with the level of care that their company is providing to them, they still have a highly developed sense of belonging to the organization.’’ [37]

Human resources management represents a process of attracting, engaging, training, motivating, retaining and rewarding employees with the aim of creating a secure and just environment for employees, on the one hand, whereas on the other, achieving the strategic goals of the organization. That indicates the fact that human resources management is much more than “personal management” today, and that in fact it represents a philosophy efficiently moving towards the needs of the modern organization. Human resources management implies the part of the organization whose activities contribute to the achievement of the strategic goals of the same by attracting, retaining quality and professional employees, and motivating them to work effectively and efficiently. Even more briefly said, the role of human resources management is to enable the organization to achieve success with the help of the people [5].

Human resources management is a field of the science of organization dealing with the study of all aspects of employment in an organization. Given the subject matter of the research, the scientific field of human resources management has not been developing in isolation, but within a broader context of industrial changes and economic development, which is indicative of its adaptation to the turbulent and continuous changes that industrialization made in society as a whole, and especially so in human work. [4]

Human resources management is of great importance to the whole of the organization and those employed in it. The role and significance of human resources management reflects in the fact that the

right organization of activities enables the organization to engage an employee with the needed characteristics in the desired workplace, enable its employees to improve and make progress, correctly motivates and rewards its employees and, through the right coordination of all of the said activities, achieve good results for the organization. However, some studies confirm that the employees are less efficient to answer on the management's expectations if they are not sure what is expected to do [34]. Being in position to know and to plan the future performance, employees are more likely to have satisfactory performance.

The function of human resources management represents a series of diverse and interconnected processes, i.e. activities, of which the following ones have special significance: planning the offer of and demand for human resources, jobs analysis, recruiting potential candidates to fill vacated workplaces, the selection of candidates who have applied, the socialization of the newly-employed, employees' training and development, motivation, the protection of employees' health, respecting the legal and other regulations regulating labor relations and so forth. [10] Following above mentioned function of human resources management, strategic human resources management is an evolutionary stage that represents synergy of strategic planning and human resources management, in order to enable a company to achieve its goals. [35]

The human resources management process implies appropriate measures and activities in which two parties participate. On the one side, there are those who manage, at least to the least possible extent, and on the other side – those who are managed. The management of the enterprise is responsible for managerial activities. Thanks to those activities, the organization comes to employees with the needed skills and abilities, interested in achieving planned tasks and goals. On the other side, there are employees whose behavior and work are managed with the aim of making them direct their mental, physical, and other potentials towards the achievement of the goals of the organization. [2]

Given the fact that human resources management constantly changes and improves by following the trends, challenges, and changes in the field of profitable business doing, huge changes have been made in it. The relations of superiority and subordination that were being cherished for a large number of years have made room for the relations of cooperation and the creative solving of set goals, so that they raise the personality, integrity and initiative of the employee to a higher level in that way. Safety and health of employees in regard to scientific discipline or science of organization is represented by theoretical basis of human resource management as a scientific discipline. In practical terms, the same model - construction safety and health at work are usually organized within sectors or departments for human resources or general affairs. A number of studies linked to the field of science of organization or scientific disciplines research the importance of safety and health at work concerning the variables or factors that are connected with leadership, motivation, performance at work, employee productivity, quality of life at work, conflicts and similar.

Exploration on quality of life at work, that was conducted on 9240 employees in the Ministry of Labor and Immigration of the United States [38] shows that 74.4% of respondents said they were satisfied or very satisfied with their employment, however, their responses about the motives were different. Generally speaking, their widespread activity, personal development, autonomy, safety and health at work were the motives that contributed to the highest level of satisfaction among employees. However, factors such as stress, routine work, risk situation or insufficient care for the health and safety at work, discrimination and harassment are considered to be obstacles that cause the most dissatisfaction. [39]

In terms of researching safety and health at work, some authors from the United States consider safety in conjunction with hygiene (hygiene and safety at work) or with occupational health. Indeed, what we notice is that this new perspective of human resource management in organizations, that is contrary to the classical perspective, is focusing on quality, providing customer service, hygiene and safety, occupational health, access and equality among workers, participation of employees, motivation and training, environmental issues, leadership, competitiveness, performance management, innovation, creativity, etc. [40]

Value of the company Sofman in the context of research studies conducted in Greece include: health and safety at work, quality, innovation, flexibility, and employee development, highlighted by a traditional, family culture. This shows itself a very low rates of staff turnover and a large number of qualified employees who are working for decades in a company. The above mentioned study manifests that children got employed in the companies where their parents were previously engaged. [40]

In the context of the science of the organization in the segment "of work, organization and design of work" vital role has the study of health and safety at work. [41] Design of work is a term that refers to the creation of a system of work as well as work environments that improve organizational efficiency and productivity, ensuring that the organization becomes "a great place to work" and therefore contributes to the health, safety and welfare of employees. The work implies effort and application of knowledge and skills that are going to be attained. Work systems combine processes, methods and techniques that are used for performing a job. Work environment consists of work design, work conditions and the way employees are treated by their colleagues and managers. Design of work is very much linked with the organization as well as with its system of work and the working environment.

Practice has confirmed that today's, contemporary and scientific workers are not "workforce, they are capital", the capital which is productive and which creates additional value for its organization. As the creative and innovative segment of every organization, people have the leading role in the creation and maintenance of its competitive advantage. Only highly-educated, properly motivated employees can respond to the challenges imposed by a new business environment through constantly and continuously learning new business skills. [3] In regard to the efficient job engagement these factors are most relevant: emotional and rational commitment, effort and willingness to stay at the company. [33] Furthermore, ambition is a new dimension for prestige and promotion in the organization. As a result, the employee wants to receive a financial reward and to be completely satisfied by job performing in a healthy work environment.

The protection of employees' health and the safety of employees, i.e. occupational safety and health, represent the discipline dealing with the improvement of work conditions and the work environment, occupational injury prevention, occupational diseases, and labor-related diseases, the protection and improvement of employees' health. This field is regulated by the norms of different countries. In our country, it implies the creation of such conditions at work by which occupational injuries, occupational diseases and labor-related diseases are reduced to the greatest possible extent and which create preconditions for the absolute physical, psychic and social welfare of employees. [6]

An efficient system of the protection of occupational health and safety implies the physical safety and protection of employees, the emotional safety and protection of employees, as well as the social safety and protection of employees. [16]

With respect to human resources management in the construction industry, it is possible to notice certain specificities connected with construction practice. Within the framework of the theoretical approach to human resources management in the construction industry, human resources management at the level of the enterprise is most often perceived, whereas it can also be perceived at the level of processes and procedures, i.e., at the project level. [15]

The Safety and Health of Employees Performing Construction Works in Serbian Railways

The construction industry in Serbia used to be a driver of the economic development of the country, and a lot of things in the country's economy used to depend on it. Now, the situation is much more different since the workers employed in that sector are in a very difficult material position, and the average salary is lower than the Republic's average. [30]

The 2018-2022 Occupational Safety and Health Strategy states as an important goal "the promotion of the development of the national culture of prevention in the field of occupational safety and health and the field of labor relations (raising the awareness of and informing the public), with a special reference

to the small and medium-sized enterprises sector and high-risk sectors (construction, agriculture, the chemical industry, and so on)". [19] [20]

Construction is a risky activity should we bear in mind the potential risk of being injured and a threat to the health of employees. A large number of the incidents happening on the construction site also imply additional plans and programs of protection. It is important that the quality of protection at work should be increased and that much attention should be paid to risk prevention and determination. It is also needed to perceive the statistics of risk and analyze unwanted events. Unfortunately, the employee protection program is frequently only applied once unwanted events have occurred, not preventively.

Most often, accidents and injuries occur in certain stages of the construction of buildings, first of all, in the stage of construction, as well as in the stage of using and maintenance. [26] According to the data displayed by the Serbian construction industry through its Yu Build Portal, a total of 32 fatal occupational injuries were recorded in the year 2016, of which a total of 17 were in the construction industry. Injuries with a tragic outcome in the construction industry of Serbia, on average account for about 53 percent of the total injuries with a tragic outcome, and more than one-half of the victims had also worked without a regulated labor status. Apart from the Serbian construction industry, there are also the employed without a regulated labor status in other fields, first of all, in Serbia's trade and catering, but the number of occupational injuries is considerably smaller. [30] In the past year in Serbia occurred 53 injuries at work resulting in death, what is the most in the last ten years. The most common causes were a fall from a height, electric shock or drop of an object. The most who died at work were engaged in industry, then in construction, service sector, agriculture, forestry, trade, traffic and storing. About 30 percent of them were working illegally, mostly in construction. The most common cause of death or injury at work with fatal results were in the construction industry through sloughing or falling from a height. [42]

Railways represent a unique organizational and technical-technological system. [8] The most frequent construction works done in railways are the reconstruction of the upper substructure of the railway line, the reconstruction of the upper substructure of the railway track – the replacement of rolling fields, the replacement of tramlines, the reconstruction of the upper substructure of tramlines, and other works on the railway line overhaul and maintenance.

When speaking about the performance of the construction activity on the railways of the Republic of Serbia, the enterprise "Serbian Railways Infrastructure" JSC is in charge of these activities. This railway enterprise is the national manager of the railway infrastructure. In the restructuring process, it assumed the responsibility for the clear and transparent management of the assets of the railway infrastructure. [8]

Within the framework of the construction activity, the planning of the current and investment maintenance, works on the maintenance of railway lines and railway line plants and buildings are organized and conducted, as well as the supervision and safeguarding of the same. The jobs related to the planning, maintenance, and reconstruction of the construction railway infrastructure are done through sectoral departments, railway line maintenance sections and the Railway Line Mechanized Maintenance Section. According to the available data displayed on the official web presentation of the enterprise, the Construction Affairs Sector has at its disposal a qualified workforce and the rail track and construction mechanization through whom/which they perform the technical examination and measurements of branch lines, switches, level crossings and other plants, the supervision over the performance of all types of construction works on the railway line, the maintenance of branch lines, switches, level crossings and other plants, the renting of rail line mechanization, and the measurement of the geometric state of the railway track. The same source makes a mention of a huge experience gained through the everyday maintenance of the rail track construction buildings: 5,540 km of the tracks on which railway traffic is performed, 5,135 switches, 981 bridges of a total length of 47 km, 3,800 gates, 334 tunnels of a total length of 154 km, as well as 2,134 level crossings (without the territory of ZOP Kosovo Polje). [31]

In the enterprise's Information Booklet for the year 2019, it is stated that occupational safety and health affairs (as well as affairs in the field of labor relations and human resources in general) are also carried out within the framework of human resources management. [32] Occupational safety and health affairs include the jobs of risk assessment for all workplaces in the work environment, participation in the preparation of normative deeds from within the field of occupational safety and health, the drafting of a proposal for the program of employees' health protection and the control of its implementation, participation in conducting investigation of occupational injuries and their analysis, organizing the inspection and checking of work equipment and the examination of the conditions of the work environment, the examination of elevators, measuring the emission of exhaust gasses from boiler plants, checking welding devices, the organization, and checking of the training and competence of employees for safe and healthy work of those assigned to the jobs with increased risk, taking professional examinations, insurance from employees' accidents and conducting preventive checkups.

A unique, integrated, strategic systemic approach to the "fields of defense, security, situations of emergency and preventive fire protection measures based on the preplanned, preventive, active and connected action" is also ensured within the enterprise's Security Center. The system monitors the processes and activities of the mentioned fields, recognizes the sources of threats that affect the security of the people, the property and the business operations, and determines measures for risk elimination or retention within acceptable frameworks.

Having in mind that railway companies are providers of public Transport Services, along with occupational safety, passenger safety must be considered and achieved, along with their satisfaction and compare with the research results of other authors like Radnović et al [36] which may be the subject of future research.

Conclusive Considerations

The considerations presented in the paper encompass the protection of employees at work within the framework of the concept of occupational safety and health, which is most often presented in the theoretical concept within the framework of human resources management as a scientific, i.e. scientific discipline. In practice, too, the care of employees' safety and health is most frequently left to the organization and implementation inside human resources management as a business function.

The central hypothesis set in the paper indicates that employees' security and safety at work are a very important item in business operations and that they are paid great attention to, which has been proven through the primary research studies. Also, this paper has a focus on the improvement of the stated measures through the implementation of preventive measures and other means that raise employees' security to a higher level.

In Serbia, in the field of occupational safety and health in the construction industry, there is room for the improvement of practice and there is much that can be done with respect to the development of awareness, preventive actions, as well as the development of the legislative framework, standards, and inspection supervision so that a smaller number of occupational injuries could be expected in the future.

With respect to construction works in the railway, the jobs have been entrusted to the joint-stock company for the management of the public railway infrastructure "Serbian Railways Infrastructure" JSC Belgrade.

Abstract

The article shows the features of functioning of network entrepreneurial structures (typology of networks), the principles of developing a strategy, and special methods of resource allocation taking into account factors operating in the entrepreneurial network. The process of determining the policy of developing an entrepreneurial network, a vision of the strategic future of the entire network business and the participation of each strategic business unit (SBU) are presented.

Keywords: Entrepreneurial Structures, Networking, Strategic Sustainability, Factors Of The Business Environment, Principles Of Strategic Development.

Introduction

In modern business conditions, one of the tools to maintain competitive positions and ensure sustainable strategic development by entrepreneurial structures is network interaction. Network entrepreneurial structures are currently an objective necessity according to the requirements of the time, they allow being adaptive due to various types of integration, using innovative technologies, and creating digital ecosystems.

The main characteristics of entrepreneurial networks are flexibility, variability, long-term partnerships, a large number of business relations based on the interweaving of many interests of network stakeholders. By a network entrepreneurial structure we mean a set of business units that has a single strategic development policy as a whole for the network and for its individual units engaged in commercial activities based on partnerships in the implementation of various business processes, as shown in research study by Gerasimova (2016).

In the mechanism of forming a strategy for the development of network entrepreneurial structures, it is necessary to take into account the features of their functioning (typology of networks), the principles of developing a strategy, and also use special methods of resource allocation taking into account factors operating in the entrepreneurial network. It is important that entrepreneurial structures cooperate, mutually strengthen and form a balanced whole with common interests within the same network. The compatibility and unity of entrepreneurial ambitions is required that is noted in researches Håkansson and Ford (2002), Ghisi and Martinelli (2006), Kashshay (2011).

First of all, in our opinion, strategy developers should take into account the characteristics of the object of study, i.e. what kind of network business is an entrepreneurial structure, as shown in research study by Asaul (2013). An exemplary typology of network business structures is presented in table 1:

Table 1: typology of entrepreneurial networks in Russian business

Typology attribute	Type of business network
By area of distribution	Regional; Federal; International
By size	Small; Average; Large
By legal form	Holding, association, cartel, consortium, syndicate, trust, concern, corporation
By specialization	Single profile; Multidisciplinary
By type of integration	Vertical; Horizontal; Independent; Mixed; Partial vertical
By ownership	State; Private; Mixed
On implementation in space	Real; Virtual

Analyzing the market situation and potential opportunities of the entrepreneurial network, it is recommended to adhere to certain principles of formation of a development strategy. The main ones, according to Gerasimova et al (2014), are presented in figure 1:

Fig. 1: Principles of forming a strategy for the development of network business structures

In the process of determining the policy of developing an entrepreneurial network, a vision of the strategic future of the entire network business and the participation of each strategic business unit (SBU) should be formed. A strategic business unit, by opinion Aaker (2001) is any organizational unit that has autonomy in carrying out business activities and its own business strategy. An entrepreneurial network may include various structures in terms of size and financial capabilities.

It seems difficult to answer the question of which strategy will be best for each SBU if the network strategy as a whole is not thought out. A strategic idea of the future business structure should include - in what direction should the global strategy, management practice, marketing strategy, reengineering of processes occurring in the enterprise, information technology, organizational development, leadership abilities and more develop.

When substantiating strategic plans, special attention is paid to the relationships between individual business entities and the possibilities for expanding individual SBU strategies, as well as the distribution of financial resources within the network. According to the authors, the possibility of restructuring inefficient enterprises should be taken into account. The following strategic management methods, is noted in researches Kashshay (2011), Aaker (2001), Gumerov et al (2015) can be used:

• Portfolio management method;
• Restructuring method;
• Method of transferring abilities;
• Method of participation in activities.

In our opinion, to determine the strategic policy of the network, the distribution of investment resources within the entrepreneurial network and determine the development potential of each strategic business unit, it is recommended to use the method of strategic maps, based on the determination of strategic sustainability and growth rate of income (Fig. 2).

Strategic business units included in the entrepreneurial network are distributed in squares according to the characteristic of the rate of growth of income and the indicator of strategic stability. The strategic sustainability indicator has an integral form, is determined by experts on the basis of an analysis of a set of characteristics that are specific to specific business units included in the network.

Fig. 2: Strategic map for positioning business units of an enterprise network

A wide range of examination characteristics is recommended depending on the type of network and the specifics of the business. Seasonality of sales, market capacity, size and innovative business, the period of activity of the enterprise, etc. Strategic stability is expressed from 0 to 10 (characteristic from 0 to 5 - low stability, from 5 to 10 - high stability).

One indicator of the profitability of an enterprise cannot give a comprehensive description of a business unit, so it should be supplemented with a characteristic of sustainability.
This can be demonstrated by the following examples (Fig. 3):

As can be seen in Figure 3, strategic business units 1,3 and 4 have approximately the same average annual revenue. SBU1, which tends to grow steadily, will be in square III, where high stability is observed. SBU3 is seasonally dependent, if this is objective and the company is not able to influence it, then this structure will also be referred to as square III. The yield of SBU 4 is not high and is limited by the size of the market. Accordingly, when a competitor appears, profitability may tend to decrease, therefore SBU4 is assigned to square II.

SBU5 is an innovative enterprise that has good development potential and is rapidly increasing its profitability, is assigned to square IV.

Square I includes business units that have a stable income, usually these are large enterprises, but based on classical business practices and introducing little innovative technology.

Fig. 3: Different types of trends in the profitability of entrepreneurial structures

To determine the strategic choice of an individual entrepreneurial structure, one can use well-known methods of strategic analysis - SWOT analysis, competitive analysis, PEST-analysis and others. However, the fact that a strategic business unit is located on the network will have a significant impact on it. Therefore, in our opinion, it is advisable to highlight another level of factors that affect the strategic development of an individual enterprise - these are network factors (Fig. 4).

Fig. 4: Entrepreneurial network factors for developing a strategic business unit development strategy

One of the main factors of an entrepreneurial network is its business reputation. The success of each next action of network participants depends on the prevailing opinion about the enterprises included in the network: attracting investments, opening a new business, launching a new product, entering a new market, etc. Violations at any of the enterprises entering the network immediately leave a negative imprint on whole business.

An important factor is the leadership policy of the entrepreneurial network. Depending on the management style and the ambitions of the founders and strategic leadership, more or less risky decisions will be chosen, the introduction of innovative technologies and the development of innovative products, and the expansion of sales markets.

A rather complex factor is the potential for the integration of business structures in the network. Business processes of individual organizational units may not always be integrated into general network processes, may have sufficient autonomy and, accordingly, require specific activities to be taken into account when developing a development strategy.

The entrepreneurial network is trying to rationally approach the use of various resources, to integrate the processes of supply, storage, transportation. Accordingly, the task of allocating resources to individual business units, as well as the selection and support of a business with a greater development potential, becomes relevant. Limited resources in the network leads to competition between individual entrepreneurial structures, which may adversely affect the profitability of the entire network business, as shown in research studies by Perminov (2014), Fedotova (2015).

In modern business conditions, information support and the creation of digital ecosystems are of particular importance. The success of the entrepreneurial system depends on the effectiveness of their work, the safety of use.

Thus, in our opinion, when forming a development strategy for network entrepreneurial structures, it is necessary to rely on the methodological development of modern strategic management, taking into account the specifics of the object of study (such as network interaction), the principles of forming a strategy for a network business, and combining the network strategy with the strategy of each business unit (and its financial strategy), as well as factors of the entrepreneurial network. This approach will ensure the effectiveness of the entrepreneurial network and long-term strategic sustainability.

Abstract

In the presented paper, comparative analysis of the main macroeconomic indicators and indicators of foreign economic activity of the EAEU countries and the CIS countries that are not members of the Union is carried out. The study is based on hypothesis that integration processes in the CIS space have promoted the stabilization of transformation processes, preservation of old and development of new trade and economic relations between member countries of the Union. The research has shown that the EAEU members received additional advantages for national economies development over other CIS countries and have better indicators of economic development in general. It was emphasized that, in contrast to some CIS countries that are not members of the EAEU, negative macroeconomic manifestations are noted in a less degree in these countries, and the growth rates of main macroeconomic indicators have a positive and growing dynamics.

Keywords: Integration, Comparative Analysis, The EAEU Countries, The CIS Countries.

Introduction

After the breakup of the USSR, fifteen republics that were a part of it on federal basis formed fifteen new independent countries. Transition to market economy and the rupture of economic ties between enterprises of former republics as a result of their breakup, led to protracted economic crisis. International organization the CIS (Commonwealth of Independent States) was formed in 1991 in order to overcome the transformational crisis in the post-Soviet space. Ten countries were the founders of it (plus 2 countries associated members).

It was suggested that this formation would allow former republics of the USSR to preserve old and to build new trade and economic relations of these countries in new market conditions. However, within the framework of the CIS, integration processes were rather slow, and some member countries preferred formal type of participation. Role of the CIS as a unifying system has changed a lot today in the result of numerous political crises and dramatic events in Georgia and Ukraine. At the same time, the need for economic cooperation between friendly countries of the post-Soviet space continued to strengthen.

Most close trade and economic ties have developed between three countries: Russia, Kazakhstan and Belarus. These countries had formed the core of integration processes. In 2007, it was decided to create the Customs Union (CU) of Russia, Belarus and Kazakhstan in order to liberalize the movement of goods, services, capital between the countries, and to strengthen cooperative ties. In 2011, the CU was

transformed into the Common Economic Space, and from January 1, 2015, into the Eurasian Economic Union – the EAEU with fully functions. Now five countries are included in the EAEU, and there are backgrounds for its expansion.

In the modern economy, integration processes are objective condition for ensuring competitive advantages for many countries of the world. Despite short life of the EAEU, we can note a significant positive dynamic in development of its member countries. In this regard, there is a unique opportunity to conduct a comparative analysis of main indicators of foreign economic activity in the EAEU member countries and other CIS countries that are still not members of the Union. Such analysis will allow us to answer the question if integration processes over the post-Soviet space do really contribute to the economic development of the countries. We would like to explore how successfully regional trade agreements (RTAs) inspire the development of international economic relations of the Union member countries compared to other CIS countries.

Review of Relevant Studies and Problem Statement

Studies of economic integration advantages have a great foundation in economic science. The most conceptually elaborated are researches devoted to theoretical and practical aspects of European integration. Brugmans (1970), Dagtoglou (1975), Genna (2003), Baele (2004), Breuss (2016), etc. are among the most famous theorists of European integration. Practical issues of European integration related to common markets formation in Europe were studied in works of Bussiere (2005), Casu (2010), Claes (2010), Gokgos (2018), etc.

Literature analysis of European integration processes has led to conclusion that integration processes usually begin with liberalization of mutual trade, restrictions removal on goods flow, then services, capital flow. Moreover, step by step under appropriate conditions and in case of interest between partner countries, it can help to form a single economic, legal, information space within the region. New quality of international economic relations is being formed. The experience of European integration confirms that it is gradual, balanced process of targeted regulation of mutual trade and economic relations (Butorina, 2016; Goncharova et al., 2018).

Dullness and inconsistency are noted in studies devoted to integration processes analysis in the post-Soviet space (Freinkman L. et al., 2004; Shadikhodjaev, 2009; Bershadskaya et al., 2013). Prolonged political and economic crises in numerous countries hamper the development of economically sound trade and economic relationships (Sopilko et al., 2019). However, it is emphasized that trade and economic ties preservation and development between individual countries that formed core of the CU favorably influenced the development of their economies (Perskaya, 2020; Pastukhova and Westphal 2018). In this regard, it is of interest to compare key macroeconomic indicators of the EAEU member countries and other post-Soviet countries that are not members of this Union, as well as dynamics of trade and economic relations development in the context of integration processes.

Research Methodology

Comparative analysis of the EAEU countries and other post-Soviet countries that are not members of the EAEU is based on the hypothesis that integration processes helped to stabilize the transformation processes, to preserve the old ones and to develop new trade and economic relations between the countries of the Union. As a result, the EAEU countries received additional advantages for national economies development over other countries of post-Soviet space.

Conclusions and fundamental points available from the study of theoretical and practical aspects of modern integration processes development are theoretical basis of hypothesis. Methods of comparative statistical analysis of main indicators which observe foreign economic activity of the EAEU countries and the reference group (the post-Soviet countries), included Azerbaijan, Georgia, Ukraine, Moldova, Tajikistan and Uzbekistan, were used for research in the work. Within the framework of this study, we cannot describe in details the specifics of these countries, but we understand and take into account the main trends in their economies. Uzbekistan is a landlocked country, as well as four others EAEU

countries. Georgia, Ukraine (like Moldova) are selected as the most affected countries in the post-Soviet space. We perceive them as good and rather close example of destroyed economic ties of two groups of countries selected for research.

The main source of statistical information is the Data of the Eurasian Economic Commission, which is the main statistical body of the EAEU, the Interstate Statistical Committee of the CIS, as well as statistical information from the IMF and the World Bank.

Results

Comparative analysis of economies development of the post-Soviet countries

After breakup of the USSR and formation of new independent countries, numerous economic ties that were formed within the framework of one country were disrupted. Retained ties became a part of international trade and, in some cases, lost their economic feasibility. After difficult initial period of market transformations, restoration and development of economies in post-Soviet space began, as well as their gradual involvement in world economic system.

General picture of turbulence of the EAEU countries and countries of the reference group over the past 10 years is presented in the figure (Figure 1).

Fig. 1: the GDP growth dynamics, % by 2010, constant prices in 2010
Source: calculated by UNCTAD. URL: http://unctad.org/k.

Statistics data indicates that, in general, the level of the GDP growth in the EAEU countries and countries of reference group shows similar dynamics. At the same time, it should be noted that the dynamic of the GDP of the EAEU countries is more stable and does not have such strong drawdowns as countries of the reference group. The dynamics of the GDP of the reference group countries is very volatile and is characterized by periods of sharp growth and sharp decline. In 2018, two countries like Ukraine and Azerbaijan, had the GDP level well below the level of 2008. One of the reasons for such decline is the gradual breakdown of cooperation ties with the countries of post-Soviet space, while involvement level of these countries in intercompany cooperation was very high.

More stable dynamics of the GDP of the EAEU countries compared with the reference group countries can be explained by partial preservation and cooperative ties development of the countries, which contributed to the stabilization of their economic development. It is important to note that their share of mutual exports to the EAEU in total exports has a steady upward trend (Table 1).

Table 1: Mutual trade of the EAEU countries

Country / year	2015	2016	2017	2018
Trade volume with EAEU member countries, million US dollars				
Armenia	256,2	393,9	571,0	688,5
Belarus	11 007,8	11 384,8	13 651,8	13 932,2
Kazakhstan	5 120,3	3 930,2	5 262,5	6 046,8
Kyrgyzstan	410,2	447,1	541,5	640,6
Russia	28 821,2	26 804,3	34 685,6	39 953,4
The EAEU, total	45 615,7	42 960,3	54 712,4	61 261,5
Share of exports to the EAEU member countries in total exports				
Armenia	17,3%	22,0%	25,4%	28,5%
Belarus	41,3%	48,4%	46,7%	41,3%
Kazakhstan	11,1%	10,7%	10,8%	9,9%
Kyrgyzstan	28,5%	28,4%	30,7%	36,3%
Russia	8,4%	9,5%	9,8%	9,0%
The EAEU, total	10,9%	12,4%	12,6%	11,3%

Source: Eurasian Economic Union in numbers: brief statistical compilation // Eurasian Economic Commission. – Moscow, 2019. – 199 p.

The largest share of exports to the EAEU is typical for Belarus and Kyrgyzstan, the smallest share of exports is in Russia. The share of exports of more than 40% within the association means high level of complementarity, which could more likely decline even if export diversification processes are developing.

The specifics of internal division of labor in the EAEU region historically has intersectoral character, which partly allowed the countries of the region to avoid the severe destruction of national economy in comparison with other post-Soviet countries. In this regard, the formation of common commodity markets plays a huge role for the EAEU.

Increase in trade volumes of the EAEU countries is also observed in dynamics with third countries. According to the EEC, it should be emphasized that in general, trade turnover has increased from 103.3% to 118.9%, exports has grown from 113.9% to 126.8% in the period from 2015 to 2018. Total exports of the EAEU countries and countries of the reference group are presented in Figure 2.

Fig. 2: Export dynamics of countries: the EAEU (left chart), countries of the reference group (right chart), % by 2008

Source: calculated by UNCTAD. URL: http://unctad.org/k.

Statistical data shows that export did not exceed the level of 2008 over the past 10 years in most countries of the former Soviet Union (Figure 2). Only three countries can be distinguished – Armenia, Georgia and the Republic of Moldova, which export has doubled during this period. Both groups are characterized by sharp decline in exports –almost by 50% during crisis periods. It indicates a significant economies dependence on the world market. At the same time, it is important to note an obvious trend after 2015 – 2016, when the decrease in trade volumes of most countries of both groups reached 50%, trade restoration in the EAEU countries was more dynamic. It can be associated with the beginning of the Custom Union functioning. At the same time, three CIS countries that are not members of the EAEU (Ukraine, Azerbaijan and Tajikistan) have an export level of only 70-80% of 2008 level.

Prospects for the EAEU development as alternative to the CIS

Integration processes development leads to refocusing of economic ties of member countries to intra-regional cooperation. Rest of the countries that remain outside the union struggle with some difficulties in trading within grouping countries. As a result, they are also forced to join integration association. For example, "Group of Three" was found in Latin America after Mexico became a member of NAFTA (it has signed free trade agreements with Venezuela and Bolivia).

Such situation may be possible with successful development of the EAEU. Union development includes markets unification. The basis of Eurasian integration is energy sector, which plays a system-forming role for the economies of all EAEU countries. In structure of the GDP, share of fuel and energy complex of the EAEU countries is about 17%, and it reaches 33% in total industrial production. Main producers, net exporters and consumers of energy resources in the EAEU are Russia and Kazakhstan, the rest are net importers. In general, the Eurasian Economic Union has the most significant energy potential in the world.

Main facilities for petroleum products production are located in Russia, Kazakhstan and Belarus. Basically, the EAEU countries import oil for refining and oil products for their own needs chiefly from Russia. In 2017 gasoline, diesel fuel and fuel oil (1.8 and 1.2 million tons) were delivered from Russia

to Kazakhstan and Armenia, gasoline and diesel fuel (960 and 940 thousand tons) were delivered to Kyrgyzstan and Belarus.

Russia and Kazakhstan export gas both to markets of the EAEU countries and to the third countries. The level of gas export orientation is 32% and 25% for Russia and Kazakhstan. Net exports of gas for 2015–2017 significantly increased in Russia (by 40.5 billion m^3 – by 21.7%) and Kazakhstan (by 6.2 billion m^3 – by 93.5%). Gas demand in Armenia and Belarus is almost completely covered by supplies from Russia, Kyrgyzstan exports it from Kazakhstan. Mutual deliveries are made between Russia and Kazakhstan for the purpose of gas supply to the northern regions of the country.

Service Markets Formation

Along with common product markets formation in the EAEU region, common service markets are also actively being created (since 2015), covering about forty-three separate service sectors, and in the near future twenty-one more areas of the economy will be covered.

It is not yet possible to quantify the intensification of trade in services between the EAEU countries due to the lack of sufficiently complete statistical data in this context (the EEC data concerning services as of middle of 2019 was presented only for the period of 2010–2017 without detailed information about mutual trade in services). However, available statistics allowed to reveal a number of certain trends. Firstly, Belarus is the only country with positive balance of trade in services among the EAEU member countries. Transport services prevail in export structure of services in Belarus, Kazakhstan and Russia, while tourist trips dominate in Armenia and Kyrgyzstan. Moreover, this structure has been preserving since 2010. The largest share is made by tourist trips in imports structure of service in Armenia, Kyrgyzstan and Russia, transport services prevail in Belarus, building and construction dominates in Kazakhstan (Table 2).

According to the data of balance sheets of the EAEU countries, total turnover of services amounted to 175.4 billion US dollars in 2017. It is for 14.6% more than in 2016. However, in 2016 volume of services turnover in the EAEU was for 9% lower than in 2015. Such statistics for 2017 emphasizes the necessity for more dynamic development of services sector and the openness of member economies in this field.

Table 2: Dynamics of services export and import by the EAEU member countries, million US dollars

Exports								
Type of service	2010	2011	2012	2013	2014	2015	2016	2017
Transport services	20 422	23 403	25 653	27 748	28 493	23 539	23 959	27 239
Trips	11 081	14 102	14 043	15 712	15 482	12 044	11 444	13 075

Labor Market Formation

From the beginning of the EAEU creation, the labor market began to develop at fairly high tempo within the region. It is determined by such indicators as population growth rate of countries, as well as supply and demand for labor.

In Kazakhstan, Kyrgyzstan, and Uzbekistan, in the EAEU countries and countries of the reference group, the lowest birth rates are observed in Ukraine and Moldova. They remain low, but have a positive trend in Russia, Belarus and Georgia. Birth rates remain high and stable in Kazakhstan, Kyrgyzstan, and Uzbekistan.

Under the current conditions, it is obvious that population migration and movement of large manpower masses is directed towards more developed and geographically endowed countries, including neighbors. Stability of labor relations, liberalization of labor and finance markets in the EAEU space ensured the expansion of labor migrants' participation from all countries of the region in Russia and Kazakhstan (Table 3).

Rapid development of labor market in the EAEU region was facilitated by the creation of some regulatory documents, including the list of key advantages over migrants from other countries. Such advantages have increased the flow of migrants within the region, as well as simplified and legalized their residence.

Gradual growth of domestic economies and employment in the EAEU countries opened job opportunities in the domestic markets of those countries, but at the same time, did not allow providing a sufficient level of income for many participants of the process. According to statistics, the number of employees in most countries of the EAEU has grown after decrease connected with the crisis of 2009, especially with the Customs Union creation and the beginning of Integration Treaty. On one hand, such conditions have ensured employment growth, and at the same time have encouraged labor migration within the Union.

There is no doubt that Russia is attraction center for migrants from the EAEU countries. Since 2010, the number of migrants from member countries has more than doubled (from 74 thousand people in 2010 to 156 thousand in 2016), but migrants share from the Union countries in relation to migrants from other countries has decreased from 39% to 28%. This decrease is mainly due to migration increase from the reference group countries.

According to the EEC in 2017, the migration balance for Armenia, Kazakhstan and Kyrgyzstan was negative, for Russia and Belarus it was positive. Russian statistics has led to conclusion that number of people entering the country greatly exceeds the number of emigrants from Russia to the EAEU countries (it is mostly typical for Kyrgyzstan). Such difference grows in time and is encouraged by the conditions for labor migration created inside the region in the framework of common labor market formation.

Relations development between the countries in the framework of trade intensification and labor migration increasing has an impact on national funding of the countries. Data analysis of cash flows from labor migrants showed that the largest volumes are associated with labor migration from/to Russia, which is one of the leading donors to neighboring countries through personal funds transfer channels. The main funds flow is directed to Armenia and Kyrgyzstan, the EAEU countries, where the competition is observed in the migration field of Russia. In Russia, huge flows of migrants from Uzbekistan, Tajikistan, Ukraine and other countries are noticed.

At the same time, personal savings play special role. In such countries as Kyrgyzstan, personal transfers are practically the same as level of national savings. Taking into account high savings ratio in this country, it also indicates a high rationalization of funds application from outside.

Capital Market Formation

Important aspect of integration processes development in the region is capital market formation. The main resources for investment in each country are internal business savings, credit, or government funds. Special role, although not the dominant one, is played by foreign direct investments, which allow to develop business without debt burden increasing, and attract management experience and technology.

Mutual foreign direct investment (FDI) increasing is observed in the Eurasian Economic Union (the EAEU) after three years of decline in 2013–2016. Statistical data of the World Bank and the ECE regarding investments is sufficiently incomplete and is published with significant delay, so it seems possible to evaluate investment indicators only for the period 2017–2018. (Table 4).

Table 4: Mutual direct investment structure in the EAEU countries, net flows for 2017–2018, million US dollars

		Investment recipients					Total
		Armenia	Belarus	Kazakhstan	Kyrgyzstan	Russia	
Investors	Armenia		3,1	0,1	–	4,8	8,0

Source: EEC, "Mutual Investments of the EAEU Member Countries" [Electronic resource]. - Access mode: http://www.eurasiancommission.org/ru/act/integr_i_makroec/dep_stat/fin_stat/express_information/Documents/mutual_investments/express_mi_4Q2018.pdf.

According to the ECE statistics, FDI stocks have amounted about $ 24 billion in the EAEU countries at the beginning of 2019. This is for 2.5% higher in comparison with the previous year.

Russian companies are the largest exporters of capital to the EAEU (over 78% of FDI exports). Kazakhstan goes second (13.5%), Belarus is third (7.8%).

What is new is that now Russia not only directs its investments to the EAEU countries, but also receives them from its neighbors. The accumulated volume of FDI from other EAEU countries reached $ 5 billion. The main recipients of FDI are still Belarus ($ 8.6 billion by the end of 2016) and Kazakhstan ($ 8.2 billion by the end of 2016).

Regarding investment areas, according to statistics, in 2016 Russia's neighbors invest mainly in the Russian chemical industry – 35.1%, agricultural sector – 15.8%, and transport sector – 14.2% of the volume imported FDI from the EAEU countries. In addition, Kazakhstan's investors participate in Russian hotel industry (14%).

Russian companies have increased investments in all EAEU countries. At the beginning of 2017, Russia mostly invested in Belarus ($ 8.5 billion) and Kazakhstan ($ 8.2 billion). Armenia comes next ($ 3.4 billion) and then goes Kyrgyzstan ($ 0.9 billion).

In order to promote an economic growth of participating countries within the framework of integration development in the Eurasian space, Russia and Kazakhstan established the Eurasian Development Bank (EDB) in 2006. Armenia, Belarus, Kyrgyzstan, and Tajikistan joined the EDB in 2009–2011. The authorized capital of the EDB ($ 7 billion) allows the Bank to act as regional financial mechanism in the Eurasian space, to be coordinator and manager of the funds of the Eurasian Fund for Stabilization and Development (the capital of the EFSD established in 2009 amounted $ 8.5 billion).

Currently (as of September 1, 2019), the EDB investment portfolio is $ 3.896 billion, and the Bank's balance sheet portfolio at that date is $ 2.611 billion (excluding provisions and discounts). At the same time, total number of its investments in the economies of the EAEU and Tajikistan reached $ 8.198 billion. The activities of the EDB is up to 96 projects in participating countries. As practice shows, on the part of the Bank, special attention is paid to financing priority projects in the field of energy, transport and infrastructure; the implementation of information-analytical and forecasting studies in the field of financial market of the EAEU, the CIS and other countries of Eurasia. The proportion of such projects amounted about 20.1% (energy) and 17.9% (transport and infrastructure) of the current investment portfolio[1].

Conclusions

Despite short life span of the EAEU and initial process of unified institutions forming that have not yet been able to influence the development of the Union countries in full, it can be already suggested that there is positive impact of integration on the GDP of countries, international trade, and on mutual trade of the member countries.

In the EAEU, in contrast to other countries of reference group, negative macroeconomic consequences are observed in less degree, and the growth rates of main macroeconomic indicators have positive and growing dynamics, which confirms the advisability of developing integration processes in this region. Key element that can impact on integration processes in the post-Soviet space might be the speed of integration processes: the formation of institutions and common markets. While successful development of the EAEU project, an effect associated with relative increase in competitive positions of the member countries over neighboring countries that are not members of the Union may firstly arise. Even now, we are observing a significant decrease in the GDP levels of some post-Soviet countries. One of the reasons was breakdown in cooperation ties and decrease in mutual trade. There is also a significant increase of mutual trade indicators of participating countries. With further integration processes development in the EAEU, «Domino» effect may arise. It's associated with the necessity to join the Union for a number of post-Soviet countries on the basis of associate or full membership for trade and economic ties maintaining.

As a part of the EAEU integration, the processes of common markets forming for goods, services, capital and energy resources have been successfully launched and are still continuing. The first results of common markets creation should be recognized as significant and successful. There has been increase in main indicators of mutual trade of the EAEU member countries in goods and services markets, as well as trade with the third countries, which indicates the efficient functioning of the Customs Union and the Common Economic Space. In the field of common energy and energy markets formation, there are some unresolved problems related to gas, oil and oil products markets, even though development and approval stage of the programs for the EAEU common energy markets creating is basically completed. It is expected that these markets will be fully formed by 2025. But at the same time, it should noted that energy integration remains one of the most important areas for the Eurasian Economic Union development, which is expected to bring significant economic benefits in the long term and is the core of economic integration process as a whole.

The liberalization of migration policy within the EAEU allowed getting free labor movement and entrepreneurial resources between participating countries. It has resulted in multiplication of joint ventures and projects between companies from the EAEU member countries. Common capital market formation makes it possible to increase the flow of mutual investments between the EAEU member countries in all key industries.

Selected Models of Recurrent Events in the Assessment of the Risk of Subsequent Registrations in the Labour Office

Beata BIESZK-STOLORZ

University of Szczecin, Institute of Economics, Finance and Management, Szczecin, Poland,
beata.bieszk-stolorz@usz.edu.pl

Abstract

The problem of occurrence of recurrent (multiple) events occurs in many areas. In economic and social sciences, it is possible to analyse the time of entering and leaving the sphere of poverty, the time of subsequent guarantee or insurance claims, as well as the time of subsequent periods of unemployment. It happens that persons looking for job use the Employment Office several times. The research motivation is the will to identify features which significantly influence the subsequent registration in the office. The aim of the article is assessment of the risk of subsequent registrations in the labour office depending on selected characteristics of the unemployed: gender, age, education and seniority. In the study, methods of survival analysis were used. The results obtained for four models were compared: Anderson-Gil model (the counting process model AG), Prentince-Williams-Peterson conditional models: total time (PWP-CP) and time gap (PWP-GT), and Wei, Lin and Weissfeld model (marginal model WLW). These models are the extensions of the Cox proportional hazards model. The AG model does not distinguish between first and next events. The number of events that occurred is important. The other three models are based on the stratified Cox model. They differ in the way risk intervals are determined. The strata are consecutive events. The study used anonymous individual data from the Poviat Labour Office in Szczecin (Poland). In the analysed period, only age and education influenced the risk of multiple registrations. Gender and seniority did not have a significant impact on this.

Keywords: Cox Regression Model, Recurrent Events Models, Risk Of Registration In The Labour Office.

Introduction

Since 2013, the economic situation on the Polish labour market is improving. This is reflected in the decreasing unemployment rate, the number of persons registered as unemployed and the increased outflow of persons registered in labour offices. From the point of view of social policy, it is important to activate the unemployed persons and take up employment. The best solution would be to take up a permanent job or start a long-term business activity. Unfortunately, statistical data show a high percentage of people returning to the labour office and registering again. In 2004 it was 68% of registered persons and it was a minimum value in the period 2004-2018. Since then, this percentage has increased and remains relatively stable. In 2016 it was 83% (the maximum value in the presented period), and in 2017-2018 - 82% (Fig. 1).

In the presented study, methods derived from the survival analysis were used to analyse subsequent registrations in the labour office. The duration of the unit in a specific state is analysed until the moment of occurrence of the specific event ending the observation. They are derived from demography and technical sciences. In the past, they were used to study the duration of human life and failure-free operation of devices. They are now also used in the analysis of the duration of economic phenomena. The investigated phenomenon may result in the occurrence of a specific event (death, illness, failure, company failure, entry into unemployment, entry into or exit from the poverty sphere). The event may not occur before the end of the observation period. Such observations in the analysis of duration shall be taken as censored. In addition to observations not yet completed before the end of the observation period, censorship includes those where the observed entity disappears from sight or there is an observation ending event that excludes the occurrence of a relevant event (Pepe 1991), i.e. a competing event.

Fig. 1: Inflow and outflow of the registered unemployed and the registered unemployment rate in Poland in the years 2004-2018

A very important issue is the analysis of processes, during which the unit can be in the state defined by the study several times. These processes can be analysed using selected methods from the area of survival analysis. These methods in the technical sciences are used for testing downtime on assembly lines or for analysing software fault detection and troubleshooting processes. In medical science, the time until the relapse of disease symptoms is examined (Sagara et al 2014). In economic and social sciences, it is possible to analyse the time of entering and entering the sphere of poverty (Sączewska-Piotrowska 2014) or the time of subsequent guarantee or insurance claims. The analysed random variable T in such studies is the time to occurrence of the event.

The aim of the study is to assess the risk of subsequent registrations in the labour office depending on the characteristics of the unemployed (gender, age, education, seniority).

Risk intervals in the analysis of recurrent events

Multiple events (recurrent events) are defined as processes that repeatedly generate specific events (Oakes 1992, Hosmer and Lemeshow 1999, Therneau and Grambsch 2000, Machin et al 2006, Cook and Lawless 2007, Aalen et al 2008). The problem of their occurrence is present in many fields of science. In the technical sciences, this involves testing downtime on assembly lines or analysing processes for detecting and removing software errors. In medical science, this is a study of the time until the recurrence of symptoms of the disease. Such events are also analysed in economic and social sciences. It is an analysis of the following times: entering and leaving the sphere of poverty (Sączewska-Piotrowska 2014), guarantee or insurance claims, duration of unemployment (Gałecka-Burdziak 2016, Bieszk-Stolorz 2018). Fig. 2 shows examples of objects with recurrent events. Objects 1, 2 and 3 experienced one, two and three full events respectively. Subject 4 has suffered two complete incidents and subject 3 is being censored. This censorship is related to the end of the observation period. Object 5 suffered an event that initiated the process, but did not suffer a final event. In this case, the observation is also censored because of the loss of a unit from the observation field. The intervals between successive events are often referred to in literature as episodes.

In case of recurrent events the time is indexed in two scales: calendar and between consecutive events (González 2006). In this case, risk ranges (episodes) shall be defined, i.e. the ranges within which the unit is exposed to an event along a given time scale. There are three types of such intervals: the time gap, the total time and the counting process (Prentice et al 1981, Kelly and Lim 2000). Intercurrence time (gap time) is time between events. In order to determine it, the clock is restarted after each subsequent event (Fig. 3). In case of total time, the clock is not restarted, i.e. the time is counted from

the selected point on the time scale. Most often it is the beginning of the observation of the unit (Fig. 4). Counting process is a combination of calendar time and time gaps. In this case, the time is calculated on the same scale as the total time, but the fact that the beginning of each subsequent period coincides with the end of the previous period is taken into account (Fig. 5). The common feature of all presented methods of determining the time is the same risk range for the first event.

Research Methodology

The basic concept of the duration analysis is the duration function (survival function) which determines the probability that an event will not occur at least up to time *t*. It is defined as follows:

$$S(t) = P(t < T) = 1 - F(t) \tag{1}$$

where:

T – duration of the phenomenon,
F(*T*) – cumulative density distribution of the random variable *T*.

The most commonly used estimator of the survival function is the Kaplan-Meier estimator (Kaplan and Meier 1958):

$$\hat{S}(t) = \prod_{j:t_j \leq t} \left(1 - \frac{d_j}{n_j}\right) \tag{2}$$

where:

d_j – number of events at the moment t_j,
n_j – number of threatened entities until the moment of t_j.

The second function used in the survival analysis is the hazard function. It describes the intensity of the event, i.e. the probability of the event occurring at moment t provided that it survives to time t, and is defined as follows (Kleinbaum and Klein 2012):

$$h(t) = \lim_{\Delta t \to 0} \frac{P(t \leq T < t + \Delta t | T \geq t)}{\Delta t} \tag{3}$$

In this case, the semiparametric model of Cox proportional hazard, defined by the formula (Cox 1972, 1975), is popular:

$$h(t, X) = h_0(t) \exp\left(\sum_{i=1}^{n} \beta_i X_i\right) \tag{4}$$

where:

t – time,
$X = [X_1, X_2, \ldots, X_n]$ – vector of explanatory variables,
$h_0(t)$ – basic hazard.

In the case of recurrent events in the study, models that are an extension of the Cox regression model may be used. Replacement of recurrent events models has been applied: Prentice, Williams and Peterson (1981) (counting process model – PWP-CP, time gap model – PWP-GT), Andersen and Gill (1982, AG), Wei et al (1989, WLW). Each unit (i) present in the study is assigned successive events that form strata. The model (4) therefore takes one of two forms (Sousa-Ferreira and Abreu 2019):

$$h(t, X_{ik}) = h_0(t) \exp\left(\sum_{j=1}^{n} \beta_j X_{jik}\right) \tag{5}$$

$$h(t, X_{ik}) = h_{0k}(t) \exp\left(\sum_{j=1}^{n} \beta_j X_{jik}\right) \tag{6}$$

where:

t – time,
$\beta = [\beta_1, \beta_2, \ldots, \beta_n]$ – vector of model's parameters,
$X = [X_1, X_2, \ldots, X_n]$ – vector of explanatory variables,
$h_0(t)$ – basic hazard for all events,
$h_{0k}(t)$ – basic hazard for all events from episode k,
i – the number of the object,
k – the number of subsequent episode.

To assess the relative intensity of the event, the hazard ratio (*HR*) determined by the following formula is used:

$$HR = \exp \beta_j \tag{7}$$

In addition to basic hazard, these models differ in the time formula used, which is linked to different risk ranges.

In the Prentice, Williams and Peterson (PWP) models, the hazard function has the form (6). It is assumed that for each episode g the basic hazard is different. Thus, the intensity of the event is considered in strata, i.e. the events that occur in an orderly manner are analysed. The risk of another event occurring is affected by the previous event. The PWP model allows to save risk intervals in two possible time scales: the counting process or the time gap. In the model, the larger the sequence of events, the smaller the size of the subsequent strata, which may lead to unreliable estimates (Cai and Schaubel 2003). Therefore, in order to avoid such a situation, the number of strata should be carefully selected.

In the Prentice, Williams and Peterson models, for the Counting Process (PWP-CP model) the intervals are counted. The counting process is the determination of a time from the start of a study where the initial time of each risk interval coincides with the end of the previous event. In this case, the risk set indicator is defined as:

$$Y_{ik}(t) = I(t_{i(k-1)} < t < t_{ik}) \tag{8}$$

The Prentice, Williams and Peterson gap time models (Gap Time, PWP-GT) are based on the time interval between two events. The clock restarts when each event occurs. The indicator of the risk set is defined as:

$$Y_{ik}(\mathrm{t}) = I(g_{ik} \geq \mathrm{t}) \tag{9}$$

where $g_{ik} = t_{ik} - t_{i(k-1)}$ represents the observed time of interruption between two consecutive events. Instead of basic hazard $h_{0k}(t)$, basic hazard $h_{0k}(t_{ik} - t_{i(k-1)})$ is therefore being considered.

In the next model – Andersen and Gill (AG model) – the hazard function has a form (5). In this case, strata are not considered and the assumption that the basic hazard is the same. The unit is still assigned several events, but they are not ordered. Events have the same risk of occurrence. Similarly to the PWP-CP model, the periods are counted. The risk set indicator is defined as:

$$Y_{ik}(t) = I(t_{i(k-1)} < t < t_{ik}) \tag{10}$$

This model was developed for situations in which events do not depend on the observed time from the last event, nor on the number of events that occur red before. Although counting the formulation of the process requires a conditional structure of dependencies, among the events it is assumed that the times between them are independent. Some authors believe that the AG model is the simplest model, but the one with the strongest assumptions (Therneau and Grambsch 2000, Cai and Schaubel 2003).

The last of the presented models – Wei, Lin and Weissfeld model (WLW model) has the hazard function calculated by means of the equation (6). It is therefore a stratified model with a differentiated function of basic hazard. The risk intervals are based on the total time, i.e. the time from the start of the observation. The indicator of the risk set is defined as:

$$Y_{ik}(\mathrm{t}) = I(t_{ik} \geq \mathrm{t}) \tag{11}$$

There are similarities and differences between the presented models. PWP and WLW models are the stratified ones and have the same hazard function, but differ in the definition of risk intervals. The AG and PWP-CP models have the same defined risk interval, but differ in their basic hazard function. The main limitation of PWP models is that they can give unbelievable results for higher-order events. As the sequence of events increases, the number of objects in the risk range decreases. The construction of the data set in the WLW model allows to avoid this problem.

Data used in the study

In the study, individual data on the unemployed persons registered in the Poviat Labour Office in Szczecin (Poland), generated from the Syriusz system, were used. The data included information on the dates of subsequent registrations and de-registrations, gender, age, education and seniority. Earlier studies indicate that these features are determinants of exiting unemployment of people registered in the Poviat Labour Office in Szczecin (Bieszk-Stolorz 2017, Bieszk-Stolorz and Dmytrów 2019). Among the registered persons, those who were first registered in 2016 were distinguished. The cohort consisted of persons registered for the first time in 2016 and were observed until the end of 2017. The entire history of their registrations was analysed. Subsequent registration in the office was accepted as an event. As a starting point for the observation of each person ($t = 0$), his/her first registration was accepted. Each history consists of events, i.e. successive registrations in the office. These are the recurrent events. Among the observed persons, the highest number of them consisted of persons that did not register again in the analysed period (2808 persons) and there were 836 returning persons. A

total of 3644 histories were analysed. After a preliminary analysis of the number of events in the history of registrations, it was decided to divide them into four groups: without subsequent return, with one, two and three or more events. The separation of the latter group resulted from the small number of people registered with at least three events. The number of separated groups is presented in Table 1. Due to such defined events, censored observations appeared. These are observations in which a given unit suffered the *k-th* event subsequent registration at the office for $k = 1, 2, 3$, and did not experience, by the end of 2017, an event with the number $k + 1$. In the case of the study, all observations are of the same nature as object 4 in Fig. 2. The observation period ended at the end of 2017, but the observed persons may register again with the labour office in the future. The calculations were performed in the R environment by means of the `survival` package.

Table 1: History of registrations by the number of events

Number of events (subsequent registrations)	Number of histories
0	2,808
1	648
2	144
3 and more	44
Total	3,644

The study took into account four characteristics of the unemployed: gender - a dichotomous variable: gender: women (1), men (0, reference group); education – five levels: at most lower secondary (S_1, reference group), basic vocational (S_2), general secondary (S_3), secondary vocational (S_4) and higher (S_5); age – six age groups: 18-24 (W_1, reference group), 25-34 (W_2), 35-44 (W_3), 45-54 (W_4), 55-59 (W_5) and 60+ (W_6); seniority (D) – two groups: people with no professional experience (0, reference group) and people with professional experience (1).

Analysis of subsequent registrations in the labour office

The study was carried out in two stages. The first one consisted in a joint analysis of events, and the second one was an analysis for subsequent events. Both stages were preceded by an initial analysis of the duration of individual episodes in order to justify the choice of the methods used. First, the median and the maximum duration of subsequent event-end episodes were determined (without taking into account censored observations). Both the median and the maximum time in the analysed period were shortened. It follows that if a person re-registered in the office, they did so more and more quickly (Table 2).

Table 2: Median and maximum time to occurrence of subsequent events

Number of subsequent deregistration	Median (months)	Maximum (months)
1	6.7	21.3
2	5.1	18.3
3 and more	2.2	12.0

Since the distribution of duration between subsequent episodes is unknown, it was decided to use non-parametric (Kaplan-Meier estimator) and semiparametric (methods based on the Cox regression model) methods derived from the survival analysis. Decreasing number of subsequent layers does not affect the applicability of these methods. In one of them (WLW model) the number of all layers is equalised by adding censored observations. In the next step the Kaplan-Meier estimators were calculated (Fig. 6).

Fig. 6: Kaplan-Meier estimators

The analysis of Kaplan-Meier's estimators indicates that the probability of survival decreases with the observation of recurrent events. Subsequent events carry an increasing risk of occurrence. Differences between the survival curves therefore justify the use of methods for analysing multiple events.

In the first stage of the study, a total analysis of the events was carried out using all four models: PWP-CP, PWP-GT, AG and WLW. It was examined whether there are significant differences between the successive events and whether the characteristics of the unemployed influence the risk of subsequent registrations in the office. The results are presented in Table 3.

Table 3: Hazard ratios for all episodes combined base d on the PWP-CP, PWP-GT, AG and WLW models

Variable	PWP-CP	PWP-GT	AG	WLW
P	0.9752	0.9702	0.9740	0.9799

D	0.9605	0.9655	0.9415	0.9318

**** p = 0.001, ** p = 0.01, * p = 0.05*

All the models gave similar results. Gender and seniority did not determine the risk of subsequent registration in the office. People with at most lower secondary education or up to 24 years of age were most at risk of being subsequently registered in the office. This risk decreased as education levels increased. However, for people with higher education, it increased again. In the case of age groups, the lowest risk was observed in the 55-59 age group. In both models the risk was 38% lower than for people aged 18-24. For people aged 60+ the parameters of the model were statistically insignificant.

In the second stage of the study, the relative intensity of subsequent events was analysed. It was examined whether the characteristics of unemployed people influence the risk of *k-th* registration in the office. In this case, models based on Cox's layered regression model, i.e. models, were used: PWP-CP, PWP-GT and WLW. Table 4 shows the hazard quotients for subsequent episodes determined using these models.

Table 4: Hazard ratios for subsequent episodes based on PWP-CP, PWP-GT and WLW models

Variable	Model	Episode 1	Episode 2	Episode 3
P	PWP-CP	1.0131	1.0042	0.7311
	PWP-GT	1.0131	1.0106	0.6478
	WLW	1.0131	1.0395	0.6416

	PWP-GT	0.6381	1.5251	2.1455
	WLW	0.6381	1.1591	4.9112*
D	PWP-CP	0.9680	0.9291	1.2199
	PWP-GT	0.9680	0.9435	1.2767
	WLW	0.9680	0.8161	0.9230

**** p = 0.001, ** p = 0.01, * p = 0.05*

According to the assumptions, the estimators for the first event are the same. Women did not differ significantly from men in terms of the risk of subsequent registration for each episode. Education and age (except for the oldest persons) differentiated between the unemployed only in the case of the first event. Professional experience was not a determinant of the intensity of unemployment exit. The analysed features were not determinants (with small exceptions) of the intensity of second, third and subsequent registrations in the labour office.

Conclusions

The paper presents a review of four methods useful in the analysis of data of subsequent events and applies them to model the event consisting in subsequent registrations in the labour office. The declining median and the maximum value of time until the next registration indicate that people who repeatedly register at the office have problems with finding a permanent job or are not interested in it. In the analysed period, only age and education influenced the risk of multiple registrations at the Poviat Labour Office in Szczecin. Gender and seniority did not have a significant impact on this. The analysis performed in each stratum, i.e. for subsequent registrations, confirmed the impact of the same features in the first stratum, i.e. on the first subsequent registration. In general, it can be stated that the analysed characteristics of the unemployed did not have a significant impact on the second and subsequent returns to the labour office. The risk of subsequent registrations was highest in the case of people with low education (and then with higher education) and aged up to 24 (and then at the age of 25-34). Young people had the biggest problem with finding a permanent job. The high intensity of subsequent registration in the case of people with higher or basic vocational education may be a sign of the search for a good job by people with high qualifications. Women and men as well as people without and with professional experience were equally at risk of being re-registered at the labour office. The result could be influenced by the number of strata. The number of observations decreased with the next event. This may have affected the reliability of estimates in the last strata, especially in PWP models. However, similar results were also obtained by means of the WLW model, where the construction of the data set eliminated the problem of decreasing number of events in particular strata.

Differentiation of The Impact of Taxation on The Propensity to Take Up Self-Employment

Adam ADAMCZYK

University of Szczecin, Szczecin, Poland
adam.adamczyk@usz.edu.pl

Abstract

The article examines the impact of tax incentives on the choice of form of work performance in Poland. In particular, an attempt was made to answer the question whether the impact of tax incentives on taking up self-employment depends on the employment industry, profession, level of education, gender and age of the taxpayer. The microsimulation model was used to determine tax benefits. The study of the relationship between self-employment and tax benefits was carried out using probit regressions. The results of the analysis lead to the paradoxical conclusion that in most taxpayers' tax incentives have a negative impact on the choice of self-employment, which may be a consequence of the phenomenon of income concealment. A positive effect occurs only in the case of taxpayers performing basic professions and employees in industries strongly associated with the public sector.

Keywords: self-employment, taxation, underreporting

Introduction

One of the basic problems that tax policy researchers deal with is how taxes affect taxpayers' behaviour. From the point of view of the impact of taxation on the economic condition of the state, the consequences it has for business activities are usually analysed. Particular attention is paid to the impact of taxation on activities that are potentially most sensitive to changes in the operating conditions of a group of entities - small businesses, including the self-employed. On the other hand, tax policy is very often used as a tool to support self-employment.

Politicians usually have predefined objectives when pursuing policies to support self-employment. The two most frequently mentioned reasons for applying the support for self-employment are the desire to reduce unemployment and support innovation. However, research shows that not all groups of the self-employed are characterised by a similar capacity to create new jobs (Mason & Brown 2013) and a similar level of innovation. According to Shane, the state should eliminate support for those companies that have a low growth generating potential (Shane 2009). Other studies, on the other hand, recognise that innovation is not a characteristic of all the self-employed, distinguishing real entrepreneurs from other self-employed people (Plotnikova, Romero, & Martínez-Román 2016). This means that supporting self-employment will not always lead to improved innovation. There is therefore a need to profile tax incentives so that they support those self-employed who can best contribute to the objectives of the state.

On the other hand, effectiveness in achieving state policy objectives depends not only on whether the supported entities can implement state policy, but also on whether they respond to the incentives. As is clear from earlier studies, the sensitivity of employment to tax incentives varies significantly between taxpayers. According to Meghir and Phillips, the impact of taxation on the provision of work depends on such factors as gender or level of education (Meghir & Phillips 2008). The motivation of the paper is to answer the question whether the differences in the impact of taxation may also relate to self-employment.

The purpose of the article is therefore to answer the question whether different groups of Polish self-employed respond differently to tax incentives that encourage or discourage self-employment. Tax incentives are understood here as the difference in the level of personal income taxation and social security contributions between employees and self-employed taxpayers receiving the same gross income. Although there is quite extensive literature on the impact of taxation on self-employment, including selected self-employed groups, it lacks a comprehensive study showing how sensitivity to tax incentives depends on the individual characteristics of taxpayers. To answer the question whether the impact of taxation on the propensity to take up self-employment varies depending on such characteristics as gender, occupation, level of education, age or sector, a two-stage analysis based on data from the EU SILC study supplemented with information supplemented by information from the Polish statistical office was carried out. The data were collected in 2017 and concerned Polish taxpayers who are natural persons. Using the Euromod microsimulation model, the tax benefits that can be obtained by changing the form of work from employment to self-employment were determined for individual taxpayers. Next, the whole group of taxpayers was divided into subgroups taking into account such features as gender, education level, age, occupation, and then for each group a probit regression of self-employment was estimated.

The results show that the impact of taxation on the propensity to become self-employed is stronger among the self-employed performing basic occupations.

Factors shaping the sensitivity of self-employment to taxation

Trying to answer the question of what may cause differentiation in the impact of taxation on self-employment decisions, it is necessary to analyse the mechanisms linking taxation with self-employment.

The classic way of explaining the relationship between taxation and self-employment is based on demonstrating that taxation can affect the relationship between the rate of return obtained by self-employed workers and the risk they incur.

The literature distinguishes three approaches to the problem of the impact of taxation on risk and the choice of the form of work provision. For a risk-neutral entrepreneur, proportional income tax with full loss deductibility has no impact on decisions on self-employment (Gentry & Hubbard 2000).

For the same person, a progressive income tax as a "success tax" with incomplete loss deductibility reduces the propensity for taking up self-employment (Gentry & Hubbard 2000);(Wen & Gordon 2014).

On the other hand, for people with a significant risk aversion, a progressive tax can function as an insurance, creating stronger incentives for self-employment than in the case of proportional taxation (Domar & Musgrave 1944).

Therefore, it results from the literature cited that the responses of the self-employed to taxation may vary depending on their risk behaviour. The risk attitudes of taxpayers may in turn depend on characteristics such as gender or age. It is well documented that women have a higher aversion to risk than men (Sexton & Bowman-Upton 1990), (Verheul & Thurik 2001), (Hintermaier & Steinberger 2005). The age of the taxpayers can also influence the attitude to risk and thus the reactions of the self-employed to taxation. According to the research conducted, the aversion to risk-taking increases with age (Hintermaier and Steinberger, 2005). At the same time, age can determine the industry in which the self-employed operate. Older people tend to be employed in more traditional industries, while younger people are more likely to work in new technology segments. There are also studies showing that attitudes to risk can be influenced by education levels. (Black & in. 2015) or occupational activities (Grable 2000). In the case of the Polish system of taxation of self-employed income, which is characterised by the lack of full settlement of income and the progression of taxation, one would expect that it will encourage self-employment of people with high risk aversion.

The second channel of influence of taxation on self-employment is related to the phenomenon of income concealment. High taxation makes taxpayers more willing to change their form of employment from employment to self-employment. This is due to the fact that self-employment gives more opportunities to conceal income than employment (Kleven & in. 2011). As with risk aversion, the scale of income concealment may vary.

Research by Pissarides and Weber shows (Pissarides & Weber 1989) that the type of work done may influence the tendency to conceal income. In the group of people working as "white collars" the level of income concealment is lower than in the group of people working as "blue collars". The opposite was concluded by (Lyssiotou, Pashardes, Stengos, 2004), (Lyssiotou, Pashardes, & Stengos 2004), according to whom it is the taxpayers performing occupations referred to as "white collars" that underestimate their income to a greater extent. According to Slemord, (Slemrod 2007) there is a greater risk of concealing income in professions where cash settlement is dominant.

Not only the occupation, but also the industry can influence the propensity to conceal income. According to Alm, it is the possibility of avoiding taxation that influences taxpayers' decisions concerning the choice of profession or the number of working hours (Alm 2012). Research by Artavanis, Morse and Tsoutsoura shows that tax revenues are most underestimated in industries such as professional services, medicine, law, engineering, education, and media (Artavanis, Morse, & Tsoutsoura 2016).

There are also studies according to which the propensity to underestimate tax income depends on the sex of the taxpayer. They show that women are more averse to tax fraud than men (Torgler & Valev 2010), (D'Attoma, Volintiru, & Steinmo 2017). As the reasons for the greater propensity of women to tax compliance are the differences in their personal and social norms. The lower propensity to underestimate income in women may be due to their higher aversion to risk than in men (Barber & Odean 2001), (Croson & Gneezy 2009).

The willingness to conceal income may also depend on the age of the taxpayer. There is evidence in the literature of a link between age and willingness to tax compliance. Research shows (Hofmann & in. 2017), that the willingness to tax compliance increases with age, although the relationship is relatively weak and regionally differentiated.

On the other hand, expectations regarding the impact of the level of education on the willingness to tax compliance are ambiguous. On the one hand, people with a low level of education have less knowledge about taxes and the consequences of not paying them - which may encourage more tax fraud in this group. On the other hand, people with higher levels of education tend to have a better knowledge of how to avoid taxation (Hofmann & in. 2017).

Since the propensity to underestimate tax income may vary between taxpayers, the benefits that the self-employed may gain from concealing income will also vary. Assuming that there is substitution between the legal tax benefits and the tax benefits from underestimating income, the impact of legal tax benefits is expected to vary between the self-employed. If the benefits from underestimating tax income are greater in a given group of entrepreneurs, it can be expected that formal tax benefits related to self-employment will be less important for them. This means that the impact of legal tax incentives on self-employment should be expected to be greater among older people and women and lower among young men. At the same time, those employed in occupations and sectors where it is easier to underestimate tax income should be less sensitive to legal tax benefits.

Research Data and Methods

The research on the impact of tax benefits on self-employment was conducted on the basis of data collected in 2017 on income and other basic economic and demographic characteristics of a group of 14461 Polish taxpayers. The research used the database of the Euromod microsimulation model, combining data from the EU SILC survey and data collected by the Polish Central Statistical Office. The analysis of the impact of tax benefits on self-employment was conducted in two stages. The first

stage consisted in determining the tax benefits that individual taxpayers can obtain by becoming self-employed. The research assumed that persons obtaining income from employment and the self-employed are subject to the same rules of personal income tax. The difference in the level of tax burden between the employed and the self-employed is due to different rules for determining social security contributions. Due to the fact that social insurance contributions for the self-employed in Poland are paid as a lump sum, while contributions for the employed are calculated in proportion to the income received, it is more profitable to be employed on a full-time basis with a low level of income, and with a high level of income, self-employment is more beneficial. Therefore, it is only when a certain level of income is exceeded (about 60% of the average salary) that the contributions paid by the self-employed are lower than those paid by the employed. This means that the tax benefit from self-employment for people on low incomes may be negative.

The tax benefits of self-employment were determined as the difference between the disposable income that taxpayers would receive on the assumption that they were self-employed and the disposable income assuming they were working under an employment contract. The Euromod microsimulation model was used to determine disposable income. The second stage of the study involved building probit models in which the explained variable is the binary variable describing the employment status (0 employed person, 1 self-employed person) and the variable explaining the value of tax benefits from self-employment. In addition, variables describing the demographic and economic characteristics of taxpayers are controlled in the model. The models were estimated for subsamples separated on the basis of criteria such as age, education level, sex, industry, taxpayer occupation. The division into subgroups will allow determining the sensitivity of individual taxpayers to the benefits of self-employment.

The first to analyse the sensitivity of self-employment to tax incentives, taking into account the division of taxpayers into industries. Data used in the study allowed the identification of 12 industries for which separate probit regressions were estimated. The results of the estimates are presented in Table 1. The results obtained differ from those that could be expected. Reasoning rationally, with the increase in tax benefits obtainable through self-employment, the inclination to self-employment should increase. Yet, the analysis of probit regressions explaining the probability of becoming self-employed shows that in most cases tax benefits from self-employment negatively affect the probability of becoming self-employed. This result was obtained for as many as seven of the twelve industries studied. The most probable reason for the obtained result is the phenomenon of underestimation of the reported income by the self-employed. According to the most recent research conducted by Kukk, Paulus and Staehr, this phenomenon in Poland may reach even 15% of the real income (Kukk, Paulus, & Staehr 2019).

For four industries, the impact of tax benefits on self-employment is statistically insignificant. In contrast, only in one industry - Public administration and defence - is the relationship analysed positive. The analysis therefore shows that the only industry with a statistically significant, though weak, positive impact of tax benefits is the one related to the public sector, which is probably due to the fact that the possibilities of concealing the income of the self-employed working with public institutions are significantly limited.

Table 1 : Impact of tax benefits on self-employment by industry (probit regression)

The industry study on the impact of tax benefits on the choice of self-employment is complemented by an analysis taking into account the division of the self-employed into professions. As can be seen from the study presented in Table 2, in the case of as many as six out of ten analysed occupational groups, there is a statistically significant negative correlation between tax benefits and self-employment. Only in the case of workers performing basic occupations, this relationship is positive. This may therefore mean that those employed in basic jobs have the least chance of underestimating tax income, thus responding more to legitimate tax incentives.

Table 2 : Impact of tax benefits on self-employment by occupation (probit regression)

Analysing the sensitivity of self-employment to tax benefits, considering the division of taxpayers by educational level, one can see that there are no clear regularities here (Table 3). This result is quite surprising, taking into account the results of the study with the division into occupations, from which one would expect that the most sensitive to tax benefits should be the self-employed with the lowest level of education.

Table 3: Impact of tax benefits on self-employment by educational level (probit regression)

Another dimension that has been taken into account in the analyses is the differential impact of taxation on the propensity to become self-employed according to sex. Given that women have a higher aversion

to underestimation of tax income, as already mentioned, they could be expected to be more sensitive to the legitimate tax benefits of self-employment. However, the analysis of probit regressions estimated separately for women and men (Table 4) shows no significant differences in the propensity to become self-employed between these groups.

Table 4: Impact of tax benefits on self-employment by gender (probit regression)

The last dimension of the analyses is to investigate the relationship between tax benefits and taking up self-employment in different age groups. On the basis of the literature review cited above, it can be expected that older people should be less prone to tax fraud and therefore more sensitive to legal tax benefits. However, the results presented in Table 5 do not confirm such regularity.

Table 5: Impact of tax benefits on self-employment by age (probit regression)

Therefore, the results of the presented analyses lead to the conclusion that the legal tax benefits have a positive impact on the probability of choosing self-employment only among persons in basic occupations for the public sector.

Discussion

On the basis of the studies carried out, the hypothesis that the impact of taxation on self-employment differs between sectors of the economy has been confirmed, which is in line with the conclusions of the work of Artavanis, Morse and Tsoutsoura (Artavanis et al., 2016). The reason for this diversity may be that in different sectors of the economy, taxpayers have different options for hiding income. Fewer opportunities to underestimate income should make taxpayers more susceptible to legitimate tax incentives to become self-employed. These groups of taxpayers would therefore be expected to have a positive link between the legal tax benefits and taking up self-employment. The obtained results also confirmed the conclusion of previous studies that the level of underestimation of tax revenues may differ between professions. According to a study by Lyssiotou, Pashardes & Stengos (Lyssiotou, Pashardes, Stengos, 2004), blue collars are less likely to underestimate income. This means that they should be more responsive to legal tax incentives – as the study has proven.

The results of the study on the impact of tax incentives on taking up self-employment, taking into account differences in education levels, did not confirm the hypotheses on the impact of education levels on the scale of income underestimation presented in Hofmann, Voracek, Bock and Kirchler's work (Hofmann et al., 2017). The obtained research results show that there is no clear link between education and the sensitivity of self-employment to tax incentives.

The obtained results do not also support the hypothesis that the impact of taxation on the choice of the form of work performance may vary depending on the taxpayers' attitude to risk. In particular, no evidence was found that the impact of taxation on self-employment changes with age. There is also no evidence to support the hypothesis that women are much more sensitive to incentives to take up self-employment. This may also mean that age and sex of taxpayers do not determine their propensity to take risks and consequently to underestimate income. This is contrary to the conclusions drawn from the work of Sexton & Bowman-Upton (Sexton & Bowman-Upton, 1990), Verheul & Thurik (Verheul & Thurik, 2001), Hintermaier & Steinberger (Hintermaier & Steinberger, 2005) and Hofmann, Voracek, Bock and Kirchler (Hofmann et al., 2017).

