- **The growth of several industries.** The positive effects, according to the goals of the government, should not have appeared immediately, but in subsequent years, but this was prevented by the sanctions imposed against Russia. However, later they had a positive impact on the Russian economy the imposition of retaliatory sanctions had a positive impact on the country's agriculture and auto industry. The import substitution policy, accompanied by significant financing, contributed to the growth of agricultural production in 2016, 2017 by 4.8% and 3%, respectively, in 2019 by 4%. In accordance with its obligations, Russia was supposed to reduce import duties on cars to 15%. The reduction in duties, according to theory, should lead to an increase in imports of products, but this did not happen with respect to the automotive industry, as the Russian government took the following measures: introduced recycling charges for all automakers, facilitated the opening of factories for the production of machinery and equipment in the country.

- **Improving the image of the country.** As a result of joining the WTO, Russia became an equal participant in the global trading system, which in turn significantly reduced the barriers to international trade and the trading market. Also, the Russian Federation has gained absolute access to various international schemes, thanks to which all disputed issues can be resolved. (Sycheva I.N., Tikhomirova Yu., 2016).

Despite the positive aspects, we can state the presence of negative consequences from Russia's entry into the World Trade Organization:

- **Increased competition in the domestic Russian market.** Due to lower duties on imported goods, competition with foreign partners inside Russia has increased. This led to the fact that imports of goods increased, and exports began to fall. In 2013, the balance of foreign trade turnover decreased by 10%. The export structure has also changed. The share of machinery and equipment, metal and chemical products increased, but the share of exports of fuel and energy products decreased. With increasing competition, it became difficult to cope with the agricultural and light industries. However, such a trend existed only at the beginning of the process of Russia's integration into the world trading system, and subsequently, as a result of the reorientation of trade directions, export flows began to prevail over import flows.

- **The lag of several industries.** In many industries, it was not possible to take part in the competition and demonstrate negative dynamics against the backdrop of declining competition with foreign enterprises [7]. The agricultural engineering industry is going through hard times. During the World Trade Organization, they expected problems, and after accession they intensified. In 2017, the share of agricultural engineering products is only 0.1% of the country's GDP, which indicates the unsatisfactory state of the industry and its low position in the economy.

- Agricultural machinery of western producers is more attractive to Russian farmers. Therefore, a decrease in import duties negatively affected the demand for domestic engineering products. At the same time, the low competitiveness of the product itself in comparison with foreign production should be considered. A complete modernization of obsolete moral and physical equipment, infrastructure and production technology is necessary. But this is possible only with the direct support of the state through subsidies, since there is no reason to hope for private investment because of low interest.

Since 2013, the state began to actively subsidize the production of domestic agricultural machinery, which had a positive effect on the trade balance: export and import of products began to level out. Another positive factor for the growth in sales of agricultural machinery was the devaluation of the national currency, which led to an increase in the cost of foreign equipment and the reorientation of Russian buyers to domestic products.

According to analytical data, in 2016, the volume of export deliveries of agricultural engineering products increased by 20%, the St. Petersburg Tractor Plant is the leading supplier of equipment, it accounted for 17% of the increase. The main buyer of agricultural machinery is Kazakhstan, it accounts for about 60% of exports.

- **Failed to achieve all the goals.** The purpose of joining the WTO - to facilitate the access of Russian products to the world market - in fact, has not been achieved. Russia did not gain access to new technologies, for example, the United States banned the import of equipment for oil and gas companies. The sanctions introduced against Russia scared off potential investors. In 2014, there was the largest capital outflow of $ 150 billion, in 2015 - $ 56.9 billion, and in 2018 - $ 60 billion. Also, Russian companies lost access to foreign financial resources. Foreign banks have become more wary of Russian borrowers and tightened credit requirements.

- **Decrease in budget revenues.** The economic losses of the state budget of Russia due to the reduction of import duties on goods amounted to about 800 billion rubles.

- **Growth in unemployment.** The entry of the Russian Federation into the WTO served the closure of about 40 thousand enterprises and firms, as well as an increase in the number of unemployed to 30 million people. There was a reduction in the total number of jobs by 40% in various regions (Tatarkin A., 2012).

The impact of sanctions and changes in foreign trade policy on the consequences of Russia's accession to the WTO

As a result of the adoption of sanctions against Russia in 2014, the main part of the benefits of joining the WTO was lost. These sanctions were introduced by the United States as amended by the GATT article, according to which countries have the right to introduce restrictions to ensure national security (Shigabiev T.N., 2014).

There are different points of view that the sanctions imposed against Russia contradict the WTO rules, which are based on the principle of “free trade”. It seems to us that this is a really difficult question, which is more legal than economic in nature. So, in one of the studies it is concluded that anti-Russian sanctions do not contradict the norms of the World Trade Organization, since they have a political basis, and the settlement of disputes for political reasons is not the responsibility of the organization.

And Russia's appeal to the Dispute Resolution Authority will not force us to lift US and EU sanctions, but it can serve as a starting point for starting the negotiation process. Also, as the authors note, in the regulatory documents of the WTO there is no such thing as economic sanctions, which in turn also makes it difficult to resolve this issue (Travina L.A., Yevtushenko S.A., 2016).

I would like to pay special attention to how the accession to the WTO affected the agro-industrial complex of Russia, since it plays an important social role in the country's economy.

Many experts said that after Russia's entry into the WTO, such a sector of the agro-industrial complex as pig breeding will be at risk. Since Russia reduced import duties from 15% to 0% under the quota and from 75% to 65% outside the quota. This led to an increase in imports of cheap pork from Europe and a decrease in the price of these products to 30%. This, accordingly, negatively affected the domestic manufacturer, many efficient enterprises had to revise their business plans, as they could not win in the competition with foreign suppliers.

However, the situation changed in 2014, when Russia imposed a food embargo on the European Union, the United States and other countries. It was forbidden to import into the country such products as fish, beef, pork, poultry, cheeses, milk, fruits, vegetables. The food embargo was a response to the sanctions imposed against Russia by the United States and the European Union. The impact of retaliatory

sanctions on the agro-industrial complex can be viewed on the positive side, as this allowed the farmers to increase production. In 2013, the volume of deliveries of products from abroad amounted to 43 billion dollars, and in 2016 only 25 billion dollars. Also, the share of imports in pork consumption from 2013 to 2016. decreased by 8%, and poultry meat consumption by 5%, the same situation was observed in 2018. Thus, it turns out that the imposition of sanctions helped the development of this sector of the agro-industrial complex of Russia. However, European manufacturers resorted to WTO tools and demanded that Russia lift the ban on the import of products into the country.

Currently, due to frequent economic and political crises, there are opinions about the need for Russia to exit the WTO. In 2017, a bill on Russia's withdrawal from the WTO was submitted to the State Duma, which was rejected. The authors of the bill referred to the significant negative effects that the Russian economy received from joining the WTO. However, according to experts, the presence of the country in the WTO allowed for a full-fledged foreign trade policy, and to build international alliances. And the exit will only lead to an increase in the influence of international sanctions and to the inability to defend the country's trade and economic interests on the world stage.

Russia's exit from the WTO will lead to isolation from the international market and technology, which in turn will be the starting point for a slowdown in the growth of scientific and technological progress in the country (Sopina N.V., Bliznyuk E.I., 2019).

An alternative to withdrawing from the WTO is the development of internal state policy aimed at stimulating economic activity in order to overcome the negative effects: reduced employment, low labor productivity, etc. (Gubaidullinaa T., Yakupov Al., 2015; Khairullov D., 2015).

According to another point of view, the World Trade Organization should no longer be regarded as the main regulator of international trade. Countries should conclude bilateral joint trade agreements, and this will be more effective.

As a threat to the international trade system today, there are contradictions of a political and economic nature that arise between states. Which in turn can lead to a crisis in the institutions of the international trade system and the WTO.

The multilateral trade negotiations that began in Doha have now come to a standstill, and new acute problems of current trade policy have been added to existing unresolved issues.

US trade policy has a clear protectionist and anti-globalization focus. This can be explained by the fact that China began to claim the role of world leader in foreign trade turnover (which happened in 2012), as well as the US’s reluctance to change its trade policy due to changing external terms of trade (Miropolskii D.Iu., Selishcheva T.A., 2018 et al.,).

In 2018, the United States introduced a series of protectionist measures, citing domestic legislation: the Trade Expansion Act and the Trade Act. The WTO does not prohibit the use of such measures but limits them to a certain scope. The member countries of the organization apply restrictive measures, but they do not comply with WTO standards.

Recently, much has been said about the US withdrawal from the World Trade Organization. According to experts, this is due to the fact that the interests of the leading members of the organization are now diverging. The reason for this was the growing role of China. If earlier the PRC was regarded as a “single assembly shop”, today it is a multidisciplinary industrial power that attracts investment and technology. This makes the United States and Western Europe more difficult to compete with. There is a contradiction in the movement of free flows of goods and free flows of capital, which is now sent to new industrial countries. Controlling them for the United States and Western Europe is becoming increasingly difficult. In this connection, they began to talk about the WTO crisis. For example, negotiations on agricultural subsidies between developing and developed countries have not yet been completed, but this does not mean that if the WTO ceases to exist, these problems will be resolved.

We will have to create new institutions that will regulate trade relations in the world and will take enough time. It seems to us that countries should use existing tools to resolve trade contradictions, and not look for new ones (Selishcheva T.A., et al., 2018; etc).

It seems to us that comparing the positive and negative consequences of Russia's joining the World Trade Organization is currently a complex process. Firstly, in order to better evaluate the results, it is

necessary that at least 10 years have passed since joining the organization. Secondly, the goals and objectives that Russia set upon entering the WTO underwent changes due to geopolitical factors, such as the imposition of sanctions and the implementation of the import substitution policy. However, if we turn to statistics (Fig. 1), we can see that the first two years of Russia's membership in the WTO yielded positive results, and only since 2014, there has been a sharp decrease in indicators.

Compiled by authors from the wto.org

Fig. 1: Foreign trade indicators dynamic of the Russian Federation.

According to the World Trade Organization, starting in 2012, Russia's trade balance remained positive, with exports exceeding imports. Starting from 2014, these indicators begin to decline and only in 2016 does the growth trend reappear. The foreign trade turnover of Russia has a similar trend, which falls in 2014 and begins to grow only in 2016. Therefore, we can conclude that over two years the country has adapted to the new terms of trade in connection with the imposition of sanctions against Russia, and only in 2016 did foreign trade indicators show positive dynamics.

Conclusion

On the one hand, the accession to the WTO for the Russian economy had a number of positive consequences: the opportunity appeared to use procedures for resolving trade disputes, the conditions for international trade improved, a number of sectors of the economy were growing, the image of the country in the international arena increased, competition in the domestic Russian market increased . On the other hand, one can note the negative sides of this process: several sectors of the economy lagged, a decrease in budget revenues was recorded, and unemployment increased.

Although the set goals have not been fully achieved, today there is a positive trend in the volume of foreign trade of the Russian Federation. The introduction of sanctions against Russia and the ongoing change in the rules of world trade had a strong negative effect on achieving the goals of WTO accession. All this led to the fact that Russia's trade policy began to move in a different direction.

Over the past decades, the situation in the world has changed dramatically, and the rules and regulations of the WTO have remained unchanged, so it becomes difficult to resolve mutual political and economic issues for different countries. In this connection, there is a need to reform the World Trade Organization. First, it is necessary to improve the legal framework of the WTO, which does not provide enough protection against unfair trade practices in the field of copyright, technology transfer, support for state-owned companies, and industrial enterprises.

Abstract

This article discusses the trends in the use of renewable energy sources (RES), and the possibility of financing them. Today, the issue of "green financing" is very relevant and is being discussed all over the world at the highest level, since the main advantage of such energy is its inexhaustibility and ecological purity. The use of renewable energy does not change the energy balance of the planet, which is very important in the framework of the concept of sustainable development and for the transition of many countries to reduce the dependence of economies on hydrocarbons. These qualities served as the reason for the rapid development of renewable energy abroad and in Russia. From a practical point of view, the transition to sustainable development means a fundamental change in business and management processes in order to stop the destruction of key ecosystems, the depletion of non-renewable resources and the widening gap between the rich and the poor. The time has come in the field of "green" (clean) technologies and sustainable development. Sustainable development has ceased to be an exclusively academic concept and is becoming mainstream in the world of business and investment.

Keywords: Sustainable Development, Renewable Energy Sources, «Green Financing», «Green» Economy, «Green» Investments, Financing Of «Green» Investments, State Support.

Introduction

At present, both in the world and in Russia, adjustments are being made to previously implemented development management models. After comprehensive liberalization of the turn of the 20-21 centuries, which has captured our country as well, there is an increase in certain conservatism in national economic policies, which is associated with an increase in the level of state interventionism, an increase in the importance of state programming and planning, a course towards reindustrialization, and expansion of social models. responsibility, etc. (Borkova et al., 2019). One of the new phenomena in the modernization of policies implemented at the international, national and regional levels is the implementation of tools for ensuring sustainable development [6-10, etc.].

In connection with the foregoing, today the green investment is considered by the Government of Russia both as a tool for solving environmental problems and as a factor in ensuring sustainable development and achieving economic growth (Vertakova Y., Plotnikov V., 2017). As follows from the Sustainable Development Goals (SDGs), approved by the UN, these two concepts - sustainability and economic growth - are interdependent, while green investment is a prerequisite for the implementation of both directions of development (Vertakova Y.V., Plotnikov V.A., 2019). The concept of a green economy and green financing based on it arose in the process of forming the concept of sustainable development (Porfiryeva B.N., 2018). To date, the process of transition to a green economy has not yet been clearly determined, since the setting up of a national mechanism for financing green investments has not been completed.

So, sustainable development in the modern world has ceased to be an exclusively academic concept and is becoming mainstream in a practice-oriented world of business and investment, which requires the development of management tools of both the market and administrative-state type, focused on stimulating green investments and creating a green finance market.

World Experience of Green Development

In the world, especially in developed countries, considerable attention is paid to green growth and development models. Thus, the countries of Northern Europe and the EU have determined their future based on a carbon-free economy, so they focus on carbon-free / low-carbon finance. At the same time, it is obvious that the transition of traditional energy systems from fossil fuels to renewable technologies will require significant financial investments. Figure 1, to illustrate this conclusion, presents data on investments in renewable energy in the world.

On the graph, we see global investment in renewable technology from 2004 to 2016. In 2004, $ 47 billion was invested in such projects worldwide. By 2016, this figure increased by almost 6 times. In 2019, according to preliminary estimates, green investments amounted to $ 288.9 billion (and even $ 340.9 billion - considering the construction of hydropower plants with a capacity of more than 50 MW). This is 11% less than in 2018 (mainly due to a significant drop in investment in China) (Publishing House "MBI", 2018).

The largest increase in renewable energy investments occurred in China, increasing from $ 3 billion in 2004 to $ 103 billion by 2016 (an increase of 3400%). China is currently the largest investor in renewable technology, investing about as much as the United States, Europe, and India combined. In 2019, investment in China amounted to $ 83.4 billion, which is 8% less than in 2018, and this figure was the lowest since 2013.

Compiled by authors from the data of the Our World. Sustainable Development Goals Tracker.

Fig. 1: Investments in renewable energy technologies per year by region, $ billion.

It is important to note that for the first time in ten years, investments in wind energy (mainland and offshore) have exceeded investments in solar energy. Investments in wind generation, thanks to the offshore segment, grew by 6% to $ 138.2 billion, and in solar generation decreased by 3%, to $ 131.1 billion. The drop-in capital expenditures in wind and solar energy probably led to by the end of 2019, a total of 180 GW of wind and solar power plants were built in the world, 20 GW more than in 2018 (Forys, I., Cymerman, J., 2019).

Back to fig. 1, it reflects the picture of the volume of investments in absolute terms, which, of course, is very important, but this picture does not consider the size of investments compared to the country's economy. At first glance, it seems that the largest economies will also be the largest investors. If we want to evaluate which countries make a fair “contribution” or “share” of investments in clean energy, then it is important for us to evaluate investment contributions as a percentage of the country's gross domestic product (GDP). We calculated the percentage of investments in GDP as a percentage and reflected on the chart the largest investors at present (Fig. 2).

Compiled by authors from the data of the Our World. Sustainable Development Goals Tracker.

Fig. 2: Investments in renewable energy, % of GDP

Thus, you can see that now the picture shows us a slightly different picture. Most countries invest less than 1 percent of GDP in renewable technologies (except for South Africa and Chile, which make an impressive 1.4 percent). However, these countries are not among the highly developed. China has been and remains one of the largest investors, its contribution at the level of 0.9 percent. Interestingly, the United States in absolute terms is the second largest global investor, but in relative terms their contribution is relatively small: in 2018, the United States invested only 0.2 percent of its GDP in green energy projects.

Not only our analysis, but also a study of the literature and evidence shows that when it comes to the relative costs of investing in renewable energy sources, countries with economies in transition, as well as developing low- and middle-income countries, usually invest more than countries high income. This may be partly explained by the fact that these countries are likely to invest a higher percentage of their GDP in total supply and expansion of energy consumption (whereas high-income countries usually have well-developed energy systems).

However, most high-income countries have set ambitious targets for reducing greenhouse gas emissions in their commitments under the Paris Climate Agreement. For example, China has set as its goal to reduce carbon dioxide emissions per unit of GDP by 60-65% from the 2005 level; Japan declared a decrease of 25.4% compared with 2005; The United States intends to achieve the overall economic goal of reducing greenhouse gas emissions by 20-28% below the 2005 level in 2025 and to make every effort to reduce emissions by 28% (while the United States declares its non-participation in further participation in the Paris Agreement) (Borkova E., Plotnikov V., 2019 et al.).

Russian Practice of Regulating Green Development

On September 21, 2019, Prime Minister Dmitry Medvedev signed a government decree on the adoption of the Paris Climate Agreement. The main goal of this agreement is to prevent climate change and to keep the increase in global average temperature by the end of the 21st century at "much lower" 2 ° C in excess of pre-industrial indicators (the parties to the agreement intend to make efforts to limit the temperature increase to 1.5 ° C). According to climate scientists, the main anthropogenic factor in global warming is carbon dioxide, which enters the atmosphere mainly from emissions from industrial enterprises. In this regard, it was precisely the reduction of CO2 emissions that became the target indicator for the implementation of the Paris Agreement.

The Kyoto Protocol (1997), which preceded this document, obliged the participating countries to reduce greenhouse gas emissions by 5.2% compared to the 1990 level. The Paris Agreement does not establish global standards for reducing emissions, and each participating country determines its own targets (it is assumed that the parties to the agreement will review them every five years). For countries that do not achieve the stated indicators, penalties are not provided, but such countries are kept in order to provide them with possible assistance. The agreement does not establish strict restrictions on mitigation of CO2 emission targets, however, in case of non-compliance, a participating country may incur reputation costs and be subjected to pressure from the world community and the media. After a minimum three-year membership period has elapsed (not including the period required for legal registration of the issue), a participating country may withdraw from the Paris Agreement (Gorobets, A., Morkovina, S., 2018 et al.).

To fulfill the obligations stipulated by the agreement, Russia set a goal to reduce greenhouse gas emissions “to the level of 70–75% of 1990 emissions by 2030, subject to the maximum possible absorption capacity of Russian forests”. There is an opinion that such a restriction may have significant negative consequences for the Russian economy. These fears are since several researchers noted a low assessment of the absorption capacity of Russian forests, given in the carbon balance of the country.

In addition, the Russian Union of Industrialists and Entrepreneurs expressed concern that the introduction of a “carbon tax” could harm Russian industry. According to ACRA, an assessment of the

potential risks of economic slowdown in connection with the adoption of the Paris Agreement should be carried out considering the correct assessment of the absorption capacity of Russian forests.

According to Roshydromet, in 2017, greenhouse gas emissions in CO2 equivalent were 2.2 billion tons, which, considering carbon sequestration by the country's forests (580 million tons), is equivalent to 1.6 billion tons. If we compare this with the volume of greenhouse gas emissions in 1990 (according to various estimates, from 2.3 to 3.1 billion tons), even according to the most conservative estimates, CO2 emissions now account for 69% of the 1990 level, which falls within the above target range of 70–75%.

I must say that 2018 was the year in which carbon emissions over the past seven years became the largest and grew by 2.0% compared to the previous year, experts directly associate this growth with an increase in energy demand.

Compiled by authors from the data of the bp.com

Fig. 3: CO2 emissions by country per million tons of carbon dioxide.

It is important to note that at the last UN summit on climate change, within the framework of the 73rd General Assembly of this international organization, 77 countries committed to completely stop greenhouse gas emissions into the atmosphere by 2050, another 70 countries promised to expand their national plans on this issue by 2020 year. For example, France stated that it would not trade with countries that did not comply with the Paris climate agreement, Germany would seek "carbon neutrality" by 2050.

The development of the above processes has not spared Russia. In Russia a restriction of anthropogenic greenhouse gas emissions to 70-75% of the 1990 level by 2030 has been declared, this may become a

long-term indicator of state policy, subject to the maximum possible absorption capacity of forests. At the same time, this policy itself, in this regard, requires a fundamental review (Iu, M.D., Selishcheva, T.A., Diatlov, 2018 et al.).

Thus, the Forecast of the Long-Term Socio-Economic Development of the Russian Federation for the Period until 2030, Developed by the Ministry of Economic Development of Russia, suggests that "a set of institutional, legislative, financial and economic measures will be implemented by 2020 aimed at the gradual transition from financing of fossil fuels to financing green technologies.

In addition, it should be borne in mind that Russia has gigantic reserves of geothermal energy, they are estimated to be 10 times higher than the reserves of organic fuel in the country. Already, about half of all new energy capacities commissioned in Russia are hydroelectric power plants, nuclear power plants and renewable energy stations. According to experts, the total energy generation potential of alternative sources is estimated at about 3 billion tons of oil equivalent per year.

Soon, more than 1.5 GW of solar generation will be commissioned in Russia. Over the past year, solar power plants have been launched in the republics of Altai and Bashkortostan, in the Orenburg region. Launched a high-tech production of solar modules in the city Novocheboksarsk. The main task of the state at this stage, according to the author, is to create tools for the transition to renewable energy sources. In the interest of combating climate change, work is underway to reduce the dependence of the economy on hydrocarbons.

By 2035, it is planned to attract $ 53 billion into the renewable energy sector. This requires the development of both special instruments to stimulate green investment and the green financing market. These institutional transformations should become, according to the author, one of the priorities of the current state policy.

Conclusion

The development of the global economy in the 21st century will take place under the sign of increasing social and environmental restrictions, which makes the choice in favor of the sustainable development trajectory uncontested. Continued implementation of the traditional expansionist model of economic growth has gained visible limits. Today, more and more often, politicians and ordinary people ask the question: "What kind of land will our children get?" To maintain and improve the quality of life, a change in the economic model is required, which requires adequate modernization of state policy (Borkova E., Kochkin T., 2019 et al.).

An analysis carried out on the example of renewable energy showed that both in the world and in Russia, in this sphere of green development, there are very important and ambitious tasks, the solution of which requires significant investments. Most likely, public finance cannot be their source, since Governments have many other urgent tasks, including those related to the SDGs, which necessitates the intensification of private investment in green projects. For this, in our opinion, both the creation of new stimulating instruments within the framework of the state investment policy and the development of the green finance market are required.

On the Causal Dynamics Between Crude Oil Process, Natural Gas Prices and Economic Activity in Poland – Time and Frequency Domain Perspective

Andrzej GEISE

Nicolaus Copernicus University, Torun, Poland
a.geise@umk.pl

Abstract

Economic activity behavior depends on all the external and internal events that have the potential to disrupt the flow of business cycle. These causes could be related with changes in main macroeconomic processes, economic policy or adjustments in external markets, like world market of energy resource. Prices of oil and gas have a significant meaning for economic development, but the relationship between economic growth and changes in energy resource prices are not always identified. Several studies have focused on the relationship between economic activity and the oil prices in time domain, where authors investigate the dynamic behavior with linear or non-linear approach. In this paper, we use a VECM model and Granger causality test in time and frequency domain to investigate the movements between oil prices, natural gas prices and economic activity in Poland. The findings of research provide evidence that economic activity in Poland depends on oil prices in long term (low and medium frequencies) and short term. In the case of natural gas prices, there is long-term and short-term neutrality of economic activity in Poland, which means that a changes in gas prices have no effect on economic growth.

Keywords: Granger Causality, Time Domain, Frequency Domain, VEC Model.

Introduction

Crude oil, natural gas and coal are main energy commodities for the global economy. All three markets are driven by the imbalances in global supply/demand relationship, which cause increased speculations on energy resource prices. The global character of energy resource markets has an important meaning for the economies of many countries. This economies are highly dependent upon imports of mineral fuel, and thus upon the prices of energy resources. From a macroeconomic policy point of view, the studies of the relationship between energy resource markets and economic activity are a part of mainstream research.

Policy makers rely on empirical research and based on it the hedging strategies against excessive economic activity and oil price movements are build. Most of empirical works were focused on theories with using time series analysis, without considering to test these theories on a context of frequency domain. The analysis of particular economic relationship in the case of time and frequency domain is useful, because the dynamics of any macroeconomic variable can be expected to reflect adjustments to an long-term equilibrium path, whereas the adjustments are due to reaction of main markets, economic uncertainty, and cost of information gathering (Hallett and Richter (2004)). That can suggest the differences in adjustment and behavior of economic processes at different frequencies. To overcome this limitation, the research were conducted both in time and frequency movements in oil prices and economic activity for a small net-importing country.

The main purpose of this study is to examine the dynamic relationship between energy resource prices (i.e. oil and natural gas) and economic activity in small net-importing country, like Poland (i.e. industrial production index, consumer prices index, exchange rate and stock exchange).

The concept of research study is presented on Fig 1.

Fig. 1: The concept of studying the Granger causality in the time and frequency domain

The hypothesis is constructed and tested using the vector error correction model (VECM) and the Granger causality in time (Wald test) and frequency domain (Breitung and Candelon approach) for polish economy. We estimate an VEC model. In the analysis the monthly data of Brent oil price, natural gas prices, industry production index, consumer price index, WIG stock market index and exchange rate for a polish economy from January 1995 to June 2019 were used.

This paper is organized as follows. Section 2 briefly shows the relationships between macroeconomic factors and energy resource prices. Section 3 presents the econometric methods used in the study. Section 4 introduce the empirical results of conducted analysis and, Section 5 presents the policy implications and concludes the paper.

Background of The Study – Macroeconomic Factors and Energy Resource Prieces

The linkages between energy resource prices and macroeconomic activity have been studied in the literature from various perspectives. Economists have been mostly analyzed the relationships between oil prices and main economic components (i.e. GDP, production index, exchange rates or stock prices) involving time series analysis. Also, it is worth to notice, that the intensity of the oil price-macroeconomy nexus is related with level of oil dependencies, use of renewable energy sources in economy, oil-importing or oil-exporting type of economy and tax structure in country.

Hamilton (1983, 2003) showed that the economic recession can be predicted by increases in the oil price, suggesting that oil prices as a leading economic indicator predict a slowdown of growth. Also, early studies in the area of relationships among macroeconomy and oil prices support the general view that oil prices were a linear and significant determinant of economic growth (Hamilton (1983); Gisser and Goodwin (1986); Burbridge and Harrison (1984)). Further findings showed that this linear relationship become weaker over time (Hooker (1996)) and the nature of this dependencies is nonlinear (Mork (1989, 1994)). In contrast, Bernanke et al (1997), rejected the hypothesis about significant effects of oil prices on economic activity in the U.S., due to a restrictive monetary policy. However, some recent works showed that the reaction of economic activity to oil price shocks is significant and asymmetric, which means the economic activity react more to increases in crude oil prices than to oil price decreases, and the intensity of reaction differ among net oil exporters and net oil importers (Brown and Yucel (2002); Hamilton and Herrera (2004); Lardic and Mignon (2008); Geise and Piłatowska (2014, 2016); Mohaddes and Pesaran (2017); Geise (2018); Evgenidis (2018)).

Distinction between oil-exporting and oil-importing economies is crucial for understanding the potential effects of oil prices shocks on economic activity. Small oil-importing developing economies are more dependent on external oil supplies which, in effect, means they are more adversely affected by oil price increases, in short- and long-term perspective (Schubert and Turnovsky (2011)). In contrast, Mohaddes and Pesaran (2017), verified that for global economy the net effect of lower oil prices is positive. Researchers showed, that the beneficial income effect for oil importers will show up in higher demand, while the income loss effect for oil exporters will show up in the loss of revenues. However the increases in spending by oil importers will exceeded the decline in expenditures by oil exporters, because it will implies the higher demand for energy and this will put the upward pressure on oil prices, which in turn, will trigger the adjustment process to long-run equilibrium (Mohaddes and Pesaran (2017)).

Using Bayesian threshold VAR model, Evgenidis (2018) concluded that the intensity of reaction in production index, inflation, economic sentiment, interest rate or stock market index to oil price shock is related with the high stress periods. It means that oil price shocks transmission mechanism in eurozone differ in stable (tranquil) and high stress state of economy. Disproportional reaction of economy is especially visible in reaction of inflation (HICP) to a larger oil price shocks. Also economic sentiment and stock market returns decline faster in the stressed period than in stable state of business cycle. Many studies have challenged the notion that fluctuations of oil prices have a significant impact on macroeconomy. For instance, Castro and Jiménez-Rodríguez (2017), based on VAR methodology conclude that European producers can adapt to higher oil price pressures without transmitting higher prices to final consumers. In turn, Diaz et al (2016), showed that stock returns in G7 countries reacts negatively to an increase in oil price volatility. Lee, Lee, and Ning (2017) using a structural VAR model, showed that net oil-importing economies are affected with higher country risk.

All research mentioned above are concentrated on the time domain analysis. Because of the unilateral perspective of analysis, there are some limitations in identification of the relations between energy resource prices and economic activity. Time series analysis may not capture the full links between those variables, while the linkages between oil prices, gas prices and macroeconomic factors may exist at different frequencies. Granger (1969), Geweke (1982), Hosaya (1991) and Breitung and Candelon (2006), among the others, showed that relationships between the economic variables can differ across the different frequencies. Methods of frequency domain analysis, currently, are used more often. Frequency domain is important because the macroeconomic variables can differ in intensity and direction of fluctuations. The sequences of cycle changes are repeatable, but not at regular intervals of time, which means the unobserved cycles have a different lengths of each phases. Also, the business cycle phases can differ in terms of steepness, deepness and sharpness (Clements and Krolzig (2003)). Total identification of relations between energy resource price shocks and economic activity among different frequencies and in time domain can capture the full picture of oil price-macroeconomy nexus.

In general, oil prices-macroeconomy nexus is asymmetric and related with state of economy. In chosen works, this relationship is reexamined with frequency methods. For instance, Benhmad (2013), explored the causality among oil prices and dollar exchange rate at various scales with using a wavelets approach. Oil prices cause the changes in dollar exchange rate at high frequency bands, but at medium and low frequency bands the bidirectional causality was identified. Asguiar-Conraria and Soares (2011), based on wavelets analysis, showed that, the demand-driven oil price shocks have become more important for fluctuations of economic growth than other shocks (i.e. supply side shocks).

Another important contribution is research Wei and Guo (2016), where based on VAR model and Breitung and Candelon (2006) procedure for Granger causality in frequency domain, conclude that oil prices can predict China's export at frequencies larger than 2 years, but there is no strong evidence to support the hypothesis about predictive power of oil prices for China's output. In time domain, authors implied that oil price shocks have a positive effects on output and negative effects on interest rate. Findings in Das, Bhatia, Pillai and Tiwari (2018) implied that in short-term perspective (high frequencies) the supply-side oil shocks are driven the US economic growth. However, in medium and low frequencies (medium-term and long-term perspective) the demand-side oil shocks driven the US economic growth.

The result of frequency domain study adds a new dimension to the literature on the relationship between crude oil prices and economic growth by focusing upon the time-frequency varying business cycle fluctuations (Das et al (2018)). Policymakers need to consider the size, direction (positive or negative), economic situation when oil price shock occurs and some hidden insights about transmission of oil price shocks to economic growth in medium and low frequencies to build appropriate and effective economic policy.

Granger Causality Testing

Time Domain

Operational definition of Granger (1969) causality in time domain is formulated for wide sense stationary time series and it is based on forecasting errors. The VAR representation of the time series can be used in forecasting and has the form (Osińska (2008)):

$$\Theta(L)z_t = \varepsilon_t \tag{1}$$

where $z_t = [x_t, y_t]'$ and $\Theta(L) = I - \Theta_1 L - \cdots - \Theta_p L^p$.

Moving average representation takes the form:

$$z_t = \Phi(L)\varepsilon_t = \begin{bmatrix} \phi_{11}(L) & \phi_{12}(L) \\ \phi_{21}(L) & \phi_{22}(L) \end{bmatrix} \begin{bmatrix} \varepsilon_{1t} \\ \varepsilon_{2t} \end{bmatrix} \tag{2}$$

The forecast variance of x_{t+1} conditional on X_t is denoted by $\sigma^2(x_{t+1}|X_t)$. Also the forecast variance is calculated with additional information about Y_t and takes the form $\sigma^2(x_{t+1}|X_t \cup Y_t)$. The above allows to formulate that the variable y_t is Granger cause for x_t if (Osińska (2011)):

$$\sigma^2(x_{t+1}|X_t) > \sigma^2(x_{t+1}|X_t \cup Y_t) \tag{3}$$

The hypothesis that y_t does not cause x_t in time domain implies a linear restriction for the coefficients in the regression equation:

$$x_t = \alpha_1 x_{t-1} + \cdots + \alpha_p x_{t-p} + \beta_1 y_{t-1} + \cdots + \beta_p y_{t-p} + u_t \tag{4}$$

Frequency Domain

To testing for causality in the frequency domain we used the framework developed by Breitung and Candelon (2006). The procedure allows us to test for causality between economic processes at some prespecified frequency. Appling a Choleski decomposition to the VAR representation (eq. 1). Then the orthogonalized MA representation takes the form:

$$z_t = \Phi(L)G\eta_t = \Psi(L)\eta_t = \begin{bmatrix} \Psi_{11}(L) & \Psi_{12}(L) \\ \Psi_{21}(L) & \Psi_{22}(L) \end{bmatrix} \begin{bmatrix} \eta_{1t} \\ \eta_{2t} \end{bmatrix} \tag{5}$$

Spectral density of x_t takes the following form

$$f_x(\omega) = \frac{1}{2\pi}\left\{\left|\Psi_{11}(e^{-i\omega})\right|^2 + \left|\Psi_{12}(e^{-i\omega})\right|^2\right\} \tag{6}$$

Based on the measure of Granger causality suggested by Geweke (1982) and Hosaya's (1991), Breitung and Candelon (2006) construct a test for causality in the frequency domain as:

$$M_{y\to x}(\omega) = \frac{\left|\Psi_{12}(e^{-i\omega})\right|^2}{2\pi f_u(\omega)} \quad (7)$$

Where the spectral density of the univariate forecast error takes the form:

$$f_u(\omega) = \frac{\sigma_1^2}{2\pi} + \frac{\left|\Psi_{12}(e^{-i\omega})\right|^2}{2\pi} \quad (8)$$

and can be reduced by using the additional information of the past y_t.

Univariate forecast error (u_t) by the equation (4) relates to the multivariate forecast error (ε_{1t}), and takes the form:

$$\varepsilon_t = \Psi_{12}(L)\eta_{2t} + \varepsilon_{1t} \quad (9)$$

Test hypothesis for Granger causality in frequency domain takes the form (Breitung and Candelon (2006)):

$$H_0: M_{y\to x}(\omega) = R(\omega)\beta = 0 \quad (10)$$

and means that y_t does not cause x_t at frequency ω, where $\beta = [\beta_1, \dots, \beta_p]'$ and $R(\omega) = \begin{bmatrix} cos(\omega) & cos(2\omega) & \dots & cos(p\omega) \\ sin(\omega) & sin(2\omega) & \dots & sin(p\omega) \end{bmatrix}$.

The test statistic has the standard F distribution as $F(2, T-2p)$.

Empirical Analysis of Relationship Between Economic Activity in Poland and Oil Prices and Gas Prices

In order to test the relationship among economic activity and energy resource prices, we employ the macroeconomic variables for Poland, denoted as follows:

- Industrial production index (ipp_t) (in constant price from 2010),
- Consumer price index (cpi_t) (in constant price from 2010),
- Warsaw stock market index (wig_t) (in points),
- Exchange rate (us/pl_t) (in polish zloty for one US dollar),
- Brent oil prices (b_t) (the adjusted Brent spot crude oil prices in U.S dollar),
- Natural gas prices (gas_t) (the adjusted spot prices in U.S dollar).

The data used in the analysis come from the OECD database (http://oecd.org), stooq database (http://stooq.com) and Energy Information Administration database (http://eia.gov). The sample covers monthly data from January 1995 to June 2019 (294 observations). All series were seasonally adjusted, where the TRAMO/SEATS procedure were used. However, only in the case of consumer price index, the seasonal component was significant and removed by the method. It is well known that most of macroeconomic processes are not stationary. To test the non-stationarity of series the ADF (*augmented Dickey-Fuller test*) test was applied. Also to support the results of unit root test, the KPSS test (*Kwiatkowski-Phillips-Schmidt-Shin test*) is used.

Table 1: The ADF and KPSS test results for economic variables

Variable		ADF test				KPSS test			
		Levels		FD	SD	Levels		FD	SD
		c	c+t	c	c	c	c+t	c	c
ipp_t	I(1)	-1,306	-2,23	-26,33 **	-	2,048 **	0,282 **	0,144	-
cpi_t	I(2)	-6,214 **	-6,28 **	-3,766 **	-13,14 **	1,804 **	0,381 **	1,211 **	0,387
wig_t	I(1)	-3,328 **	-3,27	-18,03 **	-	1,120 **	0,220 **	0,193	-
us/pl_t	I(1)	-2,288	-2,24	-15,79 **	-	0,198	0,209 **	0,121	-
b_t	I(1)	-1,713	-2,00	-13,80 **	-	-1,508 **	0,329 **	0,101	-
gas_t	I(1)	-1,953	-1,57	-5,202 **	-	1,309 **	0,342 **	0,222	-

*FD – first differences; SD – second differences; c – test with constant; c+t – test with linear trend and constant; ** - denotes rejection of the hypothesis at the 0.05 level; critical value for KPSS test (with constant – 0,463; with constant and trend – 0,146)*
Source: Own calculation in Eviews11

Table 1 presents the results of the unit roots (ADF) test and stationarity (KPSS) test in log levels and first differences. The results of ADF test confirms that the industrial production index, stock market index, exchange rate, Brent oil prices and natural gas prices are integrated $I(1)$. The ADF test results for consumer price index are inconsistent with the results of KPSS test. The null hypothesis of non-stationarity of consumer price time series in ADF test is rejected for log levels (in both types of test: with constant (c) and test with constant and trend ($c+t$)), what means that *cpi* could be a stationary process. While the KPSS test (where the null hypothesis of stationarity is rejected in log levels and first differences) suggest the second order of integration ($I(2)$) in seasonally adjusted consumer price index (see Tab. 1). Because of the inconsistence in ADF test, we diced to take the KPSS test results under consideration. Hence, all variables, except *cpi*, in log level are $I(1)$ variables, while the first differences of *cpi* are $I(1)$ then the cointegration analysis were conducted in next step.

The vector of variables used in cointegration analysis and VECM model construction takes the form:

$$\begin{bmatrix} \ln_ipp_t \\ \Delta\ln_cpi_t \\ \ln_wig_t \\ \ln_us/pl_t \\ \ln_b_t \\ \ln_gas_t \end{bmatrix} \sim I(1).$$

The cointegration tests based on Johansen's procedure used the Trace test and Maximal Eigenvalue test. The null hypothesis in trace test takes the form $H_0: r \leq q$ against alternate hypothesis $H_1: r = q$. The null means that there exist at most q linearly independent cointegrating vectors. The maximal eigenvalue test has a null hypothesis H_0: there are r cointegrating vectors, against H_1: there are r+1 cointegrating vectors (Johansen (1988)). Since all the used series have a trending behavior, a linear trend is included in cointegration rank analysis.

The results of the Johansen cointegration tests are displayed in Table 2. Both, the Trace test and Max-Eigen value suggest the existence of one cointegrating vectors at 5% significance level (the null hypothesis in the trace test ($H_0: r \leq 0$) and Max-Eigen value test ($H_0: r = 0$) is rejected with p-value, respectively 0,0239 and 0,0318).

Further, using AIC, SC and HQ criteria the order of the VAR model was identified. The criteria shows the different order of VAR model, where Akaike, Schwartz and Hannan-Quin criteria showed respectively lag equals 4, 1 and 2.

Next, the vector error correction model (VECM) with one cointegrating vector and lag order equals 2 was calculated.

VEC Model and Granger Causality

The VEC model is used to correct the disequilibrium in the cointegration relationship and to test for long and short-run causality among cointegrated variables in time and frequency domain. Vector Error Correction model has the form:

$$\Delta Y_t = A_0 + \Gamma ecm_{t-1} + \sum_{i=1}^{2} A_i \, \Delta Y_{t-1} + \mathrm{E}_t$$

where: $Y_t = [ipp_t, \Delta cpi_t, wig_t, us/pl_t, b_t, gas_t]$ are $I(1)$ variables being integrated to an $I(0)$ vector, A_0 is the intercept, Γ is the matrix containing long-run equilibrium information, A_i is the matrix which reflects the short-run dynamic relationship between variables, E_t is residual and ecm_{t-1} is the error correction term.

Cointegration equation (one cointegrating vector) takes the following form:

$$\widehat{ipp}_{t-1} = 1{,}634 + 14{,}083\Delta cpi_{t-1} - 0{,}369wig_{t-1} + 0{,}177uspl_{t-1} - 1{,}648b_{t-1} + 1.727lngase_{t-1}$$

Based on cointegration equation, it is worth to notice, that the response of industrial production to changes in oil prices is negative (parameter is equal – 1,648) and consistent with economic theory. The

positive response of ipp_t to changes in inflation can be explained by low inflation rate, near to optimal one, where the general price level was comparatively stable (Geise and Piłatowska (2014)).

The Wald statistics for Granger causality in time domain is employed to examine whether all the coefficients of a given first differenced variable are jointly statistically different from zero (short run causality) and whether the γ_i coefficients of error correction term are significant (long-term causality). Coefficients of a given explanatory variable are tested.

Table 3: Short-run Granger causality in time domain (Wald test statistics based on VECM(2))

Own calculations in Eviews11

Table 3 presents the results of the Granger-causality test in time domain for oil and gas prices and economic activity in Poland. The results of Granger-causality test in time domain, show that there is short-run unidirectional causal relationship running from crude oil prices (b_t) to industrial production index (ipp_t), stock market index (wig_t) and consumer price index (cpi_t). Unidirectional causal relationship is also identified among exchange rate (us/pl_t), industrial production index (ipp_t) and stock market index (wig_t). Bidirectional short-run causal relationships is found between industrial production index (ipp_t) – stock market index (wig_t) and exchange rate (us/pl_t) – consumer prices index (cpi_t) – see Table 3. As can be seen, the Granger causality test show the causal relationship from industrial production index (ipp_t) to oil prices (b_t). This weak relation (rejection of H_0: $\alpha_{11}-..-\alpha_{1j} = 0$ in eq(5) for b_t, but the tatter at the 10% significance level) should be treated with precaution because the real impact of Polish economy on the world crude oil prices should be insignificant (Geise and Piłatowska (2016)).

In terms of long-run situation, a unidirectional strong causal relationship running from oil prices (b_t) to industrial production (ipp_t) is found. The results also indicate that is a long-run, unidirectional relationship form stock market (wig_t) and exchange rate (us/pl_t) to industrial production – see Table 3.

To summarize, the discussed results from vector error correction model (VECM) confirmed the previous findings, that the production, inflation and stock market in Poland are related with crude oil prices (Geise and Piłatowska (2014, 2016)). However economic activity in Poland is independent to

changes in natural gas prices. This result is related with that, the Polish economy is more dependent on oil market, than gas market.

Granger Causality in Frequency Domain

As mentioned in main goal of the research, we are interested to compare the results of Granger causality test in time domain with the results of Granger causality test in frequency domain. The part of the Granger causality test results, are presented in Table 4, where we focus only on relationships between oil prices and macroeconomic variable. However, the whole diagram of internal relationships between macroeconomic variables in Poland, in the context of frequency analysis is presented on scheme 2.

Table 4: P-value for Granger causality test statistics (Breitung and Candelon (2006))

Tab 4. present only a part of results. Unreported results are available from authors on request; *** rejection of null hypothesis at 1% significance level; L stands for long cycle, M – medium cycle, S – short cycle and VS stands for very short cycle.

Fig. 2: Relationships between macroeconomic variables in frequency domain

Table 4 shows the results only for chosen frequencies that goes from 0 to 0,52 ($\approx \frac{\pi}{6}$) radians (whole frequency range goes from 0 do π). Chosen frequencies allows to focus on four types of cycle, i.e. very short cycle (1-2 year), short cycle (3-6 years), medium cycle (8-12 years) and long-term cycle (24 year).

The results for Granger causality test, based on the VAR model for cointegrated processes, shows that there is unidirectional causal relationship running from oil prices (b_t) to industrial production (ipp_t) and consumer price index (cpi_t) on frequencies similar to very short, short, medium and long cycles. Both, industrial production and consumer prices index, are related with oil prices on level of higher frequencies, like business cycle (3-6 years) but also on level of long-term trend. That means, the polish industrial production and inflation are driven by long-term and medium-term cycle of oil prices.

This results are consistent with conclusions from time domain analysis, where the significant reaction of industrial production and consumer price index on oil price changes was found. However, time series analysis also showed that stock market is under influence of fluctuation in oil prices, while the frequency domain analysis did not reject hypothesis about no relationship between oil prices and stock market index (compare Table 3 and 4). Also, it is worth to notice, that in the case of time domain analysis, there exist long-run relationship only between oil prices and production.

There is Granger causality evidence for relation from Brent oil prices (b_t) to exchange rate (us/pl_t) in Poland at the higher fluctuation frequencies, which last less than a year[1] - see Fig 2. Granger causality test statistics confirms also that there exist the significant relationship between Brent oil prices (b_t) natural gas prices (gas_t) in whole frequency range (Table 4). But, causality in time domain, running from Brent oil prices to natural gas prices was not confirmed, which means that transmission of oil price shocks to natural gas prices occur on lower frequencies. Granger causality analysis for time and frequency domain allows to identify specific relations between variable.

Based on results we can conclude that oil prices can predict production and inflation at different frequencies (larger than 2, 3-6, 8-12 years), but there is no strong evidence to support the hypothesis about predictive power of natural gas prices for Poland's economic activity.

[1] Available in unreported results.

Conclusions

In this paper, the relationship between oil prices, natural gas prices and economic activity in Poland was studied with a special interest in Granger causality analysis in time and frequency domain. First, the Johansen procedure provided evidence that industrial production, consumer price index, stock market index, exchange rate, Brent oil prices and natural gas prices in Poland are cointegrated. Second, based on VEC model, standard Granger causality tests were able to confirm the long-run and short-run relationship between industrial production and oil prices, stock market and exchange rate. Also, there is short-run causality evidence running from oil prices to stock market index and inflation.

Therefore, the evidence on causality in frequency domain suggest, that oil prices play an important role in driving the economic growth, not only in terms of high frequency fluctuations but also in terms of medium and low frequency fluctuations, which corresponds to slow dynamics in business cycle. Most of all, the results of causality in frequency domain show that, both industrial production and inflation in Polish economy are driven by changes in oil prices, not only in short run fluctuation but also in longer cycle, like 3-6 years, 8-12 years and long cycle (24 years). That means, the changes in oil prices can help to predict changes in polish business cycle. Also, the result of frequency domain study adds a new dimension to the literature on the relationship between crude oil prices and economic growth by focusing upon the time-frequency varying business cycle fluctuations.

Abstract

Despite the universally recognized dogma of accessibility and recognition for universal design, on the one hand, there is still a problem of maladjustment of environment for the needs of people with disabilities. This situations happens even in the cases of newly constructed facilities, the small effects of the changes improving accessibility. As a result of the introduced changes should be understood the use of technical facilities by evenly represented groups of people with disabilities. These imperfections of the idea of accessibility and universal design cause a kind of feedback, because the often-occurring lack of clear effects of introduced technical changes in the field of accessibility demotivates their unconditional implementation. The article compares the accessibility requirements, and based on the analysis of the methodology of conducting accessibility audits, the idea of a barrier overcoming model in terms of Incentivizing accessibility is presented. The methodology of audits has been described, which starts with method of assessing accessibility, which consists in identifying barriers by checklists, and then in accordance with the triangulation principle covering environmental check-up with use of representatives of individual user groups. Identified accessibility of limitations (in case of inability to eliminate them) are evaluated in terms of the difficulties that make users and assessed the level of motivation needed to overcome them.

Keywords: Diversity Management, Ergonomics, Accessibility, Checklist, Observation.

Introduction

Accessibility of environment and both physical and digital infrastructure for persons with disabilities (PWDs) is one of the popular issue since at least two last decades. Even though since many years different organizations attempt to make their infrastructure more accessible in context of non-standard users, only since few years organizations are obliged to provide the access for PWDs by international and national regulations. Among them, the most important is Convention on the Rights of Persons with Disabilities (CRPD), ratified in Poland in 2012 (CRPD, 2006). According to Article 9 CRPD, "to enable persons with disabilities to live independently and participate fully in all aspects of life, States Parties shall take appropriate measures to ensure to persons with disabilities access, on an equal basis with others, to the physical environment, to transportation, to information and communications, including information and communications technologies and systems". In the digital area, accessibility assessment is already routinized and evaluation procedures are automated within many programs like Pathfinder. However, for the physical environment accessibility, no uniformed standard are applied, even though some trials were already made, like European Commission M/420 Standardisation mandate to CEN, CENELEC and ETSI in support of European accessibility requirements for public procurement in the built environment (EU, 2007). Different methods of accessibility assessment

function parallel, and their effectiveness is not controlled, however some trials are already made (Jeamwatthanachai, Wald and Wills, 2019). Moreover, the accessibility declared by organizations turns out to be insufficient factor in accessing the labor market for PWDs. According to WHO estimation, about 15% of the world's population lives with some form of disability (WHO 2011). At the same time, the discrepancy in employment rate between people with and without disabilities is still high (WHO, 2011). In Poland in 2018 the employment rate of PWDs at working age was 26,2%, while the general rate was 77,4%. The similar tendency (about three times lower employment rate among PWDs) is observed over the course of last years (GUS, 2019).

Research Method and Objects

The Assessed Objects

The research covered two public buildings possessed by Wroclaw University of Science and Technology (Sobiegraj, 2018; Księżak, 2020). While one of the investigated object (building A) was designed according to accessibility requirements obligatory in contemporary Polish law, another one (building B) is over 100 years old after a large renovation made few years ago. However one of the renovation aims was increasing the accessibility level of the historic building a.o. by adding the elevator, the level of accessibility of both objects was on the quite different level.

Checklist Assessment

The first way in accessibility assessment for both buildings was checklist application. As the evaluation tool, checklists are designed for relatively quick assessment of the level of fulfilling the requirements or recommendations by the evaluated object (Martz, 2010). Their main function is preventing and detection of errors (Hales and Pronovost, 2006). However they are most often applied for medical issues to help in memorizing about single steps in diagnostics and treatment (Gavande, 2009), they are widely used in different areas. For example, in ergonomics they are very popular for rapid and rough assessment of different aspects of work-human relations (Kogi, 2001). Some popular checklists are: Position Analysis Questionnaire (PAQ) focused on the body position at work (McCormick, 1979), so-called Dortmund Checklist or Ergonomic System Analysis Checklist (ESAC) covering different environmental and workload factors (Burger and Boer, 1968) or the Rapid Office Strain Assessment (ROSA) for quickly quantifying the risks associated with computer work (Sonne et al., 2012).

For the accessibility assessment, few checklists are available in Poland (Kowalska-Styczeń and Bartnicka, 2011; Kowalski, 2016; Bartuzi, Bugajska et al., 2014). As all of them base on the same building code regulations as well as ISO 21542:2011 standard (ISO, 2011), they have some common elements. Moreover, they all are dedicated to use by non-professionals. Generally, checklist method is based on a diagnostic table, which includes requirements for different groups of users, including wide range of disabilities. The diagnosis is carried out by completing the table. Usually deviations from the recommendations are registered. In the diagnostic tables specific disabilities are listed for which the recommendations are necessary to be met that the building is perceived as an accessible Poland (Kowalska-Styczeń and Bartnicka, 2011). However, the presented checklists cover partially different issues and point to slightly different users' groups. While Kowalski indicates some recommendations for low height persons, Bartuzi, Bugajska et al. checklist distinguish good practices dedicated for users mental and intellectual disabilities and Kowalska-Styczeń and Bartnicka show some requirements for users with cultural maladjustment. As all the presented checklists are detailed, for the purpose of rough assessment the investigated public buildings some elements regarding only their public functions where chosen. The final checklist counts about 60 elements.

As a second step of the analysis two different methods were selected. The methods' choice was the consequence of the errors found by the checklist analysis.

Observation

Non-intrusive observation is a popular tool in social sciences, including sociology, ethnography, and management (Silverman, 2007). This method assumes the investigator (even though he/she gave some tasks the participant to made) is only the observer and does not interference either with the observed subject or with the investigated object. The researcher is therefore just a witness of the subject behavior, however the subject is aware of being observed and is obliged to give active consent to participate in the study. According to the method assumptions, the observation results can be generalized for all the users (Flick, 2008). Observation can be provided in a passive or an active form. In an active form, the investigator gives subjects some tasks i.e. finding the way to a chosen object, while in a passive form the unprompted subject's actions are watched. Therefore, the active form is simultaneously organized in the form of task analysis. For the accessibility evaluation the active observation form was chosen. The subjects were asking for finding their way to four targets localized in the investigated building. These were: 1. The cloakroom, 2. the lift, 3. main lecture hall, and 4. the library. All the targets act as public places and have unlimited access for everybody. The order of finding targets was not prompted. The paths of the subjects as well as time needed for each task were registered.

Audit

In case of accessibility issues, the audit is a specific kind of observation made usually by a specific users (Nijs and Heylighen, 2015; Ferreira et al., 2012). For example, to access the accessibility level for PWDs, auditors are recruited among persons with different kinds of disabilities. Auditors analyze the accessibility of the object during the site visit. Additionally they can inspect some documentation, e.g. architectural plans (Kowalska-Styczeń and Bartnicka, 2011). In comparison to observation method, audit often gives more detailed and numerous information about possible errors of the investigated object. However, due to the difficult access to the auditors, the audit is usually limited to few subjects. This causes a risk of taking into account needs and requirements the very specific group of users instead of each possible user. Moreover, because of the wide variety of abilities of PWDs, even if they have the same kind of impairment, the recommendations are often unique and nonuniversal (Kroemer, 2006 p. 77).For the accessibility evaluation, the only instruction given by the investigator to the auditor was to find the way to the café localized in the building.

Participants of Observation

The participants of the observation study were 10 students aged 22-25, most female. Seven of them studied at the university, which owned the investigated building and therefore visited the building at least once. Neither of participants had physical impairment. Four participants had vision defect corrected by glasses or contact lenses. Participants were characterized in Table 1.

Table 1: Participants of the observation

No	Gender	Age	Vision defect	Building acquaintance
1	female	22	no	yes
2	male	24	yes	yes
3	female	23	no	no
4	male	25	yes	no
5	female	23	no	yes
6	male	24	yes	yes
7	female	24	no	yes
8	female	22	yes	yes
9	female	22	no	no
10	male	22	no	yes

The Auditor

The auditor was a male, aged 26. He was chosen because of his impairment. As a blind person, he uses a white cane as an assistive. Due to the kind of disability of the auditor, during the audit the investigator act additionally as a safety keeper.

Research Results

Checklist Analysis

For both investigated building, the checklist fulfilling allowed to detect over 10 errors for each analyzed object. However, for the new building A the errors were much easier to correct. Some of the problems found for the historic building B were difficult to solve and expensive i.e. incorrect layout of stair case. In the building A most of the found problems regarded people with visual impairment. In the old one (building B), some problems were assessed as unsolvable due to costs or historical character of building. However, navigation issues were found as the most troublesome for users, even the body-abled ones. As the main reason, the complicated plan of the building B was stated. These conclusions lead to the selection of next accessibility assessment method: the audit given by a blind user for building A, and the observation of building real users for building B.

Observation Results

Time needed for each subject and task is shown in Table 2. For comparison, the reference time of the person who knows the building is presented. It can be noticed that the average time of subjects is over two times longer than reference time, however there was no relation between a subject and performance time. Two relatively easy tasks were task 1 and 3. The reason was easy noticeable, because in the building there are some signposts to the cloakroom and the main lecture hall, but not the either the lift or the library.

Table 2: Participants performance time (mm:ss)

No	1. Cloakroom	2. Lift	3. Main lecture hall	4. Library	Total time
1	00:36	02:14	00:45	03:00	06:35
2	00:40	01:30	00:35	06:20	09:05
3	00:55	02:55	00:26	05:46	10:02
4	01:04	01:40	00:30	04:23	07:37
5	00:35	00:55	00:35	06:43	08:48
6	00:40	00:42	00:30	07:13	09:05
7	00:44	01:54	00:25	03:24	06:27
8	00:32	06:20	00:40	05:37	13:19
9	01:30	01:50	02:10	06:10	11:40
10	00:57	02:01	00:38	05:32	09:08
Average time	00:57	02:32	00:51	05:25	09:05
Reference time	00:23	00:55	00:29	02:20	04:07

However, the performance time discrepancies for single subjects and tasks were much higher. The extreme case was Participant 8 in the task 2 (lift finding). Due to omitting the lift entrance, the subject was forced to make a full circle around the building, which took almost seven times longer than the

reference time. The full path is shown on Fig. 1. Therefore, the lack of appropriate markings resulted in the need to compensate for the extended search time.

Fig. 1: The path of Participant 8 in the Task 2 (Lift). Source: (Księżak, 2020)

It is worth to notice that besides the performance of single users, observations results were supplemented with subjects' opinions and remarks. This set of information let to check and extend the list of accessibility departures.

Audit Results

The audit was performed in building A by the blind user. He finally checked two alternative ways to the pointed object (cafe) by using an elevator and stair case, respectively. In comparison to the checklist, the audit exposed much more accessibility departures. The found errors were not only important for users with visual impairment, but were decisive for general safety of building users (i.e. the door connecting the parking slot and the staircase opens in the direction of a staircase; if somebody is climbing the stairs there is a strong risk of hit). Additionally, the audit confirmed the results obtained by the checklist. The auditor noticed almost all departures detected by the checklist.

Incentivizing Accessibility

Architectural accessibility, or at least its declaration, turns out to be an insufficient factor in accessing public services and using them, especially by people with special needs. Very often the possibility of using a given solution is associated with a physical, psychological or social burden exceeding the individual user resource intended to overcome the obstacle (Fig. 2)

Fig. 2: Diagram of decision within accessibility problems. (own elaboration)

Solutions that support accessibility, if they have not been completely implemented in the spirit of universal design, require a cost. This cost has a physical dimension (force needed to complete the task, increased path, physical coordination), as well as mental and social (even exposure to unwanted help). Comparison of the cost of overcoming the barrier with physical resources supported by a person's motivation leads to decisions regarding activity in a given dimension. Another proof of the need for an incentive quote is a number of approaches such as: Design-for-all, Barrier-free design, Transgenerational design, Accessible Design as well as Inclusive Design and User Sensitive Inclusive Design. They emphasize the need for greater empathy with the needs of users, and giving them satisfactory user experience (Butlewski, 2018). Accessibility alone, in terms of being able to overcome a specific barrier, is therefore not sufficient, as it does not guarantee compensation for barriers of accessibility.

Following an audit of accessibility, countermeasures have been considered for all identified non-conformities. Both proposed and existing solutions that do not completely eliminate barriers (and thus constitute a residual barrier) are assessed in terms of the user's motivation to use them. An example of this was marking the approach to the elevator, which it took a long time for a blind person to find. The examined user stopped searching for markings in the area of their occurrence. Compensating this barrier requires a lot of time. In the presented case, therefore, the demotivating factor will be the time fund of persons with disabilities. Due to the fact that the availability tests were conducted in a simulated manner, the difference between the reference time and the time actually spent by the person on the task did not give rise to the abandonment of the tasks performed. In fact, lengthening time would be impatient. Preventing this impatience would require shortening the search time or making it less annoying, e.g. by audible information indicating the distance to the markings and thus reducing the search duration.

Limitations

Due to the limited access to the auditors with special needs, the audit was conducted by a limited number of people with different disabilities. This can influence on the results. Nevertheless, the conducted research is contributing and the result is an analysis of the methodology of conduct in the field of accessibility audit.

Conclusions

The set of methods used for accessibility assessment, i.e. the combined use of checklist, observation and audit, gave the effect of triangulation (Flick, 2009; ISO 16710; Butlewski et al, 2019). The conclusions obtained by the checklist were confirmed and extended by the applied observational techniques. Considering the general trends of the European Union in the field of non-discriminatory activities the methods evaluating accessibility are a contribution to supporting and creating non-discriminatory solutions, which are important in decreasing the gap between PWDs and able-bodied in context of their social and professional life. However, despite the spread of awareness of the needs of different levels of fitness, we are still far from designing in line with the dogma Barrier Free Design. So, since we are not able to eliminate all barriers in designing, Designing for Dynamic Diversity is a better alternative (Gregor, Newell and Zajicek, 2002; Butlewski, 2019). An effective element of this approach can be Incentivizing accessibility, which can be a way to implement design for Designing for Dynamic Diversity.

E-mail: marta.mlokosiewicz@usz.edu.pl

Abstract

The article discusses the relationship between intra-organisational relations and employee stress. The paper is theoretical and empirical. The empirical part was based on an analysis of research reports on employee stress and job satisfaction at workplaces in Poland. For the purposes of the study, the notions of *positive* and *negative intra-organisational relations* were conceptualised. While providing answers to the research questions posed, three dimensions of organisation functioning were distinguished in which the quality of interpersonal relations is important; moreover, consequences of the influence of positive and negative relations on these dimensions were identified. Empirical analysis enabled drawing conclusions on the importance and quality of interpersonal relations and their connection with employee stress at workplaces in Poland.

Keywords: Intra-Organisational Relations, Employee Stress, Job Satisfaction, Employee Engagement

Introduction

Nowadays, in the face of highly competitive markets and rapid pace of change, organisations – more than ever – need committed teams of employees. Despite constant technological progress, man always stands at the centre of change and is the major factor influencing the success of any projects undertaken. The level of involvement of employees and their effectiveness are to a large extent determined by the quality of relations within the employee team, which is at present marked by the phenomenon of stress at the workplace. The article considers the relationship between intra-organisational relations and employee stress. The following research questions were posed:

1. What is the importance of interpersonal relations at the workplace?
2. What is the relationship between interpersonal relations at the workplace and employee stress?
3. What is the importance and quality of intra-organisational relations and their connection with employee stress at workplaces in Poland?

The structure of the paper was subordinated to accomplishment of its objective; theoretical and empirical character of the study was applied. The first, theoretical part of the article discusses the phenomenon of employee stress in the light of interpersonal relations at the workplace. In the second, empirical part of the study, conclusions were drawn about the "interpersonal relations – employee stress" relationship based on reports from research on employee stress and job satisfaction at workplaces in Poland. The summary presents conclusions from the considerations undertaken. In the study author uses interchangeable terms: *interpersonal relations at the workplace* (*in the organisation*) and *intra-organisational relations*.

Employee stress in the light of interpersonal relations at the workplace

Stress is defined as a negative mental condition with cognitive and emotional components (Cox, Griffiths and Rial-Gonzales, 2006). This phenomenon can be viewed in two dimensions: as an interaction – from the perspective of structural characteristics of the interaction between a person and their environment, or as a transaction – from the perspective of cognitive processes and emotional reactions that determine the relationship between the person and their environment (Tabanelli et al., 2008). In the cognitive-transactional perspective, stress is the result of mutual influences between a person and their environment, assessed by the person as burdening or exceeding their resources and threatening their well-being (Lazarus and Folkman, 1984). Similarly, the World Health Organization defines occupational stress as a reaction of the human body that occurs when it experiences work-related requirements and pressures that are not adapted to its knowledge and skills and are challenging for its ability to cope with them (WHO, 2003). Reaction to a stressful situation depends on cognitive assessment and the meaning associated with stress, individual behaviour and the ability to build relationships with others (Terelak, 1999).

Interpersonal relationships in an organisation are composed of a set of mutual relations – both formal and informal – between employees at different levels of the organisational structure, including behaviours, norms of behaviour, the way of relating to others determined by mutual work-related relationships, tasks performed and the scope of care expressed for the welfare of the organisation and its employees (Jakimiuk, 2016). Interpersonal relations in an organisation can be described from an individual and organisational point of view. The individual perspective refers to individual evaluations of such relations by employees, usually by means of a survey questionnaire form. Aggregation of individual points of view allows obtaining an average evaluation of relations in a given organisation. An alternative to this assessment is approaching relationships on the organisational level, by examining strategies and procedures affecting employees, which complements analysed employee experiences (Stoetzer, 2010). In this study – both in its theoretical and empirical part – an individual perspective was adopted for assessment of intra-organisational relations, referring to the results and relationships established on the basis of presented secondary data from employee surveys.

The results of research on intra-organisational relations confirm the relationship between the quality of those relations and the well-being of employees at the workplace, their involvement and the organisation's performance. It has been demonstrated that friendly attitude of co-workers reduces occupational stress, improves communication, helps to do the job, facilitates the achievement of goals and promotes acceptance of the process of organisational change (Berman, West and Richter, 2002). A good relationship with and support from the superior is perceived by the employee as a form of organisational support that becomes a mediator of interest in and identification with the job (*job involvement*), organisational commitment (*affective commitment*), reduces employee stress, reduces withdrawal behaviours (absenteeism, sluggishness), influences the decision to stay in the organisation and increases employee productivity (Rhoades and Eisenberger, 2002). Superior support results in better performance of employees' work related tasks, giving them a positive mood, increasing internal motivation, self-confidence and the added value of their efforts (Adil and Awais, 2016). The support of superiors and co-workers mitigates the negative impact of professional requirements on the employee's well-being (Lilius et al., 2008). In the "occupational stressor-tension" relationship, social support reduces the level of tension, mitigates the perception of stressors and becomes a moderator of this relationship (Viswesvaran, Sanchez and Fisher, 1999). The considerations performed so far provide an opportunity to define the concept of *positive intra-organisational relations* – in this paper, these are assumed to be the relations that act as protection and social support. They are a resource for coping with everyday requirements and commitment to work (Baker, Demerouti and Verbeke, 2004), they are a source of motivation to work and generate employee welfare and, moreover, have a positive effect on the way employees react to other stressors (psychosocial factors) – requirements and problems that arise in the organisation.

As well as recognising many positive effects of good interpersonal relationships at the workplace, the literature also draws attention to the fact that intra-organisational social relationships may become a

source of destructive stress (Nekoranec and Kmosena, 2015). In this negative aspect, interpersonal relationships fit into the concept of "psychosocial threats", defined as those aspects of the design and management of the work process and their socio-organisational context that have the potential to cause psychological or physical harm (Cox and Griffiths, 2005). Psychosocial threats have now become one of the key challenges for the human resources management practice and maintaining satisfactory organisational effectiveness (Matuska, 2017). The following factors have been included in the group of these threats: work content, pace and workload, work schedule, work control, physical work environment and its equipment, culture and organisational function, role in the organisation, career progression, work-home relationship, as well as interpersonal relations at the workplace, which have been given special attention in this study. Interpersonal relationships generating employee stress are attributed to such phenomena as social or physical isolation of a person at work, bad relations with superiors, interpersonal conflicts, lack of social support, intimidation, harassment (Leka, Griffiths and Cox, 2003). The phenomena mentioned above create an image of *negative intra-organisational relations*, which in this study are defined – by way of analogy to the previously adopted definition of positive relations – as relations that do not provide a sense of security and social support.

Contemporary acceleration of the pace of life, including professional life, subjected to constant time pressure, multitasking, the need to learn new things to maintain one's *status quo* (Rosa, 2013) is not without impact on human functioning at the workplace, constituting a "fertile ground" for emergence and growth of employee stress. However, it is not only the organisational culture, procedures and processes, but also the individual characteristics of employees and their perception of the surrounding environment that determine ways of dealing with these challenges. Such personality traits as aggressiveness and excessive emotionality generate tension in relations which results in the withdrawal attitude of some, while provoking others, which encourages intensification of destructive conflicts at the workplace (Stoetzer, 2010). Social support at the workplace also proves useful in the reduction of employee stress resulting from such "difficult" relationships. However, this issue has not been the subject of detailed research by the author.

Studies presented in the literature show that low levels of social support at the workplace are accompanied by high levels of anxiety, emotional exhaustion and work-related tension, as well as low job satisfaction and increased risk of many different diseases, including cardiovascular diseases, deterioration of the immune system, or they may lead to absenteeism from work due to mental illness (Davidson and Cooper, 1981; Warr, 1992; Stansfeld et al., 1997; Sime, 1997; after: Orlak, Gołuch and Chmielewski, 2014). Lack of trust among co-workers is accompanied by lack of communication, a high degree of ambiguity in the professional role, low job satisfaction and low mental well-being (Cooper and Cartwright, 1994). Bad interpersonal relations result in lack of cooperation, employees limiting themselves to fulfilling formal duties only, reluctance to help each other, share knowledge and information, lack of trust, increased frequency and intensity of conflicts at the workplace, greater propensity for counterproductive behaviours (such as theft) and destructive rivalry among employees, also increasing the likelihood of looking for another job by current employees (Szostek and Glińska-Neweś, 2017). Low level of support received from co-workers supports unfavourable psychosocial working conditions or reinforces the negative effect of psychosocial threats (Cohen and Willis, 1985). It is also important for workers how they are treated by their superiors and colleagues. The way they are treated, combined with the degree of kindness and attention among them, is perceived by the employee as an image of relational justice. Low level of relative justice is associated with negative health consequences for employees, often resulting in sick leaves (Stoetzer, 2010). Social or physical isolation at the workplace, which involves excluding a person from access to important information, from participation in meetings, social gatherings or even intimidation, harassment and mobbing, also has an adverse effect on the health and well-being of targets of this type of behaviour, on their productivity, involvement in work, but also creates an unfriendly working atmosphere, worsens relations within the employee team, thus reinforcing the negative effect of social threats.

By analysing the impact of positive and negative intra-organisational relations on the functioning of an organisation, one can draw conclusions concerning the importance of interpersonal relations at the workplace: better quality relations are accompanied by organisational benefits, while negative relations – by a number of negative consequences. Table 1 distinguishes three dimensions of the organisation's

functioning, among which the quality of interpersonal relations is important, and identifies the consequences of positive and negative relations' influence on those dimensions.

Table 1: Consequences of positive and negative interpersonal relations at the workplace

No.	Impact of the relationship on:	Consequences	
		positive intra-organisational relation:	**negative intra-organisational relation**
1.	Work efficiency	- easier and better performance of work related tasks, achievement of goals and coping with the requirements of the job - increased interest in work and increased productivity of employees - increase in the added value of work undertaken by employees - improvement of intra-organisational communication	- decrease in the productivity of employees - increased ambiguity of the professional role - impediments to (or disappearance of) cooperation, reluctance to help one another - increase in the tendency towards destructive competition among employees - unwillingness to share knowledge and information, deterioration or lack of proper intra-organisational communication - increased frequency and intensity of conflicts
2.	Employee engagement	- increased identification with work (job involvement) - increased motivation and commitment to work - exceeding one's obligations - reduction of withdrawal behaviour (absenteeism, sluggishness), increased acceptance of organisational changes - greater organisational commitment (affective commitment), greater willingness to stay in the organisation	- limiting oneself to fulfilling formal duties, decrease in involvement in work - increase in counterproductive behaviour (e.g. theft) - increase in the likelihood of current employees looking for another job
3.	Employee well-being	- reduction of employee stress, reduction of mental tension, alleviation of perception of stressors (problems within the organisation)	- increase in the level of anxiety, emotional exhaustion and mental tension, low level of mental well-being

		- positive mood that increases inner motivation and self-confidence - better physical and mental health	- decrease in job satisfaction - increased risk of disease, including deterioration in mental health

Stress and intra-organisational relations at workplaces in Poland

In the second part of the article, an empirical analysis based on secondary data from research reports on workplaces in Poland was undertaken to answer the question concerning the importance, quality of intra-organisational relations and their relation to employee stress. Selection of Polish workplaces as the research subject was caused by the fact that (as shown in Table 2) the scale and frequency of experiencing employee stress in Poland has increased in recent years and, compared to selected European countries, both the scale and frequency of stress were the highest in that country. In 2017, almost 1/3 of employees experienced it every day, with over 40% of employees experiencing stress once a week (The Workforce View in Europe, 2017, 2018).

Table 2: Stress at workplaces in Poland compared to selected European countries in 2016-2017

Year	Stress frequency	Percentage of employees experiencing stress in particular countries:							
		Poland	France	Germany	Italy	Netherlands	Spain	Switzerland	Great Britain
2016	Every day	**19**	30	25	21	33	34	30	22
	Once a week	**34**	29	27	35	33	35	31	33
	Once a month	**24**	24	27	25	22	18	24	28
	Never	**22**	17	20	18	12	10	15	17
2017	Every day	**27**	20	19	13	10	16	15	20
	Once a week	**43**	43	55	42	32	43	46	40
	Once a month	**22**	25	20	32	36	32	28	24
	Never	**7**	12	6	14	22	9	11	16

Source: The Workforce View in Europe, 2017, 2018 / ADP Poland; N(2016)=9920; N (2017)=9908.

The national survey "Safety at work in Poland 2019" (N=1517) demonstrated that the aspects describing interpersonal relationships at the workplace had, in the opinion of the respondents, a significant impact on their work efficiency (see Figure 1). Most of the respondents (53%) indicated the importance of work atmosphere for their effectiveness. Work atmosphere means subjectively felt organisational climate associated with established patterns of relations, so this factor was included into characteristics of the importance of relations for work efficiency. Stress was high in the results presented – it took the second position (49% of responses). According to the quoted report, 14% of respondents admitted to experience it practically all the time and that it was inscribed in what an employee does, 29% stated that they experienced stress from time to time in selected situations, 42% – often, in many situations, 13% – very rarely, in individual situations, while only 3% of employees considered that they practically never experienced stress and their work was not stressful. Of the total number of respondents experiencing stress at the workplace, 15% said it was positive – it motivated,

activated, in the opinion of 47% of respondents its impact was neutral (they treated it as a permanent element of their work), while 37% perceived stress as a negative, discouraging and crippling phenomenon. Among other factors describing intra-organisational relations, influencing the respondents' work efficiency, one third of employees in Poland also included relations between employees in the company and relations with the superior, 23% – mobbing, and 14% – discrimination (Bezpieczeństwo pracy w Polsce 2019 / Safety at work in Poland 2019, p. 22-24). The study shows that relational factors (marked in a darker colour on the chart) determined work efficiency to a greater extent than other psychosocial factors (such as the content of work – currently performed tasks, pace and workload – number of duties, overwork, fatigue, physical work environment – working conditions, culture and organisational function – structure, hierarchy in the company) and factors related to individual characteristics of the life situation of employees – health, diet, private problems (Figure 1).

Figure 1: Factors influencing the efficiency of employees at workplaces in Poland in 2019*

** percentage of responses; N= 1517; respondents were asked to indicate factors that affected their work efficiency*

Source: Bezpieczeństwo pracy w Polsce 2019. Mobbing, depresja, stres w miejscu pracy, Koalicja „Bezpieczni w pracy" [Safety at work in Poland 2019. Mobbing, depression, stress at work, "Safe at work" Coalition], 2019, p. 22.

Further on in the analysis, answers were sought to the question concerning the relationship between interpersonal relations and employee stress at workplaces in Poland. According to the "Bezpieczeństwo pracy w Polsce 2019" ["Safety at work in Poland 2019"] report, factors causing the greatest stress to Polish workers included time pressure, overwork, insufficient wages and the sense of work related responsibility (about 1/3 responses for each of these factors). Relational factors turned out to be the determinant causing the greatest employee stress for a smaller percentage of respondents (20 - 25%), who pointed to such causes of stress as: criticism from the superior, general atmosphere at the workplace, relations with the superior, with other employees, criticism from other employees (see Figure 2). One can, therefore, conclude that although the role of intra-organisational relations in creating stressful situations was not marginal, they were not the dominant cause of employee stress in the opinions of respondents (see Figure 2). Pursuant to the analysed "Safety at work in Poland 2019" report, 71% of them could ask their co-workers for help, while 63% could ask their superior. A much

lower percentage of employees who experienced lack of support from their superiors or co-workers, mobbing, physical violence and discrimination was registered. 18% of employees repeatedly experienced inappropriate treatment by their superior. 14% of employees repeatedly experienced verbal violence. 14% of employees repeatedly experienced mobbing. Exclusion, rejection and reluctance on the part of other employees were repeatedly experienced by 10% of employees. Every tenth employee repeatedly experienced discrimination at the workplace. Physical violence was repeatedly used against 3% of employees (Bezpieczeństwo pracy w Polsce 2019 / Safety at work in Poland 2019, p. 29, 42). Having analysed the above data, it should be concluded that positive interpersonal relations prevailed at Polish workplaces.

Figure 2: Factors causing greatest stress at workplace in Poland in 2019*

** percentage of responses; N= 1479; (1) - fear of causing damage, loss, harm; (2) - contacts from employer, superior outside working hours; (3) - interpenetration of professional life with private, family life; (4) - e.g. desire for promotion; the chart shows responses concerning interpersonal relations.*

Source: Bezpieczeństwo pracy w Polsce 2019 [Safety at work in Poland 2019], op.cit., 2019, p. 22.

Figure 3 shows that satisfaction with work in 2016-19, which remained at a relatively high level (about 70 percent of the total number of employees), increased slightly despite the aforementioned increase in the level and frequency of experiencing stress. This may have been due to the fact that positive interpersonal relationships prevailed at workplaces. The increase in employees' satisfaction with their work in the years 2010-2019 undoubtedly had its source also in consolidation of the employee market in many sectors of the Polish economy.

Figure 3: Satisfaction of Poles with their jobs in 2010-2019

** - survey sample N=1000; by 3rd quarter of 2017 – the rate of "very high" and "high" responses (concerning satisfaction level); since 4th quarter of 2017 – the rate of "very satisfied" and "rather satisfied" responses.*

Source: Monitor Rynku Pracy [Labour Market Monitor], 35th edition, Randstad, April 2019.

The Labour Market Monitor also shows that in 2019 as many as 84% of employees received both negative and positive feedback from their superiors, with the vast majority of them showing a positive reception of the feedback: 73% of employees, thanks to the feedback received from their superiors, felt motivated to continue working, while 69% of them noticed that this information influenced the quality of their work (Monitor Rynku Pracy [*Labour Market Monitor*], 2019). This proves good interpersonal communication within organisations in Poland. What is more, analysing results of the "Workforce View in Europe 2018" survey, it can be stated that – in the opinion of Polish workers – relations with co-workers to a much lesser extent (15% responses, similarly to the work-life balance) motivated Polish workers to engage in work than remuneration (53% responses) (The Workforce View in Europe 2018).

Summary

The objective of the study was to analyse the relationship between interpersonal relationships and stress at the workplace. The introduction formulated three research questions. The first one concerned the importance of interpersonal relationships at the workplace. To answer this question, the notions of *positive* and *negative intra-organisational relations* were conceptualised. Then, on the basis of a review of literature on the subject, three dimensions of functioning of the organisation (work efficiency, employee involvement, employee well-being) were identified, in which the quality of interpersonal

relations was important; moreover, consequences of the influence of positive and negative relations on these dimensions were identified. A regularity – positive relation – between the quality of interpersonal relations and functioning of the organisation was noticed: better relations are accompanied by benefits for the organisation in all three dimensions, while the deterioration of the relations results in negative consequences for functioning of the organisation in the identified dimensions (see Table 1).

Another research question concerned the relationship between intra-organisational relations and employee stress. Looking for an answer to this question, it was found on the basis of analysis of the literature presented in this study that there exists an inverse relationship between interpersonal relations at the workplace and employee stress, which means that positive relations with superiors and co-workers reduce stress at the workplace, while negative interpersonal relations in the organisation intensify it, also being a source of additional employee stress.

In order to answer the third research question concerning the significance and quality of intra-organisational relations and their relation to employee stress at workplaces in Poland, available secondary data from current research reports on employee stress and job satisfaction of Polish employees were analysed. The analysis allowed concluding that the aspects describing interpersonal relations at the workplace (in particular, work atmosphere or employee stress, but also relations between employees and relations with their superiors and – to a lesser extent – the fact of experiencing mobbing and discrimination) had, in the opinion of the respondents, significant impact on the efficiency of their work. Factors connected with relations determined work efficiency to a greater extent than other psychosocial factors or factors related to individual characteristics of the employees' life situation. It was also found that, although the role of intra-organisational relations in creating stress situations at workplaces in Poland was not marginal, they were not, in the opinion of the respondents, the dominant cause of employee stress. Still, the main stressors included time pressure, overwork, insufficient remuneration and the sense of professional responsibility. Among the factors connected with relations, criticism, especially from the superior, but also from co-workers, had significant impact on stress experienced by employees. This means that respondents paid attention to "relation fairness", expecting kindness and attention from colleagues, especially superiors. The relationship with the superior also gave rise to more stress than the relationship with colleagues. Positive intra-organisational relations in the form of support from superiors and co-workers as well as good communication between them motivated further work and made it easier for employees to cope with employee stress resulting from various reasons, which certainly contributed to an increase in involvement and high level of employees' satisfaction. In 2016-2019, satisfaction with the work performed even increased slightly, despite the recorded increase in the scale and frequency of experiencing stress. It is worth noting, however, that interpersonal relations at workplaces in Poland had – in the opinions of the surveyed employees – less impact on work involvement than remuneration.

Analysis of data concerning the scale of destructive behaviours (such as inappropriate treatment by the superior, verbal violence, exclusion, rejection and reluctance on the part of other employees, mobbing, physical violence and discrimination) led to the conclusion that positive interpersonal relations strongly dominated at workplaces in Poland. Of course, this does not mean that negative intra-organisational relations that occur on a much smaller scale do not require strong management reactions.

According to the literature and available empirical data (which is also confirmed by the data presented in this study), stress at the workplace is a consequence of a complex set of determinants, including intra-organisational relations. The interaction between these relations and the stress in the workplace, which is the subject of this study, is therefore only a fragment of a complex phenomenon. It should also be noted that other – apart from interpersonal relations – psychosocial factors generate stress in employees, which may result in worsening of relations. The character of an employee's personality, their way of interpreting events in the surrounding environment and their personal ability to build relationships with others are not without significance for the stress reaction. These issues – only signalled in this paper – may contribute to further research on the phenomenon of stress at the workplace. Yet, the empirical analysis performed is limited as a result to reference to Polish conditions only. Extrapolation of the analysis onto other countries would reflect the impact of cultural differences

on the scale and intensity of perceived workplace stress. A comparative analysis could also be an interesting area for further research

In the dynamic environment of the organisation, relations should be subject to a continuous process of improvement and development which involves anticipating and exceeding the expectations of partners (Mlokosiewicz, 2016). The key partner of the organisation are its employees. The quality of interpersonal relations within the organisation should therefore be the constant subject of organisation's interest.

The Hidden and Seen Crisis in The Healthcare System

Cristina COPĂCEANU,

Stefan cel Mare si Sfant, Boulevard 200, MD-2004
E-mail: avornic@yahoo.fr

Currently, both doctors as well as people in general support reforms of the healthcare system. However, the main problem of the system remains insufficient allocation of financial resources. What causes patients to give bribes for treatment prescribed by the doctors, because wages are by far under the limit of the decent living, especially in underdeveloped countries like Moldova.

The given research is necessitated by the fact that, not all economic and financial crises are obvious, in other words there are hidden crisis that manifest into a longer period and they are not visible. The hidden crisis is a continuous process, which once manifested is very difficult to treat. It is caused by other crises such as the personnel crisis, the financial crisis, the economic crisis, the drug crisis, the crisis of the performing medical devices.

According to the author, a crisis of health or the crisis in the healthcare system is a difficult situation, the duration of which is complex, and it affects directly the population of a country. Crisis in healthcare system in general has a significant impact on the health of the community, leading to loss of human lives (suicide) and mainly on the economy of any country (high unemployment). All of these derives from diseases, industrial process or from the country's sensitive political system. The harshness of the crisis is often measured by the number of affected people, diseases or death of the pathogenic process that is on its base, or with other words the existence of financial shocks.

Multiple research in health domain, are addressing a series of issues in this system, but remains uncovered the hidden crisis from this system, even though this crisis is manifesting, and we can say that already quite severe, however it's not brought to daylight or even more researched. That is why the given subject is actual and is extremely important through the angle of the hidden crisis from the health system from all the levels.

The current massive migration of doctors and medical stuff (nurses, midwives, etc.) in the healthcare system in Moldova, generates hidden crisis that nobody sees, doesn't study it, but it feels directly, as well on the patients as on the remaining staff in medical institutions. For example, the physicians who remained in the medical institutions have a higher volume of work, which is extremely overwhelming, and the impact is the malpractice. The massive migration of the employees from the health system is determined primarily by the low wages, the working conditions, the aging population, high level of the corruption, etc.

In conclusion, we can state that still exist financial hidden crisis in the system of healthcare, that we can to compare to a volcano, which boils inside the system, waiting for the right time to break out, having a negative impact and effect both on the population as well as on the economy of the country. It should be mentioned, that the elderly is the most exposed to the economic and financial crisis, because the risk of being fired is very high and that the chance of re-employment is very low, therefore their access to accessible healthcare is also limited.
Therefore, since the crisis is an ongoing process, a cycle, the end of a crisis, generates a new one.

Socio-Cultural Sphere as Environment for The Formation Of Human Capital: Russia Against the Backdrop of Global Trends

Abstract

The relevance of the research is due to the increasing role of human capital in the formation and development of post-industrial society. Physical force was the leading factor of production in pre-industrial society, machinery dominated in industrial society, and human capital became a leading factor in post-industrial society. The social and cultural sphere is the environment for the formation of human capital. Its institutions generate human capital through training, medical care, and cultural development. Thus, the quality of human capital depends on the quality of services provided by social and cultural institutions. Human capital accounts for most of the national wealth of the developed world. In 2014 the share of human capital in the total national wealth of developed countries was 70-75%, while in Russia it was only 49%. In the 2016 HDI ranking, Russia was ranked 49th, and thus was in the group of the countries with a high level of HDI. The world rating of Russia's HDI is declining mainly due to the value of life expectancy. The gap between our country and the leader of the rating on this indicator was 12.3 years. The most important sphere of formation and realization of human capital is the social and cultural sphere. The narrow interpretation of the socio-cultural sphere includes health, education and culture. It is of great interest to assess the effectiveness of the national health system, education and culture and their impact on the quality of human capital.

Keywords: Socio-Cultural Sphere, Human Capital, Public Health, Education, Culture, Efficiency, Level of Expenditure.

Relevance and Statement of the Problem

According to economists, the history of mankind contains such stages as pre-industrial society, where agriculture dominated, and industrial society, where industry played a leading role. They note that many countries today have stepped far beyond the industrial society. The modern economic space is identified as post-industrial.

The formation of post-industrial society meant the transition from material factors of production to

spiritual and intellectual ones. Physical force was the leading factor of production in pre-industrial society, machinery dominated in industrial society, and human capital became the leading factor in post-industrial society. Today, the individual's knowledge and skills are the basis for the formation and development of post-industrial society.

The socio-cultural sphere is the environment for the formation of human capital. Its institutions generate human capital through training, medical care, and cultural development. Thus, the quality of human capital depends on the quality of services provided by social and cultural institutions. The developed socio-cultural sphere has a positive impact on the quality of human capital.

Research Result

In modern conditions, in any sphere of economic activity, human capital, its volume, quality and forms of use are the main factors of economic growth, competitiveness and efficiency. According to the World Bank, human capital accounts for a greater part of the national wealth of the developed world. Table 1 shows the dynamics of human capital per capita in countries in 1995-2014. Data on the volume of national wealth are given per capita. In low income countries, the share of human capital in their total national wealth in 1995-2014 was 34-41%, which is almost half of the amount in the OECD countries. In the reporting period, the share of human capital in the total national wealth of developed countries was 70-75%. Per capita, the total wealth was $169,349 in 2014, while in 1995 it was $130032. In 2014 the human capital amounted to $109424 per person, while in 1995 it was $89977.

Table 1 : Trends in Wealth Per Capita by Level of Development, 1995-2014 (The Changing Wealth of Nations 2017, 2020)

	1995	2000	2005	2010	2014
World					
Total wealth	130,032	138,031	147,107	159,404	169,349
Human capital	89,977	97,445	98,923	103,211	109,424
Human capital as share of total, %	69	70	67	65	65
Low income					
Total wealth	11,601	10,435	10,240	11,802	13,629
Human capital	3,921	4,016	4,046	4,447	5,564
Human capital as share of total, %	34	38	40	38	41
Lower middle income					
Total wealth	17,718	16,745	19,426	23,675	25,948
Human capital	7,992	7,917	9,301	11,421	13,117
Human capital as share of total, %	45	47	48	48	51
Upper middle income					
Total wealth	52,135	58,652	68,118	95,607	11,445
Human capital	32,899	37,746	40,420	56,536	67,390
Human capital as share of total, %	63	64	59	59	59
High income: non-OECD					
Total wealth	165,884	165,561	199,485	245,513	264,998
Human capital	59,376	69,451	84,507	107,518	111,793
Human capital as share of total, %	36	42	42	44	42
High income: OECD					
Total wealth	551,184	617,801	655,228	674,542	709,916
Human capital	412,757	461,959	474,872	472,946	499,927
Human capital as share of total, %	75	75	72	70	70

It should be noted that with a population of 143.8 million people, the national wealth per capita in Russia was 188715 dollars. The human capital was $90,812 (or 49%), which corresponds to the group of low

income countries. For comparison, with a population of 318.9 million people, the volume of national wealth per capita in the United States is $983.280. At the same time, the human capital reaches $766470 (or 78%). In 2014 in China, with a population of 1.4 billion people, the volume of national wealth per capita was $ 108,172, and human capital – $63,369 (or 59%).

