The goal of the research was to acquire information about interests and needs in the scope of marketing processes automation in the group of investigated economic entities. In this context the authors formulated a set of questions, which constituted the basis for further analysis of the subject information. One of the initial questions in the survey questionnaire, presented in the form of 5-point Lickert scale, concerned a reaction to the statement that it is necessary to introduce solutions in the scope of marketing processes automation in the gardening industry enterprises. In this aspect the great majority of the respondents agreed with the statement (22 respondents), and one person had no opinion about this issue.

Such a juxtaposition of the obtained answers correlates with information obtained from the respondents in one of the subsequent questions regarding applying by them the said solutions – among 23 surveyed enterprises a significant majority (19 entities) declare implementing tools from this area within the conducted business activity. However, it needs to be stressed that a dominant solution in this domain is the basic solution, which is a profile in social media.

In the course of the conducted research the authors also turned their attention to the fact whether the solutions in the scope of *Marketing Automation* found practical application in the selected areas of internet marketing in the enterprises. For this reason, the respondents were asked to evaluate a set of selected factors. This evaluation consisted in determining the importance on the scale from 1 to 10 (where 1 – the least useful criterion, 10 – the most useful one). The survey respondents gave highest marks to presentation of contents on the web portals and email marketing, the lowest marks received monitoring the behaviour of mobile applications users (Fig. 1). It is worth noticing that the factor that received top marks – presentation of contents on web portals – concerns the implementation of mechanisms that adjust the contents convergent with the buying history of users, reducing in this way unnecessary or redundant information.

Fig. 1: Usefulness of solutions in the scope of Marketing Automation
Source: own analysis.

An extension to this issue was evaluating by the respondents (within an analogous 10-point scale) the necessity to introduce process automation in other areas of internet marketing, which in the vast majority of the investigated entities (20 enterprises) are not supported by tools of *Marketing Automation*. The

highest level of usefulness was attributed to communication with customers (9.3). Next positions were occupied by optimisation of sales and purchases of advertisement on the Internet (7.2) and the analysis and monitoring of user behaviours with regard to the course and execution of sales and purchasing processes (6.8).

The research also addressed the issue of usefulness of utilising in enterprises chat bots in the area of online marketing. In this aspect the respondents were asked to attribute weights for particular benefits resulting from their implementation. The survey respondents attributed the highest weight to the functionality related to embedding bots on communication platforms itself. This results primarily from the fact that the investigated enterprises do not apply this solution, but at the same time they are aware of the benefits that it can offer. At the other extreme was the functionality related to acquiring data by chat bots, which can be further used to conduct various analyses of the customers, which would provide the managerial staff with broader knowledge while making marketing and sales decisions (Fig. 2.).

Fig. 2: Evaluation of benefits resulting from implementing in enterprises chat bots.
Source: own analysis

Due to a universal nature of marketing processes automation in managing enterprises the obtained results of the pilot research conducted among the gardening industry enterprises can be referred to economic entities in other industries. The results of the pilot research are convergent with numerous analyses in the scope of online marketing presented in the literature on the subject.

According to the research published in *State of Marketing Automation 2019* 75% of enterprises utilise in their operations solutions that automate marketing processes (*State of Marketing…,* 2019). Another research conducted by *House of Marketing* demonstrates that 48% of the investigated enterprises that apply the solutions in the scope of marketing automaton evaluate them as one of the most useful tools for customer behaviour analysis (*Yearly Marketing…*, 2019). The research presented in the report *Email Marketing and Marketing automation Excellence 2018*, unequivocally show that enterprise owners indicate time saving, acquiring new customers and growth of incomes as the greatest benefit of implementing the solutions in the scope of marketing automation (*Email Marketing…*, 2018).

The greatest challenge that marketing automation is facing include search for proper tools, business processes integration with the use of available solutions and managing the acquired data (*Marketing Automation…,* 2019). *State of Marketing Automation Survey Report 2019* stresses the fact that the most useful solutions for digital marketing automation is application of communicators and chat bots, which was indicated by over a half of the respondents (*State of Marketing…,* 2019).

The conducted literature review and pilot survey allow to make an attempt at answering the first research question formulated in the introduction to the present paper: *Are the commercial enterprises that operate based in the traditional-internet business model interested in implementing solutions in the scope of e-marketing processes automation?* The results of the survey indicate that a possibility of automating processes of this type received great approval and interest. However, it needs to be remembered that these are just the results of a pilot research. It is worth stressing that that such a result may derive from the specificity and effects of the automation issue – that is, among others, increased process efficiency, decrease in its cost, time saving, decreasing the load of employees. On the other hand, it must be remembered that automation is accompanied by the costs of implementation and possible reduction of work positions. Other fears regard a short life-cycle of specific IT solutions and emergence of new technologies that in a relatively short time will replace the presently existing solutions.

What benefits are expected as a result of applying chat bots in online marketing? The answer to the second research question is not obvious. The pilot research did not allow for investigating the measurable effects of applying chat bots in online marketing, but only the opinions of the respondents regarding potential benefits of their practical implementation. One of the greatest benefits of implementing chat bots is reducing the cost of customer service and possibility of computer analysis of data acquired from customers – among others, to segment customers, analyse their loyalty. However, despite the numerous benefits it is also necessary to remember about the necessity to comply with the requirements concerning protection and confidentiality of the acquired data, and from the customer perspective also potential problems related to trust in solutions in the form of chat bots.

It should be expected that in the years to come one will observe a significant growth in the number of implementations of solutions in the area of marketing processes automation, including chat bots. This opinion results primarily from the possibility of applying these solutions within the platforms of social media and internet communicators that are integrated with them.

Conclusions

A fundamental element of contemporary enterprises functioning is a properly determined and selected marketing strategy carried out within the virtual information space. This is a component of communication between potential customers and the company. This space requires marketing processes being automated, which is done based on the mechanisms available within the presented in the paper Marketing Automation and Programmatic Marketing. A vital role is played here by artificial intelligence tools, machine learning and software bots.

The presented in the paper considerations comprise the results of pilot research. These indicate a necessity to continue the research works. The potential present in the identified benefits resulting from e-marketing processes automation justifies further research regarding in particular the economic and organisational aspect. It also seems interesting to consider the elements related to technical, social and legal conditionings.

Based on the research results one can observe a significant interest of the gardening industry entrepreneurs in implementing solutions regarding automation of processes related to marketing communication. This area can be effectively supported with the technologies - Marketing Automation,

Programmatic Marketing and chat bots. Various methods of creating the content on the websites and e-mail marketing still enjoy large interest. Therefore, it is possible to extend their functionality through applying the elements for automating the tasks they carry out. An important factor that improves the efficiency of communication is the presence of conversation interface. This is of particular importance if it takes over the advisory function in the form of a virtual consultant. This can strengthen the involvement of potential customers, increasing the conversion coefficient, optimise the flow of marketing processes with regard to measurable benefits for customers as well as enterprises.

Software Robots in Business Process Automation

Janusz Sasak

Institute of Public Affair Jagiellonian University, Cracow, Poland
janusz.sasak@uj.edu.pl

Abstract

The issues of business process automation and robotic process automation are usually associated with using physical solutions in production processes. These solutions enable performing activities independently of human participation. Such an approach limits the possibility of applying automation and robotization mainly to manufacturing and the IT processes which are performed as predefined in software used by organizations. A separate category of IT solutions is the technology of automation of repetitive business processes by means of computer programs — robots emulating human work the so-called Robotic Process Automation or RPA. The aim of this paper is the assessment of the usefulness of application of software robots cooperating in business process optimization. For the purpose of this paper, capabilities of software robots were determined, an implementation was carried out and 3 scenarios of robot work were developed. On the basis of the analysis of implementation works and effects of robot work during the studied period, possibilities and potential applications of solutions automating (supporting) business IT processes in public and commercial institutions in Poland were determined.

Keywords: Robotic Process Automation, Software Robots, Automation of IT Processes

Introduction

Business process automation as an area of management is relatively well described in the literature, however, the vast majority of studies refer to the robotization and automation of processes understood as the application of hardware solutions on production lines. However, over the past few years, solutions related to the use of specialized software that emulates the work of a human have appeared.. The software robot market is currently undergoing changes. This is because the concept of software robots cooperating as assistants to the computer operator has emerged. These changes, combined with a reduction in the prices of the solutions and a shortage of specialists, make the use of RPA economically viable, even for small businesses.

The concept of robotic process automation is based on the use of software robots, otherwise known as artificial intelligence workforce. The RPA technology is used to perform repetitive tasks such as application control, data collection, transfer of data between applications without the use of internal data exchange interfaces, and data operations. In the literature, the concept of RPA is considered in two aspects. The first regards software robots as a piece of software that can be configured by a computer to perform computing tasks. Whereas the second approach considers a software robot as a process consisting of a sequence of actions taken in a logical order, the aim of which is to automate tasks performed without human intervention. According to the available analyses, the main purpose of using such solutions is to save time, costs, improve productivity and increase the quality of work. Hence the need not only to define new areas of software robots' application, but also to determine their suitability for process optimization in terms of cost, time and quality. Therefore, when planning out the study, the following research questions were asked: what areas of activity of the organization's financial services can be automated, how the quality and efficiency of work of employees supported by software robots will change and how long it will take to see the return on the cost of purchasing a license and implementing the software in a small enterprise and public institution.

For the purpose of this study, the areas of application of software robots in public institutions and private enterprises was analyzed in only one area — accounting. The usefulness of application of robots for data transfer, creation of managerial reports, and performing repetitive accounting work was investigated. On the basis of the conducted research, potential areas of supporting work were identified, the quality and efficiency of work were assessed and the economic, time and quality benefits of using software robots as tools supporting accounting work were determined.

The software used for the research was provided by First Byte, under the commercial name — Wizlink. The research was conducted in cooperation with SenseMaking Automation and Robotics, a partner of First Byte, which deals with the implementation of RPA and BPA solutions.

Software Robots

The term robot comes from the Slavic word "robota" which means hard work, effort. Originally, it was used in reference to living beings — artificially produced humans intended for hard work. The term appeared in 1921 and was popularized through Karela Čapka's play entitled "R.U.R". Currently, the term robot refers to a device whose operations can be controlled directly by a human being, or by a pre-defined program, or by defining a set of general rules according to which the robot performs its tasks. The defined rules are translated into the performance of activities using artificial intelligence techniques and methods. The primary idea of using robots is to replace a human being in monotonous, repetitive, fixed actions or those hazardous to human health and life. In such situations, a robot performs work more accurately and more efficiently than a human would. As time passed, the concept of robots began to be applied to autonomously operating devices that receive information from the environment by means of appropriate sensors that process the information and determine the robot's behavior (Linner, Pan, Georgoulas, .2014). Currently, the term robot is used to describe automated machines that perform specific tasks in a real or in a virtual environment. Thus, it can be assumed that a robot is an electronic or electromechanical device programmed by a computer and capable of automatically performing a series of actions regardless of whether these actions are of physical or virtual nature. The condition for the robot to function is an intelligent link between the recognition of environmental conditions, the analysis of information received by the sensors and by means of artificial intelligence transformed into a sequence of activities performed by the effectors. The field of science which deals with the design and construction of robots is called robotics, and it also covers such areas as electronic engineering, computer science and mechanical engineering.

The idea behind software robots used in robotic process automation shall be explained in this paper. Software robots are virtual creations, applications whose task is to support and assist people in activities related to software operation and data analysis (Willcocks, Lacity, 2016). The primary purpose of using such technology is to gain a competitive advantage by eliminating the human labor element in repetitive monotonous activities based on clearly-defined rules. Importantly, these activities do not necessarily have to be directly related to the production of material goods or products, but can also be applied in the processing of information in its broadest sense. Examples of such activities include processes such as: invoicing, shipment tracking, inventory management, report generation and data transfer.

The 2017 research conducted by the Info Global Research Services Group indicates that the use of software robots is aimed at minimizing costs, shortening transaction processing time, increasing productivity and improving compliance in business processes (Brandon Buccowich, 2016). Software robot-based solutions are preferred over dedicated applications due to the immediate and low-cost approach to process automation based on structured rules. The use of software robots does not require re-engineering of the processes, and the result of their implementations is an increase in the quality and efficiency of the processes. The reorganization of databases, modification of applications or use of additional IT solutions is also unnecessary when using software robots. As the research (Moffitt, Rozario, Vasarhelyi, 2018) cited above suggests, software robots are used in all areas of activity, and are particularly useful in the areas of finance, accounting, e-marketing, banking, audit and HR.

The research carried out by Deckard (2018) indicates that the use of software robots allows to eliminate the element of human error in repetitive activities based on business rules and thus achieve an accuracy rate of 100%. In data processing, an additional advantage of a software robot is the robot's short learning time. A digital robot is often referred to as an intelligent, easy to use and cheap workforce, it emulates the actions performed by human resources and, in combination with artificial intelligence, can use learning algorithms in the scope of the tasks performed. Interestingly, in the public sphere, software robots can be used to handle unstructured data with the purpose of detection of fraud, such as money laundering. In the field of computer science, software robots can be used both to perform routine activities such as software configuration and installation or damage detection, and can also serve as tools to test applications for errors as well as efficiency and resistance to human error. Such a wide range of applications is possible due to the fact that software robots, unlike other solutions, emulate the work of a human and perform activities in the same way as a human operating a computer (Willcocks, Lacity, 2015).. Additionally, application of such solutions results in an increase in the quality of performed work through total elimination of irregularities and relatively low cost of work preparation. Taking into account the characteristics of modern software robots, it should be assumed that this market will develop and the solutions will find an ever-increasing range of applications.

Robotic process automation sees practically no use in Polish public sphere institutions. Considering that Polish public institutions make very limited use of standardized interfaces for data exchange, a software robot can be an ideal tool for transferring data between different systems. Currently, most of this type of operations are carried out manually by officials, which results with a large number of errors and a relatively long task performance time.

In case of small businesses, the use of software robots will become possible due to a radical reduction in costs. The implementation of this technology should generate an increase in competitiveness by relieving the workload of employees and management staff. The gained time may be used for other activities. Furthermore, small businesses should be able to increase the quality of products and services and improve customer relations. Typical errors resulting in losses and excessive operating costs should also be eliminated.

Business Process Management

The new development conditions created by the rapidly changing environment of modern organizations give rise to previously unknown risks (Röglinger, Pöppelbuß, Becker, 2012). A stable environment allowing for precise planning of the organization's activities requires the support by dynamic management methods allowing for flexible adaptation to the environment. In addition, the globalization processes observed in recent years, the free flow of knowledge and the development of information technologies form a new digital environment for organizations to function in. All the changes associated with digitization are often described as the digital revolution which leads to social changes, the evolution of the ways organizations are managed, or a new approach to research in management sciences.

A paradigm based on process thinking has become the dominant approach to management in recent years. The existing static, highly structured management thinking has been replaced by a dynamic approach, focused on change and the flow of information. These were already visible in the 1990s in organizations operating in rapidly changing market sectors. In this period, Hammer defined the process as a set of actions requiring input and output with a customer-specific value (Hammer and Champy, 1996). The then-new approach assumed that an organization is a set of processes that permeate one another and therefore a new perspective becomes necessary which would assume processes as the basis for design and management in an organization.

At the end of the 1990s the concept of Business Process Management was formulated, which focused on the revolutionary ideas of introducing changes and linking business processes with IT systems, resulting in a holistic approach to organizations and the introduction of the concept of process as a

basic reference point for the assessment and management of an organization. Despite the fact that the modern process approach was developed over 30 years ago, the term process is still understood quite ambiguously and often used interchangeably with such concepts as: procedure, action, task. R. Müller and P. Rupper describe the process as a chain of activities aimed at generating values corresponding to the customers' requirements (Müller, Rupper, 2000), thus drawing attention to the importance of processes in shaping the value and quality of goods provided to customers. M. Hammer is of a similar opinion, defining process as a group of related tasks whose common result is added value for customers (Hammer, 1999).

An important feature of processes from the point of view of managers was pointed out by T.H. Davenport, who defined process as measurable, structured actions designed to produce a specific product. (Davenport, 1993). Measurability is a particularly desirable feature from a management perspective. It is the element which allows managers to determine the effects of their actions and make decisions.

The process approach is also applied in normative management systems. For example, a process in accordance with ISO 9000:2006 is defined as a set of interrelated or interacting actions (activities) that transform input into output.

The number and variety of approaches, as well as the practice of implementing a process approach requires the classification of processes. Considering that the basic element of process identification is to define the rules and criteria for distinguishing groups of process types. There are many different criteria for dividing and classifying processes in the literature. According to M. Porter two types of processes can be distinguished:

- primary,
- auxiliary,

The primary processes included, inter alia, the following: — "input" logistics, which includes activities related to production preparation, — product manufacturing, — "output" logistics, which includes activities related to sales, — marketing, — after-sales services. Thus, primary processes are those that create value and quality of goods or services offered to customers. Auxiliary processes include those related to management of the organization and human resources, procurement, development, IT support or traffic assurance (Cushman, Wakefield 2015)
The classification proposed by APQC (American Productivity Quality Center), which is included in the Process Classification Framework (PCF), should be considered as the most comprehensive classification of processes. This classification contains 12 categories of processes grouped in two areas of operational processes deemed as key and supporting processes. The classification and characteristics of process groups are presented in Table 1.

Table 1: Process classification framework by APQC

Process group	**Description**
Operating processes	1.0 — Develop a vision and strategy 2.0 — Develop and manage products and services 3.0 — Market and sell products and services 4.0 — Deliver products and services 5.0 — Manage customer service
Management and support processes	6.0 — Manage and develop human capital 7.0 — Manage information technology 8.0 — Manage financial resources 9.0 — Acquire, construct and manage property 10.0 — Manage environment, health and safety 11.0 — Manage external relationships 12.0 — Manage knowledge, improvement and change

Source: author's own study

The modern concept of process management is based on the assumption that activities should be optimized focusing on processes and not functions. In modern organizations, this provides conditions for achieving specific goals, providing effective services and using the potential of employees and other resources. Implementation of process management also requires implementation of IT systems supporting management and automating data processing tasks.

Creating a coherent subsystem in the area of management of process organization, it is necessary to identify those concepts which in a complementary way support the process concept, facilitating its implementation and then reaching process maturity, and as a result — the current management of process organization. The list of selected management concepts complementary to process management is presented in Table 2.

Table 2: Selected key concepts supporting process management

Concept	Description of key competences
System concept	Application of basic recommendations of the concept: multidirectional analysis, static and dynamic system optimization, analysis of subsystems and supersystems, perception of seemingly distant variability, analysis of consequences of local sub-optimization, overall perception of the system
TQM	Philosophy of perceiving the functioning of an organization and its optimization resulting in the current approach to organizational optimization and process optimization aimed at increasing the added value for the customer through quality improvement
Lean Management	Optimization of processes in terms of their flexibility and cost reduction
Project management	Implementation of process management and achievement of process maturity seen as a portfolio of interdependent and related projects; ongoing optimization of process organization through the implementation of optimization projects
Network concept	Process structure seen as a network of interconnected intra-organizational processes, a network of links between organizations performing a given process (*exengeneering*) and a network of links between process resource providers and recipients of generated added value
Virtual concept	Perception of process links in terms of available KSFs (key success factors), deterritorialization of the links, flexibility of process configuration, integrator function
Fractal concept	Navigation tunnels between process links and the end customer (micro and macro tunnels), application of in-process marketing (customer-supplier relationship), self-restructuring, self-navigation, vitality, self-control, mentoring, coaching

Source: author's own study.

Among the management concepts commonly used today, at least a few support or even rely on in-organization process management. The management concepts presented in the table and process management set against them is only the author's selection of concepts and does not include all those that make use of process management. The selected concepts, however, are the representation of the connection between processes and information management, and thus also the area of application of software robots as tools to optimize process execution.

One of the most important areas of process management is process optimization, understood as a method of determining the best solution from the perspective of a specific criterion. In the case of business processes, the most frequently used criteria are time, cost and quality. Another definition states that process optimization is an activity of modelling, analysis and improvement of business and production processes in the private sector and administrative processes in the public sector.

Adopting such a defined concept of optimization, it can be considered that every action which results in an improvement in quality, increase in efficiency, or shorten the process time is in fact optimization. The effect of optimization can be achieved by a number of methods, including the use of hardware solutions, change of production technology, changes in the organization of work or changes in information management. This paper focuses on solutions that make changes in information management methods possible, based on software that replaces or assists humans in handling software interfaces.

Robotic Process Automation

Robotic process automation is a relatively new form of improvement of business processes in organizations. Robotic Process Automation or RPA uses a specific technology and methodology of using a computer based on software which, instead of a human operator, manipulates existing software used in processes. Since 2016, there has been a rapid increase in demand for robotic process automation. This increase is particularly noticeable in the area of office work and operations related to data modification in management support applications. Contemporary software robots are an intelligent and easy-to-use digital workforce that, due to new features and integration with the user interface, is able to perform actions that previously could only be performed by humans.

Both management theorists and practitioners see RPA as a tool that will significantly reduce process costs, increase information flow rate and eliminate data processing errors. The use of software robots for process optimization should relieve the employees from performing rule-based activities and give them more time to perform tasks of higher value. It is assumed that the correct implementation of software robots will allow for the creation of process teams based on active cooperation between humans and robots, and as research (Lacity and Willcocks, 2016) shows, people and robots in such teams complement each other perfectly.

The research conducted in recent years indicates that the natural purpose of using software robots is the non-invasive use of software that imitates the activities performed by the computer operator in the execution of business processes. Until now, the concept of software robots was associated with the construction of large data centers (software robot farms) in which applications were maintained and which were performing work by carrying out repetitive tasks in many locations and in different organizations. This concept was associated with the high price of software and the need to employ numerous programmers who adapted robots to customer requirements. These factors made the use of software robots profitable only for large entities and in situations where they could perform work consisting of thousands of repetitions of the same activities. Nowadays, with the emergence of a new generation of software robots cooperating with humans, it has become possible to robotize activities in business processes. Contemporary collaborative robots are characterized by a relatively low price, a fraction of the price of the robots created on software robot farms, and simple learning processes that do not require specialist knowledge to operate. According to the experience of SenseMaking Automation & Robotics, it takes several hours to train a software robot trainer, assuming that they are an intermediate computer operator. After such training, the operator is able to program any software robot cooperating in the execution of business processes.

For the purpose of determining the suitability of software robots for process optimization, a solution by First Byte, under the commercial name — Wizlink — was chosen. This application is classified as a software robot, and because of its capabilities, intended purpose and cost, it can be considered a new generation collaborative robot. Studies on the usefulness and profitability of this solution were carried out on the basis of analyses of robot use in a company managing resources and housing communities. Design works and tests of robot use for the purposes of performing work in the accounting department of one of the city halls were carried out as well. The data obtained for the purpose of this study was provided by SenseMaking Automation & Robotics partner and certified distributor of the Wizlink robot.

The software-based solution was implemented in the company managing resources and housing communities in December 2019. The company used a trial version of the software to evaluate the benefits of implementation and initial training of employees, and since January 2020 has been using a commercial version. Ultimately, the company decided to purchase a license allowing the robot to be installed on the company's internal server and run it from a remote desktop. Such a solution allowed the robot's engine to be used by many employees and for it to work beyond the company's working hours. During the test period, five scenarios were selected for the robot as shown in Table 3.

Table 3: Robot work scenarios in the company managing resources and housing communities

Scenario name	Average number of executions per month	Time of one execution performed by a human [hh:mm:ss]	Total time of execution performed by a human in a month [hh:mm:ss]	Time of one execution performed by the robot [hh:mm:ss]	Total time of execution performed by the robot in a month [hh:mm:ss]	Difference Between total times [hh:mm:ss]
Generation and printout of payment slips for residents	120	00:04:00	08:00:00	00:01:00	02:00:00	06:00:00
Recording of rent payments in the resource management system	1200	00:02:00	04:00:00	00:00:15	00:30:00	03:30:00
Recording of rent payments in the accounting system	1200	00:03:00	06:00:00	00:00:15	00:30:00	04:30:00
Preparation of financial statements for the management board (4 templates)	4	03:00:00	12:00:00	00:05:00	00:20:00	11:40:00
Generation and submission of tax return forms	7	00:05:00	00:35:00	00:00:20	00:02:20	00:32:40
					Total time savings	26:12:40

Source: author's own research

The table summarizes the results collected during the test period. The robot processed about 70% of the documents that are ultimately expected to be automatically handled under the executed scenarios. As the analysis of the data presented in Table 3 indicates, the time savings during the test period amounted to more than 26 working hours. Furthermore, it should be noted that only 70% of the documentation was processed in automatic mode. Thus, the total time savings can reach almost 40 hours with an unaltered scope of the executed scenarios. The total working time of the robot amounted to 3 hours 22 minutes, therefore it made considerable time savings that could be used for further scenarios, and the working time of the human-employee was 29 hours 34 minutes and 40 seconds

According to the data obtained in the company implementing the solution, the whole process of analyzing the robot's work and preparing work scenarios required 32 hours of consultant's work (4 days), which was valued at PLN 5000. Taking into account that the hourly wage of an office worker

performing tasks carried out by the robot is PLN 34.50, the value of working time saved amounted to PLN 1017.00. Monthly cost of using the robot (licensing fee) is PLN 216.00. Assuming the data presented above, the return on the costs incurred for the purchase of the license and implementation of the robot only in the scope presented above will be seen within 6 months. Taking into account the fact that the robot can be used in further scenarios and that during the test period the robot handled only 70% of the assumed number of scenario repetitions, the cost-return time should be significantly shortened.

For the purposes of this paper, the author conducted research in the city hall of a city with poviat rights. The analysis covered three processes performed by employees of the tax and accounting department. The first process was performed only manually, in the traditional manner. The other two were carried out by means of the software. A description of the processes and effects of the software robot use is presented in Table 4.

Table 4: Designed and tested scenarios of the robot's work in city hall tax and accounting department

Scenario name	Average number of executions per month	Time needed for one execution performed by a human	Total time of execution performed by a human in a month	Time of one execution performed by the robot	Total time of execution performed by the robot in a month	Difference Between total times
Signature of tax decisions	72000 per year	30 s	24 days 75 working days	2 s	1 day 16 hours 5 working days	70 working days
Generating and emailing information on salary components	240 per month	4 min	16godz	20 s	2h 35 min	13h 25min
Submission of tax return forms	240 per month	30 s	12 hours	5 s	20 min	11h 40min

Source: author's own research

The data compiled in the table are the results of research conducted by the author. The data on the number of scenario repetitions and the execution time in the current version were obtained by analyzing the number of documents processed in the office system. For the purposes of testing the robot, the author developed three scenarios of execution of these processes for the robot. It took 8 hours to develop the scenarios. The data determining the robot's working times in particular scenarios were measured during the execution of the scenarios prepared by the author. According to the information made available by the city hall, the monthly cost of work of the person signing the decisions is about PLN 9600. Therefore, using a robot to perform this activity will result in annual savings of PLN 27000.

Conclusions

The examples of using software robots to robotize business processes presented in the paper clearly indicate that the use of such solutions for process optimization is beneficial for both public and business organizations. Assigning even a small amount, just a few percent of the monthly workload,

to a robot is sufficient to cover the costs of software licensing and scenario development. An additional premise indicating the advantage of using software robots in improving public administration processes is the fact that these institutions use standardized procedures and solutions, therefore, with a minimum amount of work, a once developed robot scenario can be adapted to work in different institutions. The specificity of the applied solution makes it particularly suitable for work with spreadsheets, web browsers and for work that requires moving or acquiring data from various applications. The only limitation of the tested solution is that it requires the Windows operating system. However, given the widespread use of this operating system, it can be concluded that this limitation is practically irrelevant in Polish conditions.

Generating Functionalities in IT Systems Used in Public Administration Based on Reference Processes

Janusz Sasak

Institute of Public Affair Jagiellonian University, Cracow, Poland
janusz.sasak@uj.edu.pl

Abstract

The efficiency of provision of public services depends to a large extent on the IT systems used. Developing efficient IT systems that would support the provision of public services through electronic channels is problematic in Polish conditions. In addition, public administration is characterized by a lack of standardization in terms of service provision processes and a high variability of legal conditions. Hence the need to develop tools which, using business process models, will generate functionalities in the IT system. The aim of the article is to present and discuss the concept of an intelligent generator of functionalities for public administration IT systems based on models of reference business processes of public administration.

Keywords: Robotic Process Automation, Software Robots, Automation of IT Processes

Introduction

Progressing globalization, easy access to information, and citizens' growing awareness necessitate ever higher standards of functioning on public administration. Also, the limited amount of public funds makes it necessary to seek solutions that improve and raise both the quality and effectiveness of public services. Furthermore, the development of civil society, and in particular the increase in awareness and free access to knowledge about the functioning of public administration, as well as the requirements of EU and state law, make it necessary for contemporary public administration to change and adapt to the surrounding conditions which undergo dynamic changes themselves. Traditional methods of public management cease to fulfil their functions when placed in the new reality and therefore it is necessary to change the methods and forms of management in the public sector. One of the solutions that seems to meet the requirements of the modern society is the implementation of process management methods and tools that will serve as a basis for developing the functionalities of IT systems. This will allow both to streamline the work of public institutions and for a much quicker adaptation of the IT systems to provide next generation public services.

One of the fundamental problems of modern public administration is the low effectiveness of implemented IT solutions. One of the reasons for this state of affairs in Poland is the low level of standardization of public services and the lack of standardization in terms of management and functioning of public institutions.

In an attempt to find tools and methods of improvement of public administration, the author of this study proposes models of reference processes in the creation of IT systems supporting management and implementation of public services. Therefore, the aim of this study is to present and discuss the concept of an intelligent generator of functionalities for public administration IT systems based on reference models of public administration business processes.

The concept presented in this paper is the subject of current conceptual and technical-implementation work carried out by the author in cooperation with the SenseMaker Software company. In the nearest future, the process of concept evaluation will include public offices in which the modeled functions

of IT systems will be tested. This article is the first in a series of publications presenting the technical possibilities of the proposed solutions.

The article presents an analysis of literature in the scope of applied solutions of process modelling, standardization and creation of reference processes and IT systems. It presents a theoretical model of an intelligent generator of IT system functions, and indicates the conditions of its application and implementation.

The State of It Systems Used in Public Administration

The rapid development of information processing technologies led to the transformation of an industrial society into the so-called information society. This modern form of society is characterized by generating a large amount of information in electronic form (Mainka, 2018). This information is processed by high-performance electronic pieces of technology and transmitted via a global computer network. The most important feature of such a society is the blurring of organizational boundaries through the mutual permeation of the organization's IT systems and the creation of global information space (Mansell, Robin 2009). In the creation of a post-industrial society, one of the most important roles is played by public organizations, and in particular public administration units, whose task is to act as a stimulator of the evolution of society (Farazmand, (2018). This role imposes on public institutions the requirement to create a public information space in which IT systems will enable full access to public information.

The public administration units in Poland are currently characterized by a gross maladjustment in terms of participation in the digital economy. This problem is mainly caused by the lack of uniform standards concerning the IT systems used as well as poor coordination of informatization of the state. The departmentally localized use of solutions and the lack of coordination between the implemented IT projects lead to the creation of information islands between which no exchange of information occurs and which do not meet the requirements set for them. Research carried out as part of numerous projects shows that in the entire country, public offices use over a dozen different IT solutions to perform the same functions (Central Statistical Office of Poland, 2013). This situation makes it impossible to create a public information space supporting the development of the information society and at the same time it significantly increases the operating costs of public administration. Another problem is the lack of standardization of processes in public administration (Osborne, Radnor, Nasi, 2013). This leads to a situation in which the same tasks carried out in different offices require the use of different resources, and therefore the efficiency of implementation of these tasks differs as well, which in the public sector, translates to a waste of public funds. The solution to the problems that should be applied as a priority, as it seems, is the development of standards for administration processes, and then modern integrated IT systems should be built on their basis.

Lack of systemic solutions in the area of informatization of the public sector results in electronic public services of low quality. The basic problem in this area seems to be the lack of cohesion of undertaken actions resulting in the creation of “informatized islands” within public administration, instead of an integrated platform. An additional problem is that the objectives of informatization are unclear, formulated in a vague and unmeasurable manner. The analysis of the current state of informatization of the state and analyses of the effects of the implemented IT solutions shows that these barriers still persist, which means that despite the efforts made, the attempts at building a proper concept of state informatization in Poland failed. Sources of problems with effective informatization of public administration can be found already at the stage of developing the Informatization Strategy. The strategy states that the aim of informatization should be to improve the way citizens' expectations are met, which is a very vague and unclear objective (Security and Privacy Controls... 2013). In addition, the authors of the strategy do not indicate the institutions that should implement it, they did not indicate a coordinator of the informatization process and did not define their responsibilities or rights. During the development of the strategy, the optimization of processes from the point of view of computer technology was omitted, while the integration of departmental solutions was

emphasized. This leads to isolation of systems and lack of automatic exchange of information between departments. The lack of an IT framework that would integrate public administration systems, both in practice and in the strategy, means that the introduced sectoral solutions will have to be rebuilt in the future to enable their integration. This will result in unjustified costs for the state budget. The stimulating role of the state in building the information society in theory assumes that public systems (e.g. identification and confirmation of identity) will be a source of information for commercial systems providing electronic services. This issue was omitted from the state Informatization Strategy.

The basic problems of informatization also include the adoption of the superiority of a paper-based information, which leads to the consolidation of traditional inefficient information processes by means of computer technology. The result is double archiving — in paper and electronic form, both containing full information records.

Inconsistency of law or lack of regulations that will allow for a clear definition of the process that constitutes the basis for developing IT systems. The outdated organizational structure, not adapted to the organizational tasks and processes, is also a part of the problem. This causes problems in identifying process owners and makes it difficult, and often even impossible, to formulate requirements for electronic systems correctly (Glińska, 2016). An additional difficulty for companies developing computer systems is the localized specificity of processes which results in identical processes being executed differently in different offices, requiring the hardware and software to be prepared and configured in a different way.

The lack of central repositories of public information means that a client of an office is required to provide a full set of documents each time despite the fact that the office already has their information. This state of affairs not only slows down the organizational processes but also generates additional costs. Therefore, it becomes necessary to change the law to regulate electronic information repositories of public administration.

From the point of view of process management, it also seems necessary to appoint a process coordinator responsible for the smooth running of a process. Currently, each of the organizations (organizational units) is solely responsible for its part of the process. This leads to a situation where all responsibility for the process is transferred to the client (service recipient). This situation makes the citizen a “biological” integrator of the process carried out by the public administration. In such a situation, the administration adopts the principle that if the integrator malfunctions (does not transfer the information in time), they should not file any complaints against the service. This belief makes public services subordinate to the structure of the administration and not, as it should be, to requirements of the clients (Halcombe, 1997).). Therefore, a comprehensive informatization by establishing or determining an organization responsible for the coordination of processes and defining standards for data exchange seems necessary.

The literature stresses that properly carried out informatization requires the adjustment of processes to electronic support, and not the other way round. Therefore, the first step is to reprogram the processes so that they meet the standards for electronic processing of information. Failure to make such a change, or even the inclusion of the current form of the processes in information technology makes it impossible to separate the place of service provision from the premises of the office. Additionally, it results in the lack of possibility to provide the full extent of the services both in internal administration networks and via the Internet. Solutions, common in the economic sector, consisting in centralization of dispersed functions in order to reduce the costs of their performance cannot be used in public administration with its current methods of operation, which leads to incurring unnecessary costs. The experience of the economic sector shows that centralization of e.g. IT services translates to a severe reduction of costs. The analysis of administration costs indicates an opposite trend.

Both modern IT systems and those that are several dozen years old are currently in use in public administration. This state of affairs makes it impossible to assess the state of informatization in the public sector. The implemented modern solutions cannot be fully used due to the impossibility of integration with older systems. The great variety of solutions and the lack of a common concept of system integration also makes it difficult to integrate systems performing the same functions in different offices. Therefore, in the current state of affairs, it seems necessary to develop a coherent concept of state informatization, to identify and document the existing solutions and to develop a model of service integration.

Public Administration Reference Processes

The essence of a public service is that it must be provided in the same quantity to all consumers within the area of influence of the entity established to provide such service. In the case of public administration, this means that all citizens should be able to benefit equally, whether they pay for these services or not. The majority of public services provided by the administration are of an intangible — informational nature. They are connected with information processing and recording in the information registers. Taking into account the growing awareness of the society and the pressure on services to be provided quickly, it is necessary to provide IT support to the processes of providing public services. Therefore, it would to be advisable to standardize the process of service provision and, consequently, to standardize IT systems with regard to their functionality and the way information is processed. Reference processes should be used as the basis for creating such IT systems.

Analyzing the attempts to implement process management in public institutions, it should be noted that these implementations are projects related to the use of IT tools mainly for process mapping. Efforts to optimize processes based on simulation and analysis are rather seldom. However, the specificity of the public sector results in ill-considered implementation of process management meeting with great internal resistance, an increased workload and, as a result, the implementation activities fail. A common mistake is also an attempt to implement comprehensive process management covering all processes of the organization (Batko, Sasak,… 2012). This approach is often based on experiences from the economic sector, characterized by a high degree of repeatability of activities and functions as well as full control over the manufacturing process and individual functions. On the other hand, public offices do not have full control over the order or manner of performing activities, which usually only allows for partial optimization and thus does not fit into the concept of comprehensive process management. At the same time, it should be remembered that public institutions can only carry out the tasks and in the manner prescribed by law. For this reason, the concept, scope and form of implementation of process management must be different in the public and commercial sectors.

Properly conducted process management implementation in public administration should consist of the following stages.

1. Decision to implement process management methods and tools,
2. Establishment of an implementation team,
3. Organization and training of the team,
4. Development of a concept defining the objectives and scope of implementation,
5. Development of a mapping methodology and process definition,
6. Establishment of a list of processes and their owners,
7. Establishment of criteria for the selection of processes for optimization,
8. Establishment of a schedule of implementation work,
9. Conducting implementation activities.
10. Evaluation of the implementation.

As a result of implementation of process management in a public institution carried out in such a way, a database of processes is obtained, which may constitute a basis for generating functionalities

and rules of IT system operation. In the case of the Polish public administration, a problem exists related to the lack of standards of providing public services. In order to improve the quality of such optimized processes, the course of the processes and resources involved should be compared with those of other offices. This can be done using standard process modeling tools utilizing database solutions. Data on the course of processes in various public administration offices were collected in numerous EU-funded projects. Using databases of business process models of public administration and the methodology of creating public administration reference processes presented, among others, in the publication entitled "A *new paradigm of public administration functioning*" (Batko, Sasak,… 2012). The reference models of processes developed in accordance with this methodology should be implemented in IT systems of public offices.

Intelligent Generator of IT System Functionalities

The concept of using reference models to build IT systems is particularly important in public administration. This importance stems not only from the fact that the activities of public institutions become standardized, but also allows for the integration of databases and administration IT systems. A problem commonly observed in public administration is the frequent change of regulations which are the basis for the functioning of offices. Therefore, it is necessary to constantly monitor changes in regulations, modify the processes and introduce changes in IT systems. The course of implementing changes in IT systems is quite time-consuming. This is because it requires not only the work of analysts, coding, but also testing and verifying code correctness. These activities also are quite expensive, therefore the use of intelligent tools that generate system functionalities or only support the process of generating IT systems can significantly reduce the costs of adjusting systems, shorten the time of implementation work and avoid mistakes at the stage of designing and implementing IT solutions.

The implementation of process management results in the fact that making changes in the way tasks are performed entails the improvement of the organization and the efficiency of IT systems. In the case of public organizations which implemented process management, each change of regulations, law or change of the scope or manner of task execution involves a modification of processes. Modification of processes is always directly related to the need to check and possibly reconfigure IT systems. In the case of new tasks or extensive changes in the already implemented ones, it is usually also necessary to modify the IT systems by adding functionalities, modifying database structures and the data itself. The form and organization of processes also requires adapting to the specifics of electronic data processing.

Comprehensive process modelling allows for linking process activities with resources involved in their execution and automatic generation of reports and process documentation. The proper procedure in a situation where the use is IT support for modeling or process improvement assumes that by means of tools supporting modeling, a new process is created with the assignment of necessary resources to it. When modelling or improving processes, it is important to remember that they should be designed with electronic documents as the primary data carrier, which may involve changes in the resources of the organization. On the basis of the modeled process, appropriate UML diagrams can be automatically generated in the modelling support systems to configure or develop the IT systems supporting the process. Such diagrams are analyzed and, on their basis, programmers create or modify functionalities of IT systems. Lack of time and the need to commence processes in a modified version imposed by law, usually results in the omission of a thorough analysis and programmers implement the IT system functionalities according to the guidelines received from the public offices.

Modern programming tools allow to generate applications based on UML models, thus the automatically generated diagrams can be used as the basis for such systems to generate or modify relevant application functionalities. This significantly reduces the time of preparation of IT systems and as a result of implementation of the entire process.

In the proposed model, the process of creating and developing the concept consists of three stages. The first stage consists of analyzing and recording the applied IT and legal solutions, identifying barriers and factors supporting implementation of new solutions. In the second stage, a theoretical concept is defined with the necessary changes. The third stage involves the implementation, monitoring and improvement of the solution.

The need to integrate a number of levels of public administration requires an initiative to develop concepts at the highest levels of government. The team coordinating the development of the concept of informatization should be an interdisciplinary one and have sufficient powers to propose a change in the law. The most important part of the initial stage is to identify information needs. The correctness of performance of this activity depends on the proper development of informatization directions. Mistakes made at this stage can only be corrected to a small extent during public consultations. The initial concept of informatization developed should be subject to public consultation in order to verify the correctness of informatization directions and priorities. The consultations will indicate areas in which the existing IT solutions should be modified first.

In second stage, the choice and definition of the reference structure of the database may be problematic. Currently, in Poland, despite numerous attempts and IT projects, no database exists that could serve as a reference base for all public services

In the third stage, making changes to the law may give rise to certain difficulties, which will be related to the political nature of certain decisions. Building a reference base, as experience in this area shows, may be a critical problem. The process of personnel changes and the elimination of psychological barriers will also require a careful approach. The conclusions from the monitoring of the implementation and the analyses of society's needs should form the basis for future development of the concept.

Implementation of the proposed concept of informatization will enable full integration of public administration services in IT systems. The key element allowing for the integration of services is to provide access to a reference database along with developed ICT standards for public administration IT systems. The model of public administration services integration is presented in Figure 2.

Currently, there are several solutions used in Poland which act as integrators of public administration services. This state of affairs is related to the lack of task coordination between the various departments. This results in “island” solutions that integrate a part of the systems and services. Political criteria, on the other hand, lead to solutions being chosen in accordance with the current policies or lobbies rather than the best solutions in terms of technology.

The proposed model assumes that the Intelligent Public Administration Service Integrator (Pl. *Inteligentny Integrator Usług Administracji Publicznej* or IIUAP) handles the service integration. This integrator is an IT solution using knowledge base solutions, whose task is to standardize and provide access to public administration services. The information contained in the state informatization policy is the integrator's configuration guidelines. On the basis of this information, priorities for the services provided, the directions for their improvement and development are established. This information is transferred to companies offering software solutions so they can make the necessary improvements. Solutions that do not comply with the informatization policy are automatically blocked and in extreme cases removed from the database of possible solutions.

Figure 1: Process of developing an informatization concept.

Source: author's own study.

Figure 2: Service integration model

Source: author's own study.

The database of IT standards is developed in the course of creating and modifying the informatization policy. It forms a set of standardized procedures and protocols for information exchange between public administration systems. The role of the integrator is to ensure that the solutions offered within the integrated system are compliant with the standards. The third source of information external to the Integrator is the reference database. This database is used to authenticate persons and institutions using the system. Therefore, it is necessary for it to ensure that the transaction is legally sound. Such a role can only be played by a state-run database.

The Intelligent Public Administration Service Integrator (IIUAP) uses internal databases. The first group of databases are databases of form templates containing official, current and archival document templates, a database of legal acts and interpretations containing legal information about services offered on the platform. These databases are complemented by a database of public solutions that include IT implementations of service provision tools for which copyrights are held by the state or are openly distributed.

The second group of databases are application solutions — programs providing services. This database is updated and supplemented by commercial companies through the commercial companies' interface. Companies wishing to offer their solutions submit the solution to the Intelligent Public Administration Service Integrator, and after verification of correctness and compliance with the standards, the Integrator places the solution in the database and makes it available for use. Companies can remove the solution at any time and the Integrator can block it if it no longer meets the standards. This way, the software made available in this database will always be safe and compliant with the requirements.

The proposed solution uses field-specific public administration databases. Through ICT links it is possible to carry out transactions in these databases without the physical intervention of officials. This solution allows the system users to use the services at any time. The role of the integrator in this case is to verify the rights to take a specific action, provide an IT tool, secure transactions, ensure data accountability.

The efficiency of the integrator is determined by its knowledge base. The knowledge, algorithms, methods, procedures and functions contained therein allow for high autonomy of operation. A properly constructed knowledge base can analyze of offered solutions, monitor users' activity, detect security breaches and suggest changes.

System users connect via group interfaces. First, each user is authorized and authenticated using the reference database. On this basis, they are assigned appropriate rights and level of access to the application and information. Users can use different roles in the system, e.g. officials can also use the role of citizens. The choice of a role is made after the authorization process and before the granting of rights.

The use of the proposed solution is aimed at integrating the solutions used thus far in the provision of public administration services. The multitude of solutions and the lack of standardization make the electronic provision of public administration services more difficult and often even impossible. The implementation of the system should enable the coordination and cooperation of the various systems and their adaptation and integration with international systems.

Summary

The formation of the information society as well as the emergence of state-of-the-art communication solutions necessitate changes in the manner public services are provided. This process has accelerated considerably in recent years. Lack of well-thought-out solutions results in incurring unnecessary costs for informatization, which with limited resources makes the public administration inefficient. Therefore, it is necessary to change and organize the electronic aspect of public administration services. The proposed solution is one of the possible ways to improve the functioning of public administration.

The greatest threat to the implementation of solutions improving and integrating public administration IT systems is the politicization and low IT awareness of public managers. Moreover, it is common practice in the public sector to develop and build IT systems independently. Such activities often lead to the creation of systems using proprietary solutions, which, for many reasons, may become completely unusable and the data contained in them may not be available for use with other solutions.

The process of integrating administration services absolutely requires the development of uniform standards of information management in the public sector. These standards should provide guidelines for building IT systems and automating information exchange between all organizations in the public sector. It is also necessary to appoint an informatization coordinator, who will be responsible for setting standards of information exchange and rules of cooperation of IT systems in the public sector.

The proposed solution is one of the possible implementations of the concept of public service integration.

Visualization of Knowledge About the Multi-Agent Supply Chain

Katarzyna GRZYBOWSKA

Poznan University of Technology, Poznan, Poland
katarzyna.grzybowska@put.poznan.pl

Abstract

Knowledge visualization includes, among others, issues such as visualization of scientific research results. It enables creating added value and extracting new knowledge from data sets. Visualization is to help better understand the data, as well as discover new facts and dependencies that have been hidden until now. The purpose of observing and scientific research is to map that will allow determining the existing knowledge and defining the boundaries of this knowledge, and thus determining the further direction of knowledge development about the multi-agent supply chain.

Keywords: Supply Chain, Cluster Analysis, Semantic Maps, International Research Trends, Multi-Agent

Introduction

The use of mapping and visualization opens new research perspectives in inter- and transdisciplinary fields. Thus, the analysis allows you to examine the structure of science or a field or discipline and show its future trends. Semantic maps (concept maps) are a relatively new form of knowledge presentation. They enable the acquisition of both necessary and unique information. Based on one set of resources, you can create many knowledge maps that allow browsing and graphical visualization as well as filtering and searching.

Knowledge visualization is a powerful approach to analyzing various bibliometric networks. Over time, scientists began to analyze larger and larger networks, which led to the use of advanced information technology for visualization (van Eck & Waltman, 2014). The most commonly used unit for mapping or visualizing knowledge are documents, understood as scientific papers, patents, etc. Knowledge visualization maps are developed for various purposes. Let the examples be: mapping the evolution of entrepreneurship as a research field in the years 1990–2013 (Chandra, 2018), analyzing trends in the circular economy (Homrich et al., 2018), analyzing security culture research (van Nunen et al., 2018), analysis of research on multi-criteria decision making (Yu et al., 2018).

The purpose of visualizing knowledge about the concept of supply chains and the multi-agent paradigm is to answer the research questions posed: (1) What are the international research trends in the concept of supply chains and the multi-agent paradigm over the years?; (2) what are the most important conceptual clusters created on the historiographic map of scientific publications, in terms of the concept of supply chains and the multi-agent paradigm, indexed in WoS in the years 1996–2019?.

The structure of work is as follows. Part one discusses the concept of a Multi-agent solutions in supply chain. Part two presents the research method used. The third part contains the results of the visualization of knowledge about the multi-agent supply chain.

Literature Review

Nowadays, changes are faster and more unpredictable. Enterprises must respond quickly to challenges and opportunities in the business world (Saniuk, Saniuk & Caganova, 2014). High speed manufacturing involves significant investment (Jasiulewicz-Kaczmarek & Bartkowiak, 2016; Waszkowski, 2019). Multi-agent solutions have been recognized as a promising area of next-generation knowledge. An important element of survival in these dynamically changing conditions is "agility", in particular by creating flexible supply chains. Agility should be understood here as the rapid creation of a complex supply chain system based on multi-agent technology. The centralized and hierarchical organization of the traditional supply chain means that a significant part of the created system can be limited as a result of one emerging threat or failure. Multi-agent solutions ensure the naturalness of design and implementation of an efficient, intelligent and distributed system. They are by nature strongly time-oriented and highly responsive (Shen, Hao, Yoon & Norrie, 2006, p. 415; Kowalski & Chlebus, 2017). At the same time, they still focus on cost and quality. Multi-agent systems are typical collective behavior in network systems with a group of autonomous mobile agents (Sitek & Wikarek, 2018). These systems strongly rely on communication and cooperation between the involved enterprises (agents, objects). The activities and interactions of each enterprise are clearly represented in multi-agent models. Agent-based solutions are the preferred technology that allows flexibility and dynamic coordination of spatially dispersed business entities cooperating in supply chains. And due to the similarity of the supply chain system and multi-agent systems, the latter can be used to model or actually perform tasks in supply chain management.

Research Methods

Semantic maps are generated from various text sources, based on individual words extracted from scientific titles, descriptive entries or descriptors assigned by the publisher provided by the database provider (e.g. ISI keywords) (Börner et al., 2005). Then the so-called clusters are configured on the created knowledge and science maps. Cluster analysis (CA) is used to create clusters. The result of cluster analysis is the division of a finite set of objects into clusters (subsets). The finite set X consists of n objects and the finite set A contains m attributes that describe the properties of the object $x \in X$. A grouping of clusters is created during grouping (Jain & Dubes, 1988):

$$C = \{C1, C2, ..., Cc\}$$

Grouping is the basic activity that a researcher performs for cognitive purposes. Cluster analysis involves many different classification algorithms that are designed to organize a very large amount of information and data into handy, meaningful stacks or categories, called clusters (Börner et al., 2005). As a result of the cluster analysis, it is possible to divide a heterogeneous set or set of elements into homogeneous, "similar" subsets. As a result, the objects are grouped into set A and the second set not A. Each object belongs to exactly one cluster - this assumption concerns "hard" grouping. The created conceptual clusters are created using the similarity or distance function (Jain et al., 2009). In this case, the goal is to divide the set of objects into the number of subsets.

As reported by Börner et al., Clusters should be internally highly uniform and externally highly heterogeneous. Highly internally uniform clusters mean that the assigned test objects (researcher / documents / magazines) are similar. Externally highly heterogeneous means that the examined objects are not similar to other cluster objects. Hence the similarity function is expressed by the statement: the closer the examined objects are, the more similar they are. Therefore, the goal is to maximize similarity within the cluster and minimize similarity between clusters (Börner et al., 2005). Conceptual clusters are a set of closely related objects, also called nodes, in terms of themes. Each node in the network is assigned to exactly one cluster. The number of created clusters is determined based on the so-called parameter of resolution. The higher the value of the resolution parameter, the greater the number of clusters created (Waltman, van Eck & Noyons, 2010). Each created cluster is marked with a different color, which makes it easier to read the created map of knowledge on the studied topic. As a result of cluster analysis it is possible to: (1) identifying clusters by distinguishing a

group of similar objects that intensively coexist and attempting to generalize their features, (2) designation of objects with isolated values that do not match other objects, (3) the discovery of an unexplored and unknown structure of the analyzed data.

For the purpose of the work, VOSviewer version 1.6.9 was used, which was made available on August 29, 2018. The main advantage of VOSviewer, which decided to choose this and not another IT tool, is the continuous process of updating the software functions and a relatively easy way to use it. A special positive feature is that the program completely focuses on the visualization of bibliometric networks.

Due to the very large number of scientific and research works related to supply chain research, it is almost impossible to review all published research. The literature study defined on the basis of the concept of "Supply Chain" covered 49 331 scientific publications, without taking into account the supplementary words and identifying the type and type of publication. After narrowing searches, 672 scientific papers were obtained.

Based on the bibliometric analysis according to the Systematic Literature Review (SLR) method and the local base obtained, a division into four periods was made regarding the development of the concept: (1) emergence period (1996–2000); (2) definition period (2001–2007); (3) concept maturity period (2008–2009); (4) stabilization period (2010–2019).

These periods were covered by analysis and visualization according to the Systematic Literature Network Analysis (SLNA) method introduced by Colicchia and Strozzi (Colicchia & Strozzi, 2012). This stage of research can be carried out in three steps: (1) review planning, (2) conduct a review, (3) review reporting.

In order to carry out the analysis of knowledge visualization with the help of keyword co-occurrence maps, a set of keywords was separated, which concerns the created local database with a total of 672 scientific papers. A separate set of concepts was subject to the process of "normalization". This means that the specified keywords have been standardized as to form (lowercase / uppercase) and the letter 's' at the end of the keywords has been removed. Noun expressions have been transformed from plural to singular, e.g. "agents" into "agent". This way many plural and singular keywords have been unified.

As a result, a network was created based on keywords that appear at least five times (i.e. according to the default value of the software defining the threshold for the minimum occurrence of keywords). As a result, a total of 1,682 keywords were listed that describe the scientific papers identified in the local database over the years 1996–2019. Among them was a set of keywords that take into account the minimum occurrence of keywords. Their total number is 91 expressions. On their basis, a series of semantic maps were developed for specified periods of concept development and for the entire period under study.

Research Results

Each keyword as an object on the semantic map has a different color. The colors allow you to group keywords that results from the similarity and relationship of concepts and the compatibility of the research topic. Keywords that have the same color belong to the same cluster. So they tend to be more similar, coexistent and matching than keywords of different colors. Thus, each prepared semantic map has its own unique arrangement and grouping.

The first period, the so-called emergence period, was chosen for the keyword-based analysis. It was in the years 1996–2000. During this period, 13 scientific papers from the study area were published. The emergence of the research trend in the concept of supply chains and the multi-agent paradigm falls in 2000. A total of 18 keywords were identified during this period. Due to the fact that the

emergence period concerns few scientific publications for the purposes of building the semantic map, a minimum threshold of keywords has been set at 2. This means that keywords that meet this condition have occurred at least twice in the list. Of 27 keywords related to identified research papers from the emergence period, three met established guidelines.

Keywords that meet the set condition are presented on the semantic map (Fig. 1). One cluster was specified for the examined period, which is a scientific, thematically coherent area. It was based on three identified keywords. These keywords are internally highly uniform. There is a greater co-occurrence relationship between the two keywords "Agent" and "Multi-agent System". This can be identified by the thickness and color saturation of the link that combines both concepts.

Fig. 1: Visualization of the semantic network in the period 1996–2000; research area for the keywords "Supply Chain" and "Multi-agent"; Own development using VOSviewer

The evolution of the approach under investigation began with the keyword "Agent" (1998), and at the end of the period under study there appears the expansion to the keywords "Multi-agent System" and then "Suppy Chain" (2000). The transition from the term "agent" to the "Multi-agent System" falls around mid-1999. Researchers indicate that the multi-agent system is composed of four components: (1) agents, (2) tasks, (3) organization and (4) information infrastructure.

The years 1999 and 2000 are a period of shifting the multi-agent approach to the area of supply chains. Kaihara points out that every business organization in the supply chain represents independent entities with often conflicting and competing product requirements. It may also have localized information relevant to other interests (Kaihara, 1999, p. 394). During this period, researchers are looking for the answer to the question: how can industrial networks coordinate their activities more effectively? The answer is that collaboration has an evolutionary advantage that is still embedded in social norms. From the indicated period, business units and enterprises should be treated as agents who should be assigned autonomy in making decisions. It was also found that streamlining supply chains is a key mechanism to increase profitability and improve competitive position in the market. The multi-agent paradigm fits into the concept of supply chains.

In the second development period, called the definition period, falling between 2001 and 2007, 461 concepts have already been identified, of which 18 meet the minimum keyword threshold, which was set at level 5. In the period under study, 4 conceptual clusters were identified (Tab. 1).

Fig. 2: Visualization of the semantic web in the period 2001–2007; research area for the keywords "Supply Chain" and "Multi-agent"; Own development using VOSviewer

In the second period of concept development, the direct link and coexistence of three keywords identified in the first period was maintained. These are (Fig. 2): (1) "Supply Chain" from cluster 1 (red), (2) "Multi-agent System" from cluster 2 (green), (3) "Agent" from cluster 4, (yellow). Therefore, it should be confirmed that the scientific structure of the studied area is changing. It results from the development of the concept. Three keywords identified during the emergence of the concept, in the next currently analyzed period 2001–2007 are concepts from which there are three differently perceived conceptual clusters. These clusters are internally highly uniform and externally highly multidirectional. On the semantic map (Fig. 2) there are several objects representing clusters - the "best" and reference objects. And so for cluster 1 it is the keyword "Supply Chain", for cluster 2 they are the concepts of "Multi-agent System" and "Supply Chain Management", while for cluster 3 it is the concept of "coordination" and for cluster 4 "Agent ".

Table 1 shows the number of occurrences of the indicated keyword in parentheses. The keyword with the highest number of occurrences is "Multi-agent System" for which the number of occurrences is 72. It is also the node with the largest total strength of 60. This means that this node shows the coefficient corresponding to the total strength of connections between the identified keywords . "Supply Chain Management" is the second strong keyword on the semantic map.

Table 1 : Identified clusters based on keywords in the period 2001-2007

Cluster 1	Cluster 2	Cluster 3	Cluster 4
Architecture (5)	Framework (6)	Coordination (26)	Agent (15)
Design (9)	Genetic algorithm (5)	Management (15)	Cooperation (5)
e-commerce (9)	Information (9)	Model (5)	-
Multi-agent (27)	Multi-agent System (72)	Simulation (11)	-
Negotiation (18)	Supply Chain Management (60)	System (18)	-
Supply Chain (39)	-	-	-

Cluster 1 refers to aspects of the application of multi-agent solutions in distributed systems, which are supply chains. Scientific publications therefore refer to the need to redesign business processes and practices with business partners in supply chains. For this purpose, a general architecture is designed to develop an experimental environment whose purpose is to design and test decentralized and at the same time advanced systems. The architecture used allows combining agent-based technologies and other fields of knowledge, e.g. tools based on operational research (Monteiro, Roy & Anciaux, 2007; Relich, Świc & Gola, 2015), applications of elements of game theory (Choi & Han, 2007).

Scientific publications from cluster 2 touch, among others, problems that solve genetic algorithms. Due to the high complexity and dispersion of supply chains, the use of genetic algorithms is appropriate and guarantees the most reliable solution in the case of: (1) optimization, (2) searching, (3) learning, (4) process modeling. Unlike traditional methods to optimize many partial problems, genetic algorithms (Burduk & Musiał, 2017) allow you to find a better solution that allows you to respond to dynamic environmental changes in real time, and as a result increase the efficiency of supply chains (Park, Choi & Kang, 2007, pp. 705–706).

Coordination and cooperation play an important role in managing complex supply chains. Hence, in cluster 3, concepts are grouped that focus on the topic of coordination and management of distributed systems. Coordination mechanisms are also tested (Yu, Qiu-yue & Ying, 2007). On the other hand, Yang indicates that simulating and then optimizing and monitoring the functioning of the supply chain using an agent has become a method of testing this supply chain (Yang, 2007).

There are 4 keywords grouped in the cluster that touch upon cooperation issues. Research from this period shows that cooperation in supply chains has two different forms. The first assumes that cooperation between business partners can take the form in which each link has equivalent decision-making capacity. All links work together with other links to achieve a common goal. The second form assumes that each link in the supply chain has limited decision-making power that corresponds to its field of activity.

The third stage studied is the concept maturity period. It falls for 2008–2009. It contains, on average, the largest number of scientific publications (60 scientific papers) that take into account the concept of supply chains and the multi-agent paradigm. A total of 358 concepts were identified during this period. Based on these identified terms, four conceptual clusters based on identified keywords are listed.

Continuing the analysis of direct connections and co-occurrence of three keywords identified in the first period on the semantic map for the concept maturity period, it can be observed that: (1) the terms "Multi-agent System" and "Agent" are located in cluster 1 (red), (2) the concept of "Supply Chain" is in cluster 2 (green). The "Multi-agent System" and "Agent" keywords are relatively significantly related. They are directly related to each other and occur in the same cluster 1. There is a relatively high degree of co-occurrence of the indicated keywords in published scientific papers. The presented semantic map (Fig. 3) also shows the connection of the keyword pair "Multi-agent System" and "Supply Chain". They are located in two different clusters, 1 and 2, respectively. These concepts, although they occur in different clusters, are strongly connected. It can also be seen that the pair of terms 'Agent' - 'Supply Chain' has no direct connection. This confirms the supposition that the concept of supply chains and the multi-agent paradigm is still evolving. Thus, the structure of the studied area is changing further.

Fig. 3: Visualization of the semantic web in the period 2008–2009; research area for the keywords "Supply Chain" and "Multi-agent"; Own development using VOSviewer

Table 2: Identified conceptual clusters based on keywords in the period 2008–2009

Cluster 1	Cluster 2	Cluster 3	Cluster 4
Agent (16)	Multi-agent (20)	Intelligent agent (5)	Information (6)
Coordination (7)	Optimization (5)	Management (11)	-
Design (8)	Simulation (14)	-	-
Framework (10)	Supply Chain (32)	-	-
Model (11)	-	-	-
Multi-agent System (43)	-	-	-
Negotiation (8)	-	-	-
Network (7)	-	-	-
Supply Chain Management (23)	-	-	-
System (10)	-	-	-

Table 2 presents the clusters identified on the basis of the semantic map (Fig. 3). Four conceptual clusters are listed. The number of objects that make up them varies. There are as many as ten keywords in cluster 1 that are systemically and homogeneously linked. This means consistency, inseparability and complementarity of keywords present in this cluster; the concepts listed complement each other and focus. There is also cluster 4, which is a one-cluster. A one-piece cluster means that no other concepts with maximum similarity and at the same time maximally differentiate them from other concepts from other clusters were not found in the analyzed keyword set.

The set of keywords from the period 2008–2009, called the concept maturity period, can be divided into four clusters (Tab. 3). Cluster 1 contains the most keywords. It also contains concepts of high strength, such as "Multi-agent System" and "Supply Chain Management". Cluster 1 refers to the systematic perception of network modeling and its coordination. Research confirms that the Multi-agent System paradigm used in the supply chain seems to be a natural choice (Wang et al., 2008, p. 2687) to manage this type of distributed, dynamic and complex systems that are inseparably involved in the coordination and coherence of many entities. Is a modern technique of modeling a distributed system.

A growing interest in the problem of supply chain optimization and simulation can be observed in the analyzed period (cluster 2). This is a new area that is gaining importance due to the desire to both locally and globally optimize complex systems (Kazemi, Zarandi & Husseini, 2009).

Fig. 4: Visualization of the semantic network in the period 2010–2019; research area for the keywords "Supply Chain" and "Multi-agent"; Own development using VOSviewer

In the last of the specified development periods, which falls in the period 2010–2019, called the stabilization period, 1,171 keywords from the studied area have already been identified. As many as 54 of them meet the minimum keyword threshold (5). During this period, 6 conceptual clusters were identified (Fig. 4). They are presented in Table 3.

In the fourth period of concept development, the direct link and coexistence of the three keywords identified in the first period was maintained. Those are: (1) "Supply Chain", which is located in cluster 4 (yellow), (2) "Multi-agent System", located in cluster 5 (purple) and (3) "Agent", located in cluster 5 (purple). The concept of "Agent" from cluster 1 from the previous period of concept development was reallocated to cluster 4. A similar situation occurs with respect to the concept of "Multi-agent System". This concept in the previous period was also allocated in cluster 1 (currently – cluster 5). It can be assumed that these concepts lose their importance and relevance. Whereas the concept of "Supply Chain" was assigned to cluster 4; in the previous period it was allocated in cluster 2. This shows further evolution of the research structure.

Table 3: Identified conceptual clusters based on keywords in the period 2008–2009

Cluster 1	Cluster 2	Cluster 3	Cluster 4	Cluster 5	Cluster 6
Context (6)	Decision support system (14)	Bullwhip effect (8)	Algorithm (8)	Agent (22)	Allocation (6)

Transportation (6)	-	-	-	-	-

The structure of the studied area in the fourth period, called the stabilization period, is spectacularly widening. New concepts appear which have not been used in this area before. As a result, the identified set of keywords shows mosaic different dimensions and areas of the studied area. They form the unity of the studied area, taking into account diversity and multiplicity. This unity creates a complex network of concepts and subject areas. Such a complex structure of knowledge could not exist, function and evolve without being composed of diverse and even opposing concepts. This shows that knowledge is rapidly spreading to other areas of knowledge during this period. There is a very intensive flow of knowledge to other areas of science, which means that existing knowledge is absorbed and applied. As a result, the studied area is significantly enlarged into many conceptual clusters. It shows that the analyzed concepts are well established in science. Table 3 presents the conceptual clusters identified on the basis of the semantic map (Fig. 4). Six were listed in the last analyzed period of concept development. The number of objects that make up them is not as diverse as in the previous period.

Cluster 1 deals with issues of solutions based on agent models, which can be used to analyze solutions at the strategic level as well as policy and infrastructure of logistics systems (Holmgren et al., 2012). In a conceptual cluster, 2 keywords take into account problems of unreliability or reliability of systems. Risk is a common phenomenon and results from uncertainty about the future. Risk, disruption, uncertainty are becoming the main factors limiting the achievement of a high level of supply chain efficiency and disturbing the current functioning of cooperating in supply chains of enterprises.

Discussion of the Results

The concept of the supply chain and multi-agent paradigm has been emerging since 2000. It could not exist, function and evolve without being composed of heterogeneous and interdisciplinary and even opposing concepts. The conducted research shows that in the area of research on the concept of the supply chain and the multi-agent paradigm, the heterogeneity, multi-facetedness and multi-directionality is an unquestioned phenomenon. The question is also a desirable phenomenon? It is highly probable to emphasize that unification of such a complex area of research is impossible. It results from the features of modern science and knowledge, which in dominant cases is interdisciplinary (Mäki, 2016, p. 8). Research shows that the concept of the supply chain and the multi-agent paradigm is from the outset an interdisciplinary area that consists of various research fields and disciplines. The heterogeneity, richness and mosaic dimensions of the study area seem to be a natural solution here, which contribute to the further development of knowledge and science. If there is a concept of diversity in science, then you can expect alternative solutions that: can compete with each other, or can complement each other.

As a result of the conducted research, international research trends for the period 1996–2019 were identified: (1) multi-agent solutions used to optimize and reduce reliability and support a sustainable industry; (2) management and coordination of complex and distributed supply chains; (3) modeling, structure or architecture of multi-agent systems; (4) simulations using multi-agent systems, including complex, adaptive systems; (5) multi-agent solutions and intelligent solutions; (6) integrating solutions for agile and flexible; (7) ontology and semantics; (8) algorithms and allocations.

Conclusions

Visualization of knowledge about the concept of supply chains and the multi-agent paradigm presented in the following semantic maps also shows and confirms the occurrence of the law of progressive differentiation, i.e. complexity. The development of the multi-agent supply chain concept goes from slightly differentiated generality (Fig. 1) towards increasing transparency (Fig. 2) and differentiation (Figures 3 and 4). The transition from one form to another is obviously staggered and can be reconstructed. This evolution requires energy that is associated with the creative efforts of many researchers. Scientific theories and research models are being built and their empirical verification is carried out. This evolution leads to a growing unification and differentiation of knowledge, which at the same time becomes more complex and more precise, and its conceptual casters better communicated.

Abstract

For almost the entire time the human being has existed as a species, human society has remained in a state that is significantly different from modern reality. So the processes of significant processes of urbanization and enlargement of cities began in Great Britain at the end of the 18th century, in France in the 19th century, in Japan from the second half of the 19th century, in Russia in the second half of the 20th century, and in Latin American, Asian fears continue until so far. Currently, the majority of the world's population 54% currently resides in cities. At the same time, the level of urbanization depends on a specific region and country, so in Japan it reaches 91.3%, and in India 31.3%. Cities become not only the place of compact residence of the majority of the world's population, but also world centers of culture, art, as well as industrial centers and centers of innovative development. Despite the visible benefits of urbanization, there are a number of negative aspects associated with this process. These include the emergence of mono towns (city towns) or company towns, i.e. settlements that were founded by enterprises in order to provide the latter with labor resources. Such settlements are typical for countries that have experienced a wave of industrialization - the United States, Germany and Russia, and after its completion significantly reduced the volume of industrial production. The result of the completion of the wave of industrialization was a catastrophic drop in employment in mono towns (city towns), a sharp increase in social tension. The solution to the problem of mono towns (city towns) is possible by differentiating the lines of activity of the population of these mono towns (city towns), including through the development of innovative processes in these cities. The implementation of this process is impossible without the creation of an effective system of indicators monitoring the sustainable development of a mono town (city town).

Keywords: Innovation, Development, Socio-Economic Development, Mono Town, Company Town, Sustainable Innovative Development, Indicators, Monitoring

Introduction

For almost the entire time the human being has existed as a species, human society has remained in a state that is significantly different from modern reality. So the processes of significant processes of urbanization and enlargement of cities began in Great Britain at the end of the 18th century, in France in the 19th century, in Japan from the second half of the 19th century, in Russia in the second half of the 20th century, and in Latin American, Asian fears continue until so far. Currently, the majority of the world's population 54% currently resides in cities. At the same time, the level of urbanization depends on a specific region and country, so in Japan it reaches 91.3%, and in India 31.3%, figures 1.

Cities become not only the place of compact residence of the majority of the world's population, but also world centers of culture, art, as well as industrial centers and centers of innovative development. Cities grow not only in breadth, but also in height, each year the number of buildings with a height of more than 150 meters or 40 floors increases by 8% per year. Statistics show that the 600 largest cities account for about half of global GDP, while it is planned that the volume of GDP produced by large cities will increase, and these cities will provide up to 60% of future GDP growth worldwide.

Figure 1: Urban Population Index, %

According to the forecasts of analytical agencies, more than 25% of the able-bodied population of the planet will live in the largest six hundred cities, and also about a quarter of a million households will be formed in these cities, which will create additional demand for consumer goods and services. As for the world population, the UN estimates that, by 2050, 66% of the world's population will live in cities (United Nations, 2020).

Formulation of the Problem

Despite the visible benefits of urbanization, there are a number of negative aspects associated with this process. First, urbanization entails significant environmental problems (OECD, 2012). Also, the rapid urbanization of the world, although it is a symbol of social evolution, poses numerous problems associated with intensive energy consumption, endemic congestion, saturated transport networks, air and water pollution, toxic waste disposal, resource depletion, social inequality and vulnerability, and declining public health and etc. (Bibri, 2013).

Similar conclusions are made (Jabareen, 2006), who notes that the current form of development of modern cities affects people, natural resources, habitat and climate.

The fact that a number of problems associated with the rapid growth of cities have arisen is confirmed by a number of researchers (Neirotti, De Marco, Cagliari, Mangano, & Scorrano, 2014). According to them, the rapid growth of cities threatens the environmental, economic and social sustainability of these social entities.

Also among the problems associated with the growth and development of cities should include the emergence of mono towns (city towns) or company towns, i.e. settlements that were founded by enterprises in order to provide the latter with labor resources. Such settlements are typical for countries that have experienced a wave of industrialization - the United States, Germany and Russia, and after its completion significantly reduced the volume of industrial production. The result of the completion of the wave of industrialization was a catastrophic drop in employment in mono towns, a sharp increase in social tension. The solution to the problem of mono towns is possible by differentiating the lines of activity of the population of these mono towns, including through the development of innovative processes in these cities.

Also, one of the ways to solve the problems of modern cities, including mono towns as their varieties, should include sustainable development. So (Bulkeley & Betsill, 2005) note that in order for cities to better cope with growth challenges, they need to adopt long-term sustainable development approaches. Implementation of long-term approaches to sustainable development, according to (Antrop, 2004), is a prerequisite for mitigating the consequences of the adverse effects that these cities may face as a result of the expansion of the capabilities and structures of urban systems that accompany urban growth.

At the same time, a number of researchers (Colldahl, Frey, & Kelemen, 2013), in addition to the environmental and social problems of modern cities, consider the obsolete (non-automated, non-digital) infrastructure within cities, which creates technical and physical problems, to be an important problem. This is also relevant for company towns, which received the main potential during the industrial era, and in the new era of industrialization are significantly lagging behind in their development (Troyanskaya & Tyurina, 2019).

The proposed approaches to the sustainable development of urban settlements have great potential for solving problems or providing solutions for moving towards urban sustainability. This is noted by researchers such as (Batagan, 2011; Höjer & Wangel, 2015; Kramers et al., 2014). The growing relevance of finding and making smart solutions to the problems of modern cities is noted (Nam, & Pardo (2011).

Sustainable development of a city, including a mono town, is impossible without creating an effective system of indicators that monitor the sustainable development of a mono town.

Figure 2: Stages of developing a system of indicators for sustainable development of a mono town (company town)

As practice shows, an effective set of indicators that monitor the sustainable development of a mono town has not yet been developed to assess the socio-ecological and economic situation of individual

industrial cities and determine their development. This, in turn, explains the lack of a well-implemented urban management policy.

The development of a system of indicators for the sustainable development of a mono town should be carried out in 5 stages, figure 2.

Results

We carry out the selection of indicators in accordance with the above stages of the formation of a system of sustainable development of a mono town.

The list of requirements that must be met by a system of indicators of sustainable development of a mono town:

- maximum coverage of the areas of socio-ecological-economic system;

- have a balanced hierarchy of subsystem indicators

- use data from government statistics;

- should include indicators that may be applicable for different levels (state, regional, local);

- have characteristic and sensitive indicators;

Consider the existing systems of indicators of sustainable development that can be applied to assess the sustainable development of a mono town.

At the moment, there are the following scorecards that can be used for this assessment:

- indicators of the UN Commission on Sustainable Development;

- A set of indicators developed by the World Bank;

- indicators of the Organization for Economic Co-operation and Development (OECD) and the World Health Organization (WHO).

Briefly describe each set of indicators.

The UN system of indicators for sustainable development is more consistent with the objectives of the study. This system meets the specified selection criteria, and also contains methodological instructions for each indicator with detailed recommendations for calculation, sources of the required statistical information, criteria for the importance of the indicator in the issue of sustainable development and interaction with other indicators of the system.

The World Bank indicators are more focused on assessing the resource provision of the territory and the efficiency of resource use, therefore, they are unlikely to be suitable for the formation of a system of indicators for the sustainable development of a mono town.

In the framework of this study, the indicators of the standards of Economic Co-operation and Development (OECD) and the World Health Organization World Health Organization (WHO) cannot be called priority, as they reveal only certain aspects of sustainability, namely the stability of demographic development and the sustainability of the social subsystem, respectively.

Consider a system of indicators for sustainable development of the UN

This system of indicators contains:

- input indicators - or indicators of driving force. They characterize human activity, as well as processes and resources that affect the sustainable development of a mono town;

- status indicators. They characterize the current state of those or other components of the development of subsystems of the studied territory.

- output indicators or response indicators. They allow you to make a political choice or some other way of responding to changes in the current state.

It should be noted that earlier the system of indicators of sustainable development according to the UN methodology consisted of more than 134 indicators, however, the complexity of the process of assessing sustainable development by these indicators and its high cost led to the fact that the system was optimized to fifty indicators. Moreover, 50 of these indicators were in turn included in a wider list of 96 indicators of sustainable development.

In our opinion, this particular system of indicators uses the most accessible data of official statistics.

Further, the system of indicators used in the UN methodology had to be adapted for a mono town. For this, it is necessary to analyze other monitoring systems of mono towns in Russia.

Among the systems for assessing cities and settlements, one can single out the indicator system of the Ministry of Regional Development of Russia and the indicator system specially developed in Russia for the implementation of the “Comprehensive Plan for the Long-Term Socio-Economic Development of Novy Urengoy for the Period Until 2020”.

The system of indicators of the Ministry of Regional Development of Russia is built on the principle of “topic / problem-indicator”, in which each problem has a specific indicator.

This system is aimed at monitoring such areas as:

- the possibility of an alternative application of labor released as a result of stopping / reducing the production rate of the city-forming enterprise, labor resources;

- public order, as an indicator of an open form of manifestation of social tension of the population;

- the possibility of diversification of the economy of the city; balance of the city budget.

The disadvantage of the indicator system of the Ministry of Regional Development of Russia is the lack of a subsystem of environmental indicators, which is important for a mono town, since most of the Russian mono towns have environmental problems. Thus, the principle of priority of the problem of mono towns is implemented in the system of indicators of the Ministry of Regional Development of Russia in a truncated form without fully disclosing all the characteristics of the qualitative and quantitative characteristics of the Russian mono town.

The system of indicators for the implementation of the "Comprehensive Plan for the Long-Term Socio-Economic Development of Novy Urengoy for the Period Until 2020" is quite extensive. At the same time, as a more detailed analysis of the ratio of indicators in the system, it can be revealed that this program does not reflect part of the principles for assessing the system of sustainable development, and also does not allow to elicit the result of their interaction.

The analysis of Russian systems for assessing the sustainable development of mono towns has revealed a number of shortcomings requiring improvement.

In accordance with Figure 2, we will adapt the system of indicators of sustainable development to the criteria of a mono town. For this, we use the indicators of the UN Commission on Sustainable Development on Sustainable Development, indicators of the Organization for Economic Cooperation and Development (OECD) and the World Health Organization (WHO), as well as Russian methods for assessing the sustainable development of mono towns.

We outline the most important development factors that should be used in the monitoring system under development: - the quality of life of the population directly affects the level of social tension in the mono town, namely:

- the standard of living of the population;

- the existence of other areas of labor;

- imbalance in the distribution of income;

- the presence of residents of real estate assets;

- working conditions of the population;

- life support.

Thus, the level of social tension can be called an integral social phenomenon, which is formed on the basis of information about the dissatisfaction of the population of the mono town with their social, economic and political situation.

At the last fifth stage, we define a list of indicators of sustainable development of a mono town according to the methodology of H. Bossel (Bossel, 1992).

As a basis, we will use the UN Sustainable Development Commission's system of indicators for sustainable development.

To maintain comparability of sustainable development assessment methods, indicators will be selected based on development factors that were identified in the previous step. figure 2.

As a result of the selection for the system for assessing the sustainable development of a mono town, the following set of indicators can be formed.

We will form the first set of indicators on meringue indicators reflecting and evaluating sustainable development in accordance with the UN sustainable development methodology.

This block will include the following indicators.

1. The poverty index of the population (an indicator of the control of the level of social tension).

2. The provision of comfortable housing (an indicator of the control of the level of social tension).

3. The share of utilized and recycled household and hazardous waste (an indicator characterizing the degree of environmental load as a result of the economic development of the territory of a mono town).

4. The cost of the territory’s internal natural resources (an indicator characterizing the level of the natural resource base of a mono town).

5. Debt burden on the city budget - the indicator is based on the external debt / GDP indicator, adjusted to the level of the municipality.

6. The coefficient of sectorial differentiation in wages is the Gini index, adjusted for the aspects of the municipality;

7. The possibility of employment, taking into account aspects of the municipality;

The next block is based on social indicators of the organization of economic cooperation and development Economic Co-operation and Development (OECD), this block includes the indicator of

the proportion of the population (employed in the city's economy) engaged in professional activities in adverse working conditions.

Also, to assess the well-being of the city from the point of view of public health, we will include in the set of indicators an indicator that is borrowed from the system of indicators of the World Health Organization (WHO) - the dynamics of social diseases.

As a result of the selection, a methodology was developed for assessing the sustainability of innovative development consisting of 9 indicators, which allows one to effectively assess the sustainable innovative development of a municipality that falls under the definition of a mono town.

Conclusions

The current development trend of mankind suggests that the level of urbanization of the population will grow every year, and the role of cities in the production of products and services will grow every year. Cities in the future will be the main centers of cultural and scientific development providing the future progress of human development. However, any socio-economic processes carry two components, one of which is positive, and the second carries a negative component. One of the negative features of urbanization is that any negative changes in the city related to the economy, social sphere and healthcare lead to significant social tension. A special case is a company town specially created for a specific production. The practice of municipalities shows that the emergence of problems in the company of the founder of a single-industry town automatically generates a surge of social tension and the subsequent degradation of the city. At the same time, most sites of company towns (company town) can effectively use their infrastructure for the development of this municipality in a different direction. This process should be accompanied by monitoring the sustainable development of a company town (company town) which is implemented through a system of indicators of sustainable development. The proposed system of indicators will ensure the monitoring of the sustainable development of single-industry towns during the shift strategy of their development and deindustrialization.

E-mail: piotrkwiatkiewicz@gmail.com

Abstract

In Poland, despite a significant change in the quality of life, we still have a problem in this regard in rural areas. This is due to overt and covert unemployment as well as mainly low-margin activities functioning in those areas. Increasing economic development in the countryside requires creating non-agricultural jobs in the area. However, activities undertaken as part of local low-emission economy plans aimed at the development of renewable energy sources may be an opportunity for a positive change in this field. The aim of this study was a synthetic analysis of the situation of rural unemployment and to determine whether the renewable energy sources may create an opportunity to eliminate the problem.

Keywords: Sustainable Economic Development, Renewable Energy Sources.

Introduction

From the beginning of the system transformation, the main goal has been to promptly adjust the standard of living in Poland with highly developed European countries. However, in practice this goal was reduced only to changes in the economic growth rate and no attention was paid to qualitative transition. As a result, the level of economic development is low, which is manifested primarily in:

- poverty level (almost 5,4% of the population is affected by extreme poverty, over 10,9% statutory and almost 14,2% - relative) (GUS, 2019a),
- social inequalities (we have a much larger income gap than other European countries) (Jankiewicz, Pająk 2014, Chancel 2018),
- level of remuneration (in terms of the dominant value),
- difficult access to health care (including prevention and rehabilitation) (Jankiewicz 2016, NIK 2019).

From a spatial point of view, the problem of low income and quality of life occurs in the countryside. Activities undertaken as part of local low-carbon economy plans aiming at increasing the rate of sustainable development of affected areas may create an opportunity for positive changes.

The aim of the study was a synthetic analysis of the situation in the field of rural unemployment and drawing attention to renewable energy sources (RES) as the basis for increasing employment and increasing the income of the population living in the countryside. Particularly because in the current financial perspective, the EU has allocated significant funds to activities related to the broadly understood reduction of harmful gas and dust emissions to the atmosphere. The Government, however, plans to introduce programs to support the development of renewable energy sources.

The work is descriptive and analytical in nature and is based on observational, intuitive and critical analysis methods.

Characteristics of Unemployment in Rural Areas

General data on unemployment in Poland gives a notion that it is low (below 6%). However, there are still many regions where the difficulties in finding a job are significant (in some areas unemployment remains up to three times higher than the national average). It is peculiar that the affected regions remain the same for many years (data CSO and MRPiPS).

Analyzing the labor market in the context of economic development, attention should be paid to the low rate of economic activity of the society (GUS 2019b), relatively high hidden unemployment (Poczta 2013, Jóźwiak, Ziętara 2013, CSO, 2016), low salary, high economic emigration (estimated at 2-3 million people) and a significant (almost 20%) share of employees who have a fixed-term contract (which is usually never turned into a permanent one) and work only on commission or contracts of mandate (approx. 5% in total) (Palczyńska 2016).

The problems mentioned above mainly concern the villages. About 39% of the Polish population lives in the countryside, while among the unemployed they constitute about 43-45%. The only exception are villages located in the proximity of cities, which in fact become urbanized while remaining villages in an administrative sense. The problem does not apply there.

In I quarter 2019, there were 875 unemployed persons per 1000 people working in the countryside. The highest (up to 85%) level of economic activity of the rural area population related to the age group of 40 - 44 years old, relatively low was among the youth (15-24 years old) and the lowest in the post-working age population (>60 for women and >65 for men) (CSO 2019).

In addition, hidden unemployment is high in rural areas. According to estimates, it amounts from 600,000 up to 1,500,000 people (Kołodziejczak 2016, Frenkel 2013, Karwat-Woźniak, Chmieliński 2013, Kołodziejczak 2015, Nurzyńska, Poczta 2014, Bański 2013).

The release of surplus labor supply in agriculture will take place over the next 10 years, regardless of the situation on the local labor market (i.e. whether non-agricultural jobs will be created or not[1]). This will mirror the changes in the already announced European Community's agricultural policy (related to, among others, elimination of direct payments).

Spatial analysis suggests that the "release" of labor resources in agriculture will not be uniform. The highest influx will appear in the Lubuskie, Podkarpackie and Małopolskie voivodships (about 200,000 people each). A large inflow (100-150,000 people) can also be expected in the Mazowieckie, Wielkopolskie, Świętokrzyskie, Łódzkie and Podlaskie.

Without solving the problems of the labor market in rural areas, it will not be possible to significantly increase the pace of economic development and the wealth of the majority of society. The development of renewable energy sources can be a chance in this case, ensuring the development being sustainable.

RES as the Basis for Increasing Employment in Rural Areas

In Poland, primary energy production is based primarily on fossil fuels, which is a problem. Our country has committed itself to reducing production from coal-based sources in favor of ecological ones. By 2030, the share of renewable energy will increase to 20% (Directive 2009). In addition, the European Union wants to ensure energy neutrality by 2050.

[1] In the other case, unemployment will rise and citizens' quality of life will worsen.

Another problem is the current state of electricity generation and distribution infrastructure, which creates a barrier to dynamic economic development. Many areas remote from power plants experience periodic shortages in electricity supply, which effectively excludes them from the modern econmy.

The obstacles indicated above are to be eliminated thanks to the development of renewable energy sources. This will be possible due to technological development, thanks to which more and more efficient power plants of this type are created and investment costs are systematically reduced. Currently, they are relatively high, which negatively influences the profitability of such projects (Ram and others 2019). However, within a few years they should (according to forecasts) decrease significantly (Dziaduszyński, Tarka, Trupkiewicz, Szydłowski 2018).

Similarly to the renewable energy field, the progress will be possible in other areas of activity related to low-carbon economy (especially in the field of waste management) (World Bank 2011).

The conception of energy engineering based on renewable energy sources and low-carbon economy creates an opportunity for the development of many regions in Poland, especially rural areas. These changes would generate the specialists in the field of cutting-edge energy technologies, infrastructure security, logistics and energy agriculture (Jankiewicz 2014).

Increasing investment in the low-carbon economy will require appropriately trained engineering staff and qualified employees. At the same time, jobs will be mainly created in small enterprises and will be characterized by relatively high wages.
There are no obstacles, and it is even advisable that investments in renewable energy be implemented in the countryside. People will not have to move to get a job. This is especially true for young people with a technical degree (even at an intermediate level, because such jobs will not require higher education) will have long-term employment guarantees with a relatively high salary (Węglarz, Winowska, Wójcik 2015). It is estimated that several million new eco-friendly jobs will be created.

People remaining in agriculture, on the other hand, will receive additional income by installing renewable energy sources on their farms. The availability of such a solution will be possible thanks to obtaining financial support from the EU and national funds, as well as assistance from energy companies that are interested in the development of the RES micro-installations market. This will create a positive feedback loop, which will further increase the rate of sustainable economic development in the countryside.

Summary

Thinking about further economic development, increasing innovation, ensuring energy security and meeting obligations regarding environmental protection (especially those undertaken within the European Union), Poland must increase the supply of electricity generated by renewable energy sources. The optimal area for investment in this type of energy source is the countryside, which will allow for long-term increase in employment in non-agricultural field as well as increase in income. In addition, it will affect:

- improvement of the local environment,
- increase of the competitiveness and economic efficiency of the local economy,
- implementation of innovative technical solutions in local energy engineering,
- building social capital,
- development of distributed energy resources and local renewable energy sources,
- reduction of the risk of energy poverty in rural areas.

This will cause a development in which "satisfying the current social needs and the needs of future generations will be treated equally ..." and "... will merge, in a harmonious way, the concern for the

preservation of the natural and cultural heritage of the nation with the civilization and economic progress impressing all social groups" (Rada Ministrów 2017). Therefore one may call such a development balanced.

Timing in Public Health Policy:

The Case of Polish Policy in The Field of Hospital Care.

Abstract

The study addresses the problem of optimal public policy timing and in relation to public health policy. There have been presented ways of recognising this problem and the role of public policy timing, which is perceived or can be performed from various economic theories and concepts, mainly: regulation theory, the concept of adaptive public policy, theory of policy timing based on the concepts of option value and the transaction costs of the political process. The approach of methodological pluralism adopted by the authors made it possible to reach for various cognitive inspirations, borrowed from numerous theoretical approaches, in order to create a comprehensive and coherent theoretical foundation for the purposes of analysing the role of timing in applied public policies. Next, an attempt was made to define the role of public policy timing in the applied approach, i.e. on the case of Polish policy towards the public hospital care sector. The general conclusion is that the role of timing is marginalised in Polish public health policy. The time dimension of its creation was ignored or treated as an exogenous event in relation to the rest of the policy formulation process. There is no political approach that adaptively links the right combination of resources and regulatory activity to timing for specific stages of development or growth in public hospital care.

Keywords: Policy Timing, Public Health Policy, Hospital Care.

Introduction

This study assumes the understanding of timing as the ability to do something at exactly the right time. When referring to public policy, the term 'public policy timing' has been used and it means the ability to deal with matters related to public policy at exactly the right time for them.

In economic literature, theoretical thought combining public policy with the timing factor is undertaken rarely and it is not fully developed. This is evidenced by the small number of publications in the Web of Science and Scopus databases with the phrase "public policy timing"; as of February 26, 2020: Web of Science – 0, Scopus (keywords) – 0, Scopus (title, abstract, key) – 2. In economic literature, the issue of public policy timing is being exposed, but mainly in terms of formal deadlines and negotiating ('playing for time') and timing for communicating. Timing has an impact on formal public policy-making processes in specific jurisdictions. However, the right time to communicate with decision-makers about new public health policies (e.g. in the field of hospital care) also depends on other current problems and the likelihood of strong support or opposition to the policy (Kwon, Nelson 2016). In turn, the analysis of "playing for time" suggests that negotiations on divergences, in particular legal regulations, occur not only in time, but in the case of negotiations of harmonization of legal orders of different countries – on the example of the EU and its Member States – also and perhaps above all concern the unity of time (Lindahl 2008). There are also positions which determine the specific benefit for society resulting from making a political decision at the right time in the area of health policy regulation in the field of transplantation (Andreoni 2020) and implementing

environmental regulations at the right time (Asproudis, Khan, Korac-Kakabadse, 2019) . In addition, Solar and Smith (2020) showed the undesirable effects of choosing the wrong moment for decision-making, despite the supportive reforms of the police sector. There are also more, although not yet fully developed, theoretical concepts for public policy closely related to "public policy timing"; these are the concept by Koehler (2003) and the theory by Mittenzwei, Bullock and Salhofer (2012), which will be discussed in more detail in the next part of the study.

Public health policy is closely related to the regulation of the health services industry, especially those that are covered by public funding. The issue of timing in public policy is not exposed in the light of the economic theory of regulation, nor in its positive or normative approach. Public health policy is closely related to regulation in legal terms and connected with the ideology of the guaranteeing state. In the legal analysis of the obligation of public authorities in the sphere of health policy in Poland, which is to ensure equal and fair access, guarantees are understood as dynamic, taking into account the interest of beneficiaries of the system which supervises its functioning. The Constitution of the Republic of Poland imposes on public authorities the obligation to ensure equal and fair access to publicly funded healthcare services. "Ensuring" understood as a guarantee of equal and fair access to health care services (including, for example, hospital care) financed from public funds must include not only the creation of a legal framework for the functioning of the public health system, but also active and dynamic control as well as supervisory activities (however, these cannot be managed by the legislator) (Lach 2011). It is obvious that if the control and supervisory activities are to be dynamic, they must not only be appropriate, but also carried out at the right time (the timing factor is revealed) and in the right way. Ensuring by the regulator (public authorities, centralised and decentralised, conducting health policy) of an appropriate environment for conducting active control and supervision activities include identifying and developing legal and economic tools, as well as principles and mechanisms which provide the greatest chance of obtaining effectiveness and efficiency of control and supervision. It may turn out (and usually it does) that for their completion or improvement, it is necessary to observe the real behaviour of regulated entities under the new / modified health system (healthcare providers and other regulated entities) and to analyse and evaluate the effects of their compliance with the intentions and intended aims of the regulator. Service providers belonging to the same public health care subsector, e.g. public hospital care, despite functioning in the same legal environment and period, may even exhibit quite different behaviours and achieve significantly different economic, social and health effects (one example is Polish public hospitals). This also applies to other entities within the system, such as local government units, which, on the one hand, conduct a decentralised health policy and act as a regulator towards medicinal entities which they own or co-own, but on the other hand are subject to statutory regulation themselves, in order to direct their behaviour or achieve the desired change in behaviour towards subordinate medical entities. One example is the Polish regulation (Act of April 15, 2011) which increased the financial responsibility of local government units for losses incurred by subordinate medicinal entities and thus is expected to lead to a change in the behaviour of local government units relative to subordinate (unprofitable) medicinal entities. This may lead to a further observation that it is necessary to track and coordinate public policy timing with health policy and for specific healthcare subsectors, such as public hospital care.

Optimal Timing Problems in Public Policy (Public Health Policy) In Economic Theories

The last above-mentioned observation relates to the issue of adaptive public policy. As part of the theoretical approach to adaptive public policy, an attempt to associate timing with public policy was presented by Koehler (2003). The author posed the question: Can the development and implementation of public policy be improved by closely tracking and coordinating time with the policy of a regulated sector? The attempt made for such an association is based on the assumption that the asynchronisms between the political process and the regulated sectors or activities may cause unintentional disruptions in the pace of economic changes and development, and thus undermine the original intention of regulatory policy or activities. In addition, such events can lead to unexpected future disruptions. According to Koehler (2003, 99) that is why "A policy approach is needed that adaptively ties the right mix of resources and regulatory activity to the timing of particular stages of

economic development or growth associated with a particular industry." In the issue of adaptive public policy, problems with determining the right time in public policy timing were examined using a new theory based on the concepts of "time-ecology", "developmental change in time" ("heterochrony") and "temporal signature." The author emphasizes that the indicated approach may apply to various organisational issues (organisational skills, organisational culture, organisational structure, life cycle of an organisation) and related to time in various areas of the economy. The full range of space-time network linkages in the cluster government and self-government authorities, i.e. the health service industry or more precisely, e.g. public authority (government, local government) – public hospital care, creates an interconnected unique system of ecology-a time-ecology-of unique between political, economic and other elements, covering a clear time perspective in which the advantages of resource use and delayed responses of participants to ongoing changes in the industry's environment are considered. In such a system, there are more or less intense and often complex rhythmic impulses, occurring in parallel or in a punctual manner, affecting one another on a number of time scales flowing into the future. Each organised entity in the public health care system (each type of entity, e.g. public hospital, local government unit and each existing entity separately) exists in its own past, present and future in a unique way, i.e. it possesses its own "temporal signature" which determines the position of the object in time and is a detectable phenomenon. External bonds mutually affect the structuring (organisational being) by changing the dynamics of development and growth ("heterochrony") and the effects achieved by it. The whole process takes place in the combined adaptive landscapes of public authority (government and local government) or health services industry (hospital care services).

At this point, it is important to add that the "temporal signature" of a particular medicinal entity could be obtained using the benchmarking method of healthcare providers and expressed in the form of a benchmark, which by its nature positions the object (e.g. hospital) relative to other objects (hospitals) in time and can cover various organisational issues and the effects achieved by the facility. As part of the benchmarking study, it is also possible to use the acquired data and information resource to detect e.g. distinguishing features of profitable or unprofitable public hospitals as a unique system in the cluster public authority (government, local government) vs. public hospital care, for the purposes of conducting adaptive health policy (in the public care sector hospital). These are some (proprietary) suggestions for capturing the "temporal signature" and the unique entity in a given period within the "public authority / public hospital care industry" cluster.

In economic literature, theoretical thought combining public policy with the timing factor is also undertaken by other researchers, but is not fully developed. It is well reflected in the work by Mittenzwei, Bullock and Salhofer (2012). Every public authority, whenever making a political decision, must ultimately decide on three separate issues, such as: the choice of policy instruments, the setting of the levels of these instruments, and the timing of their implementation (the issue of public policy timing). However, in both theoretical and applied policy analysis, the time dimension of policy making is often ignored or simply treated as an exogenous event in relation to the rest of the policy formulation process; Policy timing is not an integral part of the public policy process.

Mittenzwei, Bullock and Salhofer (2012) argue that in the literature devoted to the problems of optimal time in politics, it is often thought that a change of policy is irreversible (e.g. Pindyck 2002). By its very nature, politics can change, and policy makers often use this through regular introduction, changing, deleting, and reintroducing policies. Mittenzwei, Bullock and Salhofer formulated their own theory, where the central element is that "Government balances the costs of delaying policy reforms against the benefits. Costs are in the form of welfare losses, brought about by delayed adjustment to changes in the economic and political environment and by the costs of the political process that accompany policy changes. Benefits of delaying policy reforms stem from receiving better information by waiting" (2012, 583). Here, we would like to make two observations of our own. First of all, what has not been said by the creators of this theory but comes to mind (taking into account the concept of proper regulation), it is the default assumption that in the process of preparing political reform, there is used every piece of relevant, cognitively valuable, already existing information (i.e. in detected phenomena in the system affected by the reform). Secondly, in the light of the combination of this theory and Kohler's concept, "better information" can be obtained by

detecting “time stamps” of participants in the health system (public hospital care system) and unique phenomena associated with the “ecology – a time-ecology” system "(e.g. the phenomenon of profitable public hospitals under systemic conditions determined for a given time, etc.). According to Mittenzwei, Bullock and Salhofer, when decisions are made in conditions of uncertainty, and with the passage of time, more and better information appears, I which case the ability to wait before making a decision is highly valuable. The value of waiting for information and the costs of changing policy both shift the balance in political economic equilibrium and cause sporadic policy changes. The model of political economic equilibrium presented by the authors is based on the concepts of option value and transaction costs of the political process.

To sum up, the new economic theoretical thought combining public policy with the factor of public policy timing is shaping towards the theory of policy timing. In general, public policy timing plays the role of an integral part of the public policy process, and is explained in different ways through the prism of an perspective inherent in the formulation and implementation of the so-called adaptive public policy or through the prism of the value of the ability to wait for better information before making decisions in conditions of uncertainty. Both approaches seem coherent and logical. In the concept of adaptive public policy, it is crucial to detect ”temporal signatures” which carry better information and unique phenomena in the “ecology - a time-ecology” system found in a given public healthcare system. This better information combined with the ability to wait for it has the benefit of delaying political reform (to avoid frequent policy changes and irreversible costs of policy change).

The Way of Examining the Case of Polish Policy Regarding Public Sector Hospitals

The study examined the approach to shaping and the realization of policy regarding public sector hospitals in Poland in terms of it being consistent with the concept of public policy timing. This meant deciding whether the approach practised in Poland involves the issue of public timing, and if so, in what scope. The approach was evaluated in terms of three components of public policies based on the concept of public policy timing:

- “temporal signatures” (time struktures) of providers of hospital services financed from public funds (public hospitals) together with their external linkages;
- the appropriate time (kairetsu) for decision-making/policy functioning;
- the ability of policy-makers to wait for better information.

The research was based on providing and explaining (according to the specific criteria) answers to the questions set in the area of each component. The sets of questions are presented below.

Component 1. TEMPORAL SIGNATURES OF PRODUCERS FROM THE SECTOR AND EXTERNAL LINKAGES OF STRUCTURES:

1. Is the sector system in possession of the information helpful in defining temporal signatures of the producers financed from public funds? The criterion: “Information to define temporal signatures of producers”.
2. Is the systematically collected information helpful in defining temporal signatures of the producers financed from public funds? The criterion: “Systematic collecting of information to define temporal signatures of producers”.
3. Are there defined temporal signatures for producers financed from public funds? This means the time delay following the introduction of a change/political initiative and the reactions (undertaken actions) of producers? The criterion: “Temporal signatures of producers”.
4. Is there systematic collecting of information about the relations producers – producing entities (the entities with the functions of ownership and own supervision)? The criterion: “Systematic collection of information about external linkages of temporal signatures of producers in the area of producers – producing entities”.

5. Is there examination of the relations producers – producing entities, and of time changes in the relations under the influence of the introduced changes/policy actions? The criterion: Examining external linkages of temporal signatures of producers in the area of producers – producing entities".
6. Does the policy (decisions, actions) make use of the knowledge about the relations and changes in the relations producers – producing entities? The criterion: "Use in public policy of the knowledge about temporal signatures of producers and their external linkages in the area of producers – producing entities".
7. Is there a systematic collection of information about the relations producing entities – decision-makers at central (national) level? The criterion: "Systematic collecting of information about the external linkages of temporal signatures of producers in the area of producing entities – decision-makers at central level".
8. Are there examined the relations between producing entities – decision-makers at central level, and the time changes in the relations under the influence of the introduced changes/ political actions? The criterion: "Examining external linkages of temporal signatures of providers in the area of producing entities – decision-makers at central level".
9. Does the policy (decisions, actions) make use of the knowledge about the relations and changes in the relations producing entities – decision-makers at central level? The criterion: "Use in public policies of the knowledge about the temporal signatures of producers and their external linkages in the area producers – decision-makers at central level".

Component 2. TIME FOR MAKING DECISIONS AND POLITICAL ACTION (IS IT THE APPROPRIATE TIME - KAIRETSU):

1. Prior to the assumption of a policy solution was it subject to public discussion and received social acceptance (it was not contested by important groups in that sector)? The criterion: "Discussed and socially accepted policy solution during the time before its introduction".
2. Before making a decision/implementing action is there a complete set of means, prepared and analysed by experts, indispensable to effectively conduct a change (in the sphere of the provision of goods and the supervision of producers)? The criterion: "The complete set of political means, analysed and prepared by experts prior to implementation of the change".

Component 3. ABILITY TO WAIT FOR BETTER INFORMATION:

1. Are the policy decisions/actions taken in the keiretsu type time? The clear proof of the existence of the ability to wait for better information are decisions made/actions taken on the basis of better economic information. Two criteria: "Comprehensiveness of the legal solutions prepared before introducing a decision about policy change" and "Comprehensiveness and sufficiency of the prepared set of policy means, before its introduction".
2. Is there the political will to wait for better information? Two criteria: "Developing informational backup for politics"; "Domination of political rationale over economic and social rationale in the process of public policy-making" (this criterion covers two aspects: political solutions based on political rationale; accountability and economic sanctions regarding political decision-makers).

The fundamental objective of healthcare policy in the area of hospital care based on the principles of universality, equality and free access for all citizens, is highly problematic in the conditions of the permanent shortages of public funds in the health service. Since the 1990s, the key problem has been the high and growing level of financial expenditure in the public hospitals sector and the financial ineffectiveness of the great majority of the service providers in this sector. The specificity of the key sector is taken into consideration in the study, as well as the specificity of the functioning of the health service in Poland in the aspect of the provision of hospital care financed from public funds, presented in the next section of this paper.

Defining the role of public policy timing in Polish policy towards the public hospital care sector

Activities focused on the public hospital care sector fall within the scope of health policy. The role of health policy is to create development directions for the entire health care system, including health care, constantly ahead of modern times so that changes in the environment and the system itself do not surprise its unprepared participants. It should also be remembered that the area of interest in health policy is extensive and a broad perspective should be used, capturing the instrumental role of many sectors of the economy. Health policy because it affects many areas. These include, among others, family and child protection policy, agricultural and food policy, industrial policy, environmental protection policy, education policy, employment policy and protection of working conditions, housing policy, other policy areas.

Determining the legal framework and directions of action in health policy is conducted by the legislative authority, government administration, local government administration. Each of the links, formulating and creating conditions for action, directly influences the shape and organisation of the health sector, including public hospital care. The legislative authority sets the legal framework for the functioning of the healthcare system. Exercise of this kind of power includes introducing new legal regulations, but also changing the current law. This area will include, among others, decisions on the broadly understood organisation of the health care system, decisions on the arrangements contained in the Budget Act, decisions on tax rules, in particular exemptions and deductions as well as health expenses obtained from the collected medical services, as well as arrangements regarding the amount of the health insurance premium (part of the tax). Government administration strengthens strategic functions and limits the functions of day-to-day management by claiming central government administration in Poland, including non-integrated administration in the voivodship and local government administration. The government administration body in the field of health care is the Ministry of Health, which, among others, has control rights over other entities operating in the system, but also sets the directions of the country's health policy. One of the most important roles in the healthcare system, however, is played by local government administration performing the functions of the so-called creating entities. As the special owner of public entities providing medical services, it accepts responsibility for incorrect activities of its subordinate entities. The most important competences of local government units as forming bodies towards independent public health care facilities (i.e. entities performing medical activity, which are not entrepreneurs) is exercising appropriate supervision over them. In the current legal framework, the principles of supervision are regulated in the Act of April 15, 2011 on medical activities (Section VI "Control and supervision"; Articles 118-122). Control and evaluation of the health unit's activity and the work of its manager is carried out in particular in such areas as: the proper management of property and public funds, financial management, as well as the implementation of tasks specified in the organisational regulations and the statute as well as in the scope of availability and quality of health services provided. Especially important is the supervision over the financial economy, which is exercised by controlling and assessing its legality, economy, purposefulness and reliability. On the other hand, supervision over the correctness of property management is carried out through control and assessment, in particular of the use of medical apparatus and equipment, the application for the purchase or acceptance of a medical apparatus and equipment, the application for the sale, lease or rent of fixed assets, or the transfer of such assets to companies or foundations.

This multi-level decision-making has caused in the activities of hospital medical entities theemergence of varying attitudes and behaviours of public hospitals in the face of changes taking place. An important source of information on the problems undertaken in the framework of health policy is the analysis of activities carried out in connection with the implementation of health care system reforms. In Poland, these reforms were usually based on organisational changes in the system, often without touching upon previously diagnosed problems. It was intentionally assumed that the new solutions would improve the situation, mainly the bad economic situation, with which hospitals had the biggest problem.

An expression of the poor economic situation of public hospitals is the high level of liabilities due to independent public health care facilities in subsequent years (2002 - 2018), which is shown in Table 1.

Table 1: Due obligations of independent public healthcare institutions in the years 2002 - 2018 (in thousand PLN). The dynamics of changes

As of:	Independent public health care facilities created by local government units and central units		Independent public health care facilities created by local government units and central units

Source: (Regulation of March 4, 2010).

The implementation of tasks adopted by the state as part of health policy is related to the amount of financial resources which can be allocated to maintaining or improving the health of society. Not only their size and structure are important, but also the use by individual institutions that provide health services. The consequences of the reforms introduced, and the financial effects of these changes are also significant. There were many significant reforms in Polish healthcare. In 1999, independent public healthcare facilities were introduced in place of health care facilities. In 2005, the place of sickness funds was taken by the centralised National Health Fund, and in 2011 the system was further organised by introducing the Act on medical activities. Each of these changes was accompanied by a strong pressure of success regardless of the degree of preparation for the transformation process. Due to the usually very short adjustment period to the new conditions, additional support for the system was organised. As a consequence, the Polish health care system has been repeatedly "deleveraged", which clearly influenced the attitudes of managers managing public hospitals and their owners assuming in their activities "tacit agreement" for further deleveraging of entities and uncertainty as to the future of entities. It should be remembered that the processes of debt deleveraging was basically not conditioned by any real economic, organisational or medical requirements. In view of the above, the Ministry of Health carried out the aforementioned process of deleveraging hospitals several times. The first debt relief took place after the health care reform in 1999, which was when sickness funds were created. The reform assumed that the facilities most frequently visited by patients would receive funding. In order to provide equal opportunities, all hospitals have been deleveraged. The Treasury took over 7 billion PLN in debts. However, hospitals started to get into debt again. The next stage of health care healing was to replace the Health Funds with the institution of the National Health Fund in 2004.

Since 2004, the National Health Fund has been dealing with the pricing and contracting of services in hospitals. Despite such a significant change, an increase in general debt of hospitals was still observed. One of the reasons was the change in legal regulations affecting the level of expenditure of public hospitals without indicating specific sources of coverage. The so-called Act 203, adopted in 2000, was a special one. It forced health care facilities to increase the staff salaries by 203 PLN. Total debt increased rapidly during this period. In 2005, the government adopted the Act on state aid and restructuring of public health care institutions. It enabled public hospitals to take loans from the state budget to repay outstanding liabilities. At the same time, the act allowed hospitals to write off public liabilities after the restructuring process was completed. Since then, the dynamics of the increase in liabilities has clearly decreased (see Table 2), which was associated with the decision-makers refraining from introducing further unannounced changes. Stable working conditions caused the settling of public hospitals in economic reality.

Table 2: Total liabilities of public hospitals by voivodships (in million PLN)

Voivodeship	December 31, 2005	December 31, 20017	2017/2005	Ranking 2005	Ranking 2017

Source: (Regulation of March 4, 2010).

The data contained in the table above shows the effects of actions taken by hospitals in individual voivodships and central units (Ministry of National Defense, Ministry of Interior and Administration). The relative stability of organisational and legal conditions and the relatively long period of stabilisation have allowed for the implementation of real remedial measures in hospitals that improve their economic results. An important success is a significant change in the ranking of hospital liabilities of the Lower Silesian, Lublin or Podkarpackie voivodships obtained as a result of numerous, often unpopular, actions. The consolidation of hospitals, changes in business profiles, or the transfer of part of unprofitable ranges to other hospitals resulted in a clear improvement of their economic situation and better ranking. Among the 18 study participants, the aforementioned voivodships have significantly improved. Lower Silesia (from position 1 – the weakest – in 2005 to position 8 in 2017), the Lublinvoivodeship (from no. 8 to no. 3), or Podkarpackie voivodeship (from no. 12 to no. 6). This demonstrates the clear need for stable operating conditions and the need to be well prepared for future tasks, i.e. timing, which is jointly responsible for success in planned projects.

Good action means the opportunity to develop, compare the effects of one's actions with the effects of others. Unfortunately, even during a period of exceptionally stable conditions, no system of universal information on phenomena occurring in the healthcare sector, a catalogue of "good practices" or system of warnings about anticipated difficulties has been introduced in Poland. The market environment encouraged hospitals to make independent decisions (not enforced by the system) resulting, for example, in the process of ownership transformation. As a result, many hospitals changed the legal form of business, usually to companies with the majority share of local government units. This form was economically justified, because it gave the right to conduct activities going beyond the system financed by the payer (National Health Fund). The year 2011 brought further turmoil in the economic situation of public hospitals, which was normalised by transferring the obligation to compensate the hospital deficit (net losses) to the forming entities, i.e. local government units. Agreeing with Kosycarz (2015) this decision was a surprise not only for hospitals but also for local government units themselves. The need for information on the situation of other hospitals and attitudes of individual LGUs has become extremely important. However, for the purposes of performing control and ownership supervision functions, individual LGUs only had their own information systems or control support tools (or did not have them at all). These systems were not consistent in any way, which absolutely limited their comparative functions. As a result, there was no available and reliable information collection that would allow rational decisions to be made either at a given moment or in the future. Only within the framework of scientific research conducted by scientific centres one can find selective or comprehensive studies on this issue. A special place is occupied by unpublished statistical reports based on data covering all voivodships, and collected as part of an innovative research project carried out in 2011-2015 by the Wroclaw University of Economics, entitled "Portraits of hospitals – maps of possibilities, i.e. monitoring the quality of public services and benchmarking with scope of supervision over the functioning of hospitals for which the territorial self-government unit is the founding body" (see: Korenik and Węgrzyn 2015). These studies have identified the distinguishing features of profitable and unprofitable hospitals. Nevertheless, interest in the results of the study was negligible, both on the part of hospitals and decision-makers. Other interesting research by Miszczyńska (2017) was conducted only fragmentarily, e.g. in the Lodz or Pomeranian voivodships. They also remained only in the sphere of scientific inquiry.

The need for good information turned out to be necessary at the time of introducing another very important reform of the so-called "hospital network" in 2017. The hospital network has been

operating since October 1, 2017. The Act of March 23 (2017) introducing this organisational change in the system was prepared in March 2017 and signed in April 2017, and the classification of hospitals into the network was announced on June 27, 2017, without prior information on planned conditions necessary to be met. Thus, hospital owners did not have enough time to prepare for this change. It means the lack of optimal time designed for hospitals, the so-called timing, thanks to which they could better prepare for entering the network. It is also worth noting that at the time the network was introduced, hospitals were at various stages of economic growth (even if they remained at their profiles, they differed in their efforts to improve their profitability) or were at various stages of economic development (some expanded the range benefits to ensure better profitability, and others that have changed their legal form). This did not affect the decision to qualify for the network.

Along with the introduction of the hospital network, the method of obtaining funds for hospital operations from the public payer, i.e. from the National Health Fund, was also changed (see Regulation of the Minister of Health of September 22, 2017). The new method of financing benefits was based on a lump sum covering existing contract performance, but without taking into account the previous numerous so-called oversupplies, i.e. necessary medical services provided by hospitals despite the lack of financial coverage in the contract with the National Health Fund.

In general, hospitals were surprised by the pace of introducing the "network" solutions and the shape of the reform discriminating against hospitals that were on the development path (not matching the concept of a general hospital or operating as commercial companies). It should also be emphasized that the intention of the domestic decision-maker regarding the profitability of contract-financed hospitals is not clear, since they had had information on the specific properties of profitable and unprofitable hospitals and information from the hospital environment about potential negative consequences for hospitals and their patients in the context of rapid entry into force of legal regulations regarding hospital networks.

As a consequence, the quickly implemented changes have not brought the expected effect so far. The introduction of the network together with the change in the financing method based on the lump sum calculated according to the algorithm did not change the decisions taken in hospitals. The assumption that by limiting the number of service providers (network of hospitals) and transferring funds at a level that takes into account the current overall performance of services (only services settled with the payer) but without additional incentives, visible improvement in the operation of public hospitals has not been proven. Public hospitals, especially those subordinate to district self-government units are reporting increasing losses and a higher level of liabilities due. The lack of real preparation for action in the new conditions and the lack of real incentives did not lead to the decision to change in the hospitals themselves. Simple services were not transferred from departments to specialist hospital outpatient clinics, although this was the decision-maker's expectation. No other explicit changes were made to improve the efficiency of operations, because another mechanism (the obligation of LGUs to cover the hospital deficit) did not inspire them. Lack of comprehensiveness in the last introduced reform as well as the lack of time for good preparation for planned changes did not allow to obtain the most anticipated effects of the reform, which are, on the one hand, an improvement in the economic situation of public hospitals but, on the other hand, an improvement in access to services for patients, including shortening of queues.

The need for public policy timing in Polish policy towards the public hospital care sector is therefore very clear. Its apparent lack means that the ability to for better information has not been developed in public hospitals. Changes in political reforms leading to uncertainty and an increase in financial risk for hospitals and their owners, not creating a system of universal information on phenomena in the hospital care sector, which should be a valuable information foundation in the process of formulating and implementing health policy and to develop proper regulation, as well as the lack of homogeneous systems used to perform the functions of ownership control and supervision in local government units cause constant systemic instability and constant dissatisfaction of the system's beneficiaries, i.e. both service providers and patients.

Results of the research on the role of public policy timing in the policy regarding public hospitals in Poland

The research results are presented in Table 3.

Table 3: Polish policy regarding the public hospitals sector in light of the components of the policy based on public policy timing

Components of public policy	Question number	Answer	Justification
Temporal signatures of the sector producers and external linkages of structures	1	YES, partly	There are defined empirical characteristics which distinguish profitable and non-profitable hospitals but only for the period 2010-2014; there is no systemic way of studying changing characteristic for the former and the latter resulting from introducing changes or the impact of policy; there is ordered and in-depth knowledge on the reactions of hospitals (undertaken actions and their effect) but only for the period 2010-2014; lack of research on the time of reaction to the introduced change, and the impact of policy on the part of these hospitals.
	2	YES, partly	Information is collected useful for defining time structures of producers but it is not being processed. Among the bodies gathering data there are the payee, NFZ, and the agency of the Ministry of Health, Centrum Systemów Informacyjnych Ochrony Zdrowia.
	3	NO	Actions taken by producers are often diverse from the expectations of decision-makers and contrary to policy intentions. Example: flat rate tax system in hospitals was supposed to impact on the change in the way of providing certain services, and transferring them from hospital wards (expensive to run) to cheaper, in-hospital ambulatory care – and this did not happen. Only the successive corrective initiatives resulted in the changes expected by decision-makers.
	4	NO	No targeted information about the relations: producers – producing entities is being collected.
	5	NO	Due to the lack of information about the relations: producers – producing entities, they are not examined.
	6	NO	Knowledge about temporal signatures of producers and their linkages is not being utilised. Example: without going into the relations and their changes, a legal regulation was introduced imposing the accountability of producing entities for the bad financial condition of hospitals.
	7	NO	No information is being collected about the relations: producing entities – decision-makers at

			central level.
	8	NO	Due to the lack of information about the relations: producing entities – decision-makers at central level, there are not being examined.
	9	NO	Solutions/changes are introduced without the knowledge about these relations.
Time of making decisions/ taking political action (Is it the appropriate – kairetsu – time)	1	YES, partly	As a rule, new solutions are subject to public consultation, but the lack of approval on the part of important groups in the sector does not always result in rejecting the change. Example: NFZ replacing the Kasa Chorych system.
	2	NO	There is a common shortage of executive acts referring to a significant part of actions, independently of the currently ruling political party/coalition and inadequacy of material, human and financial resources in the scope of the functions of production, as well as supervision and control over producers. Example: the introduced regulation regarding the increase of nursing services for patients in the context of the sharp decline in the general number of nurses.
Ability to wait for better information	1	NO	Frequent loopholes in the prepared legal regulations and their insufficiency result in the lack of ability to wait for better information. Example: detailed changes in the way of running cost accounting obligatory for hospitals appeared much later than the actual legal regulation which introduced them.
	2	YES	Actions targeted at a momentary success, without any relevance for a real permanent solution of the problem. Example: writing-off hospitals' debts without deciding about the form of future hospital work and its results; at the same time there are no significant financial sanctions planned for making wrong decisions and harmful actions.

The carried out research included three components of public policy regarding the sector of public hospitals in Poland, indicates the absence of conducting policies based on the public policy timing. Most of the criteria determined for individual components were not met, or only in part. The only absolutely positive answer appeared in the component "Ability to wait for better information" in the second criterion but since that criterion is of a negative nature, therefore this is not, in fact, a positive reply.

The approach used by public decision-makers in the policy regarding public hospitals created several effects which do not bring a positive contribution to the concept of a policy based on public policy timing; the remaining results are described below.

1/ In the period preceding the reform based on "hospital networks", there were numerous and inconsistent changes in difficult and poorly predictable reforms. They were chaotic, frequent, undertaken under the influence of current political issues and pressing financial and infrastructural problems in the health system, without a clearly defined vision. At national level, there was no waiting for 'better information', nor was it essentially sought in a methodical and reproducible manner that would allow the detection of unique phenomena in given conditions and time. Additionally, at the regional (local government) and local (district, communal) levels, interest in obtaining better information as part of the function of controlling and supervising subordinate hospitals is different. The ability to wait for better information at national and lower levels did not exist. This means that the dimension of the optimal time for creating health policy, including in hospital care, was ignored or treated as an exogenous event in relation to the rest of the policy formulation process.

2/ As a result, hospitals operated in conditions of uncertainty and growing financial risk. This forced hospitals and their owners to take some specific approach to solving the general problem: size, quality and structure of services versus hospital economic profitability. Over time, hospitals created their own survival solutions. Scientific research conducted in the environment has led to the detection and transfer of unique information to decision-makers, e.g. the properties of profitable and unprofitable hospitals, which can be treated as valuable (better) information in the understanding of theories combining timing with public policy. Before the development and implementation of the reform related to the "hospital network", it was possible to use, according to the authors' knowledge, better information, which in practice was, however, omitted.

3/ The method and scope of the reform of the operation and financing of hospitals included in the so-called the public hospital network contradicts, in the light of adaptive policy theory, a policy approach that adaptively links the right combination of resources and regulatory activity to timing for specific stages of development or growth in public hospital care.

3.1/ Public hospitals, which were included in the "hospital network", at the time of the introduced reform were at various stages of development in connection with various adopted directions and ways of adapting them to changes in the operating environment, in conditions of uncertainty and growing financial risk. Hospitals that were at a low stage of growth or at a higher level but were not sustainable - it concerns financial and production aspects which are significantly unsustainable (hospitals did not develop the quality of human resources and / or did not develop their activity to improve the quality of services, poorly responded to the intention of the previous legislator regarding economic rationalisation of operations, they did not develop the structure of the assortment of services) -, but fulfilled the specific condition of being a four-profile hospital, were granted more complete access to public funding. Hospitals which entered a higher stage of development (developed a socially desirable offer of services subject to public funding and the ability to provide these services) found themselves in the so-called trap of strategic surprise as a result of a sudden cut of some benefits financed through a public contract. Additionally, public hospitals which, according to the intention of the previous legislative authority, were transformed into commercial companies with the ownership of local authorities and modernized (with significant investment outlays) were suddenly in a difficult financial situation; their business continuity was threatened by virtually being cut off from financing health services by the National Health Fund. The omission of the timing factor in the reform related to the "hospital network" leads to the fall of some hospitals into a strategic trap, and this particularly applies to those that previously actively adapted to changes in the environment. This also jeopardizes the effectiveness and efficiency of health policy pursued by local / regional governments to which hospitals falling into a strategic trap are subject.

3.2/ The lack of an adaptive political approach is expressed in the failure to make use of the existing, even at the time preceding the communication of the new reform, unique information on the factors and sources of economic viability in connection with the qualitative elements of the operation of public hospitals and their changes over time, and thus information that could allow for the development of better regulation of the "hospital network" (i.e. one which does not ignore the importance of the profitability aspect of hospital medical entities for the health system).

4/ Ignoring or not using the already existing "better information" indicates that the decision-makers' approach in Polish health policy deviates from what is desirable in the theory of policy timing, i.e. the government balances the costs of delaying political reform with benefits (resulting from receiving better information by waiting). The introduced reform carries social and economic losses. The resources of hospitals included in the "public network of hospitals" are not better (more efficiently, rationally) used, the problem of financial debt of hospitals is growing (only partly resulting from the increased wage pressure in public hospitals at that time), there is a growing negative pressure in hospitals on treating patients not as customers but as a cost to be minimised, the management's motivation to improve the economic viability of hospitals without at the same time having a negative impact on changing the perception of the patient has been weakened. These losses could be avoided or reduced by prudent – based on valuable information, already available to decision-makers – consideration of the issue of the economic viability of healthcare entities.

Conclusions

The final conclusion is that the time dimension of Polish public health policy creation was ignored or treated as an exogenous event in relation to the rest of the policy formulation process. There is no political approach that adaptively links the right combination of resources and regulatory activity to timing for specific stages of development or growth in public hospital care. The result is a continuous lack of a long-term (or even short-term) solution to the public health problem in Poland.

The Directions of Counteracting the Bankruptcy of Enterprises in the Polish Economy in the View of the Implementation of the Restructuring Law in the Years 2016-2018

Andrzej TOKARSKI

WSB University in Torun, Poland
andrzej.tokarski@wsb.torun.pl

Maciej TOKARSKI

WSB University in Torun, Poland
maciej.tokarski@wsb.torun.pl

Abstract

The insolvency of enterprises constitutes an inherent component of any market economy. You can respond to a business crisis in two ways, either by saving it *i.e*. restructuring or remodelling the company and limiting, at least temporary, creditor rights, while preserving the jobs and assets of the restructured entrepreneur or by liquidating it *i.e*. by realization of the estate and thus liquidation of the economic entity with a partial satisfaction of creditors and simultaneous return of tangible assets to trading. Thus, both liquidation and reorganization are possible in most countries. The problem of the accuracy of choice between the liquidation of an enterprise and its restructuring is one of the main topics of interest for practitioners and theorists dealing with the bankruptcy of enterprises.

Keywords: Bankruptcy of Enterprises, Restructuring of Enterprises, Second Chance Policy, Bankruptcy Law, Restructuring Law.

Introduction

The problem of the accuracy of choice between the liquidation of an enterprise and its restructuring is one of the main topics of interest for practitioners and theorists dealing with the bankruptcy of enterprises (Fialkovska, 2015; Hashi, 1995; Prusak, 2018; Tokarski, 2018).

The solutions adopted by the legislator should therefore combine a particular individual element (the interest of the debtor and its creditors) with the interest of the society which should be understood as the safety of all market participants, including consumers, and thus affecting the wider the general public.

The state plays a particular role as it is responsible for shaping the legal environment for bankruptcy, which influences, inter alia, the possible scenarios of bankruptcy proceedings or the balance between the powers of debtors and creditors.

The decision to restructure a business entity constitutes an alternative to filing for its bankruptcy. This decision must be a thoughtful one because it creates an opportunity for entrepreneurs to continue their business activities without detrimental effects to creditors (Csikosova, Culkova, Antosova, 2016; Altman, Hotchkiss 2007).

In recent years, the approach to doing business has also changed. The general public understood that financial problems of entrepreneurs do not always the result from the bad will of managers. Many of them should be granted a second chance with the support of the legal system of the country (Tokarski, A, Tokarski, M, 2018).

The main aim of the article is to make an assessment and to show the directions of counteracting the bankruptcy of enterprises in the Polish economy with respect to the implementation of the restructuring law (remedial restructuring) in the years 2016-2018.

The descriptive analysis, the analysis of legal provisions and statistics on the functioning of the bankruptcy of enterprises as well as the implementation of the provisions of the restructuring law or the remedial restructuring in Poland and the analysis of literature on the subject were adopted in the article as the principal methods.

Supporting Enterprises in Crisis Situations – the Implementation of Second Chance Policy (Law)

The opinion that people who failed in business earlier constitute unexploited potential in the area of the development of entrepreneurship was the reasoning behind the implementation of selective instruments supporting "second chance" entepreneurship in the European Union Member States. These instruments include facilitating insolvency proceedings so that an entrepreneur can settle the past quickly and then concentrate on developing a new business (Mączyńska et al., 2015).

Business failures are and will be a permanent element of the functioning of companies, and reduction of their scale, but not their elimination, is only possible (Jenkins, McKelvie, 2016).

Professor E. Mączyńska draws attention to a stigmatising bankruptcy syndrome (Mączyńska, 2015). It is thought that only weak enterprises go bankrupt. A strong enterprise, like a person who has always been wealthy and finds it hard to imagine being poor, generally cannot imagine going bankrupt. Public opinion often associates bankruptcies with frauds and loss of confidence. However, sudden and profound civilizational changes increase the risk of failure even among perfectly working companies. Fast identification of chances and threats for enterprises becomes necessary for adopting relevant strategic decisions as is a change of the attitude of the society to entrepreneurs. The stigma of business failure can be found in the business community, legal measures and cultural and social bahaviours (Mączyńska, 2013; Ucbasaran, Westhead, Wright, et al., 2010; Simmons, Wiklund, & Levie, 2014).

Since 2001 the European Commission has been undertaking actions aiming at starting new policy which would solve the problem of threatened enterprises and negative effects of their bankruptcies. (Lukáč, Kmeťová, 2019; Mączyńska. et al, 2010). Such actions would involve collecting data on legal and social consequences of business failures, facilitating identification and dissemination of good practices and working on early warning tools as a means of reducing the stigma of business failure. Those activities helped to initiate reforms in the whole European Union. Within the Stigma of Failure and Early Warning project, an early warning tool has been developed for small and medium-sized eneterprises which enables preliminary assessment of their situation and the threat of a crisis situation and bankruptcy (Mączyńska. et al, 2008).

On 25th June 2008 the European Commission published a document entitled "Think Small First". In the "Small Business Act" for Europe, among ten main principles for the policies of the European Union and the Member States in relation to the SME sector principle number 2 there can be found one which ensures that honest entrepreneurs whose entreprises have been declared bankrupt are quickly given a second chance. The European Commission requested the Member States to do the following: (European Commission Communication, 2008).

1. promote a positive attitude of the society towards entrepreneurs returning to the market;
2. enable finishing all legal procedures leading to bankruptcy within one year in the case of bankruptcy not resulting from fraud;
3. ensure identical conditions of economic activity for both returning and new entrepreneurs.

In November 2016, the European Commission proposed a package of European legislation concerning enterprises threatened with bankruptcy. The suggested directive focuses on three elements: (Directive of the European Parliament and of the Council, 2016)

1. common rules for a framework for restructuring at an early stage, which helps enterprises to continue their activity and preserve job;
2. provisions allowing entrepreneurs to take a second chance as they will be able to relieve themselves from libilities within a period of up to three years;
3. allocating resources to Member States to increase the efficiency of the procedures in connection with bankruptcy, restructuring and relieving from liabilities.

The Dysfunctions of the Bankruptcy System in Poland in the Years 2011-2015

The model of the bankruptcy proceedings which functions in Poland does not fulfil its major goal *i.e.* the elimination of the unprofitable entrepreneurs. Thus, the model does not perform its preventive function – it does not preclude further insolvencies, which happen in the aftermath of the unpaid liabilities by the debtor (Babiarz-Mikulska, Czarpacka, Morawska, 2012).

Graph 1: The structure of corporate bankruptcy in Polish economy in the years 2011-2015

Source: (PwC 2017), Report: Upadłości i restrukturyzacje w Polsce. Wskaźniki prognozujące trudności finansowe oraz wybrane skutki zmian w przepisach z zakresu upadłości i restrukturyzacji, (Bankruptcies and Restructuring in Poland. Indicators Forecasting Financial Difficulties and Selected Effects of Changes in Regulations Concerning Bankruptcy and Restructuring), Warsaw, p. 5.

The degree to which the creditors are satisfied in the course of the conducted bankruptcy proceeding, including the liquidation of the bankrupt's assets, is minimal.

Consequently, the functioning model does not perform its debt recovery function. The cost of the bankruptcy proceedings exceed 40% of the bankruptcy estate and the average time of the proceedings, counted from the moment the petition for bankruptcy is filed to the moment the bankruptcy is declared, is two years (Masiukiewicz, Morawska, 2012). Therefore, from the point of view of the creditors the bankruptcy proceedings prove ineffective. They freeze the funds and the capital for the period of two years and they do not ensure their quick relocation Furthermore, they do not perform their debt removal function as well.

The restrictive and pro-creditor model of the bankruptcy proceedings does not develop among the entrepreneurs patterns of behaviour, which might be defined as the reliable entrepreneur attitude (the preventive function), because it does not take into consideration the fact that its recipients are

economically rational (homo economicus) units which calculate both the risk and time of the proceedings as well as their costs (Morawska, 2013).

The repressive system of the bankruptcy law that was in force in the years 2003-2015 along with the stigma of failure result in the fact that entrepreneurs conceal their financial problems so long as it is impossible to solve them. Many entrepreneurs are deficient in the necessary means and experience for the effective solution of the crisis situation.

On the basis of the conducted research E. Mączyńska shows that the Bankruptcy Law and the Reorganisation Law in the Polish economy in the years 2003-2015: (Mączyńska, 2013).

- did not guarantee any transparency or efficiency of the bankruptcy proceedings,
- did not perform their purging functions *i.e*. removing the insolvent entities from the market,
- did not prevent to the proper extent the so-called "staged" bankruptcies *i.e.* the ones which were oriented on bringing benefits to the narrow groups of stakeholders while purposefully infringing the interests of other creditors,
- did not conduce to the proper identification of the "staged" bankruptcies,
- they brought about the dominance of the bankruptcy aspects over the recovery aspects which in practice were marginalised against the principles of the bankruptcy proceedings.

Despite the European Commission's recommendations in relation to adopting the second chance policy by the Member States, in the Polish economy in the years 2003-2015, the scope of implementing so called second chance policy recommended by the EU was limited (Mączyńska et.al, 2015). In the analysed period of time, Poland both lacked a developed strategy of implementing such a policy, and those whom such a policy concerned were not precisely defined despite information included in the documents of the Ministry of Economy (Kowalewska, 2011).

It was not until 22nd July 2014 that the Council of Ministers adopted the New Chance Policy document, which provides many instruments for limiting the risk of liquidation and efficient conduct of corporate bankruptcy (Reccomendations, 2012).

The main aim of the New Chance Policy in Polish economy is to counteract corporate bankruptcy and facilitate restarting of economic activity. This objective shall be achieved with the support of the following activities: (New chance policy, 2014).

1. Preventing crisis situations in enterprises (early warning systems),
2. Limiting the risk of premature liquidation of enterprises (non-judicial and judicial forms of repair and restructuring),
3. An orderly winding down of enterprises (judicial forms of restructuring and liquidation),
4. Supporting restarting of economic activity – so called new start.

Effectiveness of the law regulating bankruptcy and restructuring procedures should be measured with the recovery ratio for creditors in such procedures. An average recovery ratio in proceedings in Poland is lower than that noted in the European Union countries (Morawska, 2011; Morawska, 2015).

Graph 2: Recovery ratio of receivables (%) in bankruptcy proceedings in 2016 – a comparative analysis

Source: PwC (2017, p.6).

According to World Bank data, in 2016 the recovery ratio of receivables in bankruptcy proceedings in Poland amounted to 58.3% (Kupis, 2017). A significantly better level of recovery marked not only the strongest European economies (e.g. British economy – about 89% or German economy – about 84%), but also some countries of Central and Eastern Europe (e.g. Slovenia – over 89%). World Data demonstrate that an average recovery ratio for all the European Union countries amounts to 65%, whereas the world average reaches the level of 42%.

Poland is located below the EU average also in terms of the time needed for recovering receivables from an insolvent debtor. According to World Bank data it is three years on average in our country, whereas in the EU it is two years and two and a half years in the world (Morawska, 2012).

Graph 3: Time for recovering receivables (years) from an insolvent debtor in 2016 – a comparative analysis

Source: PwC (2017, p.6).

Poland does not compare favourably when comparing the costs of bankruptcy proceedings in relation to a debtor's property either. It amounts to 15% on average, and in EU – 10.3%; the indicator of the costs in the world is comparable with the Polish one and it amounts to 15.7% (PwC 2017).

Graph 4: Cost of bankruptcy proceedings in relation to assets (%) in 2016 – a comparative analysis

Source: PwC (2017, p.6).

The analysis of bankruptcy proceedings in individual Member States in the years 2003-2015 concluded that Poland was a country with a not very effective bankruptcy system. It is indicated by among others a low ratio in bankruptcy proceedings with its high costs and a long period of enterprise liquidation. The figures for Poland are significantly different from average figures for the EU-15 countries, and even an average time and cost of proceedings are higher than an average for the countries which joined the European Union with Poland (Szmal-Kaptur, 2016).

The amendment of the bankruptcy law in Poland was justified as seen in the aforementioned statistical data, which clearly demonstrates that Poland was left behind by the majority of European economies in terms of the effectiveness of bankruptcy proceedings. Properly targeted legislative changes were necessary for improving mentioned parametres of conducted proceedings and in the long run improving the functioning of the economy.

New regulations were designed to improve proceedings and extend the possibility of restructuring with emphasis on preventing liquidations and maintaining the functioning of an enterprise experiencing financial difficulties and continuing its activity.

Legal Regulations in the Area of Bankruptcy and Restructuring in the Polish Economy

At the beginning of 2016, when Restructuring Law came into force, previously existing Bankruptcy and Reorganisation Law was amended. As a result, two separate laws regulating two types of proceedings for economic entities experiencing problems with settling liabilities have been in force. (Tokarski A., Tokarski M., 2019; Banasik, Morawska, 2016).

To put it simply, it can be said that restructuring law aims at saving and bankruptcy law at liquidation of a debtor's enterprise.

Graph 5: The process of changes in the bankruptcy and arrangement law in Poland

Source: own study

Separating bankruptcy proceedings, aiming at liquidation of assets, and restructuring proceedings whose objective is to maintain an enterprise's activities, constitutes the main change. The separation created a clear framework for both sides, which in its construction is similar to solutions from for instance the United States (Chapter 7 – bankruptcy and Chapter 11 - restructuring), (White, 1989).

Graph 6: Bankruptcy and restructuring proceedings

Source: own study

The restructuring law changes entirely the attitude towards an entrepreneur experiencing financial difficulties. It introduces four restructuring procedures, including sanative ones, and it changes the definition of bankruptcy of an entrepreneur .

The restructuring law with the bankruptcy law aim at creating a coherent system of regulations.

The main goal of the restructuring proceedings is the avoidance of the declaration of the debtor's bankruptcy in the course of enabling them to restructure by means of an agreement with the creditors, and in the event of the recovery proceedings also through the curative actions while simultaneously securing the valid claims of the creditors. As the new restructuring proceedings we include: (Act on the Restructuring Law, 2015; Tokarski, A., Tokarski, M., 2019a).

a) the proceedings on the approval of the arrangement,
b) the accelerated arrangement proceedings,
c) the arrangement proceedings,
d) the recovery proceedings.

Graph 7: „A decision tree" of bankruptcy and restructuring proceedings

Source: PwC (2017, p. 8).

Therefore, the new restructuring regulation – law is consistent with the new attitude to a failure in business activity and insolvency. The objective of the European Commission is to ensure that viable

enterprises in a difficult financial situation, regardless of their location in the European Union, can access national framework of bankruptcy proceedings enabling restructuring at an early stage to prevent their insolvency thereby ensuring maximising the whole value for creditors, employees, owners and the whole economy. The aim of the recommendation is also to enable honest entrepreneurs declared bankrupt to use a second chance in the area of the Union.

The Influence of Legal Regulations on the Phenomenon (Statistics) of Bankruptcy and Remedial Restructuring in Polish Economy

Analysing the effects of the introduction of restructuring law, two effects are worth distinguishing (Zimmerman, Filipiak, 2018). On the one hand, **a displacement effect** occurred, that is using a restructuring procedure by those companies which in the status quo conditions would have to go through a bankruptcy process. On the other hand, **a creation effect** occurred, as the new law encouraged attempting to restructure many companies which, without this law, would not have decided to negotiate with their creditors. The reason for introducing the new regulations was exactly to encourage faster restructuring of companies which do not want to enter the bankruptcy process. Separating those effects is not easy and it requires an econometric analysis, whereby it is estimated that out of 585 proceedings, about 40% (almost 250) are the effect of displacement and about 60% of the creation effect (over 330).

In 2017 in the Court and Commercial Gazette bankruptcies concerning 591 companies were published. In 2016 606 bankruptcies were announced. If those figures are compared with the numbers of bankruptcies in previous years, a decreasing trend is observed.

In order to specify a real trend, it must be taken into account that since January 2016 companies experiencing serious problems with liquidity and paying liabilities had been able to initiate restructuring proceedings instead of declaring bankruptcy. 234 such proceedings were observed to 30th June 2018 (there were over 460 of them in 2018) with 348 in 2017 and 212 in 2016.

Table 2: Number of restructuring proceedings in Polish economy in the years 2016-2018

Moving on from the liquidation to restructuring model of bankruptcy requires changes adopted by lawyers, economists, managers, business representatives and represetatives of the State because they create a group of interest whose main objective in this case is to conduct skilfully a bankruptcy process which leads to paying liabilities to creditors with simultaneous preserving a good economic and financial situation of an enterprise.

Conclusion

In practice, there is an urgent need to examine the phenomenon of bankruptcy in the aspect of creating rules of procedure necessary for rational regulation of this phenomenon by the legal system.

The economic sense of bankruptcy involves maintaining an entrepreneur temporarily experiencing the loss of financial liquidity or in liquidating an entrepreneur permanently unable to settling their liabilities.

The role of the State should be to minimise negative effects of a crisis situation in an enterprise, and the objective of the New Chance Policy is not to prevent bankruptcy at any cost, but, when business activity must be terminated due to financial difficulties, to conduct the process quickly and inexpensively.

Commercial Exchange of Innovative and Knowledge-Based Services with EU States: Case Study of Poland

Agnieszka MALKOWSKA

University of Szczecin, Szczecin, Poland
ORCID 0000-0002-3857-8946
agnieszka.malkowska@usz.edu.pl

Abstract

The article presents the issue of trade between Poland and EU member states. Its main focus is on innovative and knowledge-based services. The aim of the research was to identify the tendencies in the trade in innovative and knowledge-based services between Poland and the countries of the EU. The temporal scope of research includes the years 2010-2017. This results from the availability of cohesive and latest statistical data. The study is based on data published by the National Bank of Poland and the Central Statistical Office. For the purposes of this research, simple statistical methods, desk research, and graphic methods were used. Between 2010 and 2017 the value of innovative and knowledge-based services in the Polish foreign trade with EU countries increased. The generic structure of services changed. IT services and services provided by professionals predominated. Germany remained Poland's key commercial partner in the discussed category. However, its participation in the Polish exports diminished in terms of innovative and knowledge-based services, while it increased in the case of imports. The development of Polish foreign trade, trade in services included, has a positive impact on the economy. Nonetheless, Poland remains dependent on imports, including that of innovative and knowledge-based services.

Keywords: Intra EU-Trade, Polish Foreign Trade, Services, Innovative And Knowledge-Based Services

Introduction

International trade is one of the most important and fastest-developing economic activities. Foreign trade, exports in particular, is still viewed as an essential determinant of economic development. Over the past few decades, however, the manner in which its substantive scope is perceived has changed. In many economies trade is still dominated by the exchange of goods, albeit with a simultaneous growth in the significance of services. Additionally, the role of innovation in shaping the structure of trade is increasing, as well. Trade in services has been expanding rapidly, at a faster pace than trade in goods since 2011. Services currently account for around three quarters of GDP in developed economies, up from 40 per cent in 1950, and many developing economies are becoming services-based . In some cases, this is occurring even more rapidly than in developed economies (WTO, 2019).

Such trends are also observed in Poland. Despite this, there is a gap in the knowledge of commercial exchange of services, including the lack of a comprehensive analysis of the types of services involved and their impact on the functioning of the Polish economy. This has been caused by researchers rather focusing, most often, on developing only a generic description of exports and imports of services. The limited access to statistical data and their frequent lack of cohesion, particularly hindering long-term analysis, is another problem.

The aim of this research was to identify and assess the trends in the trade in innovative and knowledge-based services between Poland and EU member states. Also, an attempt was made to

assess the significance of and roles played by EU member states in the trade in such services for the functioning of the Polish economy.

Literature Review

Since 1980s, the significance of services for international trade has been on the rise. Hence, this phenomenon has been more and more often the focus of scientific research, although there is still a considerable gap in the knowledge gathered to date. This gap mostly relates to the lack of a theory of the international trade in services (Misala, 2005). Therefore, attempts are being made at explaining the international flow of services using the achievements of the theory of international trade in goods. According to van Welsum (2003), this approach is admissible as the literature does not provide for any formal or empirical barriers. However, it is required that the specific features of services and the incompleteness of statistical data be taken into account. Thus, for instance, it has been shown that the comparative advantage applies to the trade in services, as well (Stern and Hoekman, 1987). Sapira and Winter (1994) have proved that the international trade in services and goods share the same determinants. Kimura and Lee (2006), on their part, have shown the complementary relationship between the exports of goods and the imports of services. Despite this, according to Mongiało (2007) it is unlikely that a comprehensive theory explaining the international trade in services will be developed, and the reason for that is the multitude of factors affecting the shape, structure and directions of the exchange of services.

The factors determining the international trade in services constitute an important part of the research undertaken in this field. One of such factors is the question of the given country's participation in a regional trade agreement (RTA). A fairly comprehensive approach to describing this aspect has been adopted by Mattoo and Sauvé (2008), Hoekman and Mattoo (2013), and others. A positive link between the existence of regional trade partnerships and the trade in services has also been pointed to by Ceglowski (2006). Additionally, she has proved that the sizes of and the distances between the countries play an essential role in the international trade in services. Mirza and Nicoletti (2004), on their part, have confirmed that the given country's membership in a regional partnership causes the bilateral exports to grow.

Some studies on services focus only on industrial countries, although in many developing countries services are already the largest sector in the economy and an important determinant of overall productivity growth (Zahler, Iacovone & Mattoo, 2014). The positive effects of international trade on countries' economic development are thoroughly described and well-proven in the literature (Krugman et al., 1999; Jones & Kierzkowski, 2018; Malkowska, 2018). The role of services in the international trade is growing, especially with regard to innovative services. Services are much more active with respect to innovation than is widely thought (Hipp et al., 2000). In turn, innovation is frequently an essential foundation of the economy's competitiveness (Porter, 2011). Therefore, empirical studies on the international trade in innovative services within the frameworks of regional trade partnerships, for instance the European Union, should be considered as important and necessary.

Methodology

This article focuses on the international trade in services. It discusses Poland's trade in services with EU member states. Poland has been a member of the European Union since 2004, which is why the trade analyzed herein is of an intra-EU nature. The substantive scope of the research included innovative and knowledge-based services.

The study used a general description of Poland's trade in selected services with EU member states as a starting point. The three main categories of exports, imports and trade balance were analyzed. The temporal scope of the research was chosen to include the years from 2010 to 2017, a decision driven by the availability of cohesive and latest statistical data. This, in turn, allowed the author to observe the changes occurring over time and enabled both assessments and comparisons to be made. The general description was expanded by an analysis of revenues from international sales of the services concerned, and of the expenditures on all the components, including the service types classified

within them. In this case, the years 2010 (the base year) and 2017 (the target year) were assumed as the time frame.

The core part of the paper covers an analysis of the significance of EU member states for Poland's international trade in innovative and knowledge-based services. In order to specify the EU's role in this respect, a number of indicators, important from the perspective of the topic discussed herein, were chosen. The analyzed and assessed aspects included, inter alia, the following: revenues from and expenditures on services traded in with EU member states, Poland's main trade partners, the ratio of Poland's exports and imports value to its gross domestic product, the value of the Polish trade in innovative and knowledge-based services with the EU per capita, and the activity of Polish international service providers, including those with foreign capital. These indicators were analyzed for the period from 2010 to 2017 or – where appropriate – individually for 2010 and 2017.

The analysis was carried out on secondary data. For the purposes of the study, four main groups, or the so-called components, of such services were selected in line with the distinction made by the National Bank of Poland (NBP) in its reports. They were: (1.) Telecommunication, IT and information services; (2.) Research & development services; (3.) Services provided by professionals; (4.) Fees for intellectual property rights.

For the purpose of drawing conclusions, inductive and deductive methods based on desk research were used. Predominantly, data from the National Bank of Poland online database were used. Additionally, information was drawn from the public statistical database of the Central Statistical Office (GUS), including the Local Data Bank. The results were presented graphically in the form of tables and figures.