Conclusions

The research carried out leads to the conclusion that the different groups of Polish self-employed respond differently to tax incentives that encourage or discourage self-employment. Only for a small group of taxpayers the impact of tax incentives on self-employment is positive. The legal tax benefits that the self-employed may obtain for most taxpayers are not a sufficient incentive to take up self-employment. The analysis shows that for most taxpayers there is a negative relation between the value of the tax benefits available for self-employment and the likelihood of becoming self-employed. This outcome is most likely the consequence of the underestimation of income by the self-employed. Such a result is related to the fact that the tax benefit from self-employment increases with the level of income. An underestimation of income means at the same time an underestimation of the tax benefit resulting from self-employment. As a consequence, without knowing the actual level of income, one can get the impression that the self-employed often make unreasonable decisions about starting self-employment, even though it is seemingly unprofitable for them. It is also possible that the negative

relationship between the value of tax benefits and the likelihood of taking up self-employment is also influenced by other factors, including the fact that certain types of high-paid work are customarily carried out under an employment contract. It is also possible that highly paid taxpayers prefer the convenience of employment to the tax benefits available to the self-employed. However, the fact of underestimating tax income by the self-employed is confirmed by the latest research and the estimated scale of this phenomenon allows to explain the anomalies perceived. At the same time, the results put in question the sense of introducing tax preferences for the self-employed. Based on the models built, it can be seen that their operation is limited to a very narrow group of taxpayers performing basic work. Therefore, the tax preferences applied to this group cannot be expected to increase the innovation of the economy. The only argument in favour of applying tax incentives to these taxpayers is the fight against unemployment. However, in view of the significant improvement in the labour market situation, this motive for applying tax preferences is losing its importance. At the same time, the expectation that sensitivity to tax benefits will be greater among older people and women has not been confirmed. It should be stressed that most entrepreneurs are able to secure their "own" tax preferences by taking advantage of the possibility of flexible income shaping.

Acknowledgments

Abstract

Cultivation of medicinal plants need to be promoted among rural farmers in order to meet excess demand of ayurvedic companies and at the same time it can be a potential provider of returns to the rural farmers. The present paper analyses the results of socio-economic improvement of rural farmers by a restructuring of the supply chain of medicinal plants through transforming traditional agriculture system with contract farming cultivation. Moreover, a lot of studies were conducted regarding socio-economic improvement of farmers, but none has been done in connecting contract farming of medicinal plants for socio economic improvement of farmers in Kerala. This study designed to fill this gap. Data was collected from 100 farmers in five districts of Kerala through a structured questionnaire; the research design can be described as a descriptive survey. Likert 5-point scale was used in the study and one hypotheses were generated and tested using Paired t-test in SPSS software. From this study, it was analyzed that all the variables of social impact like health management (25.95%), public recognition (57.69%) and extension participation (102.63%) had shown positive shift due to contract farming in medicinal plants. There was an excellent economic impact on the savings (61.94%) which is visible in the per cent increase. From the study, it was concluded that, Oushadhavanam tripartite model of contract farming will act as a working model for large scale cultivation of medicinal plants that will create assured income and thereby improve socio-economic condition of rural farmers.

Keywords: Rural farmers, Socio-economic improvement, Medicinal plants supply chain, Contract Farming.

Introduction

Medicinal plants have significantly influenced the socio-cultural and spiritual lives of the rural population in Kerala. It has two-fold dimensions; one from an industrial and health care perspective and another from a socio-economic development perspective. Medicinal plant sector is commonly projected as one of the potential industries of employment promotion in rural areas, mainly because of the growing demand for Ayurveda. Kerala has been at the leading edge of the ayurvedic transformation in India. It is considered as a source of positive health which took the lead in promoting health tourism all over the world. The uneasiness of the people with western medicines due to its after-effects and flying increase in price has enforced people to consider and revive their faith in traditional medicines, especially Ayurveda. The rural population also depend upon traditional medicines, chiefly medicinal plants for their primary health care. This rejuvenation in traditional insight had led to an expansion in the large-scale production of Ayurvedic medicines. Rising demand for Ayurveda has paved the way for too many manufacturing units in Kerala. There are around 700 Ayurvedic drug industries producing medicines worth 1,000 crores a year in Kerala. Medicinal plants are the primary raw materials used for the preparation of drugs in these ayurvedic industries. It is a source of living for many rural populations which makes an earning through medicinal plant cultivation. The demand for medicinal plants used for health care needs is increasing at a rate of 8-15 per cent per annum The World Health Organization

estimates supports this viewpoint. Aside from this even in many of the modern medicines, the elemental content is extracted from the medicinal plant base, and these have become very well recognized due to fewer aftereffects, less price, lasting therapeutic properties and nature -friendly attitude. This has further intensified the demand for medicinal plants. Subsequent studies show that the price elasticity is positive for major medicinal plants demanded by ayurvedic firms. The Marshallian demand curve (i.e., higher the price, lower the demand) is not applicable for medicinal plants market. Therefore, cultivation of medicinal plants to meet the growing demands can be a potential provider of returns to the rural farmers and also promoting health tourism in Kerala. It is a labor-intensive activity which involves preparation of land, planting and weeding, collection of plants, drying, harvesting and processing, packing, transporting and selling of plants. In addition to industries-based jobs, medicinal plant cultivation also enhances the possibilities by value-added processing method, which increases the cash earnings and thereby it helps to gain socio-economic improvement of rural farmers.

Even though there is a rise in demand for medicinal plants, which is evolved from the demand for Ayurvedic medicines and health tourism has not upgraded the standard of living of the farmers. This is because there is no correlation between the price paid to farmers and the actual wholesale price prevailing in the medicinal plant market. The cultivators of the medicinal plants get only a fraction of the amount paid by the end-users (ayurvedic industries). For instance, Sida Alnifolia (kurunthotti) sold at Rs 35-40 by the farmers is procured by the final consumer at Rs 70, which means the farmers get only 50 per cent share of the final price. Hence, it is obvious that there involve many players in the supply chain. The players in the supply chain usually increase their profit margin by purchasing the medicinal plants at a lower cost because of the less bargaining ability and ignorance of farmers about the market price. So, this will ultimately end up in the exploitation of farmers in the supply chain.

Figure 1: Supply chain analysis of medicinal plant trade in Kerala

These involve multiple players like private traders, commission agents, wholesalers, final consumers etc. in medicinal plant supply chain and price of these plants varies when it passes from one hand to another. Therefore, the presence of too many players hampers the likelihood of the farmers.

Considering the problems faced by farmers and ayurvedic health tourism, the State Medicinal Plant Board (SMPB), attached to the Department of Health and Family Welfare, in association with the Kerala Forest Research Institute (KFRI) encourages large scale cultivation of medicinal plants by forming a direct link between the farmers and ayurvedic manufactures through a contractual agreement. By entering into contract farming agreement, the farmers ensure to cultivate medicinal plants according to the specified quantity and quality standards stipulated by the company. The company will get supplies of cultivated material of uniform quality, which is otherwise difficult in case of medicinal plants collected from the forest. In return, farmers receive a fixed remuneration from the company at the time of delivery. It provides the farmers with an assured market at a pre-agreed price. Availability of assured markets and a remunerative price for the products are two essential factors that play a significant and decisive role in encouraging farmers. The contract contains clauses which provide inputs like planting material, fertilizers, monetary incentives and training from experts. Contract farming will increase their yield in substantial quantity and thereby, farmers could sell the plants directly to ayurvedic companies without depending on intermediaries.

As the market system of medicinal plants is highly complexed, the farmers will not be successful alone without the help of an efficient cooperative society. A cooperative society can function as a reliable agency for marketing with a direct bind to ayurvedic companies and protect the interest of farmers. Oushadhavanam is a tripartite model of contract farming agreement, implemented by a cooperative labor society based at Mattathur in Thrissur district for the past few years has been proposed as a model to be emulated. The society has a tie-up with farmers registered under the Kudumbasree Mission to

cultivate medicinal plants, which they are buying back and selling through contract farming agreement to manufactures such as Kottakkal Arya Vaidya Sala, Sitaram Ayurveda Pharmacy, Vaidyaratnam Oushadhasala and state-owned Oushadhi for long-standing business. By forming clusters of farmers through Kudumbasree Mission, it would help them in gaining economies of scale by cultivating plants in bulk quantities and easily avail subsidies from the government, thereby it will help to improve socio-economic condition of farmers. The State Medicinal Plant Board (SMPB) is providing funds for procuring seedlings. The Kerala Forest Research Institute (KFRI) had been appointed as a nodal agency for the project, and they would offer technical help on the feasibility of cultivation considering the agroclimatic conditions of respective regions. The institute would also ensure the quality of the raw materials.

The Model Contract Farming Act,2018 is a revolutionary step which promises a win-win situation for both farmers and ayurvedic firms. The basic price is fixed by taking the average price of medicinal plants in previous years and if there is any variation occurs in the current market price it will be taken into consideration before fixing the final price. For instance, the company agreed to take Sida Alnifolia (kurunthotti) for Rs 100 from farmers and after one year, at the time of selling suppose its price raised to 200. In this situation, 50 per cent of the increased amount will be given to farmers, i.e., Rs150. At the same time, if the current market price falls, the company will reduce the amount only if it is going down to 50 per cent of its original price. In this example, if the price drops to 50 Rs, only 15 per cent will be deducted from the original price. I.e. farmers need to bear only 7.5Rs as their loss amount. So, contract farming can lead to an improvement in socio-economic conditions of farmers by reducing their risk faced from production and price fluctuations. Recognizing the potential benefits of contract farming arrangements in the medicinal plant sector, National Medicinal Plant Board (NMPB) provided financial aid to the society through its state branch. With the first phase of the grant, the society bought 50 acres of land in various block panchayaths. In the coming years, the cultivation will be elongated to thirty acres. With this, the cooperative society can venture into large scale cultivation of medicinal plants business with north Indian manufacturers of all Ayush drugs. Under the contract farming agreement, each company will provide an advance amount to the society which will be spent on the expenses for cultivation. Ayurveda Medicine Manufacturers 'Organisation of India (AMMOI) estimates that within six months, all the 700 Ayurveda manufacturers in Kerala will have a tie-up with the Mattathur cooperative society for a long-standing agreement for plant collection. The linkages of the cooperative society with farmers provide a livelihood for thousands of people.

The study aims at providing policymakers to make decisions on how to increase the profitability of farmers by removing intermediaries in the supply chain. The present paper analyses the results of socio-economic improvement of rural farmers by a restructuring of the supply chain of medicinal plants through transforming traditional agriculture system with contract farming cultivation. This study will act as a working model for large scale cultivation of medicinal plants that will generate more job opportunities in rural areas and promote the sustainable development of rural farmers.

Dependent and Independent variables

In the light of inferences derived from recorded evidence in the various works of literature related to this study, a framework has been developed, which diagrammatically presents the critical dimension and relationship among the different variables. This framework diagnoses the problem of research, and it portrays the socio-economic status of contract farmers

Figure 2: Variables identified for the study

Objectives

With this framework, the conceptual work is implemented to study model for cultivating medicinal plants in large scale through contract farming by removing intermediaries in the supply chain that brings employment opportunities in rural areas and improve sustainability development of farmers in Kerala. It is driven by the following objective:

1. To analyze the economic and social impact of contract farming in medicinal plant farmers.

Analytical Frameworks and Methodology

The study is a descriptive one, and the data was collected from 100 farmers in five districts of Kerala through a structured questionnaire. The Likert five-point rating scale was used. The mode of communication was a personal interview. Based on the reliability test, Cronbach's Alpha value obtained was 0. 960. From this study, one hypotheses was generated and tested using Paired t-test in SPSS software.

***Explanation of the study area*:** The study was operated in the five districts of Kerala, viz., Thrissur, Palakkad, Malappuram, Wayanad and Ernakulam. It was purposively selected because of the highest achievable medicinal plants from these states. The quality and yield are exceptional, and the soil is suited for medicinal plant production.

Statistical analysis: The collected data were entered in SPSS, where the statistical and descriptive analysis was done. Data were analyzed to answer the research objectives of the study is illustrated below.

Objective: To analyze the economic and social impact of contract farming in medicinal plant farmers.

The paired t-test is used for analyzing the significant difference of mean scores of the economic and social impacts on before and after adopting contract farming.

> H 1: There is a significant difference between the social and economic impact on before and after contract medicinal plant farmers.

Results and Discussions

Table 1: Economic and Social Impact of Medicinal Plant Contract Farmers

Sl. No.	Variables	Mean values		Percentage change due to contract farming	Paired t-test value
		Contract Farming before	Contract Farming after		
I	Social variables				
1.	Health management	1.31	1.65	25.95	6.55*
2.	Organizational participation	1.14	1.80	57.89	19.36*
3.	Public recognition	1.30	2.05	57.69	11.39*
4.	Extension contact	1.28	2.79	117.96	27.29*
5.	Extension participation	1.14	2.31	102.63	22.03*
6.	Mass media participation				
	a. Radio	1.45	1.40	-3.44	0.000NS
	b. Television	1.37	2.20	60.58	17.19*
	c. Newspaper	1.32	2.03	53.78	13.44*
II	Economic variables				
1.	Land holding	2.74	4.00	45.98	11.09*
2.	Nutrition	1.88	2.29	21.80	8.18*
3.	Housing	3.06	3.91	27.77	15.28*
4.	Saving	1.13	1.83	61.94	14.97*
5.	Material possession	1.05	1.31	24.76	6.81*

*"*Significant at 5%" "NS: Non – significant"* *Source: Primary Data*

It implies that all the social variables like health management (25.95%), organizational participation (57.89%) public recognition (57.69%), extension participation (102.63%) had switched to positive results due to contract farming in medicinal plants. But in the case of Radio (-3.44%), it had seen a negative impact. All other mass media's have increased after adopting contract farming. There was an economic impact on housing (27.77%), which is visible in the per cent increase. There is a considerable increase in savings (61.94%), compared to other variables. All the variables in economic and social impact were found to be significant but considering the value of radio were non – significant.

The results of the investigation interpreted as, by entering into contract farming, farmers got acceptance and status in the society. It is visible that health management had shown a greater impact due to contract farming in medicinal plants. Improving economic condition and awareness of the farmers made them keener about their health. The improved facilities in a rural area made them more eager about their health. Farmers started engaging in various group activities like Kudumbasree, Joint liability group and other activities very effectively. Excellent performance of the farmer in cultivation has given public recognition. There was a greater impact on extension participation and extension contact due to contract farming in medicinal plants. By engaging in a contract farming made the farmers have a connection with experts of the firm to get more knowledge about medicinal plant cultivation. The firm engaged in contract farming was conducting various programmes like classes, group discussion, seminars and training about cultivation for the benefit of the farmers.

In the case of mass media participation, which involves newspaper, tv and radio there was a greater impact in the case of newspaper and tv in contract farming. But it was non-significant in case of radio. It is because of upgraded ways of communication, nowadays radio was replaced by television, newspaper and other sources.

Variables like housing, material possession, nutrition and savings of the contract farmers made a significant impact on contract farming. When the farmers are involved in contract farming agreement, they get assured market and guaranteed remuneration for their products, which helps them to get good profit. In total, contract farming has tremendously improved the economic status of rural farmers. This helps them to gain sustainable development of farmers in the rural area.

Conclusion

The uneasiness of the people with western medicines due to its after-effects and flying increase in price has enforced people to consider and revive their faith in traditional medicines, especially Ayurveda. The rural population also depend upon traditional medicines, chiefly medicinal plants for their primary health care. This rejuvenation in traditional insight had led to an expansion in the large-scale production of Ayurvedic medicines. The Oushadhavanam tripartite model of contract farming will act as a working model for large scale cultivation of medicinal plants that will create employment opportunities in rural areas and promote the sustainable development of rural farmers. The results of the investigation interpreted as, by entering into contract farming, farmers got acceptance and status in the society. Except radio all other social and economic variables show a positive impact due to contract farming. Here, contract farmers had given more importance to savings than radio which is non -significant because there are upgraded ways of communication and it was replaced by television, newspaper and other means of communication.From the study, it was concluded that contract farming is more cost-effective than the traditional way of medicinal plant cultivation. So, it needs to be motivated and encourage farmers to take up contract farming, which is giving them assured market and guaranteed remuneration for the produce. Moreover, medicinal plant cultivation leads to a source of positive health which took the lead in promoting health tourism all over the world.

Abstract

One of the consequences of globalization is the establishment of subsidiaries of international companies in foreign countries, as well as the increasing number of employees sent from the home country to the host country, the so-called expatriates who present the category of high performance employees. The paper presents research results of the analysis of differences in the perception of selected elements of organizational culture from the perspective of expatriates and local employees. The paper tested four statistical hypotheses to verify the existence of statistically significant differences in the perception of selected elements of organizational culture, namely workplace atmosphere, addressing interpersonal conflicts, ethical behavior of employees, and communication.

Keywords: human resource management, high performance worker, expatriates, multinational companies.

Introduction

Globalization mixes cultures, languages, perspectives and increases the number of expatriates abroad. Effective expatriates should know the legislative environment of the given country, human resources management practices as these vary considerably from country to country. They have to be able to communicate effectively across different cultures and gain the confidence of local employees. As organizations expand globally, the number of variables they have to cover grows exponentially, and therefore managing the changes that come with such expansion becomes a major challenge (Romero, 2002).

Posting employees from the home country (or company headquarters) to the country where the branch resides is a very common phenomenon, even for companies that do not pursue a purely ethnocentric approach. Posting of an employee, the expatriate, is the initial phase in carrying out international activities. Tung (2001; in Sršňová, 2000) provides the following reasons for posting employees abroad: not enough high performance workers in the host country; the need to transfer managerial and product know-how; guarantees of effective communication and information structure; personal and organizational development; developing a corporate culture across national borders.

Theoretical Background

Globalization and the need to operate in an international environment have become part of the daily business of many organizations. A typical feature of international organizations is the employment of both local employees (from the host country) as well as expatriates (country of the parent company). In order for an international company to function well, its employees must cooperate and interact efficiently. Expatriates fall into the category of high-performance workers due to the difficulty and specificity of the job they have to perform abroad. For an expatriate to be able to deliver maximum performance and be productive, the company must create the most appropriate conditions for a successful adaptation in the host country. Many scientists emphasize the specific skills that

expatriates should possess, while pointing out the importance of preparing these employees to work abroad.

Intercultural communication is becoming increasingly critical for gaining a competitive advantage in the globalized world (Tange and Lauring, 2009). A possible strategy to ensure communication efficiency between parent companies and branches is to use expatriates. As part of their job, expatriates should be involved in developing activities and creating social ties across all cultural differences (Bennett et al., 2000). For this purpose, it is essential that the expatriate can communicate effectively with local employees (Minbaeva, 2005). However, expatriates are not always able to communicate at a satisfactory level in the language of the country in which they work. Thus, communication often becomes a barrier to interaction (Gudykunst, 2004). Peltokorpi (2007) points out the differences in communication styles, cultural values, and language barriers between local employees and expatriates. The vast majority of intercultural studies link communication problems with differences in cultural values that may have an effect on the behavior of expatriates and local employees. However, there are also studies showing that differences in cultural behavior cannot be held accountable for all communication problems in an international environment (Bargiela-Chiappini and Nickerson, 2003). Difficulties in creating effective in-house communication can also be related to power issues (Vaara et al., 2005) It is important that communication problems are targeted mainly in interaction between individuals from different cultures.

Many studies pay attention to the impact culture have on expatriates, however, less attention is paid to organizational culture itself. Since organizational culture distinguishes one organization from the other (Taras et al., 2009) and shapes the perception, knowledge and emotions of the members of the organization, expatriates may have difficulty distinguishing organizational cultural values from national ones. On the one hand, expatriates identify with the values of the parent company more than that of the branch, on the other hand, the branch's organizational values are often rooted in local culture, so expatriates tend to link organizational and national cultural values (Donga and Glaisterb, 2009). In addition, the presence of the expatriate in the organization is temporary, and thus he/ she does not have enough time or resources to get to know the local culture and understand the values of the host society in more detail. A factor underpinning the influence of organizational culture is the behavior of members of the organization. Their behavior can be a source of information on what is acceptable and what is not, and is therefore a valuable guideline to employee behavior (Ali Taha et al., 2016). Since expatriates are exposed to substantial cultural, social, and professional challenges, and the way they perceive home and host organizational culture, their attitudes or behavior may change, sometimes leading to an intention to step down (Nguyen et al., 2015).The expatriate failure rate may not be as high as is often stated but actions of expatriates are often far from ideal. The failure of expatriates is a major problem not only from the employee's perspective, but also from the perspective of cost. Therefore, organizations should be highly motivated to prepare expatriates for their new roles abroad in an effort to minimize potential failures. This can be ensured in two stages. In the first stage, organizations should select and train individuals for their stay abroad. In the second stage, upon arrival of the expatriate in the host country, the expatriate should begin to communicate with the host and adapt their behavior to the cultural norms and habits of the host country (Shay and Baack, 2004). Selmer (2001) states that behavioral training is more effective after arrival than it is before departure because expatriates tend to be more motivated to learn when they are in a new environment and face new challenges. Through training, international organizations try to ensure that the expatriate is well-received in the target country, thus minimizing the bad impact on the branch's organizational culture. In the course of preparation, companies seek to ensure that goals such as improving expatriate's ability to communicate in the foreign language, obtaining information about the host country, training communication skills, overcoming cultural shock, forming realistic expectations etc., are achieved.

Shenkar and Luo (2004) outline negative consequences of using expatriates, in particular the demotivation of local employees in the host country. They may feel the presence of expatriates as a limiting factor in the process of filling managerial positions at the branch. Often, in developing economies, it is a general fact that expatriates have higher salaries than the rest of the staff, which of course is very demotivating towards local employees. Companies are intensively trying to eliminate

these potential negative impacts associated with the use of managers posted from the country the headquarters are located (Bednárová et al., 2018). According to Jonasson and Lauring (2011), the expatriate should be able to accept foreign culture, the specifics of different cultural environments and intercultural differences. He/ she should also be able to lead a foreign team of employees well, be a representative of his/ her branch, and also be able to accept and respond appropriately to different situations arising from different practices. People can prepare for anything before going abroad. The success of posting depends largely on the effectiveness of intercultural education, as this education can help reduce psychological stress and cultural shock, which often causes failure of an expatriate. The successful application of an intercultural learning model can help employees become familiar with the values, rules, beliefs, working styles and other aspects of the foreign environment, thus facilitating the adaptation of employees during posting (Pinto et al., 2017).

Methodology

Expatriates represent a category of high-performance employees whose utilization rate is steadily increasing. Due to the growing number of international organizations in Slovakia, the number of expatriates in the Slovak environment is also increasing. In view of the growing use of expatriates in Slovak branches of international organizations, there was a need to carry out a research aimed at comparing expatriates and local employees in the Slovak environment.

Since expatriates come from a different cultural and institutional environment, our intention was to find out whether there are differences in their perception of aspects such as workplace atmosphere, communication style, behavior of employees, way of resolving conflicts at the relevant branch, as these can be understood as certain intangible elements of organizational culture. The aim of the research was to find out whether there are statistically significant differences in the perception of selected elements of organizational culture among expatriates and local employees in branches of international organizations operating in Slovakia. The research was conducted between January and May 2019. Data were collected using the standardized questionnaire method, and the questionnaire was distributed in person and by e-mail. The research focused on 4 intangible elements of organizational culture, which were evaluated by respondents on Likert scale 1 - 5, where 1 expressed very positive perception of the given element and 5 very negative perception of the given element of corporate culture. The elements are as follows:

1. Atmosphere at the workplace.
2. Way of resolving interpersonal workplace conflicts.
3. Ethical behavior of employees.
4. Workplace communication style.

For our research purposes we used two research samples. The research sample A consisted of local employees of branches of international organizations operating in the Slovak Republic, in which expatriates, i.e. employees of the parent company, work. The research sample A consisted of 132 local employees. Sample B consisted of 77 expatriates who have been working for some time at branches of international organizations in Slovakia. Figure 1 shows the share of both categories of employees.

Fig. 1: The share of local employees and expatriates in the research sample

The obtained data were processed using descriptive statistics and the research hypotheses were tested using the Student's t-test at a significance level of α 5%.

Results and Discussion

As mentioned above, the aim was to find statistically significant differences in the perception of selected intangible elements of organizational culture. Subsequently, 4 research hypotheses were tested.

The first variable examined was the workplace atmosphere, which is a very important determinant of individual's performance. If the employee perceives the climate at the workplace in a rather negative way, it will affect his/ her performance and result in reduced motivation to deliver the desired work performance. At the same time, the perception of the workplace atmosphere can be influenced by certain habits that the expatriate brings along from the country of origin. The results in Figure 2 suggest that both categories of employees perceive workplace atmosphere in a similar way, with both local employees and expatriates feeling positive at the workplace, which can be seen as a very favorable factor.

Fig. 2: Comparison of expatriates and local employees in terms of workplace atmosphere perception

H1: We assume the existence of statistically significant differences in the perception of workplace atmosphere between expatriates and local employees.

Table 1: H1 testing

Variable – atmosphere perception	
p – value =0.753632489	No statistical significant difference

As the t-test results show, p-value equals 0.753632489. On the basis of this result we reject H1 hypothesis and state that there is no statistically significant difference in the perception of workplace atmosphere between expatriates and local employees.

Another variable examined was the way of resolving interpersonal conflicts. Conflicts and their resolution is a common part of working life, the question is how the management and employees deal with it, how the dispute is resolved, to what extent management interferes, what are consequences, etc. Way of resolving interpersonal conflicts is an intangible component of corporate culture. Often, the attitude to conflicts is rooted in the personality of a person based on his/ her previous experience and the environment in which the person grew up.

Fig. 3: Comparing expatriates and local employees in terms of perception of resolving interpersonal conflicts

As shown in Figure 3, both expatriates and local employees show a predominantly positive perception of the element.

H2: We assume the existence of statistically significant differences in the perception of interpersonal conflicts resolution between expatriates and local employees.

Table 2: H2 testing

Variable – perception of resolving interpersonal conflicts	
p – value = 0.1497	No statistical significant difference

Based on the results of the t-test, p is >0.05. On the basis of this result we reject H2. Thus, we can state that local employees and expatriates do not perceive the element of resolving interpersonal conflicts differently from one another.

One of the essential features of one's culture as well as organizational culture is the ethical behavior of people. Ethics, like any other cultural features, is a part of the individual's personality that one acquires during his/ her life. It can therefore be assumed that there may be a different approach to evaluating what can be considered ethical and what is not by people of different cultures. Figure 4 shows how expatriates and local employees perceive ethical behavior. Similarly to the previous elements examined, both groups of employees show positive results, as most respondents evaluate the ethical behavior in the branch positively.

Fig. 4: Comparison of expatriates and local employees in terms of perception of ethical behavior

H3: We assume the existence of statistically significant differences in the perception of ethical behavior between expatriates and local employees.

Table 3: H3 testing

Variable – perception of resolving interpersonal conflicts	
p – value = 0.8673	No statistical significant difference

The results of the statistical testing show that p value is >0.05. Thus, we reject H3 hypothesis, as there was no statistically significant difference in the perception of ethical behavior between expatriates and local employees.

The last important variable in the research was the form and style of communication. Each organization has a typical style and way of communication, for example the extent to which communication is formal or informal, openness or respect in communication between superiors and subordinates, to what extent employees are consulted in person, etc. Our goal was to find out how local employees and expatriates perceive certain forms and styles of communication typical of the particular branch. The results are shown in Figure 5. Although the majority of respondents expressed a positive attitude to this element, the number of positive evaluations is slightly higher for local employees than for expatriates.

Fig. 5: Comparison of expatriates and local employees in terms of perception of communication style

H4: We assume that there are statistically significant differences in the perception of the communication style between expatriates and local employees.

Table 5: H4 testing

Variable – perception of communication style	
p – value = 0.0043	Statistical significant difference

To test the hypothesis, Student's t-test was used. The results of the statistical testing show that p value is 0.0043 (<0.05). Thus, we can state that we accept the hypothesis H4. As a result, it can be stated that the expatriates and local employees perceive communication style used in branches of international organizations operating in Slovakia differently.

Summary

The results of the research aimed at comparing the perception of selected intangible elements of organizational culture of expatriates and local employees showed that most local employees and expatriates evaluate organizational culture of international organizations' branches positively, namely the workplace atmosphere, conflict resolution, ethical behavior and communication style. Local employees perceive the ethical behavior to be the most positive factor, while expatriates see workplace atmosphere as the most positive factor and the communication style as the least positive factor.

At the same time, the results pointed to the fact that, for the 3 variables examined (workplace atmosphere, conflict resolution, ethic behavior), there were no statistically significant differences between expatriates and local employees. This result may be down to the following reasons: the country of origin of the expatriate and the host country are not that different in terms of culture and that similar style of management is used in both countries. Another reason may be sufficient training of the expatriate, which means that the expatriate knows the conditions of the host country and is prepared for possible differences in the organizational culture. Proper preparation for working in different environment eliminates the consequent negative feelings of change and facilitates the adaptation process.

The only variable in which a statistically significant difference has been found is the communication style. It is a very important factor and many authors mention it as a very important determinant of the successful interaction between expatriates and local employees (eg. Minbaeva, 2005; Tange and Lauring, 2009; Peltokorpi, 2007). The studies by these authors often mention that there is still a language barrier between expatriates and local employees which may result in the lack of mutual understanding. Based on these findings, it is essential to ensure effective language and communication training, not only on the part of expatriates but also on the part of local employees.

Acknowledgment

The paper has been realized within the VEGA 1/0237/19.

Abstract

The development of the industrial sector of Ukraine is impossible without the growth of labor productivity on the basis of improving the qualitative characteristics of the fixed assets and human resources involved, as well as the expansion of innovative activity of industrial enterprises. The study aims to deepen the empirical discussion in two directions: conducting a comparative analysis of the productivity of industrial enterprises in individual EU countries and Ukraine; substantiation of the need for the transition of industrial enterprises from growth based on capital accumulation to growth based on innovation. The aim of the article is to substantiate the directions of increasing the level of labor productivity by increasing the innovative activity of industrial enterprises. To study the productivity of industrial enterprises, data from Eurostat and the State Statistics Service of Ukraine for 2017 and individual indicators for 2010-2018 are used. The method of comparative analysis of the main indicators affecting the productivity of industrial enterprises of Germany, France, Italy, Hungary, Poland, Slovenia, Slovakia and Ukraine is applied. According to the results of the analysis, it has been determined that labor productivity at Ukrainian enterprises is much lower than in the studied group of countries. A comparative analysis of the factors that influence the size of labor productivity has led to the conclusion that ensuring productivity growth at processing enterprises in Ukraine cannot be ensured by the increase in the volume of attracted resources. It has been concluded that the growth of labor productivity based on innovation should be oriented towards enhancing the dynamics of the cost of innovation; improving the structure of innovative spending directions towards increasing the share of expenditures on financing of internal and external research development; expanding the list of sources of financing innovative activity of industrial enterprises by increasing the volume of attracted financial resources from Ukrainian and foreign investors.

Keywords:Labor productivity, industrial enterprises of Ukraine, innovative activity, capital investments

Introduction

The main indicator that allows evaluating the productivity of industrial enterprises is the indicator of labor productivity – a general indicator that characterizes the efficiency of labor resources use in the production of industrial goods.

In a broad sense, labor productivity is the efficiency of useful labor that determines the effectiveness of its use in a specific period of time, under conditions that exist during that period. The characteristics of the efficiency and effectiveness of useful work are influenced, on the one hand, by the qualitative characteristics of the labor resources involved in the process (their qualifications, professional and moral abilities, psychological mood, etc.), on the other – the conditions of use of labor resources (the state of the means of labor and technology, working conditions, etc.).

Depending on the specifics of the industry and the labor parameter (the amount of time spent or the number of employees involved), labor productivity is characterized by the ratio of the volume of production in physical, labor or value terms to the time spent on its production, or the number of employees involved.

Labor productivity growth, as a factor in the development of the industrial sector, can occur through: investing additional capital and attracting additional labor; the impact of technological change and the expansion of innovative activities of industrial enterprises.

Due to the lack of research to justify the relationship between innovation activity and labor productivity at the level of industrial enterprises of Ukraine, this study aims to deepen the empirical discussion in two directions: conducting a comparative analysis of the productivity of industrial enterprises in individual EU countries and Ukraine; substantiation of the need for the transition of industrial enterprises from growth based on capital accumulation to growth based on innovation.

Brief Literature Review

A considerable amount of foreign research on the importance of the identified areas of industry development argues that the expansion of innovation provides an explanation for more than half of the variation in productivity (Cassiman & Golovko, 2011; Huergo & Jaumandreu, 2004; Isabel Martínez Martín, Miguel Sánchez Galindorez, Césarz & Lperez, César Rosa Santero Sánchez, 2019; Tsai & Wang, 2004; Alfredo D'Angelo & Alessandro Baroncelli, 2019; Wakelin, 2001). Some scholars (Griffith, Huergo, Mairesse & Peters, 2006) argue that post-war growth in Europe has largely been based on capital accumulation, whereas what is needed now is that European countries reorient themselves towards innovation-based growth .

In conditions of capital shortages, problems associated with a shortage of qualified labor resources and a high degree of deterioration of fixed assets in the industrial sector of Ukraine, the influence of the first direction of productivity growth is weak (Sergiychuk, Karas, 2011; Kapinos, 2015; Goncharov, 2014; Semykina, 2010) . The above mentioned allows us to conclude that one of the important factors of the extensive type of economic development of enterprises in the country's industrial sector is the growth of labor productivity based on an increase in their innovative activity.

The purpose

The aim of the article is to substantiate the directions of increasing the level of labor productivity by increasing the innovative activity of industrial enterprises (a significant increase in the number of innovatively active enterprises, an increase in the share of expenses for internal and external research and development, expanding sources of financing innovation in the industrial sector, while maintaining amounts of financing from own funds). The basis of the study is a set of industrial enterprises of Ukraine.

Methods

To study the labor productivity of enterprises in the industrial sector, data from Eurostat and the State Statistics Service of Ukraine for 2017 and individual indicators for 2010-2018 are used. The method of comparative analysis of the main indicators that affect the labor productivity of industrial enterprises in Germany, France, Italy, Hungary, Poland, Slovenia, Slovakia and Ukraine is used. The theoretical basis of the study was the latest articles and publications of scientists who have studied the problem of labor productivity in industry.

Results

To analyze the activities of industrial enterprises, a general indicator used to determine labor productivity is the volume of sales per employed person in the industrial sector.
According to Eurostat (2017), the figure in Germany was 296 thousand euros per employee, in France – 329 thousand euros, in Italy – 258 thousand euros (Table 1).

Table 1: Industrial labor productivity in individual EU countries, 2017 (processing industry)

Indicator	Germany	France	Italy
Number of enterprises	190541	197657	383585
Sales volume, EUR million	2193357,5	1021247,9	965031,0
Number of persons employed	7409552	3103594	3744271
Labor productivity (volume of sales per employee), thousand euros	296,0	329,1	257,7
Labor productivity (gross value added per employed person), thousand euros	79,9	77,4	64,5

Source: Eurostat

The similar indicator calculated for the group of Central and Eastern European countries (Table 2) is much smaller and fluctuates between 121-152 thousand euros.

Table 2: Industrial productivity in individual countries of Central and Eastern Europe and Ukraine, 2017 (Prossesing industry)

	Hungary*	Poland*	Slovenia *	Slovakia*	Ukraine
Number of enterprises	50809	198757	19376	72563	63309

Source: Eurostat, State Statistics Service of Ukraine

According to the results of the analysis of the data proposed in the tables, labor productivity at the enterprises of the processing industry of Ukraine is significantly less than for the group of countries with developed economies (see Table 1) and the countries of Central and Eastern Europe (see Table 2).

More correct for analysis is the definition of labor productivity as the value of gross value added per one employed person in industry. Gross value added is the value of gross output excluding the cost of raw materials and other intermediate consumption. Using gross value added as an indicator of the evaluation of the productivity of useful labor, only what is created by the attracted labor resources in the process of economic activity is compared.

For Ukrainian industrial enterprises the gross value added per employed person is only EUR 10 thousand, while in Germany the figure is more than 8 times, in France - 7 times, and in Italy - 6 times. For the countries of Central and Eastern Europe, the excess of value added labor productivity is 2-4 times.

A comparative analysis of the factors that affect the value of labor productivity shows that the main reason for such a situation is the amount of human resources involved (Table 3). If the value added value created by the enterprises of the processing industry in Hungary is 2 times higher than in Ukraine, then the number of attracted labor resources is 40% less. In Slovakian processing industry enterprises, the volume of added value is almost identical to the volume created by Ukrainian enterprises. However, the number of workers in the processing industry is 60% less than in Ukraine (Table 3).

Table 3: Comparative analysis of the factors affecting the value of labor productivity in individual countries of Central and Eastern Europe and Ukraine, 2017 (processing industry)

	Hungary*	**Poland***	**Slovenia ***	**Slovakia***	**Ukraine**
Gross value added, EUR million	2,0	5,7	0,7	1,1	1
Number of persons employed	0,6	2,1	0,2	0,4	1

The main reasons for the low level of labor productivity in the industrial sector of Ukraine are the following:

1) a significant proportion and conservation of excess labor resources at state-owned industrial enterprises;
2) inefficiency and laboriousness of the technological process in most industrial enterprises;
3) a high level of shadowing of industrial production and, accordingly, the lack of factual reliable information on the results of industrial production and the number of people employed in industry;
4) lack of a long-term clear strategy for real restructuring of the industrial sector;
5) high level of depreciation of fixed assets and low efficiency of the technological process of industrial production;
6) weak financial interest of external and internal investors in technological and financial investments;
7) low qualifications of the involved labor resources and lack of motivation to improve their quality characteristics.

Consequently, ensuring productivity growth at Ukrainian processing enterprises cannot be ensured by increased labor input. What matters is not so much the increase in their quantitative characteristics but the improvement of their quality and working conditions.

One of the important factors that negatively affect the performance, the level of productivity of the sector, the competitiveness of manufactured products is the lack of capital investment in the development of the industry. Study of the practice of investment activity in the industries of the

Central and Eastern Europe countries (Table 4) shows that the vast majority of capital investments (94-98% of total capital investment) are investments that provide expanded reproduction. It is the focus of the industrial enterprises management on improving the characteristics of fixed assets and their modernization that is a factor in the growth of labor productivity and the effectiveness of economic activity (growth in the volume of added value and the volume of sales of industrial products).

Table 4: Capital investment in industry in individual countries of Central and Eastern Europe and Ukraine, 2017 (processing industry), EUR million

	Gross investment in land	Gross investment in existing buildings and structures	Gross investment in the construction and re-planning of buildings	Gross investment in machinery and equipment
Hungary	26,0	126,3	1652,5	4732,2
Poland	322,4	211,6	3703,9	11443,6
Slovenia	40,3	45,5	340,7	1227,2
Slovakia	47,9	38,7	877,7	2888,9

Source: Eurostat

A comparison of the data proposed in table 4 with statistical data on the volume of costs in the areas of innovative activity of industrial enterprises in Ukraine, indicates their significant thawing (table. 5).

Table 5: Total amount of expenditures by the directions of innovative activity of industrial enterprises of Ukraine, mln

	Capital Investments	Costs of innovation		Including directions			
		UAH million	% of total investment	research and development	acquisition of other external knowledge	purchase of machinery and software	Other expenses
2010	55384,4	8045,5	14,5	996,4	141,6	5051,7	1855,8
2011	78725,8	14333,9	18,2	1079,9	324,7	10489,1	2440,2
2012	91598,4	11480,6	12,5	1196,3	47,0	8051,8	2185,5
2013	97574,1	9562,6	9,8	1638,5	87,0	5546,3	2290,9
2014	86242,0	7695,9	8,9	1754,6	47,2	5115,3	778,8
2015	87656,0	13813,7	15,8	2039,5	84,9	11141,3	548,0
2016	117753,6	23229,5	19,7	2457,8	64,2	19829,0	878,4
2017	143300,0	9117,5	6,4	2169,8	21,8	5898,8	1027,1
2018	199896,0	12180,1	6,1	3208,8	46,1	8291,3	633,9

Source: State Statistics Service of Ukraine

The share of capital investments related to innovation during the analyzed period is in the range of 6-19%, which does not provide the formation of the necessary amount of financial resources for significant updating of fixed assets and improvement of their quality characteristics.

Discussion

Among the set of outlined directions of industrial sector development are the following:

- maintaining and enhancing the dynamics of the volume of expenditures on innovative activities of industrial enterprises, as the basis for ensuring their stable development;
- improvement of the structure of innovation costs directions in the direction of increasing the share of expenses aimed at financing internal and external research;
- a significant factor in the development of the industrial sector and the growth in the volume of manufactured and sold industrial products is the increase in the number of innovatively active enterprises;
- expanding the list of sources of financing the innovative activity of industrial enterprises by increasing the volume of attracted financial resources from both Ukrainian and foreign investors will increase the financial capacity of industrial enterprises and improve the qualitative and quantitative characteristics of their economic activity.

From the point of view of the impact on labor productivity, the so-called innovation process is evaluated when the innovation is introduced in the production process. There are six areas of innovation in the industry (OECD, 2005):

- acquisition and changes of fixed assets and procedures, methods and quality control standards necessary for the production and quality control of a new product or the use of a new process;
- the process of modifications, retraining of personnel in new technologies or in the use of new technology;
- marketing of new products;
- technology acquisition;
- purchase of machinery and equipment;
- design – covers plans and drawings aimed at determining the procedure, technical specifications and operational features necessary for the implementation, development, production and sale of new products and processes.

In general, there are two main problems that arise in determining the impact of innovation on the productivity of industrial enterprises:

- how to measure innovation;
- how to single out the influence of innovations in the totality of factors affecting labor productivity.

A possible solution to the first problem may be to use the costs of industrial enterprises for R&D. A positive point in using this option for measuring the innovative activity of industrial enterprises is the availability of clear statistics and the possibility of comparing results at the level of individual territories of a country or individual countries. The disadvantage is that R&D expenditures are a measure of investments that does not take into account the efficiency and effectiveness of efforts.

Research and development is an important element of the innovation activity of industrial enterprises, since it provides opportunities to maximize the use of their scientific and resource potential. Approximation of innovative activity directly to the production process extends the possibilities to take into account the features of technological, management and other processes at the enterprise level, meets the requirements of increasing their level of efficiency. From the position of stimulating this direction of innovative activity of enterprises in the country's industrial sector, the main goal of industrial policy should be to support (regulatory, patent, licensing, financial, etc.) their activities.

Given the insufficient level of development of the innovation market and the lack of financial resources for the development of national innovation, the vast majority of enterprises in the industrial sector of Ukraine prefer to purchase machinery, equipment and software. This is the simplest version of innovation activity, which provides the shortest period of commercialization of invested financial resources by increasing income from economic activities.

Analysis of the dynamics of innovation activity of industrial enterprises by directions is presented in Table 6.

Table 6: Analysis of the number of enterprises in industry by areas of innovation (2010-2017)

Areas	2010	2012	2013	2014	2015	2016	2017	2018
Internal R&D	224	214	215	189	151	232	130	218
Acquisition of R&D	124	134	114	94	70	103	62	66
Purchase of machinery, equipment and software	840	1096	1082	993	467	590	500	320

Source: State Statistics Service of Ukraine

During the analyzed period, there has been a steady positive dynamics in terms of expenditures in all areas of innovative activity and especially in the direction of the acquisition of machinery, equipment and software. The main reasons are the impact of the exchange rate and the need for a significant upgrade of fixed assets of enterprises of the country's industrial complex. In the structure of expenses during the analyzed period, the largest (in some years 99% of the total) is the share of expenses for the purchase of machinery, equipment and software.

The identified trend, in our opinion, is positive and reflects the growing interest on the part of industrial enterprises in enhancing their own innovative potential and developing internal research activities.

Conclusions of this study

A positive impact on the results of economic activity of industrial enterprises in Ukraine (the volume of sold industrial products and the volume of created added value) of the innovative activity of industrial enterprises is possible only if there are three main conditions: a significant increase in the number of innovatively active enterprises, an increase in the share of expenses for internal and external research and development, expanding sources of financing innovation in the industrial sector, while maintaining amounts of financing from own funds.

Further research will be aimed at exploring the sources of financing the innovative activities of industrial enterprises of the country and finding ways to optimize them.

Riga Technical University, Riga, Latvia, Katrina.Briede@rtu.lv

Abstract

The present paper applies a multi-criteria decision-making methodology (MCDM) and Analytical Hierarchical Process (AHP) in the Latvian woodworking sector to assess the strategic decision-making criteria. The subject of the study is the influence of digitalization on company's strategic posture and development of OSPP approach. The goal of the study is to examine the development of digitalization strategies and to consider whether the organizational changes are needed to adapt to digital change. According to the research results, our concept helps management to outline the most crucial advantages in industry regarding digital change and gaps between them and company capacity. We modified original OSPP matrix with MCDA method in order to realize the full potential of digital transformation. Nowadays companies need to add learning and digitalization relevant assets and capabilities in order to adjust them in terms of industry's digital ecosystem and assess the gaps.

Keywords: digitalization, digital transformation, multiple-criteria decision analysis, digitalization strategy, strategic management, optimal strategic performance positioning matrix, AHP

Introduction

H. Igor Ansoff is mainly seen as the leader of the 'strategic planning school', as accredited by Mintzberg (Mintzberg 1994, Martinet 2010). Ansoff's concept of the environmental turbulence in Implanting Strategic Management (1984) is extremely topical since nowadays external environment turbulence is becoming more and more dynamic (Ansoff 1999). The reason is that "Digital transformation and resultant business model innovation that have fundamentally altered consumers' expectations and behaviors, pressured traditional firms, and disrupted numerous markets" (Verhoef *et al.* 2019). The issue of employing digital technologies is becoming critical nowadays as companies are striving to develop a new digital business model in order to create and appropriate more value for the company (Kane *et al.* 2015, Schallmo *et al.* 2019). Companies are trying to perceive actual customer behavior towards any product and service through digital feedback in order to develop consumer-oriented offers (Flügge 2017). Digital transformation will become a relevant and multidisciplinary area for future research given the recent developments of digital technologies (Verhoef *et al.* 2019). Digital transformation is a company-wide phenomenon with broad organizational implications in which, most notably, the core business model of the firm is subject to change through the use of digital technology (Agarwal *et al.* 2010). It forces companies to deal with conflicts between existing and new ways of doing business (Christensen *et al.* 2016). To respond to these challenges, firms should be digitally agile to continuously modify and reconfigure existing digital assets and capabilities (Eggers and Francis Park 2018).

Ansoff's OSPP Matrix provides an opportunity to assess capacity for essential digital assets and capabilities needed for digital change (Verhoef *et al.* 2019).

First of all, a company could assess its current capacity gap in terms of Digital Resources – digital assets, such as the storage of data, information and communication infrastructure, and accompanying technologies to effectively compete in the digital era. It is also possible to identify priority for respected capacity, since not all digital assets and capabilities are equally critical for every industry. Second, digital agility concerning the capability to sense and seize market opportunities provided by digital technologies

(Sambamurthy *et al.* 2003, Lee *et al.* 2015) is also part of company's capacity to assess through the OSPP matrix.

A key issue to consider is the organizational changes needed to adapt to digital change (Eggers and Francis Park 2018) regarding organizational structure that is flexible for digital change. The need for autonomous business units that are separated from the headquarters is crucial because they allow for experimentation and quick learning, as well as avoiding cannibalization perils and conflicts (Broekhuizen *et al.* 2018). New agile organizational forms instead of standard, more hierarchical organization schemes, may no longer be effective in fast-changing digital environments, as the bureaucracy involved reduces response speed and innovativeness. New digital functional areas make communication or data flows play a more proactive and orchestrating role that supports the creation of digital value via fast and explorative responses, i.e., the attraction of employees with digital and analytical skills that may replace existing workforce (Leonhardt *et al.* 2017).

It should be outlined that Ansoff's OSPP does not provide a digital growth strategy, but helps management outline the most crucial advantages in industry regarding digital change and gaps between them and company's capacity. We modified an original OSPP matrix, but to realize the full potential of digital transformation, companies would need to add learning and digitalization relevant assets and capabilities in order to adjust them in terms of industry's digital ecosystem.

The key goal of the present paper is to provide a strategic perspective on digital transformation. We would like to open a discussion that prior to building a digital transformation strategy, it is necessary to identify the current gap between the company's capacity and external digital ecosystem. As soon as digital transformation occurs in response to changes in digital technologies, increasing digital competition and resulting digital customer behavior, Ansoff's OSPP could provide necessary tools for assessing the current gap in competitive advantages and organizational structure capacity.

Nonetheless, our goal in revitalizing Ansoff's OSPP was not to identify specific digital assets and capabilities that are relevant for company to be competitive, but to provide guidelines for creating these assets. Digitization transforms business process models and processes in many enterprises. However, many of them need guidance on how digitization is affecting the design of their information systems (Schmidt *et al.* 2017). We provided a multiple-criteria decision analysis (MCDA) for a digital transformation strategy through Ansoff's OSPP. The multiple-criteria decision analysis (MCDA) will help a company adjust our model to be more relevant for company's industry characteristics and will help perform the current digital gap analysis.

The paper consists of introduction, short observation of the OSPP methodology and the logic of the final OSPP concept, as well as some literature discussion associated with the assessment of AHP and ANP. An integrated OSPP-AHP framework has also been proposed and implemented for the wood manufacturing company.

The Optimal Strategic Performance Positioning (OSPP) Matrix

Ansoff's innovations on strategic management were to provide a methodology (Table 1) for managers to analyze and then establish the managerial behavior and capability needed to succeed vs. the present managerial behavior and capability (Moussetis 2011).

Table 1: Matching Strategic Aggressiveness and Responsiveness of Capability with Turbulence (Ansoff and McDonnell 1990)

		Production	**Marketing**	**Entrepreneurship**	**Creativity**
Turbulence scale	1	2	3	4	5
Environmental turbulence	Repetitive	Expanding slow incremental	Changing fast incremental	Discontinuous predictable	Surprising unpredictable
Strategic aggressiveness	**Stable** Based on previous cases	**Reactive**	**Anticipatory**	**Entrepreneurial**	**Creative**

		Incremental based on experience	Incremental based on extrapolation	Discontinuous based on expected futures	Discontinuous based on creativity
Responsiveness of capability	Custodial suppresses changes	Production adapts to change	Marketing pursues familiar change	Strategic seeks new change	Flexible seeks novel change

The OSPP model assists in the completion of a detailed strategic analysis of four critical variables for a company's optimal performance. The most important variable is what Kipley (2012) defines "Strategic Posture". The Strategic Posture is an assessment of the company's Strategic Aggressiveness (SA) and Capability Responsiveness (CR) in relationship to the Environmental Turbulence Level (ETL). Companies, whose CR supports its SA, and SA is matched to the ETL, achieve higher financial performance levels than firms that are misaligned (Kipley *et al.* 2012). The OSPP framework (see Figure 1) and the variables of Strategic Posture analysis data provide accurate measurements of strategic gaps (misalignments).

Fig. 1: Optimization of Strategic Posture

Source: based on Ansoff 1987; Lorsch 1986

OSPP has an extensive series of questions (a list of 36 turbulence-level 'descriptors" in 2 different tables, encompassing both industry innovation turbulence (14 descriptors) and marketing turbulence (22 descriptors) for the ETL assessment as a summary (Future Profile, Figure 1). The company's Strategic Aggressiveness (SA) is assessed measuring both marketing aggressiveness (a list of 11 marketing aggressiveness 'descriptors) and innovation aggressiveness (a list of 14 innovation aggressiveness 'descriptors) in 2 different tables as a summary. First, the model calculates the first "gap" analysis between the ETL and SA (Strategy Gap), and the strategic Aggressiveness Gap (Strategy Gap, Figure 1) is entered into the summary output.

The final gap component (Capability Gap, Fig. 1) is used to determine the company's Strategic Posture variable as an assessment of Company Capability Responsiveness against ETL. The Capability Responsiveness is generated by completing five questionnaires measuring General Manager's Capabilities (General Manger's Capability Assessment – 9 descriptors), Corporate Culture (Culture Capability Assessment – 11 descriptors), Company Structure (Structure Assessment – 7 descriptors), Company Systems (System Assessment – 7 descriptors) and Company Technology and Capacity of Management (Technology/Capacity Assessment – 7 descriptors) (see Fig. 2).

Fig. 2: Optimization of Strategic Posture. Design of OSPP
Source: created by the authors based on the OSPP methodology

Ansoff's paradigm underlines the importance of aligning SA/CR with ETL in achieving optimal strategic success. Ansoff (1986) provided guidance and clarification as to the importance of aligning SA/CR with the ETL in order to achieve optimal strategic success. Empirical evidence confirms that a "gap" in SA and/or CR will adversely affect the company's optimal performance. OSSP Posture Analysis "measures" the "size of the gap" or how wide it is in both the SA and CR.

The final matrix represents the budget committed to the strategic development of the company. The Strategic Investment is the company's total commitment of resources to a strategy, including not only for facilities and equipment (operations), but also for developing the firm's product (R&D) and market position (marketing), as well as the supporting capabilities in management, production, sales, and so on (operations). In each perspective devoted to a strategy, there is a minimal critical mass defined as the strategic breakeven point. Each budget component must be at or above its own critical mass level; misallocation of budgets in a strategy can have serious consequences. In addition, there is an optimal mass representing the level of investment beyond which profitability begins to decline due to decreased speed of organizational response and bureaucratization of the company.

Finally, Strategic Investment represents the Capacity Investment (CI; 8 descriptors) and Strategic Investment (SI; 10 descriptors) of the company. The company's competitive position will be in proportion to the ratio of the company's investment in a strategy to the level of investment that will produce optimal profitability.

We would like to reinforce the methodology, as soon as the coefficients for gaps are generated from a proprietary tables in order to create the final Matrix that is a commercial secret. The four matrix variables are displayed indicating the results of the *Strategic Posture* and *Strategic Investment from proprietary* formulas. The *Company's Future Competitive Position (27 descriptors), and Future Industry Prospects (24 descriptors)* are displayed in the Matrix. The result of the Matrix is necessary for managers to assess the area of the company where to concentrate its resources in order to improve its performance position (Figure 3).

Fig. 3: The Logic of the final OSPP Matrix
Source: created by the authors based on the OSPP methodology

The final OSPP Matrix represents contribution of Strategic Budget to *Company's Future Competitive Position* with respect to *Future Industry Prospects*.

It is recommended by the methodology to increase, modify, and replace the low-performing descriptor factors to increase the score. However, the direct correlation between *Company's Future Competitive Position* and the existing gaps remains hidden. Based on the *Company's Future Competitive Position list* of descriptors, it is difficult for management to directly correlate them with the existing gaps.

We would like to propose the MCDA method in order to assess the contribution of descriptors to the existing gaps and correct allocation of Strategic Budget to eliminate these gaps. In our opinion, correlation between *Company's Future Competitive Position* and SA/CR is sophisticated and should be separately analyzed using an Analytical Network Process (ANP), which is a subject of the subsequent study.

Literature Review on MCDA

MCDA methods allow ranking the determined strategies and factors. AHP, as a hierarchical weighted decision analysis method proposed by Saaty (Saaty 1989), is the most widely used MCDA method and combines a qualitative analysis with a quantitative analysis (Ho 2008). The global priorities of criteria, sub-criteria and alternatives are synthesized using the eigenvalue method (EM). The EM is the solution of the eigenvalue problem:

$$Aw = \lambda_{\max} w, \qquad (1)$$

where λ_{max} is the largest or principle eigenvalue of the pairwise comparison matrix and w is the corresponding principle eigenvector.

The *CR* (Consistency Ratio) of matrix *A* is used to check judgment inconsistency. $CR = CI/RI$, where $CI = (\lambda max - n)/(n - 1)$ and λmax is the maximal eigenvalue of *A*. *RI* (Random Index) is an experimental value, which depends on *n* (Saaty 1989). According to the scale principles, a comparison of pairs is derived in matrix (Saaty 1989).

ANP is a newer tool used to solve multi-criteria problems. It is a type of system decision analysis, which combines qualitative and quantitative factors based on the AHP (Saaty 2004). SWOT nowadays is combined with ANP, which is one more approach proposed to determine the factor weights of dependency or independency by creating more advanced priority determination in hybrid models. Assuming that interdependence of the factors that are used in SWOT analysis can impact the selection of a final strategy, Yuksel and Dagdeviren proposed the hybrid SWOT–ANP model for ranking the strategies, factors and sub-factors (Yüksel and Dağdeviren 2007). Later the ANP approach was widely adopted and exploited by many scientists to determine relative importance of strategic factors as the basis

of prioritizing the previously formulated strategic options (Shahabi *et al.* 2014, Grošelj and Zadnik Stirn 2015, Živković *et al.* 2015, Al-Refaie *et al.* 2016, Di Lallo *et al.* 2016, Zhü *et al.* 2016, Wang *et al.* 2017, Gottfried *et al.* 2018).

Although the ANP method is used by many authors, it has also some acknowledged disadvantages: the mutual dependency of two factors is treated as the reciprocal value in the map of an interrelation network and that does not always correspond to reality. The same problem also arises when normalizing the unweighted supermatrix in ANP, where the same relative importance is assigned to each cluster. The ANP–AHP models have also some drawbacks when experts are evaluating priority determination among factors and alternatives in the case of a huge number of factors. Experts involved in the evaluation process need to perform a mass of accurate identification procedures among factors that could be very exhausting. Another issue is the evaluation uncertainty, when an expert cannot quantify relative influence or priority of the factors very accurately and spends a lot of time to perform the evaluation process. In this case, experts could be allowed to use a linguistic variable.

Saaty (1980) states that in many practical cases the pair-wise judgments of decision-makers would contain some degree of uncertainty. It is frequently the case that the decision-maker is certain about the ranking order of the comparison elements but uncertain about the precise numerical values of his judgments. The classical AHP attempts to overcome this problem by introducing a discrete linguistic set of comparison judgments. Instead of directly assigning numerical values to the comparison ratios, the decision-maker chooses an appropriate linguistic phrase, which best corresponds to his comparison preferences (Saaty 1980).

The New OSSP Concept for MCDA

In order to reinforce the existing OSPP model, we decided to apply change management. The Burke-Litwin model (see **Error! Reference source not found.**) was significant as a bridge to emerging models and concepts of organizational change, due to its dual nature of addressing both the transactional and transformational aspects of change. The model, which emerged out of practice in 1987 and was based on the work around organizational climate conducted by Litwin (Burke, 2014), provides a systemic view of the influencers of organizational change. It does not propose a start or end point of the change process, but rather introduces key change points, with the external environment as the main input and individual and organizational performance as output (Burke, Litwin, 1992).

In the authors' opinion, the key feature of this model is the systemic perspective, representing crucial change elements: dual transformational and transactional dimensions.

The upper level of this model (see Fig. 4) investigates the transformational factors of change: environment, mission, strategy, leadership and culture. The authors distinguish two categories in transformational factors – internal and external; these categories have decisive relationship for company's development, but relationship between these factors is not clear here. The authors emphasize that mission, strategy, leadership and culture are discussed as transformational factors – "change source points".

Fig. 4: The Burke-Litwin (Burke and Litwin, 1992) model of organizational performance and change

Source: (Burke, Litwin 1992)

The lower level of the model represents the transactional factors of change: management, structure, systems, task requirements, motivation, individual needs and values. These factors represent more of the day-to-day actions in an organization, and due to their particularities, the change of one such factor will not have as large systemic implications as those of the transformational factors. The model suggests that changes in these elements have a broad systemic impact, creating revolutionary change for an organization (Burke, Litwin, 1992). Nonetheless, in the authors' opinion, the Burke-Litwin model does not focus on the element hierarchical relationship, which is important and is partly represented in (Porras and Robertson 1991) model. We combined this model with OSPP in Fig. 5.

Unfortunately, the original OSPP model does not take into consideration the individual level, which we think is very important for eliminating gaps. However, we decided to leave this inconsistency for later debates.

Fig. 5: New OSSP concept based on the Burke-Litwin model of organizational performance and change

Assessment of Digital Transformation Strategies with MCDA: A Case of the Manufacturing Company

After considering the survey results, the OSPP analysis was performed. The present section will discuss the impact of digitization on the Latvian-Norwegian manufacturing company X. The OSPP analysis for digital transformation is presented in Appendix 1; the elaboration of strategies was based on the previously created model (Steps 1–7) (Voronova *et al.* 2018). The respective experts were asked to evaluate the relationships between factors.

All pairwise comparisons were made with the inputs and guidance of the expert team. The global priorities of criteria, sub-criteria and alternatives were synthesized using the eigenvalue method (EM) in Table 2. It is common to observe that the OSPP factors have dependent behaviors; therefore, the authors used the presented model to evaluate strategy results (see Table 2).

Table 2: Evaluation Matrix. Assessment of Company's Digital Strategies by AHP Method for Digital Transformation. ETL Impact on CR

	F_1^{innov}	F_2^{mark}	*EV*	*w*		S_1^{leader}	S_2^{cult}	*EV*	*w*
F_1^{innov}	1.00	0.50	0.447	0.33	S_1^{leader}	1.00	0.20	0.196	0.17
F_2^{mark}	2.00	1.00	0.894	0.67	S_2^{cult}	5.00	1.00	0.981	0.83
		SUM	1.341	1			SUM	1.177	1

In this step, we obtained the evaluation matrix, with regard to the SA/CR alternatives provided by the expert team (Table 3).

Table 3: SA/CR alternatives

	S_3^{strat}	S_4^{sist}	S_5^{manag}	*EV*	W_1	
S_3^{strat}	1.00	3.00	5.00	0.917	0.64	
S_4^{sist}	0.33	1.00	3.00	0.371	0.26	
S_5^{manag}	0.20	0.33	1.00	0.15	0.10	
			SUM	1.438	1	
Eigenvalue 3.033; *CI*				0.0165		
RI random index 0.52; CR				*0.03*		*<0.1*

Inner dependence among the S_3^{strat}, S_4^{sist} and S_5^{manag} factors was determined by analyzing the impact of each factor on every other factor using pairwise comparisons. It is common to observe that the factors have dependent behaviors.

Interpreting Results

As a result of implementing a new concept, now it is possible to assess the impact on different change elements. Figure 6 (visualization) and Table 4 show internal contribution to strategy (CR) on the left and external contribution of company's strategic aggressiveness (SA) on the right.

Table 4: Internal Contribution (CR) and external contribution (SA)

Interrelation Contribution	Element	Gap	Result			Gap	Internal coef.	External coef.	Result
0.64	S_3^{strat}	1.03	0.66		Marketing Aggressiveness	0.2	1.041	0.33	0.07
0.26	S_4^{sist}	1.18	0.31		Innovation Aggressiveness	0.88	1.041	0.67	0.61
0.1	S_5^{manag}	0.75	0.08						

Fig. 6: Result interpretation for transaction factors

Source: calculations made by the authors

Lastly, based on the new OSPP concept we could evaluate GM and culture elements as transformational drivers in Fig. 7 (calculations and visualization).

	Score	Average Turbulence	Gap	Contribution	Result
GM *S4*	2.56	3.32	0.76	0.17	0.13
Culture *S5*	2.86	3.32	0.46	0.83	0.38
		Internal Interrelation		Result	
GM *S4*	0.17	S_1^{leader}	0.46	0.08	
		S_2^{cult}	0.38	0.06	
		S_3^{strat}	0.16	0.03	
Culture S5	0.83	S_1^{leader}	0.46	0.38	
		S_2^{cult}	0.38	0.31	
		S_3^{strat}	0.16	0.14	
			SUM	1	

Fig. 7: Result interpretation for transformational factors

Source: calculations made by the authors

Conclusion

The present paper has provided a detailed framework for prioritization of competitive strategies based on the ANP approach with an example for the specific Latvian manufacturing company.

First, the authors have observed the OSPP methodology and created the design of OSPP. Second, the important conclusion associated with the assessment of AHP and ANP has been made. Third, a new OSPP concept has been drawn and a different technique has been proposed, which is more convenient for small companies. Fast response of strategies to rapidly changing market conditions becomes the most demanded topic. Within the framework of the present research, an integrated OSPP-AHP framework has been proposed for the wood manufacturing company using the OSPP approach augmented with the AHP and ANP methodology to obtain criteria weights and prioritize alternative elements, which could be used even for small companies. Finally, according to the empirical results of the OSPP–ANP weighted analytic methodology, we interpreted results for better understanding of turbulence effect on company performance. The proposed integrated OSPP– ANP approach shows greater support of the existing OSPP elements.

The limitations of the research can be discussed since Latvia has a specific geo-political and economic position (Global Innovation Index 44 out of 127 and, compared to other EU countries, Latvian R&D expenditure is greatly reduced – 0.4% of the GDP in 2016 (EU, 2018; WIPO, 2017). Future research in the Baltic States could confirm or reject this limitation. Latvia is a good case for analysis since it has open market with perfect logistic value chains and works as a bridge between Eastern and Western Europe. For this reason, the research results are crucial for wood manufacturing companies in small countries with the target of becoming both locally and internationally competitive in the European markets.

As for practical implication of the research case, it allows even small companies to assess their strategic posture with the OSPP–AHP method and follow the discussed strategic gaps both for the domestic and international market.

According to the research results, digital transformation could be easily applied anywhere to the OSSP methodology, since the AHP-ANP approach is balancing contribution of every element.

Summarizing the results, it can be concluded that managers do not really have a common understanding of the assessment of digitalization strategies, and their main focus should be on the development of customized methodology based on the presented OSPP concept. However, we should keep in mind that the current OSPP approach lacks an individual level, concerning employees' skills, motivation, values, etc. The authors propose in the future to extend the current OSPP approach with the individual level transactional descriptors in order to fill the gap associated with performance assessment.

Development of a better digitalization strategy fitness for future OSPP is most important for the current approach in order to forecast the expected profit/performance. Companies fit their digitalization strategies according to the environmental feedback created by these strategies (or will find themselves at a relative disadvantage in exploiting their environments/resources in digitalization strategies). In the current more competitive and dynamic digital environment, the sustainability of competitive advantage exists when the system of competitive advantages is high and overall value added generated from all the components in the business model proposition is strong.

Abstract

The article studies the issues of managing the competitiveness of a tourist destination. It is established that today the tourism industry is organized in such a way that one of its basic elements of development is a tourist destination. It is stated that the tourist potential of Ukrainian territories is unrealized due to the low level of welfare of the population, overestimated cost and inadequate quality of regional tourism product, underdevelopment of tourism infrastructure, imperfect mechanisms of state regulation and stimulation of tourism development, lack of real coordination and interaction between these entities. Analytical, monographic, comparative, abstract and logical, system and analytical methods of research were used, particularly the use of analytical approach made it possible to build an infological model of innovative development of tourist destinations on the basis of allocation of basic factors and conditions of development of the territory. It was found out that the competitiveness of tourist product is the main condition that distinguishes between the concepts of "tourist region" and "tourist destination". Own definition of the term "tourist destination" is offered.
Innovative principal provisions on increase of level of competitiveness of tourism on the territory level are offered. Components of forming management of tourist destination competitiveness are defined. The infology of tourist destination competitiveness management system is developed.

Keywords: Tourism, Region, Management, Competitiveness, Development.

Introduction

Today, the tourism industry is organized in such a way that one of its main elements of development is a tourist destination. The number of tourist destinations in the world is gradually increasing, prompting market participants to compete hard and take measures to improve the efficiency of their activities management.

In Ukraine, the issue of the lack of competitiveness of tourism is still acutely topicalized. In particular, there is an underdeveloped regional market for domestic and inbound tourism. These processes are caused by both economic and social factors.

The tourism potential of the Ukrainian territories is unrealized due to the low level of welfare of the population, overestimated cost and inadequate quality of regional tourism product, underdeveloped tourism infrastructure, imperfect mechanisms of state regulation and stimulation of tourism development, lack of real coordination and interaction between actors in this area.

These shortcomings are reflected in the low level of competitiveness of the regional tourism product. To solve these problems, new approaches are needed to improve management tools aimed at solving problems of tourist destinations development and increasing their competitive advantages. Taking into account these aspects, the issues of increasing the competitiveness of tourist destinations require further research and studies.

Literature Review

Considerable contributions to acceleration of tourism development, innovative principles of formation of tourist and production processes and management of tourist activity was made by such scholars *S. Medlik, S. Pike, C. Sandage, V. Fryburger, K. Rotzoll, R. Kozhukhivska, N. Parubok, N. Petrenko, S. Podzihun, I. Udovenko*.

Among the researchers of issues related to the problems of economics and management of tourism, efficiency and competitiveness of tourism activities in the modern economy, it is worth noting especially the works of such domestic and foreign authors as *W. Wells, J. Burnett, S. Moriarty, Ch. Pearce* and others.

Recently a lot of scientific works have appeared concerning the research of theoretical and methodological bases of tourist regions development. But, the question of improving the competitiveness of tourism activities in the current economic conditions, in our opinion, is the least developed in the theoretical and practical aspects.

The analysis of theories and concepts presented in the scientific literature, allowed a comprehensive assessment of the problem of tourism development at the regional level and to draw a conclusion about the insufficiency of the study of applied nature to improve the level of competitiveness of tourism at the territorial level, and therefore requires fundamental research in this direction.

The purpose of the article is to study the formation of an innovative form of management of tourist destination and the development of fundamental provisions to improve the level of competitiveness of tourism at the territorial level.

Methodology

Methodology in research is based on the development of domestic scientists and foreign experience of studying innovative forms of development of the tourist region, as well as personal estimates of the author. Analytical, monographic, comparative, abstract and logical, system and analytical methods of research were used, particularly the use of analytical approach made it possible to build an infological model of innovative development of tourist destinations on the basis of allocation of basic factors and conditions of development of the territory.

Results

Tourism should be seen as an open socio-economic system, influenced by many factors. Many enterprises and organizations are directly or indirectly involved in the structure of such a system, each of which tends to depend on the activities of all participants in the system.

At the same time, the most important component of tourism development substantiation is the availability of tourism resources in the region (country) and the interest of tourists to visit the region.

Today the state recognizes the important role of tourism industry and strategic role of tourism in the socio-economic development of Ukraine and its regions.

According to the *Law of Ukraine "On Tourism"* "the tourism industry is a combination of business entities in the tourism sector (hotels and other accommodation facilities, catering, transport, cultural, leisure and entertainment facilities, sports, etc.) that provide tourist services ".

However, with this definition, there is no clear understanding of the relationship between the enterprises that are the components of the regional tourist system.

In our opinion, the tourism industry of a region is a complex which should include all available tourism resources, infrastructure and its varieties), products (services and goods) of the enterprises of the region which are used to organize tourism and meet the needs and requirements of tourists.

In-depth study of tourism processes, in particular, study of the process of assessing economic efficiency, profitability, social orientation, legal security, etc., provides for the expansion of the list of elements of the tourism system to understand that the tourism industry at the regional level should be understood more widely.

Here, in our opinion, the term "tourist destination" should be used. In particular, *Medlik (2003)* interprets this concept as "countries, regions, cities and other territories that attract tourists are the main places of localization of tourist activity, tourist flows and their costs; places of maximum concentration of tourist attractions, accommodation facilities, catering, entertainment, other services of economic, social and physical impact of tourism".

Pearce (1989) interprets the concept of "destination" from a psychological point of view as "a place that leaves tourists with different impressions, experiences and emotions".

Pike (2008) considers a destination from the economic point of view as a territory of tourist demand and determines its primary importance for tourist business development.

When analyzing the content of the term "tourist destination" it is necessary to consider it as a part of the tourist system.

In our opinion, a tourist destination is a geographical area that is attractive to tourists due to the presence of unique or specific tourism and recreational resources and related infrastructure, brought to consumers in the form of a ready-made tourist product to meet their various needs.

The market economy assumes the study of competitiveness in any sphere of activity, regardless of the form of ownership and scale of activity *(Bezhlibna,2017).*

Competitive can be considered a tourist destination that is capable of producing tourist products that are in demand on the domestic and foreign markets and, on this basis, of ensuring economic growth and improving the welfare of the local population.

The formation of tourism destination competitiveness management is based on the model of integration of interrelated functional blocks of management activities (education, research and development, economic and legal support, marketing) into a single independent economic process *(Fig. 1)*, which creates competitive advantages of tourism destination through management decisions that are taken.

Fig.1: Infology of tourist region competitiveness management system*

**Source: compiled by the author.*

Consequently, the competitiveness of a tourist region is managed through competitive advantage management, with each function block contributing to its creation.

The mechanism of system functioning determines the place of each element of the system, i.e. sets its hierarchy *(Kozhukhivska at all, 2017).*

The mechanism of the proposed system *(Fig.1)* has a complex structure (principles, objectives, control tasks, functions, methods, competencies, mechanisms), represented by the interaction of different blocks.

The main element of the infological system of regional competitiveness management *(Fig.1)* is the mechanism of competitive advantages formation.

The mechanism of the proposed competitiveness management system is aimed at maximum growth of competitiveness of the tourist product and satisfaction of needs of the population through optimization of the structure of distribution of tourist resources in the destination, according to their volume, structure and public needs.

The mechanism highlights the structural interaction of functional components (forecasting, planning, organization, monitoring, analysis and control), which allows to improve the interconnection of system elements, provided that the positive effects of external and internal factors are increased.

Conclusions

Based on the formation of country's (region, city) tourist destinations, which have tourist resources, there are many opportunities for socio and economic development of their territories. The development of tourism allows receiving the basic or additional income in many branches and spheres of human activity.

In our opinion, the system of managing the competitiveness of tourist destinations should cover different hierarchical levels (external and internal environment of the destination, social groups, etc.). with the use of conceptual approaches that reflect the nature of the introduction of subjects of different levels.

In particular, the management of tourist destination competitiveness can be enhanced through the formation and development of secondary sources of income of competitive advantages. It should be noted that:

1. Secondary competitive advantages of distinction are formed as a result of use of existing tourism infrastructure created by public institutions and business entities. At the same time, the destination minimizes the cost of achieving the desired competitiveness and emphasizes the efficiency of resources used to create priority competitive advantages.

Within the destination, the management system is focused on rational use of destination resources, improvement of development management, and provides for maximum use of resources to improve the quality of tourist product.

Using such approach it is possible to provide adaptation of tourist destination to changes of external environment, to increase efficiency of current functioning, that is to increase competitiveness of tourist product.

1. Secondary competitive advantages of the destination are formed as a result of using the existing tourism infrastructure created by public institutions and business entities. At the same time, the destination minimizes the cost of achieving the desired competitiveness and emphasizes the efficiency of resources used to create priority competitive advantages.

Within the destination, the management system is focused on rational use of destination resources, improvement of development management, and gives maximum use of resources to improve the quality of tourist product.

Using such approach it is possible to provide adaptation of tourist destination to changes of external environment, to increase efficiency of current functioning, that is to increase competitiveness of tourist product.