The change of the role of human capital, its transformation from an expenditure factor to the main productive and social factor of development, has led to the close interest of theorists and practitioners in the level of its development. The human Development Index (HDI), calculated by experts from the United Nations Development Programme (UNDP), is widely used for international comparisons of the state of human capital.

189 countries participated in the 2018 ranking. Table 2 shows the ranking of some countries in the world on the level of human development in 2018. According to the data presented, Norway ranks first in terms of the level of human capital development, and Niger ranks last. At the same time, the life expectancy in Norway is 82.3 years, GNI per capital is 68059, and in Niger the corresponding indicators are equal to 62 years and 912 dollars. Russia is ranked 49th, being included in the group of countries with a high level of HDI. The closest neighbors of our country in the rating are Argentina (48th place) and Belarus (50th place).

Table 2 : Human Development Index and its components 2018 (Human Development Report 2019, 2020)

HDI rank	Страна	Human Development Index (HDI)	Life expectancy at birth	Expected years of schooling	Mean years of schooling	Gross national income (GNI) per capita
VERY HIGH HUMAN DEVELOPMENT						
1	Norway	0,954	82,3	18,1	12,6	68059
2	Switzerland	0,946	83,6	16,2	13,4	59375

180	Mozambique	0,446	60,2	9,7	3,5	1154
189	Niger	0,377	62,0	6,5	2,0	912

Table 3 shows the components of HDI values for Russia and some countries in 2018. According to the table data, we can conclude that the economic component does not always have a decisive impact on the value of the Human Development Index. The world HDI rating of Russia is declining mainly due to the value of life expectancy. The gap between our country and the leader of the rating on this indicator was 12.3 years.

Table 3: Human Development Index of Russia and some countries in 2018 (Human Development Report 2019, 2020)

HDI rank		**Life expectancy at birth**		**Expected years of schooling**		**Mean years of schooling**		**Gross national income (GNI) per capita**	
1	Norway (0,954)	1	Hong Kong, China (84,7)	1	Australia (22,1)	1	Germany (14,1)	1	Qatar (110489)
47	Oman (0,834)	106	Solomon Islands (72,8)	38	France (15,5)	31	Netherlands (12,2)	49	Latvia (26301)
48	Argentina (0,830)	107	Libya (72,7)	39	Seychelles (15,5)	32	Cyprus (12,1)	50	Seychelles (25077)
49	Russian Federation (0,824)	108	Russian Federation (72,4)	40	Russian Federation (15,5)	33	Russian Federation (12,0)	51	Russian Federation (25036)

50	Kazakhstan (0,817)	110	Saint Vin-cent and the Grenadines (72,4)	42	Brazil (15,4)	35	Hungary (11,9)	53	Turkey (24905)
189	Niger (0,377)	189	Central Af-rican Repu-blic (52,8)	189	Eritrea (5,0)	189	Burkina Faso (1,6)	189	Burundi (660)

Human capital includes the accumulated stock of health, knowledge, skills, and experience that is expediently used for productive activities and increasing a person's income. In theory, there are different approaches to determining the types of human capital that distinguish between health capital, labor

capital, intellectual capital, organizational and entrepreneurial capital, and cultural and moral capital. However, most scientists identify such important components as education capital, health capital, and culture capital, which include a number of their constituent elements (Fig. 1). All these forms of capital can be converted into income in one way or another (Forrester, S.V., 2020).

The most important sphere of formation and realization of human capital is the social and cultural sphere. The socio-cultural sphere (SCS) is a dynamically developing area of the economy. The economic space of the socio-cultural sphere is a set of structural elements of industries and organizations that produce goods and services necessary to meet the socio-cultural needs of people. Performing various functions, SCS branches play an important role both in the life of an individual and in the life of society as a whole. According to most scientists, the socio-cultural sphere belongs to the tertiary sector of the economy – the service sector.

Figure 1: Components of human capital (Solovyeva, T.S., 2016)

Today, there is no consensus on the definition of the essence of the socio-cultural sphere, its structure, a set of criteria and classification features that make it possible to distinguish this industry from the national economy. According to a narrow interpretation, the socio-cultural sphere includes health, education and culture. Therefore, the socio-cultural sphere is the activity of people aimed at the production of educational, cultural and medical services to households (Karanets, S.M., 2004). According to a larger interpretation, the SCS includes science, social security and housing utilities, and a number of scientists think that physical culture, tourism, information technology and the media should also be included.

Economic literature offers several options for structuring the socio-cultural sphere (Fig. 2). These classifications allow us to interpret the socio-cultural sphere as a set of industries whose enterprises produce goods and services required to meet the socio-cultural needs of an individual. It should be noted that the dynamism of socio-cultural needs, due to the development of society, transforms the composition and structure of the SCS.

Figure 2: Structuring Options of Socio-cultural Sphere (Naumova, S.A., 2020)

It is obvious that all other types of human capital are based on health capital. Each person is born with a certain genetic set, has a certain level of physical strength, endurance, physical capacity and immunity to diseases. The capital of health is laid long before the birth of an individual and is formed throughout life. A high level of health capital increases individuals' productivity and increases their ability to work. The health of the nation and the reproduction of healthy generations of the population influence the number and quality of labor resources, the effectiveness of the work and, as a result, the pace of socio-economic development of the country.

The emergence of new medical technologies and medicines, caused by changes in the structure of morbidity and demographic problems, requires a constant increase in government expenditures on public health. Health expenditure is one of the main indicators that characterize the level of social development, since it reflects the degree of attention of the state and society to the health of citizens. The level of national expenditures on health is a relative indicator calculated as a total amount of public and private expenditures on health, expressed as a percentage of GDP. Figure 3 shows the top 10 countries in terms of public health costs in 2016. The main data source on government health expenditures is the database of the World Health Organization (WHO).

Figure 3: Top 10 countries in terms of health expenditures in 2016, %
(Global Health Expenditure Database, 2020)
(Global Spending on Health: A World in Transition 2019, 2020)

As follows from the data presented, the leader of the rating in 2016 was the Marshall Islands (23.3%), the outsider – Monaco (1.8%). There is a significant differentiation of countries by the level of public health expenditures. It should be noted that the World Health Organization recommends to spend at least 6-6.5% of GDP on public health (Kontsevaya, A.V., 2008). The level of Russian public health expenditures in 2016 was 5.3%, which is lower than the WHO recommended norm. In this indicator, the Russian Federation was ahead of China (5.0%), India (3.7%), Kazakhstan (3.5%), but behind Vietnam (5.7%), Niger (6.2%), Belarus (6.3%), Turkmenistan (6.6%), Georgia (8.4%), Honduras (8.4%), and Zimbabwe (9.4%).

Figure 4 offers the dynamics of expenditures of the consolidated budget of the Russian Federation and budgets of the state's extra-budgetary funds in 2006-2016. According to the data, the share of Russian budget expenditures on public health during the analyzed period did not exceed 3.7%. It should be noted that the share of domestic public expenditures on health in 2016 in the OECD countries was 10.1% (Health Nutrition and Population Statistics, 2020).

Figure 4: Dynamics of expenditures of the consolidated budget of the Russian Federation and budgets of the state's extra-budgetary funds for public health in 2006-2016
(Public Health in Russia. 2015: Statistics, 2020), (Public Health in Russia. 2019: Statistics, 2020)

The limited economic capacity of the health system requires increasing attention to the problem of the effectiveness of medical care. Figure 5 shows the top 10 countries in the world by the level of efficiency of the public health system. The rating was compiled by Bloomberg analysts based on data on average life expectancy at birth, government public health expenditures, and the cost of medical services per capita.

Figure 5 : Top 10 ranking of countries by the level of health system efficiency in 2016 (Miller, B.L. and Lu, W., 2020)

According to the data presented in the figure, the leader of the rating in 2016 was Hong Kong (88.9 points); the outsider was Russia (24.3 points). The Russian Federation was included in the rating for the first time in 2014 and took the last place at that time, gaining only 24.3 points. Two years later, the situation did not change. The last place is due to the low life expectancy of the population (70.37 years); the cost of medical services per capita ($ 893); the share of health expenditures (7.07% of GDP) (The Most Efficient Health Care 2016, 2020).

Education is another important component of human capital. It is a purposeful process of education and training that corresponds to the interests of the individual, society and the state, accompanied by the verification of the citizen's achievement of the educational levels established by the state (Prokopieva, A.V., Rybakov L.N. and Pchelkina, V.V., 2012). It should be noted that education indirectly contributes to the growth of human health capital and social well-being. Education contributes to the growth of the level of intelligence. It has been proven that each additional year of study increases IQ by 3-5 points. And alongside with the growth of intelligence the increase in life expectancy is recorded. People with an intelligence of 150 points have a 44% lower mortality rate than those with an IQ of 135 points (IQ Affects Life Expectancy, 2020).

The level of expenditures on education should also be considered as one of the main indicators that reflect the degree of attention of the state and society to the education of citizens. The source of data on the level of expenditures on education is the World Bank database – World Development Indicators. Figure 6 shows the top 10 countries in the world in terms of public expenditures on education in 2016.This indicator is a relative value expressed as a percentage of the country's gross domestic product.

Figure 6: Top 10 countries in the world ranking in terms of the level of public expenditures on education in 2016, % (Education Statistics, 2020)

As follows from the data presented, there are three developed countries in the top five of the rating. It should be noted that the high level of public expenditures on education in some developing economies is due to the implementation of programs to eliminate mass illiteracy. The level of public expenditures on education in Russia in 2016 was 3.7%. In this regard, the Russian Federation follows general pattern: a relatively low level of economic development corresponds to a low level of public expenditures. In terms of public expenditures on education, Russia was behind Honduras (6.3%), Chile (5.4%), Ukraine (5.0%), and Belarus (4.9%) in 2016.

The dynamics of expenditures of the consolidated budget of the Russian Federation and budgets of the state's extra-budgetary funds in 2006-2016 is shown in figure 7. According to the data, the share of Russian budget expenditures on education during the analyzed period did not exceed 4.1%. It should be noted that the share of public expenditures on education in 2016 was 6.9% in Finland, 5.8% in Israel and 4.8% in Germany (Education Statistics, 2020).

Figure 7: The dynamics of expenditures of the consolidated budget of the Russian Federation and budgets of the state's extra-budgetary

funds on education in 2006-2016 (Bondarenko, N.V., Gohberg, L.M. and Kovaleva, N.V., 2018)
The development of the education system is now a priority of domestic policy in many countries of the world. In this regard, much attention is paid to the effectiveness of national educational systems, which is reflected in the world rankings. Figure 8 shows the top 10 countries in terms of the effectiveness of national education systems in 2016. The first place in the 2016 ranking was taken by the United States (100), and the last place was taken by Indonesia (36.9). The effectiveness of the Russian educational system allowed our country to take the 34th place (49.1). In terms of the effectiveness of national educational systems, our country was behind Hong Kong (15th place), Taiwan (21st place), and Malaysia (27th place).

Figure 8 : Top 10 countries in terms of the effectiveness of national education systems in 2016 (Global Index of Cognitive Skills and Educational Attainment 2016) (Ranking of the World's Countries by the Level of Spending on Education, 2020)

The capital of culture acts as a factor of individuals' creative and intellectual potential, thus contributing to the growth of their productive forces. Cultural capital is a person's linguistic and cultural competence that legitimizes status and power and supports the established social order. There is enough research to suggest that people who engage in high-culture consumption are more successful in life than those who do not do it. Activities in the fields of culture are aimed at the comprehensive education of individuals and involve means that are perceived voluntarily, taking into account an individual's interests and free time.

The country's cultural attractiveness to the global community is reflected in the rating of national brands. The methodology of the global study of national brands developed by S. Anholt involves six evaluation parameters: export, management, culture, people, tourism, and migration. 2017 Anholt Nation Brands Index estimated national brands of 50 countries. The top five places in this ranking belong to Germany, France, Great Britain, Canada and Japan (National Brand Index 2017, 2020). In the Anholt Nation Brands Index Russia ranked 25th in 2014, 22nd in 2015, 22nd in 2016, 23rd in 2017.

Russia's positions on some components of the national brand are shown in figure 9. According to the data, in 2014-2017 our country had worst results in the parameter "power": the 43rd place in 2014, 42nd in 2015, 34th in 2016 and 28th in 2017. In 2017 the results remained below the average for the parameters such as "people" (32nd place), "investment and immigration" (28th place), "tourism" (24th place). Russia's best results in the "culture" parameter during 2014-2017 are due to high ratings from residents of foreign countries: in 2014 – 10th place, in 2015. – 8th place, in 2016 – 8th place, in 2017-9th place. Culture is still the mainstay of Russia's national brand: according to this indicator, the country takes the ninth place in the world ranking. Based on the "cultural heritage" criterion, the top five countries in the National Brand Index 2017 rating are France, the United States, Italy, Germany and Switzerland.

Figure 9: Russia's positions on some components of the national brand, Anholt Nation Brands Index 2014-2016 (National Brand Index 2017, 2020)

Conclusions and Proposals

The functioning of health care system, education, and culture should be aimed at creating a generation of healthy, educated, and cultured professionals. The coordinated development of these sectors of the socio-cultural sphere will ensure the modernization of the country's human capital, and therefore the entire economic system of Russia. For the Russian Federation today, the first priority task is to improve the quality of human capital on the basis of increasing the welfare of the people and ensuring high rates of social and economic development through it.

Abstract

The contemporary cities of highly developed countries strive to improve their competitiveness and attractiveness, both on a regional and international scale. This is possible through measures to improve the quality of life QoL. A number of factors influence QoL in cities, predominantly effective logistics infrastructure management. For this reason increasing number of expectations and requirements are being placed on the city's logistics infrastructure. As a result, it becomes necessary to develop new methods of its organization and management, enabling the inclusion of all factors that have a significant impact on QoL in the process, especially increasingly important issues regarding the provision of the optimal level of public security and national defense within the available resources.The purpose of the article will, therefore, be to analyse and discuss the main problems and challenges associated with managing the city's logistics infrastructure emerging from the national defense and public security requirements.

Keywords: Public Security, Logistics Infrastructure

Introduction

Modern cities of highly developed countries strive to improve their competitiveness and attractiveness, both on a regional and international scale. This is possible through measures to improve the quality of life. A number of factors influence the quality of life in cities, including mainly effective logistics infrastructure management. Actions taken in cities are, or should be, implemented in accordance with the principles of building local and regional circular economies. In its communication, the European Commission noted that achieving a circular economy requires "a complete system change and innovation not only in technologies, but also in organization, society, financing methods and politics" (Communication). Therefore, more and more expectations and requirements are being placed on the city's logistics infrastructure. As a result, it becomes necessary to develop new methods of its organization and management, enabling the inclusion in this process of all factors that have a significant impact on the quality of life, including increasingly important issues regarding the provision of the optimal level of public security and national defense within the available resources. The aim of the article will be to analyse and discuss the main problems and challenges related to managing the city's Logistics infrastructure resulting from the need to ensure public security and national defense.

The Scope and Goals of Modern Urban Logistics

Urban logistics is commonly defined as a continuous and multi-faceted process of managing the flow of both goods, cash and information in order to develop the city. Activities undertaken as part of this process should be implemented in accordance with the principles of sustainable development and

assume that the city is a social organization aimed at securing the needs of its clients – the city's residents (Nowakowska-Grunt & Chłąd 2015). The aim of urban logistics understood in this way is optimal planning, management and control of all flows within the logistics network in the city area, as well as integration and coordination between the interested parties (Amaral & Aghezzaf 2015).

Representatives of the parties, which are an inseparable feature of reflections on the city's logistics, represent various, and often contradictory, goals and interests. In the most general division we can classify them according to the economic sectors they represent, i.e. as public and private stakeholders (Lindholm & Behrends 2012). Public stakeholders include municipal self-government and central authorities, while private stakeholders include freight forwarders, carriers and residents (Thompson 2014, Taniguchi 2014).

The main goal of public authorities at the local level is to create the best conditions for the city's development, while in the case of central authorities to minimize the negative external effects associated with the operation of urban logistics and maximize net economic benefits. Quite different goals are pursued by representatives of the private sector, in which (Russo & Comi 2010):

- forwarders, whose main subject of interest is the delivery and collection at the lowest cost of goods at the level meeting the needs of customers;
- carriers whose main purpose is to conduct cheaper but high-quality transport activities that meet the interests of senders and recipients;
- residents whose main goal is the free access to services and goods of the highest quality.

The process of the flow of goods, cash and information requires a variety of measures and techniques. These measures, ways of their use, as well as systems of their application create a kind of infrastructure of processes taking place in cities. In order for these processes to take place, it becomes necessary to equip cities with logistics infrastructure devices that are able to meet the needs of the production and non-production sphere, as well as the individual and collective needs of the population. Therefore, they cover, to a very wide extent, all transport and communication equipment and facilities, water and energy supply, as well as devices for shaping and protecting the natural environment. Based on this infrastructure, the following areas can be distinguished in which it is necessary to introduce new management principles in cities, including in the aspect of challenges arising from the need to ensure public security and national defense. These areas include:

- supplying the cities with basic utilities, in particular water, electricity, heat and gas;
- organization of urban and freight transport including storage processes;
- organization of a telecommunications network in the city;
- organization of the export and utilization of municipal and post-industrial waste and sewage;
- organization of transport connections with the logistics system of other regions.

When analysing the processes taking place in urban logistics, it should be borne in mind that there is a permanent mismatch in the speed of changes that occur in logistics networks and changes that take place in the cities themselves. As a rule, cities are changing slowly compared to the rapid pace of development of logistics systems. Urban logistics, by setting out new communication routes, logistics centres or networks of interconnections, sets the directions for the development of cities. For this reason, factors influencing the direction and nature of changes should be considered in a coherent manner, taking into account the challenges that the modern cities have to face.

Urban logistics is by definition an element of the state's economic policy, hence the long-tern intervention of the state is its permanent and inherent feature. This has a direct impact on the urban logistics model, where a system in which the public sector acts as the main shareholder and operator of the logistics infrastructure is preferred. Another variant, currently widespread, involves the cooperation of the public sector with the private sector and the involvement of the resources of private business entities in investment activities or related to logistics infrastructure service.

Due to the varied scope of activities that the public sector plays in the process of managing logistics infrastructure in cities, it is possible to classify forms of public intervention due to the degree to which cities express their pro-development activity (Noworól 2011):

- regulatory actions which may take the form of: controlling, defining strictly acceptable forms of economic and social activity; border delimitation, permitting socio-economic activity in specific ranges of values;
- activation measures, which may take the form of: animation of cross-sectoral cooperation, in particular the coordination of pro-development activities of economic and social organizations, own activity, using public resources: field, budget, information and organizational.

These forms of public intervention reflect, among others, attitudes of authorities, which can be reduced to management through administration or through active participation in development processes.

Priorities in Managing Logistics Infrastructure in Cities

The socio-economic and technological development taking place in the world leads to a situation in which communities, especially in highly developed countries, have ever higher expectations as to the conditions in which they operate. This raises a number of new challenges, especially for cities which role as economic, service, cultural or social centres is becoming more and more important. Urban centres are therefore facing increasing problems in urban planning, education, housing shortages, transport, economics, health care, ecology, crime, law and order, and immigration. In addition, there are new challenges related to the need to protect residents against terrorism, epidemiological threats or the effects of natural disasters. Cities are making increasing investment efforts in sustainable urban logistics initiatives, such as urban distribution centres, the development of ecological public transport, improving the quality of network services or reducing the nuisance and negative impact of logistics infrastructure on residents and their environment (Taniguchi & Thompson 2002).

Therefore, a key problem appears in the management of logistics infrastructure in cities, consisting in seeking the answer to the question – how with increasing public expenditure related to the need to provide increasingly costly public services to ensure the optimal level of security of their provision and functioning of the infrastructure.

The growing scale of problems causes a number of social tensions and requires a new definition of logistics infrastructure management capabilities in the field of ensuring public security and national defense. It should be clearly emphasized that safety is an element that directly affects the quality of life in cities. It is impossible to effectively develop modern cities without ensuring an adequate level of security. In this respect, the most important priorities in managing logistics infrastructure in cities are:

- expanding the logistics infrastructure in the field of transporting people and goods in a way that ensures maintaining continuity of supplies necessary for the city's functioning and supporting communication routes and connections with other regions;
- expansion of the public transport enabling cheap, safe and ecological transport within the city;
- development of innovative IT systems enabling the functioning of entities operating in the city and carrying out acceptable control of population movement, transport of goods, capital and information;
- building crisis management systems in emergency situations.

Increasing requirements of city dwellers – especially in terms of quality of life – predispose the aspect of sustainable development as decisive in managing the city's logistics infrastructure. Urban logistics is thus becoming both the goal and driving force for the transition to a circular economy. An example of the assessment of cities in terms of quality of life can be the methodology proposed by Eurostat, which has developed a framework for analysing quality of life using eight dimensions for EU Member States, including measuring overall satisfaction with living standards. These multidimensional analyses

can indicate how Europeans think about their daily lives and the cities in which they operate and what sense of security they have (Urban & 2016). The assessments of key factors that are the most important and least important in terms of quality of life in eight dimensions: education, medical services, social services, unemployment, housing, road infrastructure, public transport, air pollution, noise and public safety in the selected 79 EU cities were presented in Table 1.

Table 1: Items perceived as being most/least important for respondents in selected European cities. (% of respondents naming the issue as one of the three most important items for their city in 2015)

Most important issue	**Highest rating (%)**	**Second highest rating (%)**	**Third highest rating (%)**
Education and training	Oulu - 60	Wien and Belfast - 58	Aalborg, Hamburg and Zurich - 55
Health services	Budapest -67	Belfast and Reykjavik - 66	Białystok, Gdańsk and Warszawa - 63
Social services	Leipzig, Vilnius, Groningen - 31	Rostock, Riga and Budapest - 29	Dortmund and Zurich - 28
Unemployment	Napoli - 73	Ostrava - 71	Miskolc - 70
Housing	Stockholm - 61	München - 56	Geneva and Zurich - 51
Road infrastructure	Tallinn - 52	Iraklelo - 50	Praha - 49
Public transport	Helsinki - 49	Oslo - 45	Istanbul - 42
Air pollution	Ostrava - 76	Burgas - 62	Kraków - 60
Noise	Praha - 35	Valletta - 28	Burgas - 20
Urban safety	Marseille - 52	Liege - 47	Rotterdam - 44
Least important issue	**Third lowest rating (%)**	**Second lowest rating (%)**	**Lowest rating (5)**
Education and training	Praha - 13	Miskolc - 11	Ostrava - 4
Health services	München - 21	Praha - 17	Ostrava - 7
Social services	Bruxelles and Napoli - 12	Paris, Malmo and Istanbul - 11	Kraków - 10
Unemployment	Reykjavik - 15	München - 14	Valletta - 5
Housing	Sofia and Napoli -5	Palermo - 4	Burgas - 3
Road infrastructure	Barcelona - 9	Paris - 8	Madrid and Malmo - 7
Public transport	Tallinn - 52	Ostrava - 5	Burgas - 4
Air pollution	Dublin and Tyneside - 7	Belfast - 6	Bialystok - 5
Noise	Roma, Stockholm, Belfast and Oslo - 4	Helsinki and London - 3	Dublin, Riga, Oulu, Malmo and Glasgow -2
Urban safety	Burgas, Rostock, Tallinn and Białystok - 16	Stockholm - 14	Cluj - 12

Source: (Urban, 2016)

The research results presented in Table 1 indicate a significant diversity in the perception of basic problem issues by individual urban communities, which should be resolved in order to improve the quality of life. While, e.g., as much as 76% of the inhabitants of Ostrava considered air pollution as the most important problem for the development of their city, about 73% of the inhabitants of Naples considered the problem of solving the unemployment in the city as the key matter. The study also

shows the multi-faceted nature of the studied phenomenon. While, e.g., the residents of Munich appreciate the quality of medical services and the labour market in the city, they perceive the problem of the lack of availability of housing, which is largely a consequence of the indicated key factors of the city's success (Urban & 2016).

In the concept of the circular economy, urban logistics is very sensitive to changes in consumption patterns (Savini 2019), which means that in order to build optimal and effective logistics systems, it becomes necessary to search for instruments and tools enabling communication between individual stakeholders and coordination of activities between the interested parties. In this regard, the application of innovative ICT and ITS (intelligent transport systems) technologies, new management methods and the development of public-private partnership (Taniguchi 2014) are helpful. The results of these processes include, among others, concepts that are recently developing very dynamically related to the urban logistics based largely on innovative technical solutions that allow solving a number of problems related to the pathologies of functioning of highly urbanized areas (Tundys & 2013)

Logistics infrastructure in cities is a kind of critical infrastructure, which is of key importance for maintaining an adequate standard of living is not widely appreciated by residents. As long as critical infrastructure works as it should, society generally underestimates its value. It is only in the event of a failure that most people find out how important it is (Broemme 2013) and what is its importance for maintaining public safety in cities. Therefore, the challenges arising from the need to build a civil society are becoming increasingly important for the security of modern cities. Residents must accept the fact that they are obliged to comply with public authority to some extent. Of course, degrees of freedom may vary depending on countries or regions and the solutions they adopt. Nevertheless, public awareness and the willingness to participate in initiatives to improve security are becoming increasingly important to build safe cities. This is a difficult issue, because you must be aware that life in modern cities is becoming more and more complicated.

Terrorist incidents or natural disasters that we are increasingly dealing with in contemporary cities significantly affect the priorities of local government and the role of public authorities. The need to ensure internal security and public security in each city require local authorities to shift increasing resources, means and attention of public administration to the issues of proper preparation of logistics infrastructure for these challenges. Therefore, it is desirable to integrate logistics capabilities with public security and security services at the local level (Wallace 2009) with security at the regional and international level.

In order to ensure the optimal level of security of urban logistics, more and more initiatives should be undertaken to coordinate between national and international organizations dealing with security and strive for continuous development of network threat analysis (including the interdisciplinary risk identification and early detection of crisis situations).

It is also important to build a local logistics infrastructure based on private logistics companies, which should also prepare for these extreme cases. To this end, apart from joint actions aimed at preparing the principles of logistics infrastructure management, it is important to familiarize them with crisis management structures and funds of state and private partners that could be used in crisis situations. In addition, undertaking joint exercises strengthens trust-based cooperation between the state and the business world and confirms the belief that crises can only be managed together (Oprach & Bovekamp 2013).

Therefore, new strategies and methods of managing the city's logistics infrastructure should take into account the entire complexity of the city's space, constituting the stage for dynamic economic, social and cultural changes, requiring openness in the sphere of mutual acceptance for diversity. This determines both an understanding of what city management is today and how logistics infrastructure should operate, based on which the development processes can take place.

The role of local communities in shaping public security and national defense

Ensuring public safety is one of the key tasks for all state bodies. It should be emphasized that public security is primarily a constitutional value, for the protection of which it is possible to limit the citizen's exercise of his constitutional freedoms and rights. In the literature on the subject, it is most often defined as such a condition of the state that allows the proper functioning of a state organization, provides the opportunity to pursue its interests and preserve the life and health of citizens with full opportunity to exercise all the rights guaranteed in the Constitution (Zaborowski 1985). In view of the measures taken at all levels of state and local government administration to guarantee security in all its dimensions, it turns out to be crucial to define the most likely threats to national security. Nowadays, these include primarily (Majer 2012):

- terrorism in any form, characterized by an absolute disregard for human life and democratic values;
- organized crime manifesting itself in various forms, regardless of national borders;
- cybercrime that is a global, technical, cross-border and anonymous threat to information systems;
- cross-border crime having a major impact on the daily life of residents;
- violence in itself, increasing the damage already caused by crime and harming the society;
- natural disasters and anthropogenic factors, such as forest fires, earthquakes, floods, storms, droughts, energy failures and large-scale information and communication systems failures.

Apart from the above threats, social, economic and military threats also constitute a significant group of phenomena unfavourable to public security (Table 2).

Table 2: Threats to people, services and the environment

Threats	
Secondary (natural disasters): - human existence, - social, - violation of biological balance, - losses on a massive scale.	**Primary (failures, catastrophes, cataclysms):** - natural, - technical, - military, - extraordinary environmental hazards.

Source: (Jakubczak 2003)

From the perspective of the analyses carried out, the special role of military threats, which are taking on new forms in the modern world, should be indicated. To counteract them, a defense system is created in each country responsible for the so-called state defense readiness. It constitutes a state of stability of the elements of the state defense system to maintain national security, effective operation in emergency situations, including the possibility of opposing any crisis and war threats (Dziubek 2010).

The range of the above threats are determined by the scale of their impact, covering the level from central to local one from the perspective of a given country. Focusing only on the local level, it should be noted that in many local community definitions, there are usually three permanent elements in the literature on the subject: territory, social interactions and psychological bond, expressed in a sense of community with people (individuals and groups) living in a specific territory, and also in a special relationship (often very emotional) perceived as our common place (Szacka 2003). In the literature on the subject of research, the concept of local community originates from two streams of social thought. Representatives of the first orientation (Durkheim, Simnel, Tőnnies) paid close attention to the essence of collective identity, lasting emotional ties, as well as social harmony (a certain state of balance) between individual people who relied on direct contacts. The society interpreted this way is a kind of community, not necessarily associated with a separate territory. Its essence is expressed in:

- experiencing and sharing the same symbols, norms and values that determine the sources of the cultural identity of a given group;
- objective dependencies and relationships that are formed among people;
- respecting mutual principles of agreement, communication and cooperation.

It is emphasized that the above-mentioned three aspects of social reality in the perception of the individual interpenetrate, creating an indivisible whole accepted by it (Starosta 2002). The second orientation places the main emphasis on the place itself and the territory organizing social life (Park, Burgess, McKenzi et al.). A very strictly defined geographical space was introduced into the area of the concept of community, the territory of which became the basis for social, economic, cultural or political organization, constituting an integral part of human existence. In the mind of the individual, it performs the functions of not only the homeland (small homeland), but also the place of civic and political self-realization (Starosta 2002). The local community is considered a relatively durable mesostructured which performs the following functions (Borkowski 2003):

- housing – ensuring adequate housing conditions, including social housing for the poorer part of the community; it is living in a given area that formally constitutes the territorial community;
- self-government – choosing and controlling local authorities, self-determination in issues important for the community, managing common property; it is worth remembering that the local government is the general population of residents, and not local authorities;
- organization of everyday life – suburban "housing estates-bedrooms" can hardly be called communities;
- identity – integrating residents around a common tradition, culture, religion, space, ownership and shaping the released "we" awareness;
- meeting basic needs – consumption, health care, educational, social assistance; it is no accident that we observe the process of "localizing" social services;
- socialization – maintaining and promoting significant social values, teaching social roles, shaping pro-social and civic attitudes;
- culture-forming – cultivating the memory of the past, animating the activities of creative associations and local amateur creators, organizing local cultural events.

In addition to the above functions, we should add a function directly related to shaping public security and national defense by local communities. The development of a local community is primarily a bottom-up activity, consisting in supporting people and shaping their ability to take up activities together with other members of a given community. This approach is based on the belief that people may not only jointly develop skills and knowledge in order to carry out changes serving others, but also create and provide conditions together that guarantee the safety of a given community. In addition, from a national defense perspective, local communities are the first link of responsibility for a given territory, which for obvious reasons is the most important for them.

Conclusion

If we consider that the city is an area integrating any activity related to the management of physical and human resources in socio-economic space, the task of urban logistics is to combine into one the controllable whole of all activities of these economic entities that are responsible for ensuring proper conditions of this management.

When analysing the issues of managing the city's logistics infrastructure in the aspect of challenges resulting from the need to ensure an appropriate level of public and national security, one should be aware that 100% protection of the logistics infrastructure cannot and can never be guaranteed, as well as its absolute trouble-free operation. On the other hand, one can actively and more consciously counteract potential threats and crisis situations. For this to happen, however, the current way of thinking about security must evolve into a new "risk culture" that requires open communication between state institutions, local authorities, residents and businesses. The new way of managing urban

logistics will also require a greater involvement of residents and enterprises in active participation in the prevention and handling of crisis events.

Abstract

The study is focused on the use of information as a specific economic resource. The essential characteristics of the term "information economic resources" are clarified. The assessment of trends in the development of the information society in the Russian Federation was made using blocks of indicators that characterize information economic resources.

Keywords: Information, Information Economic Resources, Information Society.

Introduction

In the modern world, information is the existential basis for the development of human society. Information plays an increasingly significant role in the economy, penetrating into all spheres of human activity. If we consider the subject area of the economy as a system of relations regarding the formation and use of resources and economic goods created with their help, then information can act both as a good and as a specific economic resource. If the first form is more or less clear - information as a good (service) is actively involved in the processes of distribution, exchange and consumption, then the second form is a bit unclear. There is still no consensus among scholars and practitioners on the form of identifying information as an independent economic resource. Various versions are mentioned: scientific and technological progress, knowledge, information, etc. But there is almost no disagreement in the fact that information resources are currently the main driver of economic growth (Kostyuk, 1997).

As early as 1890, A. Marshall introduced the improvement of equipment and technologies as an exception, formulating the law of diminishing returns, justifying the fall in the marginal productivity of capital (Marshall, 2013). This fact can be considered the starting point for including information resources in economic research. A large number of works by various authors were focused on the development of the information society and various forms of using information resources in the economy (Bell (1974); Castells (2009); Kelly (1998); Masuda (1981); Machlup (1962); Stigler (1961); Stonier (1983); Porat and Rubin (1978); Toffler (1970); Varnavsky (2015); Inozemtsev (2000); Konstantinov (1998); Lavrishcheva (2012); Mirzoeva (2014); Nizhegorodtsev (2002); Popov and Semyachkov (2017); Rakitov (1998), Tsyrenova (2011) etc.).

Konstantinov (1998) claims that from an economic point of view, information resources "represent information and knowledge obtained and accumulated during the development of science and technology that can be used in management as a factor in increasing production volumes and increasing its efficiency".

According to Tsyrenova (2011), information resource is a body of accumulated and scientifically systematized individual and collective knowledge that has a certain consumer utility and is in demand

by various economic entities, social and economic systems in order to ensure the effectiveness of their functioning (information factor of development).

The aim of the study is to define information as a specific economic resource and to analyze trends in the development of the information society in the Russian Federation.

Theoretical Background

Despite the large number of economic studies, in practice, the dominant interpretation of the term "information resources" is a set of systematized data placed in information systems or on digital media, which is associated with the rapid development of computer science and computer technologies.

We propose to use the term "information economic resources" (IER) for economic research to eliminate discrepancies. We will understand IER as a set of relevant information involved in economic relations that provides positive changes in the market value of other economic resources and/or the creation of new (improved) economic benefits in order to improve the efficiency and development of the socio-economic system. Moreover, it does not matter in what form and on what media the information will be stored. The main thing is how and in what form this information will be involved in economic turnover.

For example, information on the results of fundamental analysis of the issuer's activities may either remain unclaimed or lead to certain decisions on the stock exchange, which will lead to changes in the market value of securities.

Information on the results of exploration of mineral deposits has significant impact on both the cost of land and the investment attractiveness of the territory. There are many such examples.

Moreover, the specific feature of the information is that it often become available to both counterparties when it is transferred from one economic actor to another. This feature characterizes clearly expressed multiplicative effect of using IER.

The analysis of IER is rather difficult due to the peculiarities of the Russian statistical system. Since 2018 the Federal State Statistics Service of the Russian Federation has been monitoring the development of the information society in the Russian Federation on almost 150 indicators. The authors of the monitoring identified the factors of information society development:

– human capital;

– innovative potential;

– information computer technologies (ICT);

– infrastructure and access;

– economic environment;

– information industry;

– information security;

– e-government;

– e-business;

– e-education;

– e-health;

– electronic culture;

– use of ICT by households and the population.

We distinguished three key blocks of indicators from the monitoring in relation to the IER study:

– level of education and professional training of the population (Fig. 1);

– resource base for research and development and innovation (Fig. 2);

– information industry of the Russian Federation (Fig. 3).

Results and Discussion

When people apply their education to the economy, the knowledge becomes one of the most important types of IER. Fig. 1 shows that three of the four indicators have a negative trend.

Source: Rosstat

Fig. 1: Dynamics of the information society development indicators of the Russian Federation. Indicators characterizing the level of education and professional training of the population (growth rate compared to the previous year)

Thus, the share of higher education institutions connected to the Internet via broadband access in the total number of higher education institutions surveyed in 2018 decreased from 96 % to 86.2 % (growth rate of 89.8 %), which reduces the possibility of using Internet information in the educational process.

The number of university students who are the main carriers of high-level knowledge in demand by the economy also demonstrated a negative trend. It has decreased by more than a third in the Russian Federation since 2012. It should be noted that the rate of decline in the number of students decreased to 1.7% in 2018; and according to the indicator "share of students enrolled in higher education programs in the total population" to 3.4%. However, these indicators have not yet reached the growth zone.

Only the indicator "Number of students admitted to state educational institutions of higher education in the field of computer science and engineering per 10,000 population" showed growth for the entire analyzed period. It showed maximum in 2018 (14 students per 10,000 population, growth of 16.7%), which characterizes the building up of the human potential of the digital economy being formed in the Russian Federation.

In our opinion, the results of research and innovation activity are the second key block that characterizes IER in Russia (Fig. 2). Indeed, high-tech and innovative products are more competitive due to their novelty and improved characteristics.

Source: Rosstat

Fig. 2: Dynamics of the information society development indicators of the Russian Federation. Indicators characterizing the resource base for R&D and innovation

Fig. 2 shows that all three indicators characterizing the resource base of R&D and innovation declined in 2018. Especially alarming is the five-year decline in the indicator "Share of technological innovation costs in the total volume of goods, work, services shipped from industrial production organizations and service sector" (from 2.9 % in 2014 to 2.1 % in 2018).

The main reason for this situation is the reduction in the amount of state support for research and innovation activities, as well as the decrease of research funding from the real sector of the economy. Correcting the situation will require a lot of effort on the part of both federal and regional authorities, which is why the national project "Science" has been launched in the Russian Federation since 2019.

Source: Rosstat

Fig. 3: Dynamics of the information society development indicators of the Russian Federation. Indicators characterizing the information industry of the Russian Federation

The third key block of indicators characterizes the level of the information industry development in the Russian Federation (Fig. 3). All indicators show a positive trend. In this case, information technologies themselves and their contribution to the activities of economic entities act as IER. The positive trends in e-business indicators, such as "Share of organizations that had special software for managing the procurement of goods (works, services)", "Share of organizations that placed orders for goods (services) on the Internet" and "Share of organizations that received orders for manufactured goods (works, services) via the Internet" in the total number of organizations surveyed are particularly noteworthy.

Conclusions

The results of the analysis indicate that the role of information technologies and their direct impact on

social and economic development is currently increasing in the Russian Federation. This positive trend will increase in the coming years. However, other aspects of IER use (research, innovation, obtaining new knowledge in the higher education system, etc.) show certain decline, which, although slowed down in 2018, still characterizes the insufficient efficiency of using the information resource base.

The implementation of the national projects "Science", "Education", "Digital economy", "Small and medium-sized businesses and support for individual entrepreneurial initiative" and "Labor productivity and employment support" in the period from 2019 to 2024 provides new opportunities for digitalizing the economy and increasing the efficiency of using IER. This will require significant efforts both at the level of the Russian state as a whole and in each individual region.

Hamzah AL-MAWALI

Assistant Professor of Accounting, The University of Jordan, School of Business
h.almawali@ju.edu.jo

Abstract

The study aimed to investigate the extent of BSC usage in a Jordanian context, as well as examining the relationship between BSC usage and organizational performance. Finally, the study attempted to provide empirical evidence regarding the moderating effect of intensity of competition on the association between BSC usage and organizational performance. The response rate was 55%, which is considered highly accepted compared to previous studies. The descriptive analysis indicated that the level of BSC usage was at moderate for all BSC dimensions. Moreover, the study demonstrated that the Jordanian companies were facing a competitive business environment based on the intensity of competition results. Therefore, the study asserted that the BSC intergraded dimensions are necessary for a firm's long-term success in such a competitive environment. The hypotheses results of the study indicated that BSC usage has a significant positive relationship with financial performance, Thus, this result demonstrated that the main role of BSC that has been considered to facilitate organizations activities which leads to improve their overall performance, particularly financial performance. Finally, the study revealed that the intensity of competition influenced the relationship between BSC and the firm's performance and moderate the relationship between BSC usage and firm's performance. Finally, the study recommended extending the implementation of BSC due to its evidenced contributions in terms of enhancing a firm's performance in a Jordanian context by increasing the awareness of attainable benefits of the implementation of BSC. Similarly, the study endorsed the taking into account of the non-financial aspects. Finally, the study suggested employing the mixed method as a fruitful research approach and utilized other research theories such as agency theory and shareholder theory. Finally, it is suggested that other factors are studied that can influence the relationship between BSC and financial performance indicators.

Keywords: Balanced scorecard, Financial performance, Intensity of competition, Jordan.

Introduction

Several studies have argued that using strategic performance measurements systems, such as balanced scorecard (BSC), helps the managers to obtain information about how their organizations have fared in terms of integrating their vision and strategies with organizational performance based on specific metrics (Chenhall, 2005, Jusoh, et al., 2006; Kaplan and Norton, 1992, 1996b). BSC is a logic-based management accounting tool that uses multiple performance measurement and provides a strategy implementation framework. BSC, specifically, introduced both financial and non-financial measures, including four dimensions: financial, learning and growth, customers, and internal business processes in order that firms can implement strategy and evaluate organizational performance (Kaplan and Norten, 1996b).

Through using the four perspectives of BSC as a performance measurement system (PMS), BSC also monitors the performance of the organization by striking a balance between the different perspectives and performance. It provides an accurate set of tools that helps the organization to reach the performance level that it aims to attain. BSC also provides feedback about the organization's performance in order to correct or confirm its goals and objectives (Jusoh et al., 2008). The main reasons behind the need for a strong and effective performance measurement system are according to its ability to assist the company in dealing with different changes in the business environment, as such changes may cause fluctuations in the company's performance. In this manner, the intensity of competition is considered one of the factors that can play a role in using multiple performance measurements (Chenhall, 2003). In addition, companies desire to be leaders in the market where many competitors are present for that the companies are looking to adopt an appropriate performance measurement to face the high competition in the market, and to heighten the opportunities for better financial performance.

Based on contingency theory assumptions, the current study aims to examine the effect of BSC usage on financial performance, as well as investigating the moderating effect of intensity of competition on the direct relationship between BSC usage and financial performance in the context of non-financial companies listed on the Amman Stock Exchange in 2018.

Literature Review and Hypotheses Development

Balanced Scorecard

The BSC provides a framework that encourages the use of both financial and non-financial measures of performance, allowing the organization to pinpoint its strategic objectives via balancing four perspectives – financial, customers, internal business processes and learning and growth – to measure a firm's performance (Kaplan et al., 1992; Kaplan et al., 1996b). The effectiveness of the balanced scorecard is based on its ability to translate a firm's mission and strategy into a comprehensive set of performance measures (Kaplan et al., 2000).

Introduced by Robert Kaplan of Harvard Business School, and David Norton, of Renaissance Worldwide in 1992, the BSC framework is a system that measures both current performance of the firm and drivers of future performance. Specifically, the BSC framework seeks to identify the critical economic activities of the company, which generate current and future cash flows, and to build a causal model of the process by which the company generates profits by focusing on both financial and non-financial indicators of a firm's performance (Al-Mawali, 2013; Jusoh et al., 2008).

The BSC framework is based on the premise that those properties of the financial accounting system, such as conservatism, transaction emphasis, and money base unit of measurement, prevent it from adequately measuring the key activities of the company. Rather, Kaplan and Norton (1992) suggest supplementing the traditional financial measurement system with non-financial measures of customer relations, internal business processes, and organizational learning and growth in order to specify what the organization expects to receive from and give to the various stakeholder groups in exchange for those groups' continued contribution toward the organization's pursuit of its objectives. The BSC is explicitly based on the growing acceptance of two related premises. The first is that future success involves providing superior value to customers, employees and shareholders. The second is that attracting shareholder funds, employee talent, and customers are the three fundamentals of sustainable competitive advantage and superior returns to investors (Hoffecker et al., 1994; Hogan, Gressle, and Neyland, 1999; Huselid, 1995; Ittner et al., 1998a; Johnson, 1998; Kaplan et al., 1996b; Maisel, 1992; Newing, 1995). Within the BSC framework, four perspectives – financial, customer, processes and learning and growth – represent the views of four essential stakeholders in any business. All stakeholders have choices: shareholders can sell stock; customers can buy from another provider; and employees can work for another company. If value is created for each of these three essential stakeholder groups, the company will be more likely to produce a superior return for investors for a longer period (Lockamy et al., 1997; Nanni et al., 1990; Reynierse et al., 1992; Tang and Fuller, 1995).

The Four BSC Perspectives

Within the BSC framework, four categories of measures are identified in order to achieve balance between the financial and the non-financial, between internal and external, and between current performance and future performance (Kaplan et al., 1992). The four perspectives: financial, customer, processes, and learning and growth are discussed in the following paragraphs.

The financial perspective, as reflected in financial measures, is the most traditional and still most commonly used measurement tool. Financial measures are valuable in conveying the readily measurable economic consequences of action already taken. Financial measures are typically focused on profitability-related measures (the basis on which shareholders, in turn, typically gauge the success of their investments), such as return on capital, return on equity, return on sales, etc. (Kaplan et al., 1992; Lipe et al., 2000). These measures are necessary for any organization trying to measure performance for a number of reasons. First, reporting of financial measures is expected and governed under law. Second, reporting of certain types of financial measures of a firm's performance is required by institutional bodies.

The customer perspective normally includes several core or general measures derived from the desired successful outcomes of a well-formulated and implemented strategy. These core measures may include overall indicators such as customer satisfaction, customer complaints, customers lost/won, sales from new products, and on-time delivery (Kaplan, 1996, 1998; Light, 1998). Measures related to customers include results from customer surveys, sales from repeat customers, and customer profitability. The customer perspective is a core of any business strategy which describes the unique mix of product, price, service, relationship, and image that a company offers (Kaplan et al., 2001c). The customer perspective defines how the organization differentiates itself from competitors to attract, retain and deepen relationships with targeted customers. The value of the customer perspective is crucial because it helps an organization connect its internal processes to improved outcomes with its customers (Kaplan and Norton, 2001b). Of the four BSC perspectives, the customer is at the core of any business and is crucial to long-term improvement of company performance (Kaplan et al., 1992; Pineno, 2002). Heskett et al. (1994) point out the customer-based virtuous circle, whereby investment in employee training leads to improved service quality, which in turn results in higher customer satisfaction leading to increased customer loyalty, which boosts revenues and margins.

Internal business process measures relate specifically to the operational processes of the business unit. They represent the perspective of the operations management within the BSC model. The internal process perspective is based on the notion that to satisfy customers and earn a financial return, the business must be efficient and effective at what it does. The internal process measures are typically based on the objective of finding the most efficient and effective way of producing products or services to meet customer needs. For example, such measures may include order conversion rate, on-time delivery from suppliers, cost of non-conformance, and lead-time reduction (Kaplan et al., 1996b).

Learning and growth measures represent the employees as part of the four pillars used to measure performance with the BSC framework. The innovation and learning perspective is all about developing the capabilities and processes needed for the future. In the banking industry, for example, for a business to succeed not only must it effectively carry out daily transactions but it must also continually improve in terms of the value and cost of its offerings. This innovation process can be measured in a variety of ways. These may include the speed of transactions, for example, or the number of people involved in a particular transaction. Again, the choice depends on what is critical for the success of each particular business (Kaplan et al., 1996b). Acknowledging that performance measures relating to learning and growth are the most difficult to select, Kaplan and Norton (1996b, p.127) suggest measures of employee capabilities, information systems capabilities, and employee motivation and empowerment as examples.

The Intensity of Competition

The empires of local and global competition in developed and emerging economies are extending their boundaries to the maximum limits. There is therefore an urgent need to realize the concept of intensity of competition, which refers to the degree of competition that a firm faces as a result of its rivals'

actions/reactions in terms of its attempts to generate profits and returns (Pecotich et al., 1999). The increase in the competition may be an encouraging factor that boosts performance according to the BSC approach (Hoque, 2011).

In order to operate in the existing competitive business environment, there is a real necessity to obtain all relevant, timely and accurate information about the cost, the performance indicators, the firm's activities, the process, the product and the service, as well as about the customer's increasing needs for both commodities or luxuries. From another viewpoint, as a sort of management response to the direction of learning and growth, the seniors require more timely and accurate information to help make the process much more efficient and more customer-focused (Kaplan, 1995, p.6).

A spotlights is to be focused upon the high level of competition since ignorance of such a competitive situation means giving a golden opportunity to competitors to gain a higher market share, improve the quality and the standardization level of their product, and confidently enhance the proportion of satisfied customers. Furthermore, the competition will be alert to the fact that they must look for resources to distinctive and gain a competitive advantage over the other competitors (Adnan et al., 2016).

The conclusions of Al-Rfou et al. (2012) asserted that the organizations that face a higher level of intensity in competition in their operating environments tend to own and develop a higher number of product/service lines. It also reported the positive effect of intensity of market competition on organizational performance. The measures of intensity of market competition comprised six competitive items, including: the number of competitors; the extent of following the modern technological change in the industry; the frequency of producing new products; the extent of price manipulations; the accessibility level of the marketing channels; and finally, the changes in government regulation and policy.

Otley (1980) and Hoque (2001) pointed out that intensity of competition, the BSC and the organization's performance receives the biggest proportion of the interest of management accounting specialists, as the most direct indicators in the realm of controlling the system. Consistent with the study of Chong and Rundusb (2004) – which examined the interaction between the TQM and the role of intensity of competition and organizational performance by scrutinizing the higher degree of market competition – the more positive the relationship between TQM practices of customer focus and organizational performance, and the higher the degree of market competition, the more positive was the relationship between TQM practices of product design and organizational performance. All of the hypotheses were evidenced in accordance with the statistical analysis results.

The Relationship between BSC Usage and Financial Performance

Performance measurement systems (e.g. BSC), along with performance management, are still considered an academic and practical paradox (Melnyk et al., 2014; Malmi, 2016). While they offer management many useful and necessary functions, there is still evidence that they can negatively affect performance under certain circumstances (Melnyk et al., 2014; Al-Mawali and Al-Shbiel, 2013). Several studies (e.g. Chenhall, 2003; Jusoh et al., 2008; Otley, 2016) have argued that using BSC provides ex-post, ex-ante, financial, non-financial, internal and external information that allows stakeholders to evaluate organizational performance from multiple perspectives. In addition to that, it plays an important role in the implementation of corporate strategy (Kaplan and Norton, 1992, 1996). Moreover, Cobbold and Lawrie (2002) have argued that BSC could be used not only as an evaluation of the organization's performance, but also to manage business processes with the organization. Wang et al. (2006) suggest that BSC could be used as a strategic management tool. Kaplan and Norton (1992) also pointed out that different strategies need multiple performance measurement systems like BSC. Olson and Slater (2002) have pointed out that because different strategies have different requirements for success, it follows that performance measurement systems should be tailored to the organization's strategic orientation. Otley (2016) confirmed that no universal management accounting systems can apply to all companies in all circumstances, but it all depends upon the contingent factors which the strategy one of them.

The link between BSC usage and organizational performance has been examined by several researchers. For example, Hoque and James (2000) have pointed to the relationship between BSC and performance while Sim and Koh (2001) have found that there is a relationship between learning and growth perspective and financial performance. The results of their study also show that innovative measurements, new product development time and customer-oriented performance measures are associated with lower manufacturing costs, higher sales and greater market share. In addition, the findings of Maiga and Jacobs's (2003) study show the significant positive effect of the Activity Based Costing System, when joined with BSC and organizational performance. Meanwhile, Davis and Albright (2004) confirmed the relationship between internal performance measures and the implementation of BSC in the banking industry.

However, the studies discussed above have applied the BSC framework to investigate the effect of BSC on organizational performance. There are numerous studies that have examined the association between the usage of multiple performance measurements systems and financial performance (Al-Mawali et al., 2010, 2012; Banker et al., 2000; Droge et al., 2000; Ittner and Larcker, 1998b; Said et al., 2003; Bryant et al., 2004). Banker et al. (2000) showed that there is a positive relationship between customer satisfaction measures and future accounting performance, while Droge et al. (2000) revealed that time-to-market for new products as a measure often leads to higher initial prices, greater market share and customer loyalty, as well as significant cost benefits. Said et al. (2003) revealed that the use of non-financial measures is associated with future accounting and market-based returns. Bryant et al. (2004) also reported that when firms implement a performance measurement system that contain both financial and non-financial measures, they will benefit more than the firms that rely solely on financial measures. Although the previous studies show some positive association between the use of non-financial measures and performance, several other studies reveal the opposite results.

In contrast, Ittner, Larcker and Randall (2003) showed results that contradicted the prior studies by reporting a negative relationship between BSC usage and financial performance. Bastian and Muchlish (2012) indicated that non-financial performance measurement systems were significantly linked to organizational performance, but the usage of financial performance measurements is not significantly associated with organizational performance. Thus, H1 hypothesized that the relationship between BSC dimensions usage and financial performance is as follows:

H1: there is a positive relationship between BSC usage and financial performance.
H1a: there is a positive relationship between financial dimension indicators (FD) usage and financial performance.
H1b: there is a positive relationship between customer dimension indicators (CD) usage and financial performance.
H1c: there is a positive relationship between internal process dimension indicators (IPD) usage and financial performance.
H1d: there is a positive relationship between learning and growth dimension indicators (LGD) usage and financial performance.

The Intensity of Competition as a Moderator

The opportunity to exploit the benefits of the relationship between BSC and organizational performance becomes highly possible when the intensity of competition is higher based on contingency's assumptions (Chenhall, 2003). Since the organization will compete go to significant lengths to obtain a better competitive advantage. This, in turn, rationalizes the increase on the performance (Hoque, 2011). Giantari et al. (2017) indicated that the existing intensity of competition between competitors to obtain the most beneficial position becomes challengeable day after day, and this clarifies the use of diverse techniques to attract the customer. These techniques include: providing high-quality goods or services and reducing prices. Moreover, the competition tends to be an opportunity rather than a threat, used by competitors to improve their position. Asikhia and Binuyo (2012) developed their study by considering the competitive intensity as a moderator variable. They came up with a set of conclusions that indicate a positive association between competitive intensity, customer orientation and a firm's performance relationship.

The study of Adnan et al. (2016) also pays attention to how to assess the moderating effect of competition intensity on human resources management (HRM) practices and organizational performance. The results of Guidara and Khoufi's (2014) study showed that the intensity of market competition is a determinant of BSC usage. Hoque et al. (2001) investigated, in the context of New Zealand's market, BSC usage in controlling environmental factors and achieving a sustainable, fruitful competitive advantage. Thus, based on the contingency theory and related studies, the following hypotheses formulate the moderating effect of intensity of competition on the relationship between BSC usage and financial performance.

H2: intensity of competition moderates the relationship between BSC usage and financial performance.
H2a: intensity of competition moderates the relationship between financial indicators usage and financial performance.
H2b: intensity of competition moderates the relationship between customer indicators usage and financial performance.
H2c: intensity of competition moderates the relationship between internal process indicators usage and financial performance.
H2d: intensity of competition moderates the relationship between learning and growth indicators usage and financial performance.

Methodology

Population and Sample

The non-financial companies listed on the Amman Stock Exchange (2018) were used as the sampling frame for the current study. Questionnaires were distributed to the entire population (N = 129). The overall response companies (n = 71) with 55% of the total targeted companies in ASE. Looking into the similar experiences, Sharabati and Fuqaha in 2014 investigated the impact of strategic management by using BSC in business performance in pharmaceutical industries in Jordan; their study obtained a 64% response rate from the targeted sector. The demographic variables of the sampled companies are illustrated in Table 1.

Table 1: Demographic of Sample Companies

Variable	Categories	Frequency	Percent%
Type of Industry	Real estate	12	17.4
	Health Care Services	3	4.3
	Educational Services	2	2.9
	Hotels and Tourism	2	2.9
	Transportation	5	7.2
	Technology and Communication	2	2.9
	Media	1	1.4
	Utilities and Energy	4	5.8
	Commercial Services	9	13.0
	Pharmaceutical and Medical Industries	3	4.3
	Chemical Industries	6	8.7
	Printing and Packaging	1	1.4
	Food and Beverages	3	4.3
	Tobacco and Cigarettes	1	1.4

	Mining and Extraction Industries	7	10.1
	Engineering and Construction	4	5.8
	Electrical Industries	2	2.9
	Textiles, Leathers and Clothing	2	2.9
Being in Business	Less than 5 years	1	1.4
	6-10 years	6	8.7
	11-15 years	10	14.5
	more than 15 years	52	75.4
Ownership Status	Local-based owned	49	71.0
	Foreigner-based owned	1	1.4
	Mixed	17	24.6
	Family Business	2	2.8
Number of Employees	Fewer than 100	30	43.5
	100-200	15	21.7
	201-300	7	10.1
	301-400	4	5.8
	More than 500	13	18.8

Variables Measurements

The extent of BSC usage – independent variable – was measured by examined based on the four dimensions previously mentioned (Jusoh et al., 2008; Neely et al., 2007). All items relating to the four dimensions of BSC (see Table 2) use a seven-point Likert scale anchored at both ends: 1 = not at all, to 7 = to the greater extent.

The financial performance – dependent variable – was measured using objective indicates (e.g. ROA, ROE, operating profit, sales growth rate), which were extracted from the annual reports of non-financial companies listed on the ASE in 2018. The intensity of competition – moderator variable – was measured based on an instrument developed by Hoque (2011). The measurement includes five items illustrated in Table 2. A seven-point Likert scale was used, ranging from 1 = "negligible" to 7 = "extremely intense".

Results

Goodness of Measures

Firstly, the factor analysis technique was used to evaluate the validity of BSC usage and intensity of competition variables, factor analysis was carried out based on assumptions suggested by Hair et al. (2011) and Sekran (2016). The results of the first run of factor analysis for BSC indicated that the KMO = .842, Bartlett's test of sphericity (p = .00), anti-image correlation (> .50). However, item no.1 form learning and Growth dimension indicated a value lower than the low communities (.370) which should be more than .50, so the item was dropped in the second run. The second run shows a KMO = .846 and Bartlett's test of sphericity (p = .00), anti-image and communities higher than .50, which is considered acceptable (Hair et al., 2011). Moreover, the result of factor analysis for intensity of competition (a moderator), yielded one factor with KMO = .853, Bartlett's test of sphericity (p = .00), anti-image correlation (> .50) and factor loading higher than .50 for all items. Secondly, reliability for the two variables (e.g. BSC and intensity of competition) was evaluated using Cronbach's Alpha (α). The results show that α values for the two variables were higher 0.60 as suggested by Hair et al. (2011); Table 2 shows the reliability for each variable of the study.

Table 2: Factor Analysis and Reliability

		I	II	III	IV	α
Financial Dimension (FD)						.92
EVA		.86				
Generated Cash Flow		.83				
ROI		.81				
Manufacturing Cost		.80				
Sales Revenue		.77

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.853				
Bartlett's Test of Sphericity	Approx. Chi-Square	232.341				
	Sig.	.000				

Descriptive and Correlation Analysis

Table 3 represents the correlation matrix for the variables operationalized in this study. The means and standard deviations (SD) of all the study variables were also included in the table. These bivariate correlations allow for preliminary assessment and information regarding the hypothesized relationships. In addition to that, correlation analysis can detect any potential problems associated with multicollinearity among the variables of the study (Sekaran, 2016). The table shows that all the coefficients values are less than (0.75). Therefore, the correlation results indicate that multicollinearity was not a significant problem in this particular data set. The correlation matrix also reveals that the correlations are in a positive direction for the relationship between BSC and FP, and a negative direction for the relationship between IOC and FP.

Table 3: Mean, Standard Deviation, and Pearson Correlation Coefficient for All Variables

Variables	**Mean**	**SD**	**FD**	**CD**	**IPD**	**LGD**	**IOC**
Financial Dimension (FD)	4.78	1.510	1				
Customer Dimension (CD)	4.65	1.200	.620**	1			
Internal Process Dimension (IPD)	4.09	1.705	.297*	.467**	1		
Learning and Growth Dimension (LGD)	3.82	1.515	.501**	.553**	.474**	1	
Intensity of Competition (IOC)	4.62	1.465	.429**	.620**	.395**	.475**	1
Financial Performance	2.08	10.49	.002	.151	.057	.015	-.065

Hypotheses Testing

The hierarchical multiple regressions analysis was performed to test the direct effect of BSC usage on FP, and it also tested the moderating effects of the intensity of competition on the relationship between BSC usage and FP. This technique, established by Baron and Kenny (1986), and Sharma, Durand and Gur-Arie (1981), was used to test hypotheses in the current study. A three-step hierarchical regression was performed. The independent variables were entered in the first step; the moderating variable was entered in the second step, and lastly, interaction terms were introduced into the equation to test the joint effect of predictor and the moderator on the dependent variable. The interaction terms were calculated by multiplying predictor with moderating variable.

To determine whether the moderator effect on the anticipated relationship existed or otherwise, three maximum conditions were used. First, the final model must be significant. Second, the F change must be significant. Third, the beta coefficient of the interaction term must also be statistically significant. Furthermore, to find out whether the moderator was pure or quasi-moderating, the current study followed the conditions cited by Sharma, Durand and Gur-Arie (1981). If the coefficient of the multiplicative interaction term was significant and the coefficient of the moderator variable effect was not significant, the moderator is a pure moderator. However, if the coefficients of both the multiplicative interaction term and the moderator variable were significant, the moderator is a quasi-moderator.

Table 4: Hypotheses Testing

Variables	DV: Financial Performance		
	Step 1 Std. Beta	Step 2 Std. Beta	Step 3 Std. Beta
Independent variable (BSC Dimensions)			
Financial Dimension (FD)	.149**	.158**	.753**
Customer Dimension (CD)	.155	.014	.348
Internal Process Dimension (IPD)	.247	.273	.544
Learning and Growth Dimension (LGD)	.517**	.467**	.295**
Moderating variable			
Intensity of Competition (IOC)		.295**	.755**
Interaction terms			
FD*IOC			.573**
CD*IOC			-.511
IPD*IOC			.553
LGD*IOC			-.805**
F value	4.569**	4.670***	5.518***
R^2	.225	.274	.461
R^2 change	.225	.049	.188
F change	4.569**	4.158*	5.052***

*Note: Significance levels: *p < .10, **p <. 05, ***p< .01*

Table 4 presents the result of the three-step regression analysis of the four dimensions of BSC usage, IOC (as moderator) and the interaction between BSC and IOC in terms of financial performance. In the first step, only two out of four dimensions of BSC (e.g. FD and LGD) had a significant effect on financial performance. The BSC dimensions together explained about 22.5% of the total variation in financial performance. The introduction of the BSC dimensions in step 1 showed significant model value as indicated by significant F change ($F = 4.569$, $\rho < .05$). The addition of the ICO variable in step 2 explained an additional 4.9% of variation in financial performance. This means that the BSC dimensions and IOC cumulatively explained 27.4% of the variance in financial performance. The result shows that FD and LGD had a positive and significant effect on financial performance at $p < .05$, $\beta = .149$ for FD and, $\beta = .517$ for LGD. This result indicates that the higher the financial indicators (e.g. FD) and learning and growth indicators (e.g. LGD), the higher will be the financial performance. Therefore, H1a and H1d are supported. Meanwhile, other BSC dimensions show no significant relationship with financial performance. Based on this, the proposed hypotheses H1b (i.e., customers' dimension usage positively affect financial performance) and H1c (i.e., internal process usage positively affects financial performance) were not supported.

The hypotheses H2a, H2b, H2c and H2d predicted that IOC moderates the relationship between the four BSC dimensions and financial performance as depicted in Figure 1. To test hypothesis H2, the analysis starts by assessing the beta coefficients for interaction terms in step 3, which shows that IOC moderated the relationship between only two dimensions of BSC usage and financial performance, namely, FD at $p < .05$, $ß = .573$, and LGD $p < .05$, $ß = -.805$. This indicates that H2a and H2d were supported. The introduction of the interaction terms significantly increased the model value (as indicated by significant F change) and raised R squared around 18.8%, and generally the model as a whole was significant ($F = 5.518$, $\rho < .01$). However, IOC showed no moderating effect on the relationship between the other two BSC dimensions (e.g. CD and IPD) and financial performance. Therefore, this result indicates that hypotheses H2b and H2c were not supported.

Discussions

The BSC was introduced as a vital strategic performance measurement and strategic planning matric, which is trusted in achieving the company's goals which include strategic planning, improved communication and improved integrated reporting. Finally it enhances the firm's performance in many respects (financial, operation and control aspects). The BSC shaped based on multidimensional measures that could be utilized to evaluate the company's performance.

This study examined the extent of BSC usage, especially on financial performance. The study indicated that there is a correlation between use of BSC measures and financial performance. The overall result of this study revealed that there is a positive relationship between the overall BSC measures and financial performance. Considering when testing the BSC indicators separately. As the financial dimension was the most used particularly manufacturing cost measurement and the lowest was internal process dimension. This result is in agreement with previous literature; Soubjaki (2019) indicated that Jordanian companies apply both financial and non-financial measures in a balanced scorecard (BSC). Similarly, Jabeen and Behery (2017) revealed that the concept of the BSC is considered good practice in the UAE and the KSA as examples of developing countries, also reflected in other studies such as those by Braam and Nijssen (2009) and DeBarros and Wanderley (2016). Moreover, the moderating effect of IOC through the relationship between the BSC indicator and financial performance was significant. The results indicated that firms will be enhanced financially if they use the financial indicators and learning and growth indicators. The results of customer indicators and internal business process indicators have no significant relationship with or effect on financial performance. According to literature, the study by Zabri and Ahmed (2016) demonstrated that the higher the usage of a non-financial performance measurement system, the greater the effect on the firm's performance. Wang et al. (2013) also revealed that using BSC dimensions has a positive significant influence on a firm's performance. On the other hand, Al-Mawali et al.'s (2010) results indicated that branches of banks with a higher usage of CD and product indicators will have a higher financial performance. The results varied in the study of Jusoh et al. (2008), which indicated that the IND and LGD have a positive impact on a firm's performance, contrary to the FD and CD. The study demonstrated that Jordanian companies faced a competitive business environment based on the intensity of competition results. Therefore, the BSC intergraded dimensions, used as a comprehensive measurement system, are necessary for a firm's long-term success in such a competitive environment. In this regard, the study's results were compatible with the literature review, as Hoang et al. (2018) indicated that the business strategy, perceived environmental uncertainty, intensity of competition and total quality management have significant positive impacts on the usage of BSC. Another study carried out by Braam and Nijssen (2004) revealed that BSC use complements corporate strategy positively and influences company performance, while BSC use that is not related to the strategy may decrease it. Finally, Gomes and Romão (2018) showed that BSC helps to address different environmental and social aspects that are related to the implementation of strategy and their execution within a business unit or at a company level and to meet intensity of competition.

Based on the study hypotheses results, the study indicated that BSC usage has a significant positive relationship with financial performance, which means the capability of BSC dimensions in enhancing the financial performance of the firm. Thus, this result asserted to the main role of BSC that has been considered as strategic management tool that facilitate organizations to align their business activities to the vision and strategy of the organization and improve their overall performance particularly financial performance. The above conclusion is well matched to prior studies; for instance, Alao (2013) examined benefits inherent in applying BSC as against the non- specific approach of appraising employee performance in order to enhance profitability. Likewise, Karasneh and Al-Dahir (2012) indicated that the BSC model is a promising tool for organizations, to assess and evaluate their performance. Soubjaki (2019) the three other perspectives of the BSC less attention. Regarding the examination of the moderator effect of intensity of competition on the relationship between BSC usage and organizational performance, the study revealed that the intensity of competition influenced the relationship between BSC and the firm's performance and moderates the relationship between BSC usage and the firm's performance.

Conclusion and Future Research

In conclusion, the study complies with the contingency theory, which supposes a positive relationship between BSC usage and a firm's performance as a result the enhancement of performance will occur if a good fit occurs between the BSC or measure of performance system and the context variables such intensity of competition.

Based on the study's findings and due to the researching interested nature, the study recommends improving the use of BSC as a strategic performance measurement tool due to its evidenced contributions to enhancing a firm's performance in the Jordanian context by increasing the awareness of attainable benefits of the implementation of BSC. Similarly, the study endorsed the non-financial aspects such as customers, the internal control, the learning and growth as performance measures, and not being limited to the financial measures framework by paying attention to these aspects and the added value that would be gained. In addition, the Jordanian companies need to maintain a higher degree of caution concerning the environmental elements in which they are operating and encourage the firms for more environmental protection instructions. Finally, the study advises that the company will perform better at a high level of intensity of competition if it extends the implementation level of BSC for decision-making purposes; as a result this will lead to better performance. Future research needs to expand the targeted population to cover financial firms, such as insurance companies and the banking sector, which left a gap in this study. In addition, it is suggested that the mixed method is employed as a fruitful research approach and that other research theories are also utilized such as agency theory or shareholder theory. Finally, it is suggested that other factors are studied that can influence the relationship between BSC and financial performance indicators.

Abstract

This research examined the mediating role of accountant participation in strategic decisions on the direct relationship between selected Strategic Management Accounting (SMA) Techniques (i.e. Strategic Costing, Strategic Pricing and Brand Valuation) and organizational performance in Jordanian manufacturing companies. Related literatures were reviewed to develop the theoretical framework. Data were collected using survey distributed to top management (i.e. CFO or reprehensive) in 53 manufacturing companies listed in Amman Stock Exchange. The collected data were analyzed using Amos software to examine the validity and reliability first, then, to examine the research hypotheses. The results support the mediating effect of accounting participation in strategic decisions, and results reported a positive effect for SMA on organizational performance. This study contributes to the body of knowledge in management accounting in the context of developing countries.

Keywords: Strategic Management Accounting, Organizational performance, Jordan.

Introduction

Over the years, the business setting has undergone successive changes because of the huge boom in reliance on information systems, the use of modern means of communication and openness to world markets. Such changes have led to the increasing significance of accounting information, the vital nerve in the decision-making process, which has resulted in attention being paid to the concept of strategic accounting, as this is the area that shows how the strategic management methods reflect the information that accounting seeks to provide. Therefore, there has been a growing call for the need to enhance the information characteristics provided by management accounting to achieve justifiable competitive gain for organizations. Moreover, there have been many attempts to link the developments of accounting with strategic management. In this aspect, accounting literature has included various definitions of strategic management accounting (Al-Mawali, 2015; Tout et al., 2014; Kariyawasam, 2016; Ajibolade, 2013).

Simmonds (1981) initially introduced strategic management accounting (SMA) as a set of management accounting activities that he recommended, in order to include the work of an accountant who provides the necessary information to implement the strategic management of organizations. SMA is based on an analysis of the competitive situation that represents a departure from the general trend towards modern administrative accounting issues at that time. This was because the majority of the information amounted to that which SMA seeks to provide-costs, brand portfolio valuation, and product pricing decisions (Simmonds, 1982). Cravens and Guilding (1999) see SMA as a complement to a range of topics, including cost accounting and management accounting. They also considered the overall focus of management accounting to provide accounting information that supports an organization's

competitive advantage. Bromwich (1990) believes that SMA is administrative accounting and, therefore, Accountant is interested in providing information regarding the final product market. However, SMA is considered to be the product of combining strategy with management accounting.
Grundy (1992) argues that strategic financial accounting incorporates the procedure of examining the financial statements and reports of an organization using both financial and strategic methods. It focuses on the interaction between marketing and management accounting functions, as well as paying attention to the element of competition and external aspects, in order to achieve a competitive advantage in an organization. The researcher tends to brand valuation as one of the SMA techniques, based on Grundy's definition. The emergence of SMA methods has been in line with developments in the modern business setting. These developments have led to increased attention to and focus on accountability concepts by management, in order to discover areas of improvement and add value to the development of accountability systems as well as to support competitive advantages. Strategic accounting involves carrying out sufficient analysis to obtain real results. The ability to extract account results at any time without waiting until the end of the year helps to obtain immediate results and budget reports without the need for closure restrictions. Therefore, the financial statements prepared in the field of financial accounting include information that is financially and strategically useful. Benefit can also be gained from the methods of analysis and ratios that provide a more thorough and comprehensive view of an organization's performance, including its quantification and analysis, as well as its position and future, to show the continuous improvement that strategic management pursues. The rapid variations and growth in a modern business setting have affected the quantity and quality of information that enterprises need in order to quantify and evaluate performance, and hence achieve strategic objectives through specific SMA techniques related to strategic decision-making. There is an urgent need to develop financial performance measurements to handle the rapid and progressive variations in a modern business setting, as well as modern trends of performance extent and appraisal. Performance measurement is essential and one of the key elements of the success of an enterprise in a modern manufacturing environment. It is useful to focus on non-financial performance measures rather than exclusively on financial measures. A comprehensive picture of the entity's presentation should be given in an integrated manner.

The main goals of strategic management are to attain a full understanding of what the organization is doing and why, the degree of commitment of managers and employees, and their relationship in terms of strategic decision-making, which gives them a feeling that they are a part of a firm. In turn, these goals promote a sense of effectiveness among employees though their participation in the decision-making process. Accountants are considered as the most important employees and must be involved in the decision-making process, because of their role in strategy implementation (Cadez & Guilding, 2008). However, there is a shortage of studies that investigate the relationship between accountant participation in the strategic policymaking process and SMA usage related to organizational performance in developing countries such as Jordan (Al-Mawali, 2013). For SMA to be taken into consideration as an intermediary between accountant participation in the strategic decision-making process and organizational performance

The importance of this study stems from its role in indicating the nature of the relationship between accountant participation in strategic decision-making and organizational performance when using SMA techniques. There are many studies that have discussed the relationship between SMA techniques usages on organizational performance (e.g. Al-Mawali et al., 2012; Tout et al., 2014; Becker and Gerhart, 1996). However, the current study examines the role of the accountants' participation in strategic management decisions such as pricing decisions, investment and its impact on organizational performance, taking into consideration the use of specific SMA techniques (strategic pricing, strategic costing, brand valuation) as a mediator variable. Cadiz and Guilding (2008) confirmed the participation of accountants in strategic decisions, and the SMA practice of management-oriented accounting with a focus on operational issues. The researchers agree that this shift has led to several new terms such as "strategic accounting." They have also identified new active roles for accountants such as being key players in broader business analysis and advising clients. Previously, these roles were not assigned to them.

This study is motivated by the scarcity of its subject matter, given the importance of accountant participation in strategic decision-making by way of SMA techniques—strategic costing, strategic pricing and brand valuation, in particular—including SMA effect on organizational performance. In addition, this study is differentiated from previous research as it has used diversity in measuring organizational performance (financial and non-financial), employing three instruments in methodology by way of a mixed method. In addition, limited research has been conducted about the subject of strategic decision-making.

Literature Review and Hypotheses Development

Accountant Participation in Strategic Decision-Making Processes

There is an important role for accounting information in business management 1) verbalizing strategies; 2) collaborating those strategies throughout the organization; 3) emerging and carrying out maneuvers to implement the strategies; and 4) evolving and executing controls to screen the success of the implementation steps, thus enjoying success in achieving the strategic objective (Shank and Govindarajan, 1989; Cadez and Guilding, 2008). Many studies examine how accounting innovation increases a firm's organizational performance and how it helps firms in decision-making. Abernethy and Bouwens (2005) examined their hypothetical model, illustrating that resistance to accounting innovation is influenced by decentralized choices. They also argued that allocation of decision privileges can limit the potential for resistance in two ways: 1) through allowing managers to confirm that their subunits are flexible enough to adopt novel signals provided by accounting innovations and; 2) by allowing subunit managers to be engaged in the design of such systems. Their model likewise enabled them to evaluate the penalties on organizational outcomes when accounting innovations are resisted by subunit managers.

Management accountants support managers in improving the decision-making procedure through the provision of metrics and analysis, as well as accountant's ability to provide information in a timely and accurate manner. Moreover, they should manage information efficiently, including executing work thoroughly or "partnering" with a corporate to facilitate improved decision-making processes and helping value creation (Christensen and Feltham, 2003).

The main purpose of Abernethy and Bouwens' (2005) study was to ascertain how accounting innovation increases a firm's organizational performance and how it helps firms in decision-making. The study addresses the notion that the failure of accounting innovation was due to weaknesses at the organizational level such as training policies and internal management. In addition, the study examined factors that influence acceptance of innovation in a management accounting system (MAS) among the lower levels of managers.

Strategic Management Accounting Techniques

According to management accounting research, many researchers have applied various theories and paradigms as a basis for generalization (Al-Mawali, 2015; Scapens and Bromwich, 2001; Ajibolade and Ojikutu, 2010; Scapens and Bromwich, 2010; Al-Htaybat and Alberti-Alhtaybat, 2013). Moreover, depending on paradigms (Malmi 2010; Lukka 2010), there are some places, variables, concepts, values and practices that constitute ways of viewing reality. They provide and coordinate efforts that aid researchers in expanding knowledge about such issues of interest. As such, this study depends on the contingency theory, which originated from organizational studies. Many researchers have applied contingency theory (Khandwalla, 1972; Haldma, 2002; Ajibolade, 2013; Al-Mawali and Lam, 2015) in management accounting research. It assumes that no single type of organizational structure can be implemented for all organizations. Moreover, organizational efficacy is dependent on the alignment between adopted technology, environmental volatility, company size, and characteristics of the organizational structure and its information system (Ajibolade, 2013; Al-Htaybat and Alberti-Alhtaybat, 2013; Haldma and Laats, 2002; Islam and Hu, 2012; Otley, 1980).

Meanwhile, Bromwich (1990) gave powerful arguments for SMA utilizing two assumptions property costing and hypothesis of contestable markets. He noticed that in quality costing, items are required for the characteristics that they give. Thus, accountants have a part to play in costing characteristics of different items and observing the execution of such traits after some time. He additionally posits that trait costing would require accountants to hold onto key data and cost data. This would involve costing the traits or qualities possessed by merchandise and checking and routinely revealing these expenses. These characteristics of SMA are inconsistent with strategic directions. As a strategy, SMA's main characteristics involve a lasting future guidance period and an outwardly focused viewpoint. Consequently, the authors argued that these characteristics could be a useful tool in determining the appropriate accounting techniques for SMA. From this perspective, technologies must reflect the degrees of these two trends—the external and/or the long-term (forward-looking) business setting. Cravens and Guilding (2001) added three other techniques.

Cadez and Guilding (2008) further drew 16 SMA techniques from these works, classifying these techniques into five broad categories with three categories embodying the concepts of management accounting discussed in management accounting literatures. They are: costing, planning, control, performance appraisal and decision-making. "Competitor accounting" and "customer accounting" are also two distinct categories Table1 shows the SMA techniques.

Table 1: Strategic management accounting techniques

SMA technique categories	SMA techniques
Costing	Attribute costing
	Life-cycle costing
	Quality costing
	Target costing
	Value-chain costing
Planning, control and performance measurement	Benchmarking
	Integrated performance measurement
Strategic decision-making	Strategic costing
	Strategic pricing
	Brand valuation
Competitor accounting	Competitor cost assessment
	Competitive position monitoring
	Competitor performance appraisal
Customer accounting	Customer profitability analysis
	Lifetime customer profitability analysis
	Valuation of customers as assets

Anica-Popa's (2009) study endeavored to find a coordinated approach with respect to the cost examination display and the utilization of the data provided by administrative accounting and cost count in the usage of the systems for expanding the execution of ventures from the development materials industry. Then again, Jinga (2009) attempted to cover the principal parts of costing management and to clarify the assessments of directors in organizations in terms of the data created by the accounting management.

However, different papers proposed to guarantee the improvement of SMA, which was not generally embraced and connected, in both instruction and practice. Noordin et al.'s research (2015) sought to validate its propositions by two research objectives. The first objective was to investigate the extent of SMA information usage among electrical and electronic companies, while the second was to explore the outcomes of SMA information usage. The survey method was employed for data collection. Ninety-seven (97) usable questionnaires were received out of the 595 mailed questionnaires. The results suggested that electrical and electronic companies used SMA information to a high extent. Also, the results indicated that the extent of SMA information usage among companies was significantly related

to certain aspects of the companies' performance. The research revealed some notable developments in terms of SMA.

One of the papers aims to review the prevailing literature about implementing SMA and its part in providing better information for management. One of the studies, which related to SMA in Nigerian banks, examined the extent of practice and application (contribution) of SMA to strategic decision-making, not as a concept, but as a principle of operation, using the survey data obtained from 71 managers in 20 banks. A simple regression estimation technique and Pearson chi-squared test were used for data analysis. The managers were asked about external parts (customers, competitors, and market), and the study found that an SMA core ensured strategic positioning to gain competitive advantage (Obohn and Ajibolade, 2017).

Theoretical Framework and Hypotheses Development

According to the contingency theory, the successful implementation and use of management accounting techniques depend upon precise contingent factors, which include the environment, technology, size and organization structure as well as its competitive strategy, strategic mission, and culture (Al-Mawali, 2015, Ajibolade, 2013; Islam and Hu 2012). Based on contingency theory, there are many factors carrying significant implications for the SMA structure design, such as business strategy, the extent to which approved strategy is purposely formulated, firm size and market orientation.

In addition, the notion of contingency theory assumes that organizational performance is relevant to the alignment of organizational structure with its context. As a result, there is a difference between the performance of companies (Cadez and Guilding, 2008). In other words, there is a positive association between the level of fit and firm performance. Regarding the decision-making process Bartol and Martin (1994) illustrated that decision-making is the process of acknowledging and resolving organizational issues by managers. Crook et al. (2003) argue that strategic management research aims to facilitate exploring ways for performance enhancement.

As a result, it was found that this research can use contingency theory to justify the relationship between independent variables (accountant participation in strategic decision-making) and dependent variables (organizational performance) when SMA techniques are used to mediate this relationship. In addition, Cadez and Guilding's study (2008) used structural equation modeling to collect the necessary data. However, based on the previous literature review and after analyzing the Jordanian business environment, the hypotheses below were developed and will be examined with proper statistical techniques.

H.1: There is a positive relationship between accountant participation in strategic decision-making and organizational performance.

H.2: There is a positive relationship between accountant participation in strategic decision-making and SMA techniques usage (e.g. strategic costing, strategic pricing and brand valuation).

H.3: There is a positive relationship between SMA techniques usage (e.g. strategic costing, strategic pricing and, brand valuation) and organizational performance.

Research Methodology

Research Sample

The population of this study included all manufacturing companies listed on the Amman Stock Exchange in 2017, because these were the industrial sectors most relevant in order to quantify all variables of this study such as SMA techniques (strategic costing, strategic pricing and brand valuation). Thus, it is important to evaluate the extent of accountant participation in strategic decision-

making and the extent to which it affects the organizational performance. All these companies (66 companies) were used as a sample for this study. As the respondents comprised 53 companies, an 80% response rate was achieved (Table 2). The current study aimed to evaluate the degree of accountant participation in strategic decision-making and to what extent it affects organizational performance, which will be outlined using techniques employed by the accountant for making specialized strategic decisions. However, as mentioned, SMA information is generated from accounting. Therefore, the CFO or his/her representative—for example, controllers and CFO are the appropriate respondents to answer the questions.

Table 2: Response Rate of Companies

Type of company	Number
Electrical industries	10
Engineering and construction	4
Chemical industries	6
Mining and extraction industries	19
Pharmaceutical and medical industry	5
Cardboard and paper industries	1
Printing and packaging	2
Textile, leather and clothing	3
Tobacco and cigarettes	1
Food and beverages, class and ceramic	2
Total	53

Variables Measurements

The instrument contained survey items regarding the respondents' participation as accountants in strategic decision-making, organizational performance and utilizing SMA techniques. The details of each variable are explained as follows.

Accountant Participation in Strategic Decision-Making Processes: The current study has used five items to measure the extent of involvement that accountants have in many aspects of their organization's strategic decisions. The items are listed with a seven-point Likert scale (1 indicating not at all involved to 7 indicating fully involved) to determine the level of involvement that accountants have in many aspects of their organization's strategic management processes (Cadez and Guilding, 2008). The five items found in Section B, part two, of the questionnaire were classifying problems and offering objectives, producing options, assessing options, emerging details about options and taking the required actions to put strategic changes into place.

Strategic Management Accounting Techniques (Usage): the current study has applied a measurement used by previous research such as: Cadez and Guilding (2008). Twelve SMA techniques were listed with a seven-point Likert scale ranging from 1= not used at all, to 7= used to great extent.

Organizational Performance: A modified instrument based on previous studies was used to assess company performance. Each manager was asked to evaluate her/his company's performance level by comparing it with the major competitor for eight organizational performance indicators (financial and non-financial). Managers responded to each of the items of performance on a seven-point Likert scale anchored at both ends such that, 1 = Poor and 7 = Excellent (Grafton, Lillis and Widener, 2010). However, in response to possible problems with self-reporting measures, to make sure the reliability and the validity of the indexes and to minimize random fluctuations and anomalies in the data, the respondents were asked to report performance over the past three years (Katou and Budhwar, 2010).

Hypotheses Testing

Hypotheses testing includes assessing statistical relationships between accountant participation (ACPA) in strategic decision-making, SMA techniques and organizational performance. Three SMA techniques groups are used in this case, which includes strategic pricing (STRP), strategic costing (STCO), and brand valuation (BRVA). The analyses are performed in two parts, which involves statistical evaluation with respect to organizational performance measures.

Accountant Participation, Strategic Management Accounting Techniques And Non-Financial Performance

Figure 1 presents the basic structural equation modeling (SEM) path analysis, using a PLS algorithm. It shows the standardized regression weights for effects, factor loadings and R Squares. The standardized regression weights are shown in the following path coefficients table. SEM is defined a technique that analyzes structural relationships (Byrne, 2016).

A path coefficient was used to determine the level of possible relationships between the variables so the figure explains the relationship can be arranged as follows: Firstly, there is a strong relationship between ACPA and STRP; secondly, the relationship between ACPA and STCO; thirdly, the relationship between ACPA and ORPE; fourthly, the relationship between STCO and ORPE; fifthly, the relationship between ACPA and BRVA; sixthly, the relationship between STRP and ORPE.

Figure 1: Path coefficients (organizational performance)

In the SEM approach, the path coefficients are standard versions of the linear regression weights that examine possible causal associations. The path coefficient between ACPA and STRP is the highest, i.e. 0.379. In order to determine the statistical significance of each causal association, t-statistic and p-values are used (see Table 3).

Table 3: Testing significance of path coefficients (organizational performance)

Relationship	Sample Mean	Standard Deviation	t-values	p-values
ACPA -> BRVA	0.243	0.155	1.443	0.15
ACPA -> ORPE	0.325	0.119	2.675	0.008
ACPA -> STCO	0.358	0.148	2.397	0.017
ACPA -> STRP	0.385	0.13	2.92	0.004
BRVA -> ORPE	0.308	0.119	2.403	0.017
STCO -> ORPE	0.278	0.17	1.665	0.096
STRP -> ORPE	0.196	0.151	1.411	0.159
Note: ACPA is Accountant participation, BRVA is Brand Valuation, ORPE is Organizational Performance, STCO is Strategic Costing, STRP is Strategic Pricing.				

It was found that the impact of ACPA is statistically significant on ORPE, STCO and STRP at 0.05 level. Moreover, the relationship between BRVA and ORPE is also significant.

The mediating effect or the indirect effect of ACPA (independent variable) on ORPE (dependent variable) is significant. Since the direct effect from ACPA to ORPE was also significant, there is only "partial mediation."

Table 4: R Square Values Statistics

Variables	R Square	R Square Adjusted
BRVA	0.05	0.032
ORPE	0.652	0.623
STCO	0.126	0.109
STRP	0.143	0.127

Discussion

This section evaluates the proposed hypotheses to determine whether they are accepted or rejected.

H1: There is a positive relationship between accountant participation in strategic decision-making and organizational performance.

In this hypothesis, the direct impact of accountant participation (ACPA) in strategic decision-making is examined on the firm's performance. The statistics (t-statistics and p-value) reveal that ACPA in strategic decisions has a significant positive influence on non-financial organizational performance (ORPE) at 0.01 level. The result supports the previous literature, which argues that participation and engagement increase a firm's performance (Barrick, Thurgood, Smith and Courtright, 2015).

The tests reveal that ACPA has a significant influence on strategic costing and strategic pricing at 0.05 and 0.01 level respectively. The path coefficients in both relationships are positive, which suggest a positive impact of ACPA in strategic decision-making on strategic costing and strategic pricing. However, the impact of ACPA on brand valuation is statistically insignificant. It means that the results support the hypotheses 2.1 and 2.2, and do not support 2.3 as per Tables (3 and 4) Based on the SEM approach, the study examines the statistical impact of the three SMA techniques on organizational

performance using t-test and p-values. It is revealed that only brand valuation has a significant impact on organization performance (non-financial) at 0.05 level. While both strategic costing and strategic pricing are statistically insignificant in explaining a firm's performance. The path coefficient in the relationship between brand valuation and performance is positive, indicating a positive influence. This shows that the results only support H3.3. In the case of performance measures (ROA, ROE, and ROI), no significant relationships. These results suggest that SMA techniques, to some extent, are significantly associated with an organization's performance.