Statistical data were a significant limitation of the study. The analyzes mainly used NBP data, which are published only in Polish Zloty (PLN). Lack of homogeneous data in another currency, especially in EUR, made it impossible to compare Poland with other EU countries.

Results

Poland's trade in innovative and knowledge-based services with European Union member states between 2010 and 2017

The years 2010-2017 saw dynamic development of Poland's trade in innovative and knowledge-based services with European Union (EU) member states. The value of exports of the services in question grew from PLN 12.8 bn in 2010 to PLN 37.3 bn in 2017. Thus, revenues from the international sales of these services grew three-fold. As for the imports of such services, an increase of almost 200% was observed. During the period concerned, expenditures on acquiring the analyzed services from EU member states grew from PLN 15.8 bn to PLN 37.1 bn (see Figure 1). Therefore, the growth rate of exports was notably higher than that of imports as far as innovative and knowledge-based services are concerned.

Fig. 1: Poland's trade in innovative and knowledge-based services with European Union member states between 2010 and 2017 (in PLN bn)

Source: the author's own study based on: the National Bank of Poland (NBP, 2018).

Only once, namely in 2017, was Poland's trade balance with EU member states in respect of innovative and knowledge-based services positive, reaching over PLN 230 m. In the rest of the period, the balance was negative every year, deteriorating systematically until 2013 when it reached its lowest level of - PLN 5.1 bn. After 2013, the trend reversed and the trade balance improved continuously (Figure 1). It should be noted that the trade surplus of 2017 was owed mainly to IT and R&D services. The latest – though still incomplete – statistical data on Poland's trade in services indicate that this surplus will probably have maintained in the following year, as well. However, it is difficult to judge whether or not this trend is a long-term one. For the time being, we are only able to talk of a short-term nature of such surplus. Importantly, however, the surplus developed mainly as a result of a much higher growth rate of revenues from innovative and knowledge-based services rather than expenditures on the same. This is of significance in the context of assessing the functioning of the Polish economy.

Detailed conclusions can be drawn from a deeper analysis of the structure of revenues and expenditures. In this context, the research showed that considerable changes had occurred. Poland's largest revenues from the sale of such services to EU markets were from IT services (PLN 2.9 bn in 2010 and PLN 12.5 bn in 2017) and services related to marketing, market surveys and public opinion polls (PLN 3.7 bn in 2010 and PLN 6 bn in 2017), as well as business consultancy and public relations services (PLN 6.2 bn in 2017) (see Table 1). Jointly, these components accounted for almost 52% of the value of the Polish exports of innovative and knowledge-based services to the EU in 2010, and as much as 66% in 2017.

Table 1: Poland's trade with EU member states by the main components of innovative and knowledge-based services in 2010 and 2017 (PLN bn)

Source: the author's own study based on: the National Bank of Poland (NBP, 2018).

As for services acquired from EU member states, Poland's largest expenditures were on those related to business consultancy and public relations (PLN 4.2 bn in 2010 and PLN 11.7 bn in 2017) and fees for intellectual property rights (PLN 4.5 bn in 2010 and PLN 8.8 bn in 2017) (Table 1).

Between 2010 and 2017, the largest increase in exports of innovative and knowledge-based services to the EU was observed for the service components of business consultancy and public relations (by 339%), IT (by 327%) and accounting, auditing and tax consultancy (by 300%). In the case of imports, the largest growth was in respect of such service components as marketing, market surveys and public opinion polls (by 240%) and accounting, auditing and tax consultancy (by 232%). Apparently, apart from IT services, Poland's trade with EU member states was characterized by the fastest growth in significance of selected services provided by professionals.

The Roles of EU Member States in Poland's Foreign Trade in Innovative Services

The European Union is Poland's most important trade partner, also in the case of the services discussed herein. The Union's share in Poland's trade in innovative and knowledge-based services accounted for approx. three-fifths for exports and over three-fourths for imports. During the period concerned, EU member states' share in the overall exports of the services in question dropped by 2.5 p.p. (i.e. from 67.7% in 2010 to 65.2% in 2017), but its share in the imports of such services grew by 4.1 p.p. (i.e. from 74.7% in 2010 to 78.8% in 2017) (see Table 2).

The data shown in Table 2 indicate the enormous significance of the EU markets for the Polish trade in innovative and knowledge-based services. According to the latest data for 2017, the share of revenues from the sales of individual service types to the EU ranged from 47.7% for fees for intellectual property rights to as much as 83.4% for telecommunication services. As for expenditures on such services, these shares were even larger and ranged from 61.8% for IT services to 87.8% for R&D services.

Table 2: The share of Poland's trade with EU member states in innovative and knowledge-based services in the country's overall international trade in innovative and knowledge-based services

Service	2010		2017	
	Exports	Imports	Exports	Imports
Telecommunication, IT and information services	70.4	74.9	63.1	75.5
including: telecommunication	78.9	78.9	83.4	75.0
IT	69.9	77.2	61.8	77.1

Fees for intellectual property rights	61.9	65.6	47.7	73.7

Source: the author's own study based on: the National Bank of Poland (NBP, 2018).

In terms of exports, the only component that increased its share was that of services provided by professionals (by 2.5 p.p.), while the shares of the other three main service components discussed herein were seen to fall. The largest drop was observed for fees for intellectual property rights (by 14.1 p.p.), followed by telecommunication, IT and information services (by 7.2 p.p.) and research & development services (by 4.9 p.p.). In terms of imports, an upward trend was identified for all the four main service components, the largest being for fees for intellectual property rights (by 8.1 p.p.) (Table 2).

Also, Poland's most important trade partners changed with regard to the different types of innovative and knowledge-based services. Generally speaking, however, the most significant geographical directions for both imports and exports were such EU member states as Germany, the UK, the Netherlands, Sweden and Ireland. Notwithstanding, it must be noted that non-EU partners, such as the United States and Switzerland, occupy high-ranking positions in this respect, as well. Polish exports of innovative services to these markets increased. Poland's trade in the services concerned took place mainly with strong and developed economies.

The United Kingdom was an important partner both in terms of exports and imports of most innovative and knowledge-based service components (Table 3). The UK has left the European Union on January 2020, after almost half a century of membership. Brexit may have an impact on Poland's foreign trade in such services. To date, no final conditions for the UK leaving the EU have been established, which is why any direct consequences of such a move are difficult to make. Membership in the EU is known to reduce trade and investment costs (Dhringa, 2016). The basic data on trade in goods and services and investment between the two parties suggest that the cost of "Brexit" could be substantial. Trade between the UK and the EU-27 is large. All available studies concur that a significant disruption of trade links will impose economic costs on both sides (Belke & Gros 2017).

Table 3: Poland's most important trade partners in the exports and imports of innovative and knowledge-based services in 2010 and 2017

	Service	2010		2017

Source: the author's own study based on: GUS 2011a; GUS 2018a.

The role of trade in individual economies can be assessed using the export and import ratios. Due to the nature and scope of the research, the former of these indicators was calculated using revenues made by Poland from international sales of innovative and knowledge-based services to EU member states and the value of the Gross Domestic Product (GDP). The ratio of the two figures depicts the degree to which the Polish economy is open to foreign markets (in this case the EU markets). Also, the same ratio allows for assessing how much export-oriented the economy is, as basically the higher the ratio the better.

A comparison between the base and target years clearly reveals a change that occurred in respect of Poland's export partners as regards the "fees for intellectual property rights" component. In 2010, Poland's largest revenues from international sales of services came from fees for intellectual property rights from the neighboring Ukraine and from Hungary, while in 2017 they came from the USA, the UK and the Netherlands. This may mean that the Polish services provided within this component became so competitive that they could be successfully supplied to wealthy countries. Also, trade diversion form a non-EU country to an EU member state was observed here, which is characteristic of integrating organizations such as the European Union.

During the period concerned, Poland's ratio of exports of innovative and knowledge-based services to the EU grew continuously from 1.1% in 2010 to 1.9% in 2017. This means that, slowly but regularly, Polish economy was becoming more and more open to trading in these services with other EU markets. At the same time, the economy's competitiveness can claim to have improved during this period, as well. The ratio of the imports of innovative and knowledge-based services from the EU to the Polish GDP was 0.9% in 2010 and grew to 1.9% by 2017, i.e. by 1 p.p. This indicates that during this period Polish economy's dependence on importing the services concerned from the EU increased gradually (see Figure 2.).

Fig. 2: The Polish ratio of exports and the ratio of imports (%) with regard to trade in innovative and knowledge-based services with EU member states

Source: the author's own study based on: NBP (2018); Local Data Bank of the Central Statistical Office (2010-2017).

An analysis of the value of exports and imports over time allows for two conclusions to be drawn. Firstly, that the Polish economy's openness to trading with other EU member states is of a relatively permanent nature. This is vital from the point of view of the development and functioning of the given economy, and should be view positively. Secondly, the dynamics of the ratio of exports in innovative and knowledge-based services to the GDP was higher than it was for the ratio of imports. Here, any attempt at making an evaluation would be difficult and render an ambiguous result. This is so because, as it is known, export is the driving force of the given economy's development and the state's trade policy should be mainly oriented on supporting international sales. Any surplus of exports over imports brings economic benefits from international trade. However, innovative and knowledge-based services are quite specific and should be examined from a wider perspective. In their case, a growth in imports may also bring benefits – be it technical or technological, especially to poorer or developing countries that are characterized by lower levels of economic and technological development. Importing is an opportunity (and frequently the only one) to gain access to innovative services or services based on specialist knowledge developed in other countries, or to be the beneficiary of the transfer of new technologies in services. Therefore, an increase in the GDP share of the imports of innovating and knowledge-based services may undoubtedly have a positive impact on Poland's development.

The given country's economy can also be assessed by analyzing the value of the exports and imports of innovative and knowledge-based services per capita. Revenues per capita from international sales of this type of services to other EU member states grew by 193% (i.e. from PLN 0.34 m in 2010 to

PLN 0.99 m in 2017). A somewhat lower increase, i.e. by 135%, was observed for expenditures (from PLN 0.42 m to PLN 0.98 m). It can, therefore, be assumed that trade with EU member states brought growing economic benefits.

Any analysis of trade with foreign partners must take into account the business activity of enterprises trading internationally. Unfortunately, in the case of business activity related to the provision and acquisition of innovative and knowledge-based services the available data are incomplete. According to the Central Statistical Office (GUS), for example, in 2017 there were over 14.1 thousand Polish importers of services related to professional, scientific or technical activity, including over 11.4 thousand (i.e. 80.7%) trading with other EU member states. At the same time, those involved in exports amounted to almost 5.9 thousand, including almost 4.6 thousand (i.e. 77.4%) trading with other EU member states. In turn, as for businesses trading in the information and communication component of services, there were over 8.6 thousand importers and almost 2.6 thousand exporters. 76.1% of importers and 75.2 of exporters were involved in international trade with the EU. These data allow for the conclusion to be drawn that three-fourths of Polish businesses operating in different fields related to innovative and knowledge-based services traded with partners from other EU member states.

However, it should be stressed that the Polish international trade in services is characterized by the dominating role of foreign capital companies (NBP, 2017). During the period concerned, the number of such companies grew, with the number of exporters increasing by 13.7% (i.e. from almost 9.5 thousand in 2010 to 10.8 thousand in 2017), and the number of importers increasing by 7% (from 10.6 thousand to 11.4 thousand) (GUS, 2011b; GUS, 2018b). One problem that the Polish international trade in services is still struggling with is the relevantly low innovation of service sector businesses. Main problems are: regard to innovative culture, evaluating and planning innovative activities, communication and organization and financing (Norek, 2012).

Poland is an active participant of the processes of internationalization of production. More than half of Polish exports takes place within the framework of gross value chain. The data indicate that in 2016 the value added created in the service sectors accounted for 53.3 per cent of gross exports from Poland. Almost 40% of the value added of the exports of services was related to industrial goods, and 60% came from the service sectors (Mroczek, 2019). The tendency of increasing the participation of economies in the global value chain follows the trends observed in EU countries. Although, in the case of Poland the speed of index's growth is nearly the highest among EU countries. On one side, it has a positive effect on innovation creating, both on the level of companies and the entire economy (Gołębiowska, 2017).

Poland, together with the other countries of the Visegrad Group, is giving an impulse for the European economy. In 2019, Poland surpassed Great Britain and became the sixth biggest economic partner of Germany in the world. Eastern members of European Union are becoming increasingly important for EU innovation.

Conclusion

Between 2010 and 2017, Poland's trade in innovative and knowledge-based services with other EU member states was subject to much change. Both the exports and imports of the services concerned grew, with their international sales being more dynamic than their acquisitions. Apart from an increase in the trade in IT services, the exchange of selected services provided by professionals was observed to be growing, as well, with improving results of the exports of business consultancy and public relations services and the imports of services related to marketing, market surveys and public opinion polls. As a result of this, the trade balance started to improve as from 2014 to reach a trade surplus in 2017.

The development of Poland's international trade also caused its structure to change. Within the Polish overall exports of innovative and knowledge-based services, the largest growth in exports to the EU

was enjoyed by services provided by professionals, and the largest growth in imports by fees for intellectual property rights. It can be concluded, therefore, that Poland's trade with other EU countries is being reoriented from the exchange of low-complexity services to more advanced and – at the same time – knowledge-based ones, where human and intellectual capital is essential.

The analysis confirmed the enormous significance of the EU market for Poland's international trade in innovative and knowledge-based services. In 2017, the Union received over 65% of Polish exports and provided almost 79% of Polish imports. Simultaneously, Poland's sales to non-EU countries were growing, supported by the improved competitiveness of Polish services and increased acquisitions from EU markets, which could be explained by the importing of essential commodities and services and by the technical and technological benefits drawn.

Poland's most important trade partners within the EU were Germany, the UK, the Netherlands, Sweden and Ireland. As the UK's has a large share in Poland's trade in innovative and knowledge-based services, the former country's looming departure from the EU under still unspecified conditions may affect the latter state's international trade in such services. Although the exact consequences of this eventuality are hard to envisage, they should be subjected to thorough analysis aimed at identifying and preventing potential risks, both on the EU and domestic levels.

Poland's international trade in innovative and knowledge-based services was dominated by EU member states, and their role was growing. This research showed that the Polish economy was becoming more and more open to the international trade in services with other EU member states. The growing role of services was also reflected in the increasing trade revenues and expenditures per capita. Additionally, a vast majority of Polish businesses, including foreign-capital companies, had trade ties with EU partners. Therefore, it can be assumed that Poland's trade in services with EU member states had a substantial impact on the country's economic development.

Abstract

In the context of the rapid development of digital technologies, modern companies need to be flexible and constantly adapt to new trends. The ability of an organization to exist and compete in the conditions of scientific and technological development also depends on the choice and development of the main value of any company - a person with his knowledge and capabilities. The external environment forces HR managers to change constantly their approach to deal with personnel. Routine processes recede into the past, giving way to digital operations. Technologies are developing very fast, but even the most advanced HR-IT system is not able to keep up with changes in the business. In the digital age, business demands higher standards not of systems, but of people. So HR managers will have to give up hope that they will be able to continue working with the existing knowledge and technologies.

Keywords: Human Resources Management, Digital Economy, Digital Transformation, Business Processes.

Target Setting

Nowadays, in the age of scientific and technological progress, a new economic structure is being actively formed – digital one. The introduction of digital technologies in enterprises allows to use available resources more efficiently, as well as significantly increase the productivity of enterprises themselves.

According to the experts, every year there will be an increase in the digital transformation of the personnel policy, modern HR trends will be included in the everyday life of a large number of business companies. In modern practice of human resources management, archaic procedures are closely intertwined with modern digital technologies, with the help of which the process of finding and integrating the right employees is greatly simplified. In this connection, questions of assessing the impact on the personnel policy of economic entities and taking into account global economic trends require scientific justification.

It is impossible to imagine the modern development of world space without the development of information and communication technologies, the Internet of things in the context of the digital economy. This problem is interdisciplinary in nature, because to solve it one has to use knowledge of

[1] The reported study was funded by RFBR, project number 19-310-90036

computer science, electronics, sociology, economics and the whole complex of special types of management (strategic, personnel, financial, innovative, investment, etc.).

A special contribution to the study of the digital economy, the formation of new technological structures, electronic business models, the introduction of digital technologies and the development of digitalization was made by the works of the following scientists and professional communities: Don Tapscott, Boston Consulting Group, International Bank for Reconstruction and Development.

Issues of increasing labor productivity, human resource management, challenges and risks in the development of the labor market are considered by Digital McKinsey specialists, foreign scientists F. W. Taylor, P. Drucker, leading scientists of the Laboratory of Economic Forecasting of the Russian Academy of Sciences.

Moreover, in existing publications and scientific developments, the issue of the development of the digital economy is mainly considered as a whole, without studying global trends in human resource management in the context of the digital transformation of business processes.

Foreign countries are currently implementing digital transformations in all sectors of the national economy in order to increase their global competitiveness index and form Industry 4.0 (the implementation of the fourth industrial revolution), which provides for the complete digitalization of business processes, transformations in the personnel policy, and the search for new approaches to the training system and staff retraining.

The purpose of the research is to study global trends in human resource management in the terms of digital economy and business processes transformation, and to substantiate tools and technological solutions for its improvement.

Key Findings

In today's world, a person is a valuable resource of the company. His knowledge, skills and experience constitute the competitive advantage of the enterprise. In this regard, it is necessary to approach responsibly the organization of the personnel management system, improve it continuously, create favorable working conditions for employees, coordinating the tasks and content of the personnel policy with the goals, strategy and constantly changing structure of the organization.

The digital transformation of an enterprise consists not only in the installation and use of modern software, automation of all processes, but also in increasing the speed of decision-making, as well as in improving the efficiency of the personnel policy of the company [5]. In the context of the development of digitalization, the requirements for the needed set of competencies among HR specialists will increase year by year, transferring part of the service functions to information systems [8].

One of the most important technological trends is Big Data. They significantly affect the ability of HR-services to work with information for further use. Nowadays, big data in personnel management is used in 2 directions: for staff selection (analysis of terms for selecting new employees, percentage of successful completion of the probationary period, etc.) and talent management (analysis of personal characteristics of employees, their work efficiency, formation of talent pool, etc.).

Working with Big Data helps HR specialists to pay attention to existing shortcomings or problems of personnel policy, helps to eliminate them, analyze the degree of attractiveness of the company for applicants, work on the brand and ultimately increase the efficiency of the business as a whole. An important goal of HR specialists is the selection of personnel who are motivated for high personal results, thereby ensuring the growth of the company [2, 10].

The most promising area of recruitment managing is the use of artificial intelligence and robotics. A virtual recruiter - Robot Vera, who is actually a cloud technology operating on the basis of the voice menu, gained wide popularity in the Russian market.

The robot has the following key options: it finds independently suitable CVs on job search sites and calls candidates; on the principle of Skype, conducts a brief interview with the applicant for an open vacancy, asking simple questions that need to be answered either in the affirmative or negative, since the system recognizes the voice, but understands only monosyllabic answers; according to the results of such a survey, it records in its database the information about each phoned candidate [13].

The business processes digitalization allows HR managers to focus on HR tasks, finding talents for higher positions, conducting trainings and staff incentive programs, rather than selecting hundreds of candidates to fill mass vacancies. A significant advantage of digitalization is the ability to remotely search and select personnel. Such technologies significantly reduce time costs and create comfortable conditions for both recruiters and job seekers.

A fairly common service for conducting a video interview is the VCV platform. In this system, it is possible to create comments, conduct competency assessments, as well as form feedback with applicants. The HireVue platform, using artificial intelligence to read the emotions of candidates, conducts an On Demand interview and draws up interview planning [13].

At this stage, it is important to identify the motivation of the candidate and his expectations from a new job [11]. Human resources services record, analyze and store this information about candidates, on the basis of which the staff analysis and planning are carried out. To automate this process, various accounting systems for personnel services are used.

Let us present in Figure 1 the reasons for the implementation of HRM processes in large organizations, holding structures and in medium-sized companies.

Fig. 1: Reasons for implementing HRM processes in Russian organizations

The reasons given for the introduction of HRM processes in Russian organizations require explanation. Thus, the interconnection of the components of the organizational structure of the personnel management system ensures high functionality of the company, guarantees further development and coordination of various forms of managerial work. With a large number of staff, there is an overload of personnel service specialists due to the need to maintain appropriate documentation for all employees with manual registration of all necessary papers, as well as due to the large volume of calculations related to payroll, determining tax payments, etc. As a rule, the number of errors in personnel accounting increases with the growth of the number of personnel, the reliability of the results of payroll calculation decreases, and there may be delays in its payment.

The introduction of HRM-system allows you to maintain personnel documentation and document flow in electronic form, minimizing manual data entry, eliminating duplication of employee accounts, ensuring their blocking for dismissed staff, as well as quick calculation of wages and all related charges and deductions with a high degree of confidence in the results obtained.

Performance Management in the classical sense, when a manager meets with an employee once a year, sets goals for him, and then evaluates achievements, is already out of date. In the current situation, the annual cycle is too long: during this time, the external environment of a business can change beyond recognition, so that by the end of the year those goals that a person worked on can completely lose their relevance [7].

Today, HR managers use a different practice. Some call it Continuous Performance Management, others call it Real-Time Feedback. In fact, this is a frequent and systematic (for example, once a week) feedback, which is also multilateral, not limited to the direction from the head to the subordinate. Such a practice is in line with the spirit of the digital age: a person must promptly receive corrective signals about his activities. In order to reduce the number of transactions, the introduction of new goal setting and evaluation systems requires appropriate IT resources. Mobile applications become an indispensable element of HR systems, since many employees work in project teams and network structures, often remotely [12].

Immediate feedback increases the involvement of people and improves the quality of their work (companies that have adopted the Scrum and Agile project management methodologies have already evaluated this practice) [7].

HR managers are increasingly talking about Social Learning - this is learning from person to person, when the mentors are not professional teachers, but expert practitioners.

Nowadays, during the formation of Industry 4.0., employees with their knowledge and abilities are especially valuable resources of a company. It is due to their intellectual potential and experience that the organization can develop and occupy worthy positions in the market. In order to provide the company with personnel with the necessary competencies, it is necessary to pay great attention to the personnel policy, develop and improve it constantly. One of the catalysts for the transformation of personnel policy is global digitalization.

Currently the innovative technologies in HR are actively implemented and used not only by IT companies, but also from completely different fields of activity. Some of them completely reconsider their views on the current personnel policy, others introduce individual technologies and tools. Based on the experience of companies, it was possible to identify 5 features of modern companies that use digital technology in HR:

1. Maximum centralization of personnel accounting and control based on digital technologies. The knowledge dispersed in different meta (regions, divisions, etc.) gives less result out of the working on a project or key areas than a large number of specialists concentrated in one place. Thus, this feature implies that the success of the organization lies in the centralization of technologies for accounting and control of personnel in one place. Centralization helps to minimize unnecessary interactions and iterations. At the same time, communication with reality is maintained at a high level due to the fact that automation and analytics are being introduced at the enterprise.
2. Maximum processes automation. Automation and digitalization of the ordinary functions of human resources emplyees (and of any other field) makes the HR policy of the enterprise more efficient thanks to: minimizing manual labor, resources saving, minimizing risks associated with staff recruitment, etc.
3. The ease and flexibility of the organization while implementing changes [16].
4. The maximum concentration. This feature means that companies that use digital technology focus on few services.

5. Maximum simplicity. The hinge of this issue is that the company should maximally simplify the communication processes within the organization, with customers, partners and suppliers. The simplification of operations reduces the load on the entire system [16].

The digitalization trend in the field of human resources management has been discussed for several years. Thus, according to research by Grand View, the global market for technical innovations in HR has reached $ 14 billion and is supposed to grow by $ 30 billion by 2025. Coleman Services (one of the leading consulting companies providing comprehensive HR solutions for clients) conducted a study "The level of development of digital technologies in HR" and found out how and why its clients use digital technologies in human resources management [4].

Let us imagine on Figure 2 the levels of digital technology development in HR.

Fig. 2: Development level of digital technology in HR

Let us consider the automated functions of HR specialists in companies.

Among the HR functions that have automated the companies, the personnel administration prevails. An automated system has a number of advantages and can greatly facilitate the work of HRs and human resources specialists. For example, it keeps records of employees, registers orders, monitors the granting holidays, and also makes it possible to get the necessary analytical data in a couple of clicks. Thanks to this, the HR can perform a number of tasks, avoiding mistakes and optimizing their work. For example, it is possible to exclude the repeated entry of the same data into the accounting system or to minimize the risks of penalties from the fiscal authorities, to bring the "purity" of documents to the appropriate level.

The function of evaluating company personnel has been automated. The main goal of this action is to form a high-quality personnel reserve, which will increase the efficiency of the company and its production capacity. With the help of the system, human resource management specialists identify the strengths and weaknesses of employees, determine the most qualified personnel, and on the basis of the data obtained form an individual development plan for each promising specialist.

The system for calculating and paying compensation and benefits has been automated. The automation makes it possible to create an optimal and effective package of benefits, based on the needs of employees, and at the same time controls the costs of the company. The C&B system motivates employees to increase their productivity. As a result, the staff turnover is reduced and the loyalty of the organization's staff is increased.

The training and development functions of the staff were automated. This function already includes the personnel assessment, which was discussed earlier. Based on its data, the system helps to form an individual or group training program for employees, including analytics based on the results.

The automation of companies internal communications. The company management is trying to make the work of employees more coherent. In order to do it, it creates the conditions for quick and convenient communication - it introduces messengers, IP-telephony, and conference calls.

The management also implements corporate portals with company information. There you can find out news about the organization's activities, as well as find information about a colleague, get his contact details and quickly get in touch with him. Moreover, the automation helps to organize the remote work of employees.

In the century when almost everyone has a smartphone, chat bots - corporate analogues of Siri or Alice - have been added to a new trend of the internal communications automation. They know everything about the company and are always ready to help with current issues of employees.

The recruitment function has been automated. Special recruitment programs make it possible to systematize data on candidates, track the statistics on individual vacancies and job seekers. Very often, recruiters maintain a database in Excel, spend a lot of time analyzing information and transferring comments and notes from paper to electronic form. The automation of personnel selection minimizes routine operations and frees up time for searching and selecting candidates.

In the nearest future, an increase in global digitalization and in customer focus in the field of personnel management can be expected.

HR trends, which play an important role today while the formation of an HR strategy for the coming years.

1. Trend 1 – a person is at the center of everything.

HR gurus predict: the customer take centre stage in the company. And not only an external one, but also an internal one. The company employee is a client of an HR specialist. The main task of HR specialists is to reveal the potential and abilities of employees. Human capabilities are becoming one of the main resources of the company. Thus, the HR services have a complex task: HRs will need to create an environment in which talented employees can be raised. It is possible that it will be necessary to update the values and mission of the company, to rebuild the corporate culture. This work will make the foundation for the next important task.

2. Trend 2 - digitalization and automation of HR processes.

Some HR specialists are scared of technology. However, experts are sure that digitalization is inevitable. It will help to simplify not only the work of HR-specialists, but also make life of company employees more comfortable. For example, thanks to mobile applications.

Thanks to these applications, the employees will navigate easier in the office, communicate with colleagues and departments, and be involved in business processes. They will also be able to develop - remotely, quickly and conveniently for themselves. Internal specialists will have to introduce and develop new technologies. HR specialist will have to create an effective team, as well as to motivate it, create a comfortable working environment. In this regard, the following task arises. This trend contributes to other important tasks. For example, assisting in the employment and development of employees whose jobs are occupied by robots. Digitalization and automation have also a negative

side - according to the forecasts of labor market experts, some employees may lose their jobs due to bots and robots. But HRs urge not to despair: companies can help their employees [6].

3. Trend 3 - Elimination of bureaucracy.

To organize effective work, it is necessary that everything is simple, clear and understandable. And since the time is a key resource of a modern person, it is important to ensure the speed of routine operations.

4. Trend 4 - organization of a comfortable environment in which the generations X, Y and Z will be able to work together.

Xs (X) belong to the older generation. They are workaholics who are ready to solve the most complex projects, to deal with each problem in detail. Representatives of the Y generation are those who were born in the early 1980s, and of Z generation are those who were born after 1995. They are more individualistic, narcissistic, they are not interested in diving "deep", only the result is important.

They are not equal to anyone, unlike people of generation X. It is useless to compare them with others. A modern young man is indifferent to everything external and does not think that he should be like someone else.

Today, people of Y and Z generations in developed countries account for more than 70% of the total economically active population. As for their number in the staff of organizations: Ys account in average 30%, and the Zs are just starting to get a job [9]. Soon, the representatives of these generations will make up the bulk of the staff and it will be important to deal with them.

The worldview of the modern generation has its own characteristics, the main of which is the concept of freedom, that is, achieving the perfect balance between work and personal life.

Therefore, the companies need to create certain conditions, distribute the load between employees in such a way that a person does not spend at his workplace more than it was agreed.

Thus, one of the most important tasks of HR for several years to come is to ensure successful work and healthy climate in the team, by joining interests and approach to managing different generations. Therefore, it is necessary to introduce the H2H-approach - human to human (from person to person) in the company. Its hinge is that managers of all levels build human relations with employees. This does not mean that you need to indulge in everything. Managers and the company show that they value each employee, make it convenient and comfortable for everyone, but they are also expected to give good results.

5. Trend 5 – the forecast of employee behavior in the company and management of their performance.

People Analytics and Big Data are more relevant than ever. In personnel management, three tools which make it possible to study and compare information about employees are now in demand. HR Big Data - full data management.

Talent analytics is the analysis of the development of talent careers in the company. People analytics is the study of the qualitative composition of employees. By analyzing information in these areas, HR-specialists will receive data that will maximize the use of information about employees. These are demographic parameters, records about studies, appointments and promotion.

Having delved into this information, you can track the negative trends in HR processes in the early stages and quickly respond to them.

6. Trend 6 - Additional functions of HR specialists.

In order to keep pace with the market and respond to its requests, companies are forced to change quickly their business goals and diversify their activities. There are more and more tasks that arise from time to time. Keeping regular employees under them is not practical.

Therefore, the companies are increasingly outstaffing a part of the employees. Either they attract temporary employees, or they initially look sometimes for freelancers who perform specific tasks.

Let us imagine on Figure 3 the leading providers of digital HR services [7].

Fig. 3 : The leading providers of digital HR services in 2018

In 2018, SAP became the first company with a market share of 10% and revenue from HR-Digital products of $ 1.7 billion, which led to a jump in income from licenses, services and subscriptions by 19.8%. In 2017, Workday became the second ranking company, followed by ADP, Oracle and Linkedin (which is today a part of Microsoft) [3].

SAP has built one of the most popular ERP products in the history of enterprise applications with broad support from some of the largest companies in the world. Over the years, they have entrusted SAP with their complex business processes, which often include the use of internal systems that process everything from financial management to production planning. With the advent of cloud computing, these customers, including HSBC, Nestle, and Siemens, are following SAP as they transfer their internal systems to cloud services such as e-commerce, recruiting, sourcing, and more recently, vendor ERP [3].

Using its widely popular social network, LinkedIn has become a major force in the HR application on the market, offering more and more talent management products for recruiters and professional users.

LinkedIn enterprise solutions include the following six products: LinkedIn Recruiter, Job Slots, LinkedIn Referral Engine, LinkedIn Recruitment Media, LinkedIn Career Pages, and LinkedIn Talent Pipeline. All of them are closely integrated into their cloud platform, which serves the profiles of

more than 400 million people, as well as their daily interaction with each other, which at one time led to more than 109 billion page views per year [3].
Using nearly 65 years of outsourcing experience, ADP offers a wide range of HR solutions: salaries, taxes and benefits from a single source. The company serves more than 565,000 employers.

Since 2011, ADP has invested more than a billion dollars in acquisitions, as well as in internal developments to increase the volume of its HCM-offers (HCM-system, personnel system) - replicated or custom application software for automation of personnel management). In addition to its success in payroll services, ADP is expanding today in various segments of the HCM market with global solutions for recruiting, training, benefits and compensation calculating, productivity and succession planning.

Spark hire is a video stream platform and a good example of how various technologies are combined into one digital solution. Candidates can schedule their own interviews, conduct real-time interviews, and interviews can be easily accessed by other hiring managers for immediate feedback.

Access is a digital self-service company. Employees self-service (ESS) allows them to access and manage wage information, leave inquiries and other personnel information.

Impraise is a performance management tool that provides 21st century managers and employees with digital feedback.

Further on we are going to consider the examples of Russian companies:

1. Mirapolis is a Russian company that develops automated personnel management systems and their further technical support. The main solution is a platform for distance learning. However, in general, the company provides its customers with all types of HR solutions: from recruitment to planning and career development. Today, Mirapolis has more than 1.5 million users. The company's experts calculate the return on the project for customers during maximum 3 months.

Today, the users of Mirapolis services are: ECCO, Mail Group, Gazprom, Sberbank and other Russian companies [14].

2. IBS is an IT technology developer in Russia since 1992. Recently, it has become a developer of IT solutions for the personnel management sphere. HR departments of many companies use company services, which include digitalization of processes related to mass hiring, personnel analysis and training [15]. IBS clients are large Russian and foreign companies, such as: Rosatom, Gazprom, Sberbank, Aeroflot, Rosavtodor and others.
3. Ecopsy is a leading company of HR consulting on the Russian market. Ecopsy works in several areas, such as: staff training and assessment, staff development, and most importantly today - HR digitalization. The company's customers are: Coca Cola, Nestle, Heinz, OJSC Gazprom Neft, Castorama, Metro and others [14].
4. Seendex is a company which is primarily engaged in the development of B2B products for large businesses. The company introduces the following digital infrastructures:

– Seendex – Org is a tool for initial personnel analysis and assessment;

– Seendex – Human is used to assess with the help of a flexible approach the level of flexibility or agility of an employee;

– Seendex-team is a tool for assessing the agility of not one, but several employees – departments or project teams;

– Seendex – Network makes it possible to evaluate the organization as a whole.

In addition, the company includes other HR products: gamification and motivation, exchange of ideas, analytics, administration, security and access, integration.

Seendex customers are more than 150 companies in the world - Rosatom, Microsoft, Inditex, M. Video and others.

Conclusions

Summarizing the above stated, it should be noted that today there is an increase in HR trends, which are playing an important role in the formation of a business strategy for personnel management for the coming years. Among them, we can note the minimization of bureaucracy by automating the workflow system, introducing HR-Digital tools for analyzing and processing big data, simplifying some personnel functions and optimizing employee time to focus on more important tasks. Much attention is also paid to the development of human potential in view of the rapid transformation of the global economy and the development of personnel processes in relation to new generations of young people (Y and Z).

Social CRM as a Customer Engagement Approach in Social Media

PhD Katarzyna ŁUKASIK

Czestochowa University of Technology, Faculty of Management, Poland,
katarzyna.lukasik@wz.pcz.pl

Abstract

SCRM as a new approach connecting social media and customer relationship management, whose main goal is to engage customers and encourage them to talk so that they feel unique throughout the process of creating a business relationship with them. Therefore, the main goal of this article is to present the Social CRM potential in company environment and its impact on customer engagement and building relationships which are key important to the company's competitive position in contemporary realities. The conducted research were based on the literature review and empirical research. The material used for the analysis was collected on the basis of an online questionnaire, placed on a social networking site. The empirical research had an explorative character rather than descriptive due to the small research sample. The analysis showed that the awareness of the respondents about the actions taken to engage them is still very high, yet some area of SCRM solutions that require improvement in the opinion of the respondents. Therefore, the above subject requires further analysis.

Keywords: CRM, SCRM, Customer, Customer Engagement, Social Media

Introduction

The Social CRM (SCRM) concept indicate many different but important aspects in management of client engagement. Taking into consideration the modern lifestyle for the social customers and organizations is very essential to have opportunity creation of relationship follow in real time anytime and anywhere. The possibility of constant reactions permits the organization to manage their customers retention and acquisition them. It appears that presence in the social media is important in building open and honest relationship with customers and also to build competitive value, what have measurable influence on customers satisfaction and company reputation. The SCRM concept allows the organization building a network of the followers who promote company companies' products and services. They are the best promoters of goods, because they do it from their own beliefs. The followers can go shares on the users' experiences and recommendations. Features such as "likes", "shares" or "tweets" are very useful in creating social signals about which content is valuable and provide to visibility potential reach out to millions of Internet users. In comparison with other types of communication channels the social media allows to direct and immediate response capability on customers' needs, requirements, problems and complaints (Pilav-Velic et al., 2015). The automatization of the processes considerably optimizes time of operating procedures, increasing the effectiveness of activities and number of opportunities (Cerchia, 2015). From the company side the SCRM provides tools for brand monitoring and analysis which enable receive feedback on what users think about their products, services, client services and brand. The organizations have possibility to response immediate on the users feedback. Furthermore, in addition to tracking and influencing on attitudes of *opinion makers* and their followers, the organizations are continuous orientated toward customers and social media communication channels helps establishing a strong, positive and transparent relationship between customer and company (Pilav-Velic et al., 2015).

The SCRM enables better search engine positioning (Search Engine Optimization -SEO), what allows the organization to build brand image and increase credibility. What is more, it boost the brand recognition and sales. It worth to emphasis that sharing content through social media is free advertising and influence on companies' online visibility and promote organizations on top search engines such as Google, etc. Moreover, the SCRM allows use collected data and knowledge about customers obtain

based on reports and data which are include in one centralized system which provide many useful information after detailed analyze like users habits, their specific preferences, relations and the dynamic communication on social networks and identification of target groups of customers on various level of personalization and use them to appropriate categorize, which can be useful in future interactions to deliver what consumers expect, want and require (Baabdullah et al., 2018).

Nowadays, it`s absolutely necessary to appreciate the role of SCRM by that organizations. It shows that they listen to the voice of their customers, are interested they opinions, they solve customers` requests, they implement customers' recommendations and also are trying to improve the customer experience. The organizations have to start treating SCRM as useful tool which enable to conduct market research by collecting customers' details, identifying target groups, optimize campaigns and gives opportunity to rethink or improve their marketing strategies to meet their customers` requirements. Nevertheless, implementation of the SCRM certainly takes a lot of time and it is a long process which gives results in time and just from the beginning of implementation it implies employees from different departments. However, it is worth to implement such solution because SCRM allows to feedback and follow up, it generates reminders and helps the specific departments to schedule activity (Cerchia, 2015; Alt, Reinhold, 2012).

Literature Review

Social Customer Relationship Management (SCRM)-definition

In response to the problems related to the lack of possibility to obtain information from the client, the awareness of changes in their thinking and making purchase decisions and the lack of opportunities to create more attractive products, as well as the implementation of more effective marketing instruments which have impact on the market has appeared a modern concept of customer relationship management so called Social CRM (SCRM) (Sudolska, 2013).

The concept of the Social CRM is based on the traditional CRM strategy which indicate that CRM is a management philosophy on the basis of which companies' common goal can be achieved through identifying and satisfying defined and undefined customers' needs and wants (Masterman, Wood, 2006). The traditional CRM concept primarily focuses on customer retention, not just on getting new ones. What is more, it is vital to build a long-term relationship with clients and to gain loyalty through the brand's image and effective actions (Dyche, 2002).

SCRM is defined by Paul Greenberg as a philosophy and a business strategy, supported by a technology platform, business rules, processes, and social characteristics, designed to engage the customer in a collaborative conversation in order to provide mutually beneficial value in a trusted and transparent business environment (2010). According to a different definitions the SCRM is a new approach which connecting social media and customer relationship management which the main aim is engage customers and encourage them to conversation to make them feel as a key part of the entire business relationship (Yawised, Marshall, 2015).

It should be noted that the weaknesses of traditional CRM is the fact of one-way communication between the enterprise and clients and potential customers. This is a significant problem, because the lack of communication leads to the customer dissatisfaction, as well as the lack of feedbacks for the company about the products or services provided (Sudolska, 2013).

CRM and SCRM-Differences

The basic definition of traditional CRM is focuses on an operational, transactional approach to customer management that was focused around three key areas targeted the customer—sales, marketing and service and support (Greenberg, 2010). What is important, the CRM allows the company to effectively manage the customer in order to keep them purchasing a product or service (*Guide to*

Understanding Social CRM , 2010). The companies collect as much as it is possible date and information about customers in an attempt to get to "know" their clients and better target various customers (Palonka, Porębska-Miąc, 2012). The CRM relationships are more structured and revolve around traditional channels such as e-mail or call center. Although CRM has always been about the customer, however a collaborative relationship with the customer never existed and the customer was never actually a part of CRM. It is worth emphasizing that the thinking behind traditional CRM is inside-out - it means that the company creates products or services, marketing campaigns, decides about sales channels based on the data collected about customers and potential customers. It means that the traditional approach rely on the one-way communication between company and the customer and the goal is complete the transaction.

The SCRM approach is differ from CRM in few essential ways. With the increasing usage of new technologies and appearing new communication channels as world wide web and social media networks the customer expectations are higher than even before (Samer et al., 2010). The SCRM strategy is emerging as a approach to managing the dialogue, not the customer. Therefore, the main important change in SCRM approach is the addition and inclusion of the customer as a key component and foundation of SCRM.

SCRM assumes exchange of experiences continuously, not only between company and client, but primarily take place between customer and company and also from customer to customer (Sheykhlar, Shahbaz Keshvari, 2015). It is possible thanks to social network which offer dealing with conversations and building relationships with social customer. Drawing attention to customer is necessary because provides an effective result of conducting activities in all company departments. The company has the ability to build relationship with followers but also listen the customer needs and engage them to collaboration (https://searchcustomerexperience.techtarget.com/definition/social-CRM).

The SCRM is a pathway to potential customers, provides fast customer service through a consumer's preferred social media platform and enables customers to share their experiences others. The customer matters are no longer just support issues like was in traditional CRM approach but they are now also marketing and PR issues which has a very active role and is a part of SCRM (Malthouse et al., 2013). In the majority of organization, PR departments manage the social presence of brands and handle the customer engagement (Ang, 2011). In the Table 1 are presented crucial differences between traditional CRM and SCRM.

Table 1: Fundamental differences between the traditional CRM approach and Social CRM approach

	Traditional CRM	**Social CRM**
Context	• focus on individual relationship • messages are the value generators	• focus on collaborative relationships • conversations are the value generators
Channels	• single Customer View, based on the history of operations, stored in the internal information systems	• this single view is harder to achieve, since it includes the need to complement the information residing in internal systems with profile information and behavior in social networks
Processes	• customer service processes developed from the institution's standpoint • process-focused: To adapt and optimize processes to support interactions and transitions with the customers	• customer service processes developed from the customer's standpoint • conversation-focused: To include the "conversation" factor in order to establish in institution community, capture the new ideas and improve segmentation • it requires the generation of dynamic processes that provide the institution with capability of reaction towards organization what has been identified in social networks
Organization	• innovation comes from one specialized source within the entity (innovation team)	• innovation is gathered from all the employees that are closely connected with the end customer and among them via Web 2.0 tools

	• frontline employees communicate the targeted messages for transactional operations	• new skills and roles are required oriented at behavioral and Sentiment Analysis. • these roles require the analysis of information and feedback to the sector involved or immersed in the conversations in social networks • customers are in the center of the innovation cycle
Technology	• CRM solutions focused on automating and supporting internal business processes	• capture of network information in order to know the customer in his social milieu. • need to include Social Networks tools, both created and managed by third parties, which interact with CRM solutions and meet with existing security standards and regulations in each country
Communication image and brand reputation	• massive face-to-face client communications depending on business needs • segmented direct communications from the analysis of structured information • image and reputation analysis from traditional market research	• communication designed and supervised on the basis of the analysis of structured information involving the "social" traits of the client • image and reputation analysis from metrics accounting for number of followers, type of comment or impressions and influence on the Networks • need to establish communication in times of crisis or unexpected circumstances requiring timely and wise reactions

Source: own research based on: CRM 2.0 or Social CRM for Financial Industry, http://www.deloitte.com/assets/DcomCroatia/Local%20Assets/Documents/2012/FSINews03.02-Social_CRM.pdf, accessed 01.09.2019 [reviewed on January 20th, 2019]

Customer Engagement in Social Media

Customer engagement has been defined by many scientists and business practitioners but there is no still clear definition and there is a lack of consensus regarding the conceptualization of this emerging concept. According to Bowden customer engagement is presented as a psychological process that models the underlying mechanism by which new customers and regular customers become more and more loyalty towards a brand by developing mechanisms for new customers and maintaining for existing customers through repeat purchase (Bowden, 2009).

Hollebeek defines the customer engagement as "consumers' proactive contributions in co-creating their personalized experiences and perceived value with organizations through active, explicit, and ongoing dialogue and interactions" (2011). This concept definition of customer brand engagement indicate that for customer engagement very important is interactions between customers and brand, levels of cognitive and emotional and behavioral activity. Emotional activities link with individual's pride and inspiration. Whereas behavioral activity reflects individual's interaction in different forms on various levels with the brand and engagement positively make for customer's loyalty towards a brand.

Higgins and Scholer present the concept of customer engagement that recognize that individuals can be engaged on different levels, the more engaged they are the more intensive their experience will be. If a customer experiences negative engagement with the brand, the intensity of the negative experience is proportional to the level of involvement and engagement. On the other hand, a customer will have more positive experience as a result of more engagement. Thus, customer engagement consists of both positive (e.g. attraction) and negative (e.g. repulsion) elements of engagement (2009).

In 2013 Brodie proposed the dynamic conceptual model of the consumer engagement process in the online brand community. He created following definition: "Consumer engagement in a virtual brand community involves specific interactive experiences between consumers and the brand, and/or other members of the community. Consumer engagement is a context dependent, psychological state characterized by fluctuating intensity levels that occur within dynamic, iterative engagement processes.

Consumer engagement is a multidimensional concept comprising cognitive, emotional, and/or behavioral dimensions, and plays a central role in the process of relational exchange, where other relational concepts are engagement antecedents and/or consequences in iterative engagement processes within the brand community" (Poor Rezaei, Heinze, 2014). He also distinguish five dimensions of customer engagement behavioral sub-processes in online brand communities: learning, sharing, advocating, socializing and co-developing.

The first sub-process of customer engagement is *learning* characterises the vicarious acquisition of cognitive competencies that consumer apply to purchase and consumption decision-making (Brodie et.al, 2013; Poor Rezaei, Heinze, 2014). In this stage, customers share their questions with others to be informed about their issue by other customers.

The other sub-process of customer engagement is known as *sharing* stage. It includes the sharing of personal relevant information, knowledge and experiences through the process of active contributions to the co-creation of knowledge within the online community (Poorrezaei, 2016). The behavioral and cognitive dimension of customer engagement is reflected in this stage.

When customers actively encourage other members to buy a specific brand and recommend a service or product to them, this is known as the *advocating* stage. Brodie et al. suggest that advocating is an expression of customer engagement. This dimension includes the degree to which a community member wants to express the brand recommendation through engagement in the online brand community.

Socializing is the third dimensions of customer engagement in the online brand and community which is defined by Brodie et al. as two-way, non-functional interaction through which customers acquire and/or develop attitudes, norm and/or community language (2014). The degree to which a community member is interested in communicating and talking with other community members is reflected through the socializing dimension.

The last one dimension of customer engagement in online brand communities is *co-developing*, which is defined as a process where customers contribute to organizations and/or organizational performance by assisting in the development of new products, services, brand or brand meaning (Poorrezaei, 2016).

Social media has revolutionized customer engagement. Companies can engage in a wide variety of social media platforms to attract customer attention and build awareness to increase revenue or customer loyalty. The growing number of users of online platforms encourages companies to actively engage in social media. The huge scale of the reach of customers of these platforms promises countless possibilities if it is successfully implemented.

Customer Engagement Approach in SCRM

According to review of literature there can be distinguished four key constructs of customer engagement with SCRM: communication with customers, engaging in online customer communities, management of online customer communities, and mobile technology usage. Communication with customers is possible due the social media technologies to create spheres for interaction between the customer and the businesses. The recent developments of the social media technologies, enables to post opinions and discussions on blog sites, forum boards, and discussion websites, add their feedback and reviews, what indicates of engagement in online communities by users. It requires that companies have to create a strategy plan and proactive actions and control of activities in the online communities. Lack of proper management online community engagements may lead to negative word-of-mouth being spread in an uncontrolled pattern with the social media (Harrigan, Choudhury, 2012; Goldenberg, 2015). Through the dimension for customer engagement may be interpreted amount of the mobile technologies users, because thanks to smart phones they can browsing the internet and access to social networking websites like Facebook, YouTube all time.

The customer engagement in SCRM is achieved through customer relationships orientation, communication with customers and management of online customers through social media, mobile technologies and web-site usage. Customer relationship orientation includes dimensions such as perceived ease of use, perceived usefulness and attitudes towards use of SCRM. Other factors important for social media adoption are infrastructure for using social media, social influence and experience of using social media. It is likely that these factors also influence the readiness and attitude of customers towards Social CRM. The relational information processes include analysis of customer characteristics through customer transactions and activity analysis. The final outcome can leads to increased levels of trust, loyalty, co-creation and customer empowerment. Companies aiming to use SCRM need to be aware of the target group characteristics regarding degree of social media access (Paliouras, Siakas, 2017; Harrigan, Choudhury, 2012).

Analysis of The Customer Engagement in Social Media

Research Methodology

The purpose of the research is to present and evaluate customer engagement in social media in the context of SCRM. The material used for the analysis was collected on the basis of an online questionnaire placed on a social networking site. The survey was received by 74 random respondents. The condition for its fulfillment was the use of social media and entering online interaction with the selected company when making a purchase transaction or permanent use of the services of the selected (preferred by the customer) company. The research technique used in the online survey allowed for direct acquisition of information and opinions of respondents on the subject. The empirical research had an explorative character due to the small research sample.

The survey was conducted on a group of 74 respondents: 54 women, 20 men. The respondents were divided into 4 age groups from 18 to 25 (36%), from 26 to 35 (46%), from 36 to 45 (15%) and from 46 to 55 and more (3%). The questions focused on customer engagement in social media and how companies use they SCRM to build the relationships with client. It is commonly believed that women are more likely to get engaged on activities on social networks than men. Based on the survey, it can be stated that as many as 73% of women engage in social media on brand profiles. Nonetheless, the study showed that men (27%) also engaged in brand profiles in social media, but definitely less often than women. The most frequently mentioned companies, whose services or products are usually used by the respondents, include companies from the clothing (46%), cosmetics (25%) and catering (29%) sectors.

Analysis

People are aware of the purpose of the activities carried out by brands on social media profiles. The company's presence in social media is a key factor in the brand's existence on the market. By conducting activities encouraging interaction, the brand becomes more competitive. Often, such activities do not require too much financial resources, and thanks to them, the company lets you get to know each other better and builds a relationship with followers. On the other hand, other users can learn about the existence of the brand, observe the profile, and also become customers. Publish content should always be consistent with the brand strategy, because it influence on the perception of the brand by customers and affects the brand image and recognition.

Fig. 1: Forms of communication in social media

Source: Own study

In the first question respondents were asked about their favorite form of communication in social media (fig.1). The respondents opinions are divided, it cannot be clearly indicated which forms of communication in social media the most engage users. Respondents said that the most engagement in social media is contest (27%). On the second place is posts and thus brand content (24%). The 22% of respondents thought that videos about the presentation of new products or offers are engaging. According to the respondents, advertising and live video turned out to be the least engaging form in social media.

In the next question, as the respondents have indicated, the most influential factors in their purchasing decisions are (fig. 2): attractive prices (17%), high quality products (16%), a wide range of products (12%) as well as order completion and delivery time (13%).

Fig. 2: Factors influence on purchasing decisions of the respondents

Source: Own study

Customers want to buy high-quality products at an affordable price. Only 10% of respondents considered that customer service is important to them, although it may seem that it is one of the most important factors when making decisions about purchasing products. Free delivery and the possibility of free returns was considered an important factor only by 9% of respondents. Based on the results of the survey, it can also be concluded that for customers the brand prestige and additional discount codes are not significant.

In the next question respondents were asked about: do the appearing sponsored ads/posts encourage them to visit the brand/fanpage profile or take advantage of the prepared offer? Appearing sponsored ads or posts only in 18% of respondents bring the intended goal. Over half of the respondents, as much as 64%, only visit the brand's website or fanpage sometimes, or use the prepared offer. It means that the content presented does not always influence on the behavior of the target group. Only 19% of respondents answered 'No'. It means that appearing content does not influence on consumer behavior. Perhaps, this is due to the improper conducting of the marketing campaign or inadequacy content to the age group.

What is worth to mansion, surveyed customers have replied that they only occasionally receive information about new products or discounts (68%). In contrast, 32% said they always receive information. The difference in respondents' answers may be due to the fact that not all customers are subscribed to the newsletter, so they do not always receive up-to-date information about new products or the mentioned discounts. This situation can be caused by too frequent messages sent to customers , so that is reason why they are reluctant to subscribe to the mailing list. On the other hand, if customers are subscribed to the newsletter and receive too many emails, they consider to be spam and in most cases do not read the message.

The respondents were also asked about how often the company offers discounts or discount codes. The highest percentage received the answer "only on celebrate holidays or special occasions for the brand" (42%). It means that in case when the company want to increase sales of products before the holiday periods or in the event of important moments in the brand's activity, e.g. anniversary, finished projects offers customers discounts that are to encourage them to buy products. Considering the loyalty program, in which customers can receive additional discounts for last orders or reviews about products it can be assumed that 38% of respondents receive an additional discount every month because they make purchases quite often, while the others make purchase rather rarely and receive discounts every 2 months.

Fig. 3: Using promotions or discounts

Source: Own study

Based on the above data (fig.3), it can be concluded that the majority of respondents only use the promotions and discounts offered by the company from time to time. It is probably results of their economic situation and needs. A minority part of respondents (25%) often use discounts and promotions - perhaps they are people who are impressionable to marketing activities carried out by the brand, aimed at encouraging customers to place orders more often. 12% of respondents rarely use the promotion, and 3% do not use it at all. It means that respondents place orders when they need something and do not wait for promotional opportunities. What is more the majority part of respondents 72% are encouraged by the company with additional discounts by subscribing to the newsletter. 28% of respondents were not encouraged to subscribe to the newsletter through additional discounts. Perhaps the amount of discounts offered for this group of respondents is not favorable.

When it comes to expressing opinions about the purchased product, respondents in over 70% responded "Yes". It means that the brand takes into account the opinions of the customers. On the one hand, it is an excellent source of information about customer satisfaction with purchased products and on the other hand, customers feel valued by being able to express their views and more often they are eager to engagement to such activities. The vast minority of respondents (27%) replied that they were not asked to express their views. This situation may also result from the lack of a loyal customer account or not subscribing to the mailing list, because the company usually asks for opinions in that ways. Sometimes it happens that they put a post in which users are asked for opinions on the products selected by the brand but necessarily about products those that the respondent bought. In addition, adding the posts with the possibility to add comment with opinion about the products is quite risky, because in the case of a large number of negative reviews, it influence on the perception of the brand by other customers.

Fig. 4: Frequency of expressing opinions in posts about product or service

Source: Own study

Only 1% of respondents always express their opinion in comment under the posts on brand profiles, and only 11% add opinions "Often". However, as many as 20% of respondents declared that they never add their opinion. Despite the request, over 40% percent of respondents interact with the "Rarely" brand. Other respondents express their views from time to time (27%). Take into consideration, this question, it can be seen how difficult it is to engage customers and receive feedback from them. It can be assumed that users rarely respond to this type of marketing activity, because they prefer to remain anonymous on the web and are afraid of other users' reaction to their comment, and they are aware that their friends can see it.

In other question respondents were asked about frequency of visiting the profile/fan page of their favorite brand (fig. 5).

Fig. 5: Frequency of visiting the profile / fan page of your favorite brand

Source: Own study

As can be observed, more than half (68%) of the respondents indicated that they only visit the company profile when they see a new post or sponsored ad on the wall. The rest of respondents visit the profile every 2 weeks or often. Certainly these are people who follow the brand's activities on social media and want to be always up to date with emerging news.

Fig. 6: The content presented by brand

Source: Own study

Take into account the above data (fig.6), it can be seen that the respondents' feelings are as the follows: 9% of respondents said that the content involved are substantive, this result indicates that the brand

should improve the quality of the content posted. Importantly, only 10% of respondents answered whether the content is fun or serious (1%). Based on the small number of responses provided, it is difficult to interpret the above data. We can only assume that most of the content is "funny". The presented content is encouraging to read (25%), contain graphics (28%), and descriptions are short (21%).

The companies also use the options of adding live video to engage customers - indicated 74% of respondents. Users, thanks to this form of communication, can view the video and respond immediately, thanks to the option of adding comments. This is one of the most used forms of communication and engaging clients in brand activity in social media. The downside of this form of communication is the ability to view recordings only for 24 hours, after which they are removed but if the brand would like save the video it is possible thanks to add to stories on the brand profile. Perhaps 26% of respondents have never seen the video life before, or they do not have an updated application that allows to see these relations.

The analysis of the last question shows that there are still some areas of SCRM service (in the respondents' opinion) that require improvement, e.g. almost 55% of responses show that the company (using the services / products it uses) does not answer the submitted questions. 45% of respondents declared that they do not always receive answers to posted comments or questions.

Conclusions

The above analysis of data has shown that the respondents' awareness of the activities carried out to engage them is very high. Nevertheless, the engagement of clients in social media is a challenge for the analyzed companies, because they are still some area in their SCRM solutions which need to be improved. Therefore, the above subject requires further analysis. It would be worth for the company to get to know clients better and adapt the engaging activities to their needs, because as the research shows users often are not interested despite incentives. In addition, the company should draw special attention to the form in which the brand communicates with customers, because they are very often uninformed, perhaps this is due to the form or method of communication that does not reach the recipients. All actions aimed at improving the efficiency of customer engaging activities should be implemented to improve the company's image and opportunities for further development.

The SCRM provide more relevant information for sales and marketing teams because they can collect more confident information about users and customers take into account integral view of customers and communication enabled through online conversation and digital channels such as website visits, Internet searches, e-mail, mobile activities, etc. and existing SCRM activity history. The organizations planning, implementing and evaluating marketing campaigns, through SCRM activities task and marketing budgets can be planned and followed up for each activity. Marketing staff can meet potential customers at their point of need, and engage much earlier in the buying process by leveraging real-time listening and monitoring of social media activities. Marketers can better control the effectiveness of their marketing and communication efforts to their customers and prospects. They can compare different types of social media channels, forums and communities in order to statement which are the most effective in generating positive word of mouth and in the result desirable actions on an organization’s website or on other digital channels. It is helpful in calculation the ROI of their content marketing and outreach efforts by connecting associated social media activities to website traffic, downloads, sales, or other desired actions. Additionally, the direct communication with product teams create added value. Product development staff have ability to collaboration with customers and prospects throughout the development phases in from the initial generation of ideas, design, prototyping and testing products or services or modified them. Thanks to it they know the users experiences and thought. It increase considerably customers' satisfaction, advocacy, engagement and loyalty. What is more, it can drive down costs and deliver significant advocacy and positive marketplace word of mouth.

Abstract

The article presents the use of ERP/MES systems in the environment of smart devices of the fourth industrial revolution. The analysis of literature sources concerning the examined subject matter was carried out in the paper as well as the practical example of the integration of the presented software with the technologies of Industry 4.0 was depicted. The research objective was to analyze and assess the impact of the integration of ERP/MES information systems with the devices of Industry 4.0 on the growth in the performance of the cyber-physical system. The case study was conducted based on the research materials shared by the company manufacturing machinery and equipment for the polymer processing industry, i.e. Wittmann Battenfeld, applying intelligent solutions for Industry 4.0.

Keywords: ERP, MES, Industry 4.0, Big Data,

Introduction

The emergence of a new digital industrial technology, commonly known as Industry 4.0, was first launched at trade fairs in Hannover in 2011. This revolutionary breakthrough has brought huge changes in the processes of production, consumption and supplies. Due to modern machinery and equipment, which increasingly require less workforce and operate independently of humans, technological production processes have become intelligent and self-contained systems (Görçün, 2018). They enable horizontal and vertical connection of people, machinery and objects via the Internet in real-time and information and communication technologies allow for dynamic management of complex business processes (Bauer, Hämmerle, Schlund, Vocke, 2015). Researchers and practitioners express different opinions on which components make up Industry 4.0, which relationships they enter and where they are applied in Industry 4.0. Moreover, the research indicates that few practitioners are able to provide a specific definition of Industry 4.0 (Heng, 2014), some even deny the value added by Industry 4.0. and state that, as a concept, it is ill-defined and suffers from unrealistic expectations, and others claim that fully digitized products and value chains are still "pipe dreams" for some (Davies, 2015). Nevertheless, the components of Industry 4.0 are basically Big Data, autonomous robots, augmented reality, additive manufacturing, cybersecurity, Internet of Things, operating on the principle of integration and simulation in the cyber-environment (Liao, Deschamps, Loures, Ramos, 2017). It is also reasonable to combine the above components of Industry 4.0 with ERP (Enterprise Resource Planning)/MES (Manufacturing Execution System) systems used in enterprises. Obviously, it would be easy to assume that Industry 4.0 solutions will replace the above systems, however, on closer examination, the existence of synergy is noticeable, indicating the potential of a strong partnership between them. Indeed, Industry 4.0 may increase the likelihood of spreading equipment in production companies due to the inherent capacities of most ERP/MES systems. Many of these systems have already had and are still establishing communication with IoT in their contents. While relating to the statements by some scientists – the vision of Industry 4.0 is to create a highly integrated global network

where machinery, equipment, entire factories, warehouses are connected via the Cyber-Physical System and the use of artificial intelligence allows machinery to adapt to various circumstances and conditions (Gilchrist, 2016).

Literature Review

The last industrial revolution, known as Industry 4.0, is perceived as a comprehensive integrated system of two worlds connected with each other, real and virtual, to increase the efficiency of operational and technological activities. In the literature exploring the issue of Industry 4.0, there is no clear definition of what Industry 4.0 is. The most common definitions indicate that it is a holistic system of information technologies, people, machinery and equipment which enable the flow of goods, services and data in a controlled manner through the value chain, with operations with a high degree of autonomy and a high capacity to transfer useful information for decision-making (Dombrowski and Wagner 2014; Hermann et al., 2016; Mazak and Huemer 2015; Qin et al., 2016; Wolter et all., 2015; Botthof 2015). Therefore, the basis for the operation of Industry 4.0 is intelligent manufacturing; its main technologies include the Internet of Things (IoT), Cyber-Physical System (CPS), the cloud, artificial intelligence (AI) etc., which integrate production resources with sensors, cloud computing, communication technology, control, simulation, intensive data modelling and predictive engineering (Kovács, 2017b; Nagy et al., 2018; OECD 2016; Kinsy et al., 2011; Bahrin et al., 2016; Lee et. al., 2015), e.g. cyber-physical systems use Information and Communication Technology (ICT) to monitor and control physical processes and systems through built-in sensors, intelligent robots. Industry 4.0 is wireless and Internet technologies which are used to connect machines, products, systems and humans, both within the production plant and suppliers and distributors and provide an opportunity to collect vast amounts of data to analyze and use them directly to improve work in the production hall or through the analysis of Big Data and their cloud computing – for access for other entities.

The analysis of literature sources concerning the examined subject matter was carried out in the paper as well as the practical example of the integration of the presented software with the technologies of Industry 4.0 was depicted. The research objective was to analyze and assess the impact of the integration of ERP/MES information systems with the devices of Industry 4.0 on the growth in the performance of the cyber-physical system.

Industry 4.0 – new generation prospects for information systems

Smart Factories require the ability to predict machine failure and to remove the root cause of problems. As an example, SAP has developed a comprehensive framework for predictive maintenance which is able to integrate different diagnostic and prognostic models for the wear of equipment (Zacharewicz, et al., 2017). Among key technologies that contribute to the implementation of the concept of Industry 4.0 is the analysis of Big Data.

Big-Data, which is collected from ERP systems, sensors, statistics and social media, is processed and modelled in order to provide sufficient and useful visual information that can be used for different qualitative purposes, for example, historical data on customer behavior could be used to improve production flow charts to support the changing demand and to ensure balance with other production flow charts. Moreover, Big-Data can be used to develop models of artificial intelligence to ensure the ability of the machinery to make an immediate decision in the production hall; Big-Data can also warn operators in terms of recommended operations, such as predictive maintenance or better production arrangements.

Information is streamed from end customers and markets to Big Data, where it is analyzed and transmitted to production systems as production orders including instructions, quality and size specifications. The production system will automatically transfer the received orders from ERP to CPS to suggest optimum production flow charts in which process relocation may take place, based on new production orders. During production, sensors transmit data to Big Data and ERP systems; these data include material orders, maintenance orders, quality reports in the course of the process and analysis of production. Any immediate changes occurring during production (e.g. detected manufacturing

defects or machine failure) will be analyzed immediately and responses will be automatically sent to the relevant parties.

From the point of view of quality management, in the course of the process, sensors and quality control equipment will send information in real time to the global system of Big Data and locally, at the level of intelligent machinery, which will be able to analyze and adequately take right decisions in order to avoid defects, the system failure or downtime. The production system may communicate with ERP and CPS in order to analyze production flow charts, define production priorities and level resources. Quality control in real time will help ensure that qualitative requirements are met and any reasons for defects or production failures will be eliminated.

ERP/MES – the role of the systems in the era of Industry 4.0.

The combination of the world of production machinery with the world of information technology is possible, among others, due to ERP and MES systems. ERP allows for management of the company and MES is the link between the world of machines and business systems. ERP systems were initiated as integrators of the flow of information coming from various functional units of the same company. While implementing the ERP system, enterprises expect increased performance, access to information and efficiency of management in the decision-making process (Pellerin et al., 2007). Therefore, the challenge associated with management of data, their transformation into knowledge and making intelligent, automated decisions has attracted a lot of attention in recent years. At the same time, an opportunity to integrate many different devices and new services with the existing systems, e.g. ERP, MES has become important (Theorin et al., 2016). Most industrial companies have already benefited from advanced IT systems (Dai et al., 2012), however, many lack essential aspects simplifying integration.

In order to meet market requirements, ERP has undergone multiple modifications in the last 3 decades in order to improve the use of this system (Fig. 1).

Fig. 1 : Evolution of the ERP system

Source: Own study based on Lech P. (2003): Zintegrowane systemy zarządzania ERP/ERP II, Wykorzystanie w biznesie, wdrażanie. Difin, Warszawa 2003.; Parys T. (2008), System ERP III przykładem zintegrowanego systemu informatycznego ery mobilnej komunikacji, [in:] Innowacje w Zarządzaniu i Inżynierii Produkcji, Ryszard Knosala (ed.), Wyd. PTZP, Opole 2008.

From the point of view of IT, management can be interpreted as the processing of information. An efficient flow of information is the essence of the operation of contemporary enterprises, therefore, there is a growing need for an increasingly closer connection between IT and manufacturing systems. An ideal consequence of such a desideratum is the change in the substantive status of the production system so that it generates, possibly automatically, the database transaction in the combined computer system. ERP systems should integrate with Big Data and they have already done (Bi, Cochran, 2014)

in order to take into account not only structured data but also data which are semi-structured or unstructured. ERP and Big Data are already increasingly integrated and interoperable. Sustainability and flexibility in the constantly changing environment is the requirement of the new generation EIS (i.e. NGEIS) (Chofreh et al., 2014; Elragal, 2017; Lazaro, Gonzalez, and Sola, 2015; Panetto et al., 2016; Zacharewicz et al., 2017). Full implementation of the relationships described constantly imposes new IT requirements on ERP or MES.

The MES system provides common interface of the user and the data management system and the concept of this system has arisen due to the need of the production company to meet the requirements of markets in terms of reactivity, quality, standard compliance, cost reduction and deadlines (Ugarte, Artiba and Pellerin, 2009).

Both ERP and MES systems are to perform a very important role in each production plant. In view of new business requirements, the range of use of ERP has significantly increased in recent years, going beyond the boundaries of a single company for contact with others (Møller, 2005); the scope of MES is also growing, including supplies, planning and business functions of the production plant. In practice, the use of only one of the above solutions is impossible since these are not substitutable solutions but complementary. It should also be remembered that ERP does not perform tasks closely linked to production processes (Møller, 2019). These are tools for settlements and general management of the company's assets, but they do not actually support decision-making in terms of production optimization. Even the modules provided, dedicated to the production area, will not be able to visualize the process properly and directly connect to the machine park. ERP systems are undoubtedly the IT basis for contemporary enterprises, but they cannot be treated as comprehensive solutions that support complete business activities. The ERP system is not able to provide the three key capabilities of MES systems, dedicated specifically to production (https://queris.pl/...):

- Reflection of the whole production process – the function performed by the MES system, which supports decisions on improvement in performance at the specific place, the moment of the entire process. It allows for accurate identification of the problems affecting the low value of Overall Equipment Effectiveness (OEE) and taking effective actions to remove them.
- Direct connection with machinery – MES systems are integrated directly with the machine park and collect data directly from machinery and equipment. ERP systems are not integrated with equipment and the machine park.
- Data visualization in real time – is the result of the aforementioned connection of the IT system with the machine. Thus, the data are reliable and up-to-date at all times (real-time update). It is one of the characteristics of MES systems, which makes them an indispensable tool in collecting data on manufacturing processes.

Organizations should specify their business requirements well so that they could rationally select the software which helps automate key business processes adequately to the needs. The ERP software is now used by most organizations, regardless of their size. ERP "manages the whole organization", but production is not a part of its modules. In turn, MES primarily focuses on production functions, therefore, its integration with the machine park is so important so that it would be possible to freely manage departments in the production hall. Therefore, the MES system is used to monitor and generate documentation of the whole production cycle of the product itself, from the raw material to the finished product. The MES system provides information in real time, which supports decision-making in order to streamline production processes and enables the control of all the components of the production process (Kletti, 2007; Meyer, Fuchs and Thiel, 2009).

ERP/MES – the role of the systems in the production process in Industry 4.0 on the example of the polymer processing plant

Research Methodology

To conduct the research, a case study was used, developed due to the information shared by the company manufacturing machinery and equipment for the polymer processing industry, in which intelligent solutions of Industry 4.0 are applied. The data for the research were transmitted via direct contact and e-mail from the Wittmann Battenfeld company, which is one of the leading manufacturers of robots and peripheral equipment for the plastics worldwide. The research was conducted on the basis of information and materials provided by the top level manager of Wittmann Battenfeld Poland. The received materials were analyzed by the authors of the article in December 2019. The construction of the research instrument has been created in one step data collection.

Research Results

Management of the production process is no longer an isolated operation, this process is becoming a complex issue inextricably linked to technology, material, machinery and production equipment. The process is also extremely strongly related to the acquisition and management of the vast amount of data obtained from individual stages of the production process and management of its various stages.

ERP/MES systems are particularly widely used in the polymer processing industry. This branch of industry has become extremely interdisciplinary and combines the issues in the field of material engineering, mechanics, fundamentals of machine design and complex processing tools (injection molds, extrusion heads etc.), processing technologies, metrology, IT, measuring systems and broadly understood quality control.

Polymer materials have been effectively displacing the applied engineering materials (and not only) existing in the market for many years. They are used in every area of life, starting with the food industry, through the aerospace industry and ending with the medical industry. However, regardless of the industry in which these materials are used, the same principles and management systems apply.

The diagram of the process of using the ERP system in the process of management of the plastic processing industrial plant is presented in Figure 2. The system is oriented to the customer, it flexibly and quickly adapts to changes and new requirements at each level of management. Due to open communication channels, not only the control but also changes in the technological process and the properties of the finished product can be controlled at the level of the production machine and the cooperating devices (just after the change in production assumptions). The systems of this class can be divided into several levels (Fig. 2).

Figure 2: Integration of Industry 4.0 technologies in the value chain
Source: Own study based on the materials by Wittmann Battenfeld

The system is based on the chain of suppliers (this applies to primary materials supplied to the production process, secondary materials – regrinds, regranulates and semi-finished products, also the ones which are not made of polymers). Another link is the technological process of processing the materials and semi-finished products supplied. Each stage of this process is monitored and supervised and various devices are connected to the industrial network and subsequently to the corporate network enabling their management, storage and subsequent analysis (with the possibility to relate to these data in the future if it is necessary to reconstruct the history of the selected detail – the data include information concerning not only the production process or the device used but also the material type and accurate information on the specific batch with the information on the operator and the person controlling the quality and approving the detail).

All the devices taking place in the production process (in this case, the example of the injection molding plant, plastic processing plant, with the activity based on thermoplastic plastic injection technology is analyzed), i.e. an injection molding machine or machines, peripheral devices, such as manipulators, drying, conveying and packaging equipment communicate with the processing machine itself or the server including performance data through appropriate interface (some controllers of the selected peripheral or processing devices are still programmed manually and communicate with the injection molding machine only via the EUROMAP interface – however, innovative and modern injection molding plants, in order to gain control over the process and minimize volatility factors, introduce solutions enabling the connection of various devices to the network and their management).

This system is also and primarily based on the customer requirements, related to the condition of the market, behavior of final customers and variability of their behavior.

Another layer, linked to all the other layers of the management system is the physical IT layer, containing physical data carriers, covering servers and other information storage or processing systems.

The top layer is the management layer and the ERP/MES system interface which the end user has access to. It is only from this level that the tools and capabilities introduced by the systems of this class can be used, including solutions enabling dealing with Big Data and comprehensive solutions allowing for cloud computing (in the case of these systems, the attention should be drawn to two surprising

opportunities – the first is the simulation of cloud computing and the second is the adaptation of augmented reality in the construction and maintenance of machinery and processing equipment – both factors will be discussed in the subsequent part of the article).

The most important factor responsible for the correct course of the entire ERP/MES system is multi-level communication and exchange of information. Communication protocols between basic processing cell devices (driers, manipulators, feeders, transporters, etc.) and machinery (injection molding machines, extruders) are responsible for the success of the project. Another level is communication between various processing cells (if the organization is large enough, communication is developed at a higher level, between various locations - factories).

It should be noted that it is rare for plastic processors to possess machinery and equipment coming from one manufacturer and thus possessing the same communication protocols. The dominant situation in the broadly understood polymer processing industry is the one in which even global industrial plants, depending on the area, use machinery and equipment of various manufacturers. The downside of this image is the fact that these devices have different types of ports and communication protocols which impede their control and management and data acquisition.

Modern solutions introduce the unification of communication solutions ensuring compliance with protocols and communication interfaces used so far (this allows for maintaining full functionality of older devices without the need for costly replacement of the machine park). Such standardized interfaces enable fast and easy implementation of ERP/MES systems and Industry 4.0 solutions. Industrial networks applied currently receive new functionality and greater opportunities for the operation of new technological devices as well as transmission of larger amount of data.

The basic manufacturing cell of a typical polymer processing plant is presented in Figure 3. The primary device is the injection molding machine (depending on the demand, the devices of this type differ only in terms of the driving unit – there are hydraulic, electric and hybrid devices) equipped with the controller and a range of communication ports, including the solution allowing for communication with the industrial network. The machine itself and its communication protocols are so versatile that they enable the connection of a number of peripheral devices and appropriate communication with them.

Fig. 3: The basic processing cell: the injection molding machine along with peripheral devices and communication solutions

Source: Own study based on the materials by Wittmann Battenfeld

Individual processing cells and even industrial networks connect to each other and enable the exchange of information or control of individual machines and equipment. The diagram of the mode of communication at the level higher than the processing cell is presented in Figure 4.

Fig. 4: The diagram of the communication of cells and networks with the ERP/MES interface
Source: Own study based on the materials by Wittmann Battenfeld

Individual cells or entire networks provide information to ERP systems using communication protocols, which leads to their transparency, easy data acquisition, rapid and flexible management and implementation of production changes on-line.

An intermediate platform between industrial networks and end-users can be, among others, the TEMI platform supplied by Wittmann Battenfeld for minimizing the downtime of machinery and production equipment and thus maximizing production capacity (Fig. 5). This solution allows for rapid and barrier-free exchange of information while simultaneously ensuring security of the information provided.

Fig. 5: The use of the TEMI intermediate platform for communication between the industrial network and the end-user.
Source: Own study based on the materials by Wittmann Battenfeld

Another aspect of ERP/MES systems is an opportunity to use two tools which are cloud computing and an opportunity to adapt augmented reality at different stages of the production process (construction of machinery and equipment, their maintenance, advanced training).

Cloud computing may be used for work with large files, databases, for statistical processing of the obtained (process, product, quality) data in order to predict trends and establish the development strategy based on actual data received from individual devices and on the basis of the customer requirements. Moreover, cloud computing capabilities can be used to perform advanced numerical calculations. This work can be done in order to build CAD models of the future products manufactured in the company, to conduct analyses aimed at determining their mechanical properties as well as to implement advanced numerical calculations aimed at the simulation of actual technological processes (simulations of the injection molding process to determine the mode and time of filling the molding cavity or cavities, distribution of temperature, pressure, fillers, deformation of the injection mold and many other factors which the user may wish to analyze prior to the tool manufacture and implementation of the detail/details for mass production).

One of the most recognizable tools is the MOLDFLOW package. The exemplary results of the calculations are presented in Figure 6.

Fig. 6: Numerical calculations made using the advanced simulation software in the cloud (as an example of calculations carried out with the use of the MOLDFLOW – AUTODESK software)

Source: Own study based on the materials by Wittmann Battenfeld

In the user layer, it is possible to analyze the results obtained in the course of calculations, which not only accelerates the production process from the moment of the design of the molding but also leads to cost reduction and the possibility of generating errors (which are also the source of significant costs).

Fig. 7: Augmented reality systems.

Source: Own study based on the materials by Wittmann Battenfeld

Systems supporting management and the technological process through IT support and augmented reality in the area of the maintenance of machinery and equipment, training and logistics service (in terms of the amount of the space occupied in the hall and management of the available production space) – Figure 7.

Augmented reality in ERP/MES systems can be used for even better distribution of technical data, in particular concerning the construction of machinery and equipment used in industrial plants. The solutions primarily promoted by the Siemens company allow for a virtual journey to the interior of selected production equipment in terms of both the design and usability and training (at the stage of the operation of the device).

A virtual model of the injection mold (detail), machinery and equipment can be placed in the cloud and be remotely available for multiple locations.

Conclusions

ERP/MES systems, like industry and rapidly developing plastic processing technologies, are evolving. Not only the interface of communication with the end-user is subjected to changes but, most of all, their growing capabilities. Due to the integration and unification of systems and communication protocols, it is possible to combine a range of machinery and equipment and even industrial networks in one system rapidly exchanging information and adapting to changing and growing requirements of customers. Moreover, the introduction of cloud computing enables an unlimited increase in their functionality and flexibility of operations, not only in the area of acquisition and presentation of data but also in their processing, drawing conclusions and predicting future trends. Moreover, numerical calculations significantly contribute to the growth in the overall system performance and reduction in financial expenditures arising from the generation of errors.

The research goal of the presented article was to analyze and assess the impact of integrating ERP/MES systems with Industry 4.0 devices to achieve increased cyber-physical system performance. The literature review and case study were used to conduct the research. The above analyzes led to the conclusions that both systems, i.e. ERP and MES, used jointly by the company and integrated with many devices and hardware and information platforms (e.g. using Big Data tools) give better results in terms of managing the organization and its production cycle. ERP manages the entire organization, while MES focuses primarily on production functions, which is why its correct integration / communication with the machine park is so important that it is possible to easily manage activities in the production hall (taking into account material facilities, logistics, use of semi-products and maintenance used) in the production of machinery and tools). MES monitors and creates documentation of the entire production cycle from raw material to final product. As the both systems evolve, adapt to ever newer conditions, further research on this topic is advisable and will be continued by the authors of the article.

Digital Skills, Gender and Earnings: Evidence from The Polish Labor Market

Alicja GRZESKOWIAK

Wroclaw University of Economics and Business, Wroclaw, Poland
alicja.grzeskowiak@ue.wroc.pl

Abstract

The purpose of this paper is to evaluate associations among digital skills, gender and earnings in Poland. The research is based on individual data from the Polish survey on human capital (2017). Elementary and advanced digital skills are regarded. Earnings and salary expectations are taken into consideration. The empirical findings suggest that both digital skills and gender affect earnings as well as financial expectations. However, no evidence is found of the interaction effect. The associations between digital skills, earnings and salary expectations are strong and positive.

Keywords: Digital Skills, Gender, Earnings, Salary Expectations.

Introduction

Human capital, which includes competencies, is an essential element of the modern economy. In the era of technological progress, digital skills are becoming one of the most important and desired competencies. In the face of quick changes, the demand for high skilled workers increases. In Poland, which has undergone a political and economic transformation, the labor market is currently characterized by a low unemployment rate. This results in increasing difficulties in recruiting employees with appropriate skills. Wages and salary expectations are rising. The subject of interest of this paper is whether and how digital skills are related to the received remuneration and the expected salary. Gender is considered as a second factor. It should be underlined that there is no universal, objective data enabling such comparisons. Therefore, the paper is based on the results of a nationwide survey on human capital, which provides data relevant for the analysis of the problem. The study verifies the following research hypotheses:

H1. There is a relationship between the level of digital skills and gender.
H2. The level of digital skills and gender are determinants of earnings.
H3. The level of digital skills and gender affect salary expectations.

The analysis is conducted referring to elementary and advanced digital skills. The hypotheses formulated above are verified using statistical methods supported by data visualization techniques.

Background

Skills are necessary for functioning on the labor market and in everyday life. Nowadays, skills requirements are growing due to structural, demographic, technological changes and globalization (Martin, 2018). In modern economies, skills, knowledge and information based activities have an essential role in economic growth and contribute to competitive advantage (Ducatel, 1998). As the importance of skill increases, it may be expected that they have a significant effect on labor market outcomes. Despite the significance of the problem, the literature on this topic is not exhaustive. Many previous works analyzed the impact of education and work experience and were not focused on the influence of competencies (Blázquez et al., 2018). A common approach was the Mincerian model explaining the skill premium by years of schooling and potential work experience (Mincer, 1974, Heckman et al., 2003; Heckman et al., 2005; Lemieux, 2006; Polachek, 2008; Purnastuti, 2012;

Patrinos, 2016; Psacharopoulos and Patrinos, 2018). Although frequently applied, Mincerian model is a general one and lacks detailed information on skills. Another conceptual framework is described by Hanushek and Woessmann (2008), where earnings are a function of skills necessary on the labor market. Such a research approach can be found, among others, in works by Green and Riddell (2003), Carbonaro (2006), Heckman et al. (2006), Barone and Van de Werfhorst (2011), Cobb-Clark and Tan (2011), Lindqvist and Vestman (2011), Deming and Kahn (2017), Hanushek et al. (2015), Hampf et al. (2017), Hanushek et al. (2017), Edin et al. (2018), Grundke et al. (2018). The results show that both hard and soft skills are rewarded in the labor market.

As a widespread diffusion of ICT occurs, special attention is paid in the literature to computer usage and digital skills. The Survey of Adult Skills reveals that usage of ICT results in higher wages and increases the labor force participation (OECD, 2015). Many earlier studies focused on the importance of computer usage at work, not on the skills directly. The first influential paper on the impact of computerization on earnings by Krueger (1993) revealed that computer usage at work was associated with higher wages. Some authors agree with that statement (Liu et al., 2004; Arabsheibani et al., 2004) while others not (DiNardo and Pischke, 1997, Borghans and Ter Weel, 2004, Krashinsky, 2004). In further studies, digital skills, not only the fact of computer usage, were considered (Peng and Eunni, 2011; OECD, 2015; Falck et al., 2016; Liu and Mithas, 2016). The authors argue that digital skills are strongly rewarded in the labor market.

Although determinants of earnings are analyzed in the Polish economic literature, the role of skills is not often discussed. Relations between competencies and earnings are investigated in papers by Czarnik et al. (2011), Burski et al. (2013), Czarnik and Turek (2015), Grześkowiak (2017, 2018), Palczyńska (2018). As there is no detailed analysis concerning digital skills, this paper undertakes this topic. Additionally, gender is introduced as a factor contributing strongly to the gap in wages.

Data and Methods

The analysis is based on data from the last wave (2017) of a nationwide survey on the human capital in Poland (designed and carried out by PARP and Jagiellonian University). This survey is conducted on a representative sample of Poles of working age. In 2017, the survey covered 4056 respondents – individual persons. The questionnaire contained questions relevant to the subject. Firstly, respondents were asked about the average net monthly earnings in the last 12 months. Secondly, respondents specified salary expectations formulated as the net monthly salary considered as quite satisfactory if they were offered a job. The answers to these two questions were given in the national currency, i.e. PLN. Thirdly, respondents were asked to assess 25 different competencies, including digital ones at the elementary and advanced level, defined as:

- usage of computer, tablet, smartphone,
- use of specialized computer programs.

In further analysis, especially in tables and figures, these two skills are called *general usage* and *specialized software usage*. Every respondent rated each skill on a 5-point scale defined as follows: 1 - low level, 2 - basic, 3 - medium, 4 - high, 5 - very high. There were missing data in the source material, in particular regarding earnings. Only records with complete data were considered in the analysis (i.e. persons who revealed the net monthly earnings and specified salary expectations and declared the level of digital skills), what limited the set to n=1814. The structure of the complete dataset is balanced for gender. 50.8% are women, and 49.2% are men.

Several data analysis techniques were used, enabling a multi-faceted approach to the research problem. The calculations were carried out using the R environment and the SPSS program. Besides, various visualization methods were used as an important way of statistical communication. The first part discusses the distribution of the levels of digital skills and their associations with gender. Because the level of competencies is measured on the ordinal scale, standard bar charts were used to visualize the results. Although the distributions of the variables representing skills level are an essential aspect, cross-classifications with gender are also in the scope of the interest. The

associations between them were evaluated by the independence test and special graphical presentations as circularly arranged charts and association plots. Circular plots are a relatively new visualization method based on a circular layout and used mostly in genome analysis. This graphical approach is available in DescTools R package and is designed to represent "the unidirectional relationship between the rows and the columns of a contingency table" (Signorell et al., 2020). The categories of each variable are presented on one side of the circle. The marginal densities corresponding to the variables are represented by the division into segments around the circle. The relationships among the categories are reflected by ribbons inside the chart.

Chi-square test of independence was applied to assess the association between the declared level of competencies and gender. Since chi-square statistic is strongly affected by sample size (Frankfort-Nachmias and Leon-Guerrero, 2016), and a large sample was under consideration, the assessment of the strength of the relationship was done by the contingency coefficient, which takes values from 0 to 1, where zero means no association and 1 indicates total dependence (Kraska-Miller, 2014). A more detailed analysis based on the Pearson residuals was carried out if the dependence existed. A graphical method called the association plot was used for this purpose. It was proposed by Cohen (1980) and summarized and developed by Friendly (2000) and Meyer et al. (2003). The idea of this visualization is to represent each cell of the contingency table by a rectangle with "height proportional to the corresponding Pearson residual" and "width proportional to the square root of the expected counts"; the color and the position to the baseline reflect the sign while the area gives the information of the raw residual (Meyer et al., 2003). Thus, the association plot gives the understanding of the nature of discrepancies resulting in rejection of the null hypothesis of independence.

The second part of the analysis concerns the relationships among skills level and gender (treated as explanatory variables – factors) and earnings or salary expectations (dependent variables). ANOVA is used to determine if the levels of the independent categorical variables (called factors) are accompanied by different means of the numerical dependent variable. As the number of observations in the cells was unequal, it was necessary to use type III ANOVA sum of squares in calculations (Elliott, 2007, s.170). The first step in the testing procedure was to test for the interaction between factors, the second to evaluate the main effects (under the condition that the interaction was not statistically significant). However, the results of ANOVA give only the information about the overall status of differences among groups (Fink, 1995). Details must be evaluated by post-hoc comparisons. Various tests are used for this purpose, among them frequently applied methods proposed by Tukey, Bonferroni, Sheffe and Dunnet's, but they are appropriate if the assumption of the homogeneity of variance is held. As ANOVA is considered a robust statistic, it can also be used in the presence of unequal variances, but specific post-hoc tests are necessary in such a case, including Games-Howell test which has some advantages over other procedures (Shingala & Rajyaguru, 2015) and therefore was used in the analysis.

Results

Digital Skills and Gender

In the first step of the analysis distributions of the evaluation of elementary and advanced digital skills (i.e. using a computer, tablet, smartphone; using specialized computer programs) are presented. Then relationships between digital competencies and gender of respondents are assessed. Figure 1 presents the frequencies of skills levels calculated on the base of the self-assessment of respondents.

Figure 1: Distribution of self-evaluation of elementary and advanced digital skills

In the case of elementary skills, the answers 'low' and 'basic' were given relatively rarely (10% and 9%, respectively). People declared that they use a computer, tablet, or smartphone at the 'medium' or 'high' level (58.2% together). 22.8% of respondents evaluated their competencies in this field as very high. The distribution of the answers concerning the question about advanced skills is not similar. The dominant category is 'medium' level, which was indicated by 31.3% of respondents. Over ¼ of Poles have low skills in the use of specialized computer programs. Only 7.4% of people assess skills in this field as 'high'.

In the distributions of responses, there were also some differences in the assessment with respect to gender, which are shown by standard bar charts (Figure 2) and circular plots (Figure 3) in order to get a better insight into the data. Women more often indicate the 'medium' and 'high' levels both for elementary and advanced skills. In contrast, men's responses are more polarized. Particularly substantial differences were observed for 'low' general computer usage skills – 12.4% of men and 7.7% of women as well as for 'high' category declared by 26.2% of men and 32.1% of women. In the case of specialized software, men dominate in 'basic' category (17.1% while women 8.6%) and 'very high' (9.5% while women 5.3%).

Figure 2: Distribution of self-evaluation of elementary and advanced digital skills with respect to gender

Figure 3: Relations between self-evaluation of elementary and advanced digital skills and gender

The above-presented results indicate that the differences between the digital competencies of men and women may be significant. The chi-square independence test was used to verify this hypothesis, and the strength of the relationships was assessed by the contingency coefficient. The results are summarized in Table 1.

Table 1: Results of chi-square tests and evaluation of the strength of associations

Skills	Chi square statistic	df	Contingency coefficient
General usage	19.248***	4	0.102
Specialized software	21.763***	4	0.109

*** $p < 0.001$

The results of the chi-square test lead to the conclusion that there are significant relationships between gender and skills level. However, contingency coefficients are low, which should be interpreted as weak relationships. In order to check what has the biggest impact on the values of chi-square statistics, Pearson residuals are used and visualized by association plots (Figure 4).

The area of rectangles reflects values of raw residuals, and the color indicates positive (black) or negative residual (red). In the case of general computer usage skills, the biggest contribution to chi-square measure is represented by categories 'low' and 'high' while the smallest by 'basic'. A different pattern is observed for competencies related to the usage of specialized software. Most residuals are influential except for the 'low' category. These results prove that although both chi-square tests indicate the dependency between gender and digital skills, the discrepancies in the case of the knowledge of specialized software are higher.

Figure 4: Association plots illustrating Pearson residuals in contingency tables concerning gender and skills levels

The next steps of the analysis concern the relationships among gender, skills level and financial aspects of work, i.e. earnings and salary expectations. The dependencies are considered for general computer usage skills and specialized software knowledge separately.

General Computer Usage Skills

A two-way ANOVA was carried out to determine if there are differences in earnings and salary expectations for men and women declaring various levels of general computer usage skills. Multiple comparisons (Games-Howell tests) were performed in the presence of significant differences. The summary of the ANOVA outcomes is presented in table 2. Profile plots (Figure 5 and Figure 6) were created to facilitate comparisons of the marginal means in the models.

Table 2: Results of two-way ANOVA – general usage skills

Effect	Dependent variable			
	Average earnings		Salary expectations	
	F statistics	p-value	F statistics	p-value
Gender	58.381	0.000	45.115	0.000
Skills level	22.995	0.000	12.942	0.000
Gender*Skills level (interaction)	1.892	0.109	0.490	0.743

First, the interaction test was performed. The null hypothesis is that there is no interaction effect, the alternative that the interaction exists. The results in Table 2 show that there is no interaction effect neither in the case of average earnings as dependent variable (F = 1.892, p-value = 0.109) nor in the

case of salary expectations as dependent variable (F = 0.490, p-value = 0.743). The lack of interaction is confirmed by the lines in Figures 5 and 6 that look rather similar, and no intersection occurs. It leads to the conclusion that the impact of one factor on wages does not depend on the level of the second factor, i.e. the impact of the general computer usage skills level is not related to the influence of gender.

Figure 5: Profile plot: means of earnings according to gender and general computer usage skills level

Figure 6: Profile plot: means of salary expectations according to gender and general computer usage skills level

As there is no significant interaction, main effects can be considered separately. The main effects for gender are significant (F = 58.381 and p-value 0.000 in the case of average earnings as the dependent variable, and F = 45.115 and p-value 0.000 in the case of salary expectations as the dependent variable). The main effects for skills level are also significant (F = 22.995 and p-value 0.000 in the case of average earnings as the dependent variable, and F = 12.942 and p-value 0.000 in the case of salary expectations as the dependent variable). Hence, both gender and general computer usage skills have a significant influence on earnings and salary expectations. Interesting conclusions may be drawn from the location of the lines in Figures 5 and 6. First, each line rises as the level of skills increases, which indicates a positive relationship. Second, the wages or their expectations are always higher for men. Third, the discrepancies between men and women are higher for real earnings than for salary expectations.

Multiple comparisons using Games-Howell test were carried out to identify the skills levels for which the means differ significantly. The tests indicate (p-value < 0.05) that higher levels of general computer usage skills are generally accompanied by higher earnings and salary expectations. However, there are some exceptions to this rule. There are no significant differences between levels 'basic' and 'medium' as well as 'high' and 'very high'.

Specialized Software Usage

In this case, the same procedure as in the previous paragraph was used to determine if there are differences in earnings and salary expectations for men and women declaring various levels of specialized software usage. In the presence of significant differences, Games-Howell tests were applied to perform multiple comparisons. The summary of the ANOVA outcomes is given in Table 3. Profile plots (Figure 7 and Figure 8) present the comparisons of the marginal means in the models.

Table 3: Results of two-way ANOVA – specialized software usage

Effect	Dependent variable			
	Average earnings		Salary expectations	
	F statistics	p-value	F statistics	p-value
Gender	60.452	0.000	44.544	0.000
Skills level	33.555	0.000	21.554	0.000
Gender*Skills level (interaction)	1.449	0.215	0.494	0.740

The interaction test reveals that there is no interaction effect neither in the case of average earnings as dependent variable (F = 1.449 and p-value = 0.215) nor in the case of salary expectations as dependent variable (F = 0.494 and p-value = 0.740). The same conclusion may be drawn from profile plots (Figures 7 and 8). The lines are parallel, and they do not intersect. It shows that the impact of the advanced computer skills level on wages is not related to gender influence.

Figure 7: Profile plot: means of earnings according to gender and specialized software usage level

Figure 8: Profile plot: means of salary expectations according to gender and specialized software usage level

The absence of significant interaction means that the main effects can be tested and interpreted. The main effects for gender are significant (F = 60.452 and p-value 0.000 in the case of average earnings as the dependent variable, and F = 44.544 and p-value 0.000 in the case of salary expectations as the dependent variable). The main effects for advanced skills level are also significant (F = 33.555 and p-value 0.000 in the case of average earnings as the dependent variable, and F = 21.554 and p-value 0.000 in the case of salary expectations as the dependent variable). Hence, both gender and specialized software usage skills have a significant influence on earnings and salary expectations.

The same conclusions as in the previous paragraph may be drawn from the location of the lines in Figures 7 and 8. First, the general rule is that the higher skills level, the higher earnings and salary expectations. Second, both wages and their expectations are lower for women. Third, there are smaller differences for expectations than real earnings if we compare men and women.

Post-hoc Games-Howell tests were performed to identify the skills levels for which the means differ significantly. The results of pairwise comparisons (p-value < 0.05) indicate that higher levels of specialized software usage skills are, in most cases, accompanied by higher earnings and salary expectations. However, there are no significant differences between levels 'basic'-'medium', 'basic'-'high' as well as 'high'-'very high'. This is a slightly different pattern than in the case of general computer skills. Surprisingly, there is no difference in the dependent variable with respect to the declared 'basic' and 'high' level of competencies, and this is true for both earnings and salary expectations.

Discussion

The results of the study show that the earnings and earnings expectations in Poland depend on digital skills and gender but there is no interaction between these two factors. The gender pay gap is a well-recognized phenomenon in many countries, including Poland and widely discussed in the economic literature. According to Eurostat, the gap in Poland exists but is one of the lowest among European Union countries. In 2017 the unadjusted indicator (i.e."difference between average gross hourly earnings of male and female employees as % of male gross earnings") was equal 7.2% in Poland while the EU-28 average was equal to 16% (Eurostat, 2017). The findings concerning the impact of digital skills on earnings are not fully comparable with the early papers in this field of study which were focused on the influence of computer usage at work, not on the level of skills. However, the findings are consistent with the results presented by researchers who considered digital skills and found that employees are rewarded financially for them (Peng and Eunni, 2011; OECD, 2015; Falck et al., 2016; Liu and Mithas, 2016). The outcomes stay to some extent in line with the works of Hanushek et al. (2015) who identified the positive impact of problem solving skills in technology-

rich environments on earnings (using data from Programme for the International Assessment of Adult Competencies for OECD countries).

Conclusion and Final Remarks

Digital skills play an important role in the knowledge-based economy, but there are not many studies which discuss their associations with labor market outcomes in Poland. This research was designed to detect and evaluate differences in earnings and salary expectations with regard to gender and digital skills level.

The analyzes provided grounds for verifying the research hypotheses. Firstly, there is a significant statistical relationship between gender and digital skills level, but the association is very weak. Secondly, gender and digital skills level affect the pay gap. However, no interaction was found between these two factors. Thirdly, similar conclusions have been drawn for wage expectations. Analysis of variance showed that gender and the skills level should be treated as the main effects, without the interaction effect. Both earnings and salary expectations are higher for men. Post-hoc tests show that the higher the declared skills level, the higher the wages and expectations.

This research encounters certain limitations. First of all, it is based on survey data which are subjective. The level of skills comes from the self-assessment and may be biased. On the other hand, this is the best source of data possible as there are no objective and nationwide information on digital skills. Another problem is that net not gross wages were considered, which may also affect the results. It should also be mentioned that methods and outcomes do not necessarily imply causal conclusions. Nevertheless, in the author's opinion, this study uses the best data possible at the moment and allows evaluating the relations among digital skills, gender and earnings. Another limitation is that this study is limited to persons who declared net monthly earnings in the last 12 months and does not include salary expectations of those who did not provide such information. Thus, the results refer to those who had paid employment, not to the whole population of working age.

The scope of the study and the results presented in this paper indicate certain opportunities for further research. The survey on human capital includes an extensive list of respondents characteristics so that the analysis may be extended to other socio-economic factors. Various levels of salary expectations (minimal, very satisfactory) may also be taken into consideration. Further studies may concentrate on changes over time as the survey is carried out periodically. Finally, other statistical methods, e.g. non-parametric ones, may be used for more comprehensive analysis.

Acknowledgments

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019-2022, project number 015/RID/2018/19, total funding amount 10 721 040,00 PLN.

A Multivariate Approach to Evaluation of Advancement to Circular Economy in European Union Countries

Abstract

The purpose of this paper is to evaluate the degree of transition to circular economy in European Union countries. The study is based on official data from Eurostat (2016). As circular economy is a complex idea, various multivariate statistical methods are used to analyze the problem: linear ordering, cluster analysis and multidimensional scaling. The results allowed for identifying the leaders and laggards of the process. However, no distinct clusters were detected.

Keywords: Circular Economy, European Union, Indicators, Multivariate Analysis.

Introduction

Recently more and more attention is being paid to Circular Economy (CE), which is associated with the concept of sustainable development. Its importance is underlined in strategies and action plans adopted by the European Commission. In formal documents, the European Commission specified indicators that are used to assess the situation in the field of CE. Since CE is a complex idea, it must be considered in many dimensions. Hence, specific methods should be applied to evaluate the progress of countries in this domain. This study, exploratory in nature, is an attempt to assess the applicability of various multivariate analysis methods to assess the CE progress in EU member states.

Background

Circular economy is a concept which gains more and more attention since it is perceived as a way to implement the idea of sustainable development (Geissdoerfer et al., 2017; Murray et al., 2017). The concept may be an alternative to the current production and consumption economic system model and lead to '*balance and harmony between economy, environment and society*' (Ghisellini et al., 2016). Although the topic is often raised and important worldwide, there is no conceptual clarity of this term in the literature. Kirchherr et al. (2017) provide a vast literature overview by analyzing 117 different definitions and underline that the meaning is ambiguous and differs from author to author. Eventually, the authors conceptualize circular economy as an economic system oriented towards '*reducing, alternatively reusing, recycling and recovering materials in production/distribution and consumption process*', operating at various levels (micro, meso and macro), introduced by '*novel business models and responsible consumers'* and giving a chance for sustainable development (Kirchherr et al. 2017). There are also attempts to make the term more precise, e.g. García-Barragán et al. (2019) suggest a mathematical approach based on 'well-defined material flow and value system' to define the concept. Regardless of the definition, the strategy underlying circular economy assumes the transition from a linear model based on the *make-use-dispose* flow to loops in which goods at the end turn into resources for others either by repairing, remanufacturing etc. or by recycling the materials (Stahel, 2016).

As the circular economy includes policies and strategies related to a more efficient way of consuming resources, it becomes necessary to design indicators which measure the performance of a given process leading to the achievement of the desired model. Correctly constructed indicators and appropriate measurements allow not only to examine progress in implementing the strategy, but also provide guidance to improve specific CE policies. Saidani et al. (2018) conducted a thorough literature overview and proposed a detailed taxonomy of CE indicators described and used by other researchers. The authors collected 55 sets of CE indicators which can be grouped, among others, at the micro, meso and macro levels. An important contribution to the development of indicators at the business (micro and meso) level is the Ellen MacArthur Foundation report (Ellen MacArthur Foundation and GRANTA DESIGN, 2015). Likewise important, but at the national level, was the adoption of Circular Economy Package by the European Commission in 2015, including Action Plan for the Circular Economy (European Commission, 2015). As a consequence, the European Environment Agency in the Report No 2/2016 presented some potential indicators which '*would give insight into whether or not the European economy is becoming more circular*' (European Environment Agency, 2016).

Data and Methods

This study is based on official data from Eurostat designed for monitoring CE. Indicators with missing data were omitted in the analysis. The following variables are considered: *generation of municipal waste per capita* (X1), *generation of waste excluding major mineral wastes per domestic material consumption* (X2), *generation of waste excluding major mineral wastes per GDP unit* (X3), *recycling rate of municipal waste* (X4), *recycling rate of plastic packaging waste* (X5), *recycling rate of wooden packaging waste* (X6), *recycling rate of e-waste* (X7), *recycling of biowaste* (X8), *recovery rate of construction and demolition waste* (X9), *circular material use rate* (X10), *patents related to recycling and secondary raw materials* (X11). All analyses are carried out on data from 2016, except for X11 (2015 – newest information available).

Various multivariate analysis methods are used: linear ordering algorithms (cf. Hwang and Yoon, 1981), clustering methods (cf. Kaufman and Rousseeuw, 2009) and multidimensional scaling (cf. Borg et al., 2018). The purpose is to identify leaders, followers and laggards in implementing CE policy as well as to gain an insight into the data structure.

Empirical Results

The first part of the study is oriented towards the evaluation of the degree of implementation of CE policy in EU countries by linear ordering methods, i. e. TOPSIS used in multi-criteria decision analysis and standardized sums method. The rankings obtained by these procedures are presented in Table 1. Results of both methods are quite similar, what is confirmed by the Spearman correlation coefficient equal to 0.99.

According to both rankings, the Netherlands may be described as the leader in implementing CE objectives, followed by Lithuania, Belgium, Luxemburg and the Czech Republic. Estonia takes the last position in the ranking, followed by Greece and Cyprus. It should be noted that the TOPSIS method uses the development pattern, and the calculated measure (index) indicates the distance of a particular observation from a vector of the best indicators values. The index does not exceed 0.6 (except for the Netherlands), suggesting significant differences in the achievement of the CE effects in EU countries.

Table 1: Results of linear ordering

Country	TOPSIS		STANDARIZED SUMS	
	Ranking place	Index value	Ranking place	Index value
Austria	7	0.54	7	0,55
Belgium	4	0.56	5	0,57
Bulgaria	16	0.50	17	0,49
Croatia	23	0.48	23	0,44
Cyprus	25	0.43	25	0,38
Czechia	3	0.56	4	0,57
Denmark	13	0.52	10	0,54
Estonia	28	0,38	28	0.32
Finland	15	0,50	15	0.50
France	21	0,48	21	0.47
Germany	6	0,54	6	0.56
Greece	26	0,42	26	0.38
Hungary	19	0,49	20	0.47
Ireland	17	0,49	16	0.49
Italy	10	0,53	11	0,53
Latvia	22	0,48	19	0,48
Lithuania	2	0,56	2	0,59
Luxembourg	5	0,56	3	0,59
Malta	27	0,41	27	0,35
Netherlands	1	0,60	1	0,63
Poland	11	0,53	12	0,53
Portugal	8	0,54	8	0.55
Romania	24	0,46	24	0.43
Slovakia	20	0,48	22	0.46
Slovenia	9	0,53	9	0.54
Spain	18	0,49	18	0.48
Sweden	14	0,52	14	0.51
UK	12	0,52	13	0.52

The second part of the study aims at revealing the structure of the dataset. Cluster analysis methods are used to identify groups of countries with similar achievements in the circular economy field. The result of the agglomerative hierarchical procedure is presented in Figure 1.

Fig. 1: Results of hierarchical cluster analysis

The dendrogram in Figure 1 shows that there are no big clusters in the dataset. The agglomeration scheme indicates that the division should be made into at least ten groups consisting of several countries.

Very similar results were obtained by the partition around medoids method, which is robust to outliers. The assessment using the silhouette index suggests the division of the set into nine groups. Heterogeneity was also confirmed by fuzzy clustering (c-means method). The degree of membership between data and clusters is close to 1/k (where k is the number of clusters), and Dunn's index is close to zero.

The set of considered indicators creates an 11-dimensional space. In order to explore the relationships between individuals, classic multidimensional scaling is used, whose results for 2-dimensional space are shown in Figure 2.

Fig. 2: Results of classical multidimensional scaling

The first dimension is strongly positively correlated with X1, X4, X8 and X10. The second dimension is strongly positively correlated with X2, X3, X7 and negatively with X11. The configuration of points does not suggest distinct clusters. Two points representing Estonia and Bulgaria are situated far away from the others when considering the second dimension, due to high values of generation of waste excluding major mineral wastes per GDP unit, high rate of e-waste recycling and no patents in the subject matter.

Conclusion and Final Remarks

The results of both rankings (TOPSIS and standardized sums) are very similar. Therefore, countries that are more and less advanced in achieving CE objectives can be indicated. Various cluster analyses showed that it is not possible to distinguish big distinct clusters on the base of the set of circular economy indicators for EU countries. It can be deduced that the situation in this field is very diverse, and the characteristics differ substantially across the countries. The results of multidimensional scaling also confirmed this conclusion. Although the problem in question is multivariate in nature, no evident broad patterns were detected.

The study has certain limitations. The number of characteristics treated as circular economy indicators is limited, and they do not reflect all aspects of the problem. The measurement of progress towards circular economy is a multi-faceted task. Thus, further research in this field is indispensable. The authors suggest expanding the number of indicators taken into consideration and applying feature selection methods. Another approach may concentrate on how the phenomenon develops over time.

Acknowledgments

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019-2022, project number 015/RID/2018/19, total funding amount 10 721 040,00 PLN.

Innovation as a determinant of enterprise value increase

Caputa, Wiesława, WSB University in Poznań, Poland,
E-mail: wieslawa.caputa@chorzow.wsb.pl
Krawczyk-Sokołowska, Izabela, University of Technology, Częstochowa, Poland,
E-mail: izabela.krawczyk-sokolowska@wz.pcz.pl

Abstract

Building the enterprise value in a turbulent environment forces companies to introduce innovations that secure the effective creation, provision and communication of the value to the customer. The changeability of customers' attitudes and behaviour not only results in the need to identify factors determining an increase in the enterprise value, but it also necessitates evaluating their significance in terms of their influence on future capital supply.
The key goal of the article was to identify the intangible factors that secure the enterprise value growth, with a particular focus on the sphere of innovation, and to indicate barriers and ways of creating innovativeness in the future.
Literature studies enabled the authors to present the already identified factors and barriers in the innovation process. Empirical research has demonstrated that although these factors are relatively permanent, their significance with regard to increased enterprise value is dependent on changes in the environment, including in particular changes in customers' attitudes and behaviour.
Requirements and expectations of the contemporary customer force entrepreneurs to socialize the innovation process. It involves the necessity to develop lasting relations with customers, based on: cooperation, partnership, trust and commitment. It is possible only if both sides expect to win. The main barrier to the socialization of the innovation process is the apparent rooting in the mentality of managers of the necessity to pursue the customer's interest. The results of theoretical and empirical investigations conducted by statistical analysis methods, including the Anova test, have allowed for updating the information on the innovation process barriers.

Keywords: innovation, enterprise innovativeness, enterprise value

Introduction

Changes in the contemporary environment make innovation a natural process, which is necessary for enterprise functioning (Androsch, 2019). The goal of enterprise operations is to thoroughly identify the needs and expectations of customers, that is, potential users of innovative products and services (Ngo and O'Cass, 2010; Sjödin, Parida and Parida, 2019). Accurate assessment of customers' expectations is related to the usefulness of a product offered on the market (Teres, 2003; Böhrs, 2004; Rust et al., 2005). This usefulness is crucial in relations with the customer and constitutes its business value, i.e. the value of cash flows generated by the enterprise as a result of creating and developing relations with the customer (Tomczak and Rudolf-Sipötz, 2006).The value is determined by the profitability and duration of these relations, as it is a capital supply for the enterprise (Eggert and Ulaga, 2002; Helm and Gűnter, 2006; Stűker, 2008; Ngo and O'Cass, 2010). Innovativeness is considered to be an important factor of increased competitiveness and economic growth. Contemporary economy is increasingly dynamic (Stec, Filip, Grzebyk and Pierscieniak, 2014). Companies that are able to process knowledge and information, and utilize them for their purposes achieve success and cross technological, financial and institutional barriers. On the other hand, companies which cut themselves off from information society and reject innovations are doomed to slow agony (Jonek-Kowalska, 2019; Krawczyk-Sokołowska, Łukomska-Szarek and Caputa, 2018).
The aim of the article was to identify the intangible factors that secure the enterprise value increase, with a particular focus on the sphere of innovation, and to indicate barriers and ways of creating innovativeness in the future.

Innovations and enterprise value in subject literature

Irrespective of the conditions of exchange, the customer is an essential element of the functioning and development of an enterprise, and, at the same time, a guarantor of its capital supply. The problem of innovativeness in terms of establishing relations with customers and creating the enterprise value, has been widely discussed in science (Ngo and O'Cass, 2010; Navarro, Llinares and Garzon, 2016; Bruce, Wilson, Macdonald and Clarkec, 2019; Sjödin, Parida and Parida, 2019). This is confirmed by the number of scientific studies. A review of international databases (SCOPUS, WOS, Springer, EBSCO) has revealed that these issues enjoy unwaning popularity, and the systematic exploration of innovations and enterprise value constantly reveals new problems and new interesting phenomena.

Innovation, i.e. any intentional and beneficial change, is made in a specific dimension (3P): subjective (innovative enterprise), objective (product, process and organizational innovation) and spatial (region, country, world) (Krawczyk-Sokołowska, 2012).

Innovation allows enterprises to increase business profitability, enter new sales markets as well as adjust to limitations and make use of possibilities related to the changing market (Szwajca and Chovanovà - Supekovà, 2018).

Innovativeness means a tendency to create new and improve existing products, technological processes, new organizational and management systems, as well as other creative and innovative changes leading to the creation of new values (Caputa, 2018). It should be emphasized that innovativeness is also the ability (Burgelman et al., 2004) and motivation of innovative entrepreneurs to seek and introduce changes in real activity in various areas of socio- economic life in order to improve the conditions for creating knowledge and innovation. The ability to create innovation and establishing an efficient system of innovation diffusion are important elements of increasing the enterprise value and socio-economic development (Fabova and Łukomska-Szarek, 2018;).

In addition, access to information on new manufacturing technologies, the organization of production processes as well as customer expectations and preferences is particularly important for the innovativeness of enterprises. A special role in the exchange of knowledge and information should be assigned to the Internet, which among others enables establishing interactive communication and creating transactional relations online (. Understanding and awareness of customer-business relations affects their form and nature, as they are shaped by close synergies and mutual benefits. For enterprises, the customer and his demand for products and services is a promising prospect of increasing their value and development opportunities. For the customer it means that his expectations regarding the usefulness and uniqueness of the products and services offered can be met at a satisfactory level.

The approach to innovation should only be associated with the dominant role of the buyer (who expects that his preferences will be taken into account); other participants (owners, producers, agents) cannot do anything but accept this situation. Customers decide what products and services on the market they choose.

The value of enterprises and development opportunities under uncertainty are largely determined by their endogenous activity, based on specific exogenous resources (Gholamreza, et al., 2011; Slusarczyk and Grondys, 2019). It seems important to focus not only on unique resources but also on arising opportunities. The high costs of creating unique resources require different entities and institutions to build resources together, that is, to create a "group competitive advantage".A network organization can be seen as a kind of structural solution allowing the strategy to be effectively implemented in turbulent conditions thanks to the mutual utilization of network participants' competences (Sopińska and Jakubowska, 2013). Building a relationship based on cooperation (partnership) (Pierścieniak, 2015) is a response to the challenges faced in business practice, as it has been noticed that solving complex problems more and more often requires a variety of skills and resources, which are usually possessed by many entities of economic life.

Innovation and innovativeness should be treated as a set of various factors serving to improve management efficiency and increase the value of enterprises as well as economic and social benefits (Fasnacht, 2018).

Both the premises and factors of the innovation process are classified differently (Kraśnicka, 2018; Kłosiewicz-Górecka, 2016; Loren, 2011). However, regardless of the classification adopted, these premises can be divided into two groups: internal premises (factors) and external premises (factors). The group of internal factors of enterprise innovation should be associated with the productive

potential of the enterprise, i.e. creative employees and owners as well as material and financial conditions (Krawczyk-Sokołowska, Pierścieniak and Caputa, 2019). Internal premises are related to the course of the innovative process itself as well as the organization and implementation of the company's operational and R&D activities. These premises result from the need to influence three basic variables determining the value of an enterprise: revenues, costs, including costs of innovative activities and risk, including the risk of running innovative projects. The most common include:

- the possibility of increasing the sales of new products, extending the range of existing products or equipping them with new features/functionalities, which may be related to the forcing of innovation by customers,
- the opportunity to attract new customers, improving access to sales markets,
- the need for an effective use of technological and research potential,
- better utilization and faster development of the internal potential of knowledge, and thus triggering the learning effect,
- weaknesses of an enterprise forcing it to acquire knowledge from the environment,
- the need to develop the company's social influence potential,
- reduction of adverse environmental impact,
- shortening the time of product manufacturing, innovative process implementation, quality improvement, including the necessity to implement standards and adjust them to current legal regulations,
- reducing the costs and risk of the innovation process,
- streamlining the processes of production, marketing, purchasing and logistics,
- benefiting from economies of scale,
- willingness to internationalize,
- the need for protection against competitors,
- willingness and ability of the enterprise to establish relations based on cooperation, readiness to share knowledge and co-create new values (West and Bogers, 2013; Fu, Li, Xiong and Chesbrough, 2014; Lewandowska, 2018).

In the set of internal factors determining the desire to generate and implement innovations, attention is also paid to: company profile, managerial qualities, organizational culture or management style (Kraśnicka, 2018).

External factors of enterprise innovation include the purchase of licences or/and cooperation with research institutions or other business entities (Krawczyk-Sokołowska, Pierścieniak and Caputa, 2019). These factors are directly related to changes taking place in the internal and external environment of the enterprise. The set of these factors includes, among others:

- pressure from the environment, including competitors, customers and other entities in the value chain,
- availability of qualified employees, knowledge and venture capital,
- the growing barrier of demand on the internal market,
- the ongoing digitization process and progress in the development of information and communication technologies, which enables the sharing of knowledge and utilization of external effects,
- government activities, including the possibility of obtaining financial support from public institutions, among others from the EU,
- increasing emphasis on protecting the environmental and ensuring a sustainable development, forcing enterprises to search for and implement new ecological solutions,
- shortening the product and sector life cycle,
- willingness to share knowledge and co-create new values,
- willingness and ability of the company to establish relations based on cooperation, readiness to share knowledge and co-create new values (Harter et al., 2012; Fu, Li, Xiong and Chesbrough, 2014; Lewandowska, 2018; Frey et al., 2019)

Each of the indicated factors may affect the course of the innovation process, except that the strength of this impact may vary. As a result, the company faces the need not only to identify these factors, but to find an answer to the question which of them are fundamental to the innovation process efficiency, the achievement of future benefits and maintaining the ability to generate them in the longest possible period.

Research methodology

Concentrating the company's activity on value creation entails the need to identify key factors determining the achievement of this goal. In consequence, the first stage of research was based on a review of the output published in international databases in the years 2010-2020, especially Springer and SCOPUS. This review was mainly focused on identifying the factors which, being related to the company's innovative activity, determine the value of its relations with customers, and, by extension, the value of the company itself. The numerical effect of this review, presented in Table 1, indicates that innovation problems are widely commented in science. The conducted review resulted in the choice of 70 articles for analysis, the subject of which their subjects was focused on the issues discussed in the study, in particular stimulants and destimulants of innovation.

Table 1: Publications in the field of innovation in databases in the years 2010-2020 "innovation and cooperation and digitalization"

Years	WOS	Springer	EBSCO	SCOPUS
2010	0	36	0	0
2015	2	94	2	1
2017	5	352	3	5
2018	6	505	7	8
2019	13	809	12	13
2020	0	330	0	0

Source: own study

The conducted studies revealed that in knowledge-based economy it is non-financial factors that play a key role in enterprise value creation.

The empirical research results presented in the study were focused on the identification of intangible factors determining the current and future increase of the company's value, with a particular focus on the field of innovation.

Bearing in mind the need to concentrate processes and activities in a company on the creation of value for the customer, while securing the company's interests, these factors were analysed with regard to changes on the market, including changes in the attitudes and behaviour of customers.

The identification of factors was based on investigations carried out by experts representing the managerial staff of companies in the brewing industry (25).

In the analyzes carried out in 2011/2012, the experts represented 3 brewing companies whose combined market share exceeded 80% in both analyzed periods (15 experts). In the analysis of repetitions concluded at the turn of 2018/2019, an expanded group of experts and managers representing the group of beer producers (average availability). 10 managers with the participation of companies were invited to the group of experts.

To take advantage of the offer of invited related experts involved in building accessibility strategies, including: related marketing activities, finance, production, logistics and sales transactions. In the analyzes carried out in 2012, each of the above services represented 3 people, employed in various companies (research 2012). A similar selection of actions in the process carried out in 2018/2019.

Such selection of experts, allowing the identification of intangible values of data value increase, with extended various attribute coefficients assigned by persons representing different ranges of availability.

Performing the operation of including the results in the analysis of references to results carried out on the basis of literature studies, as well as other studies that are studied, and then analyze the results. As a result of the consultation, a questionnaire was developed, which was used in the course of applying the research.

The conducted research has resulted in the identification of 41 factors which in the experts' opinion determine the current and future increase in the company's value. These factors were divided into two leading groups: external (a total of 21) and internal (20) factors. Next, based on the concepts

contained in Balanced Scorecard (Kaplan and Norton, 2002) within each group the following factors were distinguished:

1. factors directly connected with relations with recipients (16 – area of customers) and relations with suppliers (5 – areas of suppliers and supply markets),
2. factors focused on the field of processes and innovation (12) as well as human resources and management (8).

This provided a basis for creating a questionnaire in which the same group of experts was presented with the distinguished factors in terms of their current and future significance for creating the company's value. The evaluation was conducted using the 5-point Likert scale, in which 1 indicated an insignificant factor, and 5 – a very important one. The reliability of the form was assessed with Cronbach's alpha, which in this case reaches 0.95. The questionnaire was used to conduct similar studies at the turn of 2011 and 2012 and at the turn of 2019 and 2019. In repeated studies, managers had the possibility of adding a factor which in their opinion should be taken into consideration as a determinant of creating the current and future value of a company. Therefore, the number of identified factors rose to 44. It is worth noting that the new factors were related to the area of both customers and innovation, while at the same time they referred to the most desirable competences.
The research results were subjected to statistical analysis based on the ANOVA test. This allowed for identifying the factors which in a given period are crucial for the implementation of directions beneficial from the perspective of value increase and for the methods of implementing the innovation processes.

Research results

Determinants of value increase for brewing industry companies in the field of processes and innovation.
Factors that determine non-financial factors of growth in a company's value were divided into four groups. The ranks assigned by experts to factors describing individual groups allowed for the ranking of these areas. The evaluation conducted in 2012 clearly indicated the increasing significance of factors describing the sphere of innovation and processes in the building of enterprise value (Table 1). The average rank assigned to this sphere increased by 0.41, while the average rank assigned to factors describing the customer area increased by a mere 0.16. (Table 2)

Table 2: Ranking of factors determining the value of an enterprise by area

Average ranks	Studies 2011/2012

Source: own study

In the presented research results, the area of processes and innovations has been described by a set of twelve factors (Table 3).
The group of the highest rated factors determining the current growth in enterprise value included: product and process quality (4.67±0.47), service and product error rate (4.33±0.70), revenues from the sales of previous products (4.27±0.57), investments in R&D (4.27±0.68) and order lead time (4.13±0.81). In the experts' opinion, the importance of the above mentioned factors in the building of the future enterprise value will increase.

Source: own study

This statement is not true for the third of the quoted factors (revenues from the sales of previous products). In the opinion of the experts, the significance of this factor will decrease. The production capacities of the analysed enterprise allow concluding that the future value of the company should be correlated to product innovations. The validity of this conclusion is confirmed by statistically significant differences in the evaluation of the rank assigned to these factors, such as: revenues from the sales of new products (p=0.006), share in the sales of new products (p=0.0023) or the number of new products (p=0.004). The growing importance of this factor means, in consequence, the need to extend the sales offer. As a result, the significance of this factor was also reflected in the set of factors describing the customer area. In the analysed area, one of the factors identified by experts was product mix width. (Table 4).

Source: own study

It should be emphasized that although experts' opinions on the current importance of factors such as the number of new products (innovation area) and product mix width were different (p=0.0408 and p=0.048, respectively), no significant differences in the creation of future enterprise value were revealed by the Anova test. The average rank of the indicated factors increased by 0.8 and 0.6, respectively. Therefore, the experts agreed that the future strategy of the enterprise should be based on product innovations. The implementation of this goal involves the need to invest in R&D, or the acquisition of licenses or patents. In both cases, differences in assessments in the examined perspectives turned out to be statistically significant (investments in R&D - p = 0.023, number of patents and licenses - p = 0.017).

The conducted studies also revealed an increased significance of the following factors: order lead time, level of production capacities utilization, average service response time. Experts see the necessity of introducing product innovations as well as process innovations. These innovations will be focused on the optimization of three process parameters: time, quality and costs; they translate into: product and service image, brand image, customer satisfaction, customer retention, brand value, and, finally, relations with customers (fig. 1).

(N- nowadays, F - in the future)

Fig. 1 Innovations in the creation of value for the customer and enterprise

Source: own study

The conducted research results allow for outlining a strategy, that is, a manner in which enterprises in the branch subjected to analysis are going to create their value. Another research based on the above quoted questionnaire was conducted at the turn of 2018 and 2019. In the majority of cases, it did not

reveal any statistically significant differences between the rank assigned to the indicated factors in the period of previously conducted studies. The rankings of factors did not change either. However, it is noteworthy that although the enterprise value increase is related to a number of new products and revenues from their sales, its rank remains on the same level. The factors indicated by experts extending the previously created questionnaire also turned out to be interesting.
The vast majority of the experts pointed to: the creation of platforms enabling interactive contact with customers, the necessity to develop digital competences, the use of social media for communication with the market, or references, recommendations and ecological activities as separate factors determining both the current and future value of an enterprise.

Summary

The research results clearly demonstrate that managers were aware of the fact that the strategy concentrated on profitability, costs and enhanced efficiency by improving internal processes and activities was not and could not be the only way of acquiring customers. They saw new possibilities in product innovations that would enable extending the range of products so as to satisfy the needs of a wider public, while at the same time creating chances for filling market niches. This course of action turned out to be right.
After EURO 2012, the beer market in Poland stabilizes. The product offer is extending. Consumer preferences are clearly shifting towards low-alcohol and flavoured beers, which is also influenced by the actions of producers themselves, who try to implement CSR concepts (Monitoring Branżowy, 2017; Caputa 2013).
Product innovation very quickly translated into the filling of market niches and extending the market offer. However, customers were not only given a possibility to choose, but they also received support limiting the risk of taking a wrong decision. The development of the Internet and information technology enabled them to obtain and send information as well as creating virtual communities (Harter et al., 2012). Such a situation is both an opportunity and a threat to the enterprise. This has been noticed by experts, who, extending the set of factors given in the assessment, clearly indicate the need to create and use the potential of the web. In the conditions of progressing digitalization, this course of action determines not only the process of innovation implementation, but also the way of building relations with customers (Harter et al., 2012).
In a flat world, where the place of production has nothing to do with the place of consumption, and the multi-dimension relationship with the customer is increasingly often based on the transfer of information in a “man-machine”, “machine-man”, or even “machine-machine” system, it becomes impossible to establish traditional relations (Kotler and Caslione, 2009; Manu, 2012; Dornberger et al., 2018).

This, however, does not change the fact that the unique value for the customer must comprehensibly solve the customer’s problems at a given time, or even at the moment when the customer makes purchasing decisions. All this means that accurate definition and effective creation of a distinctive value for the customer requires not only systematic acquisition of information and knowledge from the customer and building one’s own competence resources on this basis, but it also necessitates engaging the customer and other stakeholders of the company in the process of value creation (Storbacka, et al.,1994; West, et al, 2006; Bruhn, 2001; Krafft, 1999; Arbor, 1995). Such activities are a foundation of customer’s real loyalty, which among others provides protection against activities of competitive enterprises. It should be emphasized, however, that it can only occur when both sides expect to win (Kotler and Bliemel, 2001). Customer engagement in the process of value creation should entail a reward for the contribution made. In consequence, the customer not only wants to be a co-author of the value, but also its co-owner, who is entitled to receive adequate benefits. He/she demands a fair distribution of the value not only as a customer, but also as an employee, supplier, business partner and a member of society. Thus, the enterprise’s willingness to share the generated value becomes the subject of evaluation. In our view, this is a fundamental problem, especially for brewing market leaders, whose strategies of operation, despite declarations, are still corporate in nature rather than relation-based.

Abstract

Fire disasters occurred in developing countries and developed countries including Indonesia. The frequency of peatland fires has increased every year. Thus, communication is needed to support disaster mitigation program. One form of communications is the mass media. The mass media can serve as an early warning system and education for the community. The purpose of this research is to provide an overview of the disaster communications to support mitigation wetlands fire in the future by applying research methods study literature and text analysis framing the news on disasters both in print and online media. The findings of the study reveal that disaster communications can support peatland fire mitigation with the government's support in providing information on fire disaster. Optimization of disaster communications in an integrated manner is essential in disaster mitigation. Successful disaster mitigation is expected to minimize the peat fires in the future. Synergy of mass media and the public are also indispensable in the distribution of fire disaster information.

Keywords: Disaster Communications, Fire Mitigation, Peatland.

Introduction

Climate change is a challenge in developed and developing countries (IPCC, 2014). Caston Broto and Bulkeley, 2013; Warmsler et al, 2014 states that cities play a higher considerable role against climate change. Research development of climate mitigation policies ranging city continues to grow (Gopfert, 2014; Reckien et al, 2014) and climate change can lead to disaster all over the world which is interdependent (Masozera et al, 2007;Juneza et al, 2016).

Fire is one kind of disaster due to climate change. Mitigating climate change is one of the strategies to address future fire (Christian G et al, 2019). Society, scientific institutions, political institutions of local and international scale began to discuss the existing strategy (McKibbin and Wilcoxen, 2003; Laukkonen et al, 2009; Locateli 2010; Schule and Lucas, 2011; Dymen and Langlais, 2013). The synergy between policies, strategies and measures are to mitigate the more important scientific and practical effect (Goklany 2007; Moser, 2012; Landauer et al, 2015; Sawert, 2016; Zentrum Stadnatur

and Klimaanpassung, 2017). More and more research on climate mitigation plans and strategies will greatly assist in the mitigation of disasters (UN-Habitat, 2014; Reckien et al; 2015; Runhaar et al, 2017).

Indonesia is a developing country that is prone to various types of disasters including fire (Wardyaningrum, 2014). The frequency of catastrophic fires increases every year that requires serious treatment as the country is the location of most Reduction of Emissions from Deforestation and Forest Degradation (REDD+) projects (Rajiani & Pyplacz, 2018) as well as to manage people in preserving the environment (Mohtar & Rajiani 2016). Catastrophic fires generally occur every dry season where South Kalimantan is an area that is prone to peat fires (Wahyu et al, 2004). The problem that often arises is that every area is not prepared for disasters (Badri et al, 2008).

Information and communication are important needs for people in disaster-prone areas including fire disasters (Juneza et al, 2016; Risduansyah, 2019). Communication is the process of delivering a message that can be as formal as in the dissemination and extension (Flor and Cangara, 2018; Kamil, 2018; Bayu et al, 2019). Information and communication is not a problem anymore in line with technological developments. The rapid development of technology makes people innovative (Sartika et al, 2019). Innovation is to get news information and literature. Media information such as online media is more advanced than simply pass information to the media with business competition. Business situation is unique and competitive synergy with advances in internet and technology (Sarbaini et al, 2019; Rajiani & Ismail, 2019).

Sharing information and knowledge on disasters and mitigation is crucial. The introduction to the disaster or disaster information is needed to minimize the impact of post-disaster (Rahman, 2012).The lack of communication and coordination in disaster management impacts the rehabilitation and reconstruction. Disaster communication studies during emergency response in order to accelerate the process of construction and rehabilitation, is very important (Lestari et al., 2018). Innovations in disaster mitigation activities, especially in communicating to the public (Abbas et al., 2018) are needed besides the communication network in all phases of disaster mitigation (Wardyaningrum, 2016). As such it is necessary to do research with the aim provides an overview of the disaster communications to support mitigation wetlands fire in the future.

Literature Review

Media properties are able to reach the masses in large numbers and wide (universality of reach), as well as the public are able to give popularity to anyone who appears in the media (McQuail, 2000). Facts show with the development of technology it is easier for social interaction. Online media that is able to convey messages quickly and is able to influence society. Events there then framed media online and then delivered as quickly as a necessity to society.

Online media is the result of a study of communication technology that offers to users as a medium that acts as a communication tool. Online media can accommodate such news e-journal article. Online can be defined as the language of the internet, which means the information can be accessed anywhere and anytime as long connected to the Internet network (Aisha et al., 2015). The basis for researchers choosing online media as the object of research is based on data from the Ministry of Communication and Information (Communication and Information) in the year 2010 showed 39 million of 245 Indonesians were internet users and 64% of them are young people aged 15-19 years. This data shows that young people have great access from the internet. This statement is also supported by the fact that customers state that accessing the internet via mobile phones reaches 25 million customers. (Siregar, 2016).

Media communication as a means of supporting the disaster information system has an important role in preparedness and early warning to the public. (Lestari et al., 2018). Disaster communication carried Online Media consists of peat land fires related information and education on disaster mitigation (see Figure 1). In the study, only four online media were studied, because the four online

media selected in this study were sufficient to represent the whole of the news that appeared in the media related to information on forest and peatland fire disasters.

Figure 1: Communication Disasters

Method

This type of research uses qualitative and descriptive approach. The collection of data is through documentation study by collecting news text purposively. The unit of analysis is the news about the peat fires in South Kalimantan. The media selected is Kompas.com online media, Barjamasin.tribunnews.com, Cnnindonesia.com, and Republika.co.id in September and October 2019 (see Table 1). Determination of criteria for the month included the peak occurs peat fires in South Kalimantan. The reasons for selecting media for the four media are some of the online media concerned with fire-related news. In addition, news in the online media have good news standards according to the rules of journalism.

Table 1: Variable Research

Purpose	Variables	Data collection
Disaster Communications to support the Fire Disaster Mitigation Wetlands in the Future	Kompas.com	Secondary Data
	Banjarmasin Tribunnews.com	Secondary Data
	Cnnindonesia.com	Secondary data
	Republika.co.id	Secondary Data

Source: Walgito 2003; Sugihartono 2007

Framing analysis techniques apply analytical models Robert M. Entman. Analysis framing is trying to uncover the disaster communication in online media. The concept of framing to describe the selection process aspects of fire disasters wetlands constructed reality of the mass media (Eriyanto 2011; Asteria, 2016). The study uses the element of credibility which the observations in the study is based by taking reference from books and previous research credible used as a reference (Asteria, 2016). The researcher choose Entman framing device because the device is able to assist investigators in describing the disaster communications conducted by online media. Framing is seen as the placement of information in the context of more specific so that the issues addressed obtain a larger portion of the other issues (see Table 2).

Table 2: Analysis of Framing

Define Problems	The first element as master framing. Here, we can see how an event is understood. Whether the news is positive or negative.
Diagnose Causes	Find and estimate the source of the problem. This dimension seeks or seeks to know how the event is understood, occurs and what or who is considered to be the source of the cause.
Make moral judgment	An assessment of the moral values of used to legitimize or argue for an action or idea being made
Treatment recommendation	What efforts or solutions are offered and done to resolve the problem. This settlement depends on the issue and who the caused the problem (the first element)

Source: Eriyanto 2011

- Define problems or define problems, that is to determine what agents do with prices and profits, generally measured in the form of cultural values.
- Diagnose causes or diagnose the cause that is identifying the strength of creating the problem.
- Make moral judgments or make moral judgments, namely evaluating causal agents and their effects.
- Suggest remedies offer and assess treatment for various problems and predict the same effects.

The author uses the four dimensions of framing analysis above because based on these four dimensions, in conducting research related to the construction formed by the media can cover the problems discussed in the news to the possible effects arising from information disseminated through the media.

Results and Discussion

The study examined how the media do framing news of the disaster in wetlands. The mass media are researched online and print. The study was conducted from September and October 2019 for the month is the peak of the fire in the wetlands. Fires that occur in the month a lot happening in the area near the airport so as to disrupt flights. The media's role is indispensable in providing Early Warning System. The media's role is to frame the news about the fire disaster (see Tables 3, 4, 5 and 6).

Table 3 is the result of analysis on a daily compass framing. The results show a compass newspaper more news about a fire that occurred in the area near the airport. Framing Entman based approach illustrates that the direction of the news of Kompas.com in the framing of fire-related news. Fires emphasize largely a community role. Kompas.com successfully framing to resolve cases of fires should begin to change people's habits in interacting with the environment. Kompas.com also more interested in preaching the impact of the fires that disrupt public facilities in the public area.

Table 3: Framing Analysis on Media Compass

Title News	Date	Time	Explanation
Despite mobilizing 5 Heli "Water bombing", the smoke from wildfires begin to cover the airport in South Kalimantan	5 September 2019	13:48 pm	Land and Forest fires in South Kalimantan are widespread. What was done to anticipate this, five water bombing helicopters were deployed by BPBD of South Kalimantan to extinguish.
Land and Forest fires in South Kalimantan Threatens Aviation Traffic at the Airport	13 September 2019	11:34 pm	Smoke haze as a result the forest fire encroached the airport and 6 points in the city Banjarbaru fire spread
WALHI call *karhutla* (Land burning) occurred because people do not want to adapt to the natural world	21 September 2019	13:53 pm	Land and forest fire as a result of the attitude of man. People do not want to adapt to nature, especially with peat. Ecosystem. The campaign of WALHI said that peat ecosystem that is occupied with the approach adaptive are not going to like a forest fire**.**
BNPB: widespread land burning achieved about 857.000 hectares	22 October 2019	15:46 pm	The head of the data information and communication disaster of BNPB, Agus Wibowo stated that The same area of land burn in the entire territory of indonesia reached 857.000 hectares. This figure identified from January to September 2019.

Source: Primary Data, 2019

Framing Analysis on Media Banjarmasin Tribunnews is a fire that occurred in the area around the airport and a few other areas in South Kalimantan (see Table 4). Analysis of framing used approach *Make moral judgments* taken from the model framing Robert Entman. The analysis showed Media Banjarmasin Tribunnews in news framing emphasizes humane touch in fire-related news. Banjarmasin Tribunnews trying to show the fires, the penalty for burning and deliver the message to the reader so that it will form a new information and opinion in the community is more than just the fire.

Framing Analysis on Media Republika in Table 6 provides information on the extent of land burned near an airport is quite extensive. Online Media Coverage in the Republika very informative, backed by further strengthen the image information for the reader to be visualized condition Forest and land fires in South Kalimantan province. Conditions seen from *treatment recommendation* already covered in the news media, where one of the articles describe government South Kalimantan Province has been determined to deal with fires. Fire mitigation is done by presenting team of experts to investigate and find out the root of the problem and solutions fires.

Table 6: Framing Analysis on Media Republika

Title News	Date	Time	Explanation
In Picture: Peat fire reached population areas	14 September 2019	23:59 pm	The same area of land which is burned in south Landasan Ulin, Subdistrict of liang anggang, in the form of brushwood predicted about 400 hectares
People homes are prevented in Banjarbaru peat fire	21 September 2019	20:40 pm	The task force land and forest fire of the forestry office south Kalimantan used a syringe peat while trying to extinguish fires peat in Syamsuddin Noor area, Banjarbaru, South Kalimantan

Local police forces in South Kalimantan bring a team of experts ipb to check karhutla (Land burning) in corporate	25 September 2019	22:55 pm	Local police forces in South Kalimantan Polda bring a team of IPB's experts to an inquiry land and forest fire.
In picture: Karhutla (Land burning) in South Kalimantan burned the house of residents	23 October 2019	23:34 pm	Land and forest fire in South Kalimantan not only burn the forest and shrubs Subdistrict of Gambut, Banjar Regency, Kalsel, Tuesday (23/10) but also Burned the house of an urban center far from fire location.

Source: Primary Data, 2019

Results of several media framing is emphasizing the role of the government to anticipate and cope with the impact of fire disasters occurring wetlands. Fires lead to people losing good material, safety and health. Emphasis important value in some media that there is:

a. Coverage compass describes a fire broke out at most in the area near the airport and consequences of human behavior;
b. Tribunnews explained fire broke out in the area around the airport and a few other areas in South Kalimantan. Severe punishment will be given to arsonists;
c. Cnn Indonesia explained that the fires occurred near Syamsudin Noor Airport and near to residential areas. Fires disrupt flights and endanger public health. Special forces set up to extinguish the fire;
d. The mass media Republika burnt land near the airport reached 400 hectares. A team of experts for the investigation was imported by land and forest fires. Fire fighting with a syringe peat.

Photos in some mass media emphasize the impact of fires information affecting aviation and public health. The fire occurred around the airport and close to residential areas. Besides the photos also give information to the fire-fighting effort peat injecting technique (see Figures 2 and 3). The problem that arises is the presentation of the photos is not yet supported by the geographical location information so that the reader guessing if the location near the airport. In addition caption on the news that there is still in general.

Figure 2: A Photograph of peatland fire suppression with peat syringe technique in the area of Syamsudin Noor Banjarbaru, South Kalimantan in Republika, September 14, 2019 (23.59 GMT) (Pic: ANTARA FOTO)

Figure 3: A photograph officers BPBD South Kalimantan with MPA extinguish the fire in peat near the Airport Syamsudin Noor on CNN, September 13, 2019. (14.46 GMT) (Foto: ANTARA FOTO/Bayu Pratama)

Conclusion

a. Online media is the object of studies that have provided impartial information related to news Fires in Wetlands
b. Emphasis framing on each of the different media is appropriate from media perspective,
c. Socializing is needed by society as a medium of information to determine the extent of catastrophic conditions that occur in an area.

Abstract

Mergers among public universities have been taking place in recent decades just as often and on a larger scale as private universities. However, many management processes related to mergers of public universities vary between public and private universities. One of such cognitive and practical gaps in managing university mergers is brand management in both public and private universities. The aim of the article is to examine various strategies, methods of managing university brands in merger processes, as well as differences between public and private universities in the field of brand management. The research methods will be: literature review and comparative analysis of 3 cases of mergers of universities implemented in two European countries in the years 2000-2016. Mergers of private universities, according to the literature on the subject, are more conditioned by economic goals and implemented using business methods of brand management. In the university sector we are dealing with both acquisitions and mergers. However, the term fusion is more often used for public universities, as usually the merger of universities does not change radically the founding and ownership structures. Public mergers have their own characteristics that are different from private universities. They occur quite often in recent decades as the implementation of public policies. They have various goals, including: qualifying for world university rankings, strengthening their position in international research networks, increasing the efficiency of university management and increasing the quality of education.

Keywords: Brand, University Mergers, Brand Management, University Management

Introduction

"Merger mania" in the higher education institution sector has been an ongoing phenomenon in numerous countries for a few decades and in other educational systems consolidation experience dates back one hundred or even more years (Sulkowski, 2017). Mass merger programmes have been or were implemented in, e.g. China, the Republic of South Africa, the USA, France and Norway. Strategic mergers among large public higher education institutions, in their turn, are implemented in many countries. This has happened in Finland, Sweden, France and even in Vietnam (Pinheiro, Geschwind, Aarrevaara, 2016). In most countries the consolidation of higher education institutions is implemented at the bottom-up level but tendencies for mergers between higher education institutions at the central level reflected in public policies are also visible. Moreover, in certain countries, e.g. in the Republic of South Africa, Russia, China and Norway, top-down consolidations, which create more controversy, occur (Karodia, Shaikh, Soni 2015). Thus, the objectives of mergers are diverse and may include becoming "world-class universities", the rationalization of education and research networks and restructuring aimed at increasing the effectiveness of the educational process (Cai, 2016). Improving

the access to and quality of higher education targeted at disadvantaged groups may constitute a specific objective achieved thanks to mergers. This has been the idea of the higher education consolidation and transformation in the Republic of South Africa.

There are several reasons why brand management is of strategic importance in university merger process. One perspective is that university brand is significant for students and other stakeholders as it influence international and national recognition of universities (Sulkowski, 2016). Consolidated universities, that used to be separate institutions, now operate under one name in national and international rankings. The name of the university contributes to the creation of its image through the message reflecting the identity of the university. Cultural dimension of the university brand adds to the identity of the very organization, its staff and contributes to building the external image of the institution (Sulkowski, Seliga, Wozniak 2016; Sulkowski, Seliga, Wozniak 2018). Academic world is increasingly recognizing building reputation through intensive communication, marketing and activities related with internal branding (employer branding). Concepts such as brand and image are close to reputation, they are also associated with culture and organizational identity (Aula, Tienari 2011). All these areas of the activity of universities are subject to deep transformations in mergers and acquisitions. The concept of brand, although important for many different aspects the activity of the organization, is usually analyzed on the grounds of marketing.
The aim of the article is to show the role and importance of the university's brand management in the process of merger of higher education institutions. The article provides a review of the literature and positions contained in the literature on the subject and contains case study comparative analysis of three cases of brand management of HEI's.

Literature Review

According to the American Marketing Association (AMA), a brand, is "a name, term, design, symbol, or any other feature that identifies one seller's good or service as distinct from those of other sellers" (AMA). H. Mruk presents a different approach to this concept - the brand can be particularly identified with the notion of a trademark (Mruk 2002). Also, the concept of brand is combined with the product (Altkorn, Kramer 1998). Clients who make the decision about choosing a university increasingly take into account the value of the brand, the benefits that may result from receiving the final degree. The Aaker model can be used to verify the value of the brand. This model assumes five basic elements related to the brand's value: brand relationships, other brand-related assets, loyalty, brand awareness and perceived value of the brand.

Other assets related to the brand include for example certificates, accreditations, signed cooperation agreements, where accreditations and certificates reinforce the name, logo and brand. Loyalty is manifested in the attachment to the university through brands directed to the society, students and employees that shape ties with the university. The practice of implementing loyalty programs among students and graduates is more and more common in higher education sector. Brand awareness is the brand recognition, the number of associations with a given brand are analyzed, the bigger it is, the stronger the brand's position is. In the case of universities, these may be such features as: top quality of education, a diploma that is recognized in the labor market, good infrastructure for studying, professional scientific and didactic staff, but it may also be a well-known sports team for example. As far as perceived value of the brand, in this case the perception of the university as an institution that offers products and services is measured. It very often happens that the perception of the quality of education at a given university is a determining factor of the choice of a particular university (Sulkowski, Seliga, Wozniak 2017).

The position of the brand depends largely on the way in which consumers perceive the quality of a given brand, its advantages and disadvantages, price and value (Dibb, Simkin, 1993; Ries, Trout 1993). More and more often producers of the highest quality products must introduce elements that distinguish their product from the competition – the ranks of the growing number of international brands (Agrawal et al. 2011; Morhart, Herzog, Tomczak 2009; Henkel et al. 2007; Kaufmann, Cajthaml, Meier 2007). The

same happens in the higher education sector. Universities are seeking to obtain international accreditations from foreign, sectoral and international partners in order to differentiate themselves from other schools on the market (Hogan, Lucke 2006). Higher schools attempt to measure the satisfaction of students and graduates regarding, for example, the quality of education or conditions at the university by means of quantitative methods (e.g. surveys) and qualitative ones (such as in-depth interviews). The research outcomes are used not only to verify the university's management methods, but also to assess the effectiveness of marketing activities carried out by specific organizational units.

The university's brand also has a direct impact on the university diploma. In the literature of the subject, attention is drawn to the four terms of the brand, which can be successfully applied to both the university's brand and its diploma. According to D. Antonowicz, M. Krawczyk-Radwan, D. Walczak, the brand can be distinguished as: a utilitarian sign, a commercial sign, a social sign and a cultural sign, a sign that reflects a certain symbolic, but also mythical value of the product (Antonowicz, Krawczyk-Radwan, Walczak 2014).

The practice of management distinguishes four basic brand strategies: individual brand strategy, family brand strategy, common brands for product groups and mixed strategies. Individual brand strategy is characteristic for individual products with different brands. In the brand family strategy, all products of the company enter the market under one brand. In this strategy brand functioning involves lowest costs. Common brands for groups of products is a strategy based on entering a group of products under one brand. The mixed strategy with respect to the brand is, among others connected with combining the brand itself with the name of the company.

Methodology of Research

The research methodology used is qualitative and is based on a comparative analysis of enterprises case studies. The sample of enterprises cases was selected deliberately, the selection was based on the following criteria: data availability, literature on the subject and authors' experience. The sample is heterogeneous because different university cases are compared, both by type, size and country. The selection of qualitative data for comparative analysis was conducted with the use of the following techniques: free interviews with a list of open questions, documentation analysis, participant and non-participant observation, as well as autoethnography (the universities described are the places of work of the authors of the article) (Sulkowski, 2013).

Conducting comparative studies, based on comparative analysis of case studies, serves to better understand the dynamics of personnel processes at universities and is the starting point for further explanatory research.