Abstract

The relevance of studying the main aspects of tourism development in Ukraine is due to the fact that in recent decades tourism has developed significantly and has become a massive socio-economic phenomenon. Its rapid development is facilitated by the expansion of political, economic, scientific and cultural relations between Ukraine and other countries. Therefore, the enquiry of the tourism activities status, the identification of the main functions and factors that affects its development have big importance for the further development of this industry. The purpose of the article is to investigate and analyze the economic status of the tourism industry on the basis of inbound and outbound tourism. Social and economic aspects of development the tourism sphere in Ukraine are outlined and investigated in the article. In the course of the study the dynamics of tourist flows was identified and analyzed. The basic elements, functions and factors that affects on the development of the tourism industry are highlighted. The principles of implementation of the state tourism development policy in Ukraine and ways of its realization are generalized. As a result, it is stated that the further development of the tourism industry should be based on new mechanisms of management, effective organizational and management structures, economic freedom of producers of tourism products which in conditions of free competition will ensure the saturation of the market with high-quality services and promote the socio-economic development of the country.

Keywords: tourism, tourist activity, development, social environment, economy.

Introduction

The relevance of studying the main aspects of tourism development in Ukraine is due to the fact that in recent decades tourism has developed significantly and has become a massive socio-economic phenomenon. Its rapid development is facilitated by the expansion of political, economic, scientific and cultural relations between Ukraine and other countries.

Therefore the enquiry of the tourism activities status, the identification of the main functions and factors that affects its development have big importance for the further development of this industry. However due to the unstable condition of the economy, both in Ukraine and in the world as a whole, the issues of studying the status of tourism activity need constant research. In the educational and

professional literature little attention has been given to research of the status of the tourism industry and the factors that affects the development of the tourism industry. All this testifies the relevance of the topic and therefore the direction of the study has been determined and defined its task.

The purpose of the article is to investigate and analyze the economic status of the tourism industry on the basis of inbound and outbound tourism. The tasks of the article consists in identifying the main tourist flows, elements, functions and factors that affects the development of the tourism industry, generalization of principles of implementation of the state tourism development policy in Ukraine and ways of its implementation.

Literature Review

The question of tourism development as a socio-economic phenomenon is considered by many scholars. Among foreign scientists should be noted works written by *A. Hussen, S. Medlik, S. Pike, C. Sandage, V. Fryburger, K. Rotzoll, W. Wells, J. Burnett, S. Moriarty, Ch. Pearce*; and domestic – *V. Azar, N. Golda, R. Kozhukhivska N. Parubok, N. Petrenko, S. Podzihun, I. Udovenko* and others. However, theoretical positions and practical recommendations regarding to the social and economic development of tourism remain poorly researched. The relevance of these problems has led to the choice of research topic.

Methodology

The theoretical and methodological basis of the study is the scientific work of domestic and foreign scientists in studying the social and economic aspects of tourism development, as well as personal evaluative comments of the author. Methods of comparative and economic analysis, expert assessments, graphical interpretation, were used, etc. Thus, the dynamics of tourist flows in Ukraine has been estimated on the basis of the use of economic analysis and graphical interpretation of the data; factors of influence on the development of the tourism industry were determined using the methodology of comparative analysis and expert evaluations.

Results

Considering the tourist activity it is necessary to distinguish in it on the one hand, technical, technological and organizational processes, and on the other - the economy of this activity. Economy of tourist activity include:

- creation and provision of tourist services in volumes and in terms stipulated by the contract for the organization of travel;
- effective use of existing and creation of new logistical and resource base of tourism;
- provision of foreign exchange receipts to the state (region) budget and profit of tourism entities;
- cooperation of means of tourist activity;
- promoting the employment of the population and meeting its needs.

The tourism business is the only one economic and technological system for the formation and sale of the tourism product in order to meet the demand for tourism services. It covers four main elements: the production of tourist services; completing of tourist product; realisation of a tourist product or a separate service; consumption of the tourist product (services).

Economics of the tourism business is, on the one hand, a set of social relations that arise during the implementation of tourism activities that consists in the production, distribution, exchange and consumption of tourism services (tourist product), which is studied by economic theory, and on the other hand, is an integral part of the national economic complex of the country as a catalyst for economic growth.

The tourist business as a component of the economic complex of the country is characterized by the following properties and functions:

– has its own industry of manufacturing and providing services to tourists;
– creates tourist services, forms tourist products and implements them;
– shapes the market for tourist services of various levels of complexity;
– acts as a multiplier for the growth of national income, gross domestic product, employment of the population, development of infrastructure and improvement of the standard of living of the population;
– is an area where jobs are created and high levels of efficiency and rapid return on investment are ensured;
– acts as an effective tool that protects the environment and the historical and cultural heritage of mankind, which is the material basis of the tourism resource potential and forms a specific sphere of activity;
– compatibility with all spheres, industries and types of human activity;
– has advantages in the integration and globalization processes taking place in the world.

The main feature of tourism is its ability to influence the economy of the region, country and world. Ukraine has all the objective prerequisites for the intensive development of inbound and outbound tourism. With its favorable geopolitical location, Ukraine has great tourism and recreational potential, a favorable climate, world-class cultural and historical sites and a fast-growing tourism industry. Considering the place and role of tourism in the world economy, the Cabinet of Ministers of Ukraine approved on April 29, 2014 *Program of tourism development in 2015-2022.* In which the priority to inbound and inland tourism was given. The result of impementation *Program of tourism development in 2015-2022* was an increase in the number of inbound tourists over the outbound ones. During the period of 2011-2019, outbound tourist flow increased from 14.85 million in 2011 to 15.33 million in 2019, while over the same period the inbound tourist flow increased from 9.17 million in 2011 to 20.7 million in 2019.

Fig. 1 presents graphically the dynamics of tourist flows in Ukraine during the 2011-2019.

	2011	2012	2013	2014	2015	2016	2017	2018	2019
Outbound stream	14,85	14,73	14,79	15,49	16,45	16,88	17,33	15,49	15,33
Entrance stream	9,17	10,52	12,51	15,63	17,63	18,94	23,10	25,40	20,70
Balance	-5,68	-4,21	-2,28	0,14	1,18	2,06	5,77	9,91	5,37

Fig. 1: Dynamics of tourist flows in Ukraine, 2011-2019, million people*
**Source: built on the data of The State Statistics Committee of Ukraine.*

Assessment of the tourist flows dynamics (Table 1) shows that during 2011-2019 years there were positive trends in the development of tourism in Ukraine, namely – there was a more rapid growth of inbound tourist flow against the background of slow growth (in 2016-2017 gradual reduction) of outbound tourism, which gradually led to the creation of a positive balance of tourist flows in 2018.

Table 1: Assessment of the tourist flows dynamics in Ukraine during 2011-2019*

Years	*Outbound tourist flow*			*Inbound tourist flow*			*Balance of tourist flows*
	Million people	**Increase in million**	**Growth rate, %**	**Million people**	**Increase in million**	**Growth rate, %**	
2011	14,85	–	–	9,17	–	–	-5,68
2012	14,73	-0,12	-0,8%	10,52	1,35	14,7%	-4,21
2013	14,79	0,06	0,4%	12,51	1,99	18,9%	-2,28
2014	15,49	0,7	4,7%	15,63	3,12	24,9%	0,14
2015	16,45	0,96	6,2%	17,63	2	12,8%	1,18
2016	16,88	0,43	2,6%	18,94	1,31	7,4%	2,06
2017	17,33	0,45	2,7%	23,1	4,16	22,0%	5,77
2018	15,49	-1,84	-10,6%	25,4	2,3	10,0%	9,91
2019	15,33	-0,16	-1,0%	20,7	-4,7	-18,5%	5,37

**Information for the period 2014-2019 is given without taking into account the temporarily occupied territory of the Autonomous Republic of Crimea, the city of Sevastopol, and part of the temporarily occupied territories in Donetsk and Luhansk regions.*

***Source: built on the data of The State Statistics Committee of Ukraine.*

Thus, the process of becoming a tourist market in Ukraine during the 2011-2019 in Ukraine, on the one hand, led to a rapid saturation of the tourism market, an increase in the number of tourist companies, qualitative and quantitative indicators of their activities.

On the other hand, recently the tourist market of Ukraine has a high degree of volatility of the market situation in the conditions of economic crisis, significant seasonal fluctuations in demand for tourist services, increased competition, limited resources and so on, which leads to complex management problems in tourism enterprises.

Despite the current crisis phenomena that will in the future affect the demand and use of offers in the tourism market we predict its further development. A necessary condition for the tourism industry functioning is a stable political environment in the country.

Among the factors that affects the development of tourism should be highlighted those ones, related to the political, legal and socio-economic situation in the country and the world (Fig. 2).

The positive action of the tourism development factors ensure high economic results, stable development of activities and successful resolution of social issues.

The factors of influence on tourism in Ukraine, highlighted in the course of the study, identified the goals of state regulation and priority directions of tourism business development envisaged by the Law of Ukraine "About Tourism".

Fig. 2: Factors of influence on the development of the tourism industry*

**Source: made by the author.*

The main goals of state regulation of tourist activity are:

– securing the rights of citizens to rest, restore and promote health, to a safe and environmentally friendly life, to satisfy spiritual needs and other rights;
– protection of the rights and legitimate interests of tourists and business entities;
– restoration and preservation of the integrity of tourist resources of Ukraine, their rational use and protection in the planning and development of the territories on which tourist visit sites are located;
– creation of favorable conditions for improvement and development of tourism industry, support of tourist activity priority directions.

Priority directions of the state policy of tourism development include:

– improvement of legal bases of regulation of tourist relations;
– establishment of tourism business as a highly profitable branch of economy;
– encouraging national and foreign investment in tourism industry development and creation of new workplaces;
– promotion of inbound and inland tourism, rural and ecological (green) tourism;
– expanding international cooperation in the field of tourism and establishing of Ukraine in the world tourism market;
– harmonization of the legislation of Ukraine on tourism to the world requirements, creation of normative base of functioning of systems of standardization and certification of works and services in the tourist business, etc.

Conclusions

The development of tourism business in Ukraine is on a market basis, but it is not in "free navigation", because it is regulated by the state on the basis of legislation, national policy and

indicative planning of all types of tourism. The main tasks of economic activity in the sphere of tourism, in our opinion, are:

- creation (completing) of an innovative tourism product;
- formation of the tourist services market;
- improvement of tourism infrastructure;
- implementation of tourist services based on the use of computer technologies;
- priority development of inland and inbound tourism.

Tourist activity is based on the conditions and factors involved economy, politics, culture of the countries of the world, speed of penetration into the world civilization, the ability to adapt to the new tourist technologies based on computer technology, and the flexible advance to integrative and other processes in the world space.

An assessment of the dynamics of tourist flows shows that there are positive trends in the development of tourism in Ukraine in recent years.

The implementation of the state tourism development policy should be based on compliance with the legal framework of the legislation in the field of tourism industry, development of cooperation with foreign countries and international tourism organizations and participation in the development and implementation of international tourism development programs, etc.

Further development of the tourism industry should be based on new mechanisms of management, effective organizational and management structures, economic freedom of producers of tourism products, which in conditions of free competition will provide saturation of the market with high quality services and promote the socio-economic development of the country.

Siti NURYANAH

Universitas Indonesia, Indonesia
siti.nuryanah@ui.ac.id

Abstract

Tax amnesty often used by the government of any country to boost their tax collections in the short run. However, the effectiveness of this amnesty is still being debatable, particularly in the long term. This study aimed to examine the effect of a tax amnesty named Sunset Policy in Indonesia conducted in 2008, as a sample case in a developing country. At macro-level, this study shows that the Policy is effective in improving compliance of individual taxpayers in the long run.

Keywords: Tax compliance, developing country, .

Introduction

Tax is the most important revenue instrument for a developing country. In Indonesia, tax revenue accounts for more than 60% of the total state revenue budget. However, in collecting this tax revenue, the government could not just collect it from comply taxpayers who routinely pay their tax obligations. They often need to use extra effort as well as various additional tax policy schemes, one of which is by implementing a tax amnesty program. The tax amnesty program is a program that provides opportunities for individuals and companies to report and pay taxes that have not been paid before without the imposition of part or all of the administrative sanctions and criminal sanctions as imposed on the discovery of normal tax avoidance practices (Alm, McKee, and Beck, 1990; Alm and Beck, 1993). This kind of program is often used by any government around the world, both by developed and developing countries. Nevertheless, the impact of the tax amnesty program often does not run as smoothly as expected. The long-term impact of this program also needs to be questioned as it is argued that tax amnesty has the possibility to reduce compliance in the future (Alm, McKee, and Beck, 1990).

Previous literature examined the long-term effectiveness of a number of tax amnesty programs as for examples Alm and Beck (1993) in America, Alm, Martinez-Vazquez, and Wallace (2009) in Russia, and Kara (2014) in Turkey. Bose and Jetter (2010 and 2012) argued that there are actually critical success factors for other tax amnesty in developing countries that are different from conditions in developed countries. This study aims to examine the effect of tax amnesty program in developing countries, i.e. Indonesia. Specifically, the case of the Sunset Policy tax amnesty in 2008 is explored to answer the following specific research questions: 1) at a macro level, can the 2008 Sunset Policy improve the existing tax base, increase tax compliance, and increase total and long-term tax revenue trends? 2) at a micro level, can the 2008 Sunset Policy improve company tax compliance in the long run, which is projected to decrease the level of corporate tax aggressiveness? The measurements of the study will be carried out under macro and micro perspectives. This study uses five-year data analysis as an approach to "long-term", in reference to Dyreng, Hanlon, and Maydew (2008).

Having discussed the background of the study, the literature review and hypotheses development are then presented, followed by research methodology, results and discussions. The conclusions and suggestions for future research are presented at the end of the paper.

Literature Review and Hypothesis Development

There are at least four types of reasons/justifications for a tax amnesty program, which are: 1) To quickly increase tax revenue in the short term (Uchitelle, 1989; Alm, McKee, and Beck, 1990; Baer and LeBorgne, 2008; Saracoglu and Caskurlu, 2011; Kara, 2014); 2) To encourage repatriation of capital or assets (Uchitelle, 1989); 3) To reduce the underground economy and increase the tax base so that ultimately increase the potential for future tax revenue (Uchitelle, 1989; Saracoglu and Caskurlu, 2011; Kara, 2014); and 4) To facilitate the transition to a new taxation system (Uchitelle, 1989; Alm, McKee, and Beck, 1990).

Previous studies examined the success story of tax amnesty that ever been applied around the world, in order to formulate the factors that are likely plays a role in determining the success of a tax amnesty program. It is suggested that to be successful, tax amnesty program must be seen as a unique program so as to convince the public that this program will not be repeated in the future (Uchitelle, 1989). In addition, it is suggested that the program should not be held repeatedly (Uchitelle, 1989; Saracoglu and Caskurlu, 2011; Alm and Beck, 1993; Alm, Martinez-Vazquez, and Wallace, 2009; Baer and LeBorgne, 2008). Next, stringent tax law enforcement is believed to have a positive impact to the successfulness of the tax amnesty. In fact, it is showed that the success of a tax amnesty program tends to depend on the existence of structural reforms of the prevailing taxation system (Uchitelle, 1989; Alm, McKee, and Beck, 1990; Kara, 2014). Moreover, the program should be known by the whole community at large (Uchitelle, 1989) while it is also believed that changes in economic factors make tax evaders interested in being compliant hence the tax amnesty becomes successful (Bose and Jetter, 2010).

Despite the fact the successful factors mentioned above in regards to tax amnesty program, these factors are not achieved hence the implementation of tax amnesty program is often ineffective. This is resulted from at least two factors which are firstly tax amnesty is believed to be a form of unfair treatment by the state, that is as a form of special treatment to tax evaders; and secondly tax amnesty is conducted not only once but several times (Alm and Beck, 1993; Alm, Martinez-Vazquez, and Wallace, 2009; Baer and LeBorgne, 2008; Saracoglu and Caskurlu, 2011). Moreover, previous study found that low compliance of taxpayers and the emergence of tax avoidance practices can basically be caused by some of the following fundamental problems: weak existing tax administration and weak law enforcement in the country (Baer and LeBorgne, 2008) as well as the insufficient tax regulations and policies to overcome the compliance problem. Overall, although tax amnesty is quite attractive to lure taxpayers to voluntarily admit their mistakes/negligence in the past, as long as some of those things have not been changed the tax amnesty program tends to not increase the compliance of existing taxpayers, especially in the long run (Uchitelle, 1989). In contrast, it tends to reduce the existing compliance and increase tax avoidance practices.

In a developing country i.e. Indonesia, tax amnesty programs have been conducted several times as for example in 1964 and in 1984 which unfortunately experiencing low participation of taxpayers. Then in 2008, a lighter tax amnesty program called the Sunset Policy was also conducted to have a specific purpose to increase the participation of Individual Taxpayers, and found to be successful. Following the 2008 program, Reinventing Policy in 2015 was launched and was conducted in 2016 with the main objective is to repatriate (withdraw back to Indonesia) the capital and assets deposited by taxpayers abroad to avoid taxes applied in Indonesia.

Apart from the claim of the government that tax amnesty programs are quite effective, previous studies reveals different opinions in regards to the programs as for example Tjen and Abbas (2010) stated that most of the individual taxpayers additions that occured in Sunset Policy were employees which were not the tax authority main target since the employees have their tax obligations witheld and paid by their employers, regardless of whether they have a Taxpayer Identification Number. On the other hand, Winastyo (2010) and Anggraeni and Kiswara (2011) found that the Sunset Policy succeeded in achieving its targets in the short term, specifically in raising awareness of paying taxes and increasing understanding of taxpayers regarding tax regulations applicable. Based on Syachbrani (2013), this should be able to improve taxpayer compliance in paying taxes and in accordance with Davis, Hecht,

and Perkins (2003), taxpayers will tend to be insensitive to change back compliance so that it also increases compliance in the long run.

Various results on the effectiveness of tax amnesty program as discussed above, propositions of this study can be formulated as follows:

> "The implementation of the Sunset Policy can have a negative (positive) impact on the tax base and taxpayer compliance so that in the long run it can have a negative (positive) impact on state tax revenue."

Research Methodology

To see the long-term effectiveness of a tax amnesty program in macro perspective, this section aims to see whether there is an increase in tax revenue potential that occurred after the 2008 Sunset Policy. In the previous research (Alm and Beck, 1993; Alm, Martinez-Vazquez, and Wallace, 2009), this measurement is conducted by using empirical analysis on time series of monthly tax revenue in the long run to see whether or not there is a change in the trend of monthly tax revenue in the long run. However, due to some limitations of existing data, the measurement on this study will be carried out with descriptive analysis. Although it is not as accurate as the empirical research model, Alm and Beck (1993) have proven that the preliminary descriptive analysis conducted can still produce results that are consistent with the results of the study.

Results

The following data illustrates the condition of the tax base, tax compliance (specifically in collecting tax returns), and income tax revenue of Indonesia from 2003 to 2013. One way to measure the tax base is by using data on the number of taxpayers. The more taxpayers, the more income should be taxed as shown in Table 1 and Figure 1. According to Table 1 and Chart 1, the increment only occurred in the number of Individual Taxpayer (WP_OP) while the number of corporate taxpayers (WP_B) tends to be constant.

Table 2: Total Registered Taxpayers for the Year 2002-2013

Year	Number of Taxpayers per 31 Dec (Thousand People or Entities)						
	Individual Taxpayers (WP_OP)			Corporate Taxpayer (WP_B)			TOTAL
	Amount	+/-	Mean	Amount	+/-	Mean	
2002	2,113	-	-	941	-	-	3,054
2003	2,426	313	304	1,032	91	92	3,458
2004	2,729	303		1,116	85		3,845
2005	2,999	270		1,208	91		4,207
2006	3,331	332		1,308	100		4,638
2007	5,336	2,005	3,510	1,358	50	100	6,694
2008	8,808	3,471		1,482	124		10,290
2009	13,861	5,054		1,608	126		15,470
2010	16,881	3,019	2,812	1,760	152	180	18,641
2011	19,882	3,001		1,930	169		21,811
2012	22,131	2,250		2,136	207		24,267
2013	25,110	2,979		2,329	192		27,438

Source: Directorate of Tax Potency and Compliance, self-managed

Graph 1: Increment in the Number of Individual Taxpayers and Corporate Taxpayers for 2003-2013

Graph 2 shows the conditions related to taxpayer compliance, especially in term of submitting their tax returns. In this case, the result shows that the individual taxpayers' compliance in submitting their tax returns has increased sharply and is sufficient to last for at least five years. On the other hand, the condition is different for corporate taxpayers. The compliance of corporate taxpayers were increased slightly, but then returned to its original condition after the Sunset Policy period ended. Furthermore, despite the effectiveness in increasing the number of tax returns submission, the number of taxpayers who do not collect their tax returns are also continues to increase every year for both categories of taxpayers.

Panel A: Compliance Ratio

Panel B: Number of taxpayers who do not collect tax returns

Graph 2: Compliance in term of Submission of Tax Returns for Each Taxpayer Category for 2003-2013[1]

Finally, Graph 3 confirms the accumulated impact of changes in the tax base and compliance which should have an impact on long-term income tax revenue. As can be seen on Graph 3, the increase in the number of individual taxpayers and their compliance in submitting their taxreturns has a positive impact on the income tax revenue in the long run (Panel A). On the other hand, the number of corporate taxpayers that tends to be stable and their compliance in submitting their taxreturns that tends to return to its original condition makes income tax revenue only occur in the short term and tends to not having an impact on long-term revenue (Panel B and Panel C). However, in total, since the income tax originating from corporate taxpayers is far greater than the income tax originating from individual taxpayers, then the positive impact on income from individual taxpayers tends to be overshadowed. Thus, in total, the increase in income tax revenue seems to only occur in the short term, not in the long term.

[1] In 2011, the Directorate General of Tax (DGT) held a National Tax Census for the first time. Through this program, DGT classifies and recalculates taxpayers who are required to submit tax filing. As a result, there is a considerable reduction that occurs in the number of taxpayers who are required to submit the tax filing which leads to an increase in the compliance ratio calculated. This can lead to misinterpretation when compared with data before the census. Therefore, for the sake of this study, the estimation of compliance ratios for 2011-2013 is included when it follows the classification and calculation of the old taxpayer taxpayers.

Graph 3: Total Indonesian Tax Revenue for All Categories of Taxpayers for 2003-2013[2]

Discussions

Based on the results of this study, it can be seen that the 2008 Sunset Policy has succeeded in achieving its specific goal, which is to increase tax participation from individual taxpayers and increase income tax revenue in the long run from individual taxpayers. This is characterized by the increase in the number of individual taxpayers (Tax Base), the increase in tax compliance of individual taxpayers in the long run, and the increase in income tax revenue from individual taxpayers. Thus, this study complements the results of research by Winastyo (2010) and Anggraeni and Kiswara (2011), and shows that Sunset Policy does not only achieve its goals in the short term, but in the long term as well.

If related to the literature used, there are several factors that have contributed to the success of the Sunset Policy in achieving its specific objectives , namely:

1. *The uniqueness of the Sunset Policy*. The Sunset Policy scheme is argued to be different from the tax amnesty scheme that was previously carried out by the Indonesian government. This is in accordance with what is stated by Uchitelle (1989) where one of the prerequisites that must be owned by a tax amnesty program is that the program must be seen as a unique and unrepeatable program in the future.

2. *Sunset Policy occurs as one of a series of taxation system reforms in Indonesia*. As Sunset Policy included in the Revised Law General Provisions and Procedures for Taxation published in 2007. This is also supported by a change in a better tax administration system, at least with an increase in tax enforcement (Uchitelle, 1989, Alm, McKee, and Beck, 1990, and Kara, 2014).

3. *Sunset Policy is accompanied by various incentives for the people who follow it*. In addition to offering forgiveness for administrative sanctions and exemption from auditing, Sunset Policy also provides incentives in the form of exemption from fiscal income tax for taxpayers who have Tax Identification Number who wish to go abroad. With the development of globalization, this has become an important thing for the community. This is in accordance with Bose and Jetter (2010 and 2012).

[2] Panel A: Individual taxpayers; Panel B: Corporate taxpayers –general; Panel C: Corporate taxpayers –oil and gas industry; Panel D: All taxpayers.

4. *Sunset Policy is well socialized.* As it is known, a policy cannot run well if it is not known to the wider community. This is what the government faced successfully during the implementation of the Sunset Policy. Large-scale socialization and an extended period allegedly contributed to raising public awareness. This is consistent with the case of the tax amnesty program in India in 1997 by Luitel (2014).
5. *Psychological conditions of Indonesian society*. The last factor which may play a role in the success of the Sunset Policy is characteristic of Indonesian society which tend to be afraid of taxes. This can be seen from the many people who are willing to use the services of tax consultants to ensure that their tax obligations have been carried out in accordance with the laws and regulations that apply solely to avoid administrative sanctions that arise if there are errors. This is consistent with the results of the study of Davis, Hecht, and Perkins (2003) who found that taxpayers who have become compliant, will tend to be insensitive to change their compliance again.

On the other hand, even though the Sunset Policy has achieved its particular effectiveness, however, when viewed as a whole (together with the condition in corporate taxpayers), the actual Sunset Policy tends to be less effective in the long run. This is because this program is not effective against the corporate taxpayers, which accounts for a big proportion of income tax revenue in Indonesia. The increase in revenues from individual taxpayers was actually not large enough because most of the participants were employees whose tax obligations had been witheld directly by their employer, apart from their participation in the Sunset Policy (Tjen and Abbas, 2010). Overall, the ineffectiveness of the Sunset Policy for the corporate taxpayers tends to overshadow the effectiveness of the Sunset Policy for individual taxpayers which make the Sunset Policy seems to be ineffective in the long run.

Conclusion and Suggestion for Future Studies

This research was conducted to measure the long-term effectiveness of a tax amnesty program held in Indonesia, especially the Sunset policy 2008 which is given in relation to the income tax. The effectiveness mentioned above is measured in macro perspective and micro perspective. The measurements in macro perspective are done through the analysis of Indonesian tax base, overall tax compliance, and long-term income tax. While measurements in micro perspective are carried out through empirical research related to the level of tax aggressiveness of corporate taxpayers before and after the Sunset Policy.

The results of this study indicate that the Sunset Policy 2008 is only effective in achieving its specific objectives, which is to increase the tax participation of Individual Taxpayers. The results of the measurement in macro perspective shows the increasing number of new individual taxpayers, the increasing in compliance of individual taxpayers, as well as the increasing in income tax revenue derived from the individual taxpayers in the long run. Meanwhile, this effectiveness does not occur with the corporate taxpayers. Thus, because the income tax revenue from the corporate taxpayers are far greater than those from the individual taxpayers, the effectiveness of the Sunset Policy with the individual taxpayers is overshadowed by its ineffectiveness with the corporate taxpayers. Hence, in overall, the Sunset Policy tends to be ineffective in increasing national income tax revenue in the long run.

Further research using larger data and samples, using other tax amnesty objects and with more comprehensive methods can be carried out to further test the results of this study. One thing needs to be emphasized in this research that might be applied by the government is related to the importance of balanced socialization. In organizing a tax amnesty program, the government should not only focus on the individual taxpayers. The corporate taxpayers needs to be educated and socilized regarding to the plan to increase tax enforcement on all taxpayers after the tax amnesty is over, especially if the corporate taxpayers could also use the tax amnesty facilities provided as they constitute the largest proportion of income tax revenue in Indonesia.

Abstract

The article reveals the meaning of the concept of "student", the age limits and its features; analyzes the social well-being of the young people as of the main indicator of social development; the views of scholars on studies of the peculiarities of student youth development. The article also investigates the social function of the student youth, which consists in preparing oneself for the fulfillment of specific professional and culture-ethical tasks, mainly of intellectual and managing character, as well as focuses on the features of social work with student youth.

Keywords: Social Work, Students, Pedagogical Aspect, Social Development.

Introduction

The modern Ukrainian state is developing by acquiring the true values of humanity that have been accumulated for thousands of years by the entire civilized world. An important task during this period is to build a democratic, legal, social and an independent state which should be integrated into the international community and shape the society in which the priority is equally given to the state and individuals.

Student youth is the future of the Ukrainian state. Therefore, the prospective future depends from its behavior and way of thinking. The social well-being of young people is one of the main indicators of a society's development, and the problem of its formation is one of the leading ones. In order for the formation of youth to be adequate to social processes, it is necessary to determine its role and place in society, to find out the difficulties and problems associated with it.

The purpose of this article is to analyze the essence of social work with student youth and to identify the special aspects of social work with students.

Features of social work with students

The modern Ukrainian state is developing by acquiring the true values of humanity that have been accumulated for thousands of years by the entire civilized world. An important task during this period is to build a democratic, legal, social and an independent state which should be integrated into the international community and shape the society in which the priority is equally given to the state and individuals.

Student youth is the future of the Ukrainian state. Therefore, the prospective future depends from its behavior and way of thinking. The social well-being of young people is one of the main indicators of a society's development, and the problem of its formation is one of the leading ones. In order for the formation of youth to be adequate to social processes, it is necessary to determine its role and place in society, to find out the difficulties and problems associated with it.

The purpose of this article is to analyze the essence of social work with student youth and to identify the special aspects of social work with students.

In Ukraine the problem of student youth has normally been the subject of close attention of representatives of various social disciplines. The most important are the works of L. Aza, N. Begeki, V. Girginov, V. Kazachkov, P. Kravchuk, N. Nikolaevsky, I. Tarapov, E. Yakuba, and others. At the turn of the millennium, the investigation of topics focused on higher education in Ukraine has intensified (A. Alexyuk, V. Andrushchenko, I. Ziazyun, G. Koval, B. Korotyaev, B. Kurilo, N.Nichkalo, S. Savchenko, S. Kharchenko, S. Shevchenko and others). The analysis of the literature has shown that there are many scholars who are actively interested in researching the problems and life of the young people. Thus, the study of the problems of the students and student youth, particularly the problems of students' household and financial situation, were analyzed by the following scholars: A. Berstein-Kogan, A. Kaufman, P. Sorokin, A. Speransky, I. Yangzhul. Such scholars as M.N Rutkevich, F.R Filippov and V.N Shubkin investigated the sociology of the life plans of young people (M. Pavlyshyn, 1999). The process of socialization of youth, psychology of the age of adolescence, the problems of gender and youth subculture were investigated by: I.S Kon, V.T Lisovsky, A.M Romazan, A.S Sharov.

The authors' research expanded the concept of youth as a special stage of the life cycle, self-identity, self-identification, age crises, youth subculture, which gave rise to the development of applied methods of helping young people (M. Pavlyshyn, 1999). Researchers such as N. Kofirin, V. Levicheva, V. Livanov, F. Sherega have devoted their research to informal youth groups. In order to help the student to reach the tops in spiritual and moral and professional development, it is necessary to know his age and individual psychological characteristics as well as conditions of mental development. Such scholars as L.A. Bondar and G.S. Gribanova consider youth organizations and initiative youth movements as forms of social work with youth, social-club work with young people, and also focus their attention on the problems of employment and work of the young generation (A. Koval, 2016).

The student period of a person's life falls mainly into the period of late adolescence or early adulthood, which is characterized by mastering all the variety of social roles of an adult person. The main areas of students' life are vocational training, personal growth and self-assertion, development of intellectual potential, spiritual enrichment, moral, aesthetic and physical self-improvement.

Student youth is a socio-demographic group of society that is engaged in the preparation for highly qualified professional activity through higher education. The student embodies the intellectual potential of the younger generation of society and is characterized by certain traits. The major need is for self-determination and self-realization of oneself as an individual. The degree of success in educational and professional activity is an important criterion for a person's preparation for professional self-realization. It is necessary to emphasize the multifaceted activities of students, which include educational, professional, scientific research, socio-political, sports, leisure and

cultural activities. Of great importance is valuable attitude of students towards higher education and to the future profession, as well as to their future status (Zlipko, Pavlyshyn, 2000).

Student age is a period of active formation of an individual's inner need to relate his or her own aspirations to the interests of society. Among the scholars, who have researched this age period are: O. Dmitriev, G. Kostyuk, O. Moroz, N. Pasko and others. They view the students as a specific socio-professional group, taking into account its special place in the structure of the state, social knowledge, socio-psychological and political features [4, p. 6].

Students, as a social group, emerged in the XI-XII centuries with the opening of the first higher education institutions in Europe. They brings young people together, who consciously and purposefully master their professional knowledge and skills, acquire professional qualities, prepare for the fulfillment of important professional, cultural, social, political, family and other functions through higher education [9].

The term "student" (from Lat. studens (studentis) is one who works hard; one who is engaged, does the work, that is, acquires knowledge, studies science. According to the Law of Ukraine "On higher education ", the student (trainee) - a person who is enrolled in a higher education institution in the established manner and studies full-time (part-time), at evening or using distance learning in order to obtain certain educational and educational qualification levels.

In our opinion, it is also necessary to take into account the differences between the students of higher educational establishments of I-II and III-IV accreditation levels (14-17 and 17-22 years respectively). It is possible to talk about standard (17-22 years) and non-standard (junior or senior students) periods of student age. Examples of non-standard student age include: 1) "In June 1994, Mike Kearney (USA) became the youngest graduate to receive a bachelor's degree in anthropology at the University of South Alabama, USA, at the age of 10 years and 4 months"; 2) “The youngest Russian students are the sisters Diana and Angela Knyazevy (Moscow). In 1998, Diana successfully graduated from high school at the age of 10 years and 1 month, and became a student of higher education institution at the age of 10 years and 2 months. Angela also successfully graduated from high school at the age of 10 years and 2 months and became a higher education institution student at 12” [From the Guinness Book of Records, 2002]. A 14-year-old student also studied at Taras Shevchenko National University of Kyiv (M. Golovaty, 2006).

We conducted a social survey of 40 people of different age categories: from 17 to 60. To find out at what age they became part of the student life in Ukraine (Fig.1).

Fig. 1: A survey of people regarding their student age, %, compiled by the authors

Thus, a student is a person, mostly 17-25 years old, who is determined and works hard to obtain appropriate educational and qualification levels for further career development.

Social work with young people has a long history and is based on the basic approaches and directions of personality socialization, which were formed on the basis of the theory of social pedagogy. Social transformations in the state, economic crisis and changes in social life have necessitated the emergence of new social institutions empowered to implement social protection of young people, to form new directions and approaches in social work with youth that meet the needs and requirements of society, the social demands of young men and women (E. Golovakha, 1996).

The task of the present time is to raise an open minded individual, who is able to creatively treat the life and to be able to take on the responsibility. Today, we have the implementation of personalized education in several ways. Firstly, the anthropocentric approach that was proposed by K. Rogers and his followers: N. Basalaeva, T. Dmitrieva, M. Zara, and C. Karan.

The cultural concept of E. Bondarevskaya and the psycho-didactic concept of I. Yakimanskaya, which is based on the principle of subjectivity, have scientific and practical value. Society and man, as its constituent, must evolve according to the laws of harmony, and the greater the life of each individual will be the subject to these laws, the greater the degree of civilization will be gained by society as a whole (M. Pavlyshyn, 1999).

Appeal to the consideration of pedagogical conditions of upbringing of youth in a social context is quite relevant. For example, the dissertation research of A. Mazurenko is devoted to the problem of formation and development of social qualities of student youth. The formation of social activity and social competence was revealed in the works of M. Andreeva, S. Krasnokutskaya and others (Zlipko, M. Pavlyshyn, 2000).

The social function of student youth is to prepare oneself for the fulfillment of specific professional and cultural-ethical tasks, mostly intellectual and management skills. The process of socialization of the student's personality in the process of study and in extracurricular activities is equally important. It does not only affect the higher education system directly but rather indirectly – it influences the development of the whole Ukrainian society (M. Pavlyshyn, 1999).

The fact that the needs of the population for social assistance, psychological support and protection are increasing is indisputable. The social work with student youth in Ukraine is provided by the Ministry of Education and Science, local authorities, a big number of state legislation; a differentiated approach to different categories of young people and related problems; student self-government which is based on a number of normative documents and a high level of youth engagement in organizing the personal space of each student, group of students and all social and educational work at an institution of higher education.

Socio-pedagogical work with student youth has its own characteristics (Table 1).

Table 1: Characteristics of social and pedagogical work with students, compiled by the authors

№	adaptation of the student to the conditions and functioning of the institution of higher education (especially for the first-year students)
1	correction (protection) of the relationship between teaching staff and students
2	prevention of possible physical, mental and socio-cultural encounters of individual and risk groups
3	the development of the student as a unique personality, the formation of the quality of a creative professional through the process of learning, education, socialization

Therefore, social and pedagogical work in higher education institutions is targeted and should take into account: areas of student's life; important and most common social and psychological problems of youth; age, gender, social status of each student; the level of social activity of the student and his attitude to the future profession. The purpose of social and educational work is to create favorable conditions for physical, social, spiritual, moral, intellectual development of a person, prevention of negative phenomena, providing it with complex social-psychological-pedagogical assistance in self-development and self-realization in the process of socialization (L. Manchulenko, 2012).

An important role in social work with student youth is played by the state youth policy. It is the activity of the state that is aimed at creating legal, economic and organizational conditions and guarantees for self-realization of the young person’s identity, development of youth associations, movements and initiatives. The foundations of state youth policy in independent Ukraine were laid with the adoption by the Verkhovna Rada of Ukraine of the Declaration "On the General Principles of State Youth Policy in Ukraine" (December 15, 1992) and the Law of Ukraine "On Promoting the Social Formation and Development of Youth in Ukraine" (February 5, 1993 p.) (Zlipko, M. Pavlyshyn, 2000). Therefore, the main forms of organization of social work should include:

– individual, the essence of which is to provide social assistance, social services and social rehabilitation in accordance with the needs of the individual and the nature of the problems that confronted him/her;

– group, the purpose of which is the organization of socially significant initiatives, the participation of the individual in the socially oriented activities of public associations and organizations;

– organization of socially beneficial activities, including charity;

– social education, which is carried out in different types of educational institutions, such as public and private educational institutions and is associated with the achievement of a certain level of social education;

– socio-psychological-pedagogical and legal support, the purpose of which is the professional assistance and mediation of professionals in solving various problems of the individual and the group;

– counseling, in the process of identifying and outlining the main directions of solving the problem of concern for the individual.

In its form and method, consultation is an interaction between two or more people, during which the consultant transmits the specialist knowledge and relevant information to the advised person in order to help him or her solve overgrown problems, as well as in the preparation of social forecasts, future programs, etc.

Therefore, counseling is a process of thinking together about the client's life situation and finding the best solution to the problem. The personal and professional qualities of the consultant as tools and resources of dynamics are actively involved in this process.

Another method of working with young people is art therapy. At work, not only with children, but also with adolescents, young people, it is very important to use flexible forms of psychotherapy work. Art therapy provides an opportunity to live through, experience, become aware of a conflict situation or any problem using the most convenient means for the psyche of a person.

Art-therapeutic techniques allow you to plunge into the problem as much as one is ready for his or her experience. Art-therapy is a specialized form of psychotherapy based on art, first of all, visual and creative activity. The main purpose of this method is to harmonize the development of the individual through the development of the ability of self-expression and self-knowledge. There are many varieties and approaches in art-therapy. For example, music therapy, fairytale therapy, body-oriented therapy, etc. [10].

Also, forms of social work with student youth include surveys, testing and various trainings. M. Kholodna pointed to the interrelation of knowledge and methods of its acquisition ("cognitive and intellectual competence") (N. Shust, 2012). According to the researcher, the amount of knowledge (because lack of knowledge can be an impulse to search), as well as the strength and depth (because too much immersion impedes the emergence of a new look) does not matter. What matters is how individualized knowledge is organized and how reliable it is as a basis for making effective decisions (A. Koval, 2016).

We conducted anonymous testing in 10 universities of Ukraine to establish which forms of social work they conduct with students (Fig.2).

Fig. 2: Results of the survey of universities on the use of various forms of social work with students, %

It becomes apparent that to engage each student in an active and searching process, an adequate educational environment should be created that would provide free access to various sources of information, communication with other students, joint work, training, recreation and leisure. Due to the establishment of the paradigm of personally-oriented education, project technology, which is experiencing a second birth, is becoming relevant as an effective complement to other pedagogical technologies that contribute to student development, supplement social relations and greatly diversify the educational process. Designing is not a fundamentally new technology. The project method originated in the 1920s in the United States and developed within the humanistic philosophy and education, in the pedagogical views and experimental work of John Dewey. In the United Kingdom, Belgium, Israel, Finland, Germany, Italy, the Netherlands, the ideas of the humanistic approach of J. Dewey have become more widespread and popular thanks to the rational combination of theoretical knowledge with their practical application. Born from the idea of free education, project-based learning nowadays becomes an integrated component of a fully developed and structured education system (M. Gorbachev, 1999).

Working on a project is a practice of person-centered learning when, in the course of concrete work, on the basis of free choice of the student, taking into account his or her interests, a concrete result is obtained. Now, unfortunately, we cannot say that the person who graduated from a higher educational institution is an educated, intelligent person. Intelligence, upbringing are not issued with a diploma, they need to be developed, only with hard work one can gain knowledge – this is, in a sense, the result of self-education. An intelligent person is the one who has a depth of intelligence, intuitive nobility, breadth of spiritual inquiries and high cultural level. Therefore, there is an urgent need to actively research the project-based learning and the way it shapes the leisure culture of university students and the concerted efforts of all educational professionals to match national education with world standards. When determining the concept of project-based learning technology one should take as a basis the study of the physical, mental and social components of the health of a young person (M. Golovaty, 2006; I. Mygovich, 1998). Out-of-class project topics can be varied based on the needs of a specific cohort of students and the educational institution as a whole.

According to the method of calculating the level of economic security of the state, external economic security is defined as such a state of conformity of external economic activity with national economic interests, which ensures minimization of losses of the state from the effects of negative external economic factors and creation of benefits.

Conclusions

Thus, the basic principles and methods of working with student youth are counseling, art therapy, the content of preparing students to perform professional functions. The important areas for improving social and educational process in higher education institutions are: providing social and pedagogical assistance to the personal and professional development of future specialists in the educational process in the context of the institution of higher education with the prospect of further career growth; promoting adequate social-role identification in a student group setting taking into consideration gender differences; promoting healthy student life as a viable alternative to disruptive tendencies in the youth environment and an integrated indicator of effective educational work in the socialization process.

In the future, it is necessary to conduct a practical study of the practical application of social work with students at leading universities in Eastern Europe.

Abstract

Definitional questions and factoid questions are commonly used in recent Arabic Question Answering (QA) works. These questions are 'simple' questions which can be answered by a "simple" sentence or a Named Entity (NE). Most Arabic QA systems lack the capability of processing complex questions, namely Why-questions. Motivated by this issue, we release a new QA system aiming to answer Arabic Why-questions in the medical field. Therefore, we propose a novel approach using Natural Language Processing (NLP) and Information Retrieval (IR) techniques. Our system uses dictionaries and transducers to analyze Why-questions and to extract causal relations which represent the answer of a Why-question. Compared to previous studies, our approach obtains comparable results on processing Why-questions.

Keywords: Why questions answering, medical field, Natural language processing, Information retrieval.

Introduction

The QA is the task in which users try to find ways to make investigation easier for users who are searching for a succinct answer and not a document.

Researchers from the community of NLP and IR have made tremendous efforts to improve the performance of QA systems through several languages. Nevertheless, Shaheen et al [2014] mentioned that the Arabic, the 6th most wide-spread natural language in the world with more than 350 million native speakers, has not seen a proportional development to handle Why-questions in the field of QA.

There are many types of questions in the QA field. The most popular are the type of definition question, i.e., those asked using the word what, and the type of factoid questions, i.e., those asked using the words: how much/many, when, where, what and who. Factoid questions usually deal with NE, such as organization, location, person, etc., and look forward to a short identifiable answer. Another type has to do with the questions using the words how to or why, e.g. 'Why cancer is increasing?' or 'How to prevent hair loss?'. These questions are less common and more challenging because they are more complex and harder to answer than definitional and factoid questions. Why-questions require a different approach than definitional and factoid questions, as their answers are not NE or a short sentence, and they tend to be longer and more complex, as stated by Ezzeldin et al [2012].

The aim of the present paper is to propose a new approach to handle Arabic Why questions in the medical field. Our proposal is based on four main components: corpus study, question analysis, documents/passages retrieval, and answer extraction. We use dictionaries and transducers in question

analysis and answer extraction components and Lucene Apache in PR component to answer any Why medical question. Experimentations of our Arabic medical QA system show interesting results.

The remainder of this paper is structured as follows. Section 2 presents the related works. Section 3 cites Arabic characteristics. Section 4 describes our approach. Section 5 deals with the experimentation carried out to evaluate the efficiency of our QA system. Finally, section 6 draws the main contributions and proposes further perspectives.

Related Works

The research in QA systems began in 1960. Until now, many systems have been designed in different language to attempt QA. However, the development of Arabic QA system for Why-questions is not of high quality compared to other languages such as English and French. This is largely due to the language's particularities.

Most of the research in the area of QA has focused on answering simple questions. The system DefArabicQA is proposed by Trigui et al [2010] for definition questions. This system identifies the answer using manual lexical patterns of sequences of word, letter and punctuation symbols as well as heuristic rules deduced from a set of correct and incorrect definitions. Bekhti et al [2013] proposed an Arabic QA system "AQuASys" which is composed of three components: question analysis component, sentences filtering component and answer extraction component. This system segmented the question into interrogative noun, question's verb, and keywords. Experiments have been conducted and showed that for a test data of 80 questions the system obtained as recall of 97.5, 66.25 % as precision, and 78.89% as F-measure. Hammo et al [2002] described QARAB, an Arabic QA system that is based on a set of rules for each question type excepting "How " and "Why" questions. The system uses well-known techniques from IR to identify the relevant documents by processing the question as a query and then applies keyword-matching strategy. Brini et al [2009] proposed an Arabic QA System which handles factoid and definition questions using linguistics resources building with NooJ platform, described by Silberztein [2018]. The authors use Information Retrieval and Natural Language Processing techniques to process Arabic factoid questions. NooJ platform shows its efficiency in several tasks such as in deciding about the appropriate medicinal plant in the decision support system proposed by Dardour et al [2017]. The Japanese Why-QA system NAZEQA uses sentiment analysis and semantic word classes. This approach improves the system on a large-scale web corpus, as described by Oh et al [2012]. In a second research study by Oh et al [2013], the authors explored the utility of intrasentential and intersentential causal relations in order to rank the candidate answers to a why-question. This increased their precision by 4.4% over the work of Oh et al [2012]. LEMAZA, the Arabic QA system for Why-questions, proposed by Azmi et al [2017], uses the Rhetorical Structure Theory (RST) to extract the relevant answer. If there are several candidate passages corresponding to different rhetoric relations, then LEMAZA returns the answer whose RST relation has the highest priority.

We can confirm, from the related works, that most Arabic QA systems are designed for definitional and factoid questions. Nevertheless, there are few studies that addressed the problem of answering Why-questions, which makes the development of a new Arabic QA system is crucial.

Characteristics of Arabic Language

Arabic specific characteristics consist in its richness that need special processing, which makes regular NLP systems, designed for other languages, unable to process it. Indeed, Arabic is challenging when compared to other languages such as English and other Latin-based languages. One of the Arabic characteristic is the lack of diacritics (i.e. kasra, damma, fatha), which leads to more difficult analysis than any other language. This issue can be explained through the example of the question "لماذا يولد الطفل معاق؟" (*Why is a child born with a disability?).* The lack of diacritics in verb "يولد" (*to born*) presents at least two meaning:

- "يُولَدُ" *yuladu* which means "*born*".
- "يُوَلِّدُ" *yuwal~idu* which means "*generate*".

Arabic language is a highly agglutinative and derivational language where a word token can replace a whole sentence in other languages. For example, the sentence "*and with its spread*" can be expressed in one word in Arabic "فبانتشارها" (*fabiAntishaAriha*) which includes the stem "انتشار" (*spread*), the proclitic "ف" (*and*), the prefix "ب" (*with*), and the pronoun "ها" (*its*). Therefore, extracting keywords from an Arabic Why-question or extracting answer from a corpus will be more complex than any other language.

Another specific characteristic of the Arabic language which regards its syntax is that Arabic is a free-order language. Though the basic syntactic order of Arabic words is Verb–Subject–Object (VSO), however, it allows for VOS and SVO orders too. For instance, the sentence "أخذ المريض العلاج" (*The patient took the treatment*) is written as Verb–Subject–Object, but it may also be written as VOS "أخذ العلاج المريض" and OVS "المريض أخذ العلاج". Let's note that the diacritic marks resolve the Subject and the Object. The lack of the diacritic marks in the sentence "ركل الطفل الولد" (*rkl AlTfl Alwld*), would prevent to decide who the Object and Subject are, and the sentence could be interpreted as either *the child kicked the boy*, or *the boy kicked the child*.

Unlike most Latin-based languages and English, Arabic does not have capital letters which makes Named Entity Recognition harder, as stated by Shaheen [2014].

Overall architecture of the proposed QA system

The challenges discussed in the previous sections make clear the need for new approach to deal with Arabic QA in the medical field. Our proposal is composed of four components as illustrated in Fig. 1: Corpora study, question analysis, documents/passages retrieval, and answer extraction. The first generates the identified patterns used in question analysis and answer extraction components. The second component will use NLP techniques to process the input Why-question to extract keywords. In the third component, a list of candidate passages will be retrieved. Finally, the last component returns the appropriate answer to the user.

Fig. 1: Overall architecture of the proposed QA system

Corpora Study

We gathered Why-questions from several sources, including discussion forums, Frequently Asked Questions (FAQ), some questions translated from Text REtrieval Conference (TREC). For each gathered question, we collected Arabic medical texts from Arabic websites. Then, we identified patterns

for question analysis and answer extraction components. These patterns were transformed into transducers.

We have decided to use Finite State Transducers (FST) since they can play an important role in providing elegant solutions to alleviate the Why-questions analysis process. FST are finite state machines that are being used in different areas of NLP. FST define relations between two sets of strings by means of a transformation of one string into another, as stated by Pajić [2011]. The main feature of FST is producing some outputs. This feature explains the way transducers are being used in NLP and makes them very suitable for the information extraction process as well. Furthermore, they can be visually presented by graphs, which make them convenient for human use, as mentioned by Dardour et al [2017].

In the sequel, we detail the identified patterns and the corresponding transducers for the question analysis component.

Question Analysis

The main task of this component is to process Why-questions in order to extract some useful keywords representing the user's need. Our question analysis uses dictionaries and transducers to analyze Why-questions. In Arabic, Why-questions starting with "لماذا" (*limaA*aA*) and "ما سبب" (*maA sababu*), both are identified in the patterns of question analysis component. In the following, we cite an example of a question asking in two forms.

(1) لماذا يرتفع ضغط الدم؟

"Why does blood pressure rise?"
P(1):[N: Disease] [V] لماذا

(2) ما سبب ارتفاع ضغط الدم؟

"What is the cause of high blood pressure?"
P(2): [N: Disease] [N] ما سبب

P(1) was constructed from sentence (1) specifying that the word following "لماذا" (*limaA*aA*) represents a verb (V) which is followed by a disease noun (N). When we pose the same question using "ما سبب" (*maA sababu*), example (2), the structure of the question will change P(2). Indeed, the word following "ما سبب" (*maA sababu*),"ارتفاع " (*high*), is the noun of the verb "ارتفع" (*to rise*). This noun is followed by the disease noun "blood pressure". Our system is able to process the two forms of Why-questions. As we mentioned in the previous section, the identified patterns were transformed into transducers.

In our proposal, the question analysis module is based on four steps: Morphological and syntactic analysis, Named Entity Recognition (NER), Stop word removal, and Question Expansion (QE).

Morphological and syntactic analysis

This step allows analyzing the words of a given Why-question and identifying their attributes. We are mainly talking about the grammatical category (Verb, Noun...), definiteness, number, gender, and stem. These grammatical categories are used in the syntactic analysis, where we are interested in the structure of the question. For instance, the syntax representing in P(1) is different than the syntax of P(2).

Named Entity Recognition

The previous works emphasize that the NER is important for all the QA system components. In fact, we developed our own NER method especially formulated for our QA system. To recognize named entities, we have considered five categories: Organ, Disease, Location, Virus, and Treatment.

Stop word removal

This step removes the interrogative pronoun "Why", conjunctions, and prepositions. After removing these words, the important terms in the Why-question will be remaining. In our QA system, the stopwords are eliminated from the outputs of the syntactic transducer.

Question Expansion

Extraction, only original keywords, is proved to have some limitations. To dispose of these limitations, we need to define the meaning the user looking for. Therefore, in this step, we extend the list of the original words of the user's Why-question by adding semantically equivalent words to those in the question. Since the documents may not contain the words that the user used in his question, expanding questions will increase the chance of obtaining the answer, as mentioned by Al-Chalabi [2015].

In the previous studies, QE is achieved using Arabic WordNet. In our proposal, we used our own linguistic resources. In our dictionaries, the feature Syno (for synonyms) is used to expand Why-questions. This feature is called in the QE transducer as illustrated in Fig 2.

Fig. 2: QA transducer: Synonyms extraction

After processing the question "لماذا يحذر الطبيب من استعمال العقاقير الستيرويدية؟" (Why does the doctor warn against the use of steroid drugs?) with the previous steps, the transducer of Fig 2 can extract the synonym of "يحذر " (*yuHa**~*iru*) which is "ينبه " (*yunab~ihu*), the synonym of "استعمال" (<*isotiEomaAl*) which is "استخدام" (<*isotixdaAm*) and the synonym of "طبيب" (*Tabib*) which is "حكيم" (*Hakim*).

QE can be applied also to overcome the situations where the Passage Retrieval (PR) component excludes relevant passages containing other forms of the original words. The idea now is to add other forms of the original words that share the same root (see Fig 3).

Fig. 3: QA transducer: Different forms extraction

Let's continue with the same question "لماذا يحذر الطبيب من استعمال العقاقير الستيرويدية؟" (Why does the doctor warn against the use of steroid drugs?). Thanks to QE step, the PR module can extract not only the relevant passages that contain the keyword "طبيب" (*Tabib*) but also its broken plural form "أطباء" (*AaTibAa'*). This expansion process is applied to extracted synonyms too. In consequence, we consider each extracted keyword with its synonym and its different forms since the QE would theoretically generate all these terms.

The expanded list of terms extracted from the Why-question will be sent to the next component (PR) to extract the relevant passages that may contain the answer.

Document / Passages Retrieval

This component uses keywords extracted by an earlier component, question analysis, to retrieve a ranked list of candidate passages. In our QA system, we take advantage of Lucene Apache for developing such a PR module for Why Arabic questions in the medical field. There are many reasons for this choice. First, due to specific characteristic of Arabic language, it is very important to have the

possibility to customize Lucene by adding lexical analyzers for multiple languages including Arabic. In addition, our proposal is entirely implemented on the Java platform and Lucene is an open source library written in Java, too. Last but not least, Lucene has been proven more effective than Buckwalter's Arabic Morphological Analyzer in the same conditions.

Answer Extraction

Once candidate passages are retrieved, they are further sent to answer extraction component to return the appropriate answer.

To answer Arabic Why-questions, we need to extract a set of Arabic semantic relations that help our goal to be achieved. In fact, we identified five semantic relation types, which are interpretation, justification, explanation, result, and base. For each type, we detected several alternative forms. In addition, we consider a semantic relation as a semantic link relating two sentences in our corpus. Indeed, we use cue phrases which are used to connect two sentences, serving as a cause [C] and its effect [E]. For instance, the cue phrases of justification are بسبب/لأن *(Because)*. To locate the passages that indicate causation, we surveyed all causative connectors and the verbs that mean "cause", for example "يؤدي","ينتج","يسبب".

To extract the appropriate answer, we identified patterns representing causation relations. For instance, the pattern P(3) was constructed from sentence (3) specifying that the words preceding (بسبب) represent the effect while the words following (بسبب) represent the cause. Table 1 shows some examples of identified patterns for answer extraction component.

(3) تحدث ثلث وفيات السرطان تقريباً **بسبب** عوامل الخطر السلوكية والغذائية.

"About a third of cancer deaths occur due to behavioral and nutritional risk factors."

P(3): [C] بسبب [E]

Table 1: Examples of causation relation patterns

Pattern Number	Pattern
P(4)	[E] [C] و بسبب
P(5)	[C] لأن [E]
P(6)	[C] [E] السبب وراء

We transformed the identified patterns into transducers. For example, Fig.4 represents the pattern P(3).

Fig. 4: Extract of transducer to extract JUSTIFICATION relation

To process extracted passages, we applied, like we did in question analysis component, morphological, syntactic analysis and NER process. However, the stop-words were retained because they have an important impact to identify causation relations.

Experimental Evaluation

We implement a prototype of the proposed QA system that exclusively handles Why-questions expressed in Arabic. In this prototype, linguistic resources (transducers and dictionaries) are built with the linguistic platform NooJ. We conduct a set of experimentations to evaluate our QA system efficiency. Therefore, we exploit a test corpus that contains 1285 articles extracted from different Arabic web resources such as Altibbi, Webteb, Sohati.

An Arabic native speaker who isn't one of the authors evaluated our QA system performance and collected 138 Arabic Why-questions in the medical field. Then, each question was passed to the system to get its answer.

After testing the collected questions on the test corpus, we obtain the results illustrated in Table 2.

Table 2: Summarizing the measure values

Method	Values
Precision	83%
Recall	78%
c@1	82%

As shown in Table 2, our proposed QA system achieves satisfactory results. For cases where our proposal did not analyze the question, we noted that the problem is in writing some Arabic letters such as the letter "ا" "*A*" which can also be writing like "أ" ">" or "آ" "ا" or "إ" "<". For example, in some Why-question, we can find the word "diseases/ Plural form" written like "أمراض" *>AmrAD* or "امراض" *AmrAD*. To resolve this problem, we need to rewrite the Why-question by unifying all variants of a letter into a single form. This issue exists also in the PR module. Furthermore, the errors are explained mostly by the fact that there were other semantic relations found in the test corpus, expressed by other than the patterns considered in the present paper.

To put our system in perspective, we will compare our QA system performance with LEMAZA system, described by Azmi et al [2017] that answers Why Arabic questions. Table 3 summarizes the performance of the two systems.

Table 3: Performance comparison

	Our system	LEMAZA
No. of Why-questions	138	110
Data source	Arabic web-sites	OSAC
Corpus size (N of doct)	1285	700
Precision	83%	79.2%
Recall	78%	72.7%

From Table 3 we can see that, our method has comparable results with LEMAZA by comparing 83% to 79.2%, and 78% to 72.7%. This indicates that using existing Arabic tools such as khoja's stemmer, Arabic WordNet, Arabic morphological tool can get a small improvement in processing Why-questions. Indeed, using our linguistic resources enhances our system's performance.

Conclusion

In the present paper, we release a QA system that handles Why Arabic questions, and propose a novel method using NLP and IR techniques. Our proposal is composed of four main components: corpora study, question analysis, document/passages retrieval, and answer extraction. Experiments show that,

compared to related work approaches, our method obtains comparable results. Besides, we put identifying all causal relation patterns in future work.

Abstract

Russia is a historically agricultural country with a large area, harsh climate and a specific system of economic relations. Agriculture development is now in focus and the country has succeeded in shifting from import substitution programs to export oriented projects. The sector is being overhauled with digitalization and modernization. Many regions' economies used to be based on industry, while now the importance of farming is widely acknowledged – the development of crop and animal husbandry and even aquaculture are included in the national projects. However, agricultural labour quality remains a pressing issue – a high labour quality growth, upgrade of facilities and power infrastructure lead to lower rural employment and a labour force outflow and as a result a shortage of human resources in agriculture. Out migration depresses budget financing and increases the need for self-sufficiency of rural population. We believe that development of agricultural enterprises cannot be considered without considering the prospects of rural areas transformation. Our article deals with the key directions of their synergetic development.

Keywords: Sectorial Economy, Company Economy, Agriculture, Rural Areas, Development Strategy.

Introduction

A modern agrifood enterprise is a complex, fast developing system of economic relations. Statistics say that this is one of the sectors, where annual expansion and effectiveness persistently exceeds average economic growth and GDP. A good combination of such factors as bumper crops and competitive costs propelled Russia to the position of the world's top wheat exporter in 2016 for the first time. The strategic goal of agricultural products exports is not only their growth, but a higher share of goods with a high added value – a change of structure from raw materials (raws) in favour of high-quality goods, including packaged goods, for the sale in shops and for end consumption. A long-term development strategy of each corporation aimed at entering and cementing its position on the international market should ensure recognizability of the region, area, country of origin, while tracking will lead to the need to concentrate production, processing, packaging in one place to guarantee quality and compliance. Thus, we can easily forecast further integration of agro

corporations in rural development, preservation of their uniqueness and a higher recognizability aimed at higher effectiveness.

Literature Review

The theoretical basis of commercial organization development were laid out in multiple editions by representatives of local and foreign economic schools. Special contribution to the issue was made by such economic scientists as Yu.A. Plugina (2010), Ye. Raevneva (2006), etc. The special features of the factors underpinning development of the agribusiness, including agricultural companies, were studied by I.V. Zagaitov, K.S. Ternovykh (2006). They also pointed to the connection between agrifood companies' and rural areas development as the basis for enhancement of economic potential of the sector.

Other scientists -- M.I. Solosina, I.N. Shchepina (2016) -- laid out the methodology of long-term development management of rural municipal areas and regions.

International experience of rural development is presented in the researches by C.Kay (2009), Ja. Sallinger-McBride (1990), L.A. Picard, N.Ward et al (2003) and others.

These works lead us to a conclusion that modern economic object development is not only a positive change of its criteria and factor system, but also compliance of these alterations to the scenarios and parameters of development of the higher systems, and requires a comprehensive analysis in all spheres.

This statement can be tracked in a 2019 state program of the Russian Federation's Comprehensive Development of Rural Areas. The government's priority directions in synergetic development of farming and rural areas until 2025 include improvement of the demographic situation, ensuring conditions for development and diversification of rural economies, improvement of the living standards of rural population, a wider access of rural population to the development resources, sustainable nature management and improvement of the ecological situation in the countryside, higher efficiency of local management, better statistical surveys and scientific and methodological development of the rural areas, organization of training, retraining and talent management.

Research Question

The problem of Russian Federation's rural areas development has common and specific features. Let's consider the problem as typical for the relations of agrifood companies and rural areas of the Voronezh region. The area is an industrial centre, where various producers of hi-tech industrial products are located. The Voronezh companies produce planes, rocket space engines, mining and oil and gas equipment, forging and pressing machines, synthetic rubber, vehicle tires, bridge structures, complex radio-electronic systems, construction materials, various food and other products. The structure of the Voronezh region economy is mainly agrarian, while its industry structure is mixed. The importance of agricultural production for the region is demonstrated by the fact that it more than doubled in 2011-2016. Agriculture accounts for U.S.$ 2,028 mln in the Voronezh region's gross product in 2018, the processing industry for $1,967 mln. and retail for $2,683 mln. Crop husbandry of the Voronezh region contributed 60% to all agricultural products in 2018, cattle breeding 40%. The Voronezh region is second by the sown area in the Central Federal District (795,542 ha – 15.1% of all sown area of the Central Federal District, compared to the leader, the Belgorod region, where it stands at 16.5%), that's why the interest to the region is justified.

According to the 2016 All-Russian agricultural census, the region's agrifood industry comprises over 700 agricultural organizations, over 2, 500 farmers and small business owners, over 400,000 land plots in individual ownership, over 100 food and processing companies.

The region uses the precision agriculture methods, such as defining the boundaries of fields using satellite navigation systems, parallel driving, satellite monitoring of vehicles, differential spraying of weeds, differentiated application of fertilizers, differentiated irrigation, monitoring of cattle, breeding quality, electronic databases of their production processes, herd monitoring, identification and monitoring of animals with the use of modern information technologies (diet, milk yield, weight gain, body temperature, activity), meeting their individual needs, robotization of milking in their production organization and technology.

At present, agriculture informatization is taking place, the land resources are digitalized, electronic accounting of animals and their movement is introduced. The whole production process from sowing to sales is described in the databases to have information about the condition and production stage in any point of the region.

Although shrinking of the number of agrifood companies in the region has been gaining speed, there is practically no decline of the sown area, cattle numbers are growing, including the numbers of large cattle. This means consolidation of production and companies. Moreover, conglomerates of finances and agriculture are typical for our country, unlike in the developed markets, where such partnerships are not popular. There are also stable companies with simultaneous vertical and horizontal integration. The agribusiness remains in focus of many foreign investors, the number of companies with foreign capital is growing. In our opinion, the growth potential and the possibility to get access to land, which is limited in their home states explain this trend. All these propelled agriculture into the top three sectors on the M&A market, although the market has historically been the raw materials market.

So, agriculture is one of the top segments of the economy of the region under consideration. Moreover, it is practically the only one offering employment for many settlements. The importance of agriculture for development of the region is shown in the tax revenue structure (table 1).

Table 1: Tax payments to the budget of the Voronezh region

Indicators	2014	2015	2016	2017	2018
Tax payments, total, mln dollars	1,243	1,293	1,448	1,603	1,951
Growth, %	100	104.0	112.0	110.7	121.7
Tax payments by agricultural company, mln dollars	124	118	165	191	209
Growth, %	100	95.1	139.8	115.8	109.4
Specific weight of agrifood companies in total revenue, %	10.0	9.1	11.4	11.9	10.7

Thus, the specific weight of the tax payments of agrifood firms is above 10% and it grows consistently. A lower tax revenue could only be seen in 2015, which was connected to the general negative trend in the sector and its typical risks. In 2018, tax payments to the budget from agribusiness of the region amounted to $65.8 bln., which is 135% higher than state support paid to the farmers from the budget of the Russian Federation subject. When considering agriculture companies' of the Voronezh region's tax structure (agriculture and the food industry), we should note that the profit tax accounts for 44% of the payments, regional taxes for 35% and local for 11 %. Payments under a special taxation regime account for 10%. At that, the multiplier effect from state support amounted to 7.38, or by allocating $28 bln. from the Russian Federation subject's budget to agriculture support in 2018, the Voronezh region received $141 mln. from the federal budget and ensured tax collection growth to the regional budget from the agrifood firms. This means that one

ruble of the Voronezh region support translates into a 7.38 ruble monetary effect of investment growth in development of the sector.

The agrarian policy department, the government of the Voronezh region, the universities of region and all subjects of the agrarian segment of the economy participate in economic development and digitalization of the agrifood firms on the territory of the Voronezh region.

The digital pioneers of the Voronezh region's agriculture are EkoNiva-APK Holding Ltd, Logus-Agro LTS. These companies were the first in the Voronezh region to introduce results of R&D into their operations, invest and test new expensive technologies, cooperate with scientific organizations, the governments. Practically all projects are implemented with support from the municipal and regional authorities, which are interested in the growth of both tax revenue and the number of jobs -- one agricultural job produces up to 5 servicing jobs, while farmers' wages are often 10-30% higher than average in the municipality. Thus, according to the Social and Economic Development Strategy of the Voronezh region until 2035, each municipality plans construction of food processing factories, agrifood companies have large-scale projects of entering the international food market and at the moment expand beyond the regional boundaries.

Discussion and Results

The need for creation of theoretical and methodological basis of synergetic development of agriculture and rural areas are presupposed by the following:

First, interconnection of companies, territories and human capital develops with the help of reproduction mechanisms, described in detail by K. Marx. Commercial organizations are not only taxation subjects, but the key agent of distributive and redistributive relations, they form the population's incomes, participate in investment and social programs, in the development of infrastructure and create demand for production of related industries, capital and the workforce.

Secondly, the agribusiness firms lead the economy of rural areas, form the agricultural market, food, economic and ecological state security;

Thirdly, the key goals of the state's rural areas comprehensive development program include preservation of the rural population's share in Russia's total at no less than 25.3%; an average monthly available resources ratio for rural and urban households at 80%; an increase of the share of good-quality residential rural premises to 50%. For instance, the region under research plans to implement three subprograms:

1. Analytical, normative, methodological support of comprehensive development of the countryside for the:

- official project "State Monitoring of the Rural Territories", under which development and forming of an information and analytical resource devoted to the condition of the rural areas, scientific and methodological support of the program will be created;
- official target program "Information and Methodological Provision of Rural Areas Comprehensive Development", under which events will take place in the Russian Federation's subjects to train them in the project skills of initiative projects of rural territories comprehensive development, informing rural population about the measures under the program.

2. Federal events to develop rural areas comprehensively under the:
- official project "Rural Housing Construction and Housing Improvements". Social payments and subsidies to the people working in the agribusiness and living in rural areas to cofinance municipal costs on building (acquisition) of housing, rental of residential premises, rural mortgages, preparation of sites for individual housing construction will be allocated;
- official project "Promotion of rural employment" will ensure training and retraining of rural employees, attract young specialists to work in the countryside;

- official project "Improvement of the Rural Areas";
- official project "Development of the Engineering and Transport Infrastructure in the Rural Localities" presumes construction of gas distribution networks, local water supply, comprehensive preparation of sites for compact housing development, construction and reconstruction of motor roads.

3. The modern image of rural localities will be ensured through:
- an official target program "The Modern Image of Rural Localities", under which comfortable conditions in rural areas will be ensured through driving the share of rural localities with access to the information and telecommunications network to 100% .

After studying the official projects and target programs under the state program of comprehensive development of rural territories, we have established that the region's priorities in the rural localities until 2025 will be economic (employment and income of the households) and social (infrastructure and improvement).

Thus, our research allows us to explain the importance of comprehensive development of the agribusiness and rural localities and the backbone of the country's economy. The synergy effect of this interrelation is done with the help of reproductive processes, the key ideas of which are as follows:

a) agricultural companies and organizations are the backbone of the rural territories of the region and the country;
b) municipal, regional and federal authorities are interested in participation of agricultural enterprises in digitalization projects;
c) subsidization will help multiply investment in the segment;
d) employment in agriculture and related industries ensures a higher standard and life quality of rural population;
e) farmers are interested in branding the origins of agricultural produce, their localization with processing points.

Abstract

The goal of our research is to identify the problems of Russian horticulture and establish the directions of their solution in the modern conditions. We have considered the structure of Russia's fruit imports, established that by 2018 fresh apple imports fell by 44.5% compared with 2013. We noted a change in the key importers of horticulture produce -- now, after sanctions are introduced, they are Serbia and Moldova, whose share in total imports amounts to 58.3%. The gross harvest of fruit and berries has been rising recently in the whole of Russia and in the regions on the back of a higher yield and expansion of the area of orchards and berry fields. The state and regional programs of agriculture development and regulation of the markets of agricultural produce, raw materials and food as well as investment and innovation projects help the innovative development of horticulture. Thus, the Lipetsk region planted 2,500 ha of orchards on dwarf rootstocks in 2014–2017 under the investment programs of perennial plantings.

Keywords: horticulture, sanctions, imports, investment, the sales price, profit**,** economic efficiency.

Introduction

Horticulture is one of the forms of local agrarian productions, whose development is exacerbated by the reforms. In 1990, agricultural organizations accounted for 49.5% of fruit and berries produced, while in 2017 they, together with the farmers only produced 27.7% of fruit and berries. Despite a higher innovation activity in the sector and planting of new orchards and berry fields with the use of modern technologies aimed at a higher yield of fruit and berry crops, the Russian Federation only produced 20 kg of fruit and berries per capita (the scientific consumption norm is 90–100 kg) in 2017.

Literature Review

Demand for horticulture products both by industry and for personal consumption precondition the special role of innovative processes in the development of the sector to increase the margins of fruit

production, in raising their investment attractiveness. That's why the innovative technologies applied in production of fruit and berries mainly aim at increasing productivity of the sector.

The general theoretical and methodological approaches to the research of higher horticulture efficiency were considered in the works by S.A. Balashova, N.Yu. Kuzicheva, I.M. Kulikov, S.M. Medvedev, I.A Minakov, K.S. Ternovykh, Yu.V. Trunov, G.A. Khabirov, etc.

According to A.I. Trunov (2012), priority in the development of horticulture is the creation of a system of specialized enterprises located in the regions with favorable conditions for commercial gardening; expansion of the planted area of the low clonal rootstocks; construction of modern storages to ensure maximal preservation of the consumer properties of the products; creation of the necessary social infrastructure for the workforce in the rural areas.

I.M. Kulikov (2015) points to the choice of the varieties of fruit trees, which would grow low, produce early high quality fruit as one of the directions to increase horticulture effectiveness.

I.A.Minakov (1995) believes that rational organization of horticulture production cannot exist without efficient management, whose goal is creation of a favorable climate at the enterprise, in the employees getting material and moral satisfaction. The special features of modern management are in qualified selection and promotion of personnel, which will help raise effectiveness of horticulture companies.

Despite a great number of works about horticulture and raising its efficiency, there is a need in further research of horticulture development's future and a higher efficiency of the sector in different regions taking into account their specific climatic and economic features as the sector is shifting to the investment and innovative development model and intensification of fruit and berries production.

Research Question

The local fruit and berries can boast high nutritious and taste qualities, but their exterior is inferior to those of imported produce, undermining their competitive advantages, because the chain stores prefer the exterior to the organoleptic characteristics.

Everybody knows that fruit and berries should be of the same colour, have a similar form, while their size deviations should not exceed 5%. The failure to meet these requirements is one of the reasons behind a gradual increase of apple imports to the local market. According to the Federal Customs Service, Poland led fruit and berry imports in 2014 with a market share of 53.41%, while in 2017 the imports were prohibited following violation of Russian and international phytosanitary norms. Serbia and Moldova became the key suppliers of horticulture products with the share of these states in total imports amounting to 58.3%.

The analysis of long-term retrospective trends reveals the peak of Russia's apple imports in 2013 – 1,400,000 tons. In 2018, the volume of imports amounted to 770,000 tons, a 44.5% fall on 2013 levels (table 1).

Table 1: Russia's fresh apple imports in 2013–2018

Years	Thousand tons	Mln. dollars
2013	1,400.0	796.0
2014	1,052.8	621.8
2015	896.1	387.9
2016	676.6	370.9
2017	622.2	357.0
2018	770.0	490.4

A fall in Russians' income in the period predetermined market leadership of the countries, which were able to offer the cheapest fruit and berries.

The shortage of good quality fruit and berries on the local market has set the task of maintaining a stable agriculture situation for agribusiness companies. According to the Federal State Statistics Service, production of pome fruit, which is mainly represented by apples, rose by 15% in 2016. Besides, independent experts concluded that imported produce gave way to local products for the first time in Russia's chain stores last year.

Starting from 2015, Russia started to export apples with 70% sold to the Ukrainian market. The sales revenue from the Ukrainian market amounted to $1.55 mln. in 2015, $4.29 mln. in 2016, $2.99 mln. in the first quarter of 2017, which is a 70% increase on the same year-ago period.

Our analysis demonstrated that favorable climatic and economic conditions promoted the highest growth of fruit and berry areas in the southern part of the Central Federative District, namely in the Voronezh, Lipetsk, Tambov, Tula, Belgorod and Moscow regions, which accounted for 32% of Russia's horticulture products.