For determining the mediating effect of SMA techniques in the relationship between ACPA in strategic decision-making and organizational performance, the research study examines the "indirect effects." The test reveals a significant indirect effect of ACPA on organizational performance at 0.05 levels. Since the direct effect of ACPA on organizational performance was also significant there is only "partial mediation." Therefore, H4 is accepted for organizational performance only. The following table highlights the results of the study:

Table5: Summary for Hypotheses Results

	Accepted/Rejected
H1: There is a positive relationship between accountant participation in strategic decision-making and organizational performance.	Accepted
H2: There is a positive relationship between accountant participation in strategic decision-making and SMA techniques.	Partially Accepted
H2.1: There is a positive relationship between accountant participation in strategic decision-making and strategic costing.	Accepted
H2.2: There is a positive relationship between accountant participation in strategic decision-making and strategic pricing.	Accepted
H2.3: There is a positive relationship between accountant participation in strategic decision-making and brand valuation.	Rejected
H3: There is a positive relationship between SMA techniques and organizational performance.	Partially Accepted
H3.1: There is a positive relationship between strategic costing and organizational performance.	Rejected
H3.2: There is a positive relationship between strategic pricing and organizational performance.	Rejected
H3.3: There is a positive relationship between brand valuation and organizational performance.	Accepted
H4: The SMA techniques mediate the relationship between accountant participation in strategic decision-making and organizational performance.	Partially Accepted

Conclusion

Based on the results of this research, it is concluded that companies are required to set long-term strategic goals since they are influenced by competition and environmental variables. For gaining competitive advantage, companies need to access varied and large amounts of information and allow all members to contribute to achieving the objectives. Numerous studies have explored this phenomenon in relation to the credibility of the organizational information system (Otley, 1980; Duursema, 1999; Schuliz, 2001; Drury, 2002; Haldma and Laats, 2002; Bhimani and Langfield-Smith, 2007; Dumitrana, et al., 2008; Islam and Hu, 2012; Ajibolade, 2013; Al-Htaybat and Alberti-Alhtaybat, 2013). Accordingly, it is apparent across the industry sectors that organizations are adopting and using strategic management concepts of different kinds to cope with environmental variables and developments in economic systems.

Since traditional accounting systems no longer provide a detailed picture of organizational performance, strategic change is also required in accounting systems to reflect the performance of

contemporary organizations. This means that accounting orientation towards strategic thinking in accounting systems is important. The study findings of Al-Maryani and Sadik (2012) reflect this prospect, specifically highlighting the contribution of management accounting information towards strategically directing organizational performance. Accordingly, the current study has further refined this relationship of management accounting information and organizational performance in terms of highlighting the process of decision-making. The study also observed that, apart from the main function of the accounting unit, i.e. systematic recording, analysis, interpretation and summarizing of accounting information These findings are significantly in agreement with the research outcomes of Schuliz (2001) and Kariyawasam, (2016). Schuliz (2001) has clearly articulated the positive influence of information on firms' decision-making, and Kariyawasam (2016) has presented a strong correlation between accounting information and organizational decision-making that particularly fosters performance of the organization. Moreover, it is contended that accounting innovation promotes decision-making and improve a firm's performance (Abernethy and Bouwens, 2005).

Additionally, it was found that accountants support managers in improving the decision-making process by providing useful metrics and analysis (Christensen and Feltham, 2003; Abernethy and Bouwens, 2005). In this regard, the current study applied a number of techniques, such as frequency analysis, graphical analysis, descriptive statistics, factor analysis and structural equation modeling (SEM) to explore the relationship between accountants' participation and organizational performance. The study of Bushraand Masood (2017) also employed the SEM technique to assess the impact of employees' participation and organization performance; however, the identified variables are different. The current study considered manufacturing companies listed on the Amman Stock Exchange. CFOs or their representatives were taken as the appropriate respondents. A 36-item questionnaire was initially distributed to 66 participants and the study included 53 complete/usable responses.

According to the findings of the study, the majority of the respondents fell within the 35-40-year age bracket and have an "accounting" specialty in their last qualification. The general employment tenure of the accountants in the industry with a specific job title is long. A high majority have a bachelor's degree as their highest academic qualification and they work in mining and extraction sectors.

The frequency analysis reveals that accountants consider strategic pricing as an SMA technique and list various factors, including the competitive factor, market growth factor and experience factor. This particular finding is supported by the study results of Guilding, et al. (2000). Guilding, et al. (2000) have also presented "strategic pricing" as the most effective and recognized SMA technique in relation to a firm's performance. Another identified SMA technique involves analyzing cost data based on strategic information to develop and identify strategies to a large extent, which is supported by the findings of Manyaeva, Piskunov and Fomin (2016), Oboh and Ajibolade (2017) and Pavlatos (2011).

Moreover, researchers also examine the financial valuation of a brand through the assessment of leadership and marketing as an SMA technique (Guilding, 1992; Cravens and Guilding, 1999; Tout et al., 2014).

The research study performed SEM to analyze the statistical relationship between accountant participation (ACPA) in strategic decision-making, strategic management (SM) accounting techniques and organizational performance (non-financial and financial performance). The financial performance has been measured in terms of "return on equity" (ROE), "return on investment" (ROI) and "return on asset" (ROA), which is in accordance with the study variables of Venkatraman and Ramanujam (1986) and Al-Mawali, et al. (2012). Meanwhile, the non-financial constructs have been: margin on sales, capacity utilization, customer satisfaction, product quality, development of new products, and market share, adopted from the study recommendations of Cadez and Guilding (2008).

According to the results, there is a positive impact of ACPA on organizational performance (ORPE). This particular assertion supports the findings of Barrick, Thurgood, Smith and Courtright (2015), highlighting the influence of participation and engagement on a firm's performance.

Moreover, the mediating impact of SMA techniques was also evaluated in terms of the relationship

between the ACPA and organizational performance. The results showed that there is partial mediation that is explained by SMA techniques; thus, this supports the findings of Cadez, and Guilding (2008). The researchers agree that accountants must consider strategic pricing and strategic costing as SMA techniques because the accountant can present information that influences a firm's performance in terms of competitive factors and market growth. The researcher also agrees that non-financial indicators are more related to decision-making processes, especially when applied to contingency theory and the variance of the financial ratios between companies.

Recommendations

Based on the results of the study, the following recommendations are made for the management and for future research. Since there is a significant positive impact of ACPA on organizational performance, manufacturing firms should promote and increase participation of accountants in strategic decision-making. The insignificant relationship between ACPA and financial performance may indicate lack of alignment between ACPA in strategic decisions and organizational performance. Therefore, it is recommended that the management align the two constructs. Management may consider ACPA in decision-making to improve strategic pricing and strategic costing. Also, since SMA techniques partially mediate the relationship between ACPA and organizational performance, it is important for manufacturing firms to focus more on strategy costing, strategic pricing and brand valuation. Future research on the topic may take into account other industries and use a larger sample size to achieve more reliable results.

Abstract

The article deals with the economic aspect of motor traffic safety on roadways. Relevant problems on calculating economic losses related to road accidents are outlined. The importance of accurate determining of social and economic parameters of motor road accidents has been emphasized on. It has been also stressed that only reliable statistics data can be objective instrument for estimation the Motor Traffic Safety (hereinafter MTS) guarantee system effectiveness, establishment of its functioning regulation, and formulation of realistic concept of its development. In many countries of the world the national systems for collection, systematization and generalization of motor transport safety information have been recently characterized by insufficient accuracy and inefficiency ways. The analysis of the main MTS indicators has been performed according to outdated methods. For decades in a row the condition of MTS has been assessed by narrow range of parameters that are unable to represent comprehensive picture of the socio-economic aspect of motor transport safety. In its turn it causes the poorness of the original statistical material and the imperfection of the concepts, plans and programs of sectoral development having been worked out on its basis. Taking the above mentioned into consideration, it is obvious that the article contains analysis of modern methods for calculating economic losses caused by road accident, as well as formulation of a set of recommendations for their use in public administering and strategic management on motor transport safety.

Keywords*:* road safety, economy, accident, direct and indirect losses, material damage, cost structure.

Introduction

Strict determined conditions of macroeconomic indicators for traffic regulation level special importance acquires "cost" aspect of its safety. Exclusively on the clear definition basis of amount of material damage (i. e. notional value) from road accidents one can judge the profitability of certain preventive measures and, in general, the effectiveness of the corresponding direction of state policy. Compulsory guarantee of the completeness and objectivity of calculating the economic consequences of the road accidents are the correct determination of their structure. In addition to the obvious losses (damage to vehicles, cargo, road infrastructure, payment for treatment and medical rehabilitation of the victims, etc.) almost every accident causes a number of incidental and consequential costs, which in their totality have a significant impact on the state of the economy (both local and national). Without taking these costs into account it is very difficult

to find out the real economic scale of an accident, to identify priority areas for accident prevention, and to evaluate the profitability of road safety measures and programs.

Having grounded on the mentioned above, herewith should be confirmed that a number of "related" international organizations and foreign scientific-research institutions have conducted series of studies over the last decade aimed at establishing comprehensive list of the harmful (firstly, from economical point of view) consequences of an accident. Based on their generalization, we can distinguish the following components of economic damage from road accident: damage to property; losses related to the death of accident participants; losses related to injury of road accident participants; traffic congestion losses; administrative and legal expenses.

Estimating the Cost of Human Causalities: The Issues of Methodology

Losses related to the death of road users in traffic accidents. Beginning from the 1990's of the 20th century, a series of specialized studies were conducted by US and Western European experts to determine the economic impact of road mortality. By the information of Blincoe, Seay and Zaloshnja (2002), the US Department of Transportation released data that estimated the death of one road user costs $ 957,787. This amount includes: first extra medical aid costs – $ 833; outpatient treatment costs* – $ 22,095; loss from termination of professional activity of a person – $ 595,358; family loss (calculated basing on the market value of childcare services, persons requiring, housekeeping, etc.) – $ 191,541; insurance payments to the close ones and relatives of the deceased – $ 37,120; vacancy replacement costs (this includes the expense for recruiting new employee, the cost of overtime required to complete unfinished projects, and related administrative costs) – $ 8,702; court charges and other civil costs – $ 102,138.

Using the same methodology (referred to in special literature as RME)** Wijnen (2008) estimated one life lost in Netherlands at € 2.4 million (i. e. about $ 3.4 million). By Heslett (2006), in Great Britain the losses related to the death of road users reaches £ 1.4 million. According to Giles (2010), in Australis such losses are about 2.25 million Australian Dollars (approx. $ 2.0 million). The discrepancy between these indicators and the USA data is explained by the later terms of conducting relevant socio-economic studies (obviously, the increase in the amount of losses was significantly influenced by the general inflationary processes) as well as by the introduction of additional criteria for estimation of losses from lethal accidents, such as: age, costs for psychological help to relatives, etc.

It should be noted that many European countries (in particular, Italy, Norway, France, Sweden) use fundamentally different method of taxing the fatal accident, which is based on an assessment of society's willingness to pay for the reduction of risks to life. The mechanism of this technique (commonly known as "Willingness to pay" (WTP)) is as follows. Through a series of sociological surveys, it is to be figured out what amount of money the average citizen of the country is willing to pay in theory to reduce the risk of death in the road accident as a certain amount (let's say, n%). Multiplying the corresponding amount by the number of able-bodied populations, we get socially determined "price" of reducing road traffic mortality by n%. Since the percentage reduction in mortality is just the prevention of a certain number of accidents, it is easy to determine the "weighted average cost" of individual's life, based on available data. For this reason, it is just enough to divide the estimated cost of reducing the risk by the number of deaths to be avoided (Gurzhii, 2018).

As Beckmann (2007) admitted, the WTP methodology has gained wide spreading within advanced economies countries and relatively high standards of living, which has led to the willingness of their citizens to donate large sums of money for their own safety. Taking this into account, the cost of human life calculated by the method of "Willingness to pay", significantly (at least twice) exceeds the amount of direct economic losses from lethal accidents. In the research study of Rodney (2018) are shown

* It goes about people died in hospital within 30 days from the date of the accident.

** of Eng. "Real Money Estimate" – calculation of real money value.

different WTP-based estimations, according to which the cost of human losses caused by road accidents vary from 6 to 11.3 million Euros (approx. 8.5, 12.7 and 16 million USD).

Both of the above-mentioned methods (RME and WTP) have certain advantages and disadvantages. The first is based on objective figures, but does not take into account the aspect of road mortality such as "pain and suffering". Sometimes this leads to the paradoxical conclusion, for example, that the cost of human life interrupted by a road accident may be less than the damage caused by large-scale traffic congestion. The second is devoid of such a flaw, but has a hypothetical essence: it is based not on facts, but only on the intentions (moreover, unconfirmed by practice) of ordinary citizens.

Nevertheless, from the point of view of domestic socio-economic realities, the WTP technique seems more promising. First, in all its conventions, it gives a fairly clear idea of the socially-determined "price" of a person's life (road user). Second, it has been sufficiently tested by European practice and, admittedly, has proven itself well in formulating a number of sectoral strategies. Third, unlike RME methods, the results of which depend on the specifics of national systems of loss calculation (and they are different in each country), WTP methods are characterized by great versatility. Fourth, the WTP technique carries on positive psychological message: it determines the cost of a saved life, while the RME method calculates the cost of death. On the whole, the “Willingness to pay” method has numerous advantages, in particular that it is compact, cheap, relatively simple, and therefore it’s more convenient for immediate implementation;

Losses related to injury to road accident participants. According to statistics, one of the most common consequences of accidents is injuries to road users: pedestrians (up to 40% of the total number of injured), drivers (30%), passengers (15%), cyclists (10%), etc. One in five accidents caused by a road accident, results in permanent disability, one in ten leads to disability of the victim.

The nature and severity of these injuries varies widely. The greater bulk of them are bruise, hematomas, concussions (70%), damage to bones, tendons and joints (12%), traumatic brain injuries (9%), spinal injuries (4%), visual and hearing loss (3%). According to the International Classification of Injuries (MAIS), about 90% of accidents caused by road accidents are related as non-grave (MAIS 1 and MAIS 2 levels), 8% are mid grave severity traumas (MAIS 3), the remaining 2% are serious grave traumas (MAIS 4 and MAIS 5).

Taking into account the high graduation of road injuries, finding out its economic consequences through sociometric techniques (in particular, the WTP technique) it seems very problematic. The vast majority of citizens are not aware of medical classifications for human injury and therefore cannot form a clear opinion about the “price” of reducing correspondent risks (for example, the risk of non-grave trauma, moderate injury, severe trauma, or the like). In this regard, the economic range of road traffic injuries is determined by calculating the cost of the costs incurred. By Thomas, Wozdin, and Mackay (2007) these include: – emergency aid expenses (consisting of the cost of working hours of resuscitation crews, used medicines, fuel, etc.); – costs for outpatient treatment; – expenses for medical rehabilitation; losses from temporary or permanent disability; – insurance and social payments; – loss of life expectancy (calculated as the cost of social services related to the performance of lost childcare and household functions); – expenses caused by the performance of professional functions of the victim during the period of disability; – court expenses.

Analyzing the structure of these costs, Blincoe, Seay and Zaloshnja (2002) concluded that in USA depending on the severity of the injury, their amount can range from $ 170 (minor injuries: bruises, scratches, minor bleeding) to $ 1 million (injuries that result in permanent loss of essential functions of vital activity: damage to the spine, brain, loss of vital organs, etc.). According to estimates by New Zealand experts, the average “cost” of one traumatic accident in road transport is $ 100,000 *(see: The Social Cost of Road Crashes and Injuries, 2019)*. At the same time Wijnen (2010) estimates corresponding damages on 0.25 million Euros ($ 0.35 million).

Along with it, none of these amounts can serve as a reliable benchmark for the economic justification of activities (concepts, plans, programs) in a particular country. The output data of those studies is

strictly determined by the peculiarities of national economies and their basic parameters, such as: the national currency, the market value of goods and services, household income, etc. Therefore, even in countries with approximately equal level of economic development, the same method of calculation gives quite different results. And what is to be said about leaders and "outsiders" of the world economy: their losses from road injuries differ in several orders of magnitude.

The above-mentioned points to the necessity for the introduction of "own" mechanism in each country for assessing the consequences of an accident – a mechanism that would meet generally accepted world standards and, at the same time, fully take into account the domestic economic realities (price situation, level of social security, medical development, etc.).

Direct and Indirect Material (Non-Human) Losses Related to Road Accidents

Damage to property. According to statistics, up to 95% of road accidents finish up by more or less serious damage to vehicles, about 15% – by destruction of elements of road infrastructure (pillars, borders, bumpers and other protective structures), more than 5% – by property defilement of pedestrians rights, cyclists, animal chasers; 1,5% – by damage to valuable, expensive cargo. In addition, some car accidents (0,1-0,2% of the total number) cause damage to objects that are not integrated into the road-street system: residential buildings, farm buildings, yards and the like.

Keeping in mind the absolute dominance within the structure of property losses from road accidents, the costs associated with the repair of vehicles (according to various estimates, their share reaches 95-98%), Burch (2019) finds it inappropriate to calculate the damage caused to other property accurately. In the whole, this approach seems justified. Firstly, the information on the total "cost" of damage to vehicles is sufficient to cover the overall extent of property losses in the road and transport sector. Secondly, the damage caused to the cargo or property (excluding technical means of transportation) by road-traffic users is extremely multidimensional and complex. Therefore, its estimation requires enormous resources, which are not comparable to the weight of the specific result.

However, it is not reasonable to reject the idea of calculating losses from road equipment damage. The amount of these losses is rather large, but the calculation procedure is relatively simple (since the respective objects are on the balance sheet of state and communal enterprises, their current price is determined by universal formula, and all expenses for their renovation are clearly recorded in the budget documentation). Although this issue is worthwhile in-depth consideration; in this case the calculation of property damage is supposed to be economically grounded;

According to statistics, up to 95% of road accidents finish up by more or less serious damage to vehicles, about 15% – by destruction of elements of road infrastructure (pillars, borders, bumpers and other protective structures), more than 5% – by property defilement of pedestrians rights, cyclists, animal chasers; 1,5% – by damage to valuable, expensive cargo. In addition, some car accidents (0,1-0,2% of the total number) cause damage to objects that are not integrated into the road-street system: residential buildings, farm buildings, yards and the like.

As Burch (2019) admits, keeping in mind the absolute dominance within the structure of property losses from road accidents, the costs associated with the repair of vehicles (according to various estimates, their share reaches 95-98%), the vast majority of researchers find it inappropriate to calculate the damage caused to other property accurately. In the whole, this approach seems justified. Firstly, the information on the total "cost" of damage to vehicles is sufficient to cover the overall extent of property losses in the road and transport sector. Secondly, the damage caused to the cargo or property (excluding technical means of transportation) by road-traffic users is extremely multidimensional and complex. Therefore, its estimation requires enormous resources, which are not comparable to the weight of the specific result.

However, it is not reasonable to reject the idea of calculating losses from road equipment damage. The amount of these losses is rather large, but the calculation procedure is relatively simple (since the respective objects are on the balance sheet of state and communal enterprises, their current price is

determined by universal formula, and all expenses for their renovation are clearly recorded in the budget documentation). Although this issue is worthwhile in-depth consideration; in this case the calculation of property damage is supposed to be economically grounded;

Traffic congestion losses caused by road accidents. A large number of car accidents (especially those occurring in cities) lead to a rapid decline in traffic dynamics and mass congestion of vehicles. Failure of road and street infrastructure, critical damage to vehicles, localization of the accident scene before the arrival of emergency or ambulance vehicles, medical and other services – all this significantly reduces the capacity of the respective sections of roads and streets, disrupts the normal rhythm of traffic flow. As a result, tens, hundreds, or even thousands* of cars are blocked in traffic jams and their passengers are forced to wait for hours to eliminate the effects of a road accident.

In practice, the period of forced downtime results in serious economic losses. Due to constant acceleration of speed, deceleration and the usage of idling of the engine (this is the nature of the movement in conditions of excessive concentration of transport), the wear rates of the main units of the car increase by 10-15%, the average fuel consumption is almost twice. The volumes of exhaust gases and, consequently, their harmful effects on the environment increase proportionally. Drivers and passengers spend free and working hours in traffic jams, which causes a decline in production, reduced productivity, and the application of disciplinary sanctions for late work. Long stay in the car traffic jam and related conflicts cause mental fatigue, irritability, stresses, which is not only harmful for the health of road users but it also sometimes serves as a catalyst for further social behavior (accumulated fatigue can may subsequently result in a domestic altercation, eventually break into profession, or even provoke illegal actions). Traffic congestion is often an insurmountable obstacle for medical, ambulance and other emergency vehicles, including those being in a hurry to the traffic accident scene. As a result, the probability of fatalities increases: according to Smith (2009), long (more than 20 minutes) delays in ambulance crews become an indirect cause of the death of 34.3% of seriously injured road accident participants.

Due to the widespread and multifaceted nature of the damage they cause, traffic jams (especially those occurring at car accidents) have repeatedly been the subject of special economic research. In the course of the latter Garcia (2017) estimated that the total amount of correspondent losses for Western Europe is calculated on the level of about 3.5 billion Euros per year (that is about 150 million Euros per country). Road congestion is thus a major economic problem that needs urgent consideration and resolution on the national state level.

Administrative and legal expenses (costs related to administrative or criminal proceedings). Traffic accident is not just an accident resulting in material damage. It is also a legal fact that "brings to life" a wide range of legal relationships, and causes the launch of a complex legal and procedural mechanism. Depending on the nature of the damage caused, each accident serves as a basis for initiating and considering legal case. This process involves a set of procedural measures and a number of legal documents. It involves statutory entities funded by the state budget (inspectors, investigators, judges, attorneys, etc.). Therefore, legal proceedings always have a certain “price”, which includes: a) the cost of working time for judicial and law enforcement personnel spent on the road accident case; b) the cost of the procedural steps taken in the relevant administrative or criminal proceedings; c) the cost of legal services provided to the parties involved (defendant, victim, etc.).

Considering the relative complexity of the correspondent proceedings and the cost of individual procedural actions (registration of the accident or crime scene, technical expertise, etc.), administrative and legal costs occupy prominent place in the structure of the economic consequences of the road accident. According to Downey and Coalman (2004), the preliminary (police) investigation of one road accident "costs" about $ 120, and the trial of the criminal case, taking into account the services of a lawyer is almost $ 1.3 thousand. The annual expenses involved in implementing the relevant

* The largest traffic congestion in the world was recorded on November 2013 on the streets of the Brazilian metropolis of Sao Paulo. Its total length was 309 km, and the number of participants exceeded 4 million people.

jurisdictions are: 80 million dollars for Australia (Global Status Report on Road Safety, 2015); for the UK it is $ 55 million (Road Casualties in Great Britain, 2019); for the US - over $ 300 million (Jameson, Lesley, and Smith, 2008). Obviously, the amount of this level can significantly affect the profitability of sectoral plans, programs and projects, and therefore should always be taken into account when developing them.

The list of economic consequences of the road accident can be continued. In addition to the above indicated expenses it includes: the cost for fuel and deterioration of vehicles for special purposes (rescue, fire, ambulance ones and the like), for environmental ecological damage from getting of toxic substances into the soil, for the effects of psychological stress caused to road users, for the diseased of fauna objects, and so on. Taken together, they cause a major threat to national interests and civic well-being, which requires road safety to be raised to a higher, overall economic level. The state strategy of traffic safety should be developed and implemented within the framework of economic policy, the main priorities of which are the socio-economic stability of society and state, following the Constitutional rights and freedoms of citizens, legality, and law-abiding of all.

Conclusions

Summarizing the analysis of socio-economic characteristics of the road traffic secure, we can affirm the following. Road safety is a complex, multi-faceted phenomenon that has a tremendous impact on the demographic situation and the global economy. The scale of this impact far outweighs the effects of international terrorism, natural disasters or military conflicts. Considering social "dimension" it is comparable to the loss of mankind from the most dangerous diseases: cardiovascular disease, AIDS, pneumonia. Road accidents are the leading cause of death among young people between the age of 15 and 29, and governmental expenses in approximately 3% of GDP [17, p. 7].

Regarding overwhelming importance of the road safety, global international structures and the world's leading powers include it into the list of major political priorities. Road safety is recognized by them as a key criterion for the efficiency of transport connections, a key to the dynamic development of the economy (in particular, the manufacturing sector), and, at the same time the guarantee of human rights for the protection of life and health (Global Status Report on Road Safety, 2015).

Prioritization of the road traffic secure issues is embodied in the formulation of national strategies and the adoption of long-term targeted programs designed to ensure steady reduction of road accidents and injuries. Each of these programs is the result of complex calculations (estimating, forecasting, calculating), the accuracy of which depends on the completeness and objectivity of information on the socio-economic parameters of the road safety. It is like in general planning, and the rule here is as follows: the more authentic is the initial data, the higher is the reliability of the corresponding calculations. Therefore, the most developed countries pay the utmost attention to the issues of collecting, processing and organizing information that characterizes key aspects of the road safety: technical, social, economic, etc.

Many countries of the Western Europe, North America, as well as of the Asia-Pacific region use comprehensive informational and analytical systems for assessing the state of the road traffic secure, grounded on modern progressive methods and integrated into a nationwide network of statistic accounting. These systems ensure continuous monitoring of the road accidents; provide comprehensive information on its scope, structure, dynamics, socio-economic implications; guarantee prompt updating of relevant statistics; enable synchronous correlation of data obtained through different channels of national statistics. Their introduction not only improved the accuracy of sectoral planning, but also ensured reaching a new level of reliability, efficiency and effectiveness.

Unfortunately, in many countries (including European) such a system has not yet been established. The analysis of the state of road safety is carried out according to outdated methods. The subjects of statistical report operate in separately and in non-coordinated manner, lacking consistency among their structural units. The depth of analytical “processing” is very far from the required level: for decades in a row, the status of the road traffic secure has been estimated by a narrow range of parameters (mostly

the total number of car crashes and their victims) unable to give a comprehensive picture of the socio-economic aspect of the road safety. This, in its turn, causes poor "output" of statistical array and the neglect of the concepts (plans, programs) of sectoral development grounded on its basis.

In the light of the above mentioned, it is necessary to introduce modern methods that are to allow the calculation of expenses on human life and health, as the basic indicator of the budget estimates of national targeted programs, national and regional development programs. Their arsenal should be continuously enriched, but the procedural mechanisms, on the contrary, should be unified and simplified. Appropriate techniques are to include: a) estimation of direct economic losses (property damage, medical expenses, legal expenses, insurance payments, environmental damage, etc.); b) estimation of lost benefits (wages of the victim, GDP per capita); c) the cost of moral and physical suffering; d) estimation of the "willingness to pay" approach (i. e., the amount of money that the average citizen of the country is ready to pay for the risk reduce of the road accidents). The calculations proceeded on this basis should form the foundation of the calculation of the economic part of all national and regional road safety programs, being mandatory criterion at the same time for determining their effectiveness.

Cooperative Potential as a Key Element of Modern Organization

Agata PIERSCIENIAK

Jan Kochanowski University in Kielce, Poland,
E-mail address: agata.pierscieniak@gmail.com

Abstract

The purpose of the article is to present the cooperative potential model as a new theoretical concept. This is orderly configuration of eleven elements forming critical factors for collaboration success related to organization has been proposed. These include strategic planning of collaboration, system of communication, gaining financial resources for the partnership, decision-making process, organizing the collaboration unit, assigning tasks, duties and responsibilities, recruiting process of employees involved in cooperation, competences and attitudes of employees, leadership, external support, and goodwill. The criterion of arrangement is five organizational dimensions designated by H.J. Leavitt. The methodology of creating organization's cooperative potential based on inductive top-down theorizing concept. The value of cooperative potential concept is confirmed by the universality and fits each organization, which is a condition of comparability of research results.

Keywords: Cooperation, Collaboration, RVB, Potential, New Theory Management.

Introduction

Rapid changes in the environment, globalization and development of technology mean that there is a need for businesses to adapt to new conditions. They take place in modern organizations that are defined in literature, from a broader perspective, by Marques as (2016) any organization developing its roles in a contemporary society and adopting proactive attitudes to adapt to changes through continuous learning and innovation as organizational culture. A narrower perspective, is suggested by Jahan (2016) describing it as borderless organizations, networking together and collaborating more than ever before. The research shows that in order for a business organization to become successful and strong, it absolutely must have some form of skilled management in line with global development trends (Strielkowski et al., 2016; Łukomska-Szarek & Włóka, 2013; Krawczyk-Sokołowska & Ziółkowska, 2013; Haseeb 2019). A similar trend is cooperation related to specific activities and activities of the organization (Pierscieniak 2014), often implemented to a greater or lesser extent by each organization. In analyzing this global perspective, a question often asked is what the cooperation potential of modern organization involves? What elements make them up? **The purpose of this paper is to present a theoretical model of modern organization's cooperative potential.** It was assumed that potential is unique for each one organization and can be understood as its characteristic feature. Proposing such a purpose is logical, assuming the universality or truthfulness of the thesis that each organization has a cooperative potential that can be determined and compared. The context of comparability is also important because it involves the possibility of distinguishing one organization from another.

The cooperative potential model has been developed, based on the author's interpretation of inductive top-down theorizing concept (Shepherd, Sutcliffe, 2011).

Cooperation and Organization Potential - Research Challenges

Cooperation as a concept has not been devoid of ambiguities of understanding. Several authors have focused on varied aspects in defining the phenomenon. An attribute of cooperation is reciprocity, - interaction between parties (Friend, Cook 2000), or the exchange of information, shared vision or common knowledge development and complementarity of skills, efforts and roles, togetherness in the

creation of new values. It is also considered as relationships, international links (Galutskaia et all 2018) or exposure to collective actions (Ostrom, E. 1990), networks (O'Toole et all 2005), or a systemic approach (Pierscieniak 2015). In this context, the identification of the success factors of cooperation is not simple and should be carried out not as an individual study, but based on the literature of the subject.

The essence of the concept – "potential" is hard to explain. Hence, the methodology of systematic literature review by Tranfield D. et al., (2003) was applied in the literature analysis, which revealed that many authors look at the potential of an organization or enterprise from a broader perspective (Pierscieniak 2013, Caputa 2010). They analyze it in various thematic contexts, such as key resources, processes, organizational value (Jagoda-Sobalak D. (2019) and improvement and modification of organizational activities or in the perspective of the theory of adaptability. The concept of potential is also observable in publications discussing the specific features and attributes of the organization. The key elements of potential are resources, capabilities and organizational relationships perceived as factors, whose aim is to reinforce innovativeness and competitiveness. This conclusion is consistent with the resources approach (RBV). For each organization to compete efficiently and effectively it has to create its resource potentials skillfully (Barney, 1991). The second important element is defining the context, namely, the specific area to which a potential applies. Some organizational resources are important from the perspective of innovation (Krawczyk-Sokołowska et all 2018), while others are from the perspective of competitiveness. The awareness of what given organizational resources relate to enhances the propriety of selection of its components.

Organizations partaking in the construct of cooperative potential do so as a subject. H.J. Leavitt's (1964) organizational model, which has been adopted for this study is considered by other researchers to be the most popular and often cited due to its universalism (Cyfert 2006) in the procedure for the morphological analysis of selected organizations' models and have relied on their criteria-based assessment (Pierscieniak 2015).

Another component worthy of emphasis is the understanding of the environment of modern organizations. In literature, attention has been draws to the impact of the environment on the organization's existence by emphasizing linkages between the components and interacting with its environment (Krawczyk-Sokołowska & Caputa 2012).

Methodology

In order to enhance understanding of the logic of designing the new concept.

Step 1. The literature: It is aimed to review existing publications in search of factors contributing to successful collaboration. The methodology of systematic literature review (Jourdan et al., 2008) was employed to enhance understanding. This has enabled the objective selection of a sensory representation. One very important step of the process was the analysis by Mattessich and Monse (2001), which resulted in two issues, crucial for further stages of the research. First, the cited article was a review article, in which the authors did not just define the set of factors, but also combined them into groups in reference to varied aspects of the collaboration phenomenon, which turned out inspirational. The second, key factor was the simplicity of the goal, the cluster-type methodology and the results obtained. The article served as a base for generating knowledge that applied the "snowball" method, concerning factors encouraging collaboration, identifiable in contemporary organizations. A milestone of step 1 was the identification of a set of key factors of collaboration.

Step 2. Sensory representation that consisted of analyzing the research findings of various authors in search for factors contributing to collaborative success. Although the findings of these studies could be generalized, the issue of any unanimously agreed key for classifying success factors remained lacking. The knowledge gained from the current stage, is that research results on success factors are related more or less to the constituents of the organization where collaboration was implemented as well as its environment. The milestone (key achievement) of this step was the adoption of the organization's perspective as the object of research.

Step3. Conceptual representation**,** which involved searching for such an organizational model, whose constituent elements would serve as templates for classifying success factors of collaboration. In order to choose the organizational model, three assessment criteria (Pierscieniak 2015) were adopted. These include its universality, understood as the possibility of its adaptability to the largest population or its partial adaptation by omitting only a few of its possibly most significant features. Secondly, its inclusiveness, ensures that it covers as many elements as there are that exist in organizations or are analyzed in literature, and thirdly its simplicity, which means naming the elements in understandable ways without resorting to definitions, especially in case studies or while presenting findings to personalities in charge of running organizations on a daily basis. A milestone of this stage was the choice of the organizational model designed by H.J Leavitt and the identification of its key constituents as a benchmark for ordering factors of successful collaboration.

Step 4. The new theory that emerged as a result of ordering the success factors of collaboration in accordance with the adopted guide, including the goals and tasks, people, structure and technology. The organizational environment was adopted as the fifth element of the new theory. The development of a model of the organization's cooperative potential is considered a specific achievement of this stage.

Cooperative potential model of a modern organization - theoretical concept

Creating a theoretical model of cooperative potential is an indication of a configuration of 11 elements ordered by designated areas of H.J. Leavitt's concept (Table 1).

Table 1: The structure of the cooperative potential of modern organizations

Organization's element	Elements of cooperative potential
Aim and tasks	E1. Strategic planning of collaboration at the level of an organisational unit
Technology	E2. Communication system
	E3. Gaining financial resources for the partnership
	E4. Decision making process
Structure	E5. Organisation of the collaboration unit
	E6. Assignment of tasks, duties and responsibilities
People	E7. Process of recruiting employees
	E8. Competences and attitudes of employees in comparison to collaboration
	E9. Leadership
Environment	E10 External support for the idea of collaboration
	E11 Goodwill of a company

Goals and tasks. The organization has several goals, which are defined hierarchically, referring to its strategies. The literature review undertaken (step 2) has revealed that defining goals constitute a significant element of successful collaboration. Researchers do pay attention to several key issues such as the identification of a common vision of collaboration, identification of clear and unique goals as well as their specification. Hence, it is undeniably significant to develop employee awareness concerning the status/ significance of goals and related tasks needed to implement collaboration (Patel et all 2012; Salas et al., 2005).

People. The first is the adequate selection of employees for collaboration. The important issues considered herein are a formalized procedure for a purpose-oriented selection of members for the

collaboration team; awareness of the selection criteria; taking cognizance of the specificity of colleagues' work acquired in collaborative work or his experience working elsewhere in the selection criteria (Gabara et all 2016) In the aspect of human capital management, it is important to identify individual objectives of the collaboration team members as well as to align the tasks and objectives assigned each employee with his expectations and preferences. Equally important is the „fit" of employees at levels of personal interactions, for example, age, gender, interests, etc.

The second important area investigated was competences and attitudes (Zeng, Chen, 2003; Al-Sawa'ei et all 2015), for example, encouraging participation in trainings, employee's belief concerning benefits accruable to collaboration, trust and respect within the group, commitment of group members to the process, success orientation of the employees, employee ability to seek compromise, group members' commitment to achieving results (Grzebyk, 2009; Mizera, Pypłacz 2017).

The third area is leadership. The existence of a collaboration leader (somebody charismatic and success-oriented) is a key component of successful collaboration. The leader's diligence in aligning tasks to employee's competences, developing policy of success amongst employees, clear, transparent and understandable system of motivation acceptable to employees concerned, due diligence concerning integration at unit or group levels, procedures for controlling and monitoring support-related activities of a group as well as participation in resolving employees' problems (Bohen and Stiles, 1998, Grzebyk et all 2014).).

Technology included all components that constitute part of the organization, making up its infrastructure or elements in support of collaboration implementation.

The communication ought to be open and implemented at given levels of frequency. Equally important is the comprehension of communication signals by its recipients, a flexible (suitable to the needs of team participants) communication process, diversity of forms of media communication (adapted to the personality, age, position and tasks), formal and informal communication linkages as well as support for informal communication Unions (Mattessicht et all 2001).

Procedures for securing financing for collaboration and active fundraising constitute yet another group (Mattessicht et all 2001; Davey et all 2012).

The third group of factors is the decision-making process, which ought to be transparent and democratic. Every member of the group ought to participate in influencing its shape. Decisions are arrived at in groups, while only critical decisions are subjected to evaluation. The decision process is both rational and based on experience. Although decision-making processes make use of electronic information-flow, it does not neglect personal contacts (Mattessicht et all 2001; Hammond et al. 2001; Klein 2008; Unsworth, West 2000; Weiseth et al., 2006)

Structure. The literature review concerning the structural components essential for efficient collaboration revealed that there are two of such factors important for success (Burton et al., 2005; Conger, Kanungo, 1988; Hinds, McGrath, 2006; Langfred, 2000; Mannix and Sauer, 2006; Weiseth et al., 2006). The first component was the demarcation of an organizational unit that coordinates the entity's objectives at the partnership level. The location of the unit takes into account the limitation of levels of management (decision-making) and is in harmony with other units existing in the partnership. The organization is alert to the adaptability of its structure to changes as well as its flexibility regarding tasks being implemented.

The second component essential for successful collaboration, ascribable to a structure is the distribution of tasks concerning the implementation of the collaboration. It should be monitored by the leader. Another important thing is the mechanism for adapting tasks to the needs of partners or unit, for example, relative to the need, environmental change as well as changes in personnel composition, etc. Tasks ought to be clearly defined. Another important aspect is the role played by experts (persons of merit or well experienced in partnership collaboration) in decision-making

processes, that can be understood as activating functional roles, while curtailing excessive application of hierarchical roles (Cordery, Soo, 2008; Détienne, 2006; Pinelle and Gutwin, 2001)

Other aspects – organizational environment. The activities of contemporary organizations depend on the influence of their environments. The implementation of collaboration is influenced by two issues. The first of such is the external support for the collaboration concept (Mattessicht et al. 2001), which include political decisions, the policies or activities of institutions. The European Union, for example, views collaboration as a requirement for the provision of finances for innovation (Krawczyk-Sokołowska & Łukomska-Szarek 2018), The second issue is organizational image (Wasiluk 2014), namely, its qualitative experience in implementing tasks in partnership. This involves determining what type of organizations or whether the organization is accepted as a leader in a given sector, where the collaboration is to be implemented.

The set of 11 elements presented is to be treated as a system. With regards to the concept of systems theory (Bertalaff L. von 1968), according to which the system is something more than a simple sum of elements, the occurrence of interactions between system elements is characterized by interrelationships and closed chains of causes and effects form the so-called feedback (i.e. people shape goals, but goals influence people, etc.). These couplings, especially in modern organizations, can lead to the growth of desired results or mitigate them causing vicious circle effects (Magnuszewski 2010). Cooperation, like other areas of the organization's functioning, is subject to such mechanisms.

Discussion

Cooperative potential is presented in literature from different perspectives. Most often it is the ability to cooperate of enterprises, identified by the so-called relational competence (Czakon, 2008). The analyzes are related to the theory of transaction costs (Brandenburger & Nalebuff 1995), game theory (Meng et al. 2019) . The perspective presented in this article is about organizational resources and collaboration is more defined as a process than a relationship. The potential model presented in this article can be treated as a refinement of the P.W. concept. P.W. Mattessich, B.R. Monsey (1992, 2001) in which key success factors of inter-organizational cooperation were indicated. It is also similar in nature to the descriptive concept of CCWM (CoSpace Collaborative Working Model) presented by H. Patel, M. Petit, J.R. Wilson (2012). However, these ideas are distinguished from the presented model by means of grouping criteria, which in the cited concepts is not associated with any organization model. Hence these concepts are identified as factors of successful cooperation and not as cooperative potential.

An important element that have to be discussed is the level of cooperative potential. Let us imagine the case of a firm intending to accomplish goals of a partnership. if the company is small owing to its structural constraints (simplicity and homogeneity of tasks), it commits the entire organization in the collaboration. In another case there is the second company with an elaborate organizational structure with varied organizational units such as production, marketing and sales departments. Collaboration in this enterprise, in practical terms, does not involve the entire organization but only at the level of organizational units. The marketing department cooperates with partners in marketing (advertising agencies) and the production department with raw material suppliers. In fact, these are two distinct areas of cooperation. In putting this into scientific context, I observed that both cases are identified, however, they are achieved based on different theoretical concepts.

The first case applies to the perception of the organization from the praxeological view-point. J. Zieleniewski (1969) by relying on the Treaty of Good Work of T. Kotarbiński (1982) which defines organization as a „whole", whose components mutually contribute to the success of the „whole". All collaborative activities, based on this concept, directly relate to the strategic objectives of the entire organization. The second case illustrates the concept of H. A. Simona & Associates, witch in his conception, acknowledges the assumptions of a harmonious synthesis of human and material resources as a result of the need to improve the excellence of its constituent elements (March, Simon 1964). This case illustrates external collaboration involving specific aspects of the organization, owing to the implementation of its specific objectives.

The discussions presented in the previous sections concerning linking goals of collaboration with organizational objectives from a structural perspective are crucially significant for the credibility of the research findings. A proper definition of the object of study (level of organization or organizational unit) enables the researcher to reach the relevant respondents, better characterize the essence of the collaboration being studied, thus making it essential for the conduct of all necessary synthetic and comparative analyses (Pierscieniak 2016).

The presented concept was verified, from the perspective of classification of the theory presented by Corle, Gioia 2011). In their classification, the authors distinguished two areas of originality and utility. Originality the researchers categorized in two areas (1) advancing understanding incrementally or (2) advancing understanding in a way that provides some form of revelation. The utility dimension translates into (3) practically useful and (4) scientifically useful. The presented model of the organization's potential for cooperation has features (1), (3) and (4). It allows a better understanding of existing knowledge, organizes it and generalizes it, indicating a better understanding of what we already know. The presented concept is useful in the area of science and practice. It can be the basis for developing a tool for measuring the organization's potential for cooperation, for example, further development of knowledge related to measuring the organization's potential for cooperation or its deeper analysis (3). It can also have practical significance. Operationalization and interpretation of the organization's potential for cooperation, understood as an organization’s feature can support the process of making managerial decisions (4). Referring to the essence of the area (2), following the critical thinking process, it is argued that this concept rather in this moment not connect to dimension advancing understanding in a way that provides some form of revelation.

Conclusion

The conclusions relate to the purpose of this article and from two aspects. First, that the presented concept is a theoretical model which we can partly explain the real context of every organisation. The second, is the fact that the organisational potential to collaboration can be recognise like a specific characteristic feature for every organisation.

The presented model of cooperative potential is a fictitious object that has been described using real elements of the organization and its environment. It is a concept that indicates and organizes key success factors of cooperation from the perspective of the organization. It can be defined as the configuration of resources, attitudes and experience of organizations used (or which can be used) in acquiring and implementing cooperation between the organization and external entities**.**

Another conclusion is in recognizing cooperative potential as a characteristic feature of modern organisation. Concluding, if the cooperative potential can be recognised for every organisation, it would mean that it is common. The literature review carried out had no restrictions as to the type of organization, and the application of the universal concept of H.J Levitt's organization. The fulfilment of all its dimensions guarantees the universality of the presented theory through analogies. The elements of the model of cooperative potential sought for in each organization, since it is assumed in the H.J. Leavitt concept that every organization has goals and tasks, people, structure, and technology and functions in a given environment. The difficulty lies in identifying each of the elements and assessing them from the success cooperation perspective. If the model could be operationalized, then its unique configuration (from a qualitative perspective) can be determined or a level of cooperative potential as an assessment of the potential elements (from a quantitative perspective) for each organization can be designated. These values are comparable. This comparability is guaranteed within a given type of organization that has a specific configuration of designated elements. It is also comparable at the level of various organizations by determining the overall level of the organization's cooperative potential.

In the light of these premises, it is worth asking (If?) and (how?) contemporary organizations are prepared to implement cooperation? Do organizations with similar cooperative potential work better then organisations with differing cooperation potential? These two questions (and many others that

can be asked here) suggest new research directions that can be implemented using the theoretical concept of cooperative potential presented.

Abstract

XYZ University has implemented waste segregation policy, however The Student Dormitory of this university has not implemented this policy. To implement this policy successfully, there was a need to understand and identify drive and barrier factors of waste segregation behaviour. Theory of Planned Behavior (TPB) framework was used in this study. We used mixed methodology between qualitative and quantitative. Study 1 was conducted qualitatively by interviewing 18 participants related to waste segregation behaviour and management at student canteen dormitory. It was found that the waste segregation had been carried out in dormitory but it was discontinued. However, the dormitory management saw that there was still a need to endorse the waste segregation behavior among sellers and visitors. It was found that the aspect of attitude, subjective norm and perceived behavioural control related to waste segregation behavior. Study 2 was conducted to identify variable that affect waste segregation behaviour based on modification of TPB framework, by adding perceived satisfaction of sorting facility. It was conducted quantitatively, using accidental sampling method, by distributing questionnaires to 81 students and 7 canteen sellers. The results of multiple regression analysis show that only subjective norm variables significantly contribute 25% to the intention to sort waste and only intention and perceived behavioral control significantly contributes 47% to the behavior of waste segregation. Subjective norm and PBC could be considered as critical aspect to intervene the waste segregation behaviour in student dormitory canteen.

Keywods: Perceived Behavioral Control, Subjective Norms, Theory of Planned behaviour, Waste Segregation Behavior

Introduction

Waste management is a big problem that is happening all over the world and universities have a strategic role in solving problems arising from these matters. XYZ University produced 12.75 tons/day in 2011 and there was an increment in 2012 which reached 16.65 tons/day (Mu'minin, Hartono and Gusniani, 2013). If it was not handled properly, it would bring negative impact on the environment and surrounding communities. To overcome the problem of waste, XYZ University has implemented a waste segregation program. This program requires each unit under XYZ University to sort waste according to its type, namely organic, inorganic, residue to be processed according to its type.

Students are the biggest waste producer at XYZ University considering they are the majority group (Priono and Kusumayati, 2014). One of the biggest concentration places for students to gather is Student Dormitory of XYZ University. Waste production was even greater considering that the its functions as a residence so that student activities will be greater than if they were in the Faculty. As a unit under XYZ University, the Student Dormitory has received information about waste segregation program. However, it was found that the waste had not been sorted out so that the garbage was not picked up.

Therefore, there was a need to identify the factors that can improve the compliance of waste segregation in Student Dormitory of XYZ University. Compliance with this sorting must start from each of individual at Student Dormitory as a waste producer (Xu, Ling and Wu, 2018). The behavior of sorting trash can be instilled from the Student Dormitory Canteen of XYZ University considering the amount of garbage produced by the canteen is quite a lot and the types are diverse so it requires sorting.

This study exemined the waste segregation behavior based on the framework of the theory of planned behavior from Ajzen (1991). Many previous researches used TPB as framework to analyze pro-environment behavior. However, the study was usually conducted in quantitative approach. In this study, the author intended to understand further and identify what factors of TPB the influence the waste segregation behavior the most. This identification is necessary in determining the things to be targeted in changing the waste segregation behavior, hence the study was conducted using mixed method approach. This study was a baseline study of interventions that will be conducted later to improve waste segregation behavior. This study targeted two types of participants, namely (1) sellers at Canteen and (2) students as Canteen's visitors.

Theoretical Background

Theory of Planned Behavior

Theory of Planned Behavior (TPB) emphasizes the importance of intention to encourage behavior to occur. Intention is assumed to be a motivational factor that influences behavior; an indication of how hard a person will try, how much effort will be expended to behave in certain ways (Ajzen, 1991). Ajzen stated that intentions could change from time to time because there are many other variables that influence the intention (Ajzen, 1991). This intention is influenced by three things, namely: attitude, subjective norms and perceived behavioral control (PBC).

Attitude is a person's evaluation of behavior (Ajzen, 1991). This attitude is influenced by individual's beliefs about the consequences of the behavior and feelings about these consequences (Welcomer et al., 2010). Attitude is the degree of favorable or unfavorable evaluation related to a behavior (Ajzen, 1991) and is usually based on the calculation of the costs and results of the behavior carried out.

Subjective norms are social pressures for someone to behave or not behave (Ajzen, 1991). According to Welcomer et al (2010) subjective norms are individual perceptions of the evaluation of the social aspects of a behavior and how far individuals are motivated to obey. Miliute-Plepiene, Hage, Plepys, & Reipas (2016) stated that the perception of social norms related to waste segregation can influence sorting behavior in countries where sorting facilities are not yet advanced. Norms inform someone about what other people are doing and individuals can make this as a reference for themselves to perform a behavior both in unfamiliar situations (Schultz et al., 2014).

Social norms consist of two descriptive and injunctive norms (Kallgren, Reno and Cialdini, 2000). Descriptive norms are one's perceptions of what the majority of others do while injunctive norms are individual perceptions of what the majority of people agree or disagree (Kallgren, Reno and Cialdini, 2000). Descriptive norms provide evidence for individuals abour the effective and adaptive behavior (Kallgren, Reno and Cialdini, 2000). Descriptive norms inform the individual of what is usually done in a particular context. Cialdini et al stated that descriptive norms would be activated when salience with the situation (Kallgren, Reno and Cialdini, 2000). Schultz et al stated that descriptive norms to prevent the behavior of disposing of rubbish garbage will be activated in places that are already clean

compared to the dirty ones(Schultz et al., 2014). Descriptive norms work with two rationales namely (1) the majority of individuals often overestimate the prevalence of undesirable behavior and (2) individuals use perceptions of their groups as a standard for comparing behavior (Schultz et al., 2007). Descriptive norm messages sometimes carry a boomerang effect (Schultz et al., 2007). In behaviors that are considered negative, descriptive norms will provide information to people who do not do negative behaviors that are common in their groups so there would be a chance they imitate negative behaviors.

In contrast to descriptive norms, injunctive norms are morals that apply in groups and are usually accompanied by consequences when individuals do or do not do these norms (Cialdini, Kallgren and Reno, 1991). Therefore, the use of norms will be more effective if it uses a combination of descriptive and injunctive norms that are in line (Schultz et al., 2014). Motivation for behavior would increase when the behavior to be performed is considered normal to be done and socially agreed upon by the group. In addition, injunctive norms provide direction for individuals whether their behavior is agreed or not approved by the group.

The last, Perceived Behavioral Control (PBC) is the resources or opportunities available for someone to allow behavior to occur (Ajzen, 1991). PBC is also an actual perception of control to behave, this can also affect behavior directly. PBC is a person's personal assessment of his/her ability to do something, an assessment of direct or indirect obstacles that can be perceived as facilitators or inhibitors of a behavior (Welcomer et al., 2010). PBC can be from internal factors (information, personal flaws, abilities, and emotions) and external factors (opportunities, dependence on others and obstacles) (Armitage and Conner, 1998). Several studies have shown that PBC is the biggest contributor in sorting intention and behavior (Knussen *et al.*, 2004; Mannetti, Pierro and Livi, 2004; Botetzagias, Dima and Malesios, 2015). In addition to intentions, the TPB theoretical framework also illustrates PBC's direct contribution in influencing behavior. PBC varies in nature depending on the context in which the behavior will be carried out (Ajzen, 1991). If intentions are constant, the success of predicting one's behavior will depend on PBC.

Perceived Satisfaction to waste segregation facility.

Zhang et al. (Zhang et al., 2016) stated that waste sorting facilities also play a big role in determining someone to sort waste. The theoretical model of TPB could make someone not to do waste segregation when facilities are not available. The lack of effective sorting facilities not only inhibits the possibility of someone to sort but also reduces one's intention to sort them out (Zhang et al., 2016). Zhang stated that if the presence of a facility can influences sorting behavior through two mechanisms, the first is as a determinant of PBC variables and influences behavior through intention. Knussen stated that PBC will be stronger when perceptions of the lack of facilities are low (Knussen et al., 2004). The second is as stand-alone variable and parallel with the intention to influence behavior (Zhang et al., 2019). Sorting facilities not only exist but must also create a sense of satisfaction for individuals who do waste sorting. A study that also uses the TPB framework found that in addition to attitude factors, subjective norms and PBC, satisfaction that the available sorting facilities also influenced sorting behavior (Stoeva and Alriksson, 2017). They compare the sorting conditions in Sweden and Bulgaria where Bulgaria was considered as a country with poor sorting facilities. The results found that satisfaction with sorting would influence sorting behavior. In Sweden, where the sorting facilities are good, the dimension of attitude influences the sorting behavior the most. Stoeva & Alriksson (Stoeva and Alriksson, 2017) stated this was because in countries where the sorting facilities were already advanced, sorting had become a well-internalized value so that attitude would be the greatest determinant of sorting behavior. In countries where the sorting facilities are not yet advanced, satisfaction with the facilities will encourage the people to sort out. Considering that the waste sorting program at XYZ University has only just begun, the researchers are of the opinion that satisfaction with the facility will affect the intention and behavior of sorting.

This research was conducted as a baseline study for intervention programs to improve waste sorting behavior. This is important in order to find the right solution to instill waste sorting behavior in the Student Dormitory Canteen of XYZ University. Therefore, it is important to explore the factors that

can be the driver or barries the behavior of waste segregation. To explore this, researchers conducted two types of studies. Qualitative studies were carried out to to understand the context by exploring the description of waste segregation behavior, the information about sorting program, identifying the factors that can be a driver or barrier in conduction the behavior. Quantitative studies are carried out to identify the factors of TPB has most contribution of the intention and behavior of waste segregation so that they can be used as a reference for intervention methods. Qualitative and quantitative studies were carried out in order to get a comprehensive baseline on the behavior of sorting waste and also factors that need to be improved in the intervention program later.

Study 1: Qualitative Study

This qualitative study was conducted to answer two big questions, namely (1) How does individuals n University Student Dormitory canteen segregate their waste? And (2) What factors influence the behavior of sorting waste in the XYZ University Student Dormitory based on TPBr?

Design

This qualitative research was carried out by *case study design*. Qualitative methods are used to have better understanding about how waste sorting behavior can be formed among XYZ University sellers and visitors (Kumar, 2018). Case studies are one of the qualitative methods (see Willig, 2008, & Glasser and Strauss, 2006). The case study method is a qualitative approach in which the researcher explores a limited system using detailed data collection, abundant sources of information and reports findings in the form of descriptions and themes that are specific to the case (Willig, 2008). According to Willig this method is suitable when researchers intend to look for descriptions and explanations related to certain phenomena (Willig, 2008). The question framework given to participants was prepared using the theoretical framework of TPB from Ajzen (Ajzen, 2006).

Participants

We interviewed 18 participants that were related to process of waste segregation, both at XYZ University and XYZ University Student Dormitory. There were 11 women and 7 men who were willing to be interviewed. 2 participants came from the XYZ University waste management team, 1 participant was the Student Dormitory coordinator who handled waste management in student dormitory, 1 participant was the CS coordinator, 4 participants were CS Student Dormitory, 7 participants were Dormitory students and 3 participants were canteen sellers.

Procedure

The selection of samples was based on purposive sampling from Kumar (2018) which the target participants stakeholders, students and sellers of the XYZ University Dormitory canteen. Interviews were conducted using questions that how individual carry waste segregation behavior, individual opinions, perceived benefits, positive and negative consequences when individuals do not sort waste, the social norms related to the behavior, factors that facilitate and make it difficult for sellers to sort, knowledge about the sorting program, facilities provided and satisfaction with these facilities.

Technique Analysis

The verbatims were made from the recorded interviews. Then the data was processed through a coding process, with steps: collecting data retrieval results, making segmentation of categories, and labeling these categories (Glasser and Strauss, 2006). The author provides coding, then asks an expert in the TPB field to re-check the coding that the author made. The coding process was based on TPB theory adding new categories that were not in accordance with the TPB theory framework. The initial coding process from verbatim shows several similar categories. Similar categories were then grouped into broad themes of the TPB's theoretical framework.

Qualitative Study Result

From interviews with various parties mentioned previously, the writer found several themes related to the behavior. Some of the themes were the description how waste segregation was carried, attitudes towards waste segregation, subjective norms related to waste segregation, and PBC related to waste segregation.

a. Waste Segregation Behavior

From the analysis, it was found that waste segregation is a familiar term among canteen sellers. For the sellers, at least once a year they will receive training from the Occupational Health and Environmental Safety unit regarding the standardization of food and waste management that should be done by the canteen seller.

> *'We usually have training. Got information about the waste segregation between organixs and anorganics. But those behavior was not occurred in Dormitory.'* (D, *Seller*)

They also claimed that there had been an effort to segrgegate the waste in the dormitory in the past but this was continued. They had no idea about the reason why waste segregation is not implemented in the dormitory.

> *'In the past, there was and effort to segregate waste. I have sorted the trash, but somehow in the end, the trash was mixed. I also don't know why the waste segregation program in discontinued.' (O, seller).*

It can be concluded that the XYZ University Student Dormitory had implemented a waste segregation program in mid-2018 discontinued. In contrast to the sellers, the students know how to sort the waste from the waste bin facilities in their faculty. At least there were two types of bins found by students in each faculty, namely organic and inorganic waste bins. Some students have also seen bins for plastic bottles and cups and also for paper. When asked about waste segregation in the dormitory, all students stated that the dormitory had not yet implemented a waste segregation because there was no waste bin to indicate the existence of a waste sorting program.

> *'I am also confused why the dormitory has not started to segregate the waste. Even though in Japan alone it has been separated into category 11 types, but I don't know why this dormitory has not started it yet' (E, Student)*

b. Attitudes of waste segregation behavior

Students and some sellers also know the has some good evaluation related to waste segregation

> *'Yes. good for the environment. Waste that was sorted can be processed again so it does not accumulate in the bin '(K, Seller)*
>
> *'Waste segregation is an effort to protect the environment. Waste that can be recycled so new products can be made (from the waste) and produce economic benefits (Z, students)*
>
> *'Waste does not accumulate and becomes a source of disease* (A, *Students*).

From the statements above, it can be seen that the seller and the student already know the good benefits of waste segregation. The consequences mentioned are all positive so it can be concluded that the evaluation of waste sorting behavior is positive and related to the environment and health.

c. Subjective norm of waste segregation behavior

This knowledge of the benefits of sorting did not make the waste segregation behavior occurs among sellers and students at Student Dormitory Canteen. It could be because of the absence of strict rules for ordering canteen sellers and visitors to segregate the waste.

> *'Yes, if there are written rules from dormitory management, like a letter that was stated that every indvidual were obliged to sort trash, I think all canteen sellers will segregate the waste' (K, Dormitory canteen seller)* (K, *Dormitory canteen seller*)

It can be seen that there was a need for rules as injunctive norms that was stated which bevahior is allowed or not. The consequences and feedback from sorting behavior is also considered important factors in encouraging waste sorting behavior both among sellers and students. These consequences and feedback factors are considered to strengthen the injunctive norms prevailing in the dormitory.

> *'Like a warning letter given to seller, can make them obey to segregate twe waste. For example, there are sellers who don't sort out being reprimanded by the dormitory management via letters, we must be diligent to segregate the waste' (K, Seller)*

> *'If we have done waste segregating, we want to know how well we have performed. For example, could someone from dormitory management can give us input on how well we segregate the waste, if there is something that we still done wrong, so we know what to do' (O, Seller)*

> *'In the dormitory there is a canteen supervisor, the canteen supervisor could be assigned to monitor the waste segregation process. He/she reprimand students when sorting wrong, students then become more aware to sort out (M, Student)*

In addition, the influence of fellow canteen sellers and fellow students was also found. They claimed that they would see and copy what others did. What others did as a source of behavior to occur can be the example of descriptive norm

> *'(I usually) Look at the sellers on the righ or left of my counters, Do they sort the waste? If they did not, then I wouldn't do it' (R, Seller).*

> *'Did other canteen sellers do it? If they didn't, would they get punsihment? If they did not get punishment for not segregating the waste, neither I would do it'(O, Seller)*

> *'The students usually do what other students do. There must be someone who gives an example, the practice to sort the waste, hence the other can follow. But once, there some individuals, who are not obedient, surely others will also follow (not to sort the waste) (R, Students)*

From the above results it can be concluded that there is a need for existence of injunctive norms and descriptive norms in encouraging waste segregation.

d. *Perceived Behavioral Control* (PBC) of Waste Segregation Behavior

The facility factor is also referred to support the waste segregation behavior. When this study was conducted, the author only found one type of rubbish bin provided by the dormitory management and t was used to contain all types of rubbish. From the interview results, it was found that that there was a lack of of waste bins in the canteen to contain all the waste produced.

> *'Not like in the Faculty, the dormitory management only provide one type of waste bin. When the weekend came, the waste bin could not contain all the waste produced since the waste are not picked up by the CS team. It is useless to segregate the waste since it would be mixed up in the end.' (E, Student)*

> *'If the Dorm management can provide more waste bin to segregate the waste, I think we will be more compiled to sort the waste, but the problem at the canteen countes is that there is only one type of waste bin. '(R, Seller)*

The signage on the waste bin was also found as an important factor. One student stated that sometimes she was confused to dispose of waste according to his type because they were in a hurry to segregate the waste. The existing signage position did not make it easy for individuals to see. Usually the position of the signage wass on the body of the waste bin so individuals need to look down to see clearly.

> *'If you are in a rush, we usually can not see what kind of waste bin is. Usually the information is below (on the body of the waste bin, ed.) So you have to bow down first and know what this garbage is. If there is time, you can do it, but if you hurry it is difficult. '(AN, Student).*
> *'It will be easier if the signage can be put in position that is easily seen by people, if possible you don't need to bow anymore'* (E, students)

It can be concluded that the existence of waste bins is important for waste segregation at the Student Canteen Dormitory of XYZ University canteen. In addition, the waste bins needs to be equipped with signage posted in a location that is easily seen by people so that the they know how to segregate the waste based on the type.

The conclusion of qualitative study

It can be concluded that the waste segregation had been tried to be implemented but discontinued because the waste produced was still mixed. We also found that there was a need to instill the behavior of waste segregation given that the garbage was still mixed. In brief, conclusions from the results of the interview can be seen in the table below.

Table 1: The conclusion of the qualitative study

No	Theme	Results
1	Waste segregation behavior	Sellers: • Have training in segregating the waste • They used to do it but currently discontinued
		Students: do not segregate their waste
2	Attitude	All participants have positive evaluation related to waste segregation behavior
3	Subjective norm	There was a need for injunctive norm (such as rule and consequences) and descriptive norms (such as behaviour example from others to implement waste segregation behaior
4	*Perceived Behavioral Control*	Driver factors: • The availability of waste bin to sort with well informed signage
		Barrier factors : • The waste bin is not enough • Hurry situation when disposing the waste • Unclear and confusing signage on the waste bin

Study 2: Method and Result of Quantitative Study

From a qualitative study, it was found that the behavior of sorting waste has not been continued by the sellers and visitors of student dormitory canteen. The number of themes that can be represented in the TPB variable was also found. To identify which factor would contribute most in affecting waste segregation behavior, we conducted quantitative study. In addition to the variables from the TPB theory

framework, researchers also included the variable satisfaction with sorting facilities, considering that XYZ University has provided several facilities in the framework of sorting but not in the dormitory. The hypothesis for this study were

H1: attitudes, subjective norms, PBC and satisfaction with sorting facilities will predict intention to sort waste.
H2: Intention, PBC and satisfaction with sorting facilities will predict intention to sort waste behavior.

Design

This research was conducted using quantitative methods, cross sectional study and non-experimental research. Quantitative cross-sectional study method was done by using a self-report questionnaire using the TPB framework from Zhang et al. (2016) which measured attitudes, subjective norms, perceived behavioral control, intentions and behavior to sort waste and we also added satisfaction with waste sorting facilities from Stoeva and Alrikson (2017) which was adapted in Indonesian.

Participants

Quantitative data were obtained from those who worked as food vendors in the canteen. We also distributed questionnaires to boarding students who were eating in the canteen. It was distributed to 88 participants consisting of 81 students and 7 sellers. Participants weere 52% men and 48% women. For students, the majority came from the Faculty of Cultural Sciences by 19% and Faculty of Mathematics and Science by 16.7%. The age of the participants is in the range of 18-45 years, and the average age (M) is 20.08 years.

Procedures

Sample selection was based on an accidental sample. The data obtained by the author by visiting the XYZ University Dormitory Student canteen and asking the canteen seller or student willingness to participate in research. Before filling out the questionnaire, the researcher explained the purpose of the study and the time needed to fill the questionnaire. An informed consent was signed when they agree to participate.

Measurements

TPB questionnaire that was used in this study using a 6-point likert scales; point 1 shows strongly disagree and point 6 shows strongly agree. From the analysis of validity (internal consistency) and reliability (Cronbach alpha), the authors argue that the measuring instrument used has good validity and reliability, that can be seen as follows:

Table 2: The final validity and reliability in this study

No	Measurement	Items	Reliability (α)	Validity
1	Attitudes	4	0,73	0,41-0,67
2	Subjective Norms	5	0,81	0,20-0,82
3	PBC	6	0,80	0,30-0,74
4	Intention to segregate the waste	3	0,65	0,30-0,54
5	Waste segregation behavior	6	0,84	0,6-0,79
6	Perceived Satisfaction to waste segregation facility	4	0,75	0,53-0,67

According to Kaplan and Sacuzzo (2009) Cronbach alpha values between 0.4-0.75 can be categorized satisfactorily and above 0.75 can be categorized as good. Also according to Urbina (Urbina, 2004) a

minimum correlation value of 0.2 can be categorized as good for the internal validity category. Therefore, it can be concluded that the items used have good validity and reliability.

Analysis Technique

The answers from participants were converted into scores. The total score for each variable was used to analyzed and mean centering was performed for the total scores. Hayes (2013) suggests mean centering when the measured variable does not have a value of zero (0) in facilitating interpretation of the equation. The author conducted a multiple regression analysis in interpreting the relationships between variables by using SPSS 22. This analysis technique was based on research from Stoeva and Alrikson (2017). The first author regresses the attitude, subjective norms, PBC and perceptions of satisfaction with facilities towards intention. The second stage is using multiple regression of PBC variables, perceptions of satisfaction with facilities and intention towards waste sorting behavior. The regression equation can be seen below.

Quantitative Result

The proposed regression model proved significant in predicting the intention to sort waste (F (4.82)=6.94, p=0.00) and this model explained 25% of the variance of waste segregating behavior (R^2=0.25). Only subjective norms contributed significantly (b=0.16, p=0.03) in predicting intention while attitudes (b=0.15, p=0.28), PBC (b=0.14, p=0.14) and satisfaction with facilities (b=-0.01, p=0.91) was not significant in predicting intention.

Table 3: The result of multiple regression to waste segregation intention

	B	**SE B**	**β**
Constant	-0,10	0,27	
Attitudes	0,15	0,14	0,14
Subjective Norms	0,16	0,07	0,26*
Perceived Behavioral Control	0,14	0,09	0,2
Perceived Satisfaction to Facility	-0,01	0,08	-0,01

**significant level of confidence 95%*

For H2 analyisi, we found that the regression model was proven to be significant in predicting the behavior (F (3.83)=24.42, p=0.000) and this equation explained 47% of the variance of waste segregation behavior (R^2=0.47). Only intention (b=0.18, p=0.04) and PBC (b=0.39, p=.00) significantly contribute to waste sorting behavior while perceived satisfaction with facilities (b=0.12, p=0.07) not significant in predicting sorting behavior.

Table 4 : The result of multiple regression to waste segregation behavior

	B	SE B	β
Constant	-0,38	0,24	
Intention to segregate the waste	0,19	0,09	0,18*
Perceived Behavioral Control	0,39	0,07	0,52**
Persepsi Kepuasan terhadap Fasilitas	0,12	0,09	0,18

**significant at level of confidence 95%, ** significant at level of confidence 99%*

The conclusion of Quantitative Study

From the results of the analysis above it can be concluded that only a portion of H1 researchers are accepted, that is, only subjective norms that can significantly influence the intention to sort waste.

Similar to H1, researchers can only accept partial of the H2 hypothesis where only intention and perceived behavioral control affect waste segregation.

Conclusion and Discussion

Based on qualitative results, there were differences in knowledge between sellers and students regarding the waste segregayion program at XYZ University where the seller knew about the program and the students did not know. This could be because the seller had received training about the waste segregation program while the students had noy. It was also found that the seller at student dormitory canteen used to do waste segregation but it was discontinued.

Qualitative results have also succeeded in identifying the existence of TPB factors in waste sorting behavior. From the aspect of attitude, the researcher found if the participant's evaluation of waste segregation was positive. They agreed that sorting out trash is good for the environment. From the aspect of subjective norms, it was also found the role of rules and consequences that apply if individuals do not sort trash in the canteen. This can be identified as injunctive norms (Schultz *et al.*, 2014). Beside injunctive norms, it was also found the factor of the example that was done by other people in the XYZ University Dormitory canteen. Participants admitted that they had to see other people first (such as friends or visitors of the Dormitory) sorting out trash so they were influenced like to sort out trash. This can be identified as a descriptive norm (Kallgren, Reno and Cialdini, 2000; Schultz *et al.*, 2014). In addition, the other factors that support the waste sorting behaviour are existence waste sorting bin with well informed signage, while the barrier factors for waste segregation are rush time to dispose the waste, insufficient number of waste bins and unclear and confusing signage on the trash bin. These factors can be identified as PBC for behaviour to occur.

From the quantitative results, HI is only partially proven, which only subjective norms significantly influence the intention to sort. Subjective norms contribute 25% to explain variants of the intention to sort waste. In contrast to the findings of other research (see Tonglet, Phillips and Bates, 2004; Greaves, Zibarras and Stride, 2013), there was no attitude contribution and this could occur because waste segregation was not being a value for individuals in student dormitory. Awareness of the importance and benefits of sorting still needs to be increased among XYZ University students so that the contribution of this attitude dimension can be increased. This study also did not find a contribution to PBC and satisfaction with waste sorting facilities at intention.

The findings of the contribution of subjective norms are in accordance with the research of Miliute-Plepiene *et al.* (2016) and Niaura (2013) who emphasize the importance of the role of subjective norms. According to Miliute-Plepiene et al., the role of subjective norms is important in the initial phase of the program for the place that has not started the waste segregation program. Individuals will see what others do before they segregate the wase that the examples of other individuals need to be emphasized in terms of subjective norms (Miliute-Plepiene *et al.*, 2016). This is also consistent with qualitative findings that existence of rules and examples from others in influencing individuals to do the waste segregation.

The analysis also shows that only a portion of H2 research has been proven. Intention and PBC contribute 49% to explain the variance of the behavior of sorting garbage Intention and PBC are the biggest predictors in influencing the behavior of sorting garbage. This is in accordance with the theoretical framework of Ajzen (Ajzen, 1991) which states that behavior is influenced by an individual's intention to do something taking into account the perception of control that he has to perform the behavior. However, to increase the intention can be done by intervening the subjective norms.

This finding shows that by increasing confidence in the sorting control in an individual (PBC), it will improve the behavior of waste segregation directly to the behavior. The results of this study are also consistent with the findings of Stoeva and Alrikson (Stoeva and Alriksson, 2017) that PBC is also the biggest predictor in an environment where waste sorting facilities are not yet advanced.

However, finding in this study differs from those of Knussen (2004) and Stoeva and Alrikson (2017) where satisfaction with the waste sorting has not been proven to influence the behavior of sorting waste. This can happen because the emphasis is not on satisfaction but on the availability of trash bins in the XYZ University Student Dormitory Canteen. As long as there are enough trash bins, it will facilitate of the waste segregation. In addition, trash bins with easily-understood signage that inform the type of waste being sorted can also help improve sorting (Zandecki, 2012; Árnadóttir *et al.*, 2019).

Besides the information in the signage, the signage location on the bin also has impacts. Based on qualitative study, we found that it was difficult to see *signage* if they were located on the body of the waste bin. People should bow to read the signage. If the *signage* can be put on the top of the waste bin, it would make people easier reading the signage. The existence of information to sort the waste has been identified to increase PBC according to Ajzen (1991).

The findings in the study make the role of subjective norms and PBC become large because this variable will contribute to the intention of sorting as well as the behavior of sorting garbage in the XYZ University Student Dormitory canteen. To improve subjective norms, approaches through injunctive norms such as rules and consequences can be applied (Schultz, 1999; Kallgren, Reno and Cialdini, 2000). However, the application of this rule requires strong supervision to be able to impelemented. In addition, the selection of models or agents to provide modelling of waste segregation can also be done to intervene in subjective norms via descriptive norms (Schultz, 1999; Zandecki, 2012).This is in accordance with research from Miliute et al., which stated that in an environment that has not sorted waste, examples of behavior from other people can be a trigger for segregating the waste (Miliute-Plepiene *et al.*, 2016).

To further enhancing the PBC, the perception of ease in sorting must be increased. Increased knowledge about how to sort that was easily seen and undestood can be done by putting the signage on the top of the waste bin. Also the provision of waste bin that is enough to contain all the waste produced can be consideded to improve PBC and then will directly influence the behaviour.

The Analysis and Evaluation of The Functioning of An Employee Suggestion System on The Example of An Enterprise from The Transport Industry

Damian OSTROWSKI

WSB University in Wrocław, Wrocław, Poland
damian.ostrowski@wsb.wroclaw.pl

Jacek JAGODZINSKI

Wrocław University of Science and Technology, Wrocław, Poland
jacek.jagodzinski@pwr.edu.pl

Abstract

The article discusses the problem of the employee suggestion system (ESS) in production companies. Based on the data from a representative international company, the system performance was assessed. A number of parameters describing the system were presented, among others: a degree of participation – the percentage of employees who participate in the system, a degree of adoption – the percentage of submitted. Over half (58%) of submitted employee ideas can be classified as suggestions referring to organizational areas, followed by ideas related to work safety and the environment 22%, quality 15%, costs of organization 5%. The article is a continuation of research on the subject of the Polish economy.

Keywords: Employee Suggestion System (ESS), lean management, transport company, kaizen.

Introduction

The paper aims to present the quantitative and qualitative data regarding the operation of an employee suggestion system in a transport enterprise. It shows figures relating to the number of reported and implemented employee ideas, a theoretical division of the reported ideas, time for implementation of an employee idea, the data presented on a comparative basis. The end of the paper summarizes and evaluates in general the functioning of an employee suggestion system in a transport enterprise.

The paper aligns with the research on an enterprise, the elaboration [Jagodziński, 2016, p. 201-214] evaluated effectiveness of a production department. The article is also a continuation of the elaboration published by the Central and Eastern European Journal of Management and Economics (December 2017) [Ostrowski, 2017b, p. 259-270] which presented a theoretical approach towards importance of employee suggestions systems in practice. The implementation of continuous improvement for enterprise X was evaluated in [Ostrowski, 2016, p. 27-40] and [Ostrowski, 2017a, p. 99-120]. This paper provides results regarding an employee suggestion system elaborated on the basis of the data received from enterprise X.

Apart from its elaborated ideological fundamentals , the concept of Lean Management includes a wide list of practical tools which enable an effective transformation of an organisation operating on the basis of „lean" management contributing to reduction of manufacturing time, reduction of space occupied by a process, reduction of inventories, an increase in employees' flexibility etc. (a detailed description of Lean tools was presented by: [Czerska, 2014]) Polish enterprises most often use the so called employee suggestions systems enabling employees of all levels and departments (including administration) to report all kinds of ideas, suggestions, remarks etc. which are subject to a specific procedure (reporting, opinion, implementation) contributing to an effective struggle with wastage type 8 (muda) which is unused employee creativity. Systems for reporting ideas generate huge

benefits for an enterprise not only of material nature but also non-financial one. Particular importance is attached to successful usage of Lean tools affected by permanent and consistent creation of continuous improvement environment as well as an ability to fully engage employees in changes. (Benefits of applying lean tools in counteracting wastage are presented, inter alia, in [Byrne A., 2013, p. 15-17]).

The Polish employee suggestion system is strongly embedded in the Japanese philosophy of Kaizen made popular by Masaki Imai in his book „Kaizen. The Key to Competitive Japanese Success" [Imai M., 2007]. This approach mainly the emphasises enhancement of morale and engagement of employees as opposed to an American approach where the main emphasis is put on financial incentives [Gołaś, 2016, p. 2]. Lasrado and associates conducted a valuable review of the literature regarding indicators the effectiveness of employee suggestion systems [Lasrado, 2016 p. 316-330]. As far as the implementation of the Lean based approach is concerned, a valuable elaboration constitutes [Hasle 2014 p. 40-53]. Two approaches to the issue of employee suggestions, a modern and a traditional one, are described by Pakdel and associates [Pakdel, 2014, p. 66-68]. In their work Gołaś and associates have shown how an employee suggestion system influences effectiveness of an enterprise. It was measured by the number of implemented employee suggestions in various areas of operation. The greatest impact referred to the quality i.e. 27%, safety/ergonomics 23% and cleanliness 18%. [Gołaś, 2016, p. 6]. In his work Marx draws attention to the fact how management's involvement is essential to the development of an employee suggestion system, he also proposes factors to be measured in order to evaluate this approach [Marx 1995 p. 17]. Measures like the number of received, implemented or rejected suggestions are key indicators and therefore have been analysed by this paper.

Description of Company Activities

The enterprise under consideration is the biggest international investor in the transport industry. It employs over 1500 people in Poland. It has got 4 production facilities in Poland- in Silesian region, Łódź, Masovian and Lower Silesian regions. The facility in Lower Silesia has continued the tradition of manufacturing vehicles: bodies and bogie frames since 1833. After 1945 the company was one of the biggest in Poland in terms of the production volume and the number of employees. Since 2001 the company has belonged to an international concern based in the North America. Transport companies from Germany, Sweden, Switzerland, USA and Italy use its products. The enterprise employs 700 employees: 200 in administration and 500 in production.

An overall evaluation of years 2006 – 2016

Employee Ideas Reported and Implemented

The employee suggestion system was initiated in the company in November 2006. It was preceded by a coherent information and marketing campaign, production and administration employees were trained. Until May 31st May 2016 (the analysed period) a Continuous Improvement Department (CI) received in total 6282 ideas from the employees. The administration employees reported 2283 (36%) ideas whereas production employees made 3999 (64%) suggestions. Considering the 11-year period, on average 571 ideas were reported. 4062 ideas were implemented over this period. However, 1320 ideas were formally rejected which means that according to an initial analysis carried out by a person taking a reported idea and/or a person giving an opinion, the so called expert, the suggestion was not justified. When gathering the data for this elaboration additional 900 applications which were being elaborated, analysed, approved or abandoned were marked as rejected. An idea abandoned means that when realizing it there were circumstances which in the initial phase had not been identified or there were economic or organizational reasons for stopping implementation etc. Table 1 and Figure 1 present an overall share of reported, implemented and rejected employee ideas. To better illustrate the trends a relation of implemented to reported ideas was presented. The most ideas were reported by employees in 2009 whereas the smallest number in 2007. The biggest number of reported ideas was implemented in 2009. The highest ratio of the implemented

ideas to reported ones was observed in 2013.

Table 1: The number of implemented and non-implemented suggestions made by employees according to departments in company X broken down into years

Year	Number of reported ideas	Number of implemented ideas	Number of rejected ideas	Relation of implemented to reported ideas %
2006[1]	*34*	*27*	*7*	*79%*
2007	*331*	*222*	*109*	*67%*
2008	*790*	*500*	*290*	*63%*
2009	*1133*	*687*	*446*	*61%*
2010	*652*	*431*	*221*	*66%*

Fig. 1: The number of reported, implemented and rejected employee ideas - an overall comparison of years 2006 – 2016 (source: elaboration based on the information provided by an enterprise)

Thematic Division of Ideas Reported

Considering the topics of the ideas, there were 5 categories (the authors are aware of the fact that the presented division is of arbitrary nature- a particular idea may be assigned to a few categories; this elaboration assumed the solution enabling a free and clear analysis of the data):

a) Safety and hygiene at work- ideas aiming to increase the level of safety,

[1] The period of 1.11.2006 – 31.12.2006 was taken into consideration.
[2] The period of 1.01.2016 – 31.05.2016 was taken into consideration.

b) organizational– ideas aiming at a broadly understood improvement of management way, organization of a production or administration process, information transmission, marketing and social issues etc.,
c) quality- ideas referring to the improvement of quality at work, processes etc.,
d) costs- ideas affecting directly reduction of costs,
e) environment- ideas enhancing ecological protection.

Attention should be drawn to the fact that the above division is of arbitrary nature and results from the available data – organizational hierarchy of ideas. In the international literature environmental improvement usually include elements like a public image of a company or the safety aspect of an employee [Govindarajulu 2004 p. 370]. In this context the comparison with foreign data should also include work and safety at work and environmental issues as one. Table 2 and Figure 2 present a thematic division of reported ideas accounting for 2006 – 2016.

Table 2: Thematic division of reported employee ideas – an overall approach

Year	Organizational	Work and safety	Quality	Costs	Environmental	Total
2006	17	5	7	3	2	34
2007	166	70	47	41	7	331
2008	373	170	**211**	29	7	790
2009	**634**	**324**	115	**56**	4	1133
2010	340	199	73	38	2	652
2011	567	257	92	55	**14**	985
2012	245	67	59	30	7	408
2013	288	2	65	31	4	390
2014	283	2	75	24	3	387
2015	533	140	102	34	2	811
2016	214	110	29	8	0	361
Total	**3660**	**1346**	**875**	**349**	**52**	**6282**

Over a half (58%) of reported ideas of employees may be classified as suggestions referring to organizational areas followed by ideas related to work and hygiene at work (21%), ideas regarding improvement of quality ranked the third (15%), the fourth place was occupied by reduction of costs of company operations (5%), finally the smallest number of suggestions were reported in environment protection (1%). A Chi square test was also carried out, its result was 543.9, d.f. = 40, p-value smaller than 10-7 which indicates dependence between the topic of a suggestion and a year it was reported. Unfortunately, the dynamics of company development does not allow us to define which determinant affects such values. Lasardo and associates indicate 32 factors determining the quality of an employee suggestion systems, the further part of the paper deliberates some of them [Lasardo 2016 p. 14-16].

Fig. 2: Thematic division of reported employee ideas – an overall approach (source: Authors' elaboration based on the information provided by a company

Evaluation of An Employee Suggestions System

The overall number of work days which employees devoted to implementation of reported ideas amounted to: 266 976 considering that a work day is 8 hours – the total hours is 2 135 808. It means that on average implementation of an idea took about 67 days i.e. 536 hours. Another parameter considered involves a coefficient of ideas reported by employees as compared to worked employed broken up into particular years (the specification in Table 3). Formally, the parameter represents the number of employee ideas per one employee – this is one of the basic measurements illustrating the operation of an employee suggestion system in an organization.

Table 3: The number of reported employee suggestion as compared to the number of workers employed

Year	Number of workers employed[3]	Number of reported ideas	Number of ideas per employee
2006	No data	34	No data
2007	692	331	**0,48**
2008	940	790	0,84
2009	836	1133	1,35
2010	522	652	1,25
2011	506	985	**1,95**
2012	395	408	1,03
2013	632	390	0,61
2014	576	387	0,67
2015	690	811	1,18
2016	700	361	0,52

The highest value of the ratio was noted in 2011, on average 2 submissions were made per an employee, the smallest value was reported in 2007 when one employee reported 0.48 idea. Figure 3 presents a scatter diagram illustrating the relation between the number of ideas reported assigned to one employee over the years as compared to the number of employees.

[3] The data refers to workers employed on the basis of the labour law as of 31st Dec of a specific year

Fig. 3: Number of ideas reported by employees compared to the number of employees (source: Authors' elaboration based on the information provided by a company)

Having considered the entire period of years 2007 - 2016 the research analysis revealed that on average there was 1.03 of reported idea per employee, having eliminated 2016 the analysed indicator amounted to 1.09. A research was made showing that there was no direct interdependence between the number of employees and the number of reported ideas (the correlation ratio 0.34), similarly there is no dependence between dynamics in employment and changes to the number of suggestions (correlation ratio 0.13). It is interesting that the research was made in numerous companies regarding the number of suggestions per one employee and most often the result is within the range 0.5 a 2.0. For instance in [Marin-Garcia 2008 p. 62] the ratio fluctuates between 0.45 and 1.89. Table 4 presents the relations of the number of employees and the number of implemented ideas and this way the number of ideas per employee was calculated.

Table 4: The number of implemented employee suggestions compared to the number of employees

Year	Number of employees	Number of implemented ideas	Number of implemented ideas compared to the number of employees in total
2006	b. d.	27	b. d.
2007	692	222	0,32
2008	940	500	0,53
2009	836	687	0,82
2010	522	431	0,83
2011	506	652	1,28
2012	395	286	0,72
2013	632	301	0,47
2014	576	279	0,48
2015	690	509	0,74
2016	700	168	0,24

The highest value of the ratio was noted in 2011 when on average per employee there were 1.28 submissions, the lowest value was observed in 2007 when one employee reported 0.32 of an idea (2016 observed the lowest value 0.24 of an idea, however due to an incomplete year the result may be lowered). Figure 4 presents a scatter diagram showing a relation between the number of implemented ideas per one employee over the years.

Fig. 4: Number of employee ideas (implemented) compared to the number of employees (source: Authors' elaboration based on the information provided by a company)

The research analysis covered the entire period of 2007 - 2016 and revealed that on average per employee there was 0.60 of an implemented idea, eliminating full 2016 the analysed ration has grown and amounts to 0.66.

When evaluating justifiability of implementing an employee idea, one of the basic criteria taken into account involves costs and independence of implementing a reported suggestion into corporate operations. The most valuable ideas are those implemented by a reporting person and implementation is done using available resources (without the need of incurring additional expenditure). There were 1418 suggestions identified in the company under consideration constituting about 35% of all implemented employee ideas.

By analyzing the data received from the organization it is impossible to evaluate this point accurately due to the lack of precise remarks. The valuation of savings resulting from the operation of the suggestions system made use of a „temporary saving" indicator, which had been used for the first time to describe idea number 4064 (date of reporting: 2012.03.08) and had the value of 20 minutes. It was not systematically updated over the subsequent periods so on the basis of these data the picture of savings is underestimated. According to the possessed information the overall saving of time amounted to 2012 - 2016 53 500 minutes i.e. 892 hours. Assuming a work day of 8 hours it denotes 111 days of saved time.

Conclusions from the research carried out

Since May 2016 (the analysed period) the Continuous Improvement Department (CI) has received 6282 ideas submitted by employees, the administration employees submitted 2283 (36%) ideas whereas production employees 3999 (64%). It can be noticed that:

- the greatest number of reported ideas was observed in 2009 – 1133, at the same time over the years 2008 and 2009 the company employed the biggest number of employees, the smallest number of submissions was noticed (excluding incomplete years of 2006 and 2016) in 2007 – 331 which was at the beginning of the employee suggestion system's operations;
- similarly, the greatest number of implementations was noticed in 2009 – 687, the smallest number of submissions in 2007 – 222, (excluding incomplete years 2006 and 2016);
- The most favourable value of the ration between the number of implemented ideas and reported ones (in 2013 – 77%, the smallest value noted in 2000 – 61%, - for the entire surveyed period the ratio amounted to 66%. The international literature usually defines this parameter as a degree of adoption – a percent of submitted suggestions which were implemented. Example adoption ratios from the literature for tycoons like Xerox Venray amounts to 14%, KPN 11%, Shell 5% [Van

Dijk 2002 p. 391], in this context the performance of the surveyed company may be described as significant;

- Over a half (58%) of submitted employee ideas may be classified as suggestions referring to organizational areas then there were ideas related to safety and hygiene at work (21%), quality related ideas occupied the third place in ranking (15%), reduction of operational costs took the fourth place (5%), whereas the smallest number of suggestions was included in category of environment protection (1%), however considering safety and hygiene at work and environment as one category would constitute 22%;
- on average it took 67 days to implement one idea - ok. 67 – the fewest number of days was noticed in 2015 – about. 40 days whereas the greatest value was observed in 2007- over 129 days, it should be emphasised that over the years the number of days needed for implementing an idea since its submission has decreased which illustrates that an enterprise is smoothly improving procedures of implementing an employee suggestion into business practice;
- the ratio of reported employee ideas compared to the number of employed workers amounted to 1.09 in the analysed period, the smallest value was observed in 2007 – 0.48 whereas the biggest in 2011 – 1.95 of an idea;
- the ratio of implemented employee ideas compared to the number of the number of employed workers amounted to 0.66, in the analysed period, the smallest value was observed in 2013 – 0.47 whereas the biggest in 2011 – 1.28 of an idea;
- employee ideas were implemented by the authors of suggestions by themselves - 1418 i.e. about 35% of all implemented employee suggestions.

The research results presented in the article confirm a certain regularity (trend) outlined in the theory of operation of employee suggestion systems in enterprises. The moment of suggestion system begins the process of generating a huge number of ideas submitted by employees. The launch of the suggestion system begins the process of generating a huge number of ideas submitted by employees and implemented by the company. It is called quantitative period and in the described company it covers the years 2006 – 2009. During this time the submitted ideas constitute a very small contribution to improving the functioning of the organization, i.e. their added value is small. Company policy should enable support and promotion of the existence of an employee suggestion system during this period. When so-called the quantitative period passes, the suggestion system is transformed into a qualitative period (in the described company it covers the years from 2010). The number of ideas submitted and implemented by employees decreases, while their qualitative value increases. Ideas generate so-called added value, bringing great benefits to the company in terms of reducing operating costs, increasing the quality of processes, production of services, etc. Employees familiar with this tool are more aware of their impact on the process of participation in organization management. Of course, the trend outlined does not always fully reflect the above-mentioned regularity, in 2011 and 2015, an increase in the number of ideas submitted and implemented was noted. This was also due to the greater number of employees and a larger number of production orders.

Benchmarking of an employee suggestion system's operation in enterprise X

Carrying out a comparative analysis of the system is only possible after choosing the right model which will constitute a reference point. The elaboration has assumed that such a comparative point will be constituted by the complex research conducted by Łukasz Dekier and Adrian Grycuk called "Employee suggestions programmes. Experience of Polish enterprises" carried out in 2014 as commissioned by the Association of Management Poland. It was conducted on the sample of 249 representatives of continuous improvement department from manufacturing and service companies taking part in 3rd Open Lean Conference in Poznań in 2013. [Dekier 2013]. The obtained research results were accepted as the national average illustrating the operation of employee suggestions systems in Poland. The comparison is presented in the table including comments.

When analysing the comparative data one may claim that enterprise X ranks significantly higher than the national average taking into account effectiveness of an employee suggestion system's operation.

When benchmarking four indicators, higher values were obtained as compared to other surveyed enterprises, only as regards time of receiving the feedback by an author of an idea the result for enterprise X was lower than the enterprises in Poland.