The study was carried out in 3 stages leading to an attempt to solve the research problem and answer six research questions formulated in the introduction to the monograph.

Stage 1. Conceptualization, preparation of research methodology and piloting.

Stage 2. University case studies.

Stage 3. Comparative analysis of university case studies.

In the first stage, based on the literature analysis, the problem and research questions were formulated, research methodology was planned, free interviews were conducted and appropriate research tools were prepared. After a series of 3 free interviews conducted with key informants at three universities and a preliminary analysis of documentation, research areas, research indicators and questions the interview questionnaire were formulated. The research tool in the form of an interview questionnaire consisted of 5 open research questions, which were used to conduct an in-depth interview in the next stage of the research. Already in the first stage, a targeted sample of 3 cases was identified *a priori*.

The structure of the sample was based on two criteria: 1) secondary data allowing to describe the personnel processes at universities, 2) availability and possibility of obtaining data in primary research.

In the second stage of the research, qualitative study was conducted, based on the methodology of grounded theory, including: in-depth and narrative interviews, documentation and text analysis, as well as participant and non-participant observation. The research methodology uses the methodological assumptions proposed as part of grounded theory, which allows for deep exploration of the problem, while maintaining methodological rigor (Glaser Strauss 2006). The methodology of grounded theory can be described as "qualitative comparative analysis of case studies" (Baxter, Jack 2008). The method used allows for careful generalization of the results, while maintaining: methodological pluralism, openness, reflectiveness and flexibility of grounded theory (Sułkowski, 2013). Methodological triangulation is to be achieved through the use of a multitude of complementary research methods and techniques. The most important ways to collect data are: in-depth interviews, participant observation, non-participant observation, documentation analysis, auto-ethnography (stage 2).

The organization of the third stage of the study involved study visits at universities (observations), collecting documentation and 3 in-depth interviews. Some of the interviews were conducted directly, in other cases they were done on the telephone or online. Case studies, prepared according to the assumptions of the "thick description", were subjected to comparative analysis (stage 3). Primary and secondary data from the study and the literature were used for this analysis. An attempt was also made to provide an initial answer to the problem posed and research questions that were discussed with three participants in previous studies.

Results and Discussion

Jagiellonian University

The example here is the 1993 incorporation of the Medical Academy into the Jagiellonian University. Because of its history and its significance in Polish culture and national identity, the name and symbolism of the Jagiellonian University are invaluable. It is symbolic capital that could and should also be used to make the university a global brand. Until now, the Jagiellonian University has been better recognized by the letters ‘UJ’ (for its Polish name, Uniwersytet Jagielloński). Interestingly, apart from preserving the brand of the Jagiellonian University, which is probably the strongest university brand in Poland, the internal and dual branding of the Collegium Medicum was created. This worked in favour of both organizational continuity, and the organizational identity of the former Medical Academy.

The Université Grenoble Alpes

This example of rebranding is the creation of a federated university in France at the beginning of 2016. The Université Grenoble Alpes was founded in Grenoble with the merger of three universities in the region. The creation of its new branding was accompanied by similar dilemmas as the Aalto University. The branding was new, which meant initially low recognition. Employees of the merging universities may have had a sense of acculturation and loss of continuity. The name of the university was thought up from scratch, which allowed use of the concepts of effective marketing communication and public relations. It is a simple brand, easy to remember and readable not only in France, but also in many other cultural contexts. The name and logo of the university are rooted in the local context, which at the same time has a significant level of recognition in the global context. The Alps evoke an unambiguous association with one of the most beautiful and culturally interesting regions of Europe. The logo is minimalistic and shows the mountains drawn with one line. From the marketing point of view, the new branding and logo of the consolidated university provide a basis for success, although of course the success of the merger depends on many factors, most of which are unrelated to communications.

University of Social Sciences

An example of brand building through mergers of universities in the non-public sector is the University of Social Sciences. It is a university that occupies leading places in the rankings among Polish non-public universities and is one of the largest non-public universities in Poland. This university, due to the adopted strategy of territorial diversification and a highly recognizable brand, successfully conducted the merger process by taking over a local university (University of Business in Kielce, Department in Tarnobrzeg) with a significant position in the region in 2016. As a result of the acquisition, the acquired university adopted name and logotype of the Social Academy of Sciences. In this way, USS recognition on the new local market was strengthened.

Comparative analysis of three cases

Table 1: Comparative case study analysis

Criteria	Université Grenoble Alpes	Jagiellonian University	University od Social Sciences
Brand strategy	New	Old	Upgrade for stronger HEI
Brand creation	Competition, consultations, voting, approval of: Presidents, senates, Ministry of Education	Traditional, approval of: rectors, senates, Ministry of Education	Academy status, approval of: founder, rector, senates,
Stakeholders' participation	High, open consultations and voting	Limited, 'obvious choice'	Limited, 'obvious choice'
Image of the university	New regional association – the Alps, reference to tradition (U de Grenoble)	One of the oldest universities established by the kings, proof of the historical might of Poland	New regional university
Conscious choice of brand strategy	Yes, branding based on managerial objectives	Partially, striving after re-integration	Branding based on managerial objectives
Participation of the 'weaker partner'	Very high, joint consultations and decisions	Considerable, joint consultations and decisions	Limited, expressing opinions
Criteria for brand selection	1. A compromise between stakeholders 2. Image enhancement 3. International recognition	1. A compromise between stakeholders 2. 'Unification'	1. Decision of the stronger partner 2. Image enhancement through acquisition.

Source: own study

Analysing the results, one can also identify the overall strategy of the entities in question. Public universities merge in order to increase their scientific potential, and in consequence improve their positions in international educational rankings. Non-public universities merge in order to diversify their educational programme in terms of territory, and to strengthen their position in the national (local) sector of higher education institutions. Both strategy types are closely linked to development of the university's brand. The analysis also found major significance in the work of HEIs creating the brand image of a new university. The university's brand image, the awareness of it and its value are all particularly important when thinking about initiating a merger. The research demonstrated that these are some of the main criteria adopted by a university's authorities when selecting their merger strategy. When describing brand management in mergers of public universities, the point of reference should be the stakeholder model. A newly-merged university's name is a compromise between different internal and external stakeholders. Brand management in public universities also reflects the merger type, and so the branding strategy references the consolidation strategy. At the other end of the scale are integration mergers, as a result of which two or more HEIs create one organizational entity under one brand. An example of this from the research is the University of Social Sciences in Łódź. The typical branding strategies selected by public universities are maintaining the previous, usually stronger brand, and the umbrella brand strategy. Both cases can lead to strengthening of the brand awareness of the new university and its position in the international environment. The most important criteria for HEIs choosing a branding strategy include: compromises between stakeholders, mostly internal; image enhancement and better brand recognition, and strategic allocation of the university's existing resources to strengthen its position in the global scientific and research context.

Conclusions

The importance of mergers in the university sector is increasing in many countries. Public universities participate in consolidation processes due to the possibilities of: implementation of public policy, moving up in national and international rankings, rationalization of science and education networks, and strengthening economies of scale. The reasons for the popularity of consolidation among private universities are market and organizational sources. Thanks to mergers, private universities can achieve economies of scale, and in the case of many smaller schools, which face lower demand for higher education, avoid bankruptcy.

To sum up brand management contains: marketing strategy, branding (usually name of HEI) and partnership marketing. In addition there are different methods of brand management of HEI's depending on strategy and tradition. In our cases Jagiellonian University represent strong traditional name from medieval times that dominates the merger. Université Grenoble Alpes represent new attractive marketing name and logo, joining city name with main recognition point (Alps mountains). For described merger of two private universities, the name of stronger partner (University of Social Sciences) was dominant brand. To conclude, both for private and public universities, the name of a stronger and more prestigious partner of merger is chosen as name for merged HEI's.

How New Technologies Change the School Education

Piotr MIKIEWICZ

justyna.barzak@gmail.com

Abstract

Electronic devices, the Internet, artificial intelligence are elements of every person's life. The paper puts forward a dissimilarity between technologies for acquiring knowledge and technologies for learners to give an explanation for how technologies effect teaching and learning. The development and dissemination of modern technologies changes the context and way people function. The paper reflects on how sorts of technology application will form schools and learning.

Keywords: New Technologies, Information Society, Education, Curriculum

Introduction

From the point of view of the sociology of education, school education has a complementary function to that of the family in preparation for functioning in social life. Emille Durkheim (1984) pointed out that the purpose of formal education is to shape the moral community and prepare for the roles in the social division of labour. Earl Hopper (1971) on the other hand, pointed out that education has four key functions in modern society: competence training, selection on the basis of mastered skills, allocation in paths leading to specific social and professional positions and regulating aspirations of young people. From this perspective, education is a function of social demand - it is supposed to prepare young people to function in specific cultural (norms and values), professional (jobs to be undertaken) realities, which is connected with taking a specific place in the social structure.

The Role of School Education

The characteristics of the world to which the school prepares for set its tasks, which translates into the expected way of its work. This happens both through purposeful actions (the so-called overt school curriculum) and through non-intentional mechanisms, a kind of side effects of purposeful actions taken at school (the so-called hidden school curriculum).

What is more, technological development accelerates social and cultural change. Modern forms of communication are changing the nature of communication and redefining key social values and norms. A contemporary person must therefore be prepared to acquire new skills, not only technical, but also socio-emocional. This leads to an indication of the range of key skills necessary for the functioning of the contemporary world: *communications skills*, *the ability to learn independently*, *ethics and responsibility*, *teamwork and flexibility*, *thinking skills* , *digital skills*, *knowledge management* (see more: https://opentextbc.ca/teachinginadigitalage/chapter/section-1-3-the-skills-needed-in-a-digital-age/)

Technological development therefore changes the reality of school work. Moreover, the school is supposed to prepare individuals to function in a social world saturated with modern technologies, i.e. within specific forms of social relations possible and often enforced by modern technologies (e.g.

specific relations mediated by social media). Finally, modern technologies are a new instrumentation of school work - tools for working with students. How can we describe this change?

Technology Reshaping Teaching Process

New technologies are changing school reality by allowing teachers to use more attractive methods for students, using online materials and ready-made lesson plans. Not without significance is the possibility to consult with other teachers through social media. Dedicated educational platforms enable effective distance learning.

One of the most visible aspects of the implementation if the modern technology is the change of the dynamics of education, especially the relationship between teachers and students. Teachers are using technology to replace old models of standardized learning and create more personalized, self-directed experiences for students. There's more multi-device synchronization with software that supports collaboration and more support for virtual conversations, both within and beyond a classroom. Blended learning programs combine online and face-to-face interaction. Furthermore, it changes the wider educational community – as blended learning changes the role of the educator to become more of a facilitator and coach, there's a growing use of para-educators who work alongside teachers to manage online learning and help with classroom activities.

Teachers are responsible for managing knowledge of where students are and where they are supposed to steadfastly press; having insights into students' particular requirements and development; selections of curricular activities and materials; procedures that govern students' involvement; expectations from parents and communities; and the standards and guidelines that govern them as teachers.

The use of new technologies allows for the implementation of new pedagogy – it seems that technological saturation allows for a real transition from the traditional model of education, with the central role of the teacher as the owner of knowledge and responsible for passing it on, towards pedagogy focused around the student and his/her activity, staffing the teacher as a stimulator, coach, guide.

This corresponds to the importance of inter- and intrapersonal competences in education. The so-called *21st century competences* presuppose having skills in group work, effective communication, problem solving, perseverance, conscientiousness, etc. The methods of projects with the use of Internet resources, according to Finegold (2010), trowel in groups with the use of remote links are only the most common examples of this type of activities.

Generally speaking, education comprehends all technical innovations at its own slow pace. As it comes to IT, this process has gone fairly quickly. It is worth recalling the great organisational and financial effort that was needed to create IT labs at schools.

Technology Reshaping Learning

New technologies are therefore seen by educators as an opportunity for an educational revolution. Advanced technologies enabling the use of virtual reality in educational settings open new fields for the training of skills so far limited by the physical attributes of a given school - its location or equipment. Virtual reality enables "leaving school" and "entering" into the "reality" of the realm we are learning about. This creates conditions for education through immersion.

According to Collins and Halverson (2009) learning technologies have taken different developmental routs inside and outside of schools. Some technologies thrive in schools; other technologies that seem to argue the purposes of schooling now prosper outside of schools and bring to existence new learning environments, like home schooling, video gaming, or social networking sites. Virtual and augmented reality allows students to travel to ancient history, explore the universe and

visit museums in different countries without leaving class. One of the greatest achievements of such technologies is that they make science more engaging and inspiring. They allow us to change attitudes through engaging experiences. It is assumed, that these immersive experiences can contribute to faster learning.

Finally, the development of technology enables a progress of lifelong learning. The requirements of the modern world cause that education should not be something that is done in a specific institution for a certain period of time. Equally important is the fact that the labour market requires repeated retraining and adaptation to the reality of work, which is changing due to technological progress.

The world hit the digital age particularly hard in the last decade of the 20th century, triggering the sequence of events changing the nature of human's work and life. From the analog society the idea of digital society has been realised in a relatively short time. We are increasingly surrounded by digital products using the up-to-date electronic, information and communication technologies.

The Need for IT Preparation

According to amateur public and to a greater part of teachers, the term educational technology refers to the didactic use of computers, television, and other kinds of electronic hardware and software. Authorities in educational technology, especially college and university faculty who teach courses on educational technology, select the term *instructional technology* as it emphasises the instructional use of educational technology. Ely D.P. and Plomp T (1996) states that one of the main competent connotations characterising educational scientists, "*Instructional Technology is a complex, integrated process involving people, procedures, ideas, devices, and organization for analyzing problems, and devising, implementing evaluating, and managing solutions to these problems, in situations in which learning is purposive and controlled."* Educational technologists often make use of the expression instructional media to exemplify all of the devices that tutors and students employ to reinforce learning. As Molga (2003) states, the effectiveness of computer-assisted education determined by the expected attitudes, skills and knowledge, is tremendous and simply justifies the use of a computer. Furmanek (2011) points out that even the most flawless computers and the most genius software cannot replace a form of communication with a teacher who apart from knowledge, contributes his or her own personality and value system, which is related to the introception of values in the student. It means assigning value to one's own consciousness; approving as their own aims, standards and convention not created by themselves but recognised by the environment.The current paradox is that information and communication technologies that were shaped with a view to bringing people together actually move them away from each other.

Conclusions

To sum up, technological devices introduce a dare that educators cannot afford to neglect. Properly integrated into a regulated environment, these tools need not accomplish any dehumanization of the schools. Conventional teaching methods, classrooms systematised by grade level may let control over what is acquired, but not over what is learned. Hence, the schooling machinery must be entirely transformed. While the suitable sides of education's common methods must be preserved, the technology must be properly combined into a man-machine system.

Forecasting Electricity Prices in Poland

Jarosław KRAJEWSKI

WSB University in Torun, Faculty of Finance and Management, Torun, Poland,
jaroslaw.krajewski@wsb.torun.pl

Abstract

The aim of this article is to assess short term electricity prices in Poland and to compare the forecast accuracy based on ex post errors. We estimate the ARDL (autoregression models with distributed delays) models to calculate forecasts. The motivation to undertake the research is the demand for such forecasts reported by the wholesale electricity market in Poland. As a result of analyses for shorter forecast horizons, i.e. one and two-week forecasts, the simplest AR model gave the lowest forecast errors. For longer horizons, better results are obtained from model with additional variables.

Keywords: Forecasting, Electricity, Prices

Introduction

The history of the free energy market in Poland is not long and is associated with the raising the demand of demand for electricity and other fuels or heat due to economic transformation in 90's of 20th century. A turning point for full liberalization of the power sector was the launch of the Polish Power Exchange - Towarowa Giełda Energii S.A. at the end of 1999. One of the main tasks of the electricity exchange is to provide market participants with information on electricity and natural gas prices.

Knowledge of price forecasts on competitive electricity markets is crucial for wholesale consumers and producers in planning activities and managing risk and also plays a significant role in economic optimization in the electricity sector.

The purpose of the following paper is to determine short-term electricity forecasts and to assess their ex-post errors. The goal is achieved by using econometric regression models with distributed delays. The motivation to undertake the research is the empirical need for such forecasts reported by the wholesale electricity market in Poland.

Works, which are dealing with forecasting energy prices on the Polish stock exchange are, for example papers Fijorek et al. (2010), Ejdys et al. (2015). The forecasting of energy commodity prices is dealing by Śmiech, Papież (2015). There is a gap of comprehensive research which uses econometric methods to forecast electricity prices in Poland.

The Energy Market in Poland

The beginning of the liberalization in energy trading is associated with Chile in 1982, the next was England in 1990, the third Nordic market was developed in 1992. The first professional power exchange was called NordPool (Weron, 2006).

Electricity prices in Poland are mainly due to its listing on the Polish Power Exchange (Towarowa Giełda Energii - TGE). Energy prices is listed in the form of the next day's market index. From 2008, POLPX (Polish Power Exchange Index) also launched the Electricity Derivatives Market. Futures for the electricity supply allow to determine the price of electricity for a long time horizon. This allows sellers and large energy consumers to forecast prices and optimize their electricity costs. In 2010, there were significant changes in the structure of electricity sales in Poland. The so-called the "stock exchange obligation" and price setting method on the market became more transparent and the stock market became more important. Since then the producers were required to sell at least 15% of the energy produced on commodity exchanges. From this change, the price can be considered as a reference

price and began to function in Polish energy trading (Grudziński 2011). Currently, TGE is owned in 100% by the Warsaw Stock Exchange.

The longest-functioning market on the Polish Power Exchange is the Day-Ahead Market (DAM). This market was created on June 30, 2000 and is a real spot market for electricity. Prices on this market are the basis for other contracts on the wholesale energy market in Poland. The most important contracts are Base and Peak with the index prices: IRDN (Day-ahead market index) and sIRDN (weighted average day-ahead market index).

Futures (RTT - Commodity Forward Instruments Market) is another important market. Currently, RTT trading is based on four types of instruments due to their maturity: weekly, monthly, quarterly and annual. Contracts executed on RTT allow setting the price of electricity for a longer horizon - up to three years ahead.

Forecasting energy prices is well known issue. A wide literature dealing with different methodologies for forecasting electricity prices is contained in Weron (2014), related to dynamic factor models Maciejowska, Weron (2015), quantile regression Nowotarski, Weron (2013), Hodrick-Prescott filter Weron, Zator (2015), regime-switching models Janczura, Weron (2010) or ARMA models Nowicka - Zagrajek, Weron (2002). It should be noted that these items do not exhaust the spectrum of methodological approaches to forecast energy prices. In addition to the above-mentioned, Largo (2018) and Bunn (2004) also deal with this topic. They are considering international electricity market.

Attempts to forecast electricity prices in Poland have been made in Ejdys, Godlewska, Halicka (2015) or Fijorek et al. (2010). Analytical studies dealing with prices and their structure are also available, without setting forecasts - Grudziński (2011). Analyses for Central and Eastern European countries like Bulgaria, the Czech Republic, Estonia, Hungary, Poland and Slovakia for energy production costs is presented in Maca, Melichar, Scasny (2012).

The energy market is a basic element of each country's security policy. Energy is fundamental element and therefore is in the center of interest of the highest level decision-makers.

The key legal acts regulating energy issues in Poland include:

i. The Act of 10 April 1997 - Energy Law
ii. The Act of 20 February 2015 on renewable energy sources
iii. The Act of 20 May 2016 on energy efficiency
iv. Act of 8 December 2017 on the capacity market.

The binding strategic document for the energy sector in Poland remains the Polish Energy Policy until 2030 adopted by the Council of Ministers in November 2009, as well as the Energy Security and Environment Strategy - the perspective up to 2020 adopted by the Council of Ministers on April 15, 2014. In 2019, the draft of Energy Policy for Poland until 2040 was created. It has not been entered into operation. However, it seems justified to refer to this document as the most recent in this subject. One of the most important issues raised in the above document and also related to the subject of this analysis is energy consumption of GDP.

Data and Methodology

The study use a daily time series dataset containing 3 variables. Data concerned the period from February 6, 2006 to May 31, 2017 inclusive, so each series consist of 4,133 observations. The day-ahead market price index was chosen as the dependent variable representing energy prices in Poland (irdn). The data was taken from the commodity energy exchange website. The following processes are considered as potential explanatory variables:

- average EUR / PLN exchange rate from the National Bank of Poland website (euro),
- energy prices on the British market made available by NordPool (UK).

The EUR / PLN exchange rate was chosen because of Poland's membership of the European Union. The British market was selected as the most developed electricity market in Europe. Descriptive statistics of the variables are presented in Table 1. Their variability is relatively small, as indicated by the values of the coefficients of volatility.

Table 1: Variable descriptive statistics

	Mean	Median	Standard deviation	Volatility
irdn	166,76	166,2	39,76	0,24
euro	4,08	4,14	0,27	0,07
UK	52,36	52,03	9,45	0,18

All data were tested for integration using the ADF test and differentiated if necessary. The first differences were determined for the average EUR / PLN exchange rate (p value – 0,17). Then, using the classical least squares method, the corresponding models with distributed delays were estimated. The choice of the autoregressive delay order was based on the analysis of the partial autocorrelation function.

A set of potential models describing energy prices in Poland was obtained based on following specifications:

1. Autoregressive model for the irdn variable (Model 1)
$$irdn_t = const + \sum_{k=1}^{40} \alpha_k irdn_{t-k} + \varepsilon_t$$
ε_t – random component
2. Autoregressive model for the irdn variable with seasonal variables (Model 2)
$$irdn_t = const + \sum_{k=1}^{40} \alpha_k irdn_{t-k} + \sum_{s=1}^{6} \delta_s dummy_s + \varepsilon_t$$
dummy – seasonal week dummy variable
3. Autoregressive model with delays in the euro exchange rate (Model 3)
$$irdn_t = const + \sum_{k=1}^{40} \alpha_k irdn_{t-k} + \sum_{k=1}^{40} \beta_k euro_{t-k} + \varepsilon_t$$
4. Autoregressive model with delays in the euro exchange rate and seasonal variables (Model 4)
$$irdn_t = const + \sum_{k=1}^{40} \alpha_k irdn_{t-k} + \sum_{k=1}^{40} \beta_k euro_{t-k} + \sum_{s=1}^{6} \delta_s dummy_s + \varepsilon_t$$
5. Autoregressive model with delays in the euro exchange rate and energy prices in the UK (Model 5)
$$irdn_t = const + \sum_{k=1}^{40} \alpha_k irdn_{t-k} + \sum_{k=1}^{40} \beta_k euro_{t-k} + \sum_{k=1}^{40} \gamma_k UK_{t-k} + \varepsilon_t$$
6. Autoregressive model with delays in the euro exchange rate, energy prices in the UK and seasonal variables (Model 6).
$$irdn_t = const + \sum_{k=1}^{40} \alpha_k irdn_{t-k} + \sum_{k=1}^{40} \beta_k euro_{t-k} + \sum_{k=1}^{40} \gamma_k UK_{t-k} + \sum_{s=1}^{6} \delta_s dummy_s + \varepsilon_t$$

Results and Discussion

All estimated models contain statistically significant variables at a level 10% and are characterized by the lack of autocorrelation of the random component as indicated by low rho1 values. The coefficients

of determination R - square are at levels above 50%, which the author considers to be satisfactory for the data under consideration. The results of estimated models are shown in Table 2

Table 2: Results of estimated models

	Coefficients estimates

All of the above models, were compared using the Davidson-McKinnon test for non-nested models according to seasonal issues. The p-values for the test are shown in Table 3. The results of the performed procedure show that additional information improves the degree of explanation of the dependent variable in each case.

Table 3: Davidson - McKinnon test results

	Model 3	**Model 5**
Model 1	0,0011	1,45E-12
	Model 4	Model 6
Model 2	0,0914	1,57E-07

The final stage of the analysis was to determine forecasts and their ex post errors based on estimated models. Daily energy price forecasts have been set for one, two, three weeks and a monthly forecast horizon. On their basis, selected ex-post errors were estimated: root mean square error (RMSE) and mean absolute percentage error (MAPE). The results of forecast errors are presented in Table 4. The Diebold-Mariano (1995) test (DM) was also carried out for the significance of differences in forecast accuracy obtained on the basis of various models. The p-value of DM test are given in Table 5. The results confirm that the differences between the forecasts obtained on the basis of different models significantly differ from each other.

Table 4: Forecast errors obtained on the basis of models 1 – 6

Error	Model 1	Model 2	Model 3	Model 4	Model 5	Model 6
	1 week horizon					
RMSE	**23,115**	33,044	28,887	25,624	31,609	31,801
MAPE	**15,96**	21,706	20,89	16,724	21,293	21,13
	2 week horizon					
RMSE	**18,165**	25,412	21,223	20,097	18,97	24,53
MAPE	**10,647**	14,999	12,435	11,319	10,846	14,386
	3 week horizon					
RMSE	18,709	21,935	19,695	19,278	**18,13**	21,428
MAPE	10,384	12,162	11,209	10,251	**10,115**	11,868
	1 month horizon					
RMSE	18,305	19,2	17,819	18,048	**17,203**	18,706
MAPE	10,08	9,9794	9,696	9,6902	**9,4915**	9,6728

Table 5: Diebold - Mariano test results

Model	Model 2	Model 3	Model 4	Model 5	Model 6
Model 1	0,0212	0,0104	0,0107	0,0148	0,019
Model 2		0,2445	0,0373	0,0855	0,1322
Model 3			0,0211	0,0506	0,2496
Model 4				0,0827	0,0299
Model 5					0,0798

Based on obtained results, the best from the forecasting point of view, for shorter forecast horizons (one and two weeks), is the simplest model. It is model with autoregressive variables only. This model has a high coefficient R^2 – more than 76%. For the longer horizon model 5 should be indicated, which includes the largest variable structure but disregarding seasonal factors. And this one is similar to model 1.

Conclusions

Knowledge of price forecasts on competitive electricity markets is key information in risk management, and also plays an important role in economic optimization in the electricity sector as confirmed by the publications cited in the study. The aim of the article - estimation of short-term electricity forecasts and assessment of their ex-post errors - has been achieved.

As a result of the analysis, it was not possible to obtain a clear indication of the best tool from a prognostic point of view. For shorter forecast horizons: one and two weeks, the lowest forecast errors were obtained on the basis of the simplest AR model, for longer horizons, model which take into account additional explanatory variables gives more accurate forecasts.

Abstract

The main purpose of the study is to identify the European Union countries similar in terms of one of the most important development directions of the world: innovation and the green economy. In the paper for this purpose PROMETHEE method was applied. The results of the analyses allowed to separate groups of EU countries characterized by similar level of development in the green economy and innovations. The results of the study confirmed the previous research of Authors, according to which the EU countries should be still divided in the better developed objects located in Northern and Western Europe and others – located in Southern in Western Europe. Despite the support that the European Union countries receive from the Structural Funds, differences between countries located in these parts of Europe are still significant. The research results presented in the paper can be mentioned as one of the first studies analysed at the same time the level of development in the field of: green economy and innovation in EU countries.

Keywords: Green Economy, Innovations, Similarity Of Development, PROMETHEE Method.

Introduction

In the study of progressive processes of social, economic and cultural areas, the development of innovative activities that significantly affect the competitiveness of countries and regions plays an important role. Therefore, research on innovation should be treated as particularly important, because an innovative economy is an essential key to economic growth and raises the level and the quality of life of a society. Countries in the world are currently facing a double challenge: on the one hand, it is necessary to stimulate economic growth because it is necessary to provide new jobs and the well-being of their citizens and on the other hand, the quality of this growth should lead to a sustainable future.

The deteriorating condition of the environment that has taken place since the mid-twentieth century has focused the activities of countries on paying special attention to issues related to raising environmental awareness and counteracting environmental threats. As a result of these activities, issues related to environmental protection (with particular emphasis on issues related to Effective Energy Use and Renewable Energy Sources) were reflected in the provisions of many strategic documents. Sustainable development is a central priority that permeates all spheres of social and economic activities. The expression of sustainable development is a green economy that combines its current goals, i.e. sustainable economic development (sustainable production and consumption); the word "green" includes all environmental aspects in production, transport, energy but also values such as respect for the environment, ethicality of actions, responsibility, justice within and intergenerational (Ryszawska, 2013).
The purpose of the paper is to identify the European Union countries similar in terms of one of the two most important development directions of the countries of the world: innovation and the green economy. The research used seven main indicators characterizing the green economy and ten

indicators related to the level of innovation in 2016. The PROMETHEE method belonging to the group of multi-criteria decision methods (MCDA) was used as a research tool. It made it possible to classify EU countries in terms of the level of development of the studied areas, as well as a detailed analysis of the results obtained in the perspective of the areas analyzed separately for each concerned country.

The article has the following structure: the first part includes an introduction, the second one reflects on the economic development of EU countries including innovation and the green economy, the third part presents research material and description of the method, the fourth covers the results of the research and the last fifth part presents conclusions.

Innovation, green economy and economic development of EU countries

The world economy is characterized by high diversity in the level of development of countries. This problem is particularly evident in the list of highly developed and developing countries. However, highly developed countries are not a homogeneous group and the degree of diversification in the level of their economic development is so important that it is easy to identify both leaders and countries that are separated from them by a considerable distance. An extensive network of commercial and investment connections, integration processes, flow of production factors and technologies between highly developed countries should lead to blurring the differences between them. At the core of the idea of European integration is the equalization of the level of economic development of the Member States. The significance of this problem increased especially after 2004 together with the eastern enlargement of the EU (Maciejewski, 2017).

The European Union is the result of a long process of economic and political integration between Member States. It began with a free trade zone, over time covering other spheres of the country's economy. It was aimed at leveling the economic situation of the regions, but there are still noticeable differences in terms of economic growth. Differences in the economic situation of EU countries have been the subject of many authors, including: Tupy (2016), Maciejewski (2017).

Gross Domestic Product (GDP) is the most frequently used indicator to assess the level of the economic situation of countries. It is a monetary measure of the market value of all final goods and services produced within a given period of time (Chappelow, 2019). Nominal GDP *per capita*, however, does not reflect differences in living costs and inflation rates across countries; that is why GDP *per capita* according to purchasing power parity is used to compare living standards between nations. However, the nominal GDP *per capita* value can be used to compare the levels of national economies on the international market. Fig. 1 compares GDP *per capita* (in euros), which illustrates the significant diversity of EU countries in this respect. In 2018, the richest EU country was Luxembourg, which compared to 2010 recorded an increase in the value of GDP *per capita* by almost 25%. In the entire 2010-2018 period, the country was characterized by the highest value of the described indicator, exceeding in 2010-2014 more than twice, which came in second place, Ireland. Bulgaria came last in 2018 with an index of EUR 7955.6 *per capita*. However, the increase of the indicator by over 55% as compared to 2010 deserves a positive assessment. In the analyzed period, the highest progress (increase by over 80%) was recorded in countries such as Ireland and Lithuania. Of all EU countries, only Greece did not record an improvement in 2018 compared to 2010. In this country, the value of the gross domestic product *per capita* decreased by 15.4%.

Measuring the economic development of countries is one of the most complex issues in economics. The assessment of the economic development of countries solely based on the value of GDP and its change in the years is insufficient because it is responsible for many different economic, social and environmental factors. Economic development includes not only quantitative changes in the economy expressed by means of economic growth indicators, but also qualitative changes in the socio-economic structure of the country. The multidimensionality of this phenomenon leads to the use of complex indicators in research that require weighting for individual components (Bandura, 2008; Moreira, Simoes and Crespo, 2012; Balcerzak and Pietrzak, 2017; Pietrzak, 2019; Balcerzak, 2020).

Fig. 1: GDP *per capita* (Euro) in 2010, 2016 and 2018 in the European Union countries
Source: own study based on Eurostat data.

In recent years, in the literature on the subject a lot of space has been devoted to various areas describing the development of world economies, the aim of which is to increase innovation. Different ways are sought to identify the current level of innovation in national economies on the one hand and establish true leaders in this area on the other.

Innovation is a complex economic issue whose definition and research depend on the level it is intended to cover. That is why it is possible to analyze innovations introduced in the operations of enterprises, as well as those that concern regions or countries. Their common feature is that they affect economic development. Innovative economy is a knowledge-based economy, seeking new ideas, concepts and results of scientific research and then using them in practice (Stec, 2009). Implementing great ideas is a key to staying ahead in a rapidly changing world, which is why innovations are factors affecting competitive advantage. Economists of innovation believe that what primarily drives economic growth is not the accumulation of physical or financial capital but the innovative ability stimulated by knowledge and technology development (Lambin, 2014).

A comparative analysis of countries in terms of innovation performance can be done using the Summary Innovation Index (SII). This indicator takes values from 0 to 1, but if the value of the indicator increases, it means improvement and a better level of innovation of a given country. In most EU countries, the efficiency of innovation increased in 2011-2018 (Fig. 2). The highest increase, by over 30%, was recorded by: Lithuania, Latvia and Greece. The deterioration of the level of innovation in 2018 compared to 2011 concerned three countries: Romania (decrease by 23.8%), Slovenia (decrease by 10.8%) and Germany (decrease by 0.7%).

Fig. 2: European Innovation Index in 2011, 2016 and 2018 in EU countries
Source: own study based on European Innovation Index Reports 2011, 2016, and 2018.

The diagnosis of the situation made after the financial crisis in 2008 showed a great diversity in the economic, social and environmental situation of individual countries (Fig. 3). Attempts were made to reach the sources and causes of the crisis and programs for overcoming this crisis were developed. Describing the state of imbalance in so many dimensions has made politicians and decision-makers aware of the systemic links between contemporary problems. The analysis of the causes and effects of the global financial crisis has shown that the features of the current economic system based on economic growth (measured by GDP) generate imbalances (Ryszawska, 2013).

Fig. 3: Crisis areas in systemic terms

Source: Ryszawska (2013), p. 20

It was recognized that the return to economic, ecological and social balance would take place through the use of opportunities offered by the concept of the sustainable development leading to sustainability transition. Three options are possible within its framework (Ryszawska, 2013):

- a serious transformation of the current capitalist economic system,
- green industrial revolution,
- green growth (Geels, 2013).

All these possibilities actually mean a green (sustainable) transformation of the economy. The concept of the green economy was first formulated in a report for the United Kingdom Government in 1989 by a group of leading environmental economists, entitled "Blueprint for a Green Economy". The report aimed to find a compromise between the sustainable development and economic growth. However, in this study, apart from the title, there is no reference to the green economy. The continuation of the first report: Blueprint 2 "Greening the world economy" and Blueprint 3 "Measuring Sustainable Development" was an extension of the message that economics can and should help environmental policy (Allen and Clouth, 2012). This deadline was renewed in 2008 in the context of overcoming the financial crisis and introduced into the recovery programs of several countries. Since then, more and more publications on this topic have appeared. In the literature on the subject, the green economy is often treated as a tool for the sustainable development (Rabe, 2016).

According to European criteria, so-called the green economy is moving towards better resource management, the use of economic instruments conducive to environmental protection, supporting innovative projects, increasing the efficiency of water and waste management policies and the development of the sustainable consumption and production. This category includes renewable energy sources, biodiversity protection, clean production technologies, energy and material efficiency as well as corporate social responsibility. This comprehensive approach takes into account some important aspects of growth, including trade-offs arising on the edge of production capacity. Exceeding the critical thresholds in environmental resources may, on the one hand, cause an increase in human well-being and on the other, a biological threat. Natural capital contributes to production providing key inputs, some of which are renewable and others not. Therefore, public policy intervention is necessary because the contribution of natural resources to production and living standards is not at all, or is incorrectly valued (EaP GREEN, 2016).

The United Nations Environment Program (UNEP, 2011) defines the green economy as one that improves the well-being of individuals and societies, while significantly reducing environmental risk and environmental shortages. The easiest way to describe it is as a low-carbon economy, resource-efficient and conducive to social integration. Development in line with the green economy should maintain, increase and rebuild natural capital as a key economic resource and source of public benefits, especially for the least prosperous societies whose livelihoods depend on nature.

The document "Towards a Green Economy: Pathways to Sustainable Development and Poverty Eradication" (UNEP, 2011) describes in detail the stages of implementing the green economy by identifying green investments targeted mainly in the areas of: supply and sustainable use of natural capital and energy. Susta (2011) notes that this document does not cover all elements of the green economy specifying so-called the green growth as opening up new markets and technological innovations that can separate the dependence of economic growth from natural capital.

The European Commission defines three main goals in the Europe 2020 strategy – A European strategy for smart, sustainable and inclusive growth (2010):

- intelligent growth - development of the economy based on knowledge and innovations,
- sustainable growth - promoting more resource-efficient, greener and competitive economy,
- increase in social integration - supporting the economy with a high level of employment, ensuring economic, social and territorial cohesion.

They coincide with the assumptions of the green economy and cover all elements of the international value chain, from an access to raw materials to an after-sales service. The European Commission guarantees cooperation with stakeholders from various sectors (business, trade unions, academia, NGOs, consumer organizations) in developing a modern industrial policy that uses globalization and the green economy (European Commission, 2010).

Green growth policies aim to support people's economic development and the standard of living through the preservation and proper use of natural capital, i.e. natural resources and ecosystems that provide raw materials, energy, water and a wide range of other services that affect well-being (The Organisation for Economic Co-operation and Development - OECD, 2011a; 2011b). These policies must be based on a good understanding of the determinants of the green growth and their links. They also need relevant information and indicators to monitor progress and evaluate results. These indicators must be embedded in the conceptual framework and should be selected in accordance with well-defined criteria (EaP GREEN, 2016).

The implementation and monitoring of the green economy in individual countries requires tools to measure progress along this path, as well as international comparisons in this regard. Therefore, there is an urgent need articulated by international organizations (OECD, United Nations Environment Programme - UNEP, World Bank) and the European Union to create a synthetic indicator of the green economy.

The Relationships Between Green Economy and Innovativeness on The EU Countries Level – Research Procedure

To study results of the EU countries in the field of green economy and innovativeness two data sets elaborated based on the information from 2016 were applied. To the first one the indicators used by European Commission to describe the results of EU countries in term of innovation level and presented every year in the reports entitled The European Innovation Scoreboard Reports (EIS) were used. For this purpose the results in following areas were applied: x_{11} – human resources, x_{12} – research systems, x_{13} – innovation-friendly environment, x_{14} – finance and support, x_{15} – firm investments, x_{16} – innovators, x_{17} – linkages, x_{18} – intellectual assets, x_{19} – employment impacts, x_{110} – sales impacts.

The second database was created by main indicators applied by OECD to assess the level of development of the green growth were used, as follows: x_{21} – production-based CO2 intensity, energy-related CO2 *per capita*, tonnes, x_{22} – demand-based CO2 intensity, energy-related CO2 *per capita*, tonnes, x_{23} – non-energy material productivity, GDP per unit of DMC, US dollars per kilogram, x_{24} – environmentally adjusted multifactor productivity growth, %, x_{25} – loss of natural and semi-natural vegetated land, %, x_{26} – gain of natural and semi-natural vegetated land, %, x_{27} – mean population exposure to PM2.5, micrograms per cubic metre.

In the paper to identify the EU countries similar in terms of both: green economy and innovation the PROMETHEE method was used. The detailed description of this method can be found in many papers e.g. Kiba-Janiak (2019), Zioło et al. (2019).

The basis of the PROMETHEE method are thresholds of equivalence and preferences, on the basis of which comparisons of two analyzed variants are made (in this case 28 countries), taking into account the analyzed criteria (in the study a total of 17 different criteria assigned to 2 areas were analyzed). The main stage in the PROMETHEE process is comparison of negative and positive preferences flows that allow you to determine the degree of overstepping a given variant over others and the extent of yielding to other variants. This is the basis for determining optimal decision alternatives that can be presented in partial (PROMETHEE I) or complete (PROMETHEE II) order. After defining the set of criteria– K for the surveyed countries – V and developing the coefficients of importance for individual criteria (in the study it was assumed that all analyzed criteria are equally important, hence $V = 1$) the function and preference thresholds should be also defined. In the paper for analysed criteria linear functions were adopted. In the next stage comparison of individual variants in pairs is carried out. For this purpose the multi-criteria preference index π, by the following equation is calculated:

$$\pi(a,b) = \sum_{j-1}^{k} w_j \times P_j\,(a,b) \qquad (1)$$

where: $w_j > 0$is the normalized weight assigned to the K_j *criterion* (the more important f_j, the greater w_j), $P_j\,(a,b)$ is the value of the preference function for the Kj criterion when variant a is compared with variant b.

The index, whose value is between 0 and 1, indicates how much option a is preferred to option b, taking into account the criteria and standardized weights. Therefore:

$\pi(a,b) \approx 0$means that there is a weak advantage of variant a over b,
$\pi(a,b) \approx 1$means that there is a strong advantage of variant a over b,
Finally, the ranking based on negative and positive preference flows in Visual PROMETHEE computer software is calculated.

Study Results and Discussion

The final ranking of the results of EU countries in term of: green economy and innovations level is presented in Table 1 which contains the information about the preference flow values calculated on the basis of pairwise comparisons of individual criteria. They made it possible to determine the order (ranking) in analysed areas, taking into account assessments made for all criteria. There are three types of preference flows (Kiba-Janiak, 2019):

1) Phi + (Ø +), a positive flow: it indicates to what extent the results in green economy and innovation level of a given country is preferred over the results of other countries. The higher the value of Ø + (a), the better the position of the analysed country:
2)

$$\varphi^{+(a)} = \frac{1}{n-1}\sum_{b\neq a}\pi(a,b) \qquad (2)$$

3) Phi- (Ø-), a negative flow: it indicates to what extent the results in green economy and innovation level of a given country are preferred over the results of other countries. The lower the value of Ø- (a), the better position of the analysed country:

$$\varphi^{-(a)}=\frac{1}{n-1}\sum_{b\neq a}\pi(a,b) \qquad (3)$$

Phi (Ø): a net flow: Ø (a) = Ø + (a) - Ø- (a); a net preference flow is the difference between a positive and negative flow. Thus, it takes into account the strengths and weaknesses of a given country in term of: green economy and innovation level, which are expressed by means of one indicator. The higher the Ø (a) value, the better the position of analysed country:

$$\varphi(a) = \varphi^{+(a)-\varphi^{-(a)}} \qquad (4)$$

The top of the ranking is occupied by three Scandinavian countries characterized by the highest positive net flows (phi): the Netherlands, Finland, and Denmark. Positive net flows were also obtained for another 8 countries located in Northern and Western Europe. In the case of all of these countries the positive flows (phi+) exceeded the negative flows (phi-), which should be associated with higher level of development in the areas of: green economy and innovation.

To the second group with the negative net flows (phi) which mean that the value of negative flows (phi-) are higher than the positive flows (phi +), countries located in Sothern (Slovenia, Spain, Portugal, Italy Greece, Cyprus, Malta, and Croatia) and in Eastern Europe (the Czech Republic, Slovakia, Poland, Bulgaria, and Romania) were assigned. A development in the analysed areas in the case of these countries is not so high as in the first group. The worst situation with the results of the net flow below -0.2 for Latvia, Croatia, and Romania is observed. In the graphic form the results of ranking are also presented on the Figure 4.

Table 1: Full and partial ranking of the EU countries according to the PROMETHEE method

Rank	Group	Country	Net preference flow (phi)	Positive flow (*phi+*)	Negative flow (*phi-*)
1	I	Netherlands	0.2608	0.3045	0.0437
2		Finland	0.2439	0.3120	0.0681
3		Denmark	0.2437	0.3135	0.0698
4		United Kingdom	0.2357	0.2989	0.0632
5		Sweden	0.2234	0.3627	0.1393
6		Luxembourg	0.214	0.2893	0.0753

Source: own elaboration with application of Visual PROMETHEE software.

It can be said that the authors of this work expected similar results and the division of countries into two groups: more developed countries located in Northern and Southern Europe and less developed countries from Southern and Eastern Europe. Similar results were also obtained in previous papers on research on the sustainable development (Pietrzak et al., 2017) and the sustainable competitiveness (Cheba, 2019) in European Union countries. The obtained results also confirm the previous observations of the authors (Bąk and Cheba, 2019) regarding the impact of geographical proximity on the results of classification. It can be seen that countries located in the same parts of Europe represent a similar level of development and form homogeneous clusters, in this case in terms of development in the areas of: green economy and innovation level. Despite the support that the European Union countries receive from the Structural Funds, differences between countries located in these parts of Europe are still significant. This is also confirmed by the results presented in graphic form in Figure 4. It shows two separate clusters of more developed countries in the upper part of the graph and less developed ones located in the lower part.

It is also worth paying attention to Sweden, which despite high results like other Scandinavian countries, forms a separate group distant from other countries of the region. This means that the development of this country in the studied areas, therefore, is different. The same situation can be observed in the case of: Malta, Ireland, and Romania. The detailed results of these countries in all considered areas are presented on the Figure 5.

Fig. 4: PROMETHEE ranking as a network

Source: own elaboration in software: Visual PROMETHEE.

The results presented in the above figures confirm significant development differences of the analyzed countries. Sweden performs the best but also in this case the results in terms of the green economy are not the highest. The high place in the country's ranking was primarily due to high results in terms of innovation. The situation of other countries is different. Romania was definitely the worst in terms of innovation. However, its results in terms of the green economy are definitely better. The results of other countries are more diverse.

Fig. 5: Profile of selected countries: Sweden, Malta, Ireland, and Romania according to the analysed areas

Conclusions

The results presented in the work on the study of the level and similarity of the development of EU countries in the field of innovation and the green economy confirm, also observed in other areas, the division of EU countries into better developing ones: North and West and less developed: East and South of Europe. The results of the surveyed countries in the areas in the assessed areas vary significantly, even in the case of countries occupying the highest places in the rankings. Even in the case of the Netherlands, which ranked first, taking into account both its development in the framework of the green economy and innovation, the results obtained by this country vary. It is also worth emphasizing that none of the surveyed countries obtained unambiguously good or bad results in all considered areas. The group of countries with positive net flows is less numerous than the one in which negative net flows were identified. 11 out of 28 countries qualified for the first of them. It is worth noting the good position of the Czech Republic which ranked 12. For several years, this country has been indicated as the fastest growing among the countries of the former communist bloc. Its partial results are at a similar level, often negative values with a small range. It means a similar pace of development in all analyzed criteria.

The research results presented in the work are the first analyzes of this kind. In the literature on the subject the development of EU countries in the field of green economy and innovation has so far been considered separately. Studies are available that compare areas such as the green economy and the sustainable development. Due to the intensive development of world countries towards innovative technologies that most often take care of the natural environment, the research problem undertaken in the work is becoming increasingly important.

Basic Approaches in Interpreting Marketing Effectiveness

Witold Kowal, PhD
Wroclaw University of Economics and Business, Wroclaw, Poland
witold.kowal@ue.wroc.pl

Abstract

Effectiveness is one of the most important categories for marketing. Currently, following numerous interpretations, it is quite ambiguous as an assessment criterion. Subject literature, gives two approaches to the interpretation of marketing effect. They can be described as the behavioral and the result-based approach. They present a different attitude to marketing evaluation. Behavioral marketing effectiveness is seen as a system of standards based on the philosophy of marketing orientation. Grasping the essence of the result-based approach is more difficult, because theoretically there are many possible measures to marketing assessment. This paper is based on a literature review. It includes a review of the theoretical and empirical research achievements regarding the interpretation of the category of marketing effectiveness. This paper aims to systematise the achievements in interpreting marketing effectiveness, and to evaluate the directions of changes for these interpretations.

Keywords: Marketing Effectiveness, Effectiveness, Efficiency, Marketing Productivity, Marketing Performance

Introduction

Theoretical achievements of business and management sciences (including marketing) offer many categories related to the assessment of organisation, processes and human activities. Most often, various types of theoretical studies and empirical studies concern categories such as effectiveness, efficiency, productivity and performance. These categories represent two major management problems, i.e. the measurement problem and the assessment problem. Effectiveness is a category primarily related to the assessment of organisations, processes and human activities. This category is also particularly important for marketing. Marketing effectiveness has been the subject of studies since the 1970s. The importance of research on marketing effectiveness results from the fact that, from the very beginning, marketing has been one of the possible alternatives to the market. The higher value of marketing as a concept was to result from its effectiveness. A number of interpretations of marketing effectiveness appeared during this period. The aim of this paper is to systematise the achievements in the field of marketing effectiveness interpretation and to evaluate the directions of changes for these interpretations. The rationale for this systematisation of achievements is that marketing as a concept of action is subject to constant evolution. The variability of the marketing concept could be observed over the last several years, manifesting in its various forms (varieties), e.g. relationship marketing, value marketing or digital marketing. This is undoubtedly a reason for numerous reflections on the essence of marketing effectiveness. Another justification is the usefulness of marketing for an organisation (enterprise) itself, i.e. the problem of marketing value for an organisation. This issue seems to remain unsolved (see Hanssens and Pauwels, 2016). Based on these assumptions, two basic questions arise:

RQ1: Does the development of marketing affect the assessment of its effectiveness?
RQ2: Which interpretations of marketing effectiveness become dominant as a result of the development of marketing concepts?

The Essence of Organization Assessment

Talking about marketing effectiveness is not possible without reflection on the essence of organization assessment. Interchange of knowledge between management and marketing has often been noticed in the past. The basis for identifying the essence of organisation assessment was the analysis of such categories as effectiveness and efficiency in relation to organisation or management (see Drucker, 1967/1988; Ghorpade, 1970; Price, 1972; Steers, 1975; Cunningham, 1977; Hall, 1980, Kanter and Brinkerhoff, 1981; Koontz, O'Donnell and Weihrich, 1984; Cameron, 1986; Lewin and Minton, 1986; Simons, 2000; Davis and Pett, 2002; Shaw, 2009).

The above overview of the theoretical achievements allows us to distinguish two approaches to interpretation of organisation assessment. Effectiveness or efficiency can be interpreted on the basis of outcomes (effects) or organisation or even manager behaviour. Therefore, there are many varieties of effectiveness in literature, such as organisational effectiveness, management effectiveness or managerial effectiveness. This is a premise for identification of two approaches to organization assessment, i.e. the results-based approach and the behavioral approach (Kowal, 2015). The most numerous and earliest examples of interpretations are based on the results-based approach. As the name suggests, the results-based approach takes as its basis the assessment of the organisation's results, i.e. the set of goals and outcomes. (see fig. 1).

Fig. 1: Complementary interpretation of organisational efficiency and effectiveness – the results-based approach and behavioural approach

Source: see W. Kowal (2015)

The common assumption for the interpretation of effectiveness and efficiency is that the activity of an organisation manifests itself in its results. An organisation that wants to create results has two reference points: goals and costs. On the one hand, an organisation sets goals for itself, providing the basis for its existence and regulating its activities. On the other hand, members of an organisation are aware of the

operational costs that determine its existence. These goals and costs are the quintessence of result-based evaluations. Thus we could interpret effectiveness as the relationship between an organisation's official (strategic) goals and their results, and as the relationship between the official goals and other results that are identified with operational goals. Later, this type of interpretation became the basis for the development of research on company performance.

The behavioral approach is primarily related to Drucker's (1967/1988) interpretations of effectiveness and efficiency. Drucker defined effectiveness as 'doing the right things,' and efficiency as 'doing things right' (Drucker, 1988). The behavioural approach to organisation assessment involves the interpretation of organisational behaviour (activities, processes, and transactions) and of all the elements determining this behaviour. In this type of assessment, the dominant problem is the choices made within an organisation concerning its goals and the activities and processes associated with these goals. Literature shows that the factors determining the behaviour of a firm include market structure and theoretical concepts. The assessment of these choices (goals and activities) is a key problem for efficiency and effectiveness in behavioural approach. Effectiveness involves evaluating the choice of strategic and operational goals, which are governed by theory. Later, Drucker's interpretations formed the basis for the development of managerial effectiveness.

Breaking an organisation down like this can be useful in many ways. The most important justification is probably the problem of interest. The results-based approach refers to the specific outcomes while behavioral approach refers to the choices made within the organisation. This becomes particularly important if we highlight the time factor in these assessments. The result-based approach provides the basis for forming an ex-post assessment based on the actual outcomes of organisation actions. Behavioral approach is more conducive to ex-ante assessments, although it is also used in control (e.g. audits). Part of the results-based approach is numerical outcomes evaluation, which allows for more explicit and final organisation assessments. However, both approaches can be treated as complementary assessment systems, assuming the significance of the time factor as a criterion for dividing the organisation's assessment.

Marketing Effectiveness - Behavioural Approach

The category of effectiveness has also become a subject of interest for marketing. As with organisation assessments, there are different approaches to interpreting marketing effectiveness. In general, they fit into the diagram presented above (see Fig. 1). Based on literature studies, marketing effectiveness can be identified:

- with marketing orientation (behavioral approach),
- with specific market effects, outcomes (results-based approach),
- with the organisation's goals (results-based approach).

The last two interpretations of marketing effectiveness should be considered examples of the results-based approach. Their division is based on the fact that the assessment of marketing effectiveness can be associated with other types of results (outcomes) of marketing activities.

In marketing, marketing orientation has become one of the most original areas of research. It provided the basis for distinguishing what is known as marketing effectiveness. Kotler (1977), equated this type of assessment with marketing orientation. He defined it as specific organisation behavior, a feature of marketing processes within the organization. He described marketing effectiveness in reference to another market orientation, defined as sales effectiveness. Marketing effectiveness, as described by Kotler,

became an assessment criterion based on an *a priori* assumption that market orientation reflects the firm's most effective market behaviour. Both marketing effectiveness and sales effectiveness are based on the description of different criteria reflecting the company's way of thinking and actions. According to Kotler, marketing effectiveness depends on a combination of five elements: customer philosophy, integrated marketing organisation, adequate marketing information, strategic orientation and operational efficiency. In this interpretation, marketing effectiveness is a general assessment based on multiple criteria. This interpretation of marketing effectiveness can be found in other publications, including Norburn, Birley and Dunn (1988), Eckles (1990), or Bradley (2003). For example, Norburn, Birley and Dunn (1988) used the marketing effectiveness ranking to assess the relationship between strategic marketing effectiveness and corporate culture and beliefs. The concept of marketing effectiveness makes an ideological assumption that marketing is the most effective orientation of market activities. This effectiveness assessment is based on behavioural norms (standards). A similar assumption has been used to characterise various marketing control tools, especially strategic control (e.g. marketing audit). In retrospect, marketing audit has demonstrated the greatest utility. From the beginning, marketing audit was associated with behavioral assessment: for instance, Shuchman (1959) described the audit as 'review and appraisal of the marketing operation: of the basic objectives (...) of the methods, procedures, people, and organization employed to implement the policies and achieve the objectives' (Cunningham, Cunningham and Swift, 1987). Literature notes that audit is the dominant tool for marketing effectiveness assessment, but is also a 'subjective normative checklist' (see Kahn and Myers, 2005).

From today's perspective, assessing marketing effectiveness based on marketing orientation is more difficult. First, research marketing orientation lost some popularity . Secondly, marketing has changed, as evidenced by many concepts known as relationship marketing, value marketing or digital marketing. At a time when Kotler (1977) defined marketing effectiveness, the concept of marketing was much more explicit.

When describing the behavioral approach to marketing effectiveness assessment, it is worth presenting another proposal presented by Kahn and Myers (2005). On the one hand, they drew attention to the common definition of marketing performance assessment with results. On the other hand, they pointed to the process approach as a proposal for marketing effectiveness assessment, using cybernetic control concepts. In their interpretation, the assessment of marketing effectiveness is a process involving: goal determination, monitoring and interpretation, and regulating action (Kahn and Myers, 2005). Analysis of this process leads them to the conclusion that the assessment of marketing effectiveness should be seen as achieving the goal at the stages of the goal setting process, monitoring and interpretation as well as regulation of the activity. This is a very universal approach to defining the essence of marketing effectiveness that does not associate it only with results.

Marketing Effectiveness - Results-Based Approach

Literature also provides examples of effectiveness equated with specific outcomes (effects). This approach comprises various trends in interpreting the essence of marketing effectiveness assessment. At first, the problem was associated with the general goal of marketing, meaning producing a specific market outcome (results). Effectiveness was a function of the company's ability to compete, or with customer responses. Later, effectiveness came to be identified with other outcomes (measures) - financial and non-financial metrics. The second approach was reflected, among other things, in the category of marketing performance.

The first of these trends in defining marketing effectiveness, which we have defined as the result-based approach, is based on the assumption of producing specific market results. Initially, it was associated with competitive advantage (Ambler and Kokkinaki, 1997). This direction of interpretation was indicated by Walker and Ruekert (1987). They addressed the problem of the effectiveness of marketing strategy

implementation. They defined three categories as marketing evaluation criteria, i.e. effectiveness, efficiency and adaptability. They interpreted marketing effectiveness as 'the success of business products and programs (...) measured by such items as sales growth in comparison with that of competitors or a changes in market share' (Walker and Ruekert, 1987). As we can see, the synonym of effectiveness is success, interpreted in the context of comparing the company sales with the sales of its competitors. Metrics that were indicated as measures were typical measures of a company's competitive strength (e.g. market share). Szymanski, Troy and Bharadwaj (1995) and then Morgan, Clark and Gooner (2002) constructed a marketing performance assessment system based on the interpretation of Walker and Ruekerta. They proposed a normative marketing performance assessment system based on the theory of competitive advantage, thus also linking marketing effectiveness to competitive advantage.

Other examples are defined by the relationship between marketing effectiveness and the client. Sheth and Sisoda (1995) interpreted marketing assessments in the context of marketing productivity. In their opinion, marketing productivity covers two dimensions, efficiency and effectiveness. For them, marketing effectiveness is associated with 'long-term impact on relationships with customers'. The final result of this impact is customer satisfaction. For Shetha and Sisoda, an ideal condition for marketing (high efficiency and effectiveness) is a situation where customer satisfaction accompanies low marketing costs. Adcock (2000) took a very similar position. The very concept of marketing is associated with customer satisfaction.

Literature also provides examples of effectiveness equated with more outcomes. The proposed sets of effectiveness assessment measures are diversified in terms of both the number of outcomes and the type of metrics themselves. This kind of interpretation of marketing effectiveness considers it a multi-criteria category. Such a concept has already appeared before in defining organisational effectiveness. In marketing, such assessment criteria include: customer satisfaction, ROI, ROS, quantitative sales, customer loyalty, etc. This is, therefore, a group of results identified most often with competition, customers and company goals. For example, Green, Barclay and Ryans (1995) referred effectiveness to the benefits (effects) implemented in the most favorable phase of the product life cycle and defined it as 'the degree of market success attained by a product at market maturity'. Varadarajan (1986) and McKee, and Varadarajan and Pride (1989) recognise ROA, ROE, and ROC indicators, share growth, profit ratio on share growth, and percentage change in market share as metrics of marketing effectiveness. Brooks and Simkin (2012) reviewed marketing classification effectiveness and distinguished 13 criteria (metrics) for such assessment. These measures were divided into four categories (Brooks and Simkin, 2012), i.e. financial (ROI, DCF, brand valuation, CLV, economic value add), quantitative (market share, customer satisfaction, customer loyalty - retention, price premium), qualitative (perceived quality, brand awareness, customer satisfaction) and hybrid (brand equity and customer equity). An analysis of these measures shows that most of them are not related to the official goals of the organisation

The authors of these interpretations usually base them on quite different sets of outcomes (or metrics). In this research, marketing effectiveness is moving closer to marketing performance. In the early 1990s, research was undertaken on the relationship between marketing orientation and company performance (see. Narver and Slater, 1990, Diamantopoulos and Hart, 1993, Greenley, 1995). At the end of the 1990s, explicit descriptions of the marketing performance started to appear and attempts began to be made to indicate and classify the metrics associated with this category (see Clark, 1999, Morgan, Clark and Gooner, 2002; Vorhies and Morgan, 2003, Ambler, Kokkinaki and Puntoni, 2004; Katsikeas, Morgan, Leonidou and Hult, 2016). These studies resulted in quite extensive theoretical achievements related to measuring marketing performance. Moreover, this output is constantly updated, largely because of the development of new marketing concepts (especially digital marketing).

Publications on marketing effectiveness usually relate it to the achievement of the company goals. According to Kerina and Peterson (1990) effectiveness refers to the problem of ‘whether the organisation is achieving its intended goals, given environmental opportunities and constraints and organisational

capabilities'. In this case, the organisational prospects and resources have become the benchmark for marketing effectiveness. Ambler and Kokkinaki (1997) indirectly referred to the problem of marketing effectiveness. In their analysis, they indicated effectiveness - meaning the ability to achieve the goal - with the concept of success as an assessment criterion (in conclusion they identified it with the term effectiveness). Continuing interpretations of marketing effectiveness in terms of achieving goals appear in subsequent publications of Clark (2000), Vorhies and Morgan (2003). In their interpretation, marketing effectiveness is 'the degree to which desirable market-based market goals are achieved'. In this case, it is worth noting that the goals to which this effectiveness relates relate to the market performance of the organisation.

This interpretation also includes a number of publications dealing with the problem of marketing productivity. Literature gives examples of identifying various types of relationships between organisational goals and marketing results (see Rust, Ambler, Carpenter, Kumar and Srivastava, 2004; Gronholdt and Martensen, 2006). The problem of interpreting effectiveness as a step to achieving the organisation's goal is quite a challenge for marketing. The reason for this is the variability of organisational goals and the variability of marketing concepts (see Kowal, 2015). This is a big field for research not only on the problems of organisation assessment, but also marketing performance and marketing productivity. An example of this impact can be the concept of value marketing according to Doyle (2000). This concept entails different organization goals, different marketing goals, and a different marketing productivity models. The simple example shows the possible impact of the development of marketing concept and the adopted product marketing model on the criteria of marketing effectiveness assessment.

Conclusions

This article summarizes past and current trends in interpreting marketing effectiveness. There are not many publications that summarize the state of understanding on this category. As we can see, the development of interpretations of marketing effectiveness has its historical context. Analysing the development of marketing effectiveness studies shows several trends in its interpretation.

First, the marketing effectiveness research has shifted from behavioral approach to results-based approach. Initially, effectiveness evaluation based on the assumptions of marketing orientation was an important subject of study. Over time, results-based interpretations gained importance (although there are no explicit assessment criteria). This last approach (the results-based approach) may dominate in the future.

Secondly, at least two fields of study can be distinguished within the results-based approach. Marketing effectiveness refers to organisational goals or specific marketing outcomes (results). Nowadays, identifying marketing effectiveness with organizational goals is a premise for interpreting marketing productivity. On the other hand, relying on marketing outcomes (results) as the basis for marketing effectiveness is a premise for interpreting marketing performance. The dynamics of marketing concepts development - especially those based on new technologies - have an impact on the interpretation of marketing performance. It will be interesting to see to what extent will these changes affect the assessment of marketing effectiveness. In the past, there have been many examples of interpretations of marketing effectiveness based on marketing outcomes (results).

Thirdly, marketing effectiveness is defined not by individual criteria (e.g. market share or customer satisfaction) but by a multi-criteria assessment. It is worth considering whether the development of

interpretations of marketing performance shall affect the complexity of marketing effectiveness assessment in the future. This problem seems to arise already. Comparing performance marketing related to offline and online marketing concepts, we can see the complexity of the marketing evaluation system.

In the light of the analysis above, it is justified to see the results-based approach as the future direction of marketing effectiveness development. With this kind of assessment, its fundamental problem is whether marketing effectiveness is to be based on marketing outcomes (results) or organizational goals. This is probably the most important problem for future marketing assessment.

On the Possibilities of Halting Global Warming and Potential Courses of Action

Jakub ADAMKIEWICZ

jakub.adamkiewicz@wat.edu.pl

Abstract

Global warming is one of the greatest contemporary challenges for the international community. Research indicates that only an immediate and widespread change in the global economic model can lead to the inhibition of this process. However, are radical changes in the economic policy of states possible? This text is an attempt to indicate the answer to this question and indicate potential directions of alternative actions.

Keywords: Global Security, Global Warming, Climate Policy.

Introduction

Both the past and the present century are the period of the greatest scientific achievements and innovations in history. However, that progress has been made at the expense of huge amounts of energy produced mostly from non-renewable raw materials rich in carbon. Although in the second half of the twentieth century the danger of this practice became clear, by participating in a constant race for economic and political domination countries have continued to use these resources unrestrained. That is why today we are facing one of the most serious global challenges - climate change. Attempts are being made to reach an international agreement to reduce the impact of civilisation on the atmosphere. The transformation of energy systems in different countries into renewable energy technologies is often proposed as a remedy. However, such changes are costly from economical and political perspective. It may, therefore, appear that attempts at reform are doomed to failure. If that is so, are we prepared to function in a world with altered climatic conditions? Should we not, in parallel with our efforts to reduce our impact on nature, finally start preparing for the impending climate disaster?

Outline of the problem of contemporary global warming

The link between the increase in the concentration of carbon dioxide in the atmosphere and contemporary global climate change has already been proven beyond doubt. The content of this gas has significantly increased, especially over the last two centuries (particularly in the 20th century). The average atmospheric concentration of carbon dioxide in 1765 was 280 ppm (*part per million*). However, at the end of the twentieth century (in 1990) it already amounted to 354 ppm, while in 2011 it was 391 ppm, with a further upward trend (Stocker et al., 2013, p. 11). Earlier, before the last century - over the period of 650,000 years - concentration of CO_2 in the atmosphere had not exceeded 300 part per million. For this reason, carbon dioxide is considered one of the main factors in the current warming. There is also a noticeable correlation between the increase in CO_2 content in the atmosphere and technological progress. The concentration of this greenhouse gas in the atmosphere has started to increase since the Industrial Revolution in the second half of the 19th century, when coal (and other hydrocarbon fuels) began to be used for energy and transport purposes. It was not until the end of the twentieth century, that changing this universal energy production formula, mainly due to the increasingly noticeable negative effects of global warming, started to be seriously considered on the international arena.

The significance of the risks resulting from climate change is still growing and today it should undoubtedly be treated as one of the most important challenges of the contemporary world. In documents that identify global risks this problem appears to be important, and often constitutes a key dilemma. This is particularly evident in the regular reports of the World Economic Forum on global risks. It should be emphasised that these documents do not focus on ecological issues, but rather, based on various - mainly economic and geopolitical indicators - they search for the most important challenges for contemporary markets and their potential destabilizers. Even here, the dangers resulting from climate change are gaining in importance every year. While in 2008-2010 the risks of economic and geopolitical nature dominated, and there were no ecological threats, since 2011 environmental risks have been gaining in importance (along with social and, more recently, technological ones) (*The Global Risks Report 2017*, Figure 2). In the latest issue of *The Global Risks Report 2019. 14th Edition*, among the five most important risks presented in two categories of assessment - "likelihood" and "impact" - three concern environmental disorganisation. These are "extreme weather events", "natural disasters" and "failure of climate-change mitigation and adaptation" (*The Global Risks Report 2019*, p. 4). All of the risks listed result from increasing global warming.

Such a high position of risks resulting from climate change is not surprising when the forecasted consequences of this phenomenon are known, especially since, according to the scenarios of environmental change presented in recent IPCC reports, further warming of the climate will continue. By 2100, the global average temperature is likely to rise by 1.5 to 2 degrees Celsius (Stocker et al., 2013, p. 20). The expected consequences of this will be tragic. In the context of national and international security, the following factors are of particular importance: the risk of rising levels of the world's oceans (which will lead to the loss of a significant part of land inhabited today); the prevalent, albeit regionally varied, change in hydrological cycles, resulting both in the intensification of desertification processes and more frequent droughts and the increase in the risk of storms and floods; and finally, the increase in the frequency and intensity of natural disasters, particularly hurricanes. This will affect the ability of many countries to provide access to fresh water, maintain efficient agriculture, and protect against natural hazards. In particular, it will affect poor countries with low economic potential and weak systems of power organisation. Some of them will struggle with internal destabilisation and anarchy. Undoubtedly, millions of people will suffer, and the next waves of migration will flood highly developed countries.

Possibilities of Limiting Global Temperature Increase

Because of these risks, attempts are being made to reach international agreements focused on reducing the impact of civilisation on climate change. The last significant attempt to reach a global consensus on this issue was the Paris Agreement made in 2015. It brought hope that joint action can be taken against global warming, because most countries have committed themselves to taking action to suppress temperature increase, also by reducing carbon dioxide emissions. However, it has not been three years since the agreement came into force (in 2016) and the willingness to withdraw from it has already been expressed by the United States, which will ultimately take place in 2020 (Friedman, 2019). The question remains when other countries fighting for global domination - for instance China - will join the US.

The situation seems all the more serious when statistics, showing the leaders of global energy consumption and their sources, as well as the main emitters of carbon dioxide, are considered. According to data from the International Energy Outlook (IEO), the largest share in the production of CO2 is held by China, responsible for more than 28% of global emissions of this compound (Key world energy statistics, 2019, p. 55). According to BP's calculations, the next largest share is held by the United States, India, Russia and Japan. At the same time, these countries are the largest consumers of primary energy. China accounted for nearly 24% of all energy consumed in 2018, followed by the USA with 16.5%, India with 6%, Russia with 5% and Japan with 3%. In total, these countries use about 55% of the world's total primary energy (BP Statistical Review of World Energy 2019, p. 8). Their energy systems are mostly based on hydrocarbon fuels, with a significant share of oil and natural gas in particular, but also coal. It should also not be forgotten that China consumes almost half of the world's coal used as a source of energy. It should also be noted that, according to the *International Energy Outlook 2017* report, the demand for energy will grow, and until 2040 it will increase by 28% compared

to 2015 (*International Energy Outlook2017*, p. 9). Asian countries, including China and India, will have the largest share in this growth. Even if they continue their extensive renewable energy development programmes, the possibility of fully meeting the energy needs of such large economies without a significant share of hydrocarbon fuels seems unlikely.

Conclusions

International initiatives aimed at limiting or halting global warming constitute an extremely important and necessary pursuit. The consequences of this process will affect people living in poor developing countries (e.g. in central and northern Africa or southern Asia) to the greatest extent. However, it is not poor developing countries that are responsible for the emissions of the key carbon dioxide, but wealthy countries located in a safer, temperate climate zone. Among the main emitters of greenhouse gases are the three main political and military powers of today's international scene - the United States, China and Russia, but also India aspiring to this role (which is most at risk of climate change in this group). It is difficult to imagine that any of these countries, in the face of strong competition for global domination, would decide to take action that would weaken their potential in this quest, especially since current economic and political challenges still shape public opinion of these countries more than future environmental risks. Therefore, the fight against global warming may ultimately prove ineffective. Since such a scenario is possible, appropriate actions must be taken in advance to prepare us for life in difficult climate conditions.

Therefore, we need to take actions now to better adapt to the new reality in the future. Changes should take place in the areas of architecture, agriculture and water management both in terms of approach and planning. Building awareness in societies also seems to be an important element - although, depending on the region, it should take into account different issues. In Europe and other highly developed parts of the world, it seems particularly important to teach tolerance. It may be expected that some parts of land will be replaced by oceans, which, together with the intensification of natural disasters, will cause increased migration flows. Both finding a living space for a significant number of residents in a limited space and feeding them and providing other goods, will become an important element. The above topics and many others should, along with climate protection, become the subject of international debates and conventions.

Abstract

Significant changes took place throughout the world in the 20th century. This period was the most productive in relation to the process of implementing many scientific discoveries that were made as far back as the 19th century. The achieved results provided a technological breakthrough in many sectors of the world economy. Significant development of the economy and the processes of production of goods and services were also ensured. Statistics show that in one working day the world economy produces a volume of goods and services equivalent to the volume of their production at the beginning of the 20th century. The planet's population is growing at a faster pace, while until 1970 the world population grew by hyperbole, but since 1990, there has been a slowdown in growth. At the moment, the world population is about 7 billion people. According to various researchers, the population will increase by 2100 and amount to 11.2 billion people. A significant increase in population and industry is already exerting significant pressure on the biosphere of the planet, while the amount of animal matter in the biosphere in accordance with the law of V. Vernadsky constantly, therefore, the significant dominance of one kind of "man" over another can lead to significant changes in the life of the entire planet. Such changes can have a catastrophic effect on the entire dominant species, leading to its mass extinction. Therefore, it is relevant to change the current paradigm of economic development of society to a new one, balanced and taking into account social and environmental aspects. Changing the existing paradigm and focus of innovative processes will ensure the sustainable development of human society in the future.

Keywords: Innovation, Development, Socio-Economic Development, Biosphere, Era Of Mass Extinctions, Population, Sustainable Innovative Development

Introduction

The issues of the methodology of sustainable development began to interest the civilized world, starting from the second half of the 20th century under the influence of environmental problems. Namely, faced with the limited and fairly close onset of exhaustion of sources of non-renewable (core) resources, as well as with the appearance of a number of signs of a global environmental crisis. These signs include the rapid increase in the concentration of carbon dioxide in the Earth's atmosphere by 25%, methane by 100%, the appearance of new gases in the Earth's atmosphere that were absent in the atmosphere such as chlorofluorocarbons (Freon). It should be noted that the growth of land cover degradation processes is fast, since from 1970 to 1990, about half a million tons of the upper soil layer was lost on Earth. There is also a loss of natural ecosystems in different countries, see figure 1.

These trends are confirmed by reports of international organizations, including United Nation (2019). Negative trends associated with environmental problems have a significant pace, and can lead to

environmental and social disasters both within individual regions and around the world as a whole. One of the reasons for this situation is the use in its development of a model of unsustainable development, which is characterized by the extensive use of all available natural, biological and social resources. The imperfection of an unsustainable development system is reflected in the study (Cohen & Winn, 2007).

Figure 1: Preservation of natural ecosystems in different countries, %

The unsustainable development model has long served the interests of mankind, but is more economically centric, including, for example, the occurrence of some negative consequences in the economic spheres of human activity in the social and environmental spheres (Olawumi & Chan, 2018). Society focused more on issues of industrial relations and did not take into account social, environmental and other consequences, which, nevertheless, continued to exist and exert an influence on the economy. Already in the 19th and early 20th centuries, this led to aggravation of social problems, strikes and revolutions, and by the middle of the 20th century to a significant aggravation of environmental problems. At the same time, the sharp increase in the cost of resources, caused by the decrease in oil production by OPEC countries, led to the fact that mankind was forced to think about ensuring and maintaining the sustainable development of states (Arrow, Dasgupta, Goulder & Other, 2007).

Therefore, unsustainable development implies development in the context of growing imbalances between available natural and social resources and the desire for profit.

First of all, the world community drew attention to the solution of environmental problems that hinder the socio-economic development of the world economy. One of the ways to solve these problems was the creation of international non-governmental scientific organizations.

Such organizations are:

International Federation of Advanced Research Institutes;

International Institute for Systems Analysis;

Club of Rome

Serious concern about the state of the ecosystem and the possibility of the safe development of civilization in the context of the constant population growth of the planet was also expressed at the UN conference in Stockholm in 1972, which led to the formation of a special structure for further study of the identified problems - the UN Environment Program.

The United Nations Conference on the Human Environment, held in Stockholm in 1972, and the creation of UNEP marked the beginning of the development of environmental policy and diplomacy.

In 1987, the UN raised the question of the need to find a new model for the development of civilization, as well as the transition to solving the problems of systemic globalization, since environmental safety is only one component of sustainable development.

Currently, there are several approaches to the concept of sustainable innovative development of macroeconomic facilities.

The concept of economic social dynamics by (Rubinshtein & Grinberg, 1998) is based on two main working hypotheses. Firstly, this is the idea of the impossibility of reducing the needs and interests of society to the total result of the individual preferences of its members and the existence of special public interest and needs in this regard, and secondly, the following is the concept of the social role of the state.

The concepts of R.S. Grinberg and A.Ya. Rubinshtein speak about the constant participation of the state, through public-private partnerships and indicative planning, in the market process, the size of which can be determined by the regulatory interests of society and the resources available to them.

Theories of cumulative growth F. Perru

The French economist F. Perroux first proposed the concept of “poles of growth”, which - economic growth is reflected at certain points (growth poles) and with certain variables - spreads the intensity and effect through various channels to all areas of the economy. The decisive role in the formation of “growth poles” belongs to the state, whose tasks include a balanced growth policy based on indicative planning, which ensures a combination of interests of various functional groups. Indicative planning is the basis for the development of all types of managerial decisions in the form of forecasts, strategic programs and plans aimed at ensuring sustainable development of the territory (Perroux F., 1954).

We should also single out T. Hegerstrand's theory of the spread of innovations; in accordance with this theory, one generation (generation) of innovations includes four phases: emergence, diffusion, accumulation and saturation. In addition, according to T. Hegerstrand, diffusion can be of three types in the whole range of different innovations, and this depends on the distribution method - uniform (expansion diffusion), a certain direction (movement diffusion) and mixed (Hägerstrand Torsten, 1976).

Separately, the "volcano" model of H. Hirsch deserves. This model considers innovative development as the frequency of innovative impulses. The weakening of the innovation climate due to the influence of negative factors leads to the transformation of the once developed center into the old industrial depressive zone. Nevertheless, this does not deny the possibility of forming new centers of innovation at the end of large business cycles conducted by N.D. Kondratiev and J. Schumpeter.

The essence of the phenomenon of sustainable development is difficult to define terminologically unambiguously. This is due to the use of the concept of sustainable development in various fields of science. The first group of scientists connects the phenomenon of sustainable development and the need to change the nature of the economic growth of civilization, the second is the same phenomenon and the preservation of biospheric equilibrium, the third is the phenomenon and modernization of relations between economically developed and developing countries, etc.

The International Commission on Environment and Development has defined sustainable development as a development that meets the needs of the modern population, enabling future generations to meet their own needs. This definition is especially valuable in the sense that it recognizes the need for a strategic approach to managing the region’s sustainable development, focused on the long term, since the socio-economic system is very dynamic and subject to the influence of external and internal factors. factors that constantly deform the structure and deprive sustainable development (Lazareva, 2016).

Figure 2: Elements of sustainable development, prepared by the author

Formulation of the Problem

The need to overcome the unbalanced economic development of the world economy makes it necessary to select a number of indicators that would characterize the innovative development of the region from the point of view of its sustainability on the basis of existing concepts describing sustainable development. This set of indicators will allow you to determine the criteria for sustainable or unsustainable development of a macroeconomic region. The formation and use of this set of indicators will ensure sustainable development of both large macroeconomic regions and individual industrial clusters (Vorozhbit O.Yu., Terentyeva T.V. & Titova N.Yu, 2016).

Results

The analysis of the existing concepts of sustainable innovative development allowed us to form a set of indicators to assess the sustainability of innovative development.

Firstly, it is relevant to assess the economic efficiency of the implemented model of sustainable innovative development. It should be noted that the transition from one development to a sustainable development model involves the imposition of certain restrictions on spontaneous (naturally) successful market processes. At the same time (transition) is intended to reduce the negative impact of natural processes on society and nature. This problem can be expressed as a mathematical model represented by the objective function:

$$\begin{cases} Cost - effective\ business\ process \rightarrow max \\ Impact\ on\ the\ biosphere \leq Biosphere\ limitations \\ Social\ Impact \leq Social\ restrictions \end{cases} \quad (1)$$

The economic efficiency of the business process is the ratio between the results of economic activity R and costs C (2).

$$Cost - effective\ business\ process = \frac{R}{C}; \quad (2)$$

Biosphere restrictions are natural resources and environmental components. In turn, the components of the environment are all options for the relationship between society and nature. Based on this, we can say that environmental management is an integral element of environmental relations. At the same time, nature management should still be considered more as a process of the relationship of nature with society, since humanity extracts natural resources from ecosystems and uses them in its economic sphere.

Biosphere restrictions are understood as ensuring sustainable nature management by gradually changing the use of non-reproducible resources (IR) to reproducible (RR) and are reflected in formula (3):

$$Biosphere\ limitations = \frac{IR}{RR}; \quad (3)$$

Social restrictions associated with the need for human survival and its preservation (anthropocentric factor of the social and natural system) is reflected in the formula (4):

$$Social\ restrictions = \frac{B}{Contr}; \quad (4)$$

A key factor in social constraints is social justice, which, in turn, represents the corresponding contribution (Contr) of humanity's direct activity to the level of benefits it receives (B). At the same time, the equal distribution of basic goods (human rights and freedoms, the environmental situation in the vicinity, etc.) is considered true.

The use of these indicators in assessing the proposed transformations of socio-economic systems, by which we mean a country, region or city, would, in our opinion, allow for the effective transformation of existing socio-economic systems and at the same time avoid catastrophic changes in the biosphere.

Conclusions

Considering Fig. 1, as well as the data given above, the following conclusions can be drawn.

At the moment, mankind, despite the successes achieved in the field of scientific and technological progress, has faced significant biospheric changes that threaten the further successful life of both human civilization and all life on earth. Further development according to the existing model can lead to global environmental collapse, which can lead to the collapse of human civilization or its degradation. The existing history does not yet know such examples, but the history of ancient civilizations testifies to the catastrophe of the Bronze Age that occurred in the ancient world, one of the possible reasons for which was the disturbed ecological balance of the ancient world.

One of the ways to prevent a possible collapse is the transition from the strategy of extensive development of the world economy, in which the world economy consumes more and more non-renewable natural resources to an intensive economy that allows rational use of biosphere and social resources. For this, in its development, mankind must use in its development the concept of sustainable innovative development, which would support the rational use of all resources to achieve a certain socio-economic result. To evaluate the proposed transformations, a special set of indicators is proposed. Its use, according to the authors, will greatly simplify the decision-making process in the process of socio-economic change. Also, this set of indicators will make it possible to formulate a policy of public entities effective in the field of sustainable development (Nekhaychuk, Tarasova, 2016).

The introduction of the concept of managing sustainable innovative development into the socio-economic processes taking place in the world economy will allow mankind to reduce its impact on the Earth's biosphere in a short time and provide the existing population with acceptable living conditions even with the existing increase in the level of the world population.

Abstract

This article explores that tourism is an important part of the country's economy. The current state of tourism development in Ukraine was determined and practical propositions on ensuring of economic development of the country owing to tourism were offered. The competitive advantages and weaknesses of tourism industry in Ukraine were studied. The tourism sector is increasingly seen as a specific, ecological and attractive sector of the economy and a component of state and regional policy on which the social and economic development of the country depends to a large extent, its image on the international scene has been formed. Ukraine, having a considerable tourist potential for the formation of tourist flows, is ranked 78th among 140 countries of the world in terms of tourism attractiveness.

Keywords: Tourism, Competitiveness, Development, Potential.

Introduction

Tourism is a sphere of life that includes millions of people, many branches of economy, contributes to international exchanges and human contacts. The dynamism and scale of tourism development explain the fact that this type of economic activity, even taking into account unfavorable situation on the tourism market, is capable of preserving positive trends of development due to the multifunctional nature of economic activity, the high degree of autonomy and universality of all components of the tourism phenomenon as a socio-ecological and economic phenomenon. Its social, economic, environmental and political significance is universally recognized.

The multifunctional value of tourism is manifested in the fact that it is simultaneously a type of economic activity, leisure, consumption, cultural phenomenon and component of social development. In addition, tourism affects the ecological state of the environment determining the level of permissible ecological burden on a particular tourist region (destination). Consequently, an important ideological keystone for understanding the socio-economic essence of tourism is its interdisciplinary nature, since tourism is characterized by specific functional and sectoral features of the production chain in relation to the creation of a tourist product that are related to the inter-industry nature of economic activity. This fact manifests itself in the fact that in tourism, the production and consumption of tourist products is a whole production process, which complicates the application of managerial technologies that are successfully used in other branches.

Literature Review

The significant contribution to the development of theories and solving problems of economic trends in the tourism industry were made by our scientists: D. Basiuk, M. Bondarenko, S. Melnichenko, G.M. Boyko, V. Kyfiak, V.A. Kravtsov, O. Liubitseva and others. Although are large number of papers on the problems and trends of tourism in Ukraine, and some successes in the study of the tourism industry as an engine of socio-economic development of the country remains relevant research questions of the current state of tourism in Ukraine and prospects of his development in the future.

Methodology in Research

The theoretical and methodological background is the fundamental principles of the systematic approach, the methods of scientific abstraction, analysis and synthesis, induction and deduction, the dialectical method of knowledge of economic phenomena, the corresponding provisions of economic theory in the study of economic processes, scientific works of domestic and foreign erudites, which cover the fundamental positions, the main problems of tourism enterprises.

The purpose of the research is studying a current state of the tourism development in Ukraine and development of practical offers for ensuring economic development of the country with the help of tourism.

Results

Nowadays, tourism is an integral part of the global economy. The industry employs more than 265 million people, which is 2.8% of the number of employees (Khollovai H. Kristofer, 2016). The share of tourism in 2018 in world GDP was 10% and 34% of world exports of services. The total turnover of world tourism is USD 1.03 trillion. Tourism has become one of the priority areas of the global economy, creating development in specific areas. Overall, the tourism industry and related sectors of the economy employ 2.8% of the working population (UNWTO, 2018). The average annual growth rate of tourist profits is 8%. According to the State Statistics Service of Ukraine: number of Ukrainian tourists are catered subjects of tourist activity in 2018 was 2.8 million people and foreign tourists were 40 thousand. While in 2015-2016 these figures were 2 million and 15 thousand people and 2.5 million and 35 thousand people, respectively (Official site of the State Statistics Service of Ukraine, 2019).

Tourism is esspeially importante for Ukraine, because it is an supportive environment for small businesses that are able to operate without significant budget allocations, and a perspective for attracting foreign investment on a large scale and in the short terms. The tourism business stimulates the development of other sectors of the economy and contributes to meeting the needs of people in learning about the history, culture, customs, spiritual and religious values of different regions of the country.

Tourism has both a direct impact on the social parameters of life (improving health and human development in general) and indirect effects through improving the economic development indicators of the country: GDP growth, income, employment, etc. Improving all parameters of economic life the population is the basis for improving its well-being, improving health and increasing life expectancy. In income increasing of the population in the future becomes a factor of accelerated development, including tourism.

The development of tourism is not only an important factor in the economic development of the country, but also social, cultural and spiritual. It is recreation and tourism that can actively contribute to the effective implementation of the concept of sustainable development, which is aimed at both economic growth and social progress, the environment and, in general, humanistic, ethical and

cultural development. Therefore, the impact of recreation and tourism on the social indicators of economic development of both individual territories and the whole country is particularly relevant.

Potential tourism possibilities of Ukraine are endless, but tourism industry for a long time has the influence of such negative factors as a lack of state policy in the field of tourism, strategies and programs for the development of tourism and resorts; multiple transformation of the central executive body in the field of tourism; passivity of the Coordinating Council on tourism activity formed under the Cabinet of Ministers of Ukraine; neglect of international experience in tourism development; as well as territorial losses and military actions in the country, instability in political and economic life.

Nowadays, the political factor in Ukraine has a negative impact on the tourism industry. Due to the self-proclaimed world annexation of the Crimea, has suffered direct impact on the economy of Ukraine. Since, in the summer of Crimea was very popular among tourists. However, after the annexation of almost 90% of Ukrainian tourists declined principally from trips to the Crimea and chose to go on holiday abroad or spa resorts of Zakarpathia.

Full value development of tourism and recreational sphere has a significant impact on such sectors of the economy as transport, trade, communications, construction, agriculture, production of consumer goods and is one of the most promising areas for structural reorganization of the economy. The development of tourism at a regional level is based on both traditional resources and on the capability of creative economy, and this allows attracting such non-material factors as local ethnic characteristics, regional mental image, unique local historical-and-cultural heritage.

Growth of competition in the market of tourism demand occurs under the following factors: appearance of an increasing number of countries with ambitious expansive plans for tourists attracting; reaching the peak of saturation of some forms and types of tourism offered by tourist centers and countries (for example, in the beach holiday market). In turn, it requires the following actions from the countries seeking to preserve their tourist attractiveness: to try to keep a balance between demand increasing and supply growth; to plan tourism development in accordance with the principles of sustainable development; to foresee long-term investments in tourism sphere; to ensure availability of clear national strategies for tourism development, flexibility and efficiency in decision-making.

Ukraine has sufficient potential to make tourism one of the main drivers of its economy. Tourism should be a national priority for the development of Ukraine. It attracts foreign investment, foreign exchange and it is part of the marketing and branding strategy. This sector would boost creation of jobs, SMEs and infrastructure development, especially in depressed regions. Growing necessity to attract tourists would result in better services quality and better hospitality culture.

Competitive advantages of the tourism industry of Ukraine are beneficial geographical location, considerable recreational potential: favorable climatic conditions, healing mineral springs, diverse flora and fauna, rich historical-and-cultural heritage and high educational level of the population. The unique natural resources and cultural heritage belonging to the country cannot be considered as a single and sufficient condition for the successful development of tourism in the country because they are only one of the elements of tourism supply. Qualitative tourism infrastructure is the important component of the successful development of tourism. For the most part, tourist preference of both foreign tourists and domestic ones is connected with a high level of service and a reasonable ratio of price and quality. These conditions are the key ones while choosing tourist trips now and in the near future.

The following factors can be attributed to the competitive disadvantages (weaknesses):

- corruption and unfavorable conditions for entrepreneurship and tourism business;
- insufficiently developed tourism infrastructure in most regions of the country; a small number of hotel facilities for tourists' accommodation with a modern level of comfort and their non-compliance with world standards;

- high cost of living in the hotels, food, transport and other services offered to the tourists greatly exceeds the average European level;
- hindrance in attracting investments to tourism infrastructure, consisting of the lack of ready investment sites, existence of administrative barriers, unfavourable conditions for land lease;
- shortage of skilled personnel which is seen on the whole determines low quality of service in all sectors of tourism industry;
- poor state non-commercial advertising of tourism opportunities of the country both in foreign markets and within the country which complicates the activity aimed at the purposeful formation of the positive image of Ukraine as a country favourable for tourism which is connected with limited budget financing.

Thus, a systemic problem is that the possibilities of development of the domestic tourism market will be insufficient for raising the living standard and increasing employment among population, meeting the growing demand for qualitative tourism services while saving the current level of Ukraine's competitiveness in the world tourism market.

Analysis of competitive advantages and disadvantages of Ukraine in the market of inbound and domestic tourism shows the need for active actions, first of all from the country aimed at creating conditions for the sustainable development of tourism in Ukraine.
Intensification of the development of priority inbound and domestic tourism for Ukraine is possible only by tax and financial stimulation of the exports of tourism services and domestic tour operators that carry out these activities, as well as combining the efforts of state authorities, representatives of tourism business and civil society institutions for popularization of Ukraine in the world and promotion of brand-messages "Ukraine is an attractive country for tourism".

The mechanisms to promote Ukraine as a tourist country in the European market, and attract more European tourists include: participation in the largest European tourist and other exhibitions with the single national booth for presentation of the tourist product with involvement of the executive authorities of Ukraine; preparation of non-commercial advertising and informational printed matter and other products for distribution at the largest European tourist exhibitions and through Ukrainian foreign representations; engagement of domestic and foreign experts in tourism sector in the creation of tourism development programs with the aim of using the best European experience; dissemination of information about Ukraine as an attractive tourist country in the Internet; information support of various events held in Ukraine; organization of informational tours for European and national mass media; holding international conferences, symposiums, congresses and other events devoted to the tourist attractiveness of Ukraine.

Tourism sector depends not only on state deposits, but also on innovation. In tourism, innovations are systemic measures that have novelty and lead to positive changes, ensuring the competitiveness of the services offered. The commercial benefits of implementation of innovations are provided by their recognition of the tourism market and considering the degree of customer satisfaction. Market innovation and intellectual property products today characterize the transition from the economy of proposals to the economic demand (Holovinets V., 2018). According to the World Tourism Organization UNWTO, Ukraine’s share is only 4% in tourist flows in Europe, which demonstrates the low efficiency of Ukrainian tourism industry. Therefore, the formation of the business environment for the development of tourism in Ukraine opens up wide opportunities for creating the attractiveness of tourist products (Melnychenko S.V., 2018).

Prospects for the effective development of the tourism industry in Ukraine are related with the formation of appropriate information, scientific and technical support of this area, which at the national and regional levels should be associated with the activation of the following areas:

• development of application programs for the development of the nature management, promotion and realization of tourist product;
• development of inventory of tourist resources;

• development of a complex of scientific knowledge in the field of tourismology and tourism management;
• development and publication of manuals and directories (tourist routes, places of rest, food, etc.);
• creation of rating of all travel companies of Ukraine on the quality indicator of fulfilled obligations;.
• development of automated booking and reservation systems.
In Ukraine, the advantageous geographical location of the country is not supported by the infrastructure on the corresponding level. The main obstacles to the development of Ukraine's tourist infrastructure are poor road quality and unjustified price policy in the hotel industry. In our opinion, the following measures will have priority for infrastructure development:

• integration of Ukraine into a single European railway network, which involves the country's inclusion in the European program for the construction of high-speed railways (speed - 200-300 km / h);
• participation of our country in the network of strategic transport corridors of Central and Eastern Europe;
• attraction of funds by international credit programs at a rate of 5-7% per annum;
• ensuring the possibility of free treatment of insured tourists in city hospitals and clinics;
• introduction of innovations in the development of tourism infrastructure;
• organization of tenders and targeted investment competitions for the right to reconstruct and build new tourism objects.

The realization of listed tasks and creation of competitive Ukrainian Infrastructure of Tourism needs a lot of investments and creation of specific order for investment and business activity realization.

Conclusions

The analysis of international experience in the field of development of international tourism business shows that the increase of competition level in the international tourist market for the redistribution of tourist flows necessitates to conduct measures to strengthen the role of executive authorities in the formation and promotion of a national tourist product.

In many countries of the world, the relevant state programs are being developed and implemented, the legal framework is being improved, and the tax regime is introduced, which is favorable for the development of tourism industry, attracting investment in the development of tourism infrastructure. It should be noted that it is necessary to increase the competitiveness of the domestic tourism industry in the international tourist market and to ensure the quality of the national tourist product. In particular, the issue of proper adaptation of natural territories, objects of cultural heritage for visiting tourists, appropriate infrastructure facilities and information provision is needed to be solved.

The economy of Ukraine that aimed at active integration into the world economy, the tourism industry is becoming a determinant of social-economic development, but the pace of change remains unsatisfactory, as it is evidenced the lowest position in the world rankings tourist market. The development of tourism in the country is a basic element of ensuring the competitiveness of the country and regions in particular.

Abstract

The article analyzes the key trends typical of Russian retail and servicing firms' operations as digital technologies are introduced everywhere. It considers the omnichannel approach to the sales of goods and services as a convenient method of interaction with the consumer. It considers the integration trends, creation of online platforms and aggregators as a systematic phenomenon of commercial activities in many industries. We focused on the positive aspects of interaction with the consumer via retail aggregators and on the fallout of this method of commercial operations. The possible economic threats linked to high activities of foreign digital integrated platforms on the territory of the Russian Federation are outlined.

Keywords: On-Line, Omni-Chanel, On-Line Platform, Taxation.

Introduction

Most companies, which offer services to the end user, find themselves in fierce competition. Many instruments are used to attract and keep the consumer. Companies are forced, first of all, to focus on their price offers. However, this is not the only aspect impacting success of their sales of goods or services. Of course, the modern retail and service companies pay much attention to the so called individualization means for companies, goods, works and services, promotion of trade marks. A modern customer, as a rule, prefers a recognizable brand and buys goods or services in well-known companies with a good reputation. Finally, the consumer preferences and choice in favour of a company today are dictated not only by their price or assortment policies, but also by the company's popularity on the market. The bulk of organizations have to pay attention to the changes, which are happening thanks to growing business digitalization. The omnichanel concept, i.e. interaction with the consumer via integration of real and virtual processes is now a necessary condition of maintaining the market position. Besides the traditional forms of commercial work and interaction with the consumer, various integrated business methods, including the use of digital technologies, are spreading widely. The online instruments in retail and services are primarily the possibility to increase the sales channels. Secondly, it is a convenient way of working both with the end user and with partners and counteragents, with the state. Apart from the above, it is also a way to cost cutting, effective financial management.

Literature Review

Modern digital transformation of retail and servicing is the subject of scientific discussion of many researchers all over the world. Digital instruments are now used in all types of commercial activities of companies.

The consumer expects comfort, modern technologies used by the commercial organizations in all aspects of their activities. The spread of digital technologies covers most spheres of commercial operations of companies from many industries with the retail and servicing companies being no exception. Modern companies introduce innovations into the digital technologies in many channels of interacting with the client – (in a research study by Wagner et al, 2020). Introduction of digital instruments influences decision making about the purchase of goods or services. As the number of electronic commercial interaction, mobile purchases and intellectual technologies increase, the methods of commercial operations change - suppose (Reinartz et al, 2019). This statement is true for many Russian enterprises think Kuznetsov et al, (2017) and Korableva et al (2019). The advantages of innovative technological solutions are obvious, especially as the market environment changes. The researches discover the key factors influencing the change of client needs (digital services, digital marketing, intellectual data analysis and online communities) written in a study Reichstein and Härting (2018). There are also several researchers Kollmann et al (2019) reflecting the special features of entrepreneurship as digital technologies are introduced . (Briel et al, 2018) demonstrate that commercial processes are becoming more complicated, have an impact on the results and the risk, and develop the entrepreneurial spirit on the whole. Changes are inevitable and they occur in most sectors of the state economy (Kosov et al, 2016.) Changes in commercial activities are caused not only by digital solutions, but also by changes in legislation, especially taxes, because it affects the size of the final profit. And that means commercial efficiency. (Lehoux et al, 2019) and (Morozova et al, 2019)

Of course, the conceptual changes in transformation of the retail, servicing, touristic and other services are linked to the integration trends, creation of united industry services, which offer personalized requests. (Hänninen et al, 2019) and (Casais et al, 2020). The possible models of interaction on platforms-aggregators were also considered in detail (Chen et al, 2019). Since modern commercial operations mean interaction in the external environment, i.e. with partners, consumers as well as the state agencies, the researches pay special attention to the use of digital technologies in commercial activities when interacting with the government (Mergel, 2019). Currently, ways of interacting with fiscal services are changing and improving. (Petrov et al , 2019).

Some researchers focus on individual instruments to stimulate customers as an individual vector of commercial operations as the world goes digital. (Garaus and Wagner, 2019).

Materials and Methods

To reveal the specific trends of the use of digital technologies and the specific features of modern commercial operations in retail and services, the research used different methods of scientific information collection and processing. Data collection about the use of digital platforms in different industries, its further processing, the use of specific analysis procedures, including bibliographical sources have revealed the key trends in the use of digital platforms in different industries. A qualitative estimate of the phenomenon and the possible threats of further introduction of digital platforms as a systemic phenomenon with a wide spread regardless of the industry on the basis of logical analysis were formulated.

Research Question

At this time various aspects of the macro environment of enterprises are dynamically changing in all sectors. Although there have been a lot of changes, across industries and for many organizations (Yukhimov et al, 2019)

Digital technologies in retail and services are now widespread. At that, digital solutions cover all spheres of commercial operations of an enterprise, especially in retail and services. They focus on the segment of commercial operations, which stimulate sales, bringing the goods or product to the end user. On the other hand, digital instruments are popular among the B2B segment representatives, since they cut costs significantly and reduce accounts receivable by increasing the payments speed (Malitskaya et al, 2019) and (Lehoux et al, 2019). Traditionally, bringing the goods or services to the end user required a 'physical' enterprise, a chain store, participation of professionals in commercial retail operations.

However, modern commercial electronic activities in the trade of goods and various services, the results of intellectual activities has undergone significant change. Physical enterprises or companies, which only use remote interaction ways (we can cite the catalogue companies without a physical shop or office. Even separate online catalogues are an exception and they do not guarantee a victory in the fierce competition.)

If we consider traditional retail, the current share of electronic retail in Russia amounts to 4 % (1,150 bln rbl) of total turnover as of the start of 2019; the share is forecast to rise to 6% by 2023.[1] This indictor is significantly higher in tourism, where about a fourth of all services there is sold via online instruments. In most cases, regardless of the industry modern commercial companies have to influence their clients by creating conditions to acquire goods or services following market trends. It is the sale of goods or services that is their key function. International globalization and integration trends cover all types of commercial operations, while development of communications and digital means of data transfer have created a united information environment triggering transformation of business methods. The use of digital technologies influenced information exchange between the participants of commercial activities, transformed business processes, changed the communications means and organization of interaction with the customers. The well spread practice of omnichannel commercial sales standard can be considered as modern commercial functions, which impact and develop the sales channels of goods and services and their promotion in condition of overwhelming digitalization of all the branches of economic interaction between organizations. (Zvereva and Leonova, 2016). The omnichannel sales offer the customer an opportunity to define the interaction model when making a purchase. The cycle of acquiring goods or services can be performed virtually, or the customer can build a convenient route of getting acquainted with the goods or services before the purchase transferring some operations to the physical environment using available technologies or instruments of the environment.

The next step in the development of digital technologies was creation of online platforms and their active use by the customer; the business model of interaction between the end user and the seller of goods or services as a consequence.

Aggregation of goods of different brands or services of different suppliers on one platform creates lots of advantages for the client:

- systematization of information about the goods and services from different suppliers;
- creating a search query, selecting and comparing positions;
- automated creation of personified offers and recommended lists based on the analysis of habits and history of queries;
- higher awareness about the goods and services based on the exchange of reviews and recommendations.

[1] Retail digitalization: technologies and leadership. The St Petersburg International Economic Forum 2019. PWC [electronic resource]. URL: https://www.pwc.ru/ru/spief/2019/digital-retail.html

The modern digital platform is the basis for company transfer to the digital environment, automation of business operations, which enhances the quality and reduces the importance of middlemen in the chain, which brings goods and services to the customer. United retail platforms (we can cite as examples such retailers as Amazon, eBay and Aliexpress, and various tourism services like Booking, etc (experts put its share on the Russian booking market at about 60%). Such organizations are successful, while the interaction model is still the most lucrative business in e-commerce. Also, as economic ties are optimized and the number of intermediary links decreases, there appears a chance of using flexible pricing methods, which diminishes the cost of goods or services making them more attractive for the end user.

Transformation of services in the digital environment has formed an understanding with the business community that having a website is no longer sufficient for successful commercial operations, because the key goal of any commercial enterprise is satisfaction of the need for goods or services of a certain type and as a consequence development of competitive advantages.

Optimization of interaction with the client on the online platforms-aggregators via concentration and systematization of information can be done on the basis of different models – resale or offer of intermediary and agency services, or independent commercial operations with preservation of some features of omnichannel sales.

Talking about an online platform, where the producers sell their products of services directly to the client without the middlemen, the issues of responsibility between the operator and the supplier become very important. This interaction model requires special control. Good operations of an online platform means responsibility of the aggregator for the quality and seamless processing of orders, their delivery, for the quality of the service. There are many cases when the consumer makes a purchase on the platform-aggregator instead of a website of the brand producer or an owner, offering placement services thanks to the trust to the platform or guarantees its offers (for example, Yandex.market). This trust is mainly formed thanks to the possibility to compare the goods of different brands before making a purchase. Reviews of the customers who have already bought and used the goods or services are often of a higher importance than the characteristics announced by the producer or seller.

The digital websites are often visited more frequently than autonomous websites, while conversion rates are higher thanks to the search focus.

Along with the rising loyalty of the consumer and attraction of new buyers, an aggregated platform is a way of raising quality of the goods or services as consumer reviews are collected. Besides, it is a good chance to organize stimulation events because marketplace events are much cheaper than development of an individual program. This helps the company to use and save economic resources in the optimal way. And the last, but not the least, the potential audience, at which the advertising messages on the website are targeted, are wider than in independent promotion.

Discussion

A modern consumer has to make a choice among numerous offers from competing companies. Digital technologies and the internet environment help the consumer make purchases regardless of the geographic location of the enterprise. It is obvious that consumer's access to the international market is fraught with threats thanks to the economic policy of some states, including the Russian Federation. However, the spread of such form of interaction is understandable, because a marketplace offers a wide range of goods and services as well as good terms of the purchase and quality guarantees. At that, there is a downside to the wide spread of platforms, which offer goods or services on the territory of the Russian Federation. The volume of cross-border e-commerce (imports) or the purchase of touristic services in organizations with no Russian registration demonstrates significant stable growth. The foreign companies located outside the Russian jurisdiction but having commercial operations in the Russian Federation has no fiscal burden. This means that the government has to restrict their operations. Although the problem is the same, its solutions differ depending on industry.

For instance, foreign retailers using online platforms cap in the cost of packages for the Russian Federation. In tourism, a possible prohibition of the services aggregating offers both from the national and foreign companies, on the contrary, provoked criticism from the business community. At the same time, changes were made in Russian legislation regarding the procedure of VAT (value added tax) payment. (Akhmadeev, 2019.). It would be reasonable if the countries share their experience on introduction of control and influence measures by slapping duties and VAT[2] on the shipments of goods to individuals at the location of the buyer and profit forming. The tax claims of the state are reasonable, while introduction of fiscal restrictions could ensure balance in the competitive economy of a state.

Conclusion

The use of online platforms in commercial operations of companies is a market trend, which cannot be ignored. Along with their own websites, most companies have to use platforms-aggregators, which help them increase effectiveness of their commercial activities on the whole, boost potential revenue and help profit grow.

A retail platform is undoubtedly good for the participants of interaction. For the companies, it is a way of cost cutting on acquisition of new consumers, increasing their loyalty. For the consumer, it is a reliable neutral platform, where he can find various goods, review and compare prices. The use of digital technologies helps to increase effectiveness and flexibility of the companies' operations.

However, this global trend under review, which is typical of most industries, including retail, services, tourism, changes the system of economic ties between the producers, suppliers, consumers and the state. The government needs to restrict goods and services' access to the national markets.

Abstract

This paper surveys research on capital budgeting techniques (CBTs) with special attention to the Sultanate of Oman, an emerging market within the Persian Gulf region striving towards a more sustainable post-carbon economy. CBTs represent organisations' aggregate activities undertaken for approving capital investments in pursuance of growth strategies. Given global oil prices' volatility and public finance deficit pressures, oil-dependent countries like Oman aim to diversify their economies by investing in strategic projects that produce a flow of benefits over the long term. Content analysis tool is deployed along with authors' involvement in various projects in Oman and elsewhere to provide some integrated conceptual and theoretical perspectives. The relevance of traditional non-discounted cash flow (DCF) approaches, the DCF models, and alternative capital budgeting techniques (ACBTs) such as modified internal rate of return, real options valuation and Monte Carlo simulation are highlighted while recognizing the growing desire for proper integration of financial and non-financial considerations across the markets. Multiple capital budgeting approaches are used in several economies, but the empirical evidence of capital budgeting applications in the Omani context is rather sparse; ACBT application appears to be rare as managers prefer to rely largely on the non-DCF techniques. DCF approaches such as net present value (NPV) and internal rate of return (IRR) are more favoured in the developed economies, thus pointing to the resilience of the capital-income theory. The need for further research in the Omani context and its overall implications for the country's strategic research and knowledge development are stressed.

Keywords: Alternative Capital Budgeting Techniques (Acbts), Capital-Income Theory, Oman Manufacturing Sector, Risk Analysis.

Introduction

Capital budgeting techniques (CBTs) refer to the plethora of analytical management tools for making capital investment decisions under conditions of risk and uncertainty. Capital investment involves a large sum of cash outlay in expectation for future stream of benefits/income/return. Thus, robust capital

budgeting would entail a proper understanding of the financial market dynamics, business environment, funding sources, financial mathematics and consideration of non-financial factors (Umoh, 1997). Whatever capital appraisal model the manager chooses should align with corporate strategy, save time, money, optimize resources and guarantee sustainable benefits or income realisation.

Multiple capital budgeting approaches are used across the globe (Ross et al, 2004; Desai, 2019; Pandey, 2004, Parasuraman, 2019), but research has yet to reach an accepted comprehensive model that effectively describes the processes a capital budgeting must go through in order to transition from idea, information, to decision and funded implementation (Cleland, 2004). Moreover, empirical evidence of applications in the Omani context looks rather sparse (Al-Ani, 2015), particularly in the non-oil manufacturing sector, a capital-intensive sector requiring significant capital investment. Previous research so far has paid little attention to critically examining the degree to which managers utilize advanced or sophisticated techniques such as real options valuation in making capital budgeting decisions. Answers to this enquiry are considered to be fundamental to crafting a desirable innovation strategy (Drucker, 2007).

Overall, it is expected that the findings obtained from a contextual research would provide useful empirical guide on the practice of private-sector capital budgeting in a wide variety of applications in Oman, considering the government's drive towards sustainable economic diversification, the success which arguably rests on robust private enterprise decision-making process/models that adequately reflects optimal capital allocation dynamics (The World Bank, 2018; IMF, 2018; Hindle, 2008; Nagarajan, 2014; Desai, 2019; SCP, 2016).

Two key perspectives highlight the range of economic management issues motivating this review. First is the significance of wealth, risk and capital and the problems associated with measuring them (Piketty, 2014). Second, capital investment as a significant part of a country's gross domestic product (GDP) (Picketty, 2014). Previous studies have focused rather more on the oil sector and basic CBTs like payback period (Al-Ani, 2015). Other contributions have reflected varying practices in different jurisdictions such as the Middle East (Chazi *et al,* 2010), Canada (Bennouna & Meredith, 2010), Nordics (Brunzelli *et al*, 2013), or India (Batri & Verma, 2017). Thus, given that CBT body of knowledge has implications for industrialisation drive of a nation and quality of managerial decision-making process, research has significant role to play in bridging higher education-industry knowledge, particularly in the Oman case where robust CBT knowledge and expertise might be invaluable for reducing the country's high (49%) youth unemployment rate (The World Bank, 2018).

As part of a larger project (TRC, 2019) currently investigating capital budgeting practices in Oman manufacturing sector (CBPOMS) in support of the country's new economic diversification agenda (Oman Vision 2040), this paper is designed to provide an overview of the current state of capital budgeting research in the country. This contextual review is expected to facilitate further research at the subsequent phase of the project by bring out the key elements for further empirical investigation and analysis, with special attention to the manufacturing sector where research seems to be currently sparse.

The specific objectives are:

1. To critically review the major aspects of global capital investment techniques that managers use for screening and selecting project options.
2. To evaluate the relative role of financial and non-financial considerations in managers' choice of capital budgeting techniques.
3. To explore the development of a coalescent capital budgeting decision model for improving the quality of capital expenditure decision-making.

The paper is divided into five sections, starting with this introduction. This will be followed by section 2 where key underlying theories and concepts in capital budgeting practices are briefly highlighted. Section 3 highlights the outcome of the global literature survey including an outline of the potential

contribution of further research in the Omani context. Section 4 highlights the project's methodology and limitations, while the paper ends with some concluding remarks in section 5.

Overview of capital budgeting theories and concepts

There is a raft of theories dealing with the evolving question of 'capital' and the 'income' or benefit associated with it. At the root of our understanding is the economist idea of capital as a 'stock' or 'real assets' as distinct from "income" which is a flow or "financial assets" (Capital and Interest, 1976). Capital budgeting is grounded in the production and time structure of the economic process, suggesting there is a time-lapse between decisions and its consequences. The time value of money is long related to the classical thoughts of Adam Smith, David Ricardo, Nassau Senior and John Stuart Mill in the "annual agricultural cycle" era. Perhaps, Picketty (2014: 114 & 800) has summed up the whole capital-income idea aptly thus: "what could be more natural to ask of a capital asset than that it produces a reliable and steady income", and "the value of a piece of physical capital should be less than the total of the future values that are expected to accrue from it". The Austrian theorists ("latest thinkers"), notably, Eugen Von Bohn-Bawerk, P. H. Wicksteed, Knut Wicksell, and Irving Fisher, along with the "Marginalists" provided the mathematical expression to the time factor associated with modern capital budgeting ideas. From an economic standpoint, interest as a reward to providers of capital giving up immediate use of their funds, is regarded as the gross rate of growth of capital. This informs the liquidity preference theory of J. M. Keynes of the people's tendency to hold most of their assets in the form of money. However, the flip side is the time-preference theory which urges moderating interest rate in order to motivate people to postpone enjoyments to the future, with possible fiscal policy / political implications.

Other key explanations include pecking-order theory, risk-return trade-off hypothesis, agency cost theorem, shareholder-stakeholder trade-off, and shareholder wealth maximization, but it is yet unclear the extent to which these and other related theories can be said to validate capital budgeting practices in the Omani context.

Capital budgeting is a pivotal topic in the realm of corporate finance because of its high usefulness for project evaluations, tool for achieving strategic organisational success, and to maintaining market position or competitiveness (Nishat & Haq, 2009; Chen, 2008; Bukvic *et al.* 2016). As earlier noted, there is a plethora of quantitative (investment analysis, setting the discount rate, risk analysis) and qualitative actors distilled from the literature (De Souza & Lunkes, 2016). Qualitative approaches seem to be gaining some research attraction. For example, in responding to the challenge of differing risk perceptions among managers, Karanovic and Gjosevska (2012) provided a fuzzy logic concept for modelling the linguistic variables, in order to provide a robust quantification of the manager's opinion.

Research to date has identified three categories of capital budgeting techniques (CBTs). The first group relates to non-discounted cash flow (non-DCF) practices that do not incorporate the concepts of time value of money and business uncertainty, such as payback period (PBP) and return on investment (ROI). The second category is the DCF practices premised on the use of time value of money and business uncertainty concepts, such as internal rate of return (IRR), discounted payback period, net present value (NPV), Profitability Index (PI), accounting rate of return (ARR) and etc. The third category refers to alternative capital budgeting practices (ACBTs) which do not utilize either of these two concepts (Neelakantam, 2015). Some of such ACBTs include the Game theory, Monte Carlo simulation, Capital Asset Pricing Model (CAPM) Economic Value Added (EVA), and various integer linear programming models (ILPM) (Gustafsson *et al,* 2000; Horn *et al*., 2015; Nagarajan, 2014).

The widely-used methods for screening projects are the payback period (PBP), the accounting rate of return (ARR), and Benefits-Cost Ratio (BCR). Screening investment practices are less robust, since they do not use the concept of the time value of money and they are described to be accounting measures such as the payback period and accounting rate of return. Furthermore, the payback period disadvantages small projects that have the potential of growth beyond the initial investment recovery period. Simply, the payback period disregards the information beyond the recovery period. To

overcome the drawbacks of the payback period, the introduction of discounted payback period at the present time offers the chance of better investment decision.

Project options are typically ranked according to a chosen criteria –pay-back period (PBP), profitability index (PI), net present value (NPV), internal rate of return (IRR), etc.; projects with the highest criterion is assigned a topmost rank, followed by the next highest value, and so on. Some mathematical models for addressing identified ranking problems are documented in the literature (Nagarajan, 2014). The DCF approaches – notably, discounted PI, NPV, IRR - basically accounts for the time value of money, that is, a unit of money is more value in the present time than the same unit in the future. The NPV approach allows you to discount all future cash inflows and cash outflows using a particular discount rate to the present date, while the IRR is concerned about the rate of return whereby the future cash inflows equal the future cash outflows; that is when the NPV equals to zero.

There is evidence that the use of IRR could result in the problem of having multiple IRRs within a single investment appraisal (Gitman & Smith, 2010). To overcome such a problem, the use of modified IRR (MIRR) is often suggested as a suitable alternative. However, some authors (Ross et al 2004) have suggested that the NPV could be more robust technique than IRR, since NPV eliminates the issue of reinvestment assumption. Thus, other advanced techniques such as real option value and modified rate of return (MIRR) are evolving to complement the DCF methods (Souza & Clemente, 2008), but the actual deployment of these capital appraisal tools varies from one industry to another and even from one country to another.

A major parameter in the DCF method is the selection of discount rate (or cost of capital), the percentage used by companies to discount future cash flows over a period of time. The different ways of calculating the cost of capital include cost-debt (CD) model, weighted average cost of capital (WACC), considered the most favoured method used by firms to discount the cash flow (Batra & Verma, 2017; Graham & Harvey, 2001), the cost of equity models such as Gordon Dividends Model and Capital Asset Pricing Model (CAPM) (Damodaran, 2002; Brigham & Ehrhardt, 2002; Block, 2011).

How to effectively handle capital investment decisions under conditions of uncertainty has attracted notable research into non-deterministic, alternative approaches to capital budgeting. Risk-taking and risk management remain at the core of a finance manager's job (Gitman & Smith, 2010). Risk management practices include sensitivity analysis, scenario analysis, decision tree and Monte Carlo simulation, among others. These risk analysis practices are typically based on the probabilistic technique to estimate the risk associated with a particular investment decision (De Souza & Lunkes, 2016). Moreover, the use of real option value (ROV) for capital projects received a wide theoretical support (Pandey, 2004), as such technique offers the flexibility to the managers to either expand or abandon the project at any point of time during the project implementation.

The effect of variation in a parameter on project viability is examined in what is called sensitivity analysis, (Nagarajan, 2014). Scenario analysis works on the same principle; with this type of risk analysis, you pre-judge the viability of a capital investment proposal in a simultaneous variation of key investment parameters. Similalrly, decision tree analysis, a graphical depiction of different probability of a certain event to happen, can provide you with different consequences under different consideration of risk factors (Ross *et al*., 2004). Additionally, the Monte Carlo simulation, a stochastic simulation that covers wider applications and areas, can be deployed to analyse the effects of uncertainty (Hromkovic, 2001; Friedenthal et al, 2015; Parasuraman, 2019).

There are other complex risk-analysis techniques such as real options valuation (ROV), modified internal rate of return (MIRR), earnings multiple approach (EMA), and economic value added (EVA) that could be theoretically sound project evaluation techniques, but they might not frequently be used in practice (Block, 2007; Gustafsson *et al,* 2000; Siziba & Hall, 2019). In fact, for example, only some 8 per cent of sample firms use the more advanced ROV method in Canada (Bennouna & Meredith, 2010).

There is a large amount of research pointing to a relatively less usage of real option valuation (ROV) across economies (Siziba & Hall, 2019; Batra and Verma, 2017; Block, 2007; Graham & Harvey, 2001; Baker *et al*, 2011; Hanaeda & Serita, 2014). Horn *et al*. (2015) argued that ROV encourages managers to think broadly, and the practice offers to the managers the flexibility to evaluate the future investment return at any point of time during the project implementation. However, it was admitted that alternative capital budgeting techniques (ACBTs) including ROV are complex and that the practitioners are not familiar enough to use them when compared to a simple DCF approach, such as NPV and IRR. The use of ROV requires extensive computation, whereas practitioners desire more understandable and convenient practices having relative ease of formulation and interpretation (Cheng *et al*, 1994). While ACBTs could cost time and effort, the sound decision therefrom might bring good returns that offset such costs (Verbeeten, 2006), hence, Baduns (2013) has proposed a comprehensive ROV model aligned with the DCF techniques.

In essence, while ACBTs such as modified internal rate of return (MIRR), earnings multiple approach (EMA), economic value added (EVA) and other complex risk techniques such as Monte Carlo simulation analysis, predictive analytics (Davenport, 2014), decision tree analysis and linear programming (Gustafsson *et al,* 2000), could be theoretically sound project evaluation techniques, they are not frequently used among practitioners around the world.

Global capital budgeting practices– Mixed findings

Ample studies suggest a variety of CB practices are in use in developing and developed countries of Europe, U.S, Canada, the UK, Japan, Finland, Sweden, Australia, East Asia, Brazil, India, Pakistan, and South Africa. Hastie (1974) advised firms to be prudent on their investment decision by avoiding the use of a single capital budgeting technique. However, most firms in the developed countries are more favourably disposed to using DCF techniques (IRR and NPV) over the non-DCF; average rate of return approaches (ARR) are still used but far less than the DCF techniques for firms due to the former's slowness, among other possible reasons (Siziba & Hall, 2019).

Capital budgeting research in the developing economies such as Malaysia, India, Pakistan, Brazil, Indonesia and other Latin American countries, appears to be relatively sparse compared to the developed countries (Nishat & Haq, 2009; Al-Mutairi *et al*, 2018; Mubashar & Tariq, 2019). It is a noteworthy evidence in the developing countries' context that multiple use of CBTs are common and the NPV and IRR seem to be the most popular among managers, while ACBTs appear uncommon. This tendency towards using more DCF techniques was confirmed by various contributions in the Indian context (Batra &Verma, 2017; Bennouna, *et al* 2010; Cherukuri, 1996).

However, studies conducted in the more developed countries have somewhat shifted from a mere description or cross-sectional surveys to longitudinal analysis of CBTs limitations so as to capture the changes happened over the time in using CBTs in the same firms (Rigopoulos, 2014; Kengatharan, 2016; Siziba & Hall, 2019). Thus, in terms of descriptive models designed to ease knowledge of the relationship among selected entities, (Friedenthal et al 2015), current research in the Omani context has been indicated for non-DCF techniques (Al-Ani, 2015). Yet, given the increased uncertainties in the global oil markets, there might be opportunities to explore risk-analytics models such as integrated ROV-DCF approaches (Baduns, 2013) and ILPM (Nagarajan, 2014).

Overall, financial factors including DCF PBP, NPV, IRR, EVA, CAPM, CD model, WACC hurdle rates, Monte Carlo simulation, and so on appear to be prominent in Canada (Bennouna & Meredith, 2010), Pakistan (Mubashar & Tariq 2018; Nishat & Haq, 2009), Brazil (De Souza & Lunkes 2016), and South Africa (Correia & Cramer, 2008). However, non-financial considerations such as age, educational qualification, management levels, years of experience, company size, and CEO education, have also been reported among managers in the US (Gitman & Forrester, 1977) and Kuwait (Al-Kulaib *et al*, 2016). Notably, mixed considerations of both financial and non-financial factors have been reported among Nordic and Indian firms (Brunzell *et al*, 2013; Batra & Verma, 2017).

Overall, the following inferences could be drawn from the research to date regarding general capital budgeting applications:

i. Managers use multiple CBTs when evaluating capital projects, but, despite the divergent views on the relative utility of the NPV-IRR (Al-Awaid, 2014), the DCF techniques are more commonly applied than the non-DCF techniques. Managers still rely on non-DCF techniques such as PBP, to screen the capital project options. The use of alternative CBTs (ACBTs) is rare and to some extent not applicable, particularly in the Omani context (Siziba & Hall, 2019; Bennouna & Meredith, 2010).

ii. Capital budgeting research in the Omani context looks rather limited largely to the oil and gas sector (Chazi *et al,* 2010; Al-Ani, 2015), thus presenting the need for further research to support evidence-based capital investment policy and practices, particularly in the country's priority manufacturing sector.

iii. The adopted research design is generally cross-sectional, suggesting the prevalence of wide range of practices, but limited knowledge on trends or changes in CBT applications. It is therefore noteworthy that longitudinal surveys and modelling systems are gaining traction in trying to capture the emerging dynamics in capital budgeting (Gustafsson et al, 2000; Friedenthal et al, 2015; Siziba & Hall, 2019)

Thus, further CBT research documenting baseline data, policies and contextual decision-making models, is expected to support Oman's transition from oil-based to a knowledge-based economy by connecting the country's manufacturing secto with the growing global capital budgeting practices knowledge.

The imperatives for industrial capital budgeting research in the Omani context

The Omani context is deserving of special attention because of the country's new economic diversification strategy which places private-sector capital investments at the centre of the country's reform efforts to deal with the challenges of oil-dependency, notably its relatively high (49%) youth unemployment rate (The World Bank, 2018).

Moreover, scientific and professional consensus appear to be lacking regarding the use of some CBTs as evidenced by the paucity of empirical studies in the Omani context (Al-Ani, 2015; Chazi *et al,* 2010). This paper has also hinted on the continuing divergent view regarding the use of NPV and IRR among academics and executives, and it remains unclear what the situation really is in the Omani context (Cheng et al, 1994; Al-Awaid, 2014).

The present project focuses on the Oman's manufacturing sector, particularly firms providing packaged foods and basic construction / building materials, because industrialization has been a top priority for Oman's sustainable development. The manufacturing sector is rather capital-intensive and remains crucial for attaining the country's Vision 2040 agenda towards achieving sustainable revenue diversification and post-carbon prosperity (TANFEEDH, 2017; IMF, 2018; Kamoonpuri, 2016; MoCI, 2014).

Methodological Aspects and Limitations

The present aspect of the research has not employed any empirical approach as it is only conceptual in nature, the study being part of a larger project designed to provide an overview of the current state of capital budgeting research in Oman. This paper is therefore designed to facilitate the identification of possible scope of future studies in the Omani context, bearing in mind the country's renewed emphasis on the manufacturing sector where empirical research seems to be currently lacking.

The empirical phase of the research project is expected to adopt a mix-method approach to achieve CBPOMS' diverse objectives. Using a combination of primary and secondary data collection methods

to investigate both quantitative and qualitative factors surrounding the complex management activity that is capital budgeting would be apposite. For instance, a descriptive quantitative study would be helpful to establish some useful baseline data and the extent to be which ACBTs are used by corporate managers and investors in the manufacturing sector. Furthermore, following the insights gained from previous studies (notably, Brunzell et al 2013; Batra & Verma,2017), such cross-sectional approach would also be useful in investigating future advances in CBTs in Oman. Qualitative research design is expected to feature online questionnaires, focus group discussions and interviews with corporate managers. This is necessary, not only to better understand the prevalent non-financial elements thought to be influencing the choice of capital budgeting techniques by managers in Oman, but also to document the current state of underlying policies and procedures designed to ensure a systematic approach to CBT selection and application, as well as gauging sustainability implications.

Consequently, using the non-probability purposive sampling technique, the study will focus on the listed manufacturing firms at the Muscat Securities Market (MSM), notably those companies in the industrial sector of the MSM30 index. The MSM30 index contains a combination of services and industrial firms that have a common charateristics, such as comparatively high profit levels, high liquidity, and largest market capitalization. Using the purposive sampling technique would enable expert capital budgeting practitioners, strategy managers, CFOs, and other stakeholders to be the primary target respondents of this project. Thus, following standard practices to minimize bias (Kothari & Garg, 2014), the use of trained and experienced investigators assigned to this project would ensure that the selected samples are tolerably reliable.

Conclusions and Recommendations

This paper represents the first step of the methodology for a larger project currently investigating capital budgeting practices in Oman manufacturing sector (CBPOMS). It has attempted to provide an overview of the current state of global capital budgeting research in order to identify the scope for further research supportive of the government's new vision for a more diversified, post-carbon industrial market and sustainable economic growth. By so doing, the paper has also provided a kind of global conceptual framework for reviewing the implementation progress of the next phase of Omani caital budgeting research project: empirical investigations.

While the relevance of non-DCF approaches, the DCF models, and alternative capital budgeting techniques such as modified internal rate of return, and real options valuation has continued to attract research globally, current results point to the need for further evidence regarding the relative influence of financial and non-financial considerations in the choice of CBTs, among other knowledge gaps in the Omani manufacturing sector context. Notably, the use of alternative capital budgeting techniques such as real options valuation models appears to be non-existent. Reinforcing academic-industry collaboration to develop robust, evidence-based industrial capital investment practices towards achieving Oman's National Research Strategy to support her Vision 2040's sustainable income-diversification agenda thus becomes imperative.

Acknowledgement

The research leading to these results has received funding from the Research Council (TRC) of the Sultanate of Oman under the Open Research Grant Programme: Grant Agreement No: TRC/BFP/MC/01/2019 –"Capital Budgeting Practices in Oman Manufacturing Sector". The authors thank Professor John Bowers of the University of Stirling Management School, UK, and Professor N. R. Parasuraman of the Shri Dharmasthala Manjunatheshwara Institute for Management Development (SDMIMD), India, for their advisory support to this project.

Abstract

Statistics show that Russia is one of the largest countries in the world in almost all indicators. The problem of Russia's unbalanced economy, with significant positive achievements, was clearly manifested during the global crisis of 2008-2009 and the crisis of 2014 associated with the imposition of sanctions. It is important to reduce the impact of the global market situation on the Russian economy due to the innovative development of the Russian economy. The Russian government has been paying attention to the successful innovative development of Russia. As an example, we can cite the "strategy for innovative development of the Russian Federation for the period up to 2020" approved by the government of the Russian Federation in 2011. Nevertheless, the crisis of 2014 showed insufficient development of innovative processes in Russia. Therefore, it is important to assess the Russian innovation infrastructure in order to identify its strengths and weaknesses.

Keywords: Innovation, Efficiency, Innovation Activity, Factors, Structure, Infrastructure for Supporting Innovation.

Introduction

Data on socio-economic development show that Russia is one of the largest countries in the world in almost all indicators. For example, Russia ranks first in the world in terms of area, ninth in terms of population, and fifteenth in terms of exports. Nevertheless, the dynamics of Russia's development shows an insufficient level of scientific and production base and export orientation of the Russian economy. The problem of Russia's unbalanced economy, with significant positive achievements, was clearly manifested during the global crisis of 2008-2009, when the fall in energy prices, along with the increase in the cost of financial resources on the world market, had a significant negative effect on the Russian economy. The second example of problems in the Russian economy was the Crimean crisis of 2014, when the introduction of sanctions and falling energy costs caused the collapse of the Russian financial market and significant problems in the economy. Recurring crises make it urgent to reduce the dependence of the Russian economy on the world market conditions. This is possible through the development of the domestic market and increasing the share of the innovative economy in the economic balance of Russia. It should be noted that the Russian government has been paying attention to the successful innovative development of Russia. As an example, we can cite the "strategy for innovative development of the Russian Federation for the period up to 2020" approved by the government of the Russian Federation in 2011. Nevertheless, the crisis of 2014 showed insufficient development of innovative processes in Russia. Therefore, it is important to assess the Russian innovation infrastructure in order to identify its strengths and weaknesses.

At the moment the Russian innovation support infrastructure consists of the following three main elements:

I. The Banking sector:

VEB. RF - Russian state development Corporation, a state investment Bank 100 % owned by the state;

VEB Innovations LLC - a limited liability company established under Russian law, is a kind of single window for contacting a group of companies owned by VEB. RF for support of innovative projects, 100 % owned by VEB. RF;

SME Bank JSC is a Russian Bank that provides support to small and medium-sized businesses, as well as support for innovative projects of these economic entities. It belongs to the joint-stock company "Federal Corporation for the development of small and medium-sized businesses" which is 100 % owned by the state.

II. Venture capital companies that invest in innovative technologies:

RVC JSC is a venture capital company whose sole shareholder is the Russian Federation;

RUSNANO JSC is a company that invests in nanotechnology and venture capital investment, the sole shareholder of which is the Russian Federation;

JSC "Rosinfocominvest" is a company engaged in the development of the Russian industry of information and communication technologies by investing in innovative projects in this area, the only shareholder is the Russian Federation.

III. Specialized funds that invest in innovative technologies, enterprises and industries:

The Development Fund of the Center for the development and commercialization of new technologies (SKOLKOVO Foundation) is an innovative complex for the development and commercialization of new technologies

The Fund of assistance to development of small forms of enterprises in scientific-technical sphere (Fund of assistance to innovation) — state non-profit organization that provides financial support to young researchers in the field of innovation and small enterprises that are engaged in high-tech developments with potential for commercialization.

The Russian Fund for technological development (RFTR) is a development Institute that provided financial support for scientific and technical projects and experimental developments, providing targeted loan financing.

Fund for infrastructure and educational programs - the purpose of this Fund is to develop innovative infrastructure in the field of nanotechnology, including the implementation of educational and infrastructure programs already started by JSC Rusnano.

The Foundation for advanced research is a state Fund that aims to promote research and development in the interests of Russian defense and state security, which is associated with a high degree of risk of achieving qualitatively new results in the military-technical, technological, and socio-economic spheres.

Formulation of the Problem

The above structure of innovation infrastructure objects allows us to conclude that Russia has formed a sufficiently powerful infrastructure that allows supporting innovative projects and innovative development in Russia as a whole. At the same time, it is important to assess its effectiveness, as well as the effectiveness of interaction of elements of this infrastructure with economic entities.

The effectiveness of the Russian innovation support infrastructure can be measured by indicators such as knowledge, usage, and potential readiness to use services. The characteristics of interaction between beneficiaries and development institutions are presented below. The analytical report "on interaction of elements of innovative infrastructure" prepared by the analytical center for the Government of the Russian Federation (2020) can serve as an information base for the research. The basis for the preparation of this report was the data from a survey of respondents, participants in economic relations in the field of innovative development in Russia. It should be noted that many papers are devoted to the evaluation of innovative development, including (Banu, 2018), (Himenez, 2015), (Bekkers, Bodas, 2008) and other authors.

Results

This indicator reflects the popularity of each element of infrastructure among the subjects of economic relations. At the first stage, we will assess the infrastructure for supporting innovations through an indicator that reflects the awareness of economic entities about them. This indicator reflects the popularity of each element of infrastructure among the subjects of economic relations.

Figure 1: The popularity rating of each element of infrastructure among subjects of economic relations, %

As shown in Fig.1 the highest popularity rating is held by Skolkovo Foundation, JSC Rusnano and VEB.RF.

A fifth of them do not know about the activities of RVC and the Fund for the promotion of small-scale enterprises in the scientific and technical sphere. It should be noted that more than 20 % do not know about the existence and activities of RVC JSC and the innovation assistance Fund.

More than 40 % do not know about the activities of SME Bank, the advanced research Foundation, and the Russian Fund for technological development.

More than 60 % of respondents do not know about the activities of Rosinfokominvest. The value of this indicator can be explained by the existing condition of the investment Declaration of Rosinfokominvest JSC, which establishes that the object of investment can only be shares and bonds of Russian economic companies, as well as foreign Depositary receipts for these securities. At the same time, the Declaration does not contain information about the possibility of making contributions

to the authorized capital of limited liability companies, and it is in this organizational and legal form that the majority of small business entities are created. Thus, the Rosinfokominvest Fund's financing of innovative projects is directed towards medium and large businesses, which makes it problematic to Finance innovative projects implemented by small businesses.

Summing up the results of the rating, it should be concluded that most elements of the innovation development infrastructure are known to a wide range of participants in economic relations. At the same time, a significant number of innovative development infrastructure projects with an awareness rating below the average of 70% draw attention to this issue.

For a deeper assessment, we will rank the elements of the innovation development infrastructure according to the rating of popularity and appeal to development institutions, see Fig. 2, while analyzing the answers "we know, but did not apply".

Figure 2: Rating of fame and appeal to development institutions, %

The results of the evaluation of the rating of popularity and appeal to development institutions and appeals to innovation development institutions in Russia showed that, despite the significant awareness of the elements that make up the structure of innovative development in Russia, the share of economic entities that applied for help or for funding in these organizations is quite small. This makes it necessary to take steps to increase the involvement of economic entities in innovative development, including with the participation of elements of the Russian innovation development structure.

Conclusions

The assessment of elements of the Russian system of innovative development has shown that it is characterized by the following features:

1. The main three components are the banking sector, venture capital companies that invest in innovative technologies, and specialized funds that invest in innovative technologies, enterprises, and industries.

2. The total number of main elements of the Russian innovation development structure is more than 11 elements.

3. The main participation in the functioning of the Russian innovation development structure is carried out by the state through direct participation in banks, venture companies and funds. There is

no significant participation in the development of innovation infrastructure at the expense of private national capital and foreign capital.

The evaluation of the effectiveness of interaction between elements of the formed innovation infrastructure and economic entities of the Russian economy showed that despite the significant popularity of innovation development institutions such as VEB.RF, the Skolkovo Foundation does not actively interact with these institutions. The main possible reasons for this may be a significant number of bureaucratic procedures, the lack of information from economic entities about the positive experience of other entities when applying to these institutions of innovative development, as well as other reasons.

In order to accelerate the innovative development of the Russian economy, the following measures can be recommended:

dissemination of information about the positive experience of interaction between enterprises and organizations with innovative development institutions among economic entities;

the establishment of institutions for innovative development with the involvement of private and foreign capital;

reducing bureaucratic procedures.

Innovative development of the Russian economy will reduce Russia's dependence on foreign economic factors, increase the added value of products produced by the Russian economy, and create prerequisites for the transition of the Russian economy to a sustainable development model.

Abstract

The paper presents an analysis of approaches, tools and initiatives aimed at the formation of concepts of sustainable development in the field of education, as well as the active inclusion of all university stakeholders in solving the problems of the world community. The results obtained during the analysis show that higher education institutions around the world are actively involved in the process of forming the concept of a sustainable university and make a significant contribution to the implementation of the UN Sustainable Development Goals. Based on the example of foreign and Russian practices of introducing the concept of sustainable development of education into the strategy of modern universities, it substantiates the need to create sustainable university campuses in Russia, which will allow to solve up-to-date world problems. The results of this study may be of interest to government authorities, university management, teachers, researchers, postgraduate students of Russian and world universities, as well as to all those interested in education for sustainable development.

Keywords: Universities, Concept, Sustainable Development, UN Sustainable Development Goals, World Rankings, Education for Sustainable Development (ESD).

Introduction

At the present stage of development, there is a steady increase in the concern of the world community regarding the further paths of human development. Changes caused by the development of science and technology, globalization and the creation of a global information space, environmental degradation and deepening social contradictions are characteristic features of modern society (Grishin, A.I., Mel'nikov, M.S., & Stroganov I.A., 2015; p. 9).

Crisis have further revealed the economic, social and environmental problems of modern society. All these new challenges for the world community are connected with the main question: how will a growing population live on a polluted and changing planet, in the face of limited resources?

This study attempts to substantiate possible solutions to global environmental, economic and social problems by actively involving modern universities in this process. Today, thousands of world universities are included in international and national initiatives to introduce the principles of sustainable development in the activities of modern higher education institutions.
The topics of such university initiatives include various sets of sustainable development goals (SDG) from 17 directions of the UN Agenda for Sustainable Development until 2030. In addition, many projects take into account all three groups of factors of the Triple Bottom Line concept and are aimed at finding ways to solve global problems of the world community.

Research Methodology

The research methodology includes theoretical analysis of literature, comparison, generalization, content analysis, as well as data processing of rating systems for assessing the sustainable development of higher education institutions.

Theoretical Ground for The Research

The theoretical model of the study is based on the Triple Bottom Line concept and the concept of education for sustainable development (ESD). The UN sustainable development goals are analyzed in terms of the involvement of modern universities into their implementation.

Triple Bottom Line Concept

The origins and mass discussions of the concept of sustainable development are associated with the theory of "limits of growth" put forward by D. Medouz and her colleagues in the early 1970s, which predicts an inevitable increase in environmental pollution, depletion of planetary resources and the onset of a "global catastrophe" (Medouz, D., & Randers, I., 2007).

Thus, the challenges facing modern society have led to the emergence of a new global concept of human development, known as the "sustainable development concept". The report "Our Common Future" by the International Commission on Environment and Development, created by the UN General Assembly (Commission G.H. Brundtland), defined the definition of sustainable development: "it is a development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (Our common future: report of the International Commission on Environment and Development, 1989).

Sustainable development is seen as a necessary process of change, in which the exploitation of resources, areas of technological development and investment, as well as institutional changes are consistent not only with the present, but also with the future needs of mankind. This concept is based on the notion of a "wicked" problem. This is a problem that is difficult or impossible to solve due to incomplete, contradictory and changing parameters, which include economic, environmental and social challenges facing modern society, and the solution of which can be based on the implementation of the concept of sustainable development.

Moreover, achieving sustainable development is impossible without long-term thinking and reliance on the Triple Bottom Line concept. The Triple Bottom Line concept was first mentioned by John Elkington, the founder of the British consultancy agency SustainAbility, in 1994 (Elkington, J., 1994).
This concept combines three elements: economic, social and environmental. John Elkington introduced the "Triple-P" (People, Planet, Profit) concept, in which sustainability is seen as a harmony between economic sustainability, social sustainability and environmental sustainability (Elkington, J., 1997).

People (or the social dimension) are focused on the influence of organizations on the local community within which they operate, also known as corporate responsibility. The planet (or the environmental dimension) is focused on the direct impact on ecosystems, soil, air and water, based on production inputs and outputs. Profit (or economic dimension) is focused on the financial impact on the overall level of entrepreneurial activity, usually expressed in monetary terms, such as resource efficiency, sales / profits, cost reduction, job creation or product benefits.

This model implies a close interconnection of environmental, social and economic goals, the satisfaction of which in the complex is aimed at sustainable development. Moreover, a similar approach is applicable both to humanity as a whole and to lower-level communities - individual nations, cities, organizations, etc. (Grishin, A.I., Mel'nikov, M.S., & Stroganov I.A., 2015). Thus, we can say that the goals of sustainable development coincide with the goals of civilization as a whole.

The Concept of Education for Sustainable Development (ESD) and Its Role in The Implementation of The UN Sustainable Development Goals

Sustainable development goals for 2016-2030, set at the UN Summit, imply the coherence of economic growth, human development, and environmental protection. The 17 Sustainable Development Goals (see Fig. 1) (Sustainable development goals, 2015) and 169 goals were adopted by 193 Member States of the United Nations at the historic Heads of State Summit held in New York in September 2015. The key goal is to ensure quality education and lifelong learning opportunities for all (goal # 4).

Fig. 1: The UN sustainable development goals

New goals and objectives for 2016 - 2030 cover a wide range of problems of social, economic, environmental development. The goals of sustainable development are global, the joint efforts of governments, international organizations and world leaders are necessary to achieve them.

However, the implementation of all 17 UN sustainable development goals facing the world community largely depends on education quality and requires the transformation of the existing educational model (Saginova, O.V., Saginov, Yu.L., & Grishin, A.I., 2012). Indeed, highly qualified specialists, business and government leaders are come out from educational institutions and demonstrate a socially responsible attitude to global problems.

At a conference in Bergen in May 2005 was adopted the Bergen Communiqué, which emphasized the need to build higher education systems on the principles of sustainable development. The transition to sustainable development in the education system involves fundamental changes in the worldview, priorities, values and ethical standards of employees, teachers and students. The new educational system should be aimed at training people who can ensure sustainable development for future generations.

The main goal of education for sustainable development is associated with the need to form a new person, comprehensively educated, socially active, able to understand new phenomena and processes in society. A person guided by a system of modern ideological, moral, cultural and ethical principles, norms of behavior; prepared for socially responsible activities and lifelong education in a rapidly changing world (Fakhretdinova, G.N., 2018).

The analysis of the international documentary base regulating the activities of universities that have embarked on the implementation of the concept of education for sustainable development (ESD) is presented in the scientific work of Ursul, A.D., & Ursul, T.A. (2015).

A meeting of representatives of the ministries of environment and education adopted the "Strategy of the United Nations Economic Commission for Europe for Education for Sustainable Development" in 2005 in Vilnius.

The overall objective of the strategy is to provide people with knowledge and skills in the field of sustainable development, which allow them to acquire additional competence and self-confidence, while at the same time expanding their opportunities for a healthy and productive lifestyle in harmony with nature and in accordance with social values, principles of gender equality and national and cultural diversity (UNECE strategy for education for sustainable development, 2005).

The Global Program of Action for Education for Sustainable Development was endorsed by UNESCO in 2014 (Roadmap for the implementation of the global program of action for education for sustainable development, 2014). This program is accompanied by a roadmap for its implementation, which outlines five priority areas for its implementation.

Education for sustainable development is critical for both developed and developing countries. Concepts, approaches to the organization of the education system in each country are different. They are determined on the basis of national priorities, local characteristics, as well as environmental, social, economic problems that need to be solved. Therefore, a universal model of education for sustainable development does not exist.

Nevertheless, the formation of an education system for sustainable development (ESD) requires a transition from traditional teaching to a model that should be based on broad interdisciplinary knowledge based on an integrated approach to such aspects as the environment, ecology, socio-economic development, ethical and cultural issues (Shimova, O.S., 2017).

The National Education Strategy for the Sustainable Development of the Russian Federation is aimed at creating a concept that encompasses related environmental, economic and social problems.

Professor T.N. Gavrilyeva emphasizes that "the concept of education for sustainable development takes into account that education, leading to the acquisition of knowledge and skills, contributes to the formation of the views, positions, values of educating a person and citizen". Thus, it directly affects the achievement of the long-term goals of the UN (The project "Sustainable campus" has begun work in NEFU, 2016).

International and national education initiatives for sustainable development. Nowadays thousands of world universities are included in international and national initiatives to introduce the principles of sustainable development in the activities of modern higher education institutions.

USA and Canada

1. Enactus (Official website of Enactus Worldwide). This international social entrepreneurship program is the world's largest platform for learning through action, united by a common vision: creating a better, more sustainable world. Enactus is the largest non-profit organization that brings together students, business leaders, and universities. Enactus teams develop and implement projects aimed at improving the quality and standard of living of people.
Started in the USA in 1975, the Enactus program is successfully developing and currently covers 1730 universities from 36 countries of the world. The scope of Enactus projects includes all 17 areas of the UN Agenda for Sustainable Development until 2030. In addition, each of Enactus projects takes into account all three groups of factors of Triple Bottom Line concept and aims to create a more sustainable world.

The authors of this article compiled a classification of the draft teams according to the UN sustainable development goals based on a study of the official Enactus website, as well as a content analysis of the annual reports of the Enactus teams (Dalibozhko, A, Krakovetskaya, I., 2018).

2. AASHE. The Association for the Advancement of Sustainability in Higher Education (Official website of Association for the Advancement of Sustainability in Higher Education. Sustainability Tracking, Assessment & Rating System (STARS)). This association is established and successfully operates in the USA. Today, AASHE notes universities and colleges that have achieved outstanding success in implementing green initiatives not only on campus, but also in the communities around them.

To assess the contribution of the university campus to environmental conservation, the STARS rating system is used. Sustainability Tracking, Assessment & Rating System (STARS) is a voluntary certification system that allows colleges and universities to evaluate their efforts to implement sustainable development initiatives on campuses. This program allows to comprehensively look at issues of sustainable development of the university, compare the results of different universities, motivate universities to improve the quality of their work, and exchange information and experience.

3. ISCN. International Sustainable Campus Network (Official website of International Sustainable Campus Network). Founded in the USA in 2007, ISCN is a not-for-profit association of colleges and universities committed to sustainable development. The mission of ISCN is to provide international collaboration to support universities and to receive information, ideas and best practices for achieving sustainable campus and integrating sustainability in research and teaching. Currently, ISCN registered more than 90 universities from more than 30 countries on 6 continents.

European Countries

1. EAUS. Environmental Association for Universities and Colleges (Official website of Environmental Association for Universities and Colleges). EAUS, founded in 1996 with the aim of increasing the importance of environmental management and contributing to the improvement of environmental performance. EAUC is the champion of environmental and sustainable development in higher education in the UK and Ireland.

2. COPERNICUS-CAMPUS (Gough, S., & Scott, W., 2007). It is a pan-European university network created to mobilize the efforts of universities and research organizations to implement the objectives of education for sustainable development. The COPERNICUS-CAMPUS network developed and published in 2007 strategic recommendations for implementing the principles of sustainable development in European universities. To date, more than 320 universities from 38 countries have signed the COPERNICUS Charter, thereby proclaiming their commitment to the goals of ESD.

3. AISHE. Auditing Instrument for Sustainability in Higher Education. It is an instrument for assessing sustainability in higher education. Using AISHE, it is possible to audit universities (and other higher education organizations, such as the Dutch Hogescholen and German Fachhochschule)

or their units (for example, faculties or individual courses). Both internal and external audits are possible.

4. SDRN. Sustainable Development Research Network. The research network on sustainable development stimulates the incorporation of research results in the field of sustainable development into university policies and strategies. The goal of the SDRN is to promote and strengthen the link between universities and the state to achieve sustainable development goals.

Asian Countries

1. KAGCI. Korean Association for Green Campus Initiative (2008) (Korea's Green Growth Experience: Process, Outcomes and Lessons Learned, 2015). The South Korean Association is one of the world centers for the development of international higher education for sustainable development. Students and teachers play a key role in the research, educational, and practical projects needed to build sustainable development approaches. KAGCI currently includes 40 universities and colleges across the country.