We researched organizational and economic aspects of horticulture development of the Central Federal District in more detail and studied its southern part, the Lipetsk region, whose geographical position helps commercial gardening to develop. The first commercial orchards were planted in the Lebedyansk district of the Lipetsk region.

As we all know, effectiveness of the horticulture business is only possible if it develops intensively. Such a system should provide for specialization, concentration, cooperation, agro integration, the use of innovative technologies, the quality management, etc. Besides, raising effectiveness of horticulture is possible through loss cuts during harvesting, transportation and storage of fruit and berries; through widening of the range; the use of marketing; creation of a proper motivation system; improvements of economic mechanisms.

Agricultural companies are the Lipetsk region's key producers, which account for over 2/3 of fruit and berry gross crop.

Our research of the gross production of fruit and berries demonstrates growth in all regions of the country. In 2017, their gross harvest increased by 253,000 tons, or by 9.4% compared with 2000. The Lipetsk region's record harvest of fruit and berries took place in 2012 and 2013 -- 94,100 and 85,100 tons respectively mainly thanks to a good weather and a high yield of the orchards (table 2).

Table 2: Gross crop of fruit and berries in all categories of enterprises in 2000–2017

Years	Russian Federation		Lipetsk region	
	Thousand tons	in % to 2000	Thousand tons	in % to 2000
2000	2,690.,0	-	65.1	-
2005	2,403.8	89.36	57.9	88,94
2010	2,148.9	79.88	39.2	60,22
2011	2,514.3	93.47	67.5	103,69
2012	2,663.8	99.03	94.1	144,55
2013	2,941.5	109.35	85.1	130,72
2014	2,995.6	111.36	81.7	125,50
2015	2,903.3	107.93	60.0	92,17
2016	3,311.0	123.09	64.8	99,54
2017	2,943.0	109.41	54.8	84,18

The fruit and berry area amounts to about 3% in the structure of the Russian Federation's garden area. In 2000–2017, the orchards and berry fields' area shrank both in the whole of the Russian Federation and in the Lipetsk region by 250,300 ha and 4,500 ha respectively (table 3).

Table 3: The area and yield of fruit and berry plantings in all categories of enterprises in 2000-2017

Years	Russian Federation		Lipetsk region	
	Area of plantings, thousand ha	Yield, c/ha	Area of plantings, thousand ha	Yield, c/ha
2000	767	35.1	191	40.6
2005	598	40.2	17.4	38.4
2010	518.5	49.2	15.7	29.3
2011	514.8	64.4	15.8	50.3
2012	507.4	68.7	15.8	82.6
2013	502.2	77.1	15.7	81.2
2014	513.6	75.9	15.6	69.9
2015	511.7	75.7	15.0	63.7
2016	517.0	70.0	15.6	69.2
2017	516.7	89.4	14.6	88.0

The key reason behind the falling areas is in the fact that more than half of perennial plantings are beyond the service life in may horticulture companies. Many companies abandoned horticulture due to the lack of funds for garden care agrotechnical techniques. Dead trees were not been removed for many years, there was no proper care for the soil, tree crowns, measures against the diseases and pests were incomplete. The orchards became unsuitable for use fast without due care. Statistics say that at the moment 7,500 ha of perennial plantings of the Lipetsk region are written off and require recultivation.

Discussion and Results

Based on the above, the key condition of effective functioning of the Lipetsk region's horticulture companies is improvement or production organization, which requires the following measures:

- the use of highly productive fruit crop plantings with good taste and commodity parameters;
- introduction of modern progressive methods of drip irrigation;
- comprehensive methods of fighting pests and diseases;
- updating of orchard rotation depending on market requirements;
- creating one chain consisting of flow-line harvesting, processing and storing to ensure continuous consumption of fresh fruit and berries in winter and spring.

The most important intensification factor is planting of intensive orchards with the density of planting of no less than 800 trees per ha .

The researchers say that improvements in horticulture organization are possible as part of investment projects of planting perennial fruit trees, whose area amounted to 2,448 ha in 2014–2017. At that, the area of orchards with the use of intensive technologies (drip irrigation and a compact layout) stood at 1,014 ha. As of 01.01.2018 the total area of perennial fruit plantings at the agricultural companies of the Lipetsk region amounted to 7,400 ha, including 5,500 ha of yielding orchards and 1,900 ha of young orchards.

The Lipetsk region has developed and is implementing large scale investment projects to develop the horticulture business in 2014–2020, which provide for, along with the laying of intensive orchards and berry fields, processing and storage of fruit and berries as well as jobs for the local people.

Thus, under an investment project at Orchards de Beaulieu Ltd, 1,320 ha of intensive orchards and berry fields will be laid; 6,100 tons of fruit and berries produced and processed, 464 locals will get a job.

"UsAgro Ltd", apart from laying 155 ha of intensive orchards, production and processing of 2,100 tons of fruit and berries, is building fruit storages with a capacity of 1,600 tons. It also plans to create 20 jobs.

"Agronom-sad Ltd" is building a logistics complex with a capacity of 40,000 tons of simultaneous storage of fruit and berries produced from an area of 1,000 ha, which, in turn, will provide jobs to 158 people.

Under the "Agriculture Development and Regulation of Agriculture Products, Raw Materials and Food Market of the Lipetsk Region" program, much attention is paid to the development of intensive gardening in "Selkhozinvest Ltd" and "Rasprostranitel Ltd". The companies plan to increase the orchard area by 836 ha, build fruit storages with capacity of 5,600 and 4,800 tons of simultaneous storage of fruit, to boost production volumes to 15,000 tons and create 90 jobs.

One of the leading companies with the greatest share in the region's fruit and berry output, is CJSC "Agrofirma imeni 15 let Oktyabrya", has merged production, storage and sales in one technological process.

We should note that reproduction of orchards and berry fields is curbed by insufficient production volumes of good plating material. There is a lack of seedlings of a certain breed and varietal composition on low-growth rootstocks and new promising varieties of apples, pears and the drupaceous. besides, the seedlings offered on the market do not meet the requirements of intensive horticulture. That's why many specialized horticulture companies, including CJSC "Agrofirma imeni 15 let Oktyabrya", are shifting to growing good-quality planting material both for their own use and for sale.

At that, they take into account the requirements to selection of the planting material – high frost resistance, good rooting ability, resistance to diseases and pests. The modern apple seedling production technology in the nursery of the company ensures branched plantings with a built-in generative sphere, production of seedlings of the highest quality, which guarantee commercial fruiting of an apple tree in an orchard on the 4th or 5th year after planting, production of apples with predetermined parameters for planting intensive orchards of different types. CJSC "Agrofirma imeni 15 let Oktyabrya" increased the volume to 639,000 pomaceous plants and 56,000 bushes, which allowed the company to increase the area of the orchard by 800 ha.

One of the innovative directions of horticulture is the use of fertilizers and chemical agents for care and protection of the orchard for the whole vegetation period. The key suppliers of plant protection products and fertilizers to the Russian market until 2014 were the European states. Imposition of sanctions triggered development of local production of the goods, other countries provided the lacking volumes (China, Serbia).

Thus, the innovative development of the Russian horticulture should be aimed at:

- breeding new high-yielding, disease resilient varieties (the use of special seedlings of low-growing fruit trees);
- improvement of the technology of growing and harvesting of fruit (over 800 trees per ha);
- creation of an effective system of storage and sales (the use of modified atmosphere storage rooms);
- technical upgrade of the sector (introduction of technologies of drip irrigation, creation of a trunk fixing system).

These measures will ensure higher effectiveness and competitiveness of the horticultural business.

Factors that Shape Innovation Activity in SMEs

Paula PYPŁACZ

Czestochowa University of Technology, Faculty of Management, Czestochowa, Poland,

paula.pyplacz@wz.pcz.pl

Abstract

For many years, innovation and entrepreneurship have been perceived as the key source of economic development and increasing competitiveness and productivity. The small and medium-sized enterprise sector is regarded in Poland as one of the key sectors that affect the functioning of the country's economy. At the same time, it is observed that the sector lacks innovation activity. Accordingly, the purpose of this paper is to identify the relationship between factors that condition innovation, such as: form of innovation activity, type of innovations introduced and purpose of introducing innovations. The survey was conducted on a sample of 242 SMEs. The results show a positive correlation between the analysed variables in the surveyed enterprises.

Keywords: Innovation, Small and Medium-Sized Enterprises.

Foreword

The sector of micro, small and medium-sized enterprises (SME) is undoubtedly the largest sector in Poland. According to research conducted by the Polish Agency for Enterprise Development PARP (PARP Report, 2018), in 2017, SMEs represented 99.8% of the total number of enterprises in Poland. Also, their contribution to GDP has exceeded 50% in recent years. SMEs are also the largest employer on the Polish market.

The growing importance of the SME sector in domestic economy, globalisation, and the resulting need to meet the requirements imposed by competitors mean that there is a need to implement new products, and services, that is innovative solutions (Pypłacz and Liczmańska-Kopcewicz, 2018; Dabija et al., 2017; Domi et al., 2019). Innovations are becoming an indispensable element of every activity. Unfortunately, the strong development of the SME sector does not coincide with the introduction of innovative solutions. The pace of innovation development in Polish SMEs is currently much slower than in large companies (Czarniewski, 2016). Also, comparison to EU enterprises is unfavourable for Polish companies. The innovation gap will be growing and it will lead to a situation where SMEs will not be able to compete with companies on European market.

The good thing is, however, that despite a difficult market situation of SMEs, some companies stay on the market, expand their activities and achieve positive economic results (Zastempowski, 2019). According to research conducted by PARP (PARP Report, 2018), the enterprises that introduced innovations increased their chances for survival and development on the competitive market. At the same time, importantly, they were definitely more profitable than those who did not implement innovation processes.

The available studies lack information on the relationship between factors that condition the occurrence of innovation in SMEs. Accordingly, the purpose of this paper is to identify the relationship between the form of innovation activity, the type of innovations introduced and the purpose of introducing innovations. Considering the above premises as well as the purpose of the paper, the following research hypotheses were formulated:

H 1. There exists a positive relationship between the form of innovation activity and the type of innovations introduced
H 2. There exists a positive relationship between the type of innovations introduced and the purpose of introducing innovations
H 3. There exists a positive relationship between the purpose of introducing innovations and the form of innovation activity.
For the purpose of this paper, a survey was conducted on a sample of 242 SMEs, which introduced innovations in the last three years. The hypotheses were verified with statistical methods.

SME – the perspective of innovation

In Poland, the sector of micro, small and medium-sized enterprises (SME) started to be analysed in early 20th century. According to the PARP 2018 report, the largest group, representing 96% of total enterprises in Poland, are micro companies and their rate of survival after the first year of operation is nearly 70%. The survival rate of small enterprises is 80% and of medium enterprises – 92% (PARP Report, 2018). Undeniably, it is the fastest developing sector and at the same time, it offers the most jobs. The SME sector consists of three groups of enterprises. The definitions of the respective groups, according to the Commission Regulation (EC) No 800/2008 of 6 August 2008, is based on quantitative criteria – the number of persons employed and financial performance. A micro enterprise may employ 10 or fewer persons and its annual turnover or annual balance sheet total must not exceed 2 million Euro. A small enterprise may not employ more than 50 persons and its annual turnover or annual balance sheet total must not exceed 10 million Euro. A medium enterprise may not employ more than 250 persons and its annual turnover must not exceed 50 million Euro and/or its annual balance sheet total must not exceed 43 million Euro (Commission Regulation (EC) No 800/2008). The same quantitative criteria for distinguishing the size of enterprises are provided for in Polish legislation, in the Entrepreneur's Law Act of 6 March 2018 (Journal of Laws /Dz.U./ of 2019 item 1292 Article 7.1, as amended).

Considering the management and implementation of innovations, it is worth to take a look at qualitative criteria that to a large extent condition the method of implementing innovative solutions (Ślusarczyk, Baryń, 2018; Meyer, Meyer, Molefe, 2016). The most important qualitative criteria of SMEs include:

- The organisation being entirely dominated by the entrepreneur's personality – it is usually the owner and at the same time manager of the organisation, the 100% decision-maker
- Targeting individual consumers with services or products that meet their individual wishes and are customised,
- The activity of the enterprise being limited to a few products/services in order to minimise costs,
- Standing out and surviving on an already saturated market thanks to offering a limited range of services or products,
- Not very formal organisation and unconventional and uncomplicated management systems,
- Fast reaction to changes in the environment,
- Highly competent personnel,
- Financial and managerial autonomy and independence.

The SME sector struggles with a number of problems resulting, among other things, from legal regulations and increasingly difficult employee market. Employers pay high costs of maintaining and qualifying their employees. Also, these enterprises are to a large extent financed from own, internal funds, which makes it difficult to implement new technologies or new managerial solutions and processes.

Innovations – Theoretical Approach

"For an enterprise, lack of innovation means collapse in the long-term" (Freeman, 1982). What Ch. Freeman wrote, directly reflects the importance of innovation for the functioning of every company.

The key role of innovation in national economies results basically from two factors (Blanchard, 2013). First of all, in the stationary state, production growth rate (economic growth) is equal to the sum of population growth rate and economic progress rate, and, on the other hand, in accordance with Schumpeter's theory of innovation, major discoveries are accompanied by "long waves", i.e. multiple-year periods of intensified economic activity associated with derivative innovations. When economic growth slows down, many entrepreneurs increase their investments in risky research and development projects, which stimulates the economy (Hlaváček & Siviček, 2017; Bilan et al., 2019.

The classical approach, proposed by J.A. Schumpeter (Schumpeter, 1960), treats them as a new combination of means of production and capital covering the following five cases: introduction of a new product, - introduction of a new production method, - opening up of a new market, - acquisition of a new source of raw materials or semi-finished products, - reorganisation of existing business. Looking closely at Schumpeter's definition, one notes that at that time, innovation was associated solely with the activity of industrial enterprises, which constituted the foundations of capitalist economy in early 20th century. According to Schumpeter, innovations are only fundamental (radical), unique, one-off and discontinuous changes that involve the transformation of a new idea or invention into a market product or process. All kinds of dissemination of innovation, on the other hand, is a separate kind of change called imitation. Imitation is continuous and repetitive.

A different approach to innovation was adopted by Porter, who regarded innovation as economically successful exploitation of new ideas. He understood them as a continuum of technical and organisational changes, encompassing both simple modifications of existing products, processes and business practices and fundamentally new products and processes (new in the scale of both an enterprise and an industry and economy) (Porter, 1990). New means new for an enterprise, industry or economy (Hoerlsberger, 2019).

The current, contemporary definition taken from the Oslo Manual defines innovation as "introducing a new or significantly improved product (good or service), a new or significantly improved process, a new marketing method or a new organisational method in business practices, workplace organisation or external relations" (Oslo Manual, 2008).

Thus, the Oslo methodology identifies four types of innovations:

- Product innovation, i.e. introduction of a good or service that is new or significantly improved in terms of characteristics or application, -
- Process innovation, i.e. introduction of a new or significantly improved production or delivery method (changes in techniques, equipment and/or software, -
- Marketing innovation, i.e. introduction of a new marketing method involving significant changes in product design or packaging, product placement, product promotion or pricing, -
- Organisational innovation, understood as introduction of a new organisational method in business practices, workplace organisation or external relations.

It is important to engage in and motivate to the innovation process all employees and external entities that collaborate with the organisation, as all kinds of innovations are seen through the prism of the knowledge used (Glabiszewski *et al.*, 2018), (Wiśniewska and Liczmańska-Kopcewicz, 2019). The participation of both groups depends on their knowledge and skills in the area of given activity. Thus, innovation must be understood as a system that develops in different ways, depending on the specificity of a company, the area of its activity, its size, type of innovations, number of persons involved, level of knowledge, funds engaged and the expected results (Mahmud, Aryanto and Hasyim, 2017). According to this approach, evaluating the innovation potential of an enterprise is a multilateral and systemic process (Pachura, 2017).

Research Methodology

In order to achieve the research objective, a critical analysis of literature was conducted and heuristic methods were applied, such as brainstorming, in several familiar SMEs. Cognitive methods were supported by own research. The results of own research were analysed by means of statistical measures and data analysis with the use of pivot tables.

Representatives of companies from the Polish SME sector were invited to answer a survey conducted within the framework of the Innovation Barometer. The Innovation Barometer is a cyclical survey addressed to Polish entrepreneurs and gradually extended to other European states. The survey was conducted as online interview method (CAWI). The survey edition that is analysed in this paper was conducted from 1 April to 30 November 2018 by means of an electronic questionnaire uploaded on an internet platform. 242 companies from various industries responded to the survey. The Innovation Barometer contains 39 questions divided into groups associated with different kinds of innovations listed above in this paper, in accordance with the Oslo Manual classification. Table 1 presents the characteristics of the surveyed group.

Table 1: Characteristics of the enterprises surveyed (N = 242)

The questionnaire elements	Volume	Participation in %
Enterprise size:		
• small (10 - 49 employees)	55	22.7
• medium (50 - 249 employees)	53	21.9
• large (over 250 employees)	134	55.4
Respondent's position		
• Owner / senior level employee	190	78.5
• Employee	52	21.5
Type of enterprise		
• Service provider	99	40.9
• Manufacturer	119	49.2
• Commercial	24	9.9

Source: elaborated by the author.

This paper presents partial results of empirical research that enable evaluation of the relationship between the form of innovation activity, type of innovations introduced and purpose of innovations.

These three characteristics may be perceived in different ways. For the purpose of this research, it was assumed that the main sources of innovation and at the same time the form of innovation activity in an enterprise may be: technology transfer, research and development activity, marketing research on the domestic and international market, using idea generation methods, e.g. "brainstorming", using consulting company services, stimulating the attitudes of employees and managers. It was also taken into consideration that SMEs rely only on old knowledge and do not look for new sources, or they combine existing with newly acquired knowledge. Detailed results of responses are presented in Table 2.

Table 2: Form of innovation activity

	Frequency	Percentage of responses	Percentage of valid responses	Cumulative percentage
Is associated with the use of new knowledge (generated in the course of R&D activity or acquired from external sources)	149	61.6	61.6	61.6
Is founded only on old knowledge/is associated with new application of existing knowledge	50	20.6	20.6	82.2
Combines existing and new knowledge	28	11.6	11.6	93.8
No innovative activities are undertaken	15	6.2	6.2	100

Source: elaborated by the author.

Particularly noteworthy is research and development activity, which in the economic practice of SMEs functions in three ways: independent activity of an enterprise, using the services of external companies and cooperating with an external institution. In each of these models, the following different kinds of research and development activities are undertaken, but in the case of the SME sector, these are mainly development activities. Development activities are: acquiring, combining, forming and using currently available knowledge and skills in the field of science, technology and economic activity, and other knowledge and skills to plan production and to create and design new, changed or improved products, processes and services, excluding activities that involve making routine and periodic changes to products, production lines, manufacturing processes, existing services and other operations in progress, even if such changes are improvements.

It is also worth noting the purpose of implementing innovations. An important factor influencing the implementation of innovations are economic considerations. On the one hand, innovation is to a large extent dictated by the desire to reduce costs (including individual delivery costs), but, on the one hand, financial possibilities are a problem, which also means problems with accessing R&D facilities, new technological solutions or additional sources of financing. Another factor that influences the level of innovation in Polish SMEs are market demands and in particular customer demands. The more demanding a client or the more "difficult" and changing the market, the more innovations are implemented. This is associated with increasing the quality and producing new or significantly improved products and services, and finally with increasing the effectiveness and quality of auxiliary activities. An important factor, independent of the financial barrier, is awareness of the owners (managerial personnel) of SMEs. Unless their needs in the field of searching for and implementing innovations change, it will be hard to push forward "an innovative approach to company management", and consequently, the innovation potential of SMEs will not develop.

Having looked into the definitions presented above, one could say that innovation is a manifestation of the capacity to generate and implement innovation. The question is then how to determine which enterprise is innovative? According to the Oslo Manual, an innovative enterprise is one that has implemented at least one innovation (Oslo Manual, 2008), which another definition makes more specific: the innovation proved to be a novelty in the opinion of the given organisation and it was implemented in the last 3 years (Stawasz, 2005). Thus, as can be seen in table 3, the analysis covered survey results for 242 companies that undertook innovation activities in the last three years.

Table 3: Innovation activities in the area of process innovation undertaken in the last three years

	Frequency	Percentage of responses	Percentage of valid responses	Cumulative percentage
Innovation activities were undertaken but not implemented	18	7.4	7.4	7.4
Innovation activities were undertaken but implemented partially	124	51.3	51.3	58.7
Innovation activities were comprehensively implemented	100	41.3	41.3	100.0
Total	242	100	100	
No innovation activities were undertaken	35	Disregarded in the analysis		

Source: elaborated by the author.

In the first place, in order to verify whether the abovementioned relationship exists and to answer the question of how strongly the type of innovation introduced is influenced by the form of innovation activity, and thus to confirm that hypothesis H1 formulated in the research process is true, a statistical analysis of the relationship between the abovementioned variables was conducted. The Spearman's rank correlation coefficient was used, and the values obtained are presented in Table 4.

Table 4: Correlation between the type of innovation introduced and the form of innovation activity

			Type of innovations introduced
Spearman's rho	Form of innovation activity	Correlation coefficient	.736**
		Significance (two-sided)	.000
		N	242

*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the author.

The values of Spearman's rank correlation coefficient prove a positive and statistically significant relation. There exists a relationship between the form of innovation activity defined as research and development activity and the process innovation type of innovation. There are grounds to claim that R&D activity influences process innovation. The correlation coefficient between the factors is .736**, which represents quite a strong relation. In the other cases, no significant relationship was reported.

In order to confirm hypothesis H2, the relationship between the type of innovations introduced and the purpose of introducing innovations was analysed, and the result was a positive correlation, as presented in Table 5.

Table 5: Correlation between the type of innovations introduced and the purpose of introducing innovations

			Type of innovations introduced
Spearman's rho	The purpose of introducing innovations	Correlation coefficient	.542**
		Significance (two-sided)	.000
		N	242

*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the author.

Hypothesis H2 was positively verified only for the process innovations. There are grounds to believe that the innovation purpose of quality improvement, production of new/significantly improved products and services, influences the process innovation type of innovation. The correlation coefficient between the factors is .542**, which represents a moderate relationship. Also, the relationship between improving the quality of innovations introduced and other types of innovations was analysed, but no statistically significant relationship was reported. In the other cases (organisational, product and marketing innovations) there are no relationships between the analysed parameters.

In order to confirm hypothesis H3, the relationship between the purpose of introducing innovations and the form of innovation activity was analysed. As the results presented in Table 6 show, there exists positive relationship between the two factors.

Table 6: Correlation between the purpose of introducing innovations and the form of innovation activity

			Form of innovation activity
Spearman's rho	The purpose of introducing innovations	Correlation coefficient	.725**
		Significance (two-sided)	.000
		N	242

*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the author.

An analysis of the relationship between the purpose of introducing innovations and the form of innovation activity revealed a positive correlation, which means that the research and development type of innovation activity influences the innovation purpose of quality improvement, production of new/significantly improved products and services. The correlation coefficient between the factors is .625**, which represents a strong relationship.

Discussion

The results of empirical research presented in this paper confirm hypothesis H1. Considering the results presented above, it should be noted that there are also no grounds to reject hypotheses H2 and H3. The research confirms that innovation activity is a complex phenomenon and it depends on multiple variables. The choice of the form of innovation activity determines the type of innovations implemented, which is at the same time dependent on the purpose of implementing innovations. We hope that our analyses will contribute to a more contextualised understanding of the phenomena associated with innovation activities in SMEs and the reasons why they are treated very cautiously or even unwillingly by Polish SMEs.

The values of Spearman's rank correlation coefficient obtained prove positive and statistically significant relationship. Positive correlation means that the form of innovation activity influences introduction of process innovation and the purpose of improving product and service quality. It can

also be stated that the innovation purpose of quality improvement, production of new/significantly improved products and services, influences the process innovation type of innovation.

None of the factors were associated with very strong relationship. The coefficient values prove a strong (.725**; .736**) or moderate relationship (542**), namely positive and statistically significant relationship.

Conclusion

Innovation activity of enterprises is often very specific and exceptionally difficult to analyse. However, as customer demands develop, Polish SMEs must become increasingly innovative. Even though many companies claim that innovation is one of the elements of their strategy, new solutions are often introduced randomly and in response to sudden market demands, or in order to imitate competitors. Unfortunately, innovation is not followed by research and development activity.

SMEs should receive strong supports through a comprehensive innovation support system. Importantly, such system should be founded not only on specialist – commercial or academic – business environment institutions. Effective operation of an innovation support system should be accompanied by a business environment friendly to enterpreneurs. To develop such a support system, knowledge is needed, not only about the level of innovation in Polish small and medium-sized enterprises but, most importantly, about their innovation potential – as a factor that significantly influences the future level of innovation.

Obviously, in order to ensure innovation, SMEs also need to engage in relevant research and development activities themselves and to allocate quite substantial funds for that purpose. Moreover, it is important to engage in and motivate to the innovation process all the employees. They are often the source of new ideas or inventions. Innovation, however, should not be treated as an end in itself. To the contrary, it is a set of measures to build competitive advantage.

Creating Process Innovations in SMEs, in the Context of The Source of Information on Innovation

Paula PYPŁACZ

Czestochowa University of Technology, Faculty of Management, Czestochowa, Poland,
paula.pyplacz@wz.pcz.pl

Abstract

The small and medium enterprises sector, in spite of facing numerous financial, legal, organizational or personnel challenges, must also analyse the market situation and seek innovative inspirations. A special type of innovations includes process innovations, which affect the company's situation in a very broad scope. They concern the entire process executed in organizations. The variable market causes that one cannot be content with just imitation of competition but has to be one step ahead. This requires sufficient financial, human and information resources. This article is an attempt to define the relations between sources of information and types of innovations implemented in the organization. The research was conducted on a sample of 242 SMEs. The results indicate positive correlations in examined enterprises between selected variables.

Keywords: Process Innovations, Information Sources, Small and Medium Enterprises,

Introduction

Enterprises that want to take part in the market battle for a customer place more and more emphasis on increased innovativeness. Innovative activity is an important source of competitiveness, economic growth, as well as the image of each country (Janoskova & Kral, 2019; Kiselakova et al., 2018; Kijek & Matras-Bolibok, 2019; Jakimowicz & Rzeczkowski, 2019a; 2019b).Thus, innovations are understood as a factor of growth and development of enterprises. They are the response to market needs, and play an important role in the functioning and development of small and medium enterprises. The small and medium enterprises sector (SME) is actually facing the challenge of creating and implementing innovation, as well as managing the entire innovation process. For SMEs, the main problem, which is decisive in terms of undertaking innovative activity, is the issue of financing, followed by numerous problems related with material, human and information resources (Lewandowska & Stopa, 2018; 2019). Although it is recognized that we are currently facing an information overload, in terms of seeking innovation ideas one should search for professional sources of information, which bring reliable data that may pose the basis for further action.

The subject of this article comprises process innovations - as the selected type of innovations that conditions efficient operation of an enterprise in the SME sector. The purpose of this article is to analyse the relations between sources of information and process information. The author concentrated on an analysis of the source literature, with special focus on the on the concept of innovation, including, in particular, process innovations. Additionally, an analysis of surveys conducted on a sample of 242 SMEs was performed, with the assumption that these enterprises introduced innovations during the past three years. Data was verified using statistical methods, to define the Spearman's rank correlation.

The essence of implementing innovation and managing information in enterprises

Over the years, the approach to process innovation was changing. The following innovation models may be distinguished: the „black box" idea, linear models, interactive models, system models, evolution models, innovative environment models. Each of these models not only ensured a new manner of reviewing the issues, but also attempts to explain what affects innovativeness of individual territorial systems. The first model took into consideration only the financial means invested in research conducted by research & development entities, while the latter models provide for complex solutions such as the concept of regional innovation systems (Dermody, J., Yun, J.J., Della Corte, V., 2019; Koišová et al., 2018; Koišová et al., 2017).

Innovation may be looked at as a specific process, which covers all activities related with creating the idea, creating the invention, and its implementation. Innovation also concerns a service, process or a new product or its enhancement (Pomykalski, 2001; Androniceanu and Tvaronavičienė, 2019). Schumpeter defined innovation as (Schumpeter, 1960):

- Introducing new products or enhancing existing products;
- Introducing a new or enhanced manner of production;
- Opening a new market;
- Applying a new form of sale or purchase of existing goods;
- Obtaining new raw materials or semi-finished products;
- Introducing a new process organization.

Currently, consideration should be given to overall activities, based on an innovation strategy, which may be defined as a "long-term action plan prepared to enhance the innovation management process, meaning the process of seeking such types of innovation, which will increase the market effectiveness of the enterprise through possessed resources" (Pomykalski, 2001; Androniceanu, 2019a). Components of the innovation strategy include mainly (Afonasova, Panfilova, Galichkina and Ślusarczyk, 2019):

- Selection of innovation, meaning a purposeful selection of the technology and the technique to be invested in.
- Obtaining innovation, meaning determining the sources of innovation, methods of obtaining innovation, identification of valuable innovations in the surrounding area, analysis of integration possibilities.
- Use of innovation through internal use or enhancement, or sale of innovation.

An independent execution of the overall innovation process in an enterprise is difficult, especially in case of the SME sector. Such solution is only possible in case of the company demonstrating certain pro-innovative characteristics. These include mainly: pro-development orientation, vigilance, sensitivity, flexibility, acceptability of risk, engagement in technology, cooperation, diversity and so called "slack". Characteristics and their detailed descriptions are presented in Table 1.

Table 1: Characteristics of an organization focused on executing innovation processes

Characteristics of enterprise	Description
Pro-development orientation	Operating and tactical activities should be aimed at execution of a strategy, which assumes long-term growth of the company's goodwill, not maximizing the profit within a short-term perspective
Vigilance	The management and employees should continue to analyse the company's environment, as well as recognize the tendencies and anticipate key changes for the market (Bulut, Gencturk, Aydin, Nazli and Kahraman, 2019)
Sensitivity	Apart from generating own innovation, enterprises should demonstrate appropriate sensitivity, which allows them to detect, identify and implement solutions developed outside of their formal borders
Flexibility	Besides spotting the changes in the company's environment, companies must also present readiness to accept these changes and to quickly adjust the company to new market conditions
Risk acceptance	The innovation process carries the risk of obtaining results other than those assumed, hence it is important to take an approach that will allow to execute also risky projects
Engagement in technology	Due to the intensive progress in the technological area, innovations that take account of these changes may be of critical nature for the company and for the market
Restricted competition inside the organization and tendencies to cooperate	Execution of large and complex innovation projects forces building an organizational structure aimed at cooperation
Diversity	Creation of a pro-innovative organizational culture, including creativity, is favoured by the diversity of employees with various competences, from various cultures, or of different age
Slack	The organization must ensure space for creativity of employees, allowing them to apply unconventional solutions for problems occurring at the company and unconventional methods of creative work

Source: own elaboration based on Tranfield D., Young M., Partington D., Bessant J., Sapsed J. "Knowledge management routines for innovation projects: developing a hierarchical process model, „International Journal of Innovation Management", 2003, no. 7; Trott P. "Innovation Management and New Product Development, Prentice Hall, Harlow-Milan 2005.

The role of innovation is so significant that many organizations implement the supporting method of management, i.e. innovation management (Łobos and Puciato, 2013). Enterprises which are not innovative and do not create new products and disappear from the market, whereas the development of innovation is allowed thanks to (Tomala and Sénéchal, 2004):

- Stimulating new needs of recipients;
- Expanding the product offer;
- Improvement of quality and increasing reliability of products;
- Expanding outlets;
- Limiting external costs (e.g. environmental costs);
- Better adjustment of the company to the legal environment;
- Increase of flexibility of operation;
- Limiting costs, including personnel and material costs;
- Improvement of work efficiency.

Process Innovations

Regardless of what modern definitions of innovation is referred to, in each of them changes concern not only the product or the technology, but they also constitute market changes or even overall process changes. There are many divisions of innovation, however the one most frequently applied differentiates four types of innovation: (Oslo Manual, 2008)

- Product innovation;
- Process innovation;
- Organizational innovation;
- Marketing innovation.

Process innovation may be defined as an implementation of a new or significantly improved method of production or delivery. These methods may consist of introducing changes to devices or in the organization of production, or constitute a combination of both these types of changes, or result from using new knowledge (Riana, Rihayana and Kumala Ratih, 2019; Androniceanu, 2019b). The changes may aim at production or delivering new or enhanced products, which could not have been produced or delivered using conventional methods. Innovation of such type may also result from the need to increase effectiveness of production or the manner of delivering products. An example of such innovation may an implementation of a new IT system, which supports the management process in the enterprise, automation of the production process, or implementation of a new stock control system.

Apart from introducing a radical new approach or technology, process innovations usually requires a longer planning time and support from the senior management (Glabiszewski, 2015). They are also more risky than gradual improvement, and require a higher level of cultural and structural changes. Process innovations usually also expand to a larger part of the organization.

Process innovations may generate value for internal clients, including employees, and the organization itself, or they may create value for external clients, including business partners, end users or actual consumers. The value resulting from process innovation includes reduction of the time needed to manufacture the product or perform the service, increased number of manufactured products or performed services within a given time, and reduction of costs per manufactured product or performed service. In addition, process innovations may generate a substantial growth of the quality of the product and the level of service. In summary, a single entity must record a significant increase of certain key performance indicators (KPI), for the process innovation to be considered true and real.

Implementation of an innovation is related with adopting an appropriate action strategy, but also a relevant form of innovative activity. In many cases, a real problem in implementing innovation is the application of a “pull” strategy where the innovation process is a result of translating the customer’s needs or meeting market requirements (Mahmud, Aryanto and Hasyim, 2017).

A process innovation very likely is the least media-related and attractive form of innovation. This happens because product innovations are often visible for customers, whereas process innovations are noticed only within the organization. Hence the company cannot take pride in them before stakeholders.

Sources of information in the context of process innovation – results of research

Innovation should be treated as a process, and enterprises should properly manage innovation. The innovation management process is characterized by several stages, thanks to which the process may be conducted in an effective and promising manner:

- Search and selection

- Planning process
- Implementation stage
- Diffusion and discounting process
- Controlling

There are numerous factors, which condition the process of implementing and managing innovation in organizations. These include factors of socio-economic, production and financial nature, as well as factors related with the entrepreneur's approach to innovation. Innovation barriers may derive from the environment (e.g. uncertain demand, a lack of access or limited access to external financing sources etc.), and from within the enterprise. Internal barriers do not only include a lack of own funds, but also concerns about using the services of external consulting companies, or problems with the availability of external services, as well as a frequent lack of research & development units in a SME. These problems often result in information gaps.

Throughout the entire innovation management process, valid, reliable and carefully selected information is of key importance. Sources of innovation mean the factors, which inspire the creation of concepts, ideas and projects, which result in seeking innovation and implementing enhancements to existing solutions as well as new ideas (Ślusarczyk and Grondys, 2019). Therefore, this process is usually initiated in the entrepreneur's mind, where he analyses his insights concerning the internal and/or external environment of the company. In turn, the methods of meeting such needs may derive from both inside or outside of the unit. One of the methods allowing the execute innovation projects is to conduct own research & development works (Pypłacz and Liczmańska-Kopcewicz, 2018). Tomaszewski (2015) proposed distinguishing the following concepts: "source of innovation" and "source of information about innovation". In his opinion, sources of innovation may relate to entities, which come up with ideas to meet innovation needs, and relate to technological or organizational solutions (Dermody, Yun, Della Corte, 2019). In turn, sources of information about innovation may include both the entities themselves, as well as tangible and intangible resources, which provide information about innovation. In this case, information is provided about technological solutions, the sale of which will generate income for the source of innovation (Wlodarczyk, 2017). Therefore, sources of innovation usually constitute the sources of information about innovation. The importance of sources of innovation is varied, depending on the type. Most popular sources include: customers, fairs, specialized literature, forecasts, market studies, independent research entities, mass media, press and magazines, entrepreneurs, advisors and associates. Therefore, in terms of the place of development, sources of innovation may be divided into exogenous (e.g. knowledge transfers, scientific research conducted on national and foreign universities etc.) and endogenous (including results of the works of own research & technical units, quality wheels, management, streamlining designers etc.) (Badowska, 2012).

As demonstrated in the presented deliberations, the innovation process on the one hand depends on proper sources of information about innovation, and on the other hand conditions the need of functioning of subsequent sources of innovation.

Research Methodology

A critical analysis of the literature was conducted to achieve the research goal. In addition, cognitive methods were supported by own research. Statistical measures and a data analysis with pivot tables were used for the purpose of analysis the results of own research.

Representatives of companies operating in the Polish SME sector were invited to take part in a research conducted within the Innovation Barometer. The Innovation Barometer is a cyclical research addressed at Polish entrepreneurs, gradually developed for other European countries. The computer-assisted web interviewing (CAWI) method was used in the research. The edition of the research analysed in this elaboration was conducted from 1 April to 30 November 2018 with the use of an electronic form available on the Internet platform. 242 persons from various industries participated in the research. The Innovation Barometer includes 39 questions, divided into groups related with

various types of innovations specified hereinabove, in accordance with the Oslo Manual division (Oslo Manual 2008). Table 2 presents the characteristics of the analysed group.

Table 2: Characteristics of the enterprises surveyed (N = 242)

The questionnaire elements	Volume	Participation in %
Enterprise size:		
• small (10 - 49 employees)	55	22.7
• medium (50 - 249 employees)	53	21.9
• large (over 250 employees)	134	55.4
Respondent's position		
• Owner / senior employee	190	78.5
• Employee	52	21.5
Type of enterprise		
• Service	99	40.9
• Production	119	49.2
• Trade	24	9.9

This article presents partial results of empirical studies, which allow assessing the dependence between types of innovation and selected and used sources of information.

Discussion

A significant issue in the innovation process is to find inspiration on innovation and to obtain support in the form of data and information, which may initiate planning innovative activities in the enterprise.

The conducted study took account of 3 main sources of information, specifying their detailed elements. Tables 3-6 present all analysed sources and numbers of respondents' indications.

Table 3: Number of responses concerning the use of internal sources of information. N=242

What internal sources of information does the company take account of in the process of preparing innovation?	Number of responses
Own research & development facilities	77
Management employees	137
Other employees	79
Other enterprises within the group	67
We do not use other sources	21

Source: elaborated by the authors.

Table 4: Number of responses concerning used market information sources. N=242

What market information sources does the company use in the innovation process?	Number of responses
Suppliers of technical machines and devices, equipment, materials, components and software	82
Customers	121
Competitors and other enterprises within the same area of activity	85
Consulting companies (consultants), commercial and private R&D laboratories	23
We do not use such sources	24

Source: elaborated by the authors.

Table 5: Number of responses concerning used institutional sources of information. N=242

What institutional sources of information does the company use in the innovation process?	Number of responses
Research facilities of the Polish Academy of Sciences (PAN)	8
Research and development units	81
Foreign public research institutions	22
Universities	32
We do not use such sources	132

Source: elaborated by the authors.

Table 6: Number of responses concerning used information sources (not presented elsewhere). N=242

What other sources of information does the company use in the innovation process?	Number of responses
Conferences, fairs, exhibitions	127
Scientific/ technical/ commercial magazines and publications	46
Scientific & technical, specialist, and professional associations	33
We do not use such sources	84

Source: elaborated by the authors.

As presented in tables 3-6, in case of an overall analysis the most frequently indicated source of innovation were management employees (137 responses), meaning they are the principal decision-makers in SMEs. Fairs, conferences and exhibitions were quite popular (127 responses), as well as customers (121 responses), who are often selected as a source of an inspiration. What's interesting, 132 responses indicate that SMEs do not use institutional sources of information or use them very rarely.

A hypothesis was formulated that there is a positive dependence between the type of innovative activity and the used source of information about innovation.

To verify the existence of the aforementioned dependence, a statistical analysis was conducted with regard to dependencies between the analysed variables. The Spearman's correlation rank coefficient was used; obtained values were presented in table xx.

Table 7: Correlation between the type of introduced innovation and the source of information

		Type of innovation activity – product innovation	Type of innovation activity – organizational innovation	Type of innovation activity – marketing innovation	Type of innovation activity – process innovation
Internal sources of information	Correlation coefficient	.215**	.428**	.182**	.827**
	Significance (two-sided)	.001	.000	.004	.000
Market sources of information	Correlation coefficient	.303**	.336**	.456**	.798**
	Significance (two-sided)	.000	.000	.000	.000
Institutional sources of information	Correlation coefficient	.451**	.121	,163*	.346**
	Significance (two-sided)	.000	.061	,011	.016
Other sources of information	Correlation coefficient	.243**	.229**	.157*	.767**
	Significance (two-sided)	.083	.000	.014	.000

*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the authors.

The values of the Spearman's correlation coefficient presented in table 7 demonstrate the existence of a positive and statistically significant relation between process innovation and sources of internal, market or other information. In case of a relation between institutional sources of information with four types of innovative activity, there were no statistically significant dependencies, and there were only small dependencies (0,1-0,4). Also in the case of dependencies between all other variables (product, organizational and marketing innovation vs. market information) there are only small dependencies (0,1 – 0,4).

Further analysis was conducted in regard to dependencies between process innovations and sources of information. Results are presented in fig. 1, which demonstrate the values of the coefficient of correlations for selected sources of innovation.

Fig. 1: Correlation between process innovation and selected sources of information

Significance (two-sided): 0.000-0.001
*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the authors.

The resulting values of the Spearman's correlation coefficient demonstrate a positive and statistically significant relation. The positive character of the correlation means that the indicated sources of information affect the implementation of process innovation.

The correlation coefficient between factors was at.689** to .787**, which demonstrates moderate and quite strong relation. For two factors – dependencies between competitors and management, and their influence on introducing process innovation – moderate dependency was demonstrated, at the level of.567**, .543**. For other sources of information, obtained values were even lower, therefore they were not presented as being insignificant. No strong dependency occurred for any factor.

Summary

It should be noted that innovation play an important role in shaping the company's success on the given market. This mainly happens when the company manages innovation in such manner, so as to synchronize the implementation of innovation with its internal and external operating environment.

Innovative activities are effective if they guarantee achieving and maintaining a proper level of competitiveness. Market success is reserved for those entities, that will spot the opportunity and chances to development in the presence of numerous competitors. Identification of all factors that support innovative activity contributes to the development of an effective strategy in the permanently changing environment. The entire process of managing innovation is conditioned upon the possessed sources of information, thanks to which planning and implementing innovative solutions may be conducted more effectively. The results that indicate a positive dependence between types of innovation and sources of innovation demonstrate that one should consider the type of innovation that the company aims to implement. In particular case of SME, this may contribute to an increase in the effectiveness of innovative activities, in particular thanks to saving time and costs of obtaining information.

Innovativeness is the driver of changes, and changes constitute the basic elements of a business strategy. However, this is possible when the entity creates a culture of innovativeness, which develops when employees at all levels engage in supporting, promoting and implementing new

products, services, and business models, and conscientiously execute the assumptions of the innovative development strategy.

Abstract

Insurance is the most important institution of financial protection and a significant investment resource, but its role in the modern economy is underestimated, which is especially evident in regions with a low level of socio-economic development. The relevance of the article is due to the following. It identifies all-Russian and regional factors in the development of the insurance market, the management of which will contribute to the development of the regional insurance market and the region itself. The aim of the article is to identify and systematize the development factors of the regional insurance market, as well as to develop a mechanism for their effective impact on the insurance market and on the development of the region. The study used the method of deduction, the method of comparative empirical research, statistical methods, functional analysis, modeling. The article contains a developed algorithm for increasing the efficiency of the insurance market and the region as a whole by managing stimulating and restraining factors. It takes into account regional peculiarities and can be used for any regions of Russia. The results of the work can be taken into account when developing national and regional strategies for socio-economic development, including through insurance, as well as when adjusting the methods of state regulation of the insurance market in Russia.

Keywords: Regional Insurance Market, Insurance Regulation, Socio-Economic Development Of The Region, The Effectiveness Of The Regional Insurance Market

Introduction

The regional insurance market is able to have a positive impact on the development of the region. The article identifies and analyzes the factors of the development of the insurance market, the management of which will contribute to the development of the regional insurance market and the region itself.

The purpose of the article is to identify and systematize the development factors of the regional insurance market, in the process of developing a mechanism for their effective impact on the insurance market and

The hypothesis of the study is the management of the stimulating and restraining factors of the functioning of the insurance market in the region can ensure its effective development.

Analysis of the development of the problem showed the following.

1. The regional insurance market is part of the national insurance market. Among the issues discussed in the world and Russian scientific community that affect the development of national and regional insurance markets, Porrini (2017), Chang et al. (2013) note the processes of globalization and digitalization of the insurance market. The specifics of the development of insurance markets in regions is determined by the features of national insurance markets, which were studied in Burmaa (2018), Gaganis et al. (2019), Koijen and Shadow (2016), Mnykh (2017). Issues of financial convergence in the insurance market, competition and shadow insurance were considered in the works of Pisarenko (2013), Kuznetsova (2009), Chernova, Kuznetsova and Pisarenko (2018); Hong and Hun-Seog (2018), Geng (2018), RussellToth et al. (2019). The problems of informational openness of the insurance market are discussed in the studies of Ermolaeva (2011), Sholoiko (2018).

One of the important tasks of the development of insurance in world practice is the effective functioning of the insurance infrastructure and its interaction with banks. These issues are explored by Pisarenko (2013), Chang (2018), Sholoiko (2018).

2. The insurance market is a segment of the region's economy.

Considerable attention is paid to the functioning and development of regional insurance markets in Russia. Among the general issues discussed, first of all, there are such as state regulation and the management of regional insurance markets. These questions are studied by Ermolaev (2011), Keneshova (2018), Koijen and Shadow (2016), RussellToth et al. (2019). Factors and problems in the development of regional insurance markets are considered by Keneshova (2018), Orlanyuk-Malitskaya (2017), Tarasova and Voskovskaya (2018), Burmaa (2018). A special place in the study of the problem is occupied by the issues of the influence of the development of the insurance market on the economy of the corresponding region, discussed in the works of Bashlakova (2017), Vorontsov (2014), Efimova and Kochubey (2017), Tsyganova and Kirillova (2018).

In studies of regional insurance markets, the latter is not considered as part of the all-Russian insurance market and as a segment of the regional economy. The presented work closes this gap of fragmentation.

Research Methods and Results

The main research methods are the deduction method - the use of knowledge on the development of the entire national insurance market for development analysis; method of comparative empirical research - observation and comparison of the functioning of both the national insurance market and its regional segments; statistical research methods - correlation and regression analysis of indicators of the functioning of regional insurance markets; functional analysis - consideration of the insurance market as an institution of financial protection from the risks of the region; modeling, allowing to study the influence of the regional economy on the development of its insurance market.

The results obtained in the article include the following.

- consideration of the regional insurance market as part of the national insurance market made it possible to identify all-Russian and specific regional factors in the functioning of regional insurance markets;
- allocation of all-Russian and specific regional factors of the functioning of regional insurance markets confirmed the existence of a connection between all-Russian socio-economic factors and development factors of regional insurance markets, including the example of the Republic of Khakassia;

- to determine the specific impact on the development of the regional insurance market on the example of the Republic of Khakassia, a regression equation was constructed that establishes a relationship between significant factors in the development of the region and the final indicator of the development of the regional insurance market - the total size of all insurance premiums;
- taking into account the different directions of the impact of all-Russian and regional factors on the regional insurance market, groups of stimulating and constraining factors for its development were identified;
- in order to increase the efficiency of the regional insurance market and its positive impact on the development of the region, an algorithm has been developed aimed at strengthening stimulating and weakening constraints.

Discussion

General Russian factors of functioning and development regional insurance market

The regional insurance market is part of the national insurance market, which, in turn, is subject to the influence of all-Russian factors in the functioning and development of the entire economy of the country.

To assess the relationship between the national economy and insurance, the correlation coefficients were calculated between the values of the main indicators of the economy and the values of the functioning indicators of the Russian insurance market (table 1).

For this, we used data from the regional statistics of Rosstat and insurance statistics of the Bank of Russia. The total (total) values of socio-economic indicators for the economy of the Russian Federation and for the Russian insurance market - for the subjects of the Russian Federation for 2011-2017 were used as data arrays. The calculation results are given in table 1.

Table 1: values of paired correlation coefficients between the main all-Russian socio-economic indicators and the most important indicators of the national insurance market (2011-2017)

Factor signs	Effective signs				
	Insurance premiums total	Life insurance premiums	Personal insurance premiums excluding life insurance	Property insurance premiums	Car owner liability insurance premiums
Deposits of individuals and legal entities	0.97	0.97	0.96	0.98	0.75
The financial result of enterprises	0.83	0.83	0.79	0.82	0.78
Consolidated Budget Revenues	0.82	0.84	0.76	0.8	0.81
Fixed assets of enterprises	0.79	0.82	0.71	0.74	0.92
Gross regional product	0.74	0.77	0.67	0.70	0.81
Retail turnover	0.73	0.76	0.65	0.7	0.85
Manufacturing	0.71	0.74	0.62	0.67	0.89
Average annual number of employees	0.66	0.69	0.56	0.61	0.84
Fixed investment	0.65	0.68	0.56	0.59	0.89
Debt on loans to individuals	0.63	0.66	0.53	0.58	0.87

Average annual population	0.54	0.57	0.43	0.49	0.79
Per capita consumer spending	0.54	0.53	0.53	0.55	0.4
Per capita cash income	0.43	0.42	0.43	0.44	0.29
Mineral production	0.42	0.46	0.34	0.34	0.7
Housing commissioning	0.41	0.43	0.29	0.36	0.72
Agricultural output	0.21	0.26	0.11	0.15	0.55

Calculated according to: Federal State Statistics Service. URL: http://www.gks.ru; the official website of the Bank of Russia. URL: http://www.cbr.ru.

A strong correlation (over 0.9) is observed between the all-Russian socio-economic indicator deposits of individuals and legal entities, which describes the factor level of citizens' income and the sum of insurance premiums for all types of insurance. Its weakening is observed only for car owners' liability insurance premiums, since their size is stipulated by the obligatory nature of this type of insurance.

A high correlation (0.7-0.9) with the size of insurance premiums is observed for all-Russian socio-economic indicators financial result of enterprises, income of consolidated budgets, fixed assets of enterprises, gross regional product, retail turnover, population, value of fixed assets in the economy, manufacturing volumes. On May, a high correlation of these socio-economic indicators was noted with premiums on life insurance and premiums on compulsory liability insurance of car owners.

The average correlation (0.5-0.7) with the size of insurance premiums is observed for the following all-Russian socio-economic indicators – the number of people employed in the economy, investment in fixed assets, debt on loans to individuals, population, consumer spending per capita.

Other factors have a weak effect on the scale of insurance activity (correlation coefficient less than 0.5).

Correlation coefficients were calculated according to statistics of the country's economy and the national insurance market. The influence of factors on the insurance market of a particular region may differ from their influence on the national insurance market. Therefore, the following considerations must be taken into account.

Firstly, the relationship between the country's economy and the national insurance market should be confirmed for each region, since the all-Russian factors affecting the development of the entire national market can affect the development of the regional insurance market in different ways.

Secondly, for each region, the influence of factors for which the relationship between the all-Russian socio-economic indicators and the national insurance market indicators is characterized by a low value of the correlation coefficient (below 0.5) should be investigated, since at the country level may be insignificant, and at the level of a particular region - significant.

Thirdly, taking into account the influence of the identified all-Russian factors on the insurance market of a particular region is advisable when calculating the correlation coefficients between the socio-economic indicators of the region and the most important indicators of the regional insurance market.

Regional development factors affecting the regional insurance market

The feasibility of calculating the correlation coefficients between the values of the main socio-economic indicators of the region, describing all-Russian factors, and the most important indicators of the regional insurance market is due to the following. The geographical position of the region, its climatic and / or demographic characteristics of the region have a different degree of influence of all-Russian factors on the development of regional insurance.

The list of socio-economic indicators of the region and its insurance market should coincide with the list of all-Russian socio-economic indicators and indicators of the national insurance market.

The obtained values of the correlation coefficients will make it possible to streamline the all-Russian factors in the development of the region and its insurance market, as well as highlight specific regional factors that influence the regional insurance market.

In the table 2 shows the values of correlation coefficients calculated for the main socio-economic indicators of the region and for the most important indicators of the regional insurance market for the Republic of Khakassia (table 2). For the analysis, we used data for the period 2011-2017.

Table 2: values of paired correlation coefficients between the main socio-economic indicators of the region and the most important indicators of the regional insurance market of Khakassia

Factor sign	Effective signs				
	Insurance premiums total	**Life insurance premiums**	**Personal insurance premiums excluding life insurance**	**Property Insurance Premiums**	**Car owner liability insurance premiums**
Deposits of individuals and legal entities	0.96	0.9 3	-0.09	0.49	0.62
The financial result of enterprises	0.44	0.67	-0.66	-0.63	0.59
Consolidated Budget Revenues	0.9	0.8	-0.19	0.28	0.84
Fixed assets of enterprises	0.98	0.86	-0.1	0.28	0.98
Gross regional product	0.98	0.92	-0.12	0.22	0.85
Retail turnover	0.98	0.83	-0.04	0.3	0.87
Manufacturing	0.89	0.78	-0.24	0.15	0.91
Average annual number of employees	-0.23	0.12	-0.86	-0.9	0.12

Calculated according to: Federal State Statistics Service. URL: http://www.gks.ru; the official website of the Bank of Russia. URL: http://www.cbr.ru.

The values of the correlation coefficients calculated according to the statistics of the Republic of Khakassia and the regional insurance market (table 2), significantly differ from the values of the correlation coefficients obtained in the analysis of all regions (table 1). Most of the studied indicators of the region's economy (table 2) reflect a very close relationship with insurance premiums, life insurance premiums and third-party liability insurance (correlation coefficients up to 0.96), which, on the one hand, confirms the relationship between the regional economy and the regional insurance market and, on the other hand, it indicates a negative correlation and the absence of a connection between insurance premiums on personal insurance and most development indicators of Khakassia.

A comparison of the values of the correlation coefficients obtained from the statistics of the whole country and the statistics of Khakassia made it possible to single out the following all-Russian factors influencing the development of the regional insurance market of Khakassia: income level of citizens and enterprises (indicator – deposits of individuals and legal entities); financial potential of the region and the level of activity in the financial markets (indicator - income of consolidated budgets).

Comparison of the values of the correlation coefficients of tables 1 and 2 made it possible to identify specific regional factors — those whose influence is insignificant at the level of the entire regional insurance market, but significantly at the regional level.

Specific regional factors that have a significant impact on the development of the regional insurance market include: the level of development of agriculture (indicator – the volume of agricultural production) and the level of development of the mining industry in the region (indicator – the volume of mining).

In the general case, it is also possible that the influence of the all-Russian factor calculated according to all-Russian statistics is assessed as significant – in this case, the correlation coefficient between the indicators describing this factor is high. However, when analyzing the influence of this factor on a specific regional insurance market (through regional indicators), this factor can be deduced from the number of significant ones. Such a situation is possible, since when calculating indicators at the national level, the statistics of the functioning of a particular region can be blocked by the average values of indicators calculated for all regions. An example is a factor – investment attractiveness and innovative activity, described by such indicators of a country's socio-economic development as the volume of investments in fixed assets.

A comparison of the values of the correlation coefficients obtained for the all-Russian socio-economic indicators and the indicators of the entire Russian insurance, with the values of the coefficients obtained for the regional socio-economic indicators and the indicators of the regional insurance market, helps to highlight those all-Russian factors for the regional insurance market, which are factors in the development of all regional insurance markets and the regional insurance market.

The regression equation and its application for predicting the development of the regional insurance market

In addition to correlation analysis, the purpose of which is to identify factors in the development of the regional insurance market, a more accurate assessment of the influence of factors in the functioning of the region on the level of development of the regional insurance market is advisable. Below is a regression model based on data from the socio-economic region of the Republic of Khakassia, which reflects the influence of the main factors of the development of the republic on a general indicator of the regional insurance market - the level of total insurance premiums.

Only independent factors should be inserted into the regression model, which excludes multicollinearity – a strong correlation dependence of model factors.

According to the statistics of the economy of the Russian Federation and its regions, multiple correlation coefficients were calculated for the subjects of the Russian Federation and a correlation matrix was constructed.

According to the results of its analysis, indicators were excluded from the model, although they corresponded to various factors of the region’s development, but having paired correlation coefficients of more than 0.8, which means multicollinearity.

The construction of the regression equation involves the allocation of factor signs. For their formation, the socio-economic indicators of the region’s activity were analyzed which, with the indicators of the regional insurance market, had correlation coefficients higher than 0.5, confirming

the relationship of regional socio-economic indicators with indicators of the regional insurance market.
In general, the analysis of indicators of the socio-economic development of the region made it possible to single out significant factor signs and construct the following regression equation.

$$y = 3401701{,}9 - 7{,}12x_1 - 199{,}81x_2 - 2875{,}79x_3 + 1{,}92x_4 + 6{,}08x_5 + 78{,}02x_6$$

where x_1 – gross regional product, million rubles;

x_2 – consumer spending per capita, rubles/month;

x_3 – commissioning of housing, thousand square meters;

x_4 – financial result of enterprises, million rubles;

x_5 – the volume of mining, million rubles;

x_6 – deposits of individuals and legal entities, million rubles.

The reliability of any regression model is estimated by the coefficient of determination of R-squared. For the presented model, this indicator is 0.9985, which determines its high reliability (it is close to 100%). It is believed that the regression model correctly describes the real situation with an R-square value above 0.8.

The significance of the constructed model is estimated by the Fisher criterion (F-statistics). The model presented below is significant, so the value of the calculated F-statistics is zero, and in the general case, the model is significant if the F-statistics is less than 0.05.

The obtained regression equation can be used to predict changes in the effective indicator for a certain change in factor characteristics. So, when all factor characteristics are changed by one (each of the signs is 1 million rubles), the effective attribute (the sum of all insurance premiums) will change to the amount of 3˚398˚705 thousand rubles.

Using this model, it is possible to evaluate and predict the change in the volume of insurance premiums received on the regional insurance market of Khakassia, when one or several factor signs characterizing the development of the economy of this region are changed by one.

Stimulating and inhibiting all-Russian factors for the development of insurance of the regional insurance market

The variety of factors, as well as the different degree and orientation of their impact on the insurance market of the region, necessitate their subdivision into stimulating and restraining (fig. 1).

Fig.1: Examples of stimulating and inhibiting nationwide factors development of regional insurance

Compiled by the authors.

Among the stimulating factors are the following.

1. Cleaning the market from financially unstable and unscrupulous companies has a stimulating effect on the development of the insurance market. At the same time, regulation of the insurance market becomes more transparent and effective. In the table 3 presents the dynamics of the number of insurers, illustrating the impact of this factor.

Table 3: dynamics of the number of insurers registered in the Russian Federation for the period 2010-2018

Period	The number of registered insurers (at the end of the year)	The rate of decline,% to the previous period	Number of companies with license revoked	Share of revoked licenses,% of the total number of companies
2010	625	89.03	89	4.68
2011	579	92.64	40	8.97
2012	469	81	103	18.56
2013	432	92.11	39	6.57
2014	416	96.3	19	12.90
2015	364	87.5	70	20.35
2016	297	81.59	73	27.76
2017	226	76.09	30	13.27
2018	190	84.07	20	10.52

Calculated according to: The official website of the Bank of Russia. URL: http://www.cbr.ru; Analytical portal «Insurance today». URL: http://www.insur-info.ru/licence/?page=1&order=date&search=%EE

2. Strengthening and improving state regulation of insurance activities. The factor of state regulation in terms of impact is one of the most powerful, which is explained by the role of regulation as the main mechanism for managing insurance. This factor can have a stimulating effect when the content of the insurance regulation helps to strengthen insurance protection, and restraining, if the legal regulation of insurance is imperfect.

3. The expected growth in existing production sectors and the development of new ones. The development of the economy under the conditions of economic sanctions and the tasks of import

substitution caused by them involves the development of existing ones and the development of new manufacturing sectors. At the same time, the functioning of the production sector is accompanied by various risks. Insurance is an institution of financial protection from economic risks. Therefore, the development of industries becomes an impetus for the use of insurance coverage, contributing to the development of the national insurance market and its regional segments.

Among the constraining factors for the development of the regional insurance market are the following.

1. The imperfection of state regulation of insurance activities. Regulation of insurance activity does not sufficiently take into account the influence of general external and internal factors of insurance development, including regional. It practically does not contain regulation points of the regional insurance market.

2. The uneven economic development of the regions. The basis of insurance as an institution of financial and social protection is the economy of the region - the level of development of the sphere of material production and the social sphere, the development of regional infrastructure, the level of income of the population, the availability of qualified personnel, etc. The results of a study obtained by Tarasova and Voskovskaya (2018) illustrate the impact of the level of economic development of the regions on the insurance market. They showed insufficient insurance development in regions with a low level of socio-economic development, such as the Siberian, Ural, Volga and North Caucasian districts.

3. Insufficient participation of insurers in the pension provision of the population, which is manifested in the imperfection of the pension and tax laws of the Russian Federation and the instability of the national economy. The reasons for this situation are more burdensome taxation of long-term life insurance in insurance companies compared to non-state pension funds, high inflation, as well as long-term investment risks. The legislative solution to these problems will enable insurers to participate in the pension system, will help attract “long” money to the insurance market, and thereby ensure the development of national and regional insurance markets.

Stimulating and inhibiting regional factors in the development of the regional insurance market

A variety of regional factors in the development of the insurance market also determine the importance of dividing them into stimulating and restraining.

In the table 4 gives an example of the impact of factors of socio-economic development (nationwide and specific for the regions under consideration – Central, North-West, Southern Federal and Ural districts) and their division into stimulating and restraining. The selection of factors for each of the regions was carried out taking into account their significance according to the results of the correlation analysis.

Table 4: stimulating and inhibiting factors in the development of the region, affecting the insurance market

Federal districts of the Russian Federation	Regional incentives	Regional constraints
Central Federal District and Northwest Federal District	- high level of economic diversification - predominance of manufacturing, trade and services - proximity of European countries and foreign economic relations - high investment attractiveness - efficient financial markets - high budgetary security - high population density - profitable enterprises and high incomes of the population - significant human potential - high tourist potential - high level of catastrophic risks - adverse environmental conditions	- insignificant reserves of minerals and natural resources - active migration processes
Southern Federal District	- high level of economic diversification - average budgetary security - average development of foreign economic relations - average investment attractiveness - population density is above average - high tourist potential	- active migration processes - limitedly developed financial markets - seasonal nature of the economy - predominance of agriculture, trade - income level of citizens below average - limited human potential - insignificant mineral reserves - high level of natural risks - ecological environment is pleasant and pleasant
Ural Federal District	- attractive investment region - financial market is represented by banking - present mineral reserves - high technogenic and production risks - the environmental situation is difficult - average budgetary security - average income of citizens - migration processes are negligible	- economic diversification is weak - predominance of extractive industries - externally closed region - predominance of single-industry towns - limited human potential - weak tourism potential

Compiled by the authors.

In the regions with the highest level of socio-economic development (Central and North-Western Federal Districts), stimulating factors have a predominant effect on the development of regional insurance. In regions with a lower but satisfactory level of socio-economic development (Ural, Siberian and Far Eastern Federal Districts), both the stimulating and the restraining factors influence the development of the insurance market. In regions with a low level of socio-economic development (South and North Caucasus Federal Districts), the most significant factors are constraints.

The impact of regional insurance on the socio-economic development of the region

In order to increase the efficiency of the regional insurance market and the development of the region itself, it is proposed to use a certain algorithm aimed at strengthening stimulating and weakening constraints.

1st stage. Identification of all-Russian factors in the development of regional insurance markets. It is carried out on the basis of analysis of the level of socio-economic development of the whole country as a set of regions and general information on the state of the entire insurance market.

2nd stage. Identification of regional development factors that affect insurance in the region. Since the insurance market is part of the economy of the region, and its specificity is determined by its geographical position, natural-climatic, demographic and other features, the impact of factors in the regions of Russia is different.

3rd stage. The combination of all-Russian and regional stimulating and restraining factors. It is due to the need to draw up a common factor management program in order to increase the efficiency of the insurance market and improve the socio-economic situation of the region.

4th stage. Classification of development factors of the regional insurance market based on their controllability. Since not all factors lend themselves to direct control, they need to be divided into 3 groups:

1) insurance development factors controlled directly through the regional management system - the sectoral structure of the regional economy and the level of its diversification, tourism potential, investment attractiveness and innovative activity in the region, etc.;

2) factors that are managed indirectly through the introduction of changes to the system of state insurance regulation. These are usually all-Russian factors, the management of which is possible by adjusting insurance regulation at the country level, for example, the cost of voluntary insurance services, the development of professionalism of insurance intermediaries, the participation of bank capital in insurance activities, etc.;

3) uncontrollable factors that can be taken into account in insurance activities. As a rule, these are macroeconomic factors of an uninsurance nature. When solving the problem of forming managerial decisions on the development of insurance in the region, they are excluded from consideration.

To develop appropriate managerial decisions, it is advisable to divide all factors into manageable directly and indirectly (table 5).

Table 5: management decisions for direct or indirect impact on the development factors of the regional insurance market

Federal districts of the Russian Federation	Regional incentives	Regional constraints
Central Federal District and Northwest Federal District	- high level of economic diversification - predominance of manufacturing, trade and services - proximity of European countries and foreign economic relations - high investment attractiveness - efficient financial markets - high budgetary security - high population density - profitable enterprises and high incomes of the population	- insignificant reserves of minerals and natural resources - active migration processes

	- significant human potential - high tourist potential - high level of catastrophic risks - adverse environmental conditions	
Southern Federal District	- high level of economic diversification - average budgetary security - average development of foreign economic relations - average investment attractiveness - population density is above average - high tourist potential	- active migration processes - limitedly developed financial markets - seasonal nature of the economy - predominance of agriculture, trade - income level of citizens below average - limited human potential - insignificant mineral reserves - high level of natural risks - ecological environment is pleasant and pleasant
Ural Federal District	- attractive investment region - financial market is represented by banking - present mineral reserves - high technogenic and production risks - the environmental situation is difficult - average budgetary security - average income of citizens - migration processes are negligible	- economic diversification is weak - predominance of extractive industries - externally closed region - predominance of single-industry towns - limited human potential - weak tourism potential

Compiled by the authors.

5th stage. Formation of the insurance development program, contributing to the socio-economic development of the region. The purpose of the program is to ensure the effective functioning of the insurance market, which helps to increase the level of social economic development of the region. The key tasks of the program for managing all-Russian and regional insurance factors are to strengthen the action of stimulating factors, smoothing the action of constraining factors, and converting constraining factors into stimulating ones.

Conclusions

The regional insurance market is a part of the national market and therefore is subject to the influence of factors of an all-Russian nature. It is a sector of the region's economy and is subject to the development factors of the region, while being its driving force.

The results of the functioning of the region's insurance market are determined by the influence of all-Russian and regional factors on the development of the domestic insurance market. For each region, specific regional factors for the development of insurance are distinguished.

Improving the effectiveness of regional insurance and the socio-economic development of the region implies such management of all-Russian and regional factors, which is aimed at strengthening the impact of stimulating factors and at reducing or eliminating constraining factors.

In order to ensure the effective development of the insurance market and the region as a whole, an algorithm of actions has been developed, which is a mechanism to increase the efficiency of the insurance market and improve the socio-economic development of the region.

In general, the study confirms the hypothesis that the targeted management of factors in the functioning of the insurance market can ensure the effective development of not only the industry market itself, but also the region as a whole.

Abstract

The article deals with the problem of hydrocarbon contamination of environmental components as a result of Shebelynka Department of Gas Condensate and Oil Processingproduction activity. Studies have shown that the problem of hydrocarbon contamination of groundwater and soil within the urban village Andriyivka remains relevant today. The presence of petroleum products in 100% of soil and groundwater samples and the toxic properties of 75% of soils and 86% of groundwater have been determined. It is proposed to carry out biotesting together with analytical methods of measuring the content of petroleum products in landscape components.

Keywords: technogenic deposit, hydrocarbon pollution, biotest, toxicity.

Statement of the problem

There are a large number of naphtha, natural gas and gas condensate deposits in Ukraine. In total, there aremore than 350 deposits, including 220 in Dnipropetrovsk-Donetsk provinces in the east and northeast of Ukraine(*Chebanenko, 2002).*

More than 100 oil and gas fields are found in Kharkiv region with about 1,200 wells of oil,natural gas and gas condensate wells in operation, including more than 1,000 operating ones. The oil and gas industry is known to be multifunctional and at all stages (well drilling, production, processing and transportation of hydrocarbons), significant volumes of production waste are generated, which negativelyaffect the environment*(Pospelov, 2019).*

In Kharkiv region, the oil and gas territories are located in the form of a wide strip extending diagonally from the northwest to the southeast from Krasnokutsk to Izium. The deposits belong to Dnieper-Donetsk oil and gas province, which coincides spatially with the tectonic depression (DDD). The majority of DDD are gas and gas condensate fieldsand only two relatively large oil and gas condensate fields are located in the west – Koziivka and West –Koziivka.

Within the boundaries of the DDD, oil and gas content of the subsoil varies considerably. The largest technogenic load is associated with the extraction of hydrocarbons within Shebelynka, West-Khrestyshchensk and Yefremiv fields. Density of wells in individual sections of deposits reaches 7-10 units per km2 in the designated areas. Part of the oil and gas fields in Kharkiv region is located

within the floodplains and the first offshore terraces of the rivers. Thus, under such conditions even minor pollution can significantly affect aquatic ecosystems. Environmental problems are particularly acute in the event of emergencies due to the loss of large volumes of oil caused by corrosion of tanks, unauthorized extraction of oil and condensation from product pipelines. Man-made oil deposits that have formed in the areas of oil refineries are extremely dangerous sources of contamination of soil, groundwaterand surface water. More than one hundred oil spills from petrochemical contamination of soil in the aeration zone and groundwater have been recorded in Ukraine with a total area of 30 thousand hectares (Mitropolsky, 2002).

In modern conditions, when the process of fuel and energy resources extraction intensification in Ukraine has become one of the most important tasks of the state policy, the solution to the problem of ecological safety in the territories adjacent to the oil and gas production and processing enterprises becomes extremely relevant.

Since the ultimate purpose of monitoring is to ensure conservation of the environment in accordance with established environmental safety requirements, it is of utmost importance to organize monitoring in the oil and gas territories, taking into account specific features of petrochemical pollutionspread. The urgent need to solve this problem is explained by the fact that systematic observations of the environment state in the oil and gas territories (in particular, in Kharkiv region) are practically not conducted at present. This is connected with the spread of petrochemical contamination in large areas. Considering this fact, it is advisable to use economic technologies and effective research methods when surveying territories contaminated by the operation of oil and gas enterprises. The use of traditional ecological, geochemical and hydrochemical surveys for this purpose is ineffective because petrochemical pollution is of a site nature due to the large number of sources of oil and gas production and processing enterprises' waste in the natural environment. In addition, such surveys on a regular network in large areas involve considerable expenses and other difficulties.

Determining the approach that can be expected to produce the most effective observation results is related to and depends on the location of the petrochemical pollutionsources in the and gas areas (*Krainiukov, 2018).*

The aim of the work is to assess the impact of production activity of an oil and gas company on the state of individual environmental components.

Analysis of Studies on Hydrocarbon Pollution

Oil and gas refineriesare extremely dangerous sources of contamination of the territory where local spots are created - the so-called "technogenic deposits" of free oil products. At present, in Ukraine, the total area of such spots reaches 30 thousand hectares. “Technogenic deposits” were formed as a result of the inflow of technogenic flows from the objects of the widely branched structure of the oil and gas refining industry, the storage of fuel and lubricants, and in case of emergency leakage of petroleum products (*Mitropolsky, 2002).*Accumulation of oil stains in the geological environment is an extremely dangerous source of contamination of the soil in the aeration zone, groundwater, wells for drinking water intakes and water bodies below the technogenic stream from the source of pollution *(Gennadiev, 2015).*

When the territory is contaminated with hydrocarbon, man-made migration flows of petroleum products are created, the main load of which penetrates into soil, groundwater and surface water (*Abdel-Shafy and Mansour, 2016).*

Many petroleum hydrocarbons have high affinity for organic matter and can easily adsorb organic materials and be attached to soil and sediment due to their hydrophobicity (*Clay, 2014).*

Hydrocarbon pollution of geological and related environments has its own peculiarities in character of its impact on geosystems due to the fact that petroleum products have a multicomponent diverse chemical composition. The main characteristics of petroleum productscomposition, which determine their impact on the ecological status of the territory and on the biotic component of ecosystems, are the content of light fraction of cyclic hydrocarbons, solid paraffins, resins, asphaltenes and sulfur. The light fraction of petroleum products is simple low molecular weight methane (alkanes), naphthenic (cycloparaffins) and aromatic hydrocarbons. Methane hydrocarbons, having narcotic properties, exert a toxic effect on soil and aquatic organisms. Cyclics include naphthenic and aromatic hydrocarbons. The total content of naphthenic hydrocarbons in the composition of petroleum products varies from 35 to 60%; the aromatic hydrocarbons content is from 20 to 40%, the bulk of which is benzene. Aromatic hydrocarbons are the most toxic components. Consequences of hydrocarbon pollution of the environment are determined by a set of factors: the amount and chemical composition of petroleum products, the nature of the interaction of abiotic conditions and the biotic component of ecosystems. The combined effect of these factors depends on whether the ecosystem adapts to the hydrocarbon load or whether it degrades *(O'Brien, 2017).*

Man-made migration flows of petroleum products are created during the hydrocarbon pollution of the territory. Their main load is taken by soils, groundwater and surface water.

The main sources of pollution of the geological environment with petroleum products are oil and petroleum productsspills, sewage and emissions from oil refineries and petrochemical enterprises.