The above diagnosis allows us to draw a final conclusion:

The employee suggestion system is a permanent element of a continuous improvement process in enterprise X, the employees know its principles well, effectiveness of the system is strictly related to an overall condition of the manufacturing facility. A tendency is noticed as regards the number of workers employed in the enterprise and the number of reported and implemented ideas (although formally it is not a correlation). The analysed indicators suggest that the implementation stage of this tool of continuous improvement is on the medium level and exceeds average indicators for representative enterprises in Poland. It should be noticed that certain areas, elements need improving.

Table 5: Comparison of indicators included in the report "'Employee suggestions programmes. Experience of Polish enterprises" and the indicator characterizing the employee suggestion system in enterprise X. Source: Authors' elaboration based on the information provided by a company and [Dekier 2013]

Description of an indicator	Indicator value from the Report	Enterprise X
Possession of an employee suggestion system	82.3 % of manufacturing enterprises in Poland have an employee suggestion system	The system has been operating since 2006.
Participation in an employee suggestion system	36.2% reports at least 1 idea	In total: 47.3% Production workers: 54.3%, administration: 40%
The number of reported ideas compared to employment	0.65% of an idea	1.09% of an idea
Relation of reported to implemented ideas	60.2%	66%
Feedback received by the idea's author (days) regarding implementation of an idea or its rejection	17.1 days	67 days is the value of the indicator illustrating the number of days from submission to implementation – the authors assumed 1/3 of this value was the time for making a decision and in the discussed case it amounted to 20 days

An effective employee suggestion system should have the following elements:

1. Employee interest in submitting ideas.
2. Simple ideas submission.
3. Quick and effective evaluation of ideas.
4. Constructive and comprehensive feedback.
5. The idea is implemented as soon as possible.
6. Ideas are reviewed for additional benefits.
7. Employees deserve recognition and the program celebrates its successes.
8. The program is measured and constantly improved. [Robinson, 2006]

In the described enterprise, the following recommendations were developed to improve the operation of the employee suggestion system.
Practical recommendations:

- adding the "consequences arising from the observed problem" box to the application form,
- on the boards of the CI department located in production halls and in administrative buildings, it is advisable to place completed "ready" prints as so-called template for correct completion similar to administrative offices, post office, etc.
- encouragement of so-called"Groups of observers", i.e. employees who are inactive participating in the employee suggestion program,
- emphasis on increasing the involvement of administrative staff,
- showing benefits for employees resulting from submitting and implementing ideas in the form of illustrative comparisons - by visualizing the message it is easier to reach employee awareness than by providing "dry" data on achieved financial or time savings,
- modernizing the IT system to make it more transparent and user-friendly
- propagating group ideas, i.e. at least two employees,
- intensifying marketing activities promoting the employee suggestion system - using e.g. the company newsletter,
- creation of an acceptable measure enabling an objective (counteracting subjectivity) evaluation of a specific idea by a CI department employee or expert, taking into account examples of elements: ease of adaptation, originality, creativity, independence of implementation, economic factor, impact on other operating areas, etc. Assigning appropriate weights to individual ingredients, you can create an indicator that clearly decides whether or not the idea is implemented according to the principle stated by P. Drucker "if you can't measure something, you can't manage it."

Recapitulation

The paper presents results of research on the employee suggestion system in one of the biggest international companies in the transport industry. Ideas of employees were first used in 2006, the presented data describe a 10-year history of operation. In the company over a half of suggested solutions is placed in the organizational area, to a lesser extent in the safety and hygiene at work aspect, costs and environment (c.f. Fig. 2). A management change is usually easier than physically rebuilding an entire process e.g. a manufacturing one thus solutions regarding this aspect are dominant.

Detailed conclusions and the comparison of enterprise X with the conditions of the Polish economy have been presented in chapters 3 and 4. The number of employee suggestions per one employee ranges from 0.48 to 1.95 with an average above one idea per employee. Despite the fact that no direct correlation between the number of employees and the number of reported ideas was noticed, the boom of the suggestion system occurred over the years when employment was the highest. The analysis of dynamics also indicates that a big rotation among the staff has a negative influence on the number of new solutions.

The average time between submission and implementation is 67 days in the company under consideration. In extreme cases this time extended to over a year. It reveals the complexity of the process of evaluating and implementing a new project, a solution as every idea is unique. The transition from the hidden knowledge into open knowledge is of enormous importance even if ideas have a limited scope and are implemented by their authors themselves and that was the case in the researched company in 35% cases.

This paper is a continuation of the research on application of lean tools in Polish companies and contributes another view on the Polish economy. Polish companies with foreign capital do not fall far from the European standards but in some cases they exceed them. The paper also aims to display basic indicators applied in this operation area to managers willing to implement an employee suggestion system.

Resumen

Este trabajo presenta un avance del estudio sobre la educación para la niñez y la juventud: de la exclusión de saberes a la construcción de la interculturalidad en el suroccidente colombiano. Este territorio posee espacios rurales geoestragicamente ubicados y ancestralmente privilegiados por su diversidad cultural, paisajística, biológica y epistémica y requiere que sus comunidades y las instituciones educativas institucionalizadas y no institucionalizadas se piensen y construyan proyectos comunes hacia la construcción del tejido humano. Esta investigación tiene como propósito reconocer la heterogeneidad de pensamientos y subjetividades, a través de la estrategia de investigación- acción-participación(IAP), en dos instituciones educativas, las cuales abarcan 15 sedes y 140 niños, niñas y jóvenes, con quienes se viene trabajando en proyectos de aula, diálogos escolares, espacios de reconciliación entre otras acciones y lenguajes no monoculturales. Con esta apuesta, se espera la desnaturalización de la indiferencia, escuchar sus voces, validar experiencias y construir trayectos para pensar en el verde esperanza, el verde de la naturaleza y el verde de la humanidad.

Palabras Clave: Educación, heterogeneidad, Interculturalidad, subjetividades.

Abstract

This paper presents an advance of the study on education for children and youth: from the exclusion of knowledge to the construction of interculturality in the southwest of Colombia. This territory has geostragically located and ancestral privileged rural spaces for its cultural, landscape, biological and epistemic diversity and requires that its communities and institutionalized and non-institutionalized educational institutions think and build common projects towards the construction of the human fabric. The purpose of this research is to recognize the heterogeneity of thoughts and subjectivities, through the research-action-participation strategy (IAP), in two educational institutions, which cover 15 locations and 140 children and youth, with whom we worked in classroom projects, school dialogues, spaces for reconciliation among other actions and non-monocultural languages. With this commitment, the denaturalization of indifference is expected, listening to their voices, validating experiences and building paths to think of the green hope, the green of nature and the green of humanity.

Keywords: Education, heterogeneity, Interculturality, subjectivities

Introducción

La invisibilización de las diversidades culturales, sociales y personales afecta múltiples espacios y territorios (Barriga, 2015), uno de estos, es el de la educación donde a pesar de los avances sobre

nuevas concepciones para entender a la juventud y la niñez en la contemporaneidad y sus múltiples capacidades para pensar, reflexionar, dinamizar, agenciar , argumentar y relacionarse; aún prevalece el énfasis en la educación asistencialista y de transmisión de conocimientos . De esta forma se corre el riesgo de eliminar las capacidades de los niños, niñas y jóvenes para pensar, relacionarse, planear y soñar por vía de la estandarización de los conceptos, de los currículos, homogeneizando el pensamiento e impidiendo que aflore lo diverso.

Así, desaparece el espacio para lo diverso(Castro-Gómez, 2005) y, a través de prácticas escolares instrumentales se naturaliza la etiquetación, la exclusión de lo diferente en relación al pensamiento y la cultura y la escuela como un lugar pluriespacial de múltiples lógicas, acciones y relaciones (comunidad- escuela, maestro- estudiante, maestro- familias, comunidad – maestro) como uno de los pocos espacios que para los niños para lo común , lo cooperativo y solidario y que provoca pretextos, textos escritos orales y corporales como hilos para la construcción del tejido humano.

Esta investigación tuvo como propósito reconocer la heterogeneidad de pensamientos y subjetividades en niños, niñas y jóvenes que asisten a dos instituciones educativas en la ciudad de Cali, suroccidente colombiano para la comprensión y la transformación de los eventos y fenómenos expresados en el ámbito de la educación intercultural(Arnaiz y De Haro 2004) ; ámbito donde se transita para aprehender, aprender, comprender, interpretar y transformar la realidad y el mundo de la vida; reconociendo así que los eventos y sucesos educativos sociales, culturales, humanos se dan en y por interacciones asimétricas, polivalentes, heterogéneas e impredecibles.

Reflexión Teórica Para El Análisis De Resultados

En este momento, el proceso se encuentra en un análisis de los datos a partir de una reflexión teórica que se viene haciendo entorno a varios ejes:

1. La invisibilización de las diversidades que afecta múltiples espacios (Barriga, 2015) ,uno de estos es el de la educación donde a pesar de los avances sobre la construcción de una episteme de la juventud y la niñez en la contemporaneidad y de los múltiples acentos en el reconocimiento de sus capacidades para pensar, argumentar y relacionarse; aún prevalece el énfasis en la educación transmisora de conocimientos en escenarios educativos donde se borran saberes, sentires y deseos por la vía de la estandarización de los conceptos.

2. Se cuestiona a una escuela actual con aulas donde no hay espacio para lo diverso (Arnaiz y De Haro, 2004), con prácticas escolares instrumentales, donde se naturaliza la etiquetación, la exclusión de lo diferente en relación al pensamiento y la cultura. Así, la escuela va dejando de ser ese lugar pluriespacial de múltiples lógicas, acciones y relaciones (comunidad- escuela, maestro- estudiante, maestro- familias, comunidad – maestro); pierde el atributo de ser uno de los pocos espacios que permite a los niños aprender valores como la solidaridad y la cooperatividad para la construcción del tejido humano.

3. La juventud y la niñez en Colombia crece en medio de profundas transformaciones como los enfrentamientos insurgentes, la desterritorialización, el abandono, el abuso infantil, los desastres naturales, las hambrunas, los lenguajes digitales y la emergencia de la configuración y organización de familias desde la heterogeneidad (Britto, 2010). Acontecimientos que no solo configuran otras formas de ser joven, niño y niña sino también otras subjetividades que provocan otras formas de acceder y procesar la información, de relacionarse con las personas adultas, de reconocer estéticas y otras formas de estar y ser en el mundo (De Sousa, 2003).

4. Existen otros hechos que producen afectaciones en la construcción del ser, saber y sentir juvenil e infantil, hechos que devienen de las formas de relacionamiento y de socialización mutantes en el siglo XXI. Vale la pena destacar la forma como conforman su círculo de amigos y amigas a modo virtual, asunto que coloca en tensión la presencialidad. De igual manera, se resalta su capacidad de interacción con el exterior impactada por los medios de comunicación masivos y el desarrollo de sus habilidades para asceder a ellos. Así, construyen otras lógicas, otras formas de comunicarse y de relacionarse no lineales ni preconfiguradas.

5. La capacidad de riesgo y aventura de niños, niñas y jóvenes en tiempos de la tecnología, les hace ir más ligeros y asegurarse más en el mundo; lejos de la sociedad del miedo y el castigo instituida desde el judeocristianismo. Hoy en la sociedad del poder, están inscritos en grupos sociales o culturales, participan en movimientos para el cuidado del planeta como grupos ambientalistas al igual que se caracterizan por los deseos de transformación y participación.

6. Las prácticas educativas e institucionales se presentan en su mayoría, desde la fórmula del método de enseñanza unido a una serie de pasos para llegar a resultados; de acuerdo a unas etapas de desarrollo parametrizadas en las que las edades cronológicas se sobreponen a sus niveles de conceptualización, deseos y ritmos de aprendizaje; espacios donde se producen relaciones y discursos fundados en una imagen de niños y niñas de otros siglos y procesos generados desde acciones que colocan en sospecha las capacidades infantiles.

7. Aunque los niños y niñas de la contemporaneidad institucionalizados escolarmente, se declaran con capacidades mayores ,en algunas instituciones, aún no se logra interiorizar que sus subjetividades están permeadas de textos, hipertextos y de realidades asimétricas, desde la desterritorialidad, las emergencias climáticas entre otras; logran conocer contextos - otros que traspasan las fronteras de su escuela y de su hogar, sin censura, hasta conformarse grupos de niños/ niños, niños/adul tizados, niños/adolescentes habitantes de un mundo basado en lo disímil, lo complejo, lo emergente, lo instituyente o no lo homogéneamente instalado (Flekman, et al.2015).

8. En sus discursos con los que nominan los colores, olores, sabores, encantos, desencantos, con los que argumentan , proponen y participan su mundo , demandan ser incluidos en las prácticas educativas a partir de sucesos de la vida con significados y sentidos relacionados altamente desde su cultura y en diversos espacios donde es posible la movilización de lenguajes, en ocasiones, distante de los protocolos adul tizados. Sus textos orales se convierten en puentes vinculantes para transitar por los múltiples espacios, campos y rutas donde logran manifestarse como seres éticos-políticos a través de sus historias de vidas (Mato ,2008).

9. Los espacios escolares (Guzmán, Cely y Salazar, 2015), pueden convertirse en territorios donde se hilan oportunidades para resignificar los turnos de habla, los silencios y las puestas en común; esto es, como lugares para el encuentro con el otro (Martínez, 2016). Por ello, en este estudio se trabaja a través de actos de palabra/vida como la construcción de asambleas pedagógicas donde se coloca en común las contradicciones, el análisis de los sucesos, la reflexión, la crítica, las inquietudes, hechos de la vida diaria soluciones y propuestas. Como discurso pragmático construido en la vida diaria, toma para un tú y un yo de la vida íntima y social, hace manifiesto los lugares de interpretación, comprensión y refutación de fenómenos. La oportunidad de la existencia de esta capacidad, viabiliza el dialogo con su pensamiento, con su idea enunciada hasta alcanzar la transformación de opiniones atadas a contextos, un acto de habla que lleva en su interior una recomendación o una petición.

10. La escuela debe encontrar pretextos donde los niños y las niñas logren explicitar su pensamiento a partir de lenguajes y ejercicios de ciudadanía que les permitan participar, y proponer todo aquello que quieren, saben y piensan. Espacios de palabras, saberes culturales (Walsh, 2011), se van encontrando regiones colmadas de significados, políticas, gramáticas y campos semánticos con los que logran expresar lo que saben, piensan, construyen con razones y donde pasan de una opinión a otra. Es en estos espacios dialogizante donde proponen, imaginan y logran desde sus concepciones leer las intenciones de los otros. (García, 2015).

Este proceso de investigación se ha realizado desde la perspectiva de la complementariedad investigativa la cual hace posible que las realidades sociales y humanas sean interpretadas desde lo cualitativo (Creswell, 2007), más específicamente desde –IAP – Hermenéutica Diatópica, esto es, que la investigación se lleva al plano de la interpretación, la comprensión y la transformación de los eventos y fenómenos expresados en el ámbito de la educación intercultural y la diversidad (Arnaiz, 2004); campos y ámbitos donde se transita para aprehender, comprender interpretar y transformar la realidad

y el mundo de la vida; reconociendo así que los eventos y sucesos educativos sociales, culturales, humanos se dan en y por interacciones asimétricas, polivalentes, heterogéneas e impredecibles.

Concluyendo

Los avances afectivo, cognitivo y corporal de los jóvenes, los niños y las niñas son posible en ambientes escolares donde los discursos y las prácticas reconocen las experiencias de los niños y las niñas como lugares de acontecimientos, los contextos como nacimientos de hallazgos y las tareas como pretextos para discutir sobre los eventos de la cultura y la vida. Así mismo, cuando es posible crear pretextos escolares que se vinculen a los procesos de participación, al que, al cómo, y al cuando aprender proyectos de aula , cuando los límites de la escuela se rompen y es posible conocer el mundo a modo holístico, así mismo, cuando se rompe con los diálogos formateados dados en largos tiempos donde el maestro pregunta y el estudiante responde , cuando desaparecen las preguntas como comprobación de un saber y emergen como punto para construir. Los diálogos escolares entran por vía de construir colectivamente imaginarios y saberes, en solidaridad de acompañar los silencios, los no saberes y los saberes desiguales, desde asuntos, problemas o temas de intercambios comunicativos donde la maestra a través de palabras de largo aliento permite construir operaciones de análisis , comprensión , interpretación, de secuencialidad que les permiten argumentar.

Sus capacidades logran darse cuando son enseñadas y se construyen conjuntamente a partir de la incorporación de temas relevantes para los integrantes de la clase, así como los textos para leer, las temáticas abordadas para trabajar la argumentación deben tener sentido, significado y funcionalidad para su vida, emergen producto de la reorganización y organización conceptual de los estudiantes, de la flexibilización de tiempos y espacios dentro del proceso de aprendizaje, la valoración del medio social, la identificación de la escuela infantil como un lugar pluriespacial, la autorregulación en los procesos de aprendizaje y personales, la valoración del niño y la niña como seres humanos activos tanto en el proceso de aprendizaje y enseñanza como en sus proyectos de vida en concordancia con sus ritmos de aprendizaje y las condiciones sociales y familiares de los niños y niñas.

A muy temprana edad son capaces de exponer sus opiniones, lógicas e hipótesis y de interpretar, analizar, argumentar, clasificar, inferir, contrastar, confrontar y anticipar. Las estructuras argumentativas infantiles pasa por las hipótesis y las justificaciones a partir del lugar de verdad otorgado a un conocimiento ; las justificaciones son razones de credibilidad de las hipótesis; las razones son consideradas sus argumentos, al igual que en las ciencias sociales, están expuestas a la inefabilidad y la incredibilidad a decir de Peronard, (2002) la argumentación no demuestra sino que persuade psíquica y socialmente, "(…) toda argumentación pretende la adhesión de los individuos y, por tanto, supone la existencia de un contacto intelectual." (p.48)

Ahora bien, para el desarrollo y permanencia de sus capacidades es preciso constituir transformaciones escolares en las que se avizoren prácticas pedagógicas fundamentadas en romper con la monotonía escolar instalada en la educación desde el siglo IXX, con acento en la agregación de temas, la parcelación de los conocimientos, los tiempos y los espacios casi inflexibles. Ambientes escolares de enseñanza y aprendizaje diseñados, planeados y ejecutados a partir de los deseos y la participación de los niños y las niñas, de la conjugación del conocimiento y el lenguaje escolar con el cotidiano. Las trasformaciones, en las relaciones entre profesorado y el estudiantado y las formas de seleccionar, organizar, construir y evaluar el conocimiento pueden generar prácticas genuinas (Rosero, 2014)

Abstract

This research focuses on the implementation of a sustainable management model based on circular economy for the treatment and use of polyethylene terephthalate (PET) plastic in ecotourism services. Thus, we address the need for a management model that can be implemented into a pre-established scenario such as the Pachacamac district located in Lima, Peru. We decided to create this model because the aforementioned district has certain ecotourism characteristics; moreover, there are no such models at present in this Peruvian district. This is an adaptable and flexible model depending on the proposed scenario, as it makes use of the three stages of waste management and is supported by the Lean Six Sigma methodology and circular economy. Furthermore, it is a comprehensive model because it is based on dimensions such as the environmental culture, the social dimension, and the economic dimension. The model was implemented in three different scenarios in the Pachacamac district in Lima, Peru. In conclusion, the proper management of the three model approaches generates a highly positive economic and environmental impact, and it brings benefits to both the population and its resources.

Keywords: Lean Management, Circular Economy, Ecotourism, Environmental Management Municipal Solid Waste Management.

Introduction

Plastic is one of the most used materials across the world, mainly because of its practicality and low cost, and most products that are used daily by people contain plastic, which represents a danger for the environment. Currently, 500 billion polyethylene terephthalate (PET) plastics

are generated and consumed annually on a worldwide basis, of which only 9% is recycled, 12% is incinerated, and 79% is accumulated in landfills (OECD, 1961). A similar situation exists in Peru, where 3 billion PET plastics are generated annually, of which only 12% is recycled (MINAM, 2016). These numbers become even more worrisome because plastic does not biodegrade but rather breaks down into smaller particles without changing its chemical composition, which can be invisible to the human eye. When plastics decompose, they release a wide range of chemicals that have a negative impact on organisms and ecosystems.

Plastic is one of the most used materials across the world, mainly because of its practicality and low cost, and most products that are used daily by people contain plastic, which represents a danger for the environment. Currently, 500 billion polyethylene terephthalate (PET) plastics are generated and consumed annually on a worldwide basis, of which only 9% is recycled, 12% is incinerated, and 79% is accumulated in landfills (OECD, 1961). A similar situation exists in Peru, where 3 billion PET plastics are generated annually, of which only 12% is recycled (MINAM, 2016). These numbers become even more worrisome because plastic does not biodegrade but rather breaks down into smaller particles without changing its chemical composition, which can be invisible to the human eye. When plastics decompose, they release a wide range of chemicals that have a negative impact on organisms and ecosystems.

There are few sustainable management models based on the use of soft and hard engineering tools. Likewise, the models that currently exist do not use circular economy as a pillar. Therefore, this research contributes to optimizing the existing models by using hard engineering tools and methodologies to reduce operating costs, maximize employee productivity, and raise public awareness about the importance of reusing PET plastic.

State of the Art

Sustainable Management Models in Ecotourism Services

These authors agreed that conventional models must be replaced by sustainable development models and that innovative strategies for the management of natural resources went far beyond the economic scope, reaching the social and environmental dimension (CEWEP, 2002) (MINAM, 2016). They concluded that the ecotourism sector can be enhanced by a management model based on well-defined objectives and goals that maintain innovation and generate growth opportunities (CEWEP, 2002) (Rivas, 2011).

Lean Methodology Applied to Sustainable Management Model Sin Ecotourism Services

These authors, through different case studies, reach the same conclusion, namely, that the Lean methodology provides a continuous process improvement because it focuses not only on the product but also on human talent, since as in sustainable development, humans are the beginning and the end as well as the subject and the object of their own development (Ortega, 1994) (Seiffert, 2005).

Furthermore, these authors argue that the Lean methodology can be used to properly build and implement a sustainable management model in ecotourism, thereby resulting in the continuous improvement of ecotourism processes (Seiffert, 2005) (Prieto et al, 2017) (Galvez et al, 2020).

Circular Economy Applied to Sustainable Management Models in Ecotourism Services

In this typology, the authors agree that the circular economy is regenerative and efficient. It allows for a switch from a linear production model to a continuous sustainable development model and enables one to take advantage of new business opportunities (Samaniego & Rodriguez, 2009) (Lendínez, 2019). These other two authors agree that the circular economy is not something new because it starts from what is already established, consequently bringing modifications for a model that improves the quality of life (Tzuc, Chablé & Yuyub, 2018)

Lean Methodology and Circular Economy Applied to Sustainable Management Model in Ecotourism Services

These authors, through various business cases such as the textile factories, agree on the benefits of the Lean methodology in any process because it increases agility and flexibility; improves the value creation capability, work welfare, teamwork, and innovation; and encourages employees to be more committed and proactive. Finally, this author concludes that the circular economy can be implemented in both business and household environments, thereby enhancing environmental sustainability by extending the useful life of products.

Contribution

Rationale

This research proposes a sustainable management Lean model based on circular economy for the treatment and use of PET plastic waste applied to ecotourism services. This model is based on research regarding sustainable management models applied to existing ecotourism services, through which we identified the existing models that combine innovation with environmental spaces (Seiffert, 2005). Based on the aforementioned, we sought to implement the Lean methodology to reduce errors and establish the continuous improvement necessary for the proper use of ecotourism services (Lendínez, 2019). Moreover, in the search for a philosophy that moves from control to proper sustainable management, we investigated how circular economy could support the model. Thus, we were able to switch from a linear model to a continuous sustainable development model. Finally, according to each pre-established component and scenario, we built a sustainable management model aimed at a comprehensive implementation of each component as well as at continuous process improvement.

Proposed Model

First, MLE comprises the implementation of a waste management system dedicated to the control and management of the entire lifecycle of household waste in terms of waste collection, transport, processing, treatment, recycling, and transfer until the final deposit. This is achieved through three stages while measuring and analysing the quality of the service level.

Fig. 1: Components and description of the lean sustainable management model

Validation

Case Study

This model will be applied in three scenarios in the Pachacamac district, which already counts on a cultural, ecological, and recreational landscape and research elements. These elements represent a national identity, Peru's great tourism potential, adapted to the scenario proposed in this research. The district has large clubs, estates, and restaurants that offer recreational areas for rest and the tasting of traditional dishes. It also allows the practice of adventure sports, such as paragliding, cycling, mountain biking, horseback riding, ATV riding, and trekking. Likewise, the area counts on varied flora and fauna, typical of coast valleys, which promotes ecotourism as an alternative. In addition, it has predominantly agricultural and farming areas; however, it does not have an organizational system for grouping together most of the local micro entrepreneurs.

Results Analysis

- The statistical analysis shows that for indicator 1, the mean of the recycling percentage presents a favorable result following the implementation of the proposed model.
- In terms of standard deviation for indicator 1, the variability is more dispersed with respect to the mean.
- The analysis shows that for indicator 2, the mean of the processing time in scenarios is higher than 1, i.e., it shows a successful result. However, its standard deviation is higher than the rest of the indicators, i.e., there is more dispersion around the mean.
- For indicator 3, the mean evinces a favourable result of more than 50% satisfaction in relation to customers attending ecotourism services, i.e., an optimal and lower variability.

- The various scenarios carried out that take different services in the district of Pachacamac into account demonstrate the successful model implementation into the ecotourism areas.

Table 1: Statistical analysis by scenario and indicator

	Indicator 1	Indicator 2	Indicator 3
Scenario 0	76.00%	11.50	78.00%
Scenario 1	84.00%	10.0	25.45
Scenario 2	50.00%	7.00	15.60%
Scenario 3	75.00%	15.00	80.00%
Mean	71.00%	10.88	50.00%
Median	76.00%	10.75	52.00%
Standard deviation	15.00%	3.33	34.00%
Max	84.00%	15.00	80.00%
N	4	4	4

Conclusions

This study provided a more in-depth understanding of waste management implementation in the ecotourism services sector. The results have shown a considerable improvement with respect to the indicators that were proposed initially. The conclusions that have been identified are given as follows:

The volume percentage of waste recycling increased by 50%, which is a positive indicator because before it was only discarded.

The implemented model showed that the customer satisfaction has been increasing according to the scenario, entailing an improvement in the model each time it was implemented and assessed.

To create an innovative model of solid waste management, a literature review was conducted to identify the existing solid waste collection management models.

The 5S methodology should be carried out before the implementation of or simultaneously with the Lean tools because many of the processes or improvements intended to be carried out with these tools should be developed in a controlled environment and with easy process supervision for each employee.

The circular economy was proposed as the basis for the model to achieve an extra income and thus financially support the ecotourism area, in turn improving the solid waste management and contributing to the environmental culture.

Abstract

The purpose of this publication is to assess the mutual impact of the level of development of the absorptive capacity of financial companies in Poland and the degree of advancement of their technological portfolio in the context of the transfer of innovative technologies. In the theoretical part, the authors synthetically present the essence of the concept of path dependence and absorptive capacity in the process of technological development and discuss potential relationships occurring within these constructs. In the empirical part, based on the results of their own surveys, they verify the occurrence of mutual dependence between the degree of development of the absorptive capacity of financial companies in Poland and the level of their technological advancement, as well as identify the effects that have been obtained and are innovative. Ultimately, the authors confirm that the technological development of financial companies in Poland is carried out in accordance with the assumptions of the concept of path dependence, affecting the increase of their innovation in operations.

Keywords: path dependence; absorptive capacity; innovative technologies; technological development; financial services companies.

Introduction

A prerequisite for survival, and even more so for the market success of a company operating in a dynamically changing environment is to ensure its development in various areas of activity, but above all in those where customer value is generated that determines the level of competitiveness obtained. These areas are in particular creating, producing and providing the customer with a complete market offer. Technologies and the effects of their application play a crucial role in them. Therefore, their development is particularly important and thus desirable.

As is commonly known, not all companies are successful. One answer to the question - why is this happening? - is the diversified capability of companies to cope with changes in the environment, and especially with technological changes, which is a manifestation of the huge progress occurring in this area (Lucas and Goh, 2009). What matters in particular are dynamic capabilities (Makadok, 2001). It turns out that successes are primarily achieved by those companies that are able to adapt, renew and discover new opportunities through implemented technological innovations, allowing for pro-development reconfiguration of their business model (Hedman and Kalling, 2003).

Companies treat technological progress differently. The same changes are perceived as opportunities by some companies and as threats by others (Sabherwal, 2001). The former proactively implement

technological innovations in order to gain a competitive advantage, while the latter adopt reactive attitudes in this respect (D'Aveni, 2010). However, regardless of their attitude, while operating in turbulent changing conditions, companies are increasingly compelled to reach for the resources of specialized knowledge and modern technological solutions that already exist in the environment. However, successful transfers of knowledge and technology also requires a company with highly specialized and demanding capabilities.

Given the scope and significance of the issue, the main research objective of this article is to assess the mutual impact of the level of development of the absorptive capacity of financial companies in Poland and the degree of advancement of their technological portfolio in the context of the transfer of innovative technologies. Its implementation, based on the results of a survey conducted in the Polish financial companies sector, is to provide an answer to the question whether the absorptive capacity of financial companies has a real impact on the degree of technological advancement they gain, and then - in accordance with the concept of path dependence, whether a higher degree of technological advancement affects the development of their absorptive capacity and the effects of its use in the transfer of innovative technologies. So, do historical decisions regarding the development of absorptive capacities and the technologies obtained thanks to them really mark the technological development path, limiting future possibilities of making different decision choices in this respect?

Theoretical Background

At the initial stage of its development, the company has a wide range of decision options and scenarios to develop its technological portfolio and, consequently, the achieved effects owed to it (Sydow, Schreyögg and Koc, 2009). At this stage, they are not limited by their previous decisions or experiences. It turns out that subsequent activities undertaken in the course of business become mutually dependent. Every action taken at a given moment is imprinted in the past and will be reflected in the future. It can also begin at some critical juncture, lasting even many years, the process of self-reinforcing, thus creating path dependence (Garud, Kumaraswamy and Karnøe, 2010; Zhang, Yu and Hu, 2018). The choices or actions taken at that time will determine future arrangements while limiting awareness or the ability to make others, thereby reducing flexibility in action through targeted decisions and experiences. Historic decisions limit the ability of policy makers to see and understand the role of others, especially emerging technologies. At some point, it may turn out that there are only few decision options available for further technological development, as previous activities have created a path which the company can no longer abandon or break through to another, or can do it, but only with great and often capital-intensive efforts, which is not always justified (Sydow, Schreyögg and Koc, 2009). Path dependence is the combination of historical contingency and the emergence of self-reinforcing effects that steers a technology along one 'path' rather than another (Tsiapa, Kallioras and Tzeremes, 2018).

The concept of the critical path is also the result of an attempt to explain the lack of a rational response to technological changes taking place in the environment (Wang, Hedman and Tuunainen, 2016; Greve and Seidel, 2015). It assumes that previous actions, decisions or events, for example, the choice of technology, standard, or product portfolio, can gradually create an organizational block, narrowing the scope of potential decision variants. These processes are cyclical and last for a long time, and their effects intensify, creating more and more restrictions for the further development of the company. They set the direction for subsequent decisions, actions and results, including primarily the development of technology and the market offer obtained through it. The technological development directed by path dependence is self-reinforcing and intensifying, hence the consequences of the established path dependence can have a significant impact on the fate of an enterprise, and, moreover, they may also be irreversible (Garud, Kumaraswamy and Karnøe, 2010).

In this article, the concept of path dependence is undertaken on the basis of the theory of learning organization and knowledge management, and refers to the development of technology in a company. It is based on a simple assumption, according to which the current knowledge allows to identify, acquire, assimilate and use new knowledge, while defining its scope (Cohen and Levinthal, 2019). At the same time, for a company to be able to effectively absorb new useful knowledge, part of its existing

knowledge should be closely related to this new knowledge to allow its acquisition, while the other part must be different, although still somewhat related to allow creative use of newly acquired knowledge, even to create incremental innovation (Talat and Bhaduri, 2017).

The knowledge resources that have been accumulated in the company so far, including technological knowledge, are a key component of its absorptive capacity, which has important implications for the further development of the potential itself, as well as for the scale and scope of effects obtained, including new knowledge and innovative technologies. It should be explained here that absorptive capacity, according to Cohen and Levinthal (1990) (the pioneers of the concept), should be understood as the ability of the organization to recognize the value of new knowledge, assimilate and use it commercially, i.e. in a way that is oriented towards generating new value in the company's market offer. As a consequence, the absorptive capacity in the transfer of new technologies is, according to the authors, a bundle of specialized resources, especially intangible ones, that allow the company to successfully acquire, assimilate and use new and strategically valuable technologies to achieve the intended results (Glabiszewski, 2016).

The actual size and usefulness of the company's absorptive ability is primarily dictated by the current abundance of knowledge related to that absorbed, or in other words – to the level of basic knowledge (Jiménez-Barrionuevo, García-Morales and Molina, 2011), as previously acquired knowledge allows an organization to acquire, assimilate and exploit new knowledge, more developed and in a wider context (Zahra and George, 2002). In order to adapt the newly acquired knowledge and then be able to use it appropriately, the company must assimilate it (Glabiszewski and Zastempowski, 2017). This requires integrating the existing knowledge with new knowledge, as a result of which the level of the organization's knowledge increases, including the basic knowledge used in subsequent cycles of knowledge transfer from the environment. Thus, the ability to absorb even more advanced knowledge increases. Moreover, when combining basic knowledge with new one, we should expect a synergy effect. Such enriched knowledge resources in an organization increase its ability to create and implement innovations based on it (Pypłacz and Liczmańska-Kopcewicz, 2018).

Lack of proper involvement in organizational learning, reduces the effects of knowledge absorption, reduces future absorptive capacity and, as a consequence, may lead to the phenomenon of closing to new technologies (Lane, Koka and Pathak, 2006). Closing to new technologies, or at least limiting the possibilities of using emerging technologies, may also be a consequence of improving knowledge and technology, if it is made in a clearly oriented way in accordance with the established path dependence in a continuous, self-reinforcing and intensifying way (Garud, Kumaraswamy and Karnøe, 2010).

To sum up, the use of absorptive capacities as part of the transfer of innovative technologies initiates at the same time the process of their improvement, creating an organization-specific path dependence that determines the future state of absorptive capacity and the level of technological advancement to be acquired in the future (Todorova and Durisin, 2007). Hence, the low level of investment in absorptive capacity to date may reduce the attractiveness of investing in it at a later stage, even if the company becomes at some point more aware of the need for technological development (Cohen and Levinthal, 1990). It turns out that the new generation of technology, as a rule, is built on the achievements of the previous generation, hence it is difficult for a company to make a leap of competence by several cycles of technological development.

Research Objective, Methodology and Data

The empirical part of the article was prepared based on the results of the survey carried out in the time period 2018-2019, which is a repetition of the author's research done in the years 2015-2016. The study used an online survey method using the CSAQ technique (Computerized Self-Administered Questionnaire) in which the respondents filled in a digital version of the survey questionnaire available online (Tourangeau et al, 2013). It was sent to the heads of 163 commercial financial sector companies registered in Poland, namely all banks, property and life insurance companies, investment funds (TFI) and universal fund management companies (PTE). In total, 106 entities filled in the online survey

questionnaire, constituting 65% of the population under study. Analysis is based on the results from 36 TFIs, 25 banks, 20 property insurance companies, 17 life insurance companies and 8 PTEs.
The study carried out was the basic source of data necessary to achieve the main empirical goal of the article, which was to assess the mutual impact of the level of development of the absorptive capacity of financial companies in Poland and the degree of advancement of their technological portfolio in the context of the transfer of innovative technologies. To achieve the main goal formulated in this way, the author set the following four specific goals:

1. assessing the impact of the degree of development of the absorptive capacity of financial companies in Poland on the level of technological advancement;
2. assessing the impact of the level of technological advancement of financial companies in Poland on the level of development of their absorptive capacities;
3. assessing the degree of the impact of the development level of three separated segments of absorptive ability of financial companies in Poland on the level of technological advancement;
4. assessing the degree of the impact of three separated segments of absorptive ability of financial companies in Poland on the level of their innovation in operations.

In order to achieve the specific objectives, and thus the main research objective posed in the article, the author formulated and empirically verified the following four research hypotheses:

H1. The degree of development of the absorptive capacity of financial companies in Poland has an impact on the level of their technological advancement;
H2. The level of technological advancement in financial companies in Poland has an impact on the degree of development of their absorptive capacities;
H3. The degree of development of all three separated segments of absorptive capacities of financial companies in Poland has an impact on the level of their technological advancement;
H4. The degree of development of all three separated segments of absorptive capacities of financial companies in Poland has an impact on the level of growth of their innovativeness in operations.

The hypotheses formulated above refer to the concept of path dependence that emerged from the sphere of knowledge management theory and learning organization, according to which the existing knowledge and technology resources dictate directions for their further development, thus determining the company's future technological and innovation opportunities.

The following two methods were applied: the ordered logit model and multiple regression methods. In the first part, the ordered logit model was used the specification of which is an extension of the binary model specification to more threshold. The model is described by the following equation:

$$y^* = x'\beta + u$$

where y^* is the exact but unobserved dependent variable, x' is the vector of independent variables, u is the error term and β is the vector of regression coefficients which are intended to be estimated. The maximum likelihood estimation method and the STATA.16 software are used to estimate the model.

Multiple regression was used in the second part. This regression is described by the following equation:

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \cdots + \beta_k x_k + u$$

where β_0 is the point of intersection of the regression surface with the ordinate axis, and each β_i for i = 1, … k is the slope of the regression surface relative to the axis corresponding to x_i. The STATA.16 software was also used to estimate this model.

The subject of the analysis were six variables - two dependent variables and four explanatory ones. To determine level Y_1, the top management of the surveyed enterprises was asked to assess the level of advancement of the technologies they were currently using against their competitors, giving them four choices, namely: (1) pioneering technologies, (2) technologies with a high level of advancement, (3)

technologies with a standard level of advancement, (4) technologies with a low level of advancement. To determine level Y_2, the top management was asked to assess the degree to which the company had achieved the desired level of innovation growth in its business over the past three years using a scale from 0 to 100%, where 0% meant that the desired increase in innovation was not achieved at all, and 100% meant that it was achieved completely. To estimate the size of the explanatory variables, the top management of the surveyed companies was asked to assess the degree of development of individual capacities, using a scale from 0 to 100%, where 0% meant that the given ability was not developed at all, and 100% meant that it was developed to a maximum, and therefore fully. Table 1 presents the description and scales of all variables of the model.

Table 1: Description of variables

Variables	Description	Scales
EXPANATORY VARIABLES		
X_1	the degree of development of the ability to acquire new technologies	Quotient (0-100%)
X_2	the degree of development of the ability to assimilate newly acquired technologies	Quotient (0-100%)
X_3	the degree of development of the ability to implement newly assimilated technologies	Quotient (0-100%)
X_4	the degree of development of absorptive capacities	Quotient (0-100%)
EXPLAINED VARIABLE		
Y_1	the level of technological advancement	Quotient (0-100%)
Y_2	the level of innovation growth in conducted activity	Ordinal (1, 2, 3, 4)

Results and Discussion

To diagnose the impact of the explanatory variable (X_4) on the dependent variable (Y_1), a linear regression model was used. The model estimation results are contained in Table 2.

The conducted plausibility test (F (1, 109) = 23.84; Prob>F, 0.0000) indicates the significance of the whole model, which gives grounds for further interpretation of the results obtained. R^2 is the measure of the quality of the fit of the model to the data. It is 0.1795. This means a low level of explanation of the dependent variable. The variable X_4 - the degree of development of absorptive capacities is statistically significant.

While interpreting the results obtained, it should be concluded that the higher estimation of X_4 (the degree of development of absorptive capacities) increases Y_1 (the level of technological advancement) by 0.02.

Table 2: Results of the regression model estimation

Y_1	β	SE	t	P > |t|	[95% Conf. Intervall]	
X_4	.0213827	.0043794	4.88	0.000*	.0127028	.0300626
_cons	1.160623	.2950493	3.03	0.000*	.5758452	1.745401

F (3, 107)	23.84					
Prob > F	0.0000					
R^2 Adj R^2	0.1795 0.1719					

**. Statistically significant at the level of 0.01.*
Source: own study.

In turn, to diagnose the feedback dependency, *i.e.*, the impact of the explanatory variable (X_{Y1} - the level of technological advancement) on the dependent variable (Y_{X4} - the degree of development of absorptive capacities), a linear regression model was used. The results of the model estimation are presented in Table 3.

The conducted plausibility test (F (1, 109) = 23.84; Prob>F, 0.0000) indicates the significance of the whole model, which gives grounds for further interpretation of the results obtained. R^2 is the measure of the quality of the fit of the model to the data. It amounts to 0.1795. This means a low level of explanation of the dependent variable. The variable X_{Y1} - the degree of the level of technological advancement is statistically significant.

Interpreting the results obtained, it should be concluded that the higher estimation of X_{Y1} - the level of technological advancement, increases X_{Y1} - the degree of development of absorptive capacities by 8.39.

Table 3: Results of the regression model estimation

Y_{X4}	β	SE	t	P > |t|	[95% Conf. Intervall]	
X_{Y1}	8.39264	1.71892	4.88	0.000*	4.985797	11.79948

Further in the analysis, absorptive capacity is perceived as a combination of three separated segments (X_1, X_2, X_3) (Glabiszewski et al, 2018). To diagnose the effect of explanatory variables (X_1, X_2, X_3) on the ordered dependent variable (Y_1), the ordered logit regression model was used. Its specification is an extension of the binary model specification to more thresholds. Model estimation results are presented in Table 4.

The conducted plausibility test (LR chi2 (3) = 28.40; Prob>chi2, 0.0000) indicates the significance of the whole model, which gives grounds for further interpretation of the results obtained. McFadden's pseudo-R^2 is a measure of the quality of the fit of the model to the data. It amounts to 0.1162. This means a low level of explanation of the dependent variable. However, it should be remembered that in the case of logit models this is typical and in empirical studies the McFadden pseudo-R^2 values are closer to 0 than 1.

Table 4: Estimation results of the ordered logit model

Y_1	β	SE	z	P > |z|	[95% Conf. Intervall]	
X_1	.0458845	.0171556	2.67	0,007*	.0122602	.0795088
X_2	.0138524	.0126934	1.09	0,275	-.0110263	.0387311

N	111					
LR chi2 (3)	28.40					
Prob > chi2	0.0000					
Pseudo R^2	0.1162					

**. Statistically significant at the level of 0.01.*
Source: own study.

As follows from Table 4, in the presented model, the estimated parameters take positive signs. In other words, the diagnosed impact of the explanatory variables included in the model on the dependent variable raises the chances of Y_1 growth, *i.e.* a higher level of technological advancement. The variable that turned out to be statistically significant is X_1, *i.e.*, the degree of development of the ability to acquire new technologies. Therefore, the variables X_2 and X_3 do not have a statistically significant effect.

The model obtained can be assessed based on the odds ratios (see Table 5). When interpreting the odds ratios for the *i*-th variable (taking into account the assumption of *ceteris paribus*, *i.e.*, other variables of the model unchanged), it should be concluded that the X_1 rating higher by one unit - the degree of development of the ability to acquire new technologies, increases the chances of achieving a higher Y_1 level - technological advancement by 4.6%.

Table 5: Estimation results of ordered logit model - odds ratios

Y_1	Odds Ratio	SE	z	P > |z|	[95% Conf. Interval]	
X_1	1.046953	.0179611	2.67	0,007*	1.012336	1.082755
X_2	1.013949	.0128705	1.09	0.275	.9890343	1.039491
X_3	1.0077	.0174941	0.45	0.656	.9740585	1.042647

**. Statistically significant at the level of 0.01.*
Source: own study.

To diagnose the effect of explanatory variables (X_1, X_2, X_3) on the dependent variable (Y_2), a linear regression model was used. The estimation results of the model are presented in Table 6.

The conducted plausibility test (F (3, 107) = 28.17; Prob>F, 0.0000) indicates the significance of the whole model, which gives grounds for further interpretation of the results obtained. R^2 is the measure of the quality of the fit of the model to the data. It is 0.4413. This means an average degree of explanation of the dependent variable. The variables that turned out to be statistically significant are X_1 - the degree of development of the ability to acquire new technologies and X_2 - the degree of development of the ability to assimilate newly acquired technologies.

Interpreting the results obtained (taking into account the assumption of *ceteris paribus*, *i.e.*, other variables of the model unchanged), it should be concluded that the higher (by 1) estimation of X_1 - the degree of development of the ability to acquire new technologies, increases Y_2 - the level of innovation growth by 0.34. In turn, the higher (by 1) rating of X_2 - the degree of development of the ability to assimilate newly acquired technologies, increases Y_2 - the level of innovation growth in conducted activity by 0.37.

Table 6: Results of the regression model estimation

Y_2	β	SE	t	P > |t|	[95% Conf. Intervall]	
X_1	.3433692	.1133303	3.03	0,003*	.1187051	.5680333
X_2	.370155	.088989	4.16	0,000*	.1937448	.5465653

N	111					
F (3, 107)	28.17					
Prob > F	0.0000					
R^2 **Adj R^2**	0.4413 0.4256					

**. Statistically significant at the level of 0.01.*
Source: own study.

Interpreting the results obtained, it should be concluded that the increase in the degree of development of absorptive capacities increases the level of technological advancement. Therefore, there are no grounds for rejecting the H1 hypothesis. Therefore, the dependence resulting from the assumptions of the theory of absorptive capacity has been confirmed. In addition, the results obtained show that an increase in the level of technological advancement increases the degree of development of absorptive ability, and therefore there is no reason to reject the H2 hypothesis. Thus, the existence of path dependence in the technological development of the surveyed companies was confirmed.

By diagnosing the impact of individual ability segments identified as part of absorptive capacity, it was diagnosed that only the degree of development of the ability to acquire new technologies has an impact on the level of technological advancement in financial companies in Poland. Such an impact was not found in relation to the ability to assimilate newly acquired technologies and the ability to implement newly assimilated technologies, either. Therefore, the H3 hypothesis has been falsified, as there are grounds to reject it. It turns out that financial companies in Poland do not improve technologies transferred from the outside at the stage of their assimilation and implementation - thus they do not increase their technological advancement. They probably do not have sufficiently developed technological competences to transform them into a higher level of innovation, which seems natural due to their different domain of activity. Therefore, their technological advancement depends merely on the ability to determine their choice at the acquisition stage.

The research and analyses carried out were also to answer the question whether the three separated segments of absorptive ability affect increases in the level of innovation of financial companies in Poland. It was found that only an increase in the degree of development of the ability to acquire new technologies and the ability to assimilate newly acquired technologies causes an increase in the level of innovation. Therefore, the H4 hypothesis has also been falsified, as there are grounds to reject it. It turns out that the more developed the company's ability to acquire technology, the more advanced technology it has and the better it can implement innovation. The capacities to assimilate technologies are primarily to facilitate proper adaptation of the acquired technology to specific use, and thus ensure its complementarity with existing resources and activities. They are also responsible for adapting technologies to the individual needs of the company, which also relate to their innovative use. The increase in innovation is not ensured by the ability to implement newly assimilated technologies. At this stage, companies must be focusing their attention only on ensuring the proper use of the technology in accordance with its original purpose.

Conclusion

According to the theoretical assumptions, companies with a higher level of development of absorptive capacity, including more developed resources of basic knowledge, are able to search, acquire, assimilate and use new achievements of technological progress more effectively. In turn, the acquisition of new knowledge and advanced technologies strengthens absorptive capacity, and thus determines the company's ability to acquire and use in the future even more developed knowledge resources and innovative technologies, allowing it to achieve a higher level of innovation and competitiveness (Glabiszewski et al, 2020).

Therefore, shaping the technological portfolio in the company should be subject to long-term planning, as according to the concept of path dependence, the existing technologies determine the possibilities of their development in the future. In other words, the company's desired technological growth may not be achievable in the future if adequate investments in its absorptive capacity and technological portfolio are not made at earlier stages of its development. Therefore, the current neglect in relation to the improvement of the pro-technological absorptive capacity may prevent the use of emerging future technological opportunities. However, one needs to be careful, because unfortunately the same effect can be caused by a well-established path dependence, which has the character of a narrowly focused self-reinforcing and intensifying process.

The results of own research performed confirm that the technological development of financial companies in Poland is carried out in accordance with the assumptions of the concept of path

dependence. Thus, the scope and level of previously acquired knowledge and technology condition the scope and level of their future development. The awareness of the occurrence of this dependence should have a real impact on the quantitative and qualitative dimensions of current investments in development of the staying in close relation absorptive capacity and the technological portfolio possessed.

In order to increase the application value of the recommendations formulated above, it seems necessary to continue empirical research aimed at identifying specific absorptive capacities that, in the context of path dependence, play a key role in acquiring, assimilating and implementing innovative technologies desired for the company.

Abstract

Employees' social competence is at present a very topical issue which is extensively analysed from various angles. Social competence above all affects employees' ability to build relationships with other people, co-workers and customers. This means that it is one of the factors that influence the speed and scope of the functioning of teams and entire organizations, the achievement of their goals, flexibility and effective implementation of changes, and adaptation to diverse cultural conditions. However, building lasting positive relationships in intercultural work environment is often a great challenge. The aim of the paper is to discuss the role and significance of social competence of employees working in intercultural teams and to demonstrate the links between the level of their social competence and their effective functioning in such teams. The study described in the paper was a qualitative study (58 individual in-depth interviews and 3 focus group interviews) conducted within the project: Social Integration Leaders (Liderzy Integracji Społecznej). The model programme for the improvement of migrants' social competence under the Operational Programme Knowledge Education Development (Program Operacyjny Wiedza Edukacja Rozwój) 2014-2020, co-financed by the European Social in the field of social competence of migrants.

Keywords: Competences, Social Competence, Intercultural Teams, Intercultural Management

Introduction

At present there is no doubt that human resources are one of the most important elements of any organization. Therefore, the recruitment of competent employees, especially in the context of their social competence, is a vital tasks of human resource management.

Social competence, understood primarily as relational skills thanks to which a person is able to initiate, transform and terminate a whole range of interpersonal relationships, facilitates the establishment and maintenance of positive interpersonal relationships in work environment and is of vital importance in the effective functioning of both the individuals working in intercultural teams and the entire teams.

In the area of multicultural teams management, employees' social competence can significantly influence not only relationships between employees, but also the work of such teams, the quality of their performance, and their openness to change, new challenges, or innovation.

In the theoretical part of the paper the authors define the concept of social competence and discuss its role, significance, and impact on work and on the functioning in multicultural teams. The study to which the authors refer analysed the level of selected facets of migrants' social competence (as

migrants, they were potential members of intercultural teams), with reference to the model of social competence proposed by Argyle (Argyle, 2002). The impact of respondents' social competence on their effective functioning in such teams was also determined.

The study was conducted with the use of individual in-depth interviews, which were carried out on the basis of an interview scenario developed by the authors of the paper, and focus group interviews conducted by the moderator.

Considering the above premises as well as the purpose of the paper, the following research hypothesis was formulated - the level of employees' social competence has an impact on their effective functioning in intercultural teams.

Social competence – the concept and its meaning

Due to the changes taking place on a global scale, contemporary organizations - in order to function efficiently, develop and build their position on the market in the long run - must apply effective solutions for successful human resource management. Human resources are vital in gaining a competitive advantage on the market (Hendricks, 2002). As an organization develops and functions on the changing and dynamic global market, its employees become exceptionally valuable resources, and the demand for competent human resources is bound to increase (Wardani, 2018).

In the knowledge-based economy employees are considered to be a factor conductive to success of an organization, and not a source of its costs. Being aware of employees' competences, including their social competence, forms the basis for shaping relationships within teams and within inter-team cooperation and for building positive relations with the surroundings. Employees and their competences increase the company's competitive advantage, mainly by improving efficiency and effectiveness of teams and the entire organization, by capitalising on opportunities and avoiding threats (Choudhury and Mishra, 2010).

"Many authors (Arghode, 2013; Lang, 2010; Stump, Ratliff, Wu, & Hawley, 2009) notice that there is no universal definition of social competence" (Gedviliene, Gerviene, et al., 2014, p. 37).

For example, social competence is defined as the ability to effectively deal with social interactions. This term embraces understanding other people, being able to establish and maintain close relationships, also in work environment, and reacting in an adaptive way in social environment. Social competence covers a wide range of cognitive abilities, emotional processes, behavioural skills, social awareness, and personal and cultural values related to interpersonal relations (Orpinas, 2010).

Boyatzis (1982) defines emotional and social competence as knowledge, motives, qualities, attributes and skills that are causally linked with effective or better performance in a particular job or role. In his opinion, the most important facets of social competence are social awareness and relationship management.

Social competence is also understood as a set of elementary, equivalent social skills that determine the effective functioning in certain types of interpersonal situations (Tomorowicz, 2011).

Social competence is described as knowledge and skills that people develop to cope with life choices and challenges. The components of social competence include: adoption of social values, development of a sense of personal identity, acquisition of interpersonal skills, learning how to regulate personal behaviour in accordance with societal expectations, planning and decision-making, and development of cultural competence (Kostelnik, Whiren, et al., 2002).

It is worth mentioning here that one of the first authors who analysed the concept of social competence was an American scholar from Arkansas University, T.A. Cavell. According to him, social competence, which determines a person's effective functioning within their social contacts, consists of three key components: social adjustment, social performance, and social skills.

Another attempt to systematize theoretical assumptions regarding social competence resulted in the Argyle's Method, in which its author defines the notion of social competence as the ability to possess or acquire skills used in social and antisocial situations necessary in achieving desired goals within interpersonal relations (Argyle, 2002). According to Argyle, social competence is a set of different skills used for strengthening social interactions, among which he distinguishes the following: rewarding (i.e. motivating, using different incentives), assertiveness (the ability to exert influence without resorting to aggression or without causing harm to a given social interaction), self-presentation (attempts aimed at creating a certain impression), verbal and non-verbal communication, empathy (the ability to perceive and understand other people's point of view and to share and take their feelings into account), familiarity with the rules governing social life, i.e. the so called social intelligence, which also covers knowledge on how to improve interpersonal contacts (Argyle, 2002).

Three important facets of social competence should also be listed: the ability to build positive and healthy interpersonal relationships and to resolve interpersonal conflicts, the development of self-identity and group or collective identity (e.g. national identity), and orientation towards becoming a responsible citizen in one's own society and - in the perspective of intercultural relations - a citizen of the world (Hing Keung Ma, 2012).

The impact of employees' social competence on the work of intercultural tea

Cullen and Parboteeah observe that managing people in international organizations, that is managing intercultural teams, is inextricably linked to the area of cultural behaviours, as culture is represented in common beliefs, standards and values which form the basis of life for different groups (Cullen and Parboteeah, 2008).

"Multinational organizations have to understand that their managers need to always take into account cultural differences in their management practices" (Vlad and Stan, 2018, p. 407).

Cultural diversity is defined as "the existence of two or more persons from different cultural groups in any group or organization" (DeSimone and Harris, 1998, p. 1485). Multicultural work environment is a place where employees from different cultures meet and become members of multicultural teams. Managing such teams, which are characterised by employees' cultural diversity, poses considerable challenges to managers. The fact that different cultures must coexist within one organization or team means that it is necessary to build relationships between employees based on such values as understanding, acceptance, respect, and tolerance for otherness.

The modern manager is a person who can effectively manage employees in multicultural work environment taking cultural diversity and cultural context into account. Employees' social competence is particularly relevant in culturally diverse teams. Social competence determines the quality and quantity of human relationships in work environment and the results achieved by multicultural team.

Referring to Argyle's explanations and his assumption that social competence is a set of skills that strengthen social bonds (Argyle, 2002), the authors of the paper focused on those social skills which - in their opinion - are of great value in multicultural work environment. These are, above all, the ability to use various incentives to achieve team goals and to build good atmosphere at work; assertiveness, i.e. the ability to exert influence without resorting to aggressive behaviours directed at representatives of other cultures; self-presentation, understood as the ability to build a positive image in multicultural work environment; communication, which is of utmost importance in intercultural relationships; empathy, i.e. the ability to understand the point of view of employees from other cultures; and social intelligence, which allows for the successful functioning within complex intercultural relationships and interactions.

These facets of social competence undoubtedly exert an impact on the efficient and effective functioning of multicultural teams. Positive outcomes of cooperation within such teams include increased creativity, more complex, multi-faceted thinking in search of solutions, greater awareness

and responsiveness, improved quality, the ability to learn and to share experiences, and increased communication efficiency (Cheng et al., 2008a; Cheng et al., 2008b; Benet-Martinez et al., 2006; Davidson and James, 2006; Stevens et al., 2008).

As far as performance is concerned, a positive impact of social competence of employees from intercultural teams consists in: increased creativity and innovation, better decisions, more effective problem-solving and coping with difficult situations, an increase in tolerance and acceptance of otherness, and greater flexibility in communication (Trefny, 2001).

On the other hand, inadequate social competence of employees working in intercultural teams may exert a negative impact on more complex cooperation and interactions between employees. Such teams may work more slowly, the time needed to build relationships may be longer, communication may be more time consuming and more difficult, and the achievement of common goals may require much more effort. Moreover, different expectations of employees from different cultures can lead to conflict and misunderstanding (Trefny, 2001).

It should be noted here that social competence of employees working in intercultural teams, especially if supported by involved managers, can significantly improve creative problem solving, methods used in searching for new solutions, and greater openness to new challenges from the perspective of diverse experiences.

Contemporary organizations must be more flexible, able to respond to increasingly complex and unpredictable changes in the environment, and recruit employees from different countries and cultures in order to develop a multi-faceted approach to their activities and to increase the speed of response on the basis of their employees' competences (Mockaitis, Zander, et al., 2018).

A growing number of researchers emphasise the dependence of the organization's competitiveness on its strategic resources, especially the intangible ones. Strategic resources include know-how, innovations, patents, brand, organizational culture, good name, and reputation. Customer satisfaction or employee morale are the resources that competitors are unable to copy or imitate (Gorondutse, Ali, et al., 2017). The same applies to employees and their social competence. Employees' potential and social competence can be used by an organization to build its competitive advantage through unique social relationships inside and outside its structures.

Nowadays, people who manage organizations must possess specialist knowledge in the field of human capital management in order to implement suitable solutions within human capital management strategies. Therefore, special attention should be paid to the systems of human resource management, as they ultimately lead to increasing the company's competitive advantage (Delery and Roumpi, 2017). It is necessary to develop employees' social competence, especially in intercultural work environment, in order to build positive relationships within teams and with customers, which can have a considerable impact on the company's long-term growth opportunities.

It should be noted here that "employee competencies are considered by literature as one factor that contributed most to the sustainable creation of organizational excellence (Vathanophas, 2007; Cummings and Worley, 2001). Thus, competent employees are needed in order to increase the business success (Grigoryev, 2006)".

Methodology

The techniques used in the qualitative study described in the paper were an individual in-depth interview and an in-depth focus group interview. The individual in-depth interview was partially structured and included only open questions. In order to conduct the study, the authors developed a research tool, i.e. a scenario of an individual in-depth interview. Respondents were recruited through social networks and snowball sampling, which was initiated in several independent points in order to avoid obtaining respondents from one social circle. The actual individual interviews were held between March and May 2019, and focus group interviews - in December the same year. One

interview lasted from 45 to 85 minutes. The study was conducted in Krakow in the buildings belonging to the Jesuit University Ignatianum. Before the interviewers started asking questions, all the respondents had been informed about the purpose, procedure and confidentiality of the study and the possibility of terminating it at any point. All the respondents agreed to have the interviews recorded on a voice recorder. During the interviews, the interviewers tried to create friendly atmosphere and not to impose any opinions or knowledge on the respondents, so that they could feel comfortable. The interviews were transcribed, coded, and categorised in order to analyse the respondents' answers in a qualitative manner. The quantitative analysis of the empirical material was also conducted.

58 Ukrainians participated in the individual interviews. The group of respondents consisted of 36 women and 22 men, aged between 17 and 50, with 31 being the average age. 42 respondents held university degrees, 13 were high school graduates, 1 began university education but did not complete it, 1 graduated from a vocational school, and 1 from a junior high school. The respondents worked in intercultural teams, i.e. teams in which employees represented at least two different cultures. Most of the respondents (38 persons) worked in international corporations, in teams of high national diversity. The positions held by the respondents included: project coordinator, human resource specialist, human resource manager, EU project specialist, development manager, technical director, and regional manager.

The focus group interviews were held in three groups consisting of 6 participants, and included questions regarding the impact of employees' social competence on their functioning in intercultural teams as well as various forms of support and assistance offered to immigrants and aimed at their development and improvement of social competence. All the respondents were Ukrainians who worked in multicultural environment. The average period of the respondents' professional activity in Poland was 3 years.

The authors assumed that social competence of the respondents employed in culturally diverse teams significantly affects their effective functioning in such work environment. Therefore, the aim of the study was to determine the level of the respondents' social competence (in-depth individual interviews) and to identify the impact of their social competence on their functioning in intercultural teams (focus group interviews).

Employees' Social Competence – The Results of The Study

The aim of the study was to determine the level of the following facets of social competence: motivation, assertiveness, self-presentation, stress management, conflict management, and emotional intelligence. The choice of these areas of social competence was dictated by the analysis of the subject literature, which revealed that they were the ones in which most deficits in employees' social competence appear (Lesińska and Grzymała-Kazłowska 2017; Kindler and Górny 2016; Fomina 2016).

The first facet of social competence examined in the study was motivation (the ability to use various incentives). The respondents were asked whether they liked taking up new challenges and whether it was easy for them to find motivation to face difficulties they encountered in life. The analysis of the results indicated that 49 respondents were highly motivated to take up new challenges and deal with difficulties. One of them said: "If I have a cool team next to me, then yes, if not, I think it over whether I should do the task or rather find the right people" (Respondent 16, male, aged 38). This indicates a link between motivation to act and the group of people with whom cooperation is to be undertaken. Many respondents (25 persons) stated that they were not afraid of new challenges and could cope with difficulties effectively, and here is an example of their statements: "I like challenges (...) I'm not afraid of changes and take them lightly" (Respondent 25, female, aged 29). Some respondents (9 persons) declared low levels of motivation to take up new challenges, listing both, internal factors, existing inside them, and – mostly – external factors, which demotivated them (bureaucracy, a lack of language skills, a stay in a foreign country).

The respondents were also asked about the ways in which one can increase motivation and whether they had ever tried to work on their motivation. 43 respondents listed various ways of improving motivation ("I observed people who were developing themselves" (Respondent 26, male, aged 28); "It is good to travel because then one learns wisdom, to read books, to observe the world" (Respondent 40, female, aged 35); "I think it can be developed, I believe there are methods and techniques helping to become more open to the world" (Respondent 43, woman, aged 27); "I think I have tried, because motivation, lifestyle is discipline" (Respondent 51, woman, aged 23); "It seems to me that the answer is complex, because people are certainly born with certain temperament, with an attitude towards life, and, on the other hand, I become aware of my shortcomings and can improve them (...) surely such reflection and work on my weaknesses is important (...) yes, I have definitely tried to make such attempts, I try to observe myself and observe my reactions, and I do my best not to make them mechanical" (Respondent 56, female, aged 25)). These sample statements demonstrate that the respondents were aware of the importance of motivation in their lives and knew how to improve it. However, there was also a group of respondents (15 people) who claimed that there were no ways in which motivation could be increased. This was most often combined with innate abilities ("Parents must bring up their children, teach them skills (...), later if you don't have these abilities, you have to try to meet challenges somehow" (Respondent 7, male, aged 21).

Another facet of social competence which was analysed in the study was assertiveness (the ability to exert influence without resorting to aggression). The vast majority of the respondents (43 persons) described themselves as assertive. Here are several examples of the respondents' statements: "I have to think about it myself, and if I am sure, I say what I think" (Respondent 43, woman, aged 27); "I used to let other people talk. That's why I felt angry and then I decided it's enough" (Respondent 26, male, aged 28). 15 respondents admitted they lacked assertiveness ("No, not always. To say what I think is not so easy") (Respondent 3, male, aged 34); "I sit quietly and rather do not say anything to anyone" (Respondent 50, female, aged 26).

Self-presentation (the ability to build a positive image) was another facet of social competence examined in the study. The respondents were asked to list the factors which contribute to effective self-presentation. 49 respondents were able to answer this question, while 9 of them admitted possessing no knowledge in this area. Those who enumerated factors important for effective self-presentation agreed that the most significant thing is to be yourself and to present yourself as you are ("Being yourself above all, not to lie, not to pretend") (Respondent 43, woman, 27 years old); "To present yourself well requires long and hard learning and work. The most important thing is to be yourself, so as not to exaggerate in any way, culture" (Respondent 22, female, aged 31); "Show just what kind of a person you are" (Respondent 26, male, age 28). Almost all the respondents (55) considered self-presentation important in social contact ("Yes, it is important for relationships with other people" (Respondent 3, male, aged 34); "Yes, very important, because the future depends on it (...) the first impression is important. If someone is sad, it's bad (...) because later people judge us this way" (Respondent 58, female, aged 24)).

In order to diagnose the ability to manage stress and conflict, the study analysed, among others, the ability to identify the causes of stress and conflict. Stress and conflict management skills are vital elements of social intelligence allowing people to deal with e.g. intercultural relationships, which can be a challenge.

The respondents did not find identifying the causes of stress and conflict difficult and all of them listed several causes, including their whole range typically encountered at work, at home, in the local community, as well as the ones connected with global problems. Here are several examples of the respondents' answers: "Anyone can have a bad day, some misunderstanding, little money" (Respondent 43, female, aged 27); "A lack of self-confidence, misunderstanding other people, or expecting too much from people" (Respondent 22, female, aged 31); "People, their expectations cause stress (...) When there is an internal conflict - meditation, communication with people, talking to them" (Respondent 58, female, aged 24); "I am always stressed, the language barrier" (Respondent 26, male, aged 28).

51 respondents, so a large group, claimed to be able to cope with stress ("I try to understand (...) I don't shout and know that tomorrow will be better" (Respondent 5, male, aged 22); "I want to be alone in such situations and think it over" (Respondent 50, female, aged 26); "I try to understand, I try to control myself (...) I breathe, I avoid conflict" (Respondent 22, female, aged 31). 7 respondents declared that they had a problem with coping with stress and conflict.

Another facet analysed in the study was emotional intelligence, i.e. a way of dealing with one's own and other people's emotions. Empathy (the ability to understand the point of view of another person) is one of the components of emotional intelligence. 43 respondents claimed that they can adequately react to other people's strong emotions. One of the respondents said: "Maybe the moment was bad. I don't take it personally, I just talk calmly, ask why (...) the emotions are there, but things calm down and I take it easy" (Respondent 22, female, aged 31). 15 respondents claimed that they could not adequately respond to other peoples' strong emotions. Many respondents admitted being empathetic, e.g. "I always try to put myself in another person's shoes to understand what the cause of this, this situation, this conflict, this stress may be; I don't know what it may be there, and, well, I try to understand, to get along, to talk, to advise" (Respondent 24, male, aged 31).

All the respondents participating in the focus group interviews admitted that they were aware of the role and significance of social competence and its impact on the effective functioning in the teams in which they worked. The respondents' statements revealed that social competence of employees working in intercultural teams affects interpersonal relationships (15 persons), effective communication (16 persons), effective cooperation (151 persons), the ability to look for constructive solutions (12 persons), and the ability to resolve difficult and conflict situations (15 persons). Most respondents mentioned the cultural context (15 persons), indicating that social competence facilitates establishing positive intercultural relations (14 persons), characterised by respect for and understanding of employees from other cultures. In the respondents' opinion, social competence also influences the speed of tasks execution in a team (12 persons), the quality of work (15 persons), openness to changes (12 persons), and creativity and innovation (11 persons).

The respondents admitted that they had deficits in social competence (12 persons), of which they were aware and which considerably limited their effective functioning in intercultural work environment. They also pointed to the need to actively look for ways in which they could improve their social competence (11 persons) and reported their willingness to participate in training courses aimed at developing it (15 persons).

All the respondents taking part in in-depth focus group interviews stressed the particular role played by the facets of social competence which had been analysed in individual in-depth interviews (motivation, assertiveness, self-presentation, stress management, conflict management, and emotional intelligence). The respondents added that their effective functioning in intercultural teams also depended on other competences, among which they mentioned communication (15 persons), change management (13 persons), influencing people (14 persons), time management (12 persons) and leadership (10 persons).

Discussion

The results of the individual in-depth interviews revealed that the respondents had the greatest problems with the following areas:

- a lack of assertiveness - 15 persons,
- a lack of ways to increase one's motivation - 15 persons,
- the inability to react to other people's strong emotions - 15 persons,
- a low level of motivation to undertake new challenges - 9 persons,
- a lack of knowledge about factors contributing to effective self-presentation - 9 persons,
- the inability to react appropriately to conflicts within a team - 9 persons,
- the inability to deal with stress and conflict situations - 7 persons,
- the inability to identify the causes of stress and conflict - 6 persons,

- a lack of understanding that self-presentation is an important element of social contacts - 3 persons.

In the course of the individual in-depth interviews the authors determined the level of the respondents' social competence, and the results obtained indicate that the vast majority of them (75%) use a set of social skills particularly important in working in intercultural environment.

However, the results of these interviews also reveal the respondents' deficits in the area of their social competence, which may significantly hinder their effective functioning in intercultural teams in which they worked. In the authors' opinion, these deficits may have a negative impact on the functioning of not only individuals but also entire teams operating in intercultural work environment.

The results of in-depth focus group interviews demonstrate that the respondents were aware of the role and importance of social competence and its influence on effective functioning in such teams. The respondents emphasised the positive impact of social competence on many aspects of work in intercultural teams, such as the speed of task execution and the quality of work or interpersonal relations.

The results of the study confirm the hypothesis put forward by the authors of the paper, which stated that the level of the respondents' social competence has an impact on their effective functioning in intercultural teams.

Conclusions

On the basis of subject literature and the study described in the paper, the authors have demonstrated the role and significance of social competence of employees working in intercultural teams and have shown the links between the level of their social competence and their effective functioning in such teams.

Summing up, social competence affects the effective functioning of employees in intercultural teams and the functioning of intercultural teams themselves. The positive outcomes of work done by culturally diverse teams whose members are characterised by a high level of social competence, include greater creativity, multi-faceted thinking in search of new solutions, the ability to react quickly, improved quality, the ability to learn and to share experiences, and increased communication efficiency. On the other hand, the low level of employees' social competence may adversely affect cooperation and interpersonal relationships within intercultural teams, and lead to slower team performance, ineffective communication and the inability to achieve common team goals.

The authors are aware that that fact that the interviews were carried out in a nationally homogeneous group (Ukrainians) is a limitation of the study, however, such an assumption was the aim of the project within which the study was conducted. The fact that it is the largest group of immigrants in Poland justified choosing the respondents of this nationality. During the further stages of the project, the same in-depth individual interviews and focus group interviews will be used to determine the level of social competence among immigrants of other nationalities who live in Poland and their impact on the effective functioning of members of intercultural teams.

According to the authors, improvement and development of employees' social competence is a must as far as working in culturally diverse environment is concerned. The level of employees' social competence also depends on their openness towards representatives of different cultures, their acknowledgment of diversity in the context of values, their motivation to work, their ability to share knowledge and experiences, their ability to motivate others to take up new challenges, and their effectiveness in conflict resolution, all of which lead to improved team efficiency, especially in case of intercultural teams.

Social Expectations in The Process of Creating the Offer of Cultural Institutions

Dorota Balcerzyk

PhD, Assistant Professor at the General Tadeusz Kościuszko Military University of the Land Forces in Wrocław
Email: dbalcerzyk@interia.pl

Abstract

The article underlines the changing role of cultural institutions in shaping the habits of participation in culture. An attempt was made to assess social expectations towards public organizations. The level and scope of involvement of external stakeholders in the service creation process were examined for this work. The range of the research is the result of the conclusion that the engagement of direct recipients of services is one of the critical conditions of efficiency of the surveyed organizations.

Keywords: Cultural Institutions, Services, Public Organizations, Participation in Culture

Introduction

Cultural institutions, as public organizations, have a unique role in society. The establishment and purpose of such organizations are based on widely recognized and disseminable values such as culture and national identity.

A society, which is a collection of people with a common culture (passed on to future generations), shared territory, and collective identity, is a specific structure of human relationships that is the center of human existence (Goodman, 2009). According to Giddens (2008, p. 45), society is nothing more than a system of dependencies in which individuals are linked to each other. Traditional social networks usually develop over time under the influence of customs and habits.

In the past, families, close relatives, neighbors satisfied most of the individual's needs. Today, many of the needs are met by people one does not know or has never met before and who are part of the organization. Modern industrial and post-industrial societies form organizations to achieve specific objectives and place them in specially created places or buildings (Giddens, 2008, p. 783). Nowadays, these organizations play a greater role than ever before, while the society is aware of this and has growing expectations of such systems.

In the ever-changing world of modern technology, cultural institutions are the backbone of tradition, culture, and attachment (Azis 2019, Nort 1990). Paradoxically, these - often overly bureaucratic - institutions are an unquestionable determinant of the culture of a given society and are still perceived as carriers of the so-called higher (elite) culture that is generally approved in opposition to mass culture (Kłoskowska, 2007, 2005). They have been assigned an important role in numerous sectors of institutions belonging to the creative economy, which is currently becoming a powerful force of change in the modern world (CER, 2013; KEA, 2006; Throsby, 2008). The primary task of cultural institutions is to fulfil their mission of creating, preserving and disseminating cultural goods and services, rather than maximising the financial payoff or value generated from tchem (Wnuczak, Osiichuk 2019, Throsby 2003). Cultural institutions must go beyond their existing functions and open to changes in the environment without losing their identity; hence they should continue to carry out their activities to satisfy social needs without being profit-driven.

The work aims to assess the level and scope of external stakeholders' participation in the service creation process.

Research Methodology

The content of the article is a part of broader research on the activities of cultural institutions in the field of the offer for children carried out in 2014/2015. The research used a diagnostic survey complemented by desk research, upon which basis Wroclaw public institutions offering services to children were selected in the first stage. The survey was carried out through a questionnaire addressed to the management of previously selected cultural institutions located in the city of Wrocław. The cultural and scientific institutions with an offer addressed to early school-age children were selected based on the data obtained from the Public Information Bulletin of the Municipal Office of Wrocław (RIK, 2014) and their websites. The research covered four Youth Culture Houses: Fabryczna Youth Culture Center, Krzyki Youth Culture Center, Śródmieście Youth Culture Center, and Nicolaus Copernicus Youth Culture Center (another name: Zespół Centrum Edukacji Kulturalnej Dzieci i Młodzieży) (EDU, 2014); theaters: Puppet Theater and Polish Theater, and music scenes: Capitol Musical Theatre, Wrocław Opera House, Witold Lutosławski Philharmonic (since 2014: National Forum of Music); museums: Wroclaw City Museum, National Museum in Wroclaw (and its two branches), Museum of Post and Telecommunication, and cinemas: Multikino (two branches), Helios, CinemaCity and New Horizons Cinema. Also, the Wrocław-West Cultural Center, Agora Cultural Center, and Centennial Hall Cognitive Center were taken into consideration. As much as 90% of surveys, which is a very high percentage, were filled in. That may partly be explained by the fact that the surveys were carried out in person, and the completion of the questionnaires was monitored. In total, the survey covered 20 cultural institutions located in the city of Wrocław.

The surveyed institutions were categorized into five groups depending on the specificity of the activity. The first group included Youth Culture Houses, the second - theatres and music scenes, the third – museums, and the fourth one - cinemas. The most diverse group in terms of the nature of its activities was called others and consisted of cultural centers and cognition centers. Such a division made it possible to analyze the results of the research taking the specificity of the examined institutions into account.

Characteristics of The Institutions Under Examination

The research covered mainly public institutions established by state and local government bodies to perform specific social tasks. The open character of the surveyed institutions is an important attribute that makes them entities undertaking activities for the common good (Kozuch, 2011,p. 49).

In addition to the identifying name, the essential characteristics of the studied institutions include the year of establishment, location, and distance from the others. As shown in Figure 1, the breakthrough years in the history of Polish culture were the criterion for their division: 1945 - the end of the Second World War and 1991 - the enactment and introduction of the Act of 25 October 1991 on the organization and conduct of cultural activity (Journal of Laws 1991 No. 114 item 493), and then the Regulation of the Minister of Culture and Art of 17 February 1992 on the manner of keeping the register of cultural institutions (Journal of Laws 1992 No. 20 item 80). Given the year in which the institution was established, it can be noted that theatres and music scenes, as well as some museums, are the oldest. They were often created in the 19th century. The Wrocław Opera was founded in 1874, and most of the organizations were set up after World War II. The period from 1945 to 1990 was beneficial not only for the creation of Youth Culture Houses but also for the cultural institutions of great stages: the Polish Theatre and the Wrocław Philharmonic.

Contemporaneity, after the political transformation and the enactment of legal acts regulating the activity and registration of cultural institutions that are still in force today: The Act of 25 October 1991 on the organization and conduct of cultural activities and the Regulation of the Minister of Culture and Art of 17 February 1992 on the manner of keeping the register of cultural institutions, abounds mainly in the creation of Wrocław cinemas and cultural centers. Contemporary times also include the year 2000, when the City Museum in Wrocław was established, and the year 2012, when the Cognitive Center at the Centennial Hall was set up.

Figure 1: The number of institutions established in selected periods according to their category
Source: Own study

The studied cultural institutions, such as theaters, music scenes, and museums, are located mainly in the central districts of the city. That is because these are the areas of the Old Town, but also Śródmieście and Krzyki districts.

There is no public cultural institution of this type in the Psie Pola district, which covers an area outside the central part of the city. There is the AGORA Culture Center, which is a commercial institution conducting cultural and entertainment activities not directly using public funds. Similarly, not every district of Wrocław has a Youth Culture Center on its territory.

The situation is different for the location of cinemas - there is at least one in each district. However, it should be noted that they are private institutions (the so-called free market). Hence, a recipient of public cultural institutions must make an effort to move to the city central areas of the city.

Monitoring of Demand for The Offer Conducted by Cultural Institutions

Cultural institutions, which perform social functions, operate thanks to society and carry out specific tasks for it. Thus, it seems inevitable to act not only to enhance the service offer but also improve its quality. One of the ways to increase the quality of service is to target the offer to the recipient. The problems in the conducted research included learning about the actions taken by an institute of culture and science before planning an offer addressed to children at early-school age. This problem was divided into two issues: earlier monitoring of the demand for leisure time facilities for early school-age children and getting to know the factors that the examined cultural institutions consider when designing such an offer.

The results of the survey indicate that 80% of the examined cultural institutions monitor the demand of children at early school-age for performances, events, and other leisure time activities. To this end, they undertake various measures, including mainly: surveys and interviews with parents and teachers, as well as meetings with school principals. Also, the respondents follow the content of the core curriculum, conduct research on the demand for a specific offer (e.g., number of bookings, attendance at classes, and the like). Additionally, to obtain information about the offer desired by early school-age children, the respondents organize family workshops at weekends and festivals. Besides, during the classes, children or their caretakers are interviewed by animators or institution staff. The surveyed

also follow and are interested in Polish and foreign market novelties addressed to children, such as books, poetry, films, CDs with music, various forms of entertainment, which they can incorporate into their activities.

Gathering information on the services provided to early school-age children, and its analysis is undertaken by the surveyed cultural institutions in various forms. The fact that most respondents undertake such activities should be assessed positively. On the other hand, one fifth of the examined cultural institutions does not monitor the demand of early school-age children for performances, events, and other activities filling their free time.

When analyzing respondents' answers concerning the issue of monitoring the demand of early school-age children for the offer of cultural institutions, the account was taken of the category of examined entities (results are presented in Figure 2).

The data obtained indicate that all Youth Culture Centers and cinemas monitor the demand of children at early school age for an offer that can attractively fill their free time. The vast majority of 80% of Wrocław's museums conducts such observation. The institutions classified in the other category in a large number (75%) also research the same scope. Half of the institutions in the category of theatres and music scenes see the need to monitor the demand of early school-age children for their offer.

Figure 2: Monitoring the demand of early school-age children for performances, events and other activities and the categories of institutions under investigation

Source: Own study

The research assumed that in the process of the preparation of the offer addressed to early school-age children; other factors are probably considered in addition to the assumed goals. Respondents were prepared a cafeteria of probable rationale (factors) which they could refer to when planning an offer and then asked to assign values to them, hierarchically in numbers from one and above, with one being the most important. The weighted scale was applied to interpret the results, and individual places were given ranks from 1 to 6. Table 1 displays the results.

Interests are the most substantial factor that the respondents recognize when preparing an offer for early school-age children. As the results of the ranking indicate, the respondents declared that they contemplate the proposals of schools when designing an offer for children in the second place, while the proposals of their employees in third place. The parents' proposals occupy fourth place. Financing

takes the penultimate place in the ranking of the importance of rationale regarded in the process of preparing an offer for early school-age children. The least essential reason turned out to be following the offer of other cultural institutions.

Table 1: Rationale considered by cultural and scientific institutions when planning an offer addressed to early school-age children

Ranking Rationale	**1**	**2**	**3**	**4**	**5**	**6**	Calculation of weight	Ranking

Workers' proposals	2	4	5	1	1	7	64	**III**
Proposals of schools	6	3	2	4	0	5	76	**II**

Source: Own study

The outcomes of the research show that the examined cultural institutions contemplate the needs and interests of their audiences when planning an offer addressed to early school-age children and consult with their closest circle of experts. They consider schools and employees whom they contact most frequently to be a reliable source of information. At the same time, research shows a certain regularity of children's participation in culture. Children take advantage of the cultural institutions' offer mostly among the classmates during school trips and outings rather than with their parents or grandparents. Undoubtedly, this is a picture of a social phenomenon in which parents ruthlessly transfer the fulfillment of their roles and tasks towards children to organizations.

Parents Towards Cultural Institutions in Regard of Preparing an Offer Addressed to Their Children

It is well-known that society creates organizations to achieve specific objectives and tasks. The reason behind their establishment is, among other things, to support a society member in the performance of certain functions. Today's parents are a commercial generation, able to search for information but also to take advantage of ubiquitous services. Therefore, it can be presumed that in recent years the level of parents' expectations towards institutions regarding the organization of the offer for early school-age children has significantly increased.

The research carried out has confirmed the assumption. As shown in Figure 3, in the opinion of most respondents - directors of the examined institutions, the level of parents' expectations towards cultural institutions regarding the service offer addressed to children at the early school-age has risen to a greater or lesser extent. Among them, 50% of the surveyed declare this level has somewhat increased.

On the other hand, 30% of them are more decisive in their opinions, as they believe that the level of parents' expectations towards them has increased considerably.

Figure 3: Respondents' opinion on the level of parents' expectations towards cultural institutions regarding the offer for early school-age children

Source: Own study

Only 10% of the respondents take the view that parents have not changed their attitude towards their institution in terms of expectations concerning the offer addressed to children at early school-age. On the other hand, 5% of them even think that the level of parents' expectations in this area has rather decreased, and another 5% - that it has slumped significantly.

Figure 4 presents the dependence of respondents' answers on the level of parents' expectations towards cultural institutions as regards the offer for children at early school-age depending on the category of the examined cultural institutions.

Figure 4: The level of parents' expectations towards cultural institutions regarding the organization of the offer addressed to early school-age children depending on the category of the examined cultural institutions.

Source: Own study

There are apparent differences in the levels of assessment, depending on the categories of the surveyed entities. Nevertheless, the opinions are strongly oriented towards increasing the level of parents' expectations towards them. The respondents from museums, theaters, and institutions classified in other categories, i.e., the Centennial Hall, Agora Culture Center, and Wrocław-West Culture Center, believe that the level of expectations towards their organizations has increased considerably.

Only a few respondents in the category of cinemas and Youth Culture Houses declare that the level of parents' expectations towards their institutions regarding the organization of leisure time activities for early school-age children has not changed. There are also exceptional opinions among the directors of Youth Culture Centers, who believe that the level of parents' expectations has risen.

The surveys carried out in cultural institutions located in the city of Wrocław confirm that their perception by society has changed. In comparison to previous years, the examined entities saw a much higher level of parents' expectations towards them regarding the organization of the offer addressed to early school-age children. Such findings can be interpreted, first, as shifting the parents' responsibility for introducing their children to culture to the institutions and, secondly, as an increase in the level of trust that parents place in cultural institutions in terms of reliability and certainty of the message of culture. It might be that it is a concern for the quality, form, and safety of the message of culture and national heritage as well as participation in the culture of the youngest generation.

Conclusion

The importance of cultural institutions as creators of non-monetary value contributing significantly to people-centered sustainable development is increasingly recognized (CER, 2013). Governed by the analysis of the KEA research report, cultural institutions can be attributed to the non-industrial sector, which includes entities that produce non-reproducible, non-returnable goods and services that can be "consumed" on site. Such an approach determines the specific nature of the examined institutions functioning next to the industrial sector responsible for the manufacture of cultural products aimed at mass reproduction or mass distribution and export (KEA, 2006). Cultural institutions belong to public organizations. Their major task is to provide public services that are generally accessible. The public character of these organizations is manifested in the offering of goods and services, their financing and, taking responsibility to the public for their quality (Kożuch B., 2011; Kożuch B., Kożuch A., 2017). Cultural institutions as public organizations are open systems that interact with their environment. Not only do they exist in a given environment but thanks to it they also function in it (Urbanowska - Sojka E., Banaszyk P., Witczak H., 2007). Therefore, openness to the expectations of their surroundings should be one of the most crucial attributes of cultural institutions.

The surveys conducted among cultural institutions located in the city of Wrocław allow for the presentation of a positive image of their activities undertaken for openness. The role of the institutions under study in monitoring the demand for children's offers is particularly noticeable. It should be stressed that in social awareness, most of the examined cultural institutions function as ones directing their offer to adults. Nevertheless, the social role entrusted to cultural institutions is treated very seriously and is fulfilled reliably. The depth of activities aimed at meeting social expectations may be evidenced by the results of the research that was supposed to specify the rationale and factors analyzed by the institutions when preparing the service offer. They show that it is the recipient's interests that are most substantial in designing the future offer. That means that the institutions have made an effort to contact the recipient - participant of culture directly. It is puzzling that the surveyed institutions operating on the market next to the commercial sector consider the offer of other cultural institutions to a minimal extent.

Unfortunately, the analysis of the results allows us to notice the phenomenon of transferring to the institutions the role once attributed to the family: introducing into the culture, participation in culture, or cultivating heritage. The research indicates that children participate in culture brought by their guardians, and the initiators of the use of cultural goods are teachers - not parents. The results show

that the representatives of the examined cultural institutions take into account the school's proposals before those of the parents when planning the offer addressed to the children. Moreover, the research analysis indicates that in recent years, parents have significantly increased their expectations towards cultural institutions in terms of preparing an offer addressed to children. Recommendations are proposed to consider more activities undertaken by other institutions operating in the environment of the surveyed. The information would make it possible to assess, for example, where the proposal of a given institution is placed, or at what level, and others. Such information seems to be useful, especially when one intends to develop the quality of services and meet customer expectations.
The conducted research implies a conviction about a significant role of social expectations in the activity of cultural institutions. The more so because these expectations are continually growing and cultural institutions are not only obliged but should be sensitive to the changing needs of society.

Abstract

The purpose of this publication is to identify the factors affecting the willingness of high school students to start their own business in the future. In the theoretical part, the authors synthetically present the essence of entrepreneurship and its manifestations among high school students against the background of the educational process. In the second part of the article, based on the results of their own surveys conducted among students of selected Polish high schools, they verify the impact of ten explained variables determined by the students' self-assessment made through the prism of their entrepreneurial attitudes and experience in the field of entrepreneurial activity on the explained variable determining their propensity to launch their own entrepreneurship. The analyses carried out as part of the article led to the conclusions that students who perceive themselves as entrepreneurs are more likely to consider setting up their own business. Identifying (as part of self-assessment) two entrepreneurial qualities, *i.e.*, openness and willingness to undertake risks, by the surveyed students plays a special role in this respect. Moreover, the real factor in which students declare that they will start their own business in the future is the growing experience obtained as a result of the practical use of entrepreneurial features they perceive in themselves.

Keywords: Entrepreneurship; Development of Entrepreneurial Attitudes; Innovations; Education; High School Students.

Introduction

Today, there is a widespread belief that entrepreneurship is one of the most important factors influencing the processes of socio-economic development, including in particular the increase in the competitiveness of enterprises and entire economies. The belief is based on many years of observation of economic reality as well as on the results of numerous empirical studies, although there is a clear shortage of research on entrepreneurship in relation to youth (Geldhof et al, 2014). Due to its significance, entrepreneurship is a very desirable attitude and by all entities, regardless of the sphere of functioning, which is of great interest to scientists and practitioners. Sources of entrepreneurial attitudes are sought at the early school stage, when the youngest representatives of society learn creativity and initiative from their loved ones at home and at school. The key factor in the development of entrepreneurial attitude is the appropriate education process implemented at all stages of education. However, it becomes especially significance at the level of secondary and higher education, when pupils and students shape their entrepreneurial attitudes by actively participating in socio-economic life (Marona and Głuszak, 2014). However, despite highly developed education, many countries have struggled and are still struggling with high unemployment rates among high school and college graduates (Setiawan, 2014). Schools, in addition to transferring knowledge, should therefore prepare future graduates to effectively take on the challenges posed by the modern labour market, providing

them with the right competences, including primarily practical skills and proactive attitudes. Entrepreneurship as a school subject has gained significantly in popularity over the last decades - in Western European countries in the last decades of the last century, and in Poland in the first two of the current century (Rosendahl-Huber et al, 2012).

This article focuses on the essence of entrepreneurship and its role in starting own business activity, as well as on shaping entrepreneurial attitudes among young people in the process of school education. The main research objective of the article is to identify factors influencing the tendency of high school students to start their own business in the future. Its implementation, based on the results of a survey conducted among students of selected high schools, is to answer the question whether the willingness of students to set up their own business in the future is impacted by the fact of perceiving oneself as an entrepreneurial person, attributing individual characteristics of entrepreneurial attitudes and by the fact that they have already had the opportunity to use entrepreneurial attributes assigned to them in specific actions?