2. CGUN. China Green University Network (2011) (Official website of China Green university alliance). In 2011, the China Green Universities Network (CGUN) was established to strengthen communications, integrate resources, and promote the development of green campuses in China. It is a platform for exchanging data on energy conservation mechanisms at university campuses; promoting innovation, collaborative research and the promotion of green architecture; nurturing advanced talents and involving students and teachers in the implementation of goals for sustainable development.

3. CAS-Net JAPAN. Campus Sustainability Network in Japan. CAS-Net JAPAN was created in Japan in 2014 with the aim of developing inter-university cooperation. The goal of CAS-Net JAPAN is to exchange the experience of universities and other institutions that conduct environmental activities to further promote environmental initiatives and principles of sustainable development in the field of education.

Russian Federation

1. Russian program Campus (Campus program launched, 2013). A program for the sustainable development of Russian universities was launched шп 2013 at the initiative of Tetra Pak with the aim of disseminating environmental knowledge among students and supporting environmental initiatives. Information support for the program was provided by the World Wildlife Fund.

2. Association of Green Universities of Russia (Federal Partnership Program Green Universities of Russia). As part of the federal partnership program, educational student quests are organized to reduce the ecological footprint of the university, involve young people in solving environmental problems, and popularize the concept of sustainable development. The most important area is the creation and development of eco-clubs and the introduction of other eco-practices in the process of university management. Today in Russia, 85 eco-clubs have been created in universities in 36 Russian regions, introducing on their basis environmental practices and principles of sustainable development. The program "Green Universities of Russia" involves more than 300 universities. Also, a methodological approach for ranking green universities in Russia was proposed in December 2019.

University Sustainable Development Concept

The Sustainable Campus concept is based on initiatives to integrate sustainable development principles into the management practices of modern universities. Starting in the 1990s at US universities, this movement has become widespread throughout the world and today is gaining popularity in the developing countries of Asia and Africa.

The most interesting and informative scientific publications on the topic under study are the following works.

Analysis of world experience in introducing elements of sustainable development and internal environmental programs in the university management system is carried out in the paper of S.A. Buzmakov, & D.N. Andreev "Principles of Sustainable Development in Leading World Universities" (2012). The key importance in this process of a university's policy, transparent and understandable for all stakeholders, its regular assessment and communication of the results to the external and internal environment is emphasized.

The paper of T.N. Gavril'eva, A. Sugimoto, M. Fudzhi, R. Yamanaka, G.N. Pavlov, & D.A. Kirillin "Sustainable Development of Universities: World and Russian Practices" (2018) presents the results of a study of the practice of introducing the concept of sustainable development in international and Russian higher educational institutions in the case of Hokkaido University, whose teachers initiated the creation of a sustainable campus on the basis of their university (Official website of Sustainable Campus Management Office in Hokkaido. What is a Sustainable Campus?).

The core of the sustainable campus of Hokkaido University is scientific research and the educational process, focused on sustainable development policies. On this basis all the life processes of the university environment are built. No less interesting is the experience of introducing the concept of education for sustainable development at Northeastern Federal University. Hokkaido University is one of the pioneering universities implementing sustainable campus initiatives in Asia.

In the paper of O.V. Saginova, Yu.L. Saginov, & A.I. Grishin "Sustainable development of the university" (2012) identified the basic elements and principles of the concept of sustainable development of the university. In their study, the authors also justify the need for a systematic approach and strategic planning to develop a general development strategy for the university, ensuring its sustainability. According to the authors, this strategy includes a whole range of interconnected concepts: the concept of a "green" university, the concept of a "smart" university, the concept of a "university of a healthy lifestyle," the concept of managing the social and cultural diversity of a university, and the concept of managing a university's historical and cultural heritage.

Sharing the point of view of previous researchers, the authors of this study believe that it is necessary to expand the composition of the concepts that should be taken into account when forming the general concept of development (unique for each university). On the one hand, it ensures the achievement of a high-level university competitiveness, and on the other hand, it makes it possible to make a worthy contribution to solving global problems in the sustainable development of society.

Fig. 2 shows the author's approach to the formation of the concept of sustainable development of the university as a complex system of interconnected elements, achieving a synergistic effect due to their interaction.

Sustainability of the university as a result of the development of a number of interrelated areas described by the following concepts.

1. The concept of the green campus - the initiator of "green" initiatives, actively applying the principles of environmental safety and environmental protection in everyday university life (Official website of BestColleges. Greenest Universities; Buzmakov, S.A., & Andreev, D.N., 2012). This concept involves the formation of a "green", eco-oriented environment, the introduction of environmental practices at the university, improving the eco-culture of students and employees, environmental monitoring and assessing the quality of the environment, with a description of possible environmental risks and ways to reduce them.

2. The concept of a smart campus that effectively uses all kinds of resources and implements modern information technologies to manage its key processes, works ahead of schedule, developing promising areas based on the results of foresight studies in the digital economy (Grishin, V.I.,

Kalinina, I.A., Karasev, P.A., Kulapov, M.N., Shklyaev, A.E., 2018; Official website of SUSU. Key features of the smart university of SUSU). The concept is aimed at achieving the university's goals with minimal resources based on "smart" solutions.

3. The concept of "University of a healthy lifestyle", providing the creation of a holistic, integrated, constantly operating in the university system for the formation of a healthy lifestyle, providing its students, teachers and employees with the conditions for harmonious and comprehensive development, work and leisure, healthy nutrition, sports, refusal bad habits, etc., which makes up a kind of "health code" of modern man (Ivanov, A.I., 2011).

Fig. 2: The Sustainable University Development concept

4. The concept of managing the social and cultural diversity of the university, fostering national, racial, religious tolerance, respect for national traditions, promoting interaction and mutual enrichment of cultures, realization of the equal rights of men and women, etc. based on various types of educational models: intercultural, multicultural, anti-racist (Shtykhno, D.A., & Musatova, Zh.B., 2013).

5. The concept of managing the historical and cultural heritage of the university, aimed at the effective use of historical and cultural values (country, region, city, industry, university) as intangible development assets, which in turn leads to an increase in the social and economic stability of the university. The model of sustainable development of the university in the context of historical and cultural heritage, describing its role for the social, economic and social sphere, as well as the effects of the interaction of elements (Grishin, A.I., 2013).

6. The concept of the "third mission" of the university, which allows the university to actively interact with society as an organization producing knowledge and technology, as well as a set of social, legal, financial institutions capable of ensuring effective cooperation between regional authorities, scientific and educational organizations, industrial enterprises and business -community, non-profit organizations in all spheres of socio-economic and social life (Balmasova, T.A., 2016; Zonova, M.V., 2018).

7. The concept of a socially-oriented (civic) university, aimed at creating conditions that ensure a decent life and free development of the individual (Kirillova, T.V., 2007). The social mission of the university involves the active participation of the university in society. The social relevance and social responsibility of the university are formed on the basis of public expectations and are implemented through various projects: training of highly qualified specialists, retraining of regional personnel, social assistance and social support of students and employees, etc.

8. The concept of the university as a stakeholder organization that understands the importance of building long-term and mutually beneficial relationships with stakeholders: applicants, students, graduates, employees, potential employers, government and administration, etc. (Kovaleva, E.N., 2015). The concept is aimed at coordinating and reorienting the goals and criteria of measuring the effectiveness of the university to the goals of key groups of stakeholders, as well as organizing monitoring of stakeholder satisfaction with university activities.

Each of the above concepts contributes to the sustainability of the entire system, and therefore should be taken into account when forming the general concept of sustainable development of the university. This study also attempted to supplement and clarify the principles of sustainable university development (see Table 1).

Table 1: Principles of sustainable university development

Principles of sustainable university development	Ways to implement the principles
Incorporating sustainable development issues into university curricula.	Training programs and courses on sustainable development of a country, region, industry, enterprise, etc. Training of specialists in cooperation with foreign partners. Development of multidisciplinary educational programs dedicated to integrated research in the field of sustainable development.
Inclusion of sustainable development issues in university research topics.	Creation of new knowledge, subsequently transformed into applied knowledge, activities, programs, promotions, taking into account the profile and specifics of the scientific directions of the university.
Building the current activities of the university on the principles of sustainable development.	Resource management and ongoing processes on a university campus. Energy-saving equipment and technologies, alternative sources and types of energy, economical water consumption, water treatment and its reuse. Development of electronic libraries and workflow, on-line training to minimize the use of paper and photocopying. Sorting and recycling. Use of recycled materials. Purchase of products for dining rooms and cafes from local manufacturers. The use of environmentally friendly cleaning and maintenance products. Environmentally friendly transport.
Creating opportunities for students and university staff to acquire behavioral skills aimed at sustainable development.	Acquisition of green behavior skills by university staff and students. Creation of the necessary infrastructure: waste bins for sorting waste, eco-transport. Promotion of landscaping and cleaning of campus and surrounding areas. Interaction with socially responsible companies to guide students to practice. Organization of eco-clubs, volunteer teams, etc.
Development of cooperation programs and partnerships with other organizations for sustainable development.	Partnership programs and cooperation with commercial and public organizations. Participation in international and national programs and initiatives aimed at supporting the sustainable development of society.
The formation of a social and cultural environment aimed at fostering tolerance and respect	National, racial, religious tolerance, respect for national traditions, promoting interaction and mutual enrichment of cultures, realization of equal rights of men and women, etc. Historical and

for national traditions of all people and gender equality, preserving the historical and cultural heritage in the interests of sustainable development of society.	cultural heritage, preservation, popularization and use of historical and cultural heritage in the interests of social, environmental and economic development of society.
Active participation in the public life of the country and the region.	Enhanced participation of university representatives in the activities of professional organizations and associations representing the interests of key sectors of the economy. The implementation of lifelong education in accordance with the needs of key stakeholders and the needs of regional development. Participation in public councils at various levels of government and administration, development and examination of key documents of territorial and sectoral socio-economic development.

According to the authors of this paper, the concept of "sustainable campus" means the university's readiness and ability to build within its walls a "prototype" of a sustainable society, through the expansion of education and scientific research aimed at solving social, environmental and economic problems, organizing and developing all processes in university on the principles of sustainable development, the transfer of knowledge and technology for harmonious interaction with the environment, as well as the involvement of university staff and students in the decision of the problems of the world community.

Conclusion

The results of the study allow us to conclude that international and national initiatives in the field of education for sustainable development have contributed to the fact that today many universities in the world have actively engaged in the formation of sustainable campuses and demonstrate results confirming their contribution to the long-term goals of the UN.

An analysis of the 2019 results of the UI GreenMetric World University Rankings rating, aimed at assessing the commitment of higher education institutions to the ideas of sustainable development of the society and the formation of the green infrastructure of university campuses, shows that the leading positions are occupied by countries such as the Netherlands (1st, 7th and 8th places), Great Britain (2nd, 4th, 5th and 10th places), USA (3rd place) and Germany (6th place) (Official website of UI GreenMetric. UI GreenMetric World University).

Peoples' Friendship University of Russia (RUDN) has increased its competitive position in the WUR (Green Metric World University Ranking) relative to the results of 2018 and has rightfully earned the status of the greenest university in Russia. A high result is ensured by the significant competitive potential of RUDN University in the field of education for the sustainable development of ESD.

Today, RUDN is a leading national research university in Russia, developing programs for the conservation of the marine environment and terrestrial ecosystems, for the conservation of species and individual populations of endangered and protected animals, the rehabilitation of agricultural and industrial landscapes, and sustainable nature management in general. The university has formed an ecological culture of responsible consumption and respect for the environment since 2012. Nowadays separate garbage collection programs, energy and resource saving, maintaining the campus green area and other projects are being implemented on campus (Official website of RUDN. RUDN environmental policy).

International cooperation also helps RUDN University to gain valuable experience of colleagues - adherents of the ideas of sustainable development. So, on the basis of the University of RUDN University, a working seminar "UI GreenMetric World University Ranking Methodology" and the first tour on the campuses of universities for sustainable development of the world, headed by the

chairman of UI GreenMetric, Professor Riri Fitri Sari were organized for Russian universities (Official website of UI GreenMetric. The 3rd National Workshop on UI GreenMetric World University Rankings for Russian Universities and The 1st World Sustainable Universities Campus Tour hosted by RUDN University).

The TOP-200 UI GreenMetric World University Rankings for 2019 includes Perm National Research Polytechnic University (133rd place) and Siberian Federal University (179th place).

Further areas of research will be devoted to the analysis of cases of world universities that have achieved significant results in solving the problems of sustainable development of society. The study of the best practices for introducing the concept of sustainable development of education into the strategy of modern universities is extremely important for the formation of sustainable university campuses in Russia, which will allow more efficient solve problems caused by modern challenges at both the national and global levels.

Acknowledgment

The paper has been prepared within the financial support of Russian Foundation for Basic Research grant "Business-model of Companies as the Basis for Forming Shared Values and Social Capital" # 18-010-00340.

Preliminary Evidence of An Alarming Rise in Teachers Burnout in A Period of Economic Crisis

Sophia ANASTASIOU

Faculty of Social Sciences, University of Ioannina, Ioannina Greece
anastasiou@yahoo.com

Abstract

Currently, the public schools in Greece exhibit lack of resources and shortages in staff whereas teaches faced severe salary cuts after the onset of the current economic crisis in this Country. The hypothesis of the present work is that this condition can bring depletion in emotional support, which will lead to emotional exhaustion of teachers in Greece. The main objective of this paper is to certify the effect of the economic crisis in Greece on the risk of professional burnout for teachers. Published papers were retrieved from the Google Scholar database; keywords used during searching were "Maslach Burnout Inventory", "teachers", "Greece". The research was conducted in December 2019 (first week). The Maslach burnout inventory papers which were used and included in the analysis were either published in 2010-2019 or 1995-2010. The data extracted from the retrieved publications were used to compare the economic crisis in Greece and the level of exhaustion before and after the economic crisis started. Analysis of the results revealed that when the financial crisis began in Greece, there was an increase in the level of emotional exhaustion in teachers. Emotional exhaustion is an indicator of professional stress and further research is required to investigate the occupational stress risk of teachers in Greece.

Keywords: Teachers, Emotional Exhaustion, Burnout, Greece

Introduction

Occupational stress can be a chronic condition in the workplace and can eventually lead to burnout. Burnout is a situation brought about from depersonalization, reduced personal achievement, and emotional exhaustion (Rautakivi et al., 2019). Numerous factors affect burnout and job satisfaction. In a workplace job, burnout happens because of prolonged employees' exposure to psychological and physical stress. These exposures eventually lead to a reduced sense of professional accomplishment, depersonalization, mental, and physical exhaustion. Mental and physical stress are contributing factors that employees get to, which leads to a professional burnout zone, characterized by a lack of job satisfaction and a decrease in productivity (Sergiovanni, 1967).

Burnout problems can be seen in schools, with teachers who experience workload and psychological demanding work (Kamtsios & Lolis, 2016; Panagopoulos et al., 2014). Although teachers are well educated and skilled, they are prone to professional burnout. The magnitude of the problem is determined by the length of exposure (the more you are exposed, the more you are likely to professional burn out), burnout symptom problem increases with duration of exposure, working conditions, job demands, which leads to occupational stress (Maslach, 2003).

Low job satisfaction, reduced productivity and low moral are associated with absenteeism, and negatives attitudes towards work. If employees exposed to too much psychological and physical stress, it can result in emotional and physical fatigue. Lack of motivation to socialize and perform a task, mental fatigue, frustration are some of the symptoms of burnout (Maschlach 2003; Mouza & Souchamvali, 2016; Rautakivi et al., 2019). A research carried out by Maslach in 2011 revealed that burnout syndrome based on three principals; first principal reduced personal accomplishment, which is characterized by feeling incompetent at the workplace. Emotional exhaustion is the second

principle described by psychological and physical fatigue. Depersonalization is the principal that is characterized by detachment from work and cynical behaviors.

In Greece, in the past years, different studies have also revealed that teachers' burnout is a significant issue in the teaching profession (Panagopoulos et al. 2014; Kamtsios & Lolis, 2016; Mouza & Souchamvali, 2016).

As a result of the current economic crisis in Greece, austerity measures were enforced in all the sectors of the central government. The actions taken included a reduction in the number of teachers employed in public schools and salaries (OECD, 2014). Teachers' gross income was cut off by 30% and teachers were exposed to job insecurity, rising taxation, and increased working hours. The reduction in the number of serving teachers and their salaries had an impact on teachers' stress and job satisfaction. For instance, reducing the purchasing power imbalance and gross income can increase job burn out (Panagopoulos et al, 2014). A cut in the gross income for teachers has altered the public servant working condition as it was before the economic turmoil in Greece. In the year 2008, when Greece started experiencing financial crisis, teachers' gross income has been drastically reduced. When Greece began experiencing an economic crunch, workers in the various organizations in the public sector were faced with fewer resources and worked with fewer resources and reduced wages. For instance, for hospitals and schools' salaries were cut up to 45% and lack of resources and staff became a norm. Lack of resources and staff can result in depletion of emotional support, which leads to *emotional exhaustion* (Frenkel et al., 2012).

Indeed, some hospitals in Greece experienced medical supply and shortages of staff and their employees exhibited increased levels of emotional exhaustion (Rahiotis et al., 2014). In the same manner, some Greek schools were too faced with similar problem in their resources and their teachers exhibited increase in the level of emotional exhaustion which can be attributed to the economic crisis Greece (Botou et al., 2017).

Under the above economic hardship conditions and the lack of resources and shortages of staff, the risk of teachers to professional burnout is considered very high (Anastasiou & Anagnostou, 2020). Human resource management in Greece should include proactive policy monitoring indicators for occupational burnout. The most widely used estimator to estimate the level of exhaustion is the MBI (Maslach Burnout inventory). The MBI (inventory) has 22 questions, which used to determine three principles of burnout which are; depersonalization, lack of personal accomplishment, and emotional exhaustion — basing on the 22 items the score estimated according to responses of participants to every question using a 7-point Likert-scale ranging from 0 to 6. Each principle is determined from the corresponding questions and is classified either moderate, high, or low level (Mclean et al., 2019). For instance, when the scores of emotional exhaustion ranked high when ≥ 27 and depersonalization $\geq$ ten and lack of personal accomplishment when ≤ 33. Emotional exhaustion comes first before depersonalization, which can subsequently lead to a lack of personal achievement (Babakus et al., 1999). The prolonged economic crisis in Greece has made the public servants (teachers) experience unfavourable working conditions, which lead to occupational burnout and stress.

Methodology

The method used to certify the hypothesis on the effect of the economic crisis on the risk for professional burnout of teachers in Greece was bibliographic research. The bibliographic study analyzed a random sample which reported result in Greece on the levels of teachers' burnout. The first two pages of the bibliographical research used to come with published data from two different periods. The first page was from 1995 to 2010, and the second page from 2010 to 2019. The study was conducted in December 2019, and the first two pages from the google scholar search were screened and published, which used the Maslach Burnout Inventory. The bibliographic research sample paper used to compare and contrast before and after the beginning of the economic crisis in Greece.

Results & Discussion

The results represented in the figure below which shows the comparison between the level of emotional exhaustion before and after the beginning of the current economic crisis in Greece.

Figure 1: The level of emotional exhaustion before and after the onset of the current financial crisis in Greece. Data extracted from published papers which were either published in 2010-2019 or 1995-2010.

The results presented in Figure 1. A correlation between the level of emotional exhaustion before and after the onset of the current financial crisis in Greece indicates that after the start of the financial crisis, Teachers in Greece exhibit a considerably higher risk of professional burnout. Pre-crisis levels of Emotional Exhaustion (20.12±2.32) were significantly lower (t-test, P=0.042) compared to after the onset of the current economic crisis in Greece (24.33±4.88). The data presented in Figure 1 indicates that teachers exhibit a higher risk of professional burnout after the beginning of the economic crisis as compared to before it started.

As the effects of economic crisis, the education system in Greece has experienced numerous cuts in public spending, including a drop-in of close to 36% of its nominal terms in comparison over the past decade (OECD, 2018). Just like any other public servant, teachers faced "hostile treatment" from other active groups and the general society, perceiving them as "burden" for the public finances of a country that had led to a financial crisis (Zahariades 2016). For instance, a 2013 study portrays a negative picture of the teachers in the social media and shows low morale amongst the teachers. Under the influence of these conditions, wage differences widened in both the public and private sectors, and public employees experience difficulties in performing their skilled tasks under the conditions of limited resources (Christopoulou & Monastiriotis, 2015).

The above described conditions created unfavourable working environment which can lead to occupational stress of public servants including teachers in Greece (Mouza & Souchamvali, 2016). After a prolonged period of cuts in salary and underfunding of public schools, the teaching profession does no longer offers the recognition and job security that teachers use to enjoy previously. Teachers can easily feel that their work is not recognised and valued as it was before the onset of the profound financial crisis in Greece. (Panagopoulos et al, 2014).

According to the results of the current analysis, after the start of the Greek economic crisis, teachers' *emotional exhaustion* was increased. *Emotional exhaustion* is associated with occupational stress and can be a precursor of *depersonalization* and should be a matter of concern for School management. Monitoring the levels of *emotional exhaustion* and proactive human resources policies are required (Anastasiou et al., 2014; Anastasiou & Anagnostou, 2020) so as to deal with this issue.

Abstract

The purpose of this publication is to discuss how the intensity of actions which businesses take in order to develop dynamic capabilities affects their strategic maturity. With this goal in mind, the authors have reviewed relevant literature and refer to the results of their own research. On a theoretical plane, the authors point out the significance of dynamic capabilities in organisations and discuss strategic maturity of businesses, and how to measure it. As presented here, the results of a CAWI survey conducted in 2016-2018 on a group of 458 businesses from various sectors and industries of the Polish economy form part of broader research into dynamic capabilities of Polish businesses (National Science Centre grant decision no. DEC-2013/11/B/HS4/00697). We have used ANOVA to interpret the results of our research and have found that there is a correlation between the intensity of measures taken at each stage of the dynamic capability development process and the strategic maturity of businesses. Our research shows that the greater the intensity of actions in that process, the greater the level of strategic maturity. Based on the results of our analysis, we conclude that the intensity of dynamic capabilities in organisations at a reactive maturity level is average, which means that their organisational management systems have some built-in potential of dynamic capabilities. Our research results also point to the importance of different categories of dynamic capabilities at the different levels of strategic management.

Keywords: Dynamic Capabilities, Dynamic Capabilities Development Process, Strategic Maturity

Introduction

In the last few decades, the crucial issue in management theory has been to identify the sources of sustainable competitive advantages deriving from an organisation's unique capabilities that enable it to receive a maximum economic rent in its specific business environment (Nelson and Winter, 1982; Barney, 1991; Prahalad and Hamel, 1994). In this context, the organisational ability to sustain and renew competitive advantages under conditions of a continuously changing environment becomes a matter of primary importance. This is the area of research within the dynamic capabilities framework (Teece, Pisano, & Shuen, 1997). D.J. Teece, G. Pisano and A. Shuen (1997) define dynamic capabilities as the organisation's potential to integrate, build, and reconfigure internal and external competencies to address rapidly changing environments. Recent years have seen the concept of dynamic capabilities, which places value on organisational ability to recognise in advance and

capture new business opportunities, gaining prominence in the area of strategic management. This is indicated by a rapid uptick in a number of publications analysing the framework underlying the concept.

The link between dynamic capabilities and strategic management, which the existing literature finds to be indisputable (Barreto, 2010), prompts one to search for an answer to the research question which this paper tries to address, namely how the actions taken to develop dynamic capabilities affect the level of strategic maturity in businesses. Given the nature of dynamic capabilities, the assumption behind our research is that by stepping up their use of dynamic capabilities businesses should see their strategic maturity growing.

Review of literature

Dynamic Capability Development Process

A discussion which started after D.J. Teece, G. Pisano and A. Shuen (Teece et al., 1997) offered their definition of dynamic capabilities has led to the emergence of numerous alternative definitions of that construct (Kay et al., 2018). Sometimes, these new definitions would provide a completely different perspective on dynamic capabilities, including in relation to their purpose, character, role, context, origin and evolution, effects or assumptions concerning their nature. In 2009, D.J. Teece self-corrected his earlier proposal (Augier and Teece, 2009) and held that, being higher-order competencies, dynamic capabilities not only provide an opportunity to respond to any changes in the environment but also determine those changes.

N.M. Kay, S. Leih and D.J. Teece (Kay et al., 2018), in turn, point to empirical problems involving the lack of comparability in the cited research findings. Because the approaches to describing the nature and essence of dynamic capabilities are not so much diversified as completely different, contributions from much of research are restricted almost exclusively to listing the assumptions pertaining to the stock of dynamic capabilities and to interpreting research findings, leading some scholars to express doubts about the legitimacy of research on dynamic capabilities (Winter 2003).

Based on their assumption that dynamic capabilities develop under the influence of various variables, which can be both subjective and objective, S.A. Zahra, H.J. Sapienza and P. Davidsson (Zahra et al., 2006) conclude that having dynamic capabilities per se does not necessarily lead to improved organisational performance. Dynamic capabilities must be properly targeted and deployed in order to gain whatever benefits are sought and then transform those benefits into what would be a foundation of sustainable competitive advantage. This shows how critical it is to have a well-configured process for developing dynamic capabilities. T. Eriksson (Eriksson, 2014) points out this aspect when she notes that the literature on the subject describes dynamic capabilities as processes which are dynamic in nature and operate in and develop over time. Some authors (Helfat et al., 2007) point out that dynamic capabilities comprise both organisational and managerial processes the purpose of which is to identify needs or opportunities for change, and to accomplish that change. D.J. Collis (Collis, 1994), on the other hand, makes a point of noting that dynamic capabilities influence the pace of change for simpler capabilities, with account taken of relevant path dependencies and market positions. In discussing their nature, it is generally assumed that dynamic capabilities are a function of learning processes, that to say, of experience accumulation, knowledge articulation and knowledge codification (Zollo and Winter, 2002), and also that dynamic capabilities refer to specific and identifiable processes involved in the integrating, reconfiguring, acquiring and releasing of resources (Eisenhardt and Martin, 2000). According to the approach presented by K. Eisenhardt and J. Martin (Eisenhardt and Martin, 2000), dynamic capabilities affect organisational and strategic routines which underlie resource-base decision-making.

The conclusion from our literature review (Teece et al., 1997; Zollo & Winter, 2002; Zahra et al., 2006; Cepeda & Vera, 2007) is that there are various approaches to describing both the processes whereby dynamic capabilities are developed and the stocks of dynamic capabilities that can be used

to integrate, reconfigure, create or release resources. This paper uses a five-stage model to describe a dynamic capability development process comprising the actions involved in (1) opportunity-sensing; (2) learning; (3) coordination; (4) configuration and reconfiguration; and (5) organisational adaptation (see Figure 1).

Figure 1: Model for a dynamic capability development process

Source: (Cyfert and Krzakiewicz, 2019)

In the proposed model, opportunity-sensing activities are the starting point in the dynamic capability-shaping process. They involve: (1) analysis of various trends and phenomena in the environment geared at creating new customer needs and anticipating competitor actions; (2) creation of new ideas to mobilise those within the organisation and change their attitudes; (3) identification of the needs for change based on the developments in the environment and the organisation's potential.

Identifying opportunities in the surrounding environment is a starting point for learning processes, which involve the following actions: (1) accumulation of knowledge to form a basis for transformation of dynamic capabilities; (2) intra-organisational knowledge transfers to supply any units involved in organisational change processes with relevant information; (3) intra-organisational knowledge allocation and retention in order to embed relevant knowledge in organisational units and ensure synergy based on the accumulated knowledge; (4) intellectual property management to ensure adequate protection of the organisation's proprietary rights; (5) encouraging employees to experiment and come up with new breakthrough ideas.

Implementing a set of adopted dynamic capabilities into the management system requires coordination of both organisation members and any entities operating in its environment. This involves: (1) creating a vision to integrate stakeholders that would clearly identify what actions are taken for stakeholders and what values are created for them; (2) building stakeholder loyalty as a basis to secure key resources across all dimensions of organisational activity; (3) integrating supply chain activities to provide a framework in which the value generated in that chain can be determined and captured; (4) managing strategic alliances to make sure that key resources can be obtained and secured and to ensure that external entities deliver high-quality outcomes; (5) building employee commitment so that employees can be part of what the organisation does and become more involved in it; (6) integrating and coordinating business processes to support change processes and ensure an adequate level of organisational cohesion.

Once a vision of how dynamic capabilities should be developed is defined and the stakeholders' support and involvement is ensured, the organisation can be re-modelled through configuration and reconfiguration processes. These involve: (1) creating critical resources and skills which the organisation cannot source from its environment or which would be more expensive to source than to generate; (2) securing resources and skills; (3) integrating resources and skills to allow the organisation to make use of its available synergies; (4) creating innovations to enable proper development of dynamic capabilities and build the foundations for competitive advantage; (5) shedding (releasing) superfluous and redundant resources and skills that will generate limited added value for the organisation in a long-term development perspective; (6) deploying new technologies to ensure proper operating and development conditions for the organisation.

Making sure that the benefits of developing dynamic capabilities can be leveraged by an organisation requires it to transform its management system. This is achieved through organisational adaptation and includes: (1) business model transformation to capture the logic behind what the organisation does and, through this, to reflect the modified set of the organisation's strategic objectives and a bundle of its dynamic capabilities; (2) managing organisational boundaries, which includes transforming such areas as performance, authority, competence and organisational culture; (3) ensuring adequately dynamic strategic management processes so that they necessarily affect the organisation from within in such a way that it is aligned with its environment in the best possible way while retaining its organisational identity; (4) organisational improvement, which includes comprehensive and targeted efforts to integrate and alter the arrangements within the organisation so as to ensure a higher level of its alignment with the environment; (5) adapting and implementing best management practices; (6) ensuring flexible organisational structure with a view to implementing cutting-edge network-based organisational arrangements; (7) managing organisational identity.

Strategic Maturity

Initially, maturity models were meant to reduce defects and increase efficiency through greater focus on organisational practices (Blommerde and Lynch, 2016). While the first maturity model in management science was put forward as early as 1973 by L. Nolan (1973), it was not until the late 1980s that we can see a rapidly growing interest in the notion of maturity after programmers from Software Engineering Institute (SEI) at Carnegie Mellon University had developed their Capability Maturity Model (CMM) (Paulk et al., 1993). While maturity as a concept has found extensive use in project management (Hopkinson, 2011; Anantatmula and Rad, 2018; Crispim, Silva and Rego, 2019; Hartono, Wijaya and Arini, 2019), process management (Froger et al., 2019; Krukowski and Raczyńska, 2019; Ongena and Ravesteyn, 2020; Szelagowski and Berniak-Woźny, 2020) or organisational development (Milenković, 2016; Amir and Auzair, 2017; Grossman, 2018), there are relatively few theoretical publications and empirical studies in the field of strategic management that would address strategic maturity in organisations, despite the attraction the concept holds from the management process improvement perspective (Demir, 2018). The Strategic Management Maturity Model (SMMM, BSCI, 2010), which was developed by the Balanced Scorecard Institute, gauges maturity along seven different dimensions (Leadership, Planning & Executing, Processes & Tools, Structure & Model, People & Culture, Performance Management, Innovation) and five different levels (Ad Hoc and Static (Level 1); Reactive (Level 2); Structured and Proactive (Level 3); Managed and Focused (Level 4); Continuous Improvement (Level 5). F. Demir's proposed modification to the SMMM (Demir, 2018), called the Strategic Management Maturity Model for Innovation (S3M-i), assumes that the only way of creating sustainable growth is through innovation. Under F. Demir's model, maturity is assessed along seven dimensions (Leadership, 2. Planning & Executing, 3. Processes & Tools, 4. Structure & Model, 5. People & Culture,6. Performance Management, 7. Innovation) and at six levels (Level 0: Undefined, Level 1: Initial, Level 2: Planned, Level 3: Performed, Level 4: Optimized, Level 5: Excellent).

In assessing organisations for strategic maturity, the starting point could be either the design of their strategic management systems or strategic management processes. While the two dimensions are interlinked (Pearce, Robinson and Subramanian, 2000; Okumus, 2003; Andrews et al., 2009) – how a

strategic management system is structured should be seen as a consequence of what is done as part of a strategic management process – it is worth noting that it would be a more proper path to assess the latter, as is also reflected in the existing literature which is more preoccupied with that dimension ((Demir, 2018), BSCI, 2010, Witek-Crabb, 2016). While this conclusion is correct, one should also note that the components of a strategic management system can also be allocated to other management systems, which makes it more difficult to identify benefits flowing from changes in maturity levels.

The study described in this paper is based on the CCM framework (Paulk et al, 1993) and it proposes a five-stage model of strategic maturity comprising the following levels:

1. Reactive. Actions at any stage in the strategic management process are random and are undertaken in response to changes in the environment. The only people involved in those actions are management executives.
2. Defined. Actions at any stage in the process are defined but are not structurally integrated (each division/function formulates its own strategy). Those involved are management executives and some managers.
3. Integrated. There are specific operational procedures for any stage in the process but actions are not measured for effectiveness. Those involved are management executives and some managers.
4. Managed. There are specific operational procedures and actions are measured for effectiveness. Those involved are managers.
5. Aligned. Actions at any stage in the process are taken continuously and are linked with other components of the organisation's management system. All employees are involved.

As constructed, the model provides for 4 generic stages in the strategic management process (Andrews et al., 2009; Alkhafaji, Nelson and Nelson, 2013) including: (1) Strategic analysis; (2) Strategic planning; (3) Strategy implementation; and (4) Strategic control.

Research Methods and Research Limitations

While noting a considerable variation of research into dynamic capabilities as it relates to organisational performance, T. Eriksson (Eriksson, 2014) stresses that the usual point of reference for researchers is either economic performance or innovative, technological or environmental outcomes (Zott, 2003). T. Eriksson also notes that the studies focusing on economic performance rarely rely on objective measures for outcomes of dynamic capabilities and most of them utilise a combination of the objective and the subjective, or just the subjective measures, with respondents evaluating their company's performance in relation to that of its competitors over the three-year time span, which appears to the right approach in researching dynamic capabilities. In our research, which utilises the dynamic capabilities development model we have described above, we asked the respondents to express their subjective opinions on the levels of organisational maturity at individual stages in the strategic management process and on the intensity of actions taken as part of the dynamic capability development process.

We assessed the maturity of the strategic management process ranking it on scale of 1 to 5, where (1) = Insignificant; (2) = Negligible; (3) = Average significance; (4) = Significant; (5) = Very significant. Similarly, a one-to-five scale was used to assess the intensity of actions taken in the dynamic capability development process, where (1) = Factor does not exist (2) = Low intensity of actions; (3) Average intensity of actions; (4) = High intensity of actions; (5) Very high intensity of actions.

The techniques utilised in our survey were PAPI (for pilot studies) and CAWI (for the study proper) and we used a questionnaire with closed-ended questions. Respondents included staff in managerial positions at the companies surveyed. The questionnaire was designed to illicit two categories of information. Firstly, an attempt was made to obtain general information about the companies surveyed. Secondly, information was sought that would help ascertain what specific dynamic capabilities the companies surveyed had. Interviews were conducted between April 2016 and June

2018 on a sample of 715 specifically chosen Polish companies. On discarding questionnaires that were incomplete or raised concerns as to the accuracy of what was declared in them, the total number of properly completed questionnaires was 458.

As presented here, the results of our survey come with some limitations. On the one hand, the use of the CAWI technique utilising an online version of our questionnaire ensured a satisfactory response rate, allowing for general conclusions to be drawn. On the other hand, it increased the risk that questionnaires would be completed without much thought given to them. In an effort to mitigate both that risk and the risk of incorrect assessments because of difficulties in interpreting the issues under examination, the general part of our survey included questions the answers to which were mutually exclusive. As a result, a number of completed questionnaires from the respondents were discarded at both stages of our study. The answers reported in our survey are subject to the risk of subjective bias by the respondents whose expressed opinions might have reflected their perceptions more than the reality as it is. In their relative assessments of how their companies performed compared to competitors, the respondents might have lacked full information to make those assessments. Also, as is only natural, respondents could have been overly optimistic in assessing performance of their own firms. Another limitation of our study is that it did not focus on analysing dynamic capabilities of firms in specific industries and there was a wide variation in the scope of activities pursued by the companies surveyed. This could have led to different assessments of what in fact was similar performance by companies from different sectors.

Results and Discussion

Actions that the companies surveyed take as part of their dynamic capability development processes can be characterised as above average in terms of their intensity (see Chart 1). The results show minor differences among the various categories of actions. This provides a basis for concluding that the adopted model for the dynamic capability development process is correct. Importantly, too, while the final assessment score is “above-average intensity”, for actions taken at the adaptation stage and the configuration and reconfiguration stage, most assessments point to low or average levels of intensity, while the activities taken at the opportunity-sensing, learning and coordination stages are primarily ranked at high or very high intensity levels. In line with how the model for the dynamic capability development process is configured, this means that the intensity of actions wanes as transitions are made to each subsequent stage in that process.

Chart. 1: Intensity of actions in dynamic capability development processes, n=458

Based on their declared levels of strategic activity at each stage in the strategic management process, the companies surveyed show high strategic maturity (Chart 2). The most mature actions are those taken at the strategy implementation stage (71% of maximum response level), followed by strategic control (66% of maximum response level) and then strategic analysis and strategic planning (62% of maximum response level).

Chart. 2: Declared strategic maturity, n=458

We used the respondents' maturity assessments for individual stages in the strategic management process as a starting point to answer the question of how the actions taken as part of dynamic capability development processes affect the strategic maturity of the companies surveyed. This required us to adopt, as a point of reference, a synthetic measure to assess strategic maturity in those companies. In line with the process-based nature of strategic management, our study assumes that the level of maturity at each subsequent stage in the strategic management process can be at most the same as in the preceding stage. This assumption required modifying the levels of strategic maturity as declared by respondents, revealing that the declared levels are lower than the real ones (see Chart 3). As declared by the respondents, nearly every subsequent stage in the strategic management process was at a higher maturity level (the only exception was strategic control where the companies' maturity was lower than at the strategy implementation stage, albeit higher than at the strategic planning stage). However, once corrected, the strategic maturity assessment (comprising all stages in the strategic management process) shows the maturity of the companies surveyed to be gradually falling.

Chart. 3: Corrected strategic maturity assessment, n=458

We have used the ANOVA method to test the corrected assessment of strategic maturity against the intensity of actions at each individual stage in the dynamic capability development process. Three general concussions can be drawn on that basis.

Firstly, the greater the intensity of actions in the dynamic capability development process, the greater the level of strategic maturity of an organisation. This can be observed at virtually all stages of the dynamic capability development process. Small differences, which fall within the acceptable variance limits, are observed at the opportunity-sensing stage (between the integrated and defined levels), the coordination stage (between the integrated and defined levels), and at the configuration stage (between the managed and aligned levels). This means that organisations, which improve their strategic management processes, should pay their attention to activities that develop their dynamic capabilities.

Secondly, the intensity of dynamic capabilities in organisations at a reactive maturity level is average, which means that their organisational management systems have some built-in potential of dynamic capabilities. As regards the opportunity-sensing, learning and adaptation stages in the development of dynamic capabilities, the largest increase in their intensity is observed between the reactive and defined stages, which points to the existence of the initial accumulation effect. For the other two stages (coordination, and configuration and reconfiguration), the largest observed difference in intensity is between the integrated and managed levels. Another observation based on our study is that dynamic capabilities grow at a declining pace (the only exception is the adaptation stage where increases are linear). This means that transitioning to subsequent strategic maturity levels requires less and less intensity of action in the dynamic capability development processes.

Thirdly, different categories of dynamic capabilities are important at the different levels of strategic management. For example, the key actions at the reactive level are those pertaining to configuration and reconfiguration; at the defined level, those concerning coordination; at the integrated level, those relating to learning; at the managed level, those pertaining to opportunity-sensing; and at the aligned level, those relative to organisational adaptation. In trying to explain why this is so, one might posit that, initially in the organisational development, managers believe that activities aimed at securing and creating resources and skills that are critical to organisational development are the key to their organisation's survival in a turbulent environment. Once strategic awareness has increased, raising strategic maturity to the defined level, greater value must be placed on activities that build employee involvement. Moving to the integrated level involves accumulation and transfer of knowledge and encouraging employees to experiment so that they can come up with new, breakthrough ideas. At the managed level, identifying what changes are needed and mobilising organisation members make it possible to transform attitudes of employees. At the aligned level, managers believe that the intensity of learning and knowledge accumulation activities is satisfactory, which is why actions to adapt the organisation in response to changes in its environment begin to play a key role.

Chart. 4 : Corrected strategic maturity at different stages in the dynamic capability development process

Maturity levels: (1) Reactive; (2) Defined; (3) Integrated; (4) Managed; (5) Aligned

Conclusions

The purpose of this publication is to discuss how the intensity of actions that businesses undertake in order to develop dynamic capabilities affects their strategic maturity. The study has purposefully expanded its scope rather than limiting itself to specific sectors, and the companies surveyed were only assigned to modern, medium-technology and traditional sectors (using the OCED terminology) after the study. We believe it would be advisable to conduct studies with a scope limited to specific industries in order to capture a fuller picture of any potential correlations. Our study has found correlations between the intensity of actions taken as part of the dynamic capability development process and increases in strategic maturity levels. Having said that, the study does not allow for identifying which specific dynamic capabilities should be considered critical for transitioning to specific levels of strategic maturity. We believe therefore that it would be worthwhile to try and identify those dynamic capabilities which determine the effectiveness of transitioning into the different levels of strategic maturity.

Risk in Supply Chain Management: SME Perspective in Poland

Michal Kot

Czestochowa University of Technology, The Management Faculty, ul.
Armii Krajowej 19B, 42-201 Częstochowa, Poland
office@gjem.press

Abstract

The main aim of the survey is to find causes of risks in supply chain management in small and medium-sized enterprises. This article is also an attempt to determine the level of employee's education in the field of risk identification and prevention, identify sources of risk especially in the links between an enterprise and its suppliers and customers as well as perception of risk among men and women depending on the job position. The research sample of 50 SMEs has been chosen among small and medium-sized enterprises operating in various branches. Finally, thirty-three companies those returned completed inquiry were selected to the analysis. Study results shows different ways to identify and dealing with risk in supply chain management, depending on the size of the company, business area and economic sector in which it is. The results also contain information on the frequency of training on risk in supply chain management and their most common types, and the attitude of respondents to specific risk factors.

Keywords: Risk in Supply Chain, Management Small and Medium Enterprises

Introduction

Due to the increasing complexity and uncertainty of modern supply chains, the type and nature of uncertain developments or the impact of any action have become hard or even impossible to predict, and the importance assigned to risk considerations has grown (Helbing, 2006; Pisar & Bilkova, 2019) Managing risks is a daily issue to supply chain and logistics management. The ability to respond to and mitigate these risk events enables the company to be ahead of its competitors and diminishes the expected long-term damage to its business (Hudakova et al., 2018; Kolupaieva et al., 2019). The critical drivers for supply chain profitability are responsiveness, efficiency, and reliability (Hendricks and Singhal, 2005). The occurrence of risk events in different stages of the supply chain can put negative influences on supply chain performance. The management of risk events is termed as supply chain risk management (SCRM) which has become a key part of the business strategy. SCRM has got more attention with the movement to global supply chains and the increasing occurrence of internal and external risk events that cause disruptions of supply chain operations (Aqlan & Lam, 2015) By developing supply chain management, its content has changed. Traditional supply chains has emphasized on cost and factors such as material and parts flow, information flow and financial flows (Calvomora et al, 2015; Pakurár et al., 2019, Pakurár et al., 2019). Today the market needs to respond faster than past. Traditional factors management is not responsive to current needs of chains. The key to survive in today's world is to have competitive advantage to competitors. On the other hand it is necessary to improve performance for competition. There is a tight interrelation between country's economic competitiveness and a rate of its economic growth (Fyliuk et al., 2019; Kiseľáková et al., 2019). Performance improvement is considered an important topic in today's world. Supply chain is also considered as one of the features of the world (Eidi et al, 2013) Although supply chain risk management has gained attention in the past years in academia, there is a lack of work on this subject matter. There is a need for effective mathematics tools to work in the field of supply chain risk management analyzing the main supply chain risks for an effective supply chain risk management. Supply chains today face greater risks than their supply chain managers could recognize and in fact, Christopher and Peck clearly stated that "in today's uncertain and turbulent markets, supply chain vulnerability has become an issue of significance for many companies and appropriate researches on resilient supply chain are yet to be conducted". The optimal way is to choose flexible enough practices

that easily adapt to the constantly changing market, will be easily available to employees and managers and at the same time will be very effective in terms of their impact in the area of coping with risk in supply chain management.

The purpose of this article is to draw attention to the essence of a properly functioning supply chain in SMEs, to identify sources of risk in the context of supply chain management which in the analysis of entrepreneurs are ignored, and to identify factors that can improve methods of dealing with risk or that eliminate the occurrence of such a threat.

Literature Review

To effectively compete in the global market, SMEs must have effective supply chain management. Conflicting objectives and lack of coordination between supply chain partners may cause uncertainties in supply and demand. Therefore effective SCM is required to streamline the supply chain of SMEs. In general, knowledge management relates to supply chain management by providing the tools necessary to manage large amounts of data generated by supply chain operators and their customers.

(Carlos et al., 2013; Dost et al., 2016; Olson, 2018a, Olson, 2018b; Pérez-Salazar et al., 2017; Schoenherr et al., 2014; Rahman et al., 2019; Svazas et al., 2019). Supply chain management demands managers to understand, monitor and control operations in the entire supply chain, from sourcing, logistics, production and retail delivery to customers (Olson, 2018a, Olson, 2018b; Kovács & Kot, Bilan et al., 2017; 2017; Kot et al., 2018; Krykavskyy et al., 2019).

The term supply chain management is defined as the integration of key business processes among a network of interdependent suppliers, manufacturers, distribution centers, and retailers in order to improve the flows of goods, services, and information from original suppliers to final customers, with the objectives of reducing system-wide cost, while maintaining required service levels (Simchi-Levi et al 1999; Androniceanu and Tvaronavičienė, 2019) Greater risk in supply chain has a poorer result in performance's metrics such as inventory costs, lead-time, flexibility and responsiveness. Several authors have investigated the risk elements using different methodologies seeking to reduce the impact on supply chain performance. An integrated methodology has been proposed to classify, manage and assess inbound supply risk using an Analytical Hierarchy Process, defined as a multi attribute decision-making method. This enables a decision maker to visually structure a problem in an attribute hierarchy (Wu et al 2006) A procedure to manage the risk has also been studied. (Hallikas et al. 2004; Borocki et al., 2019; Suray et al., 2019) Other authors have been focusing on exploring flexibility to mitigate the risk, classifying it in six interruptions: suppliers, process, demand, intellectual property, risk behavior, and political-social aspects.(Tang and Tomlin. 2008) There are several ways to quantify risk such as variance (Markowitz, 1991), downside risk (Eppen et. al 1989), and maximum regret. In this research, we choose the standard deviation of the scenario profits to quantify risk, which allows for a more intuitive interpretation and comparison between supply chain network configurations. Furthermore, risk management is a scientific approach to manage risks by doing anticipating losses, and designing procedures that will minimize financial losses (Vaughan, 2008). These are seven steps of risk management process:

- Communication and Consultation.
- Establishing the context.
- Risk Identification.
- Risk Analysis.
- Risk Evaluation.
- Risk Treatment.
- Monitoring and Review.

Based on (Christopher, 2003), supply chain risks are divided into three categories, as shown below:

- Internal risk, including risks in process and control activities.

- External risk, including sub categories demand and supply risk.
- Other external risk, including sub category environmental risk that affect in upstream and downstream.

Research Methodology

The main aim of the survey is to find causes of risks in supply chain management from small and medium-sized enterprises perspective. Besides that there are some specific aims: determining the level of employee's education in the field of risk identification and prevention; identifying sources of risk between an enterprise and its suppliers and customers; to present the perception of risk among men and women - managers / supervisors / employees. Is it the same? Are there differences? The research tool was an online survey proposed by the Author, the research sample were 50 small and medium-sized enterprises operating in various branches located in southern Poland. The survey questionnaire included various types of questions - single choice questions and those ones used the Likert scale. Finally 33 completely fulfilled questionnaires were selected by students to the analysis. The data were collected in September 2019 from employees and managers of studies SMEs.

Research Results

Data presented in the table 1 indicate that 19 men and 14 women took part in the survey**.**

The largest group among respondents were women with university education 71.5%, and the least of them primary education 7%. The situation is similar among men, the most respondents has university education 68,%, and the least vocational education 5.3%.

Table 1: Distribution of respondents according to education

Education	Female	Male	Structure	
			F	M
Primary education	1	-	7%	-
Vocational education	-	1	-	5.3%
Secondary education	3	5	21.5%	26.3%
University education	10	13	71.5%	68.4%
Total:	**14**	**19**	**100%**	**100%**

Most of female respondents have an employee function in the company 71.4%, the others managerial 28.6%. In addition to these selected functions, among men there was also the function of CEOs and 21% of the answers. The most responses among men concerned 52.6% of managerial functions.

Table 2: Distribution of respondents by function in the company

What function do you perform in the enterprise?	Female	Male	Structure	
			F	M
CEO	-	4	-	21%
Manager	4	10	28.6%	52.6%
Employee	10	5	71.4%	26.4%
Total:	**14**	**19**	**100%**	

Table 3: Structure of respondents according to the enterprise size criterion

Size of company	Answers	Percentage indicator
Micro + Small	10 + 14	72.7%
Medium	9	27.3%
Total:	**33**	**100%**

As the data in the table 3 shows, there are three types of companies in the study sample: micro enterprises can be distinguished: 30.3%, small 42.4% and medium-sized 27.3%.

Table 4: Area of activity and dependencies between them

Area of activity	Answers	Structure
National	29	87.9%
International	4	12.1%
Total:	**33**	**100%**

The largest group of respondents indicated that the area of activity of their enterprises is located on the local market - 87.9%, while the remaining 12.1% of respondents conduct their activities abroad.

Table 5: Activity in the country and international

	Micro+ small enterprises	Medium size enterprises	Structure	
			M+S	Medium
National	23	6	96%	66.5%
International	1	3	4%	33.5%
Total:	**24**	**9**	**100%**	

According to the data in the table 5, it appears that the majority of respondents working in micro and small enterprises - 96% conduct their activities in Poland. However, only 4% abroad. On the other hand, in the case of medium-sized enterprises, greater activity on the foreign market is noticeable than

in micro and small enterprises, as it is 33.5%. However, in relation to the local market, medium-sized enterprises have a share of 66.5%.

Figure1: Diversity of business sectors of activity

According to the data contained in the figure 1, the majority of respondents surveyed deal with other services, as it is as much as 27% of respondents or 9 people. In turn, 24% or 8 respondents are involved in trade. Transport is handled by 18% or 6 people from among the respondents. Construction companies are run by 12% of respondents, which gives 4 people. The study noted that 2 people deal with industrial production, as well as hotel and catering industry, which gives each of them 6%. In turn, both communication, social networking and hydraulic services are occupied by 1 person, which gives a total of 6% for each of the industries.

Figure2: Activities carried out in the company in the context of risk management in the supply chain

According to the data contained in the figure 2, the majority of respondents conduct activity in transferring of risk to other business entities -18 respondents, while 15 respondents sporadically carry out activities in transferring of risk to other entities. Diversification aimed at reducing the risk level is rarely carried out by 20 respondents, while very often 13. The creation of financial reserves against the threats in the firm occasionally leads 16 respondents, whereas 17 respondents very often. The interpretation and analysis of the threat as well as employee training to prevent it are dealt with very

often by 21 of respondents and sporadically by 12 of them. while risk avoidance, which is only often addressed by 13, sporadically 20.

Figure 3: Risk management activities

According to the data contained in the figure 3, the majority of respondents are active in risking other entities, 18 respondents, while 15 respondents sporadically carry out activities involving risking other entities. Diversification aimed at reducing the risk level is occasionally carried out by as many as 20 respondents, while very often 13. The creation of financial reserves in the event of threats in the enterprise occasionally leads 16 respondents, while 17 respondents very often. As many as 21 respondents and 12 sporadically deal with the interpretation and analysis of the threat and training employees to prevent it, while risk avoidance, which is only often addressed by 13, sporadically 20.

Figure 4: Sources of risk in supply chain management

15 respondents make the most comments related to the emergence of new competitors in the industry, while the least 18. Fluctuations in demand are taken by most 24 and the least 9. Business dependence on a limited number of suppliers the most 19 and the least 14. Availability of raw materials the most 24 and the least 9. Change in raw material prices the most 22, the least 11. Negotiating problems most 14 the least 19. Currency fluctuations the most 14, the least 19. Large distance between business partners most 14, least 19. Change of suppliers most 21, least 12.

Figure 5: Participation in risk management training

The figure 5 shows that 13 respondents out of 33 participate in risk management training - irregularly, 11 respondents do not participate at all, while 9 respondents participate in training regularly.

Figure 6: Potential selection of the scope of training on risk management

The figure 6 shows that the majority of respondents (15) would introduce training with specific risks: design, financial and security, 11 respondents chose extensive risk management training, 4 respondents chose training in the application of risk management tools. The least respondents (2) would not

introduce any training. The chart shows that 94% of respondents would introduce one of the three risk management training listed above, while only 6% of respondents would not introduce any training.

Summary

The results of the conducted research provide a good basis for formulating the hypothesis that solutions that are most often used as part of solving the risk problem in supply chain management in small micro and medium enterprises are: risk transfer to other entities, i.e. insurance, guarantees, sureties to cover possible damages, interpretation and analysis of the risk and training of employees in this area in order to prevent the occurrence of such risk. Research has also shown that enterprises have a narrow range of risk factors to which they pay a lot of attention. Over 50% of enterprises attach little importance or ignore the threat arising from the emergence of new competitive companies on the local market. The European Community is not indifferent to the potential inherent in SMEs and implements a number of actions aimed at strengthening the role of this sector on the market. It enables activities within the framework of scientific and research development, product improvement, thus strengthening the company's position in a specific sector of operation. In today's world, newly created small enterprises that manage well the resources of intelligence and capital increased by the budget under the European Union assistance are able to be competitive with enterprises already operating on the market. The second source is problems in negotiations. They can have different grounds, i.e. stress, own personality, self-esteem and uniqueness, interpretation, sense of security and lack of initiative. Another negative factor is conducting irregular trainings or conducting trainings on narrow topics regarding risk in supply chain management. Staff with appropriate qualifications, trained and regularly acquainted with rapidly changing risk definitions, new possibilities and ways to prevent it is a guarantee of reducing the risk of its occurrence or faster dealing with its occurrence. Regular trainings focusing on a broader range of risk would be more effective, which would later result in a flexible workforce ready to counteract the approaching unknown risk. Orientation (point of view) focusing only on the functioning of your own business is a mistake. A good solution is to monitor emerging new companies on an ongoing basis in order to prevent any increase in competition. The process of self-improvement should be constantly carried out in the enterprise with the thought that it will soon become unrivaled on the market, although nowadays this moment in the sphere of SMEs may never take place given the very rapid development and increase of quality in enterprises as well as the appearance of new ones on the market .

Abstract

The introduction of Business Process Management (BPM) in public administration is determined by multiple factors. According to different studies, the factors related to Human Resource Management (HRM) are among the most important ones. The aim of the study presented in the article was to identify the HRM factors which occur in the community offices. Subsequently, the identified factors were assessed in the context of their significance in the introduction of BPM in the examined entities. As a result of the conducted study, it was concluded that BPM is primarily influenced by the community offices' managers regarding the constant improvement of their competences, ensuring the continuous development of employees within offices, as well as providing an organizational environment that increases their responsibility, independence in operations and acceptance of changes.

Keywords: Human Resource Management; Business Process Management; public organization; community office

Introduction

The general challenge that the public administration (public organizations) is facing was dubbed by F. Patterson as "doing more for less" (Patterson et al. 2009) However, as the examples of various countries show, the approach to managing public administration based on the assumption that it is enough to reduce expenses to increase its efficiency in the long run, did not bring benefits. Therefore, other ways to achieve this result have been sought. One of them is the transfer of solutions from business organizations to the area of public management, including the concept of Business Process Management (process approach, BPM)

The introduction of BPM to the public administration can be based on the New Public Management (NPM) model. The distinguishing features of this model were the introduction of a horizontal structure, characteristic of BPM, and the radical decentralization of public organizations, along with the assessment of activities through achieved results (Hood 1991) However, one of the basic assumptions of NPM was an attempt to implement solutions in public administration that are used in the management of business organizations, the best example of which is introducing BPM to it. With this approach, organizations imitate solutions that appear to bring beneficial results to other organizations (Hensel 2018)

The process approach allows, among others, for a better understanding of the relationships between the activities conducted by an organization. It shifts the center of gravity of management to the coherence of internal elements of an organization, but also shows a new way of thinking of managers, who should pay special attention to horizontal transfers within an organization as well as between organizations.

From the point of view of traditional public administration, this is a revolutionary approach, because it was based on a traditional, hierarchical structure in which no horizontal approach occurred.

Introducing and developing the scope of BPM use in organizations is determined by different organizational areas, such as: organizational structure, IT solutions, organization's strategy, finances, services provided, HRM solutions etc. Bearing in mind that the human factor is often crucial when introducing various initiatives into an organization, the purpose of the research presented in the article is to identify the occurrence of factors related to HRM in public administration offices and to assess them in terms of influencing the possibility of implementing the process approach in these entities.

Theoretical Background

Initially, the process approach was used only in business organizations. Its propagation in public administration started in the early 1990s, with the emergence of the concept by M. Hammer and T. H. Davenport (Reyes 1998) The first studies on the BPM in public organizations include works by G. Bouckaert, A. Halachmi (1995); R. Linden (1993); T. Packwood (1998) and L. P. Willcocks (1997). It is worth noting that in the literature related to the public sector, process approach is defined either with generally accepted terminology, i.e. Business Process Management (BPM) (Gulledge, Sommer 2002); (Niehaves, Plattfaut 2010, p. 389); (Niehaves, Malsch 2009), or the term Government Process Management (GPM) (Tregear, Jenkin 2007, p. 1).

BPM in public administration is based on the assumption that actions should be optimized, taking into account the processes implemented in the organization, not the functions. This approach proved to be helpful in fulfilling managerial roles in public administration during the implementation of reforms aimed at increasing its effectiveness and customer orientation or improving inter-organizational coordination (Ongaro 2004) According to M. Kohlbacher, the process approach is a structure composed of ten dimensions (Kohlbacher 2010). These include ones related to human resources, i.e.: managerial support, organizational structure adapted to horizontal functioning, employees' knowledge, Human Resources Management systems, coordination and integration of all process projects and organizational culture (including its elements, such as teamwork, readiness for change, flexibility and customer orientation)

In their research, T. Schmiedel, J. vom Brocke and J. Recker attempted to identify the features of organizational culture that support the implementation of effective and efficient processes (Schmiedel et al. 2013). They are called CERT values (C - Customer orientation, E - Excellence, R - Responsibility, T - Teamwork) These are elements that are often referred to as factors depending on the human resources of an organization. Other authors, who pointed to the relationship between aspects related to HRM (especially in organizational structure, organizational culture, the role of managers, teamwork or the remuneration system) and BPM, were F. Zucchi, and J. S. Edwards (Zucchi, Edwards 1999; Raczyńska, Krukowski 2019). S. Corrigan conducted similar analyses (Corrigan 1996).

According to the resource approach to the organization, social capital (human resources) is understood as a resource that is valuable, rare, and difficult to imitate and replace, and which, together with other resources, creates organizational capacity (Barney 1991). N. Lin defines social capital as "resources embedded in a social structure that are accessed and / or mobilized in purposive actions" (Lin 2001, p. 29). The social capital of the organization is therefore a resource derived from the relationships between people in the organization. It is related to human capital, which is reflected in education, training, experience or the existence of close interpersonal relationships between individuals (Coleman 1988; Lin 2001). Social capital helps solve problems of coordination, facilitates the flow of information between individuals (Lazega, Pattison 2001; Lin 2001), facilitates collective work (Putnam 1993) and explains problems related to some human behaviors, such as collaboration (Bortkus, Davis 2010, p. 44). J. Nahapiet and S. Ghoshal claim that social capital is also necessary for the development and dissemination of knowledge in organizations (Nahapiet, Goshal 1998).

The factors described above in the scope of the human resources dimension in the organization are also considered to be an important area influencing the introduction and development of BPM in public organizations.

Research Methodology

In order to identify the occurrence of factors from the area of HRM in the public administration offices, perceived as the determinant of BPM introduction, a survey was conducted. It was carried out in the community offices (as an example of public administration offices) of the Warmian-Mazurian voivodship. The survey questionnaire contained questions regarding the occurrence of factors from different areas, including HRM.

In the HRM area the questionnaire contained 17 factors:

F1 – Young age of the office's employees,
F2 – Short work experience of the office's employees,
F3 – Constant improvement of employees' competences (in non-managerial positions),
F4 – Constant improvement of managers' competences in the field of managing the office,
F5 – Precise description of the scope of duties, rights and responsibilities of each workplace in the office,
F6 – Planning employment in the office based on the analysis of the optimal demand for employees in each department (in relation to the amount of work actually performed),
F7 – Conducting employee satisfaction surveys at the office,
F8 – Using the results of employee satisfaction surveys to improve the quality of management at the office,
F9 – Limited formal control,
F10 – Encouraging the office's employees to increase their independence,
F11 – Undertaking actions to increase the involvement of the office's employees,
F12 – Public rewarding and recognition of the achievements of the office's employees,
F13 – Undertaking actions to improve internal communication in the office,
F14 – Encouraging the office's employees to knowledge sharing and teamwork,
F15 – Creating a climate conducive to changes in the office,
F16 – Initiating changes in the office (except for changes imposed by law),
F17 – Building process awareness of the office's employees.

These factors were evaluated on a five-point Likert scale (The respondents could evaluate the occurrence of different factors from the HRM area in a given community office, where: 1— a factor does not occur, 2— a factor occurs to a small extent, 3— a factor occurs to a medium extent, 4— a factor occurs to a big extent, 5— a factor always occurs). The person responding to the questions in every community office was the office secretary (secretary) and a person designated by the secretary, with – in the secretary's opinion – experience in BPM implementation in the office. The factors considered in appointing the secretaries as the respondents included their position in the office organisational structure and the scope of their responsibilities, which often required comprehensive knowledge, among other things, on the office operations, management methods and concepts used in the office or the object of activities of its different units.

The study was carried out in 2017. The questionnaire was sent to the respondents by mail or delivered to the offices personally.

All of the community offices from the Warmian-Mazurian voivodship (116) were included in the survey: 67 community offices of rural type (RCO) (57.7% of the total population), 16 community offices of urban type (UCO) (13.8%) and 33 community offices of urban-rural type (U-RCO) (28.5%) The final study sample included 99 community offices and the RCO were a large majority of them (55.7%) They were followed by U-RCO (28.9%), and the UCO accounted for the smallest group (15.4%) in the sample. So, the responses of various degree of completeness were received from 99 offices (198 completed questionnaires), which gives a response rate of 85%. 194 questionnaires – 97

pairs from different offices – were qualified for further analysis. Therefore, the final number of respondents was 194. The empirical material from the selected questionnaires was entered into an electronic database and analysed in the IBM SPSS Statistics 24.

Considering common method bias (CMB), the Brewer's Split Sample Method was used, when constructing the questionnaire (Brewer 2006). To eliminate CMB, one of the assessed aspects, i.e. the type of the community office, was an objective administrative data and only the assessment of the occurrence of individual factors from the HRM area depended on the respondents' opinions (Podsakoff et al. 2012; Jakobsen and Jensen 2015). Moreover, as it was mentioned before, the questionnaire was addressed to two people (the secretary and the person designated by the secretary) with sufficient specialist knowledge, so that the answers to the questions did not relate to vague concepts (MacKenzie and Podsakoff 2012). Also, the respondents were to assess the present occurrence of factors, which should also reduce the risk of the discussed error. As a next step, the Cronbach's alpha test, the Kaiser-Meyer-Olkin test and the Barlett's test were conducted (Table 1)

Table 1: Measures properties

Variable	Cronbach's Alpha Test	Kaiser-Meyer-Olkin Test	Barlett's Test *
HRM	0.878	0.806	1860.368

** $p < 0.000$.*
Source: Own work based on research results.

Thanks to the Cronbach's alpha and Kaiser-Meyer-Olkin test results obtained, the reliability of the research tool was confirmed. The authors are aware that the factors selected for the study are correlated with one another. However, this is due to the fact that they relate to one phenomenon occurring in an organization. The purpose of the study, however, was not to indicate their relationship but to identify their occurrence and to evaluate them in context of their influence on using BPM in the researched community offices.

Finally, a one-way analysis of variance for independent samples was conducted (by the statistic method developed by R. Fisher) in order to verify whether individual types of community offices differed with respect to the occurrence of the individual factors from the area of HRM.

Research Results

In the Table 2 the results of the one-way analysis of variance for independent samples are presented. The *F* coefficient is slightly higher than 1, which means that it is statistically significant. However, for the Human Resource Management area there are differences at a statistical tendency level, depending on the type of the office (η^2=0,03)

Table 2: The result of a one-way analysis of variance for independent samples

Variable	Type of a community office	M	SD	LL	UL	*F*	*p*	η^2
HRM aspect	urban	3,64	0,09	3,45	3,83	2,86	0,060	0,03
	urban-rural	3,46	0,07	3,33	3,6			
	rural	3,39	0,05	3,29	3,48			

Where: M - mean, SD – standard deviation, LL - lower limit of the 95% confidence interval, UL - upper limit of the 95% confidence interval, *F* - result of the Fisher test, *p* statistical significance, η^2 - effect size.
Source: Own work based on research results.

The average answers given by the respondents were in each case higher in the offices of urban type than in the entities of other types. Also, the respondents from offices of urban-rural type provided, on average, higher answers within the HRM area than the respondents from entities of rural type. In order to depict the disproportions between the offices of different category a frequency analysis for the factors related to HRM was performed. The principle was adopted that a factor is qualified as "being present" in a given type of the office on condition of the sum of respondents' declarations on its big and absolute (the factor is regarded as "absolute" if the response is "a factor always occurs") occurrence (score 4 and 5 on the numerical scale in the questionnaire) being higher than 50% (Table 3)

Table 3: Frequency of indications of the occurrence of specific factors from the HRM area in the community offices from the Warmian-Mazurian voivodship (in %)

F	Type of a community office														
	Urban					Urban-rural					Rural				
	Given answers					Given answers					Given answers				
	1	2	3	4	5	1	2	3	4	5	1	2	3	4	5

The result of the analysis of variance suggested a relationship at the level of statistical tendency, and the means of answers given by respondents from each type of offices were similar (3.64 in the case of respondents from the community offices of urban type, 3.46 in the case of respondents from the offices of urban-rural type and 3.39 for respondents from the offices of rural type) (Table 2) The obtained results gave rise to the assumption that, most likely, it will be possible to observe slight differences in the occurrence of HRM factors between various types of the examined offices of the Warmian-Mazurian voivodeship. In the course of the analysis, 12 factors characteristic for the community offices of urban type, 10 factors for urban-rural type and 10 factors for type were identified. Factors in the HRM area determining the process management in offices, which, according to the respondents' declarations, were recognized as characteristic for all types of the researched entities, were: a precise description of the scope of duties, rights and responsibilities of each workplace in the office (F5 — 96.7% of respondents from UCO, 91.0% of respondents from U-RCO and 88.9% of respondents from

RCO), constant improvement of employees' competences (in non-managerial positions) (F3 - 70% UCO, 67.8% U-RCO and 75% RCO), constant improvement of managers' competences in the field of office management (F4 - 83.3% UCO, 75% U-RCO and 67.6% RCO), planning employment in the office based on the analysis of the optimal demand for employees in each department (F6 - 80% UCO, 78.6% U-RCO and 65.8% RCO), encouraging the office's employees to increase their independence (F10 - 73.3% UCO, 64.3% U-RCO and 56.5% RCO), undertaking actions to increase the involvement of the office's employees (F11 - 70% UCO, 58.9% U-RCO and 58.3% RCO), undertaking actions to improve internal communication in the office (F13 - 66.7% UCO, 67.9% U-RCO and 54.6% RCO), encouraging the office's employees to knowledge sharing and teamwork (F14 - 80% UCP, 83.9% U-RCO and 63% RCO) and creating a climate conducive to changes in the office (F15 - 66.7% UCO, 71.4% U-RCO and 62.1% RCO)

Factors recognized as characteristic only for certain types of offices were: building process awareness of the office's employees (e.g. making subordinates aware that the work they perform is a repetitive process running across the office) (F17 - 56.7% of respondents from UCO, 62.5% of respondents from U-RCO and 50% of respondents from RCO), young age of office employees (F1 - 53.3% UCO, at 37.5% U-RCO and 35.2% RCO) and initiating changes in the office (apart from changes imposed by law) (F16 - 63.3% UCO, 57.4% RCO at 49.9% U-RCO)

In turn, recognized as factors not appearing in the community offices of the Warmian-Mazurian voivodeship, as determined on the basis of the declarations of representatives were: short work experience of employees in the office (F2 - 33.3% of respondents from UCO, lack of respondents from U-RCO and 18.5% of respondents from RCO), conducting employee survey on satisfaction from work in the office (F7 - 30% UCO, 3.6% U-RCO and 21.3% RCO), using the results of employee survey on satisfaction from work in the office to improve the quality of management in the office (F8 - 23.3 % UCO, 10.7% U-RCO and 17.6% RCO), limited formal control (F9 - 6.7% UCO, 14.3% U-RCO and 13.8% RCO) and public rewarding and appreciating achievements of employees (F12 - 40% UCO, 42.9% U-RCO and 39.8% RCO)Similarities and differences in the occurrence of individual HRM factors in the community offices from the Warmian-Mazurian voivodship, depending on their type, are presented in Figure 1.

Fig. 1: Similarities and differences in appearance of different factors in the HRM area in the community offices from the Warmian-Mazurian voivodship, concerning the office type.
Where: F1-F17 are the abbreviations of the factors listed in "Research methodology" section.
Source: Own work based on research results.

In the area of HRM, one could specify nine factors characteristic for all types of the community offices from the Warmian-Mazurian voivodship. Two factors were specific only for the urban and urban-rural community offices, and one factor only for the urban ones.

Discussion

Based on the research, the occurrence of individual HRM factors in the public administration offices was identified.

The factors present in all types of the community offices in the Warmian-Mazurian voivodship, and thus recognized as characteristic for these entities, included, among others, precise description of the scope of duties, rights and responsibilities of each job position in the office. This is a factor related to the construction of the organizational structure. The analysis of the organizational structures of offices can be made on the basis of such dimensions as: specialization of functions and roles, centralization of power, configuration of structures and roles, formalization of documentation and standardization of procedures (Pugh, Hickson 2007, p. 13). S. Richards drew attention to the importance of this element to the introduction of BPM in public administration. She presented the approach to the structure of offices based on changes in the provision of public services and administrative development (Richards 2006).

Another factor occurring in all types of the examined offices is having the employees (occupying non-managerial positions) continuously improve their competences, and managers continuously improve their competences in the area of office management. M. Hammer drew attention to these factors as important elements when introducing BPM to an organization, describing them as the key organizational abilities determining process advancement. This applies, among others, to skills in designing processes, process reconstruction, process management, as well as the use of process change methods in an organization (Hammer 2007, p. 114).

An important factor influencing the process approach is also having the management take actions to improve internal communication at the office and to encourage sharing of knowledge and teamwork. This can have a significant impact on the transfer of information (Krackhardt, Hanson 1993) and implementation of organizational activities (Shah 2000), which in turn affects one of the elements supporting process management, i.e. team cooperation.

Based on research conducted among public sector employees in Great Britain, R. McAdam and J. Donaghy (1999), found that increasing employee involvement and empowerment was one of the factors contributing to success in introducing BPM into public administration. S. L. Caudle (1995) also points to the importance of having management encourage office employees to increase their independence and take actions to increase their involvement, having distinguished six groups of key factors for the implementation of BPR in public organizations (Caudle 1995; Steiss 2003, p. 144) In the conducted research, these factors were considered characteristic for all types of the researched community offices. S. L. Caudle (1995), and R. McAdam and J. Donaghy (1999) also point to the practice of managing change. It may have a positive impact on the creation of the atmosphere supporting changes in the offices by the management, which, according to the presented studies, is a factor affecting BPM. The organizational culture of the office also undoubtedly influences the atmosphere supporting changes related to BPM in the organization. This is emphasized in many studies presented in the literature (Hammer 2007, p. 114; Siemiński, Krukowski 2011)

Conclusion

Based on the research results presented above, it can be concluded that BPM is primarily influenced by the community offices' management in terms of constant improvement of their competences and also by ensuring the continuous development of employees within offices, providing an organizational environment that increases their responsibility, independence in operation and acceptance of changes.

This is confirmed by high evaluation of occurrence of the constant improvement of employees' competences (in non-managerial positions) as well as the competences of managers in the field of managing the office. This is very important when it comes to implementing BPM within organizations.

The following are less common in the researched community offices: conducting employee satisfaction surveys within offices, using the results of employee satisfaction surveys within offices to improve the quality of management, limited formal control and public rewarding and appreciating achievements of employees. Thus, it can be noted that the municipal offices are characterized by a strong formal control system, the potential for employee satisfaction surveys is unused and people employed within the offices are rarely rewarded publicly for their achievements. This poses a risk of a negative impact on employee motivation to perform their duties required by the positions they occupy. Therefore, these factors can significantly hinder the implementation of process solutions in the researched offices.

Although, in the authors' opinion, the results of the presented study could be used in the assessment of the entire population of the community offices in Poland, the seize of the research sample could be perceived as a limitation of the conducted survey. Thus, the research could also be carried out in other voivodships of Poland, in order to compare the obtained results. Moreover, according to the results of the conducted research, it cannot be said that the type of examined offices differentiates the occurrence of individual features within the HRM. Therefore, an attempt to determine whether e.g., there is a relationship between the level of process maturity of the community offices and the specific features of HRM, could be perceived as an interesting direction of further research.

Abstract

Food cooperatives are a kind of informal cooperative whose members collectively buy food products directly from producers, aiming to shorten the supply chain as much as possible and eliminate intermediaries appearing between family farms - the food producer and the consumer. The aim of the study is to analyse and evaluate the functioning of cooperatives as an opportunity for development for family farms in a globalised economy depending on their size and organizational complexity. In order to achieve the objective, a diagnostic survey method was used, in which a questionnaire technique was applied - using a previously validated questionnaire on the functioning of two different cooperatives. The research revealed significant differences between them. The degree of organisation and number of members (the size of cooperative) affects the activity of their members and the effects of their activities.

Keywords: Cooperatives, Food Cooperatives, Cooperative Movement

Introduction

Cooperatives are not new, with a long and rich history globally. The history of cooperative activity, i.e. social, economic cooperation, is more than a hundred years old in Europe. Consumer cooperatives began to emerge in the mid-19th century, near Manchester, England and quickly spread to many countries: Switzerland, Italy, Finland, Slovak Republic, Scandinavia, Great Britain and Poland. By the mid-2000s, food cooperatives experienced growth-driven, intense consumer interest in alternatives to a market system that might not serve their needs. The Silesian region (and especially Upper Silesia) and Opole province in Poland are known for the tradition of a strong and multidirectional association and cooperation movement.

A food cooperative is a kind of informal cooperative where members jointly buy food products directly from producers - mainly farmers and small processors. These cooperatives are bottom-up, informal movements, created on the basis of cooperation of a group of people interested in obtaining natural, healthy, fresh, safe, free of contaminants and preservatives additives, unprocessed food from proven sources. They are becoming more and more popular as consumers nowadays are increasingly putting in the first place requirements for food safety and nutrition, prevention and treatment of diet-related diseases (Hoyt, 1983; Deller et al.,2009).

The purpose of cooperatives is not profit, but obtaining the food of best quality, thanks to trusted cooperation, not necessarily with an ecological certificate. This distinguishes this form of operation from healthy food shops or online platforms that enable the purchase of food from local farms. An important assumption in the cooperative's activities is maximum shortening of the supply chain and elimination of intermediaries appearing on the way between the farmer - food producer and recipient - consumer (Herbst, 2013). For cooperative members, this means direct access to products from

sustainable crops. Family farms, on the other hand, are more likely to sell their crops and have higher margins.

The aim of the study is to analyse and evaluate the functioning of food cooperatives. For this purpose we used the diagnostic survey method with previously validated questionnaire, concerning the functioning of cooperatives from the perspective of buyers. The study involved 50 buyers from two cooperatives – one operating in the Śląskie Voivodeship (20) and one in the Opolskie Voivodeship (30) in Poland. The buyer survey (CAWI) was conducted in: November-October 2018 (Opole cooperative) and April-May 2019 (Gliwice cooperative). Participation in the research was anonymous and voluntary.

Background

The initiators of cooperatives are usually consumer groups interested in obtaining healthy, good quality food from a known source (Fjeld et al., 1983). Through this type of activity, they want to support organic farming, small family farms, promote sustainable agriculture and introduce the principles of deep ecology into everyday activities (Phillips, 2012). Their goal is also to create bonds based on shared responsibility for the environment and respect for the farmer's work. The initiators of the cooperation may also be farmers who will create an initiative group and propose the delivery of goods on the forum related to healthy food, dietetics or childcare. The creation of producer groups dealing with organic production, which have a greater chance of finding regular customers and regular sale, is becoming increasingly common (Jarosz, 2000). Food cooperatives serve as important business organizations that contribute to the increase in the density of local food networks and relations. Food cooperatives can be treated as the implementation of the principle of co-management at the local level, where this concept seems to have the widest field of application (Katchova and Woods, 2011).

The possibility of obtaining products from certified organic farms that provide certainty about the lack of chemical plant protection products and environmentally responsible, sustainable cultivation and breeding plays an important role in the operations of cooperatives. However, the co-operators often also decide to cooperate with farms that are not ecologically certified and declare traditional production. In such cases, however, the farm is verified by the members of the cooperative for compliance with the declared production.

The members of the cooperative act voluntarily and democratically share the functions in the cooperative. Cooperative activities may include: collecting orders, establishing contacts with farmers, farm verification, coordinating orders, picking up goods, delivering to a distribution point, distribution, cleaning works, settlements, website maintenance, etc. The selection of functions can be fixed or rotational. Some cooperatives write in the statute the amount of time a member is obliged to work for a cooperative, others modify their assignments on an ongoing basis (e.g. Cracow Wawel Cooperative, Poznan Food Cooperative). Many cooperatives specify a membership fee or an additional, small fee (voluntary or obligatory) charged for each transaction that is to be credited to the fund supporting the cooperative's activity (Bilewicz and Potkańska 2013).

Cooperatives differ in their operating principles. Some are focused primarily on supporting local agriculture and educational activities, combined with a practical element of buying healthy food. Others focus only on acquiring and distributing products ordered by their members (Cheney, 2001; Azevedo and Gitahy, 2010).

Potential suppliers of cooperatives are sought out through local farmers' associations, agricultural advisory centres, direct contact and websites related to ecological and traditional production. The selected farm is verified in terms of the way in which it operates, the area under cultivation and the variety of products. The farmers cooperating with the cooperative are both large organic farms and small family farms whose owners sell only overproduction from a given season to the cooperative. Some of the cooperatives collect products directly from the farms, others prefer to transport the products to a specific place where they are either directly distributed among the recipients, or divided, packed and picked up at designated times. There are also cooperatives (e.g. Kooperatywa 'Dobrze'),

which run their own shops with products obtained from cooperative activities. From the point of view of some members of the cooperative, it is also important to be able to transport products to the recipient's home. Especially in the case of mothers with small children, the elderly or the disabled. As the results of other authors show, these are groups whose representatives are mainly members of cooperatives (Zepeda and Leviten-Reid, 2004). In addition to food distribution, the cooperative enables its members to establish new social contacts, exchange views and implement joint local initiatives.

Conducting educational activities reduces conflict situations resulting from ignorance of the specificity of crops and their seasonality, improper storage or misuse of products by cooperative members. It also affects the deepening of positive relationships between suppliers and customers.

Research Results

In the Opolskie Voivodeship, there is the "Opole Food Cooperative O-Ko-Spoko", founded in 2015. Initially, it accepted the active participation of cooperative members in cooperative tasks (such as: contact with farmers and cooperative members, creating orders, collecting payments and transferring them to the farmer, controlling order performance). From 2018, the cooperative gave up coordinated orders. Farmers independently, using the order forms on the cooperative's Facebook profile, collect the orders for their products. The Cooperative does not collect compulsory contributions or entry fees from its members. Products are usually delivered by farmers to the delivery place at certain times, where prepayment people can collect them. Since November 2018, there are two parts of the cooperative - the Opole Food Cooperative (traditional cultivation) and the Opole Eco-Cooperative. In the first part, it is possible to offer products without ecological certificates, in the second part, only organic farms can sell. The current number of members of the cooperative is 3.7 thousand in the organic part and 492 in the traditional part (they are also organic).

There is a "Tomata" in the Śląskie Voivodeship - Gliwice food cooperative, which was established in November 2014. It currently has about 60 members, at least 1/4 of whom have been in it since the very beginning. New members are still applying to the cooperative, but at the moment the cooperative does not accept new members, as you can read on the website - for organisational reasons. In the cooperative, each member has an equal say in organisational matters and is obliged to work two hours a month for the cooperative(regardless of the number of products purchased). The basic task that can be performed by a member of the cooperative is to work on packing and releasing parcels during weekly purchasing actions. They are the basis of the cooperative's activity. During these actions, which are carried out every Friday and Saturday, orders are placed via the Internet system and on Thursday evenings the ordered products are collected. The cooperative has a so-called fund of collection, which consists of payments for the entry fee and 10% of the order value, calculated for each purchase. In exceptional cases, this amount is increased, reduced or cancelled according to the regulations. The funds are used to cover the costs of functioning of the cooperative - purchase of scales, crates, bags, bank account costs or refunds of travel costs to suppliers, etc. With the consent of all members of the cooperative, the money may also be used for social purposes. Higher amounts can also be paid into a collection fund on a voluntary basis. Cooperative members pay for their purchases on receipt of products. There is no minimum amount to be ordered per unit of time. The characteristics of the respondents are presented in Table 1.

Table 1 : Characteristics of respondents (buyers)

Source: own study.

In the case of the Opole cooperative, the largest group among the respondents belonged to the cooperative one year and longer (60%), of which 10% were people belonging to the cooperative 3 years and longer. Among the respondents there were 2 people with an cooperative experience of 6 and 8 months. An internship of 2 months was declared by 5 out of the respondents (17%). In the case of the Gliwice cooperative, the largest group among the respondents included people who belonged to the cooperative for a year and longer (90%), of which as many as 75% were belonging to the cooperative for 3 years and longer. Among the respondents there were 2 people with cooperative participation period of 8 months and less.

The respondents in both cooperatives explained the reasons for joining the cooperative in the following way: "access to healthier, organic food", "because it is easier, more reliable and cheaper", "because of the desire to buy healthy food products after the birth of a child", "searching for products good quality from people with passion "," food allergies at home, looking for vegetables without chemicals "," access to healthy food, no intermediaries, quality of products "," interesting / unique products ","quality of food and awareness of how, where and by whom it is produced (...) because of the little children I wanted to feed my children healthily "," I have bought some products in organic stores, but due to their high price, I stopped at several products. In the cooperative I buy high-quality products, and due to their "normal" price, they already constitute about 80% of products bought every week ".

The respondents from the Gliwice cooperative also emphasized among the reasons for joining the cooperative its role in creating a community of people who share the same values: "(...) and also to meet interesting, thinking people (what succeeded!)", "Because of the direct access to healthy local food and for the sake of the community "," local suppliers, nice atmosphere, sense of community in relation to the desire to buy better quality food ". This group of respondents also indicated as a motive for joining the cooperative supporting local farms: "we liked the assumptions of cooperation, supporting local farmers and small producers".

As for the frequency of purchases of respondents from the Opole cooperative, 60% of respondents make purchases at least once a week, and 17% on average twice a month. 23% of respondents make purchases less than once a month. None of the respondents gave the answer "once a month". In the Gliwice cooperative, 85% of respondents make purchases at least once a week. Shopping frequency of "twice a month", "once a month" and "less than once a month" indicated by 1 person (5% each).

Among the most frequently purchased products via the cooperative, the respondents indicated fruit and vegetables (100% in the case of the Gliwice cooperative and 83% in Opole) as well as fruit and vegetable preparations (70% in the Gliwice cooperative and 83% in Opole). In this question, the respondents could choose more than one answer, hence the sum of individual responses exceeded 100%. Other products could also be mentioned in the question. Therefore, the respondents of both cooperatives indicated: eggs, meat, sausages, dairy products (goats, cows), honey and bread. In addition, the respondents of the Gliwice cooperatives also ordered sheep's dairy products, xylitol, oils, essential oils, dried fruits, flour, coffee, tea, peanut butter, hummus, dried fruits, groats, rice and even cosmetics, washing and dishwashers powders.

The respondents were also asked if there are products that they want to buy through cooperatives and they are currently not available. The answers to this question in the case of the Opole cooperative included the following products: organic pork and beef, brassicas, butter, sprouts, milk, cow cheese, silage and sliced honey. In the Gliwice cooperative, they were: organic apples, vegetarian patties, fruit vinegars or cranberry. Over half of the respondents (57% and 65% respectively) indicated that there are no such products that they would like to buy and are not available.

The vast majority of respondents in both cooperatives most often orders products via order forms placed on the cooperator's Facebook profile - 77% for the Opole cooperative and 95% for the Gliwice cooperative. Among the respondents, 16% and 5% declared ordering through an intermediary, respectively, by writing in the comments under the post of the person collecting the order. In the Opole cooperative, one person chose the answer "telephone orders" (6.7%).

To the question: "Which form of order pick-up is the most suitable for you?" in the case of both cooperatives, most of the respondents answered: "transport to an agreed place once or several times a week". (66.7% in the Opole cooperative and 75% in Gliwice). Delivery to a local shop or distribution point was indicated by 27% of respondents belonging to the Opole cooperative and 15% to the Gliwice cooperative. One respondent in each cooperative used the option to enter the answer "other" and entered "delivery to the place of residence". One of the respondents in Gliwice chose the answer: "collection directly from the farm".

The respondents were also asked if they were interested in the possibility of ordering products in advance (cultivation on request). Half of the respondents expressed such a desire, while the other half was not interested in this form. In Gliwice, this proportion was 75% and 25% respectively.

To the question "Are you interested in trainings or meetings with farm owners to discuss deliveries, specificity of cultivation or breeding, presentation of the farm, organization of workshops or other forms of cooperation?" in the Opole cooperative a large majority of respondents (87%) answered "no". Persons who are interested in this type of cooperation (13%) indicated the following forms of cooperation: meetings with farm representatives in order to present the offer or establish the principles of cooperation and the specificity of crops and animal husbandry, organization of workshops and visits to farms. Most of the respondents (83%) are also not interested in other forms of activity in rural areas

(herbal and gastronomic workshops, participation in farm work, activities for children). People interested in such activities (17%) indicated herbal and catering workshops, activities for children. Completely different results were obtained in the case of the Gliwice cooperative. Those not interested in training or meetings with farm owners were only 50%. Those surveyed in 85% are interested in additional forms of activity in rural areas. Among the activities that interest them, they mentioned herbal and gastronomic workshops, activities for children, but also cheese workshops, bread baking.

When it comes to the benefits of cooperation between a farm and a food cooperative from the point of view of buyers, all respondents in both cooperatives indicated access to healthy food. Among the respondents, 83% of the Opole cooperative and 95% of Gliwice also indicated the possibility of making purchases from reliable suppliers, and 33% and 70% respectively emphasized the low price. In this question, the respondents could choose more than one answer, hence the sum of individual indications for each cooperative exceeds 100%. In addition to the question, other benefits could be mentioned. This opportunity was used by two respondents of the Opole cooperative who entered the following answers: "shortening food storage time, supporting local initiatives, development of local small farms" and "new acquaintances, cool relations" and five members of the Gliwice cooperative who entered the answers: "emerging community "," a group of friends who is supportive and with which you can take various initiatives "," supporting local farmers ","crops for our needs and guaranteeing their sale (for a farmer) "," advice ".

The respondents were also asked to indicate the biggest inconveniences in the functioning of the cooperative. Purchasing after reaching the minimum number of orders (46.7% for Opole cooperative and 40% for Gliwice) was often the chosen answer in both cooperatives. Every third respondent from the Opole cooperative and 55% of the respondents from the Gliwice cooperative indicated periodic shortages of products as an inconvenience. The need to come to pick up products to a specific place and at a certain time is burdensome for 27% of the respondents of the Opole cooperative and 40% of the Gliwice cooperative. One in ten respondents from the Opole cooperative indicated the need to order larger quantities of products as an inconvenience. In the Gliwice cooperative this is an inconvenience for 40% of respondents. Only for two respondents of the Gliwice cooperative, the variability of suppliers is a problem. In this question, the respondents could choose more than one answer, hence the sum of individual indications exceeds 100% for both cooperatives. In this question, it was also possible to enter the answers in the "other" field. The members of the Gliwice cooperative pointed out: "unpredictable deficiencies in previously ordered goods, and thus difficulties in planning grocery purchases at home" and "sporadic problems with receiving goods from suppliers or lack of hands to work during purchasing actions."

Respondents were also asked to indicate opportunities and barriers to the development of cooperatives. Among the barriers, the respondents from the Opole cooperative mentioned: rising prices of organic food, various member involvement, a limited number of farms cooperating with cooperatives, irrelevancy of buyers, insufficient quantities of products at greater interest, high prices, poor advertising, lack of extensive knowledge in society about the functioning of cooperatives, not convenient forms of receiving orders, preferring to order using forms.

In the case of the Gliwice cooperative, the following barriers were given: "(...) there must be people who manage everything, sometimes it is difficult to find volunteers, because it is really a lot of work", "housing restrictions (...) it would be easier for us to organize ourselves having our own premises (the issue of storage) , storage, packaging, etc.) "," the inability to function as an official, legal entity "," the lack of a sanctioned method of operation of such organizations. Not every cooperative can afford - primarily organizationally (people's working time, accounting, etc.) to operate within an association, cooperative or foundation. Everything also depends on people, because the cooperative is based on cooperation. Despite the fact that on the one hand people want to buy, they don't always want to work for the benefit of the local community "," achieving maximum members (logistic maximum) and inability to accept new members."

Among the opportunities for development, respondents from both cooperatives indicated a desire to lead healthy lifestyles, a fashion for organic farming as an alternative to unhealthy food from

supermarkets, and increasing consumer awareness of product quality. According to one of the respondents, more and more people are using cooperatives and the growth of such initiatives raises the ecological awareness in society. The opportunity for the development of cooperatives is therefore not only to expand the range of food products, but also to "introduce cosmetics, clothes, everyday items, etc.". One of the respondents pointed to the possibility of developing the cooperative by "establishing cooperation with a larger group of farmers and creating a local collection point open several days a week or a special cooperative shop". An alternative solution could be to include small local shops in the operation of the cooperative.

Conclusions

As the results of the research have shown participants in food cooperatives are mostly women between 31-40 years of age, living in large cities with average incomes and higher than average incomes. This is consistent with Tremblay et al. findings (2019). Most of the respondents place their orders once a week. Among the products ordered, fruit, vegetables and products made of fruit and vegetables prevail. The vast majority of respondents in both cooperatives most often order products through order forms placed on the Facebook profile of the cooperative. The preferred form of order pick-up for the respondents is transport to the agreed place once or several times a week. The greatest inconveniences in the functioning of the cooperative were the execution of purchases after reaching the minimum number of orders, periodic shortages of products and the necessity to come to a specific place and time to pick up products.

The main benefits of participation in the food cooperatives on the consumer side according to respondents include: access to high-quality food obtained directly from the farmer; the possibility of verifying the ways in which the food is grown and reared; impact on the quality of the products; direct contact with the producer, possibility of obtaining additional information about the product; lower prices than in healthy food shops; freshness of products - short time from harvest to delivery; permanent cooperation with selected farms and possibility to participate in additional activities on the farm. This is consistent with Djuwendah et al. (2019) results.

The research revealed significant differences in the functioning of both cooperatives. The degree of organisation and number of members (the size of cooperative) affects the activity of their members and the effects of their activities. The creators of the Gliwice cooperative (the small one – only 60 members) wanted to create a group consisting of people who have a chance to get to know each other, cooperate closely with each other and feel responsible for their current activities, which is not supported by the excessive number of members - hence the limitation of the number of members of the cooperative. The members of the cooperative share common values, as well as a desire to support local farmers. In the case of the Opole cooperative, that has about 3.7 thousand members, it should be noted that the role of the cooperative has been narrowed down to a purchasing platform through which farmers can gather orders for the products they offer. Hence the low number of active members and the small number of initiatives concerning jointly undertaken activities. Cotterill (1983) has come to similar conclusions testing the hypothesis for retail food cooperatives that ‘small is beautiful’. Muatip et al. (2019) have also come to this conclusion.

From the farmers' point of view, however, cooperatives are becoming a new and interesting market, not requiring high costs associated with advertising or promotion of products. They allow to build a permanent network of loyal customers and sell excess production for own needs, or even production to order of a cooperative with a sales guarantee. The obtained prices are significantly higher than in the purchase points and fairly reward the farmer's workload; at the same time, they are still lower than in the shops with organic food - thanks to avoiding intermediaries (see Wang et al., 2019). Cooperatives act as social entrepreneurs, effecting positive changes in their host communities. As seen in some cases, food cooperatives serve as a catalyst in their communities, evolving and changing into social enterprises and influencing the economic and community development, helping foster economic self-sufficiency of rural areas (Ertör-Akyazi, 2020). Cooperatives can also contribute to the preservation of traditional farms, traditional and regional products, old plant varieties and animal species. It is important to note

that one crucial part of smart community development is fostering economic sustainability (Phillips, 2014; Asian et al., 2019).

According to Dantas (2020), food cooperatives can be effective in the context of development of family farms and communities in rural areas, but this requires that a number of extremely important conditions in the operation of cooperatives are met in order to build long-term cooperation between farmers and consumers (Gomez et al. 2020). Excessive growth of cooperatives and a high degree of concentration on purchasing activity makes it difficult to build a sense of community and mutual trust (Zepeda and Li, 2006; Enlow et al, 2011; Rosol, 2010).

Abstract

The government's task is to shape an effective regulatory system in the economy and in individual markets. This means implementation of tasks supporting markets, aimed at increasing their transparency and efficiency. At the same time, the processes of globalization, technical progress (e.g. the concept of e-government) and new management methods may favor the increase in the effectiveness of the market mechanism and create the need to search for directions of necessary transformations of the public sector. A number of actions are being undertaken to improve the delivery of public services. The aim of the article is to present CAF and BSC as methods of assessment the efficiency of public administration activities from the point of view of market participants. First the impact of regulatory institutions on the markets and enterprises is presented. Secondly we show Common Assessment Framework (CAF) and Balanced Scorecard (BSC) as a tools for achieving high quality of services in public administration. Specific measures are presented to assess efficiency of administration activities from the perspective of business entities. Finally implementation of NPM principles on the example of Social Insurance Institution (ZUS) in Poland is presented.

Keywords: New Public Management, Common Assessment Framework, Balanced Scorecard, Public Administration Efficiency.

Introduction

The efficiency of regulatory solutions depends on the quality of individual institutions and their mutual alignment and interoperability. In terms of the new institutional economy, institutions are understood very broadly as the rules of the game shaping relations between various entities (actors) in the economy. They constitute limitations that shape economic, social and political interactions.

According to North (1990) institutions can be divided into formal and informal. Formal institutions are rules or systems of rules created consciously and intentionally, which control or limit behaviour (legal norms). Informal institutions, on the other hand, are created spontaneously as a result of an evolutionary process and have the character of rules recognised by a given community (customs, conventions and norms, etc.). Formal institutions include regulatory institutions. They support markets and are important for economic development, regulating activities in the field of goods, services, labour, assets and financial markets (Rodrik, 2010).

The creation of regulatory institutions is closely linked to the level of development of a country. There are interrelationships between the quality of regulatory institutions and the degree of development; on the one hand, better regulatory institutions are easier to obtain in well-developed countries, and on the other, the type and nature of the institutional solutions used affect the rate of growth and development (Goranczewski et al, 2016).

As indicated by the results of empirical studies, the quality of institutions (including regulatory institutions) has a much greater impact on economic growth than the type of economic policy implemented (Olson, 1996; Snowdon, Vane, 2003). Behaviour of the actors is not the same in different institutional systems. The appropriate regulatory environment makes their actions largely predictable and reduces transaction costs. Good regulatory institutions should have specific functions, including (Building Institutions for Markets. World Development Report, 2002): supporting information flow - influencing the creation, collection, analysis, verification and transformation of information into a set of data necessary in the decision-making process of economic entities;

1) transparent definition and securing of ownership rights and contracts, taking into account the interests of all stakeholders;
2) influencing the level of competitiveness, willingness of economic entities to invest and economic growth rate.

The proper functioning of regulatory institutions affects the implementation of management processes in enterprises. It enables strategic and operational planning. Better regulatory institutions increase the effectiveness of business entities in achieving their objectives, enable faster and more complete adaptation to changing management conditions. The willingness of economic entities to undertake innovations may also result from incentives created by specific solutions in the area of regulation or deregulation. The measure of efficiency of applied regulatory solutions is the ability to adapt new trends, e.g. technical progress or knowledge diffusion process.

The efficiency of regulatory institutions can be measured in many ways, e.g. by the size of transaction costs, the ability of the system to adapt to new phenomena, generating social benefits or better coordination of economic processes in the social scale (Staniek, 2005).

As the appropriate structure of regulatory institutions forms the basis for sustainable development and economic growth, issues of improving the regulatory capacity of public administration seem important in areas relevant to the functioning of enterprises, as well as improving the quality of regulatory institutions to increase the efficiency of management processes development (Doornbos, 2003).

One of the areas of the institutional efficiency is the efficiency of public administration activities understood as the ability to provide high-quality services to citizens and enterprises.

New Public Management

In the 1980s, on the basis of criticism of Weber's theory of bureaucracy, the concept of the so-called New Public Management was created (**New Public Management, NPM**) and New Public Administration (NPA), popular in the UK, New Zealand, Australia and the USA. It assumed the introduction of management methods used in the private sector into the public sector. According to this concept, service recipients should be perceived not as supplicants but as customers. Its main determinants were (Hood, 1991):

1) professional management, strengthening management powers in the public sector;
2) refine standards and measurement of indicators of effectiveness;
3) checking results;
4) division of institutions - independence, financial autonomy;
5) promoting competitiveness;
6) use of concepts and management techniques from the private sector;
7) rationalization of expenditure.

Therefore, the NMP is a market model (also called a managerial model) in which the existence of independent and equal entities (enterprises, local governments, independent government agencies and citizens) that operate on their own account. Relations between entities are regulated by a formal contract.

From the administration perspective the NMP model is citizen-oriented (a client of public services), focused on effectiveness control (not procedures), that separates strategic and operational functions, transfers services (through public procurement) to competing non-governmental organizations, and introduces social control mechanisms. The discussed concept assumes that the purpose of public organizations is to provide services of the highest standard in the most effective manner. The measure of the quality of services is customer satisfaction, while the supply of services should correspond to the demand, which directly refers to market philosophy. The citizen is identified with the client, the buyer of services (Clarke et al., 2007; Carvalho et al., 2010; Drechsler, 2005). Within the NPM framework, four models were developed (Lisiecka & Papaj, 2008; Młodzik, 2015; Ferlie et al., 1996):

NPM Model 1 – Increase in efficiency – strives at shaping the public sector to resemble the private sector. It includes: increase of financial control; maximizing effects and reducing costs; setting transparent goals and monitoring results; development of financial and substantive audit; setting service standards and the use of benchmarking techniques; the use of questionnaires as an assessing tool; exposing the responsibility of service providers to customers; increasing market and customer orientation; implementing new corporate governance models; limiting the role of representative bodies; management accounting; moving the centre of power towards organizational cells making strategic decisions.

NPM Model 2 – Limiting the size of organization and decentralization – aims at the transition from hierarchy-based management to contract-based management. It includes: development of public service quasi-markets; increasing the role of contracting; limiting the role of hierarchical management in favour of contract management; reducing the size of the public sector and flattening organizational structures; increasing the importance of teamwork; focus on 'management through impact'; providing services characterized by diversity and flexibility.

NPM Model 3 – In search of perfection – emphasizes the organizational culture within public institutions. It includes: radical decentralization and results evaluation; focus on organizational development and organization learning; understanding the role of organizational culture in the change processes; intensive training programs for managers; emphasis on charismatic management methods; determining the mission of the organization and the image of its employee; defining development vision by organization leaders; preparation of social communication strategies.

NPM Model 4 – Orientation towards public services – aims at increased significance of quality management methods. It includes: achieving excellence in providing public services; implementation of quality management; analysis and consideration of service recipients in management; elected authorities (instead nominated); development of knowledge about public services among citizens; implementing public participation mechanisms in service management.

Although, this model met with criticism (Stoker, 1997), among others due to insufficient consideration of the complexity of governance mechanisms, roles and interests of all participants in public policies (Osborn, 2010), one still may see elements of this model in contemporary activities conducted by public sector entities.

The Common Assessment Method (CAF)

The Common Assessment Framework (CAF) is a tool for comprehensive quality management, which was created on the basis of the Excellence Model of the European Quality Management Foundation (EFQM) and a model developed at the University of Speyer. It belongs to the family of the total quality management (TQM) models. The Common Assessment Method is one of the most popular solutions for administration and its importance is still increasing (Kalfa, 2018). In 2019 there are about 4.100 registered CAF users in European and Non-European countries. The CAF is also used to assess the quality of management in police (Tomaževič & Aristovnik, 2019), schools (Ayala et al., 2019) and sports clubs (Mikalauskas et al., 2019)

The CAF model is intended for public administration units. It can be used in various public sector organizations - at national, regional and local levels. It is to support them in understanding and using quality management techniques and to diagnose the condition of the management system. This method focuses on conducting self-assessment, identifying areas for improvement and introducing required improvements. It is based on the assumption that achieving the desired results of the organization, consumers, employees and society depends on the quality of leadership that affects policy and strategy, employees, interpersonal relationships, resources and processes. The use of the CAF model enables public sector institutions to use quality management tools to improve performance (Kalfa, 2018).

The objectives of the CAF method are formulated as follows (Common Assessment Framework, The European Public Administration Network, 2019):

1. introduce the culture of excellence;
2. progressively implement the PDCA (PLAN, DO, CHECK, ACT) logic;
3. carry out the self-assessment process in order to obtain a comprehensive organisation check;
4. come up with a diagnosis that shows the strengths and improvement areas helping the definition of improvement actions.

The latest version of the method (fifth) - CAF2020 strengthens the focus on digitalisation and pays attention to agility, sustainability and diversity regarding the connection of the operational with the strategic levels to support reforms implementation.

The model is based on a system built of nine elements that indicates the most important aspects of analyzing the institution's operation. Criteria 1 to 5 (Leadership, Strategy and planning, People, Partnership and resources, Processes) relate to the institution's enablers. They point to the domain of its activity and how it approaches achieving the desired results. Criteria 6 to 9 (People, Citizens / customer-oriented, Social responsibility and Key Performance Results) are the results measured by perception and performance measurements. Each basic criterion consists of detailed criteria (there are 28 of them in total):

Criterion 1: Leadership - leaders should guide the organization's direction; formulate the vision, mission and values necessary to achieve long-term success. Create, implement and monitor an organization management system and analyze the results obtained. They should be the link between the institution, politicians and consumers.

Criterion 2: Strategy and planning - the organization should implement its mission and vision through a clear strategy focused on stakeholders; taking into account the directions and goals of public policy. The strategy should be translated into specific plans, measurable general and specific objectives.

Criterion 3: People- Effective human resource management allows the organisation to accomplish its strategic objectives, and to take advantage of the strengths and ability of people. Successful human resource management promotes people's engagement, motivation, development and retention. The organisation has to manage the competences and full potential of its people at individual levels to ensure organisational agility.

Criterion 4: Partnerships and Resources – Public organisation should develop and manage partnerships with relevant organisations (e.g. other public organisations, NGOs, education organisations, private providers of services) as well as collaborate with citizens and civil society organisations. Efficient, innovative and transparent resource management is essential for public organisations to ensure accountability towards the different stakeholders on the legitimate use of available resources (such as: finances information and knowledge, technology, facilities).

Criterion 5: Processes – public organisation should design and manage processes to increase value for citizens and customers as well as coordinate processes across the organisation and with other relevant organisations.

Criterion 6: Citizen/Customer-oriented Results - institution should examine the results achieved in relation to the satisfaction of its citizens/customers with the organisation and the products or services it provides.

Criterion 7: People Results - people results are the results the organisation is achieving in relation to the competence, motivation, satisfaction, perception and performance of its people.

Criterion 8: Social Responsibility Results – an organisation working on its social responsibility will improve: its reputation and image to the citizens; its ability to attract, motivate, commit and retain its staff; its relations with companies, other public organisations, the media, suppliers, citizens/customers and the community. These results include ethical, democratic and participative behaviour of the organisation; environmental sustainability; quality of life; economic impacts as effects of organisational behaviours.

Criterion 9: Key Performance Results – an organisation should measure the organization should measure the internal and external results of its activities:

a) external results: outputs and outcomes to goals, focusing on the link with the mission and vision (Criterion 1), strategy and planning (Criterion 2), products and services (Criterion 5), and the achieved results for external stakeholders.

b) internal results: level of efficiency, focusing on the link with people (Criterion 3), partnerships and resources (Criterion 4) and processes (Criterion 5), and the achieved results in building up the organisation towards excellence.

The indicated criteria allow for conducting evidence-based assessments that allow to answer the question which areas need improvement. Adaptation of the model enables the implementation of "good governance" in the public sphere (Jassop, 2007, s. 5-15; Grosse, 2009; Doornbos, 2003, 3-17).

From the point of view of impact on business entities the result in Criterion 6. Citizen/Customer-oriented Results are particularly important. The specification of detailed criteria and example measures are described above. They allow assessing the impact of regulatory institutions on the functioning of economic entities (Table 1).

Table 1: Citizen/Customer-oriented efficiency measures

Type of results	Example of measure
1. Results regarding the quality of products and services	a. Waiting time (handling/processing time of service delivery);
	b. Number and processing time of complaints and corrective actions implemented;
	c. Results of evaluation measures regarding errors and compliance with Q- standards
	d. Adherence to published service standards
2. Results regarding transparency, accessibility and integrity	e. Number of information and communication channels, including social media;
	f. Availability and accuracy of the information;
	g. Availability of performance goals and results of the organisation;

	h. Extent of open data delivery;
3. Results regarding stakeholder involvement and innovation	i. Extent of involvement of stakeholders in the design and the delivery of services and products and/or decision-making processes;
	j. Number of suggestions received and implemented
4. Results regarding usage of digitalisation and e-government procedures	k. Extent of evaluation activities jointly with the stakeholders to monitor their changing needs and the degree to which they are satisfied;
	l. Opening hours of the different services (departments)
	m. Cost price of the services
	n. Availability of information concerning management responsibilities of the different services.

BSC – Balanced Scorecard

Balanced Scorecard Model was developed by R.S. Kaplan and D. P. Norton in the early 90s (Kaplan, Norton 1992). This tool supports the implementation of a long-term, effective strategy. This system allows orientation on the most important aspects of the organisation and is based on monitoring and control activities, which ensures the efficiency of long-term activities. Focusing BSC on control activities allows faster verification of errors and taking corrective actions. The model was originally created for enterprises but it can also be for public administration entities. It is used, for example, in hospitals (Vitezić et al., 2019) and healthcare sector (Al-Kaabi et al., 2019), commercial banks (Tuan, 2020). The Balanced Scorecard consists of 4 perspectives focused on financial and non-financial elements, enabling the determination of proper goals. BSC perspectives include the following:

- financial;
- client;
- internal processes;
- growth and learning (development).

The financial perspective allows setting financial goals in the strategy ensuring appropriate long-term effectiveness. Indicators of this perspective in public administration include such measures as: maximizing benefits and/or cost reduction.

The clients' perspective uses measures that determine the performance indicators, institution’s targets and level of customer satisfaction. The perspective of internal processes is an element connecting the above two planes. Indicators of this perspective focus on processes that are most important for the organization, and therefore are based on creating the quality for customers. The perspective of growth and learning requires careful and accurate determination of indicators. In this area, particular attention is paid to the qualifications and skills of the organization's employees as well as information system. The measures of growth perspective include, for example: human resources potential, level of motivation, decentralization, possibilities of information systems.

The implementation of the NPM assumptions on the example of the Social Insurance Institution (ZUS)

The Social Insurance Institution (ZUS) was established in 1934 by means of an Ordinance of the President of the Republic of Poland of 24 October 1934 on the amendment of the Act of 28 March 1933 on social insurance. From 1 January 1999, the Social Insurance Institution is the main element in the administration of the Polish social security system. The Social Insurance Institution is a state

organisational unit with its headquarters in Warsaw with its own legal status as an entity. Its tasks are defined in the Act of 13 October 1998 on the social insurance system.

A modern approach to management in administration mainly directed at the needs of citizens and beneficiaries of public services, has become the reason for changes in management at the ZUS. To keep up with the challenges set for transforming ZUS into a modern institution, a new management model has been developed, consistent with the assumptions of NPM. It uses a process approach and is focused on increasing customer satisfaction. Since 2010, management control has been carried out, which supports activities improving the functioning of the institution. The most important element of this control is the system of setting goals, their implementation as well as their supervision.

The main goals of ZUS strategy are: to improve the level of service and to increase the quality of services provided. They were included in the strategy 2014-2020. Keeping in mind NPM, modern technological solutions have been implemented to improve contact with the customer (citizens and business entities). ZUS offers various communication options - paper correspondence, consultations with staff at Customer Service Room, by phone and via the Internet as well as using modern technologies. ZUS Electronic Services Platform (PUE ZUS) is the so-called e-office. ZUS client log in to the PUE ZUS account using electronic banking credentials. Each contribution payer can view an individual account. To improve communication, the number of forms that can be sent via the platform has been developed. To ensure the comfort of services for clients and stakeholders, the website and the language of the correspondence sent have been simplified. There are 83 simplified forms. Ten principles of a simple ZUS language are adopted in correspondence with the clients. The information provided must be clear and legible. Specially designed customer service rooms are prepared with the greatest care for the comfort of use by customers. The number of e-services is systematically increased.

Employees of the Customer Service Room (SOK) and Call Center (COT) regularly take part in series of trainings related to: customer service, changes in regulations, IT tools, as well as sign language The main tasks of SOK employees include customer service, providing information and explanations, as well as providing access to current information materials (leaflets, information newspapers), accepting and verifying submitted documentation.

The institution is socially responsible and expands the clients' knowledge about its activities. Among the information and educational campaigns carried out, the following can be mentioned: “I work legally“, “Lessons with ZUS“, “The Entrepreneur Week action”. The last one is a cyclical event for business representatives. It is organized in ZUS offices every two years. During the weekly campaign, entrepreneurs can take part in free seminars where experts discuss issues related to their rights and obligations. As part of the campaign, the amenities provided by the PUE ZUS profile are presented.

Efficient internal mechanisms are very important in ZUS's activity. Activities have been simplified and standardized by replacing 360 modes of operation with 15 mega processes and 42 processes. Risk analyzes are used to carry out checks on the contribution payers with dedicated software. System solutions have also been created to support and monitor the implementation of projects, as well as to manage them (Project Management Office - PMO). Special management structures, project teams and working teams were established. Changes were made to the organizational structure to unify the functioning of the facilities and increase the it’s transparency. Many organizational units have been combined to provide greater substitutability and a wider range of tasks. By optimizing costs, over 40% savings were achieved.

Table 2 presents selected measures of efficiency of the ZUS strategic goals mentioned in Strategy of the Social Insurance Institution for the years 2016-2020. We selected only measures that value are correlated with the operating conditions of business entities.

Table 2: Selected measures of efficiency of the ZUS strategic goals (BCG analysis)

Perspectives	Purpose description	Measures
Customer	**K.1.1.** Development of electronic access channels and ensuring an appropriate level of maturity of services provided through these channels	**K.1.1.1** The degree of use of electronic services for the submission of applications by customers
	K.1.2. Improving traditional forms of customer service	**K.1.2.1** Efficiency in dealing with matters "on the spot" in the Customer Service Room
	K.2. Development of the system of information exchange and cooperation with other stakeholders	**K2.2.** Indicator of the number of electronic documents received by ZUS from institutional clients
		K2.3. Number of data exchange systems with stakeholders based on standard interface solutions
	K.3. Improving the external communication system and information policy	**K.3.5.** Indicator for the overall assessment of ZUS information materials
		K.3.6. Number of meetings as part of the Counseling Days
Processes	**P.1.1.** Increasing the efficiency of services and processes	**P.1.1.3**. Indicator of timely implementation of applications for short-term benefits
		P.1.1.6. The efficiency ratio of handling applications for co-financing of contribution payers
		P1.1.12. An indicator of the timeliness of printing and sending personalized documents
		P.1.1.14. Indicator of availability of key applications

Source: own analysis based on: Strategy of the Social Insurance Institution for the years 2016-2020.

As one can see in the table, the instruments that we are interested in, from the point of view of the effectiveness of ZUS activities affecting the functioning of business entities, fall into two categories – "Customer" and "Processes". They focus mainly on providing high quality services along with the use of modern communication channels, which is in line with the assumptions of the NPM concept.

Conclusions

The new public management has contributed to strengthening public administration and creating citizen-friendly administration. As a management doctrine in the public sector, NPM is definitely managerial in nature and focuses primarily on marketization, flattening of organizational structures, efficiency and measurable achievements. Because one of its main goals is to ensure customer satisfaction in public administration, which means ensuring the right quality of goods and services provided, management tools such as CAF and BSC can be used here as consumer-oriented. Both of these methods are based on process management, that requires the construction of indicators for the efficiency of main processes.

CAF allows to evaluate the efficiency of activities in public administration by using results measures regarding: the quality of products and services, transparency, accessibility and integrity; stakeholder involvement and innovation as well as usage of digitalization and e-government procedures. As we could see on the example of the ZUS BSC also can be used as a tool for assessing the efficiency of

activities taken in public administration aiming at business entities. Implementing such measures in strategic documents of these institutions may contribute to a real improvement in the operating conditions of enterprises.

In the next study, the authors intend to assess how obtaining the above-mentioned measures of efficiency in public administration affect business entities from their point of view (using the diagnostic survey method). Because the same system is being implemented in other public administration institutions e.g. the NFZ (National Health Fund) in Poland, it will soon be allow to compare the effects of its implementation.

Abstract

One of the key and most problematic areas of interaction between public and private partners in the framework of the public-private partnership model is the sphere of financial relations between the parties. Before participating in a public-private partnership project, both private and public partners must give themselves answers to different questions of a financial and economic nature, most of which are not regulated by national legislation. The purpose of the study is to develop provisions for determining the structure of payments during the implementation of public-private partnership projects in the conditions of reengineering processes of public or private partners. They are based on the game theory tools and take into account options of strategies for private and public partners in the field of financial settlements. Game theory, which formed the basis of the proposed provisions, as well as comparison and systematization were used as research methods. As the result there were developed recommendations for the private partners, which in the framework of the public-private partnerships model have the opportunity to choose the most appropriate absolute value and relative share of initial and periodic payments in the framework of partnership projects depending on willingness to take risks regarding result indicators of the object of such partnership.

Keywords: Game Theory, Public-Private Partnership, Public Partner, Private Partner.

Introduction

In the current model of public management, private business is increasingly being carried out to solve socially important tasks. This is a common thing at both the national and local levels of government. An element of the strategy of many economically developed countries of the world is the self-withdrawal of public authorities from a considerable number of spheres of social, public or economic activity. They are responsible for certain socially significant areas of public administration only. As a consequence we have the liberalization of many markets, meeting the needs of territorial entities and solving their urgent problems. In this context, the new philosophy of public administration, as noted by Bodzoń (2013, p. 6), just provides for the so-called "privatization of state tasks", and the basis for its implementation, according to the author, is the belief that if the said activity can be implemented

without problems on the principles of market relations, therefore, it is groundless to claim that it is performed only by state entities. Taking this into account, state authorities stop (or try to stop) financing of certain events from their own budget, attracting private business for this purpose (Zvarikova & Majerova, 2013). This private business is actually involved in the reengineering of state authorities' processes. On the other hand, public-private partnership is also an effective mechanism for financing the reengineering processes at different levels of state authorities. Given the facts presented, no wonder that partnerships in different forms, both bilateral and multilateral ones are so important nowadays (Kozma, 2017; Sebestova et al., 2017; Ferencikova et al. 2018).

A key condition for the proper functioning of the market economy is a fruitful and constructive cooperation between private business and state structures. As Dmytrychenko et al., (2014) claim, "the nature of this interaction, methods, and specific forms may vary significantly depending on the maturity and national characteristics of market relations in a particular country. In recent years, this interaction is realized in the form of public-private partnerships". Public-private partnership in its content is also an agreement with the specific rules reflected in the texts of the relevant contracts for the implementation of such partnership projects. Such rules should also apply to financial relationships between public and private partners.

Analysis of public-private partnership allows us to state that one of the key and most problematic areas of interaction between public and private partners in the framework of the corresponding model is the sphere of financial relations. Before participating in a public-private partnership project, both private and public partners must give themselves answers to many different questions of a financial and economic nature. For example, a private partner can finance a public-private partnership project on its own in full, in part, or by attracting other investors. Such financing can cover all expenses from investment expenses (construction or repair of the object, expenses related to infrastructure development, etc.) to operational expenses. According to the legislation of many countries of the world, a private partner must at least partially finance a public-private partnership project, since otherwise, the interaction between public and private partners will not have the character of a public-private partnership (Valaskova et al., 2018). On the other hand, the regulatory framework of most countries does not restrict the sources of such financing, which opens up additional opportunities for private partners (grants, loans, etc). So, it is important to determine the structure of payments during the implementation of public-private partnership projects in the conditions of reengineering processes of public or private partners.

Theoretical Background

In the analyzed sources, the forms of financing public-private partnership projects in economically developed countries are classified by their reversibility into reversible and non-reversible (Fig. 1).

Fig. 1: Reversible and non-reversible forms of financing public-private partnership projects

Source: based on (Brzozowska, 2010; Ortynska and al., 2020)

The most common non-reversible source of funding the public-private partnership projects is an investment. For example, within the EU a certain share of own investments is a prerequisite for attracting EU funds to implement such projects. Thus, within the framework of public-private partnership, both public and private partners have a wide range of actions regarding the definition of financial aspects of the relevant projects.

Summarizing the practice and theory of public-private partnership, it should be noted that one of the aspects of the agreement between the public and private partners at the conclusion of the contract is the way the private partner receives income. For example, this partner has the option to specify in the contract that income is received by a one-time payment or by a combination of periodic payments and a down payment. If the second alternative is chosen, then there is still the possibility of accruing periodic payments in a fixed amount or using a commission rate. It is obvious that a number of different factors influence the decision-making regarding the choice of an alternative in the formation of the private partner's income from the implementation of public-private partnership projects, in particular:

- type of public-private partnership project;
- readiness of a private partner to take risks in the implementation of a public-private partnership project;
- requirements and restrictions of the state partner;
- policy and goals of the parties of the public-private partnership agreement;
- public-private partnership object (for example, water treatment, hospital, bridge, highway, etc);
- planned development (modernization) effects of the object of public-private partnerships, etc.

From the above, it is clear that if a private partner is not prone to risk, but still has the opportunity to choose a way to receive income from the implementation of a public-private partnership project, he will most likely choose to receive income in a single payment on the principle of "work performed – remuneration received". Also, if the contract provides for a combination of periodic payments and a down payment, the risk-averse private partner will insist on a fixed rate for these periodic payments. But, if during public-private partnership project implementation the private partner is still willing to take risks, it would prefer the combination of periodic payments and a down payment to a single one (Androniceanu et al., 2019). Moreover, the periodic payments will create a commission rate, and their amount will be substantial.

It is significant to emphasize another aspect of the private partner's income generation from the implementation of public-private partnership projects. If it prefers a single payment or a substantial share of the down payment in combination with periodic payments, there is a high probability that part of the revenue will be lost due to the fact that the expected effects of the public-private partnership project will be higher than expected. On the other hand, if such effects are lower than expected, then choosing a one-time payment or a significant share of the down payment in combination with periodic payments will minimize the risk of not receiving part of the private partner's income.

If a private partner prefers a single payment or a substantial share of the down payment in combination with periodic payments during the implementation of a public-private partnership project, he ensures himself against its failure. For example, if the object of a public-private partnership project is a highway, the private partner invests its funds, performs the relevant work and in the future wants to receive fixed periodic payments for each reporting period (for example, monthly, quarterly, annually, etc.) and this forms the basis of the public-private partnership agreement. In other cases, the principle of "work performed – remuneration received" is used, which also has a conditional risk character from the point of view of financial relations between the parties of the agreement (Oláh et al., 2019a; Oláh et al., 2019b). At the same time, private partners have another alternative. They can make the amount of income they receive from the implementation of public-private partnership projects dependent on the economic efficiency of such projects: the greater is efficiency (which means the more effective the public-private partnership project will be), the higher income will be received by the private partner.

The study of scientific sources makes it possible to assert that financial and economic management decisions in the field of project management, in particular, during the reengineering of business processes can be made in three states (Fig. 2).

Fig. 2: States of management decision-making in the field of project management

Source: based on (Wajong, 2015; Enoch, 2019; Gilbert Silvius and al., 2017; Irujo and al., 2017; Wang and al., 2004; Kryvinska, 2012; Kaczor and al., 2013; Shpak and al., 2020)

For example, if a manager makes a management decision in the field of reengineering while having complete and reliable information on each identified alternative, then it is claimed that such a decision is made in terms of certainty. The lack of complete and reliable information forces the manager to look for additional information, and if this is not possible – to make a decision at random, in conditions of uncertainty. The greater is uncertainty, the higher is the risk level. If the manager is able to identify the probability of occurrence of a particular scenario, then they say that the decision is made in a risk environment. It is appropriate to note that the modern economy is under the influence of uncertainty factors in various areas. This may be explained by a number of circumstances:

- market factors;
- political instability and imperfection of the legislation;
- natural phenomena;
- scientific and technical progress, etc.

While analyzing the works of different scholars, e.g. Wajong, 2015; Enoch, 2019; Gilbert Silvius et al., 2017; Gregus et al., 2015; Molnár et al., 2014; Borocki et al., 2019 there were distinguished a number of provisions that need to be taken into account when making management decisions in conditions of uncertainty and risk. They include:

- increase in the importance of simulation models that describe different states of systems and transitions to them;
- the basis for making management decisions should not be a probabilistic approach, not deterministic. It allows to explore various possible situations, options for making decisions, as well as the area of their uncertainty;
- it is not enough to use only formalized methods, but they should be supplemented with non-formal methods (expert evaluation method, heuristic method, etc).

It should be emphasized that for each of the above financial and economic management decisions states in the field of project management, theory and practice offer a wide range of approaches, methods, and models.

Management decisions in public-private partnership on its financial and economic aspects are more likely to be made under risk conditions. Private partners, implementing public-private partnership projects, do not have complete and reliable information about the economic effects of the project, about the amount of potential income for each other alternative of periodic payments and down payment. On the other hand, private partners in most cases still have the opportunity to determine the consequences of making a particular management decision regarding the structure of payments for public-private partnership projects (for example, using benchmarking, identifying market trends, empirically analyzing other similar projects).

A study of the scientific sources on risk management problems (Collier, 2009; Hopkin, 2017; Población, 2017; Green, 2016; Hillson, 2016) suggests that concepts such as fuzzy set theory, statistical decision theory, stochastic programming, game theory, and others are most commonly used in risk management decision-making.

Materials and Methods

A thorough analysis of each concept of management decision-making in the context of risk allows to state that it is appropriate to use game theory to determine the structure of payments in the implementation of public-private partnership projects. It involves both the study of operations, and the selection of optimal strategies by mathematical means, and a method for modeling the impact of decisions on the market and competitors, and a method for coordinating the interests of the parties (Binmore, 2007; Burguillo, 2010; Chander, 2018; Androniceanu, 2019; Haseeb et al., 2019).

The basis of game theory in making management decisions is to identify the optimal strategy for each player. The game concept is the key to this theory. It is considered as a process in which at least two players will compete for the realization of their interests. Within the game theory, these players are called participants. One of the important prerequisites for the practical use of game theory for solving management problems is to identify key players from their list by ignoring secondary participants.

In game theory, the parties involved bring their own added value (Cygler and Sroka, 2017; Cygler et al., 2018). The principle of reciprocity which is applied encourages players to give up myopia in their assessment of the situation and reduction in opportunistic behaviour. The payout structure, timeframe of the activities as well as the number of players affect the nature of the activities in the direction of cooperation (Parkhe, 1993). The tendency of players towards cooperation also increases with the importance of future movements and payments and the durability of the relationship. Players will be more interested in the long-term benefits rather than current payments (the problem of greed). Moreover, the payoff structure must encourage the parties to cooperate, such that the benefits of cooperation must be significant enough to limit the parties' motivation and engagement in competition (Cygler and Wyka, 2019). Game theory also provides that each player within the game has its own strategy. It is a set of actions that will allow him, depending on the situation, to choose certain actions that will be the best and competitive with other participants in the game.

The systematization method is used to identify reversible and non-reversible forms of financing the public-private partnership projects, states of management decision-making in the field of project management, as well as a visual representation of the game theory use stages to solve the problem of determining the structure of payments in the implementation of public-private partnership projects. In turn, the comparison method is used to select the most appropriate approach for determining the structure of payments in the public-private partnership model.

Results

Considering the definition of the structure of payments in the implementation of public-private partnerships' projects from the perspective of the game theory, it is worth highlighting that the private partner in our case will be a key player. In the framework of the public-private partnership project, the

partner has an opportunity to elect the way of defining the structure of such payments (i.e., a particular strategy among the alternatives) for maximizing the value of their profits. Another such player will be the state partner, which directly affects the private sector and the potential for them to receive a certain amount of income from the implementation of the public-private partnership project.

Based on the analysis of the sources on game theory (DeVos and al., 2016; Prisner, 2014; Avrachenkov and al., 2019; Li and al., 2019; Chander, 2018), it is possible to identify generalized stages of its use for solving the outlined issue on determining the structure of payments in the implementation of public-private partnership projects (Fig. 3).

Fig. 3: Stages of using game theory to solve the issue of determining the structure of payments in the implementation of public-private partnership projects

Source: based on (DeVos and al., 2016; Prisner, 2014; Avrachenkov and al., 2019; Li and al., 2019)

So, using the classic game theory denotations and terminology to solve the problem of determining the structure of payments for the implementation of public-private partnership projects, it is important to note that we are talking about a game of two participants: private and public partners. The first player, that is, the private partner, has two so-called alternative "clean" strategies:

$$S = (s_1; s_2) \quad (1)$$

where S – alternative "clean" strategies of a private partner in the implementation of a public-private partnership project;

s_1 – strategy for generating revenue from the implementation of a public-private partnership project in a single payment;

s_2 – strategy for generating revenue from the implementation of a public-private partnership project by periodic payments, depending on the resulting indicator agreed by the parties.

The second player - the state partner - also has its own alternative strategies, which can be displayed as:

$$\Theta = (\theta_1; \ldots; \theta_n) \quad (2)$$

where Θ- a set of alternative strategies of the state partner in the implementation of the public-private partnership project;

$\theta_1; \ldots; \theta_n$ - "clean" strategies of the state partner in the implementation of the public-private partnership project (the resulting indicator agreed by the parties).

In the analyzed context, it is clear that for practical reasons it is difficult, and often impossible, to predict the value of the resulting indicator agreed by public and private partners, so A. Shyyan (2009, p. 56) suggests taking into account the intervals of potential values of such an indicator to solve this problem. Moreover, it is known that it is enough to take into account only 7 to 10 of these intervals, without setting an excessive number of them.

Having identified the players and identified their alternative strategies, it is further necessary to formalize in mathematical terms the probability that the state partner implements such strategies. This formalization will look like this:

$$Q = (q_1; \ldots; q_n), \sum_{j=1}^{n} q_j = 1, q_j \geq 0, j = 1, \ldots, n \quad (3)$$

where Q is an alternative option the probability of reaching a state partner in their "clean" strategies during the implementation of the project of public-private partnerships (that is, options to the probability that creation or improvement of the object of public-private partnership will allow reaching a value of the result indicator (for example, due to construction of toll highway annually can be earned income from the passage through it in the amount of 100 million US dollars));

$q_1; \ldots; q_n$ - the probability of the state partner achieving its "clean" strategies when implementing a public-private partnership project.

The next stage of determining the structure of payments for the implementation of public-private partnership projects involves building a payment matrix that makes up the evaluation functionality:

$$F = \begin{pmatrix} f_{11} & \ldots & f_{1j} & \cdots & f_{1n} \\ f_{21} & \ldots & f_{2j} & \cdots & f_{2n} \end{pmatrix} \quad (4)$$

where f_{kj} is the value of the private partner's income from the implementation of the public-private partnership project, provided that they apply the strategy s_k, and the value θ_j of the resulting indicator agreed by the partners.

The first vector of the above payment matrix $F(s_1) = (f_{11}; \ldots; f_{1n})$ should be interpreted as a vector that makes it possible to evaluate the first net strategy of the private partner in the implementation of a public-private partnership project, provided that any of the set of alternative strategies of the public partner occurs.

The level of effectiveness of another alternative strategy of a private partner in the implementation of a public-private partnership project allows us to identify a different vector of the payment matrix, namely: $F(s_2) = (f_{21}; \ldots; f_{2n})$.

Thus, if a private partner chooses a strategys_1 when implementing a public-private partnership project, the amount of its income within the model of such a partnership will not depend on the value of the resulting indicator (in this case, this indicator may not be taken into account and agreed by the parties). Mathematically it will look like this:

$$f_{11} = \ldots = f_{ij} = \ldots = f_{1n} = V = V_o \quad (5)$$

where V - the expected amount of income of the private partner from the implementation of the public-private partnership project, thousand US dollars;

V_o - the income of a private partner generated by a one-time payment from the implementation of a public-private partnership project, thousand US dollars.

However, if the private partner chooses their second alternative strategys_2, then the elements of the payment matrix are calculated in this way:

$$f_{2j} = D \cdot \mathrm{K} \quad (6)$$

where D is the coefficient for the private partner to receive the expected amount of revenue from the implementation of the public-private partnership project, provided that they apply an alternative strategy s_2;

K – the value of the resulting indicator agreed by the partners for the implementation of the public-private partnership project following the j-strategy of the public partner for the accounting period.

At the next stage of determining the payment structure for public-private partnership projects, you should carefully diagnose the execution environment of such a project. The results of the research allow us to conclude that private partners during participation in the public-private partnership model are mainly influenced by the information situation, when they have the opportunity to more objectively distribute the probability of achieving their strategy by the public partner during the implementation of the public-private partnership project.

Therefore, having identified this information situation as the most common one for which private partners make decisions in the public-private partnership model, the priority criteria for making such decisions are the criteria for the variability of the value of the payment matrix and the Bayes criteria (Sadovin and al., 2011, p. 56). So, in the first case, it is recommended to make a decision for which "the measure of elements' variability of the corresponding evaluation vector relative to the selected grouping center is the smallest" (Kuzmin et al. 2007). According to the Bayes criterion (Prisner, 2014), "optimal solutions (or a set of such solutions) are considered to be those for which the mathematical

expectation of the estimated functional acquires the highest (or lowest) possible value" (depending on the type of functional: with a positive or negative ingredient).

For the best choice of the optimal alternative from the above criteria, it should be emphasized that the optimal income structure (and, accordingly, strategy) for the private partner in the implementation of public-private partnership projects will be one that will be able to get the highest income with the minimum level of risk. So, when deciding on the structure of payments for public-private partnership projects, the private partner is likely to take into account these two criteria:

- the estimated amount of revenue from the implementation of the public-private partnership project;
- the level of risk.

Theory and practice have proved that the estimated amount of income from the implementation of a public-private partnership project can be determined by calculating the mathematical expectation of the amount of this income m. On the other hand, it is proposed to estimate the level of the assumed risk using dispersion σ^2. The mathematical representation of this is as follows (Collier, 2009; Hopkin, 2017; Población, 2017):

$$m_k = \sum_{j=1}^{n} q_j \cdot f_{kj} \quad (7)$$

$$\sigma_k^2 = \sum_{j=1}^{n} (q_j (f_{kj} - m_k)^2) \quad (8)$$

where m_k – is the mathematical expectation of the assumed value of the private partner's income from the implementation of the public-private partnership project, provided that the alternative k-strategy is used;

σ_k^2 – the dispersion level of the perceived risk of a private partner to receive an expected income from the public-private partnership project provided the use of values of mathematical expectation.

The above proposals only addressed the so-called "clean" strategies of the private partner in the implementation of public-private partnership projects. At the same time, it is obvious that there are "mixed" such strategies (s_p) that combine vectors of these "pure" strategies in various combinations. Therefore, the vector of evaluation of the "mixed" strategy $\left(F(s_p)\right)$ by the private partner will have the following form:

$$F(s_p) = p_1 \cdot F(s_1) + p_2 \cdot F(s_2),\ \ p_1 + p_2 = 1, p_1 \geq 0,\ \ p_2 \geq 0 \quad (9)$$

where $F(s_p)$ – is the vector of evaluation by the private partner of the "mixed" strategy in the implementation of public-private partnership projects;

p_1, p_2 – shares of down and periodic payments, respectively, within the framework of the public-private partnership project, part. from.

Thus, using formula 9 allows you not only to formalize any "mixed" strategy of a private partner when determining the structure of payments as a result of public-private partnership projects, but also to mathematically represent any "pure" strategy. Then, provided the partners agree to receive a one-time income (first "clean" strategy of private partner) $p_1 = 1, p_2 = 0$.. If the parties to the public-private partnership agree only on periodic payments, then $p_1 = 0, p_2 = 1$. this means that the task of determining the optimal payment structure for the implementation of public-private partnership projects consists of setting a p_1 and $p_2$for each option of "mixed" strategy.

Vitlinsky (2002, p. 168) focuses on the need for a certain refinement in the mathematical expectation calculation of the estimated amount of income by a private partner from the implementation of a public-private partnership project applying a "mixed" strategy. The author displays such refinements in formulas:

$$m_p = \sum_{k=1}^{m} \sum_{j=1}^{n} p_k \cdot q_j \cdot f_{kj} \quad (10)$$

$$\sigma_p^2 = \sum_{k=1}^{m} \sum_{l=1}^{m} p_k \cdot p_l \cdot \sigma_k \cdot \sigma_l \cdot \rho_{kl} \quad (11)$$

where m_p – the mathematical expectation of the assumed value of the private partner's income from the implementation of the public-private partnership project in the conditions of applying the "mixed" strategy;

σ_k^2 – the dispersion of the estimated risk of obtaining the expected income amount by the private partner from the implementation of a public-private partnership project in the conditions of applying a "mixed" strategy;

m - number of "clean" strategies of the private partner;

σ_k,σ_l – standard deviation, of m_k and m_l elements respectively of the vector of "pure" strategies of the private partner (k and l) according to the mathematical expectation;

ρ_{kl} – a correlation coefficient of the components of the evaluation vectors k and l "pure" strategies of the private partner.

Certain clarifications should be made regarding the calculations above. First of all, the private partner, when establishing the revenue structure from the implementation of the public-private partnership project, considers two of its "clean" strategies as alternatives, therefore $m = 2$. Besides, $m_1 = V$ where V is the amount of income the private partner plans to receive from the implementation of the public-private partnership project. Also $\sigma_1^2 = 0$, since the strategy public partner is not taken into account, provided the first alternative to "pure" strategies of the private partner (it can be explained by the private partner, who will receive the income from the project as a one-time payment). This means that $\sigma_1 = 0$, since $\sigma_k = \sqrt{\sigma_k^2}$ (because $\sigma_1^2 = 0$).

It is worth emphasizing that $\rho_{11} = \rho_{22} = 1$is explained by the characteristics of the correlation coefficient of the component evaluation vectors k and l alternative "clean" strategies of the private partner. Besides, the ratio $p_1 + p_2 = 1$, $p_1 \geq 0$,$p_2 \geq 0$ are also fair.

So, based on the above and presenting $p_1$through$x$, and p_2 respectively through $1 - x$), the ratio of 10 and 11 is reflected in this form:

$$m_p = x \cdot V + (1 - x) \cdot \sum_{j=1}^{n} q_j \cdot f_{2j} = x \cdot V + (1 - x) \cdot m_2 \quad (12)$$

$$\sigma_p^2 = p_{`1} \cdot p_1 \cdot \sigma_1 \cdot \sigma_1 \cdot \rho_{11} + p_{`1} \cdot p_2 \cdot \sigma_1 \cdot \sigma_2 \cdot \rho_{12} + p_{`2} \cdot p_1 \cdot \sigma_2 \cdot \sigma_1 \cdot \rho_{21} +$$

$$+ p_{`2} \cdot p_2 \cdot \sigma_2 \cdot \sigma_2 \cdot \rho_{22} = 0 + 0 + 0 + p_2^2 \cdot \sigma_2^2 = p_2^2 \cdot \sigma_2^2 = (1 - x)^2 \cdot \sigma_2^2 \quad (13)$$

Taking into account that a private partner in the implementation of a public-private partnership project tries to maximize its profit at the optimal level of risk for it, this should be reflected in the strategy for establishing the structure of such a partner's income from participation in the partnership model. Therefore, the corresponding mathematical model should reflect these two criteria:

$$\begin{cases} m_p = x \cdot V + (1-x) \cdot m_2 \rightarrow \max \\ \sigma_p^2 = (1-x)^2 \cdot \sigma_2^2 \rightarrow \min \end{cases} \quad (14)$$

As evidenced by the study of theory and practice, the use of model 14 in establishing the structure of payments in the context of public-private partnership projects is significantly accelerated in practice, since this task will have an unambiguous solution only if an alternative "clean" strategy with zero risks is applied (then m_p will reach maximum values). In other conditions, there is no such unambiguity, which is primarily because in practice, as a rule, an improvement in the value of one criterion leads to a deterioration in the value of another. Therefore, in the case of public-private partnership projects, the optimal strategy for establishing the revenue structure of a private partner is to find a compromise.

The study of theory and practice makes it possible to justify the feasibility of ranking criteria for establishing the structure of the private partner's income from the implementation of a public-private partnership project. In other words, it is about the need to determine the weighting coefficients for both dispersion and expectation. This weighting factor for dispersion λshould be considered as a coefficient that reflects the private partner's risk aversion during the approval of the revenue structure from the implementation of a public-private partnership project: the lower the value λ, the more risk aversion the private partner increases, and vice versa.

In the analyzed context, it is obvious that if the weighting factor of the variance of the income of the private partner from the project public-private partnership is λ, then $1-\lambda$ is the value of the weighting factor of the mathematical expectation the expected value of this income. Therefore, having such information, a private partner can choose the appropriate optimal strategy for itself when determining the structure of income from the implementation of a public-private partnership project, taking into account the criteria for the expected amount of such income and the partner's risk propensity. Based on the sources, this problem of the existence of two criteria for a private partner can be solved using the maximization of the utility function:

$$U(x) = (1-\lambda) \cdot m_p - \lambda \cdot \sigma_p^2 = (1-\lambda)(x \cdot V) + (1-x)m_2) - \lambda((1-x)^2 \cdot \sigma_2^2) \rightarrow \max \quad (15)$$

Using the provisions of the utility theory, a function reaches its maximum when its first derivative $U(x)$ is 0. Given that $x = p_1$, it is appropriate to emphasize that p_1 is the optimal share of the initial payment to the private partner in the framework of the public-private partnership project, provided that the maximum of function 13 is reached.

Discussion

The study allows us to propose provisions for determining the structure of payments for the implementation of public-private partnership projects in the conditions of reengineering processes of public or private partners. In particular, the optimal amount of the initial payment for a private partner in the implementation of public-private partnership projects will be calculated as follows:

$$V_o^{opt} = x \cdot V \qquad (16)$$

where V_o^{opt} – is the optimal value of the initial payment for a private partner when implementing a public-private partnership project.

Besides, the optimal coefficient for a private partner to receive the expected amount of revenue from the implementation of a public-private partnership project within the payment structure for such a project (given that $p_2 = (1 - x)$) should be calculated using the formula:

$$D^{opt} = (1 - x) \cdot D \qquad (17)$$

where D^{opt} – is the optimal coefficient for a private partner to receive the expected amount of revenue from the implementation of a public-private partnership project.

In any case, determining the structure of payments for public-private partnership projects is a complex task that determines the need for careful calculations, analysis of the environment, forecasting market conditions, balancing the interests of various groups of stakeholders, and coordinating discussion positions.

Conclusions

The deliberations presented allow the private partner to determine the structure of payments for the implementation of public-private partnership projects. At the same time, we should not ignore the existing restrictions on the part of both public and private partners. Such restrictions, in particular, may relate to the stability of the market environment, the willingness of the other party to agree to the optimal form and share of payments determined by the other party, restrictions on the legal framework for calculations for specific public-private partnership projects, and so on. Under these conditions, you should adjust the shares $p_1$andp_2 to $p_1{}'$and $p_2{}'$.

The proposed provisions for determining the structure of payments for the implementation of public-private partnership projects in the conditions of reengineering are based on the tools of game theory and take into account the options for strategies for private and public partners in the field of financial settlements. The proposals presented in the study allow private partners to choose the optimal absolute values and relative shares of initial and periodic payments in the framework of public-private partnership projects, depending on their willingness to take risks concerning the resulting indicators of the object of such a partnership. In this case, the generalized sequence in defining the structure of these payments needs to implement the following stages: identification of alternative "clean" strategies of private and public partner in the implementation of public-private partnerships; identification of options the probability of state a partner of their alternative "pure" strategies; the formation of a functional assessment and payment of the matrix; the relationship of the assumed income of the private partner and the predicted level of risk from the structure of payments under public-private partnership when using "mixed" strategies; ranking criteria for establishing the structure of private partner income from the implementation of a public-private partnership project; determination of the parameters of the optimal structure of payments during project implementation a public-private partnership; the adjustment of absolute values and/or relative proportion of initial and periodic payments during the project implementation public-private partnerships.

Abstract

Rapid increase of remittances inflows is inherent for many developing countries. Such inflows affect exchange rate on national currency. Given this fact, the aim of our paper is to analyse the interdependence between remittance inflows and trend of Ukrainian hryvnia exchange rate. The research results of the current article is the model of remittances inflows influence on nominal effective exchange rate of Ukrainian hryvnia built using data from 1996 to 2019 period. We estimate linear regression model with trend component and autoregressive distributive lag model, because of existence of autocorrelation. Research showed that in current situation in Ukrainian economy NEER in previous period (lag 1) depreciates current NEER value as well, as remittances inflows with lag 2. Such results require further investigation as they are contrary to other studies.

Keywords: remittances, nominal effective exchange rate, balance of payments.

Introduction

Over the past two decades, the emerging and developing markets have established themselves as a significant global growth engine. That's mostly due to their consistent and faster economic growth compared with their developed market counterparts. According to the data of International Monetary Fund, since 2000 emerging markets have persistently outperformed the world and advanced markets. By October 2018 their annual GDP growth was 4.1% relative to developed markets' 2.4, and the world's 3.7 respectively (IMF, 2018). One even claims that emerging markets are important because they drive growth in the global economy. Ukraine may be regarded as one of those countries. Though the country faces a number of problems now (e.g. war in Donbas, high emigration to the neighboring countries, insufficient market reforms), it has a very big potential, which, if utilized, may cause a substantial growth of the economy. Its share in world trade should be also much higher in this situation.

There are different factors that play an important role in the development of the country's economy. For sure one of them is the need to promote long-term financial market policies. In addition, policymakers should ensure the appropriate formulation and implementation of short-term financial tools in order to foster economic growth (Mesagan et al., 2019). In turn, Kabaklarli et al., (2018) claim that the export structure has played an important role in the economic growth theories of many countries since the 1960s, as export growth has been associated with faster productivity and GDP growth. Other authors (e.g. Witkowski et al., 2017) mention also the economic, political and social situation of the

country, which is especially important in the context of attracting the foreign investors. However, regardless of the other factors, currency of the country and especially its exchange rates with leading currencies of the world (dollar, yen, euro) plays a very important role in this aspect. A real depreciation of domestic currency compared to the foreign currency may create import goods more expensive and export goods more affordable and simultaneously lead to an improvement of trade balance. However, the effect of the trade balance in a country may not occur immediately at the time of depreciation (Hidayat, 2019).

One should underline that the factors that influence the exchange rate of national currency can be unique. When it comes to Ukrainian hryvnia the definite fact is the constant decrease of its exchange rate since the moment of its introduction into the Ukrainian economy. The latter is due to frequent deterioration of state of Ukrainian economy. In the same time, due to the weakness of Ukrainian economy at present, a noticeable part of Ukrainian population was looking for employment abroad, emigrating to neighbouring countries (mostly Poland but also Czechia, Slovakia). This trend may even rise due to opening of the German market for Ukrainian employees. People employed abroad made substantial remittances to members of their families. No wonder that as the result, there is an ongoing debate whether the people who were working abroad and sending money back to their families in Ukraine support the country's economy. The impact of those remittances of the exchange rate of Ukrainian hryvnia is also analysed in details. Given the facts presented the aim of this paper is to analyse the interdependence between remittance inflows and trend of Ukrainian hryvnia exchange rate.

Literature Review

The impact of remittances on different development indicators of recipient countries is the topic of many analyses in the literature. Remittances have been a major source of economic support for dependents of migrant workers in their home countries (Olah et al., 2019). For example, data shows that remittance flows are the second largest source, behind FDI, of external funding for developing countries. The total amount of remittances received by developing countries has surpassed 300 billion US dollars in 2011, from which almost 61 billion went to Latin America and the Caribbean (Inter-American Development Bank, 2013). Their importance does not only come from their size, but also from their relative importance as a share of GDP in some countries and from their increasing share in all financial flows entering developing countries (Androniceanu et al., 2019; Ciobanu et al., 2019). They now represent approximately 45 percent of net capital inflows in these countries (Jansen, 2013).

Remittances to low-income countries were larger as a share of GDP and imports than were those to middle income countries. Remittances are also more stable than private capital flows, which often move pro-cyclically, thus raising incomes during booms and depressing them during downturns (Ratha, 2003). Neyapti (2004) reports that, during the 1990s, in countries like Samoa, Yemen, Cepe Verde, Jordan, Tonga, Albania and El Salvador, net workers remittance receipts exceeded 10 percent of GDP; in countries like Hungary, Egypt, Moracco and Sri Lanka, they exceeded 5 percent of GDP.

The research of Misati et al., (2019) who analysed he relationship between remittances and financial development using Kenyan quarterly data from 2006 to 2016 is worth considering. Five different indicators of financial development were used in their research: credit to the private sector as a share of GDP, the number of mobile transactions, the value of these mobile transactions, the number of mobile agents, and the number of bank accounts. The results from using an autoregressive distributed lag demonstrated a strong, positive relationship between remittances and financial development in long-run equations. Another country which may be regarded as the very good example is Nigeria which receives the largest amount of remittances in Africa and the third among developing economies; receiving 21 Billion US Dollars in 2015 (Adejumo & Ikhide, 2019). Despite these facts, one cannot, however, forget about some dangers of such actions as large remittance inflows could hurt the recipient economy. It relates to the situation when the flows are significant in relation to the size of the recipient economy. As a result, it could case the possibility of the exchange rates appreciation and a loss of competitiveness (Kliestikova & Janoskova, 2017).