When contaminated with petroleum products, ecological equilibrium in the ecosystem is upset, soil productivitydecreases, morphological characteristics change and physicochemical properties of soils create a threat of oil products entering underground and surface waters *(Krainiukov, 2005).*

Contamination of soils with petroleum products causes changes in their physical and chemical properties: bonding of structural parts of the soil with oil leads to a significant increase in the viscosity and density of the soil mass, impairing its air-water regime.Soils soaked in an emulsion of petroleum products lose the ability to absorb and retain moisture. Due to contamination of the soil cover with oil products anaerobic conditions arise, the redox potential changes, the carbon-nitrogen balance is upset. Leaks of petroleum products with a high content of heavy hydrocarbon fractions form a dense, viscous bituminous crust on the soil surface that impedes gas exchange between the atmosphere and the soil (*Pikovsky, 1993).*

Violations of weak soil structures and dispersion of soil particles are accompanied by a decrease in soil permeability. Due to the contamination of soil with petroleum products the ratio between carbon and nitrogen sharply increases, while the content of mobile forms of phosphorus and potassium decreases, resulting in deterioration of water, air and nutritional regimes, impairing the root nutrition of plants, hindering their growth and development..*(Hentati, 2013).*

When they reach the surface of the earth and migrate to the soil, petroleum products contaminate the soil cover and groundwater, resulting in the fact that fertile soil layer cannot restore for a long period of time. This is explained by the fact that soil displaces the oxygen necessary for the life of organisms (*Mahjoub, 2014).*

Due to the presence of aromatic and polycyclic hydrocarbons and other compounds, petroleum products are toxic to the soil biota, so the soil self-healsvery slowlyby biodegradation of oil and petroleum products. Soil is a biologically active environment in which a large number of different organisms live. Microorganisms that are capable of absorbing a wide range of hydrocarbons, including the most toxic (*Margesin, 2003),* have a decisive role in the destruction of petroleum products in soil. Soils subject to petroleum products are characterized by specific microflora with a stable species composition. It is generally accepted that bacterial microflora, the major part of which belongs to microorganisms of the genus Pseudomonas, play an important role in decomposition of hydrocarbons in the soil. The bacterial microflora of oil-contaminated soils is also dominated by representatives of the genera Vibrio, Arthrobacret, Aeromonas and others. Most studies conducted in

different bioclimatic zones indicate that soil microorganisms respond to petrochemical contamination by increasing gross numbers and activity *(Moubasher, 2015).* At the same time, the diversity of microorganisms species declines due to the selection of those with increased metabolic activity and, as a result, the structure of the soil microorganism complex changes *(Varjani, 2017).*

There is information about the impact of petroleum products on plant organisms. According to (*Mendez-Natera, 2004),* the impact of petroleum products on plants is caused by both their direct toxic effects, and the transformation of the soil environment. When entering plant cells, petroleum products cause toxic effects. They manifest themselves in the rapid damage, destruction, and then extinction of all living, actively functioning plant tissues in a vegetative state. Petroleum products affect the growth, metabolism and development of plants, as well as young seedlings, suppressing the growth of terrestrial and underground parts of plants, largely delaying the beginning of flowering. In general, the impact of petroleum products on higher plants is multifaceted: impaired photosynthesis and respiration; change in the structure of chloroplasts; inhibition of growth and root system, leaves, reproductive organs. Plants grown on soils contaminated with petroleum products accumulate more polycyclic and aromatic hydrocarbons, which are carcinogens *(USEPA, 2000).*

Soil animal organisms are an important component of terrestrial ecosystems and play a multifunctional role in the processes of organic matter transformation. The impact of hydrocarbon contamination on soil organisms is determined primarily by the intensity of the contamination. In the area of the most intense pollution, large invertebrates disappear completely, the number of small invertebrates sharply decreases. In surface contamination there is a short-term stimulationin some groups (ticks, tails), which changes to a sharp inhibition of their life. With greater pollution, both large and small invertebrates disappear in the area of the oil slick. The majority of soil animals die in the first days after contamination at a concentration of petroleum products 5 - 10 kg / m2, 3 days after contamination, the number of small arthropods decreases by 10 times, and the majority of large invertebrates die in 2 months after contamination. The lightest fractions of petroleum products are the most toxic to soil animals (*Artemieva, 1998).*

Theoretical basis of the study

To assess the impact of petroleum products on the environmental, it is necessary to have at least the following information: the content of petroleum products in individual components; the speed of their chemical and biological decomposition under the influence of abiotic and biotic factors; the level of petroleum products toxicity in relation to living organisms. With regard to the information on the content of petroleum products, such data are obtained in the standard way when making observations. Information about the second characteristic can be obtained but for this purpose it is necessary to carry out a complex of long-term and time-consuming experiments in full-scale and laboratory conditions. However, the most informative data on the environmental risk of hydrocarbon pollution of the ecosystem are the results of determining the levels of petroleum products'total toxicity in relation to aquatic organisms and phytotoxicity to soil organisms. Such information can be obtained by an integrated assessment of the biological value of the living environment, using a bioassay method that provides for the registration under controlled, standard conditions of the appropriate reactions of test organisms to the toxic effects of environmentally hazardous chemical compounds and mixtures thereof (*Krainiukov, 2013).*

Research methods and methodology

To assess the impact of the refinery on the ecological status of the territory, soil and groundwater samples, we determined the indicators of their composition and properties that give the most representative information on the environmental hazard of the hydrocarbon load. On this basis, a priority indicator of the territory's hydrocarbon contamination is the content of petroleum products - the main chemical substance that can enter the environment in the process of extraction, transportation and processing of hydrocarbon raw materials. The biotest system was also used to assess the level of environmental risk from the area'scontamination with petroleum products and its negative impact on terrestrial and aquatic ecosystems' life.

All selected samples measured the content of petroleum products by appropriate methods: the method of column chromatography was used to measure the mass fraction of petroleum products in soil samples; to measuremass concentration of petroleum products in groundwater - a fluorimetric method based on the extraction of petroleum products with hexane and the measurement of the fluorescence intensity of the extract on the analyzer "Fluorate-02".

Toxicological analyzes of groundwater and soil samples were performed using biotesting techniques: to determine the toxic properties of groundwater using representatives of aquatic biocenosis - crustacean teriodophnia; to determine the phytotoxicity of soils using seeds of higher plants - corn, lettuce and barley.

Research Results

Potential sources of groundwater and surface water contamination are possible oil leakage from integrated gas and gas condensate plantsprocessing, gas condensate pipelines, operational gas and condensate wells, as well as possible disruption of drilling technology when drilling gas and condensate wells. An example of a real threat is the situation that has developed in the territory of Shebelynka Department of Gas Condensate Processing in the village of Andriyivka, Balaklia district.

The Shebelynka Gas Condensate and Petroleum Processing Unit is located in Balaklia district of Kharkiv region. In the past it was called Shebelynka Gas Processing Plant (GPP). In early May 1983, data were obtained regarding the contamination of groundwater contained in Quaternary sands by hydrocarbons in Shebelynka Gas Processing Plant. Gasoline was found in some wells in the village.The thickness of the hydrocarbon layer in the wells of the monitoring network ranged from 0.01 m to 1.16 m. In the northwestern part of the contamination zone there was even complete substitution of groundwater by a layer of hydrocarbons. As a result of technological leaks, a man-made deposit of petroleum products was formed. A specially created commission has come to the conclusion that the causes of these pollution are the objects and systems of Shebelynka gas processing plant (sewage system of technological devices and raw material park, evaporators, technological pipelines, oil reservoirs). A number of measures have been developed to eliminate the causes of groundwater contamination: a large fleet of oil storage tanks has been replaced, evaporation rates eliminated, process pipelines erected on the ground trestle, a system for collecting and separating industrial runoff and other measures have been put in place. Measures were also taken to eliminate the technogenic deposit and establish a contamination zone. To determine the area and capacity of the hydrocarbon layer over groundwater, 148 observation wells were drilled in the direction of the hydrocarbonsmovement. In order to extract hydrocarbons, underground service tubes, underground tanks and mine wells were created. However, the measures taken at that time were not very effective and therefore, at the suggestion of UkrNDIGaz, an organization that monitors groundwater status at the well monitoring network, an anti-filtration barrier ("wall in the ground") was created in the area of the village cemetery to prevent pollution spreading to the south with subsequent hydrocarbon extraction as it accumulates before this filtration barrier (*Prybylova, 2017).*

As a result of the taken measures, the area of the technogenic deposit and the contamination zone, according to the experts of the UkrNDIGaz and Shebelynka technological workshop, decreased from 82 ha to 43 ha. However, verification of compliance with environmental legislation indicated the following gross mistakes in the geological monitoring and works to eliminate hydrocarbon pollution of groundwater. Therefore, groundwater pollution is constantly present in the western part of Andriyivka village and downstream where they drain into Kozine Lake and the SiverskyDonetsk river.In the village of Andriyivka, due to the low quality and pollution of groundwater, the population switches to the use of groundwater from the marl-chalk aquifer. Due to the fact that the position of the levels in the marl-chalk horizon is lower by 7-15 m than in the soil horizon, and there is no reliable insulation in the annulus of the wells, there is a downward flow of contaminated groundwater, which increases with the operation of the wells. There are several dozen such wells in the village.Brackish, hard groundwater contaminated with nitrates, petroleum products, toxic chemicals can penetrate into the aquifer with high-quality freshdrinking water of the marl-chalk

horizon used for centralized water supply on these channels. Water pollution in all intakes on the marl-chalk aquifer within the village Andriyivka as well as below the streamshould be expected, where there is a group water intake of Shebelynka Gas Condensate and Petroleum Processing Unit in the valley of the river Siversky Donetsk *(Prybylova, 2015).*

In order to determine the effect of hydrocarbon pollution on the quality of environmental components in the spring and summer of 2019, soil and groundwater samples were taken at 6 points in the western part of the village Andriyivka. A total of 36 soil and groundwater samples were selected.

An analysis of the obtained results on determining the content of petroleum products in soils and their phytotoxic properties showed that among the 36 samples of soils collected within the western part of the village Andriyivka had the highest oil content of 118 mg / kg. The phytotoxic properties of soils were determined in 75% of the samples selected, of which 37% were slightly contaminated; 33% moderately, and 30% dirty (Fig.1).

Fig. 1: Diagram of the data magnitude on the content of petroleum products in soils and their toxic properties.

The whole area under study was found to be contaminated by oil products (from 0.35 to 1.6 mg / dm3) in the groundwater samples, while toxicity index showed that 86% of groundwater samples collected in the western part of the village Andriyivka were toxic (Fig. 2).

Fig. 2: Diagram of the data magnitude on the content of petroleum products in groundwater and their toxic properties

The results of the comparison of chemical and toxicological analyzes of soil samples show that in the conditions of practically absence of standards for petroleum products for soils, the use of an integral indicator of their quality (phytotoxicity) is appropriate and even necessary.

To investigate possible patterns in the distribution of contamination between soils and groundwater with their toxicity levels, surfaces (graphs) of the function Rt = f (Cg; Cw) were constructed, where Rt is the soil toxicity level (phytotoxicity); Cg - content of petroleum products in soils; Cw - content of petroleum products in groundwater (Fig. 3).

Figure 3: Surfaces (graphs) of the function $R_t = f(C_g; C_w)$

As can be seen from the above nonlinear functions, Rt reaches extrema in various combinations of argument values, i.e, the high or low value of the Cg or Cw argument does not always lead to a correspondingly proportional value of the Rt function.

In view of the above, determining the acceptable hydrocarbon load on the natural environment, it is advisable to take into account, in addition to the established regulatory concentrations of petroleum products for the respective components, the assessment results of the biotic component of terrestrial and aquatic ecosystems by biological indicators. One such indicator is general toxicity, which characterizes the biological value and the degree of biological hazard of the habitat.

Summarizing the results of the assessment of the production activity of the oil and gas company's impact on the state of individual environment components, it should be noted that the negative impact of hydrocarbon pollution remains relevant today.

Discussion and conclusion

A comparative analysis of data on the content of petroleum products in water and soil samples and their toxicity has showed that in many cases assessment of the environmental components quality by chemical and toxicological parameters does not coincide. In this regard, it is advisable to concurrently use chemical and biological methods, including bioassay methods, which are complementary and none of which should be considered as self-sufficient for a comprehensive assessment of hydrocarbon pollution impact on the environmental status of the area contaminated by petroleum products.

To restore the ecological status of the oil-contaminated area under study, it is necessary to implement a number of biotechnological measures: remove the soil-contaminated layer of soil; introduce mineral and organic fertilizers and treatment with bacterial preparations. Implementation of bioremediation measures creates optimal conditions for decomposition of petroleum products hydrocarbons**.**

Abstract

The article examines development trends of new types of economic activity of Ukrainians on digital platforms through the prism of globalization processes. The study shows a dialectical relationship between the local economic situation in Ukraine and its inclusion in the global information space, which becomes the main factor in the emergence of new types of economic activity, including freelance. Local conditions of the Ukrainian population become a filter through which globalization processes pass, transforming and acquiring characteristic features. Economic problems and the high level of information infrastructure are becoming factors that contribute to the further development of freelance activities in Ukraine.

Keywords: Freelance, Digital Platform, Globalization, Glocalization.

Introduction

Globalization is a multicomponent process of a continuous transformation of humanity, interaction of social, cultural, political, economic parameters of national states in the context of new formative transnational actors (supranational and international organizations, extraterritorial financial flows and corporations), which suggests a functional relationship between all the phenomena occurring in such a "world system" (Beck, 2001). Moreover, social relations arising in the elements of this system (for example, in individual national states) cannot be integrated solely into national-state policy or be determined by it. Overcoming the space-time framework, using the latest mass media, has led to the loss of the value of "local": world society (this is, rather, an operational criterion characterizing the properties of globalization that we perceive, and, accordingly, the perception of mutually intertwined social relations by the subjects of social space arising in the diversity of their interaction) and the definition of its composition is not reduced to the sum of local phenomena and processes (Beck, 2001). There is no longer a strict attachment to both space and time (Appadurai, 1996). While in the middle of the twentieth century P. Berger and T. Lukmann, 1995, said that the pragmatic interest and business orientations of a person were tied to his daily activities in the context of the spatio-temporal organization "here-and-now", then, with the compression of this framework, human patterns of thinking, behavior, social activity and practice acquire a wide variety of life styles models (Giddens, 1991).

Direct relationship between the information and technological achievements of the scientific revolution and the economic subsystem of society is the main accomplishment of modernization, and, following the logic of E. Giddens, globalization (Giddens, 2011). These two factors - the introduction of extraterritorial subjects of economic activity on the international arena and their interweaving with communication and information technologies are called by W. Beck one of the main reasons for the inability to stop the current era of globality, that is, the era of the second modernity (Beck, 2001).

Globalization is accompanied by the corresponding specialization of labor and its differentiation. The "knowledge society" and "information society" are emerging, and its feature is the use of the latest technologies and the achievements of the information revolution in the production process (Bauman, 2004). In this regard, the traditional labor market is being restructured and takes on new forms that can be expressed in the phrase "giganomics" (Graham et al., 2017; De Stefano, 2016). The information economy is improving every year, attracting an increasing number of employers and free workers (freelancers) to virtual platforms. According to Kyiv International Institute of Sociology, in 2017, approximately 63.4% of the adult population of Ukraine were active Internet users (KISI, 2017), in 2018, according to their joint research with ILO, Ukraine ranks first in Europe and fourth in the world in terms of activities on digital platforms (Aleksynka et al., 2018). As of 2018, according to the same studies, as well as the ILO index (TiLP, 2016), Ukraine occupies high positions on many digital platforms. The problems of our study are to consider modernization of the economic activity of the Ukrainian population in the form of freelance and correlating this process as a manifestation of globalization processes.

In the framework of this study, it is important for us to understand the features of freelance functioning in Ukrainian realities. But, more importantly, we need to establish how freelance and its development in Ukraine represent the processes of inclusion of Ukrainian society in globalization processes. Thus, the aim of the work establish a trend in the development of freelance in Ukraine through the prism of globalization processes.

Analysis of studies on freelance

The main prerequisite for convergence and unification in the context of globalization is technological progress and the emergence of new commercial reality in the form of global markets. Hereof, corporations that can manipulate resource savings by differentiating labor powers in the production process can benefit from the use of marketing strategies, management and effective distribution (and division) of labor (Levitt, 1983). Latest technologies and mass media, the tools to increase the enterprises' own efficiency, include the use of crowdfunding and outsourcing with the involvement of freelancers in this type of activity (De Stefano, 2016). Freelance is understood as a form of economic activity of self-employment, the subject of which has relative independence in its labor activity (Sinicki, 2019). A freelancer is not tied to a specific employer; his work can be described as dynamic and mobile, complementing his financial and organizational autonomy (Sinicki, 2019). A freelancer is a mobile and dynamic highly qualified specialist (Muller, Safir, 2019), an independent professional who is not the subject of a traditional working relationship, i.e. he does not belong to the staff of a certain organization with a fixed rate, regulations, and an appropriate hierarchy of production relations, providing his services to many clients (Strebkov, Shevchuk, 2009). In addition, the specifics of considering freelance in the context of our study is their activity mediated by digital platforms. Freelancers can realize their potential with the help of digital work platforms, which provide the possibility of crowdfunding for tasks related to information technology (web-based crowdworking) (Berg et al., 2018). This type of crowdfunding includes freelance platforms (for example, such a platform for freelancers is Upwork). Crowdworks can also be presented on micro-tasking platforms, which helps the employer to break down massive work into many elements (micro-tasks), providing them to freelancers on a digital platform (for example, AMT is such a platform) for their flexible and efficient implementation (Berg, 2016; De Stefano, 2016). Freelancer's labor can also be involved in online outsourcing, which involves the remote work and interaction of the employer and freelancer through a digital platform (for example, the Freelancer digital platform) (Kuek et al., 2015). Online outsourcing is becoming a promising industry of digital services in the context of globalization, contributing to socio-economic progress and development of practical skills of freelancers. Both employers and self-employed workers of online platforms from "lagging countries" see the potential in this: if the client is a resident of a first-tier country, then the salary of a freelancer from a country located on the periphery and semi-periphery of economic development is very low compared to the rate of a specialist from the first-tier country (Graham et al., 2017).

The theoretical basis of the study

According to Graham et al., 2017, the two main determining factors for the development of the digital platform market are: 1) the economic situation (high un(der)employment, low wages, etc.), 2) the level of development of communication technologies, especially the Internet. The intensive expansion of freelance and outsourcing in India and the Philippines is associated with this. Considering the development trends of freelance in Ukraine through the prism of globalization processes, we can say that the same reasons play an important role here. The economic situation in the country is the third problem that worries Ukrainians (after the military conflict in eastern Ukraine and the low standard of living in general) (KISI, 2018). But, nevertheless, Ukraine remains a country with a developed information infrastructure, which was facilitated by information globalization. Interpreting these arguments in the context of R. Robertson's globalization concept, we can say that the information component is global and the economic component is local, which produces such dialectical construction (glocalization) and the emergence of new forms of economic activity (Robertson, 1987; Robertson, 1990). The scientist is sure that not only "the transnational", but also "the translocal" is being formed, i.e. we can consider the globalization process from the micro-level: events taking place at the local level allow us to include globalization aspects in that particular context that is inherent in this sociocultural space with its characteristic patterns of reproduction of everyday practices. The globalization process includes influence of the global on the local, but also a special reaction of the local on the global - and, again, transformation of global trends by the parameters of the local social space.This can lead to a global / local dichotomy and their convergence / divergence, a kind of interference or mutual extinction. We can investigate such changes by analyzing freelance and its perception and application by the population of Ukraine.

Research Methods and Techniques

A study of freelance in Ukraine was carried out by Kyiv International Institute of Sociology together with the International Labor Organization (ILO) in November-December 2017 (Aleksynka et al., 2018). It included quantitative and qualitative research. The first study was conducted using a survey of 1009 adult respondents experiencedin working with digital platforms for at least 12 months before the study itself. The second was carried out using focus group interviews with 49 freelance respondents from different regions of the country. Also, 8 in-depth interviews were conducted with people who regularly work on digital platforms. Based on this, the socio-demographic profile of freelancers was constructed, working conditions, motivation, experience working on digital platforms, cooperation with customers from other countries, qualifications and the employment sector on digital platforms, spending time on digital work, income from such activities were determined**.**

The results of the study

The data obtained both by quantitative and qualitative methods helped determine the development trends of freelance in Ukraine, its features in the context of globalization processes. The percentage distribution of freelancers in the regions of Ukraine has shown that the quantitative leaders among those working on digital platforms are the most developed cities in Ukraine (Table 1).

The primacy of these cities also correlates with a qualitative attribute, if we take, for example, the income of freelancers on one of the most popular digital platforms Upwork (income of freelancers up to and including 2016: Kharkiv - $ 54 million with the number of freelancers on the platform 14,993; Kyiv - 39.3 $ million, the number of freelancers - 32332; Zaporizhia - $ 17.7 million, the number of freelancers - 9865; Lviv - $ 17.6 million, the number of freelancers - 8206; Dnipro - $ 11 million, the number of freelancers - 3654; Odessa - 6.5 $ million, the number of freelancers - 5389; other cities - $ 17.7 million, the number of freelancers - 40561) (Bozhkova, 2017). Distribution between the general population of Ukraine and the number of digital workers by type of settlement clearly reflects this imbalance (Fig. 1).

Table 1. The percentage distribution of digital platform workers in Ukrainian cities

№	Region of residence	%, of respondents
1	Kyiv	33,7
2	Dnipro	9,2
3	Kharkiv	7,6
4	Lviv	6,1
5	Kyiv Oblast	6,0
6	Odessa	5,4
7	Zaporizhzhia	4,2
8	Poltava	3,1
9	Chernihiv	2,5
10	Donetsk	2,3
11	Cherkasy	2,2
12	Khmelnytskyi	2,2
13	Kherson	1,9
14	Vinnytsia	1,9
15	Sumy	1,7
16	Rivne	1,7
17	Mykolaiv	1,5
18	Ivano-Frankivsk	1,4
19	Zhytomyr	1,3
20	Kropyvnytskyi	1,0
21	Luhansk	0,9
22	Lutsk	0,7
23	Chernivtsi	0,6
24	Ternopil	0,6
25	Uzhhorod	0,5

	Kyiv	Kharkiv, Odessa, Lviv, Dnepr	Big cities, medium-sized towns	Villages
Population of Ukraine, % of the total	6.8%	9.8%	52.7%	30.7%
Freelancers, % of the total	33.7%	28.3%	30.0%	17.0%

Population of Ukraine, % of the total Freelancers, % of the total

Figure 1: Percentage distribution of the total population of Ukraine and the number of digital workers by type of settlement

The ratio of the number of freelancers according to the age criterion makes it clear that the Ukrainian pattern in the form of lowering the level (and intensity) of the Internet use with an increase in the age factor is not so sharp, creating gaps between age groups. The average age of the Ukrainian freelancer is 33 years, which indicates the attractiveness of freelancing as a type of activity for both young people, and the older generation. The gender factor plays a significant role in the first age group and the last - among young people (18–25 years old), women are ahead of men in activities on digital platforms (28%), while men are ahead of women in activities on digital platforms in the last age group (41 years or more) with a value of 24% (Fig. 2). The study shows that every second Ukrainian freelancer has a

higher education, that is, is a qualified specialist in his field, which is very important in the Ukrainian labor market (Muller, Safir, 2019) (Fig. 3)

Figure 2: Percentage distribution of digital platform workers by age and gender

Figure 3: Percentage distribution of digital platform workers by education

Half of the surveyed freelancers are married (49%), and the average household size of freelancers is 3 people. Almost every second freelancer (46%) has children: 30% have one child, 12% - two, 4%- three and more. 42% oftherespondentslive with older people who need financial support. 93% of such

freelancers support their loved ones solely with their income. Chart 4 shows the relationship between the number of freelancers and the number of people they support.

Figure 4: Percentage distributionof digital platform workers and dependents in household

The respondents have different motivation for freelance, but, basically, this is to earn additional income.

Respondents dealing exclusively with freelance explain their choice by a lack of jobs or low salaries at work in their specialization.

Figure 5: Percentage distributionof digital platform workers and their motivation

Most respondents (83%) who work only at home do so because they need to look after their child or a sick relative (Fig. 5). More than ⅔ (67%) of respondents have another form of employment, which is mostly related to a permanent position for an indefinite period (82%) (Fig. 6). Among them there are specialists of the highest level of qualification (24%), persons holding senior positions (24%),

specialists of the average level of qualification (21%), service and sales workers (15%) and others (16%).

Figure 6: Percentage distribution of digital platform workers and and their employment (number of respondents = 670)

A certain number of respondents (14.4%) are unwilling to increase the amount of work on digital platforms. This is due not only to permanent employment in another job (31% of cases), but also to domestic obligations (35%), a sufficient amount of money received for the completed work (28%), the need for rest (27%) (Fig. 7).

Figure 7: Percentage distributionof cause and unwillingness to do extra work (number of respondents = 144)

The prospects of freelance for Ukrainians are somewhat ambiguous. The respondents are not sure about the long-term (up to work over the next 20 years) prospects for working on digital platforms (63% of respondents deny the possibility of such a long-term experience as a freelancer). About a quarter of respondents (23%) suggest that they are likely to leave digital platforms in the short term. But, nevertheless, the respondents positively assessfurther development of digital platforms and their own development in their context (Fig. 8).

Figure 8: Prospects for the development of freelance and participation in it, %

Digital platform employees often work with foreign clients to fulfill their orders, which, unconditionally, are paid much better than orders at the local level (average income per week at the "international level" is almost seven times higher than the average income per week at the local (Ukrainian) level, although, this, in turn, is due to the fact that foreign customers offer work with high-paid IT macro tasks). The main customer for many freelancers remains a local customer from Ukraine (33.8%), regular customers from Russia (13.4%), the USA (7.1%), other post-Soviet states (5.0%), Canada (2.2%), Poland (2%), Germany (2%), Great Britain (1.8%). The main digital platforms on which freelancers operate are classified into three levels according to the country of operation and scale (local - Ukrainian, Russian and international). Below is the number of respondents (in %) experienced in working on a particular resource (one respondent can work on several digital platforms at once) (Fig. 9).

As a separate case, the activity growth of Ukrainian freelancers on the digital Upwork platform was analyzed (Bozhkova, 2017). Ukrainian freelancers show not only a high growth rate in this digital market in quantitative terms, but also in qualitative, which is reflected in the income of Ukrainian digital workers in recent years (in 2012, the income of Ukrainian freelancers almost amounted to their income for the period from 2006 to 2011, and the income of 2016 doubled the income for 2012). The table includes the growth of Internet users numbers in Ukraine over 10 years (KISI, 2017) in relation to the total population of Ukraine to represent the expansion of information globalization processes. (Minfin, 2019) (Table 2).

Figure 9: Work experience on digital platforms of various sizes, %

Table 2: The growth of Internet users number in Ukraine and the growth of activity of Ukrainian freelancers

Year	Population (in thousands)	%, the Internet using	Number of people using the Internet (in thousands)	Number of people, who are active freelancers on Upwork (in thousands)	% of people using the Internet, who are active freelancers on Upwork	Earnings on the platform (in millions of US dollars)
2006	46 929,5	19%	8916,61	n/a	n/a	38
2007	46 646,0	19%	8862,74	n/a	n/a	
2008	46 372,7	24%	11129,45	n/a	n/a	
2009	46 143,7	27%	12458,8	n/a	n/a	
2010	45 962,9	29%	13329,24	n/a	n/a	
2011	45 778,5	40%	18311,4	9,157	0,05%	
2012	45 633,6	43%	19622,45	19,105	0,1%	32
2013	45 553,0	49%	22320,97	26,067	0,12%	50
2014	45 426,2	54%	24530,15	32,973	0,13%	61
2015	42 928,9	57%	24469,47	52,354	0,21%	55
2016	42 760,5	62%	26511,51	59,648	0,22%	65

Thus, we can confidently say that the development of the information space in Ukraine has enabled people to modernize not only their everyday practices, but also economic activity (Vorona, Suimenko, 2008). The increasing introduction of the latest technology leads to the expansion of the digital platforms. Freelance is not only a factor that develops socio-economic relations, but also a resulting fact representing integration of the economic subsystem (together with a social interactions system arising on this occasion) into the information space. As studies show, the Ukrainian economically active population is far from moving from the axis of the traditional institution of labor relations, but it is at the stage of perceiving and adapting the opportunities that modern technologies offer. As we can see from the study, the main motivation for working on digital platforms is the economic situation, which forces Ukrainians to use this type of economic activity. But, at the same time, it becomes possible precisely because of the development of information technologies and the Internet. It is this dialectic of global (informational component of globalization) and local (economic development) that becomes fundamental and decisive in the development of this type of economic activity in Ukraine. The less developed regions of Ukraine, in the local (economic) plan, represent the fact that not only low wages stimulate freelance. It depends on the degree of inclusion of the region in the global information space, and on the degree of implementation of innovative communication tools in the production process. This, in principle, agrees with the conceptualization of these aspects by Graham et al., 2017. In addition, research conducted by Graham et al., 2017, show us that Ukraine is one of the countries that is involved in a large volume in the sale of services on digital platforms, but not in their purchase.

The increase in freelance activity in Ukraine is associated with a shortage of jobs, low salaries of certain specialties, inflation, and a drop in the real wage index, which occurred against the backdrop of the political crisis in the period 2014-2015, leading to an aggravation of all economic ailments of the Ukrainian system (Del Carpio et al . 2017; Aleksynka et al., 2018). Freelance in Ukraine is a reaction of the population to the stimulus in the form of an economic crisis and development of the information component of the globalization process. Of course, this form of economic activity is both a manifestation of globalization processes and enhancing its impact on society. According to the study,

it can be argued that there is a convergence of the global and the local, and not vice versa, because freelance in Ukraine is gaining momentum and is rapidly developing further. This happens in the form of perception of this type of activity and its adaptation with further reproduction in the context of the restriction by the structures of the Ukrainian social space. The local here acts as a filter with a certain throughput in relation to the phenomena arising under the influence of globalization.

Discussion and conclusion

The information element of globalization processes builds a knowledge and information society. But this does not happen instantly: various subsystems of society are getting closer and closer to the core of information and technologies for their own improvement (Vorona, Suimenko, 2008). It is precisely such a transitional moment that we observe in the Ukrainian society on the example of freelance and the progress of economic culture and activity, although this happens in a disproportionate manner throughout the country. But, all the factors of our study indicate that Ukraine is moving in this particular path of development of modern, technologically oriented economic relations.

Industry 4.0: Aspects of Implementation in Polish SME's Sector

Robert ULEWICZ

Czestochowa University of Technology, Faculty of Management, Czestochowa, Poland
robert.ulewicz@pcz.pl

Abstract

Basing on reports and numerous publications, the statement that more than half of businesses in Poland are aware of the idea of Industry 4.0 may be made. Many companies have already launched initiatives enabling introduction of some technological solutions in this area. Business needs and awareness of the spheres that require further optimization are usually quite well defined in case of big companies. In contrary, in the Polish small and medium-sized enterprises sector, the introduction of the Industry 4.0 solutions is more complicated. SME's have to face more serious barriers comparing to larger companies. The paper presents preliminary results of research aimed at identification of the barriers to the Industry 4.0 concept introduction within the SME sector in Poland

Keywords: Industry 4.0, 4th industrial revolution, SME, barriers

Introduction

The modern industrial revolution is a natural result of all previous technological developments, embedded in social and economic systems. The concept of Industry 4.0 is based on the creation of value through the close interaction of all economic agents through digitalization (Bilan et al., 2019).

The Industry 4.0 concept necessitates meeting some specific requirements, not only by entrepreneurs but also by governments. The requirements are related to changes that have taken place in perception of introduced processes, the role that humans play in production systems, as well as the key role of information systems not only in production but also in everyday life. Economic environments and societies demand higher involvement of a state in structural problems and challenges that has occurred in labor markets (Micklethwait and Wooldridge, 2015). Within the new approach, action undertaken by a state as well as their management and effectiveness are crucial. Industry policies, that are introduced by many countries, are aimed at reorientation of national economies towards the fourth generation industry (Berger, 2016).

Problems with transition are highly complexed and different approaches towards them are introduced in different economies (Ślusarczyk, 2018). Although, one common tendency can be observed. Small and medium enterprises have to face much more serious barriers when they introduce the Industry 4.0 solutions than larger entities. The situation may result from the fact that the Industry 4.0 is aimed at achievement of higher level of operational effectiveness and productivity and also a higher level of automation. The most prominent characteristics of the concept are: digitization, optimization and personalization of production; automation and adaptation; human-machine interaction (HMI); value-added services as well as automated data exchange and communication (Kovács and Kot, 2017) (Roblek, Meško and Krapež, 2016).

Polish enterprises generally represent lower level of the Industry 4.0 concept introduction; especially in the sector of smaller and medium-sized enterprises the tendency may be observed. Potential to develop Industry 4.0 in Poland and other countries may be estimated basing on different indexes. They help to indicate different barriers of transformation. There are many ratings that present the level of the 4.0 transition in different countries. Table 1 includes the collation of different indexes that are used in that area (Basl and Doucek, 2019).

Table 1: The main readiness indexes (Basl and Doucek, 2019), (https://ec.europa.eu/digital-single-market/en/desi)

Index Abbreviation	Index Name	Evaluating Authority	Number of Individual Indicators	Number of Countries Evaluated
NRI	Networked Readiness Index	WEF World Economic Forum	51	121
GII	Global Innovation Index	Cornell University, INSEAD, WIPO	80	129
OECD score-board	Science, industry and technology Scoreboard	OECD	200	31
RBI	RB Industry 4.0 Readiness Index	Rolland Berger	The size of the industry's share in the GDP forms the evaluation's second axis alongside this RB Index itself	24
DESI	Digital Economy and Society Index	European Commission	5 dimensions 30 indicators	28 EU + Iceland, Norway, Turkey

The indexes that help to analyze Industry 4.0 are related to many factors. Accessibility and data transfer rates, as well as the level of business and public administration digitalization, availability of specialists, and capability of educational systems, to provide specialists who are qualified to work within digital environments, can be indicated as the basic factors assessed in cases of these indexes (Zhou, Liu and Zhou, 2015).

Industry 4.0 Performance Indexes for Poland

The results of analyses conducted basing on the Digital Economy and Society Index (DESI) prepared by the European Commission indicate that digital competitiveness of Poland has improved for last few years. Although its score has increased, its position in overall ranking has not improved – it ranks 25th out of 28 Member States in 2019. "Poland has the highest mobile broadband take-up in the EU. However, Connectivity along with the Use of internet services and Integration of digital technology remain the most challenging areas. There has been a slight improvement in Human capital and Digital public services, but Poland still scores below the EU average. One fifth of people in Poland are not yet online and nearly half of still lack basic digital skills." In consequence the number of employees declaring even basic computer skills is at the very low level. Despite many ICT courses provided by Polish educational institutions, the supply of ICT specialist scores much below the EU average.

The World Economic Forum's Networked Readiness Index (NRI), also referred to as Technology Readiness, measures the propensity for countries to exploit the opportunities offered by information and communications technology (ICT). It is published in collaboration with INSEAD, as part of their annual Global Information Technology Report (GITR). The report is regarded as the most authoritative and comprehensive assessment of how ICT impacts the competitiveness and well-being of nations. According to the latest NRI Report published in 2019 Poland ranks 25th out of 121 countries. Nonetheless Poland is a leader in the Emerging and Developing Europe group. Figure 1 presents position of Poland in the NRI 2019 ranking and Figure 2 Polish position in the DESI 2019 ranking.

If the positive factor is higher, this means situation when customer satisfaction increases due to the "attractive" and "one-dimensional" attributes. If the negative factor is higher, this means the situation when customer satisfaction decreases (dissatisfaction increases) due to "one-dimensional" and "must-be" attributes. This interpretation is used in the case of product design (Keshavarz, 1993).

Fig. 1: Position of Poland in the NRI 2019 ranking, (https://networkreadinessindex.org/nri-2019-countries)

Fig. 2: Position of Poland in the DESI 2019 ranking, (https://ec.europa.eu/digital-single-market/en/desi)

In both rankings in the area of Human capita/people Poland ranks below the European average. Only 46% people at the age between 16 and 74 have basic digital skills while European average in this area is 57%. Within labour market ICT specialists are highly demanded. Small and medium enterprises generally are not able to offer them as good working conditions and as high levels of wages as larger entities. The supply of ICT graduates is growing steadily but it is still below the EU average. ICT specialists represent a lower proportion of the workforce (2.8%) against the EU average at the level of 3.7%. Only 0.9% employed women work as ICT specialists. Polish entrepreneurs are increasingly taking advantage of the opportunities offered by e-commerce: 12% SMEs sell online, whereas EU average is 17%. Only 4% SME's sell on-line to reach foreign markets and 7% Polish SMEs' turnover comes from the online segment. According to Cornell University, INSEAD, and WIPO Poland can be indicated as one of the countries representing „ In line with expectations for level of development" area. Within the Global Innovation Index 2019 Poland ranks 39th in the world and 26th in Europe.

Barriers to Industry 4.0

Companies, before they decide to follow the path of transformation, have to face the key challenge related to finding an answer to a question about changes that should be invested in to ensure strengthening their market position (Kamble, Gunasekaran and Sharma, 2018). The problem of finding financial sources for the investment must also be solved. In contemporary, turbulent reality, explicit indications, what types of actions should be taken to strengthen competitive advantages and to find an adequate position in different types of networks, have not be defined. There are also no ambiguous recommendations which actions should be reckon as the ones of primary and secondary signification (Türkeş et al., 2019).

The problem is even more meaningful because each transformation is generally connected with the necessity to leave a comfort zone and to change a business model (Mittal et al., 2018). That situation is typical for small and medium-sized enterprises whose positions within existing chains of value have been established. That type of rigid networks and unambiguous positioning in production processes may soon become inefficient. It may not be effective enough to assure satisfying performance in the market, and may cause withdrawal from business. In average small and medium-sized enterprises reinvest around 14.5% their incomes to introduce new technologies. Despite serious barriers that limit innovation, Polish small and medium-sized enterprises that operate in production sector have already invested and are still planning to invest in their technological expansion. Most of them have developed their employees' competences through trainings. Even the larger proportion plan to take that type of actions in the future. Despite growing awareness of the threats, entrepreneurs are not willing to abandon business models they are familiar with and which have been useful in development of their businesses so far. Entering the unknown is fraught with high risk because mechanisms and models of changes have not be defined yet. Not being able to accomplish goals that were planned and, as a consequence, losing evolved level of stability, may be indicated as a result of risk taken. Low costs of labor used to be interpreted as one of the barriers to Industry 4.0. However, changes in economic and demographic conditions caused the situation in which costs of man-hour and an hour of autonomous and robotic system performance have become comparable (Ulewicz and Mazur, 2019).

Results and Discussion

The research were conducted in the form of a survey (CAWI and PAPI) among small and medium-sized enterprises representing metal industry, located in Silesian and Łódź Voivodeships. As the result, 89 complete questionnaires were analyzed, which constitutes 32% of all surveys.

In the first part of the questionnaires the respondents were asked to indicate the areas of the highest improvement potential. Effectiveness of production processes (1), quality (2) and communication processes (3) were indicated as three main areas. Accessibility of machines as well as promptness of deliveries were perceived as the ones with much lower potential of improvement. Pilot research results for small and medium enterprises identifying areas for improvement are shown in Fig. 3.

Fig. 3: Identified areas of improvement (own study)

Questions in the second part of the questionnaires were prepared basing on results of the pilot study and the expert opinion study. As result ten main barriers to introduce Industry 4.0 solutions in the SME sector in Poland were identified.

During analyses the following formula was used:

$$\boldsymbol{BI_4 = \frac{\sum_{i=1}^{k} n_i wb_i}{k \sum_{i=1}^{k} n_i}}$$

Where:

BI_4– barrier importance index of Industry 4.0 introduction
i – place of the barrier occurrence
k – maximal weight of the barrier (indication of the order was based on weighting in the opposite order)
n_i – number of indications in the "i" place
wb_i -weight relevant to the barrier occurring in the "i" place

Fig. 4: Identified barriers in Industry 4.0 introduction in the sector of SMEs in Poland (BI_4-index) (own study)

High level of investment expenditures was identified as the most significant barrier (the highest level of the W factor). During the research this element gained the highest value of the factor BI_4=0.55. Thus, this is the main factor constricting general digitalization of manufacturing. A lack of qualified specialists may be indicated as another limitation, as well as high costs of possessing and maintaining adequate staff (Grebski and Grebski, 2019). This problem is common not only in Poland but also in other countries (Nitkiewicz and Ayen, 2018). The MSIE 4.0 program can be indicated as an example of the initiative that is aimed at reduction of a lack of employees with digital competences (Koomsap et al., 2019). It is focused on adjustment of master's degree curriculum to digital requirements of labor markets. Another problem that can be identified is adaptation of traditional/craftsmanlike processes to Industry 4.0 technologies. In case of small and medium-sized enterprises in Poland, which are not able to possess any funds from external sources, the syndrome of the closed investment portfolio can be observed. It is directly connected with enhanced insecurity and lack of expert support in adjusting processes to requirements of production that involves digital control and monitoring.

Conclusion

The Industry 4.0 concept is evaluating rapidly and many of its elements have been introduced in industries of highly developed countries in which costs of labor are generally high. It is a strategic challenge for Polish businesses that build their competitive advantage mainly basing on lower level of costs. Tendencies in the level of labor costs, that can be observed, indicate that the situation is changing. In Poland the level of wages has been increasing, so building competitive advantage basing on that aspect will not be possible soon (Ulewicz and Mazur, 2019). In addition, the predicted growth of wages will cause a situation in which a cost of one hour work performed by a robot will be cheaper than one man-hour.

Basing on the results of the conducted research we can state that small and medium enterprises are able to identify areas that require improvement quite precisely (Fig.3) that relate closely to the Industry 4.0 concept. The ratings that analyze levels of Polish preparation to the 4.0 transformation (Fig.1,2) indicate that the barrier of poor quality of info- and telecommunication infrastructure in our country is not applicable any more, and Poland is a leader in this aspect.

The main problem that hinder wider and more systematic introduction of concepts relating to Industry 4.0 may be indicated in lack of financial sources. The research results unable any further generalizations but the assumption can be made that the problem is faced by many Polish entrepreneurs, especially small and medium-sized ones. Without sufficient support from external funds, Polish SMEs may not be able to deal with introduction of Industry 4.0 solutions. The problem may be solved by (Ingaldi and

Ulewicz, 2019) join venturing of entities which use similar technologies, processes or which offer similar product portfolios.

This type of support is particularly important in those typical industrial and technological areas where there is high research complexity and considerable investment risk e.g. in anti-corrosion protection of fuel cells (Włodarczyk, Dudek and Nitkiewicz, 2011), power plants infrastructure (Dwornicka, 2014), airport programmable equipment (Osocha, Cunha and Giovagnini, 2012), implants (Pawłowska, Klimecka-Tatar and Radomska, 2017) or self-lubricating friction pairs (Korzekwa, Bara, Pietraszek and Pawlus, 2016) and their uncertainty analysis (Pietraszek, Kołomycki, Szczotok and Dwornicka, 2016). Lack of a long term financial support is also important factor in biotechnology research (Skrzypczak-Pietraszek, Urbańska, Żmudzki and Pietraszek, 2019). It may be also a significant factor in decision process in those investments where huge material resources have to be involved e.g. the management of industry processes (Ulewicz, Selejdak, Borkowski and Jagusiak-Kocik, 2013), (Ulewicz, 2016) due to a change of tools lifetime (Ulewicz, Szataniak and Novy, 2014), especially in a case of hydraulic actuators of heavy-duty machines: jet pumps (Domagała, 2013) and erosion of valves caused by particles (Domagała, Momeni, Domagała-Fabiś, Filo and Krawczyk, 2018) and cavitation (Domagała, Momeni, Domagała-Fabiś, Filo and Kwiatkowski, 2018). Such modifications should be considered in the modeling of highly cost control (Filo, 2013) and sensing (Filo, 2015) systems, mechanical models (Domagała and Momeni, 2017) as well as in failure of hydraulic cylinders (Fabiś-Domagała, 2013) or other hydraulic components (Fabiś-Domagała and Domagała, 2017), economy (Kozień and Kozień, 2016) and uncertainty (Kozień and Kozień, 2017), (Pietraszek, Szczotok, Kolomycki, Radek and Kozien, 2017) analysis. However, it should be noted that entrepreneurs in Poland are quite sceptic about that solution and are not too enthusiastic about it.

The results presented in the paper are not without limitations. The research survey was created on the basis of a preliminary survey and expert interview with a small group of enterprises of the SME sector. The authors could not find the main problems in the field of the Industry 4.0; therefore, some factor could have been omitted. Only the most important results are presented, and consequently, some elements might be overlooked, which may affect the understanding of the results. The pilot research will allow minor changes to be made to the survey form before proceeding to the next stage of the study. The research presented in the paper will be continued in other parts of Poland and later will also be continued in other European countries. Additionally, the results of these research works will be compared with each other.

Tourist Service Quality Vs. Overtourism – Polish Example

Manuela INGALDI

Abstract

People all over the world can afford trips to different part of the world. On the Internet it is easy to find chip flight or a budget hotel. Lots of place which were impossible to visit 15-20 years ago, now are visited by many tourist. The most famous places are full of people, not only during vacation and different holidays. Therefore, it can be observed rapid development in tourism and tourist services. Unfortunately, with this development another phenomenon is also observed, i.e. overtourim. It means that tourism brings work, fame and profit for local people, but at the same time it brings crowd, noise, high prices, environmental pollution etc. It is, as a consequence, necessary to consider how to make such places and people living there feel the least negative impact of tourism on their daily functioning, but also to meet the requirements of tourists, moreover, how to make tourism sustainable. The aim of the paper was to analyze the impact caused by an increase in the number of tourists who visited several popular tourist destinations in southern Poland and quality of tourist services offered in these places. The analysis was conducted in form of a survey from the point of view of visiting tourists. The Importance/Performance analysis was used. This analysis allowed seeing if tourists noted problem of overtourism in research places and to analyze the level of quality of tourist services.

Keywords: Tourist Service; IPA; Quality of Life; Overtourism.

Introduction

There is a continuous increase in the number of tourists around the world, especially in the most popular tourist destinations (Heslinga, 2018). It is associated primarily with an increased population of people around the world (UNWTO, 2018), but also the greater well-being of many people. Another reason is phenomenon of popular low cost airlines, which have significantly reduced the cost of international and domestic travels. Next element that influenced the growth of tourism is the development of technology and the Internet. Various search engines, that inform potential tourists about changes in the price of the flight or help in finding cheap accommodation, have appeared. Due to the development of tourism, it is possible to travel for a short time, often for the weekend, organize different family celebrations abroad. People imagination and own cash are the only limits (Maitland, 2013).

People want to spend their time actively, learning new places that they may have seen on TV or read about them on the Internet (Beeton, 2016; Hess, 2019). Now, with development of tourism and its availability, such places are at the fingertips for many potential tourists, they can visit them, and then boast about it on social media. People are curious about the world, other cultures, different lifestyles, and the best way to get to know them is by traveling. Thus, tourism has become an element of globalization. It should therefore be emphasized that tourism has become one of the largest industries in the world and one of the economic sectors with the largest and fastest development (Gorica, 2007).

Due to the development of technology and the Internet, tourists can organize their own trip without the help of professional tourist offices. The tourist offices themselves, in order to retain customers, outdo each other in their offers, looking for opportunities to reduce costs, which has recently contributed to the collapse of many of them. Therefore, tourist offices and organizations have to face major changes on the tourism market (Ghorbani et al., 2020).

Unfortunately, with the increase in the number of travelers, especially for tourist reason, a phenomenon called overtourism appeared. Well-known European examples of negative effects due to continued quantitative growth include cities such as Amsterdam, Barcelona, Berlin, Lisbon, London, Rome, Venice and Prague (Koens et al., 2018; Novy and Colomb, 2016; Huete and Mantecón, 2018).

According to Dodds and Butler (2019) overtourism is a newly defined term for a problem that is really an old one that many popular tourist destinations have faced, but due to the continuous increase in the number of tourists it has been defined recently. It has only begun to be described more widely from 2018-2019 (Koens et al., 2018; UNWTO, 2018). Overtourim can be defined as excessive numbers of tourists at a specific destination that can result in negative impacts of all types on the community involved. Due to the frequency of occurrence, overtourism has become the object of research for many scientists (e.g. Eckert, et al. 2019; Koens et al., 2018; Milano et al., 2019).

The development of tourism has means that residents and local stakeholders are increasingly calling for coping with the problem of overtourism. However, oveturism should be considered from two perspectives: as the right of tourists to travel and as the right of residents to a peaceful and dignified life (Perkumiene and Pranskuniene, 2019). Thus, a good deal of research on the relationship between the rights of tourists and residents from various points of view has been developed. (e.g. Juss, 2004; Dauvergne, 2004; Gilbert, J 2014).

Tourists flow causes traffic jams, more waste, higher prices, arrival of thieves, disrupting the daily lives of local residents. Tourists often do not follow local rules of life, customs, behave very freely, leave garbage everywhere etc. It also has a negative impact, e.g. on the natural environment, which is very much exploited by tourists.

However, it should be remembered that the increase in the number of tourists visiting a given tourist destination can also have a positive impact. For example, this phenomenon is associated with creation of new jobs in which local residents are employed. Tourism is also profitable for the visited place. Tourists leave money in hotels and catering facilities, as well as tourist attractions, which affects the opportunity for investment and development of this place. That is why it is important to reconcile these two sides with each other.

The aim of the paper was to analyze the impact caused by an increase in the number of tourists who visited several popular tourist destinations in southern Poland and quality of tourist services offered by these places. These destinations have to face the problem of overtourism. Perhaps, in comparison to other popular tourist countries, Poland is not as vulnerable to overtourism, but also here it can be observed felt by the tourists and residents.

The analysis was conducted from the point of view of visiting tourists. The Importance/Performance analysis was used, and the research itself had form of a survey. This analysis allowed seeing if tourists noted problem of overtourism in research places and to analyze the level of quality of tourist services.

Problem of the overtourism

Rosenow and Pulsipher (Rosenow and Pulsipher, 1979) mentioned three main problems of overtourism:

1. too many visitors, possibly aggravated by seasonality;
2. too much adverse visitor impact (e.g., noise, rowdiness and other annoyances);
3. too much physical impact of the visitor economy (e.g., touristified city centers and destruction of natural resources).

The increased number of tourists has a negative impact on many factors, for example the natural environment and local residents. Tourists make a mess, it happens that they leave the marked tourist routes, enter prohibited places. They often do not respect the rights to a peaceful life of the residents, for whom it is a normal working day (Jamieson, 2019; Bouchon and Rauscher, 2019; Seraphin et al., 2018; Staiff, 2008).

Another problem associated with overtourism may also be its impact on the quality of provided tourist services. For example, in Rome, there are so many tourists that many tourists agencies offer tickets to the most important points of the city without waiting in queue, for a specific day and hour, which of course is associated with a very high cost. Tourists who decide to buy a ticket on their own and then visit e.g. Colosseum, must take into account a long queue, and thus a long time to spend waiting, which is difficult especially in summer months, when the temperature reaches 40°C.

With the increased number of tourists it is difficult to find a place where to eat something good and not pay a fortune. Restaurants, in order not to disappoint customers and earn more, often put more tables to serve the largest number of customers. However, they are often unable to provide their services of good quality. Unfortunately, this can affect the quality of the offered dishes or long waiting times.

In the most famous and famous places, overtourism has caused another phenomenon, which is very often described by Internet users, e.g. cheating tourists on the prices of various types of services. With numerous tourists who do not know the realities of the local market, it is easier to steal someone's money by providing sky-high prices. There are also stories available on the Internet about people that had to pay huge bill for cup of coffee or bottle of water or 2 km in taxi.

More and more cities are beginning to fight the phenomenon of overtourism or different issues connected to it. An example would be Venice. The Italian parliament approved an additional admission tax for Venice for one-day tourists, which would apply from 2020 (Russo and Sans, 2009), also in Corenno Plinio (city close to lake Como in Italy) from March 2020 tourist will have to buy tickets to enter the city (https://podroze.gazeta.pl/podroze/7,114158,25621713,miasteczko-nad-jeziorem-como-wprowadza-bilety-wstepu-pieniadze.html#s=BoxOpImg11). In many Italian cities, baths in fountains or eating food near monuments (e.g. Rome) was banned. Tourists can no longer sit on the famous Spanish Steps, which until now were one of their favorite places of tourists to rest (again Rome). In Santorini (Greece) a daily limit of tourists' entry into the city has been introduced. The mayor of Capri (Italy) or the authorities of Majorca (Spain) think about similar solution. In several towns around Venice area to build sand castles on their beaches is banned (Pogórska, 2019). "Tourists go home" is the motto of the anti-tourist protest in Barcelona organized by left-wing social activists in the summer of 2017 (Mihalič, 2019; Hughes, 2018).

In many large cities there is a problem with renting apartments, not the lack of them, but above all the price, as well as the lack of licenses for such activities but also tourists behavior. Many Internet portals offer the possibility of renting such apartments for short periods of time to tourists. Tourists do not always realize that behind the wall of the rented apartment residents live, behave more freely than usual, often abuse alcohol, even drags. On the other hand, it happens that apartments offered via the Internet and paid by customers do not actually exist or their conditions are completely different (usually worse) than those promised, and tourists learn about it only after arrival. That is why in many cities, e.g. Edinburgh, Palma and Paris, protests from the local community forced the authorities to act to limit and better control such accommodation (Gutiérrez et al., 2017).

It is important that both scientists and local authorities notice this problem and try to find any solution. The European Parliament (2018) study suggests five indicators for overtourism, which in the research about overourism can be included:

1. tourism density (bed-nights per km2) and intensity (bed-nights per resident);
2. the share of Airbnb bed capacity of the combined Airbnb and booking.com bed capacity;

3. the share of tourism in regional Gross Domestic Product;
4. air travel intensity (arrivals by air divided by number of residents);
5. closeness to airport, cruise ports and UNESCO World Heritage Sites.

It should be emphasized that the problem of overtourism also affects tourists themselves and the quality of tourist services provided by visited places. Hence, the need for research.

Methodology

The Importance Performance analysis (IPA) was used for the research. This method is designed to determine the importance of the service characteristics and their assessment by the customer (Dziedzic, 2015; Ingaldi, 2018; Eskildsen and Kristensen, 2006). It also allows to assess the strengths and weaknesses of a given service (Guglielmetti Mugion R. 2010; EIPA 2006).

The authors of the method were Martilla and James, who designed in the 1970s a measurement of the perception and significance of factors, variables affecting the service quality, from the point of view of customers (Martilla et al., 1977). IPA was often used to assess transport and tourism, education and health care services (Wong et al., 2011; Kim et al., 2019).

Collecting data for the IPA takes the form of a survey. Customers answer two types of scaled questions. They assess the same dimensions of the service quality twice: once due to their importance during the service process and again, the second group of questions refers to the same features, but in relation to already provided service (Stoma, 2012; Yildiz, 2011, Mustafa et al., 2019). The obtained results are compiled in the form of a map (Fig. 1). The IPA map is a two-dimensional model divided into four areas according to two axes: the X axis is perception (performance), while the Y axis is expectation (importance) (Ormanović et al., 2017; Ingaldi and Ulewicz, 2018).The closer the feature is located to the diagonal of the map, the more its importance is correlated with provided feature.

Features' importance for customers	high	Quadrant I **Focus here** (High Importance/ Low Performance)	Quadrant II **Keep doing** (High Importance/ High Performance)
	small	Quadrant III **Low priority** (Low Importance/ Low Performance)	Quadrant IV **Possible exaggeration** (Low Importance/ High Performance)
		small	high
		Assessment of service performance in terms of a given feature (Performance)	

Fig. 1: IPA map (own study based on Martilla and James, 1977; Stoma, 2012; Hariyani, 2017; Lin et al., 2009; Wong et al., 2011)

The IPA allows to understand the basic factors of customer satisfaction that should be priorities for improvement. It can therefore be considered a simple but effective tool that is very useful in making decisions regarding resource allocation and maximizing customer satisfaction (Matzler et al., 2004). To improve the quality of service attributes, one should focus primarily on those that fit into quarter I. Customers indicate that these attributes are very important to them, but at the same they do not influence customers' satisfaction (Wong et al., 2011; Ingaldi and Lestyanszka Skurkova, 2016; Stoma M, 2012; DiPietro et al., 2019; Kowalik and Klimecka-Tatar, 2018; Labajan and Koomsap, 2019).

The first stage of the research was to create a survey about the quality of tourist services for several popular tourist destinations in southern Poland. The survey contained 42 attributes divided in 6 groups (Table 1) and a respondents' characteristics. These attributes included in the survey are closely related to the phenomenon of overtourism and can be easily noticed by tourists. The survey is quite long, however, attempts were made to include various types of tourist services available in the research places and various aspects of overtourism.

A 5-point Likert scale was used for evaluation, where 1 means I disagree and 5 means I agree. The applicable scale may contain a zero point meaning no measured value (Hariyani, 2017).

Most of the attributes contained in the developed survey are directly related to overtourism, and in particular to the problems described above resulting from overtourism. Among the most important there are attributes connected to e.g. overcrowd (attribute 1, 5, 9, 20, 27, 36), waste and dirt (2, 22, 28, 37, 40), attempts to fool tourists (4, 14, 15, 23, 24, 32, 39), high prices (3, 7, 16, 30, 31, 33), lower quality of services (8, 10, 11, 12, 13, 17, 18, 19, 21, 34, 35, 38).

Table 1: Attributes included in the IPA survey (own study)

No	Group	Attribute
1.	Transport	Buses/trams/trains were not crowded.
2.		Buses/trams/trains were clean.
3.		The prices for different mean of transport were reasonable.
4.		No one tried to fool me in means of transport.
5.		Streets were not crowded.
6.		There were many paths to walk.
7.	Accommodation	There were many hotels for every budget.
8.		The hotel I stayed offered services of good quality.
9.		The hotel was not overcrowded.
10.		The staff was big enough.
11.		The staff was nice and friendly
12.		I did not have to wait too long for being served.
13.		The room was clean and prepared for my visit.
14.		The room was exactly as found in the offer.
15.		No one tried to fool me in the hotel.
16.	Restaurants	There were many restaurants for every budget.
17.		The restaurants I visited offered services of good quality.
18.		The staff was big enough.
19.		The staff was nice and friendly.
20.		The restaurants were not overcrowded.
21.		I did not have to wait too long for being served.
22.		The restaurant was clean and prepared for tourists.
23.		Toilet was without payment.
24.		No one tried to fool me in the restaurant.
25.	Famous monuments/ places to visit/Free time	There were plenty of monuments, places to visit and ways to spend free time.
26.		These places were open in convenient time.
27.		These places were not overcrowded.
28.		These places were clean and prepared for tourists.
29.		Tickets to these places were easy and quick to buy.
30.		Tickets were not too expensive.
31.		I did not have to go to special agencies to buy tickets to visit faster and to choose hour.
32.		No one tried to fool me close to famous monuments/ places to visit.

33.	Shops with souvenirs	There were plenty of shops with souvenirs for every budget.
34.		The staff was big enough.
35.		The staff was nice and friendly.
36.		The shops were not overcrowded.
37.		The shops were clean and prepared for tourists.
38.		The service was nice and fast.
39.		No one tried to fool me in the shops with souvenirs.
40.	Other	The tourist destination I visited was clean and the waste was removed.
41.		The tourist destination I visited was properly had clear street signs.
42.		In the tourist destination I visited did not introduce any restriction for tourists.

The survey was available through various types of social media. The research took place in March - October 2019, 1289 people took part. Respondents were asked to assess the attributes from the point of view of importance (Importance) and performance of the service (Performance). 1163 completed surveys were taken into account for analysis, the remaining ones were rejected because they were not completed properly. Assessments of individual attributes were averaged, presented graphically as bar charts, and then placed on the IPA map.

To assess the level of service quality in the research tourist destinations, the importance and performance were also compared. In the graphic form (bar chart) the relation between the performance of the service according to respondents and the importance indicated by them, as well as the performance to the maximum value that could be given by them (maximum possible importance - 5) for individual attribute, were presented In addition, the total quality ratio was calculated as relation of the average service performance to the average importance and to the maximum possible importance.

Results and Discussion

As mentioned earlier, 1 289 people took part in the research. 1163 surveys were analyzed, of which the respondents were primarily women 63.11%. People aged 30-40 (37.27%) and 20-30 years (34.86%) predominated. These people were mostly employees (42.68%) and students (29.12%.), from large cities (58.47%).

The average Importance and Performance assessment are shown in Figures 2 while the IPA map created on the basis of them in Figure 3.

Fig. 2: Attributes assessments - Importance and Performance (own study)

The average Importance was 4.36 and the average Performance 2.95. This means that respondents negatively assessed the quality of tourist services, because the average Performance of the service was much lower than the average Importance.

There is also a large variation in the assessment of individual attributes for both Importance and Performance. For respondents, the following attributes were the most important: 3, 4, 16, 23, 24, 31, 35, 37, 39, 41. These are attributes for which the Importance was above 4.80. However, among the least important attributes it is possible to indicate: 6, 10, 34 (Importance below 3.50). When it comes to Performance, respondents indicated as the best attributes: 6, 13, 15, 16, 25, 31, 41 (Performance above 4). The worst assessed attributes of tourist services were: 4, 14, 23, 24, 28, 32, 33, 38, 39 (Performance below 2). These elements are closely related to overtourism and different problems cause by overtourism. According to respondents, they were assessed low, which means that respondents had negative feeling about them.

Fig. 3: IPA map for tourist services (own study)

Analyzing the IPA map for the tourist services, it can be seen that all attributes were found only in two quarters: I and II. Attributes found in quarter II were very important for the respondents, but were also largely met, which results from high Performance assessment. They had a positive impact on the quality of tourist services and should be kept at this level.

All attributes from quarter I are attributes need potential improvement. They were important for respondents, but their performance was not satisfactory. The closer to the left of the graph (value 1), the worse. These attributes negatively affect the overall level of quality of tourist services.

In Figure 4 the quality ration for individual attributes was presented. Both relations between the performance of the service to the importance indicated by respondents (white bar), and to the maximum possible importance (gray bar) were included.

Fig. 4: Quality ratio for individual attributes (own study)

Total quality ratio was 0.69 (relation to the importance indicated by respondents) and 0.59 (relation to maximum possible importance). This indicates that the quality of the tourist services was not very high. Analyzing the ratio of Performance to the maximum possible Importance, it can be seen that in several cases the result was above 0.8 (attributes 6, 25, 31, 41), these attributes had positive impact of quality level. In many cases this ratio was below 0.4. It means that only in this part they met requirements of respondents.

Analyzing this relation to the Importance indicated by the respondents, attributes 6, 10, 12, 25, 29 and 34 can be assessed positively. In these cases, the Performance assessment was higher than Importance which means tourists satisfaction. Unfortunately, in many cases this ratio was below 0.4: 4, 23 28, 32, 33, 39. These are the attributes with a high Importance advantage over Performance, i.e. attributes that need to be improved first in order to raise the level of quality of the tourist services. Especially since their negative assessment is caused by overtourism. Therefore, it can be concluded that respondents noticed the occurrence of this problem and its impact on the quality of tourist services offered in places where this problem appears.

The research showed that tourists noticed problems associated with overtourism, although they may not be aware of it or simply cannot name it. Respondents knew only that they were supposed to assess the quality of tourist services. However, they did not know that the attributes in the survey were related to the phenomenon of overtourism.

Respondents assessing Importance of individual attributes, indicated what was important for them in tourist services, which they paid special attention to. When assessing Performance, they indicated which attributes they were the most and the least satisfied with, what bothers them during travel and sightseeing. The lower the Performance assessment, especially in combination with the high Importance assessment, the more negative impact on the quality of tourist services, but also the more problems arising from overtourism.

Summary

Each of us likes to travel and certainly each of us observes an increasing number of tourists in popular tourist destinations. It is also possible to notice the appearance of a negative effect of this phenomenon, which often has a negative impact on the level of tourist services provided in such places, as well as lack of satisfaction from such visits. This phenomenon is called overturism.

In the paper the issues of overtourism and its impact on the quality of tourist services were presented. Attributes that determine the quality of these services and are associated with the occurrence of overtourism were also analyzed. The research took the form of a survey, and the Importance /

Performance analysis was used during the study. Respondents pointed out those attributes that negatively affected the quality of tourist services offered in several popular tourist destinations in southern Poland and which are associated with overtourism. These attributes form the basis for further analysis in order to make changes and improve the quality of these services.

The research is not without limitations. The survey was created based on the authors' experience and literature review presented in the paper. Some important factors could be omitted due to the subjectivity of authors and found references. Survey itself was quite long so some respondents could feel bored and filled it up without any will or at random but it was necessary because of diversity of the research problem. The sample can be also criticized to have too small size and the research period too short, which was due to tourist period in research places. Another limitation is the fact that customer requirements and are constantly changing because they get new experience about travels. Therefore, the revision of the results should be repeated in 1 or 2 years.

The survey built for the purpose of this research can be used to evaluate other tourist destinations in other countries and on other continents. It can be shortened or changed. However, it is a simple and useful tool that can help to learn about the impact of overtourism on the quality of tourist services and the perception of this phenomenon by the tourists.

A Cross-Cultural Investigation of Variables Affecting Trust In S-Commerce In 30 To 45-Year-Old Age Group

Abdulrahman ANDIJANI
University of Technology Sydney, Australia, and Academic Lecture at King Abdulaziz University, Faculty of Computing and Information Technology in Rabigh, Information System Department, Saudi Arabia
Abdulrahman.Andijani@student.uts.edu.au

Abstract

When it comes to understanding peoples' acceptance of a new field such as s-commerce, trust appears to be an important factor according to recent and former theoretical frameworks. It is also necessary to have an inclusive representation of users of social media in order to fully understand the effects of certain variables and factors in s-commerce. Previous research on social commerce has focussed on a younger demographic; to bridge this gap, we will focus in this paper on users who are college graduates and are over the age of 30 to 45. In this research, Quality of information (QI), Social media influencers (SMI), and payment methods represent the variables of trust attainment that we intend to investigate. Moreover, this study will also take into account sociocultural factors, comparing results from people from Saudi Arabia and Australia. The research data will be quantitative and the tool for data collection is online surveys. This study is targeting university-graduated people who are between 30 to 45 years. The study will analyse the effect of three variables; QI, SMI and payment methods on trust in using SC. The results will also be compared between the Saudi and the Australian responses to unveil any cultural differences. In this research, IBM SPSS software will be used for analysis of the data. The purpose of this study is to help businesses using s-commerce better understand their audience and predict the behaviour of their clients and to collect data that is inclusive of all possible buyer demographics.

Keywords: Social commerce, Trust, Quality of information, Influencers, payment methods.

Introduction

S-commerce is about using societal tools to produce an atmosphere for creating social communications. This study focuses on trust as the backbone of attracting s-commerce customers. The variables investigated in this paper are quality of information, social media influencers, and payment methods. A review of the literature regarding these variables found that there is a lack of representation of users who are older (30 to 45 years); in fact, most study populations were of students between the ages of only 18 and 24. To bridge this gap and to better represent the population of consumers, buyers, and users of social media, we will study the effect of the above variables on an older generation. The criteria of this study are the age of the consumer (college graduates between the age of 30 to 45) as well as taking into consideration the cultural background (Saudi Arabian vs. Australian respondents). With regard to cultural differences, there is a clear lack of comparison in the research between the effects of culture of Saudi Arabia and Australia on trust in s-commerce with regard to the variables in this study, which is also another gap, we intend to fill with this paper.

Literature Review

The effect of trust on social commerce

When referring to the word trust in this research, it is meant as the consumers' trust in the Social commerce seller. In the Hajli et al. (2017) study they highlighted the relevance of trust as an enabler for the intention of individuals to use SC. Given the weight placed on trust in business exchange relationships, it is vital to understand how trust affects particular aspects of customer behaviour (Doney and Cannon, 1997). Trust is also considered a challenge that is not easily attained by businesses and organizations using SC (Beyari and Abareshi, 2018). The results of a study by Hajli (2013) showed that trust is still considered a problem in e-commerce platforms and that trust can be established through s-commerce paradigms.

The role of social media Influencers (SMI)

Advertising plays a big role in social commerce, so big that companies are redirecting their advertising budget towards social media platforms for an interactive and better reach. Anatasia et al. (2016) study three advertisement strategies that are the most successful in selling skin care products. One of the results was that celebrity endorsement was positively connected with user trust in skin care product advertising. Beyari and Abareshi (2018) stated that social influences directly affect the user on SNS in intention and satisfaction upon buying something through SC. Therefore, social media celebrities are a huge component of the content that people interact with while using SNS, so by utilizing them, they become a loud voice in the consumers' pool of influences.

Quality of information (QI)

QI is a term given to the information provided by the buyer, which includes accurate descriptions and prevalence of pictures, videos, testimonials and opinions of users.. Hajli et al. (2017) believe that the quality of information in SC is considered one of the technical enablers of SC usage. They also state that the quality of information provided on the SC platform improves the users' experience. In today's world, prospective buyers can enter and access through social media websites to an overabundance of peer-generated information regarding that product before making a purchase decision. It is projected that 97% of online buyers read users' comments and are swayed by them (Ahmad and Laroche, 2017).

Payment Methods

Releasing private data and billing information causes great apprehension when it comes to e-commerce implementation, and now the concern has surfaced in s-commerce. Paying by card is the most common mode of online payments in the Western world; a vast number of users have used this method for speedy and simple transactions (Mukherjee and Roy, 2017). The second most common payment method found in Yang (2017) was third-party online payment systems like PayPal and AliPay (which is common in China). No matter the method, online payments still may have some financial risks, which has led to some companies considering the cash on delivery (COD) option (Yang, 2017). In a study of Saudi Arabian participants on the use of e-commerce, COD was classified as the most favoured method of online shopping payment (Makki and Chang, 2015). COD was rated the most-selected payment option, which was attributed to the culture and the practices of Saudi shoppers. Choosing COD offers a chance for customers to physically inspect their purchased items (Makki and Chang, 2015). In a study conducted on participants from Kuwait on electronic payment methods, the results revealed that the systems most used in Kuwait were credit cards/debit cards, COD and mobile payment (Rouibah, 2015). This study, as well as the studies done by Yang (2017) and Makki and Chang (2015), were conducted on e-commerce; there remains a gap in the study of preferred payment methods in s-commerce.

Outcome

The outcome of this study will advise business owners seeking to use SC as a platform for selling their products and or services to increase the quality of information on their page and display as many videos, reviews and testimonials as possible. It will also lead to a better understanding of the role of celebrity advertisements and if it is wise to invest in such a strategy based on their target audience and the results of this paper. Another outcome is that it will give the business the information on which type of payment method is preferable and produces the most amount of trust in the online transaction based on the target audience.

Conclusion

S-commerce is an emerging force for business expansion and growth. For s-commerce to be widely accepted and implemented, consumers need to have trust in the s-commerce platform, and corporations should work on building such trust. To bridge the gap that is evident in previous research, in which consumer populations consisted only of students and younger generations, the criteria of this study are consumer age (i.e. college graduates 30 to 45 years old) and cultural differences between Saudi Arabia and Australia. The variables of this study are quality of information, celebrity, social media influencers, and payment methods, all of which have been proven to have a direct correlation with consumer trust.

Abstract

Nowadays the interest of external users in integrated reporting significantly increases due to its practical importance, recognized both by the professional accounting community and by business entities. The actual significance of the integrated reporting is also confirmed by international as well as Russian practice. Considering the role of the integrated reporting information base, the accounting system of the construction companies was chosen. It is proposed to take into account the peculiarities of the construction company's activity when forming the integrated reporting. The article outlines the procedure of the integrated reporting formation for the construction companies, which includes at least six sections with the specific factors in each. The authors considered the section «Business model of the construction company» in detail. The paper reveals, that the integrated reporting of the construction companies should include financial indicators as well as non-financial ones. Moreover, they should be presented in the context of the main parameters of the section under consideration. Management accounting is recognized the main source of non-financial information. The methodical approach to the integrated reporting formation, using management accounting capabilities of grouping and systematization of information, has been developed. The paper performed the process of forming the indicators of the integrated reporting section «Business model of a construction company» by areas of responsibility of the construction companies. The areas of responsibility are determined according to the functional areas of the construction company's management: supply, production, maintenance and repair, sales, finance, personnel management, etc. The methodological approach proposed allows the construction companies to create the integrated information system in order to prepare the integrated reporting, represented by the subsystems of financial accounting and management accounting.

Keywords: integrated reporting, financial accounting, management accounting, financial and non-financial indicators, construction organization.

Introduction

In recent years the construction industry has been developed widely. Thereby the construction organizations have faced the problem of public reporting formation, including its non-financial component. This part of reporting discloses information regarding to the social and environmental issues of the company's activities. The significant number of construction organizations has recently started using the Global Reporting Initiative (GRI) as well as International Integrated Reporting Standard when forming their reporting. Therefore, the interested users receive the data in the form of a combined report. In addition to the financial statement, it also includes information about the company's impact on the economic, environmental, and social spheres. In some cases two reports are prepared: financial annual report about cash flows and financial results for the certain period and a non-financial one, containing an environmental report, a social report, a report on the sustainable development of the company, etc. The main reason that encourages companies to create integrated reporting is the extremely low degree of transparency of standard reporting information. The authors refer to "transparency" as the timely disclosure of reliable financial information about company's activities and their results.

Moreover, the companies with the transparent reporting are characterized by a readiness to allow interested parties of users (the so-called "stakeholders") to deal with their management information. Therefore, the trend of transparency increasing is one of the essential features of reporting, allowing to estimate the investment attractiveness of the company.

Rendering of integrated financial statements allows interested users (the so-called "stakeholders") to arrive at conclusion of company's strategy, stability and liquidity of its business, financial and economic results within the reporting year, as well as its social and environmental achievements. This also applies to construction companies since they will be obliged to submit non-financial statements in the nearest future. The integrated reporting of the construction company should give a comprehensive understanding for all interested users about the strategy of the construction company, its financial results within the reporting year as well as the social and environmental problems it faced and their solutions.

Promotion of integrated reporting by construction companies meets a number of barriers:

– lack of clear legislative regulation of integrated reporting forming for the construction companies (the International Integrated Reporting Standard is not mandatory for the vast majority of organizations);

– lack of a set of the integrated reporting indicators to evaluate the results of construction companies' activity;

– lack of qualified staff for preparing integrated reporting formation for the construction companies;

– significant time and financial costs for the preparation of integrated reporting of construction companies.

The research is aimed at developing the method of generating integrated reporting formation that characterizes production capital in the "Business Model" section of a construction company in order to provide its transparency.

The further implementation of the integrated reporting in construction sector determines the set of the basic concepts and indicators of disclosing information about company's results within economic, environmental and social spheres. On this basis they will be involved in the process of increasing the investment attractiveness of the construction business.

Main problem

Currently, there are a large number of studies on the integrated reporting of the economic entities. In 2002 J. Robert Eccles considering questions about the causes and methods of financing capital in the market, came to the conclusion that, in addition to financial reporting, non-financial reporting is no less important for investors *(Eccles, Hertz and Phillips, 2002)*. So, considering the answers to the questions given by the financial directors of the largest companies during the survey on this topic, we can conclude that they came to understand the sharp increase in the influence of non-financial information on managerial

decision-making. In particular, only three selected indicators of the ten proposed for assessing financial attractiveness were financial while seven were non-financial. Therefore, it was concluded that the role of non-financial information has been increasing and it is necessary to develop this reporting component.

The analysis of available literature sources allowed the authors to identify the problems of integrated reporting.