Theoretical Background

The Concept and Essence of Entrepreneurship

Entrepreneurship is a complex, multidisciplinary and multi-faceted concept, which is why it is ambiguously defined in the subject literature (Daszkiewicz, 2013). This article adopts the concept of entrepreneurship in a broad sense, according to which it is defined as a process of discovering, assessing, developing and expanding opportunities that allow to create a specific value, thanks to an innovative approach to using opportunities and resources (Bruyat and Julien, 2001; Glabiszewski et al, 2020). It should be added, however, that according to the basic theoretical assumptions, entrepreneurship is most often treated in two dimensions, *i.e.,* as a special type of process consisting in creating something new and as a set of selected features characteristic of an entrepreneurial attitude (Bruyat and Julien, 2001). This means that the implementation of this particular type of process is not possible without the use of these selected features, and in turn these features have no reason or chance to verify their existence if they are not used in a specific entrepreneurial process. Only together, while co-creating an integrated construct, do they determine the essence of entrepreneurship.

P. Davidsson (2003), proposed a three-dimensional approach, in which he explains the concept of entrepreneurship by referring to three separate categories: results, processes, and skills. Directly to the first of the cited categories, *i.e.,* results, refers, for example, F. Knight (2012), who presents the concept of entrepreneurship as a profit that is obtained in exchange for acting in conditions of uncertainty and risk taking. S. Schane and S. Venkataraman (2000) refer directly to the processes in their definition, for which entrepreneurship is a process during which the newly acquired knowledge is transformed into a new product, or D.F. Kuratko (2008), who treats entrepreneurship as a dynamic process that combines vision, implementing changes and creating. Certainly, the procedural approach to entrepreneurship is most often found in the subject literature. In turn, J.A. Schumpeter refers to the category of entrepreneurial skills in his definition, according to which entrepreneurship is a trait attributed to an entrepreneurial person who is a natural person and who uses market opportunities through technical and/or innovative organizations/activities (Eroğlu and Piçak, 2011).

In addition to the skills acquired, the entrepreneur should also have specific characteristics, including personality traits, that are not easy to shape. P. Davidsson and B. Honig (2003) claim that regardless of the way schools teach and regardless of the degree to which the topic of entrepreneurship in the curriculum is implemented, the issues of translating this topic into the real zone, *i.e.,* the economy, can be achieved only to a basic degree. Universities or schools aim at teaching their students mainly by passing on theoretical knowledge, at most supported by practical examples. And entrepreneurship - in accordance with the above-mentioned definitions - is not learning the rules of conduct, but actual activity assuming an innovative approach to the surrounding world based on specific competences, especially such as readiness to take risks, creativity in the search for and improvement of ideas, openness to perception in surrounded by opportunities and needs as well as activity and commitment to seizing the opportunities that arise (Glabiszewski et al, 2018; Pypłacz and Liczmańska-Kopcewicz,

2018). An entrepreneur can see challenges and take action to achieve his ambitious goals, regardless of the resources at his disposal (Amolo and Migiro, 2014). He is optimistic about the surrounding reality, in which he does not look for difficulties and justification of his passivity, but rather opportunities and possibilities of using them. He pursues his goals with commitment, perseverance and passion. He works dynamically, is constantly striving to be better and is not afraid of competition (Amolo and Migiro, 2014).

Signs of Entrepreneurship Among Young People

In accordance with the Recommendation of the European Parliament and of the Council of the European Union from 18 December 2006 on key competences for lifelong learning (2006/962/WE), eight key competences were identified that combine the knowledge, skills and attitudes considered necessary for the needs self-realization and personal development, active citizenship, social integration and employment. Entrepreneurship was recognized as one of these key competences in the education system. High school students, thanks to the support of educational, sporting, cultural, and other facilities, can take advantage of many additional classes organized by teachers and cooperating entities to develop their practical skills and entrepreneurial attitudes. Significant opportunities for students can be provided, for example, by participating in scientific clubs, ventures, events, charity campaigns, computer games imitating economic reality, special lectures with motivating people, which encourage young people to look for their own path on various levels. Schools also place emphasis on competition by encouraging students to take part in numerous competitions, contests and sports events. By organizing various additional extracurricular activities schools aim at the following (Sołek-Borowska and Laskowska-Chudy, 2017):

- developing the traits and skills of students that form the basis for undertaking entrepreneurial activities;
- raising awareness of the concept of self-employment and its values, and entrepreneurship as an opportunity for the development of one's professional career;
- providing business skills that are necessary to run and develop one’s own business and deal with various difficulties resulting from running a business activity.

The period of education is the time when high school students take the first forms of employment, though undoubtedly university students do it more often. Looking for an entry-level job in order to earn their first money and gain their first experience, they are already manifest their entrepreneurial attitudes and, on the other hand, develop them by performing various real tasks as part of their work. An entrepreneurial attitude is also manifested by managing one’s own budget, saving money, making even small investments. The conscious and deliberate use of specialist clinics or career offices, which help identify strengths and plan a career path, should also be considered an entrepreneurial attitude. An extremely important manifestation of entrepreneurial attitude, *de facto* arising from the essence of entrepreneurship, is building a network of relationships that can pay off in the future, and this is not just about the closest group, the school community, but also about outsiders - for instance, through participation in various events organized outside the school walls.

At the stage of secondary school education, attention is primarily focused on shaping entrepreneurial attitudes in non-business areas, but the main application of entrepreneurship is starting your own business (Geldhof et al, 2014). This is also indicated by selected definitions of entrepreneurship. For example, for G. Onuoh (2007) entrepreneurship means the practice of establishing new organizations, especially new companies, or revitalizing mature organizations in response to identified opportunities. Therefore, the educational process in the field of entrepreneurship should be focused on building business competences, or at least anticipate their significant elements. From this perspective, it seems desirable to study the attitudes of pupils and students to setting up their own business and their approach to the labour market at various stages of education. This diagnosis is even more justified because the results of other studies indicate that the attitudes and interests of young people shape their future plans for their own entrepreneurial future (Geldhof et al, 2014). It is also so due to the fact that in Poland there is still a belief that starting your own business is not the best way to success and career, especially for graduates (Safin, 2014). It is true that the position of the entrepreneur enjoys a good reputation in

society, but this applies to big entrepreneurs who achieve spectacular market successes. People undertaking activities on a smaller scale (they constitute 90% of all entrepreneurs) are perceived similarly to people without a profession, which is not a convincing incentive to start their own business at the initial stage of their professional career (Safin, 2014). This is confirmed by the results of studies according to which only 11-13% of graduates of Polish universities are interested in starting their own business after graduation (Sołek-Borowska and Laskowska-Chudy, 2017). It should therefore be assumed that not only teaching entrepreneurship but also cultural aspects are an important incentive to invest in your own business (Eroğlu and Piçak, 2011), This indicates that Polish people are not willing to take risks, and the status of a novice entrepreneur is even depreciated in Polish society.

Research Objective, Methodology and Data

The study, the results of which are presented later in the article, was carried out in 2018-2019, using the method of auditorium survey. It was attended by 290 first and second grade students aged 16 to 18 of selected Polish secondary schools in the *kujawsko-pomorskie* province (159 students in 2018 and 140 students in 2019) participating in a scientific and didactic project of the National Centre for Research and Development (NCBiR) entitled 'Entrepreneurship and communication in the process of creative and innovative problem solving', no. POWR.03.01.00-00-C031/16. This project was implemented by the Nicolaus Copernicus University in Toruń under the Operational Program Knowledge Education Development implemented by the NCBiR, and co-financed by the European Union.

The characteristics of the persons participating in the study are presented in Table 1. The sample selection in the study was non-random. Schools participating in the project were identified by Business Support Center Sp. z o.o., a unit representing the City Hall in Toruń, whose task is to support entrepreneurship and economic activity in the region.

Table 1: Characteristics of people participating in the study (n = 290)

Criterion	Population	Percentage (%)
Respondents by gender		
Women	194	66
Men	96	33
Place of residence		
city over 100,000 residents	134	46
city between 25,000 and 100,000 residents	23	8
city up to 25,000 residents	20	7
village	113	39

Source: own research.

The study was the basic source of data necessary to achieve the main empirical goal of the article, which was to identify the factors affecting the tendency of high school students to start their own business in the future. To achieve the main research objective, the author set three specific goals referring to the high school students questioned:

1. assessment of the impact of perceiving oneself as an entrepreneurial person on their propensity to start their own business in the future;

2. assessment of the impact of attributing individual characteristics specific to entrepreneurial attitudes on their propensity to start their own businesses in the future;
3. assessment of the impact of using self-assigned entrepreneurial features in specific activities on their propensity to start their own businesses in the future.

In order to achieve the specific goals, and thus the main research objective of the article, the author formulated and empirically verified the following three research hypotheses regarding high school students:

H1. Perceiving oneself as an entrepreneurial person means that students consider the possibility of starting their own business to a greater extent;
H2. Attributing oneself individual characteristics of entrepreneurial attitudes means that students consider the possibility of starting their own business to a greater extent;
H3. The use of self-perceived entrepreneurial traits in specific activities means that students consider the possibility of starting their own business to a greater extent.

The hypotheses formulated above are the result of the considerations on the conditions of developing entrepreneurship among secondary school students and the impact of the effects of the educational process on their propensity to start their own business in the future. The desire to verify certain views expressed in entrepreneurship theory in relation to secondary school youth prompted the authors to take up the research problem expressed in the hypotheses assumed above. In order to verify them, econometric analyses of the obtained test results were carried out.

The ordered logit model was used, whose specification is an extension of the binary model specification to more threshold. The model is described by the following equation:

$$y^* = x'\beta + u$$

where y^* is the exact but unobserved dependent variable, x' is the vector of independent variables, u is the error term and β is the vector of regression coefficients, which will be to estimated. To estimate the model, the maximum likelihood estimation method and the STATA.16 software were used.

The subject of the analysis were 11 variables - 1 dependent and 10 explanatory ones (cf. Amolo and Migiro, 2014). The explanatory variable (y1) was the possibility of starting your own company assumed by the students questioned. In order to determine the value of this variable, high school students were asked the answer to the question whether they consider the possibility of starting their own business, giving them five choices, namely: (1) definitely not, (2) rather not, (3) it is difficult to say, (4) rather yes, (5) definitely yes.

The first dependent variable (x1) was the self-assessment made by students about perceiving themselves as an entrepreneurial person. To determine the value of this variable, students were asked to answer the question whether they consider themselves an entrepreneur, and they were given the following three choices: (1) no, (2) not yet, but I am learning how to become such a person, (3) yes. The next eight dependent variables (x2, x3 ... x9) also referred to self-assessment made by students, but in this case they concerned the possession of specific characteristics of an entrepreneurial person. In order to determine the value of these variables, students were asked to answer the question about which of the entrepreneurial qualities listed above characterize them, giving the option to mark either (0) 'no', or (1) 'yes'.

The tenth and the last dependent variable (x10) was the declaration of use of entrepreneurial qualities in the specific action which were selected by students and were declared in the earlier responses. In this case, students were asked whether they had already had the opportunity to use their qualities that testify to their entrepreneurship in some activities and one of the following four responses was expected: (1) no, (2) yes, once (3) yes, sometimes, (4) yes, many times. Table 2 presents the description and scales of all variables of the model.

Table 2: Description of variables

Variables	Description	Scales
EXPLANATORY VARIABLES		
x1	Perceiving yourself as an entrepreneurial person	Ordinal (1, 2, 3)
x2	Possession of the quality of openness	Dichotomous
x3	Possession of the quality of engagement	Dichotomous
x4	Possession of the quality of creativity	Dichotomous
x5	Possession of the quality of being active	Dichotomous
x6	Possession of the ability to solve problems	Dichotomous
x7	Possession of faith in your own abilities	Dichotomous
x8	Possession of risk propensity	Dichotomous
x9	Possession of the quality of showing initiative	Dichotomous
x10	Utilizing the qualities possessed that prove entrepreneurship	Dichotomous
EXPLAINED VARIABLE		
y	Declared possibility of starting your own company in the future	Ordinal (1, 2, 3, 4, 5)

Results and Discussion

In the first step of the survey conducted among high school students, knowledge of the concept of entrepreneurship was verified. To this end, they were asked to mark, according to their knowledge, one of the three answers. The answers obtained are presented in Figure 1.

Figure 1: Knowledge of the concept of entrepreneurship (% of responses)
Source: own research.

According to the declaration, basically all students know what the concept of entrepreneurship means, although only half of them answered in the affirmative. Common knowledge of the concept is primarily due to the fact that the subject called entrepreneurship was introduced to the Polish secondary school curriculum as a mandatory one.
In view of the above optimistic result, it seems interesting for students to specifically understand the analysed concept. The survey questionnaire provided for a question in which the respondents were to define what they think entrepreneurship is, indicating one of three available options. The percentage distribution of answers obtained is presented in Figure 2.

Figure 2: Understanding the concept of entrepreneurship (% of responses)
Source: own research.

According to the presented results, the vast majority, as much as 81% of respondents, perceive entrepreneurship in two dimensions, *i.e.,* as a process of creating something new and a set of features dedicated to this process, which is in line with the basic assumptions of the theory of entrepreneurship (Bruyat and Julien, 2001). This means that students correctly interpret the fundamental issue taken up in the study.

In the further part of the study, the quantities that were the basis for determining the explained variable (y) and the explained variables (x1, x2 ... x10) were identified, which are the subject of further analyses referring directly to the objectives of the article and the hypotheses adopted in it.

In order to know the factors that determine significantly the possibility of a declaration establishing their own firm (s), using the maximum likelihood method and the estimated ordered logit model. Model estimation results are presented in Table 3.

The conducted plausibility test (LR chi2 (10) = 56.58; Prob> chi2, 0.0000) indicates the significance of the whole model, which gives grounds for further interpretation of the results obtained. McFadden's pseudo-R2 is a measure of the quality of matching logit models to data. It is 0.063.

Table 3: Ordered logistic regression and odds ratio

Variables	Coefficients	Std. Err.	Z	P>|z|	95% conf. Interval		Odds. Ratio

** p-Value <=0.1. ** p-Value <=0.05. *** p-Value <= 0.01.*
Source: own research.

As can be observed, in this model parameter estimates take both positive and negative signs. In other words, the impact of the explanatory variables included in the model on the dependent variable causes, on the one hand, an increase, and on the other hand, a decrease in the chances of starting your own business. The variables that turned out to be statistically significant are x1, x2, x8 and x10.

Interpretation of the obtained model can be performed on the basis of odds ratios (see Table 1, column Odds. Ratio). Bearing in mind the assumption of *ceteris paribus*, *i.e.,* other variables of the model unchanged, the following information was obtained:

- considering yourself an entrepreneurial person increases the odds ratio (chance) of declaring establishing your own business in the future by 58% on average,
- having an openness quality increases the odds ratio (chance) of declaring establishing a business in the future by an average of 71%,
- having the propensity to take risks increases the odds ratio (chance) of declaring establishing a business in the future by an average of 49%,
- earlier use of possessed qualities in the activity, indicating entrepreneurship, increases the odds ratio (chance) of declaring establishing a business in the future by an average of 73%.

Interpreting the results obtained, it should be concluded that the more surveyed students consider themselves entrepreneurial (passing from answer (1) 'no' to answer (3) 'yes'), the more they are inclined to start their own business in the future. Therefore, there are no grounds for rejecting the H1 hypothesis, according to which perceiving themselves as an entrepreneurial person causes that students consider the possibility of starting their own business to a greater extent. Therefore, it is worth developing a belief among entrepreneurs about their entrepreneurship, as it turns out that this may result in the future in an increase in the number of started enterprises, which is a desirable phenomenon both from the point of view of the individual, *i.e.*, the entrepreneur, and the entire economy.

In the further part of the analyses, the impact of the students assigning themselves to eight successive distinctive qualities characteristic of entrepreneurial attitudes on their propensity to start their own business in the future was diagnosed. Only two variables turned out to be statistically significant, therefore it should be stated that this impact was confirmed only in relation to the students' feeling of openness and willingness to take risks, which at the same time means that no such effect was found in the case of the remaining six entrepreneurial features. Thus, the H2 hypothesis was falsified because there are grounds to reject it. The cited results suggest that in order to increase interest among young people in starting their own business, it is necessary to focus primarily on developing their willingness to take business risks and openness to the surrounding reality in order to more fully perceive various opportunities and needs in education.

The obtained results also made it possible to refer to the last H3 hypothesis. It turns out that the more often students had the opportunity to use their entrepreneurial features in action, the more they declared their willingness to start their own business in the future. Therefore, there are no grounds for rejecting the H3 hypothesis, according to which the use of entrepreneurial qualities perceived in specific activities makes students consider the possibility of starting their own business to a greater extent. The above conclusion shows another recommendation for the education of young people in the field of entrepreneurship. In the didactic process, entrepreneurial qualities should also be shaped, and perhaps primarily through their initiation and use in real actions of a strictly practical nature. In such circumstances, these qualities are simultaneously used and developed. Then students find that they possess these qualities, have a sense of strengthening them and gain confidence in themselves and their abilities, which motivates them to undertake more ambitious ventures, including business ones.

Conclusion

According to the theoretical assumptions, an entrepreneurial person is able to achieve more. Such a person sets ambitious goals and, to achieve them, undertakes unconventional actions with full commitment, making maximum use of its skills and predispositions, which he/she tries to develop to increase effectiveness in action.

As a consequence, the entrepreneurial attitude has become widely accepted and desired. Hence, it should be shaped and developed at every stage of life from an early age, both at home, at school and in other institutions organizing social activity. An extremely important determinant of the development of entrepreneurial attitudes is a properly planned and implemented at all stages of education educational process that should be subordinated to specific goals. One of them is undoubtedly the development in society of the tendency to undertake economic activity, which is a particularly expected manifestation of the entrepreneurship of the individual.

The empirical research results obtained convince the authors of the legitimacy of shaping entrepreneurial attitudes among young people from the perspective of their orientation towards starting and running their own business. It turns out that the perception of high school students of themselves as entrepreneurial persons means that they consider the possibility of starting their own business to a greater extent, and therefore it is worth developing a sense of entrepreneurship among them. Two characteristics play a special role in this respect, namely openness and willingness to take risks. It is the attribution of these specific entrepreneurial qualities that increases youth interest in starting a company, and therefore it is the shaping of these features that should be focused to the greatest extent, also in the education process. In addition, the real factor in declaring students to take up their own business in the future is the growing experience obtained as a result of practical use of entrepreneurial qualities perceived in specific activities. An obvious conclusion emerges and at the same time a recommendation that entrepreneurial competences should be shaped not only in the teaching process, but also, and perhaps above all during the implementation of real and especially ambitious projects.

In order to increase the practical utility, and thus the application value of the conclusions formulated above, it seems necessary to continue the empirical research on the conditions for developing entrepreneurship among schoolchildren. It is necessary to identify and verify further factors determining the growth of entrepreneurship and the tendency to start one's own business, remembering that it is not enough to learn about those qualities, but at the same time one needs to look for ways and instruments increasing the strength of their impact.

Abstract

Innovation is considered as a major driver in improving enterprise activities, with direct impact on the long-term economic growth of any nation. In this backdrop, the study was devoted to examining the impact of the cross-border activity of enterprises on the innovation potential of the EU(28) countries over the years 2011-2018 in the context of global enterprise development. This article was secondary focused on the deeper analysis of the following variables – the Global innovation index, Export, Import and High-tech exports indicators on average during the selected years. Secondary data were retrieved from the publicly available reports, as well as, the Eurostat database. By using the regression analysis, we dedicated to estimating the relationships between the independent variables (High-tech export, Import and Export) and dependent variable (Global innovation index). The medium-strong impact of all independent variables (using linear regression model) on innovation potential was confirmed ($p<0.01$). Moreover, the results suggested that indicator High-tech export have a more significant impact on the global potential of EU member countries (on average 0.4652). In accordance with findings, we recommend improving the business initiatives in the process of creating high-tech products to increase the cross-border country productivity and innovation potential of firms and countries.

Keywords: Global Innovation Index, Import, Export, High-tech exports, Innovation potential, EU (28) countries

Introduction

Nowadays, the factors of innovative potential are analysed by number of researchers from a perspective of enterprise's innovativeness (micro scale) and their impact on the economy (macro scale). As reported by Nonaka et al. (2014), the whole process comes to replacing the obsolete solutions with solutions adapted to the knowledge-based economy as well as innovative economy that is one that is gaining advantage through innovation. According to Galindo-Martin, Mendez-Picazo, Castano-Martinez (2019), economic growth is one the most relevant economic objectives for policy makers. In order to determine the variables that enhance such an objective it is important to consider entrepreneurial activity in relation to innovation activity. As stated in study authors Pukala, Sira, Vavrek (2018), the development of enterprises is often based on new and unique technologies and this is also reflected in gradually increasing expenditure aimed at stimulating the development of innovation and the effects of research and development work that contribute to creating novel solutions and increase the innovation level among enterprises. Malik (2020) presented that innovation is fundamental to the process of an economy's growth and is crucial for its survival in today's dynamic world. Authors Kaynak, Altuntas, Dereli (2017) agree that innovation is important for countries in the competitive global economy. It is

one of the main criteria for countries to be superior, to remain competitive, and to produce high technology products. As well as, the increase in innovativeness is a priority for the EU which for years has been running a policy of supporting the development of innovations in member states (Eurostat 2018).

In this context in accord to research aims of the paper, we paid attention to analysing the interrelationships between innovation potential of EU(28) countries (by means of Global innovation index) and cross-border activity of enterprises (by means of exports, imports and high-tech exports), and moreover, the aim was to investigate the development of above-mentioned variables over the years 2011-2018 in order to improve enterprises position in global environment.

Global Approach to Innovation Potential Measurement of Countries

In recent times, innovation and technological activities have been recognized as a major source of economic growth and have been prioritized in national policy with a greater attention. The advantage of innovation has become a critical determinant to achieve the higher growth rates of countries. As reported by Kowalska et al. (2018), the economic development of every country and its competitiveness on the world market is supported by the creation of innovation (knowledge-based economy), especially from an Industry 4.0 point of view. An almost unanimously accepted issue is that the path to competitiveness of economies, whose companies are exposed to international competition, goes through innovation. This enables companies to adapt quickly to the pace of the technological change, in order to increase competitiveness (Ciocanel, Pavelescu 2015). Authors Mihai, Titan (2014) perceive the innovation as an essential element to generate sustained economic growth. However, we cannot speak of innovation without a high level of education or a high standard of living. According to Yusr (2016), innovation plays a critical role in predicting the long-term survival of organizations, determining an organization's success and sustaining its global competitiveness, especially in an environment where technologies, competitive position and customer demands can change almost overnight, and where the life-cycle of products and services are becoming shorter. Belas et al. (2018) confirmed that innovations are an important part of business activities, because of their impact on financial performance of enterprises and it leads to achieving countries growing competitive environment. As reported by Anton, Bostan (2017), in the extant literature, there is a broad consensus on the positive relationship between entrepreneurial activity, on the one hand, and innovation, job creation, and economic development, on the other hand.

Since the 1980s, experts began to create concepts measuring the innovation performance of countries from global perspective. Many international institutions through reports provide valuable information concerning to the innovation development and competitiveness of countries to various subjects operating in the unstable economic environment in order to compare countries and recognize the future trends and challenges. In this context was launched the ***Global Innovation Index (GII)*** examining the innovation capacity of countries. On the basis of GII conceptual framework, each ranking reflects the relate positioning of particular economy or country, because every year the sample of economies are changed.

INSEAD launched a project in 2007 entitled “The Global Innovation Index (GII)” whose objective was to find the metrics and approaches that might be better to measure the development of innovation in society and across the border (Khalid, Zhiying 2015). As reported by Dutta, Benavente (2011), the project was suggested with a goal to better capture the richness of innovation in society and exceed traditional innovatory measures (such as the number of PhD students, the number of published research articles, patents or the amount of R&D expenditures atc.). In general, the GII assesses the country by exploiting its innovative potential, it means how the countries are able to fulfill their potential. The Global Innovation Index Framework is presented in Scheme 1 below.

The GII relies on two main sub-indices: The *Innovation Input Sub-Index* and the *Innovation Output Sub-Index*. Each of them consists of pillars made up of three other sub-pillars. Overall, the GII indicator examines 81 partial indicators. Four basic values (scores) are quantified (Dutta et al. 2019):

1. *Innovation Input Sub-Index* – representing five input pillars capture elements of the national economy that enable the implementation of innovative activities.
2. *Innovation Output Sub-Index* – innovation outputs are the results of innovative activities within the economy and although the Output Sub-Index includes only two pillars, it has the same weight in calculating the overall GII score.
3. *The overall GII score* – is the simple average of both sub-indices.
4. *The Innovation Efficiency Ratio* – is the ratio of the Output Sub-Index to the Input Sub-Index and indicates how much innovation output a given country is getting for its inputs.

GLOBAL INNOVATION INDEX

Source: authors' processing by Dutta, et al. 2019

As reported by Dutta et al. (2019), all available official data needed for index construction are obtained from international organizations as the World Bank, the United Nations Educational, Scientific and Cultural Organization, the World Intellectual Property Organization, the International Energy Agency, the International Telecommunications Union as well as other private organizations.

Theoretical linkage of the innovation level to export and import activities

During the last two decades, a vast literature has addressed the issue of innovation and their impact on cross-border activities of countries. Today when globalization process is increasing, innovation enable to achieve positional advantages and better economic outcomes (Hasanov, Abada, Aktamov 2015). In this respect, innovation can constitute one of the main channels fuelling a firm's entry in foreign markets (Lo Turco, Maggioni 2014). Tuhin (2016) emphasized that firm innovation and export

behaviour are mutually driven processes. As reported by Andrijauskiene, Dumciuviene (2019), a remarkable increase in the attention devoted to national innovative capacity (NIC) has been noticed over the last decades. An investigation of 28 European Union member states in the period of 2007-2017 shows that the international transmission of knowledge through import spillovers has a positive effect on trademark applications and exports of high-tech products. Authors Chen, Zhang, Zheng (2017) also investigated the relationship between imports and innovation. They constructed a theoretical model in which imports stimulate innovation through cost-reducing knowledge spillovers. High-tech firms tended to experience greater increases in innovation intensity, as do private firms. The issue of cross-border activities in connection to innovation level was analysed also by Pirja (2016). In order to compare the relations, they have with each other, author studied their effect in the innovation and other factors (productivity and technology) related to the total economic situation. The research of authors Li, Millman, Chi (2011) was focused on examining how innovation and exports at the firm-level give impact on their technology imports. Results suggested that innovation is significantly positively associated with its technology imports.

Data and Methodology

The main aim of this paper was to examine the impact of the cross-border activity (representing by the indicators as exports, imports and high-tech exports) on the EU(28) countries' innovation potential (by means of Global Innovation Index) over the years 2011 - 2018. Cross-border activities supported by innovation were perceived as factors of the global enterprise development.

Moreover, this article is focused on the development analysis of EU(28) countries in the context of global innovation potential (represented by GII indicator), cross-border activities (represented by export and import indicators), high-tech exports (represented by high technology products). The briefly description of selected variables is given in the following Table 1.

Table 1: List of variables examined in the analysis

Variable	Description	Unit of measure
Global Innovation Index (GII)	The GII relies on two main sub-indices: The Innovation Input Sub-Index and the Innovation Output Sub-Index. Overall, the GII indicator examines 81 partial indicators.	score
High-tech Export (HTE)	The data shows the share of exports of all high technology products in total exports.	% of exports
Export of Goods and Services (EXP)	Exports of goods and services consist of transactions in goods and services (sales, barter, and gifts) from residents to non-residents.	at current prices in million EUR
Import of Goods and Services (IMP)	Imports of goods and services consist of transactions in goods and services (purchases, barter, and gifts) from non-residents to residents.	at current prices in million EUR

Source: authors' processing

The analyses of the EU (28) countries' innovation position were performed on the basis of secondary data drawn and subsequently processed from the annual reports that are the result of a collaboration between the Cornell University, INSEAD, and the World Intellectual Property Organization (Dutta, et al. 2019). Furthermore, the other needed secondary data concerning the cross-border activities, were retrieved from the Eurostat (2019) database.

In accordance to the above-mentioned theoretical approaches and the main aim of this research paper, the following hypotheses were set:

Hypotheses 1 (H1): *There is a statistically significant relation between the assessment of global innovation potential (GII) and exports activity within the EU(28) countries.*

Hypotheses 2 (H2): *There is a statistically significant relation between the assessment of global innovation potential (GII) and imports activity within the EU(28) countries.*

For the purposes of meeting the goals of presented study, we performed regression analysis presenting one of the multidimensional statistical methods. The role of regression analysis when examining statistical dependence of Y on X is to find a suitable mathematical model (function) in which the idea of this dependence is expressed. This model was adapted to investigate the relationship among one dependent variable (GII indicator) and independent variables (import, export and high-tech export). For analysing the relationship among variables, a linear regression model was used. The linear relation is a mathematical relationship that can be expressed by the regression model (Hendl 2015):

$$y_i = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \beta_n x_n + \varepsilon_i \qquad i = 1,2,\ldots, n$$

where y_i *- i^th value of variable Y in the basic file,* x_n *- i^th value of the variable X in the basic file,*
B_0 *- intersection of the y-axis with the regression line,* ε_i *- i^th random error of variable,*
B_n *- regression coefficient in the basic file.*

To process the above-mentioned data, the STATISTICA software (13th edition) was utilized.

Empirical Results

The first part of research was devoted to describing the results of performed analysis focused at examining the average values (over the year 2011 to 2018) of the selected variables (global innovation index, export, import and high-tech exports) within EU(28) countries. The intention was to compare individual countries, to identify not/leading countries of EU, as well as evaluate overall innovation potential and level of the cross-border activity.

The analysis of the Global innovation index (GII)

The following part was aimed to the analysis of innovation potential of EU(28) member countries represented by GII indicator. The comparison of average values of GII scores is presented in the Figure 1 below.

Fig. 1: The comparison of the average GII score within the EU(28) countries (2011-2018)
Source: authors' processing

To begin with, it is important to emphasize that the innovation potential of countries is quantified through scores ranging from 0 to 100. Over the reporting period, the innovation potential of EU(28) countries achieved range of values at level 24.9 points on average. Moreover, the standard deviation was quantified at level 7.51, kurtosis at level -1.16 and skewness at level 0.17. Sweden achieved the best innovation performance (62.9) and this country was indicated for the leader country of EU during the period analysed. In contrast, the lowest GII score was reached by Greece (38.0). When comparing the innovation average scores of countries, we can state that only 3 European countries (Sweden, United

Kingdom and Netherlands) achieved the level of innovation over 60 points, while 2 countries (Greece, Romania) had not even achieved a score of 40 points.

High-tech exports (HTE)

In the next section, we pay attention to analysis of the selected determinant of innovation potential, namely the indicator of high-tech exports. In the following Figure 2 we presented the average values of this indicator over the monitored period in order to compare individual EU(28) countries.

Fig. 2: The comparison of the average high-tech value within the EU(28) countries (2011-2018)
Source: authors' processing

The second indicator that was the object of the realized analysis is called high-tech exports. In this case, it is necessary to state that this indicator is express as share of high technology products on overall exports of country (in %). The results of the analysis showed that Malta was indicated as the country with the highest share (26.3%), while Portugal achieved the lowest share (3.8 %). It follows that the share was in the range of 22.6 %. Furthermore, based on descriptive statistics analysis we identified the standard deviation of values at level 6.31, kurtosis at level -0.06 and skewness at level 0.81. Looking at the results, we also found that only 3 countries (Malta, Ireland, France) within EU achieved a share of high-tech products on exports at level more than 20 %, while up 3 countries (Bulgaria, Greece, Portugal) achieved share below 5 %.

Exports (EXP) and Imports (IMP)

In assessing cross-border activity, at first we focused on exports data analysis of the EU(28) countries over the period of 2011-2018 on average. Based on the results, we came to the following findings. Germany was indicated as the unequivocal EU leader (the only one country of EU that achieved export above EUR 1,000,000 million). The second rank was held by United Kingdom, however this country reached about half lower value of exports. On the other hand, the lowest export value was achieved in the case of Cyprus and Malta. The gap between the country with the highest and lowest export activity was considerable, range at level EUR 1,372,896 million. In connection to the above-mentioned results, we can state that similar findings were revealed for import activity too. The lowest import values were found for Malta and Cyprus again. In comparison, Germany achieved almost 100 times higher import values over the analysed period on average and ranked 1st position in this ranking. In accordance with presented findings, we can conclude that range of imports values between the best and the worst country achieved EUR 1,178,956 million.

In accordance with the above analyses, we also focused on the assessing the individual EU countries (28) in terms of overall cross-border activity. However, in this case, the aim was to compare countries with regard to the achieved values of import and export all at once. In our opinion, this assessment of cross-border activities is most effective as it captures both aspects of the international activities of countries. The resulting average values of above-mentioned indicators in absolute values are presented in the following two-dimensional Figure 3 (in EUR billion).

Fig 3: The cross-border efficiency ratio of the EU (28) countries (on average of 2011-2018)
Source: authors' processing

Looking at the above presented Figure 3, we can see that Germany achieved significantly better results than the rest of the European countries during the analysed period. France and the UK also performed very well, taking both indicators into account. For the period under review, among the European countries belonging to the average were included Czech Republic, Luxembourg and Hungary. The group of the least performing countries in view of export and import consisted of Bulgaria, Cyprus, Croatia, Malta, Latvia, Lithuania and Estonia on average from 2011 to 2018.

The cross-Border Activity Efficiency Ratio of the EU (28) countries

Within the export and import evaluating process, it is essential to monitor the ratio of the two variables, not only to analyse the indicators themselves. For this reason, we have decided to examine the relations between these indicators and so to compare the effectiveness of each EU country (28) with a view to better identifying their impact on innovation potential in the next part of the research. Based on assessing the cross-border activity efficiency ratio within EU(28) countries we founded the interesting results. Out of the total number of countries, up to 20 countries achieved the favourable value of the efficiency indicator (higher exports than imports). The remaining 8 countries (Portugal, Croatia, Finland, Latvia, France, United Kingdom, Romania and Greece) reached the values below 1, but at the same time, the indicator range above the level of 0.9, which can be assessed positively. The best results were recorded in the case of Ireland with an efficiency ratio at the level of 1.24. On the opposite, Greece achieved the lowest share of exports to imports (0.93).

Results of Regression Analysis

The next part of this study was dedicated to the analysis of impact the determined independent variables (HTE, IMP, EXP) on dependent variable (GII) using the regression analysis. We decided to create two regression models in order to better differentiate and to examine the impact of export and import on the innovation potential of countries separately. Considering the high-tech exports variable as a key determinant of innovation activities (based on theoretical research), we included it in both regression models. The results of regression analysis are presented in the following tables.

Table 2: Result of regression analysis among the GII, HTE and IMP indicators

	Regression Summary for Dependent Variable: **$GII_{2011-2018}$** R= .6261; R^2= .3921; Adjusted R^2= .3866; F(2.221)=71.261; p<0.0000; Std. Error of estimate: 0.7832					
	b*	Std. Err.	b	Std. Err.	t(221)	p-value
Intercept			0.0000	0.0523	0.0000	1.0000
$HTE_{2011 - 2018}$	0.4659	0.0545	**0.4659**	0.0545	8.5482	0.0000
$IMP_{2011 - 2018}$	0.3103	0.0545	**0.3103**	0.0545	5.6928	0.0000

Source: processing of authors

The analysis of the appropriateness of the created regression analysis (Table 1) showed that the linear regression equation is appropriate with regard to Fisher's test criterion at the selected significance level α = 5% (p = 0.0000). The coefficient of determination (R^2), which explains the variability of the dependent variable (GII), achieved value 39.21%. Moreover, the regression equation confirmed that both independent variables are statistically significant and to determine the score of GII indicator (p=0.0000). While the causal relationship is not strong, but it should be emphasized that this quantification suggests only one unit to change of the HTE and IMP variables. When comparing independent variables, we can state that a higher impact on GII was revealed in the case of the HTE indicator (0.4659).

Table 3: Result of regression analysis among the GII, HTE and EXP indicators

	Regression Summary for Dependent Variable: **$GII_{2011-2018}$** R= .6266; R^2= .3926; Adjusted R^2= .3871; F(2.221)=71.430; p<0.0000; Std. Error of estimate: 0.7829					
	b*	Std. Err.	b	Std. Err.	t(221)	p-value
Intercept			0.0000	0.0523	0.0000	1.0000
$HTE_{2011 - 2018}$	0.4652	0.0545	**0.4652**	0.0545	8.5356	0.0000
$EXP_{2011 - 2018}$	0.3114	0.0545	**0.3114**	0.0545	5.7134	0.0000

Source: processing of authors

In the case of second regression analysis, we detected the following findings. The linear regression equation is appropriate with regard to Fisher's test criterion at the selected significance level α = 5% (p = 0.0000). The coefficient of determination (R^2), which explains the variability of the dependent variable (GII), achieved value 39.26%. Moreover, the regression equation confirmed that both independent variables (exports and high-tech exports) significantly determined the score of GII indicator (p=0.0000). In comparison of independent variables within this regression model, we found that variable HTE have more significant impact (again) on GII indicator (0.4652). Based on performed analysis, we also revealed that correlation coefficient of above-mentioned variables ranged at level 0.6266.

Conclusion

This article was focused on the development analysis of EU(28) countries in the context of global innovation potential, cross-border activities and high-tech exports throughout 2011-2018 to reveal the interdependencies among variables.

At first, attention was paid to development analysis of individual variables entering to our research. The EU countries (28) were gradually analysed in terms of innovation potential, exports, imports and high-tech exports based on the achieved average values over the years 2011-2018. Taking into account the overall results, we can state that Germany, the United Kingdom, France and Netherlands ranked

among the best performing countries. By contrast, Greece, Cyprus, Malta and Bulgaria achieved the lowest levels of innovation and cross-border activities. Also, Germany has been identified as the leader in cross-border activities, and as only one EU country recorded export and import values above EUR 1 billion. To the positive facts belong also that up to 20 countries achieved the favourable value of the cross-border efficiency ratio and the remaining 8 countries (Portugal, Croatia, Finland, Latvia, France, United Kingdom, Romania and Greece) reached the level of the indicator above of 0.9, which can be assessed positively.

Based on the performed research analysis throughout 2011 – 2018 within EU(28) countries, it can be formulated the following findings:

- analysis results confirmed a medium-strong impact of cross-border activity (export and import) on the innovation level of countries,
- in the case of both regression models was revealed the more significant impact of high-tech exports on innovations (on average 0.4655),
- based on correlation analysis results, we can state that both hypotheses were confirmed (at level 0.63), so there is a statistically significant relation between innovation potential of the EU(28) countries and their cross-border activity.

In line with the performed analyses, it is necessary to point the research limitations. To the main limitations of presented paper belong the validity of study findings. In view of the economic disparities and different political interventions of the individual countries in this sphere, it's difficult to generalize research findings for all EU. For this reason, the regression models should be suggested for every country separately. Furthermore, we consider the assessment of the European countries' innovation potential via the cross-border activity as insufficient. Therefore, for future research, we recommend to include other global determinants influencing innovation level of enterprises, as well as, to investigate concrete factors of countries innovation potential.

It´s obvious, that firms and entrepreneurs are at the centre of the innovation process and any innovation leads to a new product or service with an impact on long-term economic growth. In accordance with study results, we recommend improving the business initiatives for creating high-tech products in linkage to increase of cross-border country productivity, as these drivers have a significant impact on improving innovation potential of firms, as well as countries. Policymakers should attempt to make a bridge between and integrate innovation and entrepreneurship policy through interventions.

In the international environment, we can observe that global competition is intensifying, and Europe needs to deepen its innovation and risk-taking capability to compete on a market increasingly defined by new technologies. Despite the fact that Europe accounts for 20% of global R&D investment, produces one-third of all high-quality scientific publications, and holds a world-leading position in the technology sector, Europe needs to do better at turning that excellence into success and generating global champions in new markets based on innovation. This is particularly the case for innovations based on radically new technologies (breakthrough) or markets (disruptive). As reported by the European Commission (2019), the European Innovation Council is part of a wider ecosystem that the EU is putting in place to give Europe's many entrepreneurs every opportunity to become world-leading companies. Other initiatives include a Pan-European Venture Capital Funds-of-Funds programme (Venture EU), the Investment Plan for Europe (EFSI), the work of the European Institute for Innovation and Technology, the Capital Markets Union Action Plan to improve access to finance or the proposal for a Directive on business insolvency.

Abstract

Ergonomic activities are increasingly being undertaken in production enterprises, aimed at improving working conditions, streamlining processes and adapting the enterprise to applicable legal and normative provisions. However, these activities require evaluation in order to avoid unnecessary implementation costs, errors in their implementation, and to ensure that new solutions will be used by future users (operators). In this article, the FMEA (Failure mode and effects analysis) method was used for such evaluation, using its assumptions to predict potential errors in starting and running projects in the context of ergonomic activities in manufacturing companies. The applied approach has been completed with expert judgment - a selected group of experts assessed the importance of individual errors in project implementation and management, identified on the basis of an analysis of the literature and the authors' experience.

Keywords: Ergonomic Criteria, FMEA Method, Project Management, Proergonomic Project Management, Sustainability in Project Management.

Introduction

In enterprises, a project-based approach to management is more and more often noticed. Problems and new areas to develop are usually included in the project, which requires an appropriate structure and organization at every stage. Projects currently relate not only to engineering tasks, but also to financial, human resources, waste management, marketing, etc.(Huemann, 2014). Project-oriented enterprises are often seen as more innovative, which can contribute to greater success, as well as a better perception of the company on the market in front of competitors (Gemünden, Lehner, Kock, 2017). However, in order for the project- oriented approach to deliver the expected results, enterprise-specific project management methods should be used to prevent undesirable events that could lead to the project failure. Such failures can be, for example: significant exceeding of the assumed budget, exceeding the deadline, failure to implement some of the assumptions, failure to ensure adequate competence of the project group, incorrect allocation of resource (learn.g2.com). For this reason, methods are being sought to identify possible incompatibilities at individual project stages. For such analyzes project-specific risk assessment

methods can be used, for ex ample: the Ishikawa diagram (Arashpour et. al. 2017), Monte Carlo simulation (Agarval, Virnie, 2017), critical path method (CPM) (Floyd et. al. 2017). Increasingly fuzzy reasoning techniques are used, which allow for the identification of the risk associated with the uncertainty of various aspects of project management (Zeng, An, Smith, 2007; Moradi, Mousavi, Vahdani, 2017). In this article, the authors present the application of the FMEA method for risk analysis on various stages of pro-ergonomic projects. Such projects are characterized by an ergonomic approach to the design and organization of the work environment. They are specific from many aspects. First of all, design influence human behavior, its driven by non-technological aspects and in some cases justification of changes, supported by substantive ergonomic analysis is not accepted by employees for whom goods are introduced. Project stages and possible defects were identified on the basis of literature analysis and the authors' experience in conducting projects based on ergonomic analyzes. Individual errors were assessed by experts in terms of their probability of occurrence, significance and detectability using a scale developed for the purposes of this analysis. The results were used to assess the importance of individual errors in the success of the project and indicated at which stages of the project defects have the greatest impact on efficient project management.

Scientific Problem of Ergonomic Project Management

By definition, a project is a time-bound venture that aims to create a unique result with reasonable use of specific resources. To achieve this, proper project management is required, which includes planning, organizing and controlling activities in order to succeed, despite the adversities and various risks arising (Lock, 2016). Projects usually have a specific structure and have a strict budget, schedule and type of competencies required from project group members. The indication of the project stages depends on the approach taken (Demirkesen, Ozorhon, 2017; Cooke- Davies, Arzymanow, 2003), but the following are usually mentioned: defining, planning, implementation, control, closing (Kerzner, 2009). Increasingly ergonomic projects are being noted in companies. Usually they relate to the production sphere, but also projects including office ergonomics or ensuring employee well-being are distinguished (Wang, 2016). They may consist of using ergonomic assessment methods on part of the system and taking measures to improve the ergonomic quality of workplaces and it's a separate project (Sonne, Villalta, Andrews, 2012; Parham, Mirzaei, Ansari, 2016) or ergonomic design is implemented as part of another project, e.g. the creation of a new production line. Therefore, interesting approaches to project management appear, sometimes such projects are called "pro-ergonomic" and attempts are being made to propose project organization structures tailored to such orientation of tasks and activities in the project (project support by Ergonomics Comissions or Euroergonomists, ensuring employees cooperation, information on the ergonomic nature of the project) (Butlewski et. al., 2019). An interesting issue is also establishing new organizational structures for projects in terms of ergonomics based on literature review (Pikaar, 2007).

Fig. 1: Ergonomic design steps related to the project structure (own preparation based on: Pikaar, 2007).

This allows to combine the traditional approach to project management with the steps of performing ergonomic analyzes widely recognized by ergonomics practitioners. In this article, project stages identified on the basis of literature analysis have been completed with potential errors that may occur at these stages in the context of ergonomics. The FMEA method was used to structure these issues.

Literature Review on Applying the FMEA Method

The FMEA method is usually used to detect errors in production processes that need to be eliminated to ensure better product quality, higher level of safety of processes or fewer repeated deficiencies. The identified errors are considered in the context of the probability of their occurrence, their effects and the possibility of detecting them (Fig. 1) (depending on the approach, these parameters may be slightly different). The FMEA method can be used in the following cases:

- analysis of existing processes and products to find opportunities for improvement and ensure that they meet better assumed requirements,
- streamlining processes or products to meet quality and safety guidelines or individual customer preferences,
- re-analysis of processes or products after applying corrective actions or increasing their suitability,
- formalizing changes by documenting their analysis and justifying their implementation (Dudek- Butlikowska, 2011).

Fig. 1: Assumptions of the FMEA method (own preparation based on: Dudek- Butlikowska, 2011).

There are many types of FMEA method, which include approaches related to: product, process, organization, quality and efficiency, project. They can be applied to existing systems as well as being suitable for assessing errors in products or processes that are not yet physically existing (being e.g. in the design phase) (Solanki, 2015). The FMEA method is currently used to analyze the risk of ventures undertaken in enterprises of various industries. Some examples of such applications are presented in Table 1.

Table 1: Areas of application FMEA method

No	Area of application	Assumptions
1	The use of combined FMEA and FTA methods with computer software assistance to identify safety problems.	In this approach, the authors used FTA method to establish the failure and its potential causes and then assessed the basic events from this analysis by FMEA method. They also used computer software to input data from both FMEA and FTA analysis. Triangulation of methods ensured better identification of threats and potential errors, and computer aided facilitated the collection and processing of data (Liu, Hwang, Lin, 2013).
2	Risk analysis of poultry feed production using fuzzy FMEA.	Application of the modified FMEA method for risk analysis in poultry production. The methodology uses Fuzzy FMEA, which allowed to reduce the threats identified by the traditional method, thanks to which the company could implement corrective actions that hit specific areas of activity (Wessianti, Sarwoko, 2015).
3	The use of FMEA in the process of sustainable production.	An example of using the FMEA method in the assessment of new launches of products in terms of supply, input, process, output, stakeholders. The division of the analyzed areas allowed the identification of various types of threats, the elimination of which can ensure greater success of the product (Ligarski, 2017).
4	Application of the FMEA method to analyze various variants of new products.	The authors presented the concept of a modified FMEA method, supporting the estimation of risk associated with various product concepts. The dependencies of components and functions of the product were modeled into a network. Each of the network elements was subjected to FMEA analysis and on this basis it was possible to select the appropriate variant (Chahin et. al., 2016).
5	The use of a combination of FMEA and AFD (Anticipatory Failure Determination) methods to achieve synergies and advantage of both approaches.	The authors proposed an approach to risk analysis called Failure Mode and Effects Anticipation and Analysis (FMEAA), a hybrid of FMEA and AFD methods. Thanks to this it is possible to detect potential failures of systems, but also initial suggestions for correcting them. It is also possible to build various failures scenarios (Thurnes et. al., 2015).
6	Adaptation of the FMEA method to the requirements of the aviation industry.	Presentation of the FMEA method assumptions in relation to the requirements of the aviation industry (also based on the standards of the railway industry). Parameters are presented in the context of PN-EN 80612 * 2, on the basis of which the probability of error, its effects and detectability were estimated (Fellner, Mańska, 2015).
7	Safety analysis using FMEA and ETA methods supported by computer software.	The article presents an innovative method of making multi-criteria decisions (MCDM) called FlowSort-GDSS. It was proposed to sort failure modes into priority classes by involving many decision makers (Lolli et. al. 2015).
8	Hybrid FMEA and FTA method for risk analysis of safety-critical systems.	The combination of the FMEA and FTA methods to strengthen their applicability and eliminate their drawbacks. It allows the identification of threats in complex multi-element systems, thanks to the modified criteria greater efficiency of assessment accuracy has been achieved. Advantages of using a combination of several methods in risk analysis has been proven (Shafiee, Enjema, Kolios, 2019).

Despite the frequent application of the FMEA method in enterprises, its weaknesses are noticed. These include, but are not limited to, the following issues:

- partial knowledge of the process may result in not detecting significant defects,
- assessors are not always fully familiar with the product or process, which may lead to overestimation or underestimation of defects,
- the structure of the method does not allow the system to be divided into sub-assemblies and components,
- using the traditional approach to the method requires many repetitions in the text and extensive documentation, which means that reliable application is time consuming (Breiing and Kunz, 2002).

In many approaches to applying the FMEA method, it is therefore used in combination with other methods, e.g. Fault Tree Analysis. This allows for a more precise determination of risk factors, but on the other hand, it extends the analysis process time (if computer support is not available). The multitude of applications of the method in various industries and for risk assessment in various types of fields (new products, multi-element systems, occupational risk, system design) indicates its universality and its high availability, therefore it can be used in the preliminary assessment of the probability of faults, their effects and detectability.

Materials and Methods

The FMEA method structure in the context of ergonomics was used to identify defects that may appear at individual stages of the project. Errors were determined on the basis of literature analysis as well as experience and knowledge of the authors. Specified potential failure, effect of failure and causes were presented to the assessment and verification of independent experts implementing ergonomic projects in enterprises - OSH specialist. A fragment of the list being the subject of the assessment is presented in Table 2.

Table 2: Fragment of the matrix development with potential problems of implementing ergonomic projects

No	Project implementation cycle	Project stage	Potential failure	Potential effect of failure	Potential cause of failure
1	Project organization	determination of the project team	lack of an ergonomics specialist (a person with knowledge in this field) in the project team	lack of reliable and complete analysis of ergonomic aspects	company policy and management (lack of knowledge about ergonomic actions that can be taken)
2				….	
3	…	…	….	…	…

Table 3: Rated dimensions of risk

No.	Potential failure	Potential effect of failure	Potential cause of failure
1	Lack of an ergonomics specialist (a person with knowledge in this field) in the project team	Lack of reliable and complete analysis of ergonomic aspects	Company policy and management (lack of knowledge about ergonomic actions that can be taken)
1B	-	Failure to include ergonomic activities in the budget and schedule	-
2	Incorrect selection of support (internal / external)	Lack of reliable and full analysis, factual errors	Lack of knowledge (e.g. About euroergonomists)
3	Support by incompetent people	Lack of reliable and full analysis, factual errors	Many offers - the cheapest choice; staff shortages
4	Support at the wrong stages	Key ergonomic variables are not included in the design	There is an awareness of the need for support, but its type has not been established
5	No decision person on the direction of ergonomic activities (also in financial and implementation terms)	No investment in solutions, no analysis	Usually one decision-making person in the project, without knowledge of every aspect
6	Lack of knowledge of people involved in the project	No support for the project	Insufficient information or in an incomprehensible way
7	No communication of the need to take ergonomics into account in the design	No prioritization of ergonomic goals at the implementation stage	Erroneous communication of ergonomic goals to the manager / decision maker
8	Lack of employee knowledge (key participation)	Lack of employee involvement in analysis and searching for solutions	Ergonomic communication incorrect or missing
9	Lack of ergonomic aspects included	Lack of project implementation in pursuit of ergonomic goals	Lack of ergonomics consideration at the project organization stage
10	Misidentifying goals	Failure to achieve the required level of ergonomic quality	Lack of sufficient analysis by people advising on ergonomics
11	Objectives incompatible with the project assumptions	Lack of opportunities to take actions related to ergonomics inscribed in other project-related activities	No set goals in the project group at the initial stages
12	Selection of incorrect methods - after getting acquainted with workplaces and processes	Failure to achieve project goals, unreliable assessment	Lack of knowledge in the field of ergonomics of persons performing assessments
13	Insufficient number of methods for reliable analysis	Not collecting enough data	Lack of knowledge in the field of ergonomics of persons performing assessments
14	Final report without key information compatible with the project assumptions	Failure to achieve ergonomic goals of the project	Errors at the stage of planning activities related to ergonomics
15	Insufficient research sample	No data from all workplaces	No workstations

			identification by persons performing the assessment
16	No representative group selected	Analysis involving new or unskilled employees	Insufficient knowledge of ergonomics of persons performing assessments
17	Employees not involved in the activities	No cooperation	Lack of information about the project and its ergonomic nature among employees
18	Lack of coordination of the ergonomic analysis schedule with other project activities	Results of the analysis impossible or difficult to implement as part of the project	Scheduling without consultation with all project members
19	No indication of all load factors	Incorrect work process analysis	Lack of knowledge in the field of ergonomics of persons performing the assessment
20	No consideration of employees' personal aspects in the analysis	A quick analysis, without taking into account all relevant personal factors	Lack of knowledge in the field of ergonomics of persons performing the assessment
21	No consideration of contextual aspects affecting employees in the analysis	A quick analysis, without taking into account all relevant contextual factors	Lack of knowledge about the impact of contextual factors on the way work is performed
22	Observation without time to start	Unrepresentative results	Lack of knowledge of ergonomic audit principles
23	Observation without checklist / plan	Collecting insufficient data	Lack of knowledge of ergonomic audit principles
24	Failure to apply observation rules according to applicable standards	Unrepresentative, inadequate results	Lack of knowledge of ergonomic audit principles
25	Evoking a sense of being controlled / lack of cooperation	No information about the process from workers directly involved	No prior training in the principles of interviewing an employee
26	Incorrect use	Unrepresentative, inadequate results	Lack of knowledge of methods by persons performing the analysis
27	No proper conclusions from the analyzes	No problem areas identified	Lack of ability to analyze data resulting from the use of ergonomic analysis methods
28	Incorrect ergonomic risk classification	Misdirection of corrective and design actions	Lack of ability to analyze data resulting from the use of ergonomic analysis methods
29	No relevant conclusions from the analyzes	No problem areas identified	No data analysis forms
30	Indication of wrong areas with not the greatest risk	Targeting activities in inappropriate areas	No knowledge of the description of the used methods
31	Incorrect execution of load maps	Targeting activities in inappropriate areas	Lack of knowledge about the application of results of

			ergonomic risk analyzes
32	Solutions in incorrect areas	Allocating funds for inappropriate implementations	No properly performed ergonomic analysis
33	Solutions without analyzing the possibilities of implementation (including financial)	No possibility of applying solutions in processes	Implementation of idealistic and pilot solutions in other cases (e.g. In other companies)
34	Impossible to implement solution	Incorporation of solutions without reflection in reality	Lack of market analysis and company needs
35	No criteria for assessing solutions were set	Solutions without the possibility of evaluating their usefulness and operation	No long-term planning in the project
36	Selection of a non-optimal solution	Allocating funds for inappropriate implementations	No analysis of the proposed solutions
37	No key data in line with established initial goals	Failure to meet the requirements assumed at the beginning of the project	Errors in the initial stages of project implementation
38	No evaluation method established	Solutions whose validity and functioning are unverified	No evaluation included in the project

The experts used the scoring tables for Probability of error, The importance of error for the project and The ability to detect the cause of the error – on the scale 1-10 each typical for FMEA assessment method (Carbone, Tippett, 2004; Górska, 2012).

Research Results

The given answers were collected and response statistics are presented in Table 4. The assessed risk of individual events for the success of ergonomic projects was also analyzed.

Table 4: Result of the study

No.	Potential failure		Potential effect of failure		Potential cause of failure		Risk for projects	
	Mean	SD	Mean	SD	Mean	SD	Mean	SD
1	5.5	2.5	6.7	1.9	4.0	1.6	131.6	60.2

23	5.2	1.9	6.4	1.8	4.2	2.1	141.5	131.3
24	4.6	1.7	6.1	1.7	4.6	1.9	146.9	172.6
25	4.9	1.9	5.4	1.5	3.8	1.5	114.4	108.8
26	4.6	1.6	6.2	1.9	4.2	1.2	123.9	108.4
27	4.4	2.1	6.4	1.7	4.3	2.1	134.8	155.1
28	4.9	1.7	6.3	1.9	3.7	1.9	139.7	196.4
29	4.6	1.8	6.1	1.9	4.3	1.7	141.4	155.8
30	4.6	1.7	5.8	1.7	4.2	1.7	120.6	102.3
31	4.3	1.5	5.8	1.2	4.0	1.7	101.6	79.4
32	4.3	1.5	6.2	1.6	4.3	1.7	126.5	120.7
33	4.3	1.5	6.2	2.0	4.2	2.0	115.6	79.3
34	4.1	1.7	6.3	2.2	4.0	2.0	118.1	158.7
35	4.3	1.8	6.7	2.0	4.2	2.0	125.2	153.0
36	4.9	2.1	6.3	2.4	3.9	1.7	130.7	152.0
37	4.4	1.3	6.5	1.9	3.8	1.5	112.9	76.2
38	4.9	1.6	5.9	1.5	3.4	1.5	103.3	85.3

Due to the contributing nature of the research, as well as methodological and explorative rather than knowledge-making, one can only point to some general conclusions. The significant variation in the standard deviation of risk is due to the multiplicative nature of the risk formula. However, both in the case of assessments of individual risk parameters and the collective risk value, high reliability can be observed, which is confirmed by Cronbach's alpha above 0.9. Correlation of Spearman's rank order indicated a correlation of assessments of individual risk factors. Such a statistically significant correlation concerned threats to a similar project. e.g., no communication of the need to take ergonomics into account in the design, correlated highly (more then 0,7) with objectives incompatible with the project assumptions. This can be justified by the interdependence of individual threats, for which one threat results in the next. Due to cross-linked dependencies, however, threats cannot be eliminated because they are both cause and effect at the same time.

Limitations

Due to the exiguous nature of the research, the value of the presented approach is the evaluation of tools and a method of assessing methods for ergonomic projects and risk identification. The presented statistical analysis of the risk level is of an exploratory nature and cannot be regarded as universal, but shows general problem with assessments at different levels of organization.

Conclusions

The presented analysis proves the possibility of using the FMEA method in risk analysis for ergonomic projects. The specificity of these projects is the significant impact of the human factor on the achievement and classification of the positive effect of the project. Hence the need to balance costs with measurable ergonomic quality of the work environment. Therefore, methods of organizing activities are needed, among which FMEA will be a valuable tool to support management of ergonomic processes in the enterprise.

Abstract

All financial and economic activities of higher education institutions should be predictable. It should be based on a multivariate research study of the directions, resources and expected financial results of higher education institutions.The subject of monitoring the efficiency of budget expenditures, financial stability and quality of financial management of higher education institutions is the analysis of their use of financial resources, economic efficiency and results of their financial activity.
The proposed methodology synthesizes the procedures of hierarchy analysis, analytical assessment of the level of process development, statistical methods and methods of market surveys into a single technological cycle. The developed model of complex evaluation of such a system makes it possible to assess the efficiency of the existing financial mechanism of higher education institutions in Ukraine from the standpoint of economy, productivity and efficiency on the basis of a comparative analysis. Also, with the help of this model it is possible to estimate how effective the system was during a certain period.

Keywords: Effectiveness, Financial Mechanism, Higher Education Institutions.

Introduction

The scientists argue that all financial and economic activities of higher education institutions should be predictable. It should be based on a multivariate research study of the directions, resources and expected financial results of higher education institutions. Therefore, the subject of monitoring the

efficiency of budget expenditures, financial stability and quality of financial management of higher education institutions is the analysis of their use of financial resources, economic efficiency and results of their financial activity.

At the conceptual level, the proposed methodology synthesizes the procedures of hierarchy analysis, analytical assessment of the level of process development, statistical methods and methods of market surveys into a single technological cycle (Figure 1).

Fig. 1: Stages, methods and results of the procedure for comprehensive evaluation of the effectiveness of the financial mechanism of higher education institutions in Ukraine

Source: compiled by the authors

The proposed approach can be used as a basis for organizing the standing monitoring of the effectiveness of this mechanism in order to identify the problems and define priority areas for overcoming them. Its application assumes realization of the following stages:

1) system analysis of the problem and hierarchical model development;
2) formation of a system of indices and normalization of actual values of indices;
3) determination of weight coefficients;

4) calculation of group and integral estimates of system efficiency;
5) comparative analysis of the obtained results.

Evaluation of the efficiency of formation and functioning of the financial mechanism of higher education institutions requires the definition of a set of indices. Definition of the formalized dependences between primary signs and factors which influence them and results of activity transforms them into the system providing ability to use integral model for introduction of key objectives of financial mechanism management.

Hence, productivity of functioning of the financial mechanism of higher education is defined by achievement of the purposes which stand before system of higher education for the purpose of formation of educational potential of the country and rational spending of resources.

Tkachenko and Proskurovych (2017) are offered to use the following indices for the evaluation of expenses of development: share of capital expenses in the total expenses for higher education (the index characterizes technical possibility of innovative means introduction for educational process) and maintenance/workload of the faculty. Since one of the tasks of higher education institutions is not only the educational services provision, but also research and development activities, the availability of scientific and pedagogical personnel of educational institutions to characterize the possibility of directing expenditures from the maintenance function to the development of higher education in general.

According to certain indices, using the official sources of information of the State Statistics Service of Ukraine, a database was formed to characterize the effectiveness of the financial mechanism of higher education institutions of Ukraine for the years 2012-2018. All the indices that were included in the database are relative, which ensures their comparability.

Obviously, the performance characteristics of the financial mechanism of higher education institutions in Ukraine are the tagged values, so the necessary procedure is a preliminary rationing of the selected indices, which provides comparability of the existing information base.

In contrast to the traditional option, Oharenko (2014) is carried out the rationing of quantitative criteria by a formula:

$$Hi(н) = \frac{(Hi - H\max)}{(H\max - H\min)},$$

where: Hi is the actual criterion value,
Hmax is the maximum criterion value,
Hmin is the minimum criterion value,
Hi(н) is the normalized criterion value.
The selected methodology provides a simplified rationing procedure.
For rationing, a rating scale of the characteristic is defined in the range from 0 to 1. The total absence of a characteristic is equated to 0. Maximum characteristic value in the aggregate is equal to 1.

Burdenyuk and Svirsky (2012) mentioned that the for other objects, rationing is carried out according to formulas:
- for the indices-stimulants, the increase in which contributes to the efficiency of the financial mechanism of higher education institutions:

$$Hi(н) = \frac{Hi}{H\max}$$

- for the indices-destimulants, the increase in which leads to the decrease in the efficiency of the financial mechanism of higher education institutions:

$$Hi(H) = 1 - \frac{Hi}{H\max}.$$

The data, standardized in such way allow direct comparison of individual indices in dynamics and serve for calculation of the financial mechanism efficiency of higher education institutions in Ukraine both for individual groups and in the general measurement.

Further, it is necessary to assess the importance (significance) of each of the structural components of the hierarchy, i.e. to determine the weight coefficients for each of the indices of the last hierarchy level. In order to determine such coefficients there are different approaches, among which the most common are the expert methods (paired comparison method, ranking, direct evaluation, adaptive evaluation etc.) and computational approaches (paired correlation method, main components, etc.).

Taking into account the drawbacks of expert evaluation methods related to the subjectivism, limited application and high costs of conduction, it is proposed to apply a calculation method, namely the principal component analysis , to determine the weight coefficients of the hierarchy elements.

The values of the a_{ij} weights for the indices are determined by the formula:

$$a_{ij} = \frac{c_{ij}|d_{ij}|}{\sum c_{ij}|d_{ij}|},$$

where d_{ij} is the value of factor loads of the i-th index in the j-th period;

c_{ij} is the contribution of the j-th component to the total dispersion of the set of indicators and the i-th feature.

The algorithm for calculating the values of factor loads (d_{ij}) and the coefficient of contribution of each component to the factor load (c_{ij}) is implemented in standard software packages for statistical data processing (SPSS, STATISTICA, SYSTAT, etc.).

The obtained results made it possible to distribute the weight of each of the indicators included in the list on a scale of 1 to 10 (Table 1).

On the basis of the developed system of indices located at the low level of the hierarchical model, their normalized values and weight coefficients, the general estimates of each level of the hierarchy and the general integral assessment of the state of the problem are calculated, which is investigated as a whole. The calculations were made using a formula:

$$Oef = \sum_{i=1}^{n} Pi \times Ki$$

where Oef is the estimation of the financial mechanism efficiency of higher educational institutions of Ukraine;

Pi is the weight coefficient of the i-th criterion;

Kij is a normalized value of the i-th characteristic.

Table 1: Determination of weight coefficients of financial mechanism efficiency indicators of higher education institutions of Ukraine

Показники	F1	F2	Weight coefficients

Level of economic activity of persons with higher education	0,839607	– 0,417431	0,077377
Share of NDR performers in total employed population	0,450611	0,828132	0,058524
Total dispersion	9,175763	3,302483	–
Share of total dispersion	0,655412	0,235892	–

Source: compiled according to the authors' calculations

It should be noted that the specific value of the calculated integral index or indices characterizing certain aspects has no economic interpretation, only its dynamics and comparative value are important.

Thus, the developed model of complex evaluation of such a system makes it possible to assess the efficiency of the existing financial mechanism of higher education institutions in Ukraine from the standpoint of economy, productivity and efficiency on the basis of a comparative analysis. Also with the help of this model it is possible to estimate how effective the system was during a certain period.

Determinants of Bank Lending in Russia: Industry Aspect

Vera PANKOVA

Center for Macroeconomic Analysis and Short-Term Forecasting; National Research University Higher School of Economics, Moscow, Russia

vpankova@forecast.ru

Abstract

The slowdown in lending to non-financial companies in Russia since 2014 and its slow recovery from the second quarter of 2017 was a result of banks' problems with funding both in the domestic and foreign markets and also growth in overdue loans, which led to an loan rates increase and stricter requirements for borrowers. Instead of looking for relevant factors at the macroeconomic level, this research sheds some light on industry specific determinants of bank lending by types of economic activity. Moreover, this research contributes to the identification of the role of monetary policy for availability of bank loans for industries considering their heterogeneity. I found that industry characteristics explain the dynamics of bank lending by types of economic activity. Unfavorable dynamics of industry specific determinants: growth of overdue loans, increase in debt burden, output decline, liquidity and profitability reduction, cause a substantial decrease in banks' incentives to grant new loans. Economic sectors with weak financial characteristics – construction, manufacture of machinery, manufacture of wood and agriculture – are the most vulnerable in terms of the availability of bank credit resources. This investigation also reveals that tightening of monetary policy leads to shrinkage of availability of loans for all industries, as banks reduce lending due to the expected increase in companies' debt burden and growth of credit risk. Moreover, increase in loan rates reduces the demand of the most liquid industries, such as mining and quarrying, for bank loans, consequently, this leads to an additional reduction in lending growth rates.

Keywords: Bank Lending, Macroeconomic Industrial Structure, Lending Channel, Monetary Policy

Introduction

The sharp increase in overdue loans and the reduction in lending growth rates are the recent trends of the Russian banking sector. The period 4Q 2013 – 1Q 2016 was characterized by a tightening of bank lending conditions for companies, significant increase in the share of non-performing loans and a growth of the demand of companies for prolongation and restructuring of previously issued loans.

The monetary policy shift to the inflation targeting played a special role in the reduction of availability of loans. The decision of the Central Bank to raise the monetary rate by 6.5 percentage points to 17% in December 2014, which was made due to increased devaluation and inflation risks, had a particularly negative impact on the availability of bank loans for Russian companies. The companies' demand for loans, which has already decreased due to the deterioration of economic situation, slumped in response to this decision.

The volume of liquidity in banking sector was insufficient, first of all, due to the transition of the Bank of Russia to the policy of a structural liquidity deficit and an increase in the monetary rate. In addition, there was a problem with access to global financial markets due to sanctions imposed against Russian banks. Thus, the deterioration of resource availability for banks both in the domestic and external financial markets led to an increase in the price of loans for companies and toughening of requirements for the financial position of borrowers.

The demand for new loans from companies declined due to the instability of the economic situation, the slump in production activity and the price appreciation of bank credits. At the same time, the demand for the prolongation and restructuring of previously issued loans increased. The dynamics of lending has started to recover slowly only since 2Q 2017.

Thus, the set of factors influencing the dynamics of lending in Russia in recent years at the level of the economy are clear. However, it is interesting to identify and analyze the impact of specific industry factors that have an impact on the volume of lending to the sectors of the Russian economy. Moreover, this research is aimed to reveal the influence of monetary rate at the industry-level. The results can be useful for the Central Bank of Russia as it can contribute to understand how monetary policy affects the availability of bank loans for industries considering their heterogeneity.

Related Literature

There are several key areas of empirical literature about determinants of bank lending. The first direction of researches by Qayyum (2002) and Calza et al (2003) is focused on the factors affecting only the demand side for loans, in other words, the desire of firms and households to use loans as a financing tool. The second group of researches by Ogawa, Kitasaka (2000), Hou (2007), Tracey (2011), Chernykh, Theodossiou (2011) pays attention only to the factors affecting the supply of bank lending, that is, the ability and willingness of banks to issue loans. However, most of the papers, for example, by Albulescu (2009), Guo, Stepanyan (2011), Tan (2012), Shijaku, Kalluci (2013), Pham (2015) consider both demand and supply factors, which are evaluated in one equation or in system of simultaneous equations. For example, authors of the research Herrera et al (2013) construct a system of Seemingly Unrelated Regressions (SUR), which consists of the equations of supply and demand, to analyze private sector lending. Real loan rate is supposed to simultaneously reflect both demand and supply effects. It is reasonably to point out studies by Djankov et al (2007), Weill (2011), which concern influence of institutional determinants on bank lending. A type of legal system, level of financial sector development and corruption index can serve as examples of institutional factors. Institutional development is attributed both to the demand and to the supply side, because institutions create an environment for bank lending.

In addition to researches that analyze bank lending at macroeconomic level (described above), there are a lot of papers, for example, Chernykh, Theodossiou (2011) and Ladime et al (2013), in which authors examine the impact of banks' characteristics on their willingness to issue new loans i. e. microenomic-level studies. Some of the empirical studies – Kashyap, Stein (2000), Altunbas et al (2000), Drobyshevsky et al (2008), Leontyeva (2009), Cetorelli, Goldberg (2011), Jimenez et al (2014), Perevyshina, Perevyshin (2015), Borzykh (2016) – are devoted to the bank lending channel, which reveal impact of interest rates dynamics on bank lending activity and GDP growth.

Empirical papers about determinants of bank lending at the industry level represent a special direction of studies by Ogawa, Kitasaka (2000), Arnold et al (2006), Sayfieva (2013), Hernando, Villanueva (2014), Fidrmuc et al (2015). Arnold et al (2006) explore the importance of lending to industries and its role in the transmission of monetary policy in Germany. Authors of this research come to the conclusion that the volume of bank lending depends on the sectoral structure of the loan portfolio of German banks and, accordingly, on changes in the demand of industries. Monetary policy has an impact on the supply of loans; however, this influence significantly depends on the characteristics of the bank such as size and liquidity and does not depend on capital adequacy. On the contrary, in papers by Hernando, Villanueva (2014) and Fidrmuc et al (2015) it was revealed that severity of capital requirements substantially determines the availability of loans for economic industries.

Hence, it can be concluded that there is a limited number of empirical researches devoted to determinants of bank lending at industry level and none of these studies were performed using data for Russia. Besides, typical characteristics of industries are industry inflation and output. In this connection, current study contributes to the empirical literature in terms of consideration of specific industry indicators as determinants of the bank lending dynamics for Russia.

Data and Methodology

Monthly data for the period from April 2010 to December 2017 was used to assess the impact of specific industry factors on the dynamic of lending by type of economic activity. The main sources for this data are the following:

- Bank of Russia (volume of issued loans, volume of overdue loans, total loans for industries; inflation, exchange rate, monetary policy rate and loan interest rate for non-financial companies);
- Russian Federation Federal State Statistics Service (profit, costs, current assets, short-term liabilities, total equity and total debt by types of economic activity);
- Joint Economic and Social Data Archive – Higher School of Economics (output indices by types of economic activity).

In this study, industries are key types of economic activity in accordance with the classifier National Classifier of Economic Activities NCEA-1 (Table 1). For industries C (Mining and quarrying) and D (Manufacturing) statistics is more detailed due to the high differentiation between their constituent types of economic activity.

Table 1: Industries of Russian economy (in accordance with NCEA-1)

Code	Types of economic activity (i.e. industries)
A	Agriculture, hunting and forestry
C	Mining and quarrying:
CA	extraction of energy producing minerals
CB	extraction of minerals except of energy producing minerals
D	Manufacturing:
DA	manufacture of food products, including beverages, and tobacco
DD	manufacture of wood and products of wood
DE	manufacture of pulp, paper and paper products, publishing and printing
DF	manufacture of coke and refined petroleum products and nuclear materials
DG	manufacture of chemical products
DI	manufacture of other non-metallic mineral products
DJ	manufacture of metals and metal products
DK	manufacture of machinery and equipment
DM	manufacture of transport vehicles and equipment
E	Electricity, gas and water supply
F	Construction
G	Wholesale and retail trade; repair services for means of transport, furnishings and private used goods
I	Transport and communications
K	Real estate activities

In this paper, two alternative measures which approximate credit granting activity are used. The main dependent variable is a growth rate of the loan portfolio of the Russian banking system by types of economic activity. The alternative measure is the ratio of the volume of loans issued to the volume of repaid loans by types of economic activity, which helps to test the robustness of the results. Higher values of this ratio indicate a revival of lending activity and lower values, on the contrary, reflect a slowdown in lending activity. Set of independent variables is represented below (Table 2).

Table 2: Description statistics for independent variables for 2009 – 2017 years

Independent variables	Number of observations	Mean	Standard deviation	Min.	Max.
Industry					
Overdue loans / Total loans, %	1802	5.5	4.0	0.4	23.5
Leverage, %	1836	161.7	113.8	0.0	660.7
Profit / Debt, %	1836	36.6	42.9	-36.9	290.2
Profit / Costs, %	1836	10.1	10.9	-12.8	68.2
Current assets / Current liabilities, %	1836	160.9	51.5	0.0	399.0
Output index, %	1728	106.3	17.8	47.8	153.3
Banking system					
Equity / Total assets of banking system, %	1836	13.1	2.3	9.1	16.4
Total loans / Total deposits of banking system, %	1836	113.8	11.4	95.2	145.3
Liquid assets / Total assets of banking system, %	1836	5.3	1.5	3.6	9.9
Macro					
Loan interest rate for non-financial companies (up to 1 year), %	108	11.5	2.7	7.9	19.9
Exchange rate UDS/RUB (growth rate), %	108	112.2	23.8	75.6	184.9
Oil price (growth rate), %	108	100.9	35.8	43.3	188.0
GDP (growth rate), %	108	100.4	4.1	88.2	105.7
VIX index	108	18.7	7.5	10.1	45.6

Estimation of models on panel dataset is applied for identification of impact of specific industry characteristics on dynamics of bank lending.

I estimate the following regression (basic model):

$$\boldsymbol{L_{it}} = \boldsymbol{\alpha_i} + \sum_{k=1}^{K} \boldsymbol{\beta_k} * \boldsymbol{I_{k,it-n}} + \sum_{p=1}^{P} \boldsymbol{\gamma_p} * \boldsymbol{B_{p,t-n}} + \sum_{r=1}^{R} \boldsymbol{\delta_r} * \boldsymbol{M_{r,t-n}} + \sum_{s=1}^{S} \boldsymbol{\eta_s} * \boldsymbol{I_{k,it-n}} * \boldsymbol{M_{r,t-n}} + \boldsymbol{\varepsilon_{it}}$$

$\boldsymbol{L_{it}}$ – 1) growth rate of the loan portfolio for **i** industry at month **t**; 2) the ratio of the volume of loans issued to the volume of repaid loans for **i** industry at month **t**

$\boldsymbol{I_{k,it-n}}$ – industry-level variables;

$\boldsymbol{B_{p,t-n}}$ – characteristics of banking system;

$\boldsymbol{M_{r,t-n}}$ – macroeconomic factors;

i – type of economic activity (industry) code, t – time period, n – lag order (3 or 6 months).

Interaction terms $\mathrm{I_{k,it-n}} * \mathrm{M_{r,t-n}}$ allow to test hypotheses about influence of monetary policy on dynamics of lending by types of economic activity depending on industry characteristics.

Characteristics of banking system and macroeconomic factors are used in this research as control variables. As a control factor reflecting the dynamics of the macroeconomic situation, is considered the indicator of macroeconomic conditions, obtained as the first principal component from the set of variables (growth rates for exchange rate UDS/RUB, oil price, GDP and VIX index). The first principal component (PC 1) explains 63% of total variation and correct signs for factor loadings (Tables 3 and 4). The application of the principal component method is an attempt to prevent a multicollinearity caused by presence of a high correlation between macroeconomic variables.

Table 3: Results of Principal Components Analysis

Number	Value	Difference	Proportion	Cumulative Value	Cumulative Proportion
PC 1	2.506	1.584	0.627	2.506	0.627
PC 2	0.923	0.534	0.231	3.429	0.857
PC 3	0.389	0.206	0.097	3.817	0.954
PC 4	0.183	---	0.046	4.000	1.000

Table 4: Factor loadings in principal components

Variable	PC 1	PC 2	PC 3	PC 4
Exchange rate UDS/RUB (growth rate)	-0.564	-0.198	0.492	0.634
GDP (growth rate)	0.540	-0.038	0.824	-0.171
Oil price (growth rate)	0.571	0.260	-0.207	0.750
VIX index	-0.254	0.944	0.193	-0.081

Thus, the first principal component approximates macroeconomic conditions (generally), high PC 1 values correspond to favorable periods and low values, in turn, reflect crisis periods.

Results

Tables 5 and 6 represent model estimation results. For robustness check of industry variables coefficients several specifications of basic model were estimated. In Table 5, there are results for the main dependent variable – a growth rate of the loan portfolio of the Russian banking system by types of economic activity. The difference between columns (1) - (3) and (4) - (6) is an order of lag for independent variables. Columns (1) and (4) represent «short» specifications without macroeconomic

conditions, columns (2) and (5) are specifications with macroeconomic conditions and columns (3) and (6) are «long» specifications with macroeconomic conditions plus interaction terms for monetary rate and industry variables. In Table 6, there are the similar results for the alternative dependent variable – the ratio of the volume of loans issued to the volume of repaid loans by types of economic activity. It is worth noting that this variable is a satisfactory alternative for measuring credit granting activity.

We can see that in all specifications corresponding coefficients are similar to each other.

As a result of the estimation, it was revealed that industry specific characteristics affect both the willingness of banks to provide loans and the decisions of the companies (industries) to use bank loans as a source for financing their activity. Thus, the most significant variable determining features of an industry and possibility of its companies to get a loan is a ratio of overdue loans, which approximates credit risk of an industry. Industries with higher level of overdue debts are less likely to get bank loans, since essential credit risk reduces an attractiveness of such investments for the banking sector. Consequently, banks strive to minimize volume of loans issued to enterprises related to high-risk industries. This corresponds to results of researches by Hou (2007), Shijaku, Kalluci (2013), Tracey (2011). The similar logic can be applied to the leverage ratio (total debt to equity). On the one hand, industries with a lower leverage are more reliable borrowers and they can rely on attracting credit resources from banks. On the other hand, industries with sufficient internal resources have a lower propensity to use bank loans. Thus, this variable can simultaneously reflect the supply-side and the demand-side effects, however, in this study supply-side effect is stronger, and so we have negative sign for the appropriate coefficient (Tables 5, 6).

The profit to debt ratio is negatively correlated with dynamics of bank lending. High profit industries have more opportunities for development relying only on their internal sources or bond issuance; this fact ultimately leads to a reduction in demand for bank loans. At the same time, the impact may be opposite since a larger profit indicates greater stability and efficiency of the company, which are positive signals for banks (supply-side effect). However, in this study the supply-side effect is not confirmed.

Output growth positively affects the willingness of banks to grant credits, because an increase in output indicates a favorable condition for an industry (companies sustainably earn incomes), therefore banks remain confident in repayment of issued loans similar to Arnold et al (2006). Though Arnold et al (2006) noticed that output growth had a negative impact on a dynamics of lending for a number of manufacturing sectors of Germany. Probably, the cause is that industries shrink demand for bank loans when their output increases since they have larger cash inflows.

The ratio of current assets to short-term liabilities reflects a liquidity of an industry. In general, a higher value of the indicator represents more accurate matching of assets and liabilities by maturity for an industry (or companies). As a result, the higher is the proportion of current assets, the more persistent are companies of an industry, consequently, it leads to credit expansion (banks strive to issue more loans to the most liquid industries). It must be emphasized that the ratio of current assets to short-term liabilities turns out to be statistically significant only in those specifications of the model, which also include the interaction terms with loan interest rate.

In addition to the analysis of impact of specific industry factors on the dynamics of lending by types of economic activity, an important role in this research is assigned to the study of interest rate influence on growth rate of lending by industries. Since the dynamics of loan interest rate for non-financial companies (up to 1 year) fully correspond to the dynamics of the monetary policy rate, thus it reflects the importance of monetary policy of Central Bank of Russia for development of lending. An increase in loan interest rate causes a slowdown in credit growth, for example, in paper by Perevyshina, Perevyshin (2015) as banks constraint granting of loans at a higher price due to expectations of growth in overdue debt, which is similar to Arnold et al (2006). Hence, higher costs of credit resources reduce their availability for industries of Russian economy and, thereby, it limits growth opportunities for the economy. Moreover, it is interesting to test whether interlinkages between industry-specific characteristics and the influence of monetary policy on dynamics of lending by industries exist. For this purpose, interaction factors between industry variables and loan interest rate were estimated. The only statistically significant interaction factor is cross-product for liquidity ratio (current assets to short-term liabilities) and loan interest rate. The increase in loan rate for non-financial companies leads to the occurrence of additional costs for more liquid industries. In this case, the most liquid industries can attract financing from other sources (including internal funds).

Conclusions

This research examines the influence of specific industry factors on the willingness of banks to grant loans and on the industries' (companies') decisions to use bank loans as a source of financing. Also an attempt to study the impact of monetary policy on the dynamics of lending depending on specific industry indicators was made.

Applying estimations of panel data models to Russia for the period April 2010 – December 2017, I found that industry characteristics can explain the dynamics of bank lending by types of economic activity. Unfavorable dynamics of industry specific determinants: growth of overdue loans, increase in debt burden, output decline, reduction of liquidity and profitability, cause a substantial decrease in banks' incentives to grant new loans to industries. Economic sectors with weak financial characteristics are the most vulnerable in terms of the availability of bank credit resources and, as a result, they have the lowest potential for further development (other things being equal). Such sectors of the Russian economy include: construction, manufacture of machinery and equipment, manufacture of wood and products of wood and agriculture.

In addition, this paper reveals that tightening of monetary policy leads to shrinkage of availability of credit resources for all industries, as banks reduce lending due to the expected increase in companies' debt burden and growth of credit risk. Moreover, increase in loan rates reduces the demand of the most liquid industries (mining and quarrying) for bank loans, consequently, this leads to an additional reduction in lending growth rates.

Some possible extensions to this study include more detailed search and analysis of additional industry-level determinants and influence of their dynamics on linkage between monetary policy and credit growths by industries. Also, applying the proposed methodology to data for Russian regions (i.e. industry-region level research) is potentially useful.

Abstract

This paper is discussing on the information literacy skills in enhancing the learning process among undergraduate students. The deliverance of information literacy instruction to students is becoming progressively more significant due to the proliferation of electronic resources and the increased usage of the net as an information source. Information literacy is a set of abilities requiring individuals to recognize when information is needed and have the ability to locate, evaluate, and use effectively the needed information. Information literacy has also become more and more significant in the contemporary environment of rapid technical change and proliferating information resources. Because of the escalating complexity of this environment, individuals are faced with diverse, abundant information choices: in their academic studies: in the workplace, and in their personal lives. Information is available throughout the libraries, community resources, special interest organizations, media, and the internet.

Keywords: Information literacy, information literacy skills, learning process, undergraduate students

Introduction

Information literacy is one of the most important elements in enhancing the ability of the students to excel in their studies. According to the American Library Association (2019), "Information literacy is defined as a set of abilities requiring individuals to 'recognize when information is needed and have the ability to locate, evaluate, and use effectively the needed information.'" To be information literate, one is required to have the skills not only in research but in critical thinking. Besides that, ALA also referred information literacy as "Information Competency" or "Information Fluency". With those statements, it is undeniable that information literacy can be considered as an essential factor for the information seeking discoveries among all students in their studies. Igwe, Emezie & Uzuegbu, (2014) highlight that, a high obligation of education system in associating students' journey of discovery as they advance through the institutions of higher learning in the 21st century. This indicates that all educational activities should emphasize on emerging students' ability for inquiry, independent learning, innovation and critical discourse, with stress on generating graduates that are self-directed and lifelong learners. Therefore, they believe that inquiry-based learning is the trend of teaching and learning in the contemporary information and knowledge society that is focused by eruptions on data, information resources, scholarly outputs and knowledge assets.

Gun & Odafe (2014) inform that information literacy consists of library search, skills and information technology literacy, nevertheless it is wider than these. Information literacy is not only about seeking and providing information, but also related to greater direction of analysis, synthesis, critical thinking and problem solving. It includes retrieving and using information for independent study and learning, lifelong learning, participative public spirit and social obligation. On the other hand, Alkhezzia & Hendalc (2018) mention that, it is predictable that the world is observing the swift progression in the amount of obtainable and reachable information, which consequently nurtures the importance of information literacy in all fields, especially in the academic community. Nowadays, students are fortunate to be part of this information-eruption world. They can retrieve information by using different devices such as their mobile phones, laptops, tabs and more information than former generations obtained, who need to use multilevel libraries. They added that, it is not the information, only that matters, but rather the skill in treating the huge amount of information. Disclosure of information does not make us educated unless we know how to deal with it efficiently.

Literature Review

Numerous definitions of information literacy are presented in the literature. In the past decade, the term 'information literacy' has been used recurrently both in professional literature and discussion. It has become a phenomenon in helping shape and maintains educational system and policies all over the world. Granting to the Association of College and Research Libraries' (ACRL, 2000), "Information literacy is a set of abilities requiring individuals to recognize when data is needed and deliver the ability to locate, assess, and use effectively the needed information" (Ashoor, 2005). The same document points out those information literacy skills are created to reinforce the above powers. The skills of recognizing, locating, identifying, retrieving and evaluating data can be admitted every bit part of the teaching of an existing course or institute an independent course in the course of study.

Information Literacy

The foundation for lifelong learning is information literacy, which is applicable to all disciplines, all learning environments and all levels of education. It facilitates learners to understand better the subject content, extend their investigations, become self-directed, and assume greater control over their own learning. Association of College and Research Libraries' (ACRL, 2015) identifies information literacy as a set of integrated abilities encompassing the reflective discovery of information, the understanding of how information is produced and valued, and the use of information in creating new knowledge and participating ethically in communities of learning."

Coonan, & Secker (2014) describe about the Venn Diagram of intersecting literacies that contribute to information literacy. They mention that to become a genuine 'information literate' person, ones has to consecutively improve:

- Awareness of how to engage with the digital world
- How to find meaning in the information ones discovers
- How to articulate what kind of information ones requires
- How to use information ethically
- Understand the role ones can play in the communication in their profession and
- How ones evaluates information for credibility and authority.

Fig 1. Venn Diagram of intersecting literacies that contribute to information literacy

According to Doyle (2017), in his study conducted in 1992, mentions that information literacy was comprehensively concerned for the first time during that year. He has listed the characteristic of the information literate individual who should be able to:

- Recognizes that accurate and complete information is the basis for intelligent decision making
- Recognizes the need for information
- Formulates questions based on information needs
- Identifies potential sources of information
- Develops successful search strategies
- Accesses sources of information, including computer-based and other technologies
- Evaluates information
- Organizes information for practical application

On the other hand, Naik & Padmini (2014) highlight that in this contemporary era, information is increasing drastically in this world where everyone, no matter men or women, rich or poor, adults or youngsters need information in their daily lives. Those who are information literate, can easily proceed with their lives smoothly once they get the information to do their daily tasks. In the present days, information is compulsory for every aspect of our daily tasks. They highlight, information literacy is the method of knowing when and why information is required, where to find it and how to evaluate, use and communicate it in an ethical way. It is the mixture of all the skills that necessary for the operative and extreme use of information. They added that the information literacy skills have

been used as collective term catering all or several related literacies which comprise of computer literacy, digital literacy, hyper literacy, information technology literacy, interactive literacy, multiple literacy, network literacy, oral literacy, internet literacy, reading literacy, water literacy and visual literacy etc. In this case, every related literacy is required to recognize specific procedure in understanding its specific significance. For that, the users who equip themselves with new and updated techniques to attain the quality of generating significant outcomes. They also added that the whole notion of information literacy is to transfer from text-based education to resource-based education.

Information Literacy Skills

As we all know, there are many information available for the users to employ. The information available are both in the printed and non-printed forms. However, all information available need to be evaluated before ones make the decision to choose or use the retrieved information. To become information literate, ones need to have the information literacy skills. As mentioned by Theme (2019), becoming information literate embraces the capability in differentiating fact from falsehood which is an important skill needed in identifying fake news. Libraries are to be found to help users gaining information literacy skills, as well as educating them on how to recognize fake news sources and stories.

On the other hand, Mohammad Reza Soleymani (2014) highlights that the extensive progression of information and communication technology and its extreme impact on diverse phases of life have affected several activities, particularly educational events like changing students' educational necessities, students and teachers' critical skills, teaching approaches, and the usage of information and communications technology in the method of teaching. Khaleghi & Seiamak (2011) inform that the skill to put up oneself with the alterations, competitiveness, and lifelong learning are the proofs of achievement in the modern society. Watterson (2001) mentions earlier that in reaching the information literate society, extra competencies and skills are required than physical skills and financial assets.