Existence of remittances inflows on exchange rate was supported by different research. Most of them confirmed appreciation of exchange rate of local currency as a result of remittances increase. Some of them also presumed that such impact could be an evidence of Dutch disease existence. In particular, by use of linear regression and set of macroeconomic and technical variables Bourdet & Falck (2006) found Dutch disease effects such as appreciation of national currency in Cape Verde, resulted from increasing remittances inflows.

The similar effect was found for real exchange rate of local currencies in Latin American and Caribbean countries (Amuendo-Dorantez & Pozo, 2004). The article targeted estimation of fixed effects by applying ordinary least squares model and instrumental variables regression. It was revealed that remittances, like capital flows can appreciate the real exchange rate in recipient economies and therefore generate a resource allocation from the tradable to the non-tradable sector (Androniceanu & Tvaronavičienė, 2019). The same results were found for El Salvador (Caceres & Saca, 2006), Jamaica (Bussolo & Medvedev, 2007), Mexico (Vargas-Silva, 2009), 109 developing and transition countries for the period from 1990 to 2003 (Acosta et al, 2009), Bangladesh (Chowdhury & Rabbi, 2014) and Vietnam (Nguyen, 2017). Different result was found by Hien et al. (2019) who reported that in economies with low ratio of remittances to GDP (less than 1%) appreciation of local currency and Dutch disease effects are most likely to occur.

Research of Adejumo & Ikhide (2019) who analysed Nigerian economy revealed that remittance inflows have been associated with a rise in the real exchange rate in Nigeria. This implies that high remittance inflows have exerted depreciating pressure on the country's currency. Thus, contrary to the Dutch disease proposition, high remittance inflows into Nigeria have not resulted in an overvalued exchange rate but a low-valued exchange rate.

Neyapi et al. (2005), who analysed Turkey in the 1979-1993 period, claim that improving financial intermediation and preventing exchange rate misalignments would help increase the inflow of remittances. The researchers also stated that the macroeconomic variables significantly impact on workers' remittances for the Turkish case, indicating that governments of the labor exporting countries can influence the inflow of remittances by means of appropriate macroeconomic policies. In turn, Barret (2013) investigated the impact that remittances have on the escalating exchange rate in the Jamaican economy over the period 1995-2010, controlling for other fundamental variables such as government spending, official aid and the terms of trade. It empirically verified that remittances depreciated the real exchange rate. contrary to other findings, his research showed that that increases in remittances to Jamaica depreciated the real exchange rate. More specifically, an increase in remittances as a percentage of GDP lead to a depreciation of the real exchange rate by approximately 8.26%. He also revealed that official aid has no effect on the real exchange rate.

The analysis of the literature allows us to conclude that the phenomenon has a multidimensional character and is analysed from different points of view. In order to contribute to the discussion, our paper will target the impact of remittance inflows on the nominal exchange rate of Ukrainian hryvnia.

Methodology and Data

Evaluation of remittances inflows impact on trends of exchange rate of Ukrainian hryvnia is our research objective. The important decision for the current research is the choice of type of exchange rate, which demonstrates tendency of Ukrainian hryvnia since its introduction. We decided to use nominal effective exchange rate (NEER) as the variable representing exchange rate, which is explained by the following arguments. First of all, it indicates general tendency of Ukrainian hryvnia exchange rate for the researched period. Next point is the indexed value of national currency by weights of different currencies in international trade. In contrast, real exchange rate only captures effects of inflation and sometimes it is difficult to determine its tendency. Accordingly, increase in NEER value shows appreciation of local currency.

Fig.1: Dynamics of NEER of Ukrainian hryvnia and its relationship with remittances inflows in 1996-2019. Source: IMF International Statistics Database, IMF Balance of Payments Database

NEER index of Ukrainian hryvnia demonstrates descending trend, it has depreciated by 81% since the beginning of the research. Contrary remittances inflows increased significantly. We can assume existence of some kind of relationships between these indicators (Fig.2).

Fig.2: Graphic interpretation of linear relation between NEER and remittances inflows.

Source: IMF International Statistics Database, IMF Balance of Payments Database

Graphic interpretation supports an idea of existence of relationship between NEER and remittances inflows. Consequently, we are going to estimate a linear regression with a trend component using ordinary least squares method (1).

$$NEER = \beta_1 Remit + \beta_0 + t + \varepsilon_t, , \quad (1)$$

where NEER - nominal exchange rate; Remit – remittances net inflows.

In case of presence of significant autocorrelation we are going to check autoregressive distributive lag model (ARDL) or error-correction model (ECM) if data are stationary (2).

$$\Delta NEER_t = \beta_0 + \sum_{i=1}^{n} \beta_i \, \Delta NEER_{t-i} + \sum_{i=0}^{n} \delta_i \, \Delta REMIT_{t-i} + t + \mu_t, \quad (2)$$

where $\Delta NEER_{t-i}$ – change in nominal exchange rate with the time lag; $\Delta REMIT_{t-i}$ – change in remittances net inflows with the time lag.

As exchange rate adjusts to changes in trade volumes relatively quickly, we decided to use quarterly data, which were extracted from International Monetary Fund International Financial Statistics and Balance of payments databases.

Tab. 1: Data summary. Source: IMF International Statistics Database, IMF Balance of Payments Database

Variable	Number of observations	Mean	Standard deviation	Minimal value	Maximum value
NEER	90	131,2871	60,53331	39,58323	262,4165
Remittances inflows	90	807,5111	865,7412	1	3148

Additionally we conducted deseasoning of data and its standardization.

Results and Discussion

The first step is estimation of liner model with trend component. Results showed statistical significance of remittances variable, trend and constant. Regression coefficient showed that steady increase in remittances inflows maintain NEER depreciation. Trend showed inverse relationship with NEER (Table 3). But postestimation for autocorrelation by Durbin-Watson and Breusch-Godfrey LM tests revealed significant autocorrelation.

Also we found optimal lag structure for NEER and remittances inflows variables by likelihood-ratio tests using AIC criteria. In particular, for NEER optimal is lag 1, for remittances – lag 2. Considering obtained lag structure we conducted augmented Dickey-Fuller test (Dickey & Fuller, 1979) and found that data is stationary, as z-criteria for NEER is -1,306 and for remittances 1,929.

In such case we performed bound test developed in Pesaran et al., (2001) to test existence of cointegration. Additionally this test allows defining whether the remittances have short-run or long-run impact on NEER.

Tab. 2: Bound test results. Source: author's calculations.

Value	0,05	0,01
	I0 - I1	I0 - I1
F = 3,903	4,94 - 5,73	6,84 - 7,84
t = -2,785	-2,86 - -3,22	-3,43 - -3,82

At 5- and 1-% level of significance bound test demonstrated absence of cointegration, so we can use ARDL model to estimate short-term impact of remittances. ARDL model was also estimated by OLS method and showed significance of NEER with lag 1 and remittances inflows with lag 2. The other important point is that in ARDL model trend variable is not statistically significant.

Tab. 3: Results of models estimation. Source: author's calculations.

Variable	Model 1	Model 2
$NEER_{t-1}$	-	0,8829 (0,000)
$Remit_t$	0,1433721 (0,03)	0,10295 (0,316)
$Remit_{t-1}$	-	0,19 (0,199)
$Remit_{t-2}$	-	-0,2922 (0,007)

trend	-0,039157 (0,000)	-0,0042 (0,125)
Constant	1,649887 (0,000)	0,7497 (0,113)
F	566,01	909,2
F>0	0,0000	0,000
R^2	0,9224	0,9823
Root MSE	0,266129	0,1241
Durbin-Watson d-statistics	0,258	1,882
Breusch-Godfrey LM test, chi^2	68,185	1,881
Breusch-Pagan / Cook-Weisberg test, chi^2	23,87	21,03

In current situation, NEER with lag1 depreciates current value of NEER. Finally, increasing remittances inflows with lag 2 also depreciates current NEER value, which supports Hien's (2019) suggestion that Dutch disease effects do not occur if share of remittances in GDP is greater than 1%. Other possible explanation for depreciating effect of remittances inflows into Ukrainian economy could be investment of the latter into non-tradable sector of the economy. However, this needs further confirmation.

Conclusion

As the result of conducted research, we confirmed existence of relationship between NEER and remittances inflows. By estimation of linear regression model with trend component and ARDL model we demonstrated that this relation is not caused by trend, but by NEER with lag 1. The result that needs further investigation is the reverse relationship between remittances inflows with lag 2 and NEER in current period. The possible explanation for this could be the fact that remittances are used for investing in a short-run after inflow. Such interpretation was reported by Yang (2008), as the result of research of migrants' exchange rates shocks in Filipino economy. However, when it comes to Ukrainian economy the reasons for such dependence need to be further analyzed and interpreted.

This study contributes to the theory in several ways. First of all, it constitutes the study on interdependence between remittance inflows and trend of country's currency based on the Ukraine and its hryvnia exchange rate. Moreover, the findings of this study can also be relevant to practice as they give - in wider perspective - some recommendations to the governments and policymakers on how to increase the effectiveness and performance of the economy. And this for sure would be very beneficial to the economic development of the country. On the other hand, some limitations of our studyshould also be noted. First of all the situation of the country is - at least to some extent – deteriorated by its internal problems (mostly war in Donbas). That's why it would be really interesting to make some cyclical research (for example every 2-5 years) to check how the situation changes. Despite this limitation we believe that our paper gives a real picture of the situation in the country analysed.

Acknowledgements

The study is funded within the auspices of the programme of the Minister of Science and Higher Education entitled "Regional Initiative of Excellence" in 2019-2022, project number 018/RID/2018/19, the amount of funding PLN 10,788,423.16.

Abstract

The article deals with the features of assets accounting and valuation, liabilities and capital in the system of formation of risk-based financial reports based on the principles of international financial reporting standards (IFRS). The authors indicate innovations in appraisal of assets value, liabilities and capital, and highlight the accounting innovations arising from this, focused on the task of financial statements generating at fair value. In addition, the authors draw attention to the need to recalculate the fair value of assets, liabilities and capital, and, thus, its gradual approximation to the truth. It performs the need to use tridimensional measurement of financial reports using indicators at fair value, at face value, and deviations between them. Such approach to the formation of financial reports will increase the investment attractiveness and company's creditworthiness. Investors, shareholders and creditors will see the lower and the upper change ranges of financial indicators in the reports and have ideas about how assets, liabilities and capital can change when implementing a risk management system.

Keywords: international financial reporting standards, IFRS principles, financial reports, market valuation, financial accounting, risk-based approach.

Introduction

Global financial crisis has exposed the imperfection and even poor quality of companies' financial reports. Investors, shareholders, and creditors started placing higher demands to companies' financial reports. They talked about the need to take into account risks and formation of integrated reporting, which can combine not only financial but also other types of company's capital. In other words, there was a need for combination of cost and risk-based approaches in the formation of integrated and financial reports of the companies. One way or another, the assessment of all types of capital should be performed through the economic benefit, expressed in the components of financial capital. Therefore, the primary

task is to improve the appraisal of the company's financial capital. New approaches to appraisal of assets value, liabilities and capital predetermine innovations in the field of accounting, focused on obtaining indicators of financial statements in the required dimensions.

Relevance. Formulation of the problem

Global changes in approaches to preparation of the companies' financial reports started together with the global financial crisis *(Application of the IFRS: Part 3, 2016), (Alcantud, Rambaud and Torrecillas, 2017)*. The key point in preparation of financial reports is the need to take into account possible risks during its preparation. In other words, regulatory state and supranational institutions focus on the formation of risk-based financial reports. Fair value measurement standard for assets values, liabilities and capital appeared, the key point of this standard is discounting, due to which it is planned to ensure risks management in financial reports *(Drugilinskya, 2012), (Nauta, 2017), (Trubitsina and Bashkin, 2017), (Clean Technologies and Sustainable Development, 2017) (Perko and Mlinarič, 2016)*. It is clearly seen when we use discounting and form risk-oriented financial statements, it reflects situations with delay in payment (instalment of date), and such situations are widely used in real-world terms of the companies. Discounting is one of the methods of the income approach; it along with the cost and market approaches is used for fair value measurement of assets, liabilities and capital. Tatiana M. Mezentseva, Vladislav Y. Shatyi take notice of the features of discounting in the process of determining the fair value in their works *(Mezentseva and Shatyi, 2017)*. J. Jaunzeme *(Jaunzeme, 2019)* gives particular attention to the holistic approach of fair value measurement.

The authors Vera P. Sidneva, Olesya I. Kostenko *(Sidneva and Kostenko, 2014)* describe the problems of using of fair value concept in Russia, their solutions and further prospects. Loic Belze, Francois Larmande, Lorenz Schneider draw attention to risks modeling in fair value measurement *(Belze, Larmande and Schneider, 2019)*.

The impact of the fair value accounting concept using to the quality of financial statements of business entities is described by S.N. Islambegovic, E. Delic *(Islambegovic and Delic, 2019)*. Insufficient quality of financial reporting is mentioned in the works of NTH Thuong, R.C. Zhang, Z.M. Li, P.T.D. Hong *(Thuong et al., 2018)*, D. Davydov, S. Swidler *(Davydov and Swidler, 2016)*, I. Perko, F. Mlinaric *(Perko and Mlinarich, 2016)*.

Factors affecting the quality of financial statements are described by T.H.U. Akuntansi *(Akuntansi, 2019)*. The relationship between financial reporting quality and debt is described in D.C. Donelson, R. Jennings, J. Mcinnis *(Donelson, Jennings and Mcinnis, 2017)*. The insufficient quality of the notes to the financial statements is indicated by M. Randakova *(Randakova, 2015)*.

Such authors as V.-O. Muller *(Muller, 2012)*, J.E. McEnroe *(McEnroe, 2007)*, talk about the influence of financial statements quality on the company's investment attractiveness.

Improvement of information quality with the help of reflecting risks in financial reports is de-scribed in the work of M. Nichita *(Nichita, 2018)*.

In case with delay in payment (instalment of date) the fair value of assets, liabilities and capital is determined precisely by the discount method within the framework of the income approach. The logic of report preparation follows from the fact that for preparation of risk-oriented financial report it is necessary the related assets, liabilities and capital be in the report at a discounted value. At the same time, the discounted value changes over time, and these changes should include adjustments to the financial statements.

The use of fair value measurements in accounting determines the appearance of a two-component structure of the initial cost of related assets, liabilities and capital:

1) assets fair value is equal to the fair value of liabilities (capital);
2) difference between the transaction price and the fair value of assets (liabilities, capital).

The resulting accounting features on the example of fixed assets and related payables are presented in Table 1.

The emergence of a two-component structure for the initial cost of related assets, liabilities and capital completely changes the accounting system. Therefore, the purpose of this article is to designate the

innovations in accounting and valuation of assets, liabilities and capital in accordance with IFRS in a situation with delay in payment (instalment of date).

Theoretical part

Table 1: accounting innovations in connection with fixed assets evaluation and credit debts at fair value recognition

(Source: compiled by the authors)

No.	Accounting transaction	Changes in the statement of financial position		Comments to determine the amount
		asset	liability	
1. Received equipment that does not require installation				
1.1	The fair value of equipment without VAT (fair value of accounts payable without VAT)	Fixed assets +	Accounts payable to suppliers +	Equipment fair value without VAT (fair value of accounts payable without VAT)
1.2	VAT calculated with equipment fair value (fair value of accounts payable)	VAT on acquired values	Accounts payable to suppliers +	VAT calculated with equipment fair value (fair value of accounts payable)
1.3	Difference between the transaction price without VAT and equipment fair value without VAT (fair value of accounts payable without VAT)		Undistributed profits - Estimated liabilities +	Difference between the transaction price without VAT and equipment fair without VAT (fair value of accounts payable without VAT)
1.4	VAT calculated from the difference between the transaction price and equipment fair value (fair value of accounts payable)	VAT on acquired values	Estimated liabilities +	VAT calculated from the difference between the transaction price and equipment fair value of (fair value of accounts payable)

The innovations in accounting for revenue and receivables under IFRS using the Russian chart of accounts under a sales contract are presented in Table 2.

Table 2: contract revenue and account receivable innovations IFRS sales with valuation of assets and income at fair value

(Source: compiled by the authors)

Accounting transaction	Changes in the statement of financial position		Comments to determine the amount
	asset	liability	
The following operations are carried out in the accounting records for each coming date of payment by the buyer in accordance with the schedule of payments of the contract			
Reflected sales of products	Accounts receivable +	Retained earnings +	Transaction price with VAT
Reflected VAT on sales		Retained earnings - Accounts payable +	VAT, calculated on the price of the transaction
The difference between the transaction price without VAT and the fair value of revenue (receivables) (provision for doubtful debts) is reflected	Accounts receivable –	Retained earnings –	The difference between the transaction price excluding VAT and the fair value of revenue (receivables)

The fair value of assets, liabilities and capital changes over time, therefore, in order to ensure the accuracy of financial statements *(Application of the IFRS: Part 3, 2016), (Alcantud, Rambaud and Torrecillas, 2017), (Drugilinskya, 2012), (Nauta, 2017), (Trubitsina and Bashkin, 2017), (Clean Technologies and Sustainable Development, 2017), (Perko and Mlinarič, 2016)*, it is necessary to recalculate the fair value of assets, liabilities and capital. Recalculation of fair value, for example, of fixed assets, should be carried out according to one of two options:

1) upon the next payment date to the supplier in accordance with the schedule of payments of the contract;

2) at the end of the reporting period due to the need to take into account changes in the time value of money.

Similarly, in the above example, the translation of related credit debt should be carried out.

On the example of fixed assets and related payables, the first version of the accounting policy of the enterprise is presented in table 3, the second version of the accounting policy of the enterprise is presented in table 4.

Table 3: first version of accounting policy
(Source: compiled by the authors)

Additional operations for the first version of accounting policy				
№	Accounting transaction	Accounting treatment		Comments on transaction amount determination
		asset	liability	
The following operations are carried out in the accounting records for each due date of payment to the supplier in accordance with the schedule of payments of the contract				
1	Reflected increase in accounts payable to the supplier (upon maturity)		Estimated liabilities – Accounts payable +	Part of difference between the transaction price with VAT and the fair value with VAT payable at the payment date according to the schedule of the contract (the proportion corresponding to the current payable ratio to the supplier)
2	Reflected increase in the initial (fair) cost of equipment	Fixed assets +	Retained earnings +	Part of the difference between the transaction price excluding VAT and the fair value of equipment excluding VAT (the proportion corresponding to the current payment ratio of payables to the supplier)
3	Accrued depreciation of equipment in connection with an increase in the initial (fair) value	Fixed assets –	Retained earnings –	Additional depreciation based on the increase in the fair value of the equipment without VAT (calculated on the part of the difference between the transaction price without VAT and the fair value of the equipment without VAT (the proportion corresponding to the current payment ratio of payables to the supplier))
4	Paid to the supplier for the equipment (payables to the supplier are repaid on the date of the next payment)			
4.1	Paid part of the fair value of equipment with VAT	Cash –	Accounts payable –	Part of the transaction price with VAT

Table 4: second version of accounting policy
(Source: compiled by the authors)

Additional operations for the second version of accounting policy				
№	Accounting transaction	Accounting treatment		Comments on transaction amount determination
		asset	liability	
The following operations are carried out in accounting 1 time at the end of the reporting year due to changes in the time value of money				
1	Reflected increase in accounts payable to supplier		Estimated liabilities – Accounts payable +	Change in the value of accounts payable due to changes in the time value of money
2	Reflected increase in the initial (fair) cost of equipment	Fixed assets +	Retained earnings +	Part of the difference between the initial fair value of equipment excluding VAT and restated fair value of equipment without VAT
3	Accrued depreciation of equipment in connection with an increase in the initial (fair) value	Fixed assets –	Retained earnings –	Additional depreciation calculated on the basis of an increase in the fair value of equipment, excluding VAT, as a result of a translation based on a change in the time value of money

There are no transactions to pay the supplier in the second case because the situation is not related to settlements with the creditor.
Therefore, the fair value of property, plant and equipment is equal to the fair value of accounts payable at the time of recognition. Subsequently, the difference between the transaction price and the fair value of property, plant and equipment (accounts payable) is recounted.
On the example of receivables and related revenue, the first version of the accounting policy of the enterprise is presented in Table 5, the second version of the accounting policy of the enterprise is presented in Table 6.

Table 5: innovations in accounting for revenue and receivables under a sales contract under IFRS using the Russian chart of accounts (first version of accounting policy)
(Source: compiled by the authors)

Accounting transaction	Accounting treatment		Comments on transaction amount determination
	debit	credit	
The following operations are carried out in accounting at each coming date of payment by the buyer in accordance with the schedule of payments of the contract			
Reflects the decrease in the difference between the transaction price excluding VAT and the fair value of revenue (receivables) (the reserve for doubtful debts in terms of payment received from customers was restored)	Accounts receivable +	Retained earnings +	Part of the difference between the transaction price excluding VAT and the fair value of revenue excluding VAT, corresponding to the share of payment
Payment received from buyers (part of the transaction price with VAT)	Bankroll + Accounts receivable –		Part of payment (part of the transaction price with VAT)

Table 6: innovations in accounting for revenue and receivables under a sales contract under IFRS using the Russian chart of accounts (second version of accounting policy)
(Source: compiled by the authors)

Accounting transaction	Accounting treatment		Comments on transaction amount determination
	debit	credit	
The following operations are carried out in accounting 1 time at the end of the reporting year in connection with a change in the time value of money			
Reflects the decrease in the difference between the transaction price excluding VAT and the fair value of revenue (receivables) (reserve for doubtful debts was restored due to changes in the time value of money)	Accounts receivable +	Retained earnings +	Decrease in the difference between the transaction price excluding VAT and the fair value of revenue excluding VAT due to changes in the time value of money

There are no payment transactions in the second version of accounting policy because the situation is not related to settlements with the debtor.
Therefore, the fair value of revenue equals the fair value of receivables at the time of recognition. Subsequently, the difference between the transaction price and the fair value of the proceeds (receivables) is recounted.
At the next stage, we present the procedure for recalculating fair value using fixed assets as an example.
First version of accounting policy
An increase in the fair value of property, plant and equipment due to the date of payment is equal to the part of the difference between the transaction price excluding VAT and the fair value excluding VAT:

$$\Delta_{FA} = D_{excl\,VAT} \cdot S, \quad (1)$$

where Δ_{FA} is the increase in the fair value of fixed assets in connection with the due date of payment, rubles;
$D_{excl\,VAT}$ is the difference between the transaction price without VAT and the fair value of equipment without VAT (fair value of accounts payable without VAT), rubles;
S is the share of payment amount.
Second version of accounting policy
An increase in the fair value of property, plant and equipment due to changes in the time value of money is calculated using the formula:

$$\Delta_{FV_{FA}}^{D_{incl\,VAT}} = \left[D_{excl\,VAT} \cdot 120/100 - \left(TP_{incl\,VAT} - \frac{TP_{incl\,VAT}}{(1+i)^{n-1}}\right)\right] \cdot 100/120, \quad (2)$$

where $\Delta_{FV_{FA}}^{D_{incl\,VAT}}$ is the increase in the fair value of property, plant and equipment due to changes in the time value of money, rubles;
$TP_{incl\,VAT}$ is the transaction price with VAT, rubles;
i is the discount rate;
n is the period corresponding to the remaining period until repayment of accounts payable.
To assess the degree of influence of factors on indicators Δ_{FA} and $\Delta_{FV_{FA}}^{D_{incl\,VAT}}$ we set out intermediate indicators $D_{excl\,VAT}$ and $TP_{incl\,VAT}$ as follows:

$$D_{excl\,VAT} = TP - FV_{FA} = TP - \frac{TP}{(1+i)^n}; \quad (3)$$

$$TP_{incl\,VAT} = 1{,}2 \cdot TP, \quad (4)$$

where TP is the transaction price without VAT, rubles;

FV_{FA} is the fair value of equipment excluding VAT (fair value of accounts payable excluding VAT), rubles, equal $\frac{TP}{(1+i)^n}$.

Then, taking into account the formulas (3) and (4), formulas (1) and (2) will be:

$$\Delta_{FA} = D_{excl\,VAT} \cdot S = \left(TP - \frac{TP}{(1+i)^n}\right) S = TP \cdot S \left(1 - \frac{1}{(1+i)^n}\right); \quad (5)$$

$$\Delta_{FV_{FA}}^{D_{incl\,VAT}} = \left[D_{excl\,VAT} \cdot 1{,}2 - \left(TP_{incl\,VAT} - \frac{TP_{incl\,VAT}}{(1+i)^{n-1}}\right)\right] / 1{,}2 =$$

$$= TP - \frac{TP}{(1+i)^n} - TP_{incl\,VAT}/1{,}2) \left(1 - \frac{1}{(1+i)^{n-1}}\right) =$$

$$= TP - \frac{TP}{(1+i)^n} - TP\left(1 - \frac{1}{(1+i)^{n-1}}\right) =$$

$$= TP \cdot \left(1 - \frac{1}{(1+i)^n} - 1 + \frac{1}{(1+i)^{n-1}}\right) =$$

$$= TP \frac{i}{(1+i)^n}. \quad (6)$$

Let's consider the influence of the factors "share of payment amount S", "discount rate i" and "the period corresponding to the remaining period until repayment of accounts payable$n$" on the indicators Δ_{FA} and $\Delta_{FV_{FA}}^{D_{incl\,VAT}}$. As factor models (5) and (6) are nonlinear, we use the differential method of factor analysis, based on the expansion of the factor model in a Taylor series and discarding terms containing derivatives of the second and higher orders:

$$\Delta_{FA(1)} = \Delta_{FA(0)} + \frac{\partial(\Delta_{FA})}{\partial S} \Delta S + \frac{\partial(\Delta_{FA})}{\partial i} \Delta i + \frac{\partial(\Delta_{FA})}{\partial n} \Delta n; \quad (7)$$

$$\Delta_{FV_{FA}(1)}^{D_{incl\,VAT}} = \Delta_{FV_{FA}(0)}^{D_{incl\,VAT}} + \frac{\partial\left(\Delta_{FV_{FA}}^{D_{incl\,VAT}}\right)}{\partial i} \Delta i + \frac{\partial\left(\Delta_{FV_{FA}}^{D_{incl\,VAT}}\right)}{\partial n} \Delta n, \quad (8)$$

where $\Delta_{FA(1)}$ and $\Delta_{FV_{FA}(1)}^{D_{incl\,VAT}}$ – are the values of indicators Δ_{FA} and $\Delta_{FV_{FA}}^{D_{incl\,VAT}}$ under final values of factors S, i и n;

$\Delta_{FA(0)}$ and $\Delta_{FV_{FA}(0)}^{D_{incl\,VAT}}$ – are the values of indicators Δ_{FA} and $\Delta_{FV_{FA}}^{D_{incl\,VAT}}$ under the initial values of factors S, i и n;

$\frac{\partial(\Delta_{FA})}{\partial S}$, $\frac{\partial(\Delta_{FA})}{\partial i}$, $\frac{\partial(\Delta_{FA})}{\partial n}$ – are the private derivatives of an indicator Δ_{FA} by factors S, i and n with average values of factors S, i и n, equal $TP\left(1 - \frac{1}{(1+i)^n}\right)$, $TP \cdot S \frac{n}{(1+i)^{n+1}}$ and $TP \cdot S \frac{\ln(1+i)}{(1+i)^n}$;

$\frac{\partial\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)}{\partial i}$, $\frac{\partial\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)}{\partial n}$ – are the private derivatives of an indicator $\Delta_{FV_{FA}}^{D_{incl\ VAT}}$ by factors i and n with average values of factors i and n, equal $-TP\frac{i(n-1)-1}{(1+i)^{n+2}}$ and $-TP\frac{i\cdot\ln(1+i)}{(1+i)^{n}}$;

ΔS, Δi, Δn are the intervals of magnitude of factors change S, i and n.

Then factor models (7) and (8) will be:

$$\Delta_{FA(1)} = \Delta_{FA(0)} + TP\left(1-\frac{1}{(1+i)^{n}}\right)\Delta S + TP\cdot S\frac{n}{(1+i)^{n+2}}\Delta i + TP\cdot S\frac{\ln(1+i)}{(1+i)^{n}}\Delta n; \quad (9)$$

$$\Delta_{FV_{FA}(1)}^{D_{incl\ VAT}} = \Delta_{FV_{FA}(0)}^{D_{incl\ VAT}} - TP\frac{i(n-1)-1}{(1+i)^{n+2}}\Delta i - TP\frac{i\cdot\ln(1+i)}{(1+i)^{n}}\Delta n. \quad (10)$$

Practical significance

Let the transaction price without VAT (TP) is 5 million rubles, initial factors: S – 0.4; i – 20 %; n – 2 years, , final factors: S – 0.6; i – 30 %; n – 4 years, middle factors: S – 0.5; i – 25 %; n – 3 years, factor change intervals: S – 0.2; i – 10 %; n – 2 years.

Assessment of the degree of influence of factors on Δ_{FA} will be as follows:

$$\Delta_{FA(0)} = TP\cdot S\left(1-\frac{1}{(1+i)^{n}}\right) = 5\times 0.4\left(1-\frac{1}{(1+0.2)^{2}}\right) = 0.6111;$$

$$\Delta_{FA(1)} = \Delta_{FA(0)} + \Delta(\Delta_{FA})_{(S)} + \Delta(\Delta_{FA})_{(i)} + \Delta(\Delta_{FA})_{(n)} =$$
$$= 0.6111 + 0.4880 + 0.3072 + 0.5712 = 1.9776;$$

$$\Delta(\Delta_{FA}) = \Delta_{FA(1)} - \Delta_{FA(0)} = 1.9776 - 0.6111 = 1.3664.$$

Degrees of influence of factors S, i and n will be:

– factor S: $\delta(\Delta_{FA})_{(S)} = \frac{\Delta(\Delta_{FA})_{(S)}}{\Delta(\Delta_{FA})}\cdot 100\ \% = \frac{0.4880}{1.3664}\cdot 100\ \% = 35.714\ \%$;

– factor i: $\delta(\Delta_{FA})_{(i)} = \frac{\Delta(\Delta_{FA})_{(i)}}{\Delta(\Delta_{FA})}\cdot 100\ \% = \frac{0.3072}{1.3664}\cdot 100\ \% = 22.482\ \%$;

– factor n: $\delta(\Delta_{FA})_{(n)} = \frac{\Delta(\Delta_{FA})_{(n)}}{\Delta(\Delta_{FA})}\cdot 100\ \% = \frac{0.5712}{1.3664}\cdot 100\ \% = 41.803\ \%$.

Thus, under given conditions, the degree of influence of factors on decrease of Δ_{FA} is tantamount, but the greatest impact on the growth of Δ_{FA} is caused with period change n from 2 years to 4 years.

Assessment of the degree of influence of factors on $\Delta_{CC_{OC}}^{P_{cHJC}}$ will be as follows:

$$\Delta_{FV_{FA}(0)}^{D_{incl\ VAT}} = TP\frac{i}{(1+i)^{n}} = 5\times\frac{0.2}{(1+0.2)^{2}} = 0.6944;$$

$$\Delta_{FV_{FA}(1)}^{D_{incl\ VAT}} = \Delta_{FV_{FA}(0)}^{D_{incl\ VAT}} - \Delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)_{(i)} - \Delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)_{(n)} =$$
$$= 0.6944 - (-0.1024) - 0.2856 = 0.5112;$$
$$\Delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right) = \Delta_{FV_{FA}(1)}^{D_{incl\ VAT}} - \Delta_{FV_{FA}(0)}^{D_{incl\ VAT}} = 0.5112 - 0.6944 = -0.1832.$$

Degrees of influence of factors i and n will be as follows:

– factor i: $\delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)_{(i)} = \frac{\Delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)_{(i)}}{\Delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)} \cdot 100\ \% = \frac{0.5112}{-0.1832} \cdot 100\ \% = -55.895\ \%$;

– factor n: $\delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)_{(n)} = \frac{\Delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)_{(n)}}{\Delta\left(\Delta_{FV_{FA}}^{D_{incl\ VAT}}\right)} \cdot 100\ \% = \frac{-0.6944}{-0.1832} \cdot 100\ \% = 155.895\ \%$.

Thus, under given conditions, the greatest influence on the decrease $\Delta_{FV_{FA}}^{D_{incl\ VAT}}$ had a change in the period n from 2 years to 4 years.

Based on the presented models (9) and (10), the following conclusions can be drawn:

1) an increase in the fair value of fixed assets due to the due date of payment and due to a change in the time value of money depends on the difference between the transaction price excluding VAT (TP) and the fair value of fixed assets without VAT (FV_{FA}) and the greater the greater the difference between TP and FV_{FA};

2) the fair value of property, plant and equipment and related payables as a result of restatements is gradually approaching the nominal value. The same thing happens to revenue and receivables.

Conclusion

Summing up, we note the following important points.

1. The two-dimensional structure of the initial cost of assets, liabilities and capital in accordance with the IFRS valuation assumes the separation of the difference between the transaction price and the fair value of a separate item of other expenses (retained earnings in OFP) in correspondence with estimated liabilities in the case of acquisition transactions, or under reserves for doubtful debts in correspondence with the sales account (retained earnings in OFP) in case of sales operations.
2. As a result of recalculation of the fair value of assets, liabilities and capital, their value gradually approaches nominal value.
3. The difference between the transaction price and fair value should be considered as an indicator of financial potential (stock of financial strength) for assets, liabilities and capital. Therefore, the financial statements must contain a 3-dimensional measurement of indicators: fair value, nominal value and deviation.

Abstract

Population aging is a multi-dimensional phenomenon considered in terms of demography, medicine, psychology, sociology and economics. Along with the process of human aging, humans are subject to general changes in their bodies in the physical, physiological and mental spheres, all of which changes their market behaviors. The importance of recognizing the attitudes of older people in the process of purchasing products is primarily due to the fact that Poland is the fastest-aging country in the European Union. Poland has a serious demographic problem, as the number of elderly residents is constantly increasing. In 2018, the number of people aged 60 was over 9.5 million, or 24% of the population, and in 2050 it will be almost 14 million, or 40% of the population. In 'The 2015 Aging Report' published by the European Commission, referring to economic and demographic forecasts until 2060, Poland was indicated as one of the countries that will be most affected by the phenomenon of an aging population. A stereotype exists in the media of older people being maladjusted when it comes to any environmental change and not being open to market novelties. Research results, however, show that the senior consumer segment is very diverse. For this reason, the objective of this research was to define the requirements of older consumers for new products. This research was carried out in Poland in 2018 on a sample of 1617 people.

Keywords: Consumer Behavior, Senior Consumer, Product Innovation, Elderly People, Consumer Innovativeness

Introduction

Population aging is considered to be the most significant demographic change affecting all spheres of socioeconomic life, often determining social, economic, cultural and medical consequences of which we are unaware. In many European countries, and above all in Poland, this trend has been on the rise in recent years, and the effects are becoming increasingly noticeable. At the end of 2018, the population of Poland amounted to 38.4 million, including over 9.5 million people aged 60 and over. The share of people aged 60 or older in the general population has increased in recent years by more than 10 percentage points, i.e. from 14.7% in 1989 to 24.8% in 2018. In addition, as indicated by the population forecast of the Central Statistical Office (GUS - Statistics Poland) in 2030, the percentage of older people in the population as a whole will reach 29.8%, in 2040 35.5%, and in 2050 41.4%. (*Information on the situation of the elderly in Poland for 2018*, 2019).

Population aging is a global phenomenon, which is particularly prevalent in developing countries. Therefore, for economists, the role of seniors as consumers has become the subject of numerous scientific considerations; a common thread therein is the statement that the market behavior of older people is highly diverse. At the same time, as is generally believed, the frequent lack of information on how seniors behave leads to the interpretation of their behavior based on specific stereotypes. However, it should be remembered that the actions of enterprises directing their products and services to seniors

based only on a false image may be ineffective, hence the need to permanently deepen knowledge about the market behavior of older people.

Method

Research among older people (it was assumed that a senior / older person is a consumer aged 60 years and over) was conducted with the help of a personal interview carried out in 2018 on a sample of 1617 people in Wielkopolska (Greater Poland). Wielkopolska is one of the largest regions in Poland (the second-largest region in terms of the territory in square meters (m^2)), and with the third-largest population - but with the lowest aging rate in the country (taking into account the number of people over 60). Product innovations appearing on the *fast-moving consumer goods* (FMCG) market were analyzed: food, health products - parapharmaceuticals / medical, cosmetics, and household chemicals.

Sample

The respondents were selected using the quota selection method; the structure of the sample examined according to the criterion of gender and age was the same as the structure of the elderly population in Wielkopolska. Based on the statistical chi-square (x2) test, the p-value was calculated, which was 0.74 (age) and 0.99 (gender) respectively (p-value > 0.005).

Table 1: Structure of the sample in 2018 (%)

Age groups	Together	Women	Men
60-64	36.8	57.5	42.5
65-69	27.3	58.8	41.2
70-74	16.3	55.7	44.3
75-79	9.2	61.5	38.5
Over 80	10.4	72.6	27.4

Measures

As part of the analysis, descriptive statistics were used to determine the structure of the surveyed population: structure and intensity indicators (proportions, percentages), location and variability measures (mean and standard deviations). The coefficients of variation of two independent variables referred to the correlation between variables measured on a quantitative (student t-test) and qualitative (Kendall) scale (Akoglu, 2018; Croux and Dehon, 2010). While analyzing the information obtained, an exploratory factor analysis was carried out to isolate the synthetic main factors which determine the innovation behavior of senior consumers. The following analytical procedure was used in the article (Larose, 2005; Stewart, 1981):

a) determination of the degree of probability between individual variables - the use of Pearson's linear correlation coefficient as a measure of the similarity of variables of counterparts;
b) calculation of the usefulness of the data using the KMO (Kaiser-Meyer-Olkin) indicator and Bartlett's test;
c) calculation of the total explained variance, which shows to what extent the components explain the resource of common variation and allow the number of components to be interpreted;
d) using the principal components method, factor loadings for individual variables were determined. Varimax orthogonal rotation was used in each of the calculations carried out (significant factor loadings above 0.5).

Product Innovation

Every year, companies spend significant financial resources on research and development activities to create successful product innovations (Henard and Dancin, 2010). However, despite the fact that the innovations introduced on the market are technically and functionally much more effective than the existing versions, many of these innovations do not enjoy broad acceptance by consumers (Chiesa and Frattini, 2011; Cierpicki, Wright and Sharp, 2000). The acceptance of product innovations by consumers depends on their innovativeness and openness to what is new. Research to date indicates that consumer innovation significantly affects the acceptance of new products (Im, Mason and Houston, 2007; Im, Bayus and Mason, 2003).

The development of product innovations for seniors should take their requirements and expectations into account. Preparing innovations for seniors is problematic, because the creation of a new product for older consumers may in fact be categorically rejected by them (Leventhal, 1997). Seniors do not want to be treated specifically because of their age, but at the same time they expect innovations to meet their specific needs. The analyses carried out on the European market indicate numerous expectations which seniors have towards new products (*Etude 2015, Les Baby Boomers et l'innovation en France, Allemagne, UK et Espagne*, 2020). Older consumers expect that, above all, product innovations will positively improve their well-being and comfort, help change the perceived stereotypes associated with age, ensure less effort in the process of consumption and use, reduce energy consumption, simplify everyday activities and lead to time being saved.

The product innovations which are most anticipated by seniors are related to healthcare (Marsh and McLennan Companies, 2016). The future of health product innovation includes the development of medical technologies which facilitate the production of health-monitoring electronic devices that can contribute to the improvement of treatment results through greater commitment related to compliance with doctors' guidelines, the use of "Uber Health" services, i.e. short-term nursing care on request, the development of devices improving the mobility of the elderly, especially in performing activities with their arms and legs, and extending mobile phone applications, enabling seniors to increase their knowledge of preventive healthcare.

The development of product innovations on the food market is also important. As indicated by NIELSEN analysis, among others (*The age gap. As global population skews older, its needs are not being met, 2014*, 2015), healthy nutrition is becoming a priority for 45% of the seniors surveyed. Expert analyses indicate that, in the future, the following food-related innovations for seniors will appear on the market:

- specialized dietary supplements rich in protein and functional ingredients that have been prepared to help rebuild the strength and energy of older people (Deutz, Matheson and Matarese, 2016),
- ready meals adapted to the specific health conditions of seniors (*Community Servings. Food as medicine, medically tailored, home-delivered meals can improve health outcomes for people with critical and chronic disease*, 2013),
- food products with a special smooth texture for elderly people who have problems chewing and swallowing (Arensberg, 2018),
- innovations to help in food consumption, including electric cups and spoons that can create the impression of taste for those seniors who have lost this sense due to old age or during the healing process (Cuthbertson and Murakoshi, 2015).

Results

One of the determinants of shaping attitudes towards innovation is the specific attitude of seniors to changes in the environment. Researchers have noted the diversified approach of seniors to changes in the environment, which are reflected in attitudes of activity or withdrawal (Stuart-Hamilton, 2006, p. 159). Research results indicate that the innovation of senior consumers, measured as interest in new products, should be assessed as moderate. Among respondents, one in three respondents (34.9%) is

interested in new products, but only one in ten (12.2%) looks for additional information and finally makes a purchase. Slightly more than one-fifth (22.3%) sometimes take note of product innovations, but rarely buy them.

Table 2: Interest in product innovations by senior consumers

How interested are you in innovative, new products?	%
I am not interested and I do not buy such innovative products	16.0%
I am not interested, but sometimes I buy such products – as and when I need them	28.2%
I know there are such products, I can see them in stores, but I rarely or never buy them	21.3%
I'm interested, sometimes I take note, but I rarely or never buy (for various reasons)	22.3%
I am interested in looking for information on and buying innovative products	12.2%

Source: Own research

A similar-sized group of respondents (21.3%) notice market novelties in stores, but rarely or never buy them. 44.2% are not interested in new products, although at the same time 28.2% of those not interested declare that they buy new products in certain cases.

The results of the survey clearly indicate the existence of two groups of seniors with different attitudes towards innovation: consciously innovative consumers (engaged in seeking information about new products and active shopping) and market conservative consumers (showing a lack of interest in product novelties). The largest group of respondents is a group which represented a full spectrum of various behaviors that can be characterized from cautiously innovative (sometimes interested but rarely or never buyers) to innovatively unaware (declaring a total lack of interest in new products, but not ruling out making a purchase in specific situations). The degree of interest in and purchase of product innovations is clearly influenced by the specific socio-demographic characteristics of older people.

Table 3: Correlation coefficients between selected variables and interest in product innovations among seniors

Variables	interest in innovation
Gender	$p < 0.05$
Age	-0.137^{**}
Education	0.108^{**}
Health	-0.221^{**}
financial situation	0.151^{**}
Social activity - meetings with family, friends, neighbors	-0.081^{**}
Social activity - meetings organized by the University of the Third Age, a senior club	-0.111^{**}
Social activity - meetings in the organization of helping others, housing estate, religious, volunteering	-0.113^{**}
Cognitive age	0.245^{**}
Optimism about the future	0.222^{**}

*** Correlation significant at 0.001.*
Source: based on research results.

The highest correlation coefficients are seen in the relationship between the degree of consumer innovation and the subjective well-being of senior consumers. Interest in product innovations is growing along with a better assessment of health, a more frequent feeling which seniors describe thus: "I feel younger than my calendar age indicates", as well as an optimistic view of the future. A positive correlation is also seen in the case of senior citizens' education and their assessment of their financial situation: better education and greater financial resources among older people translate into an active

interest in innovation. Complementing the description of the innovators involved in the senior group, it can be said that they are more pro-social (they are active in relationships, not only with family or friends, but are members of some social organizations).

To sum up, the research results indicate a small degree of consumer innovation among seniors, defined as: interest in new products, searching for information about new products, and declaring a willingness to try or include products in consumption (purchase). It seems that certain variables dominate the process of shaping older people's attitudes towards newness; the strong impact of subjective well-being is recognized, including health, age, and future plans. Undoubtedly, boundary conditions for showing interest are the financial situation of older people and social factors, because maintaining social relations at different levels promotes openness to product innovation. Acceptance of innovation often requires changes in existing consumer habits, forcing them to develop new ones.

One of the determinants of the market success of product innovations is the positive perception thereof by consumers and the adaptation of new products to their requirements (Kunz, Schmitt and Meyer, 2011). The results of research conducted among seniors indicate a two-dimensional understanding of their product innovations. Over three-quarters of seniors (75.9%) perceive the new product in absolute (groundbreaking) terms: innovation is a product that appears on the shelf for the first time (new for all consumers). At the same time, a significant proportion of respondents (over half of those surveyed, or 56.4%) interpret innovation as a modified product (incremental innovation) with greater benefits for the buyer (change in product attributes).

A very high degree of diversity in the opinions of seniors is associated with determining what is new in the subjective approach ("product innovation is a new product for me, because I am buying it for the first time"): 46.5% of respondents agree with this opinion, while 43.8% disagree. More than half of respondents (53.8%) do not see innovation in products that have undergone slight modifications to packaging and shape, as in new products (52.5%) targeted at other consumer segments that seniors are not personally interested in.

Table 4: Perception of product innovations by senior consumers

Dimensions of perception of innovation	Definitely	To a certain extent	Probably not	Definitely not	I don't know
New product: I am seeing it for the first time in the store, but I have never heard of it before	40.0%	35.9%	12.9%	4.6%	6.7%
New product: there used to be a similar product, but now it has been changed, modified, improved	13.5%	42.9%	27.3%	9.4%	6.9%
New product: the product is new to me, but I know that others already have it; it has been known to others for some time, but I am buying it for the first time	12.1%	34.4%	30.6%	13.2%	9.7%
New product: a well-known product - was once in stores but the packaging, its shape and label have changed	9.4%	25.3%	32.8%	21.0%	11.5%
The new product is new to me, but I know that others have been buying it for some time and that it is known to others; I do not buy it and I will not buy it	7.9%	24.5%	32.0%	20.5%	15.1%

Source: Own research

Interestingly, the opinions of seniors regarding the perception of market novelties are very similar taking into account the variables characterizing the examined segment of the population; individual

dimensions of product innovation are similarly understood by older people. This encourages the search for possibilities to deepen the inference for statistical analyses - factor analysis was used for this purpose.

Table 5: Matrix of rotated components - perception of product innovations by senior consumers

Matrix of rotated components		
Dimensions of perception of innovation	Component	
	1	2
New product: I am seeing it for the first time in the store, but I have never heard of it before		0.894
New product: there used to be a similar product, but now it has been changed, modified, improved		0.734
New product: the product is new to me, but I know that others already have it; it has been known to others for some time, but I am buying it for the first time	0.619	
New product: a well-known product - was once in stores but the packaging, its shape and label have changed	0.805	
The new product is new to me, but I know that others have been buying it for some time and that it is known to others; I do not buy it and I will not buy it	0.782	

Source: based on research results. KMO = 0,708; total explained variance = 65%.

The abovementioned analysis contributed to a clearer picture of the perception of product innovation; it turns out that seniors interpret market novelties in two dimensions:

a) as absolute innovations and incremental innovations related to the modification of existing products - these are basic innovations that change the perception of the product, provide benefits, but require changes in existing attitudes or behaviors,
b) as minor innovations - understood by seniors as products which had previously been available but which appeared on the market in a different form, or which have so far been available to other consumers.

The clear distinction of two dimensions by which seniors perceive product innovations suggests that they assess market novelties subjectively, through the prism of impact on changing existing habits or providing greater personal benefits.

The results of the study allow us to conclude that, despite the relatively low interest in innovation (as previously demonstrated), seniors formulate strict requirements for market novelties – to them, product innovations on the FMCG market are products which are either not yet on the market or which have been substantially modified. The precise definition of the dimensions of understanding product innovation by the target consumer segments, which will translate into the preparation of the market offer, promotes the acceptance thereof. Research results indicate that, for older people, the necessary features of a new product are: short-term presence on the shelf (new to everyone), product modernity (new formula, shape, appearance, or consistency), visually attractive packaging and innovative composition (new ingredients).

Table 6: Importance of new product components for older people (5 - very important, 1 - very unimportant)

Elements / attributes of product innovation	average
Recent presence in the store (no more than half a year) - new on the shelf	3.23
Modern formula, shape, look - pills, liquid, tablets, balls, leaves etc.	2.94
Visually attractive packaging – colorful, interesting	2.87
Innovative new product composition - new composition, new ingredients	2.85

Ecological raw materials in the product, ecological ingredients, ecological packaging	2.60
Reduced energy content (less caloric - less salt, etc.)	2.58
More health-promoting ingredients, more ingredients for beauty	2.44
Convenient packaging - they can be easily picked up, carried – lightweight	2.37
Beneficial effect on mood - you can feel better, look better, work better	2.36
A more efficient product -	2.09

Source: Own research

Ecological, health-related and ergonomic aspects were mentioned as elements of new products which were of lesser importance to the respondents. At the same time, it turns out that manufacturers' initiatives in implementing innovations based on increased performance are not rated highly by older people as attributes of product novelty.

The perception of product innovations confirms earlier conclusions about the strict requirements for enterprises which implement innovation strategy for the senior market. Two aspects which appear in the presented research results are surprising: the low importance of pro-health values as innovative product attributes (although this can be interpreted as a fear of absolute innovations, the appearance of unknown ingredients, as well as an expression of distrust of such changes) and the low level of significance attributed to the features of efficiency and effectiveness, which are present in many innovations. It would seem that the relatively worse financial situation of senior households prompts them to seek product innovations that allow for savings; perhaps, however, innovations based on aspects of efficiency or effectiveness are hardly understood by seniors and therefore underestimated by them.

The diversity of the understanding of the dimensions of product innovation by older people inclines to attempt to replace them with new synthetic factors.

Table 7: Matrix of rotated components - the importance of new product elements for the elderly

Matrix of rotated components			
The importance of new product elements	**Component**		
	1	**2**	**3**
Visually attractive packaging – colorful, interesting			0.832
Convenient packaging - they can be easily picked up, carried – lightweight	0.544		
Recent presence in the store (no more than half a year) - new on the shelf			0.713
Innovative new product composition - new composition, new ingredients		0.722	
Reduced energy content (less caloric - less salt, etc.)		0.784	
More health-promoting ingredients, more ingredients for beauty		0.673	
Beneficial effect on mood - you can feel better, look better, work better	0.587		
Modern formula, shape, look - pills, liquid, tablets, balls, leaves etc.	0.641		
Ecological raw materials in the product, ecological ingredients, ecological packaging	0.632		
A more efficient product	0.741		

Source: based on research results. KMO = 0.802; total explained variance = 61%.

Factor analysis allowed us to distinguish three coherent groups of ingredients which form the main synthetic types of innovation that are deemed important for older people:

a) functional innovations which increase functional benefits for seniors (light packaging, greater efficiency, changed shape, stronger impact),
b) popular innovations, in line with trends - in newly emerging products, seniors appreciate producers taking changes resulting from the prevailing fashion into account - in this case trends related to health, which is an important element of their lives,
c) innovations of "attractiveness", clearly visible to seniors - described by means of two variables, namely attractive colorful packaging and novelty on the store shelf; for older people, it is important for the new product to stand out either thanks to its new feature - "for the first time on the shelf," or because the visually appealing packaging catches the eye of consumers.

In summary, understanding innovation is a more diverse phenomenon than has been indicated by earlier observations. The attributes of new products which are considered innovative by seniors are assessed according to various criteria. The senior consumer seems to be full of contradictions - on the one hand, he or she has a real and practical view on the functionality of innovation as an indispensable element of a new product; on the other hand, the "perception" of innovation as an emotional dimension is also important for older people.

Research carried out in recent years indicates that it is not only absolute innovation as an attribute of a product that contributes to its effective acceptance by consumers. It is extremely important for consumers to perceive new products characterized by 'sensible' innovation - understandable and important for consumers, consisting of attributes which are attractive to them (Henard and Szymanski, 2001; Im and Workman, 2004). Therefore, it became deliberate to determine the potential changes perceived by older people as innovative, giving existing products the attributes of novelty.

Table 8: Changes to the existing product are rated as new and innovative

Changes	Definitely	To a certain extent	Probably not	Definitely not	I don't know
It is more energy efficient, more efficient	36.6%	40.4%	11.6%	6.1%	5.3%
It is cheaper to buy, and costs less to maintain	37.0%	36.0%	14.4%	7.1%	5.5%
Has additional functions, can be used more often	27.1%	46.5%	10.8%	6.7%	8.9%
Facilitates use, easier to use, simpler	22.4%	48.1%	14.9%	6.4%	8.2%
Changing the packaging for more convenient handling and storage	14.3%	41.6%	27.3%	9.7%	7.1%
Changing the packaging to make it more attractive	12.8%	29.2%	38.3%	13.4%	6.2%

Source: Own research

It is interesting that the vast majority of respondents (77%) assess changes to the product consisting of increasing its energy savings or performance as innovative. In light of the results presented earlier (seniors consider the attributes of energy savings and efficiency as an insignificant element of product innovations), the opinions of the respondents seem inconsistent.

Inherent contradictions in the opinions of seniors - on the one hand, the low rating of the attributes of energy savings and efficiency as important elements of the new product; on the other, the belief that such changes to existing products should be considered innovative - requires additional commentary. This is most likely due to problems with understanding changes, largely technical and technological, which might be unclear to older people; another possible interpretation is that seniors notice the disadvantages of the products used to date related to performance or energy consumption; hence their approval of the development of innovation in these dimensions, but in products already known to them.

Paradoxically, new products appearing on the market that meet the abovementioned requirements may raise doubts and fears related to their use. The specific views held by older people of innovation in this sense may be of fundamental importance to enterprises offering products for seniors: they should focus on modifying existing products in terms of energy efficiency and performance, and not introduce innovations that meet these requirements onto the market.

The second attribute which determines the classification of the product as innovative is product changes, consisting of increasing their functionality for consumers and reducing the price or costs associated with their maintenance. 70% of respondents also assess changes involving the improvement of ergonomic features of the current product as innovative. Diversified opinions relate to changes in product packaging: seniors appreciate changes in packaging consisting of increased ergonomics (55.9%), but also believe that changing to more attractive packaging is not an innovation (51.7%); older consumers perceive only those modifications that provide them with real benefits as innovative.

Conclusion

A declaration of limited interest in new products by the seniors surveyed does not prevent them from assessing innovation in existing and emerging products on the market. Product innovation in the eyes of older people not only means that such changes are noticeable, but above all is associated with providing real and useful new benefits to the consumer. Seniors clearly prefer aspects of the usefulness of innovation over emotional aspects, which are often attributes of new products. It is also possible to draw the conclusion that the clear two-dimensionality of perceiving product innovations (as absolute and incremental) may cause difficulties in interpreting the contents of the shopping basket of these innovations (seniors may experience uncertainty related to determining which products they buy and consume are innovative). This makes having unequivocal opinions on innovation by older consumers problematic. The results of the study confirm the statements indicating the practicality (rationality) of older people perceiving product innovation: changes made by producers must significantly provide "tangible" new benefits or increase existing ones, because only then are they understood by seniors as innovative.

The research and conclusions drawn have their limitations related to the adopted research procedure and the research method and technique used. It is worth emphasizing that the respondents' answers, and thus also the results of the research, are only of a declarative nature. Respondents' statements regarding attitudes are not always identical to subsequent decisions taken in commercial establishments. As mentioned before, a large number of seniors avoided unambiguous answers and it is difficult to predict their real behavior when shopping for product innovations. It should be emphasized that the research of older people is complicated due to the difficulty of reaching them and the small openness of seniors to enter into relationships with strangers, unknown persons.

When generalizing the conclusions on the attitudes of seniors towards product innovations, one should also remember the limitations resulting from the selected spatial scope of the research. They were implemented in Wielkopolska, a region with similar parameters describing the consumption and living conditions of Poles in selected product categories, but differing in many variables, e.g. the structure of the number of households, the amount of income obtained or the diversified supply of new FMCG products. You should also keep a distance to your research and be careful when making final conclusions. Consumer behavior sometimes undergoes dynamic changes in the face of the strong impact of various factors, and the literature underlines the ambiguity in determining the determinants of market behavior of seniors.

Despite the limitations, the research results have undoubtedly a practical dimension and can be useful both at the stage of creating new FMCG products, as well as in the process of managing the offer of products already on the market and their possible changes. Defining the attitudes of older people towards new products may facilitate the implementation of product innovation introduction processes on the market. The application value can be considered primarily to present the direction of changes desired by seniors in current FMCG products on the market. This provides a lot of information

necessary to understand the market behavior of seniors, especially in the context of the intensifying aging processes of the society, which results in an increase in the number of people aged 60 and more. The collected material can be used in the product portfolio management process, both at the stage of initiating and introducing innovations to the market, as well as at the stage of modifying existing products in order to obtain the approval of senior consumers.

In conclusion, it should be emphasized that research does not exhaust issues related to the behavior of senior consumers in the process of purchasing product innovations. It would be interesting to continue research work that will allow us to more accurately identify the following economic phenomena: identifying barriers to the purchase of product innovations, identifying areas of existing consumer risk and possible actions affecting their leveling, or thoroughly investigating hidden motives of senior consumers' behavior towards innovation. It would also be interesting to identify possible actions that change the attitudes of seniors towards innovation, as well as determine the preferred channels of obtaining information.

Abstract

Knowledge has become the basis for understanding the processes taking place in the environment, the relationships between individual market entities and the effects of individual resource allocation models – which leads to build a unique competitive advantage. The review of definitions allows to state that knowledge management in enterprises is a complex, multi-aspect process requiring the implementation of a number of interrelated mechanisms and instruments. Only a well-constructed, implemented and modified system of knowledge management can ensure achieving the intended goals. In this paper the attempt of identification and evaluation of selected elements of knowledge management was made. The analysis was conducted in the context of communication and transfer of knowledge in enterprises in Poland in the context of their size and specificity of activity. The study was made in the group of 105 enterprises located in the southern part of Poland. This paper presents the results of research on the area of communication and knowledge transfer.

Keywords: Knowledge Management, Efficiency of Enterprise.

Introduction

Knowledge and its management are key success factors for companies operating on the market nowadays. Drucker (2009) says that one of the main features of good management is the enterprise's ability to learn. At the same time, he notes that, unlike the 20th century, when the most valuable resource of the company was the means of production, in the 21th century the most valuable resource of the organization are a knowledge worker and his performance. In this context, Toffler (1996) states that the value of effective enterprises is primarily related to their strategic skills associated with the acquisition, creation, distribution and use of knowledge. Hu and Randel (2014) emphasize that the ability to learn and development as well as knowledge transfer are recognized as the critical issues from the organization's growth and survival point of view as well as building a competitive advantage.

The importance of knowledge and intangible factors results from, among others, their specific features that can include (Obłój, 2014):

- possibility of simultaneous use in many places, processes by various entities,
- long-term process of accumulation, necessity of building inside the organization, difficulty in purchasing and standardization,
- lack of process of depreciation, development during use,
- inseparable relationship whit human resources; employees create, adapt, implement and use creatively elements of intangible resources.

The importance of knowledge management is demonstrated even by the intensive development and successes of the knowledge-based economy, the basic assumption of which are (Gabryś, 2001):

- treating knowledge as the most valuable resource of enterprises and economies,
- obtaining the highest competitive potential by products that the basic ingredient is knowledge,
- human capital that is the main source of knowledge in an enterprise and the only resource that can use it effectively; is the subject to the largest changes (in organizational, cultural and technical context) among all production factors,
- the highest level of added value occurs in the enterprises that assign a priority role to human capital (and thus knowledge) and possess skills together with the effective mechanisms allowing the use of external knowledge.

The role and the importance of knowledge and knowledge management is confirmed not only in theoretical but also practical context. Knowledge management enterprises are successful because they are strictly focused on a customer (Kaynak, 2003), strive to empower employees and use and develop their potential (Sadikoglu and Zehir, 2010), focus on continuous process improvement (Oke, 2007) and are associated with the development of an open organizational culture focused on learning (Kim et al, 2012). The results of research carried out by the American Productivity & Quality Center in large corporations with a recognized position and market reputation have shown the existence of large impact of knowledge management on the innovation potential of enterprises. This was mainly caused by following factors (Romańczuk, 2003):

- sharing knowledge in problem solving and decision making processes allows to obtain a broader analytical perspective. This leads to the increase of the accuracy of taken decisions, the increase of the efficiency of implemented activities and the increase of involvement of all employees (including managing board),
- high awareness of the importance of knowledge management existing in the enterprises and inclusion it in the strategy of action. This manifests itself, among others, in broad cooperation, knowledge shearing or self-improvement of employees,
- knowledge management requires the modification of existing or implementation new organizational structure and culture based on standards and values, language, management style conductive to building appropriate attitudes and behaviours,
- ways of implementation of work tasks in knowledge management enterprises are based on the mechanisms facilitating knowledge sharing processes and incorporating these issues into the content of work,
- important elements of knowledge management are formal and – especially – informal networks of employees (including experts), that facilitate the creation and rapid dissemination of new knowledge resources,
- employees activities in the context of knowledge management are rewarded with an effective motivating system.

In the source literature knowledge management is defined in a variety ways, often with the different distribution of accents, different components and research perspectives. This is due to the very broad and, to some extent, abstract nature of knowledge contributing to the incomplete transparency and clarity of this issue. Joseph Schumpeter and other representatives of the Austrian school of economics say that knowledge is very subjective and may change over time, and changes in economics depend on the knowledge of individual entities (Brdulak, et al, 2004). Perechuda (2005) even stated that "knowledge management is a very capacious concept, covering basically everything, because knowledge means thought, or immaterial being, from which – according to cosmogony – a universe is formed. Because of this, this concept should not be defined". At the same time, knowledge is an elusive resource of an enterprise, a free good available in information networks, inexhaustible and perfectly renewable resource what makes it a key resource of an enterprise (Koźmiński A. 2005). For this reason it is necessary to manage it, research, search relations between knowledge and other enterprise resources or understanding the mechanisms for building knowledge-based market advantages. Knowledge is perceived as:

- information used in an effective manner (Armstrong and Taylor, 2016),
- understanding, awareness or knowledge of something acquired through education or experience (Awad and Ghaziri, 2004),

- valuable and accepted information, integrating data, facts, information and often hypotheses (Brilman, 2002),
- effective use information in action (Drucker, 2009),
- a smooth combination of expressed experience, values, properly selected information and expert insight into some issue that provides the framework for accessing and incorporating new experiences and information (Davenport and Prusak, 1998),
- the reminder of thinking, more precisely the effect of using information and experiences in thinking process (McDermott, 1999),
- information that was structured so that it can be used in a certain area of activity (all knowledge and skills used by individuals to solve problems) (Probst et al, 2002),
- codified experiences that are needed in mental imaginations (Vorbeck and Finke, 2001),
- it consists of truths and beliefs, views and concepts, judgements and expectations, methodology and know-how (Wiig, 1997).

The diversity and otherness of approaches to knowledge resource are also visible in the context of particularized types of knowledge. Nonaka and Takeuchi (2000) using the results of Polanyi's work (1967) distinguished tacit knowledge (silent, natural, hidden) and explicit knowledge (available, expressive). Tacit knowledge is embedded in the minds of employees, affects the nature of actions and decisions taken by people and its transfer takes place through observation (Lee and Choi, 2003). This type of knowledge is personal, concept-specific, difficult to formulate, grasp and transfer (Karwowski, 2004). Explicit knowledge can be reasonably simply documented, transferred and tracked between organizational units orally, through computer programs or in the form of patents, schemes and information technologies (Calo, 2008). For contemporary enterprises, the tacit knowledge accumulated by their employees is invaluable organisational capital of enterprises (Nonaka and Tekeuchi, 2000). The use of tacit knowledge, by the definition inaccessible for everyone, allows to build more lasting (Teece, 2000) competitive advantages (Boiral, 2002) based on elements difficult to identify for competitors.

B. Lundvall, B. Johnson (1994) divided the knowledge into four categories:

- know-what – knowledge of facts, possession of information,
- know-why – understanding of cause-effect relationships,
- know-how – the ability to implementation specific processes (knowledge available by specialists, so it is difficult to identification and dissemination),
- know-who – knowledge maps, knowledge exchange networks, information about experts and their knowledge resources.

Nonaka and Takeuchi (2000) divide organizational knowledge into three basic categories:

- personalized core of knowledge (explicit and tacit knowledge),
- codified knowledge (documentation, reports, publications, databases, projects),
- applied knowledge of an established nature (processed, services, products, relationships, technologies).

Kwast and Herman (2004), taking into account the perspective of enterprises, specified four types of knowledge:

- about the customer,
- market,
- concerning the product,
- environment.

The implementation of knowledge management in an enterprise can contribute to the formulation of positive effects in the number of areas of functioning of an enterprise (Sperk and Carter, 2003):

- the improvement of processes and operating practices,

- the increase of the level of competences of employees, their motivation and job satisfaction,
- the increase of the level of satisfaction of customers,
- the improvement of image of enterprise on the labour market and, as a result, the possibility of employing a higher class of specialists,
- the expanding the scope of activity of an enterprise, diversification,
- the increase of innovativeness,
- better match of offered products to the real needs of customers,
- the increase of skills and knowledge of employees,
- the increase of the level of efficiency of processes and people,
- more efficient placing of new products on the market,
- the improvement of memory of organization,
- better orientation on research and development activities,
- the improvement of the search of knowledge outside the enterprise and its absorption.

In addition, it should be taken into account that knowledge develops as a result of interpersonal interactions and is, by its nature, very dynamic. It also gives social foundation for management of enterprise directing them to do what is good and appropriate for the enterprise and society.

As Takeuchi (2013) emphasizes, knowledge management complements traditional managements schools, but introduces new perception of three important elements:

- people (they are put in the centre of attention of the strategy),
- strategy (treated not as static but dynamic process),
- social relations (enterprises create social programs).

rbeck, J. and Finke, I. (2001) Motivation and Competence for Knowledge Management. Eds., Kai Mertins, Peter Heisig, and Jens Vorbeck, Knowledge Management: Best Practices in Europe, Springer,
New York: NY, 37- 56

The basic goals of knowledge management include, most of all (Grudzewski and Hejduk, 2011):

- knowledge creation,
- identification of owned knowledge resources and selection of useful knowledge,
- knowledge archiving,
- dissemination of knowledge among employees and creation of conditions for its effective use,
- taking action to minimize the risk of loss of knowledge,
- the use of knowledge to build permanent and unique market advantages.

Characteristics of Research Method and Research Group

Taking into account the diversity of activities occurring between various enterprises, the attempt of identification and evaluation of selected elements of knowledge management was made. The analysis was conducted in the context of communication and transfer of knowledge in the enterprises in Poland in the context of their size and specificity of activity. The research results presented in the literature characterize a number of issues related to this search area, however, taking into account the dynamic changes and a certain abstraction of knowledge, conducting further analysis is necessary and needed to fill knowledge gaps and improve practical solutions. The study was conducted in the group of 105 enterprises located in the southern part of Poland, mainly in Silesian and Malopolskie voivodships. The selection of research facilities had a non-random character and was based on several basic criteria: there must be functioning elements of knowledge management in the enterprise; knowledge management must be implemented consciously and located in the operating strategy of enterprise; employment must be stable over a period of at least two years. The study was conducted using a questionnaire of the survey, which was each time filled by representatives of the top management, whose responsibilities and competences were appropriate to answer the questions. The survey consists of 18 questions. Within individual issues, a bipolar scale was used, from -5 to +5, with extrema values corresponding to the indicated variants (e.g. strategic goals: -5: tacit, +5 –

explicit) and values between intermediate variants. This work presents the results for 3 questions regarding communication and knowledge transfer:

1. The preferred type of knowledge transfer: push (predetermined to whom and what knowledge can be transferred, training, newsletters, IT resources) - negative scale (from -5 to -1) or pull (searching knowledge by employees to fill the identified gap, knowledge maps, communities of practitioners) – positive scale (from 1 to 5).
2. Priority memory type: team (negative scale) or individual (positive scale).
3. Method of obtaining information: easy (negative scale) or difficult (positive scale).

The obtained results was subjected of in-depth analysis using six categories of divisions:
– changes in the number of customers complains,
– changes in the number of negative events and accidents at work,
– changes in the level of work efficiency,
– changes in staff fluctuation,
– changes in the number of ideas and improvements reported by employees,
– changes in the number of customers.

Each time the size of change was defined as the effect of implementing elements of knowledge management system (statistical tests of significance of average values before and after system implementation in a two-year perspective).

Analysis of the Results

As a part of the analysis of the area of communication and knowledge transfer in the context of knowledge management, knowledge transfer methods were examined first (Figure 1). Extreme assessment values include: push method (predetermined to whom and what knowledge can be transferred, training, newsletter, IT resources – on a negative scale of values) and pull (searching knowledge by employees to fill the identified gap, knowledge maps, communities of practitioners – on a positive scale of values). The data distribution has left-sided asymmetry (skewness -0.35) and is characterized by lower concentration of data compared to the normal distribution (kurtosis -0.57). The average of the results is -0.55 (for service enterprises it is positive: 0.18) – only 25% of indications were above 1 (with median of 0 and a maximum value of 3), while a greater concentration was observed in the group of service enterprises data (50% indications in the range of -1 to1). The majority of enterprises (52) indicated that pushing knowledge is a priority for them (as many as 18 enterprises did not define clearly the approach to knowledge in the push and pull categories indication the value of 0).

Figure 1: Distribution of answer for question 1.

Statistical hypotheses were tested in the relation of obtained data (Table 1). The results indicate that focus of the enterprises on push strategy (predetermined to whom and what knowledge can be transferred, training, newsletter, IT resource) contributes to:

- reduction of the number of customers complains,
- reduction of the number of events and accidents at work,
- increase of the level of work efficiency,
- limitation in staff fluctuation.

In cannot be unequivocally stated that undertaking such activities contribute to:

- increase of pro-innovative activity of employees,
- increase of the number of customers.

Table 1: Summary of statistical hypotheses testing results for question 1

Category	H_0	H_1	Average	Standard deviation	Number	U test
Number of customers complaints	μ=0	μ <0	-0.50	2.04	46	-1.78
Number of events and accidents at work	μ=0	μ <0	-0.75	1.94	65	-3.05
Work efficiency	μ=0	μ <0	-0.98	0.71	41	-2.90
Staff fluctuation	μ=0	μ <0	-0.57	2.65	44	-1.79

Another examined element was the type of memory preferred in the enterprise (Figure 2). The following values were indicated as the extreme values: team or individual memory. The data distribution has left-sided asymmetry (skewness -0.23) and has a platocurtinal distribution (kurtosis -0.57). The average of the results is 0.27 (for service enterprises it is clearly higher and amounts: 1.54, for manufacturing enterprises: -0.66) – as much as 50% of indication were in the range of -1 to 1 (for manufacturing enterprises 50% of responses in the range of -3 to 0, while for service enterprises only 25% below 0). Most enterprises (54) indicated that individual knowledge (including 68% of service enterprises) is a priority for them.

Figure 2: Distribution of answer for question 2

Statistical hypotheses were tested in the relation of obtained data (Table 2). The results indicate that focus of the enterprises on individual knowledge contribute to:

– increase of the level of work efficiency,

In cannot be unequivocally stated that undertaking such activities contribute to:

– reduction of the number of customers complains,
– reduction of the number of events and accidents at work,
– limitation in staff fluctuation,
– increase of pro-innovative activity of employees,
– increase of the number of customers.

Table 2: Summary of statistical hypotheses testing results for question 2

Category	H_0	H_1	Average	Standard deviation	Number	U test
Number of customers complaints	μ=0	μ <0	-0.17	1.98	46	-0.55
Number of events and accidents at work	μ=0	μ >0	0.23	2.31	65	0.77
Work efficiency	μ=0	μ >0	1.34	2.83	41	4.25
Staff fluctuation	μ=0	μ <0	-0.23	1.89	44	-0.75

The ease of obtaining information by employees were another examined element (Figure 3). The following extreme values were indicated: easy or difficult obtaining. The data distribution has slightly right-sided asymmetry (skewness 0.04) and has a platocurtinal distribution (kurtosis -0.52). The average of the results is -0.4 and it is very similar in the groups of manufacturing and service enterprises – even 25% of responses were at the level of -3 and lower, with the median of -1. Most enterprises (56) indicated that their priority is ease of obtaining the necessary knowledge.

Figure 3: Distribution of answer for question 3

Statistical hypotheses were tested in the relation of obtained data (Table 3). The results indicate that focus of the enterprises on obtaining required information by employees contribute to:

– limiting the number of improperly completed orders resulting in the occurrence of customers complaints,
– reduction of the number of events and accidents at work,
– increase of the value of work efficiency index,

In cannot be unequivocally stated that undertaking such activities contribute to:

- reducing the number of unplanned leaving job resulting in the need to supplement staff urgently,
- increase of pro-innovative activity of employees,
- increase of the number of customers.

Table3: Summary of statistical hypotheses testing results for question 3

Category	H_0	H_1	Average	Standard deviation	Number	U test
Number of customers complaints	μ=0	μ <0	-0,78	2,97	46	-1,89
Number of events and accidents at work	μ=0	μ <0	-1,22	2,19	65	-3,27
Work efficiency	μ=0	μ <0	-1,71	1,41	41	-4,06
Staff fluctuation	μ=0	μ <0	-0,41	3,30	44	-0,82

Conclusion

According to the opinion more and more commonly expressed by specialists, knowledge is nowadays – on a micro scale – a production priority and – on the macro scale – a determinant of technical progress. Potential benefits resulting from the implementation of knowledge management system include (Szara and Pierścieniak, 2007): creation new products and brands, creation a positive image and reputation of the company, optimization of the use of resources, creation of effective internal and external relations, creating innovations and conduction research and development works.

The research showed that:

- the majority of enterprises (54) indicated that individual knowledge (including 68% of service enterprises) is a priority for them.
- the majority of companies (56) indicated that the priority for them is the ease of obtaining the necessary knowledge,
- the company's focus on push strategy contributes to reducing the number of customers complaints, reducing the number of incidents and accidents at work, increasing work efficiency and reducing staff fluctuation,
- the company's focus on individual knowledge contributes to increasing work efficiency,
- focus on the ease of obtaining the required information by customers contributes to reducing the number of incorrectly completed orders resulting in customers complaints, reducing the number of events and accidents at work and increasing the value of the work efficiency index,
- it cannot be unequivocally stated that undertaking actions contribute to the increase of employees' pro-innovation activity and increase in the number of customers.

Evaluation of The Use of Quality Management Instruments in Selected Organizations

Zbigniew SKUZA

Czestochowa University of Technology, Faculty of Production Engineering and Materials Technology, Department of Production Management and Logistics
al. Armii Krajowej 19a, Czestochowa, Poland
zbigniew.skuza@pcz.pl

Abstract

The purpose of the article is to identify the most commonly used quality management instruments and an attempt to determine their usefulness in enterprises operating in accordance with the concept of Industry 4.0 (5.0).The article presents the results of research on the practical use by companies of available quality management methods and tools. The analysis was based on literature data as well as on the results of research conducted at the Institute of Production Management at the Faculty of Production Engineering and Materials Technology of the Czestochowa University of Technology. Both the organizations surveyed for this project and the cases cited in publications indicate that the group of the most commonly used tools and methods is quite limited and, in a sense, is reduced to the most popular ones.Attention was also drawn to the ISO standard, which in many cases defines the quality management system.

Keywords: Quality Management, Methods and Techniques, Industry 4.0 (5.0).

Introduction

There are many indications that the rapid technological development (leap) that has lasted for several decades will continue. The concept of Industry 4.0, a concept born in Germany and has become a fundamental element of the strategy of innovative development of the country's economy in 2011, may be a precursor of the upcoming changes. A similar decision was made by the Polish government, as reflected in the Act on the Future Industry Platform Foundation adopted on 17 January 2019 by the lower house of the Polish parliament. The first assumptions for the practical implementation of the Industry 4.0 initiative were formulated by the German "Industrie 4.0 Working Group" in April 2013. The document that was drafted was then the basis for the "Plattform Industrie 4.0" to provide final, practical recommendations for companies (Bieńkowski, 2019).

Industry 4.0, often referred to as the fourth industrial revolution, is based on automation and digitization of production processes that already exist, and assumes transformation of companies into so-called Smart Factories or Digital Factories. The idea behind this concept is to create intelligent value chains based on self-steering, self-adaptive, and self-organizing systems. This will be possible by using technologies such as Internet of Things, cyber security, Cloud Computing, Additive Manufacturing, augmented and virtual reality, Big Data, intelligent robotics and autonomous vehicles, simulations, and system integration. The resulting new work organization centered around the product will ensure high flexibility and efficiency in production. It will become economically viable to produce individualized, small batch products developed to meet the customer's exact needs (Bieńkowski, 2019; Astor, 2019).

One should keep in mind, however, that the human factor, both as the subject and the object of transformation, is of key importance in the processes in question. On the one hand, people may be a fundamental element of the new working environment, but, on the other hand, there is a concern that technology will dominate people. Concerns about job insecurity, vocational degradation of many groups of workers, development of new human-independent control mechanisms, reduction of workers' decision-making, and excessive expectations concerning productivity of the workers have led to the development of the Industry 5.0 concept. This concept was introduced in 2015 by Michael

Rada, the President of the International Business Center of Sustainable Development. This more humane, in a way, version of the Industry 4.0 initiative assumes that the human aspect and the possibilities of cooperation between humans and robots will be taken into account. Thanks to their competence, people are to be the superior entities and should create a functional whole with machines in the future (Bieńkowski, 2019; Bieńkowski, 2018).

Literature Review

ISO standards

The concept of industry 4.0 (5.0) is a global phenomenon and, therefore, requires international involvement. Standardization work in aspects related to the concept of industry 4.0 is already being carried out, among others, by the International Organization for Standardization (ISO), the International Electrotechnical Commission (IEC), the European Committee for Standardization (CEN), and the European Committee for Electrotechnical Standardization (CENELEC). The ISO has already established the Smart Manufacturing Coordination Committee (SMCC) in 2017, which provides coordination for the relevant ISO Technical Committees and is a kind of an information exchange forum and a place to develop assumptions for smart manufacturing standards (PKN, 2019).

The principle that companies should also be judged on how they fulfill their obligations to the society and the environment has been supplemented by the seven largest industrialized countries in the world (G7) with the human factor. After all, the issue of human focus, which is also present in the industry 5.0 concept, has already been reflected to some extent in the standard EN ISO 27500 - The human-centered organization — Rationale and general principles. The aim of this standard is to raise awareness among managers not only in terms of business benefits, but also in the interests of company employees (PKN, 2017; Vosper, 2019). Seven principles characteristic of a human-oriented company are listed (Adenauer and Stowasser, 2018):

- The company perceives differences between individuals (customers and employees) as an asset, not a problem.
- The company applies international standards and best practices to ensure that products, systems, and services are available to customers and employees with the most diverse capabilities and characteristics.
- The company recognizes that people are a part of the system in which they work. When designing new work systems and modifying existing ones, the company takes into account the needs of the users.
- The company takes the necessary steps to protect people from risks to their health, safety, and well-being (actions that go beyond those provided for by law).
- The company offers its employees meaningful work in which they can use and develop their skills.
- The company communicates openly and transparently both inside and outside.
- The company recognizes its social responsibility by implementing the seven principles of ISO 26000 - Social responsibility (responsibility to the society, the economy, and the environment; transparency in decision-making and actions; ethical behavior; respect for the interests of all stakeholders; respect for the rule of law; respect for international norms of behavior; and respect for human rights).

Of course, this standard is one of many in the ISO family of standards. From the point of view of broadly defined quality (Skuza et al., 2011; Taguchi et al., 2005) and management of this aspect, in addition to the already mentioned ISO 27500 standard (man is the key to quality), such standards are important: ISO 9000 -Quality management system, ISO 14000 - Standards environmental management, ISO 45001 - Occupational health and safety management systems, ISO 5000 – Energy management system, ISO 27000 - Information security management system.

Quality Assurance and Control

The stages of the product's lifecycle and quality development cycle presented in Figure 1 consists of three main phases: pre-production, production, post-production. Quality assurance in the following phases (Hamrol and Mantura, 1998):

- pre-production - includes following stages:
  - ✓ Marketing and market research - in order for a product to find a buyer, it is necessary to position it properly on the market (the task of marketing). However, it is not enough to simply identify the demand for products that the company believes it can manufacture. It must be ensured that the company is able to provide the conditions to manufacture products of the required quality in a sustainable manner at a cost which provides an appropriate profit;
  - ✓ product design - practice shows that a large number of defects detected during production, installation, and even only during use of a product have their origin in the design and planning phase (Fig. 2). Consequently, the product design and the production process planning and design should be coordinated as closely as possible;
  - ✓ design of technological processes - its purpose is to ensure conditions that guarantee the quality of workmanship that is consistent with the design quality of the product (while maintaining delivery dates and production profitability);
- production - includes following stages:
  - ✓ purchasing - many materials and services can be purchased outside; their quality often determines the quality of the final product;
  - ✓ production - one should strive to ensure the highest possible fidelity to the transfer of the design quality to the workmanship quality;
  - ✓ inspection, verification - determination of whether products/processes meet the requirements adopted at the design stage;
  - ✓ packaging and storage - ensuring the quality of the product;
  - ✓ sales and distribution - the product's promotional functions, resistance to loss of performance characteristics, facilitation of logistic processes;
  - ✓ installation and commissioning - ensuring proper functioning of the product;
- post-production - includes following stages:
  - ✓ technical assistance and service - improvement of operation processes;
  - ✓ taking care of the product after sales - maintaining contact with the user;
  - ✓ disposal, recovery - assistance in carrying out a liquidation operation of a physically or economically worn-out product.

Figure 1: Quality wheel (Hamrol and Mantura, 1998)

Figure 2: Product defect occurrence and rectification curves in the product's life cycle (Hamrol and Mantura, 1998)

The information in Figures 1 and 2 shows that at the design and planning stage, the implemented creative solutions are the source of most of the defects occurring in the finished product. It is

therefore the stage for ensuring and establishing the design quality. In the next stages, i.e. production and assembly, design quality is transformed into workmanship quality and quality assurance loses its importance to quality control (quality control and correction). The last phase of operation provides data that is used by designers and engineers to continuously improve the product and the production process (Hamrol and Mantura, 1998).

Of course, according to the idea of industry 4.0 assuming low-volume production, design quality is of particular importance.

Research Results

Analysis of the Use of Quality Management Instruments

Publications on this subject include articles on assessing the use of quality management methods and tools. The first analyzed publication (Kafel and Sikora, 2013) concerns the food industry and covers 29 enterprises. Taking into account only the number of full-time employees, this group comprises 11 small enterprises (average annual employment of more than 10 and less than 50 persons), 13 medium-sized enterprises (average annual employment of more than 50 and less than 250 persons), and 5 large enterprises (average annual employment of more than 250 persons). Due to the unique nature of the food industry, most of the surveyed entities had certified quality management systems: ten organizations - ISO 9001, nine - IFS Food Standard, seven - BRC Global Standard for Food Safety, six - HACCP (Codex Alimentarius), and five - ISO 22000. At the same time, 7 companies admitted that they did not use any quality management methods or tools in their daily operations, 14 only pointed to the self-assessment of the organization, 5 - Statistical Process Control (SPC), 4 - Just in Time, 2 - Kaizen, and 2 indicated use of the Lean Management methodology. Ten companies used only 1 quality improvement tool, seven used 2, fourteen used 3, and one used 4.

In the next paper (Zając and Kudła, 2016), 20 production companies were evaluated, mainly from the construction and automotive industries. According to the adopted classification, taking into account the number of employees, the following types of companies could be distinguished: 1 micro enterprise (average annual employment of more than 10 persons), 7 small enterprises, 9 medium-sized enterprises, and 3 large enterprises. In this group, 5 Why, 5S Practices, and statistical process control were identified as the most popular methods of quality management. The most important tools were process flow charts, Control Charts, and Brainstorming.

The last quoted publication (Gudanowska and Olszewska, 2014) showed that in 165 companies of various industries, the action plan, the control sheet, the SWOT analysis, the 5S Practices, the block diagram, and the Control Charts were most frequently used to improve the quality management system.

Similar to the above-mentioned cases are the surveys conducted at the Institute of Production Management of the Faculty of Production Engineering and Materials Technology of the Częstochowa University of Technology. The information presented in the further part of this paper concern only the data collected so far because the research work is still ongoing. So far, data has been collected from 78 randomcompanies, the vast majority of which (88.5%) are involved in production activities. The companies covered by the study include 19 small enterprises, 31 medium enterprises, and 28 large enterprises, located in Poland, mainly in the Śląskie and Łódzkie Provinces. At 59 companies (75.6%) at least one management system certified by an independent certification body was declared to exist. A majority of the analyzed enterprises, i.e. 52 (66.6%), have at least two standardized management systems, 49 (63%) enterprises have three systems, and 14 (18%) have four or more systems. The data presented in Figure 3 shows that the most popular are: ISO 9000 - 59 cases, ISO 14000 - 52 cases, ISO 45000 - 49 cases, ISO 50000 - 14 cases, ISO 27000 - 14 cases, industry standards (e.g. IATF 16949) - 25 cases, and the integrated management system - 42 cases.

Figure 3: Use of standardized quality management systems in the surveyed companies

The data obtained as a result of the analysis (Figure 4) shows that Brainstorming was the most popular among the research sample - 53 companies (68%), followed by 5S Practices - 51 companies (65.3%), Pareto Analysis - 31 companies (39.7%), Failure Mode and Effects Analysis (FMEA) - 29 companies (37%), Correlation Graphs - 25 companies (32%), Fishbone Diagram - 16 companies (20,5%), 8D - 15 companies (19.2%), 5 Whys (5W) - 11 companies (14.1%), Lean Manufacturing - 3 companies (3.8%), Sheward cards - 3 companies (3.8%), and Six Sigma - 1 company (1.28%). Only seven organizations (8.97%) declared that they did not use any quality management tools or methods in their daily activities. In eight cases (10.2%), one tool for quality improvement was indicated, in twenty-two (28.2%) - 2 tools, in thirteen (16.6%) - 3 tools, in eleven (14.1%) - 4 tools, and in sixteen cases (14.1%) - more than 4 tools (most 9) were indicated - Figure 5.

Figure 4: Use of quality management methods and techniques in the surveyed companies

Figure 5: Number of quality management methods and techniques in the surveyed companies

Conclusion

Today's businesses are facing another technological revolution. It is widely believed that concepts such as Industry 4.0 and 5.0 will bring about far-reaching changes in both production and broadly defined management processes (Shafig et al., 2020; Olsen and Tomlin, 2020; Kang, 2018). It is clear that the quality management system must also adapt to the new reality (Ślusarczyk, 2018; Saifuddin and Syaiful, 2020). The current work conducted by the International Organization for Standardization (ISO) indicates that this problem has already been recognized. A separate issue is the method and possibility to take advantage of the broad range of quality management instruments can be used in processes based on self-controlled, self-adaptive, and self-organizing systems. The integration of man, machine, and process will probably contribute to the emergence of new techniques for quality improvement and, in some part, to the adaptation of existing ones. Such trend can already be seen in theoretical studies - e.g. the authors of the paper (Oborski and Bielecki, 2017) consider the possibility of using Statistical Process Control (SPC) for small batch production.

The analysis of both the publications and the authors' own data on the use of quality management methods and techniques in the surveyed companies has shown that the group of the most frequently used tools and methods is quite limited and, in a sense, is reduced to the best known ones (e.g. Brainstorming, 5S Practices, and Pareto Analysis). This may be due to the unique characteristics of the specific industry (e.g. the automotive industry where the FMEA is recommended) and the nature of the production (mass production - possible use of SPC). It is also important to have certified quality management systems which recommend the use of a given quality improvement technique, e.g. IATF 16949 - FMEA in the automotive industry.

There is also a minimal share or lack of methods and tools aimed at implementing change and innovation (Kaizen, Quality Function Deployment, and Benchmarking), the use of which could increase the chances of achieving a more sustainable competitive advantage. Tools such as these and those that can be used at the product and technological process design stage should become more important in the future. The reason for this is that the largest number of the defects (non-conformities) that occur later in the process have their source at this stage of the manufacturing process, and, according to the concept of industry 4.0, it is possible to have a low volume (or even unit) production tailored to individual customer needs, where any improvement activities are severely limited or even impossible ("right the first time

Strategic Analysis on The Example of a Transport Expertise

Marzena OGÓREK

Czestochowa University of Technology, Faculty of Production Engineering and Materials Technology, Department of Production Management and Logistics
al. Armii Krajowej 19a, Czestochowa, Poland
marzena.ogorek@pcz.pl

Abstract

The modern market requires enterprises to build lasting and unique market advantages. Therefore, proper strategic planning is needed to allocate resources more efficiently. There are many methods to help an enterprise achieve this goal, one of them is the McKinsey matrix. This method allows for transparent presentation of results and can be one of the elements of the decision-making process leading to the assignment of enterprise products to different groups and matching the most optimal partial strategies to them. The article presents the results of the strategic analysis of a transport enterprise. A strategic analysis has been carried out with the use of the McKinsey matrix, based on SWOT analysis.

Keywords: Strategic Analysis, Portfolio Methods, Mckinsey Matrix.

Introduction

Contemporary enterprises conduct business in the environment characterised with high dynamics of market changes. Success is associated with the necessity to face the challenge of growing competitiveness. Enterprises are forced to draw up long-term plans based on the rational analysis of changing environment in which they operate (Stankiewicz, 2005).

Transport services can be assessed from the point of view of numerous criteria. One of them being the level of competitiveness. The following factors can be considered as allowing enterprises to obtain competitive advantage: the level of the enterprise's costs, the technological level (modernity of the rolling stock, availability and quality of used infrastructure, IT systems), qualifications of employees, organisational efficiency and marketing strategies (Koźlak, 2008).

In literature, there are many strategic analysis methods and strategic planning tools for enterprises allowing analysis thereof and specification of their place in the environment (Budzyńska-Biernat, 2005; Kreutzer, 2019).

Literature Review

Portfolio Methods in Strategic Analysis

The analysis of the subject literature allows locating portfolio methods among integrated strategic analysis methods (picture no. 1). A characteristic feature of integrated strategic analysis methods consists in the assumption that "the strategy is a conception of the organisation's existence and maintenance combining all activities thereof" (Gierszewska, 1993; Ahmadi-Javid, Fateminia and Gemünden, 2020).

Table 1: Classification of analysis and strategic planning methods

ENVIRONMENTAL ANALYSIS METHODS	INTEGRATED METHODS	ENTERPRISE ANALYSIS METHODS
Trend analysis	SWOT analysis	Product life cycle
Delphi method	Strategic positioning	Key success factors
Gap analysis	Experience curve	Strategic balance
Scenario methods	**Portfolio methods**	Value chain analysis
Porter's Five Forces Framework		
Sector's economic portfolio		
Strategic group mapping		

Source: own study

Integrated strategic analysis methods are aimed at confronting opportunities and threats appearing in the organisation's environment with its weaknesses and strengths, as well as enable finding balance between them. Many of these methods are presented in a form of a matrix where one variable is connected with processes occurring inside the organisation and its capabilities, and the other variable is connected with conditions and trends in the environment. Portfolio methods help to build a structure of the assortment of manufactured goods or provided services. A well-chosen structure in the selected sector will ensure strong position of the enterprise (Gierszewska, 1993).

Portfolio methods provide the opportunity of conducting quite an accurate assessment of the enterprise's competitive situation in various market segments. They constitute a universal and useful tool used in the analysis of the company's developmental opportunities, as well as constitute an important instrument of strategic planning. By using them, companies can determine with regard to which products they can have higher hopes for demand in the future and which should be withdrawn from their assortment. Such a choice depends on the company's market position and attractiveness thereof (Antczak, 2010; Vlados, 2019).

Portfolio methods have many advantages. According to K. Obłój, they support the analysis of the strategic groups' environment. They allow conducting a systematic diagnosis of entities, however, they do not replace the process of formulating assumptions and interpretations of results, which each time have to be carried out in a qualitative manner by a manager. Portfolio methods decompose the company into clearly defined business entities and give an overview of those entities' positions in the environment. Those methods have two dimensions: one concerns the condition of the environment and the other, the company's competitive position in a given market. Assessment of the product's or company's position with portfolio methods enables taking strategic decisions regarding fate thereof. As disadvantages of portfolio methods include the static character thereof and the fact that they excessively simplify the image of reality. It should be noticed that matrices are techniques organising the reasoning, yet, they do not replace the latter (Obłój, 2015; Viltard, 2019).

P. Kotler believes that using portfolio methods develops strategic thinking. However, they should be used carefully. Obtained results depend on the applied system of assessment and measures and can be manipulated. Furthermore, the above methods do not show the synergy between businesses (Kotler, 2018).

Types of Portfolio Methods

The following matrices can be enumerated as the most known and practically used portfolio methods:

- growth-share matrix, called the BCG-matrix,
- General Electric Industry Attractiveness and Business Unit Strength (multifactor portfolio matrix),
- ADL market assessment - (Arthur D. Little),
- market attractiveness (Shell matrix),

- industry attractiveness (McKinsey matrix),
- product life cycle (Charles W. Hofer).

The most popular portfolio methods in determining the strategy include the BCG matrix (Boston Consulting Group), McKinsey matrix (GE matrix) and the ADL matrix (Arthur D. Little) (Antczak, 2010; Cieśla, 2018).

Boston Consulting Group (BCG) matrix, developed in the 80s by the Boston Consulting Group, is a commonly used method of the enterprise's portfolio management. This method, also called the growth-share matrix, refers to diversified companies comprising of a certain number of strategic business units. The analysis of the so-called Strategic Business Units concentrates on three aspects: relative share of the SBU in the market, market growth rate of a given SBU and the possibility to generate cash (profit) by a given SBU (Pierścionek, 2011; Fadrian and Arifin, 2018).

Strategic Business Units are separated parts of the organisation that have own strategic analyses and plans, own identified competitors and suppliers, operate in separate markets and have own competitive strategies separate from strategies of other SBUs in the same organisation. Those units are autonomous, independent and equipped with own mission and vision. For example, a SBU is a single product, brand, product line, product composition (product mix) that meet in the common market or satisfy a specific group of needs. The traditional outlook of the BCG matrix classifies particular SBUs by market growth rate and relative market share. It describes the place and role of particular products of the organisation in its current and future incomes and is a tool used for researching strategic potential of the enterprise (Zhenping and Zhanping, no date; Penc, 2001).

Stars are SBUs with a large share in turnovers in fast-growing markets; it is the most convenient situation that promises large profits. However, they require further investment expenditures to maintain the leading position in the dynamically growing market. Thus, "the star" can turn into "a cash cow", when the market enters the maturity phase. There are "young stars" (requiring investment) and "old stars" (self-financing) (Pierścionek, 2011).

Cash cows are SBUs with a high share in the market characterised with low dynamics. Those are profitable products providing a source of financial surplus; they do not require investment, since they have their own highly profitable market share. It is recommended to exploit "cash cows" in order to provide the "stars" with conditions for development and financing other activity segments (Mutandwa *et al.*, 2009; Pierścionek, 2011).

Question marks are SBUs with low profitability, but existing in the fast-growing market. They occur in attractive, developing markets and constitute unused opportunities. Nevertheless, the market growth may require investment expenditures in order to obtain a share thereof. It is recommended to invest selectively or resign from given SBUs before they turn into "dogs" (Pierścionek, 2011).

Dogs are SBUs with a low market share characterised with low dynamics. They hold the least beneficial position in the BCG matrix; they waste and provide small amounts of cash or generate loss. They are unattractive and may become a threat to the company, therefore, it is recommended to eliminate them (Pierścionek, 2011).

Arthur D. Little (ADL) matrix, created in the A. D. Little Inc. consulting company, the conception of the ADL matrix developed by this company is based on the assumption that the product capacity to generate profit for the organisation results on the one hand, from the enterprise's competitive position and on the other hand, from the level of sector's maturity. The stronger competitive position of the product, the greater its capacity to generate a surplus (Krupski, 1999).

The ADL matrix (table no. 2) was built on the basis of two variables: the level of product's competitiveness or the enterprise's competitive position stipulated synthetically, the level of the industry (market) maturity in compliance with the product life cycle. In this matrix the "sector maturity" dimension includes four phases: introduction, growth, maturity and decline. Each of the phases is char-

acterised with various organisational and financial features influencing the selection of a different action strategy. Therefore, assessment of the sector's maturity level has to take into consideration many factors that can influence changing a given sector in the future. The dimension of "a competitive position" has a five-point scale: dominant, strong, favourable, tenable, weak (Krupski, 1999; Zic, Mikac and Dobovicek, 2009).

Table 2: Strategic action lines in the ADL method

Competitive position	Product life cycle phase			
	introduction	**growth**	**saturation**	**obsolescence**
Dominant	acquisition, maintenance of the market share	maintenance of the position, market share	maintenance of the position, growth with the industry	maintenance of the position
Strong	investment aimed at the position improvement, intensive increase in the market share	investment aimed at the position improvement, gaining market share	maintenance of the position, growth with the industry	maintenance of the position, surplus use
Favourable	selectively gaining market share, improvement of the competitive position	attempt at improving the position, selectively gaining market share	minimal investment aimed at maintaining the position, searching for new market niche	good use of the surplus or gradual reduction of activity
Tenable	selective improvement of the competitive position	searching for or maintaining a market niche	searching for a niche or gradual reduction of assets	gradual reduction of activity
Weak	strong improvement or not undertaking activity	strong improvement or withdrawal	gradual reduction of activity	withdrawal

Characteristics of the McKinsey Matrix

The McKinsey matrix, also referred to as the General Electric (GE) matrix, is an analysis tool developed by GE analysts together with the consulting company McKinsey & Company. It is based on the assumption that the greatest significance in taking strategic decisions is associated with two factors: attractiveness of the environment (industry), in which the SBU operates and the SBU's ability to gain competitive advantage in a given market (Penc, 2001; Shen *et al.*, 2015).

The McKinsey matrix, also referred to as the industry (sector) attractiveness matrix, includes 9 fields, where SBUs are located. Columns present the value of a given area and lines - competitive positions. SBU's position is decided by factors stipulating the market attractiveness level and its market power. The size of the circle indicates the size of the sector (market) and the highlighted segments of the circle refer to the studied enterprise's production share in the sector. This matrix will allow comparison of a given enterprise with market leaders. The analysis covers the environment with a particular focus on potential opportunities and threats (table no. 3.) (Penc, 2001).

Table 3: Strategies corresponding with McKinsey matrix cells

	Company's competitive advantages		
	small	**medium**	**large**
Market attractiveness	**Selective measures aimed at improving the market situation** 1. concentrate on using held resources 2. withdraw, if the sales is decreasing 3. overcome weaknesses	**Investment to improve the market position** 1. attack positions of hitherto leaders 2. use held resources to the maximum 3. concentrate on strengthening weaknesses	**Protective position** 1. invest in order to achieve maximum dynamics of sales 2. concentrate efforts on using held resources
	Limited expansion or quick gain 1. search for paths to expansion without high risk 2. minimise investment 3. rationalize activity	**Selectiveness/focus on revenues** 1. concentrate investment on the most profitable and least risky segments 2. protect the existing programme 3. maintain the protective position towards competition	**Selective measures aimed at improving the market position** 1. invest in the most attractive market segments 2. develop the ability to cope with competition 3. increase profitability by increasing efficiency of manufacture
	Divestment 1. sell until profitability 2. limit variable costs 3. avoid redundant investment	**Concentration on revenues** 1. protect strong positions on the most profitable market segments 2. improve the production line 3. minimise investment	**Protection** 1. focus on current revenues 2. protect competitive advantage 3. focus on the most attractive segments

Source: own study on the basis of (Kotler, 2018)

In order to agree on the position in the matrix, external and internal factors should be primarily separated. The external factors related to the industry attractiveness include (Dworzecki, 1992; Penc-Pietrzak, 1998): market size and market growth rates, demand growth rate, technology and its significance, cyclicity, competition structure, sector entry barriers, industry profitability, inflation, legislation, personnel availability, social problems, problems regarding environment protection, political and legal problems.

Internal factors reflecting the company's position in a given industry or the level of products' competitiveness include (Drążek and Niemczynowicz, 2003; Urbanowska-Sojkin, Banaszyk and Witczak, 2007): relative market share, assortment of products, effectiveness of distribution, effectiveness of the marketing department (promotion, advertising), efficiency of the sales department, quality and relia-

bility of the customer service, company brand and image, research and development, production, funds, management competences.

Upon specification of the assessment criteria, a score-based assessment should be conducted, which consists in calculating the value of weighted industry attractiveness and competitive position and proceeds in accordance with the following stages (Drążek and Niemczynowicz, 2003):

- specifying weights for particular factors. Weights stipulate the importance (significance/validity) of each factor. It should be remembered that the total of weights for a given group of factors cannot be higher than 1;
- assessment of particular factors in order to differentiate the impact of each factor. As the scale of grades includes numbers between 1 and 5, where 1 means weak impact and 5 – strong.
- calculating the value weighted by multiplying the weight and assessment;
- calculating the total value weighted by summing up values weighted for particular factors.

In the summary it should be underlined that for a specific enterprise and industry the list of factors and the scale of grades should be agreed on by experts and thus obtained results should be used to mark the matrix axis and stipulate the position of products. An unquestionable advantage of this method constitutes, in fact, the variety of assessment criteria of attractiveness of a given industry, market and potential of the SBU. Depending on the selected criterion, the company can receive a different assessment. With a complex assessment, several matrices should be created to allow selecting a strategy, taking into consideration all interesting aspects of a given organisation (Urbanowska-Sojkin, Banaszyk and Witczak, 2007).

Research Results

The company X was established in 2000. The headquarters are situated in Nowy Targ, in Lesser Poland Voivodeship. For many consecutive years the company has been growing its experience and developing a strong position in the European transport market by increasing its rolling stock from one truck combination in 2000 to 350 combinations in 2018. Since establishment of the enterprise X its aim has been to provide the best services related to transporting goods of its customers.

For the purposes of the portfolio analysis, the McKinsey matrix created on the grounds of the SWOT analysis has been selected (table no. 4.).

Upon determining the main strengths and weaknesses, as well as opportunities and threats, they had been attributed with weights and assessments and then, weighted assessments were determined. Such an analysis allowed entering features into the matrix and then, reading where the enterprise is located in the McKinsey matrix. In order to build the McKinsey matrix (picture no. 1.), calculations were carried out on the grounds of the total of weighted assessment from table no. 4:

strengths – weaknesses = 4.4 – 4.1 = 0.3
opportunities – threats = 4.4 – 3.2 =1.2

Table 4: Criteria for making the McKinsey matrix

CRITERION	WEIGHT	ASSESSMENT	WEIGHTED ASSESSMENT
Strengths:			
specification of individual routes, good quality of services	0.2	5	1.0
large group of regular customers	0.4	4	1.6
short time of transport	0.2	5	1.0
good location	0.2	4	0.8

In total:	1.0		**4.4**
Weaknesses:			
big competition	0.3	4	1.2
high business costs	0.4	5	2.0
several vehicles requiring continuous repair	0.1	3	0.3
high turnover of employees	0.2	3	0.6
In total:	1.0		**4.1**
Opportunities:			
growing transport needs of the society	0.3	5	1.5
large area of operations	0.2	4	0.8
economic development in Poland and the EU	0.2	3	0.6
occurrence of new regular customers	0.3	5	1.5
In total:	1.0		**4.4**
Threats:			
possibility of growing competition	0.3	3	0.9
threat to the environment	0.4	3	1.2
road congestion in the country and abroad	0.1	3	0.3
dropping prices of competitors	0.2	4	0.8
In total:	1.0		**3.2**

Picture 1: McKinsey matrix for the analysed enterprise

Determining the assessment of the competitive position and market attractiveness allows specifying the strategy recommended for a given entity. In compliance with picture no. 1, it is visible that the analysed enterprise is situated in the middle field of the matrix. This field belongs to the group of the maintenance strategy.

The maintenance strategy, also called the selective investment, is characteristic for SBU with low competitive strength operating in an attractive sector (offensive strategy that requires significant expenditures in order to improve the competitive position) (Kotler, 2018).

Conclusion

Portfolio methods of the strategic analysis constitute a good tool for initial analysis, as they allow stipulating the enterprise's condition. Conducting these analyses accurately and reliably can be treated as a tool supporting selection of the enterprise's strategy.

The article presents results of the enterprise's strategic analysis conducted with the McKinsey matrix. The analysed premises constituted the transport enterprise X situated in Nowy Targ, in the Lesser Poland Voivodeship. To conduct the McKinsey analysis, criteria were selected on the grounds of the SWOT analysis. Criteria weights were assigned to assessments and then, weighted assessments were given. It allows stipulating the unit's strategic strength (0.3) and environment attractiveness (1.2). Determining these values allowed locating the enterprise X in the McKinsey matrix – the enterprise was put in the middle field of the matrix, which means applying the maintenance strategy. According to the literature, the enterprise should conduct the selective analysis of specialisation, investment and market segmentation (Krupski, 1999), as well as focus on revenues, concentrate on investment in the most profitable and least risky segments, as well as maintain the protective position towards competition (Kotler, 2018).

Labour Mobility of Foreigners in Slovakia

Vladislav MIČÁTEK

Slovak Association of European Studies, Bratislava, Slovakia
vladislav.micatek@ecsa.sk

Abstract

Globalization and the process of European integration facilitate labour mobility. The Slovak Republic introduced several measures facilitating labour mobility of foreigners in Slovakia in accordance with its international obligations. This thesis analyses topical problems of the labour market in Slovakia and points out the process of integration into the labour market. The contribution of this scientific thesis, in terms of both theory and practice, represents the analysis of conditions of employment of foreigners and entrepreneurial activity of foreigners in the territory of the Slovak Republic. At the same time, it indicates the importance of multiculturalism that is becoming part of the labour legal relations in Slovakia.

Keywords: Labour Mobility, Foreigners in Slovakia, Conditions of Employment.

Introduction

From its accession to the European Union, the Slovak Republic is experiencing dramatic changes not only in the field of economic relations, but also in the area of free movement of persons. In this context, we should not forget that the effects of globalization are reflected in the inflow of foreign investment, growth of interdependence, and in the deepening of global division of labour. (Geistlinger, Nováčková 2018) The inflow of foreign investments requires not only the change of structural relations. There is a growing shortage of workforce in certain professions, which has the consequence of limited economic growth, low productivity and absence of innovations. The structural changes in the labour market can further increase the labour force demand, which is not immediately available on the labour market. The insufficient labour force on the domestic labour market is compensated by labour force from abroad. These foreign workers enjoy rights guaranteed by the Constitution of the Slovak Republic, namely the right to equal treatment and the protection against any form of discrimination. The fair and equal treatment represents one of the fundamental rights in the European Union. This institute guarantees equal employment conditions, equal work conditions, same safety at work requirements, equal access to professional training, education and retraining courses, same social and tax advantages. The number of foreigners working in Slovakia has been increasing; however, the number of foreigners is still much lower than the number of Slovaks working abroad. This scientific thesis relates to the labour mobility of foreigners in Slovakia and points out the significance of free movement of persons within the territory of the European Union, because the labour mobility also brings economic advantages.

Aim and Methodology

The choice of our topic is closely connected with the development of globalization and the introduction of the institute of freedom of movement of persons, the removal of barriers on the Slovak labour market and the freedom of doing business. The aim of the study is to analyze the legal system of employment of foreigners in Slovakia, of freedom to conduct business in the Slovak Republic and to open a discussion on the integration of foreigners in the Slovak labour market as well as contribute to a deeper knowledge of foreigners' employment in the Slovak labour market. Subject of the research are the legal relations concerning employment and business of foreigners in Slovakia.

- In view of the stated goal, we set ourselves the first research question: what are the conditions of employment of foreigners in Slovakia and their adaptation?
- Foreigners in Slovakia focuses the second research question on business activities.

- The third research question concerns the issue of whether there are also illegally employed persons on the Slovak labour market.

The methodological scientific study is based on secondary research and has descriptive character. The author drew on available scientific publications, Slovak legislation, legal acts of the European Union, statistics and internet sources. We also used documents of the Slovak Business Agency and the Ministry of Labour, Social Affairs and Family of the Slovak Republic

Literature Review

The era of globalization, unrestricted mobility and migration of foreigners is bringing new phenomena, but is currently being discussed not only at national level but also internationally. Several scientific studies have been published on the subject. E. Ravenstein (1885) was the first representative to conceive the principles of movement between the rural and urban environments and thus began to shape the "laws of migration" in the 1880s. The Slovak author Jurčová (2005) characterizes foreign migration as a migration in which state borders are crossed. According to Hanzelová, Kostolná and Kešelová (2008) migration to work abroad is one of the components of the overall international migration movements, which are multidimensional in nature. It is not easy to clarify the nature and causes of labour migration, although it is generally recognized that the possibility of getting better jobs and higher wages is the "driving force" and "engine" of people's migratory behaviour ”(Hanzelová, Kostolná and Kešelová 2008).

In the scientific literature, we can meet the macroeconomic neoclassical theory of migration, which is based on the imbalance between regional labour markets and migrant migrants as “suppliers” of labour. (Hicks 1963; cf. Krieger 2004) At the macroeconomic level, Massey (1993) in the neoclassical theories cites differences in wages across countries as a reason for migration. According to Galanská (2014), the neoclassical theory is considered to explain mainly migration from developing countries to developed countries, as it determines the initialization of migration based on real wage differences, or based on expected wage differences. We agree with this statement, because there are not enough jobs in developing countries and the development of industrial production is stagnating.

Economically oriented theories of international labour migration see this phenomenon as a form of labour mobility. (Pries 2001) This is also evidenced by the legal instruments of international organizations, which require Member States to remove legal obstacles to freedom of movement and discrimination because of nationality. In the context of labour mobility, the European Union also emphasizes the protection of social rights and the coordination of social security.

Legal Basis of Labour Mobility of Foreigners

In the primary law of the European Union, the regulation of the free movement of labour forces can be found in article 45 of the Treaty on the Functioning of the European Union (TFEU), which guarantees the free movement of workers within the European Union. It includes the abolishment of any discrimination of workers of the Member States of the EU on the ground of nationality related to the employment, salary and other work conditions. In brief, the article 45 TFEU guarantees the right of EU nationals to move with their employment to other Member States. Free movement of persons represents one of the four fundamental freedoms of the European Union and at the same time one of the basic characteristics of the EU citizenship. The primary legal regulation of the European Union is supplemented by a wide spectrum of secondary acts facilitating labour mobility not only nationals from the Member States, but also from third countries. The Slovak Republic has upon its accession to the Union undertook that it will stick to and properly apply the EU primary law, secondary legal acts, as well as other applicable treaties (Wefersová 2016). The Law no. 404/2011 Coll. on Residence of Foreigners as amended is also applicable in the context of employment of foreigners in Slovakia.

Law no. 5/2004 Coll. on the Employment Services as amended guarantees in its article2 paragraph 2 for the national of a Member State of the European Union and his/her family members **equal legal status** in legal relations arising according to the mentioned Law both for nationals of the Slovak

Republic and for nationals of other Member States. The concept of gender equality ranks is one of the reasons why foreigners are arriving to Slovakia in order to work here. In case of employment of nationals from EU Member States as well as from a State that is a contracting party to the Agreement on European Economic Area and the Swiss Confederation, these nationals have the same legal status in the legal relations arising under the Law on Employment Services as the nationals of the Slovak Republic unless this Law stipulates otherwise. In accordance with the article 64 of the Law on Residence of Foreigners the EU national is authorized to stay in the territory of the Slovak Republic without any further conditions nor formalities. The EU national is obliged to have a valid passport or other identity card proving his/her identity and Member State nationality. The EU national is obliged to notify his/her presence in the Slovak territory within 10 working days from the day of entering the Slovak Republic. The EU national is authorized to move around the Slovak territory within the period of three months from entering the Slovak Republic. In case of residence longer than three months, the foreigner is obliged to ask for registration of his/her residence in the Slovak territory using the official document within the respective Police Office.

The national of a third country with the granted residence of national of the third country with the granted status as the person with long-term residence of the EU also enjoys the same rights and obligations as the national of the Slovak Republic. The third country national is every person, who is not the national of the Slovak Republic, nor of other EU Member States. The employer can employ the third country national even when s/he is not holder of the so-called Blue Card. Compared with all EU member states Germany is in the first place as regards the grant of the EU Blue card. (Wefersova 2017) The Blue Card of the European Union represents the temporary stay authorizing the third country national to enter, to reside and to work in the Slovak Republic for performing highly qualified employment, and to leave the Slovak territory and re-enter within the period stipulated. During the period of years 2012-2016, the Slovak Republic issued only 32 Blue Cards. On average Slovakia granted not even three blue cards per one million inhabitants in the year 2018, while the Czech Republic and Poland issued already in 2016 39, or 42, respectively blue cards per one million working persons and thus marked much higher demand. In 2016, Slovakia only issued less than two blue cards per one million of workers. In total numbers in the EU according to Eurostat, the first Member State is Luxembourg granting much higher number of blue cards in proportion than other Member States (Slovak Business Agency 2019).

The Slovak Law on Employment further in its article 23b paragraph 2 stipulates the obligation on the employment to inform competent labour authorities on issues related to the employment of a national of the EU member state and his/her family members. The employer has the duty to inform the competent office of labour, social affairs and family in writing about the start and termination of employment of the EU Member State national and his/her family members within seven working days from the entry into employment and within seven working days from the termination of employment at the latest. The Slovak Republic further to article 45 of the TFEU and to the Regulation (EU) No 492/2011 of the European Parliament and of the Council of 5 April 2011 on freedom of movement for workers within the Union opened its market to the nationals of the newly acceded EU Member States and did not apply any transitional periods in the context of free movement of workers, as notified to the European Commission.

The answer to the first research question is that European Union law influences the Slovak legislation on the employment of foreigners in Slovakia.

Integration of Foreigners in the Slovak Labour Market

European as well as global mobility of active labour force, which is the product of globalization of markets and legislative changes arising in the field of labour relations and labour market, supports organisations and companies in deepening the relations both at the institutional and personal level and raises in companies an increasing need for personal contacts of people with different education and training, with different abilities and skills, with different experience in the functioning of a company and society, with different values, different ways of thinking, and thus a different worldview (Delgůdová 2013).

Integration on the labour market of foreigners coming to Slovakia is of special significance to them as a two-way process. It requires from foreigners to acquire rights and obligations applicable in the receiving state at one side, and on the other side, the receiving state must create conditions for the successful integration of foreigners into the society. Integration represents therefore the strategic process that takes place at all state levels and social life. Integration of foreigners is thus the multilateral process, while access to labour market represents only one of many dimensions of this process (European Commission 2015).

In Slovakia, there are mostly foreigners from Eastern and Southern Europe that are coming within the framework of labour mobility due to their cultural and language proximity to Slovaks. That is why they are mainly nationals from Ukraine, Russia, Serbia and Croatia. One of the problems of integration related to the employment of foreigners is the problem of language barriers within both business and personal contacts, this barrier being much bigger in the countries of Western Europe. For most employers and companies, the knowledge of the foreign language of employees is relatively low. As a result, the communication and cooperation within the whole collective during every day work is more difficult. As for acquiring certain work habits and business culture, the foreigners do not have problems. As the practical experience shows, after a certain period of time foreigners are able to communicate in the Slovak language and they try to integrate their families too. It is common, that after a one-year stay in Slovakia the spouse is following and, in some cases, children are following their parent who is working abroad. In most cases, there are short stays of family members of employed foreigners. The intercultural differences among Slavic nations are minimal, and for this reason, the foreigners from Eastern and Southern Europe contribute to the development of Slovakia. The tolerant attitude of employers suggests that the number of foreigners working in Slovakia is increasing and about 12% of them have got married in.

Shortage of Labour Force and Employment of Foreigners

Economic integration is a process of deepening economic relations and coordinated economic cooperation with the participation of states involved in this process. (Nováčková 2014) Due to globalization changes and the market liberalization, the Slovak Republic has become a suitable country for foreign investors. The introduction of innovative technologies and the automation of production processes are the reason why there are many vacant jobs in Slovakia. The lack of labour force is beginning to be compensated slightly by the labour force from abroad. Within the framework of free movement of persons, the most employees in the Slovak Republic are from the EU/EEA countries. In the year 2018, there were 9.800 persons from Romania, 5.900 from the Czech Republic, 5.400 from Hungary and 4.500 from Poland. This can partially be explained by the fact, that in Slovakia the Euro is used as the currency in the official payment system. This represents the competitive advantage of Slovakia in comparison to these neighbouring countries. If we look at the data from the Statistical Office of the Slovak Republic, in the regions of Bratislava, Trnava and Nitra there are up to 65-67% foreigners from the EU/EEA countries. The biggest number of foreigners from EU/EEA countries is employed in Bratislava and in the years 2012-2018 this proportion even more increased. The highest increase in the number of foreigners employed is in the Bratislava Region, where 17.138 foreigners are employed. There may be several reasons for that, nonetheless Bratislava as the capital city of Slovakia is the centre for business doing for several transnational companies and it also has suitable infrastructure. The number of foreigners working in Slovakia increased record-breaking, while in year 2017 there was an increase of 12.000, i.e. the foreigners occupied every fourth newly created job.

Although the number of foreigners present in Slovakia is increasing, the share of foreigners with long-term residence is low. The total number of foreign nationals performing work in the territory of the Slovak Republic as of 15 August 2019 has been 73.100. The number of employed persons from Serbia increased, at present there are more than 13.000 of them working in Slovakia. The number of Ukrainian nationals working in Slovakia also increased significantly, there are currently 18,200. In December 2018 there were in total 2053 nationals of Croatia employed in the territory of the Slovak Republic (Statistical Office of the Slovak Republic). There were 22.700 foreigners employed in five districts of the capital city of Slovakia, followed by Trnava district with 7.500 employed foreigners in the same

period (Ekonomika, SME 2019). There is a higher number of men than women employed foreigners in the territory of the Slovak Republic. The biggest groups were persons aged from 25 to 30 years. The biggest competition and interest have been noted in the positions of operators and machine and equipment fitters as well as qualified workers and artisans.

The following Chart illustrates the development of employment of third-country nationals in Slovakia. The data suggest that the employment of foreigners is on an upward trend.

Chart 1: Employment of foreigners from third countries in the SR

Source: Ministry of Economy of the SR (2020), Správa o stave podnikateľského prostredia. [Online], [Retrieved January 23, 2020], https://www.mhsr.sk/podnikatelske-prostredie/lepsia-regulacia/opatrenia/spravy-o-stave-podnikatelskeho-prostredia-v-sr

Conducting Business by Foreigners

The second research question focuses on doing business of foreign subjects in Slovakia. The liberalization of markets, international protection and investor support and respect for competition rules have an impact on the businesses conducted by foreigners in Slovakia

Two laws regulate business conducted by foreign nationals in the territory of the Slovak Republic – the Commercial Code – Law no. 513/1991 Coll. as amended and the Law no. 455/1991 Coll. on Self-Employed Persons as amended. A natural person can act as a self-employed person either as a Slovak person (if he is resident in Slovakia) or as a foreigner (if he is not resident in Slovakia). Further to both the Commercial Code and Law on Self-Employed Persons, the foreigner can conduct business in Slovakia under same conditions as the Slovak person.

A foreign person in Slovakia is authorized to conduct business as of the date of entry into the Commercial Register of the foreign person's business or organizational unit of the foreign person, within the scope of the subject of business entered in the Commercial Register. The basic requirement for running a business as self-employed person is to obtain a certificate of trade license. In case of a foreign person in order to obtain a certificate of trade license, it is required to fulfil other conditions

than in case of a Slovak person. A foreigner can obtain permanent residence or temporary residence in Slovakia for conducting business. In order for any business entity from abroad to be interested in entering the market, satisfactory legal conditions must be created.

The current valid legislation creates conditions for the development of business activities of foreigners who can carry on business activities in Slovakia. Freedom to conduct a business is one of the basic preconditions for the existence of an economy based on market principles. In the Constitution of the Slovak Republic, freedom of doing business is guaranteed within the framework of fundamental rights and freedoms in the second chapter, in the fifth section as a fundamental economic law, and for this reason we can also speak about the constitutional principle of foreign business in Slovakia.

An important determinant for the business of foreigners is that the Slovak Republic protects the rights of foreign investors based on international treaties. International treaties for the promotion of investment provide fair and equal treatment as well as protection against expropriation. The current regime for the development of foreigners' business activities is also determined by the double taxation treaty, which creates a legal framework for the development of universal and mutually beneficial economic relations. Their benefit is a fair tax burden on foreign entrepreneurs and they allow the tax system to create a level playing field for domestic and foreign companies and entrepreneurs, too. The peculiarity of these international treaties is that they take precedence over laws. The largest concentration of foreign companies is in the Bratislava region, which reflects the high economic performance of the Bratislava region.

Illegal Work and Illegal Employment

The third research question concerns illegal work and illegal employment, circumstances that have a negative impact on the employees, the business environment and the whole society. Further to the Law no. 82/2005 Coll. on Illegal Work and Illegal Employment that entered into force as of 1 January 2018 as illegal employment is considered in this connection the use of dependent work of employees having their labour relationship or civil service relationship based on the specific law who are not registered within the register of insured persons and pensioners within seven days. The Ministry of Labour, Social Affairs and Family of the Slovak Republic regularly issues the Report on Legal and Illegal Work. This report for 2018 shows that 2,470 natural persons were illegally employed from among 56,636 persons audited, which represents 4.4% of all audited persons. This summary number of revealed illegally employed natural persons includes 596 illegally employed women and 1,874 illegally employed men. This negative phenomenon present in the Slovak labour market can only be removed by imposing higher financial sanctions for employers, as well as for these illegally employed persons, or by their expulsion from Slovakia, respectively.

Persons who work illegally are exposed to many problems related to their claims to wages, meals, statutory maximum working hours, minimum rest or vacation. They also risk problems in claiming a pension, which they often realize only later. On the other hand, employers who employ illegally distort the level-playing field, distort the market and at the same time they face high fines and other penalties, including revocation of trade licenses.

Conclusion

By analysing the current legislation, it was possible in this scientific study to assess the current legal situation study to demonstrate the increase in labour mobility of foreigners in Slovakia. From an economic point of view, migration of foreigners balances regional labour markets. There are currently two groups of foreigners coming to Slovakia. One group represent made up of foreigners who are looking for a job; this is the group of economic migrants. The second group consists of foreigners who come to Slovakia with the intention of doing business and creating jobs. This group of economic operators is perceived positively in particular in terms of regional development.

Based on concrete facts, we reached the conclusion that the foreign nationals of both, EU Member States and non-Member States are performing working activities in Slovakia. Performing work in a foreign environment is quite difficult and the employee has to deal with intercultural differences and remove language barriers. Due to the increased number of foreigners, the competent authorities also carry out controls and inspections at workplaces and the results of their activities are facts about illegal work in Slovakia, which is forbidden and distorts the labour market.

Abstract

A balanced system of indicators for assessing the economic efficiency of social facilities should have at least two parameters: informative value and verifiability (empirical testability). The system of indicators forms the basis for methodological approaches to the analysis of economic, social, and biomedical efficiency of sanatorium-resort institutions and organizations.

The problem of studying and assessing the economic efficiency of sanatorium-resort health improvement services and the reserves for its increase consists of how fitting it is to assess economic efficiency separately from assessing social and biomedical efficiency if their efficiency exists at all. Economic efficiency should be studied and assessed independently of other human health components because sanatorium-resort health improvement and treatment services are included in the group of merit goods.

Keywords: natural monopoly, economic efficiency, sanatorium-resort health improvement services, merit good, social sphere, recreation, competition, business activities.

Introduction and review of publications

In the modern economy, an essential prerequisite to promote the competitiveness of any enterprise is the efficiency of its industrial-commercial and financial-economic activities. At the same time, economic efficiency essentially has the same scope, but it is calculated differently at different levels of the economy and is manifested differently both for individual enterprises and their groups by industries and spheres of national production *(Arsaliev, 2012)*. Accordingly, the assessment of the efficiency of an enterprise (a group of enterprises) of a peculiar production type is a rather complicated scientific task due to a number of circumstances and difficulties *(Sukharev, 2013)*.

The economic efficiency of social facilities is the efficiency of service institutions and organizations. Services as market products, unlike goods, have their economic specificity because they exist at the moment when they are provided, purchased, and consumed by consumers *(Dyatel, 2009)*. The economic nature of services lies in the intangible nature of production. Sanatorium-resort health improvement as a recreation and treatment service for a particular person cannot exist separately from him/her as a

consumer, which characterizes sanatorium-resort services from the social and biomedical side, alongside with the economic one *(Lebedeva, Kudrin and Leiserman, 2019)*.
In the conditions of the cutbacks to budget financing, sanatorium-resort institutions vitally need self-sufficiency of their services and self-financing of their sustainable operation as aspects of economic efficiency *(Chuvatkin and Gorobets, 2015)*. In this regard, it is essential to have a business behaviour pattern of the sanatorium-resort institution, which opens the reserves for increasing economic efficiency.
The objective of this study is to develop a system of indicators allowing us to assess the efficiency of a social facility (sanatorium-resort institution), taking into account the field specifics.

Literature Review

Russian and foreign science uses several methodological approaches to studying the activities of sanatorium-resort institutions, which develop, in particular, an assessment of their economic efficiency, including social and biomedical components as part of the integral economic efficiency indicator. There have been extensive studies dealing with the aspects of the mechanism of the sanatorium-resort complex functioning and development, the environmental and economic development of the recreational sphere, and technologies for managing the sanatorium-resort complex development of the RF regions *(Arsaliev, 2012), (Bryman, 1995)*.
Economists identify five economic efficiency criteria: resource efficiency; performance of the enterprise; the competitive advantage of the enterprise; quality of production activities; quality of service; service performance *(Aslanov, 2012)*.
According to foreign studies dealing with the evolution of spatial systems and the social infrastructure of territorial complexes, the implementation of sanatorium-resort health improvement and treatment services has two aspects: societal, which depends on the merit nature of the service *(Becattini, 2017), (Hirsch, 1970)*, and economic related to the prime cost of services, their quality, level, price and availability for the buyer *(Isard and Whitney, 1975), (Porter, 2008)*. Actually, the combination of the societal and economic aspects in sanatorium-resort services gives rise to the problem of their management, assessment of the service quality, and efficiency of sanatorium-resort institutions.

An analysis of specific and summarizing factors affecting the economic efficiency of social facilities

Economics forms a resource-cost approach to efficiency, according to which the efficiency (Eij.) characterizes the ratio of the final results (effects) of production and commercial activities of business entities (Ri) to the costs of resources (Cj) used to achieve them *(Aslanov, 2012)*. In the most general terms, economic efficiency is represented by equation (1):

$$Eij.=Ri / Cj \qquad (1)$$

In this case, when the economic efficiency of an enterprise is assessed according to equation (1), we should distinguish between the efficiency of using a particular resource and the efficiency of actions and operations performed in the process of achieving the economic objectives, for example, to implement a strategy *(Ermolina, 2013)*. We can obtain an assessment of economic efficiency by convolving private and summarizing indicators for individual resources and processes (operations) into a single integral indicator.
The information base for assessing the economic efficiency of a sanatorium-resort health improvement institution is a system of private and summarizing indicators, as well as the economic performance efficiency indicator, the numerical value of which can be obtained based on the model from equation (1).
The critical tool for reforming the efficiency assessment system is the development of a business activity model for social facilities.

It is evident that the theory of business activities of enterprises, institutions, and organizations is conceptually most appropriate for the analysis and assessment of their economic efficiency based on a balanced scorecard.

Economic resource efficiency is revealed and characterized by such indicators as productivity (of labour, capital) and profitability (of funds, non-current, and current assets). Labour and capital productivity are measured by the ratio of the total, average and marginal products measured in physical or monetary units to their strictly fixed volumes in man-hours and/or the number of employees, in machine hours and/or the amount of equipment. Thus, the productivity or performance indicators reveal and characterize economic resource efficiency from the tangible and physical sides *(Ermolina, 2013), (Calabina and Smirnykh, 2005)*.

The profitability indicators disclose and characterize economic resource efficiency from the cost side as the ratio of the value of products in selling or market prices to the value of the enterprise's assets or funds. Profitability ratios are dimensionless values and are taken as a percentage. To assess economic resource efficiency in terms of profitability, it is natural to refer to the enterprise's financial performance: revenue, profit (loss), commercial margin, cash flow, net cash income, etc.

Thus, based on the logic of summarizing economic efficiency indicators, the measure or generalized criterion of the economic efficiency of an enterprise over the reporting period (calendar year) will be the return on its equity (2) *(Calabina and Smirnykh, 2005)*:

$$Et\text{-}1 = Prn. / Cequity * 100\%, \quad (2)$$

where Et-1 is the economic efficiency of the enterprise over the reporting period; Prn. is the net profit of the enterprise over the reporting period; Cequity is the equity (net assets of the enterprise).

Target economic efficiency indicators are disclosed through performance indicators. In the plans of the enterprise, its economic objectives are always represented quantitatively and connected with the growth or reduction of the value of one or another summarizing indicator (for example, profit improvement and/or reduction of the cost of resources). Therefore, when calculating performance indicators, we should apply the formula of basic or chain growth rates (3), (4) *(Dyatel, 2009)*:

$$\text{basic: } \rho 1|0 = (Q1 - Q0) / Q0 * 100\% , \quad (3)$$

$$\text{chain: } \rho t|t\text{-}1 = (Qt - Qt\text{-}1) / Qt\text{-}1 * 100\% . \quad (4)$$

The integral assessment of economic efficiency as a method includes the indicators of productivity, profitability, performance, and, accordingly, the parameters of their permissible changes *(Saaty, 2006)*. However, it is necessary to reduce the number of economic efficiency criteria from five to a single criterion. Such a single criterion will be the return on equity of an organization or institution. It is recommended to convolve the coefficients into one summarizing coefficient using T. Saaty's hierarchy analysis method *(Aczél and Saaty, 1983)*.

The classification of the results of assessing the economic efficiency of sanatorium-resort health improvement institutions and social facilities in the form of summarizing indicators is presented in Table 1.

Table 1: the classification of the results of assessing the economic efficiency of sanatorium-resort health improvement institutions and social facilities
(Source: compiled by the authors)

#	Performance indicators	Calculation formula, units of measurement
1	Growth of labour productivity (Pr.lab.)	$\rho_{t\mid t-1}(\rho_{1\mid 0})_{Pr.lab.} = \partial Pr_{lab.} / Pr_{lab.} *100\%$
2	Decrease in the living labour costs (Payroll)	$\rho_{t\mid t-1}(\rho_{1\mid 0})_{Payroll} = \partial Payroll / Payroll *100\%$
3	Growth of the yield on the fixed assets of the enterprise (YIELDfa.)	$\rho_{t\mid t-1}(\rho_{1\mid 0})_{YIELDfa.} = \partial YIELD_{FA.} / YIELD_{FA.} *100\%$
4	Growth of the product profitability of the enterprise (Rprod.)	$\rho_{t\mid t-1}(\rho_{1\mid 0})_{Rprod.} = \partial R_{prod.} / R_{prod.} *100\%$
5	Growth of the enterprise profitability (Ren.)	$\rho_{t\mid t-1}(\rho_{1\mid 0})_{Ren.} = \partial R_{en.} / R_{en.} *100\%$
6	Growth of the quality of sanatorium-resort activities ($R_{qual.SRA}$)	$\rho_{t\mid t-1}(\rho_{1\mid 0})_{Rqual.SRA} = \partial I_{rhat.} / I_{rhat.} *100\%$
7	Growth of the quality of sanatorium-resort services ($R_{qual.SRS}$)	$\rho_{t\mid t-1}(\rho_{1\mid 0})_{Rqual.SRS} = \partial I_{qual.sat.SRS.} / I_{qual.sat.SRS.} *100\%$

The growth of the quality of sanatorium-resort activities (Rqual.SRA) and the quality of sanatorium-resort services (Rqual.SRS) is assessed by the growth rates of the resort and health improvement attractiveness index (Irhat.) and the sanatorium-resort service quality satisfaction index (Iqual.sat.SRS). Accordingly, Irhat. = The number of people having rest in the current year (half-year, quarter) / The number of people who had rest last year (half-year, quarter). Iqual.sat.SRS = The number of positive reviews on the SRS quality (year, half-year, quarter) / The total number of reviews on the SRS quality (year, half-year, quarter).

Discussion of Results

To develop a unified assessment scale, it is necessary to convert the private scales of economic efficiency assessment for each summarizing indicator into a new (say, 5-point) dimensionless scale: [0; N], where N is 5 points on the scale; N is a number determining the range of the new scale; 0 is the value of the indicator corresponding to the lowest quality of the property; N is the value of the indicator corresponding to the highest quality of the property.
Accordingly, the summarizing economic efficiency indicators are assessed on a scale of [0; N] converted into a unified variable X'.
1. In case of a monotonic increasing dependence (the larger the value of $X^i \mid X^i > 0$, i = 1;7, which represents one of the seven summarizing performance indicators, the higher the quality), the value of the corresponding unified variable X' is calculated by the formula (5):

$$X' = [(X^i - X^i_{min.}) / (X^i_{max.} - X^i_{min.})]*N, \quad (5)$$

where $X^i_{max.}$, X^i_{min} are the maximum and minimum values of the initial indicator X^i.
2. In case the dependence is monotonic decreasing (the larger the value of X_i, the lower the quality), the value of the unified variable X' is calculated by the formula (6):

$$X' = [(X^i_{max.} - X^i) / (X^i_{max.} - X^i_{min.})]*N, \quad (6)$$

where $X^i_{max.}$, $X^i_{min.}$ are the maximum and minimum values of the initial indicator X^i.
3. In case the dependence is not monotonic (there is an optimum X^i between $X^i_{max.}$ and $X^i_{min.}$, the value of the unified variable X' is calculated by the formula (7):

$$X' = [1 - |X^i - X^i_{opt.}| / \max\{(X^i_{max.} - X^i_{opt.}), (X^i_{opt.} - X^i_{min.})\}] * N, \quad (7)$$

where $X^i_{opt.}$ is the optimum of the initial indicator.

As a result, the integral assessment of the economic efficiency ($E_{integral}$) of an institution is calculated based on the values of the unified variables for each indicator from Table 1 using the arithmetic mean formula (8):

$$E_{integral} = \sum^{7}_{n=1} X'_n \ / \ \text{n}, \qquad (8)$$

Conclusions

It is expedient to outline resource and target economic efficiency. Resource economic efficiency is the efficiency of resource use, and target efficiency is the economic efficiency of processes. The economic efficiency of sanatorium-resort health improvement institutions is supplemented by social and biomedical (medical and health improvement) efficiency. The classification of resources, costs, and results for analysing and assessing the economic efficiency of the activities of sanatorium-resort health improvement institutions is based on the criteria accepted in economic science. The comparison of the methodological approaches to assessing the economic efficiency of organizations in the market economy conditions highlighted the priority of the business approach when building a system of economic efficiency indicators and criteria. The integral indicator will allow us to take into account the specifics of the social facility services and determine its operating efficiency reserves.

Abstract

The instruments of state influence concerning tax payers include, among others, various tax burden reduction mechanisms incorporated into the system, also known as tax expenditures. They constitute an acceptable exception from the tax standard and the tax payer's reaction to a specific stimulating tool is limited to choosing one of the alternatives specified in the act. Using the right of choice, specified by the given tax expenditure, meets the prerequisite to deem such tax payer's conduct as incorporation of a tax strategy aimed at tax minimisation. As a result of the analysis of Polish legal acts, there were distinguished three groups of the tax strategies based on the right of choice: strategies allowing for tax burden postponement, strategies allowing for reducing the tax base in periods other than those specified in the general rules, strategies allowing for definitive income tax minimisation using one or more rights of choice. Legal research has been confronted with the business practice of large 68 capital companies (located in the Opolskie Voivodeship in Poland). It was concluded that the tax strategies based on the right of choice are viewed in tax terms as safe strategies and the risk of their implementation is limited mainly to the general risk related to the company's market functioning in a specific economic reality. The only negative aspect is that the number of rights of choice constitutes a limited catalogue and the opportunities of income tax minimisation through the incorporation of tax strategies based on the right of choice are limited.

Keywords: Tax Expenditures, Statutory Right of Choice, Tax Strategy, Income Tax Minimisation.

Introduction

One of the primary functions of taxes, aside from the fiscal and redistributive function, is the stimulating function. Its essence comes down to the state's differentiation of tax burdens applicable to entities to evoke a specific impact on their decisions. This means that the state can, through applying various tax technique elements, affect economic and non-economic (including social) phenomena and alter them in the desired directions.

The instruments of such influence include, among others, various tax burden reduction mechanisms incorporated into the system, also known as tax expenditures. The Polish tax law includes no definition for this term, but the tax authorities uses it in the annual report titled "Tax expenditures in Poland". In the report's seventh edition (2018), the Ministry of Finances attempted to clarify the term based on the definitions established by the Organization for Economic Co-operation and Development. In the document titled "Best practice guidelines – off budget and tax expenditures" (2004), the OECD formulates the thesis that a tax expenditure is the transfer of public resources made as result of lowering a tax liability in relation to the adopted tax standard.

The Polish tax authorities expanded the definition by stating that a given mechanism can be recognised as a tax expenditure only when the following two prerequisites are met:

- there is an exception from the tax standard adopted in the given conditions,
- the exemption results directly in a reduction in the tax burden for the expenditure's beneficiary (tax payer).

At the same time, it was recognised that a tax standard is a solution that exercises the concept of the taxation's universality, completeness and equality, without differentiation – both discriminant and favouring (Constitutional Tribunal of the Republic of Poland, decision of 11 April 1994, ref. no. K 10/39). It was also emphasised that the tax expenditure's objectives are as follows:

- stimulation of the desired tax payer actions,
- supporting some sectors of the economy or types of economic activity,
- monitoring the tax burden progressions.

Without a doubt, the condition necessary to deem a specific solution as a tax expenditure is its abstractness and generality, i.e. providing it to an unspecified number of tax payers. In technical terms, the condition is met, for example, by the following: reliefs, exemptions, deductible expenses and lowered rates resulting from acts and refraining from tax collection resulting from a regulation of the Minister of Finances. To make a distinction, the condition is not met by a relief in tax liability repayment, awarded by the tax authorities to a specific tax payer in its individual case.

It is without a doubt that the role of tax stimulation cannot be assessed conclusively. On one hand, the legislator, by using various mechanisms incorporated into the tax system, contributes to shaping specific tax payer reactions, their decisions and actions, while on the other – tax expenditures violate the rule of equal taxation. However, aside from the opinions on the fairness of applying discretional state tax policy tools, it is necessary to note that the tax expenditures' effectiveness depends not only on their legal and tax structure, but also on the capabilities of specific tax payers. This demonstrates that systemic tax expenditures refer not only to tax mechanisms, but mainly to numerous aspects of entity functioning in the legal and economic reality. This especially concerns the entities' ability to use customised instruments (tools) and using them based on specific rules and conditions (Felis P., 2016), including the following:

- financial market instruments, e.g. credit, bonds, property rights, derivative instruments,
- other financing sources, e.g. re-investment, capital contributions, subsidies,
- financial system tools, e.g. present interest rate, discounts.

Furthermore, due to the diverse individual inclination of tax payers to use particular solutions, it is impossible to automatically assume that the tax expenditures' addressees will adequately use the system of stimuli incorporated by the legislator into specific tax structures and react to it according to the assumptions (Famulska T., 1998). This is a result of the tax payers' subjective evaluation, because their reaction to tax expenditures will always be a function of the benefits that can be achieved as result of the adopted tax strategy.

It must be noted that in the case of such defined tax expenditures, the tax payer's reaction to a specific stimulating tool is limited to choosing one of the alternatives specified in the act. Therefore, a tax strategy is based on the right of choice made by the tax payer, whereas the choice is not dependent on the tax authorities' permission and the administrative recognition institution does not apply in this case.

The basics of the division of strategies based on the right of choice

Any conditions required to obtain and maintain the right of choice are specified in the tax act. This means that when meeting and maintaining the discipline resulting directly from the act, the tax payer's choice is binding for the tax payer and the authority within the time horizon specified in the act (e.g. for a fiscal year, three years, five years or longer). Making a choice in a given scope is related to the need of considering future tax consequences assigned to the given option of choice, according to the following rule: the freedom of choice also means the freedom of accepting the consequences (Pratchett T., 2011). Clearly, the main criterion for the tax payer is the recognition of the tax benefits that can be achieved. Thereby, using the right of choice, specified by the given tax expenditure, meets the prerequisite to deem such tax payer's conduct as incorporation of a tax strategy aimed at tax minimisation.

The incorporation of tax minimisation strategies is especially clear in the case of direct taxes which feature an explicit dependency between the tax amount and each specific decision on income and expenses. The studies concerned tax strategies for the corporate income tax, which is a tax imposed commonly by tax authorities of many countries on capital companies and other legal persons conducting economic activity.

The essence of the corporate income tax is that it is focused on the result, i.e. the tax directly reduces the profit generated on economic activity. This simple dependency is reflected in each financial statement, where the corporate income tax is disclosed in the profit and loss account in the second-to-last item as a negative amount. This means that tax minimisation strategies provide a clear effect in this tax title in the form of easily estimated savings on the tax liability payment.

The studies of the polish legal acts have shown that the tax strategies based on the right of choice applicable to entities as part of tax expenditures based on the Polish Act of 15 February 1992 on the corporate income tax (Polish Journal of Laws; Dz. U. of 2019, item 865 with amendments), include the following three strategy groups:

- strategies allowing for postponing the tax burden, with a lack of certainty concerning the future final tax amount (tax postponement),
- strategies allowing for reducing the tax base in periods other (shorter) than specified in the general rules and for minimising the tax in short periods with an unchanged final tax amount (benefits' forward transfer),
- strategies allowing for definite income tax minimisation when using one or more rights of choice, which requires specific tax payer conduct, especially in terms of expenses incurred.

The analysis were based not only on legal acts but also on the interpretations of the National Revenue Information, which are related to the discussed issues. Legal research was also confronted with the business practice of large 68 capital companies (located in the Opolskie Voivodeship in Poland).

Strategies allowing for postponing the tax burden

Capital companies that use tax strategies from the first group see a benefit in short-tem cash acquisition, which would otherwise be expended on the income tax in short (monthly) periods. It is characteristic for this right of choice that the adopted strategy does not affect the final tax amount, because the tax depends on other factors. The primary benefit is the postponement of the duty of paying a substantial part of the tax liability with simultaneous tax reduction in present periods (e.g. particular months) – hence the strategy's identification as tax postponement.

During the studies, it was determined that a typical example of this strategy is the selection of the simplified form of paying monthly income tax advances. The essence of a well-planned strategy of this type is that the tax payer makes advanced payments in a fixed and relatively low amount throughout the year, whereas their sum is lower than the tax due for the entire year. The difference between the sum of the relatively lower advanced payments and the tax disclosed for the entire fiscal year is subject to payment after the end of the year, however the postponement of the duty to pay the amount due for the entire year is a substantial benefit resulting from this tax strategy. This benefit can be described by identifying the differences between the value of advanced payments calculated in the regular (real) manner and the value of advanced payments calculated in the simplified manner, with consideration of the value of money over time. For the first month in the fiscal year:

$$PV_1 = \frac{T_{1real} - T_{simplified}}{1 + (\frac{n_1}{365} \times r)}$$

Table 1: The explanations to the formula

PV_1	present value of the difference between the real and simplified advanced payments
$T_{1\ real}$	regular (real) corporate income tax (CIT) advanced payment
$T_{simplified}$	simplified income tax advanced payment
n_1	number of days counted from the first advanced payment deadline to the date of the annual tax return submission
r	nominal interest rate for working capital facility (this interest rate was adopted because the company increases its current working capital by *PV1* and this amount is not provided in foreign resources)

Source: own elaboration based on the Corporate Income Tax Act and a formula for the time value of money.

The situation is analogous for subsequent months in the fiscal year, which is why for the entire year (with the assumption that the fiscal year includes 12 months):

$$\sum PV = PV_1 + PV_2 + \cdots + PV_{12}$$

therefore:

$$\sum PV = \frac{T_{1real} - T_{simplified}}{1 + (\frac{n_1}{365} \times r)} + \frac{T_{2real} - T_{simplified}}{1 + (\frac{n_2}{365} \times r)} + \cdots + \frac{T_{12real} - T_{simplified}}{1 + (\frac{n_{12}}{365} \times r)}$$

Table 2: The explanations to the formula

$\sum PV$	present value of the sum of the differences between the real and simplified advanced payments for year
$PV_1, PV_2 \ldots PV_{12}$	present value of the difference between the real and simplified advanced payments for subsequent months
$T_{1\ real}, T_{2\ real} \ldots T_{12\ real}$	regular (real) corporate income tax (CIT) advanced payment for subsequent months
$T_{simplified}$	simplified fincome tax advanced payment
n_1	number of days counted from the first advanced payment deadline to the date of the annual tax return submission
r	nominal interest rate for working capital facility

Source: own elaboration based on the Corporate Income Tax Act and a formula for the time value of money

An additional positive aspect of the strategy based on the right of choice is the fact that its incorporation features no expenses. On the contrary, the choice of the fixed income tax advanced payment provides savings due to the reduction in the number of activities performed by the financial and accounting services, which are relieved of the duty of monthly advanced payment calculation in real amounts. The simplified method of settling upon the advanced payments is therefore especially beneficial for entities which have their tax base increased year-on-year, because then the paid simplified advanced payments will be lower than the real advanced payments. This method also eliminates the risk of generating tax arrears resulting from erroneous calculations of the real income tax advanced payments during the fiscal year.

For tax strategies based on the right of choice, allowing for postponing the tax burden, with a lack of certainty concerning the future final tax amount, the expected economic effect is minor, but also the general financial risk is minor, while there is no tax risk at all.

Strategies allowing for reducing the tax base in periods other (shorter) than specified in the general rules

The tax strategies based on the right of choice and classified in the second group also enable short-term (monthly) or long-term (annually) cash acquisition, which would otherwise be expended on the income tax. Similarly to the first group's strategies, the primary benefit is the postponement of the duty of paying a substantial part of the tax liability with simultaneous tax reduction in present periods (e.g. in several months in a year or in several years). It is characteristic for the structure of this right of choice that, on the contrary to the first group's strategies, the changes apply to one of material and legal factors affecting the tax base amount, i.e. income or expenses, income deductions or tax deductions.

Income tax deferral results from the tax base reduction in periods other (shorter) than specified in the general rules, which leads to the benefits' forward transfer. Similarly to the first group's strategies, the liability is only postponed in time and the strategy has fundamentally no impact on the final tax amount estimated in long periods of time (e.g. several years). This group can also include, for example, selected strategies based on the right of choice:

- selection of the method of deducting a tax loss on prior years (deduction amount and year of deduction),
- selection of the fiscal year (utilising a different distribution of income and expenses in a different year than the calendar year),
- selection of the method of settling upon exchange rate differences – according to the accounting
  act or the income tax act (utilising the balance sheet law and internal accounting policy rules' simplifications),
- selection of the method of exercising the right to deduct donations (priority of donation deduction before other deductions).

The studies featured the identification – as a typical example of this strategy – of the selection of a degressive method of depreciating some (acquired or generated) fixed assets (machinery, devices and transport mean with specific features). The benefit of this tax strategy is the tax minimisation in the first depreciation period.