1. The requirements formulated by the International Standard on the principles of integrated reporting are advisory in nature and are not mandatory for companies. Therefore the integrated reporting does not follow any strict structure, as well as the strict procedure of collecting the data.

In this regard, companies that are interested in the integrated reporting formation do not often have an understanding of following issues (Rupley, Brown and Marshall, 2017), (Montesinos and Brusca, 2019), (Bouten and Hoozée, 2015):

– what kind of information the integrated reporting should contain;
– what kind of steps should be taken to prepare the integrated reporting and in what sequence;
– what are the sources of getting the information needed in order to form the integrated reporting.

2. Currently, integrated information cannot be presented in the form of standardized reporting, since it cannot be the same for all companies. It depends on the type of the company and contains its unique features. In this regard, the industry-specific features of the financial activities of the company should be reflected in the structure of integrated reporting and its indicators (Nistor et al., 2019), (Bradford, Luke and Furneaux, 2018), (Stubbs and Higgins, 2015).

3. The absence of a unified methodology for assessing financial and non-financial reporting indicators, as well as the presence of a different metric assessment system, does not allow us to evaluate the results of the company from the point of view of various industry areas (Tirado-Valencia et al., 2019), (Lai, Melloni and Stacchezzini, 2018), (Maroun, 2019).

Currently, there is no unified approach to the integrated reporting formation. However, the analysis revealed some common features in the difficulty of implementing integrated reporting in the companies (Atkins and Maroun, 2018), (Rupley, Brown and Marshall, 2017), (Rivera-Arrubla, Zorio-Grima and García-Benau, 2016):

– The International Standard does not provide clear rules for most companies to regulate integrated reporting. As a result, reporting will vary from company to company and will be extremely difficult to compare them;
– Lack of a single conceptual framework for integrated reporting, that also prevents organizations from making unified integrated reporting;
– Lack of understanding of the integrated reporting boundaries, that does not allow determining the materiality of the indicators to be disclosed in the reporting;
– Lack of practical experience of a large number of companies in the integrated reporting forming that significantly complicates the comparison of results with the competitors.

The analysis of the advantages and disadvantages of the integrated reporting formation allowed us to draw the following conclusions on the requirements to be taken into account in the methodological approach to reporting:

– To determine the financial and non-financial indicators, that should be reflected in the integrated reporting of the construction companies;
– To determine the information base of the integrated reporting of the construction companies and to identify the leading role of management accounting;
– To develop a methodological approach to the organization of the collection and presentation of the integrated information system necessary for the formation of the integrated reporting of the construction companies.

Materials and methods

The interested users (investors, first of all) in the companies' activities, in order to make decisions on their transparency and investment attractiveness, need financial and non-financial information within

unified integrated. The following factors should be included in the integrated reporting of the construction company:
– Specifics of construction products;
– Organizational, economic and technological peculiarities of construction production in the company;
– The relationship between the contractor and the customer regarding the contract.
These features affect the main economic indicators of the construction companies and have a direct impact on their financial and economic activities.
Therefore, the integrated reporting of the construction company should contain at least the following sections:
– «Review of the company and the external environment»;
– «Business model of the construction company»;
– «Strategy for the distribution of resources of the construction company»;
– «Results of the construction company»;
– «Risks of the construction company»;
– «Prospects for the future development of the construction company».
The first section of integrated reporting «Review of the company and the external environment» contains information about the markets in which the company operates. Information is displayed both in geographical and technological aspects. When the technological component is disclosed, the types of construction and installation works and the corresponding construction services are specified by categories of types of construction products, main subcontractors, etc. When revealing the technological component, types of construction and installation works and corresponding construction services are: information on the role of the company in contracting relations and main subcontractors, etc. The parameters of the external environment of the construction company should describe changes in the legislative and regulatory acts, in the economic situation and in the industry trends taking place around the company, etc.
The second section «Business model of the construction company» includes the parameters of the company's resources that it will create in short-, medium-, and long-term periods. Taking into account the high capital intensity of construction products and the specifics of this type of activities, the company discloses the methods of settlement used for the completed parts of the volume of construction and installation works and for fully finished construction. When additional working capital is required, it is necessary to provide for the use of borrowed funds. Therefore, within this section of the integrated reporting, it is also necessary to disclose the model and sources of financing of the company's business model. When using the company’s borrowed resources, it is necessary to take into account the following indicators: availability of borrowed resources at the beginning and at the end of the reporting period, movement of them during the analysed period of time, rates of loans, amounts of accrued and paid interest, etc.
In the section «Strategy for the distribution of resources of the construction company» the company, focusing on its short, medium and long-term strategic goals, provides the distribution of all kinds of resources to achieve these goals. The key non-financial indicators of this section characterize the competitive advantages of the company.
The section «Results of the construction company» provides users with quantitative and non-quantitative indicators regarding to historical data. Therefore, in addition to financial indicators of cost, revenues and profit, this section will contain information of non-financial indicators, such as date of putting into operation the construction facilities, volumes of production in natural indicators, results of the company’s participation in tenders, etc.
The section «Risks of the construction company» contains the information about future events related to the company that have not yet occurred but will come with a high probability. Since this information about the future is probabilistic, events will occur with different probabilities. Therefore, all these events should be discussed, and decided upon at meetings devoted to such events. Such decisions, for instance, may involve the creation of event reserves with a probability of occurrence more than 50%.
The section «Prospects for the future development of the construction company» presents the forecast of the future, taking into account the uncertainty and risk that the company may face when implementing its

strategy. At the same time, its key performance indicators should be improved. The investor, as the main person to who integrated reporting is addressed, will be interested in information about signing new construction contracts and development of new construction projects.

Integrated reporting is formed to provide wide and consistent disclosure of company information. As a result, an interested user of reporting can obtain real information regarding to the main financial resources, as well as its economic, environmental and social fields of activities.

The integrated reporting contains multidimensional information. As a rule, financial and management accounting data, as well as any operational information, are used for its formation. Recently, the role of management accounting, which serves as the main supplier of non-financial performance indicators of companies, has become the most significant. The deeper management accounting is developed, the more points of contact with accounting information (planning, budgeting, analysis, control) it has.

As part of the further study, it is planned to give substantial approaches to the process of creating and forming an important part of the accounting system characterizing the reporting section «Business model of the construction company» based on the grouping and systematization of financial and non-financial indicators. The result will allow making a managerial decision in order to conclude that the proposed indicators are acceptable for describing the innovative development of the company.

Results and discussion

To solve the problem of creating an integrated information system capable of providing the user with the necessary information of the report section «Business model of a construction company», it is proposed to use the existing accounting system of the construction company, represented by financial accounting and management accounting subsystems, as a basis. Financial accounting forms information of a financial nature, characterizing financial results of the company's activity, its financial condition, and provision of material and financial resources. In turn, management accounting should provide the user with a wide range of information on all aspects of the company's activities of a non-financial nature. At the same time, management accounting has an unusual function, as it is intended to provide information for planning and control processes at all stages of management.

To solve the problem of creating an integrated information system capable of providing the user with the necessary information of the report section «Business model of a construction company», it is proposed to use the existing accounting system of the construction company, represented by financial accounting and management accounting subsystems, as a basis. Financial accounting forms information of a financial nature, characterizing financial results of the company's activity, its financial condition, and provision of material and financial resources. In turn, management accounting should provide the user with a wide range of information on all aspects of the company's activities of a non-financial nature. At the same time, management accounting has an unusual function, as it is intended to provide information for planning and control processes at all stages of management.

The organizational structure of the company is considered as a set of different centres of responsibility from the point of view of management accounting. The responsibility centre is understood as a part of the management system (department of the company), which head can manage the material, labour and financial resources for the implementation of the tasks assigned to it and is directly responsible for the efficiency of their use. The accounting system for responsibility centres ensures the registration, reflection, accumulation, analysis and provision of information, connected to costs and results to the company's management, which makes it possible to evaluate the activities of specific managers. It is proposed to use the management accounting options for grouping and systematizing information and its user orientation when forming the integrated reporting and provide detailed data on the construction company's internal management reporting to all interested users, thereby ensuring informational transparency of its business. However, the construction company's accounting system (primarily the management accounting subsystem divided by responsibility centres), be used directly in this form when forming the integrated reporting.

The study of the information support of integrated reporting was carried out on the example of a large construction company engaged in the construction of housing and civil facilities using monolithic frame technology. The company focuses on the implementation of projects for the integrated development of the territory, the proposal of integrated architectural, planning, engineering and organizational solutions for creating non-standard objects. It carries out all types of design work prior to the construction and operation of facilities and has great investment attractiveness. To ensure the effective functioning the construction company involves design, budget, contract, production departments, planning, economic and financial units, units of the main production (construction departments that perform the whole range of construction and installation works, production sites), units for servicing the main construction production (mechanization department, logistics service, supply departments, quality management, technical supervision, labour protection and technical services security guides), administrative units.
The procedure proposed by the authors for the interaction between the departments of the construction company as part of an integrated information system in the process of forming the integrated reporting is presented below (Fig 1).

Fig 1. The interaction of the construction company's departments within the information system of the business model of formation of indicators for the construction company
(Source: compiled by the authors)

To increase the efficiency of the process of preparing information to be disclosed in the integrated reporting, it is proposed to identify the segments of the management structure – the areas of responsibility. They will solve the problems of systematizing information about the construction company's activities.

The authors proposed to identify the areas of responsibility "Provision", "Construction Production", "Maintenance and repair of construction equipment and mechanisms", "Sales of the construction company", "Finance of the construction company", "Personnel management of the construction company", etc. in the construction company. For each area of responsibility, the scope of authority, duties, responsibility is determined, and the forms of internal reporting that it prepares are established.

Each area of responsibility combines specific elements of the organizational structure of a construction company that will directly process and summarize information received in response to information requests. Depending on the amount of information processed, this can be either individual employees or the unit as a whole. Thus, it is proposed that the supply department and the logistics service be assigned to the "Provision" responsibility zone, and the "Construction production" responsibility zone, respectively, to the production department, quality management department, technical supervision department, labour and safety protection service. The area of responsibility "Maintenance and repair of construction equipment and mechanisms" should include a technical department (department of the chief mechanic), a service (section) of operation and maintenance of vehicles and mechanisms. The area of responsibility "Sales of the construction company" will unite the marketing department, the design, budget and contractual, planning and economic departments, and the area of responsibility "Finance of the construction company" – the financial department, accounting. The area of responsibility "Personnel management of a construction company" will include a personnel department and a department of labour and wages.

Baseline information is collected at cost centres – production units, where all types of resources are consumed and costs are accumulated. In the construction company, such are the units (construction departments or individual construction teams) that perform special types of work (land, general construction, installation, finishing, etc.), and the mechanization department. The cost centre manager has the responsibility to respond to the information request of the integrated reporting compiler. It is necessary to post the financial and non-financial indicators in the accounting registers, using the data of primary documents of management accounting, and transfer them for further grouping and systematization in the appropriate unit of a certain area of responsibility.

For instance, information about the degree of labour mechanization and automation, provided by all construction management departments, is accumulated by the production department; then it is summarized, analysed and presented in the form of a report to the manager of the "Construction production" area of responsibility.

Further, the information received from all the departments within the area of responsibility, is systematized by the manager and presented in the form of a report to the employee, responsible for the preparation of the integrated reporting. In some cases, the necessary information is generated without the participation of cost centres directly in the areas of responsibility. For instance, data on the average number of employees of a company, is formed directly by the personnel department, which is part of the responsibility for "Managing the personnel of a construction company".

The process of forming the indicators of the integrated reporting by areas of responsibility of the construction company with the participation of structural departments within each area of responsibility and cost centres, is presented in the section "Business model of a construction company" (Table 1).

The choice of the section of the integrated reporting "Business model of a construction company" is determined by the following:

– It is one of the key sections in the integrated reporting. It provides interested users, primarily investors, with information about the capital used by the construction company as resources in creating value in the short, medium and long term. In accordance with the recommendations of the International Standard for Integrated Reporting, this section discloses information on the financial, production, human, intellectual, social and natural capital of the construction company;

– the business model is based on business processes that, through the interaction of elements of the internal and external environment of the construction company, transform the initial capital into the results of operations, the incremental capital of the company, as a result of which it is capable of a long-term viable business;
– practically all areas of responsibility take part in the formation of the information in this section, except the area of responsibility "Sales of the construction company", which entails significant difficulties in practice. In order to qualitatively disclose information in this section, it is necessary to understand the economic essence of the business model of the construction company, its components, and the relationships between them.

Table 1: the process of the formation indicators of the integrated reporting section "Business model of the construction company" by the zones of responsibility of the construction company
(Source: compiled by the authors)

Area of responsibility	Company departments within the area of responsibility	Cost Centres, forming Integrated Reporting Indicators	Integrated reporting indicators		Company resources (type of capital)
			Financial	Non-financial	
Finances of the construction company	Financial department			Types of investors, financing model, sources of financing	Financial
	Accounting department		The structure and cost of equity, the structure and cost of borrowed capital		
Finances of the construction company	Accounting department	Construction management department, Mechanization department	Capacity Expansion Capital Costs	The structure of fixed assets, including share of rented and leased	Production
Maintenance and repair of construction equipment and machinery	Technical department	Construction management department, Mechanization department		Asset status, capacity utilization	
	Maintenance and repair of construction equipment and machinery				
Construction production	Production Department	Construction management department, Mechanization department		Degree of mechanization and automation of labour, stock capacity of labour; Material intensity, energy intensity, labour intensity of production and construction products	
Management of a construction company	HR department			Average number of employees, including by category, structure of personnel by qualification, education, age, level of professional training, staffing	Human
	Department of Labour and		Level of average wages, including		

	Wages		by categories, its ratio to sectorial and regional indicators		
Finances of the construction company	Accounting department	Construction management department, Mechanization department	Labour costs, social support costs, staff retraining costs		
Construction production	Production Department	Construction management department, Mechanization department		Labour productivity level	
	Health and Safety Service			Labour organization, occupational injury rate, health and safety indicators	
Finances of the construction company	Accounting department	Construction management department	Structure of intangible assets and intellectual property objects of the company, their value, dynamics and structure of costs for intellectual capital, costs for innovation, R & D, for acquisition of new technologies, for research and development performed by third-party companies		Intellectual
HR management of the construction company	HR department			Share of research staff to the average number of staff	
Construction production	Production Department			Description of land plots owned by the company: area, location, dynamics and structure of consumed natural resources	Natural
	Department of technical supervision	Construction management department		Indicators of environmental safety	
Finances of the construction company	Financial department		Dynamics and structure of investments in environmental facilities, environmental investments		
	Accounting department		Cost of the natural capital		
Supply	Purchase department			Supplier structure, continuity, urgency	Social
	Logistics Department				
HR management	HR Department	Construction		Turnover factors,	

of the construction company		management department, Mechanization department		acceptance turnover, attrition turnover	
Finances of the construction company	Financial department		Composition, structure and dynamics of social investments; Dynamics of the company's expenditure on assistance to socially vulnerable groups of citizens; Dynamics of costs for support of culture, sports, municipal institutions, public organizations		

In order to implement one of the leading principles – «reliability and completeness», which underlie the integrated reporting forming on the recommendation of the International Standard for Integrated Reporting, the information provided by the accounting system of a construction company must undergo quality control by the company's internal control service. It is recommended to develop a regulation that defines the interaction between departments and employees of the construction company for the practical implementation of the section "Business model of a construction company" as a part of the integrated report forming process. This document is intended to identify employees, who will be responsible for the integrated reporting formation, to consolidate the distribution of responsibility for this process among the areas of responsibility, as well as forms of accounting registers and management reporting.

Conclusion

The proposed methodological approach to the section «Business model of the construction company» allows creating a complex information system necessary for integrated reporting formation. The basis of this system is the existing accounting system of the construction company, represented by financial accounting and management accounting subsystems.

It is proposed to collect initial information in cost centres – construction departments, and its grouping, systematization, analysis implement in departments of responsibility areas in order to reflect this information in the corresponding sections of the integrated reporting. For the effective implementation of these measures, it is recommended to develop the Regulation that defines the procedure for interaction between departments and workers of the construction company as part of the integrated reporting formation process.

This approach allows presenting the interrelated blocks of financial and non-financial information of the construction company in the integrated reporting in order to ensure the completeness and transparency of it for the benefit of stakeholders.

Abstract

The purpose of this study is to examine the mediating effect of Brand Equity and E-Trust on the relationship between Social Media Dimensions and E-Loyalty, targeting the online shoppers and online retail stores users in Jordan. A descriptive research conducted to meet the research objectives. Measurement items are adapted from existing scales found in the marketing literature. Quantitative method was used for data collection, and the research model was tested empirically using a sample of 332 respondents who had experiences with social media, online shopping and online retail stores. The data was analyzed using the Statistical Package for the Social Sciences (SPSS) and the Structure Equation Modeling AMOS 22.0. The study found that the online Retail stores can lead their online users to be loyal users by providing them with an entertaining content while they look for products through their social media pages and by delivering a clear and honest content through their social media pages. The results show that Brand Equity and E-Trust have a mediating effect on the relationship between social media dimensions and E-Loyalty.

Keywords: Social Media Dimensions, E-Trust, Brand Equity, E-Loyalty.

Introduction

Nowadays social media plays a major role in today's life, it has been defined as the online program, Media or platforms that is designed to allow people to have an interaction (Prasad et al.,2019). Tuten,(2017) has explained that social media is used to engage with customers, letting them express their opinions and thoughts; it enables customers to gain new information, share thoughts, and have better interaction with other customers and with the organization itself.

In recent years the social media became more and more attractive for businesses as it builds a strong relationship with the customers (Shareefet al., 2019). The social media became a very important aspect in people's lives all over the world, we all can notice the growing participation of consumers in all social media networking sites and applications and how it is affecting the social relations between consumers (Christofides et al., 2009) With social media sites and platforms, people with common interests are able to form their own communities and share their interest online.

According to recent reports, Facebook is the Jordanian online users' favorite site (Facebook most popular social media site in Jordan, May 2019) and according to Social Media stats in Jordan the percent of Facebook users was about 88.5%, (Social Media stats Jordan, May 2019).

Online retail stores that have been created on social media platforms and have been officially registered in the Jordan Chamber of Commerce in 2019 are 101 online stores which is second highest number of online stores in the Middle East after Egypt, used by 6 million Jordanian users, providing a profit estimate of 289 million dollars in 2017. Therefore, one of the reasons for choosing this sector for this study is its impact on the Jordanian economy.

There have been various studies and opinions that recognized the major advantages of social media but actually lack of studies discussed the consequences of social media dimensions on the E-loyalty of customer of E-retail stores, this study will contribute in investigating the impact of social media on E-Loyalty and the mediating effect of Brand Equity and E-Trust.

Literature Review

Social media is a term that is widely used and many recent researchers defined it; (Kim et al, 2012) defined social media as an online platform, application or program or media that ease joint work, interaction or content sharing. (Chang et al., 2015) Defined social media as the way of using the internet to collaborate communicate and share information and ideas we care about".

Due to the emerging rise of social media, in this research we will be exploring the effect of social media dimensions on the E-Loyalty of the customer in online retail stores considering the Brand Equity and E-Trust as a mediating Variables.

Social Media Dimensions

Reliability

Reliability measures the store's ability to deliver the service that has been promised to customers, accurately and without error (Aldweeri, 2019, et al., 2013). It all depends if the online retail store can keep his promises and fulfill the need and wants of the customer, that will definitely increase his confidence in the store (Yuen and Chan, 2010) and will gradually build customer loyalty.

The importance of reliability in businesses was discussed by the researcher; it explained how the Reliability enhances the efficiency, the customers knowledge and personal experience of the services provided (Popat et al., 2017). Brandtzaeg et al., (2016) added that a business that has reliable online position would have additional benefits in their businesses effective interaction and communication and will eventually have trusting, satisfied and loyal customers.

Customers can gain the online store' trust when the expectation of the user has been reached, reliability and trust of the business on social media platforms is one of the major concerns for online customers (Popat et al., 2017) , therefore, the following hypothesis are proposed:

H1.a: Reliability has a significant impact on Customer's Brand Equity.

H1.b: Reliability has a significant impact on Customer's E-trust.

Entertainment

Online entertainment has been defined as the online activity that grabs targeted audiences attention, providing them with the exceptional and enjoyable experience that ends up with having an interested audience (Edwards et al., 2019).

Social media provided a new type of entertainment for the online users to increase the transformation from an old fashioned entertainment tools to a new online tools. Nowadays, a large number of online users logs in into their social media accounts not for the purpose of seeking new information but for the entertainment provided by the online services, online Entertainment access to communicate with other users who use mutual online stores exchanging information reviews and feedback concerning specific products or services (Schulze et al., 2015). According to the uses of customers, individuals have a daily interact with a lot of different technologies because of their internal and external motivations. There's a type of customers who use online services for non-beneficial motivates; they

only use it for the sake of having fun, to disconnect of the outer world in a spontaneous way (Kim et al., 2012).

Social media platforms that cope with the enormous changes social media and stay updated with the new changes around the world will increase the brand equity and Trust of its current users (Edwards et al., 2019). , therefore, the following hypotheses are proposed:

H2.a: Entertainment has a significant impact on Customer's Brand Equity.

H2.b: Entertainment has a significant impact on Customer's E-Trust.

Interaction

Interaction was defined in previous studies as the Interconnection between two individuals (Szabla and Blommaert, 2018), Harrigan et al., (2017) Defined social interaction as the communication between two individual members or two separate groups. Also, Social media interaction was defined by Nguyen (2018) as direct communication between the business and its audience members. (Szabla and Blommaert, 2018) explained how to measure the active online interaction of users; it includes the number of clicks, brand mentions, profile visits and active followers and subscribers. The new online retailers and businesses must cope with the increasing activity of social media (Bonetti et al., 2018). (Nguyen, 2018) also explained that social media interaction must be more dynamic and less time-consuming because it plays a key role in the sector business of the business online performance. The interaction can be used as a tool to reach and attract new customers by delivering the value the customer was expecting.

Therefore, the following hypotheses are proposed:

H3.a: Interaction has a significant impact on Customer's Brand Equity.

H3.b: Interaction has a significant impact on Customer's E-Trust

Commitment

In the previous studies, commitment has been defined as the psychological force that binds an individual to a target or course of action of relevance to that target (Straker et al., 2019). Lim (2015) Defined the online commitment as the ethical framework that obligates the individual to act for the benefit of his online society, therefore social media can create an online commitment.

The commitment of the individual on social media platforms depends on the strength of the relationship with the social media audience and community. Also, the users' commitment depends on expectation of the quality of interaction with the business and the user's community and his perception of the brand image of the business (Belanche et al., 2019). The management of the online businesses can increase the commitment of users by encouraging high quality content, allowing users to contribute more leading the user to be more trustful.

Therefore, the following hypotheses are proposed:

H4.a: Commitment has a significant impact on Customer's Brand Equity.

H4.b: Commitment has a significant impact on Customer's E-Trust.

Brand Equity

Many recent studies have explained the importance of the brand equity concept in the new online businesses and markets. The brand is generally identified as a name, term, sign, symbol or design or combination which is intended to identify the goods and services of the sellers and differentiate it from competitors (Tabaku, 2015). Meanwhile, (Keller, 2016) defined brand equity as various effects on the brand knowledge on customer's response to the marketing of the brand. The brand Equity occurs when the customer has a strong, favorable association the brand in his mind. Brand knowledge is explained according to two components; Brand image and brand awareness (Cifci et al., 2016), the brand awareness is one of the most essential parts of customer-based brand equity by recalling and recognizing a brand (Gomes, 2016), brand image can be a direct lead to generate positive or negative word of mouth, create customers commitment and loyalty. (Biljin, 2018) When the positive brand

image in the consumers' minds is strong and favorable it can lead the brand to enjoy the benefit of commitment and loyalty. (Al-Dweeri et al., (2017) explained the link between brand equity and the customer's purchase intention and online loyalty.

Therefore, the following hypotheses are proposed:

H5: Brand Equity has a significant impact on Customer's E-Trust.

H6.a: Brand Equity has a significant impact on Customer's attitudinal loyalty.

H6.b: Brand Equity has a significant impact on Customer's behavioral loyalty.

E-*Trust*

Trust has generally been defined as the degree of confidence the customer has in exchange of options. Meanwhile, E-trust has been defined in previous studies as the degree of confidence the customer has in any online exchange channel (Yannopoulou et al, 2011). Customer trust is considered as one of the main effects on E-loyalty, trust exists when one party has confidence in the reliability and integrity of the other party, trust is subjective, and it is based on the user's beliefs rather than facts (Phua et al., 2017). Customer can trust the brands when they believe that these brands acts for the benefit and the interest of the customer and understanding the concept of trust is one of the main keys to create a long term relationship with the customers (Veloutsou, 2015), E-Trust depends on many factors; the privacy, security, presentation, technology and interaction, both parties must keep their promises, reduce the emotional risk that customer's might experience with the brand especially when customers feel the support of the brand to their needs, this can result in the development of the customer's satisfaction and loyalty. Furthermore, Phua et al., (2017) explained that the strength of customer's relationship is a strong predictor of trust that leads to E-Loyalty. Al-Dweeri et al., (2017) explained that in order to build E-Loyalty there has to be a prior development of E-Trust. Therefore, we propose the following hypothesis

H7.a: E-Trust has a significant impact on Customer's attitudinal loyalty.

H7.b: E-Trust has a significant impact on Customer's behavioral loyalty

Attitudinal and Behavioral Loyalty

In recent researches, Loyalty has been studied and defined by many researchers, (Aldweeri, 2019) defined loyalty as a deeply-held commitment to rebuy a preferred product or service consistently in the future. There's four stages model has been related to customer's loyalty: cognitive loyalty, affective loyalty, cognitive loyalty and action loyalty (Helgesen et al., 2007). Behavioral loyalty has been defined by Inoue et al., (2017) as the customer's commitment to the brand, Yoshida et al., (2015) referred to the behavioral loyalty as the repetitive purchase and the readiness to act to the benefit of a specific entity. The behavioral loyalty is an outcome of attitudinal loyalty (Inoue et al., 2017). Many previous researcher explained the definition of attitudinal loyalty as the positive attitude that leads to repeated behavior and is considered to be true loyalty (AL-Dweeri, et al., 2017; Del Águila, et al., 2013a) , (Ramaswami and Arunachalam 2016) defined attitudinal loyalty is when a brand fulfills the emotional needs or when the customer has an emotional affiliation with the brand. Strong positive attitudinal and behavioral loyalty influences the customer's behavior causing them to resist any other competitive brand or service (Helgesen et al., 2007). The repeated purchases behavior, the increase of the financial performance of the business, the increase of trust and brand recognition in the mind of the customers are considered measurements of loyalty

This research mainly focuses on investigating the relationship between the four social media dimensions as independent variables with the Behavioral loyalty and attitudinal loyalty as a dependent variable. (Pitta et al., 2012) and this study has two mediating variables which are E-Trust and Brand Equity. Depending on previous studies as the table below showing: We adapt the research Model as the showing figure:

Figure 1: research model

Data and Estimation Results

Sample Characteristics

In order to test the causal relationships, a quantitative approach was used using a web-based questionnaire addressed to Jordanian online users which are following online retailer's facebook pages The distribution of the survey to online users produced 332 useable surveys. The first question asked whether participants had ever follow Facebook pages of online retailers, if they answer no, a thank-you message was given. The survey consisted of a total of 33 items using a 1-5 scale, the survey was validated by three researchers after a pilot study. A cording to first section in the survey: (62.0%) are females. Nearly two thirds of the respondents are aged 18 to 35 years. Little more than half of the respondents 184 (55.4%) are Bachelor's degree holders and 168 (50.6%) with less than 700 J.D. monthly income. Majority connect to Facebook less than 3 hours per day.

Results

Model estimation and Hypothesis Testing

The correlation coefficients were positive and significant at the 0.01 level for all variable pairings. Figure 2 presents the structural equation modeling results specified in the AMOS 22.0 output. The results relating to the fit of the structural model generally support a claim of good fit. Table (2) provides a summary of the goodness-of-fit statistics and all of the indices fall within the recommended ranges, which support acclaim of good fit for the model. In particular, the relative enormed $\chi 2$ value of 2.226 is less than the recommended maximum value of 3.00 (Kline, 1998), which represents a good fit.

Reliability was measured using internal consistency index (Fornell and Larcker, 1981) has been commonly used to assess the degree of shared variance between the latent variables of the model. According to this criterion, the convergent validity of the measurement model can be assessed by the Average Variance Extracted (AVE) and Composite Reliability (CR), Table (1) confirming that all measures demonstrated satisfactory results of AVE ($\geq$0.5) and CR ($\geq$0.7).

Table 1: Validity and Reliability

	CR	AVE
Commitment	0.839	0.567
Reliability	0.886	0.660
Entertainment	0.878	0.642
Interaction	0.821	0.509
Brand Equity	0.840	0.567
Trust	0.890	0.670
Behavioral Loyalty	0.865	0.616
Attitudinal loyalty	0.856	0.598

The correlation coefficients were positive and significant at the 0.01 level for all variable pairings. Figure 2 presents the structural equation modeling results specified in the AMOS 22.0 output. The results relating to the fit of the structural model generally support a claim of good fit. Table (2) provides a summary of the goodness-of-fit statistics (Figure 2). As shown in Table III, all of the indices fall within the recommended ranges, which support a claim of good fit for the model. In particular, the relative normed $\chi 2$ value of 2.68 is less than the recommended maximum value of 3.00 (Kline, 1998), which represents a good fit.

Table 2: Model Fit indices:

Indicator	**Recommended value**	**Value**
$\chi 2$	$P \leqslant 0.05$	P = 0.00
RMSEA	$\leqslant 0.08$	0.061
GFI	$\geqslant 0.90$	0.910
AGFI	$\geqslant 0.90$	0.851
NFI	$\geqslant 0.90$	0.923
IFI	$\geqslant 0.90$	0.913
CFI	$\geqslant 0.90$	0.913
Normed $\chi 2$	1-2	2.226

The RMSEA value of 0.061, which is below the recommended maximum of 0.080 suggested by Browne and Cudeck (1993), also suggests that the measurement model fits well. The GFI value of 0.910 and the AGFI value of 0.851 are both above the 0.900 level recommended by Byrne (2016). This research also used IFI and CFI to measure the goodness-of-fit of the models; the IFI (0.913) and CFI (0.913) index values for the measurement model both exceed the recommended level of 0.900 (Byrne, 2016), which suggests adequate fit of the model (Hu and Bentler, 1999). The NFI value of 0.923 also suggests a reasonable fit. From all of the values outlined above, it is inferred that the structural model represents an acceptable fit. To test the hypotheses, a structural equation model was used (Hair et al., 1998). All measurements of the equations were statistically significant at a significance level of 0.05.The estimated standardized regression coefficients are shown (all t-values exceed the reference values of 1.96 for a significance level of 0.05) (Figure3).

Figure 2: AMOS Model

Table 3: Structural parameters

Causal path			Estimate Coefficient	S.E.	C.R.	P	Hypothesis
Reliability	--->	Brand Equity	.320	.080	4.020	***	Supported

Brand Equity	--->	Attitudinal Loyalty	.434	.091	4.750	***	Supported
Trust	--->	Attitudinal Loyalty	.605	.078	7.799	***	Supported

Causal path			Estimate Coefficient	S.E.	C.R.	P	Hypothesis
Brand Equity	--->	Behavioral Loyalty	.459	.106	4.340	***	Supported
Trust	--->	Behavioral Loyalty	-.051	.120	-.426	.670	Not Supported
Attitudinal Loyalty	--->	Behavioral Loyalty	.450	.167	2.701	.007	Supported

Discussion, Limitations and Future research

The aim of this study is to investigate the effect of social media dimensions (Reliability, Entertainment, Interaction and commitment) on the customers E-Loyalty and its two types: Attitudinal and behavioral, also to study the mediating effect of Brand Equity and E-Trust that influence E-Loyalty of customers toward the online retail store, perceived by the online shoppers and users.

Using a convenience sample from the online retail stores users (N=332), this study found that Social media dimensions can lead the online user to be a loyal by enriching their social media platforms with honest, entertaining dimensions concentrating in making the user committed and involved. Moreover, Brand Equity and E-Trust were found to mediate the relationship between social media dimensions and E-Loyalty.

Figure: Final Model

Figure 3: Final Model

According to the results, in this research it confirms that the social media dimensions have an impact on the online retail stores' user's loyalty and it creates a positive relationship between the main dimensions in the measurement model. Brand Equity and E-Trust has a strong and positive mediating impact on the online user if the online retail stores worked on the social media platforms and

supported it with the dimensions that effect the user the most. The results of this study confirm that Brand Equity has an effect on the E-Trust of the user therefore will affect his E-Loyalty.

Managerial Implications and Future Research

After studying the results of this research, there are several suggestions for the managers who manage an online retail store or planning to start any online businesses. The managers must work on their social media pages content, focusing on making it enjoyable for the users, providing the page with different pictures, videos and sounds that makes the visit of the user in the online retail store fun and entertaining. The firms should work on providing the best experience when the user is on their online retail stores' social media pages, a high quality service and an enjoyable time will lead the user to trust the online store more and have a better perception of the brand the online store is using leading the user to be loyal online users who will have a long term relationship with the online retail store.

Second, managers must use an effective strategy and plan to make sure that the online retail stores are keeping its promises to the users and delivering their services or products as planned in the right time and place.

Furthermore, the results shows that the users fully depend on the social media pages of the online retail stores' to get informed about all the daily news of the online retail stores, the manager must keep the content updated with recent news about the services and products their online store is providing to ensure that the user will always be informed with the latest and most recent news and to ensure that the user stay loyal.

Moreover, we would like to give a future advice for the future researchers; first, future studies should investigate other social media dimensions that influence the customer's E-Loyalty. Secondly, future studies should investigate other mediating factors that might have an influence on the relationship between social media dimensions and E-Loyalty of the online retail stores' social media platforms to ensure that the best service is being provided to the online user.

Even though the important findings discovered in this study, there are some limitations such as the sample was limited from Jordan, and the time to conduct the responses was limited as well.

This study was conducted from a limited sample, so it is recommended to increase sample size, and to apply the study on other countries beside Jordan to compare the results.

Abstract

Due to the dynamically changing external environment, private banking market entities, both producers/sellers of a specific banking product and wealthy consumers make strategic and tactical decisions in conditions of a high degree of uncertainty. The article analyzes controllable and uncontrollable environmental factors that influence the development of the banking services market, and shows the main problems and trends of this market. At the same time, the authors analyze the reaction of economic entities of the market to the influence of these factors that pose threats and opportunities for market development. The research was based on a specially developed methodology, which includes mainly qualitative methods in the form of in-depth interviews with market experts and consumers of private banking services. Banks that provide a full range of banking services to wealthy Russian consumers were selected as sampling units, in which 70-75% of attracted funds of individuals were consolidated. The authors revealed that moving towards an open banking system, tightening compliance requirements, instability of the political and economic situation, consolidating the business and reducing the degree of competition between banks, distrust of wealthy consumers in the Russian banking system, digitalization of service, staff qualifications are important challenges for business entities of the private banking services market. As a response of banks to existing challenges, the following areas of market development were identified: active regional development of banks, consumer segmentation both by demographic, psychographic and behavioral characteristics; service differentiation for target segments, changing the structure of the Bank's portfolio through the development of investment expertise both in terms of sales ethics and product line filling, remote service channels development; creating their own programs for training high-quality personnel.

Keywords: Private banking market, factors of influence, consumers.

Introduction

The complexity and uncertainty in decision-making on the part of the subjects of the Russian market of private banking services is explained by the influence on the given market and the behavior of its subjects for the most part of uncontrollable factors of the external environment of banks, informational closeness and poor market knowledge, and a slowdown in market growth. On the one hand, business consolidation in this market reduces the degree of competition between banks; on the other hand, changes in the consumers' behavior of private banking services encourage banks to seek

new strategic solutions to attract wealthy consumers and further development. In order to make objective decisions in these conditions, it is important for banks to understand what environmental factors pose threats and opportunities for business development, how a business can respond to unpredictable and very dynamic environmental challenges.

This article presents the results of one of the annual research of the Russian private banking services market, conducted by the research company Frank Research Group (Moscow)[1] in 2018-2019 according to a specially developed methodology, including desk research, as well as field methods of survey and observation of elements of a multi-stage sample:

– 13 in-depth interviews with CEO-s of private banking divisions;
– 11 in-depth interviews with heads of investment teams of private banking;
– 54 in-depth interviews with consumers of private banking services;
– a survey of 830 consumers of private banking services;
– 14 in-depth interviews with personal managers of private banking divisions;
– benchmark for 75% of banks in the Russian private banking sector [Original research report, Frank Research Group, 2018-2019].

The purpose of this research is to study and analyze the Russian private banking services market, identify and analyze factors of influence on market growth rates, and banks' reactions to dynamic changes in the external environment.

The objects of the study were banks providing a full range of banking services to wealthy consumers in the territory of the Russian Federation, in which 70-75% of attracted funds of physical entities are consolidated.

Analysis of factors influencing the development of the private banking services market

Business entities of the Russian private banking services market carry out their economic, production and marketing activities under the influence of controllable and uncontrollable factors. The use of a combination of desk and field research methods conducted in 2018-2019 on a sample of banks that make up 74% of the private banking market made it possible to describe a number of factors influencing this market and evaluate the banks' response to these factors.

According to the research, the total volume of the Russian market for private banking services is about $ 455 billion. Russian private banks have $136 billion placed in them, 70% of the capital is placed abroad, and investment companies manage about $ 4-5 billion. With the exchange rate stabilizing at 63-64 rubles against the dollar, it is forecasted that real growth in the volume of capital in the consumer segment of private banking services in the dollar equivalent of 16-17% is expected.

The Russian market for private banking services is affected by interrelated macro- and micro-environmental factors similar to those in the global market, but has some local features [Original research report, Frank Research Group, 2018-2019].

One of the most important factors influencing the activities of banks is government regulation of the private banking services market, aimed at improving the Russian banking sector as a whole. It also includes tightening supervision over the movement of funds on foreign accounts of RF residents, taxation of controlled foreign companies, as well as tightening private banking consumers' compliance with the requirements/compliance procedures established by banks [Hanh, Daly, 2020].

In order to counteract the legalization of criminally obtained incomes and cash out funds, the Central Bank systematically raises the requirements for compliance with the procedures for opening accounts in bank organizations. In addition, the Central Bank of the Russian Federation plans to tighten

[1] The author of this article, Galina Timokhina, is a marketing research consultant for Frank Research Group (Frank RG)

legislation in terms of setting limits on cash withdrawals using premium cards, which increases the costs of banks as well as reduces the attractiveness of private banking services for some large consumers.

The private banking market in Russia continues to consolidate; the share of large companies in the private banking services sector remains stable. The share of state-owned banks is growing and by 2018 has reached 72%, which indicates a decrease in competition in this market. A significant increase in the share of the public sector in the Russian banking system as a whole and in the private banking market, in particular, is a new stage in the private banking market development in Russia.

Structurally, the economic entities of the Russian private banking market are represented by banks with state participation, banks with private capital, structures of foreign banks, non-bank organizations (Table 1.). Non-bank organizations in the Russian market are represented by independent financial advisors, multi-family offices, as well as management and brokerage companies that offer consumers customized welfare management solutions. Such organizations do not provide traditional banking services and were not examined in this study did.

Table 1: Comparative characteristics of business entities of the Russian private banking market

Sellers / bank product manufacturers "Private banking"	**Number of customers served**	**Share of funds raised relative to the total amount of funds raised in the private banking segment**	**Advantages in working with consumers**	**Disadvantages in working with consumers**
Banks with state participation	More than 5000 of consumers	75-80%	Reliability, strong brand, wide regional representation	Long approval procedures, lack of flexibility, limited product range.
Banks with private equity	Depending on the scale of the Bank from 500 to 5000 consumers	15-20%	Flexibility of service conditions, the possibility of direct communication with the bank management	Low reliability compared to banks with state participation, the dependence of bank performance on the identity of the shareholder
Structures of foreign banks	1000-2000 consumers	Less than10%	Access to foreign markets, a wide range of banking and investment products, a strong brand, diversification of country risks.	The impact of geopolitical factors on banks ' activities; offer of less competitive deposit rates.

Source: Frank Research Group

The largest banks in the Russian private banking market in terms of borrowed funds are: Sberbank represented by Sberbank First and Sberbank Private Banking, VTB24 Private Banking, Gazprombank Private Banking, VTB Bank of Moscow Private Banking, OTKRITIE Private Banking, Alfa Private, Promsvyazbank Private Banking and Friedrich Wilhelm Raiffeisen. Secondary data analysis showed a slight decrease in the competitiveness of private banks with foreign capital.

One of the environmental factors that can be controlled by the bank is the potential for market growth due to new consumers among previously unreached target audiences in economically developed regions of Russia. It should be noted that active regional development and future increase in the share of regional consumers is only possible with the development of a full-fledged network of regional branches. The presence of a full-fledged regional branch of private banking is an indicator for the consumer of how seriously the bank is set to develop the direction of servicing wealthy clients in this region [Gaur, Kingshott, Sharma, 2019; [Hanh, Daly, 2020].

The results of expert interviews with heads of private banking divisions showed that almost all banks are aimed at developing their regional presence in 2019-2020. At the same time, banks plan to develop the regional network by creating small VIP modules, using the existing infrastructure of the premium-banking sector, as well remote service and in-house consultations from headquarters in Moscow.

The most important partially controllable factor that influences banks' activities in the private banking sector is the wealthy consumers' behavior and the peculiarities of the decision-making process.

Banks assign consumers to the private banking segment based on the value of the threshold for entering this segment, that is, the minimum amount of consumer funds intended for placement in the bank. Depending on the entry thresholds set by banks, banks divide the market into segments/sub-segments and develop strategies for working with them. According to the results of the study, the market of wealthy consumers can be conventionally represented as a hierarchy of segments/sub-segments (Fig. 1).

Fig. 1: Hierarchy of segments of high-income consumers in the Russian banking market

Source: Frank Research Group

The lower level in this hierarchy is the affluent segment, which in accordance with the translation from English means "financially prosperous", which can be divided into sub-segments:

- Upper affluent - a high sub-segment of financially prosperous consumers with an entry threshold of 8 to 15 million rubles;
- Mass affluent - the average sub-segment of financially prosperous consumers with an entry threshold of 2.5 to 3 million rubles;

- Lower affluent - a low sub-segment of financially prosperous consumers with an entry threshold of up to 2.5 to 3 million rubles.

The highest level in this hierarchy is the private banking segment, which, in turn, can conditionally be divided into sub-segments:

- HNWI - high net worth individuals-a sub-segment of high-income individuals with an entry threshold of 30 to 40 million rubles;
- UHNWI-ultra high net worth individuals – a sub-segment of individuals with a very high income level with an entry threshold from 100 to 150 million rubles (Fig.1).

Most banks do not distinguish the UHNWI sub-segment in the private banking segment, which means that a single product and service line is offered for the entire private banking segment. However, secondary data on Western practices of servicing wealthy consumers indicate that banks should respond to the specific consumer needs and values in the HNWI and UHNWI segments. In particular, for the UHNWI segment, a wealth management-banking product can be offered, which means managing and optimizing multimillion-dollar family fortunes located in various assets dispersed around the world. In this study, the offer of a banking product for the private banking segment is conditionally divided into two categories: the offer of the product "private banking" and the offer of the product "wealth management". The substantive content of these products is determined by the resources of banks in shaping the demand of consumers not only for banking, but also non-banking services, as well as in creating a customized product for individual consumer needs (Table 2).

Table 2: Product Characteristics «Private Banking» and «Wealth Management»

Product characteristics	**"Private Banking" product**	**"Wealth Management" product**
Product focus	Customer Bank Asset Management	Management of the client's entire state, including non-banking assets
Product range	Privileged Banking. More favourable conditions for deposits. extended limits. More favourable terms for credit products. Additional services provided by the "Concierge service" principle. Investment solutions are offered, but are not the main part of the product content.	Full range of investment services Consulting in various investment areas, such as the securities market and direct investment. Advice on tax issues. Advice on legal issues. Real estate advice Consultations on other issues
Degree of product standardization	High degree of product standardization	High degree of customization
Product manufacturer/seller	Bank organizations	Bank and non-bank organizations

Source: Frank Research Group

.

It should be noted that the "private banking" product may include "wealth management" services, which increases the attractiveness of these services in the eyes of wealthy consumers. At the time of the research, the official demarcation of the two segments HNWI and UHNWI in the framework of private banking and the offer of differentiated services was introduced in two banks - Sberbank and Citibank.

About half of the banks in the private banking market have internal segmentation, but it is conditional. The offer of a banking product varies mainly only in terms of coordinating individual deposit rates, depending on the amount of cash allocation and the possibility of providing tax and legal advice.

Most of the bank divisions focused on servicing the private banking consumer segment in Russia operate with an average capital size of 30-50 million rubles ($400 000-$650 000), this is significantly lower than the classical approach to the average capital size of private banking in the European and US markets, where the average capital size can exceed $10 million. Only 4-5 banks in the Russian private banking market operate with an average capital size of $1 million or more.

The results of the research showed that there is no unified approach to segmentation wealthy consumers in the Russian market of private banking services. Banks define and change entry thresholds for the private banking segment for marketing, organizational, economic, and other reasons.

A number of banks deliberately lower the threshold for entering the private banking consumer segment in order to provide the target consumer with an opportunity to test the Bank's service before deciding to place a larger amount. For the same purpose, a number of banks offer consumers paid services in exchange for the opportunity to receive all the privileges of private banking without placing the necessary amount of funds in the Bank. Smaller banks in the private banking market are also deliberately targeting the affluent segment, setting an entry threshold of 3-8 million rubles due to the lack or insufficient development of a separate premium service direction. However, due to the sharp weakening of the national currency, there is a tendency for banks to gradually increase the threshold level for entering the private banking segment.

This study allows us to make a private banking services consumer profile. This is mainly a male, a big city/a capital dweller, a business owner, served in the bank as a legal entity, married, with children. The age groups of 30-40 years, 40-50 years and 50+ are presented in almost equal proportion. However, experts note such a local tendency, which is specific for the Russian private banking market, as a change of generations and an increase in the share of younger consumers in the overall structure of this segment. This trend is the result of the gradual withdrawal from active economic life the owners of the so-called “first wave” capital - the creators of the first capital in the 1990s. There are more women among holders of large capital of more than $500 million in Russia. Compared to the lower segment, the share of CEOs in private banking services consumer structure is almost 2 times lower (59.1% versus 35.4%) and the share of rentiers (investors) is 1.5 times larger, 13.2% of such clients can afford to live exclusively on rent.

The surveyed beneficiaries-consumers of private banking services are mainly engaged in real estate, construction and industry. Geographically affluent consumers prefer to live in Russian cities (where large business management centers are localized) or abroad. Business owners mostly stay in the country, while rentiers can afford to leave this country. The survey conducted by the authors showed that in addition to consumer segmentation of private banking services by demographic characteristics, in particular by the amount of allocated capital, banks begin to segment the market by psychographic and behavioral characteristics [Timokhina, 2019]. Based on a survey of 884 consumers of private banking services (54 in-depth interviews and 830 questionnaires), consumers with equity of $ 1 million or more can be divided into 5 groups/segments according to psychographic characteristics: heirs to capital (up to 35 years), active young holders of capital (25-45 years), active mature holders of capital (45-60 years), rentiers (over 60 years); a group of trustees was also identified.

In order to manage the capital of more than $5 million, consumers of private banking services use an additional category of service providers – multi-family offices and trusted persons. This brings a number of features for a private banker when developing strategies for marketing communications with the consumer by means of building relationships based on trust with his representative.

The results of the analysis of the primary research data on consumer demand for private banking services abroad showed that 2/3 of the consumers surveyed have experience in being serviced abroad, of which slightly less than a third have closed their foreign accounts in the past 2 years.

Compared to the 2017 sample, the share of those who closed accounts abroad increased by 8%. The following factors such as: tightening the compliance procedure, sanctions, changes in Russian tax legislation, introduction of reporting on foreign accounts; negative experience of investing in a foreign bank, a decrease in the level of service, and an increase in capital requirements are considered to be among the main reasons why wealthy consumers close their accounts.

It should be noted that 45% of respondents from a sample of 54 units continue to be served in foreign banks, while none of the affluent consumers who have accounts abroad expressed a desire to close the account.

Respondents identify the following main reasons for servicing abroad: the consumer's and/or family members' residence, doing business abroad, frequent business trips, capital diversification to reduce financial risk, ensuring the safety of capital in reliable jurisdictions, the breadth of investment opportunities and expertise in foreign banks, more favorable terms of service – such as access to credit at low interest rates. The reaction of banks to consumer demand for private banking services abroad is expressed in the offer of these services by the majority of the studied banks on the Russian private banking market (84% of the sample). The attractiveness of banks in foreign jurisdictions for this segment of consumers remains even taking into account the stricter requirements of foreign banks in relation to Russian consumers.

Partially, the behavior model typical of capital owners, who have a fortune in Russia due to the opportunities to obtain a high level of profitability and use conservative investment instruments to accumulate and save funds in foreign banks, is preserved [Timokhina, Kapustina, 2017]. Consumers' desire to withdraw funds outside the territory of the Russian Federation, among other factors, is associated with the instability of the economic and political situation, the lack of a reliable legislative system and regulation of private property issues. On average, according to market experts, about 70% of the funds belonging to RF residents are held in accounts abroad. In this regard, large banks are betting on offering services abroad by involving their own subsidiaries and branches, as well as foreign banks included in the bank group where the Russian bank also belongs, or partner banks.

In general, experts in the private banking services market note a long-term decline in the level of consumer confidence of this segment to the Russian banking system and the stock market. After the global economic crisis of 2008-2009 and the currency crisis in Russia since 2014, not all Russian private banking consumers were able select the ways to preserve and increase their capital [Abdoli, Rostamzadeh, Feizi et.al, 2017; Darzi, Bhat, 2018].

This is reflected in the peculiarities of decision-making by consumers in this segment. The main goal of such consumers is to preserve capital, often at the expense of profitability indicators. Independent investments in the real sector of the economy, real estate and cash are becoming the most popular tools for preserving and increasing capital. Reliability remains the most important factor for all the customers among all the factors that affect the bank choice under a decrease in consumer sensitivity.

The survey of 830 consumers of private banking services showed that the most important criteria for choosing a bank for a consumer in the private banking segment are the following:

- range and quality of banking services (for 24% of consumers from the sample);
- organization and quality of service (for 21% of consumers);
- bank reliability (19%);
- investment service opportunities (11%).

A small number of consumers noted the importance of the bank providing non-banking services, the presence of bank structures abroad, and the characteristics of the bank's branch network. Those consumers who are focused on the using wealth management services are guided by several other priority criteria for choosing a bank (Fig. 2).

Fig.2: The share of consumers of the banking product in the private banking market, focused on using wealth management services, guided by the following criteria when choosing a bank, %

Source: Frank Research Group, 2019

The reaction of banks to consumer demand for capital preservation services is expressed in a clear predominance of deposits in the bank's portfolio. Deposit account for about 85-90% of the funds raised, i.e. from 5 to 6 trillion ruble. There is a high proportion of deposits in foreign currency within the deposit structure. A significant predominance of deposits is not characteristic of all banks. In a number of banks, the share of investments in investment instruments can range from 20-30% to 50-60% of the allocated capital. However, these banks together account for only about 10% of all attracted funds of consumers of this segment in the Russian market.

According to market experts, a decrease in interest rates on deposits in the banking market as a whole is expected in the future due to the exhaustion of banks ' opportunities for profitable placement of borrowed funds in the face of reduced demand for credit funds, therefore, so the demand for conservative investment instruments such as structural notes and Eurobonds is expected to increase.

In this regard, it is expected that the average share of funds placed in investment products will grow and banks with experience in interacting with consumers in terms of investment services will have an advantage. In 2016-2018, the share of investments in the banks' portfolio in private banking sector increased from 15% to 20%, while the average amount of capital placed in investment instruments grew by almost 20% per year. In response to this growth, banks are introducing the practice of investment advisory within private banking (in 11 banks under research), increasing the number of investment teams of the advisory type, and plan to further expand investment teams.

Along with organizational measures, banks are ready to expand the range of investment services by searching for new non-standard ideas and approaches, and are also working to improve the quality of investment sales.

Apart from banking and investment services, large international banks are expanding the range of private banking services: they offer an additional service for non-bank consultations, including the development of an inheritance plan and the selection of suitable tools for this, offer assistance in choosing a tax/legal advisor, and provide consulting services for consumers' family offices
The influence of technological factors on the growth rate of the private banking market and the growth of consumer demand for remote services encourages banks to widely introduce remote technologies for servicing wealthy consumers. According to experts and secondary data, more than

80% of affluent clients in Europe and about 75% in the United States use remote service channels, replacing personal contact with a personal manager with information communication channels for most operations [Shankar, Jebarajakirthy, 2019; Shuaib, Abdul, 2019].

The high penetration rate of remote service channels in this segment is due, among other things, to the emergence of new business entities offering private wealth management services online: online advisory, consultants, and investment companies in the private banking services market. More technologically advanced and mobile models of online servicing private banking services consumer segment of the above-mentioned market entities are starting to seriously compete with the traditional consumer servicing models used by banks.

According to the results of data analysis, the trend of digitalization of service channels is growing in most of the studied private banks. In 2019, all banks planned to upgrade the Internet banking / mobile application in terms of adding new features, opening separate accesses for trustees and children, life-chats with a personal manager. Digital innovations in investment services for consumers of private banking services are: automation in the risk profiling system, development of a robo-advisory to increase the efficiency of internal processes, creation and automation of a banking reporting system.

The impact of consumer requests on improved quality service in the private banking sector is reflected in the particular attention of bank top management to the professionalism and qualifications of personal managers [Wahlberg, Öhman, Strandberg, 2016]. The results of thirteen expert interviews with the heads of private banking divisions showed that banks feel a significant shortage of high-quality personnel in the market and are aimed at developing their own manpower teams. Two banks have launched an additional training system, and another bank is planning to launch its own training program in 2019-2020.

As a reaction banks after analyzing the challenges of the external environment identified the following areas of market development: meeting all the requirements of compliance procedures, regional development, restructuring banks' business portfolio in accordance with consumer requests, consumer segmentation strategy on a number of psychographic and behavioral characteristics. The main strategic focus of banks in the private banking sector for 2019-2020 is in attracting target consumers, improving the technological component of the business, and carefully working with investment products in terms of increasing their profitability for both the consumer and the bank.

Conclusion

The growth rate of the Russian private banking services market is determined by both controllable and uncontrollable factors. State regulation of the banking sector, economic conditions in Russia and the world; geopolitical conditions for doing business; the bank's potential in developing customer service abroad; regional expansion, in creating a competitive advantage in the face of intense competition; the bank's policy regarding niche segments, and the structure of the business portfolio; work organization with affluent consumers, digitalization of service processes - that is all are factors that can have the most direct impact on market development .

The factors influencing the development of this market are supplemented by the peculiarities of decision-making by consumers of a banking product in the private banking market, consumers' dynamically changing characteristics, their requests for investment products, services abroad, the degree of trust in the bank and the banking system as a whole, and the maturity of the banks ' marketing policy for demand management. The types of banking activities considered in the article will allow banks to determine the main areas of development in the form of strategic, organizational and managerial decisions.

The analysis of factors that influence the development of the private banking market presented in the article testifies to the high dynamism of market processes in this sector of the economy, which makes

it necessary to conduct not only systematic empirical research of this market, but also theoretical research in the future in order to systematize conceptual approaches to its study.

Measuring the Digital Multiverse in The European Union's Research

Michal GOLINSKI

Warsaw School of Economics, Warsaw, Poland
mgol@sgh.waw.pl

Abstract

We are currently witnessing another industrial revolution, which stems mainly from the acceleration of scientific and technical progress. What is crucial is the exponential development of Information and Communication Technologies (ICT). These technologies affect the society, economy, culture and politics - practically all areas of our existence. The term digital is increasingly used to describe the changes taking place. This article aims to assess the adequacy of the manner in which we define and measure the digital multiverse. A thesis is put forward that the methods we use for this purpose do not fully correspond to the current phenomena.

Keywords: digital multiverse, e-metrics, composite indicators, DESI.

Introduction

Our world is undergoing fundamental transformations. Within the area of intellectual competences the significance of ICT is equivalent with the significance of the steam engine in the area of energy. Digitisation creates new, often unusual shapes of reality.

The development of ICT is of a continuous nature, its pace is accelerating and its impact on our daily lives is becoming more and more meaningful. The scope of this article does not allow for a detailed description of the evolution of information technologies - the transition from standalone computing to ambient computing. Today's ICT is characterized by a cloud of concepts, which are sometimes buzzwords, as shown in Figure 1.

The aim of this article is an attempt to assess the manner in which we measure the transformations of the reality caused by ICT. The DESI (Digital Economy and Society Index), a composite indicator created by the European Union, is subject to a critical analysis here.

Fig. 1: Contemporary ICT landscape

Source: Own elaboration

Digital Multiverse

Often in the history of mankind it has been attempted to first name new phenomena in order to be able to analyse and understand them, and eventually become accustomed to them more easily. Also in the case of ICT and its impact on the reality around us many terms and descriptions have been created to reflect the nature, main elements or causes of the changes taking place. In the scientific and social discourse there were many descriptions of the impact of ICT on the reality. It seems that previously *information society* was the most popular term. *Digital society* and *digital economy* appear to be more and more popular recently. However, they do not fully reflect the extent to which ICT alters our whole reality. To reflect the complexity and multidimensionality of the research area the author will use the - perhaps a bit ostentatious - term *digital multiverse*.

As is often the case with such concepts, there is a lack of a commonly accepted and unambiguous definition. For the purposes of the considerations presented herein, the following definition of the term concocted by the author will be used.

Digital multiverse (DM) is a network of people, organizations, communities, devices, systems, applications and data and their relationships of a global nature, whose main driving force is the exponential scientific and technological progress. The constitutive elements of DM are: intensive use of ICT, integration of physical and digital systems, hyperconnectivity forcing interdependence and cooperation, automation of information exchange and data analytics, unpredictability of development, disappearance of barriers and the resulting new development opportunities and, in the economic sphere, new business models. The driving forces determining the nature of DM are the processes of digital destruction and digital transformation. The described phenomena determine the characteristics of DM, such as: flexibility of structures and processes, high level of innovativeness, increasing efficiency, globalisation, speed of reaction to signals generated by the environment, creation of new consumer needs, intensification of business interactions, creation of intelligent products and services, progressing servitisation of the economy, transition from owning to using and rise of new occurrences and phenomena. The emergence of DM generates new opportunities, but also new threats in practically all areas of human existence.

The definition presented above does not meet formal requirements. DM is an open and blurry

concept, we do not even know all its designates yet. It is rather a description of the origin, constitutive elements and characteristics of DM. This possibly too broad pseudo-definition of digital multiverse can, however, serve as a scheme, which might prove useful in a further analysis.

Several elements of modern times seem to be critical for further deliberations and crucial for the creation of DM. Brynjolfsson and McAfee (2014) emphasize the essence of modern technological progress: "In particular, we need to understand its three key characteristics: that it is exponential, digital, and combinatorial."

These three characteristics generate the phenomenon of *digital disruption*. It is a contemporary "turbo-equivalent" of Schumpeter's *creative destruction* (Schumpeter 1975) - a principle of the capitalist economy described 80 years ago. Digital disruption is responsible for the collapse of the organisations, industries or phenomena unable to adapt to the changes taking place. Today, however, it affects not only the economy but the whole reality in which we exist. The reaction is *digital transformation* - the necessity faced by existing structures craving for avoiding the consequences of digital disruption.

Another feature of modernity is hyperconnectivity, understood as the possibility of communication of everything with everything: people, devices, systems and applications. These interactions are 1:1, 1:many and many:1.

The last element is the newest achievements of ICT presented in the introduction.

The issue of measuring the impact of ICT on the surrounding

Research on the influence of information technology on the economy and society began in the 1950s (Wiener 1950, Innis 1999, McLuhan 1962, Machlup 1962) and, over time, a new field of science was formed - *information economy*. It had to deal with two still unresolved and fundamental problems: definition and measurement. It is difficult to define unambiguously the concepts it deals with (Webster 2006). It is therefore problematic to decide what characteristics of an undefined concept to measure (Webster 2006, Menou and Taylor 2006, Golinski 2012).

For more than half a century, quantitative studies on the spread of ICT and its effects have been the subject of numerous disputes and discussions. The tools for such measurement play many important functions. They are a prerequisite for the formulation, implementation and verification of development programmes and the supervision over the changes taking place - in accordance with the well-known sentence formulated by DeMarco (1982): "You can't control what you can't measure."

If we acknowledge the significance of the DM issues for contemporary times, then, in order to make rational political, business or personal decisions, we must possess quantitative tools to describe the existing situation, define the direction of desired actions and evaluate their effects.

Appropriate indicators providing information on various aspects of the application of ICT constitute the main tool for quantitative description of DM. They allow for the assessment of the level of the development of DM in regions, social groups and sectors of the economy. They are necessary for planning public or commercial projects and investments, and evaluating their implementation.

Since the 1960s numerous quantitative studies on *information society* (for years the most popular term to describe the impact of ICT on the reality) have been developed. They have used two research approaches – an analysis of a large set of partial indicators or composite measures.

It can be argued that working with a large set of partial indicators is the most dependable way of monitoring such a complex area. However, such an approach has a considerable disadvantage. An

extensive set of specialized indicators is clear practically only to professionals. For a wider audience it is too hermetic, difficult and simply boring.

This is exactly what contributed to the popularization of the second stream of research - composite indicators. The growing popularity of the issue of the impact of ICT on the world around us required the development of tools that are easy to interpret (although not to design) and suitable for propagating this issue to a wider audience and using it also in the area of marketing and politics.

In the last two decades approximately 20 tools of this type have been developed (Goliński 2012). However, they described the world of "the old ICT" - *information society*. The indicators used in them were less and less suitable for digital multiverse.

The most popular were two studies of this type, with their many issues. Published by the oldest international organization - International Telecommunication Union (ITU) - ICT Development Index (ITU 2017, ITU 2017a), the issuance of which has been suspended until a new tool, more suited to the present times (ITU 2020), is developed. The second was The Networked Readiness Index (WEF 2016) published by the World Economic Forum. 2016 was the year of the last edition (WEF 2020) of the research conducted since 2011.

Both studies served their purpose for many years. However, they do not fit into the author's definition of digital multiverse presented earlier. What they measure is only to a very small extent in line with the contemporary reality of the digital world around us and the level of the development of ICT and its applications today. This subjective evaluation will be abandoned here, for the lack of space, without a detailed analysis of the design of both indicators.

The tools presented above are not in line with the contemporary reality of ICT, development trends and the resulting changes. They did not take into account the following processes: digital destruction and transformation, integration of physical and digital systems, hyperconnectivity, network effects, “smart city”. Leading technologies were absent: Artificial Intelligence, IoT, blockchains, 3D printing, virtual, extended and mixed reality, Big Data or autonomous devices.

Digital multiverse in the European Union’s research

The creation of the *Digital Single Market* (DSM) is one of the basic strategies implemented by the European Union. It aims to "(...) open up digital opportunities for people and business and enhance Europe's position as a world leader in the digital economy." (EU 2018). The EU expects that the implementation of this strategy will adapt the single market to the requirements of the 21st century. Removing regulatory barriers and integrating 28 national markets into one is expected to generate €415 billion a year for the EU economy and create hundreds of thousands of new jobs (DG Connect 2018).

A key player in implementing the DSM priority is the Directorate-General for Communications Networks, Content and Technology (DG Connect), which is responsible for the EU policy with regards to the digital single market, Internet security and digital learning and innovation.

The implementation of the DSM strategy includes the realization of three main objectives (DSM 2019):

- better access for consumers and businesses to digital goods and services across Europe,
- creating the right conditions and a level playing field for digital networks and innovative services to flourish,
- maximizing the growth potential of the digital economy.

A platform has been created to monitor the implementation of the DSM strategy, allowing for a comprehensive analysis of the ongoing digitisation policies of the EU countries (DSM 2015). There are more than 100 partial indicators, divided into thematic groups, which illustrate the key dimensions of the digitisation issue. This allows for making comparisons both between particular countries and from a historical perspective. The use of this data set is facilitated by attractive visualization tools.

The data placed here allow for an in-depth and comprehensive analysis of the issue of digitisation. Together with other data and the tools for their exploration offered by EUROSTAT an in-depth analysis of the performance of the Member States in various dimensions is possible. These data, however, have a considerable disadvantage. Their number and nature require some specialist preparation. For those less involved in the issue, it seems to be too difficult and demanding a tool.

As mentioned earlier, composite indicators are attractive to a wider audience. For this purpose a more accessible tool has been developed to measure the implementation of the DSM strategy - the DESI (Digital Economy and Society Index) composite indicator.

DESI and its Assessment

The DESI is a composite measure developed by DG Connect to assess the degree of the implementation of the Digital Single Market strategy.

In 2017 the DESI consisted of 31 partial indicators, which were aggregated into 12 second level subindicators, aggregated into five first level indicators, forming a composite indicator (DESI 2017, DESI 2017a).

In 2019 the DESI was updated to better reflect contemporary transformations. Changes in methodology as well as changes in some data sources were introduced. The alterations applied to all three levels of the indicator. Several partial indicators were altered and 13 new ones added.

Currently, this measure consists of 44 partial indicators, which are aggregated into 14 second level subindicators, aggregated into five first level indicators, which compose the DESI (DESI 2019).

For the purposes of this article an assessment methodology based on the previously presented understanding of the term digital multiverse has been adopted. Thus, the indicators which refer to the elements that are fundamental for DM, presented in point 2, will be considered significant. In the subjective view of the author, these elements are the following:

- progressive digitisation,
- recombinant innovation,
- digital destruction and digital transformation,
- hyperconnectivity,
- the latest ICT.

Table 1 presents the details of the construction of the DESI 2017 and Table 2 – the DESI 2019. These tables also contain a subjective assessment of the partial indicators proposed by the author. The status displayed in the table: irrelevant, neutral and crucial reflects the author’s personal view and should not, of course, be taken literally. Rather, it is an attempt to assess the DESI from the point of view of the author's understanding of the ongoing digitisation process, the corresponding level of the development of ICT and the already visible development trends.

Table 1: DESI 2017 - construction and assessment of the partial indicators

	DIMENSION	SUB-DIMENSION	INDICATOR	STATUS
DESI 2017	1 Connectivity 25%	1a Fixed Broadband -33%	1a1 Fixed Broadband Coverage	irrelevant
			1a2 Fixed Broadband Take-up	irrelevant
		1b Mobile Broadband - 22%	1b1 Mobile Broadband Take-up	irrelevant
			1b2 4G coverage	neutral
			1b3 Spectrum	crucial
		1c Speed -33%	1c1 NGA Coverage	neutral
			1c2 Subscriptions to Fast	neutral

Source: Own elaboration based on the DESI 2019

The scope of the article does not allow for a detailed justification of the criticism of all the components of the DESI, in particular partial indicators. Therefore, further evaluation will be of a general nature and will be contained to the level of the five first level sub-indicators.

Connectivity

According to the ITU estimates, in 2019 97% of the entire world's population live within the reach of a mobile cellular signal and 82% live within the reach of an LTE or higher mobile-broadband signal. 93% of the world's population live within the reach of a mobile broadband (or Internet) service. Despite this, only 53% of the world's inhabitants use the Internet (ITU 2019).

In Europe 82.5% of people use the Internet, the percentage of mobile subscribers has reached 118.4%, and mobile-broadband subscribers 97.4%. 99.1% of Europeans are within the reach of mobile networks and 91.3% of LTE or faster (ITU 2019).

It is the author's belief that it is time to stop measuring the users, the level of the development of today's infrastructure and the price level of basic services. Trivializing: "whoever wants, has" and this does not determine the progress of digitisation.

This observation does not, of course, apply to ultrafast broadband networks, and, in particular, to 5G networks - a technique strategic for the development of the Internet of Things (IoT) and other applications that are key to the further development of digital multiverse.

Human Capital

It seems that the study of basic ICT skills can be discontinued. The "digital natives", who make up a growing proportion of the population, are "born" with these skills and use ICT on a daily basis and for a purpose they see fit. The ICT skills of this group of users are often at a low level, usually sufficient only for using ICT as entertainment. It also seems that there is a lack of not so much the

Internet skills but the information skills, such as the ability to critically assess the value of the obtained information or the issues of cyber security and privacy.

Whereas the key skills are the advanced skills allowing to design and create new applications, which will shape the future. Therefore, it is the potential of the developers of future applications that should be monitored, rather than the one of their users.

Use of Internet services

Counting Internet users and non-users in a European environment seems unnecessary. It is a matter of a personal choice rather than the lack of access.

The global Internet user spends on average 6 hours and 42 minutes a day online. 45% of the world's population use social media, of which 42% use mobile devices for this purpose. For Europe these values are 55% and 47% respectively. (DIGITAL 2019). The fact that these are often activities with little "added value" is another story. The "digital natives" use mainly digital content. Whether they obtain the news, play games or watch movies seems to be of secondary importance to digital multiverse. It could be light-heartedly stated that the current level of civilization is rather evidenced by the use of analogue content. The same is true of social networks, in which these people live rather than use them.

However, the use of social networks for professional purposes and digital participation in social and political life are worth monitoring. With the assumption that the Castells's *constant change* characteristic of digital multiverse will be a permanent feature of the future, the use of the Internet for self-learning becomes particularly noteworthy.

The prevalence of Internet shopping and banking makes the monitoring of this area seem unnecessary.

Integration of Digital Technology

According to the author, this is one of the most important characteristics of digital economy and its monitoring is of key importance. Digitisation of enterprises, both in the area of management as well as production, is the foundation of Industry 4.0 - a distinctive feature of DM. The digitisation of trade is already well advanced, but its further observation may still be important. Only the choice of measures can raise some doubts in both these aspects.

Digital Public Services

This is another key element of DM, which is a prerequisite not only for purely administrative applications, but it is also the foundation of such concepts as "smart city" or sustainable development. Recognition should be certainly given to pointing out the issue of open data, which is both a condition for a greater participation of citizens and a basis for creating new ICT solutions. It is also important to introduce indicators to monitor the area of e-health.

The above comments and the "assessment" of the DESI components are obviously not definitive. They constitute a subjective reflection of the author's views. Their main goal is to try to evoke a discussion on the issues of understanding and measuring digital multiverse.

Assessment of the EU actions and postulates regarding further research

The adopted by the EU concept of monitoring digitisation in the years 2016-2021 is described in a dedicated document (DG Connect 2015). It is a "wish list" of a kind - formulated on the basis of the needs of policy makers and not on the basis of the already available statistics. This document takes into account current development trends and focuses on the crucial areas.

Assuming the digitisation model presented in point 2 and the author's definition arising from it, it is important to highly evaluate all the achievements to date, and especially the EU's intentions in the

area of the research into the digitisation processes. Also the evolution of the DESI composite indicator shows that the EU has a good understanding of the requirements of the changing digital reality. The DESI 2019 comes much closer than the DESI 2017 to the understanding of and measuring digital multiverse that are proposed in this article.

It appears therefore advisable to formulate postulates for further work - a kind of a wish list for the EU.

Attention should be focused on the causal factors, the constitutive elements and, above all, on the driving forces behind the changes taking place. In other words, the causes of digitisation should be monitored more intensively, as they determine the nature and pace of the ongoing changes. It seems particularly important, although troublesome, to monitor the driving forces: digital destruction and digital transformation. However, the author finds it problematic to propose concrete measures in this area of research. These aspects appear to be more significant than the nature and potential effects of the changes taking place - they will be variable, dynamic, unpredictable, and some of them we are not yet able to envisage. This does not mean, of course, that we should completely abstain from monitoring them.

The ongoing digitisation process is characterised by high dynamics of the changes we are witnessing. Such a dynamic set of phenomena cannot be analysed by means of once established research methods. Both the subjects of the study and its tools are constantly changing.

Limitations

The limitations of the analysis presented in the paper should be clearly indicated. First of all, it is subjective and the views expressed in it are those of the author. It is an invitation to discussion rather than a final assessment. Secondly, this appraisal was made from the European perspective. The evaluations of individual partial indicators concern highly developed countries and would be inadmissible on a global scale. The EU Member States, even those that joined later, may not be "world champions" in digitisation, but the level of development of their information infrastructure and the intensity of ICT use is not comparable to many developing countries.

The EU also publishes a more global study - the International Digital Economy and Society Index (DG Connect 2018). It covers 45 countries, including 17 outside the EU. This tool, however, has a slightly different design and is not the subject of an analysis here.

The analysis presented is deliberately limited to the EU Member States - it is here and in several other highly developed countries that digital multiverse is being shaped. This allows to highlight the most important features and emerging trends of the phenomenon under investigation.

Conclusion

Future research should focus on an in-depth analysis of digital multiverse and all its aspects. The issue of measuring DM is complex but also interesting. The problem of measurement is crucial for a fundamental reason - DM is our future, therefore we should manage its development and it is not possible to manage something that cannot be measured. This is a difficult task for a number of reasons, which are not mentioned here due to the lack of space. In a way, it is an attempt to measure the unmeasurable.

Pondering on the future development of ICT, Hinchcliffe (2015) envisages the emergence of the 4th Platform, which he understands as a complex fabric of people, community, data, devices, activity and intelligence. Such a structure will have the following characteristics: billions of connected users, applications, sesnsors and uncountable number of network connections and asymptotic network effects. This will enable the implementation of such phenomena as, for instance:

- dynamic contextual services,
- shared perception and learning,
- ecosystem domination,
- instantly composable applications,
- fully digital business models,
- time augmentation,
- digital communities as institutions.

The complexity of the digital multiverse will increase exponentially. The answer to the question what tools to use to measure such a complex reality will become a great challenge for the researchers involved.

The implementation of the vision of digital multiverse will cause significant civilization changes. The society, economy, culture and politics will undergo transformation. In the economic sphere, this means the emergence of new products and services - material, digital and hybrid; the creation of new and the disappearance of many existing industries, markets and professions. DM brings along new opportunities, but also new threats, which will require us to react in real time. The world will change radically and it is not certain that it will be for the better.

Marcin KAWINSKI

Warsaw School of Economics, Warsaw, Poland
mkawin@sgh.waw.pl

Abstract

Economic crime is gaining on popularity. The perpetrators of this type of crime expect substantial financial gain by taking inconsiderable risk of being penalized. Additionally, economic crime is perceived by the society as one that causes low social harm. This factor may encourage criminals to commit economic crime. Insurance crime is one of the most complicated among economic crimes. It results in serious financial losses for the insurance industry. Furthermore, effectiveness of the claim verification process and customer trust are affected as well. The research motivation was to study the differences in social perception of different types of crimes. The aim of the paper is to show a connection between the level of social acceptance for committing insurance fraud and characteristic features of the respondents. The research was carried out using a survey on a representative random group of 1000 Polish citizens. According to the results, all crimes against financial institutions are also perceived as easy to commit. Moreover, the level of education is the key factor which affects the perception of social harm and inclination towards informing law enforcement authorities. Higher education enables to understand negative consequences of crime and helps to induce an appropriate action against fraud. This conclusion can be used for creating preventive programs against the phenomenon of crime and the development of prevention methods.