Furthermore, Soleymani (2014) highlights that extreme growths of information resources from one hand and quick progressions of other sciences on the other hand have caused students unable to acquire the whole resources in their normal educational passages. For that, Davarpanah, Ghasemi & Seiamak (2009), say helping students on how to learn, in other words training lifelong learners, is one of the most significant responsibilities of educational institutes. After graduating, students should be able to endure their creativities and reach for higher levels of education by merging their old and new information circles. Having special skills recognized as information literacy is needed to ensure achieving this level. Azin, Kokabi & Bigdeli (2009) stress that information literacy skills are the utmost crucial obligation of students in information society. They claim that these skills undeniably assure students' success in playing their social role.

Naik & Padmini (2014) mention that information literacy is a group of skills needed to find, retrieve, analyze and use the information. As of the beginning of 21st century, the year has been called as the information age because of the explosion of information sources output immensely occurred. It has become progressively clear that students cannot learn everything they need to know, especially in their related field of their studies at the beginning of their college/university years. Information literacy provides them with the critical skills essential to become independent lifelong learners. They added that most of the time many people assume that, when students are able to write research papers and read textbooks they are already achieving information literacy skills, are not so true. To them, information literacy skills may be taught by the educators, but what is important is a strong foundation of their understanding towards the courses they learned is parallel with the curriculum available.

The Importance of Information Literacy Skills

Solmaz (2017) states that information literacy plays very important role in lifelong learning as it increases the value of education both in learning environments and in educational settings. He added,

it is proven that numerous models should be used, various activities should be endorsed, and the effectiveness of these should be examined to ensure the information literacy skills at all levels of education are guaranteed. Educators' role is essential in bringing up individuals who are considered as the lifelong learners and who advance themselves persistently. Ringsted (1998) says that in order for educators to start this role, they have to be individuals who are self-learned in their educational and professional lives hence they have to be leaders in providing their students with studying prospects, retrieving information and manipulate it. In addition, Breivik (1999) mentions that it is essential to embrace information literacy in educator training packages. Therefore, Iannuzzi, Mangrum & Strichart (1999) highlights that it is considered as a significant approach in the enhancement of lifelong learning that individuals are provided with the information literacy skills. Polat (2004) says it is only probable for the teaching candidates to be effective in their teaching path based on a learning process that will continue throughout their life. Consequently the pre-service preparation for teachers must be appropriate for achieving the stated qualities. Solmaz (2017) stresses that, regardless of conceptual research on the connection between lifelong-learning and information literacy, no investigative work has been found. For that, it would be valuable to regulate the relation between their tendency towards lifelong learning and information literacy levels to disclose the learning profile of teaching candidates because by detecting the interest, attitude, ability, expectation and the tendency of them, a healthy needs exploration can be carried out and findings can be used in the expansion of the related programs.

Naik & Padmini (2014) summarize the importance of information literacy as “a prerequisite for participative citizenship, social inclusion, the creation of new knowledge, personal empowerment and learning for life”. They also stated the importance of information literacy as follows:

- Information literature is important to understand the difficult question of ownership of information and copyright
- Students should learn to respect the author’s right
- To be an independent lifelong learner, it is essential to achieve a high level of information literacy
- Information literacy is to help close the gap between the information poor and the information rich
- Information literacy is required to have a critical thinking approach, that would lead to economic and cultural progress of the nation
- A sheer abundance of information in electronic format has made information literacy increasingly important
- To be an independent lifelong learner it is essential to achieve a high level of information literacy
- Equal opportunities among people are important. One of the ultimate benefits of information literacy is to help to close the gap between the information poor and information rich
- Information literacy is required to have a critical thinking approach that leads to the progress of the nation
- Information literacy is required for democracy
- A sheer abundance of information in electronic format has made information literacy increasingly important. Traditional print resources could be subjected to a quality assurance process. Whereas online resources are in the form of electronic resources. With the Internet sources, none of the quality assurance mechanisms can be assumed

- Information literacy is also important to understand the difficult questions of ownership of information and copyright
- Information literacy is a prerequisite for participative citizenship, social inclusion, and the creation of new knowledge, personal empowerment and learning for life.

On the other hand, El Hassani & Nfissi (2015) highlight that information literacy stands at the core of freedom of manifestation and information – in the meantime, it allows people to recognize the functions of media and other information providers, to critically assess their content, and to make conversant decisions as users and producer of information and media content. In addition, information literacy is very importance to the higher learning institutions. One of the reasons is that some undergraduate students at the university have inadequate background of fundamental research and information competency skills. They might not have attained the essential skills to effectively search for information, or evaluate, synthesize and blend ideas; or may not have learned how to manipulate information in original work or give proper citation and reference for information used. They also added that, some students might have developed basic computer skills to send electronic mail, navigate the web, and share files, they may not have been taught on how to efficiently search the internet or effectively use library e-resources for their academic exploration. This is where information literacy skills are necessary and make the difference to the success of the students. If they later are given the chance to follow such programs, they will definitely face less complications while writing papers.

Information Literacy Skills in Education

The reaction of the higher education sector to the need for development of information literacy skills in students is perhaps best reflected in the view of Johnston and Webber (2003), which they pointed out that information literacy is a social response to the demand for effective use of the vast amount of data accessible in today's information society. As interest in information literacy continues to build, the scholarly discussion has started to see how information literacy can be produced employing the latest technology to adapt to the diverse student learning styles. In European countries, academic libraries have played an important role in information literacy development. Information literacy initiatives in higher education have taken a variety of forms: These include stand-alone courses or classes, web-based tutorials, course related instruction, or course integrated instruction. Most authors accept the opinion that information literacy programs be incorporated into open areas (Joint & Kemp, 2000; and Kemp, 1999).

Chu (2009) developed analysis project-based learning in a primary school with the outcome that the joining students acquired greater grades than the other students. The learning method had some positive effects like, for instance, the enhancement of the students' research and problem solving skills. On the other hands, Knautz (2013) introduces a technique to impart information literacy skills on the concept of gamification. The technique is raising learning with the theory of playing which embraces several learning approaches.

In executing the related matter, Heck (2015) has implemented four learning techniques in a retrieval course to nurture the learning process of information literacy skills. The study outcomes show that the students experienced some aspects of the learning approaches quite negatively. Nevertheless, the probability and awareness rates don't change to an excessive degree. Consequently, they accept that learning techniques have the possibility to help raising the learning process of information literacy skills. She added that, the inserting of these techniques in a university course has to properly be done. Group work is identified as rather positive, but in practice there are complications which affect its positive perception. Below are the outcomes tabled for the four learning techniques identified by the study:

Computer-supported collaborative learning	**Team-based learning**
Wiki as supportive platform: • · To foster group collaboration • · As group project storage • · As feedback tool for reviewer • · As tracking tool for teacher	Student groups as project teams: • · Foster collaborative learning • · Foster successful learning process of each student • · Support each other in finding the best solution
Inquiry-based learning	**Project-based learning**
Open retrieval task: • · The Foster students to make own decisions • · Foster self-exploration and self consistent learning	Solve a problem-oriented task • · Foster autonomous work of students • · Support creative problem-solving • · Relation to real life task

Fig. 2: Advantages of the learning methods applied in the course design. (Tamara Heck, 2015)

According to Heck (2015), computer-supported collaborative learning can be useful and backing the work in a course, but its achievement intensely subject to its intervention. The inquiry-based and project based concept was regarded positively. About the effectiveness of the introduced learning techniques related to the enhancement of information literacy skills, forthcoming work is needed regarding the analyses of the Wiki. She says, they will be able to track the history of the pages the groups created. These analyses will help them to make statements about the appropriateness of team-based learning and to conclude on the students' development of their information literacy skills.

Undeniably, students' access to information and their advantage of critical thinking directs to their active participation in educational activities. Duncan & Varcoe (2012) mention that even though there is a direct association between formal and informal information literacy and educational activities, limited studies have been conducted on this matter. Soleymani (2014) mentions that a study on the effects of teaching information literacy on the academic performance of students in Imam Mohammad Baqer Technical Higher Education Center in Sari, Iran has been conducted by Hasanzadeh & Asadi (2007). Later then, Pandpazir & Cheshmeh-Sohrabi (2011) conducted other related research and it was verified that there was a substantial variance between the academic performance of the two groups of testing and control, the ability to recognize and specify information needs, getting skills in locating and accessing information, getting related skills at using information efficiently and responsibly, the way of using information resources at the libraries. Their findings are considered good enough in understanding information needs, strategies for information searching, discovering and retrieving information, using information, combining the new and old information collections, as well as assessing search results to meet their information needs.

Conclusion

Information literacy has also become more and more substantial in the modern situation of swift technical transformation and flourishing information resources. Anafo & Filson (2014) mention that the increasing complication of this situation that need to be faced by everyone with various, plentiful information choices: in their academic studies: their workplace as well as their personal lives. In addition, information is accessible through various mediums, including graphical, aural, and textual which position new challenges for individuals in evaluating and seeing it. Ashoor (2005) highlights that the indefinite quality and increasing quantity of information contribute great challenges to the society. Therefore, it is really important for the undergraduate students to endure at least better information literacy in improving their learning process throughout their courses at the universities. While, Heck (2015) informs that computer-supported collaborative learning can be useful and

backing the work in their courses, but its success intensely influenced by its facilitation. The study found that the inquiry-based and project based theory was regarded positively. Regarding the helpfulness of the presented learning approaches related to the enhancement of information literacy skills, upcoming work is needed regarding the analyses of the Wiki. It is said that they would be able to identify the history of the pages the groups created. These analyses would help them to make proclamations about the relevance of team-based learning and to conclude on the students' development of their information literacy skills.

Abstract

The advancement of financial technology has given rise to the online peer-to-peer lending (P2P lending) platform to provide loans. P2P lending provides loans without the role of financial intermediaries such as banks. Further, P2P lending is expected to increase access to financing for business, especially for micro and small businesses, which typically find it difficult to obtain funding from formal financial institutions. However, P2P lending platforms include several concerns to lenders, as they can't always find the same guaranteed security in P2P lending as conventional banks provide. Thus, we predict that platform reputation is critical in this sector. Specifically, this study aims to determine what factors form investors' perceptions on P2P lending platform reputation, evaluate the relationship between platform reputation and lenders' willingness to provide loans, and evaluate whether trust will strengthen the relationship. Using 160 lenders as respondents, this study was conducted using the regression analysis method with the help of SPSS 23 software to test the proposed models. The results show that security and protection have the greatest influence on platform reputation. Reputation itself was found to have a positive impact on lenders' willingness to lend; however, trust is found to have no moderating effect and, instead, has a positive influence on the lenders' investment decisions as an independent variable. Considering that P2P lending is able to increase SME's access to finance, the collaboration of conventional financial institutions and technology will create a relationship that benefits both parties. With collaboration, P2P lending platforms can generate a good reputation quickly and economically, while conventional financial institutions are able to increase customer bases to a wider range of borrowers from the SME sector.

Keywords: Financial Technology, Peer-To-Peer Lending, Platform Reputation, Willingness to Lend, Indonesia

Introduction

Online peer-to-peer (P2P) lending allows users to directly borrow and lend funds through a platform without the help of a financial institution as an intermediary (Downes & Goodman, 2019). This method is popular among MSMEs due to its convenient process and requirements to obtain loans, considering that 51% of Indonesia's population remains classified as unbanked (World Bank, 2017). The unbanked population makes up the majority of MSMEs, of which only 18% are bankable. This financial access gap causes a lack of funding for MSMEs, totaling up to Rp1,000 trillion (OJK, 2017). Oliver Wyman and an Indonesian fintech company, *Modalku*, found that the lack of access to credit for MSMEs resulted in losses of 14% of the total national GDP in 2015. With the large contribution MSMEs offer the economy, their access to finance should be attended to. Since the rise of fintech in Indonesia, various companies have taken this financing gap as an opportunity to create access for those who are unbanked but credit-worthy through P2P lending. The main features of a P2P lending platform's role as a dis-intermediary is to reduce transaction costs and increase the flow of information through technology. With that, however, users cannot expect to find the security, guarantee, and high monitoring that a conventional bank typically provides. This situation raises the potential for asymmetric information received by lenders, since the borrower is determined by the platform, and the lender can only rely on the credit score given by the

platform to the borrower. Therefore, the reputation and credibility of the company can be a significant competitive advantage in attracting investments from lenders.

Regarding corporate reputation itself, previous literature has noted that there hasn't been a universal agreement regarding the dimensions of the construct (Fombrun & Shanley, 1990; Walsh & Beatty, 2007). Vasconcelos (2016) states that, especially for fintech, the long-term prospects for alternative finance companies will depend on the credibility of the platform as part of their reputation and will develop according to their proven success, including in terms of products, returns for lenders, and interaction with consumers. Jackal Mal, co-founder of Tongdun Technologies, added that fintech companies should strengthen their reputation in order to be accepted by the market, placing emphasis on technology-based transaction security and protection. Based on the above explanation, the author uses service quality, quality of information available on the platform, transaction security and protection, and social capital as a measure of the reputation of the P2P lending platform. Dowling (2006) found that a good corporate reputation would make it easier for consumers (lenders) to choose service providers. In addition, Johnson and Grayson (2005) found that trust has a positive relationship on reputation, where trust supports overall perceptions of service companies (Lin *et al*., 2007).

This paper is structured as follows. After the Introduction, we present a literature review regarding P2P lending, financial risks, and investor continuance intention to invest in Section 2. We describe data and methods in Section 3. Analysis and discussion are presented in Section 4, followed with a conclusion in Section 5.

Literature Review and Hypotheses Development

Peer-to-Peer Lending

Currently, there are a number of P2P lending platforms in Indonesia, e.g., Investree, Modalku, Koinworks. These platforms use a similar lending mechanism in which prospective users, both lenders and borrowers, must create an account by providing personal information, e.g., name, address, telephone number. When applying for a loan, the borrower will create a profile that includes the amount of funds needed, the purpose of funding needs, and information on financial conditions, including income and debt; then, the borrower will go through a credit analysis process and designated a risk category in the form of a credit score that determines the interest rate on loans (Ika & Gunadi, 2018). Lenders typically make investment decisions based on the credit score that suits their risk appetite. Some P2P lending sites also specialize in providing services to the needs and interests of certain types of borrowers and lenders (Wang, Greiner, & Aronson, 2009). For example, Amartha provides credit specialized for women in rural areas. The peer-to-peer lending platform then brings together the appropriate lenders and borrowers, distributes funds, and collects the loan principal and the interest the borrower must pay and transfers it to the lenders.

Although convenient, the lean nature of the electronic market can cause transaction risks due to lack of information about the quality of services and products or the identities of related parties that can often be anonymous (Ba & Pavlou, 2002). Consequently, P2P lending is faced by asymmetric information problems (Duarte *et al*., 2012; Dorfleitner *et al*., 2016). It is difficult for lenders to ensure the authenticity and integrity of the information (Klafft, 2008). Stiglitz and Weiss (1981) explain that asymmetric information exposes lenders to higher investment risks. Diamond (1989) shows that reputation plays a key role in controlling asymmetric information and moral hazard problems.

P2P Lending Platform Reputation

Crane and Clarke (1988) found that reputation is the most important top-of-mind evaluative criterion in service-based businesses. Numerous literature has also discussed corporate reputation; however, the many variations of this definition are caused by differing perspectives and discipline. However, most definitions refer to social cognitions such as trust, knowledge, and perception. The most frequently cited definition is from Fombrun (1996), which explains that a company's reputation is a perceptual representation of a company's past actions and future prospects that describe the company's overall attractiveness for all its constituents, compared with other leading competitors, whereas Walsh and Beatty (2007) defines it as a consumer's comprehensive evaluation of a company based on their reaction to their products, services, communication, interaction with the company (employees, board of directors, or other consumers), and the company's activities. To manage their reputation, companies using the P2P lending platform need to measure their users' perceptions, specifically the perceptions of lenders as providers of funds. Schwaiger (2004) states that the parameters forming a company's reputation include the quality of products and services, employee quality and management, financial performance, consumer orientation, social and

environmental responsibility, reliability, transparency, and credibility. Emotional closeness, communication, and interaction between the company and the public are also additional parameters (Walsh & Beatty, 2007). These series of parameters are then adapted for this research to adjust according to the relevant aspects of online lending companies and their relationship with lenders, namely, service quality, quality of information provided by the platform, security and protection of online transactions, and corporate social capital.

Service Quality

In the online lending perspective, service quality refers to the quality of functions and supporting activities provided by the platform to make the P2P lending experience run smooth and convenient (Chen, Lai, & Lin, 2014). Numerous literature finds that service quality is an important component in a company's reputation (Walsh & Beatty, 2007; van der Merwe, Puth, 2014; Han *et al*., 2015). One way the P2P lending platform can improve the quality of its services for lenders is to guarantee the quality of the products it offers, namely, the quality of borrowers provided on the platform's marketplace. With this, the platform can minimize the risk of default on lenders and increase the satisfaction of their transactions.

Crane and Clarke (1998) found that reputation is the most important top-of-mind evaluative criterion in assessing service-based business, and numerous literature has found that service quality provided by a company is important in creating added value and increasing customer satisfaction (Parasuraman, 1998; Wixom *et al*., 2005). In the context of P2P lending, the quality of services provided by a P2P lending platform depends on the guarantee regarding the quality of borrowers in the marketplaces through the selection and screening of prospective borrowers (Pavlou & Gefen, 2004). More importantly, high-quality services will lead to lender's confidence in platform reliability, capability, and integrity (Eisingerich & Bell, 2008). For this reason, lenders will expect a satisfying experience in the future, so that they are more likely to invest through P2P lending services. Thus, the researchers propose that intermediaries who consistently provide high-quality service have a positive influence on the reputation of the P2P lending platform.

H_1: *Service quality of P2P lending platforms positively affects platform reputation.*

Security & Protection

Security and protection in the context of P2P lending refer to the perception of lenders that security requirements will be met by the platform, including authentication, integrity, and encryption. Lender's perception of security protection in online transactions depends on how clearly individuals understand the level of security measures carried out by the platform (Gefen & Straub, 2003; Wixom & Todd, 2005). One of the safety and protection measures commonly understood by the public and applied by many companies is the privacy policy. Kim *et al*. (2008) explained that perceived privacy protection is a perception of the possibility that the platform will try to protect the user's confidential information collected during online transactions from misuse by unauthorized parties. Given that the protection of personal data is a relevant concern in this digital era, safety and protection become an important aspect of a company's reputation.

*D*ue to the high risks borne by lenders, the security and protection of lenders are among the main priorities of the P2P lending platform as an intermediary. A lot of sensitive information is collected in online transactions, i.e., information that is prone to abuse. The act of spreading illegal personal information can significantly harm the parties concerned (Ratnasingham, 1998). Notably, in the digital age, data protection has become a sensitive issue. Thus, when the platform has sufficient security features and protection mechanisms on its site, lenders can see the efforts made by the platform in fulfilling the security requirements of online transactions (Chellappa & Pavlou, 2002). This makes it easy for consumers to make investment decisions by looking at the efforts that platforms deploy to reduce the risks that lenders face.

H_2: *Security and protection provided by P2P lending platforms positively affects platform reputation.*

Social Capital

According to OECD (2007), social capital can be considered as links, values, and shared understanding in society, which fosters trust and cooperation between individuals and groups. In terms of the P2P lending platform, Kim *et al.* (2008) describe social capital as a resource that can be accessed through social networks. The platform as a member of a social network with a good reputation will be more respected and its online activities will be considered more trustworthy. Social capital can function as a signal that

can play an important role in the market, as it is difficult to develop but easily accessible to lenders (Collier & Hampshire, 2010).

Overall, the platform as a member of a social network with a good reputation will be more respected, and his or her online activities will be considered more reliable. Given the vast access to information and the strong influence of social networks, the platform should build its social network to increase its social capital. Platform actions that harm consumers will bring sanctions from members of their social networks, drain their social capital, and can even cause reputation damage.

H_3: *P2P lending platforms' social capital positively affects platform reputation.*

Information Quality

Information quality refers to consumers' perceptions of the accuracy and completeness of the information provided on websites related to products and transactions (Kim *et al*., 2008), including loan amounts, interest rates, loan duration, and credit rating. This information is all relevant in assessing credibility and trust in borrowers (Chen *et al*., 2014). Because loan transactions are the most prone to asymmetric information for lenders, high-quality information can significantly help lenders minimize the chance of experiencing bad credit. The authenticity and integrity of information in the P2P network platform affects the level of perceived information asymmetry and trust in the platform (Wang *et al*., 2015).
The quality of information available on the Internet varies, ranging from accurate and reliable to deliberately misleading. Pack (1999) suggests that it is often difficult to know how often website information is updated and whether or not the facts listed have been checked. Quality information can help to reduce the level of perceived uncertainty and perceived risk related to electronic transactions like P2P lending, because high-quality information can make transactions more controlled, thereby reducing uncertainties and risks contained therein (Kim *et al*., 2008). Thus, it is suspected that high-information quality is a factor that influences the reputation of the P2P lending platform.

H_4: *Information quality provided by P2P lending platforms positively affects platform reputation.*

Trust in P2P Lending Platform

Pavlou and Gefen (2004) describe a lender's trust on the P2P lending platform as a lender's belief that the platform will follow regulations, procedures, and yield fair results in the marketplace as a competent and reliable platform with integrity. A lender's trust in a platform consists of two aspects: (1) technical protection of the platform and (2) good reputation from the borrower and strict transaction rules. Zand (1972) states that trust in a business is an important factor in determining the effectiveness of various relationships and is one of the main motivators of behavior in general (Konovsky *et al*., 1994; Schurr *et al*., 1985). Lack of trust will reduce the effectiveness of communication and distort important information (Gibb, 1961), resulting in reduced risk-taking behavior. Chang (2013) states that trust, together with reputation, has an influence on consumer consumption behavior, in a relationship where trust creates positive expectations in the intentions or behaviors of related companies (Singh & Sirdeshmukh, 2000), thus increasing purchase intention.

Willingness to Lend

One important aspect of success in adopting new technologies is willingness to engage. Fukuyama (1995) describes willingness to engage as a willingness to be involved in an activity in which a person is exposed to risk without having the ability to control the behavior of other related parties. Regarding P2P lending, Wan *et al.* (2016) states that willingness to lend refers to lenders' intention of providing loans to borrowers. This statement is relevant in the context of P2P lending, considering that lenders have no control over borrowers, thus exposing lenders to financial risks, security risks, and operational risks. Hence, willingness to lend is a key variable in this study.

The reputation of the company acts as a form of information that is validated by the market (Hansen, Samuelsen, & Silseth, 2008) and which can signal the quality of products/services offered (Rose & Thomsen, 2004). Thang and Tan (2003) show that companies with a good reputation are preferred by consumers, so that, in the case of P2P lending, platforms will be easier to attract lenders to invest. This is because consumers will trust a company with a good reputation for the guarantee of quality services. For this reason, it is suspected that the reputation of a good P2P lending platform will increase the lenders' willingness to lend.

***H5**: Platform reputation positively affects willingness to lend.*

Numerous literature has also shown that a company's good reputation is associated with consumer satisfaction, loyalty (Fombrun & van Riel 1997; Hall, 1992), and trust (Doney & Cannon, 1997). Johnson and Grayson (2005) found that the trust consumers have toward a company has a positive relationship with a company's reputation as a service provider.

***H6**: The effects of platform reputation toward willingness to lend is stronger in lenders who trust the P2P lending platform.*

Method

Research Data and Sample

This study uses a nonprobability sampling method, specifically judgment sampling, where the respondent must meet criteria set by the researcher (Malhotra, 2010). Respondents of this study must be above the age of 17 years and have invested at least once in a P2P lending platform in Indonesia. The samples collected were 160 respondents who used nine different P2P lending platforms (Investree, Koinworks, Akseleran, Amartha, Uang Teman, Modalku, Danamas, Modal Rakyat, and Crowde).

In order to guarantee validity, this study adapted variable indicators from several previous studies and tested them first using a pre-test. Finalized instruments consist of two core parts: the first is the main construct that includes service quality, security and protection, information quality, social capital, platform reputation, trust, and willingness to lend. Each item uses a Likert scale from 1 (strongly disagree) to 6 (strongly agree). The second section covers respondents' profiles, including the P2P lending platform used, frequency of investment on platforms, time of platform usage, gender, age, last education, employment, income, and sources of information about P2P lending.

Research Model

We develop two models for this research. The first model aims to determine the dimension of the platform's reputation variable itself, considering the previous literature suggests the nature of dimensions that are specific to each industry. We evaluate how service quality, security, and protection, social capital, and information quality variables affect platform reputation variables. The second model aims to analyze the effect of the reputation on lender investment decisions, which is measured using the willingness-to-lend variable and also whether trust can strengthen or weaken the relationship.

Figure 1: Research Model

Data Analysis

Data were analyzed using multiple linear regression to see the relationship of service quality, security and protection, social capital, and information quality variables with reputation platform, and moderation regression to see the influence of trust on the relationship between platform reputation and willingness to lend with the help of SPSS 23. Before being processed, the pretest results showed all variables and indicators used reliably with Cronbach's alpha > 0.6, and valid with KMO > 0.5 and Bartlett's test < 0.05. The classic assumption test also shows all multicollinearity free variables with VIF < 10 and tolerance > 0.1. In addition, the data proved to be homoscedastic with a significance Gjerser test > 0.05.

Result and Discussion

The first regression analysis was performed using four reputation factors as independent variables (Service Quality, SQ; Security Protection, SP; Social Capital, SC; and Information Quality, IQ). The effect of each variable on platform reputation as the dependent variable (Platform Reputation, PR) can be viewed via the figures below.

Figure 2: Determinant of Platform Reputation (Model 1)

The model can explain as much as 50.7% of the reputation platform variance. Of the four reputation predecessors, service quality (b = 0.152), security and protection (b = 0.198), social capital (b = 0.144), and information quality (b = 0.166) have a positive and significant influence on the reputation platform, supporting four hypothesis H1, H2, H3, and H4. Then, the result of 2nd model presented as follows.

Figure 3: Willingness to Lend (Model 2)

The second model shows regression result about how platform's reputation influence on investor willingness to lend. The regression is carried out by adding interaction variables to see if trust variable is moderate the relationship or whether trust variable can strengthen the relationship between the platform reputation on willingness to lend. Figure 3 shows that the model can explain as much as 80.1% of the

willingness-to-lend variance. The reputation of the platform (b = 0.698) has a positive and significant influence on willingness to lend, so H5 is acceptable, whereas trust as a moderating variable is found to be insignificant, so that the hypothesis H6 rejected. However, we found that trust has a positive and significant relationship as an independent variable on willingness to lend.

Platform Reputation

Platform reputation is significantly affected by service quality, which is consistent with several previous studies (Crane & Clarke, 1998; Walsh & Beatty, 2007; van der Merwe & Puth, 2014). Parasuraman (1998) and Wixom *et al*. (2005) suggested the importance of the quality of services provided by a company in creating added value for its consumers. The screening and selection of borrowers registered in the marketplace platform is a guarantee of the quality of borrowers in accordance with the risk appetite of lenders, resulting in satisfying transactions and adding to a company's good reputation. Security and protection of transactions that take place through the platform also have a positive influence on the reputation of the P2P lending platform. With consumer concerns increasing regarding abuse of personal data, companies are increasingly pressured to adopt privacy protection practices to encourage online transactions. The efforts that are deployed by the platform to minimize risk will certainly be an input to the views and ends of lenders' investment decisions. A company's reputation has a positive relationship with its social capital. Social media as one of the most popular social network instruments also plays an important role in this regard, namely, as a window through which users can access social capital information. In these containers, lenders and borrowers can interact with each other, and both can interact with the platform. Platform actions that harm consumers will bring sanctions from members of their social networks and drain their social capital, where one result can cause damage to reputation, so that, indirectly, social capital acts as an important signal in the market (Lin *et al*., 2009). Finally, there is a positive relationship between the quality of information from the P2P lending platform to the reputation of the platform. With the amount of information circulating on the Internet, it is difficult for lenders to determine the integrity of the information found on the platform, especially when the information will be used as a relevant basis in assessing lenders' credibility and trust in borrowers (Chen *et al*., 2014). Inaccurate or unclear information can lead to misconceptions and adverse selection that will generate the potential for default transactions. Lenders will certainly not be satisfied with these results, and the company's image can be tarnished.

Willingness to Lend

The reputation of the P2P lending platform (platform reputation) has a positive influence on willingness to lend. This is due to the fact that reputation is a form of information that is validated by the market (Hansen *et al*., 2008), which functions as a signal for consumers (Rose & Thomsen, 2004); hence, it will certainly influence willingness to lend. Especially in the context of P2P lending, given that lenders have no control over the borrower, this reputation signal will be a major factor in lender investment decisions in the platform. This finding is consistent with that of previous literature, including Thang and Tan (2003) and Chang (2012), who conducted similar research in the retail context. The authors found that a good corporate reputation would be preferred and lead to willingness, even loyalty to consumers. One of them is influenced by word-of-mouth recommendations from friends and relatives, which is an indicator of reputation measurement in this study; thus, in the case of P2P lending, platforms will be easier to attract lenders to invest.

Related to trust in a business, this factor is important in determining the effectiveness of various relationships and is one of the main motivators of behavior in general (Konovsky *et al*., 1994; Schurr *et al*., 1985); further, lack of trust will reduce risk-taking behavior. Fombrun (1998) found that consumer trust in a company was facilitated by the company's reputation drawn from service quality and market performance or media reports. Then, that trust creates positive expectations of the intention or behavior of the related company (Singh & Sirdeshmukh, 2000), so that it increases purchase intention. In other words, trust acts as a mediating variable. Supporting this theory, the findings of Mui *et al*. (2002) and Chang (2013) also revealed the mediating effect between reputation and willingness to pay in the retail context. This could be the reason why the moderating influence of the trust variable is not significant. However, although the moderation effect is not significant, trust has a direct and positive influence on willingness to lend as an independent variable. This finding is consistent with the findings of Chen *et al*. (2013), which shows a significant relationship between trust in platform and willingness to lend on P2P lending platforms in China. On the other hand, there may be limitations to the model, approach, or sample characteristics

used in this study, so that the moderating influence of trust variables is not caught in the relationship between platform reputation and willingness to lend as expected at the outset.

Managerial Implications

In order to carry out its functions, the P2P lending platform, as an intermediary, needs to attract active lenders who are willing to lend to borrowers in the marketplace platform. In accordance with the results of this study, it is important for the platform to improve quality and ensure the security and protection of transactions that significantly affect the reputation and availability of lenders to lend. In addition, the completeness and clarity of the information contained in relation to borrowers and transactions are also important factors in reducing asymmetric information from the lender side. Finally, the company's social capital must also be considered, especially in terms of social networking. Given the strong influence of social media today, the platform must reflect good relations with relevant parties. Because P2P lending services in Indonesia are still at an early stage, the reputation of the platform can build a foundation for reflecting the benefits of investing using this instrument and building lender confidence and prospective lenders who are interested in trying.

Furthermore, considering that one of the objectives of P2P lending as an opening access to finance for MSME players and financial inclusion instruments, the collaboration of conventional financial institutions and technology will create a relationship that benefits both parties. Banking institutions can join hands with fintech companies such as peer-to-peer lending to expand the scope of their customers. Supporting this idea, the OJK Financial Market Sector Development Team has also encouraged the distribution of a micro credit program (KUR) by the government through fintech peer-to-peer lending.

Conclusion

The four company's reputation variables used here (i.e., service quality, security and protection, social capital, and the quality of information) show a positive and significant relationship in the platform reputation. The influential strength of these four factors is quite similar, with security and protection showing a slightly stronger influence. In the context of P2P lending in Indonesia, a lender's willingness to lend is positively influenced by the reputation of the platform as an intermediary. The implication is that a lender's positive perception of a platform plays an important role in the decision to lend through P2P lending. Given lenders' limited control over borrowers, reputation plays a role as a signal, which will be a major factor in lender investment decisions in the platform. Regarding trust, this study did not find enough evidence to show a moderating influence on the relationship between platform reputation and willingness to lend of a lender. Instead, trust in a platform variable shows a direct positive effect on willingness to lend. This finding implies that lender trust in the platform does not affect the strength of the relationship between reputation and willingness to lend but, rather, has an independent influence on lender investment decisions through P2P lending. Considering the conclusions and limitations of this study, it is expected that, in the future, there will be further research related to P2P lending in Indonesia. Future research can include lender experience as an additional variable, considering that P2P lending is still uncommon in the community. Besides, because willingness to lend is a dynamic behavior, respondents' responses can vary according to the duration and frequency of use of P2P lending services.

Abstract

This study aims to analyze what criteria are used by Venture Capital (VC) firms to value Indonesian tech startups as high-flyer investments. We define high-flyer investment here as start-ups projected to generate return five times or more than its initial investment. We evaluated what criteria are considered more important than the others by VC's. Research carried out on variables that considered as main aspects evaluated by VC firms are: company, product, and market factors. We used mixed qualitative and quantitative primary data collected through questionnaires for quantitative data and interviews for qualitative data. Logistic regression results revealed that companies with product performance passed the minimum viable product (MVP) phase have a significant chance to value as high-flyer investment compared to those who offer products or services that are not market-proven yet. Sequential qualitative interview findings indicate VC preferences for companies that are fast followers over the pioneers and also suggest that the founder, or human-related aspect, is a critical factor in investment decisions made by VCs.

Keywords: venture capital firms; tech start-ups; investment criteria; high-flyer investment; Indonesia.

Introduction

The global startup economy continues to grow, valuing US $ 2.8 trillion between 2016 and 2018, indicating a 20.6% increase over the previous period and more than double the growth five years ago. The creation of this value is equivalent to G7 and higher than the annual GDP of the UK. Until 2018, VCs worldwide have invested a total of US $ 220 billion on one occasion. (StartupGenome, 2019). In mid-2018, Southeast Asia was home to eight unicorns. Compared to other Asian regions, Southeast Asia has had a thriving success. China dominates this list with 90 companies, India has ten, and only three unicorns in South Korea. Japan, Australia, and Hong Kong each have only one. Jakarta is the base of operations of four Indonesian unicorns: Tokopedia, Go-Jek, Traveloka, and Bukalapak. With a population of 260 million and smartphones reaching Indonesia having reliable internet and cellular adoption, with around 75 percent of online purchases made via mobile phones. With this, Indonesia becomes a promising business landscape compared to other ASEAN ecosystems (Nordin, 2019).

The presence of four unicorns in Indonesia is also the growing trend of the company, which continues to grow until now has helped increase economic growth for the community. Besides employment and broader business opportunities for conventional MSMEs, the role of startups is also crucial to the process of developing competent human resources to encourage advanced transfer technology (Ministry of Industry, 2018). In the long term, companies break down based on potential utilization and represent the core of a healthy national economy. With the support of becoming "Digital Energy of Asia," the Indonesian government is trying to support e-commerce and digital services. As quoted from the Ministry of Industry's report on the Industrial Revolution 4.0 roadmap, what was included in the national priority for developing the digital economy was the development of ecosystems and incentives for technological investment, where the role of VC becomes essential in fostering the event of a new invention or business model.

Well-developed venture capital networks provide tremendous incentives for entrepreneurship by reducing the difficulty of entering the industry (Winton & Yerramilli, 2008). VC can also use their experience and contacts to reduce the amount of information costs and the opportunity costs associated with forming new businesses. Availability of venture capital also attracts high-quality entrepreneurs and personnel to an area that then accelerates the emergence of new companies, innovation, and economic development. Both the private sector and the state through state-owned enterprises are increasingly increasing their role in providing venture capital and stimulating the establishment of startups.

However, until now, the level of risk faced by venture capitalists was still quite high, with 70% of technology-based startups failing within 20 months of their first funding (Bhardwaj, 2018). This reduces the incentives of venture capitalists to invest in Indonesian startups due to the enormous risk. Thus, understanding of the way VC evaluates pilot companies is essential so that startups can find out what criteria considered crucial so they can make them a priority. Information about the VC decision-making process can be useful to increasing the potential of startups to be funded so that the digital economy can continue to grow exponentially. This research will also attempt to find out how VCs build a system that can help them in deciding that a startup is feasible to invest. This belief system also influences the way they value the leverage of one startup company compared to another, which is a 'premium' factor in a company.

This paper is structured as follows. After the introduction, we present a literature review regarding P2P lending, financial risks, and investor continuance intention to invest in Section 2. We describe data and methods in Section 3. Analysis and discussion are presented in Section 4, followed with a conclusion in Section 5.

Literature Review and Hypotheses Development

Characteristics of VC Financing

Financing in Several Stages

Venture Capital companies do not provide on time financing for start-ups, preferably multi funding in several stages. In every stage, venture capital firms evaluate the start-ups and then decide whether to provide additional investment or liquidate their interest in the start-ups. Generally, financing amount in the next step is more significant than before, and the amount of funding in investment stages may be dozens of hundred times compared to early stages. Venture capital firms provide financing in several stages to minimize adverse selection problem typically inherent in a start-up. (see Senalasari et al., 2019).

However, in very early stages, only limited number venture capitals may be willing to provide financing due to high uncertainty regarding survival and potential growth of a business. In this stage, a start-up sometimes generate fund from angel investors. In this stage, stocks are usually cheaper to obtain, but the risk is very high. Angel investors are better known as altruistic investors compared to venture capital

and tend to pursue goals such as personal satisfaction, opportunities to influence new business development, and job creation in addition to maximizing economic value (Harrison & Mason, 1992; Landström, 1993)

Support from Incubators and Accelerator

Along with funding, VC companies provide managerial support and network for a start-up to incubate or accelerate business for success. The managerial and network support usually through cooperation with the incubator and accelerator institution developed by a university or corporation. But recently, incubators and accelerator developed program (SAO program) to 'create' start-ups products and founders, not necessarily as part of the cooperation with a venture capital firm, but from the venture capital firm perspective, the existence of incubator and accelerator institutions benefits the focus of their investments to pilot companies that have emerged as some of the 'graduates' from SAO programs, especially in the biotechnology industry, since the pilot companies, incubator, and accelerator have the potential to have valuable intellectual property (Baum & Silverman, 2004). But on the other hand, SAO usually gets a return on the amount of an ownership for the services to help pioneer a company (Munari, Odasso, & Toschi, 2011; Wright et al., 2006).

Seek for Strategic Partners

Another characteristic in VC financing is a need to find strategic partners. VC firms are financing company by nature, but they are highly involved in a managerial aspect of the business. Strategic partners refer to companies operating in relevant sectors, usually a significant or leading player in it. Previous literature concluded that partnerships created benefits, especially in technology-based startups, because reduced uncertainty, while managing dependence on external institutions, obtaining access to partner-owned resources, and obtaining the benefits of learning from experience from partner's expertise (Pangarkar & Wu, 2013). Besides, establishing strategic partnerships with the right parties is an important for company's positive reputation, indicate that startups received positive evaluations from industry players with more knowledge (Baum & Silverman, 2004).

Venture Capital Investment Selection Criteria

Bank financing is known to be evaluated based on 5C criteria (character, capacity, capital, collateral, and condition). However, 5C criteria are not applicable in VC financing for start-ups. Start-ups founders usually has nothing credit record to assess character and start-ups business lack fixed assets to use as collateral. Thus, VC firms evaluate start-ups based on different criteria consisting of human or founder related, product related, market-related, or potential cash-out (Tyebjee & Bruno, 1981; MacMillan, Siegel, & Narasimha, 1985). In Indonesian context, Widyanto et al. (2019) found six criteria considered necessary by VC firms to evaluate their investment, consisting of five human or founder-related criteria (capable of sustained intense efforts, able to assess and react to risk well, thoroughly familiar with the market the VCF targets, demonstrated leadership ability in the past and have a track record relevant to venture capital investment) and one product-related criteria; target market has enjoyed a significant growth rate.

However, human or founder related is one of the most essential fields but also most difficult to quantify when evaluating startups (Kozmetsky, Gill, & Smilor, 1985). Thus, the investment criteria analyzed in this study is related to the aspect of the company, product, and market of the pilot company. These criteria assumed to represent the trade-off between risks and opportunities for success of start-ups and is analyzed by paying particular attention to exits with high valuations.

High-flyer Investments

High-flyer investment is defined as high-quality investment, a type of stake in a startup company expected to provide return five times or above of the amount invested in the beginning (Streletzki & Schulte, 2013). As can be indicated from its name, investment with a return of more than five times is an excellent value investment and not all startup companies can achieve similar valuations. Regarding the age of investment companies in Indonesia, which are quite young and no startup companies are entering the IPO stage or can realize an exit with high returns for any VC (Alessandro Gazzini, 2017), then analysis on VC funding that invests in the Indonesian startups is done by looking at the valuations

of each VC in the startup company in its portfolio, using multiple valuation methods (numerous estimates) used by VC operating in Indonesia.

Method

This research is conducted using mixed between quantitative and qualitative data generation method. At the first stage, we performed quantitative analysis and developed hypotheses to test the data collected. Then, in the second stage, we interviewed a significant person to confirm findings in the first stage. The overall conclusion provided is based on both types of data collected. This purpose to employ this method is to carry out qualitative interviews to explore and discover the intent of quantitative findings (Banyard, Williams, & Siegel, 2001).

Research Design

We evaluate three aspects of investment criteria for VC firms financing; company-related aspect, product-related aspect, and market-related aspect. Previously, Streletzki and Schulte (2013) evaluated three points also, but variables used is quite different due to different investment environment. For example, Streletzki and Schulte (2013) assess patent and prototype as relevant product-related variables, which are considered not crucial for Indonesia case (see Widyanto et al., 2019). Instead, we use product performance variable for this study. Table 1 present differences in variables used in Streletzki and Schulte (2013) and this study for each aspect of evaluation criteria.

Table 1: Comparison Variables Used

Aspects	Streletzki dan Schulte (2013)	This study
Company	Stage Cluster Distance Academic Spin-off Corporate Spin-off Strategic partners	Stage/*Pre-funding* SAO Spin-off Strategic partners
Product	Patent Prototype Product diversity (*single*) Product diversity (*multiple)*	Product performance Product diversity
Market	Market segment Pioneer strategy	Market fragmentation Market segment Pioneer strategy

We define variables used in this study as follows:

Product Performance

In previous research, significant differences have found between businesses that have developed their products into prototypes that function with companies that have not arrived at that stage (Kakati). At the initial stage, the focus will be on Minimum Viable Products that can be created by the company. MVP is a useful tool to solve all these gaps, both within the pilot company team and also between the group and external stakeholders (Duc & Abrahamsson, 2016). At a further stage, namely in the Series, A series, and so on, Product-Market Fit (PMF) becomes very important. It is defined as a condition where the company plays in a good market with products that can satisfy the market (Andreessen, 2007).

Product Diversity

In the context of pioneering corporate funding carried out by VC, it found a tendency for some VCs to choose their portfolio companies based on the diversity of products or services they offer (Hall & Hofer, 1993). It also found that portfolio company strategies that target a broad market scope are significantly superior to those that target the Sandberg and Hofer focused markets (Sandberg & Hofer, 1987). Also, product diversity leads to relatively more significant sales because the broad market that can be captured increases business competitiveness by creating customer value and meeting different customer needs

(Wally & Baum, 1994). Previous research also proved the existence of a positive relationship between the diversity of products or services with the performance of technology-based companies. (Zahra, Sapienza, & Davidsson, 2006)

Market Fragmentation

A fragmented industry is defined as a business environment with the majority of small companies spread geographically. There is no market leader, nor is there a company that has the power to shape industrial events (Porter, 2008). So, Porter stated that overcoming fragmentation could be a very significant strategic opportunity. Rewards for consolidating fragmented industries have the potential to be very high because the costs of entering the sector tend to be low, and there are no specific arrangements because there is no market leader to shape working conditions in a trade, so the situation becomes very competitive (Carpano, Chrisman, & Roth, 1994; Porter, 2008).

Market Segment

This difference between the two types of buyers, namely B2B and B2C customers, will require a different response. From the perspective of VC, Muzyka, Birley, and Leleux (1996) show that the preferences of European VC companies for B2B or B2C portfolio companies based on their own experiences. In other words, they prefer market segments that they already know well (Brettel, 2002).

Pioneer Strategy

Although synonymous with high risk-taking and preference for industrial disruption, most research on VC investment selection criteria found that startups targeting mature markets were more attractive to VC than startups that had new target markets (Brettel, 2002). The risk of failure with the first movers strategy is high because new markets are full of uncertainty, and VC tends to want to avoid the risk of failure of portfolio companies that target uncertain new markets. But in terms of performance, pioneer companies were found to outperform competitors who imitated them, with the finding of a positive correlation between pioneering strategies and business success (Sandberg & Hofer, 1987).

Data and Participants

Data for quantitative analysis are management of venture capital firms who provide financing for start-ups in Indonesia. We evaluate quantitative data using logistic regression to find out whether there is significant valuation based on each independent variable analyzed. Valuation here is defined as whether a start-up is categorized as high-flyer investment or not or whether it is assessed as a start-up expected to generate at least five times return or not.

Meanwhile, data for qualitative analysis are management of venture capital firms who are willing to participate in interviews. In-depth interviews are designed based on two main objectives, namely to confirm the results of quantitative data processing, and the second is to answer research questions that are created from the beginning as part of qualitative analysis so that researchers can have an in-depth understanding of the topic of funding by the VC. To form these questions, the researcher also made a comparison between the findings obtained with the previous literature and the situation of the Venture Capital investment industry. The participants were picked using the *snowballing* sampling technique by leveraging the researcher's network. Of the six participants in the questionnaire contacted by researchers, all of them stated that they were willing to be resource persons in further qualitative research with interview methods. However, considering that the majority of interviewees in this interview were bound by non-disclosure agreements (Carpano, Chrisman, & Roth, 1994) with their respective companies, the results of interviews were presented by disguising both the names of individuals who were the speakers and the VC they represented.

Result and Discussion

Table 2 presents logistic regression results.

Table 2: Wald Test Results

	B	S.E.	Wald	df	Sig.	Exp(B)	Conclusion
Pre-funding	-0.483	1.789	0.073	1	0.787	0.617	Not significant
Incubator/accelerator program participant	-0.806	1.802	0.2	1	0.655	0.446	Not significant
Strategic partners	-1.329	1.189	1.248	1	0.264	0.265	Not significant
Product performance	3.61	2.147	2.828	1	0.093	36.961	Significant
Product diversity	1.241	1.545	0.646	1	0.422	3.461	Not significant
Market fragmentation	2.114	1.881	1.264	1	0.261	8.282	Not significant
Market segment	-1.766	1.582	1.246	1	0.264	0.171	Not significant
Pioneer strategy	-1.079	1.932	0.312	1	0.577	0.34	Not significant
Constant	-0.216	1.714	0.016	1	0.9	0.806	Not significant

We generate 22 responses from VC firms who were answer questionnaire we sent, and each response represented one venture capital firms. These firms focus on different investment stages, with the prevalence of being multi-stages focused from Seed to Series B stage and with the geographical focus of mainly ASEAN and around a quarter of them specifically only investing in Indonesia.

Company's Aspect

Company's aspects consisted of stage/pre-funding variables, incubator/accelerator participant variable, and the presence of strategic partners variable. Logistic regression for stage/pre-funding variables shows that odd ratio or Exp(B) is 0.617, indicate that if a company gets pre-funding, it's opportunity to value as high-flyer investment is 0.617 times compared to a start-up who does not get pre-funding, while logistic regression for incubator/accelerator participant variable shows that the odd ratio or Exp(B) is 0.446, indicating that if a start-up was an incubator/accelerator program participant, it's opportunity to value as high-flyer investment is 0.4446 times compared to a start-up who ddi not participate, and logistic regression for the presence of strategic partner variables shows that odd ratio or Exp(B) is 0.265, indicating that if a start-up was an incubator/accelerator program participant, it's opportunity to value as high-flyer investment is 0.265 times compared to start-ups who do not have a strategic partner. However, p-value for all variables higher than 0.1 indicates that those findings are not statistically significant.

From an in-depth interview, we found that the pre-funding status of a startup company do not determine whether VC will invest or not, let alone give a high valuation. One of the informants explained that the company did not make the startup company's pre-funding status a benchmark because it could cause them to conduct FOMO "Fear of Missing Out" "Fear of Missing Out" Investment as described in (Collewaert & Manigart, 2016). Meanwhile, even though it has proven before that in a more niche industry such as biotechnology associations with the program was considered as proof of the legitimacy of the company (Baum & Silverman, 2004), in Indonesia the existence of a program was not considered a significant value enhancer. Most informants acknowledge that accelerators that have been established for a long time will have advantages — the only program mentioned in the US accelerator, Y Combinator. Y Combinator is the most prestigious accelerator in the United States (Stross, 2013). However, this finding might indicate that absence of the SAO program in Indonesia associated with the ranks of graduates who are ready to capitalize. However, regarding the presence of a strategic partner is contrary to previous studies (Malecki & Tootle, 1996; Easingwood et al., 2006) who stated that the presence of strategic partners so becomes a point that needs to be re-confirmed in the venture capital industry in Indonesia because for startups at a very early stage, the nature of strategic partners is essential. From in-depth interviews, we found that participants are very concerned about the influence that can be quantified from the existence of strategic partners, as seen in (Faems et al., 2010) and Pangarkar & Wu (2013).

Product-Related Aspect

Logistic regression for product performance variable shows that odd ratio or Exp(B) is 36.961, indicating that if start-ups with proven product performance, it's opportunity to value as a high-flyer investment is 36,961 times higher compared to a start-up who does not have a strategic partner. And the p-value indicates that this finding is statistically significant. This finding confirms Streletzki and Schulte (2013) and Widyanto et al. (2019) results and proves its role as the primary indicator used in the venture capital industry. However, the results related to product diversity is not statistically significant. The latter consequence confirmed in interview processes in which participants did not think that product diversity was a substantial factor in evaluating startups and confirm to Sandberg & Hofer, 1987; Wally & Baum, 1994) who stated that investors prefer a product-focus start-up.

Market-Related Aspect

Logistic ratio for three market-related aspects – market fragmentation, market segment, and pioneer strategy – indicate that the finding was not a statistically significant factor to assess a start-up as high-flyer investment. Regarding pioneer strategy, this finding suggests that venture capital firms are not excited with first-mover start-ups rather than market leaders. This finding supports Brettel's (2002), who stated that startups competing in mature markets are more attractive to VC than companies that operate as first-mover.

Premium Factor

In summary, all participants have the same view that the founder is a crucial factor in determining investment. It is believed that a capable founder is able to gain investor's confidence. In assessing the initial stage of the company, the due diligence that can be done by VC is limited to the validation of the founder's competency and integrity. Therefore, at this stage, the focus is to bridge the 'perception asymmetry' (Wirtz, 2011) rather than 'information asymmetry.' Interviews found that VC helped startup companies in different capacities and intensities. There are incentives that VC can get by helping to accelerate the growth of the company, but the significance of share ownership and understanding of the VC team regarding the pilot industry is a significant consideration. Both will shape the VC's confidence. Fiet (1995) found that there are two forms of beliefs from the VC point of view, namely (1) the trust given to the founding team, and (2) the confidence that the VC has in the possibility of business success based on factors not related to human resources such as product attributes (Jones & George, 1998). So the discussion from the results of the above research indicates that the premium factor that will make one startup company superior to any other is the founding factor, so VC then tries to shape the perception of the startup founder's ability to execute the business plan, either by directly participating in minimizing asymmetry information regarding the performance of startup companies and depends on their high level of confidence in startups.

Conclusion

This research found that market performance is the most crucial factor used to evaluate a start-up as high-flyer investment or not. We do not see other factors, such as having pre-funding, participating in incubator or accelerator program, the existence of strategic partners, product diversity, market fragmentation and segmentation as well as pioneer strategy, as factors crucial to categorize as high-flyer investment for Indonesia context. However, we recognize that this study only covered limited number of venture capital firms as respondent due to limited number venture capital firms provided financing for Indonesian startups. Moreover, this study does not highlight the importance of human-related factors, which were found as an essential aspect for VC financing.

Acknowledgement

Abstract

Conditions in an employee's family life affect his or her work performance. Conversely, conditions in workplace also effect on one's family life. This study aims to determine the level of servant leadership and social support at work from the family environment and whether organization-based self-esteem mediated those relationships. We defined family environment here as family satisfaction and quality of life. Most of the existing research discusses how the working environment affects employee performance, but this study discusses how working conditions affect employees' family lives. This research covers Indonesian civil servants explicitly at the headquarters of the national civil servant personal agency (Badan Kepegawaian Negara, BKN). We collected data from 100 respondents who are married and who worked for more than one year. Data was processed using the regression method with help of SPSS software. The results indicated that organization-based self-esteem fully mediates the relationship between job support on both family satisfaction and family quality of life but only partially mediates the relationship between the serving leadership on family satisfaction and family quality of life.

Keywords: Servant leadership, job social support, organization-based self-esteem, family satisfaction, family quality of life

Introduction

Work and family have emerged as two essential domains that exist in one's life. They evolved into different and inseparable fields (Beach, 1989). In the past, a person's role in work and family expected to be separated and carried out by different individuals, but now it is important to note that both parts are interdependent with one another. If an employee holds a double role but has difficulty achieving a balance between the two roles, it could potentially affect both sides of life negatively. Conversely, if a person can manage various roles well, this can add to the satisfaction and quality of family life.

An organization can help improve the satisfaction and quality of one's family life. A pleasant working environment can affect the favorable conditions of the employees (Pierce, 2004). The presence of proper environmental conditions can provide an implicit signal to employees that they are respected, valued, and trusted by the organization and that the organization sees them as capable and competent members of the organization. Positive working environment factors can come from colleagues and employers.

Employment as a civil servant (Aparatur Sipil Negara, abbreviated ASN) is still the dream of most of the workforce in Indonesia. However, the thought of being a civil servant is sometimes not accompanied by the moral awareness that, when a person passes through selection and is appointed as a civil servant, he or she is a servant. One might even assume that he or she is the one who rules over their subordinates, and sometimes ASNs forget the functions and duties of serving the people. The Indonesian civil servant personnel agency (Badan Kepegawaian Negara, abbreviated as BKN) is a non-ministerial government institution in charge of implementing government duties in the field of personnel management of civil servants. BKNs tend to have the notion of serving employees implanted in their minds from an earlier age. Then, later, when the young officer becomes a leader, the officers can demonstrate leadership to help subordinates and other officers.

The leadership model strongly affects the environmental conditions of the organization. Walumba (2010) raised a new perspective on traditional leadership theory on organizational behavior, referred to as servant leadership. Implementing a servant leadership is expected in order to create a positive working environment, as stated by Pierce (2004), who noted that an excellent environment communicates to employees that they are respected, valued, and trusted by the organization and that they are capable and competent members of the organization.

In addition to leadership style, several studies reveal that social support in the workplace also brings a positive working environment (Carlson and Perrewe, 1999). Social support at work can also create a more positive work environment in which employees are more likely to feel valued and beneficial. Wiesenfeld (2001) found that, when individuals perceive themselves as supported in the workplace, they are more likely to think "central, in it, valued, and respected" within their organizations and experience higher organization-based self-esteem (OBSE).

In this study, we analyze how servant leadership and social support on the job affect employees' family satisfaction and quality of life. This study is critical because, as we stated previously, family life and work life strongly influence each other. Many studies have revealed how family life affects employees' work performance, but the research on how working conditions affect family life is limited, despite the fact that family file is still a significant concern for Indonesians. Specifically, in this research, we analyze how organization-based self-esteem (OBSE) mediates the relationship between servant leadership and job social support on the family environment. We evaluate two aspects of the family environment: family satisfaction and family quality of life. In this study, we analyze employees from the head office of the national civil servant personnel agency of Indonesia (BKN) as the case for this study, because typically civil servants are required to implement service leadership.

This paper is structured as follows. After the introduction, we present a literature review in Section 2. We describe data and methods in Section 3. Analysis and discussion are presented in Section 4, followed by a conclusion in Section 5.

Literature Review and Hypotheses Development

Organization-Based Self Esteem

Organization-based self-esteem (OBSE) is reflected as a value perceived by a person belonging to an individual as a member of the organization acting in the organizational context (Pierce et al., 1989). Pierce and Gardner (2004) conducted a literature review in this concept and stated that, in reference to Pierce et al. (1989), OBSE is defined as the degree to which an individual believes him/herself to be capable, significant, and worthy as an organizational member. OBSE is a self-evaluation concept regarding one's adequacy in the organization. Employees with high organization-based self-esteem believe that "I matter around here." Pierce and Gardner (2004) also stated that self-esteem is affected by several forces based on one's work and organizational experience regarding (1) the implicit signals sent by the environmental structures to which one is exposed, (2) messages sent from significant others in one's social environment, and (3) the individual's feelings of efficacy and competence derived from his/her direct and personal experiences.

Servant Leadership

Greenleaf (1970) states that serving leadership begins with the natural feeling that a person wants to help. Serving leadership is characterized as "beyond self-desire" (Greenleaf, 1977). It confirms the moral behavior of taking responsibility for the success of the employee development (Enhart, 2004). Rather than prioritizing the organization, such as motivating **employees** to achieve performance that exceeds expectations, servant leadership focuses more on the holistic needs of subordinates (Graham, 1991; Sendjaya and Ethics, 2010). The servant leadership is also associated with ethics, virtue, and morality (Parris and Peachey, 2013). One of the themes for ministering leadership is ethicality, which concludes that the ministering leader must interact with his subordinated fairly and honestly (Liden, 2008).

Serving leaders are welcomed in the organization, because they focus on the interests of others rather than self-interests (Hale and Fields, 2007). The servant leadership creates a prominent context for learning and development for employees (Luthans and Avolio, 2003). Employee skills and competencies are enhanced by observing leaders as showing and spreading knowledge at work. Furthermore, serving leadership encourages employees to learn by providing opportunities and empowering employees to make their own decisions (Konczak, 2000) from which they develop the skills needed, knowledge, and abilities to achieve their career objectives.

Pierce and Gardner (2004) stated that good workplace conditions can provide signals to employees that they are respected, valued, and trusted and that the organization sees them capable and competent members of the workplace. When an employee is given autonomy and support by superiors, for example, this positive working environment can help the employee feel that he or she is indeed competent in the workplace. Hence, our first hypotheses constructed as follows:

Hypothesis 1 (H1): Servant leadership affects organization-based self-esteem.

Job Social Support

Social support is an interpersonal transaction involving emotional attention, instrumental assistance, information, and appreciation (House, 1981). Social support in the workplace can arise from sources such as co-workers and superiors, which can create a more positive working environment (Roskies & Lazarus, 1980). According to the research by Wiesenfeld (2001), when individuals perceive themselves as gaining support in the workplace, they are more likely to feel central to their organization, and this can lead to self-improvement. Social support at work can also create a more positive work environment (Carlson and Perrewe, 1999) where employees are more likely to feel valued and beneficial. Because job social support can provide a more positive working environment, it can affect the OBSE, according to Pierce (2004). There is also the possibility that the environment and relationships with supervisors and co-workers has direct involvement in or provides clear signals to employees about their competence and specificity. Hence, our second hypotheses constructed as follows:

Hypothesis 2 (H2): Job Social Support affects Organization-Based Self-Esteem.

Family Satisfaction and Quality of Life

Family satisfaction can be defined as a level in which one is generally satisfied with a person's home family and a constituent relationship embedded within it (e.g., parent-child, sibling) (Carver, 1992). Family satisfaction is defined as "The affective state resulting from a person's judgment of the family aspect of his life in general" (Karatepe & Baddar, 2006). Therefore, similar to life satisfaction (Pavot & Diener, 2003), family satisfaction is defined as a conscious cognitive assessment of a person's family life in which the criteria for judgment depends on the individual (Zabriskie, 2013). Patel et al. (2018) found a positive relationship between self-esteem and satisfaction and verified this result among male and female respondents. Hence, our third hypothesis is constructed as follows:

Hypothesis 3: Organization-based self-esteem affects family satisfaction.

Zuna (2010) identified several common themes among the definition of family quality of life. First, satisfaction as a concept communicates three meanings. The first is a sense of family welfare, indicators of perception, and judgment by personal values, also referred to as component definitions. The second theme that arises from this definition is the idea of meeting the needs of individual family members. The third theme is that the family as a unit has characteristics that cannot be described simply by understanding the respective family members. Based on these three themes, the definition of family quality of life is a dynamic feeling of family welfare, collectively and subjectively defined and informed by its members, in which individuals and family levels must interact (Zuna, 2010).

Individuals with high self-esteem tend to experience lower levels of stress in their roles at work and in their families, perhaps because they are committing their roles confidently under favorable psychological circumstances (Greenhaus and Powell, 2006). Also, people with high OBSE are more hesitant to respond to negative information (Hui and Lee, 2000), and therefore tend to communicate negative information and discuss it with family members, thereby increasing the anxiety of concerned family members. In the long run, all of these positive consequences of OBSE represent the favorable treatment of family members, increasing their feelings and positive emotions and leading to a positive reciprocal attitude (Carlson, 2011).

Hypothesis 4: Organization-based self-esteem affects family quality of life.

OBSE as mediating variables

As previously explained, Bowling (2010) asserted that a good working environment is a crucial predictor of OBSE. Meanwhile, Greenhaus and Powell (2006) stated that self-esteem has been identified as a vital psychological contributor to an enriching family life.
Hypothesis 5: OBSE mediates the relationship between servant leadership and family satisfaction.
Hypothesis 6: OBSE mediates the relationship between servant leadership and family quality of life.
Hypothesis 7: OBSE mediates the relationship between job social support and family satisfaction.
Hypothesis 8: OBSE mediates the relationship between servant leadership and family quality of life.

Based on hypotheses developed, the model of this research is shown in Figure 1.

Method

This study provides conclusive research on design. We collect data using questionnaires distributed to the respondents at the Indonesian civil servant personnel agency (BKN) head office. The collected data is then tested for validity and reliability and is processed using the SPSS program.

Research Model

In the first model, we evaluate here how the servant leadership and social support on the job relate to family satisfaction and how OBSE mediates that relationship. In the second model, we evaluate how servant leadership and social support on the job relates to family life quality and how OBSE mediates that relationship.

Figure 1: Research Model

Data and Pretest

We use the non-probability sampling method with purposive sampling procedures. Non-probability sampling is a sampling method that provides certain opportunities to only certain population members who are likely to exclude other members, whereas purposive sampling is a method of non-probability sampling conducted based on specific criteria (Cooper & Emory, 1995). The number of samples specified in this study was 100 civil state employees at state personnel agency headquarters.

We use five variables here: (1) the servant leadership measured by the servant leadership questionnaire developed by Ehrhart (2004); (2) Social support on the job, which is measured using four questions designed by Van Yperen and Hagerdoom (2003); (3) organization-based self-esteem (OBSE) measured by OBSE-scale developed by Pierce (1989); (4) family satisfaction measured by the scale developed by Kopelman (1983); and (5) family quality of life measured using a scale developed by Summer (2005).

The results of the validity and reliability tests based on the collected data show that all data is valid and reliable. Validity is displayed based on the value of the loading factor, while reliability is tested based on Cronbach's alpha value. The results of the validity and reliability tests can be seen in Table 1.

Table 1: Validity and Reliability Test

Variables	Validity	Reliability
Servant Leadership	0,893	0,955
Job Social Support	0,625	0,821
Organization-Based Self-Esteem	0,814	0,940
Family Satisfaction	0,723	0,867
Family Quality of Life	0,768	0,916

Result and Discussion

The total respondents were 100 people consisting of 54% women and 46% men. The majority of respondents were from 26 to 30 years (71%), while the second most populous age group was 18 to 25 years (15%). The rest are those who are over 30 years old. Respondents mostly have been working in the BKN head office for 1 to 5 years (79%), followed by 6 to 10 years (19%), and only 2% who have worked for more than 11 years. The average value for each variable can be seen in Table 2.

Table 2: Average number of variables

Variables	Average numbers
Servant Leadership	3,47
Job Social Support	3,86
OBSE	3,85
Family Satisfaction	4,37
Family Quality of Life	4,27

The average value divided into three categories consists of low (1.00-2.33), medium (2.34-3.67), and high (3.68-5.00). For example, the average value of servant leadership is 3.47, which means that its value goes into the medium category, while the other variables go into the high category.

The results of the regression calculations from the variables in this study are shown in Table 3. The servant leadership and social support on the job variables have significant effect on the OBSE variables that, in this study, are the variable mediators. Hence H1 and H2 are accepted. Furthermore, the OBSE variable regresses to the family satisfaction and family quality of life variables, and the results indicate that the OBSE variable significantly affects the two variables. Hence, H3 and H4 are accepted.

Table 3: Regression Results

Hypotheses	Beta	Sig	Conclusion
H1	0,578	0.000	Accepted
H2	0,628	0.000	Accepted
H3	0,314	0.001	Accepted
H4	0,340	0.001	Accepted
H5	SL-OBSE: 0,578 OBSE-FS: 0,314 SL-FS: 0,258 VAF = 42%	SL-OBSE: 0.000 OBSE-FS: 0.001 SL-FS: 0.009	Reject mediation role
H6	SL-OBSE: 0,578 OBSE-FQL: 0,340 SL-FQL: 0,327 VAF = 35%	SL-OBSE: 0.000 OBSE-FQL: 0.001 SL-FQL: 0.001	Reject mediation role
H7	JSS-OBSE: 0,628 OBSE-FS: 0,314 JSS-FS: 0,046	JSS-OBSE: 0.000 OBSE-FS: 0.001 JSS-FS: 0.652	Accept full mediation role
H8	JSS-OBSE: 0,628 OBSE-FQL: 0,340 JSS-FQL: 0,095 VAF = 70%	JSS-OBSE: 0.000 OBSE-FQL: 0.001 JSS-FQL: 0.346	Accept full mediation role

Test the mediating role conducted by comparing the VAF values to 0,5, in which the value of higher than 0,5 indicates a fully mediating role. Based on the results of the calculations, OBSE does not mediate the relationship among servant leadership, family satisfaction, and family quality of life. Regarding the influence of job social support on family satisfaction and family quality of life, OBSE fully explains the relationship of the two variables. The result of the calculation is shown in Table 3.

Based on the results of the test, the servant leadership can directly influence the family satisfaction and family quality of life variables from the employees at BKN head office. Conditions in the work environment are closely related to leadership or superiors' roles. Superiors, as role models, give psychological impact to the subordinates. This psychological impact can also affect the conditions of the family environment. For example, if an employee at the office gets less pleasant treatment from his superiors (such as being given a different treatment from another employee), it will affect the employee's psychological condition. In this case, employees or in this case as subordinates will feel depressed, uncomfortable, and unimportant in the organization. Mental health can carry over into the family environment. Serving leadership is as an independent variable that can influence family satisfaction as a directly dependent variable. This finding supports the research conducted by Tuckey (2012), who found that leaders may have a significant impact on the family environment conditions of their followers, not only in terms of creating psychological effects and other positive outcomes but also by improving mental well-being.

Employers and co-workers play an important role in creating a positive work atmosphere. Favorable conditions in the workplace have a good impact on an employee's psychological well-being. For some employees, the support of co-workers feels more important than the support from superiors regarding work satisfaction, which leads to an increase in self-esteem in the work environment (OBSE).

Conclusion

From this study, we conclude that OBSE fully mediates the relationship between social support on the job and family satisfaction and also fully mediate the relationship with family quality of life. However, we have no enough evidence that OBSE mediates the relationship between serving leadership on family satisfaction or family quality of life. However, this finding might be affected by the serving leadership variable, which has a moderate average value, and there is still room for improvement. However, further research is needed, especially among broader Indonesian civil servants, not only who serve in the head office of BKN.

Acknowledgement

We greatly appreciate to Universitas Indonesia who funded this research through PITMA 2019 Program and all parties who participate for completion this manuscript

Waste Management: The Relevance of Economic Motives, Environmental Concerns, and Convenience in Processing Household Waste

Rachmadi Agus TRIONO

Universitas Indonesia, Faculty of Economics and Business, Indonesia, 16424
rachmadi78@gmail.com

Abstract

Our study aims to evaluate how economic motives affect a household's intention to participate in waste management, along with environmental concerns, waste processing convenience, and household exposure to waste management campaigns. We also evaluate how the existence of waste collection and attitudes toward thrift moderate those relationships. We conducted research, specifically in Depok, West Java, Indonesia, on household participation in a 2019 community program carried out by the Universitas Indonesia. The households were trained to utilize composter kits to process household waste to a liquid and solid compos fertilizer. We compared their intention to waste process with households not participating in the program. We found that households that participated in the program did not show higher intention to process their household waste compared with the group not participating in the program. We then found that environmental concern is among the strongest factors that determine household intention to process waste, while economic motives negatively correlate to household intention to process waste.

Keywords: household intention to process waste; community program; economic motives for waste management; waste processing convenience; exposure to waste management campaign.

Introduction

Indonesia is the second-largest contributor of plastic waste to the world's water after China; according to Conserve Energy Future, the Citarum River is the second most polluted river in 2019, after the Gangas River in India. Households contribute significantly to a country's waste problem through certain behaviors (Mattar et al., 2018).

Household waste management behaviors and factors determine the participants who have been analyzed and evaluated since the early 1970s, both in developed and developing countries. Barr (2007) evaluated three management behaviors, i.e., waste reduction, reuse, and recycling, stating that environment values, situational characteristics, and psychological factors play significant roles in prediction of waste management behaviors. Miafodzyeva and Brant (2013) conducted meta-analysis from 63 empirical studies based on published research from 1991–2010 carried out in 17 countries and found that the strongest predictors of households' recycling behaviors were convenience, moral norms (i.e., personal concern about waste management), information, and environmental concern.

Despite studies regarding household waste management behaviors, rare studies have evaluated how economic benefits affect household intentions for waste management. Among these is research carried out by Owasu, Adjei-Addo, and Sundberg (2013) in Ghana, Bergeron (2016) in Geneva, and Nainggolan et al. (2019) in Denmark.

One form of waste management behavior is self-processing household food waste into liquid and solid fertilizer. This fertilizer, i.e., compost, can be used for household needs or to sell to the market. The process technology is affordable and easy to implement. Universitas Indonesia, through a community engagement program in 2019, trained about 40 households in this program and provided them with

composter kits needed to self-process their food waste. This group was expected to process their food waste and generate economic benefit from compost produced, thus reducing the need to send the waste to a final disposal field. We then analyzed the results of the program toward household willingness to process the waste.

Specifically, this study aims to evaluate how economic motives affect a household's intention to participate in waste management, along with environmental concerns, processing convenience, and exposure to waste management campaigns. We also evaluate how existence of waste collection and attitude toward thrift moderate those relationships.

This paper is structured as follows. After the introduction, we present a literature review in Section 2. We describe data and methods in Section 3. Analysis and discussion are presented in Section 4, followed with a conclusion in Section 5.

Literature Review and Hyphoteses Development

Household Waste Management

Household waste management is implemented in several forms, e.g., waste reduction, waste reuse, waste recycling, waste separation, and waste disposal. Further, discussion regarding waste management takes on various forms. Barr (2007), for example, discussed three kinds of waste management behavior, i.e., waste reduction, waste reuse, and waste recycling. Kaplan et al. (2019) defined two waste management behaviors as minimization and recycling in which recycling involves separation (distinguishing recyclables from the rest of the waste) and throwing items into the right bin. Matter et al. (2018), Kaplan et al. (2019), and Farni et al. (2019) mainly discussed waste reduction behavior, while Owusu, Adjei-Addo, and Sundberg (2013); Aprile and Fiorillo (2019); and Nainggolan et al. (2019) discussed waste separation behavior. However, most studies concern recycling practice (see Miafodzyeva & Brandt, 2013; Yokoo et al., 2018; Sorkun, 2018).

Which waste management type is the most important? Kaplan et al. (2019) stated that waste minimization is more effective than recycling in terms of environmental impact. Similarly, Farni et al. (2019) suggest that waste management behavior should emphasize waste reduction partly because the authors found that, in Tehran, Iran, every consumer wastes about 27.6 kg of edible food annually. However, Yokoo et al. (2019) focused on recycling behavior in their study and notes the importance of voluntary recycling. The authors found that the majority households in Hanoi, Vietnam, recycle all the recyclable materials they consume, even though such recycling is not obligatory. Half the recycling households sell their recyclables to informal junk buyers, whereas the other half provides recyclables without monetary compensation.

Factors Determining Household Waste Management

What factors determine household behavior in waste management? Barr (2007) stated that the links between household attitudes and environmental behaviors are complex and interrelated but can broadly be attributed to three groups of independent variables, i.e., environmental values, situational variables, and psychological factors. Miafodzyeva and Brandt (2013) classified four variables affecting the recycling behavior of households as socio-psychological, technical-organizational, individual socio-demographic, and study-specific.

Aprile and Fiorillo (2019) evaluated how environmental concerns affect household waste management behavior in Italy during a government campaign and a program to raise public awareness of the importance of waste prevention, disposal, and recycling. The authors found that lifestyles mainly influenced the public's sensitivity and behavior toward waste issues. Mattar et al. (2019) found that lifestyles such eating out frequently and buying best offers increase food waste while feeling guilty

about wasting food reduces this waste. Similarly, the authors found that rural households contributed less to food waste compared with those in urban areas. In sum, Sorkun (2018) confirmed the influence of social norms on household recycling behavior; however, this influence was found not to occur through internalization processes.

The literature analyzes how economic benefits affect household waste management behaviors. Owusu, Adjei-Addo, and Sundberg (2013), in their study in Ghana, evaluated how cash incentives affect waste management behavior. The authors revealed that about 80% of households are willing to accept a cash incentive of GH¢1.6374 (US$1.6347) per month to participate in source separation. Further, Bergeron (2016) evaluated tax incentives in Geneva. The authors found that tax incentives are effectively encouraging the Genevan municipalities to implement and improve sorting infrastructures and services, but it must be combined with infrastructural (e.g., collection points) and persuasive (e.g., awareness-raising campaigns) instruments. In research in Denmark, Nainggolan (2019) revealed trade-offs between household preference to waste management type to time spent sorting and estimating the value of time for this activity of between 2.8 to 6.3 EUR per hour. However, a studied conducted in Vietnam by Yokoo et al. (2018) found that voluntary recycling behavior is more effective; however, this behavior is associated with altruism.

Methods

Research Data and Sample

This study was conducted on households participating in the Universitas Indonesia community engagement program. The program consists of training and technical assistance for households willing to participate in food waste management processing. Participants were selected by community leaders (Pak RT/guru ngaji). Each household participated in the program then granted with composted kits consisting of drum and EM4 needed to process food waste to liquid and solid fertilizer called compos. The program distributed 40 composter kits, 34 of which were surveyed. For study purposes, we also evaluate 30 households that did not participate in the program to determine whether there are differences in each group intention to implement food waste processing.

Respondents were interviewed on their intention to process waste, along with their motives behind the intention, which are economic motives (EM), environment concerns (EC), easiness to process waste (PC), and whether or not they are exposed to a government community program to process waste or not (EXP). The instrument used five-point Likert scales, ranging from totally disagree to totally agree. Data were processed using SPSS. Some operating variables are omitted due to their validity and reliability problems. The succeeding operating variables are processed to test the hypothesis.

Results and Discussion

Sixty-four respondents were chosen, 34 people received a composter to process their household waste while 30 did not. There are no significant differences in their intention to process waste (average values are 6.9 vs. 6.7)

Validity and Reliability Tests

All operating variables are reliable and valid to measure the concepts used (Table 1). Validities were measured using Pearson correlation, while reliabilities were measured with Cronbach's alpha. All the operating variables used to test the hypothesis are reliable for gathering all respondent's data and valid to measure concepts used in this research. Results of the validity and reliability of the data in this research are presented in Table 1.

Table 1: Validity and Reliability test result

Variable	Cronbach	Validity	Result
EM1		0.615	Valid
EM2		0.874	Valid
EM3		0.836	Valid
EM4		0.788	Valid
EMTOT	0.767		Reliable
EC1		0.725	Valid
EC2		0.8	Valid
EC3		0.723	Valid
ECTOT	0.602		Reliable
PC1		0.918	Valid
PC2		0.888	Valid
PCTOT	0.771		Reliable

EXP4		0.849	Valid
EXPTOT	0.818		Reliable
IP1		0.813	Valid
IP2		0.833	Valid
IPTOT	0.524		Reliable

Results

Twelve hypotheses are tested. Four hypotheses are tested to discern the relationship among independent variables and dependent variables, while eight hypotheses are used to determine the effect of moderating variables in coupling the relationship between independent and dependent variables.

A summary of the hypotheses testing is presented in Table 2, which shows that the first three hypotheses are accepted, while the fourth hypothesis, government program to promote household waste management, does not influence the intention to process waste by the respondents. Economic motives and degree of difficulties in processing waste are negatively affected in the intention to process waste (Hypotheses 1 and 3).

We also tested the moderating variables that jointly affect the impact of independents toward dependent variable; tests show that variables, i.e., environmental concern together with government program to induce waste processing, are not jointly affected with the existence of waste collection and attitude toward thrift (Hypotheses 6, 8, 10, and 12). The moderating variables work on only the relationship between independent and dependent variables described in Hypotheses 1 and 3, which are Hypotheses 5, 7, 9, and 1. A summary of the results is presented in Table 2.

Table 2: Summary of hypotheses testing

Hypothesis	Research Hypothesis	Beta	Significance	Result
h1	Economic Motive correlate with Intention to Process	-0.19	0.007	accept h1
h2	Environmental Concern correlate with Intention to Process	0.238	0.066	Accept h2
h3	Processing Convenience correlate with Intention to Process	-0.429	0.001	Accept h3
h4	Expose to Government Program correlate with Intention to Proc	0.113	0.108	Reject h4
h5	Existance of waste Collectore moderates the relation of h1	-0.257	0.002	Accept h5
h6	Existance of waste Collectore moderates the relation of h2	0.238	0.068	Reject h6
h7	Existance of waste Collectore moderates the relation of h3	-0.435	0.001	Accept h7
h8	Existance of waste Collectore moderates the relation of h4	0.075	0.498	Reject h8
h9	Attitude toward Thrift moderate the correlation of h1	-0.186	0.021	Acept h9
h10	Attitude toward Thrift moderate the correlation of h2	0.265	0.063	Accept h10
h11	Attitude toward Thrift moderate the correlation of h3	-0.417	0.004	Accept h11
h12	Attitude toward Thrift moderate the correlation of h4	0.115	0.127	Reject h12

Discussion

The results of testing Hypothesis 1 seem naturally accepted; further, the results corresponded to Zhaohua et al. (2016) in reverse order, while result of Hypothesis 3 is in contrary to that of Kumar (2019). Zhaohua found that, in China, the recycling behavior (which is parallelized to waste process behavior) is positively driven by economic motives, while this study revealed a negative correlation. It should be noted that throwing garbage wherever one wants to is a non-costly activity in Indonesia; hence, the waste processing behavior is negatively impacted by cost and revenue considerations.

The result of testing Hypothesis 2, i.e., environmental concern work on the intention to process waste, parallelly indicates that people concerned with environmental issues are willing to process waste. This finding is parallel to Barr (2007) and Wang, et al. (2016). The two moderating variables jointly impact the relationship of economic motives and process convenience on intention to process waste, respectively, both in a contrary order. This means that the two moderating variables couple the effect of those independent variables.

Conclusion

From this study, we found that environmental concern is the strongest factor in determining household intention to process household waste, while economic motives negatively correlate to household intention to process waste. One interesting finding in our study is that participants acknowledged that household waste processing is a convenient and positive effect in their intention to implement waste processing, but the existence of a waste collector reverses this intention.

Acknowledgement

We greatly appreciate to Universitas Indonesia who funded this research through community development program 2019 and all parties who participate for completion this manuscript.

Influence of Subliminal Messages in Television Advertisements on Adolescents Behaviour: A Study of Coca-Cola

Evaristus Adesina, Okorie Nita, Lanre Amodu, & Babatunde Adeyeye and Darlynton Yartey [12345]

Department of Mass Communication, Covenant University, Ota, Nigeria[12345]
Correspondence: Email: evaristus.adesina@covenantuniversity.edu.ng

Abstract

Subliminal messages are gaining prominence in contemporary advertisement globally. This study examined the influence of subliminal messages in Coca-Cola advertisements; its effect on adolescents; the utilization of subliminal messages by the advertising agency of Coca-Cola. The study was anchored on individual differences theory and media bullet theory. The quantitative method of research was utilized. A total of 250 copies of questionnaire were distributed to Coca-Cola consumers in Ikeja, aged between 10 to 25 years. The study showed that 78% and 76% of the respondents have never heard of the term subliminal messages and did not know what they were respectively. Furthermore, while 47.2% of the consumers affirmed they have not been influenced by subliminal messages embedded in Coca-Cola television advertisements in their purchasing decisions, 32% of the respondents were not sure of the influence. The study therefore recommended a responsible utilization of subliminal messages by advertising agencies and advertisers to prevent the dissemination of messages that would negatively influence consumers' attitudes.

Keywords: Consumers, Influence, Knowledge, Subliminal Messages, Utilisation, Adolescents, Behaviour, Coca-Cola, Advertisement

Introduction

The purchase of goods is determined by the need of the consumers and sometimes the materialistic level of some consumers. The successful emergence of advertising led to the growth and adoption of advertising by organizations and product producers for increase in sales. Advertisers have taken different steps in winning the interest of their product consumers with the use of the different media, ranging from word of mouth, print, billboards, and audio to audio-visual.

The mythically-believed James Vicary's study of 1956 on persuading the buying behaviour of consumers, led to the adoption and knowledge of subliminal messages and subliminal advertising by different organizations over the years. According to Ahmed, KhurshidMian, Buzdar, Ali and Irshad (2014), subliminal advertising has progressed as a noticeable tool used by the media to entice consumer attention and greatly funded the advertising agencies of the present age. The understanding of subliminal messages in advertisements by products consumers as well as the knowledge of utilising advertising brands of products initiates this study.

Dating back to the 1950s, subliminal advertising had its limelight from James Vicary's study on a mass of movie viewers in a theatre through the use of an advertisement that inscribed hidden words " 'Eat Popcorn' and 'Drink Coke' " (Vokey, 2013, p. 287). These words were believed to have been flashed "for a third of a millisecond every five seconds during the film" (Vokey, 2013, p. 287). Though this study occurred and was recorded by psychologists and scholars, the belief and disbelief of different scholars and psychologists in the existence of subliminal advertising has led to controversies with experiments backing up their principles. This study has led to the rebirth of subliminal messages in films, advertisements, radio and television programmes. Rebirth, because subliminal messages as well as subliminal advertising has existed before Vicary's study.

The history of individual persuasion can be seen from the era of the Ancient Greece but instead of the name 'subliminal', it had the name 'rhetoric'; the art of persuading people through speech. Having the

Sophists in the Ancient Greece, to Cicero in the Ancient Rome, persuasion has been in existence for decades. "The proliferation of mass media in the 20th century caused another shift in the study of rhetoric. Images in photography, film, and TV have become powerful tools of persuasion." (Mckay, 2018, para. 23).

The word subliminal was introduced by Vicary during his experiment. "Subliminal advertising was infamous in 1957 as a result of publicity of James Vicary, a researcher, who claimed to have significantly improved sales of Coca Cola and popcorn in a movie playhouse, by covertly and subliminally blinking the content 'Drink Coca Cola' and 'Eat Popcorn'". (Karremans, Stroebe, Claus, 2006, p. 792). Notwithstanding the opinion of scholars on Vicary's real or apocryphal study, the exposure of consumers to the new turn to advertising which is the use of subliminal messages, has left consumers to ponder on the persuasion of their unconscious minds by brands and their advertisements.

Though the study is significant, there are different points of views on subliminal messages and Vicary's experiment by different scholars ranging from that of Wilson Bryan Key, John Vokey, Don Read, Timothy Moore, Hal Becker, to Gary Greenwald, some supporting and others opposing the theories of subliminal persuasion.

Contradicting the existence of subliminal messages and the occurrence of Vicary's 1956 subliminal study, "Notwithstanding obvious use of subliminal means in different media, there is no indication for effective subliminal inducement in video, advertising, and there is no theoretical justification to expect it."(Vokey, 2013, p. 301).

Conversely, Moore defends the notion that subliminal messages in advertisements are effective in influencing consumer behaviour and choices. He believes that the "practices are supposed to stimulate consumer action by subconsciously changing preferences in the direction of consumer products".

Therefore, this study is initiated by product consumers' knowledge of subliminal messages in ads as well as the utilization of subliminal advertising by brands of products.

Statement of The Problem

Advertisements are conducted with the main purpose of influencing consumers' decisions but advertising agencies seem to have taken a step further to persuade the buying decisions of their product consumers. This is the emergence of subliminal contents in advertisements.

Though it is believed that subliminal messages exist, some theories by authors deny the existence of this advertising technique. It is believed that there are little or no proofs of the efficiency of subliminal messages in influencing an individual's buying behaviour or decision (Vokey, 2013, p. 21).

Although studies have shown that there has been an increase in the purchase of some products perceived to be backed up by subliminal messages, controversies exist on the belief in subliminal persuasion and its comparison with selective attention. Creed (1987) states that "what Key appears to mean by 'subliminal perception' is more akin to the processes of selective attention, not perception without awareness" (as cited in Vokey, 2013, p. 293).

The placement of subliminal in advertisements may be seen as a negative effect on the consumer since "it often do occur without our awareness, and without our having to or, in many cases, even being able to consciously control them."(Vokey, 2013, p. 21). On the contrary, some stores have testified on the use of subliminal messages behind songs played in the stores to prevent or reduce theft.

For this purpose, the study will identify the usage of subliminal messages in advertisements by Nigerian advertising agencies, the knowledge of consumers on subliminal messages in advertisements and examine its effectiveness in the promotion of products.

Research Questions

1. To identify the knowledge of product consumers of Coca-Cola on subliminal messages in advertisements.

2. To recognise how subliminal messages in Coca-Cola adverts influence the purchase behaviour of product consumers.

Theoretical Framework

Individual Differences Theory

This study will be making use of the individual differences theory. Individual differences theory can be traced back to the existence of modern psychology. This explains that individuals react and respond in different behaviours to messages disseminated through the mass media. The differences in consumers' perception of subliminal advertising, will be studied based on their experiences.

Magic Bullet Theory

"The Magic Bullet theory graphically assumes that the media's message is a bullet fired from the 'media gun' into the viewer's 'head'" (Berger, 1995). Individuals react to a stimuli uniformly. The media creates a large effect as it influences the activities and decisions of consumers. The media inserts its messages in the audience making the latter vulnerable to the messages. It is referred to as the shot gun that injects bullets (messages) in the minds of the audience. It is also known as hypodermic needle theory. It is very important to this study to find out if indeed the messages have an effect on the buying decision of the consumers.

Methodology

This study adopted the quantitative method of survey to elicit the knowledge and the influence of subliminal messages in Coca-Cola television advertisement on adolescents. This population of study are citizens of Lagos State who are product consumers of Coca-Cola. In relations to Wimmer and Dominick (2003), the study adopted a sample size of 250 respondents based on the authors' claim that a sample size of 200 is fair, a sample size of 300-500 is good and a sample size of 1000 is excellent.

Result

RQ 1: To what extent are Coca-Cola product consumers knowledgeable of subliminal messages?

Table 1 : Are Subliminal Messages used in Coca-Cola Advertisements in Nigeria (N=250)

Responses	Percentage (%)
Yes	28.0
No	10.4
Not sure	61.6
Total	**100.0**

In table 1, 28% of the respondents believe that Coca-Cola makes use of subliminal messages in their advertisements, 10.4% of the respondents believe that Coca-Cola does not make use of subliminal messages in their advertisements while 61.6% are not sure of the usage of subliminal messages by Coca-Cola.

Table 2: If Yes, how frequent does Coca-Cola Use Subliminal Messages in their Advertisements (N=250)

Responses	Percentage (%)
Very often	6.4
Often	17.2
Rarely	5.2
Never	0.8
Total	29.6
Missing Info	70.4
Total	**100.0**

The table above identifies the question of how frequent Coca-Cola uses subliminal messages in their advertisements. Due to the information in table 2, there were some missing information in table 4.8 because the question referred to those who chose the option "Yes" in table 2

For the respondents that chose "Yes" (they believe Coca-Cola makes use of subliminal messages in their advertisements), 6.4% of the respondents believe Coca-Cola use subliminal messages in their advertisements **very often**, while 17.2% of the respondents believe that Coca-Cola **often** make use of subliminal messages in their advertisements.

Moreover, 5.2% of the respondents believe Coca-Cola **rarely** uses subliminal messages, while 0.8% of the respondents believe Coca-Cola **never** uses subliminal messages in their advertisements.

The missing information includes the respondents that do not think Coca-Cola makes use of subliminal messages in their advertisements (No), and those who were not sure.

RQ 2: How have subliminal messages in Coca-Cola adverts influenced the purchase behaviours of product consumers?

Table 2: Do you think Coca-Cola Subliminal Messages Influence Your Purchasing Decision (N=250)

Responses	Percentage (%)
Yes	20.8
No	32.0
Not sure	47.2
Total	**100.0**

In table 3, 20.8% of the respondents believe that Coca-Cola subliminal messages influence their purchasing decision, 32% of the respondents do not believe that Coca-Cola subliminal messages influence their purchasing decision while 47.2% are not sure.

Table 4: Would you Continue Watching (N=250)

Responses	Percentage%
Yes, I would continue watching	56.8
No, I would stop watching	43.2
Total	100.0

In table 4, 56.8% of the respondents replied that they would continue watching a television advertisement even after discovering that subliminal messages are embedded in it. 43.2% responded that they would stop watching the advertisement or programme as soon as they detect subliminal messages in the advert.

Table 5: Degree in which Coca-Cola Subliminal Messages Affect People's Attitudes or Beliefs (N=250)

Responses	Percentage (%)
Very large extent	11.2
Large extent	20.4
Moderately	43.2
No effect	25.2
Total	**100.0**

In table 5, the degree in which Coca-Cola subliminal messages affect people's attitudes or beliefs were reviewed. 11.2% of the respondents believed it affected people's attitudes in a very large extent, 20.4% believed it affected people's attitudes in a large extent, while 43.2% believed it affected people's attitude moderately. However, 25.2% of the respondents believed that there are no effects on the attitudes and beliefs of people.

Conclusion

The findings of this study shows that a large number of consumers consciously feel influenced by the advertisements seen on the television, but a large number of consumers believe they do not consciously feel that their purchasing decisions are influenced by the television advertisements. However, most consumers have not heard of subliminal messages and have no knowledge of what subliminal messages mean. Another finding shows that most consumers believe subliminal messages are used in Coca-Cola advertisements in Nigeria and they are often used in the brand's advertisements. On the contrary, they believe that the Coca-Cola advertisements do not influence their purchasing decisions and they would continue watching a television programme that is subliminally embedded after their awareness of its presence.