The value of the benefit (postponement of tax-deductible expenses) can be specified by estimating the tax from the difference between the value of particular degressive tax depreciations and the value of the estimated linear tax depreciations – with consideration of the value of money over time. For the first period (month, quarter or year, depending on the adopted periods of burdening expenses with tax depreciations) of degressive tax depreciation:

$$PV_{Tax1} = \frac{t \times (d_{degresive1} - d_{linear})}{1 + (\frac{n_1}{365} \times r)}$$

Table 3: The explanations to the formula

PV_{Tax1}	present value of tax calculated from the difference between the degressive tax depreciation and the linear tax depreciation
$d_{degressive1}$	degressive tax depreciation
d_{linear}	linear tax depreciation
t	tax rate
n_1	number of days counted from the tax advanced payment deadline, including the degressive tax depreciation to the deferred tax payment deadline
r	nominal interest rate for capital facilities (this interest rate was adopted because the entity increases its current working capital and this amount is not provided in foreign resources)

Source: own elaboration based on the Corporate Income Tax Act and a formula for the time value of money

For the next fixed asset depreciation periods:

$$\sum PV = PV_{Tax1} + PV_{Tax2} + \cdots + PV_{Tax\,n}$$

therefore:

$$\sum PV = \frac{t \times (d_{degresive1} - d_{linear})}{1 + (\frac{n_1}{365} \times r)} + \frac{t \times (d_{degresive2} - d_{linear})}{1 + (\frac{n_2}{365} \times r)} + \cdots + \frac{t \times (d_{degresive\,n} - d_{linear})}{1 + (\frac{n_n}{365} \times r)}$$

Table 4: Explanations to the formula

$\sum PV$	present value of the sum of the tax calculated from the difference between the degressive tax depreciation and the linear tax depreciation
PV_{Tax1}, PV_{Tax2}… $PV_{Tax\,n}$	present value of tax calculated from the difference between the degressive tax depreciation and the linear tax depreciation – for subsequent periods
$d_{degressive1}$, $d_{degressive2}$... $d_{degressive\,n}$	degressive tax depreciation – for subsequent periods
d_{linear}	linear tax depreciation
t	tax rate
n_1	number of days counted from the tax advanced payment deadline, including the degressive tax depreciation to the deferred tax payment deadline
r	nominal interest rate for capital facilities

Source: own elaboration based on the Corporate Income Tax Act and a formula for the time value of money

Analogous effects are associated with a similar tax strategy based on the right of choice, which utilises a one-time depreciation, the income deductible expenses of which include the sum of tax depreciation up to the amount of EUR 50,000 in a fiscal year (Article 16k paragraphs 7-11 of the Corporate Income Tax Act). Then there is a one-time expense burden with the fixed asset value and the tax minimisation takes place in the first settlement period.

The use of the degressive tax depreciation or one-time depreciation method includes no risk – neither financial, nor tax-related. Similarly, the methods require no additional expenses, because the only expense is the increased workload required to perform labour-consuming calculations and accountancy.

This means that for tax strategies based on the right of choice, allowing for reducing the tax base in periods other (shorter) than specified in the general rules and for minimising the tax in short periods with an unchanged final tax amount in long periods (benefits' postponement) – the achieved economic effect is minor, but there is no financial and tax-related risk, or additional expenses incurred to implement the strategy.

Strategies allowing for definite income tax minimisation when using one or more rights of choice

The tax strategies from the third group, used by capital companies, based on the right of choice, are more complicated than the strategies from the first and second group, because the income tax minimisation – when using one or more rights of choice – requires specific tax payer conduct, especially in terms of expenses incurred. The primary benefit is not the postponement of the duty of paying a part (or all) of the tax liability with simultaneous tax reduction in present periods (as in the case of the first and second group strategies), but the definitive reduction in the corporate income tax burden. The characteristic feature of this group's strategies is that the change applies not only to one

or more material and legal factors, which affect the tax base amount (as in the case of the second group strategies), but to the company's internal environment. Furthermore, the right of choice is burdened with the duty to meet the requirements resulting from the act and their executive acts and – in some cases – the duty to obtain a relevant permit.
The most spectacular example of this group's tax strategy is the establishment of economic activity in a special economic zone (SEZ). The Polish legislator created special zones as a support instrument with the purpose of accelerating the growth of regions by attracting new investments and promoting workplace creation. Its objective was achieved through administrative separation of country areas in which it is possible to conduct economic activity on preferential terms, including the use of a corporate income tax exemption. The basis for using the income tax exemption is the exemption for conducting economic activity in a special economic zone.

The rules and terms of investing in a SEZ and the scope of benefits deriving from conducting economic activity in one are specified in the Act of 20 October 1994 on special economic zones (Polish Journal of Laws; Dz. U. of 2019, item 482), harmonised with the Regulation of the European Commission no. 70/2001 of 12 January 2001 on the application of Article 87 and 88 of the EC Treaty in relation to state aid for small and medium enterprises (EU Official Journal, series L no. 10/33). The numerous benefits include a wide spectrum, i.e. from aiding local governments to availability of investment areas equipped with full infrastructure. One of the most important benefits is the income tax exemption, whereas the exemption applies to a tax payer solely to the income generated from economic activity conducted within the given zone.

The amount of available tax exemption depends on many factors, the main of them include the following:

- establishment of investment in an economic zone in a specific voivodeship,
- classification of an entity to a specific group – small, medium or large enterprises,
- amount of eligible expenses, i.e. the value of investment incurred by the tax payer or the sum of remuneration paid to employees in a specific period of time.

The maximum value of tax exemption is calculated as the product of eligible expenses (investment or sum of remuneration) and the percentage index reflecting the regional aid intensity in areas belonging to particular voivodeships (10% - 50%). The calculation of the tax exemption amount is represented by the following formula:

$$T = r * PV$$

Table 5: The explanations to the formula

T	income tax exemption
r	tax rate applicable to a specific voivodeship (10% - 50%)
PV	value of incurred expenses - discounted as of the date of permit issue

Source: own elaboration based on the Corporate Income Tax Act and a formula for the time value of money

The expenses incurred are subject to discounting according to the formula specified in the executive regulation to the Act on special economic zone:

$$PV = FV * \frac{1}{1+\frac{r_1}{12}} * \frac{1}{1+\frac{r_2}{12}} * \dots * \frac{1}{1+\frac{r_n}{12}}$$

Table 6: The explanations to the formula

PV	value of incurred expenses - discounted as of the date of permit issue,
FV	value of incurred expenses - as of the day they were incurred
$r_1, r_2, \ldots r_n$	discount rate applicable to the given month (according to the rate specified by the European Commission)
n	number of months elapsed from the date of obtaining the permit to the date of expense incurring

Source: own elaboration based on the Corporate Income Tax Act and a formula for the time value of money

The exemption period depends mainly on the date specified in the permit (tax exemption period limitation) and on the income generated in subsequent tax years, because:

- for each tax year, the tax payer specifies the amount of tax it was not obliged to pay due to the available corporate income tax exemption,
- the specified amounts are deducted by the tax payer from the available amount of exemption (with consideration of the discount) until it is spent.

The expected effect of the tax strategy based on the right of choice exercised by establishing an economic activity in a special economic zone, is the tax exemption on income generated on activity conducted within the zone, which in essence means income tax (only on this specific income) minimisation to zero in the specified amount limit and the resulting time horizon.

This tax strategy requires substantial expenses – both investment expenses and in terms of internal organisation. In practice, the choice means establishing a new enterprise from the ground up (the so-called greenfield investment) at a specific location, size and time, with the duty of maintaining *status quo* in a specific time horizon. In the case of non-maintenance of employment in the designated size and time or infringing the permit terms in a different manner, the tax payer is obliged to pay the tax for which he was granted exemption. Thereby, the strategy is encumbered with high general risk, constituting the sum of all risks applicable to an economic activity conducted in a volatile market. Additional financial risk is posed by the uncertainty concerning the exercise of tax exemption at its full amount. Due to the fact that the exemption availability period is specified both in terms of the generated income and the limit date, it is possible that an entity uses the tax exemption in a partial extent, because it didn't generate enough income to exhaust the relief prior to the limit date (the tax sum in subsequent years will be lower than the exemption limit). In such circumstances, companies strive to expand their tax strategy with new elements aimed at transferring income from the future to the time of use of public aid in the form of a tax exemption (forward transfer). The effect is achieved by delaying the creation of tax expenses in exempted activity or forwarding the time of income generation in the given activity. This ability is given, for example, by the exercise of the right of choice in terms of lowering the depreciation rates for asset components. The tax regulations do not regulate the bottom limit of depreciation rate reduction, which is why it is possible to reduce them to 0%. Similarly, the regulations do not refer to the period for which the rates can be reduced, therefore in consequence the expenses (tax depreciation) can be transferred forward to the period in which the company will not use the tax exemption and only then will it reduce taxable income.

The conducted studies demonstrate that in the case of this strategy, the expected economic effect in the form of tax minimisation seems equally appealing as the economic motive resulting from a non-tax expenditure. On the other hand, the real barrier for using the strategy are the expenses related to its incorporation – covering the investment expenses or level of employment and remuneration of employees at a given level – which is decisive for the acquisition of the permit for conducting activity in a special economic zone.

Conclusions

A specific feature of tax strategies based on the right of choice is the tax payers' undisputable right to minimise the income tax, provided that it is done in the manner and on the terms specified directly in the act. This means that the strategies are viewed as safe in tax terms. Thereby, the risk of tax strategy implementation is limited mainly to the general risk related to the company's market functioning in a specific economic reality. On the other hand, the tax risk covering any additional tax annotations (including interest and other consequences, including fines), constituting effects of a negative strategy assessment by the tax authority, is negligible. It primarily results from the companies' non-compliance of the terms specified in tax acts or in the permits, however it is not generated by any possible allegation of tax law circumvention.

Table 7: Assessment of the effects of corporate income tax strategies based on the right of choice.

	Corporate income tax strategies based on the right of choice	Additional financial effect	Risk		Cost of execution
			business	tax	
1	**strategies allowing for postponing the tax burden**, with a lack of certainty concerning the future final tax amount (tax postponement), e.g. simplified advanced payments	low	none	none	none
2	**strategies allowing for reducing the tax base in periods other (shorter) than specified in the general rules** and for minimising the tax in short periods with an unchanged final tax amount (benefits' forward transfer), e.g. forwarded depreciation	average	none	none	none
3	**strategies allowing for definite income tax minimisation** when using one or more rights of choice, which requires specific tax payer conduct, especially in terms of expenses incurred, e.g. establishment of activity in a SEZ.	high	average	average	very high

Source: own elaboration based on research

Another feature of tax strategies based on the right of choice is their universality, which results from the fact that all strategies in this group are available to any capital company – in a specific situation, within the limits specified in the tax act regulations.

In opposition to the specified positive aspects of the strategies based on the right of choice is a single – and most important – negative aspect, the point of which is that the number of rights of choice is limited. The lawmaker used legislative solutions to encourage capital companies to make specific decisions aimed at minimising the tax burden, but limited the number of mechanisms allowing for the use of the right of choice. Therefore, the scope of tax strategies based on the right of choice is clearly and precisely specified. At the same time, tax interpretations as well as court and administrative decisions include a view that any tax exemptions and reliefs in the Polish tax law system constitute an exception and that the interpretation expanding the statutory scope of tax exemption cannot be applied in this regard.

The negative premise makes the opportunities of effective implementation of (tax minimisation) strategies based on the right of choice not so plentiful as the tax payers expect. Furthermore, aside from statutory limitations, there are also numerous limitations related to the essence of company functioning – including the level of resources – that result in the lack of objective opportunities to use specific strategies. Analogous limitations concern other rights of choice not specified herein.

Thereby, the opportunities of income tax minimisation through the incorporation of tax strategies based on the right of choice are very limited.

Abstract

Customers feedbacks are important for businesses to provide the best service and to promote their product. In this digital era, people are expressing emotions and opinions via social media towards various issues including the satisfactions of using certain products or services. Since telecommunications companies are competitive, they tend to focus more on which is the best service they can give to consumers, rather than concentrating on what consumers need. In addition, customers require other user reviews to help them choose the most suitable service based on their criteria. This work focuses on obtaining the positive and negative feedbacks by the customers using sentiment analysis method to visualize the data in an informative way. Lexicon-based approach is used during pre-processing phase as it is more suitable to manage abbreviations, symbols and language other than English. Then, Naïve Bayes classifier is applied to classify the positive and negative words. The result is represented in a graphical representation of pie chart and word cloud using Highchart as the data visualization tool. Three top telecommunication providers in Malaysia (Maxis, Celcom and Digi) are used as the case study. From the results obtained, Maxis has the most positive reviews by the customers. In order to focus on the problems faced by their customers, word cloud is used to observe the most common and important keywords used by them. The system is beneficial for businesses and customers to analyze the important features needed to meet their requirements to improve the business management and increase customers' satisfaction.

Keywords: Business, Sentiment Analysis, Telecommunication Provider, Customer Feedback.

Introduction

The advancement of technologies has made people's lifestyle changed abruptly, especially the way of communication (Pinto et al., 2019). Through digitization, it provides telecommunication companies an opportunity to enhance their business management for a better service to customers (Caylar & Ménard, 2016). In order to obtain feedbacks from customers, various types of media are used and one of the most popular platforms to get customer's reviews is the Social Networking Sites (SNSs) such as Facebook and Twitter (Salloum et al., 2017). Hence, it gives opportunity for businesses to promote their products and services based on the customers' need. Advertising is an important aspect in businesses to boost visibility of the industry to expand the business and to widen the word of mouth referrals (Hessinger, 2019), thus, obtaining customers' reviews will assist in marketing the products and services better. The reviews can spread across thousands of people by having customers posting their feedbacks and experiences on their SNSs (Khatoon, 2017).

According to Vidya et al. (2015), SNSs has been used by most telecommunication companies as their marketing strategy in order to improve their services due to the competitions among the other telecommunication industries (Susanti et al., 2018). This has caused the companies to focus more on

gaining benefits by offering numerous offers without concerning on the users' requirements. Although many tempting offers are being advertised to the public, certain group of people have different needs based on their location, internet usage activities, call time and many more (Khatoon, 2017).

Telekom Malaysia is the first telecommunication company in Malaysia that provides land-lines and mobile services (Munyanti & Masrom, 2019). As the technology grows rapidly throughout the years, there are several telecommunication companies such as Maxis, Celcom and Digi providing many types of packages according to the trend during the era. Table 1 shows the comparison of packages offered by the three different telecommunication providers (Maxis, Celcom and Digi).

Table 1: Comparison of Telecommunication Packages in Malaysia

	Maxis Hotlink Red	**Celcom**	**DiGi**
Monthly Internet passes (RM)	35/45/60/70	30/50/79	35/50/70
Base data quota(GB)	6/8/10GB	5/10/15GB	6/7/12GB
Free data(GB)	FREE Non-stop RED(Chat/Social/Video) Unlimited Calls for monthly Internet passes RM60 and RM70 only	FREE Unlimited Late Night Youtube(1AM-7AM) Unlimited Music Walla iflix VIP Access	biGBonus(bonus data from 1pm-7pm) Unlimited Calls

Therefore, this has caused users to find it difficult to choose the most suitable telecommunication packages to suit their needs. A web-based system to visualize customers' positive and negative reviews is developed to assist in choosing the most suitable telecommunication provider.

This paper is organized as follows: Section 2 will discuss on the related work of Sentiment analysis in determining positive and negative texts and Section 3 will explain on the methodology. The results obtained will be described in Section 4 followed by the conclusion in Section 5.

Related Work

Sentiment analysis is a technique that detects people's emotions or attitudes (Liu & Cocea, 2017) which consists of five stages: enrichment, transformation, pre-processing, vectoring and mining. Enrichment stage is to identify and tag name entities to be used during the filtering of words. Next, transformation is the phase that change textual data into structured data to classify positive and negative sentiments. Pre-processing is then performed to clear unnecessary elements such as numbers and symbols in the texts. During the vectoring stage, the data will be transformed according to the number of positive and negative words which leads to the last stage, mining where the texts are classified into positive and negative categories. Text processing and classification techniques are the most important techniques for sentiment analysis. Text processing involves bag-of-word, corpus and lexicon-based method whereas classification involves methods such as Naïve Bayes (NB), Support Vector Machine (SVM) and K-Nearest Neighbour (KNN).

Bag-of-word calculates the appearance of words in text which is also called unigrams. This technique is easier to understand where the process can achieve a higher performance and more efficient in computation (Kolchyna et al., 2015). On the other hand, text corpus is based on large body text for linguistic analysis purposes which is quite difficult to perform annotation process (Dootio & Wagan, 2019). The lexicon-based approach is based on unigram to assign polarity score where dictionary of words is involved and can be created manually or automatically using seed words to increase the list of words (Kolchyna et al., 2015; Goyal & Daume, n.d.; Rajput & Solanki, 2016). Hence, this work used lexicon-based approach for text processing as it does not require any procedure of learning for data labelling as well as identifying the meaning via context and library.

NB is a supervised algorithm with independent feature. It is based on probabilistic classifier using Bayes Theorem to calculate the data that belongs to a specific class (Abdi et al., 2018; Ali et al., 2017). Besides NB, SVM is also commonly used as a classifier that provides maximum separation between classes as it is a technique that finds "maximum margin-hyperplane". In addition, SVM contains more statistical learning theory and method of structural risk minimization which represents two layers of neural network that can be used for linear or non-linear regression. In the binary classification problem, the hyperplane method can be separated and keep as large as possible (Ali et al., 2017). On the contrary, KNN is known as one of the simplest algorithms known as instance learning method. According to Vidya et al. (2015), KNN has some aspects that are easy to interpret the output, calculation time and predictive power. Table 2 shows the three classifiers' performance for sentiment analysis.

Table 2: Comparison of Classifiers' Performance for Sentiment Analysis

	Naïve Bayes (NB)	**Support Vector Machine (SVM)**	**K-Nearest Neighbor (KNN)**
Azizah, Ivan and Budi (2015)	F-1: 89.08% Recall: 81.48% Precision: 91.38%	F-1: 89.33% Recall: 92.61% Precision: 86.26%	F-1: - Recall: - Precision: -
Mustafa, A and Sohail (2017)	-	-	F-1: 75.6% Recall: 76.6% Precision: 75.4%
Jadhav & Channe (2016)	Precision: 81.667%	-	Precision: 100 %

Based on Table 2, each of the classifier has their own advantages and disadvantages. According to Jadhav and Channe (2016), the advantages of KNN are it is easy to understand and to implement because KNN can store all training samples and do not need to create classifiers until a new unlabelled sample needs to be classified. However, KNN has limitations where they need more memory space and it runs slower than NB which has computationally intensive recall (Devika et al., 2016). The advantages of SVM is that it has high dimensional input spaces and the vector of the document is sparse but also requires a large amount of training sets and the data collection of SVM is tedious. Therefore, this work used NB as the classification method since it has a precision of 91.38% in (Azizah et al., 2015) work. Moreover, the speed for computational training by NB is faster than KNN in Jadhav and Channe (2016) study and can deal with noisy data by removing irrelevant features to enhance the classification performance which is suitable for a large dataset.

Several previous studies on measuring customers' satisfaction using sentiment analysis is shown in Table 3.

Table 3: Previous Related work using Sentiment Analysis

	Azizah, Ivan and Budi (2015)	Mustafa, A and Sohail (2017)	Khatoon (2017)	Susanti, Djatna and Kusuma (2018)
Focus Element	To measure customer loyalty using NBR and NPS	Measure English comment of the different telecommunication provider	To enhanced customer with the management	Sentiment Analysis on GSM service based on: - SMS - Data Usage - Service provider
Technique use	Classifier SVM	Classifier KNN	Text Processing lexicon method Classifier SentiWordNet	Classifier Multinomial Naïve Bayes.

From Table 3, the study by Azizah et al. (2015) measures customer loyalty using Net Brand Reputation (NBR) and Net Promoter Score (NPS). NBR is a digitally reputation value of brand. NPS is by asking question or distribute the questionnaire. NPS and NBR is to simplify the measurement of customer loyalty. Measuring brand reputation using positive and negative mention in the Twitter comment. SVM is used to classify NPS while the formula used to calculate NBR is as follows:

$$NBR = \left(\frac{Positive\ mentions - Negative\ mentions}{Positive\ mentions + Negative\ mentions}\right) \times 100\%$$

In Mustafa and Sohail (2017) work, it measures English comment on Twitter based on different telecommunication provider. TF-IDF is used to collect the data from tweets on Twitter, then, KNN is used as the classifier. The scoring of words is calculated as follows:

$$f_{ij} \log \frac{number\ of\ tweets}{number\ of\ tweets\ that\ include\ word\ i}$$

where f_{ij} is the frequency of the word in tweet.

Furthermore, Khatoon (2017) work enhances the telecommunication management for customers in which the Customer Relationship Management (CRM) system maintains information about customers such as the customer behaviours, feedbacks and complaints. Lexicon-based approach is applied to compute sentiment scores from collected tweets, then, SentiwordNet (SWN) is used as a classifier. The calculation is performed as follows:

$$Score(Term_i) = \frac{1}{TotalSyn} \sum_{i}^{n} Score\ (i)$$

The total score term (*Score (Termi)*) calculates average values of all terms that are found in the texts. *TotalSyn* is the total number of sysnset of all possible POS of term *Ti* found, *Score(i)* is the score for each synset. The individual term sentiment score is calculated as the value of all the tweet words.

Moreover, in Susanti et al. (2018) study, sentiment analysis was conducted on GSM service, the telecommunication in Indonesia. The sentiment analysis is based on the level of service data usage, Short Message Service (SMS) and service provider. It uses Multinomial Naïve Bayes as the classifier also on training and testing level.

In order to represent data in an informative way, data visualization is used. Data visualization is a general term that describes any attempt by putting it in a graphical context to help people understand

the significance of the data. Through data visualization tools, patterns, trends and associations that may go undetected in text-based data can be revealed and recognized more easily (Gebremeskel & Biazen, 2019). Nowadays, there are various tools to visualize data. For example, D3.js, Highchart, Looker and Three. To map the graph of relevant data, any programming language could also be used such as python, in which graph can be plotted using classes such as Pyplot() with the aid of certain nested conditions. Another approach for data visualization is to use any pre-existing software such as tableau and Matlab (Vij & Pruthi, 2018). Thus, this work uses Highchart to represent the results of the data.

Methodology

This work performs sentiment analysis using pre-processing, classification, and visualization to deliver the information about customers' feedbacks on the telecommunication provider services. The system architecture is illustrated in Figure 1.

Figure 1: System Architecture

Based on Figure 1, raw data is extracted automatically from Twitter from the three telecommunication providers' (Maxis, Celcom and Digi) Twitter page. Then, pre-processing is performed by using Lexicon-based approach to process the data involving filtering of texts to be stored into the database. By using the cleaned texts from the database, classification is done by applying NB method. Both English and Malay texts are classified into positive and negative categories. Once the words have been classified, visualization of data is then being performed to represent the information in a better view. Data is presented in two different types of chart which are pie chart displaying the percentages of positive and negative comments from customers, and word cloud to view the most common words being used by the customers in their tweets.

Results

Three columns are obtained representing sentiment, tweets and user respectively. The sentiment is mapped automatically for each user based on their tweets. Figure 2 shows the tweets obtained from Maxis Twitter page after pre-processing and classification.

Figure 2: Maxis Twitter Tweets

Based on Figure 2, all tweets from Maxis customers were extracted and categorized into positive and negative sentiments. After classification of sentiments, the data is represented in a graphical representation as illustrated in Figure 3.

Figure 3: The Percentage of Positive and Negative sentiment for Maxis Provider

From the pie chart shown in Figure 3, positive words are being used more than negative words. This shows that most customers are satisfied with the services provided by Maxis company. However, the company should focus on the percentage of the negative tweets to overcome the problems being experienced by their customers in order to improve their service. On the other hand, customers will refer to the percentage of positive sentiments to assist them in selecting the most suitable telecommunication provider. Hence, the result of positive tweets by the three telecommunication providers are represented in Figure 4.

Figure 4: The percentage of Positive Sentiments for Maxis, Celcom and Digi

Based on Figure 4, there is not much difference in percentage between Celcom and Digi provider with only a difference of 6.1% but Maxis has the greatest number of positive tweets. This shows that most customers prefer to use Maxis as their telecommunication provider compared to the other two. Therefore, the good features provided by Maxis should be considered by the other telecommunication providers in order to compete in terms of the line coverage, internet speed, cost and other important features for the customers to be keener in using the service.

To have a detail outlook on the problems faced by the company based on the users' perceptions, word cloud is implemented to represent the results as shown in Figure 5.

Figure 5: Negative words used by Celcom users via Word Cloud

From Figure 5, there are various of negative words used by Celcom users which needs to be taken into consideration for service improvements. The larger the font size of the word, the more customers are emphasizing on the matter. According to the result obtained, most Celcom users are not satisfied with the internet speed, line coverage and the price. Thus, these features need to be enhanced to provide customers with a better service in the future.

Conclusion

In this paper, a web-based system to visualize the customers' feedbacks using sentiment analysis on three telecommunication providers in Malaysia (Maxis, Celcom and Digi) is presented. Various techniques of pre-processing and classification are being used for sentiment analysis to classify positive and negative sentiment texts. For this work, lexicon-based approach was used for pre-processing as it is more efficient and easier to be implemented due to the language other than English being used in the tweets. Moreover, it is more convenient to filter abbreviations, acronyms, symbols and other non-useful texts during the cleaning stage. NB was applied for classification as it produces a much better accuracy performance to classify positive and negative sentiments. Then, visualization of the data was performed to observe and analyse the customers feedback towards the telecommunication provider services. From the result obtained, Maxis has shown to have the most positive words used by the customers in Malaysia. This portray the good services being provided by Maxis company towards its customers since most of them are satisfied with 69.5% of positive feedbacks compared to Celcom and Digi with only 12.2% and 18.3% of positive feedbacks respectively. However, the negative words need to be taken into consideration by using word cloud as a tool to focus more on the lacking features of the services. It is recommended for the companies to observe the negative feedbacks to improvise their services for the betterment of the business management in the future.

Abstract

Mobile E-Services is becoming the main medium of digital interaction in the modern age digital economy. Currently, Mobile E-Services are widely applicable and useful for: (1) business and industry operations, (2) banking (3) education and (4) health care. This paper presents a mobile E-Services application that provides digital coordination and management of the electricity users' accounts and consumptions in Malaysia. The application was expected to be beneficial to many users as compared to the conventional online management system. However, based on the users rating and preliminary user interview it was revealed that the users' adoption to the mobile E-Services application was low. Therefore, this research was initiated to identify the factors associated with the users' acceptance towards the mobile E-Services application. This research used the Technology Acceptance Model (TAM) to explain intention and usage of technology with an additional determinant of personal innovativeness in technology. This research involved 298 residential customers who participated to answer the survey either through online or printed questionnaires. The questionnaires were formulated based on the proposed TAM constructs and the data collected was analysed based on using descriptive and Pearson correlation analysis. The finding of the research indicates that all the determinants used for the TAM construct have significant relationships towards the mobile E-Services users' acceptance.

Keywords: Mobile E-Service, Users' Acceptance, Perceived Usefulness, Perceived Ease of Use, Personal Innovativeness in Information Technology

Introduction

Nowadays, information and communication technologies (ICT) plays a crucial role in supporting the achievement of corporate goal. The use of e-commerce, e-business, e-education, e-banking, e-services and other kinds of activities have become a vital way of interacting information digitally. Furthermore, with the continues popularity of smartphones, the use of mobile application has given a global positive impact to the today's society, the majority in business management, operation and marketing. A typical mobile application runs on a small handheld mobile device, that is easy to use and accessible from anywhere and at any time. Various business and industries are earning revenue through the use of mobile application, including the service industries such as communication and electricity providers. The mobile e-service is a mobile application which supports business operations within the service industry. This mobile application enables customers to: (1) access their account information (2) manage their account subscription and (3) keeping track of their bill and payment history.

This study investigates the users' adoption and acceptance towards the mobile E-Service application of an electric provider in Malaysia. In 2013, there were about 9.2 million of customers from commercial, industrial and residential that subscribes to the electric utility provider. The number of customers kept growing yearly thus demanded the electric provider to develop a mobile e-service application. The application was expected to cater 8.5 million residential customers in order to allow them: (1) to pay monthly bills (2) to keep track of payment history and (3) to report of service problems. According to the customer service officer from the electric utility provider, the expected returned from the mobile e-service application investment was not yet satisfying, thus it created an important issue to the management. The users' adoption of the mobile e-service application among the customers until recently is very low. From Google Play Store, the number of download hit is less than 500 thousand and the rating by the customers is somewhat discouraging. It only reached 3.5 out of 5 rating value in the Google Play Store and 3.4 out of 5 in the Apple App Store. It is also observed that a few negative comments has been written by the customers on the review comment section. Responding to these issues, there is a need to determine the factors that affect customer acceptance towards the mobile e-service application.

Research on technology users' acceptance that used Technology Acceptance Model (TAM) and its extensions has been widely reported in the literature (Ngafeeson and Sun, 2015). Perceived usefulness and perceived ease of use are the common constructs for the TAM model. As very little research that investigated users' personal innovativeness in IT towards the users' acceptance model, it would be interesting to get insight into this aspect as one of the additional determinants.

Background of Study

Technology Acceptance Model (TAM)

In the study of technology adoption, several theories have been introduced and some of the theories have received much attention by researchers for modification and extension (Durodolu, 2016). Among the existing theory, TAM has become one of the utmost major models for technology adoption. This theory first introduced by Davis (1989) and has been widely used in describing users' adaptation to the new technology. The TAM model focuses on the determinants of Perceived Usefulness (PU) and Perceived Ease of Use (PEOU) in order to study a user's acceptance or rejection of a technology towards the Behaviour Intention (BI). In other words, the attribute of BI is a dependent variable of the acceptance model that relies on the elements from the PU and PEOU variables. Figure 1 below illustrates the original TAM model.

Fig. 1: Original TAM Model by Davis (1989)

Behavioural Intention (BI)

According to Fong and Wong (2015), BI is defined as consumer readiness and likelihood to use the technology (i.e. mobile commerce services). Alharbi and Drew (2014) states in TAM, BI describes the actual use of a given technology. Research by Brusso (2015) demonstrated that BI leads to the development of implementation plans, which then lead to technology usage. Consumer behaviour has changed over the decade and businesses had attempted to comprehend the virtual consumers by understanding consumer online behaviour and factors influencing their behavioural intention to engage in online transactions. Furthermore, some users view the technology will be better in spite of their approach to technology usage if they assume a technology to increase their performance on the job. BI could largely foresee the actual customer behaviour when the behavioural intention was correctly measured (Mutuku, Iravo and Omwenga, 2016). They were associated with the service provider's ability to make its customers responded with a more positive review and tends to recommend the technology to other customers, remain loyal and willing to engage with premium solutions. According to Wahyuningsih and Djayani (2010), BI positively related to customer satisfaction. This leads the customer to likely repurchase products or services from the same company.

Perceived Usefulness (PU)

Many researchers argued that PU is an important factor to rectify the TAM (Bireswar, Mei and Shu, 2018). According to Keswani et al. (2016), PU has been widely recognized as one of the main determinants besides perceived ease of use in the field of technology acceptance. In her research, she discussed the factors influencing consumer intention to adopt online shopping systems and discovered that perceived usefulness significantly associated with the use of the internet. They also integrate the beliefs of TAM with perceived enjoyment as a moderator, which yields a better perspective to use online shopping systems. Research by Cigdem, Aycan and Erhan (2018) revealed that there is a positive relationship between PU with the intention to adopt mobile banking usage. On the contrary, in mobile games application, Khong et al. (2018) identified some beliefs that promote the use and acceptance of the technology. They enumerate perceived usefulness, an attribute of usability and user satisfaction as factors that promote intention to use technology in mobile games. The results of the research by Ali et al. (2017) revealed that PU found as an important factor in fostering a positive attitude towards adopting E-Learning.

Perceived Ease of Use (PEOU)

Intention to use directly influenced by PEOU, which consumers attempt to minimize their effort and try to search the easier process in using technology. Therefore, research by Keswani et al. (2016) found PEOU directly influenced customer's intention to use online shopping. Dutta, Peng and Sun (2018) acknowledged PEOU as the key drivers for the adoption of the personal health record in an information system. In addition, Rashid, Abdulaziz and Yasin (2018) adopted the existing determinants of PEOU with other determinants, namely system quality, information quality, and service quality to explain the acceptance of Health Information System. Similarly, Pedro, Jose, and Anna (2017) reported that PEOU is a significant determinant of BI in location-based service technology. Cigdem, Aycan and Erhan (2018) mentioned in their paper that BI of technology acceptance is incomplete without looking at PEOU as the variable effect user intention to use M-banking or mobile banking. In addition, to supporting the research, the authors added other variables such as perceived risk, mobility access, compatibility, perceived self-efficacy, and subjective norms.

Personal Innovativeness in Information Technology (PIIT)

According to Ngafeeson and Sun (2015), less attention has been given to the technology innovativeness with acceptance or adoption of technology decision. This also supported by Davis (1989), who states, future technology acceptance research needs to address new constructs such as technology innovativeness towards explaining a user's intention to new technology. Further, in the study by Amoroso and Lim (2015), it was indicated that there is a strong relationship between innovativeness towards a user's repurchase intention. This indicates that people with high personal innovativeness feel innovative services are more beneficial when incorporating with the degree of mobility. This is also supported by the research from Mohd Ayub et al. (2018) that indicate, that PIIT and user readiness are the main determinants in an individual technology acceptance behaviour. Recent research by Wijesundara and Sun (2018) has examined PU, PEOU, and PIIT as the three main determinants in social networking sites. The result from this study has revealed that PIIT and PEOU shows a positive relationship towards a user's behavioural intention. Figure 2 below is the proposed research model for this research study.

Fig. 2: Proposed Research Model

Methodology

A survey was conducted to gather data for this study. The respondents for this study was residential customers and the electric utility provider staffs. The ideal sample size for this study is 291 respondents base on the recommendation by by Krejcie & Morgan (1970). As the measurement scale items for this study is adapted from several TAM studies, a content validity test. Content validity refers to "the degree to which items in an instrument reflect the content universe to which the instrument will be generalized" (Straub et al. 2004, p.424). The content validity test for this study was conducted by thorough literature review and expert opinion discussion (i.e. academician, and industry experts). The outcome from this content validity test indicates that the proposed measurement scale items for this study is appropriate and reflects each construct of interest. Once the survey data was collected, each respondents input was subjected to data cleaning, upon which only 95 respondents was valid to be further analysed. The analysis in this study first begin with: (1) descriptive analysis (2) reliability test (4) pearson correlations and (5) multiple regressions. Each of the analysis test in presented in the following section.

Results

Reliability Analysis

Reliability test in this study was examined based on the Cronbach alpha score for each construct of interest. Table 3 shows each construct used in this research with the corresponding Cronbach alpha values.

Table 3: Results of Reliability Test and Alpha Value

Variables	Number of Items (Questions)	Cronbach's Alpha
Perceived Usefulness (PU)	5	0.925
Perceived Ease of Use (PEOU)	6	0.950
Personal Innovativeness in IT (PIIT)	4	0.879
Behavioral Intention (BI)	2	0.942

The results from Table 3 led to increased confidence in measurement items of used in this study, therefore further justifies its use in this study.

Descriptive analysis of users' type

Table 4: Awareness about apps (*n* = 298)

Variable	Frequency (%)
Aware about myTNB apps	
Yes	171 (57.4%)
No	127 (42.6%)
Sources of information	
Mass media	13 (7.6%)
Social media	38 (22.2%)
Internet	66 (38.6%)
Friends	45 (26.3%)
Others	9 (5.3%)
Active User	
Yes	95 (55.6%)
No	203 (47.4%)
Frequent use of apps	
Once in few months	27 (9.1%)
Once a Month	45 (15.1%)
More than 2 times in a month	23 (7.7%)
Never use within the last 6 months	203 (68.1%)

Users' type can be active or not active. From the 298 respondents, only 171 of them were aware of the mobile E-Service application which is apps (Refer table 4). Most of them got information on the application through the internet (38.6%), friends (26.3%) and social media (22.2%). The least source of information was from mass media (7.65%) and others (5.3%). Surprisingly, out of these 171 respondents, only 95 of them or 55.6% are active users. Active users are defined as the frequency of using the application for at least once in six months for viewing their billing record or doing a transaction of payment. The inactive users (47.4%) are those who do not download and not use the application for more than 6 months even they are aware of the existence.

Table 5: The association between gender and awareness about the application (*n=298*)

		Aware about myTNB application		χ^2 (df)	*p* value
		Yes	No		
Gender	Male	99 (33.2%)	63 (21.1%)	1.698 (1)	0.193
	Female	72 (24.2%)	64 (21.5%)		

Next, a test was performed to investigate the association between the gender of a respondent and the respondent's awareness about apps using a Chi-square test for independence. Since each variable (gender and awareness about apps) has only two categories, Yates' Correction Continuity was used to compensate the chi-square value. The corrected value (see Table 5) indicated non-significant association between gender of the respondent and the awareness about apps χ^2 (1, n = 298) = 1.698, p = 0.193. This means that the proportion of males that aware about application is not significantly different to the proportion of females**.**

Pearson Correlation Analysis

Table 6 : Results of Pearson Correlation Analysis (n = 298)

		Correlation	PU_Score	PEOU_Score	PIIT_Score
		Pearson Correlations	0.653	0.7111	0.691
	BI	Sig. (2-tailed)	0.000	0.000	0.000
		N	298	298	298

Dependent Variable: BI

Pearson correlation coefficient was computed to assess the relationship between the Behavioural Intention (BI) and the three determinants: Personal Ease of Use (PEOU), Personal Innovativeness in IT (PIIT) and Perceived Usefulness (PU) and the results are shown in table 6. There was a strong positive correlation between BI and PU Score [r = 0.653, n = 298, p = 0.000], BI and PEOU Score [r=0.7111, n = 298, p = 0.000] and BI and PIIT Score [r = 0.691, n = 298, p = 0.000]. The results clarify that perceived ease of use, perceived usefulness and personal innovativeness in IT correlate significantly with customer's continuous behavioural intention to adopt a mobile E-Service application.

Conclusions

The results of this study which focused on mobile E-Service for electric utility has shown that the personal innovativeness to IT as an additional construct to the Technology Acceptance Model has contributed to a significant positive effect to the users' acceptance. Further, the personal innovativeness to IT score is higher than perceived usefulness construct. In response to the low deployment of users, firstly, the services provider should employ strategies which can increase the mobile application usability as this is the most determinant that influences the users. Next, the mobile application user interface can be also be redesign mainly to simplify the registration steps. As for example, the mobile application can use a QR code generator image that can redirect users to the registration page and auto-key in some fields, which carried information from single sign-on mechanisms. Finally, as personal innovativeness to IT also contributes to the users' acceptance, it is essential to employ the individual with good knowledge for IT awareness and skills.

Polish Transport Companies in View of The Principle of Posting Workers in Road Transport in The European Union

Katarzyna PIETRZYK-WISZOWATY

War Studies University, Faculty of Management and Command, Warsaw, Poland,
k.wiszowaty@akademia.mil.pl

Abstract

The free movement of goods, persons, services and capital was one of the fundamental objectives of the creation of the European Union's internal market, which was legally anchored in the Treaty on the Functioning of the European Union (TFEU). It states that the freedom of establishment and freedom to provide services is a guarantee for the mobility of EU businesses and workers. In recent years, there have been attempts to interfere with national transport markets in EU countries in order to protect them from transport operators on their territory. Since 2017, the European Parliament has been working on the regulation of international road transport rules in the European Union, known as the 'Mobility Package'. With the same article adopted, the research objective is to identify the probable effects of the implementation of the minimum wage in the EU on the functioning of Polish transport companies. The pragmatic dimension of the research was based primarily on two main research trends, i.e. showing the importance of Polish carriers in the provision of transport services within the Community and the possible consequences of reducing the supply of these services in the EU in the light of the entry into force of minimum wage regulations.

Keywords: Transport Policy, Transport Companies, Posting of Workers, Minimum Wage.

Introduction

The minimum wage is one of the tools of economic policy of countries. This is the minimum wage that an employee must receive for the work he or she has done, set in terms of time (hourly or monthly). It should be stressed that the economic impact of the minimum wage is not thoroughly investigated. Nevertheless, the primary objective of the minimum wage is to safeguard the minimum subsistence level of workers and to avoid them being unable to cover their living costs. The adoption of such a solution is particularly important in markets where the number of active people exceeds the number of job offers. In such case, employees are ready to work for very low wages to maintain their position (Lauresh, Patorska, 2015, p. 19). In April 2014, a conference on the harmonisation of social regulations in road transport was held in Paris, during which the theses were presented (Rydzkowski, 2017, p. 149) related, among other things, to the need to introduce solutions in legal regulations which will eliminate the phenomenon of social dumping and unfair competition from Central and Eastern European countries, including: Poland, Romania and Bulgaria for carriers from France, Germany, Denmark, Belgium or the Netherlands. Polish transport companies have gained their position on the European market thanks to attractive transport rates and good quality services. Thus, 91% of freight forwarders and half of producers and traders (so called shippers) from Western EU countries often use carriers from Central and Eastern European countries (Posting of workers in transport - opinions and concerns of European entrepreneurs, 2018, p. 3). Thus, changes to the EU minimum wage in the transport sector, as implemented in the legislation, may have adverse economic consequences for all Member States as a result of rising transport service prices. These challenges generate questions: what is the importance of Polish carriers in the implementation of the transport work of the Member States, and will the implemented minimum wage regulations imply negative consequences for Polish drivers? These questions will serve as the main research problems.

International road transport services market in Poland

The transport services market is one of the key economic categories. In the literature on the subject, both Polish and foreign is understood quite clearly. In the theory of transport economics, this is considered to be the whole of trade-economic relations taking place in the process of transport services exchange (Koźlak, 2008, p. 209). Another definition is that this is where demand for transport services meets supply. Entities operating on the transport services market are transport, freight forwarding and logistics companies, transport users, as well as units ensuring the flow of information on the market, as exemplified by the transport exchanges (Burnewicz, 1993, p. 121). In research on the structure of transport markets, many criteria for their classification can be found. It is worth noting the division into the area of activity according to which it stands out (Koźlak, 2008, p. 208):

- local markets (e.g. commuting to work and schools, distribution of goods in cities);
- national markets (e.g. express, construction, cabotage markets);
- international markets (e.g. transit traffic).

The research has focused on international markets, which can take three main forms, namely, as destination markets for own-account loads in imports and exports, transit and cross-trade (Koźlak, 2008, p. 209).

Transport is the cornerstone of civilization. The spread of production, trade and ideas and the economic advantage of humanity depend on movement. The mobility of society is one of the most cherished freedoms of democracy, even though a surprisingly large part of our income is devoted to the movement of people and goods (Stubbs, Tyson, 1984). This assertion currently takes on even greater importance, since the free movement of persons within the European Union makes it possible to counteract labour shortages in individual countries and the free movement of goods stimulates the competitiveness of businesses. It should be stressed that today the transport market is a consumer market, which means that it is characterised by an excess of supply over demand'. (Bentkowska-Senator, Kordel, Waśkiewicz, 2012, p. 17). With so much competition in both the internal and Community market, the consumer is free to choose his or her service provider, thus actively contributing to the quality of service provision. On the other hand, in order to win a contract, transport companies compete not only with the quality of service, but above all with price, which may ultimately lead to a decrease in profitability (Łepkowski, Walendzik, 2016, p. 93-94). A transport user wishing to transport his cargo must choose a carrier that goes beyond a simple analysis of carrier rates and rates for the different modes of transport. It should be noted that the criteria for selecting the carrier have been evaluated over the years. Their hierarchy and relevance has been changing. Today, the decision making process for carrier selection includes, in addition to price or delivery time attributes, the identification of relevant variables related to transport performance, quality of service and evaluation of carrier performance (Monczka et al., 2005). In the implementation of the transport process, these are important decisions on which a company's competitiveness in a given market depends.

The idea adopted by the EU on the freedom to provide transport services within its territory has become the basis for the development of this market. The dominant position in the structure of the transport market in Poland is occupied by road transport, characterised by a large fragmentation of entities providing transport services. Since Poland's accession to the EU in 2004 and the opening of European markets, Polish carriers have gradually built their position and competitive advantage in the European arena. Today, Polish transport companies have over 200,000 vehicles and over 1 million people are employed in the transport and logistics sector, generating €55019 million in turnover. This is a consequence of the fact that Poland has been one of the best developing countries of the European Union in recent years. In 2019, the average annual economic growth was 4.3%, which puts Poland in the top of the top of the most economically strong EU countries from the perspective of the dynamics of gross domestic product (GDP). By the end of the third quarter of 2019, Poland's largest share in the export of goods was recorded with the EU countries, among others, with the Czech Republic and Slovakia: Germany, the Czech Republic, Great Britain, France, Italy, the Netherlands and Hungary, representing 79.9%. On the other hand, in the case of imports from EU countries, this

indicator was 57.9%, and Poland's largest partners from EU countries are: Germany, Italy, the Netherlands, France, the Czech Republic, Belgium and Spain. Poland has the largest percentage of trade with its neighbour, Germany. In the analysed period, exports with the largest economic partner, which is Germany, amounted to EUR 54.4 billion, which represented 27.7% of the total economic turnover. By contrast, imports represented EUR 42.9 billion or 21.9%. Trade with France, which also constituted a significant part of the structure of Polish exports in the first three quarters of 2019, should also be taken into account. For exports, it amounted to EUR 11.5 billion, which accounted for 5.8% of the total number of Polish export trade in goods, while for imports, the result was lower and amounted to EUR 7.1 billion, which accounted for 3.6% of domestic import trade in goods (Foreign Trade in Goods, 2019). Constantly growing trade also results in high demand for transport services. In 2018, the GDP was 5.1% higher in real terms compared to 4.8% in 2017 (in constant prices). Taking into account the services sector, including transport and warehouse management, in 2018 the gross value added increased by 9.2% compared to the previous one (Gross Domestic Product in 2018, 2019). Statistics published by the General Road Transport Inspectorate show that between 2008 and 2018 the number of licences issued for the international road haulage of goods increased slightly more than eleven times, while the number of licence extracts increased by more than 18 times over the period under examination. Polish companies currently rank first in terms of share in total transport work in the EU-28, followed by carriers from Germany and France respectively (Transport of the future, 2019, p. 19). The transport work carried out by carriers from all EU-28 countries and the share of Polish carriers in 2008-2017 is shown in Figure 1.

Fig. 1: Transport work performed jointly by all EU-28 countries and the share of Polish carriers, 2008-2017 [trillion tkm] (Transport of the future, 2019, p. 19).

Thanks to competitive transport rates and high quality of offered transport services, Polish road hauliers are among the leaders of EU countries in cargo transport. Both carriers and their associations shall demonstrate the implementation of the provisions concerning the posting of workers and payment of the minimum wage of the country in which they provide transport services.

Essence of the minimum wage in the context of the occupation of carrier

In this respect, European Union legislation has not fully unified national legislation. Directive 96/71/EC on posted workers introduced the obligation to provide such workers with minimum rates of pay, including overtime, but the determination of the minimum wage and its definition was left to the national discretion. Article 3(1)(g) of Directive 96/71/EC reads as follows: '(...) the concept of minimum rates of pay is defined by the national law and/or practice of the Member State to whose territory the worker is posted'. Serious concern arose in broad circles when the German government administration presented a broad interpretation of the new regulations that came into force on 1 January 2015 in the German Minimum Wage Act (MiLoG). The new rules have made it compulsory

to apply the hourly minimum rate for road hauliers established outside Germany and carrying out transport operations within Germany. The introduction and broad interpretation of these provisions has made the free provision of services more difficult, if not impossible, in Germany or, for example, in France, where similar provisions known as 'Loi Macron' have been introduced. Similar actions have also been initiated by countries such as: The Netherlands, Italy and Austria. These provisions, which are often emphasised in employer circles, constitute a very serious interference with labour law relationships that are in force in the European Union Member State concerned.

Countries introducing laws on minimum wages, which also apply to drivers employed in foreign companies, base their actions on the provisions of Directive 96/71/EC of the European Parliament and of the Council of 6 December 1996 concerning the posting of workers in the framework of the provision of services (Directive 96/71/EC). The provisions of Directive 96/71/EC apply to undertakings which are established in the Member States of the European Union and post their employees to temporary work in the territory of another country in the European Union. According to the provisions of the Directive, a "posted worker" is one who, for a limited period of time, carries out his work in the territory of a Member State other than the one in which he habitually works (Directive 96/71/EC, Article 2, paragraph 1). In the light of Article 1, paragraph 3, the provisions of the Directive apply to persons employed in an employment relationship, whereas the Directive does not apply to persons who are self-employed. According to the adopted provisions, the conditions to be met are, among others: maximum working time and minimum rest periods, minimum paid holidays, minimum hourly rates for work done, equal treatment of men and women. Thanks to these provisions of the Directive, every posted worker is entitled to the minimum wage that applies in the country to which he is posted, if it is higher than the minimum wage applicable in the country of origin. The same rules apply to other terms and conditions of employment, e.g. holiday period, working time, safety at work. Directive 96/71/EC upholds fair competition between companies registered in one country and companies from other Member States. This is to prevent the latter from trying to take unfair advantage of circumstances where there is a higher level of social protection in the host country than in the country of origin.

An important piece of legislation in the context of this study is the Directive 2014/67/EU of the European Parliament and of the Council of 15 May 2014 on the enforcement of Directive 96/71/EC concerning the posting of workers in the framework of the provision of services (Directive 2014/67/EU of the European Parliament and of the Council, OJ L 159/11). Its main objective is to provide guarantees in respect of an adequate level of protection of the rights of posted workers for the cross-border provision of services while facilitating the exercise of the freedom to provide services by service providers and promoting fair competition between service providers and thereby contributing to the functioning of the internal market (*Minimum wage in Germany legal basis, 2017).* The controversy arising from the implementation of this legislation is connected with the inclusion of drivers engaged in international transport under the posting of workers rules. The rules on the posting of workers aim at balancing the interests of employers in the posting country who see an opportunity to do business in another European Union country with the fears of countries assuming that wage dumping may harm their industry. Wage dumping may occur due to unreasonably low paid foreign workers. To prevent this, the Posting Directive ensures that all workers posted to the territory of the host country are subject to the 'hard core' rules of the host country, such as the minimum wage principle (*Klaus, 2019, p. 16*). In this context, it should be noted that the European Union's transport policy declares the creation of a single transport area as one of its objectives. Entrepreneurs are bound by the same business rules, regardless of the country in which their companies are registered. Thus, road hauliers may operate not only in the country of registration but also in other European Union countries, thus making it possible for them to avoid return journeys with an empty vehicle (Understand European Union policy - Transport, 2014, p. 13-14).

The European Parliament's Committee on Transport (TRAN) voted in mid-January 2020 on the proposed amendments, inter alia as regards posted workers. It was agreed that drivers would be treated as posted workers, with a minimum wage in line with the rules of the country in which they provide transport services at that time. This means that Polish drivers carrying out transport in the territory of another country will receive the same remuneration as employees of that country. From Poland's perspective, the positive aspect of the adopted amendments is the exclusion of international transit from the regulations, which means that for transport from Poland to Spain there will be no

need to apply separate minimum wage regulations for Germany or France. However, for all other modes of transport, including cabotage, there will be a full posting regime from day one (EP transport committee supported the mobility package, 2020). It should be stressed that the agreement will become law once it has been formally adopted by the Council of the EU and then voted by the plenary of the European Parliament. According to the arrangements adopted in January 2020, companies will have an 18-month transition period to adapt to the new situation, which will take effect at the end of 2021.

Impact of the implementation of the minimum wage on Polish transport companies

The main rationale for applying the minimum wage is the belief that there is a fair distribution of income in the economy, which should be ensured and shaped by the state. On the other hand, the existence of a minimum wage increases the cost to the employer of hiring more employees. This may lead to negative consequences for the employees themselves. Increased employment costs can increase unemployment and reduce social security. In order to avoid additional costs, employers may use civil law contracts that do not guarantee social benefits as a form of employment. In extreme cases, people can be employed without any contracts. A minimum wage can also lead to inefficiency. In some markets the minimum wage may be higher than the market balance wage. The market equilibrium wage is the wage at which labour demand and supply in a given market equalize. Such a phenomenon leads to employment which is lower than market-optimal employment and, consequently, to unemployment. Moreover, a nationwide uniform minimum wage does not take into account regional wage differences (Lauresh, Patorska, 2015, p. 19).

Between 2017 and 2018, the financial indebtedness of transport companies increased by almost 40%, which is related, among other things, to the inability to pay leasing instalments and loans on time. This was reflected in the database of the National Debt Register of the Economic Information Bureau, where in 2018 there were 23.7 thousand transport companies, whose total debt exceeded 925 million PLN (National Report of the National Debt Register of the Economic Information Bureau, 2018, p. 13). The implementation of minimum wage legislation for posted workers will not improve the financial situation of transport companies. The increase in drivers' personnel costs will translate into higher transport rates and thus reduce the demand for transport services and the competitiveness of Polish carriers in the European arena. Micro and small road transport companies will be in a particularly difficult situation, making it more difficult for them to compete with large companies, with the result that they may not survive in the market. This represents a real threat to the loss of thousands of jobs in Central and Eastern Europe. It can be particularly felt in the countries that joined the European Union after 2004. It should also be added that the legal solutions adopted and the related obligations, such as different documentation of working time, communication in multiple languages, calculation of overtime, complicated forms of registration of posted workers, preparation and storage of posting documentation will generate additional costs related to the employment of new office workers dealing exclusively with the minimum wage and posting of workers.

Based on the results of research carried out on 1074 Polish transport companies by the consulting company Deloitte, the aim of which was to clarify the solutions that can be taken by companies in adapting to the new regulations. Several key actions were identified, including (Lauresh, Patorska, 2015, p. 27):

- increasing prices for contractors;
- the search for new transport markets and thus an increase in the supply of transport services in these markets and, consequently, increased competition;
- restricting travel within Germany;
- failure to respect social conditions in the industry, which will mean unfair competition;
- to reduce your own margin.

It should be stressed that wages are treated as a cost element and therefore as a category that should not increase as it harms entrepreneurs. However, wages, including the minimum wage, perform many other functions, including income, social, motivation and demand creation functions. The latter

function is particularly important in the conditions of low propensity of entrepreneurs to invest, which is the opposite of increasing the quality of labour resources and allocating large expenditures to investment activities (Krajewska, 2015, p. 314). These conditions are inherent in building sustainable market advantage.

Summary

Since Poland's accession to the European Union, the branch of international cargo transportation performed by Polish companies has been developing dynamically, thanks to which, in terms of transport work, Polish carriers have taken a dominant position on the European market. The implementation of the posting of workers legislation has been opposed by many communities and countries. This is due to legitimate concerns about the loss of the high position of Central and Eastern European carriers on the Community market developed over the last few years. Carriers will restrict or withdraw from countries where the provision of transport services will be uneconomic.

The new regulations may have a negative impact on the financial condition of Polish enterprises, which is currently not very good anyway. It will also have its social dimension, as the excessive costs of carriers will contribute to the reduction of jobs or entire enterprises, which in turn will increase unemployment in certain regions of Poland. It will no longer be possible to compete with carriers on the basis of price criteria as before. It should also be added that the effects of the new regulations will also be felt in EU countries where the costs of transport services will increase.

Unpaid Tax Debt as a Threat to Russia's Economic Security

Viktoriia A. KORETSKAIA-GARMASH

Ural Federal University named after the first President of Russia B.N. Yeltsin, Yekaterinburg, Russia,
E-mail: vkoretskaia-garmash@urfu.ru

Abstract

Economic security is essential for any society since it is only by ensuring the enduring prosperity of the country that the government can fulfil its obligations towards the citizens by providing them with high standards of living, opportunities to obtain education, to establish and operate a business.
This study aims to purpose of the survey was to identify the main reasons for tax evasion and non-compliance among young, socially active Russian citizens aged 20-24 a serious threat to the country's economic security. Young adults in Russia doubt that the principle of social justice is actually applied and think that a more differentiated approach to personal income taxation is necessary depending on people's income, the number of dependents, and the non-taxable minimum subsistence income. Their answers can be seen as predictors of tax non-compliance. Over a half of respondents (62.7%) believe that non-compliance is caused by the inefficient use of budget funds by the government, the lack of state support for private entrepreneurs and other groups, the lack of tax incentives for start-ups and tax breaks for entrepreneurs, tax credits for child and dependent care, for the elderly, disabled and individuals suffering from a serious medical condition or injury. Respondents were announced and ranked by the degree of significance of the event, which will reduce the amount of tax debt among taxpayers: conduct a public awareness campaign for personal property taxpayers; use text messaging and e-mail to inform taxpayers about important tax deadlines and due dates for filing income tax returns.

Keywords: Economic Security, Tax Debt, Survey, Tax, Tax Receipts.

Introduction

According to the law 'On Security', national security encompasses economic security; protection of the rights of individual citizens and society in general; detection, analysis and assessment of threats; allocation of funds to meet the needs of national security; and control over the spending of these funds. It should be noted, however, that the terms 'security' and 'economic security' have no agreed definitions not only in Russian but also in international research literature.

Oleynikov E.A. (1997) defines economic security as 'a condition of economy and government institutions that would guarantee the protection of national interests and ensure harmonious, socially-oriented development of the country as a whole, sufficient economic and defense potential even in the occurrence of adverse domestic and international scenarios'. Senchagov V.K. (1995) gives a similar interpretation of economic security, adding that it is not only 'the protection of national interests but also the readiness and ability of the government institutions to establish mechanisms of realization and protection of national interests in terms of economic development, social and political stability'.

In the current economic conditions, the imbalance of the national budget creates new challenges and threats to the country's stability. In accordance with the Budget Code of the Russian Federation, the country's budget system comprises the federal budget, regional budgets, local budgets and budgets of state extra-budgetary funds. All citizens have the duty to pay taxes as prescribed by the Constitution of the Russian Federation ('everyone shall be obliged to pay the legally established taxes and dues'). The key principles of the taxation system are described in the Tax Code of the Russian Federation, which specifies the types of

taxes and fees, special taxation schemes for certain groups of taxpayers; defines the rights, responsibilities and duties of taxpayers, tax authorities and other parties; and sets penalties for violations of the tax legislation. Nevertheless, situations when taxpayers conceal or misreport their income and assets or when families, struggling to pay for basic necessities, fall behind on their taxes occur quite frequently. The mounting problem of unpaid taxes and non-compliance poses a serious threat to the country's economic security.

This study aims to consider the causes of non-compliance and tax evasion, which lead to erosion of federal and regional tax revenues and, therefore, may be considered a serious threat to the country's economic security.

Tax revenues of Sverdlovsk region in 2016-2018

To this end, we analyzed the data provided by the Administration of the Federal Tax Service of Sverdlovsk region on tax revenues in 2016-2018 by the type of taxpayers (physical persons or legal entities) (see Table 1) (Form 1-NM Report on the accrual and receipt of taxes, fees, insurance premiums and other mandatory payments to the budget system of the Russian Federation for 2016-2018).

Table 1: Tax revenues of Sverdlovsk region in 2016-2018

Indicators	Budget revenues by type of tax, bln rbs						Growth in tax payments, %	
	2016	Percentage, %	2017	Percentage, %	2018	Percentage, %	2018/ 2017	2018/ 2016
Corporate income tax	2279.1	30.2	2527.6	30.9	3104.5	33.0	122.8	136.2
Personal income tax	3017.3	40.0	3251.1	39.7	3653.0	38.9	112.4	121.0
Excises on products manufactured in the Russian Federation	661.7	8.8	611.7	7.5	632.4	6.7	103.4	95.6
Biological resources use fee	68.9	0.9	72.6	0.9	71.6	0.8	98.6	103.9
Stamp duty	18.8	0.2	18.9	0.2	20.4	0.2	107.9	108.5
Tax on the use of objects of animal world and biological water resources	2.1	0.03	2.2	0.03	2.3	0.02	104.5	109.5
Corporate property tax	764.5	10.1	856.1	10.5	985.2	10.5	115.1	128.9
Transport tax (legal entities)	29.9	0.4	27.3	0.3	29.2	0.3	107.0	97.7
Transport tax (physical persons)	109.2	1.4	127.6	1.6	132.0	1.4	103.4	120.8

Gambling tax	0.8	0.01	1.0	0.01	2.0	0.02	200.0	250.0
Individual property tax	36.1	0.5	52.2	0.6	61.3	0.7	117.4	169.8
Land tax (legal entities)	141.0	1.9	140.7	1.7	142.0	1.5	100.9	100.7
Land tax (physical persons)	35.4	0.5	45.3	0.6	45.1	0.5	99.6	127.4
Sales tax payable in the territories of cities of federal significance	8.0	0.1	7.9	0.1	7.7	0.08	97.5	96.3
Other taxes and fees	380.5	5.0	436.9	5.3	510.4	5.4	116.8	134.1
Arrears for cancelled taxes	0.2	0.003	0.07	0.0009	0.3	0.003	428.6	150.0
Total	7553.7	100.0	8179.1	100.0	9399.4	100.0	114.9	124.4

As Table 1 illustrates, revenues from the personal income tax account for the largest share in the structure of tax revenues of the consolidated budget of Sverdlovsk region – 38.9-40.0%. The second main source of revenue for the regional budget is the corporate income tax – 30.2-33.0%, followed by the corporate property tax, 10.1-10.5%; and excises, 6.7-8.8%. Revenues from the other taxes and fees are insignificant. In 2018, in comparison with 2017, there was a certain decline in the revenues from the biological resources use fee (by 1.4 pp); land use tax (physical persons) (by 0.4 pp); and the sales tax (by 2.5 pp). As for the other taxes and fees, there was a general increase in the revenues of the regional budget. At the same time, in comparison with 2016, in 2018, there was a fall in the revenues from indirect taxes: excise tax revenues decreased by 4.4 pp; revenues from the transport tax collected from legal entities, by 2.3 pp; sales tax revenues, by 3.7.

The decline in the tax revenues from specific tax types has raised some serious concerns about tax security, which makes it necessary to address the problem of the reasons for taxpayers' non-compliance.

In their **analysis of the problem of unpaid taxes**, Russian scholars focus on the ways to raise the level of tax culture, even though there is a lack of unified understanding of what tax culture actually is. Much less attention is paid to such questions as the development of tax consciousness and tax awareness (Bogoslovec, 2015; Smirnov, 2013; Samsonova, 2010). The term 'tax awareness' was proposed by the leading Russian expert on taxation Mayburov I. (2012), who defined it as the 'level of social and state development that determines the public awareness of the inextricable connection between society and the state and awareness of the citizens of their rights and the need to perform their duties in the sphere of taxation'. Most importantly, 'taxpayers cannot be requested to fulfill their duties unless similar demands are imposed on all the parties involved in the taxation process (tax inspectors, police, judges, bailiffs, financial authorities, deputies, heads of ministeries and other government bodies, chairman of the government and the president)'.

International scholars are more interested in the quantitative evaluation of the connection between tax consciousness, tax awareness and the probability of tax evasion (Chawla, 2013; Dup, 2014). They believe that enhancement of tax literacy will result in a better understanding of tax law among the population and, therefore, will improve tax compliance.

The study of Indonesian taxpayers by Arum has shown that taxpayer awareness has a positive effect on compliance behaviour.

Overall, there is sufficient evidence provided by Russian and international studies that people' inclination to cooperate with tax authorities and their willingness to pay taxes in general depend on the level of taxpayer awareness and tax literacy in society. Citizens' knowledge of tax law and their understanding of the benefits of taxation are important preconditions of tax compliance and effective prevention of tax fraud and corruption. Failure-to-file, failure-to-pay and accuracy penalties also have a preventive effect.

To this end, we conducted a survey among the 3rd-5th-year students of universities in Ekaterinburg (Sverdlovsk region) majoring in disciplines 'Economic Security' and 'Customs Administration'. The purpose of the survey was to identify the main reasons for tax evasion and non-compliance among young, socially active Russian citizens aged 20-24.

The questionnaire consisted of two parts: the first part comprised closed-ended questions with a list of answer options and the second part, ranking questions. In the second part, respondents were asked to rank in order of importance the measures that could raise the level of tax literacy among Russian taxpayers and help solve the problem of unpaid taxes. We used the rating scale of 0 to 5, with '0' corresponding to the least important measures and '5', to the measures deemed crucial.

Student questionnaire

1. Describe (in one word) a person who evades taxes (select one of the options below). He/she is
a) a cheat;
b) sly;
c) smart;
e) hard-working;
f) resourceful;
g) a criminal;
h) selfish;
i) a corruptionist;
j) thief

2. Describe (in one word) a person who is a law-abiding taxpayer (select one of the options below). He/she is

a) honest;
b) lazy;
c) stupid;
e) hard-working;
f) resourceful;
g) cowardly;
h) a patriot;
i) an altruist;
j) a bankrupt

3. How just is the Russian tax system in setting the same income tax rate at 13% for all tax residents regardless of their income?

4. What age, according to the Tax Code of the Russian Federation, is the age of tax liability (select one of the options below)?
a) 18;
b) 14;
c) 16.

5. Using the 0-3 scale below, indicate your agreement with each statement:
0 - strongly agree;
1 - slightly agree;
2 - slightly disagree;
3 - strongly disagree

The scale is used to assess respondents' agreement with the following statements:
a) A taxpayer must comply with the law regardless of his or her financial situation.
b) If there were no punishment for tax evasion, the majority of taxpayers would not comply.
c) Small and medium-sized Russian businesses are struggling to meet their tax obligations, because if they fulfil their tax obligations fully and on time, they may be left with no funds to stay afloat.
d) Russian people evade taxes because the funds from tax revenue are used inefficiently.
e) The Russian tax system is oriented towards large businesses, which are allowed to dodge their tax responsibilities.

The survey covered 251 respondents, including 70 students majoring in 'Economic Security' (37.1% men and 62.9% women) and 181 students majoring in 'Taxation' (32.6% men and 67.4% women). The unequal gender distribution in our sample stems from the gender-specific differences in major choices at Russian universities (see Table 2).

Table 2: Respondents' opinions about the characteristics of a law-abiding taxpayer and tax evader

Tax evader	Percentage of responses in the total number of responses, %	Law-abiding taxpayer	Percentage of responses in the total number of responses, %
Cheat	57.8	Honest	97.6
Sly	41.6	Lazy	1.8
Smart	22.3	Stupid	9.6
Hard-working	2.4	Hard-working	39.8
Resourceful	28.9	Resourceful	12.0
Criminal	42.2	Cowardly	12.0
Selfish	13.9	Patriot	47.6
Corruptionist	16.3	Altruist	15.1
Thief	16.9	Bankrupt	7.2

As Table 2 illustrates, students generally give negative evaluations to tax evaders ('cheat', 'criminal' and 'sly'), thus displaying their awareness of the negative implications of tax evasion for the country's economic development and for vulnerable population categories dependent on state support. Surprisingly, in 28.9% of cases, a tax evader was given positive characteristics, for instance, such person was described as 'resourceful'; in 22.3% of cases; as 'smart'; and in 2.4%, as 'hard-working'. These answers can be seen as significant predictors of tax non-compliance within this age group.

In most cases, a law-abiding taxpayer was described as 'honest' (97.6%), ‘patriot' (47.6%), and 'hard-working' (39.8%). In 9.6% of cases taxpayers were described as 'stupid' and in 7.2%, as 'bankrupt', which may be considered as an alarming trend, since such responses reveal the negative attitudes towards the fulfilment of one's tax responsibilities, that is, the respondents who gave such answers are more likely to evade taxes.

One of the key principles of an efficient tax system is the social justice principle, which, if applied consistently, will keep the level of social tension low. The results of our survey are shown in Figure 1.

Fig. 1: Percentage of responses, %

As Fig.1 demonstrates, young adults in Russia doubt that the principle of social justice is actually applied and think that a more differentiated approach to personal income taxation is necessary depending on people's income, the number of dependents, and the non-taxable minimum subsistence income. Their answers can be seen as predictors of tax non-compliance. Thus, our findings may be used by tax authorities in designing their policies of non-compliance prevention for this age group.

The next question in the questionnaire concerned the age of tax liability set by the Tax Code of the Russian Federation. Survey results are shown in Figure 2.

Fig. 2: Percentage of responses, %

Figure 2 demonstrates the answers our respondents gave to the question about the age of tax liability in Russia (according to the Tax Code of the Russian Federation, natural persons can be held liable for tax offences starting from the age of sixteen). Only 13.1% respondents answered this question correctly, which reveals the lack of tax knowledge among young adults in Russia, who have reached the age of tax liability.

In the second part of the questionnaire, students were asked to express their agreement or disagreement with several statements (the results are shown in Table 3).

Table 3: Respondents' attitudes to the Russian tax system and views on taxation

Questions	Distribution of scores			
	0	1	2	3
A taxpayer must comply with the law regardless of his or her financial situation	22.9	40.4	29.5	7.2
If there were no punishment for tax evasion, the majority of taxpayers would not comply	56.6	28.9	12.7	1.8
Small and medium-sized Russian businesses are struggling to meet their tax obligations, because if they fulfil their tax obligations fully and on time, they may be left with no funds to stay afloat.	20.5	30.1	32.5	16.9
The Russian tax system is oriented towards large businesses, which are allowed to dodge their tax responsibilities	18.7	32.5	31.9	16.9
Russian people evade taxes because the funds from tax revenue are used inefficiently	24.1	38.6	30.7	6.6

Table 3 demonstrates young people's attitudes towards the Russian tax system and provides some insights into the reasons why Russian taxpayers fall behind on their tax payments.

63.3% of our respondents agreed that everybody should pay taxes regardless of their financial situation; the third of our respondents disagreed with this statement, pointing out that people should have financial resources to meet their basic needs, which means that low-income households will owe taxes as they can't afford to pay them. Our respondents see this situation as an indication of the state's failure to fulfill its obligations towards the citizens.

Interestingly, 85.5% of students are willing to comply with tax regulations even in the absence of punishment for non-compliance, which shows a high level of civic responsibility among young adults in Russia.

In Europe, SMEs are considered the backbone of economy because private entrepreneurs combat unemployment by creating new jobs. In Russia, tax compliance places a large burden on SMEs, many of which are family businesses. This, in turn, leads to rising rates of tax evasion and higher levels of unpaid tax debt. This problem can be addressed through special tax schemes and by reducing the number of field tax audits conducted by local tax authorities.

Large enterprises generate most income for the state budget and, therefore, draw most of the attention of the tax authorities. In case of disagreement with the tax audit assessment, large businesses may file an appeal and the findings of the original audit may be overturned or modified in the taxpayer's favour. Smaller enterprises, however, often cannot afford to do that.

Over a half of respondents (62.7%) believe that non-compliance is caused by the inefficient use of budget funds by the government, the lack of state support for private entrepreneurs and other groups, the lack of tax incentives for start-ups and tax breaks for entrepreneurs, tax credits for child and dependent care, for the elderly, disabled and individuals suffering from a serious medical condition or injury.

The second part of the questionnaire included a list of measures to reduce tax evasion and non-compliance as a threat to national economic security. The respondents were asked to rank these measures in order of importance. The ranking results are shown in Table 4.

Table 4: Ranking of measures in order of importance

Measures	«5»	«4»	«3»	«2»	«1»	«0»
Conduct a public awareness campaign for personal property taxpayers	+					
Use text messaging and e-mail to inform taxpayers about important tax deadlines and due dates for filing income tax returns	+					
Conduct anonymous taxpayer satisfaction surveys	+					
Organize taxpayer loyalty programs		+				
Organize on-line (via Skype) tax counselling		+				
Organize social media campaigns 'Pay your taxes and sleep peacefully!'				+		

Overall, the data illustrated by Table 4 show the importance of establishing a fruitful and effective dialogue between Russian taxpayers and tax authorities, which would help raise taxpayers' trust in the government and enhance tax compliance. It is necessary to raise public awareness of the fact that both sides – taxpayers and tax authorities – are working towards a common goal of improving the living standards and general welfare in Russia and ensuring the country's overall prosperity.

Discussion and Conclusion

The majority of respondents in our survey demonstrated a rather high level of taxpayer awareness and willingness to raise their level of tax literacy. This confirmed our initial hypothesis about the possible causes of non-compliance in Russia.

Our research has identified the following causes of non-compliance in Russia:

1) young adults lack tax literacy and capacity to meet taxpaying requirements;
2) they doubt the fairness of the processes of taxation, especially in relation to low-income taxpayers;
3) respondents see centralisation of tax revenues in the federal budget as a drawback of the Russian tax system;
4) respondents believe that the replacement of different types of taxes with one, mandatory for all categories of taxpayers, would enhance compliance;
5) the survey detected the influence of cultural norms and values on taxpayers' behaviour.

E-learning in Education of Convicts

Daria BECKER-PESTKA

WSB University in Gdańsk, Poland
dbecker@wsb.gda.pl, dabepe@op.pl

Abstract

In the following article the use of e-learning in education of convicts is discussed. E-learning comes as a modern form of education and vocational training which contributes to the development of contemporary culture of education and which is also applied at penitentiary institutions to educate convicts. E-learning allows prisoners to acquire education and to complete education gaps that they may have, regardless of the length of their imprisonment sentences. This method of education is largely focused on independence and self-discipline of users who learn with the use of digital platforms. Education – including, perhaps, first of all, education of people who are exposed to social exclusion, such as convicts – must meet various needs expressed by the developing society. It results from the necessity of solving problems related to the growing possibilities of media in the field of generating, processing and creating information.

Keywords: E-Learning, Education, Convict, Readaptation.

Introduction

At present, new media come as an important factor in the process of learning community formation. In the near future, education – especially education of adults – will be based on various forms of distance learning. Having become a component of modern social communication, it considerably determines education processes. Activities fostering distance education are undertaken in various environments, including the penitentiary system.

E-learning is the latest generation of education products. It comes as a form of education provided with the use of electronic means, the Internet in particular. E-learning is an attractive alternative for traditional learning; it allows students and teachers to learn and teach at a high level, at any time and at any place they choose. It provides people who are socially withdrawn, unemployed or who wish to improve their knowledge with a lot of opportunities. It can reduce costs and provide access to relevant information at a proper time and place (Wieczorkowski, 2015, p. 24).

E-learning provides education and training with the use of information technologies. New technologies provide learners with vast possibilities. E-learning allows them to take advantage of distance and flexible learning methods. It is often combined with traditional learning in a form of combined courses. E-learning exploits possibilities provided by the Internet for the requirements of knowledge dissemination.

Development of scientific research in the field of distance education allows us to think that, in numerous cases, this education method can bring about much better outcomes. It may turn out to be more interesting and motivating for learners; it provides us with a possibility to invest in the development of the information society; it allows learners to acquire skills required to use modern information technologies (Wieczorkowski, 2015, p. 32).

In search of answers to the questions how to design digital environments which will be efficient in terms of didactics and learner-friendliness, e-learning specialists refer to the current learning and teaching theories, such as behaviourism, cognitivism, constructivism, to an education theory referred

to as instruction designing and to some psychological theories related to development of emotions and human motivation (Szczepaniak-Sobczyk, 2016, p. 111; Bednarek, Lubina 2008, pp. 31-39).

It can be assumed that e-learning has become a contemporary form of education and professional training which creates a modern culture of education and which proves to be perfectly efficient for penitentiary institutions. It is education which is focused on independence and self-discipline of digital platform users.

Elaboration

Implementation of e-learning is a complex process, however it provides convicts with an opportunity to acquire education and to fill in any education gaps they may have, regardless of the length of their imprisonment sentences; even convicts with short-term sentences can learn because after leaving prison they can still continue their education in freedom. Frequently, e-learning also comes as an alternative for people with short-term sentences who wish to learn at their penitentiary institutions but who cannot start learning at prison school because their sentences will soon end.

E-learning allows people to learn what they need at any time, place and pace which are the most convenient for them. Furthermore, it allows learners to enjoy enriched and varied traditional courses and it eliminates factors which can restrict learners' education potential. The advantages of e-learning in education of convicts undoubtedly include reduction in education costs, standardisation of knowledge, convenient implementation of education processes, introduction to self-reliance and self-discipline. However, there are also some disadvantages, such as high investment costs and some possible resistance of convict learners to whom the contact with modern technologies may negatively affect the course of education (Hyla, 2005, pp. 25-27).

On one hand, application of e-learning in education of convicts, who serve their imprisonment sentences at penitentiary institutions, seems to be a very modern and efficient solution; on the other hand, however, considering the specific character of convicts who are educated with the use of this method, it might also seem highly controversial. It is difficult to obtain data on the use of e-learning in education of convicts. Some very scarce research indicates that e-learning applied to educate convicts is not competitive to prison schools at all. E-learning is an alternative for convicts with short-term sentences who wish to learn but who cannot be qualified for education at prison schools. E-learning becomes an important resource also for convicts who cannot be moved to another penitentiary institution in order to start their education because of the distance from their places of residence (Szlęzak-Kawa, 2011, pp. 10-11).

In the Polish penitentiary system, e-learning takes two paths and it is addressed to two groups of convicts: to convicts and to the Prison Service staff members. There are not any separate legal regulations in that field for convicts. Education at penitentiary institutions is provided in accordance with the Education Act, in the same way as it is provided at any other school outside prison. Each penitentiary institution is responsible for providing convicts with such a form of education. The authorities of the Prison Service do not keep any records referring to convicts who use this form of education and to penitentiary institutions which are interested in providing e-learning education.

A good example of using e-learning in education of convicts can be a project entitled *A Checked Notebook*, initiated in 2009 and implemented by the Prison Service in cooperation with the European High School for Adults in Warsaw. At the beginning, it was a pilot programme and it was initiated at two custody suites in the capital city of Poland. However, in 2011 some other penitentiary institutions from other regions joined the e-learning programme. Eventually, over 35 penitentiary units in Poland implemented e-learning projects.

In the years 2012-2014, e-learning in education of convicts was implemented under the cooperation of the Regional Inspectorate of the Prison Service in Warsaw and the Alcide de Gasperi University of Euroregional Economy in Józefów and, since 2015 in cooperation with the Stanisław Konarski Foundation in Warsaw which runs the High School for Adults No. 3 and the Institute of Life-long

Learning. At present, e-learning is implemented at two penitentiary institutions where the convicts obtain their education at the secondary school level. The number of penitentiary units which provide this form of education is regulated by the current demand in the field of supplementing education for convicts who meet the above-mentioned requirements.

E-learning in education of convicts is implemented through an Internet education platform which has been developed by an external entity, namely a school providing education. Each penitentiary unit participating in the project provides a prison room equipped with computers for learners. At the initial stages of the project implementation, a project coordinator from a particular school or a teacher providing substantive help are always present in the room. Classes are held systematically, in accordance with a schedule sent by the school to the prison. Apart from the classes implemented through the use of the education platform, convict learners solve tests and pass exams. Learners are given their logins and passwords in order to use the platform and to access particular modules with the topics discussed during particular semesters. Learner groups are recruited once a year, in accordance with the school year schedule. It should be emphasized that the documents sent by the school are a formal basis for convicts to continue education at other education institutions. Convicts pass their secondary school-leaving examinations in compliance with the general regulations, in front of the relevant examination board, in prison environment (Trela, 2016).

A research survey carried out at penitentiary units, where - as a result of some organisational changes - prison schools have been closed, indicates that over 95% of convicts wish to improve their education. The results of the survey indicate convicts' positive attitudes towards the system if there is no prison school at the penitentiary institution where they serve their sentences. Convicts express their interest in the continuation of their education in the form of e-learning. Convicts' aspirations may be related to inaccessibility or limited accessibility to education, but still, their declarations considered in the context of e-learning, which has been developing as an alternative form of education, can instil a lot of optimism. E-learning education is addressed to people of various age groups, including juvenile and minor convicts. In a situation where there is no prison school at a particular penitentiary institution, or convicts cannot learn in an open environment, e-learning is certainly recommended. Most convicts indicate their positive attitudes towards participation in classes where some cameras are installed in the back of the classroom to provide current monitoring of education processes, making notes, performing tasks, active listening. (Szecówka, 2011, pp. 234-242).

Implementation of e-learning is not an experiment but a fact well-approved by all the participants of education processes. The need of life-long learning means that distance learning will become more and more common (Bednarek J and Lubina E., 2008, p.7). Convicts form a very specific group of learners. Optimisation of prison education can allow convicts to acquire knowledge in a more efficient way, to obtain qualifications required to enter the labour market, to meet growing requirements of employers and to continue a coherent process of their social re-adaptation (Szecówka, 2011, pp. 234-242).

Closing

More and more often, E-learning becomes an opportunity for convicts serving their imprisonment sentences at penitentiary institutions to fully participate in social life. Some examples of good practice indicate that the possibilities to use e-learning forms of education in order to improve accessibility of education are exploited more frequently.

The resources implemented with the use of e-learning in education of convicts include various components which allow learners to acquire and to consolidate their knowledge. E-learning in education of convicts comes an opportunity for providing equal chances in education, it also provides education which can be adjusted to convicts' needs. It also seems that e-learning in education of convicts is inevitable, considering the vast advancement in technology, the necessity to prepare convicts for living outside prison, for finding their places on the open labour market and for continuing their life-long learning.

Abstract

The objective of the article is to assess the activities and conditions for the development of Socially Responsible Investments (SRI) within Spain and Poland. These two countries were chosen intentionally. Both experienced prosperous periods in the 16th century followed by a decrease in political importance, and then dictatorships in the 20th century. Another factor is the prevalence of the catholic religion, which may affect the decisions of socially responsible investors. In order to realize the objectives of the research, the focus was placed on the comparison of the socio-economic and cultural aspects of both countries and the size of sustainable markets against the backdrop of other European countries. In the study, descriptive and multidimensional statistical methods were used (i.e. correspondence analysis - CA). The results indicate that Poland and Spain have relatively similar socio-economic conditions compared to other EU countries, but this does not seem to be the result of historical conditions. It can be concluded that this similarity is the result of a similar commitment to socially responsible investing.

Keywords: Socially Responsible Investments, Ethic Finance, Sustainable Investments in Europe

Introduction

Socially responsible investing (SRI) is any investment strategy which seeks to consider both financial return and social good to bring about a social change.

The distinction between those different objectives of social (sustainable) investment is a part of a more general "division of moral labor" (Porter, 2009; Scheffler and Munoz-Darde, 2005). Responsible investors are those who recognize their share of moral labor and manage their role in social, economic and environmental development.

The classical approach to investment in financial markets does not take into consideration the idea of social responsibility, which is becoming more and more popular and commonly implemented in economic practices. According to the concept of social responsibility, the selection of companies made by an investor to be included in the investment portfolio, takes place first of all by means of so called positive selection (the best companies in the group if such factors as quality, social, ecological and corporate governance are considered) or negative selection (the elimination of the companies which have a negative influence on the environment or society). The second criteria considers quantity factors (the relationship between rates of return and risk). It is a completely different approach from the classical one, which assumes that the rate of return is strictly connected with portfolio risk and a rational investor allocates capital on the basis of the preferences specified in the utility function. Another pattern of the approach of socially responsible investors to the concept of assets allocation is implied by portfolio behavior. Hence, portfolios including the shares of socially responsible companies may be characterized by a higher risk (by a smaller spectrum of selected companies and simultaneously limited possibilities of portfolio diversification).

SRI may be made by socially responsible investors as well as conventional ones. However, while SR investors expect maximum income only if quality criteria are met, conventional investors expect high rates of return.

Even though the concept of SRI itself is rooted in religious movements, (Kinder, Lydenberg and Domini, 1994; Kinder and Domini, 1997; Kreander, Molyneaux and McPhail, 2003; Sparkes, 1995), and consequently should be very similar, it developed differently in the United States as opposed to Europe. These discrepancies concern the objectives, definition and use of the basic terms, diversified structure of the entities operating on the market or applied investment strategies. The American approach emphasizes social goals, whereas European markets concentrate on financial effects (Louche and Lydenberg, 2006). The American market belongs mostly to individual investors and the state's involvement in such investments is minimal if any. In Europe, on the contrary, the market is dominated by institutional investors [1], and the state's engagement is much bigger because it is responsible for pension systems. The American approach favors negative selection (exclusion and elimination strategies), which is not such a common investment strategy in Europe (Giamporcaro-Sauniere, 2004). Also, the SRI market in Europe is about 25% bigger than in the United States (GSIA, 2018).

Louche and Sakuma (2014) have undertaken an assessment of the SRI concept in Japan, comparing the Japanese model with the American and European models. Chapple and Moon (2005) evaluated the Asian market.

In Europe the approach to ethics finance including SRI also differs depending on cultural context and geographical location. Palmisano (2015) defines it as cultural paradigms on the basis of Ethical Finance. Poland and other post-communist countries are in one group: the "Former Warsaw Pact" countries, where the economic and social necessities after the fall of the USSR have favored the diffusion of microfinance. Spain and other Mediterranean countries (apart from France) belong to the group of Mediterranean countries, influenced by Catholic culture. France is within the countries possessing a stronger mutualistic and cooperative matrix (Palmisano, 2015).

Such a different approach to SRI on the European financial markets, as a result of cultural models conveyed in the process of primary socialization, may influence the dynamics of such investment developments.

From the investor's point of view, the performance of SRI is important. Despite the fact that it is difficult to point out the advantage in SRI performance above conventional investments, the SR concept is gaining more and more popularity worldwide.

According to the data by Morningstar, assets accumulated in SRI funds grow faster than in conventional funds (Hale and Gries, 2016). Thus meaning that this growth does not result from investors' expectations concerning high rates of return on invested capital, but rather the number of 'conscious' investors is increasing.

Research Methods

The objective of the paper is to assess the activities and conditions for the development of Socially Responsible Investments within Spain and Poland. Among many similarities between Spain and Poland, the following may be mentioned: similar population numbers until recently, peripheral geographical location within the EU, prosperous periods in the 16th c. and a dramatic fall of their importance one hundred years later (Poland), and two hundred years later (Spain), authoritarian system in the 20th c.; a strong influence of the Catholic Church on policy, education, and value systems preserved both by Spanish and Polish nations. Despite the fact that Spain and Poland have a lot in common, every time we become absorbed in the history of both countries, obvious similarities seem to be more problematic. The analysis of the culture of national groups living in selected regions

is often applied. The country's borders, however, are not necessarily equivalent to the borders of an organically developed, relatively homogenous society sharing the same culture. Nonetheless, strong bonds of integration may bring about a significant process of shared cultural ideals found in both nations, which have existed for a while (Hofstede, 1990). Usually there is one dominant language, educational system, army and political system, common mass media, markets, services and national symbols.

Nonetheless, the authors of the article assume that societies sharing similar features and systems of values may make similar investment decisions.

The studies conducted so far on this research problem allow us to formulate two research hypotheses. They assume that:

H1: *Spain and Poland are similar in economic and social spheres in comparison with other European countries.*

H2: *Socio-economic similarity affects the similarity in the volume of SRI and applied investment strategies.*

The comparative analysis of Spain and Poland was performed according to the following criteria: population, geographical location, policy, economic development, religion and volume of SRI.

The similarity of socially responsible assets structure in Spain and in Poland was assessed by Cluster Analysis (CA). The agglomerative hierarchical clustering procedures, (Ward's method with Manhattan distance metric) was adopted. The results of the countries grouping is presented in the hierarchical tree plot.

The data collected by Eurosif and presented in the European SRI Study 2018, enabled the analysis of institutional and retail assets from twelve different European markets (Italy, France, Switzerland, the United Kingdom, Spain, Germany, Belgium, the Netherlands, Sweden, Austria, Denmark and Poland). In order to assess the preliminary relations between SRI volume and selected variables in the analyzed countries, the Spearman correlation coefficient was used. The analysis was made on the set of variables based on Eurostat data; SDGs indicators [2] and Europe 2020 indicators. The SRI per 1000 inhabitants (SRI/1000) was used.

Results

Socio-economic factors and policy

Population

The population of a given country surely is not a factor in determining the development of any financial investments, hence such a factor should not be analyzed independently, still it is of some importance since it shows, in general, the potential of a given society to develop financial investments, including socially responsible ones.

Spain and Poland are countries which as early as at the beginning of the 21th c. had similarly sized populations. However, due to a mass inflow of immigrants, the Spanish population increased by 6 million people. In 2017 there were 46.5 million citizens in Spain (INE), compared to January 1, 2001, when the population of this country equalled 40 million people (INE). This population growth was directly connected to an influx of immigrants from Latin America, Morocco, Pakistan, Indian, Bangladesh. According to the data from 2017, Poland is inhabited by 38.5 million citizens (CSO). Since 2000 the population of Poland has remained relatively stable. It is highly probable that Poland

will face a similar growth in its population soon, although it may not occur in the near future despite a huge influx of immigrants from the Ukraine.

Geographical location (peripheral location within the EU)

Even though Spain and Poland are EU members, i.e. a relatively strongly integrated social and economic area, none of these countries participated in the process of forming the European Community in the 1950s, hence they were not founding members. Spain joined the EU in 1986, whereas Poland joined in 2004.

Similar to Spain, Poland is at the gateway to a Europe identified as the EU. So, the consciousness of both Poles and Spaniards is consumed by the 'problem' of a being a border state. In the case of Spain, the border is not only a physical one due to historical, economic and family relations being the result of former colonies. In the case of Poland, the borders are rather physical. Polish participation in the Eastern Bloc made the Poles unwilling to integrate socially with former members of the Eastern Bloc because of painful memories of oppression under communists' ruling.

Policy (authoritarian system in the 20th century)

A non-democratic political system was the reality of the 20th c. in both countries. In Spain after the civil war (1936–1939), Francisco Franco came to power. His authoritarian ruling ended when he died in 1975. At this point it should be mentioned that the dictatorship, though led by one person, was the most drastic at the beginning of his ruling, in the 40s. After some time there came slight relief allowing for the creation of a strong underground movement. A similar situation could be observed in Poland. Still, the two countries followed absolutely different paths of economic development in the non-democratic systems of the 20th c. After introducing the stabilization and liberalization plan of 1959, Spain opened the possibility of integration with the economy of other European countries (Sarda 1970; Varela Parache 2004; Fuentes Quintana 1984; Gonzalez 1979; Prados de la Escosura, Rosés and Sanz Villarroya, 2011). In the case of Poland, until 1989 the country was totally separated from the Western bloc.

After some time Spain opened a new chapter of its history after the death of Franco and became a democratic state (in a long process of political transformation), and 11 years later it joined the EU. Nevertheless, ghosts from the past did not stop haunting them. Similar to Poland, the representatives of the political class, performing prominent roles in the previous system were not punished for their deeds.

Religion (the influence of the Catholic Church on the society)

The Catholic Church has significantly influenced the policies, values, and education in both countries, although the process of secularization is accelerating. The Catholic Church, until the death of Francisco Franco, had a much greater influence on Spanish policies than in Poland. It was the Iberian Peninsula where the Spanish Inquisition began in 1478, acting against the enemies of the catholic religion. According to the Catholic Church representatives, the Jews apparently converted into Catholicism after 1492 only under the threat of being expelled from Spain. It was the church which accompanied Franco's dictatorship after 1939. In Spain Opus Dei enjoyed huge power, which in the 60s penetrated political structures. In spite of the fact that both countries are characterized by a strong influence of the Catholic Church, currently there is only one extremely important difference in the perception of this institution in Spain and Poland. Behind the Pyrenees, after Franco's dictatorship, a withdrawal from church institution took place due to its support given to Franco, whereas in Poland the church was a defense against the totalitarian system and did not lose the trust of its followers.

Economic Development

In Poland, after the economic, political and social transformation initiated in the 80s, and after helping to dissolve the communist regime of the 20th c. (Przybylska-Kapuścińska, 2007; Kowalski, 2013; Ponczek, 2007), the financial sector of Central and Eastern Europe underwent a complete transformation. After free elections many socialist market economies collapsed, national banks and insurance companies were privatized, stock exchanges were reactivated and some countries formed private pension systems as an alternative to state systems. The economic needs of post-communist countries were initially concentrated on economic growth more so than social development (Stiglitz, 1996).

In Spain the economic transformation started much earlier, as early as during Franco's regime, whereas social transformation took place after his collapse in the mid 70s. The above mentioned economic transformation, more specifically the process of economic institutionalization and entering mature markets provided Spain, which joined the EU in 1986, with a much higher level of economic development than Poland, enabling it to regain its liberty from the communist regime in 1989. Nonetheless, this differentiation diminished over the course of time.

The differences in the level of development of Spain and Poland are reflected in the value of gross domestic product per capita calculated according to the Purchasing Power Parity – PPP against the EU average which amounts to 100 (EU28=100) [3] . According to the economic growth, Spain significantly exceeds Poland. The indicators in 2017 amounted to: 92 and 70 respectively, nevertheless simultaneously both countries were below the average in the EU member states (see Fig. 1). It is worth noticing that in the years 2003-2017, the economic distance between the countries was regularly diminishing – in 2003 Spain was ranked 13 among the EU member states and in 2017 – 14, whereas Poland went from 24th position in 2003 to 22nd in 2017.

Fig. 1: Gross Domestic Product (GDP) per capita at PPP (EU28=100) in Spain and Poland and in EU countries in 2003-2017 (strateg.stat.gov.pl)

Spain and other EU member states recorded a clear decrease in the dynamics of GDP after 2008 due to the world economic crisis. However in Poland, in spite of the crisis, GDP was on the increase.

The similarities and differences in the values of selected indices for Spain and Poland were presented in Fig. 2 by means of uniformed values (normalized within the range 0 to 1 as compared to the EU).

Considering the general economic situation (GDP per capita at PPP), Spain achieved better results in 2017 compared to Poland. The regulatory quality index was slightly higher when compared to Poland, whereas the index of material deprivation (reflecting the level of poverty and social exclusion) is significant higher in Spain. The phenomenon of corruption perception in Poland in 2017 was lower than in Spain (CPI is higher). In the economic sphere, both countries were ranked almost the same in terms of social development – as confirmed by the Human Development Index.

Fig. 2: Similarities of Spain and Poland according to selected indices in 2017 (normalized values) (strateg.stat.gov.pl)

SRI Analyzes

According to the data from 2017, the value of socially responsible investment amounted to 23 493 billion EUR. The investments in Poland, according to the data from 2017, amount to 22 billion EUR, and Spain 300 billion EUR. Investment in Poland constituted 7.32% of the investments in Spain (Eurosif, 2018).

In both Spain and Poland the level of socially responsible investments is low compared to the remaining European countries where this market is most developed. In western European countries such as the UK and France, the volume of socially responsible funds was a dozen or so times higher (see Fig. 3).

Fig. 3: Socially Responsible Investments in Europe per country, 2017

In order to assess the similarity between the countries according to the size of the assets within particular strategies of investing in socially responsible funds, hierarchical Cluster Analysis (CA) was applied. According to the Eurosif classification (Eurosif, 2018), the following division of investment strategies was adopted: Best-in-Class; Sustainability Themed; Norms-based Screening; ESG Integration; Engagement and Voting; Exclusions; Impact Investing.

As a result of agglomerative grouping, we can identify groups of countries that are similar according to the volume of investment within particular strategies. The structure of data agglomeration is presented in the hierarchical tree plot below – see Fig. 4. The grouping effect is formed by cutting the hierarchical tree plot at any level. Assuming, as the horizontal cutting line, the distance of 12.5 (the vertical line on the graph), three focal points were achieved: 1. Austria, Poland, Belgium, Spain, and Denmark; 2. Germany, Italy and Switzerland; 3.the Netherlands, Sweden France and the UK. The graph confirms that, on the basis of the analyzed European countries, Spain and Poland are most similar.

Fig. 4: Dendrogram (similarity structure) of 12 European countries in terms of SRI strategy in 2017

Spain and Poland are in the group of countries with the exclusion strategy as the dominant one (Eurosif, 2018). Simultaneously, it is the simplest and the oldest strategy used by investors.

In order to indicate if there are similarities between all the analyzed countries and to group them according to the volume of SRI and selected socio-economic variables, a multidimensional correspondence analysis (MCA) was used.

First, the macroeconomic situation was analyzed. The following variables were chosen: GDP per capita at PPP (GDP), index HDI (HDI) and Material deprivation rate (DR). Fig. 5 presents a multidimensional dependency between SRI/1000 and the above - mentioned variables.

Fig. 5: Correspondence diagram (MCA) of: SRI/1000 [SRI]; Gross Domestic Product [GDP]; Human Development Index [HDI], Material Deprivation Rate [DR]

There are three clearly separated groups of countries seen in the correspondence diagram (see Fig. 5), which indicates a strong relation between the variables of particular countries. The value of SRI/1000 reached the highest level in the countries characterized by high (GDP) per capita, high (HDI) and low (DR): The Netherlands, Switzerland and Sweden. Austria is also grouped among strong countries though its absolute value of SRI is low.

The value of SRI/1000 was the highest in the countries characterized by a lower level of (GDP) per capita, (HDI) and high (DR): Poland, Spain and Italy.

Next, the level of CSR was analyzed including the transparency of a state's activities in terms of bribery perception. Here, the following variables were selected: index measuring Corporate ethics (CE), Perception of corruption (PC) and Legal Transparency (TL). The purpose of such a selection was to check if the ethical standards of companies are related to legal transparency and the perception of bribery by a society.

Fig. 6: Correspondence diagram (MCA) of: SRI/1000 [SRI]; Corporate ethics [CE]; Perception of corruption [PC], Legal Transparency [TL]

There are three groups clearly distinguished in the correspondence diagram (see Fig. 6), which indicates a strong relation between the variables of particular countries. The value of SRI/1000 was the highest in the countries characterized by high (CE) and low (PC) as well as low (TL): The Netherlands, Switzerland and Sweden.

Relatively low (CE) and high (PC) and low values of (TL) were observable in Italy, Spain and in Poland – i.e. in the countries of the lowest SRI/1000. Interestingly, Germany, the UK and Denmark are not related to any group.

The last illustrated correspondence is the relationship between SRI/1000 and Innovation Index (INN), Quality of Education (QE) and R&D expenditure as a percentage of GDP (RD). Such a selection of variables for the analysis is justified since the objective here is to show the relationship between the quality of education in particular countries with innovativeness and R&D expenditure against the volume of SRI. The correspondence diagram (see Fig. 7) shows a multidimensional dependency between SRI/1000 and these variables.

Fig. 7: Correspondence diagram (MCA) of: SRI/1000 [SRI]; Innovation Index [INN], Quality of education [QE], R&D expenditure as a percentage of GDP [RD]

The correspondence diagram (see Fig. 7) clearly distinguishes three groups of countries, which indicates a strong correlation between the variables of particular countries. The value of SRI/1000 was the highest in the countries with high (INN), (QE) and (RD), namely Switzerland, Sweden and the Netherlands. Germany, despite average SRI/1000 values, was included in the strongest group due to the fact that the remaining variables are strong.

Low values of the variables are observable among the countries with low SRI/1000, such as: Spain, Poland and Italy – the countries of the lowest SRI/1000 (with the exception of Austria – despite low SRI/1000, it is included in the group with average values of the respective variables.

Conclusion

The attempt to find some common values which would be the basis for further analysis in the context of taking investment decisions by socially responsible investors from Spain and Poland was ineffective. Although it is claimed that the roots of social responsibility in contemporary history reach the 18th c. and were motivated by religious values, the different paths of the Catholic Church in the analyzed countries resulted in a different perception of the church, and as such the promoted values. In Spain, the church supported Franco's regime, which consequently pushed people away from the church, whereas in Poland the church opposed the ruling power, and hence enjoyed huge support.

Big differences were especially observable in the economic dimension. Franco's regime, as well as the regime in post-communist countries finished not only at various points in history, but also had completely different courses. At the beginning of the 60s, Spain was entering the economic mainstream opening itself to foreign markets. In Poland at this time, socialist economy was prevailing, where the process of exchanging goods and services took place only between the post-communist bloc and its economy was subordinated to the apparatus of State. After Poland's accession

to the EU, the observable distance between Spain has been diminishing both in the social and economic dimensions. As far as the social and economic situation is concerned, Spain and Poland, when compared to other European countries, are similar to a great extent.

The analysis of socio-economic factors from 2017 data indicate that Spain and Poland, in comparison to other EU countries, are very similar. Spain, however, is relatively more advantaged due to the economic growth measured by GDP per capita, whereas the material deprivation rate is almost the same. The biggest differences concern the level of development in social and economic factors measured by the Human Development Index. The index is a summary measure of basic achievement levels in the fundamental dimensions of human development, crucial in terms of motivation to invest in a socially responsible manner. The regulatory quality indicator is slightly higher in Spain. The last discussed indicator is the Corruption Perception Index, reflecting the level of trust in the public sector. The index confirms higher levels of trust in Poland compared to Spain, but the differences are not enormous.

The analysis of the nominal value of SRI and SRI per capita show differences between Spain and Poland. Even though the two countries are in the weakest group, Poland has the lowest nominal value of SRI out of the twelve analyzed European countries. Nonetheless, it should be emphasized that Poland is the only country from the post-communist bloc which is involved in SRI. The analysis also shows that countries of low nominal values of SRI have similar investment strategies usually dominated by the exclusion strategy, which is the oldest and simplest investment strategy.

The analysis results show that not only Spain and Poland, but also Italy constitute one group of countries with low values of analyzed variables and low values of SRI/1000. It concerns both the variables indicating the level of economic growth, legal transparency, bribery perception, quality of education, innovativeness or R&D expenditure as well as the differentiation of the quality of life, social development or corporate ethics. Low SRI/1000 are also noted in Austria and Germany, however the high values of other variables qualifies these two countries to join other groups as they are located close to the center of the diagram. They show high SRI/1000 and at the same time are grouped among strong variable values represented by the Netherlands, Switzerland and Sweden. Despite apparent similarities, Spain and Poland are motivated by different historical backgrounds. Still, currently the similarities are visible in socio-economics, the value of SRI and applied strategies if compared to the twelve analyzed European countries.

It may be assumed that social, economic and political factors (such as membership in the EU) mainly contribute to the development of ethical finances. The cultural factors are significant, which may strengthen or diminish social awareness.

Notes

[1] It results somewhat from a legal obligation, namely pension funds in some EU countries are obliged to publish information pertaining to the involvement in sustainable investments (Solomon, Solomon and Norton, 2002).

[2] Sustainable Development Goals.

[3] If the indicator is lower than 100, then the level of GDP per capita in a given country is lower than the mean values un the EU and vice versa.

Logistics Maturity in Service Enterprises – Research results

Karolina WERNER-LEWANDOWSKA

Poznan University of Technology, Poznan, Poland
karolina.werner@put.poznan.pl

Abstract

The service industry is the basis of the economy in the European Union in terms of its share in GDP and the employment rate. The said fact makes the service industry attractive to investors, which results in growing competition within it. One of the key factors of company success is logistics. Properly performed logistics activities guarantee the achievement of a high level of customer service. At the same time, however, they generate high operating costs. The described trade-off relationship is known in the manufacturing industry and has been an object of scientific research for years. However, the author noticed a research gap related to this question in the area of logistics in the service industry.
The aim of this article is to present selected results of research on the logistics maturity of service enterprises. An original Logistics Maturity Model for Service Industry (hereinafter LMM4SI) was used to assess the logistics maturity of the service industry. Research methods applied in the presented study include surveys used to obtain primary data from 2,000 Polish service enterprises, mathematical analysis used to determine the level of logistics maturity and statistical analysis which allowed to draw conclusions about the logistics maturity of the Polish service industry.

Keywords: Logistics Maturity, Service Industry.

Introduction

The service industry is currently the dominant source of GDP in the EU-28. According to Eurostat data, the share of services in the total gross value added for the EU-28 amounted to 73.2% in 2018 compared to 72.2% in 2008 (2020), According to the quoted Eurostat data, the relative importance of services was particularly high in Luxembourg, Malta, Cyprus, France, the United Kingdom, Greece, the Netherlands, Belgium, Portugal and Denmark. In Ireland, Slovakia and the Czech Republic, the share of services in GDP averages around 60%.

The growing importance of services in the European economy is the result of technological progress, changes in the level of relative prices, outsourcing and globalization. According to Eurostat data, in 2018 all types of industries in the EU-28 recorded an increase in gross value added compared to 2017. The industries that recorded the largest increase were information and communications services (4.7%), construction (3.6%) and business services (3.3%).

The above information proves that the service industry has a strong impact on the EU economy. It should therefore become the subject of scientific research and whose results should contribute to the continuous growth of this kind of economic activity.

In her research, the author focuses on assessing the logistics maturity of service enterprises. Therefore, the subject of research is the logistics activity of service providers. In this context, the author notices a research gap. A low number of studies on logistics in service enterprises result primarily from the research entity itself. Service enterprises experience difficulties in performing logistics activities due to the following features of service: Lack of ownership, Intangibility, Inseparability, Variability, Perishability and User participation, which render the service, treated as a product, non-susceptible to logistics activities. Despite this fact, service enterprises implement logistics processes by storing stocks of materials needed to perform services and then transporting them to the place of service, cooperate

within supply chains and use IT solutions associated with logistics. It can therefore be assumed that logistics activity is undertaken in the service industry. Its character, although fuzzy and hidden, is necessary for doing business.

Juxtaposing the two topics under discussion, bearing in mind the importance of services in the modern economy and viewing logistics as one of the key success factors for companies, the author is of the opinion that the assessment of logistics maturity in the service industry is a justified subject of literature and empirical studies.

This article is devoted to the logistics maturity of service providers. Manufacturing, trading and service enterprises, regardless of their business line and size, strive to improve their operations in order to become competitive in the market and increase profits. Kosieradzka and Smagowicz (2016) mentioned, maturity models allow to assess the current situation of the organization and determine the direction of further development. Over the years, depending on the areas of management, many different maturity models have been devised, for exemple in research studies by: Lathi et al. (2009), Steenberg et al. (2010), Janse et al. (2010), Eadie et al. (2011), Jasiulewicz-Kaczmarek and Drożyner (2011), Cao and Jiang (2013); Bemelmans et al. (2013), Jellouli and Abdel-kadhi (2013), Looy (2014), Mazur and Stachowiak (2014), van Lith et al. (2015), Benmoussa et al. (2015), Tontini et al. (2016), Modrák and Šoltysová (2020). In addition, in a research studies by Battista et al. (2013) and Battista and Schiraldi (2013), logistics maturity models have been developed to analyze logistics processes taking place in enterprises of one business line. In recent years, researchers have also shown interest in the subject of digital maturity, also in relation to logistics, the so-called Maturity Logistics 4.0, incl. in research studies by Oleśków-Szłapka and Stachowiak (2019), or in the aspects of sustainable development, incl. in research studies Golinska et al. (2015). In this article, the author proposes a maturity model dedicated to the service industry, in which the areas of logistics activity, and not logistics processes, are assessed. This is due to the fact that service enterprises, unlike manufacturing enterprises, rarely have precisely defined logistics support processes.

Theoretical Background

Research on developing a logistics maturity model for the service industry was preceded by literature studies on the logistics maturity of service enterprises. The object of the research was scientific articles on logistics maturity. The research was conducted in the first quarter of 2017. The following databases were used in the research: Web of Science, SCOPUS, Emerald Insight. In total, 11 publications were analyzed. The conclusions of the study were the basis for further research. The most important conclusions (hereinafter C1- C5) from the literature review can be formulated as follows:

C1: there is a research gap in the definition of "logistics maturity"despite growing interest in the issue, which is manifested in the increasing number of publications on this subject.
C2: logistics maturity models developed so far in 45% concerned enterprise logistics in the overall (systemic) approach, while the remaining 55% was associated with maturity models dedicated to a single subsystem, e.g. a supply subsystem or a distribution subsystem.
C3: models developed the most frequently have 4-6 levels of maturity. Limiting their number seems justified from the perspective of the need to indicate factors determining a specific level. The more levels, the harder it is to describe a given model.
C4: most maturity models subject to inference allowed for assessment in specific dimensions by using specially developed questionnaires. The assessment of the achieved level was carried out in a strict way, which meant that in order for a given level of maturity to be assigned, all requirements indicated at this level should be met. As a result, information was obtained about the extent to which achievements at a given maturity level were met.
C5: each level of maturity should be identified by requirements indicated at an adequate level, not level descriptions, as this may raise doubts during the maturity examination.

The above conclusions became guidelines for the authors in building the logistics maturity model of the service industry. The model is based on the authors' proposition of the definition of logistics maturity understood as: the organizational level of an enterprise indicating the extent to which logistics tools are used in the areas of logistics activity of a service enterprise.

In the proposed model, the authors departed from known maturity models related to the process approach. The authors do not question process maturity models, yet their goal was not to develop a process maturity model in the field of logistics in service enterprises. The authors' aim was to develop a model that in a broader context, not only in the context of the process, would assess the logistics maturity of the service industry. Therefore, individual logistics processes implemented in the enterprise are not assessed in the model. What is being examined is the area of logistics activity. The authors identified the following areas of logistics activity of service enterprises:

Warehouse management - all activities related to the storage and management of the storage space of materials needed to provide services,
Transport management - all activities related to the transport of human and material resources to the place of service,
Supply chain and distribution - all activities related to cooperation within the supply chain and distribution of services,
Stock supply and management - all activities related to supplying the enterprise with materials necessary to perform services and related to management of these materials, if such exist,
IT solutions - understood as the use of IT tools in the enterprise to support the implementation of the previous 4 logistics activities.

The developed model assumes the individual assessment of logistic maturity in the above areas of activity, assuming that in each of these areas this level may be different. However, the model does not allow to determine the overall level of logistics maturity of the service enterprise. This can be considered as the biggest disadvantage of the proposed model. However, the lack of aggregation allows to indicate those areas of logistics activity that in the first place should be improved if a low level is recorded.

In their research on LMM4SI, the authors assumed that the level of logistics maturity achieved by the service enterprise corresponds to the phase of logistics evolution in which the enterprise is located. However, to prove which phase the enterprise is in, it is necessary to perform a measurement. Therefore, it was assumed that the measure will be the use of logistics tools by the enterprise, commonly known and used in manufacturing enterprises. For this purpose, the authors used a list of 90 most popular logistics tools proposed by Richards and Grinsted (2016). A selection of tools was made by choosing those that can be used in the service industry and complementing it by the authors' own proposals. In this way, a list of 65 logistics tools was created, which, in the authors' opinion, can be used by service enterprises during the performance of logistics processes. These tools were assigned to the areas of logistics activity of service enterprises

Due to the assumption that individual levels are evaluated by logistic tools that are used in the enterprise and which determine the level of logistics maturity of the research object, it was necessary to specify which tools from the set of defined logistics engineering characterize a given level of logistics maturity and to what extent a given logistics tool determines the level of maturity. To this end, the authors used expert research to minimize the subjectivity of the assessment.

Research Method

As part of the research, a model was developed to determine the logistics maturity of each service enterprise - LMM4SI.

The Logistics Maturity Model for Service Industry presented in the paper includes the following elements which are proposed in research by Werner-Lewandowska and Kosacka-Olejnik (2018):

- 6 maturity levels (L1-L6), which correspond to the particular phase of industrial logistics development (Fig.1), which are proposed in research by Ballou (2007);
- 5 logistics system areas (hereinafter LA) under assessment including: warehouse management (hereinafter: WM), transport management (hereinafter: TM), supply and inventory management (SIM), supply chain and distribution (hereinafter: SCD), IT support (hereinafter: IT tools);

Fig. 1: Phases of logistics evaluation and connection with LMM4SI

- the given levels are evaluated by 65 logistics engineering tools used in the enterprise (Tab. 1), that determine the level of logistics maturity of the research object. Table 3 presents the strength of the impact of individual tools on the level of logistics maturity.

The assessment of logistics maturity according to LMM4SI is carried out according to the procedure presented in Fig. 2.

Fig. 2: Stages in logistics maturity assessment with the use of LMM4SI

Source: own elaboration based on Werner-Lewandowska and Kosacka –Olejnik (2019b).

The subject of the presented research was the logistics maturity of service enterprises. Logistics maturity dedicated to the service industry was used in the research. The detailed description of this model may be found in research studies by Werner-Lewandowska and Kosacka-Olejnik, (2018, 2019a, 2019 b).

To collect information, the CATI (Computer-Assisted Telephone Interviewing) method was used along with a questionnaire. The questionnaire contained 65 questions about logistics engineering tools, formulated as follows: "Does the company use the following tool ....?" Acceptable answers were "Yes," "No," or "The tool is not known in the company."

Some questions were filtering questions which are used to verify logistics areas that should be assessed (as FQs on Fig.2):

FQ1 (WM): Is there any place for storing materials needed to provide services in the future?
FQ2 (TM): Is any means of transport used for the service?
FQ3 (TM): Does the company have its own vehicle fleet?
FQ4 (SIM): Does the company collect materials needed to provide services in the future?

In the case of a negative answer to a filtering question, a given area of logistics activity was not analyzed in terms of logistics maturity assessment (as NA - no analysis on Fig. 2).
The maturity level from L1 to L6 is determined in accordance with the LMM4SI assumptions described by Werner-Lewandowska and Kosacka –Olejnik (2019b). In the model, each logistics area is verified in terms of immaturity, which was expressed by the following boundary conditions (as BC1 and BC2 on fig.2):

BC 1: if more than 50% of all logistics tools determining a given area of logistics in a service enterprise are not used, then the area is not subject to evaluation (NE no evaluation).

BC 2: if more than 50% of all logistics tools assigned to a given logistics area are not known, then the enterprise represents level L0 of the logistics maturity. Consequently, in this situation the enterprise is immature because employees do not know the basic logistics practices in this particular area.

Research Object

The research, whose results are presented in this article, covered a population of 2,000 Polish service companies. The characteristics of the studied population by the type of service according to NACE (French Nomenclature statistique des Activités économiques dans la Communauté Européenne, Statistical Classification of Economic Activities in the European Union) are presented in Fig. 3.

Fig.3 : Structure of the surveyed population by industries according to NACE Rev. 2

In Fig. 3, the individual letters are codes of service activity sectors, meaning in turn: F- construction, H- transportation and storage, I- accommodation and food service activities, J - information and communication, K-financial and insurance activities, L- real estate activities, M- professional, scientific and technical activities, N- administrative and support service activities, O- public administration and defense; compulsory social security, P- education, Q- human health and social work activities, R-arts, entertainment and recreation, S&T- other service activities and activities of households as employers; undifferentiated goods- and services-producing activities of households for one's own use.

As can be concluded from the data presented in Fig.3, the most studied service in-dustries were: construction (18.5%), professional, scientific and technical activities (15.8%), other service activities and activities of households as employers (10.3%). The remaining sectors of service activity are represented in the studied population in a share less than 10%.

According to Eurostat (2020) data, in 2008-2018, in services such as transport, accommodation and catering services, the share in total gross value added remained at the same level and amounted to 19.1%. The share of public administration, defense, education, healthcare and social welfare in the total added value increased and reached 18.5% in 2018. The next largest sectors of service activity in gross value added in 2018 were professional, scientific, technical, administrative and auxiliary services - hereinafter referred to as "business services" - (11.2%; share increased by 0.9 points between 2008 and 2018), real estate market activities (11.1%; decrease by 0.1 points), followed by construction (5.6%; decrease by 0.8 points), ICT services (5.1 %; increase by 0.2 points) and financial and insurance services (4.8%; decrease by 0.4 points). The smallest share was recorded by services related to arts and entertainment and other services (3.4%; unchanged) followed by agriculture, forestry and fisheries (1.6%; decrease by 0.1 point).

Research Results

According to Eurostat data, in 2018 all types of industries in the EU-28 recorded an increase in gross value added compared to 2017. The industries that recorded the largest increase were information and communications services (4.7%), construction (3.6%) and business services (3.3%), that is why the author decided to devote to them this part of the article regarding the results of research on logistics maturity. In the analyzed population, these enterprises constituted 113 economic entities, which is 5.7% of the population.

According to the Statistical Classification of Economic Activities in the European Community, Rev. 2 (2008), this section covers the production and dissemination of information and cultural goods, the transfer or dissemination of these goods, information technology service activities, data processing and other information service activities.

Service providers in this sector conduct:

- publishing activity, including software publishing,
- activity related to the production of films and sound recordings,
- radio and television activity,
- telecommunications,
- information technology activity,
- other information service activity.

Analyzing the scope of services in this sector, it seems that logistics is an indispensable element of business activity. It is in particular visible in the case of film production companies, where the service provided requires the use of materials and their storage and transport. Companies providing services in the field of information and communications are companies that provide business services, thus playing an important partner role in supply chains.

Werner-Lewandowska and Kosacka-Olejnik, (2019b) mentioned, that LMM4SI assumes that the level of logistics maturity is determined by the logistics tool used in the company Therefore, in the first place, when presenting the results of the research, the focus was on indicating which of the 65 tools subject to research are, and to what extent, known to the population of service companies. The research results are presented by individual areas of logistics activity undertaken by service companies.
In the area of warehouse management (WM), only 8 (7%) companies were analyzed, because only such a number of them declared that there is a place in the company to store materials needed to perform services in the future. Fig. 4 presents the level of use or unacquaintance with logistics tools affecting the level of logistics maturity.

Fig.4 : Level of use and knowledge of logistics tools in the area of Warehouse Management (WM)

As it results from Fig.4, companies providing information and communications services do not use logistics tools in the area of warehouse management. The exception is the WM02 tool - Selection of storage solutions (e.g. a rack, a type of pallet) based on various criteria, which are used in the warehouse by 63% of those assessed in this area.

The research shows that in 93% of the surveyed entities, there is no warehouse for storing materials for future services, and none of these companies outsource storage by a 3PL or 4PL operator.

At the same time, 19% of the surveyed companies declare in their responses that they collect materials needed to perform services in the future. The fact that 7% of the companies have a warehouse for this purpose indicates that companies providing information and communications services do not store their stock in a designated place, which may negatively affect the quality and, consequently, value of materials stored.

Fig. 5 presents the level of use or unacquaintance with logistics tools affecting the level of logistics maturity in the area of Supply & Inventory Management (SIM).

Fig.5 : Level of use and knowledge of logistics tools in the area of Supply & Inventory Management (SIM)

Although 19% of the surveyed information and communications service providers maintain a supply of materials to perform future services, most of them do not use or do not know the tools for managing inventory.

In the studied population, 40% of the companies use internal means of transport to carry out their services, and 51% of this share have their own vehicle fleet for this purpose, which indicates that every 5th surveyed company providing information and communications services uses its own vehicle fleet to provide its services. In the case of the surveyed companies which use external transport companies to perform services, 5% assess the transport service provider using various criteria, 77% do not know such a tool. Such a situation may contribute to delays in the service provided due to the use of unreliable carriers.

Fig. 6 presents the level of use or unacquaintance with logistics tools affecting the level of logistics maturity in the area of transport management (TM). The presented values apply only to those companies which have their own vehicle fleet.

Fig.6: Level of use and knowledge of logistics tools in the area of Transport Management (TM)

Most companies that provide information and communications services do not use or do not know the tools to manage means of transport or the transport process despite their fleet. This factor probably affects the high level of operating costs associated with transport. Unacquaintance with the TM02 tool: Transport Management System TMS) and not using the TM03 tool: Calculating the demand for transport services taking into account the size of the load and transport capacity, undoubtedly generates the phenomenon of the so-called dead running, which is a manifestation of waste and irrational actions taken.

Due to the scope of services rendered, the analyzed group of service providers acts as a partner within supply chains. This is manifested in the answers provided by the respondents, with 41% of them indicating that they maintain long-term relationships with suppliers, but unfortunately only 9% plan, forecast and replenish inventories together with suppliers and customers. The low percentage of using the CPFR tool may be due to the fact that only 19% maintain a supply of materials needed to perform the service and that the service, due to its features, is not kept in stock. It probably translates into the fact that CPFR is not used by 84% of the surveyed companies.

Fig. 7 presents the level of use or unacquaintance with logistics tools affecting the level of logistics maturity in terms of cooperation in the supply chain and distribution (SCD).

Fig.7: Level of use and knowledge of logistics tools in the SCD area

The last examined area of logistics activity of service companies was IT solutions, which in the opinion of the creators of the LMM4SI model can support the logistics of service providers. Due to the type of services provided, the results in this area are completely different from those presented so far. Most of the tools are used in companies and only one is definitely unknown - IT09: Z-WAVE protocol (Fig. 8).

Fig.8: Level of use and knowledge of logistics tools in the IT area

Based on the hitherto considerations, it can be argued that the type of services provided determines the type and level of tools used to support the logistics of the service industry. In the case of the group of companies discussed in this article, this thesis is confirmed. However, Werner-Lewandowska (2019c) mentioned similar analyses of service and transport providers have not proved it.

In accordance with the LMM4SI procedure, after the stage of data collection from service companies and their analysis, the stage of logistics maturity assessment and the determination whether the test object is immature (L0) or whether it has reached the level of maturity between L1 and L6 take place. The WM area was assessed only among companies in which a warehouse exists. In the scope of SIM, only those companies that maintained stocks of materials to perform services were subjected to assessment. In the scope of TM, only those companies that use means of transport to perform the service were assessed. Based on the results of the research presented in Fig. 9, it can be stated that service enterprises providing information and communications services do not create stocks of materials needed to perform services in the future, which means that there is no space in the company for storing goods for services.

Fig.9: The scope of logistics maturity assessment in service companies

In the range of WM, TM and SIM, 5%, 24%, and 4% of the companies respectively were subjected to the assessment of the level of logistics maturity (as LME on Fig.9). These companies were not rejected at the stage of determining NA and NE. In the SCD area, 72% of the surveyed population was evaluated (the remaining was rejected because they do not use over 50% of the logistics tools that were assessed - BC1). In the IT area, all the enterprises were subjected to the assessment of the level of logistics maturity.

The area covered by the research affects the level of logistics maturity in companies providing information and communications services (Fig. 10).

Fig. 10: Logistics maturity in the sector of services related to information and communications.

Enterprises providing services in the field of information and communications, despite the fact that they use means of transport to perform the service, are not mature in terms of logistics, which results from their unaquaintance with the tools used to manage transport. The likely reason for this is the treatment of transport as an auxiliary process to the main process. However, the transport process may affect the quality of services rendered, e.g. their timeliness, costs. Ultimately, the lack of transport management can translate into the level of customer service and their perception of the company as a service provider.

In the area related to warehousing (WM) as well as supply and inventory management (SIM), the surveyed companies achieved levels 5 and 4 of logistics maturity respectively. It should be remembered that these areas do not relate to the storage of service supplies, as it is excluded due to its immateriality, but relate to materials necessary to perform services in the future. From a logistic point of view, this is a satisfactory result. It demonstrates the understanding by service providers in this sector that the availability of materials needed to perform the service translates into the level of customer service, and their lack may result in non-performance of the service or its delay. Due to the lack of proper materials, the service performed may fail to comply with the order, which affects further cooperation with the customer.

In the area of cooperation within supply chains and distribution (SCD), level 4 of logistics maturity dominates. However, it was only achieved by 2 out of 5 surveyed companies. In this sense, the result is not optimistic, especially since service providers operating in the area of information technology are partners in the chains of the supplier playing a role supporting the flow of streams between particular links of the chain. Their support provides access to real data in the supply system links regarding e.g. customer orders, stock levels, availability of transport means. The surveyed companies should therefore increase the effectiveness of cooperation in supply chains in which they function as links.

In the area of using IT solutions related to or dedicated to logistics, companies providing information and communications services achieved 6 - the highest level of logistics maturity. In this area, almost 6 out of 10 surveyed companies reached the level of the digital industrial revolution in logistics - Logistics 4.0, which results from IT solutions used (Fig.6).

Conclusions

Logistics is an inseparable element of every business activity. It may be treated as a key success factor. A large body of research has so far been devoted to logistics in the manufacturing industry. Unfortunately, only a few studies concern logistics in the service industry. The author of this article provided an original model for assessing the level of logistics maturity - LMM4SI. The article presents the results of research on the logistics maturity of enterprises providing information and communications services. Future research should focus on the development of a road map for the described type of industry, taking into account the results of the research presented in this article.

Abstract

This article provides a political and military analysis of the Baltic Sea region from the end of World War II to the break-up of the Soviet Union. This chapter presents a period called the "Cold War", in which two opposing blocks tried to win an advantage over the enemy. In addition, there is a clear distinction between democratic and undemocratic countries. The chapter describes the purpose and tasks of the military blocks, which were based on specific alliances. Studies on the degree of militarisation of the Baltic Sea region were also presented. An important stage in the work in this chapter was to present the Soviet Union's dialogue with the United States of America AP and the impact it had on the region. The information obtained from the research created a geopolitical picture of the Baltic Sea region during the "Cold War" and became the starting point for research and reflection in the next chapter.

Keywords: Political, Moli Tary, Situation, Baltic Sea, Biopola Division

Introduction

This article presents the period referred to as the "Cold War", in which two opposing blocks tried to win the advantage over the enemy. In addition, there is a clear distinction between democratic and undemocratic countries. The characteristics of the purpose and tasks of the military blocks, which were based on specific alliances, were made.

Author's studies on the degree of militarisation of the Baltic Sea region are presented, as well as the Soviet Union's dialogue with the United States of America and the impact it had on the region. On the basis of the information obtained as a result of the research, a geopolitical picture of the Baltic Sea Region during the "Cold War" period was created and an initiative to conduct further research in this area.

The following were used to achieve this objective.

The military importance of the 20th century Baltic Sea

From a military point of view, the Baltic Sea is considered an inland, semi-enclosed epicontinental sea of the Atlantic Ocean (Encyclopedia of Gazeta Wyborcza, vol. 2, 2007, p. 123). It is located between the Scandinavian Peninsula and the central and eastern part of the European continent. It has a natural connection with the Atlantic Ocean through the North Sea, Skagerrak and the straits: Great and Small Belt, Sund and Kattegat (Będźmirowski, *op. cit*., p. 33). In addition, it has an artificial connection, which allows to shorten the route from the White Sea through the White Sea Canal and to the North Sea - through the Kiel Canal (Mickiewicz, 2012, p. 116).

The advantages of sailing on the Baltic Sea undoubtedly include its geographical dimensions. The short distances between its opposite sides make it possible to cover the route quickly, even under unfavourable weather conditions. On the other hand, short distances can make large ships an easy target for shore-based missile systems and aviation. This is due to the shape of the coastline - especially the Polish coast - which thwarts the silent passage of the ships. Consequently, small ships that are less resistant to ice must be used in combat operations.

The Baltic Sea region is a special kind of area

The Baltic Sea region is a special kind of area. Despite its location outside the main communication routes, the Baltic has been an important area of political and economic relations since the beginning of time (*Ibidem*, p. 5). For centuries, it has been an area of trade and struggle for the rule of its waters. It is from this period that "XV - XVI" originates - initiated by King Sigismund Augustus - the idea: "*dominion of Maris Baltici*". Denmark, Sweden and Poland were all striving for Baltic domination at that time. However, these countries did not focus on political dominance in the region, but on equality of rights: "free navigation, maritime trade and ownership of its own territorial waters" (Mickiewicz, *op. cit*., p. 5).
It is worth noting that, with few exceptions, the hegemony in the Baltic Sea was not associated with the need to exclude the role of other countries.

The departure from a kind of "balance of power" in favour of military blocs resulted in an imbalance of power in Europe, which resulted in the outbreak of the First World War. In 1914, two empires and two kingdoms came into contact in the Baltic region, after the end of warfare and the ratification of the last peace treaties in the south, the situation changed radically (Palmer 2008, p. 326). To the east and south, seven new countries appeared, and the Free City of Gdansk administered by the League of Nations Commissioner. Autocracy is over (*Ibidem*, p. 326). Located in the centre of the events of that time, the Baltic Sea became an area of competition not only for the hegemony in the region, but also for the dominance over the whole world.

The representatives of the USA and Great Britain, considering it realistic and justified to adopt the "Curzon line" as the basis for determining the future Soviet-Polish border, practically agreed to include the liberated Poland in the 2nd zone of influence of the USSR (Fenby 2007, p. 149). Such a decision was undoubtedly influenced by the rapid movement of the Red Army towards Berlin, which worried British Prime Minister Winston Churchill, who tried to protect the largest part of Western Europe from Soviet influence (Będźmirowski 2011, p. 23). In turn, US President Franklin Delano Roosevelta did not protest about the shifting of Poland's borders to the west or about the Baltic States, since his main goal in Tehran was to outline the concept of "Four Police Officers". (See H. Kissinger, *Dyplomacja*, Warsaw 2002, p. 429) for the world (Kissinger 2002, p. 448). Over time, the "Big Three" began to show more and more divergences of interest, and so on plans for the future of Europe, a full agreement was never reached.

The new order was definitely different from the pre-war one. The most important difference was the collapse of the existing balance of power in Europe. The Third Reich ceased to exist, France's defeat lost its former superpower, and Britain, although it emerged victorious from the war, ruined its economy with a five-year war. An economically weak and defenceless Europe has become an area of confrontation between two winning countries: United States and Soviet Union (Mączak 2006, p. 753). The two powers had a completely different view of the creation of a new order. This was reflected in the decisions made in Yalta (4 - 11 February 1945) and later in Potsdam (17 July - 2 August 1945), which divided the world into zones of influence.

Joseph Stalin's assets during the Yalta Conference were unquestionable, while the Western Allies did not have much to offer and needed a lot. Especially the United States, which counted on the Red Army to help end the war in the Far East. Moreover, they believed that obtaining Joseph Stalin for cooperation will be necessary to establish the United Nations (*Ibidem*, p. 130). In return, the West was able to offer

the recognition of Soviet territorial achievements and the allocation of part of the USSR's war booty. Thus, Soviet control over Eastern Europe - except for Poland - was not questioned by the Allies. The division of Europe into spheres of influence, resulting from the agreement of the great three, caused Stalin to obtain the territorial acquisitions he wanted.

The Anglo-Saxon powers have accepted the situation, hoping that the area of influence that has emerged in Europe will be exclusive and not dominant. That's the idea that prevailed in the United States camp. The prevailing view among President Franklin Delano Roosevelt was that after the end of the war with the Soviet Union it would still be possible to live in friendship and cooperate (Holzer, *op. cit*., p. 21). It was hoped that the Soviet influence would have an impact on the international arena of the countries under its control, but it was not thought that it would be deprived of its own internal policies, especially economic and cultural policies. The promises of the Soviet Union that democratic politicians would be able to join the communist government intensified the impression that it would be possible to cooperate with Stalin. That idea, it turned out to be wrong. This was indicated by a note he wrote down - even before the end of the war, at the end of January 1945 - during a meeting with Stalin, the former General Secretary of the Communist International, Bulgarian activist Georgi Dmitrov: "The crisis of capitalism is manifested in the division of capitalists into two factions, fascist and democratic. This is how our alliance with the democratic capitalist faction, which was interested in ending Hitler's reign, came about,because such brutal rule led to the extremes of the working class and consequently to the fall of capitalism. Now we're against the other faction, but in the future we'll be against it too." (*Ibidem* p. 24) The Soviet leader's statement predicted a future Cold War.

The Potsdam Agreement has confirmed the Yalta provisions. The facts were as follows; the borders of the Soviet Union included the territory it reached during the 1939/1940 campaign, plus Zakarpattia Ruthenia; the border with Poland was drawn on the basis of the Curzon line (outlined on the Bug River and east of Bialystok). This meant that the USSR's influence reached as far as the Elbe and Marice territories. Such a zone of influence did not have, even Russia from the times of the Tsarist empire (M¹czak, *op. cit*., p. 748). The outcome of the Potsdam conference was not satisfactory, either party. The division of Europe into East and West was slowly becoming a fact.

The situation was best described by the former British Prime Minister Winston Churchill, who announced the situation on March 5th 1946 during his speech at Westminster College in Fulton (USA, Missouri): "from Szczecin on the Baltic Sea to Trieste on the Adriatic Sea, an iron curtain sank across the continent. Beyond this border lie all the capitals and ancient lands of central and eastern Europe - Warsaw, Berlin, Prague, Vienna, Budapest, Belgrade, Bucharest and Sofia (...) This is certainly not the liberated Europe for which we have fought. (Davies 2005, p. 1134). The Iron Curtain, a British politician became reality after 1947, as a result of three events: the creation of the Communist and Workers' Party Information Office (Kominformu), the communist coup in Prague and the Berlin blockade.

Churchill, during his speech in Fulton, called on the United States to oppose Soviet policy. He thought that they should take decisive steps to this end, he spoke about the "right moment" of such an action, which a few years earlier had not been carried out in relation to Hitler's Germany.

Churchill's speech is widely regarded as the beginning of the "Cold War.

The Cold War grew out of the World War, which explained the confrontation that emerged so quickly after the old one. The post-war arrangement made it impossible to keep the war dinner because there was a security dilemma. As a result, a spiral of mistrust was unleashed, from which it was difficult for even the best-intentioned leaders to break free (Gaddis, *op. cit*., p. 41). The United States and Great Britain wanted to base the order of the post-war world on a balance of power, while respecting certain principles. This was to be achieved through cooperation between the powers, in the form of a new collective security organisation, the United Nations. Moreover, they believed that, thanks to economic integration, of

individual countries, the allegations of conflicts would be eliminated. Therefore, the primary goal of the Americans and the British was to reconcile their own ideals with the territorial claims of the Soviet Union.

Despite pressure on Stalin to allow free elections in the Baltic States and Poland, the leader of the USSR did not respect previous arrangements. The Kremlin's vision was to ensure his own safety, while at the same time fuelling rivalry between capitalist states (*Ibidem*, p. 41). Thus, he confirmed that all that matters is power and influence (Będźmirowski.,s. 23). Both visions turned out to be incompatible.

The first sign of this was the "long telegram" published in February 1946 by the United States Ambassador to Moscow, George Kennan (*Ibidem*, p. 22). The main thesis of the famous telegram was that the foreign policy towards the USSR during the Second World War was completely wrong (Gaddis 2007, p. 32). Kennan emphasized that the issue of cooperation with the USSR is impossible because of the leader Joseph Stalin, who, for the legitimacy of his own power, created a sense of external threat, created by the USA and Great Britain. Divergent goals and the needs of the great powers led to the poisoning of the war order and the subsequent division of Europe.

To sum up, the "Cold War" can be defined as a complex and lengthy process, characterised by states of increased hostility, tension and crises intertwined with states of international relaxation, which, under the influence of factors determining it, ran from one to the other culminating point (Malendowski 2007, p. 11).

The distance between the two blocs - Western and Eastern - was further widened by each of them belonging to supranational military structures: The North Atlantic Alliance (NATO) 1949 and - since 1955. - The Warsaw Pact (UW).

The North Atlantic Treaty itself consisted of 14 articles which set out the most important mutual obligations of the allies, such as: cooperation between Member States, objectives of joint action. Moreover, it has become a pillar of the allied strategy, establishing a new defence framework in the North Atlantic area (Zarychta 2012, p. 43). The most important article of the Treaty is Article 5, which says: "The parties agree that an armed aggression against one or more of them in Europe or North America will be considered an aggression against all of them and therefore agree that if such an aggression occurs, each of them, in the exercise of their right of individual or collective self-defence under Article 51 of the Charter of the United Nations, shall assist the party or parties assaulted (the so-called Musketeer Principle, one for all, all for one)".

Truman's doctrine was initiated by the message of the American President on March 12, 1947.
He proclaimed the United States' engagement against Communist forces in Greece
and Turkey as part of the global fight between democracy and dictatorship. In Greece guerrilla warfare was developing, supported by the communist bases of Yugoslavia and Bulgaria, which were satellites of the USSR. The Kremlin, on the other hand, made territorial demands on Turkey concerning the Bosporus and Dardanelles straits. The USA's interest in these countries was inspired and proposed by Great Britain. In the winter of 1946 to 1947, the British Government informed Washington that it would cease military and financial aid to Greece on 1 April (Kissinger, *op. cit*., p. 493). By that time, 16 thousand British soldiers stayed there and the financial support for the royal government in the years 1945-1946 amounted to about 700 min. dollars (Kukułka, *op. cit*., p. 39). The United States, at London's suggestion, has taken steps to strengthen countries threatened by Soviet aggression.

On March 12th 1947 Truman presented the new principles of American politics by announcing: "United States policy must include assistance to free nations that resist attempts by armed minorities or external pressure to subdue them. (Davies, *op. cit*., p. 1132). The doctrine of the American President has been

defined as "deterrence" consisting in acting with appropriate force whenever the Communists show a desire to violate the interests of a peaceful and stable world (Kissinger 2002, p. 496).

The new strategy was most fully expressed in Truman's doctrine, while the person who developed it, making it an interpretation of national strategy was an American diplomat George F. Kennan (Gaddis, p. 37). At the end of 1948, he presented three main objectives for the creation of international order: "the first was to restore the balance of power by helping to restore self-confidence among the peoples threatened by Soviet expansion; the second was to reduce the Soviet capacity to expand its influence beyond its borders; the third was to modify the Soviet understanding of international relations in order to negotiate an agreement on key issues" (Ibidem, p. 57).

This meant that the United States voluntarily assumed the burden of leadership and defense of every free (non-communist) nation in every corner of the world. The doctrine of suppression was a cornerstone, becoming a permanent principle of the policy of the USA and countries threatened by communism (Zarychta, *op. cit*., p. 45). Thanks to it, Truman strengthened anti-communist and anti-Soviet positions in Western Europe. He has implemented them both in the military and economic fields. The first goal was served by the North Atlantic Alliance, and the second was Marshall's plan to rebuild Europe by means of American supplies and loans.

The introduction by the United States of the Truman doctrine, the Marshall Plan, and later the creation of NATO clearly influenced the fate of Germany. It was decided, above all, by the lack of agreement between the winners of World War II: The USA, the USSR and Great Britain. According to the decisions taken at the Potsdam Conference, Germany was divided into four occupation zones: Eastern-Soviet, North-Western-British, South-Western-American and Central-Western-French. Despite this, there was a consensus among the western countries that Germany should be one. Unfortunately, it turned out to be only a fantasy, and the American-Russian rivalry led to the creation of dividing lines.

On January 1, 1947, Bison was formed from the American and British zones, and on April 8, 1949, it was agreed to include the French zone, which gave rise to Trizonia.

The transformation of the North Atlantic Alliance in relation to the increase in armaments in Europe has led to the initiation of actions aimed at remilitarising Germany. The aim of the great powers was to link Germany more closely to the western countries through rapid militarisation and its introduction into Atlantic structures. Under longer negotiations, a series of agreements were signed on 23 October, which went down in history under the name of the Paris agreements. These included: full German autonomy, the creation of a West German army with 12 divisions, Germany's accession to the North Atlantic Alliance and the creation of the Western European Union (Kukułka, op. cit., p. 41). The Paris agreements entered into force on 5 May 1955, thus making Germany a member of NATO and the Western European Union. This has changed the political and military situation in Europe.

Functioning of the North Atlantic Alliance

Meanwhile, the functioning of the North Atlantic Alliance was subordinate to successive strategic concepts that were adopted and introduced (Ciszek, *op. cit*., p. 131). Since 1952, the concept of a new strategy, described as asymmetric deterrence, began to be promoted in administrative circles - Dwight D. Eisenhower, applying for the presidential seat (Gaddis, p. 179). Its architect was, the future U.S. Secretary of State John Foster Dulles, who pushed for American politics with "more courage". The strategy of asymmetric deterrence, over time, has been described as "mass retaliation". The term was popularized after the famous speech - January 12th 1954 - to the US Foreign Affairs Council, Secretary of State Dulles, who said that: "the only way that free societies are able to deter aggression is for them to react decisively in their own chosen place and with their own choice of means". (Ibidem, p. 203). As a consequence, the strategy was based on US readiness to use nuclear weapons (Ibidem, p. 203). Dulles

himself, in Foreign Affairs magazine, said that the essence of the new strategy is to make the potential aggressor aware, "that he can lose much more than profit from aggression. (Ibidem, p. 207).

The strategy assuming nuclear deterrence, put great emphasis on increasing the number of carriers of this kind of weaponry, both bombers and ballistic missiles based on the Earth's surface (Silence, *op. cit*., p. 132). It should be noted that the Americans did not have a monopoly on this kind of weapon.

At that time there were also major transformations, in the North Atlantic Alliance. It was about building integrated military structures and establishing command bodies (*Ibidem*, p. 131). The adoption of an integrated command structure by the member states resulted in the subordination of individual NATO countries to the Supreme Allied Commander Europe (SACEUR).

At the same time as Western Europe was changing, the central and eastern part of the continent was also changing. The processes taking place in the Western bloc led Moscow to seek institutional structures for integration. The result was a military pact: "the Friendship, Cooperation and Mutual Assistance Agreement" referred to as the Warsaw Pact.

On 14 May 1955, 8 countries signed it in Warsaw: Albania, Bulgaria, Czechoslovakia, the GDR, Poland, Romania, Hungary and the USSR. After its entry into force on 4 June 1955, it was to remain in force for 20 years, assuming that this period may increase to 10 years for member states that have not terminated it by that time (Ślusarczyk 1992, p. 37). It was given the status of a political-military alliance.

The deadline for signing it was not accidental. By decision of the great powers the day after - 15 May 1955 - a state treaty with Austria was to be signed. According to it, the armies of the four powers were to withdraw from Austrian territory and consequently recognise its neutrality. This meant - in accordance with the post-war provisions - that the Soviet troops left Romania and Hungary. The Warsaw Pact justified the need to maintain Soviet troops in the member states (Holzer, op. cit., p. 36).

Officially, the Warsaw Pact was created to defend against the German threat, which according to the signatories increased after Germany's accession to NATO (Jarząbek, 2008, p. 9). Its creation was preceded by a Moscow conference (29 November - 2 December 1954), during which it was assessed that the "Parisian systems" were a threat to a new war in Europe. Formally, the Warsaw Pact, like NATO, was of a defensive nature, as evidenced by Article 4 stating that: "...each State Party to the Agreement shall, in the event of armed aggression in Europe against one or more States Parties to the Agreement (...) provide immediate assistance to the State or States, including the use of force". (Nowak 2011, p. 912). Its main task was to use appropriate means to ensure security and peace in Europe. To this end, the signatories of the pact have committed themselves to basing their policies on the prevention of the threat of the use of force, the settlement of disputes by peaceful means and participation in international conflict prevention projects (Ibidem, p. 912). In fact, the Warsaw Pact served the interests of the Soviet Union, which, through its structures, had political and military control over the member states. This was mentioned in Article 3, which requires consultation on all relevant international matters (*Ibidem*, p. 47).

The development and use of the multilateral structures of the Agreement began only in 1969, when the Committee of Defence Ministers and the Technical Committee and Military Council of the University of Warsaw were established. The Defence Committee of Ministers, meeting twice a year, was a body subordinate to the Soviet General Staff. The sovereignty of the Member States was served by the provision that the Advisory Political Committee (APC) would be the centre of coordination of foreign and international security policy. The statutes of this body stipulated that it would meet twice a year. But the reality was quite different. During the first six years, he gathered only four times (Holzer, *op. cit*., p. 342). The Secretary-General of the Advisory Political Committee was in practice only a technical

official who was responsible for the organisation of meetings of that highest authority. Two standing instances of the Committee: The Commission and the Secretariat are located in Moscow.

The Warsaw Pact was a powerful military force that consisted of: 200 Soviet divisions and 80 member states divisions. As a result of bilateral agreements that the Soviet Union concluded with: In the Polish, Hungarian, Romanian and GDR, his troops were stationed almost all over the eastern block. The largest number of them stayed in the GDR, where until January 1958 there were 425 thousand soldiers (Holzer, *op. cit*., p. 342). According to the "*Agreement between the Polish People's Republic and the government of the USSR on the number, deployment and movements of Soviet troops temporarily stationed in Poland and the mode of entry and exit of Soviet units from and to Poland" of 23 October 1957* (See A. Skrzypek 2005, p. 112), 40,000 ground troops, 17,000 air forces and 7,000 navies were stationed in Poland.

The key factor determining the views of the Soviet military thought was the degree of threat from the NATO naval forces. At the beginning of the 1960s, the North Atlantic Alliance began to introduce the so-called flexible response strategy, which emphasized the acceleration of the development of conventional forces, which were to play not only a defensive role, but also perform offensive tasks (Ciszek, *op. cit*., p. 131). This was mainly due to the unpredictable repercussions of using only nuclear weapons. This meant strengthening the combat readiness and the interaction of command and armament systems of the emerging maritime forces of the United Baltic Fleet (Będźmirowski 2004, p. 40). An example is the operational directive from 1964, introduced in the Polish Army. It specified the following tasks for the Navy of the Polish People's Republic: "participation in combating NATO naval forces and preventing them from operating in the central Baltic Sea; participation in defending the coastline of the People's Republic of Poland together with the National Defence Forces; securing transports with supplies for the coastal front; conducting landing operations together with the coastal front troops; participating in organising the system of base of own and allied forces". (Piwnicki, Zalewski 2002, p. 136).

The introduction by the United States of the strategy of "realistic deterrence" forced the Command of the United Baltic Sea Fleet to set a strict division of tasks for the individual allied fleets sailing on the Baltic (Będźmirowski, p. 44). Detailed operational and tactical plans were developed by the general staffs of the allied armies on their own, but they were characterised by common goals such as: "to dismantle the enemy's naval forces in the Baltic Sea, support the activities carried out by the land forces on the enemy's shore and provide tight cover and defence for the coast, sea bases, ports and shipping routes". (*Ibidem*, p. 45).

The area of the development of the United Baltic Fleet can be divided into the following areas due to the combat activities: Missile submarines - the island of Osmussaar (at the entrance to the Gulf of Finland), the northern part of the Gulf of Riga (under the cover of the southern coast of Sarrema Island, the central part of the North Sea, the central part of the North Sea; classic submarines - Gotska Sandom Island, the central part of Gotland Head and Slupsk Bank and the southern part of Skagerrak; reconnaissance and surveillance vessels - the English Channel area, the area north of the port of Cardiff, west of the entrance to the Skagerrak, the Baltic Straits area, the northern part of the Gotland Deep, between the islands of Gotska Sandom and Sarrema; Ship's surveillance area - Pre-strait zone and approach to ports - Baltiysk, Liepaja, Riga, Tallinn, and Sarrema Island Strait; Ship's Exploration and Impact Group - Pre-strait zone, Gotland Island, northern part of the Gulf of Gdansk, approach to the Gulf of Finland; Nida - Nida - Nemunas estuary and towns: Prochładnoje, Zaliwnoje, Poddubie (Kaliningrad Oblast) (Ibidem, p. 138).

The division of Europe into two military blocs was also connected with the formation of specific forms of subregional integration. This resulted in the creation of transnational structures in the economic sphere. The Eastern Bloc was represented by the Council for Mutual Economic Assistance (GCC) and the Western Bloc by the European Economic Community (EEC).

The GCC was created as a result of the convention signed by the GCC: Bulgaria, Czechoslovakia, Poland, Romania and the Soviet Union in Moscow 5 - 8 January 1949. In the following years they joined the organization: Albania (1949), GDR (1950), Mongolia (1962) and Cuba (1972). The creation of the GCC was the Soviet response to the Marshall Plan, which was treated in Moscow as a tool to "respect the sovereignty of European countries". (Calvocoressi, *op. cit*., p. 316). Its main tasks were: collecting and analysing statistics, exchanging technical information, providing mutual assistance in food, raw materials, machinery and industrial equipment, and promoting bilateral and trilateral trade agreements. The first stage of the Comecon's activity can be described as "building socialism" on Soviet fashion (Davies, *op. cit*., p. 1173). At the end of the fifties, the organisation was revived. As a result of this, she was involved in helping Hungary in 1956. She organised loans to the country and promoted extensive investment, for example through cooperation in electricity distribution and pipeline construction. In the early 1970s, a major document was adopted which contained a long-term plan: "the development of socialist economic integration of the Member States". (Calvocoressi, *op. cit*., p. 325).