Keywords: Insurance, Insurance Fraud, Social Acceptance

Introduction and Theoretical Background

Economic crimes, so called white collar crimes have specific attributes, which differ them from common crimes, as was mentioned by Strader (2002). Broad field of economic crime consist of fraud, bribery, corruption, money laundering and market abuse, compare with the book by Palmer (2018). According to the definition placed in the text of International Monetary Fund (2020) it is non-violent crime which results a financial loss. In most cases economic crime is carried out in a way that is not directly noticeable. The detection of this type of crime require professional expertise. It is not simple to identify the damage. In most cases the perpetrators are characterized by high qualifications, and they have plenty possibilities of defense. Finally the mechanism of committing economic crimes due to its complexity is incomprehensible to the average citizen, who have limited knowledge concerning finance, banking and insurance industry.

From this reason, police statistics show serious increase of the threat of economic crimes. Although the share of economic crimes is still not very high, the value of losses for financial institutions and whole economy is very significant, like mentioned by FBI (2020).

Insurance crime is one of the most sophisticated economic crimes. So called fraud is committed by dishonest customer, principally as a result of a faked claim. There are many definitions of insurance

crime that are used in practice, as in the text by Derring (2002). For this reason, a coherent definition of insurance crime has been developed for the needs of the insurance industry. According to Insurance Europe report (2013), insurance crime is a claim for unjustified compensation or compensation for it through fraud.

Insurance fraud is a serious problem, which impacts all insurance markets in Europe. Losses of insurers reach as much as 10 per cent of expenditure related to payment of claims and benefits, see report Insurance Europe (2013). Apart from measurable direct financial losses, insurers bear intangible costs in the form of complication and prolongation of claim adjustment processes as well as they lose trust and reputation among clients. Numerous sources indicate insurance fraud as one of the main threats for the development of insurance markets, like in reports by World Economic Forum (2015), PwC (2015), and EIOPA (2016). Over the years, insurers have managed to create numerous methods of preventing crime, as mentioned by Hymes and Wells (2013). They are based on using IT tools and multidimensional analyses as well as exchange of information about clients, damages and the objects of insurance. However, fighting frauds is hindered by a serious problem of how insurers are perceived and also by social acceptance for committing extortions, as in research by Karsten (2011).

People who are inclined to commit an insurance fraud act on their own or they act as members of an organized crime group. In both cases, the decision to commit an extortion depends on the so called crime triangle – that is motivation (usually economic), opportunity (chance) and rationalization, as noticed in a book by Cressey (1973). Additionally, the perpetrator ponders the ethical risk connected with the committed offence, like in the article by Posner (2004), and in report of FRISS (2016), also in the article by Kassem and Higson (2012). It is related to the level of social acceptance for a given type of crime. In the case of economic crimes it is higher than in the case of serious criminal offences.

Insurance fraud are some of the more complicated economic crimes. That problem was mentioned in the book by Riddle (2014) and by Association of Certified Fraud Examiners (2019). Committing them requires a certain level of knowledge of the functioning of the insurance industry, see reports by KPMG (2013) and KPMG (2011). At the same time, it needs to be noted that the perception of insurers by the society is not explicitly positive due to frequent disputes arising in the process of claim adjustment. The level of social acceptance can significantly impact the number of committed insurance fraud, particularly those incidental ones without participation of crime groups.

The Objective and Meaning of the Research

The objective of the authors is to determine the level of social acceptance for committing insurance fraud and to show a connection between the level of social acceptance for committing insurance fraud and characteristic features of respondents, such as age, gender, level of wealth and education.

A potential connection between the level of education and the level of social acceptance for committing insurance fraud can be used for creating preventive programs based on educational actions directed at clients and for formulating informative policy of the industry in the scope of informing about the attitudes of insurers towards the phenomenon of crime and prevention methods.

The contribution of this paper is to examine the perception of insurance fraud in the context of other types of economic and common crimes. Such research has not been conducted in Poland so far. The respondents were asked, among others, about the perception of six different types of crime, including insurance fraud. The questions concerned the perception of social harm, the easiness of committing certain types of crime, the readiness to inform law enforcement authorities and the probability of being punished. The article also researched potential motivations which may induce potential perpetrators to commit extortions as well as the relations between an incident of not receiving a proper financial consideration from a financial institution in the past and the perception of crime.

Research Methodology

The research was conducted using a survey questionnaire applying the CATI method with the assistance of a professional research agency. The research was conducted in March 2015. The respondents were a nationwide, representative random group of 1000 Polish people over 18 years old.

The respondents were asked, among others, about the perception of six different types of crime including insurance fraud. The questions concern the perception of social harm, easiness of committing certain crimes, readiness to inform law enforcement authorities and the probability of suffering consequences. Potential motivations that can induce perpetrators to commit extortions were also researched.

The respondents compared six different types of crime:

- Shoplifting (Shop)
- Extortion of compensation from an insurer (Insurance)
- Stealing property from an employer (Employer)
- Tax evasion (Taxes)
- Loan fraud (Loans)
- Extortion of benefits from social insurance ZUS or KRUS (ZUS)

Research Results

Individual types of crime present different levels of social acceptance, different types of motivations inducing to commit them, as well as the willingness to object expressed through the will to inform law enforcement authorities. Comparing the results of research conducted on the entire surveyed test group it is difficult to notice significant differences in the perception of social harm. The respondents are clearly stratified here and it is difficult to talk about any tendencies or differences between different types of crime. Some of the participants in the research treat all the enumerated types of crime as highly socially harmful, some of them do not have an opinion, some of them do not see any harm. Similarly, the respondents are divided into practically three equal groups in terms of the willingness to inform law enforcement authorities of the commitment of every of the abovementioned crimes. There were also no significant differences noticed between the different types of violating the law.

Table 1: Question: Would you inform law enforcement authorities of a crime if your anonymity was guaranteed?

Answer	Shop	Insurance	Employer	Taxes	Loans	ZUS
Definitely not	19%	22%	20%	22%	19%	23%
Rather not	24%	29%	22%	30%	25%	30%
Neither yes or no	16%	15%	16%	15%	14%	15%
Rather yes	24%	21%	23%	18%	22%	19%
Definitely yes	14%	9%	13%	11%	15%	9%
I don't know	4%	4%	5%	4%	4%	3%

This demonstrates very large discrepancies in individual perception of a crime as violation of common good. Similar results were reported earlier in the nationwide research entitled "Social Diagnosis" by Czapinski and Panek (2015), placed in Table 2.

Table 2: Categories of behaviour

Type of crime	I don't care at all	I care very little about it	I care a little about it	I don't care about it	It is hard to say
Someone pays taxes lower than they should	22.5%	26.6 %	26.7 %	18.1 %	6.2 %
Someone avoids paying for using public transport	22.0 %	30.7 %	24.7 %	17.2 %	5.4 %
Someone receives disability pension unjustly	17.9 %	22.8 %	25.8 %	27.2 %	6.4 %
Someone extorts insurance compensation	18.6 %	23.6 %	23.9 %	26.4 %	7.5 %

In the cited research, the indicators of sensitivity to common good have slightly improved over the past few years.

All types of crime mentioned in the research are considered relatively easy to commit. Only shoplifting is perceived considerably different as exceptionally easy to commit. Nevertheless, all crimes against financial institutions are also perceived as easy to commit.

Figure 1: Question: Is it easy to commit a given crime?

Comparing motivations, which potential crime perpetrators are induced by, also provide interesting conclusions.

Table 3: Question: What motivates people who choose to commit a given crime?

Reason	Shop	Insurance	Employer	Taxes	Loans	ZUS
Poverty	75%	40%	51%	38%	45%	46%
Opportunity	56%	45%	57%	34%	43%	39%
Legal loophole	14%	39%	19%	49%	41%	37%
High contributions/costs	3%	14%	6%	25%	5%	16%
Everyone does that	6%	7%	12%	8%	6%	8%
Dishonesty of financial institutions	5%	17%	12%	18%	18%	18%
No threat of punishment	31%	22%	26%	17%	25%	22%
I don't know	2%	4%	2%	2%	3%	4%

For better illustration, the above data was pictured in the form of a chart.

Figure 2: Question: What motivates people who choose to commit a given crime?

There can be a very interesting conclusion drawn from the categories provided by the respondents such as: "opportunity" and "legal loophole" as the main reasons for committing crimes to the detriment of financial institutions – banks and insurers. Only in the case of shoplifting the dominating cause of "poverty" was clearly most frequent. The following causes were considered not significant: "high costs", the universality of the phenomenon – "everyone does that" as well as "dishonesty of financial institutions".

Additional information on the nature of economic crime is provided by the perception of a given characteristic of a crime (in this case it is insurance fraud) in relation to individual traits of the respondents. The main traits considered in the research are age and level of education.

There is a noticeable relation between the level of education and the perception of social harm caused by insurance fraud. The higher the level of education, the more this type of crime is considered more socially harmful. Financial crimes, as they are more complicated, require a certain knowledge so that its essence, scale and effects for the society and economy can be understood.

Table 4: Question: What is the social harm of insurance fraud?

Education	Very low	Low	Average	High	Very high	I don't know
Elementary	9%	20%	38%	13%	8%	11%
Vocational	4%	20%	44%	18%	9%	5%
Secondary	4%	11%	40%	32%	9%	5%
Higher	3%	10%	36%	40%	9%	2%

Figure 3: Question: What is the social harm of insurance fraud?

For the above relation the Cramer's V factor was calculated and it resulted in proving that there exists a relation between the researched traits: V Cramer: 0.166153926 with p-value 0.000.

The level of education and age affect the willingness to inform law enforcement authorities of a committed crime, as long as anonymity was guaranteed. The younger the respondents, the more willing they were to report a committed violation to the detriment of an insurer. The older they were, the more resistant they were to fulfil their civil obligations.

Table 5: Question: Would you inform law enforcement authorities of a crime if your anonymity was guaranteed? (insurance fraud)

Age range	Definitely yes	Rather yes	Neither yes or no	Rather not	Definitely not	I don't know
Age 18 to 24	16%	28%	10%	32%	13%	1%
Age 25 to 34	8%	22%	25%	24%	17%	4%
Age 35 to 44	10%	21%	15%	29%	22%	3%
Age 45 to 59	6%	18%	15%	30%	26%	5%
Age above 60	10%	19%	8%	31%	26%	6%

Figure 4: Question: Would you inform law enforcement authorities of a crime if your anonymity was guaranteed? (insurance fraud)

For the above relation the Cramer's V factor was calculated and it resulted in proving that there exists a relation between the researched traits: V Cramer: 0.120309565 with p-value 0.000.

This relation can be explained by a more idealistic attitude of young people, who believe in the standards of law and order and who have not yet experienced negative consequences of reporting a crime. Older people prefer "not to get involved" or they have experienced, for example, an inappropriate reaction of law enforcement authorities to reporting a crime.

As the level of education increases, the size of the group, which is indecisive whether to inform law enforcement authorities, increases. This is a chance for educational programs, which bring awareness of negative consequences of economic crimes. People who are educated at a higher level are able to understand negative consequences of crime and change their decisions in terms of reacting to encountered cases of extortion.

Table 6: Question: Would you inform law enforcement authorities of a crime if your anonymity was guaranteed? (insurance fraud)

Education	Definitely yes	Rather yes	Neither yes or no	Rather not	Definitely not	Don't know
Elementary	8%	23%	6%	26%	27%	10%
Vocational	13%	18%	12%	29%	24%	4%
Secondary	8%	20%	15%	33%	21%	3%
Higher	8%	23%	23%	26%	18%	2%

Figure 5: Question: Would you inform law enforcement authorities of a crime if your anonymity was guaranteed? (insurance fraud)

For the above relation the Cramer's V factor was calculated and it resulted in proving that there exists a relation between the researched traits: V Cramer: 0.136786255 with p-value 0.000.

The level of education also influences the perception of criminals' motivations. With the higher level of education, the factor of poverty disappears as the one characterizing the potential motivation selected by people with elementary education. People who have secondary and higher education select opportunity and legal loophole as the main motivation.

Figure 6: Question: What motivates people who want to commit an insurance fraud?

Conclusion

Crimes to the detriment of financial institutions is a serious multi-layered and complicated phenomenon. It is difficult to unambiguously determine efficient prevention methods.

The conducted research inclines towards drawing the following conclusions: Crimes to the detriment of financial institutions are perceived by large groups of respondents as not very socially harmful and relatively easy to commit. The level of education is the key factor, which affects the perception of social harm and inclination towards informing law enforcement authorities.

The research proves that investing in education can be an effective method of preventing economic crime, including insurance fraud. The respondents who are characterized by education level higher than average are aware of the dangers related to insurance fraud and are inclined to inform law enforcement authorities. At the same time they are aware of the true motivation of crime perpetrators and can see legal loopholes, which favour committing extortions.

Abstract

The essence of integrated management systems for business structures is revealed, in particular, from the point of view of their structure and static-dynamic characteristics. It is proved that no matter how integrated structures are considered- from the standpoint of a hierarchy or process, their characteristics remain the same. It is argued that integrated structures can be in a state of forming or functioning, in addition their properties include: the system's ability to coordinate the goals establishment, choose and apply the ways to achieve them; the system's ability to counteract information entropy; the system's ability to show internal purposeful activity.

Keywords: System, Integrated System, Management System, Objectives Of The System; The System State, Sustainable Development.

Introduction

In the world practice, since the 70s of the twentieth century, integration processes in industry, in particular, in mechanical engineering, have been an important factor in economic shifts. Despite the fact that in Ukraine more than 3000 business organizations in mechanical engineering belong to various integrated structures, the synergistic effects of their activities are low. The management systems of these integrated entities are unbalanced and irrational, the production potential of these organizations is neither reproduced, nor reduced, and it has a negative impact on the environment. In order to overcome destructive phenomena and processes in mechanical engineering, it is necessary to create sustainable development management systems that would take into account such features of domestic machine-building business structures as the environmental needs of society, the number and complexity of production processes, the variety of materials used and finished products, the territorial branching of structural divisions, the volume and diversification of data sets of employees and business partners, objects of financial, managerial and statistical accounting, and so on. This task is aimed at integrating local management subsystems based on the introduction of highly automated information systems, which will ensure that machine-building business structures gain competitive positions, increase investment attractiveness, and increase the level of sustainable development. The problem is that there are no conceptual, theoretical and methodological, and methodological-applied provisions for the formation and use of integrated management systems for sustainable development of entrepreneurship in mechanical engineering.

Research Results

It is expedient to reveal the essence of integrated management systems for the economic development of business structures in the engineering industry (IMSBS) on the basis of a theoretical and analytical model based on the use of dialectics and abstraction as general methods of scientific knowledge aimed at specifying the static-dynamic and qualitative characteristics of these systems (Fig. 1).

Fig. 1: Theoretical and analytical model for studying IMSBS characteristics

From the dialectics the integrated management system of business structure economic development is a set of interacting management sub-systems (local systems) totally managed by senior level management to shape and implement management decisions for the sustainable development of entrepreneurial structures based on hierarchical and functional coordination of the organization's goals and ways of their achieving [1]. From the hierarchy perspective the IMSBS constituent elements are a management senior, providing the IMSBS general management; the IMSBS goals; the local management systems. Accordingly, from the point of the management process view, the

IMSBS components include: the management subsystem; management functions and methods; management decisions; the controlled management subsystem; information and communications.

It is advisable to divide the IMSBS goals into the local and general ones. The local goals are a set of the local business structure tasks by management subsystems. Their implementation is a necessary, but not sufficient, condition for achieving the IMSBS goals. In IMSBS, the organization's overall goals play the most important role. Their formation reflects the object of the management system – sustainable development. An example of the local goals is the timely provision of production units of the entrepreneurial structure with raw materials and materials, achievement of the expected level of labor discipline and labor productivity of workers, ensuring compliance with current standards of technical conditions for production and storage of products, and so on. Among the general goals are to increase the volume and the rational use of the own resources, achieve financial stability of the business structure, ensure the growth of the business structure innovative potential, increase the competitiveness of products, and so on. Based on setting the common goals, the local goals are specified. Using the general and specific management functions and methods, the IMSBS goals are implemented. On the one hand, the IMSBS functions and methods are aimed at achieving its goals, and on the other hand, at the management object. Given that IMSBS, like any management system, is informative, the hierarchical and functional coordination of the approaches to the objectives largely determines the IMSBS performance [2]. This coordination is achieved through the introduction of automated information management systems. Their purpose is to provide management entities with timely, reliable and complete management information when forming and implementing management decisions. Performing this task in a large business structure is facilitated by a high level automation of all the management processes [3].

The top management executives provide overall management of the business structure, that is, set the common goals for sustainable development, detect problems of the local systems' interaction, make decisions regarding the implementation of organizational changes in order to rationalize the formation and use of material, financial, information, intellectual and other resources of the enterprise, and so on. The nature and pace of sustainable development depend more on the quality of the top managers of the business structure management than on the other IMSBS components [4]. Top managers of business structure management, as well as the system's goals, play an integral role in the IMSBS formation. They are associated with local coordination link management systems. Accordingly, local control systems are connected by links of structure and functioning.

Considering sustainable development as an object of the management system, it is also appropriate to treat it as a function of management systems for business structures. Sustainable development of business structures as an object of the management system is characterized by the dynamics of volumes and levels of efficiency in the use of material, financial, labor, intellectual, information and other resources; actual financial stability; the level of innovative potential; competitiveness, and so on. The dynamics of the volume and the level of efficiency of using the resources of the entrepreneurial structure indicates the effectiveness, systematic and consistent implementation of the selected sustainable development strategy by the owners and managers of the enterprise. Regardless the chosen strategy, if as a result of its application, the volume and efficiency of the resources, which the company owes, increase, this is the evidence of its effectiveness and the sustainable development of the enterprise [5]. As for the financial stability, it characterizes the enterprise's ability to fully and timely settle accounts with the creditors, as well as to ensure such a turnover and profitability level of the used resources that the enterprise has the opportunity to expand its activities, qualitatively update the used technologies, etc. [6]. The actual financial stability of the business structure is a factor that affects the choice of sources and methods of financing by the enterprise, the terms of cooperation with business partners, the ability to fulfill obligations, implement innovative projects, apply for participation in the state order, etc. [7]. Taking this into account, the financial stability of the business structure should be considered as one of the main strategic vectors of sustainable development of the business structure, which should be taken into account by managers at all levels of management when forming and implementing management decisions.

In the context of economic globalization, strengthening integration processes, expanding communication networks, increasing the influence of multinational companies on national economies, achieving economic growth by industrial and economic associations and business structures in particular is impossible without the development of innovative potential. The formation of innovative potential as a strategic reference point for sustainable development of business structure is necessary to ensure its economic efficiency and competitiveness. The competitiveness of business structure is its ability to acquire advantages from consumers of finished products and business partners, who are manifested in growing finished products' sales, improving the conditions for providing the enterprise with raw materials, fuel, materials, etc., and liberalizing the requirements of investors and creditors. These characteristics of sustainable development are general strategic guidelines (development vectors) of business structures, on the basis of which the strategic and current plans for sustainable development are formed.

Fig. 2. depicts IMSBS in dynamics.

Fig. 2: IMSBS in dynamics

Note: MIS – management information and communications.

Since IMSBS is an open system, forming goals and making decisions on the choice of ways to achieve them are on accumulating management information from the organization internal and external environments [8]. Management decisions made by top managers are aimed at achieving the expected state of the management object. Top managers do not directly influence the management object, but indirectly through local management systems. Under this impact IMSBS performs several functions, namely: ensures sustainable development of business structures, particularly in growing own resources and increasing their use efficiency, forms and uses the innovation potential, achieves financial sustainability and competitiveness; hierarchically and functionally coordinates the local management systems' goals and methods of achieving them; informs the entities of all management levels of the entrepreneurial structure on the priorities of sustainable development, resource state, and appropriate mechanisms for their use; performs storage, recording, saving, processing and transmissing management information from the controlling management subsystem to the controlled one and vice versa.

Based on abstraction as a general method of scientific knowledge, the thesis highlights the IMSBS properties and states. It is known that the modern systemology considers the systems' property as their ability to manifest certain aspects in the interconnection and interaction. The properties determined by the systems' structure and functions are the system-forming ones. These properties usually include organization, division, elementary, homogeneity, completeness of systems, and so on. In IMSBS the indicated group includes the properties generated by the IMSBS integration-forming elements. All the IMSBS components belong to them except local management systems. Among the properties determined by the systems' structure and functions, it is advisable to highlight its emergence, that is, hierarchical and functional consistency in setting the IMSBS goals, as well as the choice and application of the ways to achieve them. According to the above classification, this property is the main one in relation to all the other IMSBS properties.

With regard to the properties forming the ability of the system self-preservation, they include the systems' abilities: to maintain their own state regardless of changing conditions, and adapt to the conditions of the external environment. The IMSBS property, which belongs to this type, is the system ability to counteract information entropy, that is, the economic and political and legal uncertainty of the external environment, which changes the conditions for functioning the business structure and generates temporary fluctuations within the system. These fluctuations, as the materials of business structures showed, are manifested in the system inability to timely and fully meet the expected values of the sustainable development indicators and are accompanied by top managers' identifying the need for responding to changing environmental conditions. Given that the economic entities are the main engine of sustainable development, their conscious ability to set goals and achieve them is a characteristic of any economic system, in particular IMSBS. This system's participants, that is, managers and subordinates, regardless whether the conditions of the external environment have changed or not, can change priorities (goals) and act in their implementation under the influence of internal beliefs, their own needs, moods, ambitions, and corporate relationships. The properties are also divided into the complex properties (the ones that can be decomposed) and the simple properties (the ones that cannot be decomposed). Among the distinguished IMSBS properties, the complex properties include: the IMSBS ability to hierarchically and functionally coordinate the setting of goals, choose and apply ways to achieve them, as well as its ability to counteract information entropy, i.e., economic and political and legal uncertainty of the environment, which changes the conditions of the business structure and generates temporary fluctuations within the system. The properties that undergo decomposition are generated by its completeness and minimality. These properties indicate that it is not possible to attach a new or delete an existing element of the system without destroying it. Each element of the IMSBS is functionally related to the other elements, so its removal entails the system's inability to function. Joining a new element in the conditions of the system completion means its external integration, which will require changing the IMSBS goals, and therefore, changing the system functional relationships, the role of its constituent elements, and so on. As a result, the system becomes an integral part of the new system and thus, loses its identity. The properties that cannot be decomposed are based on the IMSBS ability to adapt to the environmental conditions (adaptability), as well as the properties of structural and functional stochasticity. As already noted, the system's subjects are its engine. Under the influence of various combinations of the organization internal and external factors, top managers who exercise the IMSBS overall management decide to adapt to the developed conditions, or apply the measures of their changes. Since the list of the factors and their impact on IMSBS are constantly changing, it is almost impossible to fully formalize options for changing environments and making decision-options for managers, so the property of structural and functional stochasticity is manifested in the generation of new options for counteracting the detected entropy by top managers.

With respect to the systems' states, they are characterized by the presence of quantitative and qualitative characteristics of the systems' properties fixed in time. The system state is related to the concept of "system behavior" (the transition of the system from one state to another). As a result of the performed research, the two IMSBS states are identified: the state of system formation and the state of its use (functioning).

It is established that from the dialectics, IMSBS is a set of interacting management subsystems (local systems), the total management of which is performed by a top manager shaping and implementing management decisions for sustainable development of business structures based on hierarchical and functional coordination of the organization's goals and ways to achieve them. The IMSBS components from the hierarchy perspective of systems are the goals, local management systems and the top manager who carries out the general management of the system, but from the perspective of process management are the controlling and controlled management subsystems of the economic development of a business structure, functions and methods of management, management decisions, information, and communication. IMSBS performs the following functions: ensures sustainable development of business structure, particularly, in increasing the volume of its own resources and increasing the efficiency of their use, forming and using the innovative potential, achieving financial stability and competitiveness; hierarchically and functionally coordinates the goals of local management systems and methods to achieve them; informs subjects of all management levels of business structure about the priorities of sustainable development, the resources state and appropriate mechanisms for their use; accumulates, registers, saves, processes and transfers management information from the managing subsystem to the managed system and vice versa.

The conducted research allowed identifying the IMSBS properties and states. The IMSBS properties are classified: by type (properties due to the systems' structure and functions; by the properties that form the ability to the system self-preservation; by the properties that characterize the tactics and strategy of the system's behavior when achieving the goal); by structure (complex and simple properties); by nature (main and auxiliary). As a result of the performed research, the two IMSBS states were identified: the state of system formation and the state of its use (functioning).

The content of integrated business structure management systems, in particular, from their structure's and static-dynamic characteristics' point of view, is justified solely by the quantitative approach, since the qualitative assessment results of integrated systems are covered by the author in his works published earlier.

Abstract

It is proved that the information support level for enterprise management entities is crucial in forming an enterprise management system stable to internal entropy. Based on the expert assessment method and statistical analysis tools, the factors affecting the information support level for enterprise management entities are analyzed empirically. The significance of the factors' influence on the information support level for enterprise management entities as well as the objectivity of the expert research are proved.

Keywords: Factors, Management System, Information Support, Enterprise, Entropy.

Introduction

In our previous research [1], it is proved that integrated enterprise management systems (IEMS) are formed and developed in the entropy of the enterprises' internal and external environment. Under the influence of the objective and subjective factors' interaction forming the economic development conditions, entropy occurs in economic systems, that is, the disorder phenomenon, the economic systems' disorder, and uncertainty about their development's nature and directions. Entropy is present in both the internal and external environments of enterprises. Fig. 1 depicts the signs of the enterprises' internal entropy.

The performed researches suggest that the internal entropy signs before and during the recent global financial and economic crisis, on the one hand, is a consequence of the negative influence of external global, national and industry environments, and, on the other, the internal entropy, in many cases, is caused by the construction's irrationality and the applied management systems' underdevelopment. Enterprises can counteract the entropy of the internal environment by the construction's rationality of the used management systems [2]. By implementing a highly automated information management system, enterprises turn the used management systems into internal integrated management systems [3], which are devoid of the phenomenon of internal entropy and are able to adapt to the entropy of the external environment [4].

Fig. 1: Entropy signs in the machine-building enterprises' internal environment

It is established that the key parameter that determines the enterprise management system effectiveness is the information support level (software) of management entities [5; 6]. In order to study the identified factors' influence (realism and coherence of the integrated system of enterprise management objectives used by the enterprise (P_{rcz}); supplying enterprise with the management information (P_{dz}); documentary support of management activities (P_{tz}); technological support of management (P_{zi}); management staffing, and maintenance used management information system (P_{kz})) per level I3, and setting the indicators' weigh characterizing I3, questionnaire survey of

enterprises managers is made. The need for expert research is related to the fact that there are no other sources of information on the basis of which these factors can be estimated. The processing of expert information provided for calculation of the following indicators for each factor: the average amount of points and ranks set by experts; the frequency coefficient of the maximum possible ratings; the average weight of factors; the scope of ratings, and so on. Experts were selected according to certain criteria. Questionnaires were sent to 241 enterprises. Taking into account the requirements for experts selection, it turned out that potential experts can be 17 people from 28 enterprises. In order to determine the volume of a simple non-repeat sample, where the share marginal error mustn't exceed 10% with the probability of 0.99, we used the formula [7]:

$$n = \frac{W(1-W)\cdot t^2 \cdot N}{N\cdot \Delta_w^2 + (1-W)\cdot t^2}, \qquad (1)$$

where W is the sample share (the share of the sample population elements that corresponds to the studied feature); t - the confidence coefficient for a given probability value; N – the number of the general population; Δ_w^2 - the margin error.

For the probability$p$=0.990, we find t =2.59 in the table of the normal distribution . Since the share variance is unknown, we assume σ^2 = 0.25, so $n = 17,06.$ Thus, the number of a simple non-repeat sample with the probability of 0.99 and the share marginal error no more than 10% should be approximately 17 people. The organization elements of this expert study were its methodical and informational support. It provided for forming a questionnaire, guidelines for completing it, and reference information about the study subject.

Research Results

Next, we will analyze the factors that affect the determining effectiveness factor of the integrated management systems – the information support level for enterprise management entities. In tables 1-3 the points are given, the ranks assigned by experts studying the factors are calculated, and the results of processing expert information are given. As you can see, the experts assigned the highest amount of points to factor P_{tz}-1000 points. On average, the experts assigned 58.82353 points to this factor. The second place was taken by factor P_{dz}– 880 points, the third place was taken by factor P_{rcz}–780 points, the fourth place was taken by factor P_{kz}–750 points, the fifth one – by factor P_{zi} 690 points. The sequence number of the analyzed factors as a result of summing points and ranks is different. Taking this into account, it is advisable to draw conclusions about the factors' weight by the frequency value of the maximum possible estimates. It characterizes the importance of developing the j--factor by the number of the first places assigned to it by the experts. Preference for a particular factor should be given depending on the average rank values or points. And only under the other equal conditions, the factor can be considered the most important for the maximum value K_{100_j}. Given that, the frequency indicator of the maximum possible estimates should be considered as the additional one to the indicators shown in Table. 3.

P_{zi}	80	30	100	30	30	10	70	10	60	40	60	50	20	10	20	50	20
P_{kz}	30	30	10	70	70	100	30	30	10	70	30	40	60	10	50	60	50

Table 2: Matrix of ranks for evaluating factors that affect I3

Factors	Experts																
	1	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	**13**	**14**	**15**	**16**	**17**
P_{rcz}	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
P_{dz}	2	2	2	2	2	2	2	2	2	2	2	2	2.5	2.5	2	2	2
P_{tz}	3	3	3	3	3	3	3	3	3	3	3.5	3	2.5	2.5	3	3.5	3.5
P_{zi}	4	4.5	4	4	4	4	4	4	4	4	3.5	4	4	4.5	4	3.5	3.5
P_{kz}	5	4.5	5	5	5	5	5	5	5	5	5	5	5	4.5	5	5	5

Table 3: Results of expert information processing

Factors	Sum of points assigned by experts to the *j*-factor	Average sum of points assigned by experts to the *j*-factor	Sum of ranks assigned by experts to the *j*-factor	Average sum of ranks assigned by experts to the *j*-factor
P_{rcz}	780	50.71429	17	1
P_{dz}	880	52.14286	35	2.058824
P_{tz}	1000	58.82353	51.5	3.029412
P_{zi}	690	40.58824	67.5	3.970588
P_{kz}	750	44.11765	84	4.941176

It can take values ranging from 0 to 1, but the closer it is to 1, the more significant the factor is. The results of the calculation are shown in Table. 4. To increase the adequacy of the expert information perception, the absolute indicators are converted to the relative ones. To do this, the individual indicators are normalized and the average weighted values are calculated.

Table 4: Results of calculating the average weight of each factor taking into account the position of each expert

Factors	The average weight of the factors
P_{rcz}	0.48008
P_{dz}	0.749663
P_{tz}	0.996104
P_{zi}	0.75431
P_{kz}	0.51992

The results of calculating the average weight of each factor, taking into account the position of each expert, are shown in Table 5.

Table 5: Advantage matrix

Factors	P_{rcz}	P_{dz}	P_{tz}	P_{zi}	P_{kz}
P_{rcz}	-	17	17	17	17
P_{dz}	0	-	15	14	17
P_{tz}	0	0	-	14	17
P_{zi}	0	0	0	-	15
P_{kz}	0	0	0	0	-

As with the results of assigning points to factors, factor P_{zi}got the highest average weight. With respect to the other factors, their weight as a result of calculating this indicator has changed slightly compared to the results shown in Tables 1-2. Taking this into account, it is advisable to perform the next stage of processing the expert information, namely, to build a matrix of preferences. It will allow estimating how many experts gave preference to one factor over the others. The importance of factors in the constructed matrix corresponds to the factors' importance, which was revealed during the summation of the expert ranks in Table 2. Let us calculate the scope of assessments, and to identify the significance of the specific expert assessments, let us calculate the coefficient of expert activity. The results of determining these indicators are shown in Table 6.

Table 6: Indicators of the factors' comparative importance

Indicators	Factors				
	P_{rcz}	P_{dz}	P_{tz}	P_{zi}	P_{kz}
Calculating the amount of points set by experts to the *j*-th factor	17	35	51.5	67.5	84
Calculation of the average amount of points set by the experts to the *j*-th factor	1	2.058824	3.029412	3.970588	4.941176
Calculating the average amount of ranks set by experts to the *j*-th factor	50.71429	52.14286	58.82353	40.58824	44.11765
Calculating the frequency coefficient of the maximum possible estimates	0.48008	0.749663	0.996104	0.75431	0.51992
Calculating the average weight of					

factors	0.48008	0.749663	0.996104	0.75431	0.51992
Calculating the range of *j*-factor scores, points	90	90	90	90	90
The calculation of expert activity to assess the factor	1	1	1	1	1

Evaluating the indicators of the factors' comparative importance indicates that the experts gave preference mainly to factors P_{tz}, P_{zi}, P_{kz} . As the magnitude of the scope shows, when evaluating all the factors, there is a significant scope in the experts' responses. Based on the values of the expert activity indicator, we come to the conclusion that all the assessments of the factors are sufficiently justified, since all the experts participated in the assessment of all the factors without exception. It may also indicate a fairly high competence of the experts. The frequency Indicators of the maximum possible assessments indicate that all the proposed factors were evaluated by the experts with 100 points , especially factor P_{tz}.

After calculating also the concordance coefficient and checking it with using the Pearson criterion (Table 7) there are grounds to assert that the concordance coefficient is statistically significant.

Table 7: Determining the average sum of ranks and the squares of deviations of the sum from the average amount

Factors	**The sum of ranks S_j**	**Deviation of the amount from the average amount, d_j**	d_j^2
P_{rcz}	17	34	1156
P_{dz}	35	16	256
P_{tz}	51.5	-0.5	2.5
P_{zi}	67.5	-16.5	272.25
P_{kz}	84	-33	1089
Totally	255	-	2775.75
On average	51	-	-

Using the data from previous calculations, we calculate the Pearson coefficient:

$$X_p^2 = \frac{\sum_{j=1}^{n} d^2}{\frac{1}{12}[mn\cdot(n+1) - \frac{1}{n-1}\cdot\sum_{i=1}^{m} T_i]} = \frac{2775,75}{\frac{1}{12}[17\cdot 5\cdot(5+1) - \frac{1}{5-1}\cdot 30]} = 69,04. \quad (2)$$

Comparing the calculated value of the Pearson coefficient with the table value X_T^2 for n-1 degrees of freedom and confidence probability (P=0.95 or P=0.99), we see that the above condition is met, so the concordance coefficient is significant.

Abstract

This article explicates relevance of the Eurointegration agenda for reforming higher education in Ukraine and characterizes key studies on administrative and legal aspects of Ukraine's integration to the European and global higher education areas. It emphasizes the importance of implementation of the Bologna process requirements in the higher education system to improve access to education for underrepresented and vulnerable groups, and it proposes to raise the mentioned direction to the level of the national issue of protecting rights and freedoms of participants of the educational process. The article points out the benefits of introduction of the institution of the educational ombudsman in the national system; offers steps to secure adherence to the gender equality principle in the educational system; acknowledges the issue of securing adequate quality of educational services as one of the most important factors in the government policy. The article also emphasizes the importance of deploying the National Higher Education Quality Assurance Agency, and the corresponding system of agencies, as provided by the legislation.The article explores the legal foundations for establishment of the National Higher Education Quality Assurance Agency, and emphasizes the progressive nature of the stipulated procedures to secure gender equality in this process. The article articulates the strategic goal and the guidelines for the Agency's activities, emphasizes the broad scale and constant progress in the educational sector, which calls for continuous academic research, whose practical implementation will help advance the national higher education and propel it towards the European standards.

Keywords: Reforming Higher Education; Higher Education Quality, Anti-Discrimination Assessment of Curriculum Content, Gender Equality.

Introduction

The Eurointegration processes that encompass all sectors of public life in Ukraine are relevant also in the context of reforming higher education in Ukraine and the corresponding administrative and legal regulation of these procedures. Laws and bylaws adopted in the last five years are of importance for this. At the same time, the legislative process in regulating the higher education reform calls for further development. This is why it is useful to analyze and generalize societal relations in the sphere of higher education, to review its current regulatory grounds, and identify the ways to further improve the regulatory grounds of the educational sphere with regard to the European higher education area's norms and standards.

Scientific Hypothesis of the Research

The Eurointegration course of the Ukrainian higher education reform is an adequate response to the globalization challenges. The legal regulation of the mentioned reform will allow formation of the corresponding legal grounds and aligning higher education with the international standards with a goal of its complete integration to the European higher education area.

Methods of the research

In connection with the above, comparative legal analysis of Ukrainian legislation was conducted, with regard to the European Union standards. The legislation in effect regulating public relations in higher education was analyzed using the formal legal method, and the relevant proposals were made for updating and improving the legislation. Possible outcomes of implementing the proposed updates were modeled using the prediction method. The hermeneutical method was used to study and to explain the content and the peculiarities of the laws and bylaws that regulate various aspects of the Eurointegration processes in the higher education sphere. These methods were applied in combination with the general logical methods and techniques, such as analysis and synthesis, generalization, analogy, etc., which enabled conducting an optimal research for identifying problems that can be resolved by improving the current legislation.

Analysis of the Actual Material

The Eurointegration-oriented fundamentals of the higher education reform in Ukraine are crucial and require studying, and so researchers of different fields, in particular, the legal experts, focused their attention on it. Organizational and legal, pedagogical and content-related aspects of Ukraine's integration to the European Union higher education area were studied in the works by N.L.Huberska, I.M. Zarubinska, S.A. Kalashnikova, O.I. Kozievska, V.I. Luhovyi, S.M. Nikolaenko, Y.M. Rashkevych, O.V. Spivakovskyi, O.O. Masalitina, and others. In particular, they studied the problems of changes caused by globalization in the educational sphere, reasons for emergence, goals and instruments of the Bologna process were identified, in particular changes focused on achieving the standards of student-centered learning as the main feature of Europe-bound transformation of the higher education. The research addressed the issues related to regulating procedures of competence-based teaching and assessment of the higher education curricula. Normative, organizational and methodological grounds were laid for introducing the European credit transfer and savings system in Ukraine. The theoretical foundation was developed to implement higher education cycles, qualification frameworks, securing quality of higher education, deployment of international academic mobility, and participation in the European Union's international programs for modernizing higher education. Theoretical fundamentals were laid to restructure the systems of education and its new standards, and organizational, academic and legal support was developed for conducting the reform related to integration into the European higher education system. The Gender Equality Implementation Strategy in the education sector was developed under the name «Education: Gender

Dimension – 2023», whose draft was approved at the Government committee meeting in January 2018.

Protection of the rights of the educational process participants in higher education became the subject of academic analysis conducted by O.O. Kulinich, O.F. Melnychuk, Y. I. Chalyi, and others. Issues of the regulatory mechanisms for implementing the constitutional human right for higher education were addressed, as well as the academic grounds for the constitutional and legal mechanism of implementing the Ukrainian citizens' educational rights. The status of the educational service as the civil law juridical entity was established, and the legal peculiarities of a juridical entity in educational relations were established from the position of securing remedies for their lawful rights and interests. Special attention is turned to securing educational rights for people with disabilities and to development of inclusive education.

The organizational and legal foundations for the reform, improvement, and democratization of management relations in the sphere of higher education were articulated in the works by O.M. Bandurka, L.A. Hayevska, N.M. Zavorotynska, S.V. Krysiuk, M.N. Kurko, M.I. Lehenkyi, R.V.Shapoval, and others. The researchers conducted a comparative legal analysis of centralized and decentralized models of education management, and the latter model proved to be a more advantageous one. The problems of formation and implementation of the innovative educational management were addressed, and the procedures for administrative and organizational, financial and economic, psychological and pedagogical spheres of innovative education management were explicated; the conditions for improvement of expediency and flexibility of higher education public administration were identified, and the guidelines for building the governmental mechanism's organizational structures were articulated. The need to improve the legislation with the goal of normative regulation of communities' participation in education management was substantiated, and the strategy for transition to the state-public model of higher education management in Ukraine was determined.

K.B. Levchenko and O.I. Suslova studied the issue of formation of gender competences of specialists and introduction of gender approaches in education, which is an important direction of further improvement of the education system and of the administrative relations in this sphere.

The problems of ensuring quality of higher education are addressed in the academic studies by V. Y. Bakhrushyn, M.B. Yevtukha, M.Z. Zhurovskyi, H.P. Klimova, H.O. Oborskyi, I.F.Prokopenko, A.A. Sbruyeva, O.V. Spivakovskyi, and others. The strategic goals for the higher education reform at the current stage of social development were established; importance of securing the quality of higher education, as a key point for European grounds of its modernization was explained; the higher education quality management standards were articulated; the ways of standardization and certification of higher education quality management procedures were outlined; the global and regional tendencies of higher education development tendencies in the conditions of building a knowledge-based society were summarized.

At the same time, the advancement and the broad scale of the mentioned issues require constant academic research, and the relevant development and introduction of innovative science-intensive technologies into the higher education reform procedures.

The purpose of the article is to study academic achievements and practical experience of deploying the European higher education area, and to develop the relevant reform proposals for the regulatory framework that will secure incorporation of Ukraine's higher education into this area.

Theoretical provisions of regulatory grounds for the higher education reform in the Eurointegration context

Integration of Ukraine into the European higher education area within the Bologna process framework might be the most important aspect of the educational Eurointegration that calls for researching (The Bologna Declaration, 1999). The Paris Communiqué, approved by the Conference

of Ministers for Education of the European higher education area (May 24–25, 2019), pointed out the achievements of European countries in this sphere, and feasible ways for further development, which, in particular, include deployment of institutional autonomy and formation of civil responsibility for development of higher education, securing a high level of higher education quality to comply with the *Standards and Guidelines for Quality Assurance in the European Higher Education Area*, as well as improvement of access to higher education for underrepresented and vulnerable groups (Paris Communique, 2018). Specifically emphasizing the latter direction's exceptional importance, we consider it feasible to extend it to the level of the overarching problem of protecting rights and freedoms of educational process participants in higher education, which, in addition, is based on crucial international documents as the Incheon UNESCO declaration as of 2015, which was adopted at the World Education Forum (World Education Forum 2015, Incheon, Republic of Korea, May 19-22, 2015) (Forum, 2015), the Council of Europe Gender Equality Strategy 2018-2023 (Council of Europe Strategy, 2018), etc.

Systemic analysis of regulatory grounds for the higher education reform in Ukraine

Pointing out a number of important steps made in this direction, first of all, those related to school education, we emphasize both the importance of their extension to higher education and search and implementation of new forms of protecting and safeguarding the rights of the educational process participants specifically in higher education, and their regulatory codification. In particular, as a positive example of this we can mention the anti-discrimination assessment of textbooks and of the curriculum content conducted by the expert group of the Ministry of Education and Science of Ukraine within the framework of the Laws «On the Principles of Prevention and Combating Discrimination in Ukraine» and «On Ensuring Equal Rights and Equal Opportunities of Women and Men». (On the Principle, Law, 2012 & On Ensuring Equal Rights, Law, 2005). Based on the expert evaluation results, cases of direct, indirect and hidden discrimination based on race, skin color, political, religious, and other beliefs, sex, age, disabilities, ethnic or social background, citizenship, language, marital and property status, place of residence are identified. The expert evaluation results are articulated in a form of an extended expert opinion and are published on the website of the Institute for Modernization of Education Content. They serve as recommendations for correcting regulations and guidebooks (if deemed discriminatory), which are printed at the expense of the state budget. This practice should be extended to include all teaching aid materials used not only in the secondary education system, but also in the higher education system.

An absolute innovation of the Ukrainian educational legislation, focused on facilitation to creating conditions favorable for implementation of the human right for education, is introduction of the institute of the educational ombudsman by the Law of Ukraine «On Education» (On Education, Law, 2017). The educational ombudsman is the official of the Cabinet of Ministers, who has a mandate to review complaints on the issues of education and to verify the facts reported in such complaints, to obtain information necessary for his/her activities from educational institutions and from education administration bodies, and to make decisions based on the results of the verification pertaining presence or absence of violations of educational rights, and to give the relevant recommendations, to notify law enforcement agencies, to visit educational institutions and to participate in meetings/conventions of governmental agencies with relevant competencies, to provide consultations for the educational process participants, to participate in counteraction to bulling in the educational institutions, and to represent the interests of individuals in court.

The bylaw (provision) on the educational ombudsman, as well as the procedure and conditions for filing complaints and addresses to this official are approved by the decree of the Cabinet of Ministers of Ukraine (Some Issues, Decree, 2018). The mentioned document stipulates the procedure for assigning and dismissing the official for the ombudsman office by the initiative of the Minister of Education in Science, for the term of five years, without a right to re-assign. Here, we should point out that designating the Minister of Education and Science as the initiator to nominate the education ombudsman is disputable, as in this case, the ombudsman becomes dependent on the Minister, which can considerably limit the ombudsman's motivation to act in protection of the educational process

participants. A more appropriate solution would be a democratic procedure for assigning the educational ombudsman based on the results of an open competition conducted by the Cabinet of Ministers.

The requirements for the applicants for the position of the educational ombudsman also need improvement. Currently, those requirements include: a Ukrainian citizenship, permanent residence in Ukraine in the last five years, five years of work experience in the sphere of education, fluency in the official language, legal competence, and no criminal record. Our proposal is to expand these requirements by adding 'absence of administrative sanctions for corruption-related offences'. At the same time, the educational ombudsman was already selected and appointed. The current educational ombudsman, S.I. Horbachov, and his office, besides purely organizational measures, have been focusing their attention on resolving the issues of fire safety in educational institutions, use of public service announcements to raise the public awareness about the rights of the educational process participants, tenders for textbooks, etc. The educational ombudsman's key sphere of activities is the pressing problem of combating bullying.

The urgent problems to consider are those of general democratization of the higher education management system both on the national scale and in each higher education institution separately. First of all, this encompasses transition from the state-owned to state-public forms of higher education management and implementing innovative managerial forms and methods. Reform is required for the very management model of higher education, which should secure its competitiveness on both the Ukrainian and European and international labor markets, encourage investments into the educational sphere, and become a foundation for improvement of the quality of educational services by changing motivation of all of the educational process participants. To legislatively support the mentioned innovations, the draft on amendments to the Law of Ukraine "On Higher Education" introducing changes to the management system for higher educational institutions was developed and filed for consideration by the Verkhovna Rada of Ukraine (Draft Law On Higher Education, 2018). The main idea of the proposed legislative changes is re-aligning the higher education management system by dismantling the authoritarian command and control models and deploying democratic and transparent ones, and inclusion of elements of corporate governance. The administrative, legal and organizational aspects of the draft provide for redistribution of powers between the administrative structures of higher educational institutions by means of giving more power to supervisory boards and academic boards, a clearer regulation of activities of the institution's executive body and for activities of the financial director, which is the position introduced not as an imperative requirement, but as following the position and wishes of higher educational institutions.

The authors of the draft law believe its approval and implementation will help make higher educational institutions more robust, enhance their administrative and organizational potential, and secure transparency, effectiveness, and high quality of university educational services by universities.

The draft itself provides for amendment of Section 7 «Managing a higher educational institution», and expanding it with new articles 34-1 (Executive body of a higher education institution), 34-2 (Financial director), and 41-1 (Council of young researchers). The amendments provide for extension of powers of the supervisory board of an educational institution (approval of the institution's development strategy, control over the institution's economic activities and over the elections of the head, approval of nominees for the position of the financial director, approval of the budget and of annual reports, etc.), and updating the procedures for its formation. A considerable focus is on democratic and transparent procedures of formation and operation of supervisory boards. It proposes to task the academic boards mainly with the issues of setting the content and quality of curricula and scientific research, educational and research activities of the higher educational institution. The draft is innovative, first, in its focus on the normative definition of the administrative and legal status of the executive body of an educational institution and on introduction of the position of the financial director, as well as on regulating legal relations that emerge as a result of this. The draft continues the strategy focused on further strengthening of the role of student self-government in organizing the process of education, and in the entire functioning of the institution in general. Of special note is the proposed innovation concerning introduction of the young researchers' council, whose introduction is

seen as deployment of research activities in the community of students. This draft also amends the procedure of electing the head of a higher educational institution, first, by changing the share of votes required to elect a candidate. The draft law stipulates that two thirds of the total number of voters should vote for a candidate to elect him or her the head of the institution without any further conditions. If no candidate makes it to this threshold, the supervisory board retains the right to make this decision and can either ask the founder to appoint one of the candidates that received over a quarter of votes, or to declare the elections void. It is also proposed to align regulation of the appointment procedures with the legislation in effect that stipulates a special validation process for people who are candidates for offices that have the status of "responsible" and "especially responsible", as well as for the offices with increased corruption-related risks.

For the first time, the anti-crisis management procedure is stipulated, the procedure of implementation of which is supposed to be approved by the Cabinet of Ministers of Ukraine. At that, the founder is granted a right to assign, based on the supervisory board's motion and under the term-limited labor agreement, the acting head of a higher educational institution for implementing the anti-crisis management measures, for the term not exceeding two years. Certain limitations are set: the person who was assigned to the position for anti-crisis management may later run for the head of the institution but can be elected only with at least two thirds of the votes during the elections. To improve the transparency of the election procedure, the draft stipulates that it is possible to incorporate public control over the procedures at all stages of the elections.

At the same time, we emphasize that implementation of the innovations listed above will require amendment of the powers of the central government body of the executive power in the sphere of education and science, and of other agencies that have higher educational institutions in their sphere of competence. These amendments are also included to the content of the draft law.

When evaluating viability of the innovations proposed, we can quote the opinion of O.V. Spivakovskyi: «The proposed draft for amending the Law «On Higher Education» is focused, first of all, on improving the effectiveness of management of higher educational institutions, their autonomy, and their internal self-regulation. Mutual reinforcement of different administrative chains should take place by means of rational and measured distribution of powers, combination of the elements of democracy and effective control by key internal and external stakeholders. The draft authors are convinced that this amendment of the legislation will facilitate institutional solidification of the institutions and improvement of the academic sphere in general» (Spivakovskyi, 2018).

Institutional support priorities for quality of higher education in Ukraine

One of most important requirements for Ukraine's entering the European and international area of higher education is securing proper quality of educational services and thus we can consider it among the key aspects of the state education policy. At that, the general agenda of improving the quality of Ukrainian higher education centers around the issues of development and implementation of the updated contents of education and of the standards of educational activities, introduction and running-in of the quality management system and assessment of its results. The latter direction requires this education quality assessment system to be theoretically substantiated and legally regulated, transparent and efficient.

Within the European integration framework, securing proper quality of higher education aligns with the Standards and Guidelines for Quality Assurance in the European Higher Education Area (ESG), which were adopted by the Ninth conference of Ministers responsible for Higher Education in countries of the European education area, (Yerevan, May 14–15, 2015) (Standards, 2015). These standards and guidelines address the external and internal quality assurance systems and quality assurance agencies. As to the latter aspect, the authors of this document emphasize the significance of the organizational support of these agencies' operation, which has to enable regularity of their activities towards achievement of clear and understandable objectives and public exposure as well as the required scope through, first of all, engagement of stakeholders. These agencies should possess an official legal status acknowledged by the corresponding governmental agencies and independence

and autonomy in their activities, achieved through adequate resources at their disposal, both financial and human. Their activities should be made transparent through regular publication of reports and conclusions, internal quality assurance and integrity in their activities. External assessment of activities of such agencies is also provided for.

Therefore, these Standards envision both a wide deployment of the higher education quality assurance agencies and the need for a government institution, which would ensure deployment and operation of such system and oversee it. As to the first aspect, we want to point out that deployment of such agencies can rely on the principles of centralization and decentralization. While we wholeheartedly support the strategy of Europeanization of education in Ukraine overall through decentralization of its management, we believe we should point out a caution against superfluities in such processes related to quality assurance of higher education, expressed by experts from the Netherlands. Yet, the researchers also emphasize an exceptional effectiveness of a decentralized system, which allows engaging prominent scientists and cultural luminaries, as well as general public, into the administrative procedures of evaluating quality of higher education (Maassen, 1997).

As to the governmental support for securing the proper quality of higher education, it is related to the mandate of the National Higher Education Quality Assurance Agency, which the legislators establish as a standing collegial body, authorized to implement the governmental policy in the sphere of quality assurance of higher education (On Higher Education, Law, 2014). The legislators establish the procedures for establishment of this body, which, importantly, include the sectoral representation principle and the gender balance principle. This body's legally regulated powers, main requirements to its structure, grounds and areas of its activities, as well as sources of its financing are also stipulated.

We emphasized the importance of application of administrative and legal mechanisms to secure such an innovative principle of establishment of the body as gender equality. Attention to this point reflects the content and the directions of the governmental policy of European integration and extension of representation of various social and demographic groups in the decision-making processes. For example, Article 1 of the Law «On Ensuring Equal Rights and Opportunities of Women and Men» gives a definition for the notion of «gender equality» as an equal legal status of women and men, and equal opportunities for its implementation, which enables people of both sexes to equally participate in all spheres of the society's life (On Ensuring Equal Rights, Law, 2005), a balanced representation of representatives of both sexes in administration and in decision-making: «governmental agencies and bodies of local self-government, enterprises, organizations and institutions, NGOs facilitate a balanced representation of sexes in management and in decision-making. To achieve the goal of this Law, in their activities they may use affirmative actions».

The mechanism of practical application of affirmative actions is gender quotas – regulating the ratio of males and females in all decision-making agencies, which is supposed to be used at formation of the National Higher Education Quality Assurance Agency, and which at the same time can be viewed as a practical implementation of Article 4 of the UN Convention for Elimination of All Forms of Discrimination against Women concerning temporary special measures (UN Convention, CEDAW, 1979). This article establishes that member countries can use temporary special measures aimed at accelerating de facto equality between men and women that shall not be considered discrimination as defined in the Convention, but shall in no way entail as a consequence the maintenance of unequal or separate standards; these measures shall be discontinued when the objectives of equality of opportunity and treatment have been achieved.

Clause 5 of the State Social Program on Securing Equal Rights and Opportunities for Women and Men by 2021, approved by the Decree of the Cabinet of Ministers of Ukraine as of April 11, 2018, No. 273, also provides for the necessity to reduce gender imbalance in the sphere of public service and in the human resources sphere (On Approval of the State Social Program, 2018).

A positive example of application of this norm is the Decree of the Cabinet of Ministers of Ukraine as of August 29, 2018 No. 703 «On approval of the Provision on the competition for selection of the

members of the National Higher Education Quality Assurance Agency», which provides for adherence to the principles of gender balance during the selection. (On approval of the Provision on the competition, 2018). The Provision approved by this resolution establishes that, according to part one of Article 19 of the Law of Ukraine "On Higher Education", the National Higher Education Quality Assurance Agency consists of 23 people, who are appointed by the Cabinet of Ministers of Ukraine based on the resolution of the Competition Committee for selection of the members of the National Higher Education Quality Assurance Agency, based on the results of the competition, conducted with adherence to the principles of gender balance and sectoral representation. The principle of gender balance is implemented according to the requirements of the Law of Ukraine "On Ensuring Equal Rights and Opportunities of Women and Men" by means of: mandatory delegation as candidates to the membership in the National Agency of people of different sex by the delegating entities listed in clause 3 of this Provision, if this particular entity delegates at least two people; application of the affirmative action to achieve a more balanced representation of women and men in the National Agency – with preference of representatives of the sex that is a minority (clauses 2 and 4 of the mentioned Provision).

At the same time, implementation of the gender-sensitive approaches into the process of selecting people who will form the National Agency requires its members and all participants of the educational process to have gender competences. For this, it would be reasonable to use the approaches worked out by K.Levchenko and O.Suslova to identify the specialists' gender competences (Levchenko & Suslova, 2019), as well as to secure integration of the topics of gender into the curriculum programs of specialists of all levels.

The strategic goal of the National Agency's operation is deployment and support for functioning of the entire legally-grounded and research-supported quality assurance system for the national higher education, which should be characterized by an active academic and research community, students, employers, professional associations, general public, and mass media. At that, the mentioned system, just as stipulated in the legislation, should cover both internal and external quality assurance institutions of higher education, as well as quality assurance of the operation of the National Agency itself. By identifying, developing and sharing effective and progressive approaches, models, algorithms and technologies for evaluation of the quality of higher education, the National Agency should facilitate integration of the Ukrainian system of higher education into the European and international higher education areas.

It seems feasible to articulate the operation principles of the National Higher Education Quality Assurance Agency, which, in particular, should include professionalism, responsibility, nonpartisanship, openness and transparency. Deployment of the National agency's operation on the foundation of the mentioned principles and their relevant reflection in the operation principles of the system of independent institutions of evaluation and quality assurance of higher education will help advance this sphere to the level of the European and international educational standards.

Conclusions

Analysis of theoretical, methodological, and applied studies of the problematics of administrative and legal grounds for the higher education reform in Ukraine in the context of Eurointegration shows that they are relevant and deserve more attention of the researchers. At the same time, the broad scale and constant development that characterize this sphere, require continuous academic studies be conducted, as it can improve the higher education in Ukraine and bring it closer to the level of the European standards. Probably, the most urgent of the issues in the mentioned academic research are the issues of protecting rights and freedoms of the educational process participants in the higher education, structural reconstruction of the national higher education's management system and improvement of quality assurance system for educational services, and inclusion of the gender equality principle into the system of education. It is advised to resolve these problems by taking organizational, legal and methodological measures for securing rigorous observance of constitutional rights of all participants of the educational process, development of the democratic basis for a higher education organization, and its realignment to state-public management, institutional development of

governmental bodies and institutions of Ukraine, called to facilitate protection of rights and freedoms in higher education, and securing the quality or higher education, and the relevant regulatory and legal support for the mentioned innovations.

Abstract

This research aims to determine the primary factor of character high school students. The formation of character as a behavior developed from the theory of constructivism, and the theory of social learning Bandura. The research method is a survey with a correlational approach. The population research is 432 High School students with 115 samples of data analyzed. Hypothesis test with regression Liliefors, normality test, linearity test and significance of the regression coefficient and correlation with ANAVA then conducted path analysis. The results showed the direct and positive influence of the learning environment variable on self-concept, direct and positive impact of self-concept variable to learning attitude, the direct and positive effect of attitude variable on the character. The indirect and positive influence of the learning environment on the character through self-concept and attitude with the total weight and the learning environment has a positive indirect effect on the attitude through self-concept. The character is formed effectively by instilling self-concept students through the learning environment to create the right attitude in learning.

Keywords*:* Character, Learning Environment, Self-Concept, Attitude.

Introduction

The character is an essential aspect of the national development of a country. Low character of society will affect into social and economic downturn. Cultural values of the nation as the basis of thinking society and act formed through education. Schools can develop a character-building curriculum as a character education curriculum as former student behavior.

Character issues in Indonesia reflected on the data of Transparency International Corruption Perceptions Index that the level of corruption in Indonesia still show vulnerable numbers (high corrupt) in the rank of 90 out of 176 countries in score 3.7 with the most-cleanest country of corruption is Denmark in rating 9.0 (Transparency International, 2016). Corruption imposes considerable economic and social costs (Starke et al., 2016); (Lewis, 2016) in Indonesia (Merkle, 2018); (Prabowo, 2015) and become a basic problem of development even the classification of corruptors in Indonesia, especially the state officials being imprisoned (Hamdani et al., 2017). Indonesia overcomes it by launching the

national education curriculum program that emphasizes character education as a process and academic subject with the school-based curriculum (SBC) in 2013.

Many factors influence the character as a learning result such as attitude (Muhammad B. & Saparahayuningsih, 2016), (Mohammed Chowdhury, 2016) environment which students develop (Kerr et al., 2018); (Suparno, 2018); (OECD, 2018) which consists of learning environment, social environment, as well as parenting patterns (Ceka, 2016).

Changing student behavior permanently into character is the result of a long learning process. In constructivist learning theory, changes in student behavior is a result of knowledge and learning experiences (Alt, 2016); (Fernando & Marikar, 2017). "Bandura's social cognitive theory explains individual learning, development, acquisition of knowledge, and self-regulated competency within a social context, in which parents, peers, and teachers play a significant role as social models" (Hulleman et al., 2016).

From the perspective of learning, student behavior is learning outcomes programmed through a set of planned and measured curriculum based on plan behavior according to Ajzen's planned behavior theory (de Leeuw et al., 2015). Based on that theory is very important for the school to design a learning program that integrates character in the curriculum (M. A. Arifin, 2017); (Virtues, 2014) merged with lesson with three components of good, there are moral knowing or knowledge of moral, moral feeling or sense of morality, and moral action or moral act (Mohammed Chowdhury, 2016). Learning at school requires the creativity of teachers and a good learning environment so as to foster good learning behaviors and intentions (Saptono, 2016); (Febriantina, 2018).

Character learning result is student behavior after completing learning activities through experience and practice in cognitive, affective and psychomotor. S.M.A.R.T is one of the character education models in IIS students. As an education character developer, integrated Islamic school incorporated in ISS network in Indonesia than in 2017 reached 2100 schools from primary school until senior high school. IIS as a pioneer of education character has a high potential to produce smart students that are needed by the future of the nation such as leadership, entrepreneurship even innovations in science and technology. S.M.A.R.T is an acronym from saleh (pious), musleh, cerdas (intelligent), mandiri (independent) and terampil (skilled).

Various models of character building still not effective, because the character education program needs curriculum and approaching for giving permanent learning experience to students to become independent knowledge. The purpose of this research is to provide a S.M.A.R.T character building model for students in school. Analysis of factors that influence S.M.A.R.T character building of the students being the emphasis on development in the educational process. The learning environment, social environment, parent patterns as a place for students to grow up, attitude and self-concept building, which make the permanent character and ready to live in society. Based on the theory, the structure path analysis (constellation) which built in the research, are:

Figure 1: The Proposed Model

Literature Review

Previous research about the learning environment, social environment, parent patterns, self-concept, attitude towards S.M.A.R.T character building of the students only partially analysis. Simultaneously, measurable behavioral changes were evaluated as a habit and being the S.M.A.R.T character of the students which can be formed in school. From the education perspective, the school must be sure as a formal institution that can form the S.M.A.R.T character of the students through the curriculum always evaluated constantly being developed. S.M.A.R.T character of the students comprehensively analyzed based on three fundamental theories there are knowledge formation and behavior based on environment in Social Learning Theory (R. binti M. Arifin et al., 2018); (Hope & Ca, 2016) plan behavior, person behavior to do something based on the attitude toward the behavior, and behavioral control as classification of action, such as deliberate action or done with specific purpose for future which becomes a habit as a character, as well as the formation of knowledge and character as behavior based on experience in constructivism learning. Through behavioral model build upon environment influence accordance Bandura theory, and the effect towards self-concept and attitude, thus becoming a planned behavior matching planned behavior theory, and impact of permanent changing which become a habit of learning theory, as well as cognitive behavior, or even knowledge construction based on experience.

Study character is the focus of the study as a fundamental value of education and morals continue to be developed. Various countries as the study of curriculum development and effective behavior building in Japan (Kimura & Tatsuno, 2017); (Ministry of Education, Culture, Sports, Science and Technology-Japan, 2018), in British (Taylor, 2017), in China (Yang, 2018) and being modern central theme (Pattaro, 2016), even into the 21st-century education theme (Kimura & Tatsuno, 2017); (Bertram, 2016); (Singh, 2019).

S.M.A.R.T Character

Education provides the learning process to change behavior. The character curriculum encourages permanent learning experience as a long-term memory of the learning experience. Implantation of values and long-term habituation is not easy, through character school programs will begin to appear, familiar, and if successful it will be entrenched.

Character is a positive value that can be developed in student behavior, starting with habituation and becoming a repetitive and permanent activity in students. The character becomes the focus of educational institutions in developing student personality as a whole. According to Salls (Suparno, 2018),) character education is the process of transforming values so as to cause virtue/transformation (transforming values into wisdom). Schools as formal educational institutions need to develop models for the formation of character education as excellence in the education curriculum to enter learning classes (Retnawati et al., 2018). Daniel Goleman states that character education consists of 9 basic

values, namely: "1) responsibility; 2) respect; 3) fairness; 4) courage; 5) honesty; 6) citizenship; 7) self-discipline; 8) caring; and 9) perseverance " (Evy et al., 2016).

Character according to the Indonesian Ministry of National Education is nature, behavior, morals or personality which is formed from the internalization results of the various virtues which are believed and used as the basis for perspective, think, attitude, and act. Schools as an educational institution develop character learning to learners. Many patterns developed by the school into a model to reached permanent learning results as a culture or habituation. Character values took from national education purpose then adjusted with school coaching patterns.

S.M.A.R.T character as an acronym from Saleh (pious), muscle, cerdas (intelligent), mandiri (independent) and terampil (skilled) became an application model in IIS. Character values developed as a form of learning, habituation, and create culture suitable with IIS character. When many schools did not have model and character building, S.M.A.R.T is the basic character values that are implemented through a learning process based on students, class, and school as the totality of implementation and school responsibility.

Learning Environment

An environment where learning takes place very influences students' development in learning. Informal education, students learning environment can be done by conditioning and manipulation to obtain learning outcomes that are desired and be able to bring the real learning condition so produce a learning experience.

The environment could be a stimulus for the formation of knowledge and skills. A conducive learning environment is able to shape the character of students so that they have good learning. The learning environment as a determinant of the main learning outcomes can be designed to produce education and character according to learning objectives. Human first educational human is family (Demirel et al., 2016) even parents' responsibility is unlimited for formal education. Family as an early education give a basics character and noble values which formed since early stage. The family environment itself consists of the parent (father and mother) and child. Parenting is an interaction between a child and a parent during parenting activities. This parenting means parents educate, guide, discipline and protecting the child from reached mature by norms that exist in society. This parent's attitude covers how parents give rules, prize even punishment and the way parents give attention and responsibility towards the children. Parent patterns are away or parent manner in interaction with children during parenting in giving rules, prize, punishment, attention, response, and education.

The social environment influences learning activities and behavior (R. binti M. Arifin et al., 2018). The social environment that surrounds our lives and children could be very influential in the learning and development of children. Therefore, we must be able to assist the child so the child could recognize a good environment, in order not to become obstacles or barriers towards the learning process and his development. The environment can make human as the learning process. In a bad environment, a person can do and pushed to do things negatively. In contrast to a conducive and enjoyable learning environment will be able to provide excellent learning and encourage someone to do good things.

Based on the study above it can be concluded the learning environment is everything that comes from outside on student influence, either directly or indirectly and associated with the learning process in the form of the physical environment of schools, parent patterns at home and social environment for growth and development of students to achieve learning success.

Self-Concept

Behavioral change as a result of learning is strongly influenced by individual learners to accept, understand and implement the knowledge gained. Information as the learning process will be verified

and determined by conformity to him. A wide range of knowledge and thought someone about himself reflected in the concept of self (Dani, 2018). Meanwhile, according to Hurlock, self-concept is an idea that people have about themselves and a combination of beliefs that people have about themselves, the physical, psychological, social and emotional, aspirations, and achievements (Mualifah et al., 2019) even important at the time of one's career formation (Istiana, 2017).

Self-concept was formed because of individual interactions with the people around him. What is perceived by other individuals about him is not separated from the structure, role and social status that carried people? Thus, the social image can be realized in the ability to socialize and adapt to the surrounding environment, both at school and in the community. In reviewing of self-concept as a feeling to be appreciated and assessment for self. Djaali (2003) argues self-concept originally came from feeling appreciated or unappreciated (Sustikasari, 2018); (M et al., 2017). So that feeling is the basis of view, assessment or someone's shadow about himself which overall called self-concept. There are four factors which had a role in self-concept formation, there are, a) ability factor of each child, b) feeling factor c) Virtue factor d) strong factor of behavior.

Perception or outlook of itself as a self-concept, which is formed through experience and interaction with others, either physically, psychologically, and socially so that will affect a person's attitude and develop the character by deciding what to do or not to do as a choice based on its knowledge.

Learning Attitude

When someone involved in the social environment and social interaction, then there will appear feeling like it or not. Azwar (2013) states that the phenomenon of attitude, which is the emergence of other than the specified state of the object being faced is also determined on experience. An attitude is a form of evaluation or feeling reaction (Ari Saptono, 2016).

Attitude has a power, where a strong attitude will be relatively stable over time, withstand persuasion and predict real behavior to change. Attitude towards an object act as an intermediary between response an object in question then crystallized as a potential reaction to an attitude object. Furthermore, according to Ajzen, attitude is a picture of a summary evaluation from psychology object recorded in some dimension attributes such as bad-good, harm-benefit, happy-sad, and liked-disliked (Ari Saptono, 2016). “attitude is the basis for all social behavior. In general, attitude is perceived as the hidden reason for people’s behavior towards an object, issue or person”(Kibrislioglu, 2015)

In summary, attitude towards an object showed with a cognitive response, which reflects perceptions and beliefs about an object; effective response, evaluation and feelings towards an object, and the answer showed by a tendency of someone to act in connection with the attitude object. Someone's attitude which response repeatedly to an object becomes a behavior as a character.

Based on the theory and conceptual above, the hypothesis proposed in this study there were six as follows: 1). H1: There is a positive and significant link between the learning environment and student self-concept, 2). H2: There is a positive and significant link between the learning environment and learning attitude, 3). H3: There is a positive and significant link between learning environments and S.M.A.R.T student character, 4). H4: There is a positive and significant link between self-concept and learning attitude, 5). H5: There is a positive and significant link between self-concept and S.M.A.R.T student character, 6). H6: There is a positive and significant link between learning attitude and S.M.A.R.T student character

Method

This study aims to obtain information about the relationship causality and the strength of the relationship directly and indirectly between the variables of the research that is learning environment, self-concept, learning attitude, and SMART character from data that can be trusted and proven

empirically. Information and facts about the influence of these variables can be an alternative guideline for the development of student character for students, teachers, schools, and parents.

The method used in this research is the survey method with a causal approach. The survey method aims to obtain an overview of the observed object, explaining the relationships of several variables whose position has been described regarding theoretical thinking while the research design used in this study is ex post facto. The population in this study are 432 students as respondents. The sampling technique used in this research is a random sample technique or a simple random sampling technique of 115 students. Data collection was done to 125 students with a complete questionnaire instrument as many as 115 students which then analyzed as respondent data.

The development of the instrument of student character variables that reflect the learning activities in the Integrated Islamic School. In carrying out SMART values is measured by Likert scale questionnaire with the dimensions of Sholeh, Muslih, Cerdas, Mandiri, and Skilled, the learning environment variables with the dimensions of physical environment, non-physical environment, variable self-concept with the dimensions of the physical state, psychological, social, variable attitude learning with the dimensions of cognition, affection, and behavioral in learning. Techniques of collecting research data in the form of the statement of instrument items developed based on the conceptual definition, operational definition, and grid on research variables. Data analysis in this study used path analysis (path analysis), used to analyze the relationship pattern between variables to know the direct or indirect effect of a set of independent variables on endogenous variables. Data processed with SPSS 20.

Results and Discussions

The S.M.A.R.T Character variables on the muscle dimension with the commit indicator, with the item "I always correct the mistakes that I've ever done with better practice" have the highest score while the lowest score is "I lead others to carry out good activities". The Learning Environment variables in the Physical Environment dimension with Classrooms in-use indicator and the "I was not focusing on learning for condition of the room" statements have the highest score, while the Facilities and infrastructure in schools indicator on the statement "There are many learning facilities need to be provided in classroom "has the lowest score of student ratings. Variable Self Concept on Psychological dimension with indicator Confidence statement "I can be successful" has the highest score in the assessment of the students, while the Physical state dimension on the indicator Appearance yourself with the item statement "I do not care about my appearance" has the lowest scoring score from students. Attitude variable in Cognitive/thinking dimension with indicator Thought the importance of learning and knowledge and the statement "I have to seriously study to give an important knowledge" and "By learning I can become a successful person" have the highest score, while the dimension of Conative/predisposing action with indicator Predisposition act from learning with item "The results of my study can apply in daily life" has the lowest score. It indicates that learning needs to be done contextually and constructively.

Based on research data is tested and analyzed as follows:

Table 1: Test data distribution research: One-Sample Kolmogorov-Smirnov Test

		Learning Environment	Self Concept	Attitude	S.M.A.R.T Character
N		115	115	115	115
Normal Parameters[a,b]	Mean	55.26	65.66	62.80	53.28
	Std. Deviation	13.93	9.35	8.33	10.29
Most Extreme Differences	Absolute	.084	.119	.107	.071
	Positive	.039	.119	.107	.066
	Negative	-.084	-.079	-.067	-.071
Kolmogorov-Smirnov Z		.904	1.273	1.149	.760
Asymp. Sig. (2-tailed)		.388	.078	.142	.610

a. Test distribution is Normal.

b. Calculated from data.