Abstract

Poverty is a worldwide phenomenon that affects continents, countries and people differently; it affects people in both urban and rural areas. This study investigated the mediation role of foreign aid on the relationship between human capital factors (i.e. education, health and vocational training) and poverty reduction strategy implementation in republic of Chad located in the sub-Saharan Africa. Thus, a total of 550 questionnaires were distributed to the target respondents which were community leader, member of independent association, foreign aid representative and non-governmental organization (NGO). After data cleaning, a total of 537 questionnaires were used for the analysis. Structural Equation Modeling (PLS-SEM) software was used as the tools for data analysis. The findings show that there is direct effect from both education and vocational training on poverty reduction strategy implementation. But health does not have positive effect. In addition, the result revealed that foreign aid mediates the relationship between education and poverty reduction strategy implantation and also it mediates the relationship between vocational training and poverty reduction strategy implantation.

Keywords: Education, health, vocational training, foreign aid, poverty reduction, Chad, Africa

Introduction

The issues of poverty have become a serious concern worldwide, especially in Sub-Sahara Africa (Joseph, 2014). Olawole et al. (2016) citied that the World Bank (WB)(2004) defines poverty as that level of income below which a certain percentage of the population lives in. The WB described it in terms of the inability of a person to earn a daily income of USD2, poor health services, not having access to safe drinking water, having a high rate of illiteracy and high infant mortality rate. Similarly, The World Health Organization(WHO) defined poverty as a condition where one lacks basic human needs such as nutrition, shelter, healthcare, and access to clean water (Durak, 2017). This is definitely true as most people in Sub-Saharan African countries live on less than US$1.25 per day (World Bank and IMF, 2015). Among the countries in Sub-Saharan Africa, Chad Republic's socio-economic indicators rank among the worst in the region. In the early 2000s, 54 percent of the population in Chad lives below the poverty line (Apenteng, 2004). Meanwhile, in the republic of Chad, the poverty chart indicates that 46.7 percent of the country's population of over 14 million people were extremely poor (United Nations, 2017). Although, republic of Chad has drawn up and executed numerous national economic and social development plans since its independence in 1960. The overall listed objectives of these plans were to improve the standard of living of its citizens. However, the population has become poorer over the past three decades (Alkire and Santos, 2010).

For almost more than 5 decades, poor countries are receiving aid from developed countries and agencies to encourage economic growth, and consequently to reduce poverty and income disparity (Magnon, 2012). Muftau (2018) noted that the high rate of poverty in most of the African countries could be related to the lack of management and misuse of the international aid that many of the African states received. Furthermore, in less developed countries, there is a lack of substantial inflow of financial resources which affect the successfully implementation of poverty alleviation plan (Kilama, 2013; Pedrosa Garcia, 2017). Hence, Ardl et al. (2017) added that aid flows to developing countries is ultimately intended to support recipient countries to attain sustainable development especially in the area of human development, sustained economic growth, poverty reduction as well as in reducing the mortality level. The Republic of Chad is among the African countries that received a huge financial assistance from international development organizations such as the United Nations (UN), United Nations Children's Fund (UNICEF), United Nations Development Program (UNDP) and the World Bank Group (WBG), African Development Bank Group (AfDB), International Fund for Agricultural Development (IFAD), European Union(EU), International Monetary Fund (IMF), Islamic Development Bank (IsDB). Although Chad gained a high amount of foreign aid, the country still remains poor. For instance, in 2016, the largest official aid was received from the European Union institutions in a total of US$37.8 million, as shown in Figure 1.

Figure 1: Top10 Foreign Aid to Chad in 2016

Source: OCHA (2016)

Alimi Shina (2018) argued that the interaction of foreign aid with public investment reduces the level of poverty in high, low and middle-income categories. However, foreign aid has a negative influence on the level of poverty reduction in high-income countries whilst in less or low-income countries, foreign aid has a positive effect on the status of the poverty rate. In Sub-Saharan African countries, foreign aid inflows with lower stages of poverty as the aid inflow is directed to public investment rather than consumption (Alimi Shina, 2018). In addition, Ardl et al. (2017) mentioned in his study on aid, growth, and poverty reduction that there are more than 1 billion people still living under absolute poverty. Donors and countries that receive the aids should monitor the implementation of the strategies which are formulated to reduce poverty carefully. Although the official aid has a positive impact on poverty reduction, its impact is not significant (Ardl et al., 2017). As population growth exerts a negative influence on poverty reduction in the long and short-run (Ardl et al., 2017). Ardl et al. (2017) recommend that international aid organizations and aid donors should allocate for specific needs and take prudential actions in making sure that recipients' countries utilize the aid for the targeted objectives with fact-based appraisals and execution reports (Ardl et al., 2017).

Although Chad is one of the richest countries in Africa generating high revenue from oil exploitation, exporting livestock to neighbouring counties like Nigeria, Niger, Central Africa Republic and Cameroon. However, the poverty rate has not been reduced significantly over the years (Sabina Alkire, 2018). In Chad, the percentage of people living below the Multidimensional Poverty Index (MPI) is 87.1 percent in 2014-2015 (Alkire, Jindra, Robles, and Vaz, 2016). Therefore, in 2011, the percentage of poor people living with less than USD1.90 a day income was 38.4 percent and USD3.10 a day income was 64.8 percent. The overall percentage of the poor national poverty line was 46.7 percent in 2011 (Oxford, 2017).

The main factors that led to this failure were due to weak leadership and management as well as the lack of commitment to and ownership of economic activities. The social reforms have slowed the implementation of the poverty reduction programs (World Bank, 2009 and IMF, 2010). African Development Bank and African Development Fund (2015) stated that the National Development Plan strategies failed to achieve its expected goals due to unclear shift from past strategies and outlines. In addition, the lack of strong leadership, poor roads and infrastructure, lack of training programs for teachers as well as poor financial resources in the implementation of the strategies (AfDB and ADF, 2015; Mohammed, 2011; and Kanagaratnam, 2018) is also one of the cause of the failure. In addition, the large

size of the country associated with the weak road infrastructure was among the biggest challenges to meet during the implementation of the projects (AfDB and ADF (2015).

Literature Review

The Relationship of Education, Health and Poverty Reduction Strategy Implementation

In relevant to poverty reduction, health plays a very important role and it is a vital human right. Healthy bodies permits or allow people to work and children to learn (Chung et al., 2018). In the other word, health is the key element for societies to lift themselves out of poverty Mohammed (2011). Hayyat & Chughtai (2015) health is the major challenge on effectively addressing poverty is to help powerlessness people and enhance their abilities and capabilities so that they can take more control of their lives. Further, poverty and ill health are extremely connected with disempowerment, marginalization and exclusion. Thus, poverty is progressively being addressed as the absence of power to enjoy an eclectic range of freedom and human right, cultural, economic, political and social (Hayyat & Chughtai, 2015).

Furthermore, without money to purchase medications, to form and prepare hospital facilities, to ensure sufficient and acceptable workers to manage effectively the health system in the nations and therefore to increase investments in other sectors important for health such as transportation, building equipment and other necessary staff (Aitsi, Egawa, and Sasaki, 2015; Chung et al., 2018). In addition, to enhance the health condition and avoid the spiral from ill health to poverty, the national governments with the collaboration of the international development organization particularly the world health organization need to give priority to promoting, protecting and improving the health of poor communities. This includes the establishment of public quality services in health and personal cares, with reasonable financial tools (Luiz and Salazar, 2014). Furthermore, without potable water and sanitation health is at risk (Woo and Chung, 2015). In short, development agencies should help partners' nations develop pro-poor health systems by strengthening local capacity in numerous areas (Aitsi et al., 2015).

Education and poverty are reciprocally linked. As mentioned by Addo (2017) the higher the level of educated people the lesser number of poor people will be, because education teaches knowledge and skills which is helpful. In the other word, the impact of education on poverty alleviation is through increasing the income or salaries of the population (Addo, 2017). The education helps in the success of basic needs such as water and sanitation, utilization of health facilities, and shelter (Awan, Malik, Sarwar, and Waqas, 2011). Moreover, education aids the availability, therefore provision of education and achievement of basic needs both support each other (Jung, Cho, and Roberts, 2013). Nonetheless, Incompatibility of the education policy, Absence of preprimary education, limited teachers training programs and lack of basic school facilities and education materials, shortage of teachers and low quality of the existing ones as well as poor financial resources all these challenges have direct effect on effectively executed the poverty reduction strategy in many developing counties (Kolstad and Wiig, 2014; Assefa, Damme, Williams, and Hill, 2017).

Based on empirical evidence from Arias Rafael (2016) uses data from the Population Census of 2011, he conclude that succeeding greater levels of education helps people from urban and rural areas and those who live in the different planning regions to fight poverty. Arias Rafael (2016), reported that people who finish secondary education reduce poor shelter between 8.0% and 33%, reduce low levels of knowledge between 26% and 44%, and reduce poor consumption between 12.0% and 30.0%. In urban areas those who finish secondary education would have a significant effect on poverty reduction 36% in shelter, poverty of access to knowledge in 48%, and in 22.0% regarding access to other goods and services. Similarly, completing secondary education in rural areas would reduce poverty of shelter in 18%, poverty related to access to knowledge in 30%, and poverty in consumption capacity in 32% (Arias Rafael, 2016).

The Role of Foreign Aid on Poverty Reduction Strategy Implementation

Many countries in Africa, remain surrounded in extreme poverty and dysfunctional social services amid continued increase in foreign aid (Seedee, 2018). Given the importance of foreign aid for poverty reduction strategy implemenation effectiveness, it is evident that foreign aid may play direct and indirect roles in influencing poverty reduction strategy. There are serval scholars who have studied the effectiveness of foreign aid on poverty reduction strategy. As cited by Mahembe and Odhiambo (2019) earlier theorists like Rosenstein-Rodan (1943); Nurske (1953); Lewis (1954) have suggested that foreign aid provides the necessary capital to enhance developing countries into self-sustaining economic growth. Clunies-Ross, Forsyth, and Huq (2009) argued that big push is needed for the poor countries to free themselves from the constraints of the low-level setup. Thus, foreign aid jump starts economic growth, and initiates a righteous cycle whereby investment generates income and therefore increase the economic return to further investment (Shleifer, 2009; Clunies-Ross et al., 2009). Moreover, Hirano and Otsubo (2014) stated that foreign aid has an indirect effect on poverty and well-being if it is spent on disadvantaged poor people. Likewise, Woldekidan, (2015) studied "The role of foreign aid in reducing poverty in Ethiopia" he (Woldekidan) has reported that foreign aid has a significant effect on poverty reduction, by reducing infant mortality rate and increasing household consumption expenditure. However, its impact found to be negative when poverty is measured by gross primary enrollment ratio.

Henceforth, based on aforementioned statement foreign aid influence poverty reduction through economic growth. In general, the increase in foreign aid has had a positive impact on investment and growth; this evidence came from numerous empirical studies outcomes (Rajan, and Subramanian, 2008; Arndt, Jones and Tarp, 2010; Clemens, Radelet, Bhavnani, and Bazzi, 2011; Alvi and Senbeta, 2012; Kaya and Gunter, 2013; Arndt, Jones and Tarp, 2015; Appiah-konadu, Shitsi, Abokyi, and Twerefou, 2016 and Odhiambo, 2017; Minasyan, Nunnenkamp and Richert, 2017; Mahembe and Odhiambo, 2019). Although those scholars have agreed that aid promotes either directly or indirectly impact in reducing poverty. However, the impact is depending from one country to another, regions, recipient country policies and the level of aid given by the donors to targeted sectors in the specific country or continent.

For instance, Hirano and Otsubo (2014). used the conceptual framework of globalization and the poverty-growth-inequality (P-G-I) relationship to examine the effectiveness of aid to development. Their analysis revealed that social aid such as education, health and water and sanitation spending significantly and directly benefits the poorest in the society and economic aid on the other hand, like transportation, energy and communication and financial infrastructure spending increases the income of the poor through growth (Hirano and Otsubo, 2014). Likewise, another study done by Arndt et al. (2015) who measured the impact of foreign aid on economic growth, social welfare used indicators (poverty and infant mortality) and intermediate outcomes (health, education and agriculture, consumption, investment). They concluded that foreign aid does encourage growth, improve social welfare indicators and reduces poverty. However, Arndt et al. (2015) have also indicate that aid does not have a significant effect on inequality, it was discovered that aid can raise investment, improve school enrolment, boost life expectancy and reduce infant mortality. Notwithstanding, many scholars concluded that foreign aid or official development assistance (ODA) has direct or indirect influence on reducing poverty; others state that it does not affect poverty reduction strategy for example, Briggs and Briggs (2015); Appiah-konadu et al. (2016); Ugwuanyi, Uche Boniface, Ezeaku, Hillary Chijindu (2017); Chikwede, (2017); Muftau, (2018); Pedro Gil, (2018) and Shitile and Abubakar (2019).

Kaya and Gunter (2013) used a sample of 46 developing countries between 1980 and 2003 to investigated whether aid allocated to the agricultural sector has an impact on poverty. They conclude that, in fact, aid given to agriculture is effective in poverty reduction, likewise it has positive effect in other sectors as well (Kaya and Gunter, 2013). Likewise, Alvi and Senbeta (2012) analyze the impact of foreign aid on 79 developing countries between 1981 and 2004, findings confirm the existence of a direct poverty reduction impact of assistance, since the assistance coefficient appears to be negative and significant for all measures

of poverty used. Juselius et al. (2014) who have found that foreign aid contributed to long run growth in 36 sub-Saharan countries between the mid-1960s to 2007. This conclusion was reached through the use of an autoregressive (VAR) model. Also, Walin (2014) conclude that foreign aid promotes positive economic growth and enhanced in a stable macro-economic policy environment in sub-Saharan Africa.

Human Capital Theory

Human Capital Theory explains the dynamics of incomes/wages which is one of the most common poverty determination (Kasali, 2016). The human capital theory notes that the individual's decision to invest in education, training or any other long-term personal development is depends on his/her lifetime incomes earned. Hence, people investment in education and training according to the future anticipation of the return from the investment that they made. Direct and indirect cost of investment can solely be determined by the nature of the investor to the labor market (Mohammed, 2011). However, people who invest less long-term self-development are likely to be trapped in poverty; because they received less payment (salaries/wages) and yet the payment that they received is not match with the life condition. According to the human capital theory the younger ones tend be poor because they invest heavily on education and training and forgo the present earnings. Similarly, old people reaching the retirement age receive less wages and remain poor as they retire (Chakravarty and Tavoni, 2013).

The human capital theory displays how increase in education leads to rise in productivity and efficiency of workforces by increasing the level of their intellectual skills (Alor and Udeorah, 2018). People invest in education thus as to increase their stock of human capabilities which can be formed by combining native abilities with investment in human factors (Alor and Udeorah, 2018). The establishment of education is seen as a productive investment in which the promoters of human capital theory considers to be worthwhile than the physical capital. Human capital theorists have established that basic literacy enhances the productivity of labors low skills professions. In addition, human capital (health, education and skills) is vital to economic growth. Hence, development strategies that lead to greater human capital, improve access to new technologies, produce better quality public goods, improve market functioning, address deep-rooted problems of poverty; besides, it improves access to finance, prevent environmental degradation and foster a vibrant civil society all promote development of the nation. For instance, investments on education, on-the- job training, health, and nutrition. The Millennium Development Goals (MDGs) and the Poverty Reduction Strategy Paper (PRSP) considered human capital is as a weapon against poverty reduction. Therefore the idea that education is a determinant of poverty captures much attention in recently (Awan and Waqas, 2011). Therefore, a country that have high percentage of educated people but lacking of good health cannot be productive effectively. Thus, both health and education investment are desirable in order to increase productivity and reduce the level of poverty of the country.

Research framework and Hypothesis of the study

H_{1a}: Education has a positive effect on poverty reduction strategy implementation.
H_{1b}: Health has a positive effect on poverty reduction strategy implementation.
H_{1c}: Vocational training has a positive effect on poverty reduction strategy implementation.
H2: Dose foreign aid mediate the relationship between health, education, vocational training and poverty reduction strategy implantation

Figure 2: Research framework of the study

Methodology

This section focuses on the methodology adopted in this study, in an attempt to find answers to the questions raised in this study. The study investigated the mediating role of the foreign aid between human capital factors (i.e. education, health and vocational training) and poverty reduction strategy implementation in Chad republic. Thus, the study used a quantitative method to achieve the objective of the study. Gray (2017) stated that the quantitative approach is the most suitable for the questions that rate the degree of agreement, or views.

Therefore, a convenience sampling technique was used, as recommended by Etikan, (2016). convenience sampling is a type of nonprobability or nonrandom sampling where members of the target population that meet certain practical criteria, such as easy accessibility, geographical proximity, availability at a given time, or the willingness to participate are included for the purpose of the study (Etikan, 2016). Thus, a total of 550 questionnaires were distributed to the target respondents which were community leader, member of independent association, foreign aid representative and non-governmental organization (NGO). After data cleaning, a total of 537 questionnaires were used for the analysis.

Analysis and Findings

The analyses were conducted with the aid of partial least squares (PLS) structural equation modeling (SEM) software and also known as (SmartPLS-SEM). Partial least squares structural equation modeling (PLS-SEM) has become a popular method for estimating (complex) path models with latent variables and their relationships (Sarstedt, Ringle, & Hair, 2016). This software application has become a popular method for complex path models with latent variables and their relationships (Wong, 2019). According to Carrión, Nitzl, & Roldán (2017) PLS-SEM is a variance based structural equation modeling technique that has been used to model latent variables. precisely, composites and the relationships between the variables (Henseler, 2017).

Convergent Validity and Reliability

Reliability is the extent to which an assessment tool produces stable and consistent results. While validity refers to the extent to which the construct measures what it is supposed to measure (Valle & Assaker, 2016). Hence, convergent validity is the extent to which the indicators of a specific construct converge or share a high proportion of the variance for that construct (Hair, Ringle, & Sarstedt, 2011).

Table 1: Convergent Validity and Reliability

	Cronbach's Alpha	Composite Reliability	Average Variance Extracted (AVE)
Education	0.864	0.897	0.600
Foreign aid	0.884	0.903	0.584
Health	0.851	0.891	0.581
Poverty reduction strategy implementation	0.938	0.947	0.643
Vocational training	0.700	0.807	0.555

To achieve convergent validity, the constructs should have an AVE of ≥ 0.50, and the factor loadings should be preferably greater than 0.70. However, Byrne (2013) recommend that factor loadings of 0.50 are acceptable if the summations of the loading results in high loading scores contributing to AVE scores of 0.50 or greater. Thus, as presented in Table 1 the convergent validity is sucessfuly achived.

Discriminant Validity

Discriminant validity is one of the key building blocks of model evaluation (Henseler et al., 2015). Henseler et al (2015) sated that discriminant validity analysis ensures that a construct measure is empirically unique and represents phenomena of interest that other measures in a structural equation model do not capture.

Table 2: Discriminant validity

	Education	Foreign aid	Health	PRSI	Vocational training
Education	0.774				
Foreign aid	0.602	0.695			
Health	0.488	0.362	0.762		
PRSI	0.752	0.700	0.352	0.802	
Vocational training	0.503	0.457	0.645	0.441	0.675

Legend: PRSI= Poverty reduction strategy implantation

Besides, the cross-loading criterion, advocated by Chin (1998), required that items are required to load higher on their own construct that their cross-loadings on other constructs. This approach is considered liberal in determining discriminant validity (Hair *et al.,* 2014). The discriminant validity is presented in Table 2 and Table 3 present Heterotrait-Monotrait Ratio (HTMT) to support the achievement of the discriminant validity.

Table 3: Heterotrait-Monotrait Ratio (HTMT)

	Education	Foreign aid	Health	PRSI	Vocational training
Education					
Foreign aid	0.621				
Health	0.565	0.395			
PRSI	0.804	0.696	0.381		
Vocational training	0.626	0.542	0.800	0.531	

Legend: PRSI= Poverty reduction strategy implantation

Table 3, all the values in the HTMT table are below both 0.85 and 0.9. Furthermore, after all the possible discriminant validity tests, it has been found out that discriminant validity is not a problem in this study. In addition, Table 4 shows the factor loading criterion to evaluate discriminant validity.

Table 4: Outer loadings

	Education	**Foreign aid**	**Health**	**PRSI**	**Vocational training**
E1	0.874				
E2	0.804				
E3	0.892				
E4	0.836				
E6	0.593				
E9	0.584				
FA1		0.736			
FA10		0.737			
FA2		0.661			
FA3		0.621

Legend: PRSI= Poverty reduction strategy implantation

After the validity and reliability of the measurement model established, it then follows that the structural model needs to be measured. Hair et al (2011) stated that the structural model provides a means of assessing the interconnections in the measurement model to establish causal relationships or simply show the relationships between the exogenous constructs and the endogenous constructs. Likewise, structural models provide answers to the objective research and the developed hypotheses. Thus, the main goal for measuring the structural model is to determine the quality of the model in terms of its ability to explain the variance of the endogenous variables (Götz, Liehr-Gobbers, & Krafft, 2010). Therefore, Figure 3, shows the measurement model of the study.

Figure 3: Measurement model of the study

Collinearity Assessment

Hair et al. (2016) defined collinearity as a condition in which some of the independent variables are highly correlated. Two variables are said to collinear when there is an exact linear relationship between the variables. It is identified by examining the correlation coefficient between each pair of independent variables. Hair et al (2006) stated that collinearity exists in a model when its variance inflation factor values exceed 5.00. Likewise, Diamantopoulos and Siguaw (2006) recommended more stringent criteria based on Average Variance Extracted (AVE) with the values of 3.3 or greater as a possible indication of collinearity. As shows in Table 5 all the values are less than 5 and 3.3, indicating that multicollinearity was not an issue in the model of this study.

Table 5: Evaluation of Collinearity based on the Variance inflation factor (VIF)

	Education	Foreign aid	Health	PRSI	Vocational training
Education		1.426		1.846	
Foreign aid				1.652	
Health		1.823		1.824	
Poverty reduction strategy implementation					
Vocational training		1.860		1.939	

Legend: PRSI= Poverty reduction strategy implantation

Path Coefficients

The bootstrapping analysis in Partial Least Squares (Structural Equation Modeling) was used to examine the effect between the variables and the investigate the mediation role. According to Hair et al (2014) Path coefficients that are close to +1 represent strong positive relationships while those that tend towards -1 represent strong negative relationships. Hence, the structural model is an essential instrument for evaluating the significance level of the path coefficients. The level of strength of a relationship is measured by the magnitude and significance of the estimates as suggested by Hair et al (2014). Table 6 shows the path coefficients for the various path model hypothesized in the study.

Table 6: Significance test for the structural model path coefficient, t-statistics and p-values

	Original Sample (O)	Sample Mean (M)	T Statistics (|O/STDEV|)	P Values	Decision
	Direct Effects				
Education -> Poverty reduction strategy implementation	0.535	0.534	19.732	0.000	Supported
Health -> Poverty reduction strategy implementation	0.078	0.078	2.465	0.014	Supported
Vocational training -> Poverty reduction strategy implementation	-0.047	0.048	1.367	0.172	Not supported
Specific Indirect Effect					
Education -> Foreign aid -> Poverty reduction strategy implementation	0.194	0.195	10.560	0.000	Supported
Health -> Foreign aid -> Poverty reduction strategy implementation	-0.010	-0.009	0.611	0.541	Not supported
Vocational training -> Foreign aid -> Poverty reduction strategy implementation	0.084	0.084	4.164	0.000	Supported
Foreign aid -> Poverty reduction strategy implementation	0.385	0.386	13.161	0.000	Supported

As present in Table 6, education and health have positive and significant direct effect with on poverty reduction strategy implementation with t-values above the t-critical value of 1.96 and p-values value less than 0.05. However, vocational training has negative effect on poverty reduction strategy implantation. Thus, it can be said that there is a positive effect of human factors (education and health) on poverty reduction strategy implementation in Chad republic. Likewise, Table 6 shows the mediating effect of foreign aid on the education, health and vocation tanning and the implantation of the poverty reduction strategy. The result shows that foreign aid mediation the relationship between education and PR strategy implantation and also it mediates the relationship between vocational training and PR strategy implantation with (t-value <1.96, p-values > 0.05). But foreign aid dose not mediates the relationship between the health and PR strategy implantation in Chad republic.

Figure 4: Structural model of the study

Discussion on the study findings

In this study three hypothesizes were developed examine the effect of the education, health and vocational training on poverty reduction strategy implementation in Chad. The results from the analysis support the hypothesizes that there is significant positive relationship between education and poverty reduction strategy implementation and between health and poverty reduction strategy implementation. But vocational training has negative relationship on poverty reduction strategy.

Based on empirical evidence from Arias Rafael (2016) uses data from the Population Census of 2011, conclude that succeeding greater levels of education helps people from urban and rural areas and those who live in the different planning regions to fight poverty. Arias Rafael (2016), reported that people who finish secondary education reduce poor shelter between 8.0% and 33%, reduce low levels of knowledge between 26% and 44%, and reduce poor consumption between 12.0% and 30.0%. in addition, as mentioned by Addo (2017) the higher the level of educated people the lesser number of poor people will be, because education teaches knowledge and skills which is helpful.

The health finding of this study is corroborated by argument of Braveman and Gruskin (2013) they have argued that health associations can deal with poverty problems and health within outline or structure surrounding equity and human rights concerns in five general ways. Namely, applying reasonable health care financing, which should help to reduce poverty while increasing access for the poor community. Secondly, institutionalizing the systematic and routine application of equity and human rights perspectives to all health sector actions. Next, strengthening and extending the public health functions, other than health care, that create the conditions necessary for health. Next, ensuring that health services respond effectively

to the main reasons of preventable health among the poor and disadvantaged; and finally, monitoring, advocating and taking action to address the potential health equity and human rights implications of policies in all sectors affecting health, not only the health sector (Braveman and Gruskin, 2013). In addition, the findings also in line with the results of David and Bloom (2018) who examine the relationship between health and poverty, the review obtained to determine the extent to which the factors contacts between health and poverty and between good health and poverty reduction are scrutinized.

The results also raveled that foreign aid mediate the relationship between education and vocational training and poverty reduction strategy implementation in Chad republic. This study finding is in line with some scholars' findings and contradicting others results. For instance, Hirano and Otsubo (2014). used the conceptual framework of globalization and the poverty-growth-inequality (P-G-I) relationship to examine the effectiveness of aid to development. Their analysis revealed that social aid such as education, health and water and sanitation spending significantly and directly benefits the poorest in the society and economic aid on the other hand, like transportation, energy and communication and financial infrastructure spending increases the income of the poor through growth (Hirano and Otsubo, 2014). Likewise, another study done by Arndt et al. (2015) who measured the impact of foreign aid on economic growth, social welfare used indicators (poverty and infant mortality) and intermediate outcomes (health, education and agriculture, consumption, investment). They concluded that foreign aid does encourage growth, improve social welfare indicators and reduces poverty. However, Arndt et al. (2015) have also indicate that aid does not have a significant effect on inequality, it was discovered that aid can raise investment, improve school enrolment, boost life expectancy and reduce infant mortality.

Conclusion

This study scrutinized the mediating role of the foreign aid between human capital factors (i.e. education, health and vocational training) and poverty reduction strategy implementation in Chad republic. Quantitative analysis was used to answer the raised questions of the study. The results show that education and health had significant positive effect of poverty reduction strategy implementation in Chad republic. Although vocational training dose not has effect on poverty reduction strategy implementation, we can conclude that human capital factor (education and health) play a vital role in poverty reduction strategy implantation in the republic of Chad. In addition, the result revealed that foreign aid mediation the relationship between education and poverty reduction strategy implantation and also it mediates the relationship between vocational training and poverty reduction strategy implantation. However, foreign aid dose not mediates the relationship between the health and PR strategy implantation in Chad republic.

Limitation of the Study

Regardless of several significant results this study achieved; there are few limitations that must be highlighted; below are the limitations of this research:

- The study is limited to examining the mediating role of foreign aid on the relationship between education, health and vocational tanning and poverty reduction strategy in republic of Chad.
- The also limited in collecting the data was taking from the few districts in N'Djamena.
- Lastly, the study employed quantitative research methodology, Smart-PLS was used for data analysis.

Implications and Future Research

The findings from this study show that there is significant relationship between education and health on poverty reduction strategy implantation in Chad. Thus, the study recommends that one of the ways by

which government should reduce poverty is to focus on education and health. In this study vocational training shows a negative effect on poverty reduction strategy implementation in chad, therefore, the government should invest and focus more on vocational training. Previous studies have proven empirically that vocational training play a vital role in reducing poverty. For instance, Hayyat & Chughtai (2015) found a significance impact of vocational training on poverty alleviation and also generated competitive human capital for economic development. In addition, further researchers can consider on examining the moderating and mediating role of foreign aid and the relationship between human capital and poverty reduction implementation.

Abstract

Two perspectives have been proposed to explain how a company should invest in employee training and development. The first theory, the human capital theory, states that training and development (T&D) increase the market value of the employee and thus affect employee intention to stay negatively. On the other hand, social exchange theory argues that T&D contribute to employees' positive perception of the company's commitment to their development and thus positively affect employees' intention to stay. This study aimed to evaluate how T&D affect employee intention to stay in their job in Indonesia. Derived from the social exchange theory, we evaluated two possible work attitudes, change-related anxiety and employee-engagement variables, as mediating variables. We used primary data collected using a closed-ended questionnaire administered to employees of various companies in the Greater Jakarta area, Indonesia. We collected 125 datasets from employees who worked for two years or more and used multiple regression analysis to analyse the data. We found that in Indonesia, the social exchange theory can explain the relationship between T&D and employees' intention to stay. We found a positive relationship between perceived T&D and employee intention to stay. Regarding the mediating effect of work attitude on the relationship between T&D and employee intention to stay, we found that while change-related anxiety only partially mediated the relationship, employee engagement variable fully mediated the relationship between T&D and employee intention to stay.

Introduction

Change is an inevitable part of life, including work setting. For many people, changes in the workplace may be challenging to manage, as they may worsen one's career as well as life. Employees might fear losing their jobs or being transferred to unfavourable positions. Changes may trigger increased uncertainty, tension, and other job stress. Several studies have suggested that companies should understand the emotional landscape of changes and provide employees with tools to address related issues.

Training and development (T&D) equip employees with skills and competencies to better carry out their duties. T&D may also help employees develop the adaptive capacity to cope with changes in the business environment that drive changes in the workplace; as Robertson et al. (2015) claimed, a resilience training increases personal ability to cope with changes and consequently subjective wellbeing. For companies, it is essential to maintain high-skilled employees. Many companies need to deal with voluntary employee turnover, which can have severe consequences for a company's strategic and operational plan. Maintaining high-skilled employees is challenging not only for western

companies but also for Southeast Asian corporations, such as those in the Philippines with the highest rate (14.8%), followed by Malaysia (about 14.8%), and Singapore 14.1% (Memmon et al., 2017). Ultimately, T&D need to be designed to retain employees in an organization effectively.

Thus, researchers have questioned how T&D affect employees' retention. Fletcher, Alfes, and Robinson (2018) suggested that studies examining employee retention should include a broader range of work attitudes. From previous studies, several work attitudes, such as intrinsic motivation (Dysyik & Kuvaas, 2008), job satisfaction (Koster, de Grip, & Fouarge, 2011; Fletcher, Alfes, & Robinson, 2018; Zhang et al., 2018), employee engagement (Eltaybani et al., 2018; Fletcher, Alfes, & Robinson, 2018; Zhang et al., 2018), and perceived career opportunities advancement (Stamolampros et al., 2019), have been found to mediate the relationship between T&D and employee intention to stay.

From theoretical perspectives, two theories predict T&D's effects on employees' intention to stay. The human capital theory states that T&D increase the market value of the employees and thus encourage employee turnover. Meanwhile, the social exchange theory states that T&D increase the positive organizational perception of employees and thus increase their commitment to stay and work better in the organization. Moreover, a rare study has evaluated empirically the mediating effect of this work attitudes on the relationship between T&D and employees' intention to stay, especially among Indonesian workers. This study aimed to fill this gap. We hypothesized that two work attitudes, change-related anxiety and employee engagement, mediate the relationship between perceived T&D and employee intention to stay.

This study used primary data collected using a closed-ended questionnaire containing items measured on a 5-point Likert Scale ranging from strongly disagree to strongly agree. The questionnaire was administered online using Google form to employees of various companies in the Greater Jakarta area. The data were then analyzed using multiple regression analysis in SPSS 22.

The rest of this paper presents a literature review followed by hypothesis development in part two and research methods in part three. The results of the regression are summarized in part four, while the discussion is presented in part five and the conclusion in part six.

Literature Review and Hypotheses Development

T&D and Intention to Stay

Koster, de Grip, and Fouarge (2011) offered two theories, the human capital theory and the social exchange theory, on how a company should invest in employee training and development. The human capital theory predicts a negative relationship between T&D and employees' intention to stay. This theory states that training and development increase the market value of the employees and create more opportunities outside the organization. A changing environment tends to create more opportunities for high-skilled employees. The human capital theory suggests that a company should not invest too much in employee training and development because high-skilled employees tend to look for a better opportunity offered outside the organization. Contrary to the human capital theory, the social exchange theory predicts a positive relationship between T&D and employees' intention to stay. The social exchange theory argues that T&D contribute to employees' positive perceptions of the company's commitment to their development, increasing their attitude and commitment to work better in the organization.

Several studies have examined the mediating role of work-attitude in the relationship between T&D and intention to stay. Koster, de Grip, and Fouarge (2011) found that T&D reduce employees' turnover because perceived T&D increase employees' positive perception of the organization and increase job satisfaction. Fletcher, Alfes, and Robinson (2018) examined Russell's model that included job satisfaction, job engagement, change-related anxiety, and emotional exhaustion as mediating variables. They found that job satisfaction, change-related anxiety, and job engagement fully mediated the relationship between perceived T&D and intention to stay while emotional exhaustion did not mediate this relationship. A recent study conducted by Stamolampros et al. (2019) highlighted the importance of career progression in employee retention and suggested that employees leave a company primarily

due to the lack of opportunities for career advancement. Thus, this idea supports the social exchange theory.

Work-Related Attitudes: Change-Related Anxiety and Employee-Engagement

Zalewska (2011) defined job-related anxiety as perceiving a job-related situation that is potentially threatening and reflects the quality of the person-environment relationship. Job-related anxiety consists of situational anxiety (emotional reaction to current situations) and persistent anxiety (perceiving the job as a source of potential threats). Haslam et al. (2005) stated that anxiety affects work both at an individual level through, e.g., impaired work performance, accidents, and sickness absence and at the organizational level through reduced productivity, worsened staff morale, accidents, absences, and staff turnover, among others.

Eltaybani et al. (2018) defined work engagement as a positive, fulfilling work-related state of mind characterized by three dimensions: vigor, dedication, and absorption. A recent study conducted by Zhang et al. (2018) further divided employee engagement into job engagement and organization engagement and found that employees' organizational engagement has a stronger effect on their intention to stay compared to job engagement. Based on the previous studies, in this research, we hypothesized that;

H.1: Perceived training and development have a positive relationship with employee intention to stay.
H.2.1: Change-related anxiety mediates the relationship between perceived T&D and employees' intention to stay.
H.2.2: Employee engagement mediates the relationship between perceived T&D and employees' intention to stay.

Research Methodology

This study used a quantitative method. Our respondents were employees from various companies in the Greater Jakarta area. We choose this area because most companies in Indonesia are located in this area. We used primary data collected using a closed-ended questionnaire containing items measured on a 5-point Likert scale ranging from strongly disagree to strongly agree. We developed three questions assessing how those employees perceived T&D in their working place or to construct perceived T&D variable, three questions assessing change-related anxiety variable, six questions measuring employees' engagement variable, and we added two questions measuring intention to stay variable.

Results

Before conducting the main test, we examined the validity and reliability of variables using 30 respondents. Following *Bartlett Test of Sphericity,* several invalid questions removed. Subsequently, we included data from all 125 respondents for the multiple regression analysis using SPSS 22. Reliability test results for all variables show in table 1.

Table 1: Reliability Test

Construct variables	Cronbach's alpha	conclusion
Perceived T & D	0,782	Reliable
Change-related anxiety	0,828	Reliable
Employee engagement	0,902	Reliable
Intention to stay	0,729	Reliable

Furthermore, all assumptions of regression, including normality test, multicollinearity, heteroscedasticity test, and the DW, were met, indicating that the model can be used for hypothesis

testing and analysis. From the regression results, we found that the direct relationship between Perceived Training and Development and Intention to Stay was significant, with a coefficient of 0.455 and a p-value of 0.005. The indirect relationships among variables are presented in Figure 1.

Figure 1: The regression results

Regression results supported the first hypotheses proposing a positive relationship between T&D and employee intention to stay (with beta coefficient 0.510). We also found a negative relationship between change-related anxiety and intention to stay (with beta coefficient -0.542), a positive relationship between employee engagement and intention to stay (with beta coefficient 0.693), and a positive relationship between perceived T&D and employee engagement (with beta coefficient 0.693). However, the data did not support the hypothesis that proposed a relationship between perceived T&D and change-related anxiety.

After calculating both direct and indirect effects of perceived T&D on the intention to stay through change-related anxiety, we calculated the coefficient VAF of 0.196 or 19.6%. It means that change-related anxiety did not mediate the relationship between perceived T&D and intention to stay, disproving hypothesis 2.1. Calculating both direct and indirect effects of perceived T&D on the intention to stay through employee-engagement yielded the VAF coefficient of 0.506 or 50.6%. It means that employee engagement fully mediated the relationship between perceived T&D and intention to stay, following the criteria developed by Hair et al. (2013) and hence supporting hypothesis 2.2.

Discussion

Our findings here are in line with Koster et al. (2011), who stated that the company's investment in T&D significantly contributes to the perceived support in employee development, as predicted by the social exchange theory. In other words, T&D increase not only employees' skills and their market value but also their loyalty to the company. This finding does not support the human capital theory, which argues that skilled employees will tend to seek another opportunity outside the company.

However, two important work attitudes, change-related anxiety and employee engagement, explained the positive relationship between perceived T&D and employees' intention to stay reveal differently. We found that employee engagement variable fully mediated the relationship between T&D and intention to stay while change-related anxiety did not mediate this relationship. This finding is inconsistent with Fletcher et al. (2018), who found that both employee engagement and change-related anxiety fully mediated the relationship between T&D and employees' intention to stay. In other words,

in the case of Indonesia, T&D were positively related to employees' intention to stay if the T&D program were able to facilitate employees' engagement with their job and company. Meanwhile, the T&D program that is purposely designed to minimize change-related anxiety will not provide the same result, even though change-related anxiety tends to encourage employees to leave their jobs.

Conclusion

This study concludes that for cases in Indonesia, the social exchange theory can explain the relationship between T&D and employees' intention to stay. We found a positive relationship between perceived T&D and employees' intention to stay. However, the two variables examined, change-related anxiety and employee engagement, played different roles in mediating this relationship. Change-related anxiety did not mediate while employee-engagement fully mediated this relationship. We suggest that when designing a T&D program, a company should address how the program will increase employees' commitment, not just their job-related capability. Another conclusion, we do not suggest that companies should invest in a T&D program to mitigate change-related anxiety, even though change-related anxiety appears to have a significantly negative effect on employees' intention to stay. However, further research is needed with broader respondents to evaluate this finding.

Abstract

This paper aims to evaluate how entrepreneurial orientation affects the access a startup has to financing, from both angel investors and venture capital firms. Entrepreneurial orientation in this context consists of risk-taking, proactiveness, and innovativeness. We also evaluate whether a company's growth mediates those relationships. For this research, we use primary data from surveys distributed to the CEOs or managers of startups in Indonesia collected through e-mail, WhatsApp, and social media. The data collected is then processed using the multiple regression and binary logistic methods with the help of SPSS software. Linear regression reveals that risk taking positively affects startup growth, as does innovativeness. However, there is no evidence that proactiveness affects the growth of startups. Furthermore, our logistic regression showed that startups with high growth had a much greater chance of generating funds from venture capital firms. However, growth alone cannot attract angel investors for provide financing for startups. This finding indicates that start-up founders should highlight different aspects of their operations when seeking suitable investors.

Keywords: *Start-up financing; entrepreneurial orientation; start-up growth; innovativeness; risk-taking.*

Introduction

According to the Google and Temasek report regarding the economy in SEA 2018, the size of Indonesia's digital economy market is estimated to have a value of US $27 billion, which is almost 40% of the entire Asia Pacific market, and is expected to reach US $100 billion in 2025. In 2018, the same report stated that Indonesia's gross merchandise value (GMV), or total sales of all goods on the e-commerce platform during a certain period, reached 2.9% of its GDP. Based on the data from the Indonesian Creative Economy Agency (Bekraf), there have been 992 startups spread across Indonesia's provinces. Previously, Indonesia presented a new vision of becoming the most significant digital economy in Southeast Asia in 2020. Of course, in order to achieve that vision, it must make the most of local products and actors.

Even though entrepreneurs have strong ambitions to build startups and can provide ideas and innovation, entrepreneurs still encounter many obstacles as they continue to grow their startup companies. According to a survey conducted by Bekraf in 2018, the main problem faced by entrepreneurs is obtaining capital. Startup financing has unique characteristics, since this type of business brings high risk and a lack of collateral to access funding from commercial banks.

Widyasthana et al. (2017) stated that investors who finance start-ups require high and fast growth. When funding a startup, investors tend to be willing to invest in businesses with high growth rates.

Firlana et al. (2019) also found that, in the context of digital startups in Indonesia, growth is an important factor for investors.

Although there is still limited research that identifies a direct relationship between the two variables, Covin and Lumpkin (2011) state that the dimensions of entrepreneurial orientation can support the acquisition of capital or funding for companies. Megha et al. (2016) then stated in his study that one of the indicators of growth for a startup is the value of entrepreneurship. Venture capital firms usually provide financial assistance for creative and innovative young entrepreneurs who want to build their businesses (Calopa et al., 2014). Common reasons for angel investors to invest include earning profits, encouraging business activities, creating value, and also encouraging entrepreneurial values (Calopa et al., 2014), thus indicating the importance of entrepreneurial orientation for angel investors.

Many other researchers have carried out studies on the relationship between entrepreneurial orientation and company performance or growth and have analyzed the relationship between access to corporate funding for the growth of individual companies. However, research related to the relationship between the three variables, namely entrepreneurial orientation, growth rate, and access to the financing from startup companies, is still limited, especially in Indonesia. Based on the lack of research related to the three variables above, this study seeks to identify whether access to funding from a startup company is supported by entrepreneurial orientation and the growth of the company. In this study, we evaluate two primary funding sources for a start-up: venture capital firms and angel investor.

This paper is structured as follows. After the introduction, we present a literature review regarding startup financing and entrepreneurial orientation in Section 2. We describe the data and methods in Section 3. Analysis and discussion are performed in Section 4, followed by a conclusion in Section 5.

Literature Review

Start-ups Access to Finance

Financing for start-ups different from funding of for business in general, even since seed stages. In seed stage, a new company need to develop business plans, making prototypes, and conducting additional research (Barell et al., 2015). As companies grow and the need for funding increases, generally, they seek funding through commercial banks. Usually, lenders need a definite business plan, a positive record of achievement, and collateral with high value (Bista, 2016).

The startup financing process is different. According to Calopa et al. (2014), most startup companies try to avoid bank loans; instead they seek financing from angel investors or venture capital firms. Angel investors are individuals or groups of individuals who invest during the initial stages of new high-risk businesses with the hope of receiving a high rate of return (Bovée & Thill, 2014). Also, angel investors help entrepreneurs to realize the business ideas of entrepreneurs by sharing knowledge and experience (Calopa et al., 2014). They also bring connections, relationships, and expertise in specific sectors or business areas (Bista, 2016). A venture capitalist (VC) is often known as an investment specialist who collects funds from many sources (both private and institutional) to fund new businesses that have high growth potential. VCs require capital and often receive a proportion of ownership instead (Barell et al., 2015). Their main objective is to invest in companies with high levels of risk and growth in the hope of gaining tremendous profits (Bista 2016).

Entrepreneurial Orientation

According to Covin and Wales (2012), entrepreneurial orientation (EO) is "*managerial disposition rooted in decision making*." Previously, Covin and Slevin (1986) outlined three dimensions of entrepreneurial orientation: risk taking, proactiveness, innovativeness. Risk-taking refers to the behavior of an entrepreneur in the face of uncertainty. Without readiness to take risks, innovation and opportunities for success in the future will not be easily obtained (Caruana et al., 2002). The action of risk-taking is considered very important in order to maintain the position of the company and

performance in a dynamic and extraordinary business environment (Kreiser & Davis, 2010). Proactivity or proactiveness refers to the ability of an individual to foresee problems in the future. Proactive behavior is considered an initiative by an entrepreneur to exploit opportunities and then introduce new products and services to be able to overtake competitors (Rauch et al., 2009). A proactive nature reflects the importance of taking the initiative in the entrepreneurial process, which can then create a competitive advantage so that companies can influence their environment by actively observing the pressures that arise (Grande et al., 2011). The dimensions of innovation are described as behaviors that are bound by creative and experimental characteristics that generate new products or services based on research and development (Rauch et al., 2009). Innovativeness reveals the tendency of companies to use and maintain procedures, new ideas, originality, and experiments, which then lead a company to produce new products, services, or operational processes (Lumpkin & Dess, 1996).

Start-up Growth

Davidsson et al. (2005) argue that it is difficult for us to capture a clear picture of all of the literature about the determinants of company growth. According to Davidson et al. (2005), the growth of small companies should be based on the perspective of amount-change perspectives, such as revenue growth and a measure of size change, such as market growth. Lechner and Dowling (2003) state that the contribution of business partners is significant for companies to achieve their strategic objectives and then measure growth based on the number of business partners it exhibits. Firlana et al. (2019) measured a start-up's growth based on the number of acquisitions undertaken and the number of monthly user visits on the platform or application.

Methods

Research Data and Sample

In this study, the quantitative data used was obtained through surveys in the form of questionnaires that the authors distributed to the respondents. The questionnaire was compiled using forms which then spread to respondents through e-mail, Whatsapp, and LinkedIn. The questionnaire includes questions that aim to measure each research variable addressed to the CEO/Board of Directors/Managers of startup companies in Indonesia. In collecting samples, this study adopted a non-probability sampling technique. Based on the needs of this study, researchers have set specific criteria to be met by prospective respondents, so the researchers adopted the judgmental sampling method. When determining the sample, researchers make specific considerations that were adjusted to the criteria set (Malhotra, 2006). The requirements set by the researchers include that the respondents must occupy positions of CEO/Director/Manager of startups in Indonesia that have IOs and Android applications.

Because the performance and growth of the company can be assessed using a variety of indicators, to anticipate variations in performance and growth assessments in this study, researchers define company growth as the extent to which financial and non-financial goals, compared to competitors, are achieved based on the perception of the business owners and Chief Executive Officers (CEOs) surveyed.

Results and Discussion

Validity, Reliability, and BLUE Test

We conducted a pre-test for the data consisting of KMO to evaluate the adequacy of the data used, Bartlett's Test and component matrix to evaluate questionnaire validity (we found values above 0.5), and Cronbach's Alpha to evaluate the reliability construct used for each variable (we found values above 0.6). As we use regression method to test our hypothesis, we also conducted a statistical (BLUE) test, including the normality test using the Kolmogorov Smirnov test (the result of 0.20 indicates that the model is normally distributed), a multicollinearity test using VIF (with a VIF value for each variable of less than 10), a Glesjer test for heteroscedasticity (value above 0,5, indicate homoscedastic residual).

We also found the DW to be 1,879, indicating that the model does not contain misspecification errors or autocorrelation. All tests were passed, suggesting that the model met the goodness of fit criteria.

Results

We conducted three regressions for data processing. The first regression is a multiple linear regression to evaluate how entrepreneurial orientation affects start-up growth. The second and third regressions are logistic models to evaluate the likelihood of a start-up to gain access to venture capital financing or not (2nd regression) and the likelihood to gain access to angel investor financing (3rd regression). A summary of the results are shown in Figure 1.

) significant at 5%, *)significant at 1%

Figure 1: Summary of regression results.

The results of the first regression show that two dimensions of entrepreneurial orientation – risk-taking and innovativeness – positively affect start-up growth, while there is not enough evidence that another dimension – proactiveness – affects startup growth. Innovativeness shows better to explain startup's growth. The model itself indicates that both risk-taking and innovativeness can explain 32.6% of a start-up's growth.

The second logistic regression shows that start-up growth significantly explains its access to venture capital financing. A startup with high growth has a much greater chance of generating funding from venture capital compared to start-ups with low growth. However, the third regression shows a different conclusion, since there is not enough evidence that a startup growth affects its access to angel investor financing. A startup with high growth has only a 0.88% chance of generating funding from an angel investor compared to startups with a lower growth rate.

Discussion

The results of data processing show that two aspects of entrepreneurial orientation – risk-taking and innovativeness – have a significant effect on startup growth, while proactiveness shows no effect on startup growth. While this result is contrary to that of Megha et al. (2016) and Sidek et al. (2016), the results are in line with Filser and Eggers (2014). This finding is reasonable because, according to Kreiser and Davis (2010), the optimal level of each dimension of entrepreneurial orientation is different based on each company's environment. Therefore, environmental factors could explain why proactiveness does not significantly affect the growth of all startup companies in Indonesia.

The logistic regression revealed that a startup's growth has a significant effect on its access to venture capital funding but has no significant impact on its access to angel investor funding. These findings

supported the work of Van Osnabrugge and Robinson (2000), who stated that angel investors tend not to carry out professional due 2diligence but act more on their instincts in the financing process. Most angels use their funds to invest based only on personality, despite the fact that it can lead to poor investment decisions (see Sudek, 2006).

Conclusion

This study aims to evaluate how the entrepreneurial orientation of startup companies affect their access to financing from angel investors and venture capital firms. We found that two dimensions of entrepreneurial orientation – risk-taking and innovativeness – affect start-up growth. However, the third aspect of entrepreneurial orientation – proactiveness – does not have an effect on start-up growth. We then found that the proven growth of a start-up significantly increases their chances of obtaining funding from venture capital firms but not from angel investors. This finding indicates that venture capital financing representatives significantly consider a start-up's growth for their investment, while angel investors do not emphasize the same element. We suggest that founders of start-ups who seek source of financing, especially those in Indonesia, consider these differences.

Abstract

In every society, the idea could be regarded as a component of development in as much as its source could be associated with human thinking for solutions to combat problems confronting human existence. From time immemorial, it is evident in the literature that every invention and innovation that has resulted in the transformation of human lives and society is traceable to a conceived and explored the idea. The exploration and documentation of such an idea have engendered positive creativities in all spheres of life for the betterment of the human race. In other words, an undocumented idea, no matter how brilliant, can be decimated and eventually become useless. In the same manner, the ancient guild system conceived by Karl Marx in the medieval period could be regarded as one of such notable ideas in human history. Guild system is the union of craftsmen for communal assistance and fortification in furtherance of professional benefits. Also, it could be regarded as the process of training "a new generation trader" between the 11th and 16th centuries in Europe. The system was said to have formed a vital aspect of the economic and social fabric of the era before it was later discarded or consumed by the propensity of capitalism. Either by acculturation or academic linkages or most especially the poor economic development of Nigeria that has resulted in the high rate of unemployment and abject poverty, the practice of indigenous Igbo business mentoring has brought to bear the relevance of the ancient guild system in recent times, as a cogent solution to job creation to reduce the plague of unemployment and abject poverty confront the youth population in the Southeast Geopolitical Zone of Nigeria. The present paper intends to explore secondary data and content analysis as a methodology to examine the connection between the guild system and indigenous Igbo business mentoring and illustrates its usefulness in raising entrepreneurs. In addition to the above, it tries to discuss the possibility of developing the practice to engender, human and economic development in Nigeria

Keywords: Guild system, relation, indigenous Igbo business mentoring.

Introduction

In every society, ideas of human beings could be regarded as components of development. This is because the source of every notable development could be traced to human thinking and the inspiration of God to provide solutions to various problems confronting humanity and to make existence comfortable (Rodeny, 1972). From time immemorial, human ideas explored and documented have resulted in invention and innovation that has stemmed from the transformation of human lives from poverty to affluence. Also, many such ideas have engendered social change that has propelled human society from agrarian societies to a more civilized type, characterized by Information Science and Technology (ICT). In other words, an undocumented idea, no matter how brilliant it could be, can be decimated and eventually become useless.

In human history, the ancient guild system conceived by Karl Marx in the medieval period could be regarded as one of such notable ideas that has influenced human lives positively in the area of raising entrepreneurs to alleviate unemployment, abject poverty and to encourage job creations, production of goods and services for exportation and home consumption, and to facilitates economic development (Suvittawat, 2019).

Guild system is the union of craftsmen for communal assistance and fortification in furtherance of professional benefits. Besides, it could be regarded as the process of training “a new generation traders” between the 11th and 16th centuries in Europe. The system was said to have formed a vital aspect of the economic and social fabric of the era. According to Bruno (2017), its decline was expedited by patents provided by royal families of the era and it later facilitated the rise of industrial revolution and capitalism, which has been responsible for the dilapidation of human labour, social, physical product and the environment in the present age Bruno, (2017) as the capitalists' established industries for the production at the expense of human safety, life, and decency.

The negative effect of capitalism has continued to generate an extensive argument in academia, mostly on its drive for maximum profits and enslavement of manpower, which seems to have resulted in the poor economy of most developing countries and also aggravates joblessness and abject poverty in such countries. As a way out of this situation, the guild system suddenly reemerged as a strong strategy for raising entrepreneurs in the Southeast Geopolitical Zone of Nigeria in a new form of indigenous business mentorship. With this development, it appears the idea of Karl Marx on the guild system has become inconsumable and a strong strategy to be reckoned with in raising entrepreneurs in the contemporary.

The practice of indigenous Igbo business mentorship could be regarded as an informal business education to lunch people, mostly the youth into the world of business transactions. Apart from that, the concept could be considered another form of apprenticeship that ensures skill acquisition for the incursion into trade and commerce. Furthermore, it is a special idea conceived by “Ndigbos” for rising young entrepreneurs (Udeze, 2014).

Apart from comparing it with the ancient guild system, the practice of indigenous Igbo business mentorship could be linked with various strategies emanated from developed nations for raising funds to establish small-scale enterprises. Such include Venture capital (Alexy and Block, 2012; Obi-Anike, Okafor and Adeleke, 2020), Crowdfunding Mollick, 2014; Ali, 2020), bootstrapping Lahm and Little (2005), angel investors Ramadani, (2012). While some authors have explored some of the above strategies in developing countries, approaches originating from a traditional background in developing countries such as Nigeria have not been adequately addressed in academic literature. Such include the practice of indigenous Igbo business mentorship for establishing small scale business in contemporary Nigeria. Although, some scholars have carried out studies on this strategy Orugun and Nafiu (2014), its connection with the ancient guild system in respect of raising entrepreneurs is seemed to have been neglected.

The neglect in business and academic literature in academia in Nigeria could be regarded as a serious flaw in the knowledge that needs to be corrected. This is because it could create an impression that Africans do not value their ideas, not to talk of developing it, but ideas and concepts developed in

Western nations, which seems to have failed in engendering national development (Akeredolu-Ale, 1975).

Had it been that various indigenous entrepreneurship in Nigeria has been properly developed, the scheme might have attracted global influence, job and wealth creation as well as improvement in the standard of living of many Nigerians. Thus, the high rate of unemployment and abject poverty (Akinbobola & Saibu 2004; Eweniyi, 2019) which some authors have associated with criminality among the youth population, could have been avoided.

This paper is sub-divided to discuss the concept of mentoring and guild system, indigenous Igbo business mentoring, its origin, nature, translation to small-scale business and relevance to youth development, etc.

Literature Review

The Concept of Mentoring

The term mentoring according to Bozeman and Feeney, (2007) cited in Idemudia, (2011) is a process involving the transformation of knowledge (formal or informal), social capital and psychosocial backing, which beneficiaries (mentees) considered appropriate to work or business transactions. This author also argues that it entails face-to-face informal communication during a sustained period, between persons who are considered to possess cognate knowledge and individuals who are novice (protégé) Idemudia, (2011).

Dwelling on the above definition, mentoring could be considered a process that involves time, assistance, process, the relationship of self-development between a mentor and protégé Idemudia, (2011). The mentor is generally expected to mediate on expert knowledge for the novice, help develop the novice's full potential in areas of human endeavours (Ilieva-Kolev, 2015; Kunaka and Moos, 2019). For Kunaka and Moos (2019), it has successfully been engaged as a valuable private development instrument in both business and academic environments as it bridges between business and academia. However, the thrust of this paper is on the indigenous Igbo business mentoring which could be akin to the Cognitive Apprenticeship Theory developed by Collins, Brown, and Newman (1989) as the process where a principal of a skill teaches that skill to an intern to develop the potentials in him or her.

Kram, (1985) cited by Okurame, (2011) identifies four stages of mentoring, which include: the initiation stage, usually between 6 months and 5 years; the cultivation stage which is usually between 6 months and 2 years, a separation stage that falls within 6 months and two years and lastly redefinition stage where the relationship is redefined and partners see each other as contemporaries.

According to Kram (1985), mentors perform two main functions. These include career development and the provision of psychosocial needs (Noe, 1988b; Schockett & Haring-Hidore, 1985). While studies have shown several instances of mentoring in all spheres of life, the aspect involving the practice of indigenous Igbo business mentoring has not been adequately addressed in academic and business literature in Nigeria. Nevertheless, a few existing pieces of literature on the subject has shown that its influence in transforming the lives of youth has remained impressive. In present-day Nigeria that most families and government, at all levels do not have plans for the youth, indigenous Igbo business mentoring seems to have provided a possible solution to the escalation of unemployment and abject poverty among the youth population.

The Concept of Guild System

The guild system is strongly associated with (Marx, 1954). Based on his notion, it means the amalgamation of craftsmen for communal support and strengthening of professional benefits. As indicated in several studies globally, Karl Marx (1818–1883) is extensively known as the originator of scientific socialism and one of the best revolutionary critics in human history (New World Encyclopedia, 2020). The system aimed at training "a new generation traders" in the medieval period, between the 11th and 16th century in Europe. Marx (1954), argues that it formed a vital aspect of the economic and social fabric of the era. The system operated in the following three stages: Master, Journeyman, and apprentice. The system emerged due to the need to safeguard commerce and industry

in rural areas that were outside the scope of feudalism since there were no laws or customary laws directing economic activities in the era. In many places, town charters specifically stated that the inhabitants of a town could form a guild (New World Encyclopedia, 2020).

The Concept of Indigenous Igbo Business Mentoring and its Origin

Indigenous Igbo business mentoring could be regarded as a traditional form of business skill and acquisition in the form of an apprenticeship or mentoring for establishing SMEs. It could also be regarded as a scheme or service that entails financial rewards to complement the skill acquired to settle oneself in a business of a lifetime with the possibility of transcending into generational ventures. According to Dibia (2013), this apprenticeship scheme is considered an unstructured training or scheme arranged for a definite time, which youth undergo to gain a desirable aspect of entrepreneurship skill through the development and automation of the Igbo Trade Apprenticeship System (ITAS).

Its origin could be associated with the negative effect of the Nigerian civil war on Igbos in the Southeast Geopolitical Zone of Nigeria. The quest of many of them for survival after the war seemed to have prompted them to look inwards for what they could do to attract affluence and greatness outside white-collar jobs. As illustrated by Aremu and Buhari (2017), the acute problem of starvation experienced in the course of the war negatively affected them and it prompted them to device ways of settling themselves through the indigenous business mentoring. The concept according to Orugun and Nafiu (2014), later became an indigenous apprenticeship model for raising entrepreneurs through the Igbo business learning culture otherwise known as (ITAS).

The Nature of Indigenous Igbo Business Mentoring

According to the popular dictum, nothing good is easy to come by, the practice of indigenous Igbo business mentorship is not without cost. The cost involving youth forfeiting early marital pleasure in life for this training, which could enable them to settle down permanently. This is because the opportunity to acquire training for personal development for the betterment of one's career is better acquired at an early stage when the strength and time suitable for it are available. Apart from this, the Igbo nation believes that marriage attracts heavy responsibilities from men and that it is better to acquire skills needed to acquire wealth before marriage. The aim of this is to enable Ndigbos to perform obligations relating to family affairs properly.

The significance of this strategy in many communities in Igbo land necessitates traditional ceremonies on two major occasions. The first has to do with the induction of "Nwa Boy" into mentorship. The occasion necessitates the presence of the parents of "Nwa Boy" to hand over their sons to his "Nna Ukwu" (mentor). The importance of Igbo culture is usually brought to bear on such occasions as cola nuts are broken and shared with decorative rituals beseeching the spirits of the assembled ancestors or with prayers to bless the occasion. Palm wine drinks are served and the oral agreement is made after the prospective "Nwa Boy" has been advised to imbibe qualities such as diligence, uprightness, and veneration (Agozino and Anyanike 2007). The ceremony also allows Nna Ukwu to state his expectations and give the parents of "Nwa Boy" his assurance about the welfare of their son under his tutelage. Upon the completion of mentoring, a freedom party, normally regards as a graduation ceremony and the commencement "Nwa Boy" business in life.

Although, "Nwa Boy" is in categories but there is a clear difference between a businessperson who engaged in indigenous Igbo business mentoring and others who engage in just serving the master in his or her house. Women are in such a category. They are either paid or unpaid in the service of their mistresses at home. However, studies have shown that some of them are permitted to partake in skills of their choices while living with their mentors, depending on the agreement, after which they are properly settled but those who engaged in paid services never participate in any skills acquisition, except if their mentors permit them to do so (Obunike, 2016).

Translation of Indigenous Igbo Business Mentoring to Small-Scale Business

As soon as "Nwa Boy" completes the period of mentorship, he receives "Idu-Odibo" (the financial assistance) to complement the skills acquired (Obunike, 2016). However, it should be noted that "Idu-Odibo" could either be in form of a cash reward to enable him to open his own business and run it by

himself or a new business entirely set up for him by his mentor. The family of both the mentor and "Nwa Boy" as well as their community members usually see the day of settlement as a great day because both the mentor and "Nwa boy" are perceived as being faithful and responsible to each other. In such an occasion, people wine and dine, as it marks the graduation ceremony of "Nwa Boy" and his inauguration into business world Obunike, 2016).

The Relevance of Igbo Business Mentoring to Youth Development

Dwelling on UNESCO (2018), the most accurate description for youth is young persons transiting from the dependency stage to adulthood. The period marks the commencement of awareness of interdependence as affiliates of a given community (UNESCO, 2018). Besides, age, education, and employment are other concepts that are similar to the above description. Thus, youths are generally specified as persons between the age of leaving compulsory education and entering their first employment UNESCO (2018). However, our focus in this study is hinged on age and employment. Age is crucial to the indigenous Igbo business mentoring, as persons engaging in the scheme do so early in life and their time of graduation could be regarded as the period of entering the labour market for productivity for personal and societal development, which concurs with Seers (1969), who argues that development entails a given country's capability to reduce or eliminate her experience on poverty, inequality, and unemployment

Just like other careers in every human society, business is regarded as a lucrative adventure that enables the youth to develop business potentials for income generation and job creation to reduce poverty (Igwe, Adebayo, Olakanmi, Ogbonna and Aina 2013). Thus, it could be observed that success in life is not tied down to one profession and education may not determine it, but it could be used to aid the attainment of success. However, what matters is the development of potentials in one life and business acumen or entrepreneurial skills could be regarded as parts of them.

At a tender age, most "Ndigbos" youth, especially those who do not have an interest in education or those who lack sponsorship engage in business mentoring to settle the issue of employment in life. The training and financial assistance received at the end of mentoring allow them to set up their businesses. In such SMEs, income could be generated and it could be used to expand the businesses and to perform sociological obligations in the family and the society. These include getting married to settle down. Based on African traditional belief, getting married is regarded as the first step to becoming responsible in life and the responsibility is determined by how a man makes provision for his family members. This involves sponsoring children in educational institutions where quality education could be obtained, granting adequate treatments to members of the family during sickness or disease, ensuring befitting accommodation and nourishing meals three times daily, etc.

In addition to the above, a part of such income could be used to assist members of the extended family, most especially one's parents. At old age, decent accommodation could be built for them while provision could also be made for their upkeep. Further to that, the income could be used to pay the school fees of those in educational institutions, opening the business for others who are into vocational business. In addition to the above, it could be used to assist in community development. In as much as Obunike, (2016) argues that wealth is determined in Igbo land via some factors, out of which the number of communal development projects launched per time contributes significantly, and it is only those who are successful in their pursuits, business inclusive, who could contribute to such projects. Such persons do so because they share the belief of Ndigbos on "Aku ruo ulo, o kwuo ebe o si", meaning developmental projects pronounce one wealthy and they cherish being called wealthy persons in their communities.

According to Obunike, (2016), such projects include the erection of beautifying edifies in rural areas to replace the old and dilapidated ones which support comfortable accommodation that is considered as one of the major determinants of a standard of living that influences peoples life expectancy ratio, as often indicated in development index. The income derived from Igbo business mentoring could be used to influence facility development in the educational sector to promote literacy. It could also be used to support orphans and indigent students, either in education or vocational trainings, support electrification projects and grading of roads in communities, which are major determinants of development using the United Nations development index.

Besides, the number of "Nwa Boy" trained in a given community by "Nna Ukwu" is also been used to determine their wealth in Igbo land. As argued by Obunike (2016), Igbo nationality is an aggressive communal setting rather than individualistic and wealth is, therefore, the only means of attaining social prestige. In African settings, money determines the acquisition of social prestige which includes respect, the invitation to ceremonies and the conferment of chieftaincy titles on people. The highest of such titles in Igbo land is called Ozo titleholders and it is being given to wealthy persons in their professions, irrespective of education. Among Igbos, obituary, naming and marriage ceremonies are held in high esteem. Concerning obituaries, the wealth of persons in the family is shown when parents are about to be buried. It involves the killing of cows, engaging popular musicians, purchasing of "Aso Ebi" (family clothes) and spraying of money in parties to accord due respect to the death. Hence, income from businesses set up through indigenous Igbo business mentoring could be used to fulfill the above mentioned obligations in the family and community.

In addition to the above, the practice of Igbo business mentoring could enable some youth who possess entrepreneurial skills to acquire training and financial assistance to develop their potentials and prevent such potentials from decadence. The training and financial assistance received to setup business could prevent such youth from indulging in criminal activities that undermine national development.

Lastly, as a concept that is strictly associated with Igbo extraction, indigenous Igbo business mentoring provides a planform for orienting youth from one immediate and extended family into business transactions (Obunike, 2016). Given this, entrepreneurship drive has been running through families in many towns and communities in Igbo land. **Table iii** shows a few of such families, their communities and line of businesses. Therefore, cases of children towing the footsteps of their community mentors or siblings or parents in business from one generation to another have been gaining ground in Igbo land for the past few decades (Egwu, *et al.*, 2011).

Table iii: Some "Ndigbo" Family Names, Line of Business and Sources

SN	Family Name	Line of Business	Sources
1	Akokwa local entrepreneurs	Kitchen utensils and household equipment	Obunike (2016)
2	Nando indigenous traders	Pharmaceutical drug business	Obunike (2016)
3	Nnewi indigenous entrepreneurs	Motor parts and transport business	Egwu, Ogbu, Ogunji, Oselebe & Udu (2011)
4	Alor indigenous entrepreneurs	"ogbo abada" (wrappers),	Obunike (2016)
5	Abiriba indigenous traders	Okirika" (second-hand materials)	Obunike (2016)
6	Agulu indigenous traders	Bread making	Obunike (2016)

The Connectivity Between the Ancient Guild System and Indigenous Igbo Business Mentoring

The ancient guild system could be compared with the practice of indigenous Igbo business mentoring in the following ways:

Firstly, the two schemes aim at achieving objectives bothering on raising a new generation entrepreneur. In the medieval era, the system formed a vital aspect of the economic and social fabric (Bruno 2017). Also, indigenous Igbo business mentoring is considered a platform for expanding entrepreneurial development in contemporary Nigeria.

Secondly, as the guild system protected the business professionals in its time, indigenous Igbo business mentoring has been protecting the business profession among "Ndigbos". This is evident in the formation of the Igbo Trade Apprenticeship System (ITAS) (Orugun and Nafiu, 2014).

Thirdly, when the guild system was in place, it impacted business skills on prospective entrepreneurs, indigenous Igbo business mentoring has been impacting business skills and financial assistance on "Nwa Boy". The most critical aspect is the recycling of "Nwa Boy" in various communities in Igbo land, which has been responsible for transforming lives from abject poverty to affluence (Obunike, 2016).

Fourthly, both systems aim at protecting the business interest of the mentors and mentees at the same time. The two were put in place to assist both the mentors and mentees. As mentees continue to serve his master, they are acquiring business skills while the service they sender goes to promote the mentors' business.

Fifthly, in its era, the guild system was considered a vital aspect of economic development and in the present generation, indigenous Igbo business mentoring is considered a powerful system of building the economy in Nigeria where the economy is poor. It is also regarded as a weapon for job and wealth creation amidst the present rate of a high level of unemployment and poverty.

Further to the above, both systems (guild and indigenous Igbo business mentoring) could be traced to capacity building and transformation of society from one level of development to another. The contributions of guild system to economic development before the advent of capitalism could be difficult to ignore while the contributions of the indigenous Igbo business mentoring in transforming the Igbo nation to the epicenter of business transaction in Nigeria has been strongly illustrated in previous studies (Orogun and Nafiu, 2014).

The Challenges of Indigenous Igbo Business Mentoring

Since the indigenous Igbo business mentoring is a loose or unstructured form of skill acquisition, it appears the agreement binding the practice is verbal and yet to be entrenched in the customary law in the practicing communities in the 21st century where business laws guide economic activities and make parties involved in transactions secured against fraud. Although some studies have shown that it relates to the culture of Igbo nation Orogun and Nafiu (2014), the failure to formalize the practice in the customary laws guiding custom and tradition of Igbo people may present it as a primitive system which could undermine justice, a cogent aspect of development in contemporary societies. The modern business transaction is being guided by some laid down rules and regulations to enforce justice whenever there is a breach of contracts. In the absence of such, an unfaithful "Nwa Boy" who steals "Nna Ukwu" money may be difficult to prosecute except if the "Nna Ukwu" wants to obtain justice by consulting an oracle or by forcing such "Nwa Boy" to swear before his deities.

Apart from the above, the probability of some "Nna Ukwu" being greedy by paying "Nwa Boy" an insignificant "Idu-Odibo" (the official settlement) that may not be sufficient to run his proposed business may not be ruled out. Such "Nwa Boy" may need to source additional funds elsewhere to augment his "Idu-Odibo". Applying this to the Surplus Value theory of Marx (1954), a part of the success of "Nna Ukwu" is related to his ability to expropriate the surplus-value of the power of labour of the "Nwa Boy" who served and received an insignificant "Idu-Odibo" under him. In so doing, the labour of "Nwa Boy" creates value and if it were to be paid in wages, the "Nna Ukwu" could still retain the proportion of the profits produced as surplus value.

In addition to this, Obunike, (2016) argues that some "Nna Ukwu" belong to occult groups and usually initiate their "Nwa Boy" to such groups to extend their social networks for a greater economic impact in their areas of influence. Also, it has been argued that some "Nna Ukwu" usually force their "Nwa Boy" to swear before their deities to prevent them from stealing their money and goods. And in an attempt to secure greater economic and social impact some "Nna Ukwu" use their "Nwa Boy" for ritual to convert their potentials to their Obunike, (2016). These activities impede the fundamental human rights, economic and religious development of "Nwa Boy".

In another development, some studies have shown that most "Nwa Boy" work long hours and under unsafe conditions. These include working 16 hours a day and all through the week and residing inside "Nna Ukwu" shops. The negative implication of residing in business premises could be grievous on the health and safety of "Nwa Boy". Authors such as Omonijo, Adetola, Lawal, Odukoya, Olowookere, Okunlola, and Rotimi, (2019) argue that if not well managed, it could jeopardize the "Nwa Boy" intending economic feat and human development Omonijo, Uwajeh and Anyaegbunam, (2019).

Furthermore, one of the two parties ("Nna Ukwu" or "Nwa Boy") could die in the process of mentoring. In such a situation, the purpose of engaging "Igba-Odibo for establishing small scale business and development is defeated (Agozino and Anyanike, 2007). Although, if "Nna Ukwu" is affected, the probability of "Nwa Boy" switching over to another "Nna Ukwu" may not be ruled out it may amount to forfeiting "Igba-Odibo" for the years he had served his "Nna Ukwu", and starting a new term of mentoring with the new one could be frustrating. As it could be regarded as labour lost and the prolonged years of mentoring which could cause unnecessary delay in setting up his business. Similarly, if "Nwa Boy" is affected, his "Nna Ukwu" may not want to compensate his family which means labour lost to both "Nwa Boy" and his family.

Apart from the above shortcomings, "Nwa Boy" has been condemned on anachronistic sexist stereotype due to the inability of its practitioners to extend it to female fold (Obunike, 2016; Agozino and Anyanike, 2007). As demonstrated by the above scholars, the practice is common among males than females. Apart from that, it could be argued that the practice is a primitive system that encourages modern slavery and child labour. Since most youth usually engage in the practice early in life, the probability of it contradicting the law of child labour may not be ruled out.

Recommendations for Further Studies

In order to determine the true position of critics on the ground that indigenous Igbo business mentoring is a primitive system and modern time slavery that encourages child labour, the paper recommends further studies to either support these criticisms or negate them.

Concluding Remarks

This paper compared the ancient guild system of Karl Marx in the medieval period with the practice of indigenous Igbo business mentoring in Southeast Geopolitical Zone of Nigeria. Although its emergence in the Southeast Geopolitical Zone of Nigeria that has no link with the medieval period could be regarded as a mystery, it goes to illustrate that a notable idea originated and documented in a part of the world could be revisited in another part of the world, either through social change or advancement in science and technology or education, for the betterment of the human race. Thus, the comparison becomes essential due to the cogent roles the two systems play in the impartation of business skills, provision of financial support for mentees to commence their businesses and the protection of mentors' business interests and the profession involved. The paper is of the view that if the system could be properly organized, it could be a major source of economic development and a weapon of human transformation in Nigeria, where the level of unemployment and abject poverty is unusually high.

Abstract

In every work organization either formal or informal, the conditions of service are usually put in place to ensure human development. While its importance in the lives of workers and apprentices has been expressed in the literature emanating from developed nations, mostly in areas of health and safety, studies in many developing countries have shown otherwise, especially in modern and traditional vocational jobs, like motor repairs and indigenous Igbo business mentoring. This could give an impression that health and security of workers and apprenticeship are not considered very important; whereas studies have shown the expediency of health and safety not only for workers and apprentices but the entire populace. Thus, it is the responsibility of the government of every nation to make adequate provision for them. The level of development in developing countries coupled with poor leadership that is self-centred with little concern for the well-being of its citizens/followers have created an impression that health and safety of people are not important. In Nigeria, it appears the situation is more horrible in some apprenticeships in some private organisations such as motor, bicycle repairs, and business transactions such as indigenous Igbo business mentoring. But this study limited its scope to indigenous Igbo business mentoring which entails mentoring the youth for business skills and financial support to establish small-scale enterprise for a time frame. The article examined the condition under which apprentices-"Nwa boy" serve and the implications it portends to human development. The study used data from a secondary source and also engaged with content analysis as a methodology. The article, in its concluding remarks, commended the practice due to its contributions to job creation to reduce the high rate of unemployment in Nigeria. It also commended its contributions to the social and human development of "Nwa boy" (apprentice) that have enrolled in the practice. Despite these, the study argued that if the conditions of service of indigenous Igbo business mentoring could be improved so that the purpose of indulging in the scheme could be properly established and also influence its sustainability

Keywords: Conditions of service, indigenous Igbo business mentoring, implications, human development.

Introduction

Dwelling on several pieces of literature reviewed on work organisations, (the Brazilian Ministry of Labour and Employment 2013; Sani, 2013; Junaidu & Aminu, 2015; Naz & Sharma, 2017), Conditions of Service (CoS) could be regarded as special terms designed to ensure fair treatment between

employers of labour and employees in work organisations. Thus, in both developed and developing countries, other studies have shown that it is a vital aspect of work and its expediency could be attributed to the following factors:

- Granting workers a befitting treatment at work;
- Enabling the workforce to develop potentials for fulfillment;
- Granting manpower a sense of belonging in work settings;
- Providing workers with an opportunity to be effective and efficient at work;
- Granting workers an assurance of sustenance after retirement;
- Enabling employees to contribute immensely towards actualizing the goals of the organization; and
- Enabling training and to retain experienced manpower, which is essential for economic development (The Brazilian Ministry of Labour and Employment, 2013).

As CoS service is regarded as work settings global phenomenon, research has shown that its applicability to workers varies between developed and developing countries, probably due to different countries' level of development, the type of government in each of them and the nature of the elites in power. Thus, some authors have argued that good and attractive CoS exist in developed nations while that of developing countries is characterized by unattractive and unimpressive. This according to them has been responsible, majorly for the menace of brain drain in developing countries and brain gain in the developed world.

This is not surprising, studies have shown that the economy of developed nations is good Nnadi, (2014) and that their elites and government functionaries are responsible to the masses Stiglitz, (1993). Thus, they perceive governance as an opportunity to serve humanity. Besides, it appears the nature of human beings in developed nations tends towards having considerations for the masses. This could be used to explain the minimal level of siphoning the resources meant for national development in their countries. But in developing countries, the reverse is the case; most of the elite and government functionaries are irresponsible to people in order to be selfishly responsible to themselves (Nnadi, 2014). Thus, they perceive an opportunity to serve as an occasion to siphon the resources meant for development. Besides, it appears they lack any concern for the plight of the masses as they often loot the resources of the nation and stockpile the loot in developed nations. Apart from the above, it appears developed nations ensure compliance to CoS in various organisations in their countries while developing countries are less concerned, judging from the way human capital is being treated with contempt in various organisations (Nnadi, 2014)

In developing countries, studies have shown that CoS exists in both the formal and informal sector. In informal organisations, such as vocational or apprenticeship centres, the application of CoS to training apprentices may not be prominent like formal organisations. This could be attributed to the fact that the products or services of such centres are extremely different from that of formal organizations. Besides, most formal organization operate on profit-making while the informal centres like apprenticeship focus on skills impartation. Thus, the CoS of profit-oriented organisations may be different from the non-profit oriented version.

In Nigeria, some authors have argued that the focus of people for work is gradually been shifted from formal organisations to vocational occupations due to the prevalence of high rate of unemployment that impacts negatively on lack or wants among the populace (Muraina and Bawalla, 2019). Thus, articles on means of creating self-employment in craftsmanship and artistry such as sewing and tailoring, bricklaying, shoemaking Schmitz (1995), bicycles and motor repairing, black-smiting, carpentry, weaving pottery and dyeing, hair plaiting/dressing/barbing Onyechukwu, (2006) have featured prominently in academic literature.

In recent times, some others have focused on trade, commerce (Hodge & Smith, 2019) and others relating to small, medium and large-scale businesses, which involves the practice of indigenous Igbo business mentoring. The practise according to the few pieces of literature in its favour in business and academic literature involves the youth enrolling in business mentoring early in life in order to acquire

skills and funds to set up SME as a profession of a lifetime Udeze, (2014) cited in Omonijo, Adetola, Lawal, Odukoya, Olowookere, Okunlola, Rotimi, (2019).

The Igbo nation is the third large ethnic tribe in Nigeria (Findlay, 2016). The nationals occupy the southeast region of the country but spread across Nigeria engaging in business transactions. Their presence is obvious in towns, villages and cities in the country promoting economic development through small and medium enterprises (SMEs) that has its origin in mentoring. Despite this, indigenous Igbo business mentoring is yet to be adequately addressed in the literature. Although the works of (Agozino and Anyanike 2007; Orugun and Nafiu 2014; Obunike, 2016; Omonijo et al., 2019) are related to entrepreneurship in line with the practice but none of these studies investigated the conditions under which intending or prospective entrepreneurs undergo mentoring, which may not be appropriate for human development. The present study was therefore conceived to address this gap in knowledge.

As a country that is being confronted with poor economic development, restricted access to funding business in both short and long terms, inadequate institutions for training a skillful class of businesspersons and workforce, a small revenue, and poor guidelines to aid economic and social upgrading of SMEs, Herr and Nettekoven (2017), the practice of indigenous Igbo business mentoring could be a welcome idea but the CoS guiding the practice needs to be discussed to ensure its survival and contributions to human and national development in Nigeria. This paper addresses this flaw in knowledge gap and the mentoring process.

Although, authorities on the subject of entrepreneurship, such as (Wilken, 1979; Schumpeter, 1983; 1989; Davidson & Wilkins, 2001 & Storey, 2003) and have illustrated the importance of entrepreneurial activities to developed and developing countries but the work of Schumpeter (1983) on SMEs, in particular is more relevant to this discourse. As argued by Schumpeter (1983), SMEs is designed to help the masses in developing countries due to the prevalence of unemployment and poverty in such countries. Nigeria is one of such countries, where the economy is poor, coupled with the high rate of unemployment NBS (2019), poverty Eweniyi, (2019) and lack of welfare system (Rudra, 2007). Since its inception, the practice of the indigenous Igbo business mentoring, has been assisting some of the youth to setup their personal businesses to get rid of unemployment and poverty.

This paper is sub-divided to discuss the exposition of research on the conditions of service, research on human development, indigenous Igbo business mentoring etc.

Literature Review

Exposition of Research on the Conditions of Service

In several studies, various terms have been used to describe CoS. These include Terms and Conditions (T & C), Terms of Service (ToS) etc. Such conditions are regarded as legal treaties between employers of labour and employees but it could be amended at any time as stakeholders deem fit, most especially the employer of labour Kornblum, (1997). In Brazil, such CoS is generally regarded as an apprenticeship contract which means a special work-related agreement created in writing for a specified period not more than two years. However, it should be noted that CoS are in different categories, depending on positions being occupied. Thus, while there are CoS for a fixed employments there are for temporary ones, but all of them are illustrated in the staff handbook.

In most organisations CoS include salary, benefits and allowances which include medical, life and disability insurance, savings fund, dependency benefits and education allowance, rent, annual leave and bonus, maternal and paternity leave, installation allowance, resettlement allowance, home care, removal expenses-leave and leave to travel abroad.

In business transactions that deal with mentoring, mentors should be able to come up with CoS for the mentees with the aim of providing them methodical technical and vocational training measurable with their moral, physical and psychological development. In turn, it should contain the mentees obligations to act diligently in carrying out all the necessary tasks for the training. However, it appears such

provisions have not been adequately expressed in academic literature with respect to the indigenous Igbo business mentoring.

Examination of Research on Human Development

United Nations Development Programme, (2019) view human development as a means of expanding the abundance of human life, instead of the economy in which people live. Moreover, it could be regarded as a strategy channelled at creating fair opportunities and choices for humanity. UNDP, (2019) stipulate the following approach to human development:

- People-in this approach, the emphasis is placed on how to improve the lives people and not on economic growth. Income growth is therefore perceived as an important means to development rather than an end in itself;
- Opportunity- this approach is concerned with how more freedom and opportunities could be giving to people to live lives that they value. This connotes granting people ample opportunity to develop their abilities and chance to use them. For Instance, educating a girl child could enable her to build her skills and with the skill, she should be giving an opportunity to display the skill in the labour market; and
- Choice- This approach is hinged on making choices available for people and not insisting that they must make use of them all because the choices that people make are their own concern.

Fig. i: Approaches to Human Development

Source: *UNDP, (2019)*

These approaches could be viewed in line with Sen, (1989) work on human capabilities which is hinged on whether human beings are able to "be" and "do" desirable things in life, which expresses if people are well fed, have sheltered, and living a healthy life. It also includes being educated and working, voting, participation in community life.

Indigenous Igbo Business Mentoring (IIBM)

IIBM, according to Udeze, (2014) cited in Omonijo, et al., (2019) is regarded as an informal apprenticeship system specially designed to impact business skills and also grant financial assistance to prospective entrepreneurs among youth in the southeast geopolitical zone of Nigeria (Just like other informal vocational training, it is a loose form of acquiring skills where serious conditions of service may not be considered essential, except the agreement policy, which is not supported by the legal system, that binds "Nna Ukwu" (mentors) and "Nwa Boy" (mentees) throughout the period of mentorship.

"Nna Ukwu" usually acts as the mentor and the owner of the SME while the "Nwa Boy" is the mentee who enrolled in mentoring. The role of "Nna Ukwu" has to do with what Bozeman and Feeney, (2007)

cited in Idemudia, (2011) refers to as imparting informal knowledge relating to economic, cultural, political and psychosocial backing relevant to a particular business. It entails face-to-face informal communication during a sustained period of time, between the mentee and his mentor. Moreover, it goes with financial assistance to enable the "Nwa Boy" to establish his own business, which could reduce the rate of unemployment and poverty.

The process commences when the intending entrepreneur (mentee) identifies a successful entrepreneur in his locality either through his parents, friends or siblings and approaches him for mentorship. The mentor, in turn usually organizes an initiation ceremony where the mentee is handed over to his mentor in the presence of village Chiefs for a couple of years for mentoring (Obunike, 2016)

As soon as "Nwa Boy" ends the period of mentorship, his "Nna Ukwu" grant him "Idu-Odibo" (the financial assistance) to complement the skills acquired under him (Obunike, 2016), either in form of cash reward or a new business open in his favour. The family of both the mentor and mentee as well as their community members usually see the day of settlement as a great day because both the mentor and mentee are perceived faithful and responsible to each other. In such occasions, people wine and dine at the settlement party, which serves as a graduation ceremony and the inauguration of the mentee into his personal SME (Obunike, 2016).

SMEs according to the development plan of the Nigeria small scale industry (1980) as cited by Ayozie (2006) are either service industries or manufacturing processes that have investments not more than one hundred and fifty thousand naira in manufacturing and equipment alone. However, for the purpose of this study, SMEs are regarded as service industries which engage less than ten workers to run the business (Ayozie 2006). As the rate of unemployment and abject poverty keep on escalating in Nigeria as indicated in **Fig. ii and iii**, the drive towards the engagement of SMEs through IIBM is gradually gaining ground among the Igbos

Contributions of IIBM to Human Development in Nigeria

IIBM serves as a source of funds and skill acquisition for intending entrepreneurs, irrespective of social-economic, background. The "Idu-Odibo" received at the end of mentoring could be successfully used to set-up small scale businesses. In such enterprises, incomes could be generated for re-investment and revenue to the government. The income from such business could also be used for human development of "Nwa Boy" to the level of being able to cater for his family, in term of sociological, educational, cultural and economic obligations. It could also be used to assist in building community projects.

The expansion of such businesses could also provide an opportunity for recycling of "Nwa Boy" within the family and in the community and also provide job opportunity for some persons. These include the clerk, driver, administrative officers, security guards etc. (Ayandibu and Houghton, 2017). In such businesses, goods produced could be exported to other countries in order to earn foreign exchange which could help the government to get rid of the balance of payment deficit. Apart from that, good produce in such enterprises could contribute to the Gross Domestic Product (GDP) Opafunso and Adepoju, (2014).

Examining the Conditions of Service in IIBM and Implications on Human Development

Just like most organisations, formal or informal in developing countries, the conditions of service is usually poor Asogwa (1981) and it could impact negatively on human development of mentees/employees. Factors such as biological, chemical, social and chemical are normally encountered at work Asogwa (1979) and they should be categorized along with conditions of service. Further to that, working hours involving duty shift and off, quality of residence, feeding and environment where the work takes place are essential parts of the conditions of service which could be used to determine peoples wellness and life expectancy. And if they are not properly managed, they could cause disorder and occupational diseases Sambo and Shamang, (2012) in the lives of workers/mentees.

With reference to IIMB, Obunike (2016), argues that many "Nwa Boy" work long hours every day, including weekends. This means staying in "Nna Ukwu" shops or premises for more than necessary and it goes to contradict the European Commission's Working Time Directive which stipulates proper time out periods' to maintain health Working Time Directive (2003). In the course of rest, Meijman and Mulder (1998) argue that the recovery, that occurs when people rest is vital for the maintenance of their health. The period is considered the return to and steadiness of psychophysiological systems at a starting position of stimulation in the period of lack of demand for work.

Although, the continual availability of members of staff in some organisations outside the nine to seventeen hours working-day is necessary but such is regarded as a nonstandard working schedule that is detrimental to human health. According to Merkus, Holte, Huysmans, Mechelen and van der Beek (2015) nonstandard schedule connote any roster that is different from forty-hours of engaging in work-related activities per week. This includes working for eight hours a day, from Monday to Friday; employments relating to shift-from six am to six pm, extended hours of working for weeks (> 5 days), on-call duties, etc. In most businesses involving the indigenous Igbo business mentoring, the description of nonstandard hours of engagement of Merkus, et al., (2015) could be applied to "Nwa Boy" who are observing their mentorship in enterprises located in popular cities and junctions, where commuters stop to refresh themselves before proceeding on their journey to their final destinations.

In Southern Nigeria, such include Lokoja, Ore, Aba, Oshodi, Okene, Oluku, Auchi and Aviele junctions etc. In such locations, "Nwa Boy" could engage in nonstandard training schedule since customers are constantly patronizing the business 24/7. The negative implication of engaging in nonstandard training schedule lies in depression Merkus, Holte, Huysmans, Mechelen and van der Beek (2015), harmful health effects like sleep disturbances (Amagasa and Nakayama, 2013; Kato, Haruyama, Endo, Tsutsumi and Muto (2014) and other occupational diseases like fatigue Muller,

Carter and Williamson (2008) and coronary heart disease Bannai and Tamakoshi (2014). The probability of "Nwa Boy" who fall victim getting treatment promptly may be doubtful, due to the cost of treating such ailments and the poor condition of health centres across Nigeria. Besides, some "Nna Ukwu" may not want to spend their money treating him or her.