The problems of the Comeconvivenza were mainly due to the economic strategy chosen by Moscow. It focused on heavy industry and mining, the cost of agriculture and consumer goods (M¹czak, *op. cit*., p. 768). Since 1950, production for civilian purposes was stopped, allocating the entire growth to military purposes (Holzer, *op. cit*., p. 64). In addition to common interests with the Eastern Bloc countries, some countries were also interested in trading with Western Europe. However, under pressure from the USSR, this was impossible, so it was difficult to make the "big leap" of modernization by cutting off from the world economy. This led mainly to a deepening of economic disproportions between the Eastern and Western Bloc.

Denmark is located in the central part of Europe between the Baltic Sea to the east, the North Sea to the west and the Skagerrak Strait to the north (Szyma, R. Łazarz, P. Ostrowski 2007, p. 34). The area of the country is 43 094 km2 and covers almost the entire Jutland Peninsula and nearby 443 islands, 76 of which are inhabited (Zawadzki, *op. cit*., p. 50). In the period in question, the capital city was and is Copenhagen. Denmark is a constitutional monarchy with two autonomous overseas estates: the Faroe Islands and Greenland.

After the Second World War, Denmark entered the path of political, military and commercial integration with Western European countries. Such decisions were undoubtedly influenced by the fact that despite the neutrality of 1940, the country was attacked and remained under German occupation for the next five years (Froese 2007, p. 299). For this reason, in 1949 Denmark became one of the founders of the North Atlantic Alliance. The accession to the Atlantic security structures has broken with the policy of neutrality, which would have been extremely difficult in the Cold War.

Since 1952, Denmark has been strengthening its relations with the Scandinavian countries: Iceland, Norway and Sweden by setting up the Nordic Council. These countries undertook to develop cooperation: legal, culture and science, social, economic and environmental protection (Piwnicki, Zalewski, *op. cit*., p. 144). The Federal Republic of Germany was founded on 7 September 1949 with its capital in Bonn. Situated in central Europe, it bordered France, Luxembourg, the Netherlands and Belgium to the west; Switzerland and Austria to the south; and Czechoslovakia and the GDR to the east. The area of Germany was 248 717 km2 (Zawadzki, *op. cit*., p. 49). In the analysed period, Germany was a parliamentary democracy, which was formed by numerous federal states, among others: Bavaria, Rhineland-Westphalia and Lower Saxony. Its first president was Theodor Heuss, and the executive power was held by a government headed by Chancellor Konrad Adenauer. The Paris agreements concluded between Germany and the North Atlantic Alliance resulted in the integration of the country into the Atlantic structures. As a member of NATO and the European Economic Community, Germany was the second (after the USSR) power of the Baltic Sea region. Although it had the most powerful impact forces on land, sea and air (Będźmirowski, 2005, p. 14). It was believed that in this way the country was seeking to take over dominance in the North Atlantic Alliance on the European continent. In order to rule the sea in the

western and southern part of the Baltic Sea, a theory of so-called advance defence was developed, according to which the German naval forces were to participate in the maintenance of the Baltic straits. As a consequence of this theory, about 70% of ship forces (all rocket boats and submarines) and the entire maritime aviation (*Ibidem*, p. 14) were called up for probable combat operations in the Baltic Sea. This meant that Germany was looking for its own security in gaining freedom of action in the distant foreground (*Ibidem*, p. 14).

Economic importance of the Baltic Sea Region in Russian security policy

The Baltic Sea region is a specific area at the meeting point of conflicting political interests of East and West, which makes it an object of particular interest for the North Atlantic Alliance and the Russian Federation. Today, it is an important area for maritime transport, trade and the acquisition of both living and non-living resources. Moreover, its strategic importance is enhanced by the presence of the longest offshore gas pipeline in the world - Nord Stream. Direct access to the Baltic Sea is not only a space for economic activity but above all an opportunity to shape the regional political situation, thus influencing the neighbouring countries. In recent years, the economic factor has become an essential tool for achieving political goals in the Baltic region. An example of the practical use of economic methods has become the Russian Federation, which has again started to manifest geopolitical ambitions aimed at gaining a dominant role in the post-Soviet area. The demonstration of strength made by Russia is primarily a large-scale economic pressure exercise aimed at changing the security architecture in the Baltic Sea region. Such activities pose a particular threat to the Baltic States, and in particular to the ports and base area.

The Baltic Sea Region is considered by the Russian Federation to be a classical political and strategic maritime region due to the possibility of shaping the political and military situation in Europe. Such an assumption is connected with the possibility of trade with the countries of the European Union and countries of the American continents such as the United States or Brazil. It should be noted that the key role in the Russian transport strategy is played primarily by Germany, which has a permanent connection with the Russian ports of Ust-Luga, Baltiysk and St. Petersburg . As a result, the port of Rostock handles around 70% of the estimated 7 million tonnes of total freight traffic and the port of Sassnitz-Mukran, with Germany's largest ferry base suitable for handling broad gauge wagons, has a quay allowing 80 wagons to be loaded onto the ferry at the same time. This situation has certain economic consequences in terms of Russian ports dominating the overall traffic around the Gulf of Finland. Apart from the solutions imposing the use of the principles of free navigation in the Baltic Sea, the Russian Federation aims to make this area a key route for oil and gas transport. An example is the North Stream pipeline (Nord Stream) running along the bottom of the Baltic Sea, which marginalises transit countries such as Poland and the Baltic republics. A continuation of this project is the extension of the pipeline by two further lines with a total capacity of 55 bcm of natural gas per year. The project, in which Gazprom is the main shareholder, has primarily a political dimension and concerns the strengthening of Russia's position in the Baltic Sea region, and thus the creation of the so-called 'gas loop', which would facilitate bypassing the gas supplies of Central and Eastern European countries. A similar strategy is followed by the transmission of crude oil through the Baltic Pipeline System BTS-2, connecting Unechia in the Brien region with the port terminal in Ust-Ługa on the Gulf of Finland, which is an alternative to the existing transit routes in the form of the 'Friendship' oil pipeline, leading through Belarus and Poland to Germany. The strategic goal of building the BTS-2, whose route can transmit 50 million tonnes of crude oil per year, is primarily to reduce dependence on the transit of this raw material through Belarus, Poland, Ukraine and the Baltic republics. Russian activity in the field of energy security in the Baltic Sea region focuses on dominating the gas and oil supplies of Central European countries and preventing these countries from creating infrastructure to diversify supplies of both raw materials.

Conclusion

To sum up, until 1991, the USSR was at the head of the Warsaw Pact and the Council for Mutual Economic Assistance, and it had the largest area, population, armed forces and was the only one to possess nuclear weapons, making it a superpower and leader among the countries of the Baltic Sea region.

The next country to be included in the Eastern Bloc in the Baltic Sea region was the People's Republic of Poland. After the Second World War Poland found itself in the sphere of influence of the USSR, which began with the announcement of the Manifesto of the Polish Committee for National Liberation on 22 July 1944. PKWN was transformed by the Provisional Government of the Republic of Poland, and in June 1945, as a result of agreements between representatives of this government and some politicians in exile, the Provisional Government of National Unity was formed. As a result, a political system was created on Polish soil, in which the communist party was the hegemon. This involved a loss of sovereignty through control of the authorities, political parties and the economy. Since 1952, the People's Republic of Poland, as a state aiming at socialism, was defined by the Constitution, modelled on the Soviet one from 1936. According to its principles, the Sejm remained the highest authority, the function of the Head of State was held by the Council of State. The Council of Ministers, appointed by the Sejm and headed by the Prime Minister, was the chief executive and administrative body. However, the real power was held by the Marxist-Leninist Polish United Workers' Party (PZPR). From that moment on, all important decisions were made at meetings of the PZPR political office and discussed with the Soviet embassy.

The Polish People's Republic's membership in the Eastern Bloc was consolidated by its accession to the Comecon Council in 1949 and to the Warsaw Pact in 1955. Poland, being a member of the Warsaw Pact, had to adapt to the Soviet war doctrine. The most important role in the offensive activities of the University of Warsaw was to ensure the march of the Soviet Army to the west of Europe. Moreover, according to the "Plan of the ND's organisational plans for the years 1955 - 1960", one of the tasks entrusted to the Polish Armed Forces was to participate in activities in the northern part of Europe aimed at seizing, among others, Denmark. For this task, the Polish army has separated the sea landing units - the 7th Landing Division, the so-called "Blue Berets" (Piotrowski 2002, p.3).

. The main activities in the field of landing operation were contained in the Operational Directive of 1964. According to it, the Polish Navy was incorporated into the operational troops, separated by the Armed Forces of the People's Republic of Poland into the United States of America (Makowski, 2011, p. 9). Polish naval forces peaked in development and combat capabilities in 1980. At that time, the Polish Navy was part of the Polish Navy: 1 destroyer, 13 rocket launchers, eight torpedo boats, two submarines, 24 minesweepers, five minesweepers, 29 PO raiders (eight large, 21 small), 23 medium-sized landing vessels, 176 auxiliary and special vessels, making up a total of 280 vessels with a total tonnage of 85 256 tonnes'. (Ibidem, p.9).

The People's Republic of Poland had a fourth area and a third population of the Baltic Sea region. In terms of the number of soldiers, Poland with 412,000 (1989) was the third force after the USSR and Germany in the Baltic region.

The last state belonging to the Eastern Bloc in the Baltic Sea region was the German Democratic Republic (GDR). It was established on October 7, 1949, on the area of 108.3 km2 of the former Soviet occupation zone. The capital of the state was East Berlin, separated from West Berlin by the Berlin Wall. The German Socialist Unity Party (SED), governed by the communists, played a dominant role in Germany. The party had full control in all aspects of life: political, economic, cultural, etc.

The first president of the GDR was Wilhelm Pieck and thepost of SED prime minister was filled by social democrat Otto Grotewohl. From 1950, the GDR was a member of the Comecon Council and until 1955 of the Warsaw Pact, which meant that in the analysed period it was a state fully dependent on the Soviet Union. The GDR armed forces in 1989 consisted of 173,000 soldiers. The naval forces consisted of 16,000 sailors and were equipped: 19 frigates, 38 patrol and small rocket ships, 42 mine fighting ships, 12 landing ships, 15 support ships (The Military Balance 1990, *op. cit*., p. 124 - 127, 212 -224).

Abstract

This article indicates the management of international dialogue and its impact on the security of the Baltic Sea Region. The new military situation in the world was pointed out, forcing the Command of the United Baltic Fleet to create a new war strategy assuming that in the event of armed conflict the fleets of the socialist dinner states will carry out combat tasks in the Baltic Sea, in close cooperation with the USSR Baltic Fleet and the land forces. The issue of disarmament was raised at a conference in Geneva. The political changes in Central and Eastern Europe and the phases of the process to achieve independence in the Baltic States were also pointed out. In order to achieve the assumed objectives, domestic and foreign literature was analysed. Its purpose is to assess the political, military and economic changes that have taken place in the Baltic Sea region as a result of the break-up of the Soviet Union. These events have influenced the new situation in the Baltic Sea region. The most important player on the political scene was the United States. The Baltic Sea states have reduced their armies. This resulted in a state of stability in the region. The security of the Baltic States and the whole region increased.

Keywords: Bipolarity, European Order, Monopoly, Weapons, Military Situation, Baltic Sea.

Introduction

The bipolarity shaping the post-war European order caused a clash of opposing visions between the victorious powers, one of which (the U.S.) has had nuclear weapons at its disposal since 1945 (Mączak, *op. cit*., p. 754). The United States - having a monopoly on weapons that can change the fate of the world, and being a financial power - was not able to separate the USSR from the domination of Central and Eastern Europe together with Western countries. It involved a specific understanding of security by Americans. They assumed that security imposes openness on the world, including an open Eastern Europe (Holzer, *op. cit*., p. 62). To put the issue in this way indicated that they would not destroy Moscow and Leningrad with atomic bombs. It was enough for Americans to feel like having a nuclear boron, tested in August 1945 against Japan. The Soviet Union, on the other hand, despite the fact that it had a great deal of conventional forces on the old continent, could not base its security guarantees on the grace of the United States (Calvocoressi, *op. cit*., p. 20).

This extremely frustrating situation for the USSR has accelerated work on the construction of Soviet nuclear weapons. The efforts were successfully completed in 1949[1].
The USSR's mastery of nuclear weapons production has resulted in the achievement of nuclear balance on the European continent and the aggravation of the Cold War. It should be noted, however,

[1] The explosion of the first Soviet atomic bomb took place in September 1949 on a training ground in New Earth

that the atomic power of the United States was definitely superior to the Soviet one, as evidenced by the following data: "The US in 1948 50, 1952 841, 1955 2,000 and 1962 28,000 atomic bombs, while the Soviet Union in 1950 only 5, in the late 1950s 1700 bombs". (Judt*, op. cit*., p. 294).

Between 1952 and 1953 the United States and the Soviet Union carried out the first tests with fusion and hydrogen bombs2. In addition, both countries have worked hard to produce means of transporting the heads. In the context of the Baltic Sea, it is noteworthy that the USSR, like the United States, had first-rate military units of various components of its armed forces in the area. This meant that a possible armed conflict in the area could turn into a nuclear war.

The emergence of nuclear and missile weapons caused significant changes in the implementation of operations and combat activities at sea (Będźmirowski, Polish Navy, p. 44). The military theorists of the North Atlantic Alliance had doubts about the tasks of the fleet in a nuclear war, asking themselves: *Is it supposed to destroy the enemy, or to gain dominion over the water, risking the enemy destroying it faster (Ibidem,* p. 43). Admiral Sergei Gorshkov had a different opinion about it: "*such a category of the art of naval warfare as the conquest of the sea still retains its relevance and therefore studying it in all its aspects from the point of view of its application to the present day is one of the most important tasks of war science*". (*Ibidem,* p. 43).

The new military situation in the world

The new military situation in the world has forced the Command of the United Baltic Fleet to create a new war strategy assuming that, in the event of armed conflict, the fleets of the socialist dinner states will carry out combat tasks in the Baltic Sea, in close cooperation with the USSR Baltic Fleet and the land forces (Ibidem, p.43). In addition, the approved strategy assumed that the main tasks of the fleet would be: "actions against the enemy fleet and coastline" (Ibidem, p.43).
The development of military potential through the imposition of an arms race has resulted in the need for an agreement on the reduction of armed forces between the two superpowers3.
The issue of disarmament was raised at a conference in Geneva (18-23 July 1955). During the meeting, the Soviet Union put forward an initiative for a pan-European collective security pact in Europe. This was linked to the demand that "no member of the Big Four will use atomic or hydrogen weapons first against any country". (Cuckoo, op. cit., p. 82). The United States has requested the establishment of a system of inspections involving the taking of aerial photographs on both sides. At the time of the Geneva Conference, the issue of disarmament imposed a fundamental question: "to what extent should an arms limitation be carried out, total or only to a certain extent? The deliberations did not bring about any agreement because the Western powers wanted the arms restriction zone - which was also the dividing line between East and West - to run on the Oder and Lusatian Neisse, and not on the Elbe.
The main problem in reaching a consensus was the issue of inspection and verification. It was natural for Western countries that the checks had to take place on the spot. The government of the USSR, on the other hand, thought completely different. The Russians were primarily afraid that after such a visit their arsenals of weapons would be destroyed4. Inspectors who carry out inspections were often taken as spies. This lack of mutual trust was extremely dangerous and could lead to a nuclear attack5.

[2] The first hydrogen bomb test was carried out by the USSR on 12 August 1953.
16 April 1953 Dwight Eisenhower, the then President of the United States of America, in a speech to the American press, raised the issue of disarmament talks. This happened in spite of the current doctrine of liberation, which was to expand the sphere of influence on the countries under Soviet tutelage and push socialism to the borders of the Soviet Union. It showed that the American administration saw the risk of world war. See J. Kukułka, *Historia współczesna stosunków międzynarodowych 1945 - 2000*, Warsaw 2007, p. 80.

[4] Until one point in the USSR, it only allowed the control of weapons for destruction
[5] In spring 1961, the US administration withdrew its demands for on-site inspections.

The breakthrough of the nuclear poate took place in the autumn of 1961. At the UN General Assembly, negotiators McCloy (USA) and Zorin (USSR) opened a new stage in the negotiations. It was intended to eliminate all arsenals and means of delivery of weapons of mass destruction from international life and to settle disputes in accordance with the United Nations Charter6. A joint statement by McCloy and Zorin outlined a vision of Europe without an arms race.

On 1st July 1968 in order to maintain the status quo within the nuclear hierarchy, the USA, the USSR and the UK concluded the Non-Proliferation Treaty (NPT). Other countries were also invited to participate: Germany signed the agreement with big objections, while France and China did not agree to sign it. The political atmosphere, after the initialling of the NPT, began to foster further agreements between the USA and the USSR. As a result, both countries have expressed their willingness to initiate a Strategic Armaments Limitation Talks (SALT) dialogue7. Negotiations were launched on 17 November 1969 in Helsinki, and over time have developed into long and arduous negotiations. The results had to wait until April 1972, when the Bacteriological Weapons Ban Treaty was signed. The proper signing of SALT I took place on 25 May 1972 in Moscow. It was a temporary agreement on certain measures to reduce strategic offensive armaments8. It was to be in force for 5 years and obliged the signatories not to start building permanent ground-based Intercontinental Ballistic Missiles (ICBM) launchers, as well as old launchers from before 1964. - were not to be replaced by new ones, and the number of ballistic missile launchers from submarines was to be limited (Kukułka, op. cit., p. 183).
The recapitulation of SALT I was the signing of an agreement on the reduction of anti-missile defence systems Anti-Ballistic Missiles System - ABM, also in Moscow. The signatories have concluded it for an indefinite period of time, with the indication that it will be reviewed every 5 years. On this basis, the USSR and the US have committed themselves to maintaining only two ABM systems. It was a decisive stoppage of the race, as both powers were planning to expand them9.

The signing of SALT I and ABM has contributed to improving relations between the two blocks. This thesis was confirmed by the signing of an agreement on the basis of mutual relations between the USSR and the USA. SALT I also proved to be an important stimulus towards a policy of relaxation, called from the French language - détente. The word detente, used in the international relations of the 1970s, meant "reduction of tension" between the Eastern and Western Bloc (Davies, op. cit., p. 1189). The policy of relaxation - associated with the presidency of Richard Nixon - was aimed at making cooperation an instrument to influence the actions of the USSR in areas where the two powers could not agree.

In the Baltic Sea region as well as in Europe as a whole, the road to an "era of relaxation" was opened by the appearance of Willy Brandton the political scene. This German politician, and since 1969 the German Chancellor, came out with a bold thesis assuming a rapprochement to the Eastern Bloc for those times (Kissinger, op. cit., p. 808). He believed that since the attempts to unify Germany with the help of the West did not bring results, the unification should be pursued by normalising relations with the Warsaw Pact countries. Brandt's proposed Eastern policy (from German Ostpolitik) quickly began to be successful.

On 12 August 1970 in Moscow, an agreement between Germany and the USSR was signed. The aim was to improve relations between the two countries, and to work together to promote peace and security in Europe. The most important provision concerned the recognition of the status quo on the continent and Germany's resignation from its revisionist territorial inclinations towards Poland (Kukułka, op. cit., p. 192).

---

[6] J. Cuckoo, *op. cit*., p. 136.
[7] Strategic weapons include missiles or bombs (on board long-range aircrafts, launched from submarines or launchers on land) which, when fired from their own territory, can reach targets lying on enemy territory.
[8] On 25 May 1972 a bilateral agreement on the prevention of incidents in the open sea was signed at SALT I for the safety of navigation of warships and military aircraft.
[9] For example, the US to 12.

The Moscow Agreement led to the signing of an agreement between the People's Republic of Poland and Germany in December 197010. Both sides declared that the inviolability of borders and respect for the borders of all countries is an essential condition for preserving world peace. The key provision of the agreement was Article 1 confirming that the border on the Oder and Lusatian Neisse is legal and inviolable now and in the future (ukułka, op. cit., p. 192).

The Moscow and Warsaw systems became an introduction to the main goal of Ostpolitik, which was: "to halt the growing sense of alienation among the population of divided Germany." (Holzer, op. cit., p. 538). The prelude was to be a solution to the West Berlin question11. The agreement of 3 September 1971 regulated its status. The USSR recognised the sovereignty of the four powers in western Berlin - established after World War II - which confirmed the existence of a separate unit in the western part of the city. Furthermore, the agreement set out the obligations of the USSR to respect the freedom of transit of persons and goods from Germany to Berlin. The consensus reached showed that great powers can solve the tensions at the junction of two blocks.

The deadlock in German relations was broken by the signing of the Basic Agreement on 21 December 1972 in Berlin on the foundations of relations between the GDR and Germany[12]. The problem of Germany has not been solved, the Iron Curtain continued to divide the two countries, but relations between them have been regulated and contacts between them have increased in economic, cultural, scientific, technical and sports fields. Following the signing of the agreement in Berlin by the GDR and Germany, both governments exchanged notes in which they announced that they were applying for admission to the UN. This took place on 21 June 1973.

The agreements signed by the Federal Republic of Germany with the USSR, Poland and the USSR put the past in order. First of all, there was the recognition of the territorial reality in Europe and the normalisation of relations between Bonn and the Warsaw Pact countries (Wolle 2003, p. 83). This meant that *Ostpolitik* achieved success by easing the confrontation between East and West.

Standardisation of relations between the two German states

The normalisation of relations between the two German states has helped to strengthen the *détente* policy. Its most famous manifestation was the convening of the Conference on Cooperation and Security in Europe (CSCE) in Helsinki in July 1973. The meeting was initiated by the Soviet Union, whose aim was to approve the post-war borders in Europe[13]. The second intention was a security issue - "the number and deployment of military bases and the level of the armed forces". (Calvocoressi, *op. cit*., p. 76).

The second stage of the CSCE taking place in Geneva (18 September 1973 - 21 July 1975) was important because of the appearance of the so-called 'third basket'. It contained provisions on humanitarian cooperation and in other areas, such as respect for human rights and fundamental freedoms. For the Eastern Bloc countries, this meant that they would have to choose between respecting the rights of their citizens and the risk of exposing the act of breaking their own serious decrees.

Phase III of the CSCE in Helsinki, ended with the signature on 1 August 1975. The Final Act. The Helsinki Final Act of the CSCE was the greatest achievement of the relaxing policy. From the point of view of the USSR, the success was not unequivocal; on the one hand, it sanctioned the Soviet

[10] The ceremonial signing by the Prime Minister of the People's Republic of Poland Józef Cyrankiewicz and German Chancellor Willy Brandt took place in Warsaw on 7 December 1970.

[11] As a result of the second Berlin crisis, from 13 August 1961, Berlin was divided by a wall, which was the border between the West and the East.

[12] The agreement was signed by the secretaries of state Michael Kohl (GDR) and Egon Bahr (FRG), considered the architect of *Ostpolitik*.

[13] The borders of the Soviet Union were not ratified by any peace conference after World War II.

gains from the Second World War. On the other hand, the signing of human rights concessions by the Russian delegation has resulted in support for the organised opposition throughout the Eastern bloc[14].

The establishment of the CSCE - where aspects of peaceful coexistence were considered - led to the continuation of the relaxation dialogue as a prelude to further disarmament negotiations.

According to the provisions of SALT I, it was to be continued. The SALT II negotiations were aimed at addressing all the issues that have been omitted so far. The negotiations started in Geneva on 21 July 1972 were not easy, due to their very complex content. In addition, discrepancies quickly emerged regarding the different perceptions of security by the two blocks. The dispute concerned mainly the *Multiple Independently Targetable Re - entry Vehicle (*MIRV) (Calvocoressi, *op. cit*., p. 58). In the initial phase of the negotiations, the United States did not want them to be included in the agreement, which was influenced by the fact that they had an advantage in them[15]. The conversations have been dragging on for years and have not been successful. Further negotiations were hampered by another dispute, this time over *Cruise Missiles'* self-steering *missiles*, in which the US again had an advantage. The breakthrough came on June 18, 1979, during the meeting of the First Secretary General of the Communist Party of the Soviet Union, Leonid Brezhnev, with US President Jimmy Carter in Vienna. The leaders of both countries signed the "Strategic Offensive Arms Reduction Agreement" - SALT II. It limited the launchers of: nuclear rockets to 2400, battalion rockets to 1200, and multi-headed independent guidance rockets to 820 (Cuckoo, *op. cit*., p. 186). SALT II has raised hopes for an acceleration of the process of relaxation between the two blocks and for the positive development of the Vienna negotiations for the reduction of the armed forces in Central Europe[16].

The Vienna Disarmament Prognosis

The Vienna disarmament negotiations began on 30 October 1973 with the aim of reducing armaments
in Europe[17]. The Warsaw Pact countries have presented a project involving a "symmetrical reduction" of the armed forces based on the assumption that there is a balance between the two blocks in Central Europe.
In 1975, 20,000 soldiers from each side were to be reduced. The Western countries had a completely different view of this issue. Instead of "symmetrical reduction", they proposed an "asymmetry of reduction" to reduce 2.5 times more Soviet forces than the U.S., explaining this by the numerical superiority of Soviet troops (Kukułka, *op. cit*., p. 200). The first projects outlined showed the dissonance between NATO and the Warsaw Pact countries, which cast a shadow over further Viennese negotiations.
The deadlock in the discussion on the reduction of the armed forces had its causes in the political situation that took place after the end of the seventies. The year 1979 brought two important events that influenced further relations between East and West. The first was the entry of Soviet troops into Afghanistan, the second was the Iranian Islamic revolution. Conflicts in the Middle East have met with a strong response from the United States. The announcement of a new political doctrine by President Jimmy Carterwas an example of this. It assumed immediate US military intervention for any attempt to restrict access to the Gulf (Mączak, *op. cit*., p. 788). For the countries of the Baltic Sea region and the world at large, this has meant that the *détente* policy has given way to a return to the Cold War concept.

---

[14] Since then, the Helsinki Final Act has been referred to, among others, by the Polish Workers' Defence Committee (KOR), established in response to the brutal suppression of protests in Radom and Ursus in June 1976, and by the very name of the "third basket" of the Human and Citizen's Rights Defense Movement (ROPCiO)

[15] In 1972 the US had 1710 missiles capable of reaching 3350 targets, the number of which was to rise to 7000 as a result of the MIRV missile upgrade

[16] SALT II was not finally ratified by President Jimmy Carter, who suspended the whole process in the Senate on 3 January 1980 for electoral reasons.

[17] The Vienna negotiations were preceded by a preparatory consultation on the MBFR (Mutual and Balanced Force Reductions) which took place in Vienna in 1973: Germany, the GDR and the PRL.

Inter-Block Arms Race

Carter's successor, Ronald Reagan, continued his return to the interlocking arms race. From the very beginning, Reagan's policy was conducted "from a position of strength". It was supposed to cause nuclear anxiety in the USSR by making it aware of the risks of further expansion (Kissinger, *op. cit*., p. 846). Unlike his predecessors, Ronald Reagan did not hesitate to define the Soviet Union as the "Evil Empire" and pursue the goal of victory in the Cold War (Burakowski, A. Gubrynowicz, P. Ukielski, *op. cit*., p. 24). Time has shown that this rhetoric was at the heart of an unprecedented East-West dialogue.

In 1983, the U.S. administration decided to introduce the *Strategic Defense Initiative* (SDI) into Europe under NATO[18]. The idea of "Star Wars" announced by Reagan heralded a strategic breakthrough in which nuclear weapons would lose all power. In addition, the SDI was intended to lead to a poly-strategic restructuring that would prove to be a nail in the coffin of the Soviet economy[19]. She realized to the USSR that a further arms race would either consume all her resources or end up with the United States winning (Kissinger, *op. cit*., p. 856).

The prospect of profound reforms in the USSR and a relaxed relationship between the two blocs was created by the new head of the Communist Party of the Soviet Union, Mikhail Gorbachev. He was a dynamic politician, the youngest of the management to date (54 years old), aware of the overwhelming stagnation. As a proponent of profound reforms, Gorbachev based his programme on two elements: *perestroika*, i.e. reconstruction, and *glasnost*, i.e. political liberalisation (Kissinger, *op. cit*., p. 876).

The new leader of the USSR has been paying tribute to the efforts to end the Cold War by limiting its most dangerous manifestations and effects: "an arms race, ideologizing and militarizing international relations, promoting stereotypes of images of the enemy, conducting confrontational politics". (Cuckoo, *op. cit*., p. 374). The reorientation of the foreign policy of the USSR, through the creation of subsequent peace and disarmament initiatives, had its resonance in the resumption of Soviet-American talks. The most important manifestation of this was the Geneva summit meeting of Gorbachev-Reagan on 19-20 November 1986.

It was an important stage on the road to global relaxation between East and West. Both leaders stressed that a nuclear war should never happen and there should be no winners (Cuckoo, *op. cit*., p. 268). Both sides declared to make every effort to bring about a positive conclusion to the Stockholm Conference on confidence-building measures and security in Europe at that time.

The Stockholm Conference began on 17 January 1984 at the level of foreign ministers and was a continuation of the disarmament talks in Geneva and Vienna (See J. Kukułka, op. cit., p. 517). The "diplomacy of concessions" began to operate during the meeting, especially in the field of the activities of the maritime and land and air forces. After long and difficult negotiations, an extensive document of *the Stockholm Conference* was adopted in which mutual notification of military manoeuvres of the Warsaw Pact and NATO was established.

The success of the Stockholm Conference

The success of the Stockholm conference was facilitated by the organisation of the next summit meeting with Reagan and Gorbachevin Reykjavik, the capital of Iceland (Gaddis, *op. cit*., p. 268). During the negotiations, Gorbachev presented a proposal to halve the reduction of Soviet and

[18] Ronald Reagan presented his strategic defensive initiative in a television message to the nation on 23 March 1983.

[19] For the period 1984-1989, the SDI program has an expenditure of $25 billion. Overall, it was to last until 2000 and be $125 billion.

American strategic arsenals during the first 5 years. It was basically an acceptance of the American "zero option"[20].

In exchange for concessions, the USSR leader demanded that the U.S. comply with the missile defense agreement for the next ten years, conducting SDI tests only in laboratories (Gaddis, *op. cit*., p. 268).

The resignation from the SDI was unacceptable to Reagan, who ended the summit due to disagreement.

In spite of this, Reykjavik was not a testimony of defeat, and according to Gorbachev it turned out to be:

"a breakthrough that allowed us to look beyond the horizon for the first time." (*Ibidem*, p. 269). Such a statement meant that the USSR and the USA, however, had a common interest in the elimination of nuclear weapons.

Discussions on the control of armaments throughout Europe - since 1986 through the Warsaw Pact - were held at the CSCE forum. The aftermath was the opening of new negotiations in Vienna on the reduction of conventional arms in the Old Continent. During the second round of negotiations in July 1989, there was a breakthrough in the deliberations, which made it possible to draw up the final document. As a result, on 19th November 1990 the *Treaty on Conventional Armed Forces in Europe (*CFE) was signed. It assumed the implementation of five processes, which included: the principles of calculating conventional military equipment and equipment and ways of achieving these ceilings (Mickiewicz, 2005, p. 16)[21]. At the same time, standards and a timetable for the elimination of surplus equipment, methods for observing the reduction process by individual countries and the implementation of stabilisation measures were agreed (*Ibidem*, p. 16). In fact, the Treaty implied restrictions on military equipment in five categories. The signing of the CFE by 22 signatories (sixteen NATO countries and six Warsaw Pact, already without the GDR) meant the renunciation of hostility by both military blocks. This was followed by a declaration that the "era of division and confrontation in Europe" has come to an end (Cuckoo, *op. cit*., p. 384). She also said that from now on both military blocks would not treat themselves as opponents, but more as partners and friends. Such a statement allows us to conclude that the "Cold War" is over.

The end of the Iron Curtain

The end of the "Iron Curtain" started the disintegration of the communist system in Central and Eastern Europe. There were many reasons for this. The Soviet Union's erroneous interpretation of the situation of the world after World War II should be taken first (Pietkiewicz 2007, p. 80). The vision of building a unipolar system of world communism with a decision-making centre in Moscow proved to be a utopia (*Ibidem*, p. 80). The leadership of the USSR recalculated with forces, assuming a rapid collapse of capitalism. This caused the Eastern Bloc countries to stand out more and more over time: economically, technologically and militarily (*Ibidem*, p. 80).

The arms industry slowly demolished the Soviet economy. It absorbed 20 - 25% of the gross domestic product, while in the USA it was 6.5% (*Ibidem*, p. 80). In total, between 1970 and 1990, the Soviet Union spent 700 billion rubles on armaments. Becoming a world market leader among manufacturers of: tanks, artillery, combat aircraft, helicopters, submarines etc. Spending astronomical sums on the military was at the expense of civilian production. The management has allocated funds previously reserved for the engineering industry and science. To sum up, the growing militarised economy has weakened the country instead of strengthening its defence.

[20] It was about the complete elimination of medium-range missiles of the USSR and the USA.
[21] P. Mickiewicz 2005, p. 16.

As a result of a roundtable compromise between the Polish United Workers' Party (PZPR) and the Solidarity opposition, on 4 June 1989, partially free elections to the Sejm and completely free elections to the Senate took place (Burakowski, Gubrynowicz, Ukielski, op. cit., p. 37). The victory of Solidarity resulted in the first non-communist government in the Eastern Bloc in September22. Poland, being the leader of political changes, has paved the way for events in Central Europe, which have been named the Autumn of Nations.

Position of the Soviet Union

The Soviet Union's position was initially reluctant to consolidate the German state. This was expressed by the USSR Foreign Minister Eduard Shevardnadze, who believed that at the beginning it was necessary to create political guarantees that reunification would not pose a threat to other countries and to Europe as a whole. The Soviet diplomat brought the military issues of the new Germany to the forefront and their position towards the allied forces on German territory (Kukułka, *op. cit*., p. 171). Moreover, the Soviet side feared that German reunification would strengthen NATO and at the same time weaken its state.

The position of the USSR changed after Helmut Kohl's visit to Moscow (10-12 February 1990). During the meeting Gorbachev assured the German Chancellor that it is the German side that must decide when and under what conditions it will unite. Despite this, Russian diplomacy maintained its opposition to the future of Germany being part of NATO. The breakthrough came during another conversation between Gorbachev and Kohl, 15-16 July 1990 in Stawropol in the Caucasus. As a result, Gorbachev agreed to the unification and withdrawal of Soviet troops from the GDR and that Germany itself should decide on its attitude towards NATO (Holzer, *op. cit*., p. 832).

The four powers had the opportunity to present their ideas on Germany through "2+4" talks. The idea was born during the open space conference on 13 February 1990 in Ottawa. The "2+4" formula consisted of discussions, two German states with four powers - France, Great Britain, the USA and the USSR. The Polish side also took part in the Parisian talks. The Polish government wanted to regulate the problem, the Polish-German border on the Oder and Nysa rivers. During the Paris round of "2+4", the Polish voice was heard and, as a consequence, the minutes containing the statement that: "the borders of the united Germany will be final, which cannot be challenged by any external events or circumstances" (Praise, *op. cit*., p. 128).

Before the next "2+4" meeting, on August 23, 1990, the GDR People's House of Representatives passed a resolution on the GDR's accession to Germany (*Ibidem*, p. 126). The unification agreement between the two German states was signed on 31 August 1990. The new German Chancellor was Helmut Kohl.

The decisive settlement of the German case ended with the signing of the "Agreement on the Final Settlement of the German Question" during the fourth round of the "2+4" negotiations in Moscow on September 12, 1990. The adopted document established that Germany would be a sovereign state, which could have up to 370,000 conventional forces and belong to the North Atlantic Alliance (Kukułka, *op. cit.*, p. 388). In addition, it was decided that Soviet troops would leave the territory of the former GDR and Berlin within four years (Parzymies, *op. cit*., p. 173). The agreement also clarified disarmament issues, thus the German government committed itself not to have nuclear, biological and chemical boron.

[22] The "Solidarity" was won in June 1989. 161 seats out of 161 possible to win in the elections to the Sejm (the agreement between the PZPR and the opposition assumed that only 35% of the seats could be won in free elections) and 99 out of 100 seats to the Senate (free and democratic elections).

Political changes in Central and Eastern Europe

As a result of political changes in Central and Eastern Europe, the sense of the existence of political and military blocs has been undermined. The matter of the Warsaw Pact, the main instrument of political and military domination in the Eastern Bloc, came to the fore (Parzymies, *op. cit.*, p. 166). In June 1990, at the request of the Member States, a Commission of Government Plenipotentiaries for the revision of the Warsaw Pact was established. Following three meetings of plenipotentiaries, it was agreed that most of the political and military structures of the Warsaw Pact would be liquidated, except for the consultative bodies (Kukułka, *op. cit.*, p. 451). These reforms were to be implemented in the first half of 1991. The course of events was accelerated due to the GDR's withdrawal from the Warsaw Pact on 24 September 1990.

A meeting of the foreign ministers of the UW member states was held on 25 February in Budapest. It turned out to be a breakthrough, as it established a common position on the liquidation of UW military structures by 1 July 1991 (Strzelczyk 2002 p. 183). On the basis of these arrangements, the political structures of the Warsaw Pact were dissolved at the meeting of the Political Advisory Committee in Prague on 1 July 1991. The protocol was initialled there, saying: "on the loss of power of the Friendship, Cooperation and Mutual Assistance Agreement of May 1955" and the document extending its duration of April 1985 (Kukułka, *op. cit*., p. 451).

In November 1991, during the meeting of sixteen NATO member states in Rome, a new strategic concept on peace and cooperation was announced (Zarychta, *op. cit*., p. 97). The new concept emphasized the defensive character of NATO, the collective defence and indivisibility of the allies' security. Moreover, at the meeting it was assumed that the threat of an attack from Eastern European countries, gave way to multi-faceted and multi-directional threats (*Ibidem*, p. 97). The establishment of the North Atlantic Cooperation Council (NACC), the NACC was a forum for consultation and dialogue between NATO countries and the former Warsaw Pact member states. The future tasks of the Alliance with the countries of Central and Eastern Europe were defined by the Rome Declaration, which said that the Alliance would maintain its defensive character and that its policy would be based on: dialogue, cooperation and common defence (*Ibidem*, p. 97). Moreover, the Declaration emphasised NATO's active support for the development of the CSCE and support for reforms in Eastern Europe. An important element of the new strategy were changes in the military field, which included: improving their readiness and flexibility; reducing the number of troops and dependence on nuclear weapons; and changing the integrated NATO armed forces (*Ibidem*, p. 97).

The second pillar of the Eastern Bloc that was falling apart was the Mutual Economic Assistance Council. The main reason was the collapse of trade between the Soviet Union and the satellite states in early 1991. This led to an intensification of the economic crisis and increased unemployment (Kukułka, *op. cit*., p. 452). The problem was further exacerbated by the impossibility to carry out transactions in transfer roubles, - between GCC members - and settlements in dollars were too expensive. Neither did the GCC's attempts to transform it into a market-oriented organisation help. The project put forward by the Executive Committee at its meeting in Moscow on 4-5 January 1991 assumed the establishment of the International Organisation for Economic Cooperation, which was to include the former members of the GCC, Yugoslavia and Germany. The organisation was to be open to integration with the western economy by focusing on consultative and advisory activities, not decision-making.

Phases of the process to achieve autonomy for the Baltic States

However, the deepening recession in Central and Eastern Europe caused a delegation of GCC member states to decide on 28 June 1991, six months after the meeting in Moscow, to cease its activities. According to the protocol signed there, the Comeconry Embassy was to cease to exist ninety days after it was signed (Parzymies, *op. cit*., p. 168).

Since the end of 1987, political national movements have become apparent in Estonia. They put forward demands demanding changes to the USSR Constitution. Protest actions were also held under

ecological and economic slogans. In a wave of thaw in 1988, the ban on the use of the historical national flag was lifted and a year later, Estonian became the official language.

Lithuania woke up from among the Baltic States at the latest. The first demonstrations in this country took place on the fiftieth anniversary of the Molotov-RibbentropPact. About two million Lithuanians, Latvians and Estonians took part in the protests. Relatively late opposition appearances in Lithuania intensified in subsequent demonstrations in 1988, and in July 1989 the leading politician of the Lithuanian Movement for Reconstruction (Sajudis) Kazimir Prunskieneentered the government as Deputy Prime Minister.

The next phase of the process towards independence for the Baltic States was the proclamation of independence by individual republics. On 11 March 1990 it was announced by the Supreme Council of Lithuania, on 30 March 1990 by Estonia and on 4 May 1990 by Latvia[23]. The declaration of independence by the Baltic republics meant leaving the Soviet Union. This met with opposition from President Mikhail Gorbachev, elected on March 15, 1990. This resulted in an attack by Soviet tankers and KGB (State Security Committee) units on the parliament in Vilnius. Despite this, the action failed, and Gorbachev, fearing for his authority in the west, ordered to stop the military action.

Gorbachev wants to maintain the existence of the Soviet Union, he had to decide on reforms. They were to consist in changing the structure of the state from formally federative to actual federation (Holzer, *op. cit*., p. 842). The prologue for these reforms was to hold a referendum on 17th March 1991 in which the people were to say whether they wanted a federal and sovereign state. As a result of a poll, six republics refused to participate in the federation: Lithuania, Latvia, Estonia, Moldova, Armenia and Georgia[24].

The failed coup has accelerated the decomposition of the Soviet empire. Boris Yeltsin came out of this confrontation victorious. Mainly because of the weaknesses and internal conflicts in the putsch camp, and not because of their own strength. Despite this, he became a hero of Russia, which resulted in the marginalisation of the role of Gorbachev, who resigned from the office of President of the USSR on 24 August 1991. From that moment on, Yeltsin could have acted faster and more efficiently, As a result, on 28 August 1991, he ordered the dissolution and banning of the Communist Party of the Soviet Union.

The last act of liquidation of the Soviet Union took place on December 21, 1991 in Almaty, Kazakhstan. The Additional Protocol to the Belarus Agreement on the creation of the CIS was signed there by 11 republics. The meeting established that the Community "is not a State or a supranational formation". (Ibidem, p. 454). In addition, there were more substantive discussions on military and economic issues.

It was decided to preserve the united command of strategic forces, to maintain uniform control over nuclear weapons and to stop the common economic area (Holzer, *op. cit*., p. 848).

The CIS uprising was considered equivalent to the dismantling of the Soviet Union. The former president Mikhail Gorbachev handed Boris Yeltsin over to the USSR president. At the meeting of heads of state - members of the CIS on December 30, 1991 in Minsk, the agreement of Białowieża and Almaty was ratified. The final announcement of the liquidation of the Soviet Union has become a fact.

[23] In addition to the Baltic States, they opted for independence: Ukraine, Belarus, Moldova, Uzbekistan, Turkmenistan, Tajikistan, Azerbaijan, Kazakhstan and Kyrgyzstan.

[24] It also rejected participation in the federation: Armenia, Georgia and Moldova. The other participants in the referendum, among others In the Asian republics and Azerbaijan, there has been an advocacy for maintaining the federation.

Summary

To sum up, it should be noted that until 1989 there were seven countries in the Baltic Sea Region, five of which belonged to different political blocks. The Western bloc consisted of two states - Denmark and the Federal Republic of Germany - which were members of the North Atlantic Alliance and the European Economic Community. The Eastern Bloc was: The Union of Soviet Socialist Republics, the People's Republic of Poland and the German Democratic Republic, which were part of the Warsaw Pact and the Council for Mutual Economic Assistance. There were also neutral states in the Baltic Sea Region: Finland and Sweden, which did not belong to any military and economic agreements.

An analysis of the general political and military situation of the Baltic Sea during the period of operation of the United Baltic Sea Fleet shows that the Baltic region was characterised by a high degree of militarisation, where the potential accumulated threatened to exceed regional armed conflict. On the basis of the events presented and the military arsenals of the two military blocs - NATO and UW - it should be concluded that it was in the Baltic Sea region that the border of the bipolar world ran. Located on a possible direction of the USSR's military action, it would probably be a field of possible confrontation between NATO and UW.

The collapse of the USSR resulted in nine countries in the Baltic Sea basin with different objectives: political, military and economic. Denmark and the Federal Republic of Germany are members of NATO and the European Economic Community (since 1993 the European Union); Finland and Sweden have remained neutral; the former Warsaw Pact states - Russia belongs to the CIS, while Poland is located in the so-called grey security zone; the Baltic republics - Lithuania, Latvia and Estonia have declared neutrality.

Thanks to the changes that took place after the break-up of the bipolar world, the Baltic Sea region became one of the most dynamic developing areas of Europe (Zawadzki, *op. cit*., p. 129).

Abstract

The importance of the financial security of the enterprise is proved. The main purpose of the article is to determine the management mechanism in the system of ensuring the financial security of the enterprise. The main components of the economic security of the enterprise are characterized. The main resources have been allocated to ensure the financial security of the enterprise. The basic principles of ensuring the financial security of the enterprise are determined. The basic provisions for ensuring the financial security of the enterprise are highlighted. The model of the mechanism for ensuring the financial security of the enterprise is formed.

Keywords: Security, Financial Security, Enterprise, Management, Mechanism.

Introduction

Entrepreneurship in Ukraine today is not going through the best of times. For example, liquidation procedures, poor financial condition - all this gave rise to the phenomenon of “crisis” in the industrial sphere. In addition to the industrial sector, the crisis is also encountered in other sectors of the Ukrainian economy: construction (a critical lack of investment in 2009), agriculture (the 1998 agrarian crisis prompted half-speed food production), and trade (half of 2015 - half as many food products were opened shops, half of which by the end of the year was on the verge of bankruptcy). Such results are due to an ineffective financial security system at domestic enterprises.

The concept of "financial security" today can be put almost on a par with such a concept as "economic security" in terms of research worldwide. Even when scientists undertake to investigate only the system of ensuring the economic security of the enterprise, in one way or another they touch on the concept of “financial security”. In today's economic environment, the study of the concept of “financial security of an enterprise” becomes even more relevant through the political and economic instability in Ukraine that has led to new threats and requires a new look at this concept.

The main purpose of the article is to determine the management mechanism in the system of ensuring the financial security of the enterprise.

Methods

The methodology for constructing support systems, international and country methods is based on: input and departure, systematization and systematization; analysis and synthesis; system analysis and paired porn; Model morphological analysis; graphical; abstract-logical.

Determining the place of management mechanism in the system of financial security of the enterprise

Every day, domestic enterprises are influenced by various kinds of factors that can threaten their existence and lead to the formation of a crisis. Events such as the financial crisis in 2008 and the political instability in the country that has formed since 2014 only strengthened a number of negative external factors causing new financial threats and risks. As a result, domestic enterprises today are characterized by a decline in production, a decrease in key financial indicators of activity, an increase in prime cost, and as a result, all this can lead to bankruptcy. A key role in preventing this is played by the effective system of financial security of the enterprise.

The concept of “financial security” was formed in the process of a thorough study of the concept of “economic security”, when scientists and economists realized how important financial activity plays in the system of ensuring economic security of an enterprise. The situation with the very concept of "economic security" is almost the same. This concept is part of a broader concept, which forms the basis of all safety-free - this is the concept of "security".

Having considered the existing concept of “financial security of an enterprise”, a logical step will be to establish its main subjects and objects.

The main objects of economic security of an enterprise, mainly in the scientific literature, are found in two variations: fragmented when financial resources and basic financial and economic indicators are considered as objects of financial security of an enterprise comprehensively, when the object of financial security is understood as the entire financial activity of an enterprise (K. Goryacheva, 2003).

We agree that financial security should cover all the financial activities of the enterprise.

As for the subjects of financial security of an enterprise, one can meet their division into two groups: scientists (K. Goryacheva, 2003) highlight only the subjects of the internal environment of the enterprise (the management of the enterprise and its personnel) or emphasize (Kh. Mandzibovskaya, 2016) that the subjects of financial security of the enterprise should be both external and internal.

We partially agree that it is necessary to highlight both external and internal subjects of financial security of the enterprise, but, in our opinion, this list needs to be expanded and grouped according to the following criteria:

1. Internal subjects of financial security of the enterprise:

- “management” group: director, financial and commercial director and deputies.

- group “management personnel”: heads of economic, financial or financial and economic security services and their deputies; chief accountant, head of the economic, planning, economic, financial or financial and economic department, head of the internal audit department, head of the human resources department, and their deputies.

- group “personnel, implements measures to strengthen the financial security of the enterprise”: personnel of departments of economic, financial or financial and economic security; personnel of accounting departments, economic, planning, economic, financial or financial and economic departments; staff of the internal audit department.

Agreeing with the list of external entities of financial security of the enterprise proposed by H. Mandzinovskaya (2016) (legislative, executive and judicial authorities; law enforcement agencies; subjects of the non-state security system, auditors), we consider it expedient to expand this list and include the following entities of financial enterprise security: specialists in financial planning, risk management, production and financial management; financial management training practitioners; tax planning experts.

Under the functional components of the financial security of the enterprise should be understood such areas of activity of the enterprise, differ from each other in essence, but ensuring the security of which will lead to an improvement in the level of financial security in general.

The components of the financial security of an enterprise that are found in the scientific literature are fundamentally different from those inherent in the financial security of an enterprise.

After analyzing the scientific literature (Kh. Mandzibovskaya, 2016) regarding the establishment of the main components of financial security, we came to the conclusion that in order to obtain a high level of security of financial interests, it is necessary to ensure the security of the following components:

1. Innovatively investment component. The combination of these components is due to the fact that any innovative activity requires additional investments, that is, ensuring the safety of these two components is a very interrelated factor. Improving the investment security of the enterprise provides for avoiding a decrease in the level of investment attractiveness, which, in turn, will reduce the likelihood of not receiving the necessary investment volume and strengthen financial security. In addition, ensuring the investment safety of the enterprise should provide for the security of all operations related to the investment activities of the enterprise: investing in securities, assets of other companies or conducting deposit operations and the like.

2. Budget and tax component. A significant number of scientific, note that ensuring the financial security of the enterprise cannot be achieved without taking into account the relationship of the enterprise with the state and local budgets regarding taxes and fees, operations to obtain tax benefits or budget financing, and the like.

3. The stock component. Ensuring the stock security of the enterprise provides for the implementation of measures to maintain an appropriate level of security for its operations on the issue of securities and the distribution of dividends between shareholders. A high level of stock security will reduce the risk of a decrease in the volume of capitalization of an enterprise and increase the level of financial security.

4. Monetary component. L. Matviychuk (2011) and O. Malik (2015), offer to distinguish between these components, but, in our opinion, these components are closely related and allow not distinguishing the following components: banking and currency. Since they take into account all cash and non-cash operations of the enterprise and ensure the security of the operation related to obtaining a commercial loan.

5. The insurance component. In carrying out its business activities, the company in one way or another is faced with insurance operations. This may be operations regarding employee insurance, property, liability and the like. Therefore, ensuring the appropriate level of insurance security plays a

key role in strengthening financial security, as it allows you to insure the company from possible financial and only risks.

Schematically, maximizing the financial security of an enterprise by ensuring the security of its major components is shown in Fig. 1.

Fig. 1: Maximizing the financial security of an enterprise by ensuring the security of its core components (compiled by the author)

Other components of the financial security of the enterprise, which can be found in the scientific literature, for example, issue, banking, currency, can be attributed to the aforementioned components, since ensuring the security of transactions with these components occurs with increasing investment, monetary, and stock risks, respectively.

Separately, it should be highlighted, such a component as foreign economic (Kh. Mandzibovskaya, 2016), which provides for security during the operation of the enterprise for export and import. In our opinion, this type of security plays an important role in strengthening financial security, but it is not advisable to include it in the general list due to the fact that not all active companies carry out export-import operations.

In addition, to increase the financial security of the enterprise, it is necessary to protect the basic resource-functional elements of the enterprise. Six main elements requiring appropriate protection should be identified in order to maximize the financial security of the enterprise:

- financial resources. To ensure that the basic financial performance indicators of the enterprise are not reduced;

- labor resources. To ensure the necessary working conditions of high qualification, in order to prevent a decrease in labor productivity, which may affect the general activity of the enterprise;

- informational resources. To ensure the protection of trade secrets, contains information on the main financial transactions of the enterprise;

- material resources. To ensure the protection of property values of the enterprise, in order to prevent production stoppage and losses, which may significantly affect the financial condition;

- special and industry resources. To ensure the protection of specific resources available at the enterprise, which are inherent in its industry, and may affect its general financial condition;

- intangible resources. To ensure the protection of the intellectual property of the enterprise (Fig. 2).

Fig. 2: Priority-schematic representation of resource-functional elements of financial security of the enterprise (compiled by the author)

As in any other science, the mechanism for ensuring the financial security of an enterprise should include a number of mandatory structural elements:

- principles on which the mechanism should be based;

- tools to be applied;

- the main functions that the developed mechanism should perform.

Exploring professional economic literature, we came to the conclusion that today there are a large number of principles, compliance with which is necessary to ensure financial security at the enterprise. We systematized the existing principles for ensuring the financial security of the enterprise and formed the basic principles, compliance with which is necessary for the effective implementation of the mechanism for ensuring the financial security of the domestic enterprise. In our opinion, the existing principles for ensuring the financial security of an enterprise should be grouped into the following categories: principles relating to the structural elements of the mechanism for ensuring the financial security of an enterprise; principles governing the process of ensuring the financial security of an enterprise; principles governing the wording of the main goals and objectives of the mechanism for ensuring the financial security of the enterprise (Fig. 3).

Fig. 3: Priority-schematic representation of resource-functional elements of financial security of the enterprise (compiled by the author)

Consider the principles we have proposed:

1. The principle of confidentiality. Discussed and developed strategies to ensure the financial security of the enterprise should not be disclosed outside the enterprise.

2. The principle of concretization. All goals and objectives facing the mechanism of ensuring the financial security of the enterprise should be detailed and accessible concretized.

3. The principle of professionalism. Personnel establishing and developing a plan and measures to ensure the financial security of an enterprise should be competent in matters of security and financially competent.

Financial instruments are a list of transactions that allow you to increase the assets of one side and financial liabilities of the other. The financial instruments that must be applied in order to implement the mechanism for ensuring the financial security of enterprises include:

1. Payment orders, letters of credit and checks.

2. An agreement with a bank on lending.

3. Received bills from debtors.

4. Various kinds of certificates of deposit and agreements.

5. Shares and investment certificates.

6. Insurance policy or contract.

Scientists [2, p.51] identify four key functions of the mechanism for ensuring the financial security of an enterprise:

1. Planning function. It provides for the formation of operational and strategic plans, programs and forecasts.

2. The function of organization and regulation. Development and implementation of management decisions, the use of financial instruments.

3. Incentive function. Implementation of measures to improve the effectiveness of the administrative apparatus.

4. The control function. The implementation of careful monitoring of the implementation of plans and programs.

According to an environmental analysis, we found that any security mechanism should be as accessible as possible and meet the requirement of the absence of uncertainty. So, you should expand the list of existing functions and add an educational and methodological function, which would provide for the formation of information about the financial security system, in order to conduct training and explain its main process for the enterprise personnel.

Also, it is necessary to highlight the analytical function, which would help to fulfill the planning function, since this function would provide for a thorough analysis and assessment of the current state of the enterprise, with a view to further planning.

For the main studies conducted above, it is possible to formulate the main provisions of the mechanism for ensuring the financial security of the enterprise, taking into account the possibility of using crisis management (Fig. 4).

Fig. 4: Basic provisions of the mechanism for ensuring the financial security of the enterprise (developed by the author)

The place of the management mechanism in the financial security system of the enterprise is shown in Fig. 5.

Fig. 5: The place of the management mechanism in the financial security system of the enterprise (developed by the author)

A separate issue is the system and mechanism for ensuring the financial security of the enterprise.

It should be noted that the very concept of "security" is often used in various industries. For example, in the field of law, the term "security" is understood to mean the creation of conditions conducive to the realization and protection of rights. In our opinion, in the field of safety, security should be understood as the creation of such conditions for the implementation of activities, we can talk about a high level of security.

The system of ensuring the financial security of an enterprise is a set of interrelated activities that allow you to create the conditions under which each transaction is conducted will be accompanied by an appropriate level of security.

The system of ensuring the financial security of the enterprise and must meet the following requirements:

- the ability to fully ensure the effectiveness of the functioning of the financial security system of the enterprise;

- the ability to most effectively combine all the key elements of ensuring the financial security of the enterprise;

- the complete absence of any manifestations of uncertainty or spontaneity in application;

- be as low cost as possible;

- be available;

- meet the conditions for the functioning of the enterprise and the specifics of its activities.

This section should follow keywords. This section should provide background of the study and highlight research motivation.

Conclusions

Our proposed scientific and methodological approach to the formation of a system for ensuring the financial security of an enterprise allows us to take a new approach to assessing financial security because of the possibility to regulate the choice of anti-crisis measures aimed at adequately counteracting the negative impact of threats. Summing up, it should be noted that the analysis made it possible to form the theoretical and methodological base necessary for further research to form a system for ensuring the financial security of the enterprise. We believe that only the correct application of all elements of the financial security system will ensure the stability and development of the enterprise in the face of the negative impact of the external environment, and if necessary, apply crisis management in a timely manner.

Abstract

At the moment, due to the significant openness of the national economy, France is exposed to many global risks - economic, political, environmental, etc. That is why the crisis in the world economy in 2008-2009 had a negative impact on its economy, and the debt crisis in 2011 further strengthened the negative trends in the national economy. The increasing number of non-tariff barriers to mutual trade between France and third countries leads in general to a reduction in total output and a decrease in the well-being of the population, negatively affecting the purchasing power of less affluent groups of the population which, in turn, contributes to the strengthening of socio-economic differentiation and other negative consequences. The policy of partial reindustrialization of the French economy leads to a decrease in total exports. The position of the EU's governing structures on overcoming the crisis and solving the accumulated problems with partner countries is ambiguous and contradictory. Due to the uncertainty in the political and economic course of the US, the EU is forced to look for new markets for its products, including high-tech products. As a result, in the future, the foreign economic policy of France within the EU will face intractable contradictions.

Keywords: Foreign Trade Relations, France, WTO, Price Competitiveness, Sanctions.

Introduction

France, as one of the leading EU economies, has always had mutually beneficial trade, investment and diplomatic relations not only with Russia, but also with other countries (Aghion, 2009). However, in the current context of trade wars, Western countries, including France in the EU, have imposed sanctions against Russia, thereby violating the basic principle of WTO trade - non-discrimination of trade partners. At the same time, the EU's dependence, in particular - France, on imports of raw materials and, first of all, energy resources (up to 45% of the total consumption level) makes the EU conduct a rather cautious and balanced foreign trade policy (Chalmers, 2013). In the current conditions of growing global instability and increasing competition in world trade, France as part of the EU is trying to solve its economic problems mainly by strengthening protectionist measures.

Literature Review

All French foreign trade is regulated under EU regulations. Methods of regulating cross-border trade activities within the EU include the establishment of a common customs tariff; regulation of imports of goods; regulation of exports of goods; quotas and licensing of interstate trade (Akhmadeev et.al, 2018; Becker, 2018). The basis of France's foreign trade activity is laid down in the common rules within the Customs Union (Customs code of 1993), the Common customs tariff (1969), which is

applied in the trade of EU member States with third countries (Beugelsdijk, 2005). The General customs tariff may consist of both ad valorem duty rates and contractual duties (Malitskaya et.al, 2019). The General rules for the export regime in the EU are set out in Council Regulation (EC) no 2015/479 of 11 March 2015, which sets out general export rules based on the principle of freedom of export, and also defines procedures that allow EU member states to implement, if necessary, supervisory and protective measures.

Exceptions to the general export policy are certain types of sensitive goods, such as fuel, coal, agricultural products, raw materials for the production of metals (Kosov et.al, 2018; Turishcheva et.al, 2019). Special export regulations apply to the following types of products: oil and petroleum products, foodstuffs, hazardous chemicals, cultural goods and dual-use goods. The procedure for export control of dual-use goods is defined by Council Regulation (EC) no 428/2009 of 5 may 2009. Export credit insurance is regulated by Council Directive 98/29/EC of 7 may 1998 on the unification of the main provisions concerning export credit insurance for operations with medium and long-term coverage (Korableva et.al, 2018; Glubokova et.al, 2019).

The procedure for exporting cultural property outside the EU is defined by Council Regulation (EC) no 116/2009 of 18 December 2008. At the same time, the list of bodies authorized to issue licenses for the export of cultural values, as well as the list of customs authorities authorized to solve issues related to the export of cultural values, has been defined (Medda, 2020). Council regulation (EC) no 125/2019 of 16 January 2019 on trade in certain goods that may be used for the death penalty, torture or other cruel, inhuman or degrading treatment or punishment prohibits any export or import of such goods (Bykanova et.al, 2017; Cappelen, 2020). To avoid a shortage of a certain vital commodity, the EU Commission can introduce an export authorization system. In the interests of the Union, the EU Council may impose quantitative restrictions on the export of goods. General EU import rules are defined by Council Regulation (EC) no 2015/478 of 11 March 2015, which sets out general EU import rules based on the principle of freedom of import, as well as procedures that allow EU member states to implement, if necessary, supervisory and protective measures.

General rules for the import of goods from third countries are established by Council regulation (EU) no 2015/755 of 29 April 2015 on General rules for imports from third countries. Quantitative restrictions on exports and imports of goods can be implemented through quotas and licensing. The procedure for administering quantitative quotas is defined by Council Regulation (EC) no 717/2008 of 17 July 2008. At the same time, on December 20, 2017, the new approved EU legislation on protection in trade was published, which will change the methods of solving the problems of subsidized imports to the EU from countries with significant market imbalances caused, according to the EU leadership, by state interference in the economy (Petrov et.al, 2019). The legislation introduces a new way to establish the fact of dumping in imports to the EU from countries in the economy of which, according to European experts, there are significant deviations from the generally accepted world practice (Kosov et.al, 2016). After negotiations with the EU governments, the European Parliament and the EC, it was decided that the new EU legislation will make exceptions to the rules and principles of the WTO for cases of so-called "market distortions", which include excessive state intervention in the country's economy (Castellani, 2020).

Theoretical Background

Customs regulations in France are carried out in accordance with the Customs code of the European Community, the Customs code of France (Code des douanes), as well as agreements between WTO members, including the General agreement on tariffs and trade, the Convention on Harmonized system of description and coding of goods, Customs Convention on the international transport of goods (Golubtsova et.al, 2019) the Brussels Convention on customs co-operation Council, the Paris Convention for the protection of trademarks, The postal Convention and other regulations of the EU and the French Republic and bilateral treaties and agreements on customs and trade and political issues (Dorofeyev et.al, 2018). Let's look at the dynamics of France's foreign trade with the WTO member countries in the period from 2008 to 2018 (table 1).

Table 1: Dynamics of French foreign trade turnover with WTO countries, 2008-2018

Year	Turnover (in thousand US dollars)	Absolute increase (in thousand US dollars)		Growth rate (%)	
		basic	chain	basic	chain
2008	1237501133	0	0	0	0
2009	965383973	-272117160	-272117160	-21,99	-21,99
2010	1067087797	-170413336	101703824	-13,77	10,54
2011	1247866455	10365322	180778658	0,84	16,94
2012	1175618357	-61882776	-72248098	-5,00	-5,79
2013	1190568827	-46932306	14950470	-3,79	1,27
2014	1182269934	-55231199	-8298893	-4,46	-0,70
2015	1018694954	-218806179	-163574980	-17,68	-13,84
2016	1008200908	-229300225	-10494046	-18,53	-1,03
2017	1099660859	-137840274	91459951	-11,14	9,07
2018	1186136123	-51365010	86475264	-4,15	7,86

Calculated by the authors on the basis of data published on the official Internet portal of the international trade center UNCTAD / WTO. URL: http://www.intracen.org/itc/market-info-tools/trade-statistics/ (accessed: 05.01.2020)

According to the data in table 1, over the past 10 years, France's trade turnover has decreased, and the country's participation in world trade has decreased. Foreign trade turnover was at its maximum value in 2011, and at its minimum value in 2009, which is due to a reduction in both exports and imports due to the global financial and economic crisis. This drop was the sharpest in the period under review, with exports falling by 22.45% and imports by 21.59%. Further, from 2009 to 2011, there was a gradual increase in trade, caused by both an increase in exports and imports, with the growth rate of imports outpacing the growth rate of exports.

During the period from 2012 to 2014, there was an unstable growth in the country's trade turnover, which ended in 2015 with a sharp decline of 13.84%, which is the second largest reduction in the period under review. Since 2016, there has been an unstable increase in the country's trade turnover, but the level of 2008 has not been reached. France's share of world trade has been declining since 2009. Thus, the share of France in both world exports and world imports fell when comparing the indicators of 2008 and 2017. The exception to the trend of continuous decline was in 2016, when both indicators improved their positions. However, it should be noted that France's share of world imports has consistently exceeded the country's share of world exports. The foreign trade turnover of France over the past 10 years has been characterized by a tendency to decrease. Let us present a more detailed analysis of French exports to WTO countries during the period under review (table 2).

Table 2: Dynamics of French exports to WTO countries, 2008-2018

Year	Exports (in thousand US dollars)	Absolute increase (in thousand US dollars)		Growth rate (%)	
		basic	chain	basic	chain
2008	572783450	0	0	0	0
2009	444187328	-128596122	-128596122	-22,45	-22,45
2010	490679304	-82104146	46491976	-14,33	10,47
2011	564313673	-8469777	73634369	-1,48	15,01
2012	538657682	-34125768	-25655991	-5,96	-4,55
2013	548707057	-24076393	10049375	-4,20	1,87
2014	548835803	-23947647	128746	-4,18	0,02
2015	478047891	-94735559	-70787912	-16,54	-12,90
2016	475159856	-97623594	-2888035	-17,04	-0,60
2017	507888042	-64895408	32728186	-11,33	6,89
2018	552519753	-20263697	44631711	-3,54	8,79

Compared with 2008, exports in 2018 decreased by 3.54%, and during the entire period, it was not possible to achieve the level of exports of the base year. The dynamics of exports in this period of time was unstable: exports decreased in 2009, 2012, 2015 and 2016, but showed an increase in 2010-2011, in 2013-2014 and in 2017-2018, gradually restoring its level. Chain indicators of export growth are characterized by instability. The largest chain growth rate was observed in 2011, and the lowest, as previously noted, was recorded in 2009. Also, a fairly serious reduction in exports to WTO countries occurred in 2015, and only in 2018, France was able to restore the level observed before 2015. Let's consider the dynamics of French imports from WTO countries in 2008-2018 on the basis of the data contained in table 3.

Table 3: Dynamics of French imports from WTO countries, 2008-2018

Year	Imports (in thousand US dollars)	Absolute increase (in thousand US dollars)		Growth rate (%)	
		basic	chain	basic	chain
2008	664717683	0	0	0	0
2009	521196645	-143521038	-143521038	-21,59	-21,59
2010	576408493	-88309190	55211848	-13,29	10,59
2011	683552782	18835099	107144289	2,83	18,59
2012	636960675	-27757008	-46592107	-4,18	-6,82
2013	641861770	-22855913	4901095	-3,44	0,77
2014	633434131	-31283552	-8427639	-4,71	-1,31
2015	540647063	-124070620	-92787068	-18,67	-14,65
2016	533041052	-131676631	-7606011	-19,81	-1,41
2017	591772817	-72944866	58731765	-10,97	11,02
2018	633616370	-31101313	41843553	-4,68	7,07

Compared to the 2008 baseline, imports in 2018 were lower by 4.68%, and throughout the period under review this indicator was lower than the baseline, except for 2011, when imports increased by 2.83% compared to the 2008 indicator, and the chain growth rate was recorded at 18.59%, which was the largest increase in the analyzed period of time. The last 10 years have been characterized by unstable dynamics of imports, so the situation with the dynamics of imports is similar to the situation with the dynamics of exports. Negative chain growth rates were recorded in 2009, in 2012 and in the period from 2014 to 2016. The largest reduction in imports occurred in 2015 (-14.65% increase).

Discussion and Result

Based on data for the period from 2008 to 2018 on foreign trade in France, we will conduct a multi-factor correlation and regression analysis to identify the factors that have the greatest impact on the value of trade turnover between France and the WTO member countries. The dependent variable Y will be the volume of trade between France and the WTO member countries from 2008 to 2017. Let's choose the factors: X1 - the value of the Euro against the US dollar; X2 - the price of a barrel of Brent oil; X3 - the inflation rate in France; X4 - the unemployment rate in France; X5 - an index of business confidence in the French industrial sector. Based on the initial data, we build an auxiliary Table 4.

Table 4: The volume of trade between France and the WTO member countries from 2008 to 2017 and the potentially influencing factors

Y	X1	X2	X3	X4	X5
1237501133	1,47	96,94	2,8	7,4	-10,63
965383973	1,39	61,74	0,1	9,1	-26,34
1067087797	1,33	79,61	1,5	9,3	-9,03
1247866455	1,39	111,26	2,1	9,2	-3,11
1175618357	1,29	111,57	2	9,8	-13,36
1190568827	1,33	108,56	0,9	10,3	-11,63
1182269934	1,33	98,97	0,5	10,3	-9,21
1018694954	1,11	53,03	0	10,4	-6,09
1008200908	1,11	45,13	0,2	10,1	-4,4
1099660859	1,13	54,71	1	9,4	1,59
1186136123	1,18	71,34	1,8	9,1	-1,96

We estimate the tightness of the relationship of indicators using the matrix of correlation indicators obtained as a result of the implementation of the correlation analysis procedure (table 5).

X4	-0,3222784	-0,5572017	-0,1337776	-0,7106529	1	
X5	0,30432234	-0,5683869	-0,1682552	0,19221519	0,10255721	1

Next, it is necessary to select those values of paired correlation coefficients that exceed the $r_{кр}$, that is, values greater than or equal to 0.6. These are the coefficients r_{yx2} and r_{yx3}, which we can consider statistically significant. Let's check the multicollinearity of these factors, since it is impossible to include closely related factors ($r_{кр} \geq 0,6$) in one model. Obviously, there is a multicollinearity between the X_2 and X_3 factors (r_{x2x3}= 0,61760805). In order to get rid of multicollinearity, we exclude the least significant factor for Y from the model, that is, the factor X_3. The next step in the analysis is to build a pair regression model (Table 6).

Table 6: Coefficient of determination

Regression statistics	
Multiple R	0,817453584
R-squared	0,668230361
Normalized R-squared	0,631367068
Standard error	59502749,86
Observations	11

According to table 6, we conclude that the coefficient of determination is equal to R-squared=0.668 and, therefore, the model is adequate for the coefficient of determination, since the R-squared is greater than 0.5. This means that 67% of the variation of the variable Y is explained by a constant regression equation for coefficients having the form 868576979+3163589.53410757*X_5. Let's evaluate the quality of the regression equation (Table 7).

Table 7: Regression coefficients and Dispersion analysis

Y-intersection			Coefficients		
			868576979		
X2			3163589,534		
	df	*SS*	*MS*	*F*	*significance of F*
Regression	1	6,4181E+16	6,4181E+16	18,12726	0,002118585
Remains	9	3,18652E+16	3,5406E+15		
Total	10	9,60461E+16			

Since the significance of F is 0,002118585, which is a smaller number than 0,05, we can conclude that the model is significant (Table 8).

Table 8: Checking the significance of parameters "a" and "b"

	Coefficients	Standard error	t-statistics	P-significance
Y-intersection	868576979	62923966,07	13,80359556	2,31695E-07
X2	3163589,534	743043,25	4,257611564	0,002118585

Based on the fact that the P-value is less than 0.05 (table 9), it can be argued that the parameter "a" and the parameter "b" have significance. As a result of correlation and regression analysis, it can be concluded that 67% of the variation in trade turnover between France and the WTO member countries depends on the level of the price of a barrel of Brent oil, the remaining unaccounted factors account for 33%.

Conclusion

France, as a member of the EU, has a trade policy similar to other member states with a common weighted average EU tariff rate. Also, France's participation in the WTO has an impact on the formation of the country's foreign trade policy as a whole (Petrov et.al, 2019). France's foreign trade policy is primarily aimed at reducing foreign commodity dependence and creating favorable conditions for the growth of export supplies and France's share in the world economy (Emlinger, 2020). During the period from 2008 to 2018, there was a reduction in trade turnover between France and the WTO member countries and a decrease in the share of France in both world exports and world imports (Dellmuth, 2017; Kosov et.al, 2017). According to the IMF, France has lost external competitiveness over the past two decades, reflecting both price and non-price factors. The world market shares of French exports of goods and services have declined more steeply than in many other advanced economies, particularly

in manufacturing where France has been losing its comparative advantage in more high-tech and knowledge-intensive sectors (Zimakova et.al, 2016). Consequently, the contribution of tradable sectors to growth and jobs has been modest compared to some peer countries (Titova et.al, 2019). The loss of external competitiveness reflects several factors. Firstly, relatively slow demand growth of France's trading partners, especially in the high-tech sector, partly explains the erosion of export market shares relative to peers. Secondly, the appreciation of the euro after its introduction affected competitiveness across the currency zone. Thirdly, the pre-crisis period opened a competitiveness gap against Germany, largely reflecting differential wage growth, especially in services (Estrada, 2015).

However, given solid labor productivity growth, France's unit labor costs did not grow faster than in other euro area countries, while firms compressed their margins to protect their price competitiveness. Fourthly, the rapid rise in the relative price of non-tradable, largely driven by public and social services, may have contributed to declining competitiveness by increasing the cost of inputs to the export sector. Finally, total factor productivity growth has declined, as in many other advanced countries, with the slowdown more substantial in services than in manufacturing. In order to solve these problems and increase France's share in the world market, the French government has embarked on a course of reforms aimed at reviving the national economy, restoring industry and attracting foreign investment. However, in order to increase the country's international competitiveness, it is necessary to pursue not only a policy of reducing production costs, but also to pay attention to longer-term measures, such as reforms in education, science and innovation, etc.

Abstract

The education sphere of the Russian Federation is at the stage of reform, the main purpose of which is to create a mechanism for its sustainable development and ensure quality training in accordance with international standards. This article deals with the problem of mastering distance learning technologies, which, as a rule, is associated with significant amounts of attracted investments. In this context, in industrialized countries, the policy not only of the state, but also of private business is the principle of priority investment in education. Innovations in educational institutions based on distance technologies are a key mechanism that allows creating advantages in a competitive environment. In this regard, the main activities in the informatization development are to create a reliable and efficient infrastructure, to introduce unified methods of access to data, to improve the management of the entire complex of distance resources, as well as ensuring compliance with the infrastructure of the strategic goals of the university. Distance learning technologies are changing states and societies, which is clearly seen in the example of the Internet development, where there is not just a technological breakthrough, but the inevitable emergence of a new lifestyle and the emergence of a new "network" generation.

Keywords: Distance Learning Technologies, Innovation, Student, Educational Institutions, Activities of the University

Introduction

This article discusses the problem of developing distance learning technologies and university management, which is usually associated with significant amounts of attracted investment. In this context, in industrialized countries, the policy of not only the state, but also private business is the principle of priority investment in education.

Innovations in an educational institution based on distance learning technologies are a key mechanism that allows creating advantages in a competitive environment. In this regard, the main activities in the development of informatization are the creation of a reliable and effective infrastructure, the introduction of unified methods of access to data, improving the management of the entire range of distance learning resources, as well as ensuring that the infrastructure meets the strategic goals of the university [7,13].

Methodology

Analysis of the informatization of higher education institutions shows that in most universities with existing distance learning and interaction systems, the staff suffers from both a lack of necessary information and an excess of incorrect or outdated information [8]. In addition, many employees and students either do not know what resources and services are available, or do not understand how to use them, and sometimes do not have the opportunity to do so. The staff often does not have the ability to quickly publish unstructured data and make it available to a specific target group. In the educational process, there is a clear shortage of high-quality digital teaching materials, and what is available is difficult to "convey" to the student. There are problems with identifying users when accessing resources and managing the actual information resources.

How can we determine the main tasks and methods of increasing, the effectiveness of which in the university is directly related to the use of distance learning technologies [16]? Distance learning technologies make it possible to organize people's access to digital data in the most efficient way. Moreover, if processes are formed that connect logically people and data, then the IT-solution becomes more stable and successful [2-4].

Based on this, there are three main components of IT-solutions in any university that are related closely: people, processes, and data. From the point of management view, the success of the university depends on how well the processes connecting people and data are solved and organized [9].

Informatization of the university is understood as a set of measures aimed at improving the activity of the university as a system. To improve the efficiency of the university, it is necessary to influence comprehensively the system as a whole - the strategy, network infrastructure, organizational structure, management system, motivation system, and corporate culture [10].

We can consider the informatization of the university as the process of transition to a state of the information environment in which users (including students) get access to necessary, relevant, complete, correct and consistent information. So the solutions in the field of information technology is included into the core business processes of the university that staff and students can no longer do without the services provided by the information environment [15]. At the same time, job responsibilities are performed by staff with greater efficiency, and student training is performed with better quality, which makes IT-investments economically justified.

Features of the university as an object of informatization associated with the multidisciplinary nature of the activities, the abundance of forms and methods of educational work, the spatial distribution of infrastructure (branches, representative offices), variety of funding sources, a well-developed structure of support units and services (construction, manufacturing, economic activity), the need to adapt to the changing educational market, the need of analysis of the labor market, the lack of a generally accepted formalization of business processes, the need for electronic interaction with higher-level organizations, frequent changes in the status of employees and trainees, etc. All this makes it necessary [11]:

- comprehensive study of informatization tasks, starting with the concept and ending with the support of software and technical solutions;
- attracting a large number of subject specialists who know the content of automated tasks;
- using the modular structure of the corporate information system, where each module covers an interconnected group of business procedures or information services while ensuring uniform interface requirements;
- documentation of developments based on reasonable application of standards, which guarantees the creation of a successful system.

Activities aimed at the creation of an information infrastructure also require certain cost:

- equipping departments with computer equipment and peripheral equipment;
- designing and creating a structured physical data transfer environment;
- design, installation and administration of server computer platforms, system software and communication equipment of the corporate computer network;
- installation of telecommunication equipment and organization of data transmission channels for interaction with university branches, regional and global information networks.

The corporate information and computing network is a key component of the infrastructure that affects the efficiency of increasing informatization problems in the university. The experience of making a university network shows that in the absence of a common network development project at a certain point the network loses catastrophically control, the flow of user requests to a network service becomes huge, which has to be restrained by all the staff of its departments [12].

The key condition for the reconstruction is to simplify the work of users in the network, starting with registration, organization of access control to information services and applications and ending with interaction with the university's network service.

The effect of electronic resources introduction in the university is as follows:

- ensuring free access of employees and students of the university to digital materials;
- creating effective educational and methodological support for the educational process;
- providing advanced tools for publishing and searching for the necessary material.

The repository introduction of electronic resources reduces the cost of publishing and distributing university literature, provides access to full-text scientific materials for the entire Russian and world scientific community, and provides an opportunity for mutual exchange of educational and methodological materials between universities.

Results

In relation to the educational institutions activities, the concept of "innovative activity" can be considered as a purposeful transformation of the training content and organizational and technological foundations of the educational process, aimed at improving the quality of educational institutions and their graduates, ensuring comprehensive personal and professional development of students. The innovation process at the university involves the gradual implementation of appropriate changes in the educational environment. We propose the following scheme for promoting innovation in higher education (Fig. 1).

For the field of students training, innovations can take the form of new educational programme, educational plan, curricula and teaching materials, new pedagogical, information and organizational technologies or their combination, new educational technologies, new status of the organization, etc. Innovations can be both new products - educational programs, and new technologies used in the educational process, new organizational technologies, new ways of promoting educational services. Innovations are usually the result of research, development, or experimental work aimed at improving the effectiveness of the organization [1, 6].

The authors propose the following criteria for identifying stages: the content of the work, the level of risk, sources of funding, the sequence of work, and the level of costs.

In accordance with the selected criteria, the following stages of the innovation process in educational technologies can be identified:

• Research. Search for new educational methods and technologies, organizational forms, etc. Ideas can relate to all processes occurring in an educational institution, the processes of its interaction with partners, consumers and stakeholders, as well as be aimed at creating new processes [5].
• Design and analytical. Identifying the consumers' needs of an educational institution can be met as a result of innovative activities of the university.
• Experimental. Creating an educational object (for example, an electronic training complex) may include conducting research, developing educational programs or processes, etc., pilot implementation, and generating reports on results. The introduction of innovation involves the creation of technology and implementation procedures for realization of educational programs or the introduction of changes in the structure of the university.
• Promotion. Information activities, market positioning, author's support of an innovative educational object in the educational process improve the quality of work and improve the image of the university.

Fig. 1: Scheme for promoting innovation in higher education

The scheme of the innovation process in the university can be presented as follows (Fig. 2).

Fig. 2: Diagram of the innovation process at the university

Conclusion

Thus, the allocation of innovation process stages and management objects of innovation activity and their relationships allows creating an effective structure of distance training and fixing the selected management objects to specific structures and officials, as well as creating the necessary internal standards (orders) that regulate the processes of starting, maintaining and controlling remote educational activities.

Abstract

The transition to an innovative economy is changing the role of higher education, placing new demands on the quality of educational services. At the present stage, the leading countries of the world attach special importance to education in the formation and accumulation of human capital. Its level determines the intellectual potential of the state as the most important component of national wealth. Moreover, the effective use of the accumulated scientific and educational potential is the main condition for the economic and social stability of society. The purpose of the university is to provide quality educational services to improve the level of education in society. Therefore, when deciding to invest in the development and implementation of distance education services, first of all it is necessary to assess how its implementation will affect the achievement of the general goal. The practical significance of this article is in the possibility of using materials, conclusions and proposals to improve distance learning technologies. The stages of the innovation process are systematized. The developed methods allow structuring the costs by stages of the innovation process and determining the effectiveness of investments in distance learning technologies on the basis of cost assessment of improving the education quality.

Keywords: Higher Education, Distance Educational Services, an Innovative Economy, Effectiveness of Investments

Introduction

The transition to an innovative economy is changing the role of higher education, making new demands on the quality of educational services. At the present stage, the leading countries of the world attach special importance to education in the formation and accumulation of human capital. Its level determines the intellectual potential of the state as the most important component of national wealth. Moreover, effective use of the accumulated scientific and educational potential is the main condition for economic and social stability of society.

The practical significance of this article is the possibility of using materials, conclusions and suggestions to improve distance learning technologies. The stages of the innovation process are systematized [7]. The developed methods allow structuring costs by stages of the innovation process and determine the effectiveness of investments in distance learning technologies based on the cost assessment of improving the quality of training [15].

Methodology

The object of the research is institutions of higher professional education that carry out remote educational activities. The purpose of the study is to substantiate tools for evaluating the effectiveness of investments in distance education technologies [2-4].

To assess the effectiveness of investments, various methods are used based on criteria and indicators that comprehensively characterize the state of the invested objects. The main problem is the scientific justification of criteria and indicators for evaluating the effectiveness of various investments types.

The variety of effects obtained from learning services, the scale of their impact on a particular individual, the economy and society as a whole lead to the fact that the effect cannot be estimated from market positions and only by the criterion of profit, since profit is not the main goal of an educational institution [12]. If the profit is generated at the university, it should be reinvested in the development and expansion of the production of educational services, improving their quality. Also, we cannot use the criteria for financing education, which is used by the state, because there is no possibility to increase the amount of state funding. The effectiveness of education as a social sphere can be assessed by a set of different criteria. Criteria such as [9]:

- net present value (NPV);
- return index (RI);
- payback period ;
- internal rate of return (IRR);
- modified rate of return.

These criteria are based on the theory of cash flows. The peculiarity of these criteria is that they are based on a comparison of useful economic results and costs determined taking into account the time factor. The NPV criterion is a comparison of the current value of future cash receipts from investors with discounted (current) investment expenses necessary for its implementation. The NPV depends on the discount rate and is calculated using the formula:

$$NPV = \sum_{t=0}^{T} P_t \cdot D_t - \sum_{t=0}^{T} I_t \cdot D_t ,$$

where t – calculation step;
T – duration of the estimated period;
P_t – component of cash flow;
I_t – investments (capital investment);
D_t - discount factor:

$$D_t = \frac{1}{(1+i_t)^t} ,$$

where i_t – discount rate.

The investment realization is reasonable if the NPV > 0, the nonnegative NPV is an obligatory condition for the effectiveness of investments. If there is a set of alternative investment directions, the one, for which the NPV is maximum, is selected (the greater the value of the criterion, the greater the investment effectiveness).

For a number of non-production facilities, for example, increasing the level of population education, for prestigious buildings, the value of this criterion may be negative for the entire calculation period, that is, the cost of construction and operation will exceed the income. Choosing the minimum of the

given (discounted) costs based on the criterion can lead to negative social consequences [8].

The "return index" (RI) criterion represents the relative "return on investment" on invested funds. The ratio of payment flows similar to NPV flows is used to determine the effectiveness of investments:

$$RI = \frac{\sum_{t=0}^{T} P_t \cdot D_t}{\sum_{t=0}^{T} P_t \cdot D_t}$$

it is obvious that if the NPV is positive, then the return index will be greater than one, and Vice versa, if the NPV is < 0, then the return index is less than one. The more the return index exceeds one, the greater the investment effectiveness [10].

The occurrence condition of the payback period is a non-negative NPV:

$$NPV = \frac{\sum_{t=0}^{T} P_t}{(1+IRR)^t} + \frac{\sum_{t=0}^{T} I_t}{(1+IRR)^t} = 0 \ ,$$

at the same time, all the disadvantages of the NPV criterion are inherent in the "payback period with discounting" criterion, which, in addition, are supplemented by the inability to account for cash flows beyond the payback period of investments.

The "internal rate of return" (IRR) criterion is a discount rate, or test discount, in which discounted cash flows are equal to discounted investments. The resulting IRR value is compared with the level of return on investment (E). If IRR < E, then NDI < 0 -- investments are ineffective, if IRR > E > 0, then NDI > 0 - investments are effective, if IRR = E, NDI turns to zero - we can make any decision.

In practice, the IRR is determined by the method of sequential iterations using tabulated values of discounting multipliers according to the formula:

$$IRR = r_1 + \frac{f(r_1) \cdot (r_2 - r_1)}{f(r_1) - f(r_2)}$$

where $f(r)$ is the net present value at the discount rate r;

r_1 – the value of the discount rate at which $f(r_1) > 0$ (or $f(r_1) < 0$);

r_2 – the value of the discount rate at which $f(r_2) < 0$ (or $f(r_2) > 0$).

The shorter the interval length (r_1-r_2), the more accurate the calculated value for the internal rate of return.

One of the algorithms that "improve" the IRR for investments with non-traditional cash flow is the "modified internal rate of return" (MIRR). All negative flow values are discounted at the deposit rate at the beginning of the settlement period. All positive values are compounded at the rate by the end of the billing period. The MIRR defined in this way does not turn into IRR for traditional cash flow. The difficulty lies in the fact that the MIRR value has nothing to compare with (as IRR) and is difficult to use to conclude on the effectiveness of investments [13].

Results

The analysis allows concluding that from the point of view of evaluating results in higher education, the NPV criterion has the following disadvantages:

1) the value of the criterion depends significantly on the accepted calculation scheme, different methods give different results;

2) the criterion depends on the value of the subjective discount rate (DR), the greater the value of the DR, the smaller the value of the NPV;

3) non-objective assessment of the investment direction, which provides for gradual expansion;

4) the final value of the NPV is conditional, since it does not correspond to the real income of investors and creditors;

5) it is difficult to assess the effectiveness of investments in the non-productive sector.

When determining the effectiveness of investments in higher education, an important point is the formation of an integral indicator that reflects the effect of investments in all areas of the investment system [14].

From the point of view of the university's investment effectiveness is evaluated on the activities of the university and is characterized by a set of parameters taken into account for certification, licensing and accreditation of universities. These indicators characterize the quality of the educational process, its provision and educational services. The duration of the beneficial effect is limited to about 2-3 years, and then it stops to act or has a smaller effect.

Calculating investment performance is an extremely multi-faceted process that depends on various factors. These factors often cannot be expressed only in quantitative terms.

According to T. Malyutina, the effectiveness of professional education is associated with the development of new ways of students' intellection and activity.

I. S. Byk gives the coefficient of economic effectiveness in research work as one of the criteria for evaluating the effectiveness of investments, which is calculated using the formula:

$$\rho_{np} = \frac{P}{V} \cdot \rho_1 \cdot \rho_2 \cdot \rho_3 \cdot \rho_4 ,$$

where P is the economic effect obtained from the results implementation of completed research works, rub.;

V is the total volume of expenses for performance of research works, rub.;

P_1, P_2, P_3 - coefficients that characterize the relative number of doctors, candidates of science, teachers without academic degrees and titles, postgraduates and students who participate in research.

World economic practice has long developed methods for evaluating investments that take into account all possible conditions for their implementation and therefore have the property of generality.

Today, various expert methods for measuring complex properties are used: the classification method,

the ranking method, the pairwise comparison method, and the rationing method. The choice of method depends on the supplied task. The rationing method consists of evaluating the values of social performance indicators on a pre-developed scale, for example, starting from zero to one or up to ten. The indicator that has the greatest impact, that is, that has the greatest value, is assigned the highest score.

To assess the effectiveness of investments in educational objects, we can use the rating system. Rating - a term denoting the subjective assessment of a phenomenon on a given scale. The essence of the rating is to derive a final assessment for the effectiveness of investments based on the results of current performance assessments in vocational education objects.

The rating assessment for the effectiveness of investments in the education sphere consists of the effectiveness of investments for each type of the university activity. Performance indicators for the reporting period are used as a basis for determining the rating assessment. These assessments are taken into account when allocating funding to support each type of activity, and based on this; priority areas of funding are allocated. Currently, the methodology developed by the ministry of education in the Russian Federation is the most widely used among rating systems. The system evaluates the university according to 45 indicators that determine the rating of the university's potential and the rating of its activity, followed by calculating the efficiency rating. The authors of the rating assessments are representatives of universities, regional and government structures, media, associations and unions in the sphere of education. The rating method is not widely used when deciding on investments, as the problem of the complexity of data collection and verification of their reliability remains relevant.

The expert survey form, which has been widely used, is of great importance for the results of the generated list of objects (rating). The expert survey form allows conducting:

a) correspondence survey – it involves independent work of the expert;

b) full survey – it involves direct contacts of the analyst with the expert when evaluating the objects listed in the questionnaire.

When recruiting a group of competent specialists, it’s necessary to solve two problems: determine the optimal number of experts in the group and the level of their competence. The economic literature presents a number of approaches for determining the required number of experts. The analysis showed that an increase in the number of experts, starting from a certain point, leads to an increase in the mistake of examination, and it is advisable to include no more than 10-15 of the most competent experts in the expert group. When forming a group of experts, it is necessary to take into account the qualifications and experience of experts, the degree of complexity and severity of the problem under discussion.

Currently, in Russia, the state continues to be the main investor in the sphere of education, so the list of indicators of state accreditation is used everywhere to assess the performance of universities. Indicators of state accreditation determine the status of higher education institutions by type and kind.

When determining the type of education institution is estimated as follows: the content of training, quality of training, information and methodological support of educational process, informatization of the university, material-technical base of educational activities of educational institutions. In determining the kind of higher education institution it’s important to evaluate: facilities implemented the basic educational programs, the opportunity to continue their education in programs of postgraduate and additional professional education, scientific research, scientific-methodical work, the qualitative composition of the teaching staff.

The assessment is carried out by expert means, by preparing an expert opinion based on the results of

comparing actual indicators with the standards approved by the ministry of education of the Russian Federation for accreditation.

The list of indicators of state accreditation covers the main areas of activity, but not all. They do not take into account indicators of the effectiveness in international cooperation, the effectiveness of scientific research, and specific indicators for specialized universities. Therefore, indicators need to be improved in accordance with changes in external and internal factors. Normative values that serve as evaluation criteria, it is also necessary to modify in accordance with the requirements of the market [11].

The competitive evaluation method of accredited universities for placement of the state task for training specialists with higher education is used today by the state to select priority objects of budget financing. Competitive selection indicators are divided into two groups. The first group describes a specific sphere of training. The second group characterizes the university as a whole.

Along with the state accreditation system, some forms of university public and international accreditation and individual programs have been developed. An example is the work of Russian universities with international accreditation agencies, such as GATE, ABET (American). The result in this case is the possibility of recognizing Russian diplomas in this specialty abroad. But the forms of international accreditation were not widely recognized.

Global trends towards the integration of national educational systems are evident at the functioning level of national education quality assessment systems – the common European structure of education quality assurance agencies ENQA, which uses international databases. Russia is a member of the international structure of higher education quality assessment and assurance agencies (INQAAHE), and is a full member of the structure.

Despite the variety of evaluation methods developed in the local and foreign literature, which we have discussed above, the rating method of evaluation based on state standards continues to dominate in Russia, since the main investor in our country was and still is the state. However, today there have been significant changes in the search for and attraction of investments and the need for the participation of the private sector (households) and legal entities (firms, public funds and organizations) in the process of investing in higher education is increasing. Given that the rating system cannot process different indicators in a complex, so it is not always effective. The use of modern methods for evaluating the functioning of complex socio-economic systems is becoming relevant. Modern methods will allow identifying the gaps in our education system from the requirements of social and economic development in the world community and direct investments primarily to the designated priority areas.

A comparative analysis of methods for evaluating the effectiveness of investments in education is presented in table 1.

Table 1: analysis of investment effectiveness assessment methods

Method	Content	Disadvantages
1	2	3
Economic and statistical	On the basis of statistics, a quantitative assessment of the education quality is given, the costs of education through "loss of earnings" are calculated, and the calculation of the profitability of education for an individual and society as a whole is proposed	To evaluate the effectiveness, we need fairly objective information, the calculation is carried out only for one type of efficiency - economic
Index	According to the theory, the effectiveness of investment in education can be evaluated by correlating the corresponding benefits and costs	Only economic efficiency is evaluated, and there is no comprehensive approach to evaluation
Integral	It is proposed to use an integral criterion that includes a set of particular criteria, which, in turn, are expressed in terms of the corresponding indicators	The calculation is carried out only for one type of efficiency – economic, there is no normative criterion for comparison
Expert	Efficiency is evaluated by ranking, pairwise comparison, classification, and rationing. The rating is based on the received opinions	The problem of forming a group of experts. Question of consistency of experts' opinions. Subjectivity of the assessment
Conventionally, the base	To assess the effectiveness of education, it is proposed to use a basic criterion and a set of corresponding indicators	There is no quantitative assessment of effectiveness and it is mainly aimed at the effectiveness of the education quality
Program-target	The problem of criteria and indicators is considered through the prism of the success of educational development programs	The proposed model can only be used for effective educational policy

Having analyzed the existing methods of evaluating the effectiveness of investments in education, proposed by the above-mentioned authors, we can draw the following conclusions:

- many methods can evaluate the effectiveness only verbally, so, they do not consider market conditions;

- one parameter is used as a determinant, or the parameters are only qualitative in nature and do not allow quantifying the quality of the educational process;

- the complexity in assessing the effectiveness of investments in education is not reflected, so take into account the effectiveness of investments in the areas of the university's activities only from the point of view of the state.

Conclusions

Research results indicate that these theories and methods may not be suitable for all occasions. Since the main output indicator in the field of education is the quality of educational services, it is necessary to develop and use a method for evaluating the effectiveness of investments in the field of education, which would allow rational use of funds allocated due to their limitations. Therefore, it is advisable to use a comprehensive approach based on an interrelated indicators system in the effectiveness of financing certain areas of the university's activities, taking into account the requirements of the market. An integrated approach requires the use of a formalized method of

evaluating effectiveness that would take into account the functioning specifics of such a socio-economic system as education (table 2).

Table 2: comparison of methods for evaluating investment effectiveness

Method	**Determination of the effectiveness for**			**Comparison with regulations (standards)**	**Use of accreditation**	**Issue of recommendations for the university**
	as the ratio of results and costs	using university investments in certain areas	functioning of the University in all areas (complex)			
Economic and statistical	+					+
Index	+	+		+	+	+
Integral	+		+		+	+
Expert		+	+			+
Conventionally, the base		+	+		+	+
Program-target	+			+	+	

Thus, most authors consider the possibility of obtaining the maximum economic or social effect as a criterion for evaluating the effectiveness of investments. The main difficulty faced by the researchers is the accuracy of measuring the effect. Obviously, a different type of criterion must be developed and used to measure effectiveness.

In our opinion, the university needs to take into account the needs of consumers, the financial capabilities of the university and the requirements in the state of households, firms, and public funds. The quality of education has been and will continue to be decisive.

It is obvious that for solving the considered problems and evaluating the effectiveness of investments in education must take a holistic approach, whose main objective is to improve the quality of education, competitiveness of the university through more efficient use of the allocated education investment.

Thus, evaluating the effectiveness of investments in distance education technologies is associated with the problem of evaluating not only the costs of innovation, but also, above all, with the cost assessment of the expected effect.

Abstract

This article considers modern innovative technologies as a means of improving the quality of students' education at the university. An important aspect of assessing the professionalism of the teacher is his knowledge of innovative technologies, readiness and ability to apply innovative teaching methods in practice in the conditions of the course held in Russia to improve the quality of education. With the transformation of the educational paradigm, the creative activity of the teacher and the use of innovative methods and technologies in teaching are actualized. The basis of quality education should be such teaching methods that develop students' critical thinking and ability to self-development. The article deals with the current state of Russian vocational education, identified patterns and trends of its development. Various forms of basic methods for active means of teaching students are shown in order to improve the quality of education, the importance of personal and professional teacher's competencies. The application of innovative technologies and teaching methods in the educational process is substantiated.

Keywords: Case-Study Method, Learning Technology, Learning Method, Active Learning Methods, Method of Analyzing Specific Situations, Interactive Methods.

Introduction

The new state educational standards apply the principle of variability now, which allows higher educational institutions to choose and design the pedagogical process according to any model. In this direction, the educational process of the university is underway: the development of various versions of its content, scientific development and practical justification of new ideas and technologies [14]. In this regard, the teacher should be guided by modern advanced technologies, and choose those technologies that meet the requirements of the time and contribute to the training of specialists in the future.

To organize a successful educational process, teachers of Krasnoyarsk state agrarian university from the Russian Federation are searching for effective methods of active learning in their classes with various techniques and methods, because modern society needs professionals who can look for solutions to problems and in the future will be able to make decisions in life. New approaches to learning are needed to address these challenges [1,15].

Methodology

The development of information and communication technologies, and the Internet, has also had a serious impact on the organization of the learning process, as students have new opportunities for information. In these conditions, the roles of the teacher and the student change fundamentally. The student gets the opportunity to select actively a knowledge provider. It becomes very important for

the teacher to provide friendly support for the learning process [4-7]. At the same time, the methods of knowledge transfer are determined by both pedagogical technologies and information capabilities of the student and the educational institution (Fig. 1).

Fig. 1: The role of the teacher and the student in the modern educational space

The main goal of training in economic specialties, as well as master's degree in economic areas, is to develop the knowledge and competencies necessary for a young specialist who is in demand in the modern labor market. The basis for the formation of a given level of qualification is not only the theoretical base obtained by the student at the undergraduate stage, but also a profound study of theoretical disciplines provided for by the master's program.

An important stage in the process of developing system thinking is the use of case-study methods [2]. Case (situation) is a set of conditions and obligations that describe the actual situation at the enterprise in the period under review. The situation involves a management problem and usually includes information about goals, financial status, and relations between management and production staff, market conditions, competitor activity, and other environmental influences.

Methods and techniques for working with various educational and business situations have long been widely used in the educational process abroad and in the leading universities of Russia [16]. One of the main features of working with cases is their broad interdisciplinary nature. At the same time, unlike training tasks, in such situations there is no clearly defined set of initial data that must be used to obtain the only correct solution. Also, in the structure of the case there is no a number of questions that need to be answered. Instead of this, the student should fully understand the situation described in the case, and identify the problem and issues that need to be resolved. This ensures the development of independence and initiative, the ability to navigate a wide range of issues related to various aspects of management and research in the economy. Each economic or managerial discipline uses its own thesaurus, theories, processes, and qualitative and quantitative research methods. Case-study method provides an opportunity to expand this set and go beyond specific disciplines when analyzing the situation [3].

Using case technologies in teaching special disciplines will solve the problem of improving the education and training quality of qualified staff related to work. It’s necessary for the student to require important professional knowledge, standard requirements, employer requirements, practical knowledge for adapting to the conditions of real production. It is quite difficult to have all this

knowledge using traditional technology. Comparison of classical and interactive teaching methods is presented in the table 1.

Table 1: comparison of classical and interactive teaching methods

Comparison criterion	Classical methods	Interactive methods
	Emphasis on formation of knowledge and skills	On the formation of competencies
Logic of the educational process	From theory to practice	From the formation of a new experience to its theoretical understanding
Teacher's role	Source of information	Organizer of the training process, group leader, creator of conditions for student initiative
Students ' tasks	Mastering a certain amount of knowledge	Development of personality, cognitive and creative abilities

Materials and Methods

The case-study method or analysis of specific training situations is a method of active problematic and situational analysis based on learning by solving specific problem situations. The purpose of which is to develop and make a practical decision by students after studying the situation that arose under certain conditions [8-11].

The case-study method refers to interactive methods, the ideas of which are quite simple; the work takes place within groups, through dialogue, mutual cooperation and distribution of roles. The teacher organizes educational activities with the help of training.

Interactive educational practices increase interest in the discipline and allow students to live through the economic situation in a short period of time, pass it through themselves, do conclusions and thus get solid knowledge and competencies. One of the methods which is effectively used for studying organizational behavior is case-study.

Students are asked to understand a real life situation, the description of which simultaneously reflects not only a practical problem, but also updates a certain set of knowledge that must be learned when solving this problem. At the same time, the problem itself does not have definite solutions. Method of conducting classes using the case-study method is presented in the table 2.

Table 2: method of conducting classes using the case-study method

Phase of work	The actions of the teacher	The actions of the student
Before the class	1. He picks up the case. 2. He defines basic and auxiliary materials for training students. 3. He develops the lesson scenario.	1. He gets a case and a list of recommended literature. 2. He prepares individually for the lesson.
During the class	1. He organizes a preliminary discussion of the case. 2. He divides the group into subgroups. 3. He manages the discussion of the case in subgroups, providing them with additional information	1. He asks questions that extend understanding of the case and the problem. 2. He develops solutions, listens to what others say. 3. He makes a decision or participates in its adoption
After the class	1. He evaluates the work of students. 2. He evaluates the decisions made and questions raised.	1. He makes a written report on the lesson about this topic

The case-study method helps to develop the ability to analyze situations, evaluate alternatives, choose the best option and make a plan for its implementation. And if this approach is applied repeatedly during the academic cycle, students develop a steady skill for solving practical problems. Thus, although the case-study method technology itself is quite old, it is innovative for Russia, since it is based on innovative learning principles [12-13].

The case-study method combines features of many training methods. It acts as specific practice organization method of the educational process, method of discussions with the point of view of incentives and motivation in the learning process, method of laboratory control and self-control. From the point of view of binary methods, it combines many types of visualization. But, most likely, it should be considered visually problematic, visually practical and visually heuristic at the same time, since it provides a visual description of the practical problem and demonstrates the search for ways to solve it. Finally, by the criterion of practicality, it is most often a practically problematic method.

The case-study method can be presented in a methodological context as a complex system that integrates other, simpler methods of cognition. It includes modeling, system analysis, problem method, thought experiment; methods of description, classification, and game methods that perform their roles in the case-study method. The main methods that are integrated into the case-study method are presented in the table 3.

Table 3: methodological base of the case-study method

Method integrated in the case study	**Characterization of the method's role in the case-study**
Modeling	The construction of a situation model
System analysis	System representation and analysis of the situation
Thought experiment	A way to get knowledge about a situation through its mental transformation
Description method	Create a description of the situation
Problem method	Representation of the underlying problem
Classification method	The creation of ordered lists of properties, the parties that make up the situation
Game method	Presentation of options for the behavior of the situation heroes
«Brainstorming»	Generating ideas for solving the problems described in the situation
Discussion	Exchange of views on the problem and ways to solve it

When selecting information for a case, it is necessary to focus on educational goals. The data must be real for the study direction; otherwise they will not be interesting to students. When selecting information, teachers can work with companies that are interested in attracting young professionals. Business leaders can clearly explore the possibilities of future candidates, and students will have the opportunity to prove themselves, and the more companies participate, the more often the method is possible and, accordingly, students will receive more skills.

Attracting companies to help with the preparation of tasks can help teachers collect a high-quality and relevant case for work, as well as evaluate the opportunities of future applicants and identify interesting students for themselves. For students, this method makes it possible to practically apply the information they know and consolidate the professional skills obtained during lectures and seminars.

When developing a case, they should take into account the level of complexity of tasks and situations, and observe a strict correspondence between the level of case complexity and the level of students' preparedness. The main stages of creating a case based on the materials of a real enterprise are shown in Fig. 2

Fig. 2: The sequence of creating a case based on the material of a real enterprise

The general rule for working with cases is that nobody can use "outside" information. For example, if a student reads a message in the Internet about an enterprise whose problems are described in the case, the data from this message cannot be taken into account when completing the task. Since the student who decides this case is in the role of the decision-making manager, he has only the information that is presented in the task. Sometimes, on the contrary, the student may be given the opportunity to add facts from a specific market situation that existed during the time period in question. In such cases, the student's erudition and knowledge of the material should be taken into account.

The students can use the following methods of group discussion: brainstorming and morphological analysis in the implementation of the case. There are some criteria for the assessment of students:

- Professional, competent solution of the problem
- Novelty and originality of the problem solution
- Brevity and clarity of the theoretical part for the problem solution
- Quality of the graphic part in the problem solution design
- Discussion ethics
- The activity of all members in the small group
- Penalty points (violation of the discussion rules, incorrect behavior, etc.)

Results

So, it's better to evaluate the case-study method by students of our university from the institute of economics and management of agriculture, on the example of the disciplines "Fundamentals of management", "Business management", "Strategic management", "Anti-crisis management". The survey was attended by bachelors in the direction of 38.03.02 « Management» (50 people) from the first to the fourth year study. The evaluating the case-study method by students is shown in table 4.

Table 4: evaluating the case-study method by students

The case method contributed to:	Totally agree (person)	Rather agree (person)	I don't know (person)	Rather disagree (person)	Totally disagree (person)
better assimilation of the material	11	18	10	7	4
increasing interest in business topics	9	15	12	9	5
motivation to view business news and search for additional information	18	12	9	7	4
improved understanding of the issues associated with a career in business	20	15	6	6	3
adding confidence during interviews	24	10	8	8	-
development of abstract thinking and integration skills	15	11	12	6	6

There are some recommendations for working with the case method. The best assimilation of the material is promoted by:

- Gradual increase in case complexity
- Data visualization
- Availability of text information
- Time sequence of the material
- Scrupulous elaboration of the discussion strategy
- Setting a clear time frame depending on the complexity of the case
- Creation of conditions for unimpeded communication within the micro-group
- The ability to express their own opinion for each student
- Assistance of the teacher in case of difficulties in solving the case

Conclusions

The education system should be based on the maximum activity of students. Modern society is interested in its citizens being able to independently, actively act, make decisions, quickly adapt to changing living conditions, work with information competently (be able to collect facts, analyze, generalize them, put forward hypotheses for solving problems, making reasoned conclusions).

These problems can be solved if there is:

- involvement of each student in the active cognitive process;

- a clear understanding by the student of where, and how this knowledge can be applied;

- ability to work in collaboration to solve a variety of problems, while showing communication skills.

The main reasons for the introduction of the case-study method in the educational process are the orientation of educational standards on the development of students' practical skills and the formation of students' professional competence.

The case-study method is necessary in the educational process not so much for the development of specific knowledge or skills by students, but for the development of the competence potential of the student and the teacher.

Using the case-study method in the educational process generally has a positive effect on the learning process of students, as they will get relevant skills that will be useful in their work, and students will feel as involved in the learning process as possible, getting real professional skills.

Abstract

Based on the assessment of the current state of knowledge, research premises can be formulated as a point of departure for this study. One is the complexity of consumer behavior, which forces the interdisciplinary nature of analyses and the search for new research perspectives. In the face of permanent changes in the environment, the search for new knowledge about consumer behavior will always be timely and practically useful. It should be emphasized that currently there is no single common stance as to what extent food consumption (level, structure, preferences for the degree of processing, etc.) among Polish consumers refers to global trends, and to what extent it stems from other conditions, e.g. cultural, financial, health, awareness, information or situational. The purpose of this article is to present the identified determinants of Polish consumer behavior in the food market. Secondary data in the form of literature and available statistical data was used in the research proceedings. To supplement these analyses, empirical material was also collected using a questionnaire. To that end, a total of 1,067 adult Poles were surveyed. In determining sample size, the size of the entire population in the study area was considered along with the assumption that the statistical inference regarding the fraction coefficient is set at a confidence level of 0.95 and a precision order of 3%. The initial data analysis included checking the correctness of the measurement tool and carrying out the analysis of internal compliance of the scales using the α-Crombach method. Statistical and descriptive methods were used in the analysis of the empirical material. A statistical analysis of the correlations between pairs of variables was performed using Pearson's chi-squared test of independence. In order to examine the coexistence of the category of more variables, correspondence analysis was performed using Bart tables. The confidence level was assumed at 0.05.
The conducted research indicates that the desired values to be found in a food product are: favorable price, taste values as a source of new sensations, health benefits, ease of use, or broadly understood social attributes. The improving income of Polish households provides opportunities to meet the increasingly sophisticated nutritional needs and contributes to the increased role of quality in consumer decisions. In Poland specifically, the impact of gender blending, which consists in blurring the boundaries between roles and behaviors traditionally attributed to women and men and adopting patterns of behavior of the opposite sex, remains low considering that sex was the variable most often differentiating the attitudes and purchasing behavior of the respondents.

Keywords: Consumer Behavior, The Food Market, Surveys, Statistical Data.

Introduction

The evolution of consumer attitudes and behaviors, both in the market and in other areas of social life, is significantly shaped by the socio-economic development of economies and the changes of structural and technological nature constantly occurring in the environment. Consumer needs and ways of satisfying those needs are transforming, and with them the way consumers make decisions, which is the result of progressing globalization and convergence processes on one hand, and disintegrative and divergent processes on the other hand. New technologies and communication methods also play an important role in this evolution.

Based on the assessment of the current state of knowledge, research premises can be formulated as a point of departure for this study. One is the complexity of consumer behavior, which forces the interdisciplinary nature of analyses and the search for new research perspectives. In the face of permanent changes in the environment, the search for new knowledge about consumer behavior will always be timely and practically useful. It should be emphasized that currently there is no single common stance as to what extent food consumption (level, structure, preferences for the degree of processing, etc.) among Polish consumers refers to global trends, and to what extent it stems from other conditions, e.g. cultural, financial, health, awareness, information or situational, as discussed by Bogdan Sojkin et al. (2009). The conditions underlying Polish consumers' purchasing decisions in the innovative food products market have not been fully identified either.

The purpose of this article is to present the identified determinants of Polish consumer behavior in the food market. Secondary data in the form of literature and available statistical data was used in the research proceedings. To supplement these analyses, empirical material was also collected using a questionnaire. To that end, a total of 1,068 adult Poles were surveyed. In determining sample size, the size of the entire population in the study area was considered along with the assumption that the statistical inference regarding the fraction coefficient is set at a confidence level of 0.95 and a precision order of 3%. The initial data analysis included checking the correctness of the measurement tool and carrying out the analysis of internal compliance of the scales using the α-Crombach method. In the study, the value of the Cronbach α-test was in the range (0.70 - 0.90), which showed that the scales had internal consistency and reliability (Hinton, Brownlow, McMurvay and Cozens, 2004). Statistical and descriptive methods were used in the analysis of the empirical material. A statistical analysis of the correlations between pairs of variables was performed using Pearson's chi-squared test of independence. In order to examine the coexistence of the category of more variables, correspondence analysis was performed using Bart tables. The confidence level was assumed at 0.05.

The essence of consumer behavior in the food market in the light of literature review

The behavior of consumers in the food market depends on various factors, which may be economic (i.e. product price, consumer income, savings, assessment of future consumer income), non-economic (especially personal, socio-cultural or psychological factors) or related to food quality (i.e. appearance, taste, smell, availability, etc.). K. Gutkowska and I. Ozimek (2009, pp. 118-132) argue that food market behavior is the result of factors such as:

- internal stimuli - the level of hunger felt, consumption patterns shaped in the family home,
- external stimuli - factors related to the external environment (fashion, reference groups);
- marketing mix elements

Researchers emphasize that food preferences are the result of genetic predisposition and environmental factors. Preferences for sweet and salty taste, or aversions regarding bitter and sour taste, are often the result of a genetic makeup. Learned preferences arise under the influence of the environment and experience (Niewczas, 2013). Food preferences are determined by (Jeżewska-Zychowicz, Babicz-Zielińska, Laskowski, 2009):

- food characteristics: taste, aroma (smell), texture, appearance;
- individual characteristics of the consumer: age, sex, body weight, personality, worldview, economic status, knowledge of food;
- characteristics of the social environment: family patterns and relationships, peer influence, mass communication, religion.

Consumers are looking for convenience and are increasingly migrating between available suppliers and forms of shopping. They are becoming conscious buyers who value their time. In the opinion of some researchers (Gutkowska 2011, Iwińska-Knop and Zając, 2015; Gregor and Gotwald-Feja, 2017), shopping behaviors are evolving towards a consumer profile that can be called all-channel,

hybrid. In what concerns Polish food consumers specifically, the following changes in attitudes can be observed (Bywalec 2010; Olejniczuk-Merta, 2016):

- rejection of a 'consumer civilization', based on a quantitative increase in consumption, in favor of qualitative aspects improving the quality of life;
- increase of critical attitudes towards the future and the effectiveness of the economic policy pursued;
- striving for personal growth, search for identity and internal balance which encourage greater interest in local food products,
- a return to tradition, which contributes to increased demand for regional products;
- a sense of responsibility for the environment and humans, expectation of sustainable development;
- consumer participation in the creation of innovations.

The consumer evolves from a passive, impersonal entity into an active and demanding partner, a part of the same socio-cultural tissue (Maciejewski, 2012).Differences in consumer market behavior, income disparities or different expectations regarding food products can be an inspiration for managers to increase market saturation with innovations.

Economic determinants of Polish consumer behavior in the food market

Economic conditions, such as the level and source of income or price level (Dąbrowska, 2006; Światowy, 2012; Andrejovská et al., 2015; Kułyk, & Michałowska, 2017) have a direct impact on the amount of individual food consumption and the tendency for it. At the same time it should be noted that the level and structure of consumption reflects the state of economic growth and the economic situation at large. Consumer income determines the ability to meet food needs, while the structure of household expenditure changes along with changes in income. In Poland, the level of average monthly disposable income per person in a household stood in 2018 at PLN 1693.50, up 42% compared to 2010, while the average expenditure per capita was at PLN 1,186.86, with expenditure on food and non-alcoholic beverages making up 24.8% of that - the largest share of the total. Nominal expenses in Poland were PLN 1091.19. The average monthly disposable income per capita in Poland is steadily increasing, while a systematic decrease in the share of expenditure is noted (Fig. 1). Households reported higher incomes with expenses staying at a similar level, pointing to an increased surplus of income over expenses and therefore an improvement of Poles' finances overall. In 2018, expenditure on consumer goods and services reached PLN 1,137 0.8% lower in real terms compared to 2017 (Fig. 1). Consumer income determines the possibility of satisfying food needs. Essential information on the degree of satisfaction of consumption needs is provided by the analysis of food indicators. This can be the share of expenditure on food and non-alcoholic beverages in total household expenditure, calculated on the basis of personal income in current prices. All income theories indicate that consumption follows income. Along with the increase in the standard of living and satisfaction of basic needs, the structure of spending on individual types of purchased goods changes: the share of expenditure on higher-order goods, including services, increases, while food expenditure decreases. The average share of food expenditure in total EU expenditure was 13%, and its lower share in individual countries is an expression of increased prosperity. In Poland, while this share is constantly decreasing, it is still significantly higher than the EU 28. The analysis of consumer income and expenditure confirms the hypothesis that the higher the economic development of a country and the income of its residents, the smaller the share of expenditure on food in total household expenditure (Gutkowska, Ozimek 2009, pp. 118-132). Research by Poland's Central Statistical Office (GUS) on households' self-assessed financial situation also shows that the number of households assessing their finances as either *very good* and *good* is growing, which may strengthen the demand for higher-quality, slightly more expensive but still healthy items. Favorable income changes may explain the observed trend among Poles to move away from quantitative consumption towards pro-quality consumption. As indicated by S. Figiel (2016), higher incomes determine the demand for sophisticated choices of food products geared towards fun, quality, health, personalization and the demand for a diet based on functional, organic, fresh and convenient food.

Figure 1: Average monthly disposable income and average monthly expenditure per capita in a Polish household and the share of total expenditure on food and non-alcoholic beverages in disposable income in 2010-2018

Source: Local Data Bank 2020

A certain barrier to the development of demand for higher-quality food products in Poland is still the relatively large diversity of average monthly income and expenses between various socio-economic groups of households. In 2018, the highest average monthly disposable income per capita in households (PLN 2012) and average monthly expenses (PLN 1,400) per capita were reported, as in previous years, in self-employed persons living in a non-rural household. In this group of, compared to the average for all households in Poland, both income and expenses were higher, by 18.8% and by 17.9%, respectively (in 2017) and by 20.1% and 16.3%, respectively. Since 2014, the income gap per capita in households has been systematically decreasing, as expressed by the Gini coefficient, but this trend stopped in 2018 when the coefficient remained at the 2017 level of 0.299 (Fig. 2). In Poland, there is a clear difference in the income situation of households from rural areas compared to those from urban areas (*Sytuacja gospodarstw* ..., 2019).

The share of expenditure on food needs is negatively correlated with consumer wealth. An increase in income triggers a decrease in the share of expenditure on food and a simultaneous increase in the share of expenditure on meeting higher needs (Kieżel, 2010). People with higher incomes are quicker to embrace new food products and adapt their purchasing behavior to current trends (Sojkin et al., 2009).

Figure 2: Income differentiation measured by Gini coefficient for Poland in 2004–2018

Source: Local Data Bank 2020

Socio-economic changes have significantly influenced not only the structure of household expenditure, but also the very model of food consumption. Their impact has been both qualitative and quantitative. Qualitative changes in the consumption of daily diet products over the course of twenty years were caused by greater availability and a more diverse range, as well as lifestyle evolution consisting, among others, in the increasing awareness of the role of nutrition in human life. In 2018, as in previous years, the downward trend in the consumption of most basic food products continued. The decrease concerned especially vegetables (by 3.9%), oils and fats (by 3.6%), bread and cereal products, fish and seafood (by 3.4%) and eggs (by 2.9%). In the meantime, fruit consumption increased the most (by 3.0%) (Fig. 3)

Figure 3: Average monthly consumption of selected food products per capita in 2010, 2014 and 2018

Source: Local Data Bank 2020

The level of consumption of food products is largely determined by household income. Along with the improved financial situation of household, the level of consumption of some food products such as bread and cereals, meat, vegetables, fruit, cheese and curd as well as mineral and spring waters increased. The level of food consumption is also influenced by eating habits, availability and prices of food products, the last being related to the place of residence. Households located in rural areas have a slightly different nutrition model than urban households (*Sytuacja gospodarstw*…, 2019).

The most favorable ratio from the perspective of the consumer, the total price index of consumer goods and services as well as of food and alcoholic beverages, was reported in 2015 and 2016, with the fact that the average monthly disposable income per capita increased (Figure 1) having contributed to an additional increase in the purchasing power. In 2015, consumers could buy more food than in the previous year, but this trend was notably worse in 2017, to improve significantly again in 2018 (Fig. 4).

Non-economic determinants of Polish consumer behavior in the food market

Food demand cannot be seen merely as a function of prices, income and consumer population. Food market consumers are also influenced by social and interpersonal factors. Herman et al. (2003) argues that the choice of food depends on the desire to convey a certain impression or to comply with social norms. There are strong theoretical reasons to suggest that perception of a reference group may affect consumption. The theory of social comparisons (Festinger, Carlsmith, 1959) explains that people compare themselves to others to show that they are fashionable or are keeping up with their reference group. Consumers feel different pressures from other members of the reference groups to suit their individual predispositions (Goldsmith et al., 2010). Scientists indicate that food consumption has the strongest connection with culture at country level, and therefore, compared to non-food consumption, it is less susceptible to the globalization process (Mazurek-Łopacińska, 2006). The influence of culture on eating behavior is reflected in national cuisine, food and nutrition habits, and indirectly finds confirmation in the diet patterns of individual nations. At that time, products consistent with tradition that has been cultivated for years are important. It should be noted that the same

physiological needs are met in different cultures according to current habits and customs. What is more, according to researchers Jan-Benedict E.M. Steenkamp and F. Ter Hofstede (2002), culture influences consumer beliefs and decisions regarding product quality. According to M. van Mesdag (2000), food-related products form part of the so-called culture-bound products.

Analysis of consumer lifestyles makes possible naming the main consumption trends which correspond to the expectations of food products. For example, the tendency to adopt a simpler lifestyle that is closer to nature requires the development of products seen as supporting this new art of living. These can be products such as healthy food, natural fibers, simple furniture and household tools (Mazurek-Łopacińska, 2003). In the food market specifically, fast lifestyle is playing an increasingly important role. It implies behaviors manifested in the preparation of meals using semi-finished products, or reaching for all kinds of ready-made foods.

The research sample was selected from the entire adult population of Poland, i.e. approximately 31,532,048 people. The sample size was set at 1,067 respondents who were selected based on their place of residence (village, towns of up to 30,000 inhabitants and over 30,000), age (up to 25 years old, 26-40 years old, 41-55 years old and 56 or more years old) and sex. Women accounted for 53% and men accounted for 47% of the respondents in the sample. Important factors determining consumer behavior in the Polish food market are also education and professional activity, especially in relation to women whose professional activation has changed the division of household responsibilities in the family. The in-depth analysis of our empirical material showed that gender was a significantly differentiating variable, and therefore the hypothesis about the role of gender in purchasing decisions regarding food products was confirmed (Barska, 2014; Barska and Wojciech, 2014). The identified correlations were expressed by the corrected Pearson C contingency coefficient, whose analysis indicates that gender differentiates the attitude of Polish consumers to information and its sources. Women definitely value personal sources of information, and unlike men, they also show greater sensitivity to other communication activities. Gender differentiated the assessment of the importance of information the most in terms of: expiry date (for women this information had a more important role, the weighted average value in the group of women was 0.66 higher), whether the packaging is biodegradable (also for women this information was more important, the weighted average value in the group of women was 0.61 higher). For women, information on nutritional recommendations (0.57 higher rating) and the content and type of preservatives (0.55 higher rating) were also more important. Men, meanwhile, rated the importance of information about the producer higher (by 0.22 points). The research also shows that eating habits, the fifth most important criterion for food-purchasing decisions, significantly determine the attitudes of Polish consumers.

Both in Poland and other developed countries there is a noticeable trend of the expansion of higher education, which translates into greater awareness in the field of healthy eating. Increasingly educated citizens are becoming aware of their rights as consumers and are able to use available market information to purchase goods that maximize their perceived value. This in turn places higher demands on producers and suppliers, with consumers expecting high-quality food products at a reasonable price. Non-price attributes of food products, which are a source of utility for the consumer, play an important role, too. These include: nutritional values, safety and convenience of consumption, place of production, environmental impact or production technology (Antle, 1999). The conducted survey research shows that quality, taste, freshness and price play a key role (Barska, 2013). It should be noted that Polish consumers are increasingly paying attention to food's nutritional value and its impact on their health. This is due to the increasing knowledge and nutritional awareness among consumers.

The analysis of correspondence in the group of Polish consumers for simultaneous occurrence of variable categories describing expectations towards a food product proves that consumers have high requirements for the broadly understood quality of food, defined as the degree of its healthiness, sensory attractiveness and availability in a wide consumer and social semantic range (Zalewski , 2008). Qualitative attributes are closely related to those of taste (marked as S_W) and they are a variable that least differentiates consumer expectations, as evidenced by the location of this criterion in the immediate vicinity of the projection center (Fig. 5). This means that consumers place high demands on this attribute. When evaluating the quality of a food product, consumers primarily take

into account the element of sensory evaluation, which is palatability and which should be understood as a set of closely interrelated taste, visual and fragrance impressions that the consumer feels at the moment of direct consumption of a product. Taste and aroma helps consumers assess the palatability of a product, while visual impressions are shaped by the consistency and texture of the food. Consistency determines the functional and sensory evaluation of properties related to hardness, brittleness and the shape and size of particles, while texture refers to the surface properties of food - humidity or juiciness. The same applies to the price (marked as C_W), which is an important criterion of choice. A significant group of respondents are linked by the importance of product composition (Sk_W), primarily in terms of health (Z_W) and the so-called fit values (Fit_W). Consumers want to eat not only less and healthier, appreciate quality and originality, but also wish to explore new flavors and share these experiences. These buyers pay attention to the share of ingredients (Sk_W) that have a positive effect on health, reduce the risk of lifestyle diseases, prevent the occurrence of disease threats and aging processes, which is verified by including by them in the purchase process relevant information contained on the label (ZI_E_W) and paying attention to designations (ZI_C_W). For them, a high degree of product processing (St_P_W) is synonymous with a loss of health benefits, which is why a significant share of the consumers prefer traditional products. Another group of important attributes are features related to ease of use and are associated with convenience foods in convenient packaging - disposable, single-serving products to eat on the go or during a lunch break at work (attributes marked as W_U_W, S_U_W, respectively – Fig. 5).

Consistency is significantly influenced by the conditions of product processing and storage, which is why food manufacturers, knowing the importance of texture in consumer choices, use a variety of practices that increase and consolidate food attractiveness (Cyran, 2014). Overall, today's consumers are mostly driven in their food choices by:

- convenience of purchase, use and preparation,
- the opportunity to express their views and professed values,
- maintaining fitness, health and beauty.

Figure 5: Graphic representation of the results of correspondence analysis for the simultaneous occurrence of variable categories describing the criteria of food product evaluation

Source: own elaboration and own calculations (R 3.1.0 software)

Legend:

W – somewhat or very important criterion in the process of food product evaluation
M – not at all or not very important criterion in the process of food product evaluation
Fit – relates to food properties such as content of ingredients with a positive effect on the body, including anti-aging and beauty-enhancing.
Z – relates to food properties such as content of ingredients that have a positive impact on health, reduce the risk of lifestyle diseases and prevent threats.
A_Sp - social attributes of the product coming from producers who comply with the principles of environmental protection, fair trade and animal welfare
Sk - product composition
Ma - product brand
ZI_E - label as a source of information
ZI_C– food certificates and designations
W_U - disposable single-serving products in special packaging (convenience foods), food products that can be easily used
S_U - processed or semi-processed products, ready to eat without additional treatment, ready to serve
St. P - processing degree of a food product
Cr. P - country of origin of a product
C - product price
O - ecological aspects of packaging

It is worth noting that the relationships between the categories of the indicated variables were mapped in a two-dimensional space, reproducing 87% of the original correlations, which is considered to be a very high value.

Conclusions

Consumer behavior in the food market is determined by the income and family conditions, as well as preferences, habits and culture-bound tradition. The improving income of Polish households provides opportunities to meet the increasingly sophisticated nutritional needs and contributes to the increased role of quality in consumer decisions (Barska, 2014). Modern consumers expect of food products to not only to satisfy their hunger, but also fulfill their hedonistic desires (e.g. products with high-taste qualities). There is now much interest in slimming or weight-loss friendly food (light products) and healthy energy boosters (functional food). Consumers want to save time when preparing meals (convenient, highly-processed or ready-to-eat products). A significant group of Polish consumers are not indifferent to preserving the values of the natural environment, which they express through their interest in organic food. The conducted research indicates that the desired values to be found in a food product are: favorable price, taste values as a source of new sensations, health benefits, ease of use, or broadly understood social attributes. In Poland specifically, the impact of gender blending, which consists in blurring the boundaries between roles and behaviors traditionally attributed to women and men and adopting patterns of behavior of the opposite sex, remains low considering that sex was the variable most often differentiating the attitudes and purchasing behavior of the respondents.

Abstract

Education is the process of preparing the students so that they can carry out their lives. That goal will be achieved if schools implement a teaching system that uses the power to facilitate the students to participate in the learning process actively. Several experts indicated that the use of power would affect the perception and participation of students in the learning process. However, the results did not depict a representation of power in speech acts used by teachers or students. Based on the fact that this study was conducted to illustrate the representation of power in speech acts of teachers and students in the learning process. This study used ethnographic methods. The results of this study indicate that the use of the following directive represents power. Teachers and students in classroom discourse using four types of the directive, namely the command, request, ban, martial arts, and suggestions. Usage follows the directive of the commands and prohibitions have a level of restriction tends to represent the dominant power, while the use of demand, invite, and advice, have the power to represent the level of restriction humanist. Directive dominance level associated with the use of the type of modality and socio-cultural dimensions that build classroom discourse. The findings of this study imply that to foster active participation in the learning process, teachers should use a command that represents power humanist. Also, the realization needs to consider socio-cultural dimensions that build the discourse of class.

Keywords: Representation, Power, Speech Acts.

Introduction

As one of the educational institutions, the school is the domain that is inseparable from the use of power. In the process of learning in the classroom, teachers (T) and students (S) can not be separated from the use of power. Characteristics of classroom discourse influence the use of power in this domain. For Fairclough (2001) the school has a social order and the order of discourse involving the structure of the social space of its own.

Now the question is how to form the power usage in classroom discourse. Based on a review of the literature that can be reached, up to now, several studies discuss the use of power in the classroom discourse. For example, Abdullah and Hosseini (2012) concluded that teachers play a dominant role in the classroom so that students seem passive and helpless.

With a variety of speech acts, teachers and students build a culture of a particular communication that indicates the process of mutual influence or even dominate. The process indicates the use of a specific power. The speech acts were among the tools that can be used to control and adapt to the environment. Thus, the speech act is the basic unit of power representing the discourse of class teachers and students (Mey, 1996).

In this study, the representation of power in the speech act focused on the giving direction. This speech acts with various kinds constitute speech acts designed to encourage the hearer to do something. For Leech (2014), the speech act is often included in the competitive categories, namely illocutionary goal to compete in the social goals, such as commanding, requesting, and demanding. Power is the potent of a person to affect the thoughts, feelings, and behaviors of others. It is a potential power to influence others for good or evil, to be a boon or a whip Lee (2002).

The construct of the theory of power used in this study is proposed by the Raven (2017) where he divides power into five types, namely coercive power, legitimate power, reward power, power expertise, and power reference. The use of each power is related to the components of speech, among others, the difference institutional roles between teachers and students, the goal said to be achieved in the learning process, and the topics explained as controlling the flow of execution of the learning process, both in the classroom and in the laboratory.

The objective of this study is to determine how the representation of power in directing students as well as which directing reflects dominative and humanist power.

Methodology

The theoretical perspective implications methodology in assessing the power of representation in the discourse of class. Based on the theoretical perspective, this study uses ethnographic research of communication. Ethnography of communication understood as presented by Maschler, & Schiffrin (2015) defining the discourse based on the field of anthropology and linguistics. This approach recognizes the diversity of possibilities and habits of communication (cultural relativity), and the fact each is a custom integrated part of the thing known and do the participants said as a member of a particular culture. This study uses ethnography of communication of Hymes (2003), which saw a variety of shapes and meanings of the components of speech communication.

Collecting data is done through observation and interview techniques. By observation, the researchers conducted direct recording and recording field against a variety of learning contexts high school in Indonesia. This research was interviewing techniques using the technique of in-depth interviews. Data analysis was performed through an interactive model adapted from the model developed by Miles, Huberman & Saldaña (2014).

Result

Power Representation in Command

When compared with other types of directives, commands verbal performance is often regarded as the most explicit directive (Holmes & Wilson, 2017). Explicitness level command characterized by a direct relationship between the command illocutionary power with syntactic structure. These characteristics affect the levels of restriction and the nature of the power that it represents. The command has restriction levels are higher than other types of directives. According to Nugraha et al., (2018), high levels of restriction is because, in order, the speaker is a source deontic which has high levels of restriction to the hearer.

In the learning process, use the command has certain restrictions, whose levels are related to the characteristics of the structure and elements of the command builder. Based on these results the restriction levels associated with the direct command whether or not the command, the modality used, the type of diathesis selected, greeting words are used, and the length of the speech that builds a command. The following quote an example of using direct commands in the context of the initial direction of the semester.

[1] T: You should be able to follow the lessons well! (1) If it is too late, there are procedures that you must do. (2) Do not do mischief. (3) If a fight, who struck first should account for his actions. (4) The others, if there were ill, have permission. (5) Well, it seeks no letter. (6) The exit tries to have the certificate. (7) [...] If the lessons left behind more than one subject, all teachers must be asked for permission. (8)

S: (Students listen to the teacher's explanation and without anyone daring proposal)

Citations [1] contains several direct commands that are used by teachers to guide at the beginning of the semester. Following its role, teachers have the legitimate power to provide guidance and learning programs at the beginning of the semester. Submission of directing it tends to be dominating. The nature of the briefing dominating is shown by restriction level commands used and the direction of the delivery strategy. In the conveying direction of the teacher uses direct orders that tend to have high levels of restriction. The use of modalities to be in order (1), (3), (4), (5), (7) and (8) and modalities try on command (6) enhancing the levels of restriction commandments. Dominating nature directives were also demonstrated by the delivery strategy that tends to be instructive, not dialogue.

Beside related to whether or not the command, power restriction levels are also associated with the use of the modality in a speech that builds a command. Related to this modality, Fairclough (1998) states that the modalities are one of the essential things of value relational and expressive grammar value. Working modalities with the authority or power of the participants said.

The use of modalities in order pertained relational modality or deontic. The use of this modality showing the relationship of authority against counterparts speakers. Thus, the use of relational modality or deontic in power represents a valid command. The following quote proves it.

[2] T: [...] Thus, the smallest unit which? (1)

S: (Students seem afraid to answer so that the sound is not clear).

T: One does nothing, why was not fined. (2) The answer does not have to correct first. (3) Try to learn to express opinions! (4) Yes, who?

In the citation [2] revealed the use of several commands. In this context, the teacher uses the command restriction levels so low that power which is also represented more humane, Low levels of restriction is also caused by the use of the modality that tends to reduce the levels of restriction orders. The use of relational modality or deontic like it does not matter, not fined (in command (2)), does not have to (in the order (3)), and try (in the order (4)) to reduce levels of restriction orders. The students perceive that the order number represents power humanist. Though they are compelled to do something as intended by the amount of the order, they do not feel pressured.

The choice of having diathesis also affects the levels of restriction orders and the nature of power is represented. Judging from diathesis, follow commands revealed in classroom discourse can be divided into two, namely have diathesis command active and passive have diathesis command. When have diathesis active, the command has the restriction levels high, but so is transformed into a passive have diathesis orders, orders that have lower levels of restriction. In order to have passive diathesis, the subject of the sentence is precisely the target of the action, not the perpetrator. In fact, according to Fairclough (1998), lack of subject/agent on the passive have diathesis command causes the causality and the agent did not clear.

The representation of power in command is also influenced by the use of the address in the order. Eckert and McConnell-Ginet (2003), states that the word greeting associated with power and solidarity. The results of this study indicate that the use of an appropriate greeting affects the levels of restriction command and the nature of power is represented.

The findings of this study indicate that the use of the second person said greeting you, you, and the name tends to heighten the levels of restriction command. The following excerpt shows symptoms.

[3] T: Well, now that all kinds of tissues in the organ, you learn. (1) Please discuss, but the first bench! (2) To the upcoming meeting, I hope you had formed ten groups. (3) If I want, you should be ready. (4)

S: (Carry out the command teacher).

From the citation [3] it appears that the teacher uses several addresses so that he uses. In the speech (1) used the second person said greeting you, while in command (2) and (3) use the word greeting you. According to students, the use of both types of address tends to enlarge the dimensions of the social status of teachers as the ruling party and the students as those who are being governed. The word greeting was not to build equality and familiarity in the learning process. Therefore, in general, the students perceive the use of greeting it heightens levels of restriction orders that tend to represent a legitimate power which tends to be dominating.

The nature of the dominating power wane if the command was using the second person greeting you or brother. Although formal impressed, the students perceive the use of the greeting that just build up equity. Thus, commands using your greeting words and you tend to minimize the dimensions of social status thus represents a more human power.

Representation of power in demand

When compared with the command, request to have lower levels of restriction so that the power which is represented also tend to be more humane. Although it tends to be lower than the command, the demand also still has the restriction levels are heterogeneous. Heterogeneous linked to several factors as shown in the command, for example directly or absence of a request, the type used diathesis, modality is chosen, greeting words are used, and the length of speech that build demand. However, of all these factors, three dominant factors are affecting the level of restriction request, direct the least demand, the selected modalities, and the length of the speech that builds a request.

The participants said in the discourse of the classroom using direct request and requests indirectly. Fairclough (1998) states that there is a close relationship between the demand and power when the right to ask someone to do something because there is a power possessed. Forms of direct requests explicitly indicate power relations, while the form of indirect demand is clearly implicit.

The results of this study indicate that the use of the type of request adapted to the said purpose and participant said. For teachers, the main factor taken into consideration is the purpose of the speech. When it intends to provide a restriction that the students do something / do not do something, for example, teachers tend to use direct request. To clarify this exposure, the following quote is worthy of scrutiny.

[4] T: [...] Problems what about much signage in the city? (1)
S: (Respond with a voiceless loud).
T: Ha ..., can sound a bit harsh? (2)
S: Crime. (3)
T: Crime; correct it. (4)

Speech (2) in the above quote request classified as indirect. In that context, the teacher uses the structured interrogative request to ask the student to raise his voice when answering. In order not to give the impression that demand restrictive, teachers use indirect request. The use of indirect requests is usually related to empowerment (empowerment) students to achieve the learning objectives.

For students, in addition to said destination factor, counterpart also a consideration in the use of both forms of the request. When speaking to teachers, they feel more polite to use indirect request. When forced to use direct request, usually they are trying to reduce levels of restriction by using specific modalities or use a query with a longer speech. However, when speaking between them, the students can talk immediately and can also request an indirect request.

In addition to the direct or absence of speech, the degree of restriction related demand also with the modality used. The following excerpt will clarify this exposure.

[5] T: You see Worksheet on page 9 organ systems! (1) Try to give an example one kind of organ and gave an overview of how the organ was called as an organ. (2) Please put the bag! (3) [...]. For example, what? (4)

S: Small intestine. (5)
T: The small intestine's function What? (6) Please, explain its function!

From the quote [5] revealed three acts directive to the query form, namely speech (2), (3) and (6) respectively using the modality try, please, and please. The third use of adverbs modality seems to reduce the concentration of power represented restriction. Without the presence of these modalities, the third speech it becomes imperative request directly with the imperative structure which tends to represent more dominating power.

Representation of power in prohibitives

Directive to forms prohibitives also contains a command, but the command is negative, namely that listener not do anything. Prohibition tends to have high levels of restriction so that the power which represented tend to be dominating. The results showed that levels of restriction associated with the direct prohibition least the ban form and modalities used. Forms have a direct prohibition restriction levels higher than the prohibition of indirect, and restrictions with a particular modality is more restrictive than with other modalities.

High levels of restrictions, it has implications for anyone who has legitimacy ban prohibits and what it has done. The results of this study indicate that teachers use many bans rather than students. Use of the ban could occur in the process of briefing or the learning process. The following excerpt is an example of a ban that is used by teachers to guide at the beginning of the semester.

[6] T: I expected the rules respected. (1) Do not let the picket monopolized one person every task; it was his turn. (2) They already spent some hours, then followed by the others in the next hour. (3) Do not until told to remove by Mr / Ms Teachers without you having own initiative! (4)
S: (Students pay attention diligently).

In the citation [6] above, we see that speech (1) and (3) classified directive to form an outright ban with modalities do. Such prohibitions are likely represented the dominating power. Through the speech, teachers forbid students to make the bad habits in the classroom; the lazy do picket. Teachers submit this prohibition in his capacity as the guardian class, which is responsible for the cleanliness and order of the cultivated classes. Therefore, it is reasonable that teachers use legitimate power to prohibit students to do lazy picket.

The use of forms of this prohibition may occur in a variety of topics and purpose said. In the learning process, for example, teachers also use restrictions. Typically, the ban was related to the prevention and streamlining of deviant behavior, understanding and skills improvement in specific learning topics. Representation of the power generated is dominating.

From the results of this study revealed that high levels of power restriction would increase if used specific modality that shows the attitude of force. When giving a ban on high-yield restriction, in addition to using modalities do, teachers also often use other modalities, such as prohibited, not allowed, not allowed, not allowed. Conversely, if reducing the levels of restriction restrictions placed, in addition to utilizing the modality, the teacher also uses the structure of a specific prohibition, namely (a) using indirect prohibition with structure declarative, interrogative, gestures, and innuendo; and (b) using a certain modality that can reduce the levels of restriction.

Ban the use of the above tends to represent a reference power or power behavior. According to teachers, the use of forms that such restrictions could reduce the threat advance. Although it is indirect, in certain contexts, the use ban as it was very effective. The symptoms are aligned with Kaur & Pahuja (2019) stating that in the discourse of class, there are three prominent power, namely power expertise, legitimate power, and power reference. Power coercion and power prize as supporters of the three main power.

Although rarely use ban, sometimes students also use one form of this directive, especially when spoken between them. The following excerpt shows the symptoms.

[7] S1: Sst ... do not crowded! (1) We will be answering questions The next group 6: what causes the planets and away from the sun? (2)
S2: (Students instantaneous not crowded).

From the citation [7] appears that students using speech (1) to prohibit other students that are not crowded. The speech pertained outright ban that has a high restriction. The use of hush gesture reinforced high levels of restriction ban and modalities are not commonly used to stop the commotion in the classroom. Frequently, the ban was used by speakers that have a social role parallel to or higher than the hearer. Such prohibitions are likely to represent the power of coercion.

Representation of power in invitation

When compared with other forms of the directive, invitation directive forms that have the lowest levels of restriction. Low restriction invitation indicated by the use of the modality. In the Indonesian language, speech discloser form this invitation can use multiple modalities, such as please, let it be, allowed, welcome, and allowed (Rahardi, 2000). In a directive to use classroom discourse invitation shape represents the power of teachers and students. For teachers, the use of invitation to reduce levels of power restriction or build equity with students. However, for students, the use of invitation to show politeness in order not to threaten the teachers face. Citation [8] contains the invitation of speech teacher.

[8] T: [...] How, no one asked this? (1)
S: Question, sir. (2)
T: Yes, please! (3)
S: Meeting the charge that what means.8 (4)
T: Meeting of the charge is the average mean it. (5) Thus, they spread the average of the load. (6)

Speech (3) in the citation [8] belongs invitation. Invitation it as a response to students asking utterances mean he had not yet mastered the material. Forms such invitation much revealed in the speech teacher. For example, the teacher let the students into groups; teachers invite students who want to criticize the idea of another student's role in the discussion; in fact, the teacher let the students when they dispute the idea or presentation. Teachers do not press students to trust what it explains. In that context, the teacher let students develop ideas or thoughts, without intimidation or emphases. Please make use of the modality as a teacher rather than as the dominant nor dominated parties,

Use of the directive with invitation form was not only used by teachers, but students can use the invitation. The following excerpt shows symptoms.

[9] S1: Questions. (1)
S2: Oh, yes, please! (2)
S1: E ..., you see, the sun was right as well as a star, for example a star A and B. Review (3) Now, A can move, why the sun not moving? (4) If the star A is moving, the sun also has the potential to move. (5)
S3: I will try to answer, yes. (6) [...]

In the discussions, utterances like invitation (2) in the citation [9] is often revealed. Usually, the speech used by the moderator or presenter when there are participants in the discussion to ask, deny, or provide clarification. An invitation like utterances (2) tends to represent the power of humanist.

Representation of power in suggestions

As one of the directive, suggestions are also likely to represent power humanist. In the discourse of class, students are a rare act of advising teachers, unless they are asked by the teacher to give suggestions. More advice was given to students or student teachers to other students. This is understandable because based on the data found, suggestions tend to represent a legitimate power and

power expertise of the participants said in classroom discourse. The following quote is worthy of attention.

[10] T: [...] One is not the issue. (1) I remind you now if you go forward to no need to fear any front. (2) One was not anything in the study. (3) But then if replay should not be ...? (4)

S: False. (5)

T: Ha, yes. If the test should not be wrong. (6) Do not reverse: if the exercises are wrong, if not afraid of any test. (7) We are not a good use of these principles. (8)

In the citation [10] that there is a directive to the shape of advice, namely speech (2), (3), (4), (6) and (8). Illocutionary power of speech is not indicative of coercion from teachers. Realization of advice tends to depend on the awareness or willingness of students. The use of several modalities, such as no need to fear either, one does nothing, it is, and no good can lower restriction such suggestions. Therefore, it represents the fifth suggestion of humanist power.

Directive to the shape of the advice also revealed in the speech of students. Following the position and role as a student, the advice they provide is more often directed at other students, not for teachers. In reality, the act of giving advice lot going on when discussions. The following excerpt is proving symptoms.

[11] S1: I'm sorry, from the information we have gone too far. (1) So, here the conclusion that the data you too pessimistic about progress technology. (2) [...]

S2: I think we can think. (3) As a thinker candidate should, we can argue. (4)

S1: Well, we should take the middle course. (5) In the opinion Our group you are asking right in the opinion of our group. (6) [...]

Many suggestions were revealed in quotations [11]. The suggestions came from students devoted to other students after the discussion without having obtained a consensus. The third suggestion was to use different modalities. Suggestions (3) using the modality I guess, suggestion (4) using a modality should be, and suggestions (5) used preferably. Of the three , suggestions (4) seems to have higher power than the second restriction other advice. However, modality restriction levels should remain lower than the modalities should be, which is usually used in the directive with the order form. Thus, all three of these suggestions have lower restriction levels that tend to represent the power of humanist.

Discussion

The findings of this study indicate that the directors of speech acts with various kinds of power represent teachers and students. With a directive speech, acts of the participants said in class discourse interplay of thoughts, feelings, and behaviors to achieve the learning objectives. Thus, the use of directive speech act represents power used by teachers and students to achieve the learning objectives.

The findings of this study in harmony with the opinion of Mey (2012) states that speech acts are among the tools used to control our environment, and conversely also the tools to adapt to our environment. In the process of communication, speech acts are used to control the environment or adapt to the environment representing the domination of power by certain properties.

In the perspective of speech act theory of Austin or Searle, dimensions of socio-cultural materials are not used for prediction and explanation of the characteristics and behavior of speech acts, Lockwood et al., (2019) show some ideas in the development affecting shift in language study, which was focused on studies of the structure of language, then leads to the function of language.

For Thompson (2003), experts speech acts duly into consideration the social a communication, but they rarely acknowledge the social character of these conditions. The conditions of suitability proposed by Austin and Searle refers to 'conventional procedure' to be followed by performative utterances are worth. However, they have never been tested in detail conventional conditions, let alone explore its relationship with the institutions of which they are part.