With testing One-Sample Kolmogorov-Smirnov Test on Asymp. Sig. (2-tailed) obtained data distribution of character variable 0,610; learning environment 0,388; self-concept 0.78; and attitude 0,142; with normal test distribution. Furthermore, the substructure hypothesis test. Sub-structure 1 consists of learning environment variables ($X_{1)}$ as an exogenous variable and self-concept as endogenous variables ($X_{2)}$. Next, influence path form becomes structural equation with the formulation: $X_2 = \rho_{21} + \varepsilon_{1,}$ calculation of path coefficient using SPSS 19.0 and can be seen in this following table:

Table 2: Test the influence of the learning environment toward self-concept coefficients

Model		**Unstandardized Coefficients**		**Standardized Coefficients**	**T**	**Sig.**
		B	**Std. Error**	**Beta**		
1	(Constant)	.771	7.719		.100	.921
	Self Concept	.830	.116	.557	7.130	.000

a. Dependent Variable: Learning Environment

Based on the calculations above, the large path coefficient ρ_{21}= 0.83. Thus, structural equation form is $X_2 = 0.83\ X_1 + \varepsilon_{1.}$ The value of $R^2_{2.1}$ or R square can be seen in the model summary table with 0.310, then the magnitude of other variables influence outside the model *(error)* towards endogenous variables X_2 is $\varepsilon_1 = 1 - R^2_{2.1} = 1$ to 0.310 = 0.69. Form visualization and coefficient value on the path shown in the following figure:

Fig. 2: Model Path Coefficient Sub Structure 1

The model path coefficient substructure 1 test will give a decision-making hypothesis test 1. Sub-structure 2 consists of learning environment variables ($X_{1)}$, self-concept ($X_{2)}$, and learning attitude ($X_{3)}$. Model path coefficient analysis substructure 2 declared in equation $X_3 = \rho_{31}X_1 + \rho_{32}X_2 + \varepsilon 2$. The test results of substructure 2 by using SPSS 19.0 is available at the following table:

Table 4: Test the influence of learning environment, self-concept toward attitude. Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	25.037	3.915		6.395	.000
	Learning Environtment	.224	.048	.374	4.686	.000
	Self Concept	.387	.071	.434	5.443	.000

a. Dependent Variable: Attitude

Based on the calculations above, large of path coefficient ρ_{31}= 0.224 and ρ_{32}= 0.387. Thus, structural equation form is $X_3 = 0{,}224X_1 + 0{,}387X_2 + \varepsilon_2$. Value of $R^2_{3:12}$ or R square can be seen in model summary table with 0,509, then the magnitude of other variables influence outside the model *(error)* towards endogenous variables X_3 is $\varepsilon_2 = 1 - R^2_{3:12} = 1$ to 0.509 = 0.491. Form visualization and coefficient value on the path shown in the following figure:

Fig. 3: Model Path Coefficient Sub Structure 2

Model path coefficient substructure 2 test will give a decision making hypothesis test 2 and 3. The substructure three consists of learning environment variables (X_1), self-concept (X_2), learning attitude (X_3) and S.M.A.R.T character (X_4). Model path coefficient analysis substructure 3 declared in equation $X_4 = \rho_{41}X_1 + \rho_{42}X_2 + \rho_{43}X_3 + \varepsilon 3$. The test results of substructure three by using SPSS 20.0 is available at the following table:

Table 5: Test the influence of learning environment, self-concept, attitude toward S.M.A.R.T character coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	-6.746	4.732		-1.426	.157
	Learning Environtment	.232	.054	.314	4.299	.000
	Self Concept	.362	.083	.329	4.382	.000
	Attitude	.373	.098	.302	3.814	.000

a. Dependent Variable: S.M.A.R.T Character

Based on the calculations above, large of path coefficient ρ_{41}= 0.232; ρ_{42}= 0.362; and ρ_{43}= 0.373. Thus, structural equation form is $X_4 = 0{,}232X_1 + 0{,}362X_2\ 0{,}373X+_3 + \varepsilon_3$. Value of $R^2_{4,123}$ or R square can be seen in model summary table with 0.658, then the magnitude of other variables influence outside the model *(error)* towards endogenous variables X_3 is $\varepsilon_3 = 1\text{-}R^2_{3:12} = 1$ to 0.658 = 0.342. Form visualization and coefficient value on the path shown in the following figure:

Fig. 4: Model Path Coefficient Sub Structure 2

Model path coefficient substructure 2 test will give a decision making hypothesis test 1, 2 and 3. The complete path is shown in the following figure:

Fig. 5:Path Analysis Results of Influence of Learning Environment, Self-Concept and Learning Attitude towards S.M.A.R.T Character.

Description:

X_1 = Learning environment

X_2 = Self-concept

X_3 = Learning attitude

X_4 = S.M.A.R.T character

The coefficient value in the picture above we can conclude that all paths are significant. Path analysis calculated direct and indirect influence. Direct influence is an influence from one exogenous variable towards an endogenous variable without any other exogenous variables. Indirect influence is an influence where exogenous variable affects endogenous variable through other variables which are called mediating/ intervening variable. Direct and indirect influence is visually displayed through the path diagram. Meanwhile, total influence is a combination of direct and indirect influence. The direct influence, indirect influence, and total are presented in the following table:

Table 6: Summary of Path Coefficient, Direct Influence, Indirect Influence, and Total Influence

Effect Variable /Hypothesis	Causal Effect				Indirect	Total
	Direct	Variable traversed				
		X_2	X_3	X_2 and X_3		
1. X_1 to X_2	0,83	-	-	-	-	0,830
2. X_2 to X_3	0,387	-	-	-	-	0,387
3. X_1 to X_3	0,224	-	-	-	-	0,224
		(0,83) (0,387)	-	-	0,0473	0,304
4. X_3 to X_4	0,373	-	-	-	-	0,373
5. X_2 to X_4	0,362	-	-	-	-	0,362
		-	(0,387) (0,379)	-	0,0812	0,307

Effect Variable /Hypothesis	Causal Effect				Indirect	Total
	Direct	Variable traversed				
		X_2	X_3	X_2 and X_3		
6. X_1 to X_4	0,232	-	-	-	-	0,232
		(0,83) (0,362)	-	-	1.192	0,258
		-	(0,224) (0,379)	-	0,0948	0,304
		-	-	(0,830) (0,387) (0,373)	0,0175	0,227

Discussion and Conclusion

Direct Influence

The learning environment (X1) has a direct positive influence on a high low self-concept (X2). So, the upper low of self-concept can be explained by the learning environment with 0,830. The research result shows that the learning environment gives a direct positive influence on student self-concept, which means learning environment can explain high low entrepreneurship intention. The magnitude learning environment influence of path coefficient towards entrepreneurship intention (ρ41) of 0.209. The research result is consistent with findings that an excellent learning environment with lots of learning interactions in teacher discussion with the whole class significantly made "self-concept academic" which better on students.

The learning environment (X1) has a direct positive influence on a high low student learning attitude (X3). Furthermore, a high low of student learning attitude can be explained by the learning environment with 0,224. This is consistent with research that learning environment based on the classroom gives an effective contribution of about 27% towards student attitude (r2 = 0.267).

The learning environment (X1) has a direct positive influence on high low S.M.A.R.T. character students (X4). Furthermore, the high low of S.M.A.R.T. student character can be explained by the learning environment with 0,232. Bandura's formulate a concept of important cognitive, social theory and intervention in behavior, looked at human behavior is not simply a reflex automatically on the stimulus, but also as a result of the reactions that occur due to an interaction between the environment and human schemes cognitive. The basic learning principle of Bandura included moral and social learning. According to Bandura, a person's behavior can be explained by the relationship of three factors that determine each other *(triadic reciprocity).* The basic principle of this theory is reciprocal influences *(reciprocal determinism)* on three factors that exist, and there are individual, environment, and behavior. School environment as formers of S.M.A.R.T character student closely as an education process and learning. A better condition of school environment, so S.M.A.R.T student character will also improve.

Self-concept (X2) has a direct positive influence on a high low attitude (X3). Furthermore, a high low of learning attitude can be explained by self-concept with 0,387. This indicates that giving counseling guidance services especially good and useful personal guidance on a student could be able to provide the understanding and student insight about self-concept, counseling guidance teacher be able to run program or service with provision of activity programs which can make an attitude and good student behavior (Santoso, 2016). The concept of self (X2) has a direct positive influence on high low S.M.A.R.T student character (X4). Furthermore, the high low of S.M.A.R.T student character can be explained by self-concept with 0,362. That findings strongly that self-concept and social skill together contribute effectively with 29,6% towards power struggle. That thing explained how important self-concept in character building.

Learning attitude (X3) has a direct positive influence on high low S.M.A.R.T student character (X4). Furthermore, the high low of S.M.A.R.T student character can be explained by learning attitude with 0,373. The research findings strongly that attitude in student character development (social care) is significant.

Indirect Influence

The learning environment (X1) has an indirect influence on S.M.A.R.T student character (X4) through self-concept (X2) and attitude (X3), namely: X1 → X2 → X4; X1 → X3 → X4; X1 → X2 → X3 → X4 with total influences 0,227. This indicates that to make student character through self-concept and attitude making gives the most significant contribution of about 22%. Self-concept has an indirect influence on S.M.A.R.T student character (X4) through learning attitude (X3) namely X2 → X3 → X4 with total effect about 0,307. This indicates that to establish student character through self-concept and attitude making gives the most significant contribution of about 3%. The learning environment (X1) has an indirect influence on learning attitude (X3) through self-concept (X2) namely X1 → X2 → X3 with a total effect of about 0,304. This indicates that to establish student character through self-concept and attitude making gives the most significant contribution of about 3%.

Based on that have been described above, it is clear that the social environment, the learning environment, parent patterns, and self-concept has positive influences towards S.M.A.R.T student character according to results on this research and also supported the theory as well as reinforce the relevance of research results. Base on result research the conclusion is there is positive and significant influence between social environment, learning environment, parent patterns, and self-concept towards S.M.A.R.T student character. Some of the research recommendations are: *First,* for school is input to optimizing the achievement and developing character education curriculum, *Second,* for students, that character is essential to be developed. Friendships with peers and group are essential to motivate each other and provide good role models so could give a good character in friendship. *Third,* for the teacher, that character cultivation in learning is essential. Teachers' familiarity aspect, employees in education and interaction in learning became an essential aspect of character cultivation. Learning conditions which flexible will give space to think and character cultivation on the student. *Fourth,* parents, give clear rules and educating is an important part to make S.M.A.R.T student character. Parents are expected to make the character in the family environment through good patterns. Norms and values as the restriction to make a good character that implanted on family education with parents at home as the basic to developed S.M.A.R.T student character.

Abstract

Problems regarding the balance of relations between human activities and the natural environment are particularly evident in the Environmental Goods and Services Sector (EGSS). In this sector, it is possible to identify inter-organizational networks based on waste collection processes, recycling, purification, reclamation and the provision of municipal services. These networks may perform operational and supervisory functions. This paper presents a case study of a networks dedicated to the collection, recycling, processing and waste management of tyres and beverage packaging. The study has the character of theoretical assumptions and operationalization of concepts for further empirical research, which going to be a continuation of the ongoing project of analysing relationships in a selected sector.

Keywords: Business Ecosystem, Inter-Organizational Network, Waste Management, Deposit System

Introduction

Problems related to environmental protection have ceased to be the exclusive domain of ecological sciences many years ago, as evidenced by the interdisciplinary concept of sustainable development formulated in the 1980s (Brundlandt, 1987). This idea allowed to undertake extensive research, as well as to search for specific solutions to problems presented at the conference in Rio de Janeiro in 1992 and at subsequent "Earth Summits" (Murphy and Drexhage, 2010). New challenges have emerged over the years and some unfavourable phenomena have deepened (Merino-Saum et al., 2020; Nordhoff et al., 2017). Among them, special attention deserves, among others, differences in the distribution of goods between social groups and countries, a decline in biodiversity, decreasing agricultural resources, shrinking freshwater resources, an increase in ocean water levels, and progressive pollution of seas and oceans (Graczyk, 2019). It should be noted that in the 1980s, problems mainly concerned the natural environment and then also became economic and social problems (Merino-Saum et al., 2020).

The concept of sustainable development in social sciences, especially in economic sciences and management sciences, resulted in the delineation of theoretical assumptions and definitions for the so-called green economy (Ryszawska, 2013) and green jobs (Kryk, 2014). In addition, there was a greening of many fields of science, i.e. the transfer of academic discussion to the field of implemented solutions in technological (Graczyk, 2013) and economic practice (Sulich, 2019), as well as the development of strategies and support for public administration (Sobol, 2015). Moreover, based on the principles of sustainable development, new definitions and classifications of economic activities have

been created (Sulich and Zema, 2018). Therefore, greening is the concentration of activities directly or indirectly solving environmental problems and ecological challenges, e.g. managing limited resources or implementing dedicated patents (Graczyk, 2019). Despite such numerous and even spectacular activities, it has been relatively recently understood how important their success is based on management and organization. They allow the transfer of ideas related to sustainability from the theoretical dimension and global scale to practice and a closer scale (Sobol, 2015). In this context, it is required to develop a description of the relationships occurring in the economic community with the ecological terms previously described (Stańczyk, 2018). The sciences of management and organization, by undertaking the issues of sustainable development, aim to examine the relationships between organizations (Niemczyk and Stańczyk-Hugiet, 2014).

The aim of the work is to present the case of an inter-organizational network functioning in the sector of Environmental Goods and Services (EGSS) in the context of business ecosystem theory (Stańczyk, 2018). Extensive research into the population of organizations in their exploratory relationships can help in the future reveal the reasons for their complexity in ecosystem features such as emergence, self-regulation, coevolution, and coadaptation (Stańczyk, 2018). That is why this article has a character of theoretical assumptions and operationalization of concepts for empirical research, which will be a continuation of the conducted project. The method adopted at work is abductive explanatory reasoning (Wirth, 2005).

Management and Sustainable Development

Evidence of the greening of management sciences is the business ecosystem theory, which is a metaphor directly derived from the theory of ecology (Stańczyk, 2018, p. 64). Therefore, the business ecosystem is defined by the dynamic organization system (biocenosis) connected with each other by the economic environment (biotope) it occupies (Stańczyk, 2018, p. 64). In the natural environment, relationships between organisms are nutritious (trophic), and there are no neutral relationships between them (they mean no relationship). Trophic relationships define different food networks within the ecosystem. The same applies to the business ecosystem. However, in the modern economy, organizations choose to cooperate, that is, "act with others when at least two entities have complementary goals" (Jasiński, 2012, p. 101). According to many authors, positive impact and cooperation is the basis primarily for inter-organizational networks (Niemczyk and Jasiński, 2012, p. 12). In addition, the success of implementing such ambitious and long-term projects related to the concept of sustainable development depends, as it seems, on positive relationships between entities, cooperation and synergy (Häkansson and Johanson, 1993; Sobol, 2015). Cooperation, therefore, is the basis for forming an inter-organizational network in which many different and undefined relationships can also occur (Stańczyk-Hugiet, 2012; Zema and Sulich, 2019).

"While one can see [...] the significant contribution of management sciences researchers to understanding the essence and nature of business networks, there is still a shortage of theoretical and empirical studies that would allow them to understand their network structure and the relationships that co-create them" (Stańczyk, 2018). The issue of relations between networks in such a diverse sector as the sector of Environmental Goods and Services is a new topic, not yet addressed in the management sciences literature. Moreover, entities focused around the exchange of one good or ecological service may have different relationships (positive or negative) with entities of a separate network, e.g. public administration, which also belongs to the sector of ecological goods and services (Gontarz and Sulich, 2019).

The transformation of the economy towards a sustainable, green economy (Ryszawska, 2013) requires activities in the field of green management (Lorek and Sonnenschein, 1999; Sulich, 2019) environmental management and environmental management (Sulich, 2019). These activities lead not only to a reduction in anthropopression, but also to the creation of green jobs (Sulich and Zema, 2018), which is also a manifestation of green management. This requires management to make a comprehensive diagnosis of variables, phenomena and processes occurring in the multidimensional economy - society - environment system (Kasztelan, 2016; Sobol, 2015, p. 226; Sulich et al., 2018). These activities may be accompanied by such behaviours towards other business entities that include antagonistic, neutral and non-antagonistic activities (Stańczyk, 2018). However, it is not unequivocal

that antagonistic actions towards certain groups of business entities do not entail positive or at least non-antagonistic actions towards other members of the business ecosystem within the sector.

The Environmental Goods and Services Sector

The concept of the Environmental Goods and Services Sector (EGSS) sector is used by the European Commission and Eurostat in their documents (Lorek and Lorek, 2002). They define this sector as covering various producers of goods and services whose purpose is to protect the environment and manage its resources (Eurostat, 2018). Moreover, in addition to the definition of the sector itself, Eurostat provides a definition of services and environmental goods, which are products manufactured or services provided for the purpose (Eurostat, 2018):

- reduce or prevent pollution, degradation or depletion of natural resources;
- restoring the original state of air, water, biodiversity and landscapes, reducing waste and noise;
- reducing, eliminating, repairing and managing pollution, degradation and depletion of natural resources;
- conducting other activities such as measurement and monitoring, control, research and development, education, training, information and communication related to environmental protection or resource management.

The presented definition of Ecological Goods and Services is broad and recognizes as ecological those goods and services from the pool of all goods and services available on the market whose "methods of production, distribution, consumption have or can have a significant, positive or indifferent effect on the functioning of ecosystems and population health human, as well as on the aesthetic values of the landscape and the unique elements of nature" (Lorek, 2002). It is impossible to completely eliminate the production of pollution and production waste and consumption that cause anthropopressure (Bogusz and Sulich, 2019), which means that there are no products or services that are completely neutral or have a positive impact on the natural environment (Ryszawska, 2013; Sulich, 2018). Sometimes it depends on the scale of their use whether they will be anti-ecological (Khall Khalid, 2019). What to consider in the case of consumables, among others: for the automotive industry, which will be created regardless of whether the cars will be electric or fuelled with minerals. Therefore, due to production, use or final utilization techniques, products and services can be distinguished (Lorek and Lorek, 2002, p. 119):

- ecological - related to new techniques that reduce environmental pressure,
- ecologically neutral - associated with techniques that, at the current scale of application, cause anthropopressure that is within the capacity of the environment to assimilate them (Dokurno, 2006).
- anti-ecological - mainly associated with old techniques characteristic of the brown economy (Sulich and Zema, 2018), causing large environmental pressures, which can be improved by greening the economy (Grudziński, 2018) or modified by creating eco-innovations (Rutkowska, 2016).

The EGSS in Poland is developing mainly in the field of public services and municipal services. Moreover, "the municipal economy is the sphere of socio-economic life in which radical transformation has been taking place in Poland in recent years" (Sobol, 2015, p. 8). The successful transformation in the direction of the green economy is determined by the combined efforts of politicians (local government officials), residents (consumers) and the broadly understood sector of environmental protection entities and institutions. This is because in Poland the main direction of the transformation process are activities for environmental protection, which is served by the majority of ongoing investments and organizational changes (Sobol, 2015). The green economy and its concept (Ryszawska, 2013; Sulich, 2018) lead to the creation of a green labour market, which is a consequence of the market of Environmental Goods and Services. This market operates within management processes, covering the real and regulatory sphere. However, the basic entities of this market are (Lorek and Lorek, 2002, p. 120):

- natural environment - a source of raw materials and energy,
- consumers (households),

- business entities,
- producers (industrial enterprises, farms, craft workshops),
- service enterprises, trade enterprises,
- financial institutions,
- state government.

The state and its administration are part of the regulatory sphere in the course of material and material processes. The state through legal systems has a significant impact on economic processes. The issue of normative acts (environmental management), the role of market moderator and the representation of the natural environment articulating the environment preferences on the market (environmental management) are important tasks of the state (Ponomarenko et al., 2018). However, the current state policy and related legal regulations transpose the Community provisions of the European Union (Sobol, 2015, p. 226). A condition for including natural resources in economic market mechanisms is to cease their perception as free goods and to establish an entity with ownership competences. "Such an entity should be a regional or state authority or an international institution" (Lorek and Lorek, 2002, p. 121).

Public Green Services

Public administration in Poland is responsible for the implementation of the majority of services provided to society and the environment. Therefore, the state is not only a participant (investor, contractor), but also a coordinator of the market of Environmental Goods and Services, in accordance with the assumptions of sustainable development (which is a constitutional principle) ensures safety for the environment, economy and citizens. An important component of implementing sustainable development activities is spatial planning and municipal management (Sobol, 2015, p. 225). In this way, some public administration at the local (commune) level has a service character to residents (Pawliszczy, 2016). The quality of service to residents is improving due to the pressure of the private sector, which is why changes in the public sector are visible mainly in the area of municipal economy (Pawliszczy, 2016; Sobol, 2015). In addition, many of the statutory tasks of the commune concern services related to the market of ecological goods and services (Sobol, 2015, p. 230), and these are:

- collective water supply;
- collective sewage disposal and treatment;
- waste management;
- air protection;
- transport, maintenance of municipal roads;
- protection and maintenance of green areas;
- ecological construction;
- soil protection, reclamation and revitalization of brownfield sites;
- flood protection;
- ecological education;
- alternative energy sources, improving energy efficiency;
- protecting nature and biodiversity;
- protection against noise,
- organic farming.

"The greening of the municipal economy is also an expression of the growing ecological awareness of the inhabitants" (Sobol, 2015, p. 226). Pursuant to the Act on municipal economy of December 20, 1996 (Journal of Laws 1997 No. 9 item 43), municipalities may create their own organizational units or engage external entities that belong to the sector of Environmental Goods and Services (EGSS).

Orientation to innovation and environmental protection is one of the manifestations of a modern approach to management. Eco-innovations play a special role on the market of ecological goods and services, i.e. "any innovation that reduces the negative impact on the natural environment throughout the product life cycle and reduces damage to this environment" (Rutkowska, 2016; Sobol, 2015). In this case, green jobs are gaining importance, which are also treated as eco-innovation, because "they are solutions to ecological and economic problems, which are becoming both social and management

problems" (Sulich, 2019). Green jobs transfer the theoretical assumptions of sustainable development to economic practice (Grudziński, 2018; Kozar, 2015). The European Commission defines green jobs as "all jobs dependent on the environment or created, converted or transformed (in terms of the greening of qualifications, working methods, job profile) in the process of moving towards a greener [green] economy" (Cox and Foley, 2013; Sulich, 2019). For many organizations, one of the expected results of eco-innovation is to increase ecological efficiency - directly by improving environmental performance and parameters, and indirectly by increasing competitiveness (Niemczyk and Trzaska, 2018; Sobol, 2015, p. 229). However, the ever-faster pace of technological changes and the shortening of the life cycle of products and technologies require increasing expenditure on research (Jasiński, 2012, p. 103), development and of course the introduction of new products, with increased requirements for environmental protection and consumer service (Gontarz and Sulich, 2019).

Inter-Organizational Networks

The growing popularity of networks among researchers in the field of management is mainly due to the dynamic development of network collaboration. This cooperation is primarily "innovation-oriented, i.e. cooperation in an innovation network" (Klimas, 2014, p. 7). Cooperation is a positive impact. Networks are based mainly on material exchange and mutual services, supplemented by the exchange of intangible resources "which are the driving force of a strategic process having the nature of a holistic process" (Klimas, 2014, p. 27). Sometimes these networks are separate structures in which the value provided to stakeholders is created (Klimas, 2014, p. 27). There is therefore a positive interaction within the network, but there is some separation between the networks. This separation means that various inter-organizational networks, focused on their own defined goals, have non-antagonistic, neutral impacts (without relationships) in a given sector. In this approach, inter-organizational networks are treated as a source of information, knowledge and a place to create and implement innovations, e.g. green jobs (Rutkowska, 2016). The set of all networks and interactions between networks forms the business ecosystem of the Environmental Goods and Services sector.

An inter-organizational network is a system of at least two independent and independent organizations (diadems), connected with each other by a set of bonds for cooperation. The inter-organizational network is "a system composed of long-term, non-incidental relationships of entities oriented on the relationship of convergent goals" (Klimas, 2014, p. 31). In the description of the inter-organizational network based on graph theory, the organizations forming the network are called nodes or nodes, while "oriented towards achieving common goals, long-term ties" (Klimas, 2014, p. 31) between them (inter-organizational ties, links) they are called edges. The use of graph theory allows to trace the processes occurring in the network, including determining the direction of interactions (Zema and Sulich, 2019). A process that may reveal the existence and elements of an inter-organizational network is the product life cycle management (Stańczyk-Hugiet, Lichtarski, et al., 2019). However, in the case of an inter-organizational network within the sector of Environmental Goods and Services with waste, e.g. used tyres.

The Tyres Utilization Centre

The considered example of an inter-organizational network in the sector of Environmental Goods and Services is the network created by the Tyres Utilization Centre - Recovery Organization (Polish: Centrum Utylizacji Opon Organizacja Odzysku S.A., abbreviated as the CUO) together with producers and processors, among others companies from Grupa Recykl S.A. and cementation, create a network dedicated to the recycling, processing and management of post-consumer waste, such as tyres. The main task of CUO is to solve the problem of used tyres, by organizing their collection from tire change points and car workshops, and subjecting them to recovery and recycling (Tyres Utilization Center - Recovery Organization, 2019). The collection of tyres from residents can be organized by the municipal government, who, as an entity of state administration, will entrust the CUO with their collection. In this case, the inter-organizational network cooperates with entities of various levels of public administration of a control and executive nature for reporting purposes, while the mutual provision of services occurs at the lowest local government level. Grupa Recykl S.A is a strategic partner of the

CUO, and as a result of the entire inter-organizational network, used tyres are processed, e.g. in the mechanical grinding process, products such as:

- rubber granulate - mainly used for the production of rubberized surfaces (surfaces of playgrounds, sports facilities, release thresholds);
- chips - used for co-firing with fine coal and alternative fuels in the cement industry;
- steel scrap - used as input in the steel industry.

Other companies also produce rubber flour, which is a cheaper substitute for rubber and is a valuable secondary raw material for the tire industry (Majka, 2011). The CUO is a company founded by the largest tire manufacturers on the Polish market: Bridgestone, Continental, Dębica, GoodYear, Michelin and Pirelli, which also act as the company's shareholders. The purpose of activities is to fulfil the assumptions of the Act of 11 May 2001 on the obligations of entrepreneurs in the scope of managing certain waste and on the product fee (Journal of Laws of 2018, item 1932). The Act imposes, among others for tire manufacturers and importers, the need to collect within the country and recover waste mass of tyres not less than 75% of the tonnage of tyres they placed on the market in the previous calendar year. CUO comprehensively deals with the entire logistics process, starting from free collection of used tyres from all entities indicated by the CUO customers as authorized, through sorting by type to transport to points that recover them (e.g. energy) or material recycling. At the same time, the company makes it easier for entrepreneurs from the automotive industry to meet their obligations under environmental protection regulations. Among other things, thanks to the activities of the CUO, within a few years the problem of the creation of illegal landfills for used tyres and their illegal landfills was virtually eliminated. the Tire Utilization Centre - Recovery Organization (the CUO) is also a member of ETRMA, the European Association of Tire Manufacturers and Rubber Products (Tyres Utilization Center - Recovery Organization, 2019).

In the case of the network presented, there are no cases of competition because waste from the tire industry is not a rare recyclable material. Cooperation between entities reflects the recycling process. Waste treatment in the network under consideration is primarily a fulfilment of the formal requirement imposed by the state administration (centralized hierarchical network), (Stańczyk-Hugiet, 2019). However, belonging to the network are elements of prestige and building a responsible brand (tire manufacturers). Post-consumer waste from the automotive industry is the most difficult to recycle and will be generated irrespective of the power source of automotive vehicles, which is why effective network functioning is so important (Gontarz and Sulich, 2019).

Waste Deposit System in EU Countries

The deposit system and the related waste collection system on various scales operates in most European Union (EU) countries. But it takes the most developed and technologically advanced forms in the countries where it operates the longest. Within the EU, three ways to manage waste from liquid packaging can be identified (Crawford, 2011).

- refilling (usually with a deposit) - bottles and cans that have been used by the customer are transported back to the manufacturer, where they are rinsed, refilled and transported back to the consumer for use. Reusable glass bottles can be filled more than 50 times, reusable PET bottles up to 15 times. The result is zero waste, minimal environmental impact and significant savings for municipalities.
- one-way deposit - bottles and cans are used by the consumer only once, the producer can recover the packaging only when it comes to him directly from a recycling company that produces completely new bottles. The producer then fills the bottle and sends it back to the store. Such solutions provide zero amount of garbage but have a greater negative impact on the environment than it was in the first case.
- one-way no deposit - the customer uses bottles and cans, and the producer - at best, pays the fee to the waste management organization, but after processing it will have nothing to do with their product. The public authorities will bear the main costs of creating the waste, and a

significant part of the waste will have to be landfilled or incinerated. The result is a large amount of garbage, a high environmental impact, but the cheapest option for producers.

At the level of the entire community, the waste deposit system is regulated by EU Directives. These are: Directive 94/62 / EC and Directive (EU) 2018/852 which updates it. Both documents contain measures to prevent the generation of post-packaging waste and to promote recycling and other forms of post-packaging waste recovery instead of final disposal, thus contributing to the transition to a circular economy (European Commission, 1995). The goals defined are:

- improving the quality of the environment;
- protection of human health;
- resource protection;
- ensuring the functioning of the internal market and restrictions of competition in the EU.

Table 1: Share of recycled waste in the total amount of waste, presented in Directive 94/62 / EC and in Directive (EU) 2018/852 which updates it.

Year 2025	Year 2030
50% plastic	55% plastic
25% wood	30% wood
70% glass	75% glass
70% ferrous metals	80% ferrous metals
50% aluminium	60% aluminium
75% paper and cardboard	85% paper and cardboard

Source: author own elaboration based on (European Commission, 2018, para. 5).

Another provision in the directive is that EU countries must ensure that packaging placed on the market in their territory meets the following requirements (European Commission, 1995):

- limiting the weight and volume of the packaging to a minimum to achieve the required level of safety, hygiene and acceptability for consumers;
- reducing the content of hazardous substances and materials in the packaging material and its ingredients;
- increasing the number of reusable or recoverable packaging.

The purpose of the above changes is to implement a circular economy (Sulich, 2018), the circular economy minimizes resource consumption, waste production, and energy consumption (Stewart, 2009). This can be achieved through prolonged and reuse of packaging and recycling. This contrasts with the linear economy, which uses resources without reprocessing and using them (Geissdoerfer et al., 2017). Among European countries should be distinguished countries in which the deposit system for waste was introduced at the earliest.

Table 2: List of European countries that have introduced the deposit system for drinks after drinks at the earliest

Sweden	• 1984 - a one-way deposit for cans • 1994 - a deposit for PET • bottles average packaging return at 80 –90%
Norway	• 1999 - a deposit was introduced in a nationwide one-way deposit for bottles of non-alcoholic beverages and beer • average level of packaging return at the level of 75 -90%
Finland	• 1996 - one-way deposit for cans 2008 - a deposit for PET bottles

Germany	• 2003 - a national deposit system for PET bottles, glass bottles and cans
Denmark	• 2002 - a national deposit system for PET cans and bottles for water, soft drinks
Netherlands	• 2006 - a deposit for large PET bottles
Estonia	• 2005
Croatia	• 2005

Recently, many countries, including European countries, are moving towards the automation of waste management methods, using, among others, Radio-frequency identification (RFID) (Abdoli, 2009). The implementations to date indicate that the technology can ensure effective waste management and can also contribute to its effective recycling (Sulich and Zema, 2018; Tomari et al., 2017). In addition, at the end of the previous century, reward was found to be the most effective way to maintain a high level of participation in the recycling process (Grau, 1997).

The development of issues related to extended producer responsibility (EPR) creates an opportunity to support green innovation and new business models by changing the institutional environment of the current waste segregation regime in cities (Lynch, 2007). The new policy changes the existing approach, and its main goal is, inter alia, to encourage entrepreneurs to create product innovations with less environmental impact (Lynch, 2007). EPR extends the producer's responsibility, both physically and financially, for its product to the post-consumer stage, and transfers waste management costs from local government to consumers and producers (Tong et al., 2018). The framework of the new policy also changes the functions of products and services rendered, to more efficient functions of product and service systems, interest in the reprocessing of used resources (Grudziński, 2018; Pires et al., 2015).

One of the possible methods of implementing the provisions of Directive 94/62/EC and Directive (EU) 2018/852 updating it is the implementation of the concept of Reverse vending machine (RVM), under which the consumer will receive an award for taking the used packaging for recycling (European Commission, 2018). RVM is undoubtedly an innovative concept that was introduced to collect materials for recycling to effectively improve recycling activities and thus improve waste management ((Wahab et al., 2014). RVM machine encourages the community to properly dispose of waste, recycling materials such as plastic, glass, paper and aluminium.

Fig. 1: Two types of reverse vending machines, from the left: a vending machine for bottles and a vending machine for larger plastic packaging. Source: Authors and (Gaur et al., 2018).

The construction of RVM required several studies and works in order to best adapt to the needs of the local community (Exito et al., 2015). Basically, in the RVM construction you can distinguish the components that are crucial for the device due to its purpose. The machines mount various types of microcontroller (Karin et al., 2017) and detection mechanism (Wahab et al., 2014)). The selection of equipment depends on the purpose of the machine and the type of waste it collects (Lorek and Lorek, 2002). The RVM operating process consists of three main stages (input stage, process stage, result), and the operation during the process has the following course (Gaur et al., 2018):

1. The consumer can insert the correct shaped waste into the Reverse Vending Machine.
2. After insertion, the packaging is checked by a series of sensors. The size of the packaging, the type of plastic and the origin of the packaging are checked (based on the bar code).
3. Then, once the packaging is accepted, the consumer gets a discount in the form of a cash or shopping voucher.

Then sorted precipitation is stored for a short time and recycled. Recycling brings tangible benefits to consumers, producers and local authorities (Tonglet et al., 2004). It was also found that the remuneration system (Tomari et al., 2017) next to public education on recycling (Sidique et al., 2010)are the most effective methods to increase the recycling rate.

RVMs are usually located near food supermarkets and are equipped with automatic devices that accept empty glass, plastic or aluminium packaging in exchange for a cash amount in the form of a coupon or receipt (Tomari et al., 2017). An increase in the number of these vending machines can be observed, especially in countries where it is required by regulations regarding the recycling of this type of waste, regulations regarding the system of bottle deposits (Groth, 2008).

RVM implantation at the point of sale is also associated with the implementation of a new business model. Research to date in this field, using organizational level theory and case studies, identifies various business models for the Environmental Goods and Services sector (Schaltegger et al., 2016). According to Teece (Teece, 2010), the business model describes the design or architecture of the mechanisms used to create, deliver and capture value. The essence of the business model is that it crystallizes the customer's needs and ability to pay, determines how the company provides value to customers, encourages customers to pay for value and transforms these payments into profit through proper design and the operation of various elements of the value chain. In the case of the model where the key factor is a sustainable development strategy by sharing the company's sustainable value by customers, employees and all other stakeholders within the organization (Porter and Kramer, 2011).

The Lidl Stiftung & Co. Supermarket Chain

One of these models based on an inter-organizational network is the PET bottles recycling model in the Lidl chain store belonging to the Schwarz group in Germany. In 2003, the deposit was introduced in Germany by the legislator. One of the goals was to avoid or reduce littering. After that time, PET bottles were almost entirely made of newly produced, more environmentally friendly PET material. The German company Mitteldeutsche Erfrischungsgetränke GmbH & Co. KG (MEG) produces soft drinks in bottles. The production area of (MEG), which currently belongs to the Schwarz Group, contributed to this process very efficiently by producing disposable PET bottles from recycled materials.

After several years of research and development at the recycling, German company Rossbacher Kunststoffverarbeitung, which also belongs to the MEG group, in 2007 for the first time in bottles sold in Lidl, using small quantities of processed PET material for the production of bottles. In 2009, close cooperation in research and development was established with the recycling company Vogtland PET. In this way, MEG, Vogtland PET and the Schwarz Grupe began cooperation in research and development on the processing of PET bottles. Due to the full integration of the recycling plant with the Schwarze corporate group, in 2011 the share of recycled PET in the sales of the Lidl network is constantly increased. This is essentially through the constant refinement of technical requirements has

become possible, in particular through substantial investments in machinery and plants in recycling, as well as in the technology of processing and filling plastics.

The producer of mineral water Saskia joined the cooperation within the presented inter-organizational network. The share of recycled material in new Saskia private label bottles is 60 percent. In 2016, MEG launched a recycling plant in North Rhine-Westphalia. Thanks to investments in the recycling process, the goal of MEG is to use the new material in the long term so that the new bottles are entirely made of recycled material.

Fig. 2: PET bottles recycling cycle in the Lidl supermarket chain.

One-way deposit led to the fact that littering due to disposable PET disposable bottles almost disappeared. The LIDL explicitly demands and promotes the efforts of the Federal Ministry of the Environment to use the deposit system on disposable PET packaging for beverages that were previously not subject to deposit. This creates an increasingly stable basis for the PET recycling cycle. LIDL made very high investments at an early stage of over half a billion euros in beverage return machines, which is the best condition for high-quality recycling. In addition to the installation of recycling loops, the weight of bottles has been significantly reduced. In addition, we have reduced the transport distance of disposable bottles by investing in new bottling plants and central warehouses. These measures have made significant ecological progress.

Conclusions

Inter-organizational networks are a specific form of multi-stakeholder cooperation in which the relationships between entities are inter-organizational ties (Stańczyk-Hugiet, Piórkowska, et al., 2019). For educational goods and services, inter-organizational networks in the Environmental Goods and Services sector have 'value constellations' or 'value networks. The activities of individual networks are process-oriented, and their activities serve to improve the state of the environment. Interactions between networks are controlled by the state administration, which "in accordance with the assumptions of sustainable development, ensures synergy of economic, social and environmental aspects, and also ensures security for both men, the environment and the economy" (Sobol, 2015, p. 225).

There is a non-antagonistic (positive) relationship between the supreme government administration network and the analysed tire recycling network. As a result, green jobs may be created, i.e. jobs that

have a positive impact on the environment in terms of product (service) and process. What's more, within the network whose centre is made up of CUO, there is a group of enterprises involved in the continuous development of the organizational network they co-create. Their behaviour is based not only on intangible relationships (searching for new tire recycling techniques), but primarily on the exchange of material goods and accompanying services, and is determined by the desire to develop. A similar network of inter-organizational links was created by producers, distributors and recyclers of PET bottles for soft drinks in Germany. The result of their cooperation is to create a modern solution for collecting, recycling and reusing PET garbage. This action is in line with the environmental policy of the European Union and the needs for sustainable development in Germany. A positive aspect of the network is the reuse of a significant amount of recyclable materials in tire production and the reduction of the negative effects of the tire industry.

Acknowledgement

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN.

Abstract

Market research shows that the number and value of claims in medical malpractice cases is increasing. From the point of view of risk management processes in healthcare entities, it is important to analyze both the frequency of claims and potential damages. Research covering US, Western Europe or China markets indicates that - apart from the differences in compensation systems - the frequency and value of claims depend on specialty, and their effectiveness is lower than e.g. in traffic accidents under liability insurance. The authors in this article undertake research for the Polish market. The study hypothesized that the percentage of claims effectiveness is lower than in third party liability insurance, close to the level in developed countries, and the risk of claims arising from medical malpractice depends on specialty. The article reviews research and data on other markets. Their results were compared with data identified for the Polish market - general, including statistics covering lawsuits in medical malpractice cases and with detailed data obtained from a large university clinical hospital from Poland, to illustrative and initiating further case study. The data includes claims and benefits paid to victims in 2017-2018 and applications submitted in 2010-2014. The structure of the size and number of claims and payments was assessed in terms of recognition of claims by the court and reimbursement by the insurer. Potential costs related to claims submitted in 2017-2018 were estimated. The methods of descriptive statistics and the triangulation method were used for the analysis. The obtained results were compared with data from other markets. FINDINGS: The results confirm that the number and value of claims depend on the ward specialty. Neurosurgery faced the highest risk and is also the specialty highly affected in other markets. However other risky specialty as gynecology and obstetrics wasn't examined due to the lack of such one in analyzed hospital. The effectiveness of medical malpractice claims on the Polish market is similar to other markets (20-30%) - which is confirmed by aggregated data on claims brought in courts and claims faced by analyzed hospital.

Keywords: Medical Malpractice Insurance, Hospitals Risk Management, Claims Management, Compensation

JEL Codes: G23, G32, I11, K32.

Introduction

Market research shows that the number and value of claims in medical malpractice cases is increasing. This implies discussions about optimizing compensation systems for damages - based on the traditional tort liability, fault or negligence, by the ADR mono- fault systems (Raposo 2016 Watson Kottenhagen 2017), with the participation of insurers or (Koch 2011). These discussions also include the problem of the impact of system design on the attitudes of entities at risk of liability (hospitals, doctors) and harm (patients). It is pointed out that often entities providing medical services adopt defensive attitudes (defensive medicine), may affect the scope of services, work comfort, focus on basic goals. Different solutions regarding the legal basis for pursuing claims and offsetting damages can, on the one hand, lead to excessive escalation of claims or, on the contrary, to a reduction in the scope of compensation and externalization of losses. It is argued that they are "frustrating" for patients, health professionals, health institutions and society (Raposo 2016).

Meanwhile, risk assessment, management and design of compensation systems, also by the regulator, requires risk analysis, identification and assessment taking into account the basic parameters such as probability and potential damage value (which is unquestionable - against the background of COSO, FERMA or ISO standards).

Research covering US, Western Europe or China markets indicates that - apart from the differences resulting from compensation systems - the frequency and value of claims depends on specialty, and their effectiveness is lower than e.g. in claims for personal injury from traffic accidents.

Polish health service does not conduct public detailed record of this medical errors, which in fact is a mistake and disability for the processes of risk analysis and optimization of solutions for both compensation and prevention, minimizing the likelihood of risk implementation and potential effects. Such records are kept and made available to varying degrees in the United States, and in Europe, e.g. in Denmark or Germany, and are intended to serve, as is indicated, analysis, elimination of causes and improvement of system solutions (Korytkowska, 2013). This is, moreover, consistent with the assumption of a conscious and active attitude relevant to success in the risk management process (among others Hillson, Murray-Webster, 2017).

The study hypothesized that the percentage of claims effectiveness is lower than in motor third party liability insurance, close to the ratio in developed countries, and the risk of medical malpractice claims depends on specialty.

Research and data on other markets will be reviewed in order. Next, the data that has been identified for the Polish market will be presented. First, statistics covering lawsuits in medical malpractice cases from 2001 to 2018 and from other sources. Then a case study will be presented - based on detailed data obtained from a large university clinical hospital from Poland.

Medical malpractice claims vs specialty in selected countries

Medical malpractice claims are analyzed in many publications and collected in reports. Their comparability, conclusions, and assessment of findings from various studies may be difficult due to:

- system differences cited (the liability rules and compensation systems in individual countries),
- differences in the scope of the concept of medical malpractice, which may include medical malpractice as well as other actions, resulting in bodily injury, upset health, but also violation of the patient's rights without harming the person (the right to documentation, information, respect for dignity),
- differences in the approach to the problem of medical malpractice, as it can be included through the structure of hospital wards or staff specialty (for example, in one study anesthesiologist errors are reported separately, and in some jointly, recognizing that they are connected with treatment provided in other departments, for example surgery, obstetrics)

– different bases used to determine the loss ratio of a given specialty - some studies compile them by the number of reported claims, others by claims paid, and others consider the value of claims – made or only paid.

It should also be pointed out that on the one hand the analysis is also hampered by the long period of incubation of damages (which, for example, in insurance implies the need to consider triggers - e.g. occurrence vs loss occurrence or claims made) and, on the other hand, the length of claims settlement processes and claims components, which also include long-term annuities, which makes it difficult to assess and compare the value of claims. These issues are not the subject of this study, only pointed out as requiring further work.

Table 1 contains a concise extract from selected analyzes related to medical malpractice depending on the specialty / scope of medical services.

Table 1: Summary results of the relationship between medical malpractice claims vs specialty

Research	Country and time range of the analysis	Specialty	Method of calculation of " claims"
Munich Re Group - for Insurance Monthly (2002)	Germany	Total surgery - 37% Obstetrics - 27% Other - 10% Internal Med. -8% Pediatrics - 7% Anesthesiology - 5% Orthopedics - 4% ENT - 2%	The number of reported damage dependi ng on the specialty of staff (not branches) to the total number of reported damage
		Gynecology - 41% General surgery - 18% Pediatrics - 13% Other - 13% Anesthesiology 8% Internet - 5% Orthopedics 2%	Value of claims paid by staff specialty to the total number of claims paid
Alsaddique AA (2004)	1999 - 2003, Ministry of Health Riyadh, Kingdom of Saudi Arabia,	Obstetrics - 27% Surgery - 17% Sp. Surgery - 17% Internal Med - 13% Pediatrics - 10% Orthopedic - 6% Anesth - 4% Others - 3.5% Dental - 3.5%	The number of lawsuits for a given specialty to the total number of lawsuits
Anupam et al. (2011)	USA, 1991 – 2005, data of 233,738 physician-years of coverage in one insurance company	Neurosurgery - 19.1% thoracic – cardiovascular surgery - 18.9% general surgery - 15.3% listed in order without data (figure 1): orthopedic surgery, plastic surgery, gastroenterology, obstetrics and gynecology, urology, pulmonary medicine, oncology, cardiology, gynecology, neurology, internal medicine, emergency, anesthesiology, diagnostic radiology, ophthalmology, nephrology, pathology, dermatology family medicine - 5.2% pediatrics - 3.1% psychiatrist - 2.6%.	Number of claims to specialty to the total number of claims

		No value figure 3 - median payouts from the highest: Pediatrics, pathology, obstetrics and gynecology, neurosurgery, pulmonary medicine, internal medicine, cardiology, urology, thoracic – cardiovascular surgery, general surgery, anesthesiology, gynecology, family general medicine, neurology, diagnostic radiology, orthopedic surgery, gastroenterology, psychiatry, emergency, plastic surgery, ophthalmology, other, dermatology	The ranking is different after the values paid in the specialty Mean payments ranged from $ 117,832 for dermatology to $ 520,923 for pediatrics.
Saber Tehrani el al. (2013)	The USA, 1986-2010, from the National Practitioner Data Bank	Diagnostic -36% Surgery - 24% Treatment - 19% Obstetrics - 16% Internal med. - 5%	Value of claims paid in a given category to the total value of claims paid
Buzzacchi, Scellat, Ugh etto (2016)	Italy, 2004-2010, public hospitals	(the analysis is for each of the surveyed years separately, I refer only to the total - the average structure for 7 years in total) Orthopedics - 32% Other - 31% Surgery - 15% Specialist surgery - 11% Obstetrics - 11%	Number of claims submitted to the total number of claims
Benetti (2016)	Italy, from January 1 st 2004 to December 31 st 2012, from 15 Italian regions (over a total of 20).	Surgery - 30% orthopedics - 16% emergency - 15% internal Med. - 14% other - 12% Obstetrics - 10% Anesthesiology - 3%	The number of reported errors depending on the specialty of the staff (not branches) to the total number of reported errors
Hwang el al. (2018)	Taywan January 2002 to December 2013	Other - 26% Obstetrics - 11% Orthopedics - 10% Rescue - 8% Neurosurgery - 8% Total surgery - 7% Plastic surgery - 6% Internet - 5% pulmonary medicine - 5% gastrointerinst - 5% urologist - 4% ophthalmology - 4% pediatrics - 4%	The number of claims submitted depending on the specialty of the staff (not branches) to the total number of claims submitted
		Orthopedics - 10% Urology - 9% Midwifery - 8% Rescue - 8% Neurosurgery - 7% Surgery - 7% Plastic surgery - 7% Gastrology - 7% Internet - 6% Pulmonary - 2% Other - 30%	Paid, up to the total number of claims paid

Source: own study

It is also worth mentioning after the last report cited in Table 1 (Hwang et al., 2018) that "in 133 cases only 14.1% of the verdicts were against clinicians, with a mean indemnity payment of $ 83,350. The most common single specialty involved was obstetrics (10.7%), while the surgery group accounted for approximately 40% of the cases. In total, 46.3% of the patients named in the claims had either died or been gravely injured. Compared to the $ 75,632 indemnity for deceased patients, the mean indemnity payment for plaintiffs with grave outcomes was approximately 4.5 times higher. The diagnosis groups at high risk of malpractice litigation were infectious diseases (7.3%), malignancies (7.2%), and limb fractures (4.9%). A relatively low success rate was found in claims concerning undiagnosed congenital anomalies (4.5%) and infectious diseases (5.8%) group. A surgery dispute was the most frequent argument in civil malpractice claims (38.8%), followed by diagnosis error (19.3%).

The study of Hickon el al. (2002) based on the cohort study in a large US medical group between January 1992 and March 1998, accounting for 2546 physician-years of care, in which he compares only two specialties important for claims and shows that the risk of claims is higher for surgeons than for neurosurgeons. Specifically, 137 (32%) of the 426 nonsurgeons had at least 1 risk management file compared with nearly two thirds (137 [63%] of 219) of all surgeons.

Also the report on error risk assessment for liability insurance purposes in the US market, prepared by the American Medical Association (AMA, Guardado 2018) titled "Medical Professional Liability Insurance Premiums: An Overview of the Market from 2008 to 2017," indicates that in an analyzed period rates have remaining largely unchanged, however, cites that some specialists face higher risk and will also require higher limits of liability coverage. Therefore specialties that fall into a higher risk category will also be charged with higher premium rates. Those specialties assessed in this report as more risky include:

- Obstetricians.
- Neurosurgeons.
- Emergency room physicians.
- Cardiovascular surgeons.
- General surgeons.
- Orthopedic surgeons.
- Plastic surgeons.

Another important issue concerns the effectiveness of claims. That is, what percentage of claims are recognized and results in the necessity of payments. Anupam et al.(2011) examining data from 1991-2005 of 233,738 physician-years of coverage in one insurance company in US indicated that 78% claims was unsuccessful. The small insurance company from Maryland (US) Capson reported the percentage of considered and recognized claims depending on the selected specialties (Table 2).

Table 2: Effectiveness of claims depending on the specialty

	number faced a claim annually	Claims resulted payment to a plaintiff	Mean payment in USD
Radiology	7,3 %	2,3 %	233.000
Neurosurgery	19,1 %	3 %	344.000
cardiovascular surgery	18,9 %	3,8 %	308.000
General surgery	15,3%	4,2 %	290.000
Internal medicine	7,8 %	2,4 %	311.000
OB/GYN Obstetricians and Gynecologists	11,2 %	3,7 %	375.000
General practitioners/family practice	5,2 %	1,3 %	255.000

Source: data presented by Capson Physicians Ins Co https://www.capson.com/medical-malpractice-insurance-by-specialty (received 06.05.2019)[1]

The cited results correspond to German data, which show that as much as 76.4% of patients' claims are unfounded (Becker, 2017).

Research on the Japanese market indicates very high claims effectiveness. As gives Wang el al. (2017) Of the cases we investigated, 68% ended with monetary compensation. This percentage is close to the corresponding values previously reported in China (67%), Japan (60%) and the USA (56%) but substantially higher than the value reported for Canada (33%). 5,6,32,38 The between-country differences in this proportion probably reflect between-country differences in legal and medical systems and socioeconomic backgrounds[2]. In addition, it is pointed out that these high-performing data include claims in which medical malpractice was recognized, as well as bodily injury and health impairment.

Also the already mentioned study of Anupam el al. (2011) indicates, that of 7, 4% faced only claim 22% payment with a plaintiff.

Medical malptractice claims in Poland

In Poland, the legislator, as the basic source of compensation in medical malpractice cases, introduced the compulsory liability insurance - thus transferring the risk to a certain extent to commercial insurers. The regulation indicates the minimum guarantee sums, which are respectively (Regulation of the Minister of Finance on compulsory third party liability insurance of an entity performing medical activity of 29 April 2019, Journal of Laws of 2019, item 866):

– for a medical staff
- EUR 75,000 per one occurrence,
- EUR 350,000 with respect to all occurrences;

– for a hospital are:
- EUR 100,000 per one occurrence,
- EUR 500,000 with respect to all occurrences.

It should be noted that the cost of compulsory liability insurance for hospitals reaches 30 % of the guarantee sum, and the sum is exhausted by the payment of claims. Due to the high insurance prices, in practice the policies are concluded with minimal guarantee sums. Excessive damage will thus be charged to the healthcare provider. At the same time, the legislator did not provide for the differentiation of the minimum guarantee sum depending on the specialty and scope of services. These factors are only analyzed by insurance companies in premium valuation. In addition, in recent years the phenomenon of connecting public health care institutions has intensified. This is done by means of horizontal connections. The result of the merger is the creation of a large variety of functioning hospitals in Poland, both in terms of the number of beds and the scope of health services. At the same time, the legislator did not provide for modification of the minimum guarantee sum of compulsory liability insurance in the event of a merger, thus the guarantee sum indicated as minimal - and at the same time constituting a guide to the legislator on the risk level - applies to both small and large establishments.

---

[1] However it has to be pointed that Capson Psychisians Ins Co has only 0,07% market share in one US state Maryland in 2017 (Redmer, 2018) and was placed into liquidation on June 28, 2019, at the request of the Texas Department of Insurance (http://www.capsonsdr.com/index.htm).

[2] But this assesment is based on a review of old Canada literature from a 1991 publication (Coyte PC, Dewees DN, Trebilcock MJ. Medical malpractice – the Canadian experience. N Engl J Med. 1991 Jan 10; 324 (2): 89 –93. Http://dx.doi.org/10.1056/NEJM199101103240204 pmid : 1984189) or US of 2006 (Studdert DM, Mello MM, Gawande AA, Gandhi TK, Kachalia A, Yoon C, et al. Claims, errors, and compensation payments in medical malpractice litigation. N Engl J Med. 2006 May 11; 354 (19): 2024–33. http://dx.doi.org/10.1056/NEJMsa054479 pmid : 16687715

As indicated - the Polish health service does not keep publicly available detailed registers of medical errors, including component claims on the one hand, and the areas of medical services to which they relate, on the other.

The image of the Polish market regarding compensation for medical malpractice is provided by data from the Ministry of Justice records regarding civil court proceedings for compensation for damages caused by the health service in the years 2011-2017 (ISWS, 2018). General data on cases referred to litigation provided by the Ministries of Justice presented in Table 3 indicate that since 2011 the number of civil lawsuits has not increased drastically, remains relatively similar, their value changes, which is illustrated by the decrease in cases brought before District Courts as courts of first instance, where cases of value are considered in accordance with the property jurisdiction up to 75 thousand PLN.

According to data for the period from 2001, the total number decreased - in 2001 it was 1295 lawsuits, in 2002 -1447).

Table 3: Impact of cases at first instance in 2011 - 2017*

	2002	2005	2010	2011	2012	2013	2014	2015	2016	2017

** only 3 years were selected for the years 2002 - 2010*
Source: own study based on ISWS, 2018

The effectiveness of cases can be generally assessed on the basis of cases in which the claim has been upheld in whole or in part. These data are presented in Table 4 - and includes cases that in a given year ended in a ruling (settled) and only cases in 1 instance (the analysis does not include appeal proceedings, i.e. related to the fact that the judgment may be appealed by the losing party or by the claimant if partially accepted).

Nevertheless, the presented data indicate that the effectiveness was in the range of 19-28% in cases in district courts, and slightly higher 25-30% in cases of claims of higher value examined by regional courts.

Table 4: The number and effectiveness of court cases in 1 instance in 2011-2017 - included in full or in part

Source: own study based on ISWS 2018

Data for earlier periods indicate that the effectiveness was similar in 2001 and then since 2006. In 2002-2005, however, significantly higher 33-35%. In 2001, 30% of cases dealt with in district and regional courts, the claim was granted in full or in part. 38% for 2002 and 2003. In the following year (2004) in 33%, in 2005 in 37%, in 2006 = 28%, 2007 = 27%, in 2008 = 25%, in 2009 = 26% and in 2010 = 25% (Korytkowska, 2015).

Based on these data, it is difficult to assess the shape of claims on the total market, because some of them do not go to courts, some are settled in amicable proceedings, e.g. by recognizing the claim by a medical entity and more often by the insurer. Some claims are considered in the alternative system - by provincial commissions for medical events.

It is also difficult to assess the structure of medical malpractice in Poland, taking into account the type of events, the type of claims (for property, non-pecuniary damage) as well as the specialty / area of services. Available data includes cases of patient rights violations, not just cases of bodily injury or health impairment or death resulting from medical errors.

However, some data indicate that there is a growing tendency to direct claims in this area. According to the report of the Chief Ombudsman of professional responsibility of doctors in Poland:

- the number of complaints increased in the period 2006 - 2013 from 3,085 to 4,030 (by 30%)
- including the number of complaints covering events such as illness or death from 1822 to 2328

The number of complaints in the above title represents in this period 56-60% of the total complaints.
The structure of complaints depending on the specialty (however, it also includes allegations regarding the acceptance of material benefits, unethical behavior of the doctor, confirmation of untruth, violation of the rights of the mentally ill and conflicts between doctors) in the years 2006-2013

- internal medicine, mainly cardiology 28-33% of all complaints
- surgery with orthopedics 22-25%
- dentistry 15-17%
- obstetrics and gynecology 10-13%

Another study worth considering in the Polish market is the work of Tyminski and Serocka (2018). The authors based on the analysis of 312 court rulings in the field of medical errors and patient rights in the period 2000 to 2016 determined areas of specialty in which claims were submitted and considered:

- General surgery 25%
- Orthopedics and traumatology 20%
- Gynecology and obstetrics 11%
- Ophthalmology 4%
- Oncology 4%
- Neurosurgery 4%
- Neurology 3%
- Other 28%

The authors also indicate that in 45% of the analyzed cases the patient or his family won as a claimant, which is higher than that resulting from the analysis of aggregated data, however, it should be noted that aggregated data includes only decisions in 1 instance. They do not include appeal proceedings - however, the authors abandoned this analysis from general data and it cannot be determined which party appealed. In addition, this study covers the period with higher efficacy relationships at first instance (2002-2003).

Unfortunately, it was not indicated how the effectiveness is shaped depending on the specialty. However, the figures are similar to the specialty indicated, as areas which are submitted complaints to the Ombudsman professional liability.

Empirical Example

The following example is a contribution to further analysis of the Polish market in terms of claims directed to hospitals. Due to the very difficult access to data illustrating the scale of the phenomenon, we present data on one medical facility. It is worth emphasizing that this is a large university /

clinical hospital. The article analyzes data on claims lodged in 2007-2018 (no data for 2014), as well as claims for personal injuries in patients in 2015-2018. In 2017 and 2018, compensation paid and claims paid were analyzed in relation to individual claims. Data for other years were aggregated. The data came from one of the Polish clinical hospitals, which in 2017 had over 300 permanent beds in 15 wards. Of which 13% of beds in the neurosurgical department, 11% in each of the departments: ophthalmology, plastic surgery and general surgery, 8% each in the department of transplantology and lung diseases, 7% in the gastroenterology department, 6% in the neurological department, 5% in the department percussive, on other branches below 5%. There is no gynecological ward in the hospital. The structure of the number of beds in hospital wards is similar to the structure of the number of patients per year in these wards. All of these departments service approximately 2000-2400 patients annually. Hospital total about 21 thousand. In 2017, the value of the contract at the neurosurgery department was over 17 million PLN, for the entire hospital over 90 million PLN.

In the analyzed years, the structure of the size and number of claims and payments was assessed in terms of recognition of claims and reimbursement by the insurer. The hospital's future costs were estimated based on the claims made in 2017-2018 in two options: assuming 100% recognition of claims and assuming 20% recognition of the value of claims (this value was estimated on the basis of historical data on the percentage of recognized claims).

Analysis of claims submitted in the years 2007-2018

The analysis was started by presenting the number (Fig. 2) and size of claims (Fig. 3) for personal injury reported in 2007-2018 (no data for 2014) in the analyzed hospital. It is worth emphasizing that the presented data relate only to claims for personal injury, and do not relate to complaints addressed directly to the hospital, university or Provincial Department of the National Health Fund. In 2015, 16 such complaints were recorded. Of these, 2 complaints concerned distant dates of access to medical services (including 1 justified), 3 complaints concerned dissatisfaction with the quality of health services provided in relation to interpersonal relations (including 1 justified), 2 complaints concerning refusal to provide advice (considered justified), 6 complaints regarding doubts or advisability of medical services (including 2 justified), 2 complaints related to documentation problems (including 1 justified), 1 complaint concerned the accusation of a hospital employee to steal patient's money (considered unreasonable).

Fig. 1: The number of claims reported in the hospital in years 2007-2018
Source: own study

Fig. 2: The value of claims reported in the hospital in years 2007-2018
Source: own study

Analysis of data on the number and value of claims for personal injury (Figure 1 and Figure 2) shows that in 2007-2013 the number and value of claims increased from year to year. In 2015, 2017 and 2018 the number of claims decreased compared to 2013, in 2016 a large increase in the number and value of claims was observed, but it is still eight times higher than in the first year of the analysis.

A total of 16 claims totaling over 1.8 million PLN were filed in the studied hospital in 2017. The average claim size was 113 thousand PLN, with a minimum value of 5 thousand PLN and the maximum value of 657 thousand PLN. The median value of claims was 76 thousand PLN. In 2018, 17 claims totaling over 4 million PLN were filed at the same hospital. The average value of the claim was higher and amounted to 237 thousand PLN. The lowest claims were 20 thousand PLN, the highest over 1.6 million PLN, median 125 thousand PLN.

Given the similar number of claims in these years, a significant increase in the amount of claims should be noted.

Most of the claims reported in 2017-2018 were contentious. Only two cases out of 33 ended in a settlement. It should be emphasized that not all claims filed in a given year related to damage incurred in this year. One claim among those filed in 2017-2018 was considered by the insurance company to be time-barred, and in five cases the insurer stated that there are no grounds to recognize the claim. Court proceedings extend the time for resolving contentious damages. An analysis of the benefits paid in 2017-2018 shows that the duration of court proceedings ranged from one to as many as 10 years. Withdrawals in 2017 were on average after 2.5 years, while in 2018 on average after 5.5 years.

There is a caveat necessary in the assessment of claims submitted - if they include personal injury, they may include disability claims for serious damage: lost income, increased needs or reduced future views. The value of these claims may not be reflected in hospital statistics, as they are recognized e.g. monthly and the hospitals are not used to establish provisions for their value, like e.g. insurance companies. Meanwhile, they may result in far more significant charges in terms of value, given the

long payout period (Jędrzychowska, 2015). The examined hospital left a budget reserve of approx. 28% of claims in the given year to cover future claims, benefits and pensions.

Analysis of claims and benefits paid in the years 2017-2018

In 2017, the examined hospital paid a total of over 341 thousand PLN of claims and benefits, of which approximately 30% were pensions and 70% compensation plus interest and court costs. The insurer covered 70.23% of costs (Figure 3). In other cases, the insurer considered that there were no grounds for the insurance undertaking to accept liability.

In 2018, the hospital paid over 412 thousand PLN, of which 20% were pensions and 80% compensation and court costs. The insurer covered 80.41% of the payment costs incurred (Figure 3).

Fig. 3: Contribution to the costs of payments (%)

Source: own study

Looking for the answer to the question about the hospital's own participation in the claims payment - several suppositions can be made. It may come from an integral franchise (until July 15, 2016 deductible was allowed in the contract of compulsory third party liability insurance, and claims may be made from events prior to that date (Act on Medical Activity of April 15, 2011 Art. 25) - the basic limitation period in Poland is 3 years, in the case of crimes up to 20 years, but it is interrupted by reporting to the insurer or e.g. filing a lawsuit against the institution). Other options are – recognition by the hospital of claims not recognized by the insurer (although the scope of exclusions in compulsory liability insurance is very limited (Regulation 2019), e.g. excludes property damages). These may be payments recognized in other procedure of settlements of so-called "medical events" considered by the Medical Incident Commission (alternative dispute resolution), where insurance was compulsory for several years only. They can also be payments due to the exhaustion of the guarantee sum or over the guarantee sum for one occurrence. It should be noted here that until December 2011 in Poland, the guarantee sum in compulsory medical liability insurance was lower than the amount mentioned above, i.e. 46,500 EUR per event and 275 thousand EUR for all for ZOS. There are such claims on the market for a failure from that period, reported a few years later, especially when the damage results from a crime.

The share of pensions in benefits paid out may imply the assumption that the value in this respect will increase, as the next ones, newly awarded or awarded will be added to the paid. In addition, the injured party may request verification of the benefit awarded due to the decrease in its real value over time (inflation) and apply for valorization, which will increase the cost for the hospital or insurer.

When assessing the claims and benefits paid in respect of hospital departments, the largest share in the payments not covered by the insurer in the period under review was related to neurosurgery (around 66%) (Figure 4).

Fig. 4: The participation of payments in total payments by hospital wards in years 2017-2018
Source: own study

They amounted to an average of 7 thousand. on a branch bed. Other wards are gastroenterological surgery and laryngology (Figure 5).

Fig. 5: Average payment per ward bed

Source: own study

Comparative analysis of claims and benefits paid in 2017 and 2018 with claims submitted in these cases

In the further part of the study, only payments were analyzed, for which full data on the value and type of claims submitted was available.

Fig. 6: Claims and payments in 2017 and 2018

Source: own study

The value of claims and benefits paid in 2017 was over 167 thousand PLN (average payment is 33 thousand PLN) and accounted for around 17% of the value of claims submitted in these cases. The amount of expected claims was over 960 thousand PLN (average claim amounted to 193 thousand PLN), of which approx. 850 thousand PLN constituted compensation, over 92 thousand PLN damages, over 20 thousand PLN annuity. The average value of expected redress was around 170 thousand PLN, and paid slightly over 33 thousand PLN. Compensation was not paid, the average value of the granted disability pension was over 10 thousand PLN.

In 2018, claims and benefits paid out amounted to over 275 thousand PLN (average payment amounted to 55 thousand PLN) and accounted for over 20% of the value of claims submitted. The amount of expected claims was over 1.3 million PLN, and the average value of a single claim was 265 thousand PLN. The average value of expected redress was approx. 260 thousand PLN and 87 thousand PLN paid out. Data is referenced in Figure 6.

It should be noted that the average value of the claim for compensation in 2018 increased by 53.57% compared to the previous year, while the average value of compensation paid after a court case in 2018 increased by 160.61% compared to 2017.

Simulation of future hospital costs due to claims made in 2017-2018

In this part of the study, the authors want to show how the finances of the hospital will be charged in four hypothetical variants regarding the recognition of claims. The first option is the "black scenario" stating that all patients' claims will be recognized, the second will be 40% of claims and the third 30% of claims will be recognized. The last one is the "typical" scenario based on the 20% level of recognition of claims submitted based on historical data. It was also assumed that the costs not reimbursed by the insurer constitute 25% of the value of claims and benefits paid in each of the variants.

Table 5: Costs of future claims and benefits due to claims submitted in 2017 and 2018 respectively

Year of Claim	Value of future claims and benefits [PLN]			
	Variant I – 100%	Variant II – 40%	Variant III – 30%	Variant IV – 20%
2017	452 752	181 101	135 826	90 550
2018	1 007 894	403 158	302 368	201 579

Source: own calculations

Fig. 7: Value of estimated claims and benefits

Source: own study

The data in Table 5 and Figure 7 indicate a large increase in the value of future costs incurred by the hospital.

Summary

The results confirm that the number and value of claims depend on the ward specialty. Neurosurgery faced the highest risk and is also the specialty highly affected in other markets. However other risky specialty as gynecology and obstetrics wasn't examined due to the lack of such one in analyzed hospital.

The effectiveness of medical malpractice claims on the Polish market is similar to other markets (20-30%) - which is confirmed by aggregated data on claims in courts and claims faced by analyzed hospital. Based on data on the effectiveness of claims in motor liability insurance (MTPL) made available by claims management companies in the report of the Promotor Association edited by Monkiewicz, Monkiewicz April (2011) it was established that - effectiveness of seeking claims in 2007-2008, before courts exceeded 99%. However, it should be noted here that in cases of MTPL insurance more often, the dispute concerns only the amount, not the liability itself, unlike in case of medical malpractice.

Research indicates that the type of wards in the hospital determines the scale of payments. It should be should considered whether the guarantee sum should not be correlated with the profile of wards of the entity performing the medical activity and the number of medical services provided.

Liability insurance of entities conducting medical activity does not fully cover the costs incurred by hospitals. The research shows that the insurer did not cover, on average, around 25% of the costs in the years under review, stating that there were no grounds for recognizing the claim or limitation,

despite positive court judgments for the injured party. This contradicts the basic protective function of insurance and indicates a lack of competitiveness on the insurance market in the scope of the discussed civil liability insurance. Hospitals, as public entities, include the said insurance through public procurement, where there is often only one offer in the proceedings.

The insurer's failure to reimburse part or all of the claims and benefits is particularly worrying because of the significant increase in the value of claims from year to year. On the other hand, due to the lengthy court proceedings, the entity finds it difficult to estimate future costs.

When referring to the risk management process in hospitals, it should also be borne in mind regarding personal injury that:

- average values of claims and total value faced by analyzed hospital are low and fall within the statutes guarantee sums, but our other studies show that the values in the case of serious bodily injuries, as well as Swiss Re scenario - are much higher and the guarantee sums are insufficient,
- the incubation time of loss and claims as well as the claim adjusting time and limitation periods make analysis difficult and should be taken into account.
- the value of disability benefits is not limited by time, but by the life expectancy of the injured party. In addition, the value of the benefit may be adjusted and increased.

Abstract

The article presents the author's methodology for creating customer value chain, which includes a set of methods and techniques, i.e., the method of structuring the business portfolio of producers by goods and consumers; a method for clarifying the main and supportive types of business processes for the production; the methodology for determining critical success factor in the identified business processes and determining the benefits and values of each critical success factor for various market segments; a method for identifying key factors in selected business processes that lead manufacturers to failure and developing marketing decisions to turn failure factors into success factors; a method for determining the added value for different market segments from the developed marketing-management solutions and a method for evaluating the effectiveness of customer value chain by product manufacturers. The author's methodology for creating customer value chain is provided on a basis of a case on organizing an eco-business at Ecocluster LLC, the largest Russian voluntary association of producers, suppliers and sellers of natural, environmentally friendly and functional products under the Ecofarm brand, in which hundreds of farmers, processors and owners of agro-tourism complexes in 37 regions of Russia cooperate. The author's methodology is universal and can be applied in analyzing the effectiveness of creating customer value chain and making marketing-management decisions in order to create perceived and benefit by producers not only of organic products, but also of various types of products.

Keywords: Value Chain, Customers, Methodology, Organic Products

Introduction

In the face of deteriorating living conditions, the country's population begins to seriously think about the need to consume at least safe products and, at the very least, products that provide a high quality of life. This level of needs and values when consuming food corresponds to products with the prefixes "eco", "bio", "organic".

Organic products are products of agriculture and the food industry that are manufactured in accordance with approved environmental standards that provide for the rejection of the use of pesticides, synthetic mineral fertilizers, growth regulators, artificial food additives, genetically modified organisms.

Demand for organic products in Russia is growing in line with global demand trends. Over the past 15 years, the global market for organic food has grown 5 times, the share of organic products amounted to 10% of the total global food market. Relative to the global market, the Russian market for organic products is in its initial stage and is 0.16% of the world market. The country's government sets actual and potential producers of organic products an ambitious task: in the near future to produce and sell volumes of organic products, which will make up 10-25% of the global volume. In 2019, per capita consumption of organic food accounted for only 48 rubles [Analysis of the Russian market of organic products, 2019].

According to forecasts of "Euromonitor International", it is expected that sales of organic products as a whole will grow by 30 percent in the coming five-year period. This growth will be due to a new stage in the production and certification of products and increasing demand from the Russian consumer [Kuznetsova, Avzalov M, Avzalov R., 2019; Kuznetsova, Avzalov, Gorbunov, et.al. 2019].

The supply in the market of organic food is presented by both certified and non-certified producers. As of May 2019, 82 certified organic agricultural producers are engaged in the production of organic products in Russia, of which: 25 farms in the field of crop production, 9 farms in the livestock sector, 6 farms are engaged in wild plants collection, 2 enterprises - in the production of alcoholic products, 2 enterprises - in agricultural processing, other enterprises combine several types of production [Overview of the market for organic products in Russia, 2019]. Six certified manufacturers export products to EU countries. The annual growth rate of agricultural land areas in Russia involved in the production of organic products is 40-70%, which is the highest rate in the world [Seifullaeva, Panasenko, Shirochenskaya, et.al, 2018; Seifullaeva, Shirochenskaya, Shklyar, et.al, 2017].

Domestic producers of organic agricultural products are affected by both domestic and global competition. Internal competition is becoming increasingly intense on the domestic market due to selling products labeled as environmentally friendly, without the use of food additives, synthetic fertilizers and GMOs, without manufacturers passing the appropriate certification procedure. Thus, unscrupulous manufacturers, speculating on the names of products with the prefixes "eco", "bio", "organic", using obscure labels and misleading consumers, are participants in the organic market, drawing a substantial market share.

According to marketing research conducted by AgriCapital, 45% of Russian food manufacturers illegally place such labels on the product label, and about 60 percent of consumers in Moscow supermarkets are willing to pay more for products if their package contains an "organic" mark [Overview of the market for organic products in Russia, 2018].

On the domestic market, domestic producers of organic products are affected by international competition due to their imports from EU countries, such as Germany, France, Italy and others.

According to the NeoAnalytics research, about 80-85% of the Russian market for organic products is imported [Analysis of the Russian market of organic products, 2019]. Due to many years of experience in the market of organic food, international companies supply the Russian market with high quality and innovative organic products, many of which are not yet produced in Russia. The competition between domestic producers and international companies for "shelf space" in supermarkets is increasing due to the long-standing presence of these companies on the Russian market and the presence of long-term contracts for the supply of products.

Consumer demand for organic products is mainly represented by the consumer demand in mid-price, premium and luxury segments. According to the results of a study conducted by the Centre of System Business Technologies SATIO on a sample of 210 units, it was revealed that under the prefixes "bio", "eco", "organic", consumers of these products understand products in which most of the ingredients are of natural origin. Regarding the price of organic products, the opinions of respondents were divided: 41.9% of respondents agree that organic products should be more expensive than their equivalents, and most of the respondents are willing to overpay for the naturalness and environmental friendliness of the products [Kozlova, Sukhostav, Anashkina, et.al, 2019]. The main values in the

consumption of this product for 81.1% of respondents are health benefits, while for every third respondent it is important that the consumption of such products will give him/her a sense of some status and will allow to save the environment. [Research: Portrait of the consumer of eco-products in Belarus, 2018].

In marketing as well as consumer behavior theories and practice, it is assumed that a consumer buys not goods or services, but opportunities to meet needs, get benefits and values [Doyle, 2001; Graf and Maas, 2008]. The perception of values from the consumption of organic products varies from culture to culture [Timokhina, Wagner, Ürkmez, 2018; Lepak, Smith and Taylor, 2007; Maccion, Borgianni, Basso, 2019].

For example, according to the Research Institute of Organic Agriculture (FiBL) and IFOAM, the main value in the consumption of such products for the French and Czechs is health care, for the German consumers is care for the environment, for the Danes is care for animals, for US residents is health due to the lack of genetically modified organisms in food. Secondary data obtained by us show that the main values of organic products are health care and the status “I can afford it” for Russian consumers. Organic food is more expensive than their equivalents in the range from 20 to 400 percent, so not every Russian consumer can afford to eat such food [Overview of the market for organic products in Russia, 2018]..

The current market conditions for organic food products, intense competition in this market and changes in consumer preferences, the level of their purchasing power are the main factors that determine the managerial, economic and marketing strategic decisions of organic producers.

Theoretical Framework

Organic production is localized, mainly on a regional basis in the form of a cluster organization of the business of small and medium enterprises. Regional localization of the business is explained by the need to bring the producer closer to the consumer due to the short shelf life of organic products and the need to build logistics with a view to the quick delivery of products to consumers living in this territory [Gusmanov, Kuznetsova, Stovba, et.al., 2018].

According to M. Porter, the advantages of cluster organization of agricultural business within the region will also be the strengthening of interconnection, complementarity of agricultural enterprises and related industries due to faster dissemination of specific knowledge, technologies, professional skills, marketing, innovation, etc. [Porter, 2005; Zamora, 2016].