Wacquant (2019) in analysing the Bourdieu's Dyad: *On the Primacy of Social Space and Symbolic Power*, argues that the effectiveness of performative utterances can not be separated by the existence

of an institution that defines the conditions (such as place, time, agents) must be met. In reality, the institution granting the user authority to bring forth an action language by displaying the speech acts.

Conclusion

Power is an integral part of classroom discourse. All activities in classroom discourse, both in the context of a briefing at the start, learning in the classroom, as well as laboratory experiments are related to the use of power. The use of power is influenced by socio-cultural dimensions (Rajiani & Pyplacz, 2018) that build the discourse of class, especially the differences in institutional roles between teacher and student.

Associated with the representation of power in acts directive, the participants said in a discourse of class uses four types of the directive, namely the command, request, prohibition, and suggestions. The uses of a follow-directive type of commands and prohibitions have high levels of restrictions that tend to represent the dominating power. Meanwhile, the use of demand, invitation, and advice, has lower restriction levels that represent power humanist. Restriction levels and the nature of power that affect the legitimacy of the users follow the directive. Following its institutional role, teachers have the legitimacy to rule and prohibit the student, but not vice versa.

Abstract

The main purpose of research presented in the article was the diagnosis of the knowledge management process in small and medium-sized companies in the Lower Silesia Voivodship. To achieve the goal, the first part of the article explains the meaning of the term "knowledge" in the literature of science about management. Next, on the basis of the conducted research (in three Universities), an attempt was made to answer the questions: what are the barriers to the intellectual development of the organization and how companies develop knowledge management. Based on the research, conclusions have been presented and can be used to improve the discussed knowledge management system.

Keywords: Knowledge, Knowledge Management.

Introduction

The development of a knowledge-based economy and globalisation have led to a revolution in management concepts. In its annual report of 1975, Chaparral Steel published an information that its strategy and structure would be based on knowledge management, which was a milestone in terms of knowledge management.

The development of knowledge management concept was first and foremost influenced by modern IT systems used in management. "Bare" data, interpreted appropriately by people enabled distinction of an additional level that became a decisive factor regarding effectiveness, namely knowledge. The possessed knowledge resources began to determine company value. It should be also noted that this resource does not belong to organisations, but to the employees themselves. It is first and foremost the employees' knowledge contained in their minds, which results from their experiences, trainings and talent, and determines the intellectual capital of the organisation. However, accountancy of competence assets and intellectual capital enables introduction of units assessed in monetary terms, employee competence and their source into the books.

Since the end of the 20th century demand for information and knowledge has been enormous. Its possession is related to an increase in effectiveness and, as a result, leads to gaining competitive advantage. It should be also added that products and technologies have become more knowledge-consuming (Dabic, Kiessling, 2019). Contemporary organisations are focused first and foremost on change and innovation that guarantees survival on the global market (Crespo, Griffith, Lages, 2014). H. Tanriverdi showed that IT relatedness plays a role in augmenting knowledge management capabilities and organizational performance (Tanriverdi, 2005). Intellectual capital (the level of possessed knowledge in particular) determines competitiveness of the company and generates its "added value". The phenomenon is unique as it is clear from the quoted definitions that "knowledge carriers" are people, not companies. People have become their most valuable assets. Thanks to people, companies can develop and compete with others. It should be noted, however, that the same people constitute the "critical mass" in every company. Employee competence development has

become the key activity of the managerial staff. Managers realize that the employees should develop professionally along with the organisation, forming a so-called intelligent organisation.

The contemporary, knowledge-based organisations increasingly often seek people who eagerly learn and are open not only to improving their qualifications, but also to the development of the possessed professional competences. Survival of the organisation on today's market and its competitive advantage can be ensured by its employees - experts, people who possess unique knowledge or skills devoted to the company. According to the demographic indices, shrinkage in the resources of the labour market can be predicted. For these reasons, it is preferred to hire employees with the greatest potential in terms of development.

The concept of knowledge management in the literature on management sciences.

Attempts at defining knowledge were already made in the ancient times (Galata, 2004). Greek philosophers, such as Plato and Aristotle, were the first ones to try to define what knowledge was. Socrates, Plato and Aristotle stressed that the measure of wisdom was the ability to show surprise (I know that I know nothing). Attempts to explain this concept were also made by the supporters of idealism (Descartes, Kant), empiricism (Locke, Hume) and the 20th century philosophers (Ryle, Macmurray).

Information (latin: informatio) means representation or image. It is an interdisciplinary term that is differently defined in various fields of science. In managing knowledge, organizations must implement procedures that will allow them to overcome dilemmas related to the observance of secrets. On the one hand, permission to provide data on the other, information provided (Hannah, Parent, Pitt, Berthon, 2017). Employees' obligation to trust confidentiality is forced by contracts concluded with the employer (Liebeskind, 1997).

M. Armstrong defines it stating that "knowledge is an information prolonged for productive use, it is individual and often difficult to grasp, and can be elusive" (Morawski, 2006). He says that "knowledge is exhaustive and comprehensive, blatant and hidden, common and personal, physical and intellectual, static and dynamic, verbal and encoded". Knowledge is a network of connections and interactions. The knowledge network is a dynamic structure, not a static one. The role of knowledge networks is to promote interactions such as knowledge acquisition, knowledge transfer and knowledge innovation, and knowledge transfer by connecting a series of interconnected network nodes (Chen, Xu, Zhai, 2019).

According to K. Perechuda "knowledge management is a process of continuous implementation of management functions, focused on knowledge-related resources (internal and external, existent and non-existent, known and hidden) and the tasks and instruments of organising and communicating" (Perechuda, 2005). Knowledge management systems (KMS) are “information systems that are perceived to facilitate organizational learning by capturing both content and process knowledge and making these knowledge available to all employees (Al-Tal, Emeagwali, 2019). Knowledge management involves four processes: creation process, transfer process, integration process and application process (Asiaei, Bontis, 2018).

L. Wełyczko (like M. Komanda) considers human capital in three levels (Wełyczko, 2012). The first level is management of individual human intellectual capital. The process of developing professionally by participating in courses, trainings or post-graduate studies is important in this case. As a consequence, it leads to a change in the implementation method of such subfunctions of staff management as selection for positions, implementation of professional careers or staff turnover. The second level is managing the intellectual capital of a team of employees. Organisational culture in a given organisational unit, which is the same as human personality, is of utter importance. It distinguishes it from others. Attention should be paid to the developed team work system, participation of the employees in achieving the objectives of the organisation, the current system of motivating the staff, communication and interpersonal relations among the employees. Managing

the intellectual capital of the organisation is the highest level. It is primarily about developing such mechanisms that the synergy effect is the result of each team's work, and it subsequently occurs also in the links between the groups and the environment.

Building the intellectual capital of the organisation becomes possible thanks to knowledge sharing. It depends on many factors: organisational, individual and technical (Figure 20), (Brzeziński, Mietlica, 2011).

Fig. 1: Factors influencing the process of knowledge sharing
Source: M. Brzeziński, D. Mietlicka, 2011

Knowledge management involves several elements like human resources practices, technology, culture and organizational structures (Abubakar, Elrehail, Alatailat, Elçi,, 2017). The factor that significantly influences knowledge sharing is the organisational factor. First and foremost, organisational culture plays an important role. It primarily comprises the adopted norms and values which distinguish the organisation form others.

Organisational culture also includes ways of communicating, the preferred management styles, the adopted motivational system, teamwork, mutual respect and trust. The attitude of the supervisors towards openness in terms of knowledge-sharing as well as creating proper and friendly atmosphere is also important.

Managers can increase knowledge sharing by creating a less centralized structure that supports communication among employees. Knowledge sharing can increase when it is embedded in the daily work routines and shared in informal meetings in open workspaces (Abdelwhab, Dddp Selvam, Paris, Gunasekaran, 2018). In promoting knowledge management, the manager uses immaterial (recognition, status) and material (financial rewards, bonuses) incentives. In this way, they want to encourage employees to share knowledge (Kianto, Sáenz, Aramburu, 2017).

The individual factors should also not be forgotten. On the one hand, the employees should be willing to gain knowledge, on the other - to share it with their coworkers. They have to be aware of the current importance of knowledge in terms of achieving competitive advantage in development and innovation-oriented business. They must be emotionally attached to the organisation and know its strategy and mission. Efficient knowledge management is possible thanks to appropriate technical infrastructure which manifests itself in proper organisation of office space, but first and foremost in possession of modern IT technologies.

Barriers related to knowledge management should not be forgotten while discussing the matters related to it. Many of them can be attributed to the employees, but a significant amount of the obstacles result from organisational culture and include (Krok, 2007):

- fear of losing the position at the organisation (the "knowledge is power" syndrome is revealed);
- underestimation of oneself, lack of belief in one's ideas and in oneself;
- isolation in sharing;
- lack of appreciation from the superiors;
- lack of time for both increasing the level of one's knowledge and sharing it;
- lack of positive role models in company's managerial staff in terms of knowledge sharing;
- lack of trust in the source of knowledge;
- lack of trust in the potential recipients;
- unfriendly organisational culture aimed at individualism and non-preference of teamwork;
- competition and envy between the employees, divisions;
- unfavorable communication system in the organisation;
- lack of IT infrastructure;

Methods and characteristics of the research sample

A number of research methods were used in the studies:

- studies and analysis of the literature on knowledge management;
- studies and analysis of the results of the conducted studies related to knowledge management;
- participatory observation;
- diagnostic survey;

The leading method in the conducted studies was diagnostic survey. The other research methods applied in the study were auxiliary (complementary).

The survey questionnaire was developed on the basis of literature analysis. Part-time students of three Universities of the Lower Silesian Voivodeship participated in the studies. In the research, the following variables were set as independent variables: the gender of the respondents, the age of the respondents, the size of the company (workplace), the place of residence.

The respondents are part-time students at three Universities in Wrocław and nearby municipalities. A total of 356 students were examined. The studied group was evenly divided on the basis of gender. Women constituted 51% of the surveyed group and men constituted 49% of it. The gender of the respondents is presented in Fig. 2.

Fig. 2: The group studied according to gender.

Source: own research

About 69% of the respondents were young people aged 19-29. 19.7% of the respondents were aged 30 to 40. The least numerous group were students over 40 years of age (11.2% of respondents). During the analysis of the structure of the group examined in terms of age, it should be noted that the respondents are young people at the stage of preparation for a career or early professional career, during which a crystalisation, the narrowing of the field of exploration and finalisation of the choice of profession take place. They recognise the need for continuous improvement and learning. They want to build their own intellectual capital to ensure their competitiveness on the labour market. It consists primarily of acquired knowledge, skills and experience, which are used in the work performed. They invest in themselves while simultaneously having higher requirements regarding career and professional development. The age of respondents is shown in Figure 3.

Fig. 3: Group examined in terms of gender

Source: own research

About 35% of the respondents are employees of companies employing more than 100 people. Over 21% of students were employed in medium-sized companies (from 21 to 50 employees) and the same percentage in organisations employing from 6 to 10 employees. The companies employing from 51 to 100 employees account for only 10.1% of the respondents. Respondents are mainly employees of small and medium companies due to the fact that they live in the surrounding villages. The employment of respondents in terms of the size of the company is shown in Figure 4.

Fig. 4: Employment of respondents due to the size of the company

Source: Own Research

Two of the examined Un**iversities were located in poviat towns in the Lower Silesian Voivodship. Therefore, 43% of the respondents are** inhabitants of small municipalities with up to 50,000 inhabitants (Figure 5). Almost one third of the respondents are rural residents (over 28%). A relatively small group of respondents are inhabitants of municipalities with up to 10,000 inhabitants (7.3%). Only 1.1% are residents of larger cities. Therefore, the respondents are employees at small and medium companies.

Fig. 5: Respondents' place of residence

Barriers to knowledge management implementation

Implementation of "knowledge management" in the organisation brings certain benefits which concern three entities: the organisation, the employees and the market. In the survey, the respondents were asked for opinions on how the employees benefited from the presence of "knowledge management" in an organisation. Their opinions are shown in Figure 6.

Fig. 6: The opinions related to the employee benefits resulting form "knowledge management"
Source: Own research

Every fourth respondent (25%) believed that "knowledge management" facilitated access to the knowledge source at a company. This entailed optimisation of the work performed and, as a result, its higher efficiency. It can be, therefore, concluded that they value such features of knowledge as transferability. Thanks to it, it is possible to use the knowledge resources in various areas at the same time (simultaneously by individual employees, in various departments or divisions of the company). This results in optimisation of work process.

Approximately 23% of the respondents stated that "knowledge management" positively influenced employee creativity, which resulted in generating new values for the organisation. They probably had in mind such attributes of knowledge as subjectivity or self-supply. While discussing subjectivity it should be remembered that an employee strives for professional excellence. The result is the creation of new concepts and ideas. Using knowledge resources and sharing it within the organisation causes its growth. This, in turn, generates new ideas and innovative solutions.

Almost 14% of the respondents believe that the presence of "knowledge management" attaches the employees emotionally to the organisation, and creates a bond with the company. It results in low turnover of staff. The respondents view this as a chance for organisation functioning in the conditions of limited human resources. In the recent years, more and more companies have been struggling with finding qualified staff. This problem affects practically the entire Europe. Increasingly often, while taking up employment, employees take into account such factors as the atmosphere, the sense of self-fulfillment, or the opportunity for professional development.

For 13% of the students "knowledge management" meant time saving. Skillful knowledge sharing improves virtually all processes in an organisation.

More than 13% of the respondents view "knowledge management" as an opportunity to improve their skills, and treats it as continuous development. For many employees this factor is more important than financial matters. The desire for perfection is a part of human nature.

In the opinion of the employees, less significant benefits included: self-fulfillment (5%), satisfaction with work (4%), increase in the competitiveness of the employees on the job market (3%).

There are a number of barriers in terms of "knowledge management" Some of them are related to the company's own organisational structure and others - to interorganisational cooperation. In the studies, an attempt was made to determine the factors that constitute a barrier to "knowledge management" between organisations. The results are presented in Figure 7.

Fig. 7: Respondents' opinions regarding "knowledge management" between organisations.
Source: Own research

According to the opinions of the respondents (35%) the biggest barrier to knowledge management at interorganisational level is protection of the company's own solutions. It shows that the company fears losing its own innovative ideas and solutions before they are patented. New, innovative products and services are the factor ensuring that the company will maintain its good economic condition, and, thus, remain competitive.

The fear of the company losing its position on the market constitutes another barrier (33%). Knowledge acquired by the competition may decrease the bargaining power of the company, and, thus, lead to a decrease in or loss of competitive advantage of the company. In fact, both factors are closely linked. Own, innovative solutions ensure company's survival in such turbulent environment.

Every fifth respondent (19%) believes that cultural and national differences constitute a barrier as well. A considerable part of our behaviours results from the acquired habits or the upbringing characteristic of a given cultural area (ethnic group, region). Cultural differences should be indicated primarily in communication, knowledge, values and attitudes. The possessed knowledge and the context in which it is used can also be interpreted in various ways.

The conducted studies also show that the time spent on building trust and loyalty between companies does not play an important role in "knowledge management" (9% of the respondents indicated time as a barrier).

Distance was believed to be a barrier by 4% of the respondents. Therefore, it can be assumed that it is a completely irrelevant factor. It is transferability of knowledge that makes distance so insignificant in the contemporary world.

Participation in local economics forces Polish entrepreneurs to develop the intellectual capital of organisations. The respondents systematised the biggest barriers of such development, and their opinions are presented in Figure 8.

Fig. 8: The opinions of the respondents regarding the barriers to intellectual development of organisations

Source: Own research

According to the respondents, in terms of the development of the intellectual capital of the organisation we are dealing with three main barriers. Around 23% of the respondents considered high cost of new technologies implementation as one of the barriers. It is related to the necessity of ordering business analyses before purchasing technologies, purchasing licences or software, development of the IT infrastructure, adapting the currently used computers programs or training the staff. After the implementation of the new solutions, the cost associated with the maintenance of the new infrastructure and its possible expansion should be added. Most of the studied organisations are small companies which cannot afford to bear such costs.

According to the same number of the respondents another barrier are problems with supervising the effectiveness of trainings, namely verify to what extent the knowledge of an employee increased after the training, and to what extent it was used. It shows that these companies lack staff responsible for the design and implementation of trainings and professional development. Properly conducted trainings translate into increase in product or service sales, increase in the quality of customer service, improvement in the effectiveness of distribution channels or new business partners.

According to around 21% of the respondents problems with knowledge sharing among the oldest and most senior employees constituted another barrier. It most likely results from the lack of proper organisational culture in the studied companies. The employees feel uncertain about their employment, and perceive their co-workers as a competition rather than a team.

More than 14% of the respondents said that failure to realize the significance of knowledge in terms of increase in competition intensity by the employees constituted another barrier. It means that some employees are not interested in the problems related to the global economy. They have no knowledge of economics.

Lack of formalised procedures and standards of knowledge management as well as lack of regularity in replenishing knowledge resources was another barrier according to almost 10% of the students. It means that formalised procedures of knowledge sharing function efficiently in most companies. It enables efficient knowledge transfer between the employees.

Insufficient absorption of knowledge on technical novelties constituted a barrier according to every tenth respondent (9%). The employees are unenthusiastic about changes.

The next question asked to the respondents was to determine the features of the company's organisational structure that hinder the flow of knowledge within the organisation. These features are shown in Figure 9.

Fig. 9: Respondents' opinions on the features of organisational structure hampering the flow of knowledge

Source: Own research

A significant part of respondents (37%) stated that a feature hindering the flow of knowledge in an organisation is excessive formalisation. The course of implementation processes is strictly defined in procedures, rules or regulations. Rigorous adherence to them is not conducive to transferring knowledge. In the opinion of the respondents, the degree of formalisation in the organisations surveyed is greater than necessary to meet legal requirements or discipline employees in terms of excessive and unjustified freedom of action.

Knowledge sharing is a developed hierarchy (29%) and hampered by the lack of inter-departmental teams established to implement specific processes or projects (25%). The lack of inter-departmental teams is probably due to excessive formalisation, which does not provide for the involvement of employees in working teams outside the parent organisational units. Too many management levels in an organisation's structure make it difficult to communicate information, exchange opinions between various units in the hierarchy and, in particular, share knowledge. The reason for these difficulties is also the fact that each lower-level employee is assigned to a specific supervisor. Only 9% of the respondents said that the barrier to knowledge flow is excessive centralisation. This means that in every tenth company the top management does not delegate authority to lower levels of management, and therefore is not competent to implement the concept of knowledge management, for example in solving problems.

A significant increase in knowledge and information in modern market economy implies creating new methods and tools of management. A "learning organisation" is the answer to such demand. Within the "learning" organisation, the learning process is continuous. It is based on permanent acquisition of knowledge and skills within the scope of functions of management, preparing the management staff for particular positions, development of own professional competences. The

respondents were asked for their opinion regarding the factors that encourage companies to "learn". The results are presented in Figure 10

Fig. 10. The opinions of the respondents regarding the factors encouraging the companies to "learn".

Source: Own research

More than 32% of the respondents believe that the main factor that encourages the companies to "learn" is the pressure of the competition, the need to compete and survive on the market. In the era of market economy (which is noticed by the researchers) knowledge becomes the main resource of organisations, and "learning" becomes a necessity. The researchers are aware of the necessity of continuous struggle with the competition by permanent "learning" of the organisation. This should result in promptness of reaction to the changing environment, implementation of changes and novelties, creation of new ideas and knowledge.

More than 20% of the respondents stated that the need for quality improvement encourages "learning". They understand that quality means constant acquisition and development of new knowledge, improvement of products and services. It is a never-ending process. The organisation gains trust of its customers thanks to high quality.

Another fact that determines organisation's "learning" is the pace of changes (16% of employees are of this opinion). Therefore, in their opinion, the message for managers may constitute a statement that managers reduce variability through "learning".

Approximately 13% of respondents believe that previous failures or restructuring force "learning" of the organisation. The group studied is aware of the importance of constant technological or information challenges that the organisation faces in the 21st century. In order to cope with the increasing globalisation, development and adaptation to the environment are necessary. Restructuring changes also concern corrective actions. They consist in the improvement of systems in the company or in the refusal of unfavourable links in the company (reduction of employment or assortment).

Less important factors include the desire to improve the company's image (8%), the desire to focus more on people (5%), the need to change the company's culture (4%).

Conclusions

Summing up, the problem of implementing "knowledge management" should be described as the process involving the benefits for the company, employees and the market. The functioning of "knowledge management" results in an increase in management effectiveness, improves the communication process in the organization, reduces costs, increases creativity and innovation. Efficient use of knowledge resources increases the competitiveness of not only the company itself, but also of its employees. Flexibility to adapt to market needs increases. This also creates a positive external image of the organisation.

The barrier to "knowledge management" at the interorganisational level is protection of the company's own solutions and the fear of losing its market positon. Sharing knowledge between organisations sooner or later leads to a weakening of the organisation's bargaining power (of both supplier and customer) and consequently to a loss of competitive advantage. Innovative products or services (i.e. the organisation's intellectual capital) increase the market value of a company.

The implementation of "knowledge management" is primarily conducive to increasing the company's competitiveness on the market, supporting the organisational culture, retaining knowledge workers, creating a positive image of the organisation on the external labour market.

The conducted research shows that the implementation of "knowledge management" programmes, their preparation and taking specific actions related to data acquisition, processing and "storage" of knowledge turned out to be a considerable challenge for companies.

It seems that in the first place companies wishing to develop "knowledge management" should focus their activities on identifying talents among the people currently employed in the organisation and create them working conditions that will guarantee a chance for development, promotion and implementation of interesting and difficult challenges through sharing knowledge with coworkers.

The turbulent environment is a 21st century challenge for the organisation. Organisations that wish to successfully face it must meet specific requirements. These requirements include constant and very intensified changes, good quality of goods and services provided, novelties and innovations, rapid acquisition of new technologies and ideas, creation of own solutions. This can be achieved through permanent "learning" of the organisation.

Abstract

The subject of the study is the financial solvency of international cooperation organizations with the participation of Russia-BRICS and Shanghai cooperation organization (SCO). The article presents a factor analysis of the dynamics of financial solvency in BRICS and SCO countries with an assessment of the growth rate (GR) of a set of interdependent indicators- Bank's liquid reserves in relation to assets, broad money supply, exchange rate, deflator index, inflation (consumer prices), interest rate on loans (private sector), trading domestic companies (according to the World Bank Group), followed by a polynomial approximation. As a result of the factor analysis of financial solvency dynamics in BRICS and SCO countries, it was revealed that Russia's cooperation with the BRICS countries leads to greater losses than with the SCO countries. The article identifies promising areas of cooperation between Russia and SCO countries.

Keywords: Amplitude Values, Analysis, Dynamics, International Cooperation, Growth Rates, Financial Solvency.

Introduction

In the conditions of increasing global competition along with the change of leaders of world economic activity and changes in the world order, the need for the organization and implementation of new forms of cooperation between countries increases. Numerous international cooperation organizations are being formed to consolidate their interests in the unstable world order.

The increasing global competition requires a constant assessment of the potential of international cooperation organizations. As a result of the assessment and subsequent analysis it is necessary to review the potential of the organization and its individual participants to strengthen the organization's position in the world economic activity.

Monitoring of the financial solvency dynamics of international cooperation will identify and help to solve the financial problems of the development of its participants. The modern financial world

order is diverse and contradictory. This situation requires accessible and understandable approaches for researchers to identify the financial solvency dynamics of various international cooperation organizations and its participants.

Factor analysis is one of the few approaches that meet these criteria and it is used in the world practice of studying the behavior of cross-border Bank flows (Cerutti, Claessens and Ratnovski, 2017), analysis of IMF forecasts and the EU fiscal contract in a large number of countries (Eichengreen and Panizza, 2016), using various mathematical methods (Cardiel, 2009), (Grigoli, Cesca, Dahm, Krieger, 2012), (Xu and Warner, 2015).There given the analysis of the choice and consequences for types of preferential economic integration agreements (Egger and Wamser, 2013) as well as the analysis of the growth and fall of current account deficits in some countries (Kang and Shambaugh, 2016), (Karlan and Thuysbaert, 2016), (Smirnov and Huraskina, 2018; Smirnov and Filippova, 2019) and assessment of opportunities and final achievements (Peragine, Palmisano, Brunori, 2014; Smirnov and Perfilova, (2019); Smirnov and Dulina, (2019)).

Method and Results

Analysis of financial solvency dynamics in BRICS countries

The analysis of financial solvency dynamics in BRICS countries includes the assessment of a wide range of interdependent financial and economic factors: Bank's liquid reserves in relation to assets, broad money supply, exchange rate, deflator index, inflation (consumer prices), interest rate on loans (private sector), trading domestic companies (according to the World Bank Group https://data.worldbank.org). In the process of analyzing financial solvency of BRICS countries with respect to a complex set of interdependent financial and economic factors, indicators in the associated time series are used, followed by a polynomial approximation, which is the most suitable for describing frequently changing values and for the analysis of a diverse combination of factors with an unstable value. When using polynomial approximation, the sixth degree is applied, having not more than five extremes, which is sufficient for the studied time interval. The analysis revealed the main provisions of financial solvency dynamics in BRICS countries:

1) high GR2006–2018: Brazil – liquid reserves of the Bank in relation to assets GR2006–2018 = 4,18; South Africa – broad money supply GR2006–2018 = 18,44, inflation (consumer prices) GR2006–2018 = 11,34; Russia – exchange rate GR2006–2018 = 9,55, index-deflator GR2006–2018 = 10,96, interest rate on loans (private sector) GR2006–2018 = 3,66; China – trading domestic companies GR2006–2018 = 7,63;

2) low GR2006–2018: Russia – liquid reserves of the Bank in relation to assets GR2006–2018 = -2,98, broad money GR2006–2018 = -9,1; China – exchange rate GR2006–2018 = -1,82, index-deflator GR2006–2018 = -3,75, inflation (consumer prices) GR2006–2018 = -41,44, interest rate on loans (private sector) GR2006–2018 = -1,13; South Africa – trading domestic companies, GR2006–2018 = -1,21;

3) high absolute amplitude values of instability: Russia in relation to the Bank's liquid reserves in relation to assets, in the broad money supply, deflator index, trading domestic companies; India-in the exchange rate, interest rate on loans (private sector); China – in inflation (consumer prices).

4) low absolute amplitude values of instability: South Africa – liquid reserves of the Bank in relation to assets, inflation (consumer prices), interest rate on loans (private sector); Brazil – broad money supply; China – exchange rate; India – deflator index, trading domestic companies.

Analysis of financial solvency dynamics of SCO countries

The analysis of financial solvency dynamics in SCO countries includes an assessment of the growth rate of the GR complex of interdependent financial and economic factors, in accordance with BRICS.

The analysis of the Bank's liquid reserves relative to assets, broad money supply, exchange rate, deflator index, inflation (consumer prices), interest rate on loans (private sector), trading domestic companies, followed by a polynomial approximation, revealed the following provisions:

1) high GR2006–2018: Tajikistan – liquid reserves of the Bank in relation to assets GR2006–2018 = 26,03; Kyrgyzstan – the broad money supply GR2006–2018 = 73,76, inflation (consumer prices) GR2006–2018 = 24,67; Kazakhstan – exchange rate GR2006–2018 = 10,17; Uzbekistan – GDP deflator index GR2006–2018 = 16,36; Russia – interest rate on loans (private sector) GR2006–2018 = 3,66; China – trading domestic companies GR2006–2018 = 7,63;

2) low GR2006–2018: Russia – liquid reserves of the Bank in relation to assets GR2006–2018 = -4,09, broad money GR2006–2018 = -9,1; China – exchange rate GR2006–2018 = -1,82, index-deflator GR2006–2018 = 3,75, inflation (consumer prices) GR2006–2018 = -41,44; Kyrgyzstan – interest rate on loans (private sector) GR2006–2018 = -1,26; Pakistan – trading domestic companies GR2006–2018 = -1,21;

3) high absolute amplitude values of instability: Kazakhstan – liquid reserves of the Bank in relation to assets; Tajikistan – broad money supply; India –exchange rate; Russia –index-deflator; trading domestic companies; China –inflation (consumer prices); Kyrgyzstan – interest rate on loans (private sector);

4) low absolute amplitude values of instability: Kyrgyzstan – liquid reserves of the Bank in relation to assets; China – broad money supply; India – index-deflator; Pakistan – interest rates on loans (private sector).

Analysis of cooperation areas between Russia and SCO countries

To identify the areas of cooperation between Russia and SCO countries, we will analyze the following positions: the results of mining, manufacturing, production as well as distribution of electricity, gas and water, gross disposable household income, final consumption expenditures, social transfers in kind, the real accrued wages of employees of organizations, the number of employees per pensioner, the real size of pensions assigned, the ratio between average pension and average salary of employees of organizations, spending on benefits and social assistance, population rate with money income below the subsistence level, the Gini coefficient (index of income concentration), monetary costs and savings, mandatory payments and diverse contributions of the Russian economy (according to the World Bank Group). When analyzing a polynomial approximation was used. This analysis revealed the following aspects:

1) heterogeneous intervals with major GR2006-2018: mandatory payments and diverse contributions are dominant and related to GR manufacturing, gross disposable household income and final consumption expenditure; social transfers in kind are determinative and correlate with GR cash expenditure and savings, mining, production and distribution of electricity, gas and water; the number of employees per pensioner is dominant and interdependent with the use of the Gini coefficient (income concentration index) and real accrued wages of employees of organizations;

2) the lack of a stable interval with major GR2006–2018: spending on benefits and social assistance is dominant and correlates with GR ratio between average pension and average salary of employees of organizations, the actual size of assigned pensions.

The situation concerning population number with monetary incomes below the subsistence minimum is highlighted. And this insignificant factor for the dynamics of the Russian economy has earned special attention from the country's leadership.

Conclusion

As a result of the analysis of financial solvency dynamics in BRICS countries through a polynomial approximation of the GR complex of interdependent financial and economic factors the following high GR2006–2018 were revealed: Brazil-liquid reserves of the Bank in relation to assets; South Africa-broad money supply, inflation (consumer prices); Russia-exchange rate, deflator index, interest rate on loans (private sector); China-trading domestic companies. There were also revealed high absolute amplitude values of instability: Russia- to the Bank's liquid reserves in relation to assets, in broad money supply, deflator index, trading domestic companies; India-in the exchange rate, interest rate on loans (private sector) and China-in inflation (consumer prices). High GR2006-2018 are stated in South Africa and Russia, low GR2006-2018 can be seen in China; high absolute amplitude values of instability are revealed in Russia and India, low ones in South Africa.

Thus, as a result of the factor analysis of financial solvency dynamics in BRICS and SCO countries, it was revealed that Russia's cooperation with BRICS countries leads to greater losses than with SCO countries.

Promising areas of cooperation between Russia and SCO countries are in the field of solving the following problems: mining and manufacturing, production and distribution of electricity, gas and water; the number of employed persons per pensioner; the real size of pensions assigned (absolute averages); mandatory payments and various contributions, cash expenditures and savings; population growth with cash incomes below the subsistence level and the Gini coefficient (income concentration index).

Abstract

The subject matter of the research is a modern geo-economic attractor of capitalism; the research is based on the systematic approach applying methods of descriptive statistics and cluster analysis. The article analyses the reasons of the establishment of the modern geo-economic capitalism space and exposes the criteria of its existence. Specifying progressive role of capitalism in the historical development of society is shown, cognitive abilities of people being the driver of capitalist social and economic structure development. The work reveals that capitalism possesses its own geography i.e. spatial extension characterized by development disparity (Anglo-Saxon, Continental Europe, Northern Europe and Eastern Europe). Capitalism geo-economic attractor defining exposed the absence of the USA, Germany, France and Japan, and domination of China and India. China and India do not possess definite features of capitalism demonstrating social color at that. Transition of Russia to the new type of society ranks it with China and India but does not endower it with attractor's features. The research resulted in understanding of development opportunities of the world and national economies concerning geo-economic capitalism attractor. The problem of establishment of geo-economic capitalism space is intensified through entropy of social and economic structures in the modern world order. Globalization became the counteraction against entropy. It resulted in strengthening interdependence of national economies, formation of unified world economy structure within the framework of capitalist social and economic structure focused on satisfaction of natural human instincts of egotism. Capitalism turned out to have specific geography, spatial extent.

Keywords: Geo-Economic Attractor Of Capitalism, Globalization, Of Social And Economic Structure, Progressive Role Of Capitalism, Social Color, Establishment, Unified Structure Of World Economy.

Introduction

The ideas of existence of social and economic structure under the circumstances of legitimate exploitation of working class set forth by K. Marx, a German economist, in his work "The capital. Critique of political economy" (K. Marx, 1867) constitute the basis of classical understanding of capitalism. This scientific study presents the foundation of Marxist political economy containing critical dialectical and materialistic analysis of capitalism. Capitalism is understood as social and economic system based on private property of bourgeoisie for means of production and characterized by working class exploitation.

The principle criteria of capitalism existence are the domination of overall commodity-money relations and private ownership on means of production. Capitalist production is aiming at capital gain through appropriation of unrequited labor (surplus value).

Being a consistent stage in the historical development of society, capitalism played a progressive role breaking patriarchal and feudal relations among people and substituted them for monetary relations. K. Marx and F. Engels stated: "In less than a hundred years of its class domination, the bourgeoisie has created more numerous and more ambitious productive forces than all previous generations combined. The subjugation of the forces of nature, machine production, the use of chemistry in industry and agriculture, shipping, railways, electric telegraph, the development of whole parts of the world for agriculture, the adaptation of rivers for shipping, the whole, as if called out from under the ground, the masses of the population - which of the former For centuries it might have been suspected that such productive forces are slumbering in the bowels of social labor!" (Marx, Engels, 1955).

Under capitalism social progress is implemented at the expense of aggravation of social antagonism, wasting of productive force, sufferings of masses all over the world. The process of capitalism proliferation all over the world resulted in its new essence, i.e. imperialism, monopolistic capitalism (Lenin, 1969).

The process of capitalism proliferation speeded up considerably under the influence of globalization – incorporation of all countries into the world market and strengthening of world economies interdependence. It resulted in the formation of the unified structure of the world economy comprising the aggregate of depersonalized national economies, states with destroyed national sovereignty but connected with each other through the system of various relations.

These relations are based on the principles of the division of labor which made it possible to expose the modern phenomenon of migration on the world capital scale, manufacturing resources, social, economic and technological processes, closer relations and merging of cultures of different countries.

Arguments concerning the choice of large countries to search for capitalism attractor are naturally related to the extent of their economies, to be more exact, to Newton's Law of Gravitation. Capitalism attractor sense is manifested in the idea of gravitation interaction.

Methods and Materials

Large countries (The USA, Germany, France, Japan, China or Russia) were chosen to define Geo-economic attractor of capitalism. The choice of large countries to search for capitalism attractor is related to Newton's Law of Gravitation, i.e. to gravitation interaction. The pointlessness of considering small countries as geo-economic attractor of capital is unconditional, no matter how high the growth rate of their economy may be.

Descriptive statistics and cluster analysis are applied to the research. Descriptive statistics include empirical data processing, their classification, pictorial presentation as charts and tables, presentation through basic statistical indices (Lazar and Feng, 2017) and their interrelation (Schofield, 1993).

Using descriptive statistics, we estimate the data array by statistical indicators - median and variance. Cluster analysis will give proof of the reasons for the change of the geo-economic attractor, identify the main patterns of grouping countries, formulate hypotheses (Adolfsson, and Brownstein, 2019; Favero and Belfiore, 2019).

To define the geo-economic attractor of capitalism from the aggregate of large countries (USA, Germany, France, Japan, China, India or Russia), we apply indicators united by the principles of diversity of unity - nineteen types of indicators of GDP (GDP) and the same amount of Gross capital formation (time) , their growth rate (Rates of Gain, RG). As a tool for implementing descriptive statistics and cluster analysis, the SPSS Statistics application package is used, and the World Bank Group and the International Labor Organization (ILO) are the data source.

Median value (Me) estimation resulted in limited hierarchy (indicators – Me > 1.0E+13; RG – Me > 3.0%) (Table 1): -by indicators: GDP (constant LCU) – China and India; GDP (current LCU) – China, India, Russian Federation and United States; GDP (current US$) – China and United States; GDP, PPP (constant 2011 international $) – China; GDP, PPP (current international $) – China and United States; GDP: linked series (current LCU) – China, India, Russian Federation and United States; Gross capital formation (constant LCU) – China and India; Gross capital formation (current LCU) – China, India, Japan and Russian Federation; Gross domestic income (constant LCU) – India; Gross domestic savings (current LCU) – China, India, Japan and Russian Federation; Gross fixed capital formation (constant LCU) – India; Gross fixed capital formation (current LCU) – China, India, Japan and Russian Federation; Gross fixed capital formation, private sector (current LCU) – India, Japan and Russian Federation.

Table 1: Hierarchy of median values (Me) indicators and increase rates: GDP – (constant 2010 US$), (constant LCU), (current LCU), (current US$), deflator (base year varies by country), deflator: linked series (base year varies by country), growth (annual %), per capita (constant 2010 US$), per capita (constant LCU), per capita (current LCU), per capita (current US$), per capita growth (annual %), per capita, PPP (constant 2011 international $), per capita, PPP (current international $), per person employed (constant 2011 PPP $), per unit of energy use (constant 2011 PPP $ per kg of oil equivalent), per unit of energy use (PPP $ per kg of oil equivalent), PPP (constant 2011 international $), PPP (current international $), linked series (current LCU); Gross capital formation – (% of GDP), (annual % growth), (constant 2010 US$), (constant LCU), (current LCU), (current US$); Gross domestic income (constant LCU); Gross domestic savings – (% of GDP), (current LCU), (current US$); Gross fixed capital formation – (% of GDP), (annual % growth), (constant 2010 US$), (constant LCU), (current LCU), (current US$), private sector (% of GDP), private sector (current LCU); Gross savings (% of GDP), 2010-2018.

Series - Country Name	**Me**	**σ^2**
Indicators, Me > 1,0E+13

Source: computed by «SPSS Statistics» on the data of «The World Bank Group». https://databank.worldbank.org/source/world-development-indicators# (Accessed 01 December 2019).

When defining geo-economic attractor of capitalism from the aggregate of large countries unavailability of the USA, Germany, France and Japan, and dominance of China and India came as a surprise.

The study resulted in the conclusion on the substitution of geo-economic attractors of capitalism of the USA, Germany, France and Japan having lasted for many years for new ones, i.e. China and India.

Transition to the new type of society characterized by wealth, markets, private ownership, democracy and civil society ranks Russia with China and India. From the point of view of a company structure, economic results and social integration models, elite and class fragmentation, similarity of the Russian economy transformation (Lane, 2000) makes it possible to assert the availability of common features in the models of capitalism characteristic of China and India.

To analyze the establishment of new geo-economic attractors we evaluate the changes in the annual growth rate of production per worker, the share of labor income, the growth rate of the poverty level among workers(the data of International Labor Organization, ILO). Conscious choice of these criteria is related to the idea of capitalism given by K. Marx in his work “The capital. Critique of political economy” (see above) and its major trait that is exploitation of wage workers.

The estimate of the annual production growth rate per worker 2001-2023 (Picture 1)showed high and sustainable median values in China (Me = 7.55%; σ^2 = 4.36). India (Me = 5.35%; σ^2 = 3.76) being insignificantly behind China.

Picture 1: Annual production growth rater per worker, % (GDP, const. $ 2010).

Sourse: on the data of International Labour Organization, ILO. https://www.ilo.org/shinyapps/bulkexplorer25/?lang=en&segment=indicator&id=SDG_A821_NOC_RT_A (Accessed 01 December 2019).

ILO forecasts that by 2023 the trends of China and India will have come closer at a slightly lower level than 6,0% of GDP. Russian economy (Me = 2.47%; σ^2 = 8.69) is lagging behind India two times, let alone China. It reflects high sensitivity of Russian economy to negative changes during cyclical world crises of 2009 (-5.75%) and 2015 (- 2.05%).Moments of Chinese and Indian economies not only reach high values but also demonstrate multidirectionality regarding Russian economy.

Resulting from estimates of the share of labor income as a percentage of GDP in 2004-2017 (Picture 2) there was revealed high volatility in India(σ^2 = 15.75; Me = 54.35%),relative to stable values in China (σ^2 = 1.83; Me = 49.25%) and Russia (σ^2 = 6.86; Me = 50.60%).

Picture 2: Share of labor income as a percentage of GDP.

Source: according to the data of International Labour Organization, ILO. https://www.ilo.org/shinyapps/bulkexplorer57/?lang=en&segment=indicator&id=SDG_1041_NOC_RT_A (Accessed 01 December 2019).

India enjoying considerably higher levels in 2004-2014 than those of China and Russia loses its advantages after 2014. Russian trend except for the period of financial and economic crisis of 2008-2009 is shown as if encircling a graphic display of dynamics of labor income share of China. Significant deviations in the dynamics of the share of labor income during the crisis confirm the thesis of a high sensitivity of the Russian economy to negative changes.

The growth rate of poverty among working people (percentage of the employed living below $1.90 PPP) in 2000-2023 (Picture 3) exposes significant volatility in Russia (σ^2 = 1100.62; Me = 0%).

Picture 3: The growth rate of poverty among working people (percentage of the employed living below $1.90 PPP)

Source: according to International Labour Organization, ILO. https://www.ilo.org/shinyapps/bulkexplorer25/?lang=en&segment=indicator&id=SDG_0111_SEX_AGE_RT_A (Accessed 01 December 2019).

The Chinese State Poverty Alleviation Program has reached high, even though volatile, negative median values (Me = -10.63%; σ^2 = 231.89). India is sustainably (Me = -5.73%; σ2 = 14.31) heading for the decrease in poverty growth rate among working people by 10% and coincides with the Chinese decrease trend within the period of 2019-2023.

Russian economy in its wide amplitude demonstrates instability to the process of regulating the growth rate of poverty among the employed. For instance, the 2008-2009 period of financial and economic crisis in the Russian economy shows a significant decrease in poverty growth rate among working people due to natural decrease in the number of the employed (increase in unemployment) (Smirnov and Perfilova, 2019; Smirnov and Huraskina, 2018). The periods of significant economic growth reveal deep connection of this growth with the increase in the growth rate of poverty among the employed (Smirnov and Filippova, 2019; Smirnov and Dulina, 2019 I.e. the decrease in income among the employed constitutes the major driver of the Russian economy growth.

Results

The process of establishment of new geo-economic attractors of Chinese and Indian capitalism possesses a number of different and common characteristic features. China attracts attention through the quality of unity diversity of GDP growth (annual %) and GDP per capita (constant 2010 US$) – GDP (constant LCU), GDP (current LCU), GDP (current US$), GDP, PPP (constant 2011 international $), GDP, PPP (current international $), GDP: linked series (current LCU), Gross capital formation (constant LCU), Gross capital formation (current LCU), Gross domestic savings (current LCU) and Gross fixed capital formation (current LCU).

Indian attractor is defined by the unity diversity of GDP deflator (base year varies by country) and Gross capital formation (constant 2010 US$) – GDP (constant LCU), GDP (current LCU), GDP: linked series (current LCU), Gross capital formation (constant LCU), Gross capital formation

(current LCU), Gross domestic income (constant LCU), Gross domestic savings (current LCU), Gross fixed capital formation (constant LCU), Gross fixed capital formation (current LCU) and Gross fixed capital formation, private sector (current LCU).

Despite the unequivocal dominance of China and India as a geo-economic attractor they are different through the variety of indices unity that impacts the opportunities of reaching their aims. For China these opportunities are linked to c GDP growth (annual %) and GDP per capita (constant 2010 US$) – GDP (current US$), GDP, PPP (constant 2011 international $) and GDP, PPP (current international $), а для Индии – GDP deflator (base year varies by country) and Gross capital formation (constant 2010 US$) – Gross domestic income (constant LCU), Gross fixed capital formation (constant LCU) and Gross fixed capital formation, private sector (current LCU).

It should be highlighted that socialist economic policy, government participating in the private sector, underlies the economy establishment of China and India. For instance, the issue on what social and economic system exists in China has not been solved yet. Chinese authorities assert that it is socialism while economists state that it is capitalism. The traits of socialism are intermingled with main points of capitalism and vice versa creating a new different quality (Kolodko, 2018).

The traits of socialism manifest themselves as a prevalence of state ownership which negatively impacts the inflow of direct foreign investments. It is explained by the state socialism logic that is incompatible with market mechanisms underlying international expansion (Tang, 2019).

The world practice knows that state owned enterprises prove not to be effective enough as compared with privately owned ones. However, Chinese state-owned enterprises, being in control of the Central Government, outperform all types of companies proving to have the highest asset turnover ratio and lowest business administration ratio (Li and Xue, 2018).

Growing geo-economic influence of China related to broader changes in the global capitalism and inability of the US government to maintain trust to the dollar stipulates directed changes of the Chinese economy structure by capitalist type. The process of capitalism structuring in China is based on the Guanxi (Guanxi principle means network or connections – "it's not *what* you know, but *who* you know that's important") and this principle is described through the theory of “discriminating way of union” implementing the concept of “centrally controlled capitalism” (Wang, Rowley, 2017).

Huge dollar reserves and macroeconomic restrictions through maintaining fixed foreign exchange rate are supposed to ensure internal economic security of China (Lim, 2010).

Differences between China and India in the structure of the diversity of unity of indicators characterizing the geo-economic attractor of capitalism affect the possibilities of achieving the goals.

Possibilities of achieving the goals by Indian economy are related to GDP deflator (base year varies by country) and Gross capital formation (constant 2010 US$) – Gross domestic income (constant LCU), Gross fixed capital formation (constant LCU) and Gross fixed capital formation, private sector (current LCU).

In terms of average annual GDP growth, the Indian economy is not much inferior to the Chinese one, that defines it as one of the fastest growing in the world. The main exports of India are machinery and equipment, handicrafts, chemicals, food and agricultural raw materials, ready-made clothing and textiles. The main buyers are the USA, the EU and Japan. The main imports are oil, machinery, fertilizers and chemicals.

The major problem of economy development of India, as well as that of China, is a significant gap between increasing demand for energy and its supply (Kotikalapudi, 2016).

Thus, new geo-economic attractors of capitalism China and India are characterized by a transition moment from the socialist establishment of social structure to the capitalist one. This process is an attractor both for the developed countries which have lost their zeal and for the developing countries.

Conclusion

The deep foundation to the problem of establishment of the geo-economic space of capitalism is the variety of forms of existence of social and economic structures in the modern world order, which allow the possibility of exploitation of wage workers. The main criteria for attractiveness are the dominance of universal commodity-money relations and private ownership for the means of production. Capitalism played a progressive role in the historical development of society destroying patriarchal and feudal relations among people, substituted them for monetary relations. The process of globalization resulted in the strengthening of interdependence of national economies, formation of unified structure of the world economy comprising the aggregate of impersonal national economies, national sovereignty of states being destroyed. Capitalism proves to be the most resilient economic system of all alternatives of social and economic systems. It is attributed to capitalism focusing on the process of satisfying natural human instincts of egotism. Capitalism causes inequality that allows people to maximize their efforts and optimize their activity. Capitalist system raises individualism to the rank of major ideology. Cognitive abilities of people become the driver of individualism development in the capitalist system, and their abilities gain the major role in the accession of economic wealth.

In modern economic science four types of capitalism are distinguished: Anglo-Saxon, Continental Europe, Northern Europe and East Asia. Thus, capitalism has its own specific geography – spatial extent characterized by uneven development.

Identification of the capitalism attractor location is a momentous issue for the states focused on raw materials export, to be more exact on its consumers. The research on geo-economic attractor of capitalism revealed the unavailability of the USA, Germany, France and Japan, and dominance of China and India. These new attractors of capitalism do not possess unequivocal traits of capitalism demonstrating a social color.

Transition to the new type of society, characterized by wealth, markets, private ownership, democracy and civil society puts Russia on a par with China and India but does not endow it with features of attractor. To a large extent it is connected with indifference of the authorities to the process of controlling the growth rate of poverty among the employed. This indifference resulted in the pattern of the Russian economy development when income of the employed is reduced.

Abstract

This article studies the relationship between the main economic and social indicators characterizing the regions of Russia, and their impact on the value of average consumer spending per capita. The main goal of the study is to determine indicators that affect to a greater extent the value of average consumer spending per capita. The main research tools were selected methods of mathematical statistics, linear regression, mathematical regularization and machine learning. As the subject of the study, statistics were used for all 85 constituent entities of the Russian Federation for 2010-2019, provided by an official source, the Federal Service of the State Russian Federation. A large sample of statistical data guarantees the accuracy of the forecast and the reliability of our conclusions, which allows us to judge the scientific approach in our work. The study will make it possible to mathematically precisely substantiate which indicators contribute most to the value of average consumer spending per capita, which enables regional and federal authorities to obtain information on data that will help to better develop regional economic and social policies. Using machine learning methods, a mathematical model will also be developed that allows predicting average consumer spending per capita if other economic and social indicators of the region for the period preceding the study are known.

Keywords: Regions of The Russian Federation; Average Consumer Spending Per Capita; Statistical Data Analysis; Indicator Forecast; Quality of Life of The Population; Regional Policy; Socio-Economic Situation of The Regions.

Introduction

The aim of the study is to find those social and economic indicators that form the value of average consumer spending per capita. It is also necessary to develop and test a mathematical model that can predict the value of the desired region indicator if other social and economic indicators for the region are known. The study used statistical indicators for all subjects of the Russian Federation.

The relevance of the topic can be defined as follows: in most modern research methods of mathematical statistics and machine learning are not used. In this study, actual mathematical methods are applied, which make it possible to obtain accurate data and draw reasonable conclusions from the results. Based on the results, government agencies will be able to more accurately regulate and determine regional policy, which will increase significant macroeconomic indicators and improve the quality of life in all regions of Russia.

For the study we used only relevant statistical data of the Federal State Statistics Service, one of the most reliable and authoritative sources in the Russian Federation. We used the statistical indicators of the regions for 2010-2019, this time period was chosen to ensure the usefulness and accuracy of the study. The article uses the most recent published data for 2019.

Main Part

Average consumer spending per capita is one of the main indicators that are used to assess the quality of life in the region. Most rating agencies in Russia use it as one of the indicators that form an integral indicator of the quality of life or socio-economic well-being of the subject of Russia. The size of consumer spending is directly related to such economic indicators as well-being and average consumer income. Using mathematical methods, it is necessary to check how these indicators contribute to the average consumer spending per capita, which indicators, which are usually ignored, also have a strong effect. When developing local policies and planning the regional budget, regional authorities often rely on statistics and studies made on them, so a technique is needed to identify key indicators that need to be addressed first. To assess the impact of various socio-economic indicators on consumer spending, two correlation coefficients are calculated: Pearson and Spearman.

Pearson's correlation coefficient is calculated using the following formula:

$$r_{xy} = \frac{\sum_{i=1}^{n}(x_i - \overline{x})(y_i - \overline{y})}{\sqrt{\sum_{i=1}^{n}(x_i - \overline{x})^2 \sum_{i=1}^{n}(y_i - \overline{y})^2}} \quad (1)$$

Where x_i, y_i are the elements of the samples from the studied pair of indicators.

To calculate the Spearman correlation coefficient, the concept of the rank of the sample element is introduced - the number of its position in the variational series constructed from the sample. Spearman's correlation coefficient is calculated using the following formula:

$$\rho_{xy} = 1 - \frac{6\sum_{i}^{n}\left(rang(x_i) - rang(y_i)\right)^2}{n(n-1)(n+1)} \quad (2)$$

Where x_i, y_i are the elements of the samples from the studied pair of indicators.

$rang(x_i)$ - the rank of the element x_i.

Both coefficients characterize the strength of the relationship between the two indicators by their magnitude: in the case of the proximity of the coefficients modulo to 1, the indicators are considered to be highly interconnected, in the case of proximity to 0 they are not related.

We conducted a correlation analysis of the impact of various socio-economic indicators on the value of consumer spending per capita. The most significant indicators, which have a significant pairwise correlation with the value of consumer spending per capita, are shown in table 1.

Table 1: The results of the calculation of the correlation coefficients

Indicator	r_{xy}	ρ_{xy}
The average annual population, people	0.57	0.33
The proportion of urban population, %	0.54	0.47
Employment rate, %	0.56	0.54
Per capita income	0.88	0.95
The population with cash incomes below the subsistence level, %	-0.52	-0.53
The number of own cars, per 1000	0.5	0.61
Gross regional product per capita	0.7	0.8
Fixed capital investment per capita	0.51	0.63
Volume of paid services to the population per capita	0.89	0.9

Source: Calculated by the authors on the basis of statistical data for the regions of Russia.

Compiled by authors.

Figure 1: The relationship of the average annual population and average consumer spending per capita for 2010-2019.

The graph shows many vertical stripes consisting of dots. This is because the average annual number of regions does not change as fast as consumer spending. The rightmost lane, which is characterized by the largest consumer spending, is Moscow, the richest region of Russia. The next lane is the Moscow region, the border region with Moscow. However, in most regions, per capita consumer spending is much less and does not exceed 30,000 rubles per month.

Compiled by authors.

Figure 2: The relationship between the level of employment and average consumer spending per capita for 2010-2019.

The figure shows a direct correlation between these indicators. in regions where low employment is observed (less than 50%), average consumer spending per capita is small and does not exceed 10,000 rubles. With further growth in employment, expenditures grow in direct proportion. Note that the maximum values are achieved with employment of 70% - in a healthy economic environment, not all people are engaged in active activities. These are the following regions - Moscow, Moscow Region and the Nenets Autonomous Okrug.

Compiled by authors

Figure 3: The relationship of population with cash income below the subsistence level and average consumer spending per capita for 2010-2019.

In Figure 3, we can note a clear example of negative correlation. With the growth of poor people, expenses fall, because people have less money to spend. The largest cluster cloud is in the left corner. The majority of regions are characterized by the number of poor people in the region of 10-20%, the highest percentages being the Republic of Kalmykia and Tuva.

Compiled by authors.

Figure 4: The relationship between the gross regional product per capita and average consumer spending per capita for 2010-2019.

Gross regional product is one of the main economic indicators. In Russia, it can be noted that only a small number have high values for these indicators. A direct correlation of 0.7 is observed with the studied indicators. Again, the main region is Moscow, which is characterized by a high level of GRP per capita. The bands on the right are regions whose main activity is mining (Nenets Autonomous Okrug, Sverdlovsk region).

Compiled by authors.

Figure 5: Relationship between fixed capital investment per capita and average consumer spending per capita for 2010-2019.

The size of the correlation between these indicators is 0.51, since some regions of Russia are not directly related. In regions such as the Khanty-Mansi Autonomous Okrug-Yugra, Chelyabinsk region, Sverdlovsk region, etc. there is a large amount of investment in fixed capital per capita, but in these regions, there are many companies that produce oil, gas and other natural resources. These companies actively invest a lot of money in their businesses, but this does not increase the quality of life for most residents of the region.

Compiled by authors.

Figure 6: The relationship between the volume of paid services per capita and average consumer spending per capita for 2010-2019.

Paid services per capita partially overlap with consumer spending. However, paid services can be used by companies and government agencies, and consumer spending includes expenditures on material resources. In figure 6, it can be noted that the correlation is strong and almost linear. consumer spending is growing evenly with the volume of paid services per capita, and this is typical for all regions of Russia.

To study the influence of all socio-economic factors in the aggregate on the value of consumer spending, we construct a model of regularized linear regression.

$$y = \sum_{i=1}^{n} \alpha_i x_i + \alpha_0 + \varepsilon \quad (3)$$

Where x_i - the independent socio-economic parameters of the model

y - the dependent variable corresponding to consumer spending in the region
α_i - weighting coefficients of the model parameters
α_0 - free member
ε – error term
n - the number of independent parameters in the model
The coefficients α_i, α_0 are determined in the process of solving the following optimization problem:

$$Q(\alpha, X) = \frac{1}{2l}(y - X\alpha)^T(y - X\alpha) + \gamma\|\alpha\|_1 \underset{\alpha}{\rightarrow} \min \quad (4)$$

Where $y = (y^1, \dots y^l)^T$

$$X = \begin{pmatrix} 1 & \dots & x_n^1 \\ \dots & \dots & \dots \\ 1 & \dots & x_n^l \end{pmatrix}$$

$\alpha = (\alpha_0, .. \alpha_n)^T$
l – sample size
γ – regularization parameter

All available data is divided into 2 parts - training and test samples in the ratio of 80% to 20%. The quality of the constructed model is estimated using the coefficient of determination.

$$R^2 = 1 - \frac{\sum_{i=1}^{n}(y^i - \alpha^T X_i)^2}{\sum_{i=1}^{n}(y^i - \overline{y})^2} \quad (5)$$

Where X_i – i-th row of matrix X

This coefficient (5) shows how much of the variance of the dependent variable is explained by the model.

We made model settings and selected the regularization coefficient γ equal to 100. Then the quality of the model in the training and test samples is 90% and 89%, respectively. This indicates the high quality of the constructed model and allows us to interpret the obtained weighting coefficients as the contribution of relevant factors to the value of consumer spending per capita.

Compiled by authors.

Figure 7: Weight coefficients of the regularized model.

As can be seen from figure 7, the value of average consumer spending per capita is mainly influenced by 5 factors, with 4 having a positive relationship and 1 having a negative one. The highest contribution is made by the average per capita income of the population. The smallest contribution is the number of people with monetary incomes below the subsistence level.

Conclusion

The results of our study and mathematical models it is possible to identify the main indicators forming the value of the average expenditure per capita, namely: the volume of paid services per capita, average per capita income, population with money incomes below the subsistence minimum, the number of private cars per 1,000 of population, average annual population, people with weight coefficients we can estimate the contribution of each indicator in the final. But despite the fact that these indicators have the greatest share and their improvement will lead to an increase in the studied indicator, which is why they may receive increased attention from the regional authorities, they should also not forget about the improvement of other economic and social indicators of the region, which also form the level of quality of life in the region. The charts that show the correlation between average consumer spending per capita and other economic and social indicators also re-confirmed the existence of a strong economic differentiation of regions in the Russian Federation, which has been repeatedly proved by previous studies. This observation allows us to conclude that the Central

regions are developing faster than the rest, using Finance and other resources from other regions of the Russian Federation. Our mathematical model allows us to determine the average consumer spending per capita with high accuracy, if we know the other indicators of the region, which allows us to forecast the data, as well as more accurately calculate the average consumer spending per capita. The state needs to adjust the current regional policy in order to ensure improvement of economic and social indicators, since without this it is impossible to achieve high indicators in the quality of life of the population of the Russian Federation.

Abstract

The digital economy offers great opportunities for developing a country's competitiveness system. Modern technologies make it possible to use a high-tech digital platform that minimizes the human factor and the associated corruption and errors, automates the collection of statistical, tax and other reporting, and makes decisions based on analysis of the real situation. The state can create the conditions for the development of the digital economy: a legal framework, an appropriate infrastructure in the form of the ubiquitous high-speed Internet and resolve security issues. It is important for the consumer to know that when using a digital product and observing simple safety measures, it will not incur losses.

Keywords: Digital Economy, Competitiveness, ICT Sector, Digitalization.

Introduction

The ongoing complication of social structures and relations, which are increasingly based on modern digital technologies, which cause an exponential growth in data flows, highlights the issue of creating a digital economy. The importance of the ongoing processes has raised the question of the formation of a new type of economy, where relations with respect to the production, processing, storage, transmission and use of an increasing volume of data become dominant. Data becomes the basis of an economic analysis that examines the patterns of functioning of modern socio-economic systems (Abdrakhmanova G., Vishnevskiy K., et al, 2018).

The digital economy is the basis of development for the economy of the country as a whole and has an impact on such diverse industries as banking, retail, transport, energy, education, healthcare and many others. Digital technologies, such as the Internet of things, big data, the use of mobile devices and devices transform the ways of social interaction, economic relations, institutions.

However, based on the events of foreign policy and global trends, each country in the world faces the issue of global competitiveness and national security, and the development of the digital economy plays a significant role in addressing this issue. Some elements of the digital economy are already operating successfully. Today, given the massive transfer of documents and communications to digital media, the permission of electronic signatures, communication with the state is also moving to an electronic platform. All these circumstances indicate the relevance of the chosen research topic (Borkova, E., Chulakova, A., et al, 2019).

The goal is to identify the relationship between the level of digital development of the country and its competitiveness at the global level.

The objectives of the study are:

• Analyze the position of various countries in the world in ratings characterizing the level of digital development of the country's economy.

• Consider world indices characterizing the level of competitiveness of countries.

• To identify the relationship between the level of development of the country and the level of its competitiveness.

The hypothesis of this study is the assumption that the development of the digital economy, through the introduction and improvement of technology, helps to increase the competitiveness of any country.

This study is pilot and requires further detailed study of this issue.

To solve the set tasks, theoretical and empirical methods of scientific knowledge were used. The method of comparative analysis of statistical data comparing individual economic phenomena in order to identify their similarities and differences made it possible to identify the characteristic, features and problems of the Russian information and communication technology sector. An analysis of causal relationships has revealed a relationship between the level of development of the country's digital sector and its competitiveness (Borkova E., Plotnikov V., et al, 2019).

Results and its Discussion

The term “country’s competitiveness” describes a country's ability to produce goods and services that can meet the requirements of the international market and specific consumers. These goods and services must be of high quality and meet the level of world standards.

Any product after entering the global market begins to gradually spend its competitiveness potential. In order to slow down this process, it is necessary to constantly improve the quality and operational characteristics of the product, and the production of a new product should be carried out systematically in order to create conditions for its entry into the world market.

Digital technologies enable enterprises to reduce costs, optimize supply chains and sell goods and services around the world at lower costs. Trade growth while lowering costs can have a positive impact on the economy as a whole, for example, due to increased competition, increased labor productivity and innovation, as well as increased opportunities for the use of qualified personnel. In other words, the digital economy makes the products of the country of origin competitive compared to countries that do not use digital technology. The ability of countries and enterprises to use new digital resources is becoming a key factor in competitiveness. Access to data and its analysis are becoming strategically important to increase the competitiveness of countries in different sectors (Selishcheva T.A., Sopina N.V., et al, 2018).

Consider the state of the indicators of the digital economy in various countries of the world (Tab. 1). This allows you to analyze the level of development of the digital economy and its impact on the competitiveness of the countries of the world, using developed indices. The level of development of the digital economy and the country's rating are measured based on various composite indices that integrate individual sub-indices that are responsible for the digital transformation of individual sectors of the economy and society.

Table 1: Countries of the world in the ratings of the development of the digital economy.

Country	IDI 2017	DESI 2018	WDCI 2018	DEI 2017	NRI 2016	EGDI 2016	EPART 2016	GCI 2018	GII 2018	Average

Compiled by authors from the data of the ICT Development Index – IDI; Digital Economy and Society Index – DESI; IMD World Digital Competiveness Index – WDCI; Digital Evolution Index – DEI; Boston Consulting Group (e-Intensity); Networked Readiness Index – NRI; The UN Global E-Government Development Index – EGDI; E-Participation Index – EPART; Global Connectivity Index – GCI, Huawei; The Global Innovation Index – GII.

These indices consider various aspects of the development of society: institutional, economic, technological, social, and economic integration. At the same time, some indices to a greater extent reflect the level of development of the information society, while others - to a lesser extent. Therefore, comparing them, it is difficult to give an accurate description of the level of digitalization of the economy of a country. Let us turn to the index of national development of the digital economy, which was calculated by Rosatom State Corporation. The National Digital Economy Development Index is a measure of the degree of preparedness, use and impact of digital technologies in developed countries.

Table 2: National Digital Economy Development Index.

Compiled by authors from the National Digital Economy Rating.

The most developed among European countries in the field of the digital economy are Sweden, Norway, Denmark and Finland, Switzerland. Singapore and the United States should be singled out separately. Low index values are - Hungary, Greece, Bulgaria and Romania. Russia takes only 23rd place. Its strengths are cybersecurity, digital government and digital health. If we compare countries by the level of development of individual industries, the leading countries also have high index values. Particularly noteworthy are the high values of the index in the digital business (Netherlands - 0.486, Finland - 0.486, Norway - 0.475) and information and communication technologies (Netherlands - 0.629, Finland - 0.669, Norway - 0.650). Russia in these sectors has the following values of 0.334 and 0.494.

The considered indices are inextricably linked with such indices as the Global Competitiveness Index and the Global Competitiveness Rating. Comparison of the positions of countries in these indices will reveal the relationship between the level of digitalization of a country and its competitiveness.

Compiled by authors from the - Global Competitiveness Report- 2018. https://www.weforum.org/reports/the-global-competitveness-report-2018

Comparing the values of the indicators on the national index of the development of the digital economy and the Global Competitiveness Indexes, we can see that the same countries occupy leading positions in them. This testifies to the relationship between the level of digitalization of the country and its competitiveness. The more developed the country's digital sector, the more competitive products it can provide to the world market (Gontar, A., Plotnikov, V., et al, 2019).

Today, the country's competitiveness is determined by the level of its technical development. The level of technical development depends on the ability to use modern achievements of science and technology in production. And as a result, global competitiveness requires investments in R&D and innovation, which are determined by the scientific potential, scientific effectiveness and innovative activity of the business sector. Which, in our opinion, are the most important factors for the digitalization of the economy, which are considered by the National Rating for the Development of the Digital Economy in a separate rating.

Table 5: Rating for R&D and innovation.

Compiled by authors from the National Digital Economy Rating.

Among the countries included in the rating, Russia has a very low value of the integral index "R&D and innovation", ahead of only Romania and India (Fig. 5). The vector of state policy of the Russian Federation, taken for the intensive development of scientific and technological fields, has not yet led to a tangible change in diagnostic indicators. At the same time, according to a number of indicators, Russia's lagging behind the leading powers does not seem insurmountable.

In Russia, a relatively small share of domestic research and development costs in GDP remains, which in recent years has been about 1.1% of the country's GDP, which corresponds to 33rd place in the ranking of the Global Innovation Index 2018 for this indicator - 40. For comparison: in Canada this share is 1.61%, in China - 2.1%, in Germany - 2.9%, the leader (Israel) - 4.3% - 41. This indicator determines the security of research activities with financial resources. Its low value is explained, in particular, by the insufficient interest of national business in the development of new technologies — the share of business spending on R&D in Russia is small and amounted to only 26.5% in 2015 and

28.1% in 2016, which is significantly less than in such innovative economies as German (more than 65%), Chinese (almost 75%) or Japanese (78%).

For a more detailed examination, the leading countries of the world in terms of R&D expenditures and innovations.

Table 5: Leading countries in R&D expenditures 2018

NO.	The country	Billion US $	Attitude to GDP, %
1	USA	511,1	2,74%
2	China	451,2	2,12%
3	Japan	168,6	2,02%
4	Germany	118,5	2,02%
5	Korea	79,4	4,24%
6	France	62,2	1,54%
7	India	50,1	2,56%
8	Great Britain	47,2	3,21%
9	Brazil	41,1	2,5%
10	Russia	39,9	1,1%

Compiled by authors from the Rating of the countries of the world in terms of global competitiveness, 2018.

To note that countries that regularly invest in science occupy leading positions in the index of development of the digital economy and the ranking of global competitiveness. It is also worth noting that patent statistics are the main indicator of innovative potential and one of the key indicators of technological development of countries and regions.

Table 6: Leading countries, but the number of patents 2018

Rating	The country	Applications Total	Applications residents	Applications non-residents
1	China	526 412	415 829	110 583
2	USA	503 582	247 750	255 832
3	Japan	342 610	287 580	55 030
4	South Korea	178 924	138 034	40 890
5	Germany	59 444	46 986	12 458
6	India	42 291	8 841	33 450
7	Russia	**41 414**	**26 495**	**14 919**
8	Canada	35 111	4 754	30 357
9	Australia	25 526	2 383	23 143
10	Brazil	22 686	2 705	19 981

Compiled by authors from the Rating of the countries of the world in terms of global competitiveness, 2018.

Conclusion

Based on the study, we can conclude that the level of development of the digital sector of the economy, of course, affects the degree of competitiveness of the country. It was determined that the countries

that are leaders in the development of the digital economy occupy leading positions in global competitiveness ratings; moreover, they spend the most money on R&D and innovation.

Abstract

The paper analyses the main determining factors of crop patterns in Dobrogea, the most droughty region of Romania. Before 1945 extensive agriculture with more or less resistant species to the drought was practiced. In the period of socialist agriculture (1945-1989), the crop pattern was established by plan. After 1990 the crop pattern is established at the farm level by a manager depending on several factors such as land reclamations, sorts or hybrids, resistance to drought, market demand and others.

Keywords: Crop Pattern, Drought, Biologic Materials, Manager, Land Reclamations

Introduction

Dobrogea is a Romanian province located at the southeastern extremity of the country. The agricultural area, 897,206 ha represents 6.1% of the total in the country and the tillable area 764,578 ha, 8% of the total in the country, area that constitutes the main agricultural resource of the region. From an orographic point of view, Dobrogea is a sum of plateaus. From a climatic point of view, it is considered the main pole of drought. In the past, the low population rate related to the land resource favored a system of agro-pastoral agriculture in which the pastures dominated, and the structure of the crops in the little cultivated tillable land was composed of cereals in which the barley dominated - over 40% of the tillable land, followed by wheat and later, corn. This in a growing arable area. Although Dobrogea was a dry region in the more distant past as well, as Ionescu from Brad stated in 1850: *The surface of Dobrogea being open makes the climate of this country dry* (Ion Ionescu from Brad, 1968), the main argument for establishing the structure of cultures was another one revealed by the same Ionescu from Brad: *Dobrogea has a huge stretch of land and very few arms. This circumstance created the system of rural economy that dominates there. The inhabitants cultivate what they can, but this does not stop the extent of land affected by the crops being very small* (Ionescu de Brad, 1968). It seems that in this period when the pastoral farming system based on animal husbandry predominated, the arable area did not exceed 10,000ha. Later, in the last quarter of

19th century and especially after the union of Dobrogea with Romania in 1878, the tillable area increased greatly reaching almost 300,000 ha in 1900, and 757,474 ha in 1927 (Brătescu, 1928). During the Romanian rule over Dobrogea, the arable area of the two Dobrogean counties Constanta and Tulcea totaled almost 720 thousand ha, approaching tillable surface area at present. During the period of planned-socialist agriculture the arable area increased further due to the regime's ambition for the arable land of Romania to reach the figure of 10 million hectares, a figure reached at least on paper, 10,080.4 ha in 1987 (Statistical Yearbook, 1988). In fact, the figure designating the arable area at the end of 1989 was 9,458.3 thousand ha, with 622.1 thousand ha less than the arable area reported by the statistics in 1987 (Statistical Yearbook 1990). The present cultivated arable area of Dobrogea amounts to 754,872 ha (Statistical Yearbook 2017).

Materials and Methods

The used materials include, besides the papers on the statistical data on the structure of the crops in different periods in Dobrogea, some bibliographic data on the history of agriculture in this Romanian province. The research method is specific to the economic exploration: the collection and selection of the material, the processing by appropriate means, synthesis, conclusions and proposals. The comparisons relate to three distinct periods in terms of the influence of the main factors on the structure of the crops: a) the period before 1945, when the planned economy was introduced; b) the planned economy period 1945-1989; c) the market economy period after 1990.

Results and Discussions

a) The pre-1945 period. It is a very long period, practically starting with the first agrarian structures in the region. We have somewhat significant data regarding the structure of the cultures from the middle of the 19th century and we owe them to the agronomic scientist Ion Ionescu from Brad, who was tasked by the Ottoman Empire to write the famous *Agricultural excursion in the Dobrogea Plain in 1850*. In its text, Ionescu from Brad says only that the soil of Dobrogea is more favorable to spring crops and that the law of crop alternation, respectively of the crop rotation that would suggest a certain crop structure does not exist (Ion Ionescu de Brad, 1968). We will have more clear data on the structure of cultures in the Dobrogea after 1878 when Dobrogea had a Romanian administration. The engineer C. Filipescu, in the chapter dedicated to Dobrogea agriculture in the volume *50 years of Romanian life in Dobrogea,* will make an average of the structure of cereal crops for the 1894-1927 period, grouped by cycles, from which we extract the 1894-1927 period (table 1). The way in which the structure of cultures in arable land evolved during the first 50 years of Romanian administration in Dobrogea is presented in table 2.18. However, we only have accurate statistical data for the whole period for cereals, which on average accounted for 90.9% of the arable area of Constanta county and 87.0% of the arable land of Tulcea county. The extension of cereal culture as a result of the growth of arable land constituted the great technological revolution from the end of the 19th century and the beginning of the 20th century in Dobrogea.

Table 1: Structure of cereal crops in Dobrogea's tillable land in the 1894-1900 and 1920-1927 periods

Culture	1894-1900		1920-1927	
	ha	%	ha	%
Grain	89551	19,8	76083	13,6
Corn	59404	13,1	130453	23,4
Barley	202901	44,8	256673	46,0

Oats	43257	9,6	78755	14,1
Rye	16522	3,7	4311	0,8
Millet	40770	9,0	11879	2,1
T o t a l	*452425*	*1000,0*	*558254*	*100,0*

The area cultivated with cereals reached almost 560 thousand ha in 1920-1927 from 230 thousand ha in 1886, which meant an increase of more than 2.4 times. By species and counties, the evolution of the areas cultivated with cereals during the 1886-1927 period is as follows:

- wheat had expanded almost 2.2 times in Constanța county and by about 20% in Tulcea county;
- the cultivation area for rye was reduced by almost 27.0% in Constanta county and by 42.0% in Tulcea county;
- barley, cultivated on the largest areas, had expanded more than three times in Constanta county and about 2.3 times in Tulcea county;
- oats had, in relative values, the strongest extension of about ten times in Constanta county and over 4.5 times in Tulcea county, the largest areas being cultivated during the 1906-1915 period when it is competing with wheat;
- maize was extended in the reference period by approx. four times in Constanta County and more than three times in Tulcea County.

Among the advances made by Dobrogean agriculture during the 1894-1927 period, we must also mention the extension of food and industrial species. Both in 1915 and in 1927, over 45,000 ha were cultivated with food species in the following order and evolution:

	1915 (ha)	1927 (ha)
Beans	38 178	32 340
Melons	4 886	6 851
Potatoes	881	2 304
Onions	291	918
Cabbage	241	551
Pumpkins	264	159
Lentils	99	362
Peas	235	94
Other vegetables	355	2 002

Some of these species will grow on increasingly larger areas (melons, potatoes, cabbage, onions), others will lose their values (peas, pumpkins). The development and diversification of the assortment of food plants result from the growth of more than 5.6 times of the areas cultivated with other food species (from 355 ha in 1915 to 2 002 ha in 1927).

Industrial plants had increasing importance in the structure of cultivated areas during this period from 15,196 ha in 1915 to 39,792 ha in 1927. These include rapeseed: from 11 302 ha to 22 434 ha; flax: from 2,023 ha to 10 341 ha; tobacco: from 1,827 ha to 3 806.

The next stop in the structure of arable areas will be done in the first half of the fourth decade (1931-1935) for which we have statistical data on the main cereal species for the Dobrogean counties Constanta and Tulcea (table 3).

Table 3: The cultivated area and the share in tillable land between the main cereals in Dobrogea in 1931-1935

Specification		Constanţa county	Tulcea county	Dobrogea
Total	*Ha*	*390 470*	*200 349*	*590 089*
	%	*100.0*	*100,0*	*100,0*
of which: - Grain	Ha	36 081	14 977	51 058
	%	9,2	7,5	8,7
- Barley	Ha	165 865	98 099	263 964
	%	42,5	48,9	44,6
- Oats	Ha	65 143	17 046	82 189
	%	16,7	8,5	13,9
-Corn	Ha	123 381	70 227	193 608
	%	31,6	35,1	32,8

The most important cereal species cultivated in Dobrogea during this period were, in order of the sown areas:

- barley with a share of 36.8% in arable land compared to only 13.4% in the country average;
- maize, cultivated on 26.9% of the arable land compared with the average of 36.8% in the country;
- oats still occupy 11.4% of the arable land in Dobrogea while only 6.2% in the country;
- wheat was still cultivated at that time, only on 7.1% of the arable land (more than three times less than the country average).

Therefore, in the reference years, 1931-1935 in Dobrogea much more barley and oats and less wheat and maize were grown (as a share in tillable land). Overall, the share of cereal species cultivated in Dobrogea is similar, the four crops being sown on 82.2% of arable land in Dobrogea and 80.4% on average across the country. Also, in Dobrogea, rye was also relatively widespread (over 6.0% compared to 2.8% of the country average). In the same period areas cultivated with fodder plants are also mentioned (perennial and annual): 18,769 ha in Constanta county and 11,911 ha in Tulcea county. We will conclude the presentation of the evolution of the plant production profile in Dobrogea before the Second World War by an enumeration of the share in arable land of the main crops and crop groups in 1937: grains - 86.3%, legumes for grains 3.7 % (3.3% beans), potatoes 0.2%, oily plants 4.8% (3.4% rapeseed, 0.8% flax, 0.2% sunflower, 0.4% soy), tobacco 0.1%, fodder plants 3.7%, vegetables 0.3%, melons 0.7%.

In this first analyzed period, which covers practically the whole of the nineteenth century and half of the twentieth century, the determining factors of the structure of cultures in Dobrogea were in order:

- a system of pastoral agriculture with a predominance of breeding animals based on both tradition and low population in relation to the land resource;
- an extensive dual farming system in which the small peasant household practiced a larger crop structure to ensure an assortment of products necessary for subsistence, and on the other hand the export orientation of the large owners with a narrower assortment of crops (cereals);
- throughout the period, both the species and the recognized local varieties or populations, including fodder, were chosen according to their drought resistance.

b) The period of planned economy and socialist agriculture. It includes the chronological interval between March 6, 1945 and December 1989. This period is subdivided in the 1945-1957 period (12 years) until the end of the collectivization process in Dobrogea and the 1957-1989 interval (32 years), the period of socialist agriculture. In the first period, both small and large owners (50 ha after the agrarian reform in 1945), established their own crop structure. After 1957, two are the determining factors for the crop structure in Dobrogea: the central agricultural product fund of the state and the evolution of irrigation arrangements that changed crop structures in the sense of increasing the share of species, varieties, hybrids of high intensity with higher water needs than could only be ensured through irrigation (Table 4).

Table 4: The evolution of irrigation arrangements in Dobrogea from 1960-1990

Specification	1960	1965	1970	1975	1980	1985	1990
Agricultural area - thousand ha -

Dobrogea	*13,5*	*13,1*	*69,6*	*263,3*	*434,3*	*514,3*	*549,4*

To highlight the influence of irrigated areas on the structure of crops, the surface and the weight in arable land of some crops or groups of crops more or less influenced by irrigation in two situations were compared:

a) the year 1968, when the share of landscaped areas was so low that it did not significantly influence the structure of the crops;

b) the year 1989, when the arable land of Constanța county was irrigated in proportion of 82.4%, and the arable land of Tulcea county was irrigated in proportion of 54.2%. The comparison of the two situations is presented in table 5.

Table 5: The surface and weight of arable land for the main crops or groups of cultures significantly influenced by irrigation

Culture	U/M	1968		1989	
		Constanța county	Tulcea county	Constanța county	Tulcea county
Cereals	ha	215381	97762	181602	103321
	%	43,1	38,2	37,5	35,6

	%	8,9	7,5	5,2	6,3
Soy	ha	-	-	39674	16348
	%	-	-	8,2	5,6
Sugar beet	ha	969	95	7062	6520
	%	0,002	0,000	105	2,2
Potatoes	ha	2942	2829	8013	4089
	%	0,06	1,1	1,7	2,2
Vegetables	ha	9274	5819	10116	6117
	%	1,9	2,3	2,1	2,1

We note that the group of cereals with lower water needs decreases as a percentage in arable land in 1989, compared to 1968. On the contrary, corn cultivation with higher water needs was cultivated in 1989 in larger areas. The share of sunflower culture is also declining. On the other hand, the proportion of species that more or less depend on irrigation, such as sugar beet, vegetables, potato, increases in the structure of crops.

On the surfaces arranged for irrigation, the culture of soy appears. We mention that in the last years of the socialist economy there have been reasons that have somewhat blurred the influence of irrigation arrangements on the structure of cultures. One of these reasons was the fact that in big productions the irrigation facilities not properly exploited did not give expected results. And also in the last years, the territorial self-provisioning program that obliged each county to produce its entire product range was a second cause for the influence of irrigation to be significant.

c) The market economy period, after 1990. A few years after the *conversion* of the Romanian agriculture to the market economy there were still agronomists who declared: *I know how to produce* and who were soon convinced that they did not know how to sell. We appreciate that the market demand for certain products, including niches, was the determining factor that influenced the crop structure under the conditions of decision-making autonomy at the farm level. Of course, market testing also included the price with different profit margins from one product to another depending on the costs. The offer was also conditioned by certain factors such as:

- large homogeneous exportable parties which imply including association actions, which did not happen;
- the system of subsidies depending on the quality of the product or the impact on the environment;
- restrictive legislation or even the exclusion of products with a certain content of certain genetically modified substances or organisms;

- the possibility of irrigation, mandatory for certain products with higher water needs (corn, for example).

This sum of factors - otherwise incomplete - results in a permanent change in the structure of cultures in which the area represented by the natural framework (climate, soil, relief) or anthropic land management (irrigation, in particular) plays a major role.

For Dobrogea, the specific natural factor (climate, to which recent evolutions are added) and the anthropic one (hydro-ameliorative arrangements) have a decisive role in establishing the culture structure. Synthetically, the characterization of the Dobrogean territory from the point of view of natural water resources accessible to plants is presented in table 6.

Table 6: Humidity resources in Dobrogea

Subzone	Humidity resources				Soil moisture reserves: 0-100 cm in m / ha at 31. III	IV-X deficit at 0-100 cm in mc / ha	Optimum sowing times (average data)	
	Annual	In the following months:					Autumn (wheat)	Beginning of spring (corn)
		IX-III	IV-X	VII				
1	350-400	150-200	200	35-40	1133-1173	4417-4646		
3	400-475	125-175	275	40-50	1137-1273	3857-4472	01-20.X	10-15.IV

The average amount of rainfall is between 350-400 mm in sub-area 1 (the coast) and 400-475 mm in sub-area 2, values that characterize one of the most drought-stricken provinces of the country. The humidity deficit registered in the 0-100 cm layer during the 1.IV-31.X vegetation season is between 4,417 cubic meters / ha in sub-area 1 (coastal) and 3,857- 4,472 cubic meters / ha in the rest of the territory.

The aridity of the area was also the reason why the Dobrogean arable land was arranged in 1989 on an area of almost 40,000 ha in Constanța county and 154,000 ha in Tulcea county. Whether or not these areas were irrigated confirms the results, but after 2003 less than 100,000 ha were irrigated throughout Dobrogea, and in recent years the area actually irrigated (with a minimum of one watering) has not exceeded 5,000 ha.

In 2018, for example, 2,538 ha were irrigated in Constanța county (data from ANIF Dobrogea branch). It is true, there are programs that consider the rehabilitation of the old irrigation systems on surfaces of over 100,000 ha, but for the time being only on paper. In these conditions, the surface and weight in the arable land in the two counties Constanța and Tulcea, for the main cultures and groups of cultures present in 2016 are shown in table 7.

Table 7: The surface and weight of arable land for the main crops or cultural groups in Dobrogea in 2016

Culture	Constanța county		Tulcea county	
	ha	%	ha	%
Cereal	259163	53,5	115254	42,5
Corn	61521	12,8	50360	18,9
Sorghum	832	0,002	-	-
Oleaginous plants	122258	25,3	84446	31,2
Sunflower	76854	15,9	57670	21,3
Soy	180	0,0005	3239	0,12
Rapseed	44509	9,2	22696	8,4
Sugar beet	-	-	-	-
Potatoes	397	0,0008	1431	0,005
Vegetables	3700	0,008	5620	0,02

The share of arable grain in arable land is increasing, the cultivated areas are closer to those of 1968 (with the insignificant influence of irrigation) than to those imposed by the plan in 1989. The areas cultivated with maize have been reduced drastically, and the sugar beet has completely disappeared after the disappearance of irrigation and the beet processing plant in Constanța. Vegetables and potatoes are also grown on minimal surfaces. Instead, the share of oil crops has increased. Sunflower is cultivated on surfaces more than three times higher than in 1989 and more than twice as large as in 1968. Rapeseed, which with some luck has enough moisture to rise in the fall and benefit from a milder winter (characteristic of Dobrogea) has expanded up to 8-9% of the cultivated area, benefiting from an advantageous market both in demand and price. Soybean reappears with some grant facilities.

Sorghum in Dobrogea. The region's recognized aridity, associated with the evolution of climate change, is currently bringing back the crop of sorghum as a substitute for maize, and some of the oilseeds recognized as big consumers of the nourishing substance in the soil. Worldwide, sorghum grains are recognized as a substitute for maize in such as in Africa or other drought-stricken regions of Australia, Asia and even the United States and some countries in Europe. In Africa, for example, 25 million hectares are cultivated with maize and 23 million ha with sorghum. In Oceania, 23 million ha are grown with sorghum, and maize is cultivated on under one million ha. Yields per hectare are higher in sorghum than maize in South Africa or Mexico and close to maize in Tanzania or Thailand (Chirilă, 2000). The movement is greatly favored by genetics, prestigious companies in the field such as *Euralis* or the National Institute for Cereals and Technical Plants Research from Fundulea in Romania, launching a wide range of hybrids of high productivity adapted to practically any conditions. The introduction of sorghum as an alternative or complementary to corn cultivation in dry areas is not new. In Romania, sorghum in the form of grains is statistically mentioned since 1938, with an area of 400 ha. A surface of 68.8 thousand ha is recorded for 1976 (Statistical Yearbook 1981, p.257), and in 1985, 21.3 thousand ha were cultivated with sorghum. After 1989 the average of the years 1990-1995, records an area of 1,703 ha with an average production of 588 kg / ha, and on average for the years 2011-2016 only 675 ha, but with an average production of 2,126 kg / ha. In research, the first experience with sorghum hybrids of American origin received from ICCPT Fundulea was carried out in 1961 at the Agricultural Research Station in Valu lui Traian, Constanța county, by Ing. A. Lup, then a researcher at the plant improvement laboratory at the Valu lui Traian resort (Table 8).

Table 8: The results of the experience with American sorghum hybrids compared to the corn hybrid HD 302 rayoned in the area

Hybrid	Plant height (cm)	Vegetation period (days)	Grain production		Difference from control sample kg/ha
			Kg/ha	%

X 3037	102	145	6459	127,8	1405
NK 140	118	138	5741	113,6	687
HD 302	220	132	5054	100,0	Mt.

Sorghum hybrids outperformed maize in this experiment with production values between 687 and 3,359 kg / ha of grain, respectively by 13.6-66.4%. The first 5 sorghum hybrids NK 210, NK 300, NK 120, X 3000 and X 3021, exceeded the production of double hybrid maize with increases between 2557 and 3559 kg / ha. In 1961, a number of 6 sorghum hybrids were also introduced into production experiments in state and collective farms, on areas between 1 and 6 ha for each hybrid. Although for the sorghum grain the most suitable agrotechnical system has not yet been established and applied. The most productive sorghum hybrids have consistently surpassed maize production. The NK 210 sorghum hybrid, which proved to be the most productive of the hybrids tested in 1961, outgrew maize with 1,011 kg / ha of grain at G.A.S. Casimcea Tulcea County with 1,055 kg / ha of grains at G.A.C. *August 23*, Constanta County (Tomoroga, 1963). Also, in 1961, engineer A. Lup also established a field of amelioration, consanguinity with a collection of lines in different stages of consanguinity of American origin (obtained through the kindness of the late colleague Sarca). Both the experimental cycle and the improvement field were interrupted due to the transfer to a production unit of the author (figure 1). After a long time, Dr. Eng. D. Manole restores the experiences with hybrid sorghum in 2015, by collaborating with the EURALIS company in his own field of research of SC Sport Agra SRL Amzacea, Constanța county (figure 2). Some of the results obtained are presented in table 9.

Table 9: Production, costs, income and profit for several crops under the conditions of the year 2017 at SC Sport Agra SRL

Specification	U/M	Maize	Sorghum	Wheat	Sunflower	Soy
Average production	Kg/ha	8364	8859	7271	3800	1992
Price	Euro/t	130	130	164,7	294	299
Production value	Euro/t	1087	1152	1197	1117	595
Technical expenses	Euro/ha	789	577	797	764	720
Profit	Euro/ha	298	575	400	353	-125

We mention that both the experimental field and the entire surface of the farm are not irrigated. The high yields are due to the performing biological material, optimum technologies, but especially to the advancement of the sowing times by about a month earlier than the recommendations in specialized literature.

Figure 2: The experimental field from SC Sport-Agra SRL Amzacea, Constanța county

Conclusion

In Dobrogea, the main factor that influences the structure of crops in arable land is the drought, associated in recent decades with climate change such as global warming, rhythm disturbances and the amplitude of meteorological phenomena. For a long time, the low population rate allowed the cultivation of a small area in which species, local populations more resistant to drought, needed for subsistence, predominated.

Later, after the establishment of the planned economy system (1945), the structure of the cultures was established by law. During this period, a crop structure which ensured the establishment of the central agricultural product fund of the state was practiced, the crop groups evolving proportionally according to the areas set up with irrigation, the main means of combating drought during this period.

Under market economy conditions sorghum grains can be a real component of crop structure in dry areas such as Dobrogea, both through yields and profit. But this requires a receptive market that could be constituted by a promotion program among pig and poultry breeders.

Abstract

The momentum effect of assets of various classes has been known and presented in the literature for a long time. However, there is no work confirming the existence of a similar effect on intellectual assets. The reason for this lies in a different mechanism for the trade turnover of such assets. In this paper, the comparable effect of copyright assets traded on modern digital microstock platforms is proved. The paper proposes first a structural model of the portfolio of digital assets of copyright that explains the momentum effect of assets of this class. The revealed effect is then introduced in the hybrid Bayesian network model of digital images portfolio, developed by the authors to study financial risk.

Keywords: Bayesian Network Model, Digital Copyright Asset, Momentum Effect, Portfolio, Risk.

Introduction

The momentum effect in financial assets has been discovered and described for a long time. A lot of works is devoted to the study of this effect, especially in stocks and in instruments built on the basis of stocks (Asness, 1997; Grundy and Martin, 2001). In addition, a similar effect was revealed in government bonds, currencies, commodity futures (Asness, Muscovite and Pedersen, 2013). The results of this discovery are implemented in new financial instruments that are successfully traded on the stock market. Nevertheless, there are no messages about the momentum effect in intellectual assets yet. There are the following possible explanations for this.

First, intellectual property literature generally focuses on patent assets, as patents are of most interest to large technology companies. At the same time, the mechanism for trading such assets does not involve a large number of trading events. As a result, there are no long time series of price movements, quotes and other historical data (performance history) for specific patent assets, and it is impossible to draw a conclusion about their inertia.

Secondly, digital copyright assets have been circulating on the trading floors of aggregators for about 20 years. This applies, in particular, to digital assets such as images (photographs), videos, sound and literary works (Glückler and Panitz, 2013). However, economists have not yet noticed and fully appreciated this powerful investment breakthrough, and have not drawn the appropriate conclusions.

In this article, we reveal the momentum effect in digital copyright assets that we identified as a result of more than 10 years of observation of the digital image portfolio as a whole, and of individual record-holder assets with a very clear performance history. The obtained experimental data were used by us to develop a generalized structural model of the portfolio of digital assets of copyright, as well as to study financial risks using Bayesian network models (Voronov, Kazansky and Davydov, 2018).

The Data

The mechanism of market trading in digital images and similar assets was described in detail in our previous works (Voronov, Ivanov and Darushin, 2016). The main feature of this mechanism is that assets can be sold multiple times, with each sale necessarily generating income. In this sense, there can be no loss on the portfolio. However, the amount of income in each case depends on a combination of several factors that are random in nature and introduce significant uncertainty into the final financial risk and financial result.

Figure 1: Total number of sales of S-image including subscription, on demand, single and others in 2011-2019.

(Source: compiled by the authors based on own research)

Figure 2: Total sales revenue of S-image in 2011-2019.

(Source: compiled by the authors based on own research)

In particular, the result of this uncertainty can be seen even visually by comparing the diagrams shown in Figure 1 and Figure 2. These diagrams show the sales results of a specific asset that has been demonstrating a clear performance history for 9 years since November 2011, when it was first uploaded to the Shutterstock collection. In 2011, only 5 sales of this image took place. Thus, it can be seen that for about two years it reached a certain level of sales. These observations are quite consistent with the opinion of industry experts that the adaptation of an individual digital asset on the microstock trading platform takes about two years on average. That is, approximately two years of exposure is required on average in order for an asset to attract market attention and begin to generate stable income. However, one should not think that all assets in the portfolio work the same way, and this is another, even more serious reason for the uncertainty of the financial result. The fact is that the creative nature of such assets greatly affects their investment parameters, and no forecasts and predictions made regarding ordinary financial assets work on the intellectual property market.

In order to find approaches to solving the problems of risk and uncertainty of intellectual assets, we have developed our own structural portfolio model (Voronov, Kazansky and Darushin, 2017). In this model, all the assets in the portfolio are distributed among groups showing approximately the same demand. However, one group, representing assets that have never been sold, plays a special role in the portfolio. We called this group as “group of suspense”, and it was this portfolio structure that prompted us to understand the nature and mechanism of momentum effect.

The Model

In our structural model, the process of selling the assets of a real portfolio for a fixed date is illustrated by a cascading diagram, which has some similarities with the sales funnel (Figure 3). The top bar of this horizontal chart represents the aforementioned group of suspense, which includes assets that have not been sold once. Under it is a rod showing the total number of assets that have been sold at least once. The next rod 1+ represents the number of assets that have been sold more than once, so the difference in the values of the second and third rod gives 101 assets sold only once. Then, the 10+ bar represents assets sold each more than 10 times, so the difference in the values of the third and fourth bar, respectively, gives the number of assets (148) sold from 2 to 10 times. Finally, the 5th, last rod 100+ represents a group of record holders - assets sold each more than 100 times. Even a simple averaged calculation shows that the total portfolio income is formed, in fact, by the two lower groups of assets (31 * 10 + 6 * 100 = 910 sales), which make up only about 6% of the portfolio. At the same time, we note that among the six champions there are assets, each of which has been sold more than 250 times and more than 1,100 times, which only strengthens the conclusion.

Figure 3: The number of assets in the group of suspense (226), and assets sold at least once (Sold), incl. more than once (1+), more than ten times (10+), and more than a hundred times (100+) in the studied portfolio of digital images.

(Source: compiled by the authors based on own research)

As will be shown below, the process of filling a portfolio with assets is associated with the creative productivity of the author and is not necessarily stable. This process has its own uncertainties depending on the author's strategy. Our studies have shown that portfolios of this type have the property of momentum. It lies in the fact that the portfolio, first put up for sale, after market adaptation begins to generate income, regardless of whether it continues to replenish with new assets or not.

Here we understand momentum as a property to maintain stable functioning and long-term reproduction of achieved indicators, for example, such as the return on financial assets. In addition, structural momentum implies the ability of the system to maintain built-up causal relationships for a long time. For the studied area, the concept of investment momentum is close, as a property inherent in many classes of financial instruments (Grundy and Martin, 2001). Thus, the momentum effect of the intellectual assets portfolio that we have identified is the closest to the concept of momentum investing.

At the initial time, the owner of such a portfolio does not have any frequency or probability characteristics (sales, profitability, etc.) necessary for assessing risk. That is, it does not have any parameters that are usually used by the owners (managers) of portfolios of securities and similar assets. This uncertainty accompanies the portfolio of intellectual assets as long as there are assets in it that have not been sold at least once. In our model, this "group of suspense" plays the role of a kind of capacitor that responds to the impact of market demand with the events of the first sale of assets. The analogy with the capacitor here is not random, because our studies have shown that group of suspense, among other things, provides momentum property to such portfolios.

Each fact of the first sale is a primary indignation, which conditionally moves the sold asset to the next group of the first sale in order. Then, with repeated and subsequent sales, the assets are transferred to the following groups in order, but it is from the first sale that the information flow begins, which, on the one hand, shows the increase in total portfolio income, and on the other hand, a decrease in uncertainty. Note that in accordance with the concept of the cost of information, this flow can also be considered from the point of the cost of uncertainty (Morris, 1968).

Assume that a portfolio that is first put up for sale has an a priori uncertainty value proportional to the number of assets **n**. In this case, each first sale of each asset will reduce this value by an amount proportional to 1 / **n**. For example, if on a specific date 226 of the 506 assets in the portfolio were not sold at all, then the value of uncertainty can be estimated by the probability 226/506. Since, due to uncertainty, we do not know which of these assets will be sold, when this will happen, or whether it will happen at all, then this value is quite acceptable to use to determine the probability of non-receipt of income for this portfolio. Other absolute or relative indicators of uncertainty can be constructed, however, as noted above there is a portfolio management problem that significantly complicates the risk assessment algorithm.

This problem is that the author (owner) of the portfolio can put it up for sale at a time, and then do not take any action, for example, not replenish it with new assets. With this strategy, due to the already noted momentum, the uncertainty will decrease gradually, in the process of forming the first sale group and the further flow of assets in the direction of the record-holders group.

The portfolio works in a fundamentally different way when the author continuously replenishes it with new assets (for example, daily). In this case, it is impossible to significantly reduce the uncertainty, because each new work increases it, but sales, due to momentum effect, can occur much later, or not at all.

Finally, the author, guided by his own strategic motives, can upload new series of works with large time intervals, or vice versa, continuously replenishing the portfolio, periodically take long breaks. Thus, the ability to choose a portfolio management strategy makes it almost useless to use simple probabilistic uncertainty indicators. Nevertheless, observing the sales process for a long time, we can confidently say that a quantitative increase in the group of suspense always positively affects the profitability of such portfolios, and the momentum effect can significantly reduce the negative impact

of interruptions in replenishment of new assets. Moreover, a portfolio brought to a certain level of income, due to momentum, can continue to generate it for a long time with virtually no participation from the author. These observations tell us that the author's creative productivity factor is not critical from the point of the risk of non-receipt of income, but from the point of portfolio volume, it affects the achievement of the required income level.

Figure 4 shows the version of our simple hybrid Bayesian portfolio model that includes variables: Author's creative productivity (Prod), Demand, Sales, and discretised continuous variable of Earnings (Earn). To take into account the momentum effect, a priori probabilities on the bar chart of the author's productivity parental node are set in a ratio of 50/50. Managing of such a node allows us to simulate both a replenished portfolio and momentum effect without replenishment. The ratio of marginal probabilities in the demand node corresponds to our realistic assumption that, in the general case, market demand for assets should rather be characterized as low. Additional evidence for this assumption can be found in Figure 3.

a.

b.

Figure 4: Initial Bayesian model (a) and one possible state of diagnostic inference (b).
(Source: compiled by the authors based on own research)

The probabilities in the earnings node were given by the real continuous distribution that we experimentally obtained in one of the previous works (Voronov, Ivanov and Darushin, 2016). Each interval in this discretised diagram corresponds to one of the probabilistic states of the target variable. This distribution allowed us to test the hypothesis that, with a diagnostic probabilistic inference, the propagation of evidence in the earnings node in the direction from lower to higher values should be accompanied by an increase in probabilities in the sales node and (at least) in the demand parental node. By the selection of values in the conditional probabilities tables, such dependence was indeed

obtained. Actually, after that, direct, inverse and mixed probabilistic inferences with the model became possible (Mittal and Kassim, 2007).

The response of network to the input of evidence that the level of total portfolio income exceeded the expected value is shown in Figure 4 (b). The changed diagrams of the parental nodes indicate that it is more likely that such income is provided less by the author's productivity (probability increased by 1.6%) and to a greater extent by an increase in demand (increase from 40% to 50.9%). With this the total probability of getting sales has increased from 27.3% to 35.7%, and the probability of falling decreased.

Figure 5: State of mixed probabilistic inference.
(Source: compiled by the authors based on own research)

The modeling of the portfolio momentum effect (Figure 5) is programmed by a scenario in which the author's productivity node is put into a low probability state (low 100%). In fact, this means that the node does not affect sales. If at the same time the demand node is transferred to a state of high probability (high 100%), then even with an income level corresponding to the expected value (33.8%), the network gives a rather high probability of continued sales (high 63.8%). Propagation the evidence in the earnings node to the maximum continues to increase the likelihood of sales. Conversely, switching the demand node to the opposite state of low 100% gives the total probability of low 98.9% in the sales node, which indicates their complete cessation, regardless of the probability state in the earnings node moves to the maximum.

Conclusion and Further Research

The examples shown demonstrate the wide possibilities of network learning during the modeling of various probabilistic states of the portfolio under study. Even a simple Bayesian network allows us to analyze dozens of probabilistic states of the model and gradually reduce the aforementioned uncertainties. In particular, this became possible due to the fact that the earnings target variable is set by the continuous probability distribution obtained by us at the previous stage of the risk study of digital image portfolios.

In the structural model, taking into account the momentum effect of the portfolio, the productivity variable is directly related only to the group of suspense, which is actually not a sales group and makes the largest contribution to the sales uncertainty. Recall that all assets prior to the first sale are assigned to this group. The events of the first sale are not determined in time and are random in nature. For this reason, the group of suspense is the most-at-risk group. In this regard, we argue that the presence of such a group is typical for portfolios of intellectual assets of various classes and radically changes the approach to assessing risks and, in general, to managing such portfolios.

Our further work is aimed at solving the problem of uncertainty in the group of suspense. Preliminary calculations show that for this it is possible to use the algorithms of the theory of random sets (Dempster-Shafer theory, or TDS). The joint use of Bayesian network models and TDS allows us to quantify all possible situations and conditions that experts can foresee.

Resumen

Las pequeñas y medianas empresas (Pymes) se constituyen en una de las fuerzas de desarrollo económico más importantes a nivel mundial, especialmente en los países en vía de desarrollo como Colombia. Pese a que cuentan con ventajas competitivas, las Pymes siguen desapareciendo fácilmente del mercado. Muy poco se ha indagado sobre los factores internos que pudieran explicar las dificultades que atraviesan actualmente las Pymes, en especial aquellos que involucran al recurso humano, un factor que afecta otros procesos de la empresa. El presente estudio de tipo descriptivo, no experimental y transversal, busca identificar los procesos y/o prácticas más comunes en materia de gestión del talento humano en una muestra piloto de Pymes de la industria turística, manufacturera y logístico-portuaria de Cartagena, Colombia, considerados los sectores económicos más importantes de la ciudad. Los resultados muestran que, aunque las Pymes reconocen la importancia de los procesos de gestión del talento humano y su impacto en los resultados de las empresas, presentan serias limitaciones en cuanto al conocimiento e implementación de los mismos, lo cual se atribuye, en parte, a la falta de personal cualificado que los maneje. En los procesos y prácticas predomina la desarticulación e informalidad, así como la falta de direccionamiento estratégico del recurso humano para el crecimiento y competitividad en el mercado. Finalmente se observa, que, aunque las Pymes tienen un alto potencial para generar empleo, también poseen altos índices de rotación mostrando así sus dificultades para retener el talento humano.

Palabras Claves: Procesos, Gestión, Talento humano, PYMES.

Abstract

Small and medium-sized enterprises (SMEs) are one of the most important global development forces that mark the economy, especially in developing countries such as Colombia. Although they have competitive advantages, SMEs continue to disappear easily from the market. Very little has been asked about the internal factors that could explain the difficulties that SMEs are currently facing, especially those that involve human resources, a factor that affects other processes. This descriptive, non-experimental and cross-sectional study aim is to identify the most common processes and / or practices in the field of human talent management in a pilot sample of SMEs in the tourism, manufacturing and port logistics industry of Cartagena, Colombia, the most important economic sectors of the city. The

results shown that, although SMEs recognize the importance of human talent management processes and their impact on business results, they face serious limitations in terms of knowledge and implementation of human talent management processes, which is attributed, in part, to the lack of qualified personnel to handle them. In the processes and practices the disarticulation and informality predominates, and the lack of strategic direction of the human resource necessary for the growth and competitiveness in the market; with the activities they are currently doing. Finally, it is observed that, although SMEs have a high potential to generate employment, they also have high turnover rates thus showing their difficulties in retaining human talent.

Keywords: Processes, Management, Human talent, SMEs

Introducción

Las Pymes también conocidas como pequeñas y medianas empresas, son organizaciones económicas que desarrollan actividades industriales, comerciales y de servicios con un número limitado de trabajadores y facturación moderada (Jaramillo, 2005; Soto, 2013). Según La Confederación Nacional de Cámaras de Comercio "Confecámaras", en Colombia existen aproximadamente 1.500.000 micro, pequeñas y medianas empresas registradas, las cuales según el Departamento Administrativo Nacional de Estadística (DANE, 2013), representan al menos el 96.4% del parque empresarial nacional, con una participación en el PIB del país que alcanza el 38,7%. Así también, de acuerdo con una publicación de la revista Dinero (2016), el Ministerio de Comercio, Industria y Turismo de Colombia resalta que las Pymes generan más del 80% del empleo en el país.

Las Pymes además son reconocidas por la buena distribución que hacen de sus ingresos, por su agilidad en los procesos, flexibilidad laboral, capacidad de adaptación y aprendizaje, cercanía y orientación al cliente, lo que les permite detectar y satisfacer necesidades muy específicas; así como por su participación en el conjunto de la industria manufacturera y de servicios (Jaramillo, 2005). Estas organizaciones juegan un papel muy importante cuando se trata de hacer frente a retos de desarrollo, sostenibilidad y prestación de servicios. Debido a su importancia y grandes ventajas, el Congreso de la República de Colombia creó la Ley 590 de Julio 10 del 2000 (modificada en 2004 por la Ley 905) conocida como la ley MiPymes, la cual tiene por objeto promocionar y dirigir estas empresas hacia un desarrollo integral, proporcionándole los mecanismos necesarios para que puedan competir con éxito en mercados internos y externos. De igual forma, organismos como el Banco mundial, entre otros, han diseñado y ejecutado programas para hacer más competitivas a las Pymes.

A pesar del reconocimiento y del apoyo del estado, las Pymes están expuestas a riesgos que amenazan su estabilidad, lo cual se ve reflejado en su bajo promedio de vida. El estudio sobre supervivencia empresarial del 2016 realizado por la Confederación Colombiana de Cámaras de Comercio (Confecámaras, 2017), reveló que en Colombia la vida promedio de una empresa es de 5 años y que el 30% de las Pymes no sobreviven antes de este tiempo. De acuerdo con la Organización para la Cooperación y el Desarrollo (OCD), las Pymes enfrentan dificultades internas y externas que las ponen en desventaja frente a las grandes empresas, entre estas, la deficiente administración del talento humano que las integra, caracterizado con frecuencia por bajos niveles de innovación y emprendimiento, poco desarrollo de competencias y el predominio de la informalidad en los procesos (Jaramillo, 2005).

Existen pocos estudios sobre las características de los procesos de gestión del talento humano en las Pymes. La mayoría de los trabajos realizados al respecto estudian solo algunos de los procesos o se basan en las grandes empresas, por lo que la información obtenida no resulta generalizable a las Pymes, las cuales tienen características particulares que deben ser consideradas al momento de idear estrategias de intervención, y que influyen en la eficacia de cualquier metodología de gestión y planificación de los recursos humanos (Soto-Dolan, 2004). La mayoría de estudios desarrollado sobre las Pymes se han interesado en indagar sobre los factores externos que ponen en riesgo su existencia y desempeño (BID, 2002; BID, 2005; El banco mundial, 2008; FUNDES, 2003, 2010 entre otros, citados por Mora, Vera y Melgarejo, 2015), de manera que la participación de los empleados en los procesos de desarrollo y competitividad de estas organizaciones no ha sido suficientemente estudiada. En este sentido, el

objetivo de este trabajo es caracterizar los procesos de gestión del talento humano puestos en marcha por las Pymes de la industria Turística, Manufacturera y Logístico Portuaria y de la ciudad de Cartagena, Colombia, entendiendo que un manejo deficiente de esta área, funciones o actividades, influye en los demás procesos críticos de las empresas, si se entiende que solo a través del esfuerzo humano se pueden llevar a la realidad las grandes ventajas de otros recursos materiales, como la tecnología, la información, las materias primas etc. (Robbins & Judge, 2009).

Diseño Y Metodología De La Investigación

Se realizó un estudio descriptivo no experimental, transversal, en el que participaron 21 Pymes de la industria manufacturera, turísticas y logístico-portuarias de la ciudad de Cartagena. Se caracterizaron seis procesos de Gestión del Talento Humano en estas organizaciones: Planeación estratégica de los recursos humanos, selección de personal, capacitación y desarrollo, compensación, reconocimientos e incentivos, bienestar social labora y seguridad y salud en el trabajo. Para la selección de las organizaciones se realizó un muestreo no probabilístico por conveniencia, dado la dificultad de acceder a este tipo de organizaciones por las demandas que manejan en su operación. Se incluyeron todas las Pymes interesadas en participar en el estudio.

Para la recolección de la información se utilizó un cuestionario estructurado tipo encuesta de elaboración propia teniendo en cuenta una exhaustiva revisión de la literatura. El cuestionario está conformado por 100 preguntas que pretenden indagar de manera rigurosa sobre los procesos de gestión humana y fue diligenciado por un representante de cada organización.

En cuanto a las características de los encuestados, el 61,9% son mujeres y el 38,1% hombres, con una antigüedad de entre 1 y 13 años en la organización. La mayoría ocupan cargos gerenciales y de coordinación, tres encuestados tenían cargos relacionados con la gestión del talento humano y cuatro eran asistentes administrativos y auxiliares contable. Del total de las Pymes participantes, 16 (76,2%) eran empresas pequeñas (10-50 trabajadores) y 5 (23,8%) eran medianas (50-200 trabajadores). En relación al sector económico, 11 (52.4%) pertenecen al sector logístico turístico, 5 (23.8%) al sector logístico portuario) y 5 (23.8%) al sector manufacturero.

Resultados

El 66.7% de las Pymes, es decir 14 empresas, cuentan con un área de recurso humano. Todas las Pymes encuestadas del sector Logístico-portuario cuentan con esta área. Se evidencian oportunidades de mejora al respecto en las empresas turísticas y principalmente las de manufactura.

En relación al responsable de los procesos de recursos humanos (RRHH) en las Pymes, el 33,3% de las organizaciones informan que el gerente general, que además suele ser uno de los socios del negocio, es el encargado de realizar las funciones relacionadas con el manejo del talento humano, en seis de las Pymes (28.6%) estas actividades las lleva a cabo un asistente administrativo y solo cinco Pymes (23.8%) informaron que quién se encarga de tales funciones ocupa el cargo de Director/Coord. de RRHH.

A continuación, se describen las características de los procesos de gestión del talento humanos en las Pymes.

Planeación Estratégica De Los Recursos Humanos

La totalidad de las Pymes encuestadas consideran importante el recurso humano para alcanzar las metas y objetivos de la empresa. Todas informan que cuentan con una declaración explicita y compartida de su misión, visión y objetivos, metas, estrategias, políticas y valores, observándose que menos del 23,8% de estas organizaciones no cuanta con una declaración de estos últimos elementos de la gestión estratégica de la empresa. Lo anterior puede explicarse por el hecho de que los primeros elementos son requeridos por la Cámara de Comercio, entidad encargada de registrar legalmente la razón social de las

empresas en el país. El 81% de las Pymes manifestaron que cuentan con el personal necesario para cumplir sus metas y objetivos y el 76,2% cree que el personal con el que cuentan para ello está adecuadamente cualificado. Cabe resaltar que cuatro de las empresas (19%) señalaron no cumplir con estos criterios de la planificación estratégica del recurso humano. La mayoría de las organizaciones indicaron que en la actualidad un aspecto prioritario para ellos es ser rentables. Muy pocas empresas señalaron como prioridad, ser competitivas o aumentar su valor.

Selección De Personal

El 81% de las Pymes llevan a cabo el proceso de selección de personal, todas consideran que es un proceso necesario para la organización y el 85% afirma que impacta en los resultados de la misma. Dos empresas no realizan proceso de selección y en uno de los casos se desconocía si la organización realizaba este proceso. Los responsable o cargos que suelen participar en su ejecución son psicólogos, gerentes, supervisores y asistentes administrativos. Para este proceso las empresas tienen en cuenta principalmente las actividades que se señalan en la figura 1.

Figura 1: Actividades realizadas en el proceso de selección de personal

Es de anotar que nueve empresas no utilizan pruebas psicotécnicas para sus procesos de selección, sin embargo, las empresas que lo hacen (57,1%) recurren principalmente a las pruebas de tipo técnicas y de personalidad. Finalmente, el 60% de las empresas participantes informaron que en promedio llevan a cabo anualmente de 1 a 4 procesos de selección para cubrir sus vacantes. El 40% restante realizan de 5 a más de 10 procesos de selección al año, es decir, cuentan con una alta rotación de personal, despidos o creación de nuevos puestos. En la mayoría de los casos los procesos de selección duran entre 1 y 2 semanas (76,2%).

Capacitación Y Desarrollo

La capacitación y desarrollo es un proceso que se percibe como necesario para las empresas (85,7%) y que impacta en sus resultados (81%), sin embargo, resulta interesante que cuatro Pymes indiquen que no es así o duden de la importancia de este proceso. La mayoría de las empresas afirman realizar entrenamiento a los nuevos empleados (90,5%) e indagar sobre las necesidades de capacitación de sus trabajadores (71,4%), principalmente a través de la información proporcionada por los jefes o supervisores (57.1%). Muy pocas manifestaron indagar con los mismos trabajadores o considerar la información en los perfiles de cargo (23,8%), apoyarse en las evaluaciones del desempeño (38,1%) o

en las observaciones del desempeño en el puesto de trabajo (28,6%). La mayoría de las Pymes ejecutan planes de capacitación, realizan de 1 hasta 20 sesiones de capacitación al año, sin embargo, seis empresas manifestaron que no hacen capacitaciones o no dieron respuesta a esta pregunta. El 74% dicen disponer de los recursos necesarios para llevarlos a cabo, ya sean económicos, humanos, de infraestructura y equipos; pero no cuentan con el tiempo para desarrollar las capacitaciones. Es importante señalar que alrededor de siete empresas no disponen de ninguno de los recursos señalados. Solo el 52,4% de las empresas realizan estas sesiones de capacitación en el horario laboral, seis empresas capacitan al personal por fuera de su horario y dos no dieron respuesta.

Solo el 61,9% de las Pymes evalúan los resultados de la implementación de los planes de capacitación, pero no son claras acerca de los métodos que utilizan para medir el impacto de estas en los resultados de la empresa. Las competencias que con frecuencia buscan fortalecer o desarrollar en sus trabajadores son las técnicas que se relacionan con el cargo (66,7%), luego las personales o del ser (38,1%), interpersonales (23,8%) y profesionales (19%).

En cuanto al proceso de desarrollo de los trabajadores, la mayoría de Pymes refieren ofrecer oportunidades de ascenso y espacios para el desarrollo profesional (76,2%), por ejemplo, el 57,1% indican dar aviso a sus empleados acerca de oportunidades de becas o cursos. Sin embargo, se observa que la mayoría no realiza diseños de planes de carrera (61,9%) ni identifican las necesidades del personal para establecer estos planes (52,4%), lo cual es razonable si se considera que el tamaño y la estructura de estas empresas no posibilita que se realice con facilidad estas actividades.

Compensación, Reconocimientos E Incentivos

El 76,2% de las Pymes encuestadas consideran que este proceso es necesario y el 85,7% señalaron que este proceso tiene impacto en los resultados de la empresa. La mayoría de las Pymes aseguran contar con un sistema de compensación que estimule el ingreso, permanencia y motivación de los empleados (76,2%), sin embargo, al indagar sobre los elementos que componen el sistema, se halló que solo el 47,6% de estas empresas tiene en cuenta el pago de aspectos legales como salario y prestaciones sociales, y extralegales como incentivos por rendimiento. Solo el 42,9% afilia al trabajador y realiza el pago por concepto de seguridad social, y solo el 38,1% integran los beneficios como medida extralegal.

Aunque no todas realizan los pagos por compensación, al pregúntales si realizaban los pagos de manera oportuna por concepto de salario, prestaciones sociales y aportes al sistema de seguridad social, la mayoría respondió que sí (90,5%). Para establecer los salarios a los empleados, las Pymes tienen en cuenta el contenido y complejidad del cargo, los precios que se manejen en el mercado y el aporte del cargo a la producción. Por otra parte, el 57,1% indica que cuentan con un plan de incentivos por rendimiento que reconoce el desempeño individual y el 52,4% realiza retribuciones en especie para maximizar el desempeño.

Bienestar Social Laboral

Aunque un porcentaje importante de Pymes (85,7%) indicó que es necesario porque impacta los resultados de la empresa, solo el 52,4% señaló que cuenta con un programa estructurado de bienestar laboral para sus trabajadores y/o familia, pese a que el 61,9% de las Pymes señaló que contaban con los recursos para llevar a cabo los programas de bienestar, refiriéndose principalmente a los económicos, pero no así a los espacios de tiempo y la infraestructura física. Aunque la mayoría no cuente con un programa estructurado de bienestar, el 76,2% refiere implementar actividades que contribuyen al bienestar, principalmente las celebraciones; muy pocas realizan actividades recreativas, deportivas, culturales, de salud física, integración, formación etc. Las actividades van dirigidas principalmente a los trabajadores (52,4%), muy pocas involucran a las familias.

Seguridad Y Salud En El Trabajo

El 95,2% de las Pymes consideran que es necesario implementar este proceso porque impacta en los resultados de la empresa. Éstas indican cumplir con los requisitos mínimos para salvaguardar la

integridad de sus trabajadores, principalmente con el registro y reporte de incidentes, accidentes de trabajo (AT) y enfermedad de trabajo (ET) (85,7%), encontrándose mayor debilidad en la verificación de la gestión y resultados del sistema de gestión de seguridad y salud en el trabajo (SG-SST) (42,9%). De manera específica, el 57,1% de las Pymes señala que cuentan con políticas y objetivos en relación al SG-SST, 52,4% dice asignar los roles y responsabilidades al interior de la empresa para que dirijan este proceso, pero solo el 42,9% señalaron que estos roles rinde cuenta sobre su desempeño. Menos de la mitad (47,6%) afirma que cuentan con planes de capacitación y prevención sobre los peligros y riesgos prioritarios de la empresa que se extienden a todos los niveles de la organización, manejan indicadores en relación a este proceso, archivan y conservan los documentos que exige el SG-SST. Por otro lado, la mayoría (52,4%) no cuenta con una matriz legal vigente que aplique a las características de la empresa, no cuenta con mecanismos de comunicación y autoreporte en SST (57,1%), solo entre 10 y 11 empresas identifican y evalúan la adquisición de servicios y proveedores para el SG-SST.

En cuanto a la evaluación de las condiciones de salud de sus trabajadores, solo el 57,1% indicó que le hacen entrega de los perfiles de cargo al médico con la descripción de las tareas y el medio en el cual se desarrollará el trabajo, el 42,9% hace custodia de las historias clínicas a través de una institución prestadora de este servicio o del médico que práctica los exámenes laborales de la empresa, el 47,6% realizan y tienen en cuenta las restricciones y recomendaciones medico laborales y ponen en marcha programas para promover los estilos de vida y entornos saludable. El 66,7% señala que cuentan con el suministro de agua potable, servicios sanitarios y mecanismos para disponer y eliminar residuos sólidos, líquidos o gaseosos peligrosos que se producen y podrían poner en riesgo a los trabajadores. En relación a los mecanismos para la vigilancia de las condiciones de salud, el 81,0% indican que no llevan reportes de incidencia, prevalencia, frecuencia, severidad, mortalidad, ausentismo, e incapacidades por accidentes o enfermedad laboral, y no cuentan con programas de vigilancia epidemiológica.

La mayoría de empresas (81,0%) no realiza mediciones ambientales por riesgos químicos, físicos o biológicos, pero si realizan inspecciones de seguridad (61,9%), hacen mantenimiento periódico de instalaciones, equipos, máquinas y herramientas (71,4%), entregan elementos de protección personal (61,9%), solo un poco más de la mitad (57,1%) cuenta con brigada de prevención capacitada y dotada, realizan simulacros (61,9%), y cuentan con procedimientos para el trabajo seguro (52,4%). La mayoría no realiza auditorias anuales (71,4%) y la alta dirección no hace revisión de las acciones en materia de SG-SST (57,1%).

Discusión

La mayoría de las Pymes informaron contar con un área de recurso humano, principalmente las organizaciones del sector Logístico-portuario, no así las empresas turísticas y las de manufactura, un sector actualmente débil, pero de gran potencial para el desarrollo económico de la ciudad de Cartagena (Reyes & Vergara, 2009). Esto no es usual teniendo en cuenta que un rasgo característico de las Pymes, según la literatura, es que en muchas de ellas no existen departamentos de recursos humanos, ni órganos especializados para su gestión (Dolan, Valle, Jackson y Schuler, 2007). Los gerentes generales, administrativos y asistentes administrativos son los responsables de los procesos o prácticas relacionadas con la gestión del talento humano, lo que pone en entre dicho la existencia real de áreas de Recursos humanos, ya que son cargos que por su formación no deberían ser responsables directos de las funciones, procesos o actividades de manejo de personal.

De manera específica se encontró que, en materia de planeación estratégica de los recursos humanos, las Pymes participantes reconocen que es un proceso muy importante para alcanzar los resultados organizacionales, y cuentan con la cantidad de personal necesario y cualificado para cumplir con los objetivos de la empresa en coherencia con la misión y visión. En la actualidad, un aspecto prioritario para las Pymes es ser rentables, es decir, obtener el beneficio acorde con la inversión realizada. Muy pocas empresas tienen como prioridad ser competitivas o aumentar su valor, lo cual muestra la lucha de este tipo de empresas por adaptarse, mantenerse o sobrevivir en un mercado cada vez más cambiante, entre otras amenazas internas y externas a las que se ven enfrentados, pese a los intentos del gobierno

colombiano (señalados en la Ley 590 de 10 julio del 2000) por facilitar los mecanismos necesarios para que puedan competir con éxito en mercados internos y externos.

En lo concerniente al proceso de selección de personal, se encontró que la mayoría, pero no todas las empresas estudiadas, ponen en marcha este proceso; aunque reconocen que es necesario ya que impacta directamente en los resultados de la empresa. Las actividades menos frecuentes para la selección son la aplicación de pruebas psicotécnicas y las visitas sociofamiliares. Estos resultados coinciden con los encontrado en una muestra de MiPymes de los sectores de alimentos y confecciones de la ciudad de Barranquilla, en las que se evidencia que no contemplan en sus procesos las pruebas psicológicas y las visitas domiciliaria ya sea porque no cuentan con los recursos para contratar a un profesional de la psicología o porque no cuentan con el tiempo para realizar procesos rigurosos de selección (Jaramillo, 2005).

Las empresas participantes refirieron que para cubrir sus vacantes, en promedio llevan a cabo de uno a cuatro procesos de selección al año, aunque una cantidad igualmente importante de Pymes indica llegar a requerir de cinco a diez procesos de selección durante el mismo periodo de tiempo, esto debido a la alta rotación generada en parte por sus dificultades para retener al personal y por los despidos a trabajadores que sorprenden presentando comportamientos desviados, que como ya se ha señalado en la literatura, aparecen ante la insatisfacción de los trabajadores. De esta manera, se evidencia que, si bien las Pymes tienen un alto potencial para generar empleo, también presentan dificultades para mantener o motivar al personal en el que ya han invertido sus recursos económicos y de capital intelectual (Dolan, Valle, Jackson y Schuler, 2007). Por otro lado, la mayoría de las Pymes señalan tomarse entre una y dos semanas para realizar sus procesos de selección, indicando agilidad, pero no necesariamente calidad o eficacia al momento se escoger al personal. El criterio preferido de reclutamiento en estas empresas es la familiaridad o conocimiento previo del negocio (Hernández, Naranjo y Álvarez, 2007; Naranjo, 2012).

Acerca de los procesos de capacitación y desarrollo, considerados claves para el perfeccionamiento de las competencias del personal para mejorar el desempeño en sus labores y aumentar la competitividad de las organizaciones, se encontró que, aunque la mayoría de empresas manifiestan llevarlo a cabo, a diferencia de lo reportado por (Jaramillo, 2005), se identificaron empresas que no lo hacen. Esto llama la atención si se considera que todas las Pymes reportan que este proceso es necesario dado que reconocen el retorno de la inversión por el impacto que tiene en los resultados de la empresa. Las organizaciones que implementan procesos de capacitación se inclinan por métodos que no les representen mayores costos económicos y de tiempo; y las competencias que más buscan fortalecer o desarrollar son las técnicas o relacionadas con el cargo.

Por su parte, en cuanto al proceso de desarrollo de empleados, la mayoría de Pymes refieren ofrecer oportunidades de ascenso y espacios para el desarrollo profesional especialmente cuando dan aviso a sus empleados acerca de oportunidades de becas o cursos. Sin embargo, la mayoría no realiza diseños de planes de carrera y demás acciones requeridas para ello, lo cual resulta razonable si se considera que el tamaño y la estructura de estas empresas no posibilita que se realice estas actividades.

Con respecto al proceso de compensación, reconocimientos e incentivos, se encontró que la mayoría de las Pymes aseguran contar con un sistema de compensación que estimula el ingreso, la permanencia y motivación de los empleados. Solo cinco empresas indicaron que no, lo cual no coincide con los resultados encontrados en otros procesos en los que se evidencia las altas tasas de rotación que manejan las Pymes. Al consultar sobre los elementos que componen el sistema, se evidenció que solo la mitad de las empresas encuestadas manifestaron tener en cuenta el pago de aportes legales y extralegales, y menos de la mitad señalaron incluir la seguridad social y los beneficios, lo cual también difiere de lo encontrado en el proceso de contratación en el que se asegura que la mayoría de empresas detalla en el contrato estos aspectos, lo que indicarían una desconexión entre el proceso de contratación y de compensación o un desconocimiento por parte de los encuestados de los elementos que componen un sistema de retribución.

Por otra parte, solo un poco más de la mitad de las Pymes indican que cuentan con un plan de incentivos por rendimiento que reconozca el desempeño individual y retribuciones en especie para maximizar la eficiencia y desempeño de sus empleados, lo cual se relaciona con lo encontrado por Jaramillo (2011) en su estudio, en el que indica que si bien las Pymes cumplen con aspectos fundamentales de ley como el salario mínimo, las prestaciones y seguridad social, no se otorgan beneficios adicionales voluntarios que apunten a satisfacer y motivar el máximo rendimiento de sus trabajadores.

Por lo que se refiere al proceso de bienestar social laboral, las Pymes señalan que les resulta muy importante su puesta en marcha dado que impacta los resultados de la organización, no obstante, solo la mitad de las empresas encuestadas señaló que cuentan con programas de bienestar establecidos formalmente para los trabajadores, y muy poco involucran a las familias, resultados que se relacionan con lo encontrado por Jaramillo (2011). La mayoría de empresas dicen no contar con políticas de bienestar laboral y tampoco indagan sobre las necesidades y percepciones de los empleados en materia de bienestar.

Con respecto a la Seguridad y Salud en el Trabajo (SST), para las Pymes es indiscutible la necesidad del proceso por las implicaciones que tiene en los resultados de la empresa, pero principalmente porque está regulado por la ley colombiana. Al indagar sobre los requisitos mínimos que deben cumplir en materia de seguridad y salud se encontró que la mayoría de las empresas participantes reportaron contar con un Sistema de Gestión de Seguridad y Salud en el Trabajo. Dado las implicaciones legales, económicas y sociales que tiene la puesta en marcha de estas acciones para las empresas, sus trabajadores y familias, resulta preocupante que seis de las empresas participantes manifiesten no estar adelantando estas medidas y peor aún, no tener conocimiento acerca de ellas.

En relación a las actividades que ponen en marcha las Pymes en cuanto al proceso de SST, solo un poco más de la mitad indicó contar con políticas y objetivos en relación al Sistema de Gestión de Seguridad y Salud en el trabajo (SG-SST). Sin embargo, la mayoría de las empresas coinciden en que no se están realizando las acciones específicas que integran el SG-SST, poniéndose en evidencia la aparición del fenómeno de deseabilidad social o el desconocimiento de la legislación. Finalmente, aunque las Pymes ponen en marcha actividades para prevenir y controlar riesgos que podrían afectar la seguridad y salud de sus trabajadores, estas medidas son insuficientes según los requerimientos de ley.

En general se logra evidenciar que más que procesos articulados entre si y alineados con la gestión estratégica de las empresas, las pymes desarrollan a través de personal poco calificado una serie de prácticas y actividades no estandarizadas, la mayoría regulada por la ley y de naturaleza reactiva. También se encontró que estas empresas no miden el impacto o resultado de las acciones que emprenden en el desempeño de sus colaboradores y en la productividad de la organización, lo cual permite entender la razón por la que la alta gerencia se muestra reacia a invertir mayores recursos, toda vez que tienen dificultades para cuantificar el beneficio de la inversión.

Se puede observar que reconocen, aunque de manera incipiente el valor de la gestión del recurso humano, pero presentan dificultades para planear, diseñar e implementar las medidas necesarias para atraer, motivar, retener y desarrollar el talento, ya sea porque no cuentan con el personal idóneo o compétete para ello, o porque debido a la escasez de recursos económicos, las demandas del mercado y a la necesidad de ser rentables, centran su atención y disponen el tiempo para la operación. Lo anterior se traduce en un círculo vicioso que a su vez resulta en la alta rotación y el bajo aprovechamiento del potencial creativo-innovador del recurso humano característico de las Pymes, condición que finalmente nos les permite mantenerse y competir en un mercado globalizado.

Abstract

Unlike value added tax, excise taxation is limited by excisable goods, the list of which each state establishes on its territory and taxes once, or in the case of resale via tax deductions, which undoubtedly meets the requirements of indirect taxation. Our research of excise influence on budget efficiency of a state allowed us to formulate the key provisions. The influence of alcohol and tobacco excises is a disincentive factor, which helps reduce consumption of the harmful goods. Excises on petrochemical goods, whose production hurts the planet's eco system demonstrate the same approach. At the same time raising the state's excise rates on the goods harmful either for the people or the eco system is aimed at looking for alternative ways of attaining our goals and maintaining life. This is the way the government attracts attention of business to ecological problems. When the government sets higher excise rates on the traditionally excisable goods, it reduces revenues of their producers. In the short term, it undermines budget revenue from excisable goods produced in the country. From a macroeconomic point of view, we see a general declining trend of tax revenue on imported excisable goods although the government raises excises on all groups of goods (products) annually.

Keywords: Excisable Goods, Tax Rates, Taxation, Budget, Taxes on Consumption, Functions of Taxes

Introduction

Excises are one of the oldest groups of taxes. At that, excises along with the customs payments, VAT and the retail tax belong to the category of indirect taxes, which are charged to the taxpayers during production or sales of the products (goods). Besides, the excises are paid by the end consumer, because their size make part of the sold products' (goods') price (Zhang, et. al. 2020; Huang, et. al. 2020; Akhmadeev, et. al. 2019).

At the same time, unlike other indirect taxes, the excises are set as a rule on high margin goods (Nwaka, 2020). In this case, part of the tax is paid to the budget from the super profits of excisable goods' producers (sellers).

On the other hand, the excises are seen as a means of limiting consumption of harmful goods (alcohol, tobacco) or polluting substances (petrochemical goods, petrol and its derivatives) by the end consumer (Zeng, 2020).

Literature Review

For practical means of excise taxation, one should single out the obligation to establish the key elements of the tax for each country -- the taxpayers, the subject of taxation and the taxation base structure, the types of rates (specific, ad valorem and combined) as well as the order of their calculation and payment (Lehoux, et. al. 2019; Golubtsova, et. al. 2019).

This in turn means that the excise payers have a statutory obligation to the tax agencies, and the legal content of obligatory, individual and free taxation for the taxpayers to pay money to ensure functioning of the state. Another key difference of the excise type of taxation from other levies and tax payments is the statutory aim of its collection to replenish the state coffers for further distribution (Morozova, et. al. 2019; Petrov, et. al. 2019).

While talking about the key differences of excises from other types of taxes on ultimate consumption, we should note the specific features of their use on the goods from the list of taxable goods (products), which, in its turn, has no expanded taxation base, like, for instance, VAT. Another feature of an excise is its non-equivalent nature of collection (Lehoux, et. al. 2019) which differs them from customs payments and collections on the use of socially important goods.

We can single out several types of excises by their functions in international taxation:

a) traditional groups of excisable goods (alcohol and tobacco products, furs, etc), which have the purpose limitation for the end user and a significant fiscal component for the payers (organizations, small business owners or people carrying out operations with excisable goods), etc.
b) a group of combustive and lubricant materials and petrochemical products, which have a saving and ecological function (Kosov, et. al. 2016; Xin, 2020).
c) a group of expensive and branded goods (vehicles and appliances of the lux segment), which represent the redistributive function of taxation from the individuals' super profits or the encouraging function for local producers of the goods with the help of the excises, taking into account customs payments on imported goods (Petrov, et. al. 2019; Chaudhary, 2020).

At the same time, we should note state support for the cars with petrol and diesel engines with lower CO_2 type emission and the use of necessary catalysts as a promising international trend in the development of excise taxation – the application of lower excises on less pollutive engines and lower coefficients when calculating the taxation base for another tax, the transportation tax (Petrov, et. al. 2019), because different countries use different approaches (Akhmadeev, et. al. 2019; Kosolapov, et. al. 2019). That's why considering the current approach to compiling the list of excisable goods and revealing their budget effectiveness is important.

Theoretical Background

The Russian Federation has been using the following classification of excisable goods by group since January 1, 2020 (Fig. 1).

Fig. 1: The current classification of excisable goods of the Russian Federation from January 1, 2020

We should note that straight-run petrol includes any petrol fractions (except car petrol), acrylates produced from:

1) distillation (fractionation) of oil, gas condensate, associated oil gas, natural gas;
2) refining (chemical conversion) of shale oil, coal, oil fractions, gas condensate fractions, associated oil gas, natural gas.

According to the written explanations of the Finance Ministry of the Russian Federation (№ 03-07-06/4458 dated February 1, 2016), the petrol fraction is a liquid hydrocarbon mixture with a temperature ranging between 15 and 20ºC, and pressure of 101.3 kPa. The petrol fraction should meet the following criteria under the current regulations:

a) density in a range of 650 - 749 kg/m^3 and operating temperature of 15 - 20ºC;
b) the temperature, at which no less than 90% of the mixture is distilled (pressure 101.3 kPa) does not exceed 215ºC.

The fractions are not petrol fractions if they are produced as a result of:

1) introduction (alkylation) of the corresponding hydrocarbon gases;
2) content of methyl tert-butyl ether or other ethers and alcohols does not exceed 85% of the volume;
3) oxidation and etherification of olefins, aromatic hydrocarbons, alcohols, aldehydes, ketones, carboxylic acids;
4) hydrogenation, hydration and dehydration of alcohols, aldehydes, ketones, carboxylic acids;
5) the mass fraction of benzene or toluene or xylene should exceed 85%, while the mass fraction of paraxylene, ortoxylene, pentane, isoprene or isopentane should exceed 95% of alphamethylstyrene.

We should note that the current order puts the liquid hydrocarbon mixtures at 20ºC and atmospheric pressure of 101.3 kPa produced as a result of primary or secondary refining of oil, gas condensate, associated gas and shale oil in the middle distillates category. Density indicators should not exceed 930 kg/m^3, temperature to be no less than 20ºC. The high viscosity products category comprises the mixtures of liquid hydrocarbons with the following indicators: temperature 20ºC, atmospheric pressure 101.3 kPa and physical and chemical features as follows:

a) kinematic viscosity at 100º C amounts to 2.2 centistokes and more;
b) flash point in an open cup of over 80ºC and the pour point not exceeding 35ºC (Akhmadeev, 2019).

The excise taxable oil stock includes the following hydrocarbon mixtures:

a) oil and stable oil condensate;
b) vacuum gasoil at a temperature of 20ºC and pressure of 101.33 kPa with density of over 845 kg/m^3 and kinematic viscosity at a temperature 80ºC of over 3 centistokes;
c) tar at temperature of 20ºC and pressure of 101.3 kPa with density of over 930 kg/m^3, and heating oil.

We should note that the current order puts liquid or solid hydrocarbon mixtures (temperature 20ºC, operating pressure 101.3 kPa) into the excisable goods category. These liquids can be produced as a result of primary or secondary refining of oil, stable gas condensate, associated gas, shale oil. At that, the maximum density indicator should exceed 860 kg/m^3, and temperature 20ºC. If there is kinematic viscosity and temperature below 100ºC, centistokes and sulphur content should not exceed 1.2% of the volume. At that, the following goods (products) are not excisable:

1) medicine, including homeopathic drugs, with state registration and included in a special list approved by the customs union of the EAEU states;
2) alcohol-containing products: perfume and cosmetics, household chemicals (in metal aerosol packaging) and perfume products of small volumes;
3) veterinary drugs in tanks with a volume no more than 100 ml with state registration and included in a special list
4) wastes of further refining or use for technical means of ethyl alcohol and ethyl alcohol derivatives;
5) wort.

Results and Discussion

Let's make a comparative analysis of budget income by the tax category: Group A: the goods (works, services) sold and taxable in Russia (VAT and excises); Group B: imported goods subject to VAT and excises; Group C: taxes on income (profit); Group D: property tax; Group E: taxes, levies and charges for the use of natural resources; Group F: other taxes, levies, fines (fig. 2).

Fig. 2: Budget revenue from taxes by category of taxes and levies

The grand total growth of tax revenue of the Russian Federation budget amounted to 54.44% as of January 1, 2019 compared with January 1, 2018. However, we can see that the growth of tax contributions to the budget of some categories under analysis declines in 2019/2018 and 2018/2017. For example, growth in the B group fell by 0.019%, while in groups D and E by insignificant 0.039% and 0. 067% respectively. This is why the most important aspect of our research is a review of group

B, which analyzes budget revenue from the excises on the goods (products) imported to the Russian Federation and produced in the Russian Federation (fig. 3).

Fig 3: Tax revenue growth from excisable goods

Thus, our research of excises on excisable goods and their contribution to the state coffers for the period under research allowed us to formulate the following statements. The influence of excises on excisable alcohol and tobacco products is a disincentive factor, helping to reduce consumption of the goods. The excises on petrochemical products, whose production harms the eco system of the planet, have the same role (Kuznetsov, 2017; Fitzpatrick, 2020).

Conclusion

Consequently, when the excise rates on the goods harmful for the humans or nature rise, we should look for alternative ways of attaining our goals while safeguarding life. Thus, the state agencies attract attention of business to ecological problems (Korableva, 2019; Loureiro, 2020). One the one hand, higher excise rates on the traditional excisable goods reduce producers' revenue. In the short term, it can undermine budget revenue mainly from the excisable goods produced in the Russian Federation.

At the same time, due to the macroeconomic situation and despite annual indexation by the government of the excises on all groups of goods (products), there is a general falling trend on budget revenue from excisable imported goods. Consequently, the key advantages of the excises on excisable goods in the groups we researched are as follows:

a) stable tax revenues in the group of consumption taxes;

b) a clear list of excisable goods (products), which allows the government to have a direct influence on inflationary expectations in the economy;

c) direct influence on the reduction of consumption of harmful goods from some excisable categories (tobacco products, electronic systems and e-cigarette liquids, alcohol products;

d) state regulation and cost reimbursement for the ecologic component for some types of excisable goods (oil stock, dark marine fuel, natural gas, middle distillates, benzene, paraxylene, ortoxylene, etc.).

Abstract

The article is devoted to the study of the consequences of Russia's entry into the WTO. The main content of the study is an analysis of the positive and negative effects on the economy that followed the country's accession to the WTO. The authors substantiate the idea that at the moment it is difficult to give a clear assessment of the results of Russia's accession to the WTO due to a number of factors, which include the introduction of economic sanctions against Russia and a change in the foreign trade policy of a number of WTO member countries. Nevertheless, the emphasis is placed on the high importance of precisely the positive aspects. The article focuses on the possible reform of the World Trade Organization. The article summarizes the intermediate results of the study of this issue and defines the main introductory provisions.

Keywords: WTO, Russia, international trade, economic sanctions, WTO reform.

Introduction

Currently, the Russian Federation is an integral part of the international trade space, however, Russia's accession to the WTO was preceded by lengthy negotiations for 18 years. The desire of the Russian Federation to join the World Trade Organization has been criticized more than once and contributed to the development of disputes and discussions on this issue. Not all countries that joined the WTO were able to integrate effectively into the global economic space (Pomfret R., 2005); Baccini L., Impullitti G., Malesky E.J., 2019). Seven years have passed since Russia entered the WTO, which allows us to analyze the results of this process. The aim of the study is to study the positive and negative consequences of Russia's entry into the World Trade Organization, which are present in the country's economy. The object of the study is the Russian economy, we do not consider its individual industries or spheres.

The objectives of the work are to consider the goals that Russia set for itself when entering the WTO, to analyze the positive and negative aspects of this process and assess the need for reforming the international trade organization.

The hypothesis is the opinion that the positive effect of Russia's entry into the World Trade prevails over the negative. The scientific novelty lies in the fact that the positive aspects arose not as a result of achieving the set goals of joining the WTO, but as a result of external factors, such as the imposition of sanctions against Russia and the failure of the members of the trade organization to comply with the rules and regulations.

At the present stage, the World Trade Organization, which includes 164 countries, is the only and uncontested regulator of world trade. However, the norms of its activity have not been fully implemented by member countries recently, since trade operations are not based on market rules but considering the political and economic interests of the participating countries. This approach is contrary to WTO standards, and therefore an opinion has emerged about the need to reform the World Trade Organization. This determined the relevance of this study.

The study is introductory, should not have previous scientific work. We define only general provisions and approaches.

Regulatory documents, scientific publications, as well as statistical databases, based on which generalized conclusions of the study were used as sources of information.

The basis of the work is the theoretical methods of cognition: the study of scientific, economic, statistical information and literature regarding Russia's participation in international economic relations, an analysis that made it possible to compare the initial goals of Russia's accession to the WTO with the results achieved, a generalization of which made conclusions.

Reasons for Russia's accession to the World Trade Organization

Russia, being an integral part of the world economic system, is taking key vectors of its development. The world economy is characterized by trends towards globalization, and national economies are integrating into the new system. Obviously, the active economic and political development of Russia is impossible without intensive participation in world integration processes. That is why one of the most pressing and important issues of economic policy is the process of Russia's entry into the World Trade Organization (Lapshina O., 2011).

Russia's desire to enter the WTO is argued by the following factors (Kuhlevskaya A.N., Molodezheva N.S., Brestskaya A.E., 2017):

1. An increase in the pace of Russia's integration into the world economy;

2. Increase in foreign trade by reducing customs duties;

3. Creating a favorable climate for attracting foreign investment in the country;

4. Opening access for Russian investors to the financial resources of WTO member countries;

5. Use of the dispute resolution mechanism within the WTO;

6. Creating conditions for the modernization of production, improving the quality and competitiveness of domestic products as a result of access to the latest world technologies;

7. Getting protection from financial, technical, sanitary discrimination;

8. Improving the country's image at the international level.

All of the above reasons should be considered as the intended goals of Russia's accession to the WTO, and as a prerequisite is the fact that Russia - a country with great economic, resource, scientific potential, participating in international trade, but not having legal protection at the world level, was obliged become a member of the WTO.

An international trade system can provide the following benefits to participants:

- for enterprises that are exporters of goods and services;

There is a guarantee of access for exporting enterprises to world markets as a result of the existence of so-called “frozen” tariffs, which will not be changed as a result of their sudden growth or the introduction of new restrictions by importing countries (Polubotko A.A., Gerasin K.S., 2018). In the

service market, there are also obligations between countries to not restrict access to the market for service providers, which are recorded in the national list of obligations.

In the WTO system, there are uniform rules that make unified the requirements that apply to exporters in various markets, which helps them in their activities.

All these circumstances make it possible for Russian export industries to develop investment and production plans in conditions of instability and uncertainty.

- for enterprises that act as importers of raw materials, goods and services necessary for participation in production.

For such enterprises, a rule applies in the international trade system, according to which it is necessary to issue a permit to import imports without further restrictions after payment of customs duties. There are also guarantees that the rules applied at the border comply with the uniform rules of the agreements. All these measures facilitate the import process. Also, the value of tariffs determined by the framework of the agreements is an indicator of the stability of the costs of importers as a result of increasing customs duties.

As part of the negotiations on goods, 57 bilateral protocols were signed on liberalizing access to the goods market. The parties agreed to reduce the weighted average import tariff rate for all non-agricultural products to 7.3% of the current level - 9.5%. In accordance with the concluded documents, export duties began to apply to about 700 tariff lines, affecting various types of goods.

The agreements concluded as part of the negotiations concerned various sectors of the economy. The agreement on agriculture prohibits WTO member countries from providing any measures of state support for the production and export of agricultural products beyond those agreed upon during accession negotiations. As a result of negotiations, at the time of Russia's accession to the WTO, the level of possible subsidies was determined at $ 9 billion, and by 2018 it was reduced to $ 4.4 billion. However, the green box measures can be used as support, since WTO, their size is not regulated, as well as create regional unions. As a condition for integration, a reduction in import duties on all food products by 30% produced in Russia was adopted. In January 2020, Russia fulfilled its latest tariff obligation to the WTO, setting a flat pork tariff at 25%. Prior to this, a zero rate was in effect, and for pork delivered in excess of the quota, the tariff was set at 65%.

In the field of access to natural resources, Russia has committed itself to increasing the price of natural resources for domestic production (prices for the population are to be temporarily regulated) to the level of export prices for resources.

In accordance with the agreement on the protection of intellectual property rights in the field of trade, a payment is required for the use by a participating country of patents of other countries. As a result, deliveries of equipment and technologies to Russia for the proposed technological re-equipment of the economy will certainly have a “patent” price premium since 97% of world patents are property of highly developed states.

There are obligations to reform legislation and public administration. In accordance with the requirements of normal organizations. Nevertheless, some obligations are still not fully implemented in the field of reforming the public procurement system, transparency of legal acts, responsibility for discrimination abroad, etc. The first two groups of obligations (lowering import duties and removing administrative barriers) will have the greatest consequences for the domestic economy, which will greatly simplify access to the Russian market for foreign goods and lead to a reduction in the market share of Russian enterprises.

Thus, joining the WTO is a significant challenge for the competitiveness of the state as a whole and for individual organizations. But, this should have become a catalyst for the development of the economy, improving the business climate, which in the medium term could enable Russia to take a more advantageous place in the international division of labor, increase attractiveness for investments, and the possibility of taking part in the formation of international trade rules and norms.

Pros and cons of Russia's entry into the WTO.

As positive points, you can specify the following:

- **Now you can use the procedures for resolving trade disputes.** Russia began to file lawsuits against other countries, mainly European, to remove or reduce tariff restrictions. For example, in 2012, 143 restrictive measures were set against Russia, then in 2017 there were already 83. There are disputes that still cannot be resolved: disputes over the Third Energy Package with the European Union, wagons and railway equipment with Ukraine, over the introduction of duties on steel and aluminum by the United States (Sycheva I.N., Tikhomirova Yu.,2016).

- **Improving international trade conditions.** Immediately after joining the WTO, some countries canceled several their protectionist measures against Russia. So, the United States canceled the Jackson-Venik amendment, according to which Russia did not have the most favored nation treatment in the field of trade.