Besides, it could be observed that most "Nwa Boy" dwells in their "Nna Ukwu" shops which undermine the quality of residence as illustrated by Ayedun, Omonijo, Durodola, Akinjare and Akannni, (2019). This means places, where business transactions take place, could also be used as "Nwa Boy's" residential quarters. Also, such places could be used for cooking, eating and sleeping. Apart from these, bathing, watching of plates and clothes etc. could equally be taking place in the same shop. The implication of using one shop for these activities could be grievous for "Nwa Boy" health and security mostly when chemicals and biological substances are involved. In respect of security, "Nwa Boy" dwelling in "Nna Ukwu" shops stands a great risk in contemporary Nigeria that the rate of armed robbery, ritual killing, kidnapping are exceptionally high Omonijo, Obiorah, Uche, Anyaegbunam, Shaibu and Ogunwa, (2017).

Apart from the fact that shops could be broken into in the night, and goods worth thousands of naira stolen away, "Nwa Boy" residing in the shop could either be maimed, killed or used for ritual purposes. In the course of the robbery, it could be very intricate for "Nwa Boy" to escape since he resides in the premises. If he survives, the probability of his "Nna Ukwu" accusing him of being an accomplice could be very bright. Such a wrong accusation could prompt "Nwa Boy" to develop psychological trauma which may likely affect his social relationship with his "Nna Ukwu"

In another development, the IIBM condition of mentorship is said to entail an agreement for settlement in term of funds to complement the training received, but the probability of some greedy "Nna Ukwu" exploiting their apprentice by paying them an insignificant "Idu-Odibo" at the end of mentoring may not be waved aside. Any business, either small, medium or large that is not controlled by the government is governed by the core principle of capitalism- minimization of cost for actualizing maximum profit and since profit is one of the purposes of setting up the business, hardly can any capitalist be found solely committed to benevolence in business transactions? "Nna Ukwu" are private businessmen who are out to make a profit. Before such entrepreneurs could grant their "Nwa Boy" enough funds to set up their businesses, they must have used them to make a huge profit. In case, some of them fail to make a huge profit in the course of mentoring a greedy "Nna Ukwu" may find it difficult to honour the term of service properly. In such a situation, Marx (1954), position on exploitation could be justified. The major implication of this is that "Nwa Boy" may need to source for additional funds from elsewhere, to commence his business which may not be forthcoming. In such a case, he may find it difficult to find his footing in business for a very long time.

The probability of such "Nwa Boy" being subjected to depression and psychological trauma may not be ruled out. It may be very difficult to get rid of the pains incurred in the process of trying to struggle to raise enough funds to commence his business. If he eventually succeeds, he may likely use it as a yardstick to exploit "Nwa Boy" who pass through him and may likely become a vicious circle of exploitation which could be very difficult to get rid in IIBM.

Concluding Remarks

This article discussed Condition of Service (CoS) with a special reference to the Indigenous Igbo Business Mentoring (IIBM). It illustrated the existence of nonstandard training schedule in IIBM and its implications on "Nwa Boy" in terms of social, economic, health and security. Also, the article commended the practice due to its contributions to job creation to reduce the high rate of unemployment and poverty in Nigeria. The paper is of the view that if the CoS of the indigenous Igbo business mentoring could be improved, the purpose of indulging in the scheme could be properly established. It could also engender efforts to sustain the practice for the betterment of the Nigerian youth.

The Influence of Social Media Marketing on Brand Equity in Evoking Brand Choice Intention Amongst Smartphone Brands

Muhammad Ridzki ADIPUTRO and Agung NUGROHO*

Department of Management, Faculty of Economics and Business Universitas Indonesia

corresponding author: a.nugroho@ui.ac.id

Abstract

This study aims to provide further insight into how Social Media Marketing (Twitter, Facebook, Instagram, Youtube) may affect ones brand choice intention mediated by the level of consumer value in the brand or Brand Equity (Perceived Quality, Brand Awareness, Brand Image) of Samsung and Apple users as they are notably similar brands which sell smartphones at a relatively premium price compared to its rivals. This research compiled 160 respondents for each brands Samsung and Apple, wherein the writer had simply aimed to provide a general overview of whether the model may be applied to such context and each brand individually. Hence, having processed the data through a Structural Equation Model approach using SmartPLS the writer had found that for both brands there is a significant positive impact of Social Media Marketing Efforts on evoking ones brand loyalty and its outcome brand choice intention; with a higher indirect effect when considering the role Brand Equity has on Brand Loyalty.

Keywords: Social Media Marketing Efforts; Brand Awareness; Brand Image; Perceived Quality; Brand Choice Intention

Introduction

By definition, "social media marketing are processes or events that use social media in an attempt to positively influence consumer's purchase behavior" (Dann, 2010). Such marketing channel already reaches more than two thirds of all Internet users; provides unparalleled opportunities for brand and reputation building (Zuniga, 2010). Specifically within Indonesia, based on a survey conducted by Hootsuite; social media usage has reached almost 48% of the total population indicating that the potential market for businesses to implement digital marketing strategies is widespread (Hootsuite, 2019). Among those who access social media, 130 million Indonesians use their mobile devices implying that the country is well technologically savvy and that 150 million people are active in exchanging and activating their social media as users. Among the 150 million people active in using social media, data from Hootsuite as of January 2019 indicate that the top 4 social media platforms used by Indonesians by rank respectively is YouTube, Facebook, Instagram, Line, Twitter

In response to such growing usage of social media, a growing number of businesses are using social media namely Social Media Marketing as a new of interacting with its consumers in various industries. Among the many industries contributing to Indonesia's GDP/national income in 2019, data from BPS/Badan Pusat Statistik abbreviated as the Central Statistical Body indicates that within the Non-Oil & Gas Manufacturing industry, both the Electronic and Food/Beverage Sector are major contributors to the nation's GDP each amounting to 65 575,9 and 253 583 billion respectively. the smartphone industry primarily makes up for the electronics sector in terms of web traffic usage. In accessing such digital content and social media marketing efforts, shown through web traffic by the latest Global Web Index (2017) 69% of Indonesian's use their mobile phones while the remaining 31% make use of their laptops and tablet devices. Such data implies that many consumers have preference in using mobile phones or smartphones in engaging with social content.

Research from the Statista Research Department, shows that the expected smartphone penetration rate as a share of the total population in Indonesia may reach 33% in 2023 (Statista, 2019). Because of such high potential in market size and current demand for smartphones in Indonesia, smartphone brands must provide for effective social media marketing efforts to engage and retain its consumers in the long run. It is for this reason that this paper will examine further such industry, specifically Samsung and Apple as these two brands are notably known to be premium smartphone brands with a relatively high standing in market share as of September 2019 ranked respectively based on research conducted by Statcounter. To elaborate further on the object brands of this research that is Apple and Samsung, generally the prices set for its smartphone products are higher than other competitors within the Indonesian market. As of 2020, based on data from Price Price.com new Apple smartphone products for generations released from 2014 up until its newer products in 2019 are priced ranging from Rp 1,660,000 for its Iphone 6 with 16GB capacity up until its newest model Iphone 11 Pro released in 2019 priced at Rp 11, 950,000 (Editor)Such prices, are retrieved from various online and offline vendors which are then averaged to provide a glimpse into the market price ranges for such products. Samsung on the other hand, up until such similar period for its product released in 2014 that is Samsung Galaxy Note 5 with 32GB capacity at today's market price is set at Rp 1,000,000 with its most recent model launched that is the Galaxy Fold priced at a staggering Rp 28,000,000. Both brands, have products categorized as its relatively cheaper models that is the A and J series for Samsung whilst Apple reaching such category through their R and C smartphone versions of their flagship series the Iphone.

Based on the issues and findings aforementioned in the previous paragraph, the writer then intends to continue such research. For the purpose of this paper, the writer would further analyze the impact of social media marketing efforts (Entertainment, Interaction, Customization, Trendiness, EWOM) brand loyalty and its impact on brand choice intention as its outcome as a criterion variable. More dimensions of measuring ones brand equity is also taken into consideration by perceived quality to further provide insight. Also, to fulfill limitations set within the previous study the writer will incorporate social demographic variables such as ones gender, age, income in order to identify whether such factors may have an influence on the proposed model and others. In addition to this, research examining social media marketing effects from the perspective of branding literature is also still mainly exploratory and lacks empirical studies (Boride, 2014). Hence, the object of this research would be focused on a different industry that is on premium selling smartphone brands (Samsung and Apple) wherein, smartphone usage is exponentially on the rise and that social media engagement is done primarily through mobile phones/ smartphones in Indonesia. As Indonesia is currently ranked third in Southeast Asia for its use of smartphones, such study on such brands would have to employ effective SMME to engage its consumers. Following the main journal by B Godey, as the writer has made general explanations as to why the object of this research would be focused on Smartphones such change in focus is justified as in short compared to the luxury fashion brands, smartphone brands are naturally more competitive thus contributing to a shorter life cycle for its products than the retention of luxury fashion items. The writer wishes to explore such different nature of product through this research compared to luxury fashion brands, which are complementary in nature. Based on an article by Kompas, Indonesian consumers in Indonesia have become more critical when opting to choose Samsung products in the midst of the growing number of Samsung brands.

Generally, smartphone brands are substitute products wherein the characteristics have positive cross price elasticity, which measures the impact of the demand of a product towards the relative change in price of a another competing brand. Compared to luxury fashion brands, the nature of such products are complementary in nature as consumers are less sensitive to price changes due to their understanding that such products are meant to be priced at high levels. This as a result, contributes to its negative cross price elasticity, wherein a change in price of a rival fashion brand will not necessarily impact demand of another competing product.

Literature Review

Digital Marketing

By definition, the American Marketing Association's firm denotes that Digital marketing is seen as 'activities, institutions and processes facilitated by digital technologies for creating, communicating and delivering value for customers and other stake holders. In other words, digital marketing is marketing done online whether via websites, online ads, opt in email, mobile apps or other emerging platforms (Smith, 2017). The development of technology has allowed firms to create more value through new customer experiences and interactions by known digital platforms. Data indicates that sales made through mobile devices are increasing at a rapid rate to between 22% and 27% of all online sales (L, 2015). Corporations now highlight the importance of creating a "digital relationship" with customers (E, 2015). In other words Digital Marketing is an umbrella term wherein the process of using digital technologies to acquire customers and promote sales is measured. With a more customer centric focused approach of marketing its products, firms will face the shifting of younger customers to use digital platforms wherein "younger, digitally oriented consumers enter the ranks of buyers" (Bughin, 2015).

Complementary and Subsitute Products

Generally, within marketing literature product categories must be defined so that proper analysis of an inter category relationship may be identified. In short, products are considered a substitute if lowering the price of a product leads to an increase in sales of its rival product within the same category (A, 2004). Contradicting, Complementary products are those whose demand are not elastic to changes in price of a another similar brand. Generally, strong substitutes should be offered separately whereas complements are advised to be offered to consumers in a bundle so that it may maximize its profit (A, 2004). Complementary goods are divided into those with weak and strong relationships wherein it is judged by its cross elasticity of demand; changes in the price of one good will not neccesarily cause a demand decrease of another good. If such good is used parallel with another product, its overall value is deemed to increase hence the higher offering.

Social Media Marketing Efforts

For the purpose of this study, the research of Kim and Ko (2012) provides a framework of understanding factors within SMME namely entertainment, interaction, trendiness, customization and word of mouth (Ko K. &., 2012). As each consumer has differing preferences and experiences to perceiving ones SMME, enterprises must organize marketing activities according to different user needs and that they must understand users' needs earlier than the users themselves and learn which products users need in order to organize events that leave lasting impressions

Entertainment

Entertainment is the result of the fun and play emerging from the social media experience (Gionis, 2008). Users who are having fun and experience a lot of enjoyment are basically the pleasure seekers on social media sites (Tang, 2013)

Interaction

Interaction is the act of involving consumers and communicating with consumers through the use of social media. It can offer the exchange of ideas and create a room for dialogue between brands and its consumers. Social media interaction is a platform where the users interact with each other, contribute to the discussion, give suggestions on specific products or services and likeminded people meet to express their views on issues (Smit, 2011)

Trendiness

Social media as a channel for communication should provide the latest news and hot discussion topics to the public (Gravano, 2011)Consumers consider the information which is given on social media to be more trustworthy than information provided by the traditional sponsor of the brand (Precourt, 2008).

Customization

The level of *customization* describes the degree to which a service is customized to satisfy an individual‘s preferences (Schmenner, 1986). Having elements of personalization incorporated within the firms SMME would evoke a degree of individuality hence potentially creating stronger brand loyalty (K M. , 2010

e-Word of Mouth (eWOM)

Within SMME, when implemented effectively it is a great tool for evoking *eWOM,* as consumers may spread information and brand ideals to their friends, peers and other acquaintances without constraints (Ko K. &., 2012).

Brand Equity

For the purpose of this research, Brand Equity is measured in terms of consumer based brand equity wherein it acts as the impact of consumer knowledge on a specific brand given the set marketing activities.

The model of brand equity that Keller (1993) proposes is dominant, providing the link between its two dimensions- brand awareness and image. According to him*, brand awareness* refers to the strength of the brand node specifically the consumer’s ability to identify the brand under different conditions. Keller describes brand image as ‘Perceptions about a brand which the brand association in consumers memory reflect (Keller, 2003).

Perceived quality refers to “ a consumers judgment resulting from comparisons made by consumers between expectations and the perception of the service performance” ((Chambers, 1989). The term perceived quality might be gathered through both prior use of a certain product and clues such as brand name price and brand advertisements (Dodds, 2002).

Brand Loyalty

From previous journals, as suggested by Oliver (1999) Brand Loyalty is regarded as a customer’s “deeply held commitment to rebuy a preferred product or service consistently in the future, despite situational influences and marketing efforts having the potential to cause switching behavior” (Oliver, 1999). In addition to this, he suggested that brand loyalty means the strong trust of customers in a specific product or brand which leads to reduction in the probability of customer’s brand switching.

Brand Choice Intention

Brand choice intention refers to the preference of consumers to choose a certain brand over rivals given the information and knowledge presently available. In other words, it is a “consumer outcome to a certain brand wherein brand loyalty is a determinant” . According to Keller (2003), brand choice intention is the consumer intentions to still choose a brand in the midst of other competitor brands. Also, Keller states that consumers would prefer brands to which they are familiar in recognition.

Methodology

According to Malholtra (2010), a research design is a framework or blue print necessary for conducting a marketing research project as it explains the necessary steps in obtaining desirable information to solve research problems (Malholtra, Marketing Research: An Applied Orientation, 2010). Specific for this research, the writer would use a conclusive approach to solving the subject at hand. This is due to the reason that a conclusive approach provides a more formal and structured manner in reaching conclusions and aid in providing information reliable for decision making. As the writer intends to examine the relationship between SMME and its ultimate impact on ones brand choice intention as an outcome from loyalty, the structure of research would be Causal

Table 1: Operationalization of variables

Item	Definition	Operational Variables		Likert Scale	Source
Entertainment	Entertainment is the result of the fun and play emerging from the social media experience			**Likert 1-7**	Kim & Ko (2012)
		Using X Brand Social Media is Fun			
		Content of X brand's social media seems interesting			
Interaction	It can offer the exchange of ideas and create a room for dialogue between brands and its consumers				
		X Brand's social media enables information sharing with others			
		Conversation or opinion exchange with others is possible through X Brand's social media			
		It is easy to provide my opinion through X brand's social media			
Customization	The level of customization describes the degree to which a service is customized to satisfy an individual 's preferences				
		X brand's social media offers a customized information search			
		X brand's social media provide customized service			
e-WOM	Consumer gesture to spread information and brand ideals to their friends, peers and other acquaintances without constraints as a consequence of Brand X social media.				

Item	Definition	Operational Variables	Likert Scale	Source
		I would like to pass information on brand product or services from x brand' social media to my friends		
		I would like to upload content from X brand's social media on my blog (Any active social media platform currently used by the respondent; either Twitter/Facebook/Instagram/ / YouTube)		
Trendiness	Social media as a channel for communication should provide the latest news and hot discussion topics to the public (Naaman, Becker & Gavano 2011			
		Content of X brand's social media is the newest information search		
		Using X brand's social media is very trendy		
Brand Equity				
Brand Awareness	Refers to the strength of the brand node, the consumer's ability to identify the brand under different conditions			
		I am always aware of X brand		
		Characteristics of X brand come to mind quickly		
		I can quickly recall the symbol or logo of x brand		
Brand Image	Perceptions about a brand which the brand association in consumers memory reflect			
		X brand is a leading smartphone company		
		X brand has extensive experience		
		X brand is a representative of the smartphone industry		
		X brand is a customer oriented company		
Perceived Quality	The term perceived quality might be gathered through both prior use of a certain product and clues such as brand name price and brand advertisements			
		Brand X offers very good quality products		Buil et al (2008), Yoo and Donthu

Item	Definition	Operational Variables	Likert Scale	Source
		Brand X offers products of consistent quality		(2001) and Netemeyeret al (2004)
		Brand X offers very reliable products		
Brand Loyalty	Loyalty means the strong trust of customers in a specific product or brand which leads to reduction in the probability of customer's brand switching			
		I regularly use this brand		Kim and Kim 2004
		I will repurchase such brand		
		This brand is my first choice compared to other brands		
		I am satisfied with my experience in using such brand		
Brand Choice Intention	Brand choice intention is the consumer intention to still choose a brand in the midst of other competitor brands; denoting ones preference to repurchase an outcome of brand loyalty.			
		Even if this brand has similar features to others, it seems smarter to choose this brand		**Hsu et al's (2012)**
		This brand is always a better choice compared to its rival brands		
		It makes sense to choose X brand instead of any of the other brands		
		This X brand is my favorite smartphone brand among all other competing smartphone brands out there		

For the purpose of this research, the writer will conduct its method of collecting data in a manner that is generally preferred by the writer. In total, the research would collect 320 responses from respondents wherein the questionnaire would be distributed to an equal proportion amongst the two brands so then the data retrieved would prove for a more detailed analysis of latent variables per brand. However, the collection process would be aimed to be representative of the intended age group population.

The researcher has adopted and referenced two research models for this study. The first model was retrieved from a journal in Journal of Business Research Vol. 69 entitled 'Social Media Marketing Efforts Of Luxury Brands: Influence on Brand Equity and Consumer Behavior' by researchers Bruno Godey (2015). Parts of the second model were retrieved from a Journal in Journal of Business Research vol 101 entitled "The effect of authenticity perceptions and brand equity on brand choice intention" by authors Minh Tuan Phung and Pham Thi Minh Ly (2019). The journal aimed to examine the relationship of Customer Authentic Perception mediated by Brand Equity (Brand Awareness, Brand Image and Perceived Quality) on Brand Loyalty as an antecedent to Brand Choice Intention as an outcome to loyalty.

Based on the previous literature and established research models, as a form of novelty the writer has decided to implement minor alterations to the used research model by partially combining components from both two previous models as the writer had found it to better fit the object and nature of this research. The writer therefore had primarily adopted the first model by including dimensions of SMME and two dimensions of Consumer Brand Equity (Brand Awareness, Brand Image). From the second reference journal, the writer had combined relationships between Brand Loyalty and its outcome variable Brand Choice Intention as prior literature had affirmed its relationship between the previous endogenous variables as notably Brand Loyalty is a form of behavioral consumer response as applied in the first journal. However, as the first journal had used three dimensions to measure consumer response that is Preference and Price Premium the writer had simply decided to incorporate Brand Loyalty as the endogenous variable due to the objectives and fitting nature to the object of this research.

Hypotheses

Within the context of social media, SMME enhance customer based brand equity (Bruhn, Schoenmueller & Schafer, 2012; Kim & Ko 2012). Bruhn et al. (2012) disclose that traditional as well as social media communication have an impact on brand equity; though its degree of influence is yet to be as significant. In a social media setting, (Bruhn, Schoenmueller & Schafer, 2012; Kim & Ko, 2012) may enhance the customer based brand equity.

H1 Marketing efforts on social media (Entertainment, Interaction, Trendiness, Customization and e-WOM) have a positive and direct influence on Customer Based Brand Equity

How consumers perceive a brand as denoted by Brand Equity, positive and stronger brand equity contributes to increased brand preference which may heighten ones willingness and preference to purchase the product. The level of perceived brand equity is the result of SMME and is positively related to future purchase behavior (Kim and Ko 2012).

Based on Oliver (1999) brand loyalty is referred to as the 'deeply held commitment to rebuy a preferred product or service consistently in the future. It is also suggested that the brand loyalty means the strong trust of consumers in a specific product or company brand which leads to a reduction in the probability of customers brand switching (Oliver 1999. In providing for the linkage between brand equity namely (Brand awareness and Brand Image), Brunner, Stocklin and Opwis (2008) and Lai Griffin and Babin (2009) argued that brand loyalty is a consequence of such brand equity dimensions.

Kayaman and Arasli (2007) found that dimensions of perceived quality and its relationship on brand loyalty are revealed to have positive influences on service brand loyalty. The existence of relationship between perceived quality in evoking customer loyalty is affirmed in the study by Gallarza and Saura (2006)

For the purpose of this study, the mediating effect of Brand Equity and its dimensions on each relations between SMME and Brand Loyalty is evident as Bruhn et al (2012) disclosing that traditional as well as social media communication have a significant impact on brand equity. Quite similarly, most scholars agree that stronger brand equity contributes to customer loyalty (Aaker, 1991). Thus, affirming the mediating effect it has on the relations between SMME's and Brand Loyalty.

H2 Brand equity (Brand Awareness, Brand Image, Perceived Quality) has a mediating effect on the relation between marketing efforts on social media and brand loyalty

Various statistics have shown the importance of social media marketing efforts on evoking certain consumer responses wherein they act as platforms to develop certain preferences and information sharing amongst consumers. A study published by eMarketer, has shown that 81% of teenage girls use their peers as source of information and decision making. According to Laroche, Habibi and Richard (2013), social media activities help build relationships with the brand and their product hence evoking certain consumer responses such as brand loyalty. Therefore, such influence is examined further for this study.

H3 Marketing efforts on social media (SMMEs) have a
Positive and direct influence on the consumer preference specifically brand loyalty

Oliver (1999), brand loyalty means the strong trust of customers in a specific product or company brand, which to leads to a reduction in the probability of customers brand switching. Other studies such as Brunner, Stocklin and Opwis (2008) state that it is a consequence of the dimensions of brand equity and that they also tested whether it has a significant influence on brand choice intention.

H4 Brand loyalty has a positive influence on brand choice intention amongst smartphone brands analyzed

Discussion and Analysis

Before the writer may proceed further with the structural equation modeling method analysis of this research, a measurement model analysis is conducted to determine the validity and reliability specifically between latent variables shown in the model and its corresponding indicators. The validity test is conducted to measure the degree of how the indicators may present valid results; which is condcuted by establishing convergent validity and discriminant validity. Specific for this research, convergent validity will be established by means of analyzing the Average Variance Extracted and discriminant validity by use of cross loading. In establishing reliability, the writer will use the value of outer loadings as a threshold and composite reliability for measuring internal consistency reliability.

Table 2: Apple

Marketing efforts on social media (Entertainment, Interaction, Trendiness, Customization and e-WOM) have a positive and direct influence on Customer Based Brand Equity	**0,790**	**21,038**	**Accept**
Marketing efforts on social media (SMMEs) have a Positive and direct influence on the consumer preference specifically brand loyalty	**0,404**	**3,883**	**Accept**
Brand loyalty has a positive influence on brand choice intention amongst smartphone brands	**0,709**	**10,292**	**Accept**

Hypothesis	Direct Effect	Indirect Effects	Conclusion
Brand equity (Brand Awareness, Brand Image, Perceived Quality) has a mediating effect on the relation between marketing efforts on social media and brand loyalty	3,883	4,117	Accept (Partial Mediation)

Table 6: Social Media Marketing Effectiveness

Brand	Lowest Loading SMME /Path Coefficient	Highest Loading SMME /Path Coefficient	Brand Equity (R Square)
Apple	0,759 EWOM	0,845 Customization	0,430
Samsung	0,781 Entertainment	0,866 Trendiness	0,624

The SMME activities employed by the brand are seen to have the highest coefficients towards the customization variable. This indicates that changes in SMME are greatly caused by the level of customization of the activities employed by the brand. In other words, Apple consumers have found the social media marketing activities of the brand to be highly tailored to their needs individually hence the highest coefficient compared to other dimension features of SMME.For instance, as the majority of its marketing campaigns compel a pull approach to social media postings; the firm puts emphasis on attracting its customer segment that is the tech savvy and the productive. Therefore, it focuses on posting content which showcase photos which may appeal for the hobby of consumers. The lowest path coefficient however, lies within the EWOM variable wherein it only contributes to a value of 0,759 indicating that usch variable is perceived by consumers to be less effective in raising cahnges in SMME. This would be evident, due to the possible unattractiveness or desire for Apple consumers to privately share content regarding the brand on their social media platforms. This may be caused by, the lack of innovation content or campaigns provided by Apple to provoke incentive or interest to spread social medai sharing by its consumers.

Contradictingly, for Samsung the highest path coefficient lies within the dimension of Trendiness wherein it attributes 0,866 indicating that such dimension has succesfully be deemed effective in highlighting Samsung's social media marketing efforts. This may be true, as in contrast to Apple the brand has employed a localized social makreting strategy wherein it is managed by the country individually indicating the possibility for delivering relevant and up to date information to its respective Indonesian consumers. Also, Samsung as a brand is known to constantly post social media content which are hard selling in nature consisting of promotional offers and firm driven features of its product. These may include, weekly promotional offers for its products and seldom events which may attract a large following. The lowest path coefficient reflected in SMME of Samsung however, is Entertainment indicating that the brand has yet to employ social media marketing activities, which are fun and entertaining in engaging its consumers as it has only a value of 0,781. This could be explained, as the brand has employed a less pull strategy and more of a push approach to social media activities when compared to Apple wherein they have yet to establish many posts or compaigns to provoke personal interest from consumers to the brand hence contributing to the element of fun. For instance, the brand has yet to encourage its consumers to actively participate in its campaigns by personally posting user generated photos which may drive curiosity and fun when exposed to its social media.

Conclusion

Firstly, the overall findings of the research found that for both Apple and Samsung consumers Social Media Marketing Efforts are seen to have a significant and positive impact towards the latent variable brand equity. Thus, social media marketing reflected through its dimensions is crucial for Indonesian consumers to have heightened brand equity specifically resulting in positive perceptions on the perceived quality, strength of the brand node and its brand image.

Second, the findings showed that SMME reflected by its dimensions for both brands are seen to impact brand loyalty significantly and in a positive manner. The social media activities employed by the brands have successfully promoted consumer trust in the brand which could lead to brand preference in the midst of other rival brands.

Third, a consumer brand equity approach to measuring overall brand value is found to have a mediation effect towards the impact of brand loyalty amongst both Apple and Samsung Consumers. This shows that the importance of Brand Equity as a latent variable is crucial as it measures the overall perceived quality, brand awareness and brand image of both Apple and Samsung thus potentially causing changes in ones consumer response to choose the brand in the midst of competitors.

Fourth, findings affirm of the impact brand loyalty has on ones repurchase intention amongst Apple and Samsung Consumers wherein its values are significant and exceed the threshold. This would indicate that heightened increases in ones trust in brand, may positively impact the decision of Indonesian consumers to repurchase their smartphone

Limitation and Reccomendation For Future Researcher

1. As the research mainly relied on response mainly distributed from a focused region and less random distribution that is Jabodetabek, future researchers may perhaps aim to gather respondents from a more diverse demographic in terms of domicile and age group so that furtuer insight and variation may be retreived as to how perspectives differ in agreement of the role of social media in evoking ones brand loyalty..
2. The research was unable to thoroughly examine and identify the role of each of these specific social media platforms and its contribution to brand loyalty hence future research should consider incorporating and specifically analyzing ceertain social media platforms as their object of the study instead of a general approach.
3. The researcher has only used two brands of similar category to justify and be used as the object of the research hence for further insight future researchers may also consider incorporating more than two brands as their object of the study so that it may provide a more hollistic generalized view of the smartphone industry in Indonesia.
4. In order to build on the theoretical model and the implementation of it on different contexts, perhaps researchers may consider applying such a modified research model to different consumer oriented industries in Indonesia specifically within product categories which require more product learning and purchasing effort for its consumers due to the nature of a more expensive price point.
5. The pooling and findings of this research may be at some point bias in terms of the respondent's recollection of the media posts of their respective brands. In order to better limit the bias of findings related to perceived social media sightings and interaction, perhaps the future researcher may specifically generate a screening question which would effectively display ones recent sighting and interaction with a specific social media post by giving a time constraint and also by rephrasing the question structure its social media post.

Managerial Implication

As the writer has elaborated on its findings, there are several managerial implications to which may be offered for relevant business enterprises to follow through on the conclusions drawn.

1. From a business perspective, brand managers operating within the FMCG dealing with Business to Consumers products may expand its efforts on marketing through a social media standpoint. As the study has ultimately affirmed the impact of ones SMME has on brand choice intention for both brands, the utilization of social media strategies through a firm driven approach are crucial to generating consumer trust and ultimately preference for repurchase in the midst of rival brands.

2. According to the research, brand managers may also employ extensive efforts maintain its level of brand equity or value in the perceived eyes of its respective consumers as it is found to be an important factor to mediate between the impacts of brand loyalty and employed social media efforts. Indonesian consumers from this research have shown that they are social media savvy with the majority of both Apple and Samsung consumers to access social media 4-6 hours daily. This indicates that they are perceptible and readily accessible to information which may be shared online. Also, firms may opt to employ consumer oriented marketing strategies to actively engage and improve the perception of brand equity amongst its consumers.
3. From the nature of the respondent profiles gathered, for both brands the role of Social Media is seen to significantly aid in ones product learning of the brand itself. Acknowledging such result, perhaps firms may provide social media content more oriented on the ways of consumer use and on the features of the products. Also, the firm should maximize its activities on its social media platforms to generate content daily so that its consumers are actively engaged and provide product learning. In addition to this, it is also seen that for both brands the majority of Indonesian consumers are sought to still use the conventional approach to purchasing its product that is through traditional shopping centers and shops
4. In terms of gauging the effectiveness of the current social media marketing effectiveness employed by the brands, insight is retrieved that both Apple and Samsung must still improve its social media posts by maximizing the dimension EWOM for Apple and Entertainment for Samsung. As explained earlier, these two dimensions perceived by consumers have relatively the smallest impacts towards SMME as a whole. For Apple, managers must employ social media content, which better provide initiative for the consumer to share the brand's social media posts by perhaps providing more interesting marketing campaigns, and viral content which would draw the willingness to post something unique for consumers. For Samsung, managers must optimize to provide more content which are more entertaining innature by perhaps employing social media posts which may raise the awareness of the product whilst packaged in a mini game and interactive manner therefore driving the level of fun experienced. The results of such research hence would provide marketers of the respective brands to further their efforts in social media by enhancing the relevant lackluster dimensions as their next strategy.

Abstract

The main aim of this paper is to review the literature related to the factors affecting economic development in relation to Chad. As there is lack of studies conducted in this area, the paper also focuses on the empirical review based on economic development around the world as well as reports from World Bank. The paper attempts to identify why despite effort made throughout the years, economic development is still very critical in the country. Although many studies have examined issues and challenges of economic development in sub-Saharan Africa, most have been conducted within SSA countries, making it difficult to identify the scenario of Chad position in this part of the world. The paper highlight the following arguments are the main challenges of economic development in Chad such as lower human development index, increase in the population and the level of poverty, inequality, lower health and wellbeing factors, unemployment, growth, decline in oil price, weak security environment, decline in the business freedom. Thus, in order to overcome the different challenges and issues of economic development in Chad, it is strictly important that national governments and the international development organizations around the world together working very hard to achieve the objectives.

Keywords*:* Economic Development, Poverty, Productive employment, Republic of Chad.

Introduction

Economic development is a systematic process that influences growth and economic reform (Todaro & Smith, 2011). Economic reform involves three major areas which are government policies undertaken to meet inflation targeting, high employment, and sustainable growth. Secondly, policies and services vis-à-vis infrastructure, public transport facilities, and healthcare access to the poor. The last area involves policies and programs clearly designated to improve a country's business climate from finance, marketing, neighbourhood development, business retention, the business expansion, technological transfer, and real estate development (The International Economic Development Council's, 2018). In other word, economic development must therefore be regarded as a multidimensional process comprising of major changes in social structure, national institutions, the

acceleration of economic growth, the poverty reduction and eradication, as well as the reduction of inequality (Todaro & Smith, 2015). Hence, it is important to note that economic development is a critical indicator affecting countries around the world (Feldman et al., 2014; The International Economic Development Council's, 2018).

The issue of economic development has long been globally discussed among scholars and policy makers (e.g. Otto & Ukpere, 2014; Amaya Muñoz et al., 2016; Ray, 2019; Saxena & Bansal, 2019). Nevertheless, more than half of the world population have no access to social protection, continuing high level of subsistence activities, etc. This problem has further pushed the target level of poverty and inequality with decent jobs creation to be achieved as argued by scholars (Luebker, 2012; Ridzuan, Ismail, & Che Hamat, 2017; Stewart, Ranis & Samman, 2018). For example, the United Nations (2019), stressed that low income growth can jeopardize sustainable development goals due to low infrastructure, inadequate health improvement, failure to upgrade human capital and broaden opportunities such as FDI (Danquah & Ouattara, 2014; Jaiblai & Shenai, 2019).

More specifically, in regions likewise Chad where poverty level and inequality are high, as well as fragile income per capita growth acts as a severe obstacle to social development. Alongside the social dimension including economic growth usually fails to reach those who need the most. As a result, despite considerable progress over the last two decades, more than 700 million people still remain below extreme poverty line, where more than half are in Africa including Sub Saharan Africa (SSA) and Chad in particular. Hence, among the factors affecting economic development in Chad including human development, human development index, economic performance, socio economic level, economic globalization, economic decline, uneven economic development, economic freedom, poverty at different level, as well as population, relative poverty and absolute poverty are accounted for the economic development of the country. However, despite the contribution of the economic activities of the country and the World bank as well as others interventions; Chad's economic development has not significantly improved even ever since the country is an oil exporter since 2003.

Literature Review

There exists no single definition to incorporate all the various stands of economic development. Hence, economic development or development economics can be described as a systematic process that influence growth through restructuring an economy in order to enhance the economic welfare of a society. It also involve the process of creation of jobs and wealth, as well as the overall improvement of quality of life of a given community or nation as a whole (The International Economic Development Council's, 2018). Moreover, a similar definition by Feldman et al. (2014) decsribe economic development as the development of capacities that expand the capabilities of individuals, firms, industries as economic actors. This section aims to review the factors affecting economic development from previous studies and reports. However, prior to liteerature and reports, there contribution of these factors have not significantly improved the oveeral econimic and social dimension of the country (Chad).

Table 1: Definitions of Economic Development

Authors	Definition
Robbins (1968)	Increase in the absolute size of capital or annual production regardless of the population size.
The U.S. Economic Development Administration (1999)	It is the expansion of capabilities that contribute to the Improvement of a society through the realization of the potential of community individual, and firms.
Lakeland (2011)	It involves programs, and activities seeking to create jobs that facilitate growth undertaken to improve well-being and quality of life for a given community.
Bob (2011)	The increase in sustained growth from a simple, low-income economy to a modern, high income economy. It includes the process and policies a nation improves its people's economic, political, and social wellbeing.
Haller (2012)	Economic development is a process that generates economic, social, quantitative, and qualitative changes, which cumulatively lead to the durability of national economy to increase its real national product.
Ray (2019)	Development involves the removal of poverty and undernutrition. It is an increase in life expectancy through the access of clean water and health services; it is the reduction of infant mortality and decrease in illiteracy rate involving increased access to knowledge and schooling.
Sun (2002)	Economic development is an all-encompassing concept. It centers on economic and social progress, but also entails many different aspects that are not easily quantified, such as political freedom, social justice, and environmental soundness.

Table 1 summarises, the various definitions given to economic development throughout the years. It is universally accepted that economic development involves not only income, but also human welfare. Economic development is therefore the process of increase in a country' output in real term in order to achieve society welfare. Todaro & Smith (2011) argued that although development economics often appeal on relevant principles and concepts from different branches of economics either in a standard or modified form, more often, it is rather a field of study that is faster growing its own distinctive analytical and methodological identity.

Economic Development Indicators

One way to measure the development progress of a country is to look at its economic indicators. Hence, there exist main dimensions of development.

Table 2: Dimensions of Development

Economic	Social	Political
Standard of living through household purchasing power	Health	Individual freedoms and human rights
Distribution of wealth through poverty and inequalities	Education	Political freedoms and democracy
	Social protection	Quality of regulation and corruption

Source: Silve (2013)

Among the above indicated dimensions of development (Table 2) the following indicators include economic and social dimensions;

Gross domestic product (GDP) is the market value of all final good and services produced on the national territory within the period of one year. Real GDP growth also known as GDP growth; it is the nominal GDP adjusted for inflation. Unlike GDP, GDP growth takes into consideration the effect of inflation from consumer price index (CPI) (UNCTAD, 2019).

Gross national product (GNP) comprises the products and services produced from labour and assets by the citizens of a country. It is the sum of GDP plus income factors on abroad minus the non-citizens in a country (World Bank Group, 2016).

Gross national income (GNI) is GNP minus indirect taxes. It refers to the sum of a nation's gross domestic product and the net income received from overseas (Silve, 2013).

Unemployment refers to the number of people who do not have a job, and who are currently looking for a job or start a business. Employment also occurs when people who are actively searching for employment and who are unable to find a job (South Africa Planning Monitoring and Evaluation, 2013).

Poverty and inequality. The World Bank defines poverty as a pronounced deprivation in people's well-being (Haughton and Khandker, 2009, p.1). Hence, *Absolute poverty* refers to the level below the standard of what households should be able to count in order to meet their basic needs. The most commonly used global comparative poverty line is usually between $1.25 and $2 or $3 per day (Hulme,2010). *Relative poverty* is defined in relation to other people in a given society. For example, in high income countries, people are part of a society and consider broader quality of life issues (Hulme,2010). Meanwhile, *poverty as well-being* is related to the lack of specific type of consumption of commodity. It is defined by the extent to which people have poor shelter similar to slum, poor food, poor health and asset. For instance, it is concerned with household's education or nutritional level (Haughton & Khandker, 2009, p.2-3).

Inequality refers to the disparities and discrepancies in areas such as health, income, wealth, education, space, nutrition, politics and social identity. Hence, intersecting occurs when people face inequality in various aspect of their lives. While vertical inequality occurs between individuals in a society, horizontal inequality occurs between groups. The inequality of outcome is the difference in what people achieve in life such as the level of income. Another type is the inequality of opportunities which refer to the differences in people's background or circumstances that condition what they are capable to achieve. Similarly, global inequality is the difference in income between all households in the world rather than inequalities between countries (Milanovic, 2012; UNDP, 2013).

The human development index (HDI). Countries are ranked based on their score and split in categories suggesting how well the country is developed. While infant mortality rate is the number of infant dying below one-year-old per 1,000 live birth in a given year. Literacy rate is the percentage of people who are able to read as a useful indicator of the state off education within a country. Life expectancy is an indicator of healthcare quality in a country or province; the level of sanitation and the provision of elderly care. Usually, when these conditions are met, the higher the life expectancy. Developed countries have high expectancy rate compared to under developed countries (UNCTAD, 2019; World Bank Group, 2016; World Population Review, 2019).

Factors Affecting Economic Development

The study of economic development is one of the recent, most exciting, and yet, the most challenging branches of the field of economics (Todaro & Smith, 2011; Okeke, 2020). The systematic study of issues and processes of economic development in Africa, Asia, and Latin America has only emerged over the last five decades (Lee & Lloyd, 2016). Among the factors affecting economic development in it is important to consider poverty, health and wellbeing, productive employment, clean water sanitation, growth, inequality reduction, demographic transformation, and primary school completion.

Poverty

Many countries have made dramatic progress in reducing extreme poverty. Table 1 illustrates the percentage of population living below $1.90 a day, the percentage of population living below $3.10 a day, and the percentage of poverty gap at $3.10 a day among selected countries around the world excluding Europe.

Table 3: Population below International Poverty Lines

Countries	Reference year	Population below $1.90 a day %	Poverty gap at $1.90 a day %	Population below $3.10 a day %	Poverty gap at $3.10 a day %
Albania	2012	<2.0	<0.5	6.8	1.4
Argentina	2013	<2.0	1.0	3.6	1.6
Brazil	2013	4.9	2.8	9.1	4.3
Cameroon	2007	29.3	8.3	54.3	21.7
Chad	2011	38.4	15.3	64.8	29.7
Gabon	2005	8.0	1.9	24.4	7.2
Kenya	2005	33.6	11.7	58.9	25.5
Malaysia	2009	<2.0	<0.5	2.7	<0.5
Nigeria	2009	53.5	21.8	76.5	39.1
Thailand	2012	<2.0	<0.5	<2.0	<0.5

Source: World Bank Group (2016)

Overall, in 2012, 13% of the world's population lived below the international poverty line of $1.90 per day. While in the year 1990, the percentage was far below, around 37%. The significant decline in all regions contributed to the early target of the millennium development goal of reducing extreme poverty all over the world. As a result, over the past 25 years, the number of the population suffering from hunger in the world has declined (World Bank Group, 2016) which implies a significant progress toward development although not sufficient.

Good health and wellbeing

Good health and wellbeing indicators in low income countries show that more than half of the population die from communicable diseases, nutrition conditions, maternal and prenatal deprivation.

Similarly, in middle- and high-income countries, more than two third of the population die from non-communicable diseases over the last 25 years. Hence, the 3rd sustainable development goal which focuses on improving well-being at especially the most vulnerable stages of life, providing health care service and improving the imbalances between the poorer and richer countries is getting restored (United Nations Inter-Agency Group for Child Mortality Estimation, 2015). For instance, this objective was achieved by reducing dramatically the rate of global maternal mortality between the year 1990 and 2015.

Figure 1: Maternal Mortality rate from 1990-2015

Source: Say et al. (2017)

Among the rate of mortality illustrated in the Figure 1 above, least developed and sub Saharan African (SSA) countries have the highest rank of mortality rate between the year 1990 to 2015. From the maternal death rate of 385 per 100,000 live births to only 216 per 100,000 live births. In 2015, the global under-five mortality rate was less than half the rate in 1990. Despite these effort, the global mortality ratio is still below 44 percent goals (Say et al., 2017).

Productive Employment

Productive employment remains one of the key driving indicators to economic growth, considered as the bedrock of both economic and social development (Al-Habees, 2012). Awolusi et al. (2017) argued that enhancing economic productivity and value added for labour-intensive sectors to sustained economic growth is achieved through higher productivity within sectors. It allows shifting to sectors that generate higher value added and yield benefits not only to workers, employers, but to the economy as a whole. As a result, the variation between sectors is higher in countries with low labor productivity can then lead to higher inequality. For instance, in many lower income countries, one way to achieve sustainable development through poverty eradication is by leveraging labour where both individuals and households have a sustainable pathway out of poverty. According to the World Bank (2019), more than 200 million people were still unemployed in 2015 globally, and several more were underemployed in low-productivity informal sector jobs.

Clean Water Sanitation

Clean water sanitation as another factor affecting economic development which remains one of the greatest challenges the poorest countries who are still struggling to sustainably provide safe water and adequate sanitation to all (UNCTAD, 2016).

Figure 2: Population access to clean water from 1990-2015
Source: UNCTAD (2016)

In the meantime, Figure 2 illustrates clean water sanitation shows that only over a quarter of people in low income countries have access to an improved sanitation facility despite halving the number of people worldwide without access to an improved water source over the past 25 years. This compared with just over half in lower middle-income countries. World Health Organization (2015) and UNCTAD (2016) argued that distribution of water supply and sanitation is not just a challenge of service provision; it is intrinsically linked with climate change, water resources management, water scarcity, and the water quality.

Growth

Figure 3: Projected Global Economic Growth from 2010-2021
Source: World Bank (2019)

The global growth illustrated in the Figure 3 indicates that the world's economic growth is dramatically experiencing slight improvement of growth and recession between 2010 to 2017. Figure 3 illustrates shows that GDP increased by 2.4% in 2015, to about $74 trillion in current prices, and is

projected to grow to 2.9 percent in 2016. Besides, low- and middle-income economies accounted for 33% of the global economy in 2015, an increase of 1 percentage point. Their growth is estimated at 4.3 percent in 2015 and is projected to grow 4.8 percent in 2016. In high income economies, expected growth has been revised from earlier forecasts to 1.6% in 2015 and 2.1% in 2016. According to the global economic prospects report, in 2017, the growth in advanced economies is estimated to recover to 2.3% while emerging and developing economies (EMDEs) were projected to have higher than-expected growth of 4.3%. Overall, global growth is projected to edge up to 3.1% in 2018 (International Monetary Fund, 2019). While after recovery, overall growth is expected to slightly decline from 2018 to 2021. As such, in order to regain sustainable recovery from the recession, some 600 million new jobs need to be created by 2030, in order to maintain balance with the rising population. For instance, the 8th sustainable development goal aims for higher economic productivity and at least 7% annual GDP growth in the least developed countries.

Surprisingly, both the IMF world economic outlook and the World Bank global economic prospect show that the worldwide economy is at recovery. Furthermore, it is expected that the upturn is broad-based as the growth is increasing in more than half of the world economies (World Bank, 2019; International Monetary Fund, 2019). Among the developing economies, the East and South Asia regions remain on a relatively strong growth trajectory, expanding by 5.8% and 5.6%, respectively in 2018. While economic prospects at the global level have improved over the past two years, several large developing countries have seen per capita income decline (United Nations, 2019).

Inequality Reduction

Among the main factors of economic development, remain the reduction in inequality. Such as the context of income inequality within a country including gender, age, religion, opportunity, ethnicity, and social class. As such, the 10th sustainable development goal focuses on to tackle inequality between countries in terms of voice, international aid, and migration. A study conducted by the United Nations (2019) found that a total of 56 out of 94 countries with data collected from 2007 to 2012 show that the per capita income of the poorest is 40% growing faster than the national average for the countries. This including the high-income countries likewise the United Kingdom, the United States and the middle-income countries such as Guatemala and the Kyrgyz Republic. The results implied that higher growth among the poorest 40% does not necessarily lead to prosperity.

Demographic Transformation

The United Nations human settlements programme estimates that the proportion of urban population living in dwellings lack access to an improved drinking water source, improved sanitation facilities, sufficient living area, durable structure, or security of tenure (Ritchie and Roser, 2019).

Figure 4: World Urban and Rural Population Projected to 2050

Source: United Nations (2018)

As such, this aspect will affect and slow down the proper development of a nation. Beside, factor such as the UN projections of the world's total urban and rural population estimated for 2016, are based on the UN world urbanization prospects and its median fertility scenario (United Nations, 2019).

On the other hand, in the Figure 2.4, by 2030, an estimate of 60% of the world's population will live in urban areas and most of the expected 1 billion increases in urban dwellers between 2015 and 2030 will occur in Africa and Asia. This demographic transformation will affect not only the economic, environmental, social, but also the political futures of individuals everywhere. Hence, improving the quality of housing, access to adequate, safe, and affordable housing and basic services are the focus of the 11th sustainable development goal on making cities and other human settlements safe, inclusive, resilient, and sustainable in addition to slum upgrading, which are found to be critical to sustainable cities (United Nations, 2018).

Primary School Completion

The 4th objective of sustainable development goal focuses on education quality, proficiency in key subjects at various ages, and the access to modern education facilities. With 92% worldwide children completing primary education, and 74% of children completing lower secondary education implies that progress has been made toward global education system and alphabetization. Nevertheless, the universal gross tertiary enrolment ratio still remains around 30%. Increased access to higher education is needed to achieve a productive, talented, and diverse labour force and an empowered citizenry (Ray, 2019). Between the periods 1990 to 2013, the completion rate of primary school education in the Middle East and North Africa increased from 76% in 1990 to 94% in 2013. While in the Sub Saharan African (SSA) region the scenario is questionable. For instance, the region has the lowest primary education completion rate in the past decade has shown significant progress recently (Say et al., 2017). The primary completion rate increased from 15% (during the 1990s) to 69% in 2013. Hence, Latin America and the Caribbean regions are among the faster growing. The primary education completion rate reached up to 101% in 2013, following the East Asia and Pacific which achieved a higher rate of 105% (Ritchie and Roser, 2019).

Meanwhile, other parts of the world have also achieved significant progress over the past two decades (Ntuli & Kwenda, 2020). In total, three (3) countries have quadrupled their primary school completion rate. For example, in 1990, the percentage of primary school completion in Benin is 19 percent and 76 percent in 2014; while in Ethiopia, the percentage vary between 14 percent in 1994 to 54 percent in 2014; followed by Bhutan having a rate of 24 percent in 1993 and 97 percent in 2014. Despite these substantial progresses made, inequality still remain high in under developing countries (United Nations, 2018; Ritchie and Roser, 2019).

Economic development in Chad

Oil and agriculture are the main drivers of the Chadian economy (BBC News, 2018; World Population Review, 2019). Ever since Chad has joined the list of oil producing countries in 2003, the economy has been heavily dependent on oil and the GDP per capita has increased from $497 in 2001 and 2002; to $967 in 2014. The per capita GDP) of USD 1768.15 at purchasing power parity (PPP) in 2017. However, the decline in oil price in 2014 and weak security environment has driven Chad into a deep recession with expected poverty to increase to 39.8% in 2019. Due to decline in public expenditure, and loss in income reflected by the disruption of cross-border trade with Nigeria in livestock (The Economist Group, 2019). Similarly, due to the current economic and financial crisis the country (Chad) is facing, the World Bank Group projected an increase in the poverty level and the absolute number of poor to increase from 4.7 million to about 6.3 million between the year 2012 to 2019 (Knoema.com, 2019).

Besides, economic development progress has also been hindered by several other limitations. The country has suffered from a long-term violence and political instability which damaged the

infrastructure and seriously impeded its development. For example, the country land locked situation seriously handicaps exports and imports which must pass through Cameroon where corruption inflates transportation costs (Theodora, 2019). The overall growth increased by 0.6 %, with improvements in labour freedom, fiscal health, and monetary freedom exceeding a decline in the freedom of the business sector and trade freedom in Chad. This implies that the country is ranked 36th among 47 countries in the Sub Saharan African region, and its overall score is well below the regional and the world averages (World Population Review, 2019). As a result of the increase in the population and the level of poverty.

Figure 5: Population of Chad from 1970-2018

Source: The World Bank (2019)

The Figure 5 estimated population of Chad to 15.95 million in 2019 (World Population Review, 2019), thus considered as the 72nd world most populous country. Nevertheless, given its large size, the country is separated with only 8 people per square kilometre (21/square mile) in the world, and the average population growth of Chad is 3 % per year and is expected to continue further rapid growth yet unstable economic growth that will strain country (World Population Review, 2019). On the other hand, the capital city of Chad, N'Djamena covers an estimated population of below 1 million in 2019. Which means only 26% of Chadian live in urban area, and almost half are under of 15. According to the World Health Organization, the life expectancy in Chad is just 55 years in 2016, (World Health Organization, 2019).

Figure 6: Population Growth, Mortality Rate, and Labour Force Participation rate of Chad from 1990-2018

Source: The World Bank (2019)

Figure 6 shows that a decline in child mortality between 79% to 65%, maternal mortality has also decreased from 1,099 per 100,000 births to 860 to per 100,000 births (World Bank Group, 2018; The Global Fund, 2018). Despite these challenges, there is a constant disruption in the service provision due to strikes in the public health indicators and a decrease in the labour force participation over time. Which means Chad lacks physicians (The World Bank, 2019). In addition, between 2005 and 2009, the rate of infant mortality has declined from 91% and to 72% between 2010 to 2014 according to the Demographic and Household Survey (DHS) and the Multi-Indicators Clusters Surveys (MICS). The Human Development Index (HDI) of Chad was ranked at 185 out of 188 countries in 2015 according to United Nations Development Program (UNDP).

However, in 2016 the country's HDI was ranked 186 out of 188 countries with a Human Development Index value of 0.396, indicating that the country is lagging significantly in this area (United Nation, 2015). Thus, the greatest challenge of Chad remains the lack of human development factors. Therefore, most Millennium Development Goals (MDG) were not met in 2015, as a result, many Chadians people are still facing severe deprivation. Notwithstanding, the national poverty rate has declined from 55% to 47% between 2003 and 2011 which implies that Chad achieved moderate but significant level of progress in poverty reduction (African Development Bank Group, 2019). For instance, the percentage of poor people living with less than $2 per day has significantly declined over the years (2003 to 2011). Nevertheless, the number of poor living between $3.20 to $5.20 per day has dramatically increased over the years (Knoema.com, 2019).

Conclusion

In conclusion, Economic development towards growth and improvement of social dimensional conditions are the main objectives of all developing and underdeveloped nations around the world. Government and non-government organizations are facing greatest challenges to overcome issues related to slowdown of economic growth and economic development of struggling nations. Although many studies have examined issues and challenges of economic development in sub-Saharan Africa (Blekking et al., 2020; Romdhane, Loukil, & Kammoun, 2020), most have been conducted within SSA countries, making it difficult to identify the scenario of Chad position in this part of the world. This paper provides a critical review of the extant literature on economic development factors and indicators and briefly scrutinizes the focus of Chad. It examines, in the midst of considerable economic development indicator and factors affecting economic development. The review attests that the pattern and the relationship of the gaps are somehow similar across countries, broadly pointing towards policies that contribute to the achievement of the Sustainable Development Goals in order to remedy to the issues and challenges (the gaps). Besides, the area of concentration of economic development in Chad among various that are taken into consideration clearly indicate there is lack of significance in human development as well as the socio economic and economic performance of Chad.

In the short run and medium-term outlooks, the instability of oil revenue is a treat to the fiscal management and budgetary planning as it affects the economic activity by disturbing public expenditure, trade, and private investment. In terms of social context, there is a decrease in the government employees' salary since January 2019 due to the Budget Act 2018. This budget act has stripped away some of these employees' bonuses and allowances. Another issue facing the country is the refugees from Sudan, Central African Republic (CAR), and Nigeria about 400,000 representing 4% of the country's total population (The Global Fund, 2018). Thus, in order to overcome the different challenges and issues of economic development, it is strictly important that national governments and the international development organization around the world together working very hard to achieve the objectives.

Intuitionistic Fuzzy Synthetic Measure as A Method of Employee Satisfaction Benchmarking

Bartłomiej JEFMAŃSKI

Wroclaw University of Economics and Business, Wroclaw, Poland

bartlomiej.jefmanski@ue.wroc.pl

Abstract

The satisfaction of employees is one of the key determinants of the effectiveness of an enterprise, thus it is often the subject of measurement and benchmarking. The result of measurement and comparative analysis of the satisfaction of employees is the basis for making management-oriented decisions and as such they should be properly designed and conducted. The article proposes the method of benchmarking the satisfaction of employees while utilizing an intuitionistic fuzzy synthetic measure. This method allows for the inclusion of the degree of uncertainty in the evaluation of each aspect related to work satisfaction. The utility of the proposed method has been presented through an analysis of the results of the study of the satisfaction of employees conducted in an international enterprise from the automotive industry. The analysis includes the opinion of 323 employees from 18 departments. The results of the analysis indicated a large differentiation in the level of satisfaction of employees with regards to the assumed benchmark.

Keywords: Employee Satisfaction, Benchmarking, Fuzzy Sets, Intuitionistic Fuzzy Synthetic Measure

Introduction

Satisfaction surveys are some of the most commonly used tools of measuring the opinions of employees at enterprises. Their wide utilization is a result of the numerous benefits, which they can deliver for organizations. They are an aid for management boards and managers in making decisions related to different aspects of management. The interest in the topic of work satisfaction stems from the fact that the phenomenon is related to different aspects of the functioning of enterprises. Regularly conducted satisfaction surveys contribute to the increase of the engagement of employees and the effectiveness of their work through recognizing what is most important for employees, what motivates them and what is a source of their frustration. The actions undertaken by management boards of enterprises based on the results of satisfaction surveys of employees can contribute to reducing the turnover of employees or minimizing the risk that key employees will leave. Conducting satisfaction surveys reinforces the image of the enterprise, as one, which takes care of its employees through a constant monitoring and recognition of their needs.

One of the first and most important papers on work satisfaction has been written by Vroom (1964) and Locke (1969, 1976). In accordance with Vroom's definition, work satisfaction is a positive attitude towards work (towards the nature of work), which requires meeting expectations. Locke (1976) defined work satisfaction as a result of perceiving one's own work as one, which enables achieving important values from work, granted that these values are consistent or reinforce the fulfillment of basic human needs (Biesok and Wyród-Wróbel 2018). Other definitions of work satisfaction have been proposed, i.a. by: Brief (1998), Agho et al. (1993), Schulz and Schulz (2002) and Robbins (2004).

One of the key stages in the process of managing employee satisfaction is measuring the construct itself. Given the complex character of the term *work satisfaction*, this area is dominated by methods of multidimensional statistical analysis. Of particular value are methods of measurement, which yield

synthetic measurements, as they allow for conducting comparative analysis, and as such, they can be utilized i.a. for benchmarking achievements. Methods of measuring the satisfaction of employees are constantly developing and one of the latest achievements in this field is the application of fuzzy sets theory. A fundamental benefit of such an approach is accounting for the uncertainties in the evaluations of each of the elements of work satisfaction expressed in terms of word categories, which constitute the points of ordinal measurement scales. Given the multidimensional character of the term *work satisfaction* itself, fuzzy sets are most commonly used in conjunction with multicriteria methods. The result of such an approach is most often the construction of a synthetic measure allowing for the evaluation of the level of work satisfaction and conducting a comparative analysis of its value. Examples of the application of such an approach in the field of work satisfaction surveys can be found in the following publications: Masouleh et al. (2013), Aouadni and Rebai (2016), Aouadni et al. (2014), Li and Wang (2014), Abijev et al. (2016), Denavi et al. (2018), Gębczyńska and Kwiotkowska (2018), Kumar (2018), Maghsodi et al. (2018).

The main goal of the article is presenting new method of satisfaction benchmarking with the application of a intuitionistic fuzzy synthetic measure (IFSM). The proposed approach – in addition to including the uncertainty associated with the interpretation of each of the elements of ordinal scales – allows for the additional inclusion of an extra element of uncertainty in the evaluations of employees, namely when respondents indicated that it was "difficult to say". It should be noted that the proposed approach assumes that such a category does not constitute a point on the ordinal scales of measurement as applied in employee satisfaction surveys.

Methodology

Benchmarking is one of the most commonly used methods of managing an organization. It is a constant and deliberate process of identifying, analyzing, designing and, as a consequence, implementing better solutions in the scope of processes, products and problem-solving methods as well as realizing goals while utilizing recognized and verified internal and/or external templates of an organization, the result of which should be an increase in its effectiveness (Węgrzyn 2000). Other definitions of benchmarking can be found i.a. in publications by: Harrington (1991), Karlöf and Östblom (1993), Pieske (1994), Balm (1996), Watson (1996). Benchmarking is applied i.a. in areas of managing an organization such as: manufacturing, finances, logistics, IT, quality management and process management. It also finds applications in the evaluation of managing human resources and team work, which makes it possible to compare one's own performance with benchmark performance (Gajda 2015).

One of the commonly applied types of benchmarking is internal benchmarking. Its popularity is a result of the ease of obtaining information critical to carrying out comparative measurements. In general, internal benchmarking deals with conducting comparisons between units, departments, branches and subsidiaries within one organization. If the subject of benchmarking is a complex phenomenon, for instance the level of employee satisfaction, in this case, synthetic measures prove useful. If the issue of work satisfaction is in question, an additional difficulty in performance benchmarking is posed by applying it at the stage of measuring ordinal scales, since they limit the range of allowed arithmetical operations necessary for conducting comparative analysis. A solution in this case can be setting the benchmark and conducting a comparative analysis in accordance with the method of an IFSM described in the publication by Jefmański (2020). This method allows for measuring the satisfaction of employees with the utilization of a synthetic measure, the values of which will be utilized in comparing objects with regards to the applied benchmark. The formal description of the construction of an IFSM has been presented in three stages:

Stage 1. Determining the pattern object with the "most favorable" values for each variable. Depending on the variable preference function, the coordinates of the pattern object will have the values:

$$O^{+} = (<\mu_1^{+}, \nu_1^{+}, \pi_1^{+}>, <\mu_2^{+}, \nu_2^{+}, \pi_2^{+}>, \ldots, <\mu_m^{+}, \nu_m^{+}, \pi_m^{+}>), \quad (1)$$

where:

$$<\mu_j^{+}, \nu_j^{+}, \pi_j^{+}> = \begin{cases} <\max\{\mu_j\}, \min\{\nu_j\}, 1-\max\{\mu_j\}-\min\{\nu_j\}> \text{ when } X_j \text{ is a stimulant} \\ <\min\{\mu_j\}, \max\{\nu_j\}, 1-\min\{\mu_j\}-\max\{\nu_j\}> \text{ when } X_j \text{ is a destimulant} \end{cases}$$

X_j variable is a stimulant, when for every two of its observations x_{ij}^S, x_{kj}^S referring to objects O_i, O_k take $x_{ij}^S > x_{kj}^S \Rightarrow O_i \succ O_k$ ($\succ$ means O_i object domination over O_k object). Variable X_j is a destimulant, when for every two of its observations x_{ij}^D, x_{kj}^D referring to objects O_i, O_k take $x_{ij}^D > x_{kj}^D \Rightarrow O_i \prec O_k$ ($\prec$ means O_k object domination over O_i object) (Walesiak 2016, p. 11).

On account of the ordinal measurement scale in the proposed method there is no need for the normalization of variables.

Stage 2. Determining the distance of individual objects from the pattern object using the Euclidean distance measure for intuitionistic fuzzy sets:

$$d_{iO^+} = \sqrt{\frac{1}{2}\sum_{j=1}^{m}(\mu_i(X_j)-\mu_{O^+}(X_j))^2 + (\nu_i(X_j)-\nu_{O^+}(X_j))^2 + (\pi_i(X_j)-\pi_{O^+}(X_j))^2} \tag{2}$$

Stage 3. Calculation of the intuitionistic fuzzy synthetic measure according to the formula:

$$S_i = 1 - \frac{d_{iO^+}}{d_0}, \tag{3}$$

where: $d_0 = \bar{d}_0 + 2S(d_0)$, $\bar{d}_0 = \frac{1}{n}\sum_{i=1}^{n} d_{iO^+}$, $S(d_0) = \left[\frac{1}{n}\sum_{i=1}^{n}(d_{iO^+} - \bar{d}_0)^2\right]^{\frac{1}{2}}$.

The measure takes values from the interval $< 0 - 1 >$. The higher values of the measure the less the object is away from the pattern object.

In the presented method, the object can be a department, branch, branch of the enterprise etc. The reference object in this case should be understood as the benchmark for the objects which are subject to a comparative analysis. The presented method enables the estimation of the synthetic measure, allowing for evaluating each of the objects with regards to the level of work satisfaction against the reference benchmark.

Results

A practical application of the method of benchmarking work satisfaction based on the IFSM has been presented based on an analysis of employee satisfaction at a branch of a large international automotive company. The study utilized an ordinal measurement scale with the following categories: “highly unsatisfied”, “unsatisfied”, “satisfied”, “highly satisfied”. Additionally, employees had the opportunity to answer with “difficult to say”. Employees of 18 departments partook in the study. A total of 323 employees participated in the survey. The results of the measurement shared for the purposes of this article were expressed as numerical totals of the categories of the 4-point ordinal measurement scale for each of the analyzed variables, as indicated by employees. This is a fairly common practice when it comes to international corporations, where the HQ of the enterprise conducts a survey of employee satisfaction, whereas individual branches, receive aggregated results in the form of the percentage of answers in each category, which are points of the measurement scales. In the analysis conducted for the purpose of this article, 8 variables identifying the general level of satisfaction among employees in the areas of activity of the enterprise have been included: x_1 – satisfaction with work performance, x_2 – satisfaction with workplace safety equipment, x_3 – satisfaction with the ability to develop one’s career path within the enterprise, x_4 – satisfaction with cooperation with other employees, x_5 – satisfaction with cooperation with direct superiors, x_6 – satisfaction with information flow at the enterprise, x_7 – satisfaction with the ability to implement new ideas within the enterprise, x_8 – satisfaction with the enterprise’s responsibilities towards employees. Given the wide data set, only the set of answers for variable x_1 has been presented in Table 1, which includes the number of indication of particular points of the measurement scale in a cross-section of enterprise departments.

Table 1: Data set for variable x_1

Departments	Measurement scale points				
	1	2	3	4	N
D1	1	-	9	1	21
D2	1	-	5	2	10
D3	-	4	10	1	29
D4	-	-	7	1	13

D18	-	-	6	-	8

Source: own computations.

Utilizing the proposed benchmarking method, in the case of each variable, requires the estimation of the parameters of the intuitionistic fuzzy set, which will contain employees satisfied with their work. Similarly, for each variable the level of membership in the intuitionistic fuzzy set has been determined as the share of the total number of answers of "satisfied" and "highly satisfied" for all responses of the employees. In a similar manner, the level of non-membership in the intuitionistic set has been determined, with the difference that the total number of responses has been used as a reference point for the total sum of answers of "unsatisfied" and "highly unsatisfied". The third parameter of the intuitionistic fuzzy set, the level of uncertainty has been calculated as the difference between value 1 and the sum of the degrees of membership and non-membership. This operation has been conducted separately for all 18 departments of the enterprise, which were the subject of benchmarking. The formal notation of the proposed approach has been presented in the paper: Jefmański (2019). The obtained results have been presented in Table 2 (only for variable x_1 due to a large size of the data set).

Table 2: The parameters of intuitionistic fuzzy sets (for variable x_1)

Departments	$\mu_{A_j'}(X_j)$	$\nu_{A_j'}(X_j)$	$\pi_{A_j'}(X_j)$
D1	0,476	0,048	0,476
D2	0,700	0,100	0,200

Source: own computations.

The proposed method assumes that the reference object contains the values most desired for the variables stimulating the level of work satisfaction as well as the least desired values for the variables, which have a negative impact on the level of work satisfaction. Keeping in mind that the coordinates of the pattern object have the form of intuitionistic fuzzy sets, this determines that in the case of variables, the stimulant should be found in the data set – the maximum value of membership in the intuitionistic fuzzy set and minimal values for the levels of non-membership and uncertainty. In the case of variables, which have a negative impact on the level of work satisfaction, an opposite course of action is required. This should be carried out separately for each variable. In the analyzed example, there are no variables, which have a negative impact on the level of work satisfaction. The coordinates of the pattern object in the form of intuitionistic fuzzy sets have been presented in detail in Table 3.

Table 3: Coordinates of the pattern object

Variables	Parameters		
	$\mu_{A_j'}(X_j)$	$\nu_{A_j'}(X_j)$	$\pi_{A_j'}(X_j)$
x1	1	0	0
x2	0.943	0	0.057
x3	0.667	0	0.250
x4	0.923	0	0.077
x5	1	0	0
x6	0.750	0	0.125
x7	0.786	0	0.214
x8	0.769	0	0

Source: own computations.

For each department of the enterprise, the distance from the pattern object, in accordance with the formula (2) should be calculated. Having obtained the distances calculated as such, the next step should be calculating the IFSM for each department of the enterprise, in accordance with the formula (3). The values of IFSM are the basis for ordering the departments based on the level of satisfaction of employees employed within it. The higher the value of the IFSM the higher the level of satisfaction among employees. The distances and values of the IFSM for each of the evaluated departments have been presented in Table 4.

Table 4: IFSM values for the evaluated departments of the enterprise

Departments	Distance (2)	IFSM	Departments	Distance (2)	IFSM
D1	0.940	0.363	D10	0.688	0.533
D2	1.112	0.246	D11	1.033	0.299
D3	1.386	0.060	D12	0.883	0.401
D4	0.984	0.333	D13	1.107	0.249
D5	0.668	0.547	D14	0.239	0.838
D6	1.152	0.219	D15	0.949	0.357
D7	0.771	0.477	D16	0.687	0.534

Source: own computations.

Conclusions

The satisfaction of employees, given its relationship with several other aspects of the operation of enterprises, is part of the group of constructs, which should be periodically monitored. Utilizing tools of measuring the satisfaction of employees in conjunction with the method of internal benchmarking allows for an effective identification of the group of employees with a low level of work satisfaction as well identifying the reasons for being dissatisfied with work. One of the proposals in this area is the measurement of the satisfaction of employees and setting benchmarks with the application of the IFSM.

The analytical approach proposed in the article allowed for the determination to be made that the analyzed enterprise is dominated by departments with a low level of satisfaction among employees as compared with the benchmark. The values of the IFSM for 72% of departments have not exceeded the level of 0.5. The observed spread of values of the IFSM is significant. The group, which was the subject of analysis, contained departments with both an extremely low and extremely high level of the IFSM. The highest level of satisfaction among employees has been observed in department D14. The value of the IFSM for this department amounted to 0,838 – a result that is close to the benchmark. The second department with the highest level of satisfaction among employees is D18. The value of the IFSM in this case is significantly lower at 0.67. The method applied in the article also allows to identify the departments with a low level of satisfaction among employees. This pertains in particular to departments D3, D9 and D17. In each of the mentioned cases the values of the IFSM did not exceed the threshold of 0.2.

The proposal of the method of work satisfaction benchmarking with the utilization of the IFSM allows for conducting comparative analysis with the inclusion of the degree of uncertainty in the opinions of employees, which are based both on raw data and aggregated data. The presented IFSM can be based on other complex measurement scales dedicated to the satisfaction of employees. It can be also constructed for the so-called sub-scales that create the hierarchical structure based on the shape of composite indexes.

Acknowledgment

Approach to Control Meters Use in Management of Logistic Customer Service

Marta KADŁUBEK

Czestochowa University of Technology, Faculty of Management, Częstochowa, Poland, martakadlubek@wp.pl

Abstract

The article presents the results of research on control of the level of logistic customer service using the meters of this service in the surveyed freight transport enterprises in southern Poland, as well as control of the level of logistic customer service offered by competitive enterprises. Moreover the distribution of the use of the meters of logistic customer service level in the surveyed enterprises and the frequency of surveys of the level of logistic customer service offered by competing enterprises in dependence on the size of enterprises were presented.

Keywords: Logistics, Control Meter, Management, Transport Enterprise.

Introduction

Logistics competences enable more efficient use of the enterprise's potential inherent in its resources and logistic capabilities conditioning the creation and delivery of values in reference to the customer expectations. Customers should be the focus of every business. What counts for the company is the value generated by them, often resulting from customer satisfaction with the services offered.

By purchasing a specific product, the customer takes into account not only its features, but also the standard of service offered by a company. Logistic customer service refers to the ability of a logistic system to meet the needs reported by customers. These needs can be defined as a set of wishes and expectations of buyers regarding the logistic attributes of the delivery of a good or service. Customer service is not limited to the transaction phase, but also includes the pre-transaction and post-transaction phase.

A requirement for providing high-level logistic service is its regular verification. The main problem that arises in this matter is the appropriate selection of meters as well as control of the level of service elements significant from the point of view of the company's clients. The purpose of the paper is to present research results on control of the level of logistic customer service using the meters of this service in the surveyed freight transport enterprises in southern Poland (Jacyna, 2009; Wojewódzka-Król and Załoga, 2016), as well as control of the level of logistic customer service offered by competitive enterprises. Moreover, the distribution of the use of the meters of logistic customer service level in the surveyed enterprises and the frequency of surveys of the level of logistic customer service offered by competing enterprises in dependence on the size of enterprises were presented.

Literature Review

Logistic customer service is an element of the utmost importance for management of many business operating systems. From the perspective of logistics, customer service focuses mainly on the real distribution of goods taking into account the right condition, place, quantity and time, simultaneously achieving a profit (Witkowski, 2002).

According to the definition proposed by Bowersox et al. (2012), logistic customer service should be understood as many mutually linkaged logistic activities that determine customer satisfaction when

purchasing a product or service. Logistic customer service is usually associated with activities related to the performance of a specific delivery, however, the quality of service depends on the course of proceedings throughout the entire supply chain (Długosz, 2010).

According to Gołembska (2009), logistic customer service focuses on enabling the customer to purchase the offered product in the right place and time, and the measure of this service is the ability to perform orders from current reserves.

Further examples of defining customer service in logistics are the terms presented by Coyle et al. (2010). These are all necessary activities related to the acceptance, preparation and implementation of orders while ensuring its correctness and intervention in the event of errors to compensate for damage (Ciesielski, 2011). It is also a reliable delivery of products to buyers, according to their requirements. Its essence can be defined as an action involving all areas of business which goal is customer satisfaction while achieving the goals of suppliers (Hartmann and de Grahl, 2012; Mesjasz-Lech, 2015; Niemczyk and Stańczyk-Hugiet, 2014).

Elements of logistic customer service (so-called features) can be described as those parts of the service that are of particular importance to customers, whereby the weight assigned to them by customers may change depending on the market segment, type of products, distribution methods or the size of competition (Kempny, 2001).

Customer service is of interest to many areas of enterprise management (Jelonek and Bylok, 2017; Jędralska and Dyduch, 2017; Lichtarski, 2015; Nogalski and Ronkowski, 2007; Osbert-Pociecha and Nowosielski, 2016; Romanowska, 2001), however from a logistics point of view we can analyze it with its division into four main elements (Christopher, 2011):

- time (delivery time control, order submission, order processing, transport time);

- reliability (inventory level and costs of exhaustion, complaints, proper order processing);

- communication (order information between the seller and the customer in both directions);

- convenience (flexibility).

To sum up, logistic customer service consists of many elements, which in turn are influenced by many different factors. When designing the company's logistic system, all the components described above should be taken into account. The company must take into account both its own point of view and the perspective of customers, only then try to find the optimum operation (Kempny, 2009; Sharma and Lambert, 2013).

The logistic customer service process should be constantly monitored to fulfill its basic task, i.e. satisfy customers (Saif, 2012). Based on the results obtained during this audit, the company may make adjustments to improve the structure and essential elements of the customer service system.

The starting point for determining the control measures of the customer service logistic system should be setting the required service standards (Twaróg, 2005). It’s main element is identifying customer needs regarding the level of performance of individual service elements. It is also important to analyze competition activities in this area and to examine the relationship between customer satisfaction and the implementation of standards. Standards should not be easily reached - there is a risk that such standards will be too low for service at their level to meet the needs of the company's customers (Heskett, 1994). Even setting standards at a satisfactory level may not be sufficient in the struggle against competition (Hasan et al., 2014). Some of the management philosophies (e.g. Deming's quality assurance method) assume that an acceptable level of quality should be set at 100%.

This is not really synonymous with 100% performance of the service, but with the attitude expected of the company in relation to the issue (Coyle et al., 2011).

The main elements of logistic customer service and the possibilities of their measurement enabling control are characterized in Table 1.

Table 1: Elements and measurement of logistic customer service

Elements	Element description	Objective of measurement
Product availability	- the most common customer service indicator; defined as the percentage of products in stock (target level of performance) in several different units (e.g. according to product orders, by value)	- percentage of availability in selected units
Delivery time	- the time from the moment the order is placed until the receipt of the goods; usually measured in units of time, target delivery times or variants of accepted standards; delivery frequency, product availability and delivery time are combined into one standard (e.g. 95% of orders delivered within 10 days)	- promptness and compliance with the declared standard
Flexibility of the distribution system	- the system's ability to respond to special and / or unexpected customer needs, including the ability to substitute and expedition	- lead time for special requirements
System for removing errors and dysfunctions in distribution	- the efficiency of the procedures and the time necessary to remove the dysfunctions in the distribution, such as: errors in invoices, shipments, damages and complaints	- error response time and dysfunction removal time
Information system	- the company's information system's ability to provide accurate and fast information to customers as required	- promptness, accuracy and detail of information
After-sales service	- the efficiency of after-sales service after product delivery, including technical information, spare parts or modification of equipment	- response time and quality of response to customer requirements

Source: own elaboration on the basement of Kempny (2001).

For a logistic customer service control system to be useful in business practice, it should include (Ballou, 2003):

- defining the needs related to the level of service required by customers in a way that takes into account their point of view;

- measuring the number of lost and acquired customers and this reference to their service policy;

- measurement of the currently offered level of customer service in a way that takes into account information accuracy, time aspect and its availability for competent employees;

- comparison of own service with competitors' offer.

Methodology Research

The research was realized on a sample of 147 respondents employed in freight transport companies, mostly third party logistics providers, with their registered premises in southern Poland. The survey method of the research was used for collecting data through the standardized survey questionnaire. The primary information were gained from pre-defined group of respondents, i.e. representatives of the management board of the surveyed entities. It's purpose was to obtain data on chosen problems in the field of logistic management of customer service in these enterprises. As a result of obtaining, processing and analyzing empirical material received from the survey using the questionnaire, the conditions of the logistic scope of customer service in the surveyed freight transport enterprises are presented. This paper demonstrates two chosen problems indicated in the questions of the survey questionnaire, which are part of a broader survey. The areas of interests introduced in the paper referred to the preferences of controlling the level of logistic customer service in the opinion of respondents using measures of this service and examining the level of logistic service offered by competing companies.

Subsequently, taking into account the overall research proceeding, the results of research in area of two above mentioned problems were referred to the size of the enterprises. For this purpose, in the aspect of marked issues in the performed statistical analysis, the Pearson's linear correlation coefficient was used (Sobczyk, 2017).

Results and Discussion

Preferences for the control of the logistic customer service level in the opinion of respondents

The methodology of specifying the level of logistic customer service within the enterprise, its monitoring and control using appropriate logistic categories, i.e. measures of logistic customer service, was the point the surveyed entrepreneurs were asked in the questionnaire survey. Among all 147 enterprises surveyed, the level of logistic customer service was controlled using appropriate measures of this service in 29 enterprises (19.7%) at regular intervals, and in 45 entities (30.6%) the control was carried out occasionally. As many as 73 companies (49.7%) never used this form of controlling of the level of logistic service. Therefore, the majority of respondents did not monitor the logistic level of customer service or, to assess the level of logistic customer service within the enterprise, adopted a different control model, including more or less appropriate service standards, procedures to ensure correct and systematic level measurement and taking regulatory actions. Research of logistic customer service measures conducted among the customers of transport enterprises in relation to the needs in the field of logistics service management depending on the market segment to which the customer belongs, would provide information that on the one hand enable entrepreneurs to better conform the level of service to the most important strategic customers, on the other enable to estimate the costs of the level of service received. Also divisions of the transport services depending on the customer's level of wealth, and thus its potential profitability, turnover and distribution considerations (Ballou, 2004) would useful in researching the level of logistic service offered among enterprises customers. Figure 1 presents the distribution of answers to

the question about the level of logistic service offered by the surveyed entrepreneurs using the service's metrics.

Fig. 1: Control of the level of logistic service using the meters of this service in the surveyed enterprises

Source: own study.

Determining the position of the company in terms of key factors of logistics service compared to the competition, requiring research on the level of logistic customer service offered by competing companies, was the subject of the next question of the research tool. The surveyed entities declared regular consideration of the position of the level of logistic service offered by the enterprise to competitors in 27.9% of cases (41 enterprises). Occasionally, 74 entities (50.3%) conducted surveys on the level of service to competitive enterprises, and 32 enterprises (21.8%) admitted that they were not interested in this area. Thus, the dominant group of entrepreneurs showed an understanding of the implication necessity of this element of the logistic customer service policy, using the obtained information to compare the level of service for competing companies in the transport sector, and then probably considering taking over the benchmarking solutions due to mobilizing effect of benchmarking on the increase in the value of the measure of elements of services. Knowledge about the competition is often the basis for transport companies to create their own logistics service strategies, or allows them to eliminate some mistakes due to very important skill possessed by the best entrepreneurs which is learning not only on their own mistakes, but much less costly learning from the mistakes of competing enterprises. Having information about competitors' shortcomings can be used both to improve the functioning of the company and to implement a customer acquisition policy in which competitor's mistakes should be used. In the current conditions of market competition, a chance for a company's success appears only when it has features that place it before its competitors. Figure 2 presents the distribution of answers to the question about the level of logistic service offered by competitive enterprises by the surveyed entrepreneurs.

Fig. 2: Research results on the level of logistic service offered by competitive enterprises
Source: own study.

Control of the logistic customer service level in dependence on the size of enterprises

Among 147 enterprises surveyed, micro entities dominated, constituting 76% of the research sample (112 enterprises). The share of small entities constituting 16.5% of the total number of respondents (24 enterprises) was also significant. A small share in the research was recorded at the same time by medium and large enterprises, together constituting 7.5% of the research sample (11 enterprises).

Table 2 presents the distribution of the compliance of the control measures of logistic customer service level in the surveyed enterprises in dependence on the size of enterprises, which showed a statistically significant relationship between the use of appropriate measures and the size of entities. A correlation of -. 0.710 indicates more frequent use of these measures by large and medium-sized enterprises. The result indicates a higher level of development of these enterprises, awareness of the essence of logistics customer service control, as well as greater investment opportunities in the R&D sphere. Frequently, the control of the logistic customer service level in large and medium-sized enterprises is carried out using more advanced information technologies than micro and small enterprises are able to dispose.

Table 2: The distribution of the use of the meters of logistic customer service level in the surveyed enterprises in dependance on the size of enterprises

Application of the meters of logistic customer service level	Type of enterprise			
	micro	small	medium	large
regularly	1	18	7	3
occasionally	39	5	1	0
never	72	1	0	0

Source: own study.

Determining the position of the company in terms of key factors of logistic service compared to the competition, requiring surveys on the level of logistic customer service offered by competing companies, was the subject of the next question of the research tool. Respondents' responses presented in Table 3 showed a significant, high (- 0.716) relationship between the size of enterprises

and surveys of the level of logistic customer service offered by competing enterprises. Enterprises as they grow more and more often notify the need to analyze the actions of competitors. Also noteworthy is the significant, at 73.2%, share of the smallest enterprises in observing competitive entities. The results confirm greater awareness of competition analysis as needed and necessary process. Aiming to create a stable company and the best offer on the market, the entrepreneurs understand they need to get to know and control those who are also active on the market. Then they should improve, develop and introduce changes that allow achieving better results.

Table 3: Distribution of the frequency of surveys of the level of logistic customer service offered by competing enterprises in the examined enterprises in dependence on the size of enterprises

Frequency of surveys on the level of logistic customer service offered by competing companies	Type of enterprise			
	micro	small	medium	large
regularly	9	22	7	3
occasionally	71	2	1	0
never	32	0	0	0

Source: own study.

Conclusion

The results of the research on on control control of measuring of the level of logistic customer service identified among the representatives of freight transport companies in the southern Poland, allow for the conclusion that their sphere is recognizable in the management processes of the surveyed enterprises, although to a little extent.

Entrepreneurs showed minor understanding for the needs related to the control of measuring of logistic service level desired by customers and taking into account their opinions. Apprehension may cause an inclusive decline to discern the need to recognize the level of logistic service with the participation of its consumers, close to nearly three-quarters of the whole of companies in the research sample. Merely insignificantly fewer representatives of the firms, as almost half of them, did not took monitoring of the level of logistic service of their customers into the consideration in the management processes, or another models of control could be selected and implemented for their common use in estimation of the level of logistic customer service. At the same time the foremost group of the research companies, as more than three-quarters of whole research sample, stated to recognize the prerequisite of determining the position of the enterprise in terms of key logistic service factors compared to the competitive entities, and to estimate the level of logistic customer service offered by competing companies.

With regards to the size of entities in the research sample, the distribution of the information obtained from their managers most often confirmed the tendency to increase the focus on carrying out the above-mentioned measurements along with the increase in the size of the firms. Large and medium-sized companies more frequently and in depth examine the issue of conducting control surveys determining the level of logistic service both among recipients of their services and within the organization.

Polish enterprises marginalize the role of customer service in their management processes, mostly in reference to suspection that contemporary efforts are simply competent and decent enough. Nevertheless, as theoretical and practical background a number of times indicate, such an approach is a short-term solution. In reference to nowadays struggle on national and international market the transport companies should try find reliable areas of attracting their current and future customers, establishing higher standards of logistic service, measuring their levels and regularly controlling.

Abstract

Cloud computing is a modern mean that offers high complexity solutions comparing to the traditional calculation center. A major advantage for the beneficiary is the fact that the cloud services provider is directly responsible for the acquisition and maintenance of the infrastructure. Within this work we have initiated a quantitative research which has targeted the identification of the advantages and disadvantages perceived by the employees from Romania regarding the cloud services that they use in their current activity, inside of the company where they professionally activate. The study has been conducted among 315 respondents, using an online questionnaire. It was used as a selective statistical research method and posted on an online platform which allowed the access of potential respondents to the survey during the entire data collecting assigned, regardless of the time of the day or the utilized device. As a main result, all the cloud services users that participated at this research were able to identify them after visualizing the proposed definition and declared themselves very satisfied with these services. All the respondents claim that they personally use cloud services in their professional activity. The research also has precision limits, one of them being represented by the data collecting method, the online environment, which offers no guarantee for the respondents' honesty. The survey was applied to workers in major corporations.

Keywords: cloud computing, online survey, IT&C.

Introduction

Cloud computing can be defined as an amalgam of hardware resource, networking, storage capacity, services and interfaces (Shah, Vyas, 2015, p. 5702). Cloud computing represents the technology that changed the IT&C domain in a dynamic way. Everyday an impressive amount of information is generated; making storing and processing necessary as soon as possible. (Greavu-Șerban, 2015, pp. 8).

The hardware and software components from the IT&C domain have suffered a dynamic evolution. In order to keep up with it, considerable initial investments in infrastructure and services, as well as subsequent for modernization are necessary. The informational system is limited by the processing capacity (CPU and RAM) and by the storage space (HDD/SSD). Furthermore, in order to establish or

modernize a local center (on-premise) periodical investment in operating systems, applications, network elements, as well as additional costs are necessary if the ISO quality standards' implementations are pursued.

A version for the future investment costs' reduction is the initial overcollateralization with processing capacity (CPU and RAM), as well as the storage space (HDD/SSD), however, implying much higher initial costs. Although, in reality, the majority of computing systems are rarely used at their maximum capacity, requiring their replacement due to obsolescence, to the software and hardware incompatibilities with the new versions or the lack of support from the producer. (Greavu-Șerban, 2015, pp. 8-9).

Cloud computing is a modern mean that offers high complexity solutions comparing to the traditional calculation center. A major advantage for the beneficiar is that the cloud services provider is directly responsible with the acquisition and maintenance of the infrastructure. Cloud services acquisition transforms the equipments' investments into operational costs for companies. In addition, a major advantage is that through cloud services the prompt access to certain resources (hardware and software) is allowed, much affordable to ″rent″ than the investments in a data center. Furthermore, there is the possibility that these will be used only occasionally, as a consequence an investment in infrastructure won't be efficient from the economic point of view. The resources and licenses acquisition is done promptly and paid only when they are used which represents another advantage of the cloud services.

Services and cloud resources' (network, storage, processing) managing is made with the help of certain web instruments. Connection from any location is allowed, regardless of the time of the day and computer, with any operating system that allows Internet access through a stable connection.

By using these services, companies have the possibility to reduce expenses as the IT&C services and infrastructure can be externalized towards another entity, that will provide cloud services. In this way, the company does not invest in infrastructure, but only contracts the services. In the private sector, the usage of cloud services allows the improvement of the method of resource use, access, as well as the users' availability to a higher quality than the local ones.

Dumitrache (2014) illustrates several cloud computing initiatives at the European Union: G-Cloud (Great Britain), Andromede (France) and Trusted Cloud (Germany), all these projects have streamlined the cloud services at the European level. Furthermore, in the article the "EUROPEAN UNION OPEN DATA″ is mentioned as well, single point at the level for the institutions and bodies of the European Union, that offer a simple and efficient access to data.

Cloud technologies at the European level

According to the Eurostat Digital economy and society statistics – enterprises (2017) report, almost all the companies from the European Union had Internet access in 2016, but only 21% of these used cloud computing services. To be mentioned the fact that, services use differs among companies depending on the number of employees: approximately 45% of the large companies (over 250 employees), 29% of the number of employees between 50 and 249 and only 19% of the small companies (10-49 employees). In comparison with 2014, a general 2-point percentual growth has been registered (from 19% to 21%), with growths on each segment individually, like so: (2%increase), medium companies (5%increase), large companies (10%increase).

With regard to the assimilation degree of the cloud services in 2016 within each of the countries contained in the European Union, it can be concluded that in the Nordic countries, cloud services are the most used (over 40%), with the highest degree of usage in Finland (57%), while the lowest degree (less than 10%) is observed in Greece, Poland, Bulgaria and Romania. Several data referring to the use of cloud services (in percent) at the European Union level in 2014 comparing to 2016.

The most used cloud services at the EU level in 2016 were the e-mail and the digital information storage, services used by over 60% of the companies that use cloud services, 44% of the companies use cloud services to keep data bases, 41% for software and 32% for financial and accounting services. Approximately 1 of 4 companies use cloud services at an advanced level (for example, customer services relation) and 21% of these integrate personal developed softwares in the cloud platform. In general, at the European Union level, the use of e-mail service doesn't register a significant increase between 2014 and 2016, but the storage service of the cloud files has increased with 9% in only 2 years.

Cloud computing, mobile devices and their applications and Big Data analysis represents approximately 20% of the expenses allocated to IT at the level of 2012 and it is estimated an exponential till 80% in 2020. The majority of the users estimate a decrease of the costs with 10-20% in the case in which they use cloud services (Gabriella Cattaneo, 2012).

At the level of 2016, research show that 45% of the activities developed in companies have migrated to cloud (public, private or hybrid) and it's projected that till 2018, to reach 60%. The biggest companies allocated a quarter of the IT budget for the costs related to cloud services, however, the companies under 1000 employees are much more cautious in allocating budget towards cloud services. At the international level, in 2016 the companies with less than 1000 employees preferred public cloud services, and the ones over 1000 employees adopted private cloud methods. In addition, from the budget allocated to cloud services, the companies direct 45% to SaaS (Software-as-a-Service), 30% to IaaS (Infrastructure-as-a-Service), 19% to PaaS (Platform-as-a-Service), the rest of 6% being directed towards the implementation of certain data storing operations for an improved security and for other types of data storage (Cloud Computing Survey 2016, IDG enterprise).

In the Right Scale report (2016) several aspects regarding the main public cloud providers at the international level are presented. The report concludes that the main cloud services provider for companies with over 1000 employees is AWS, followed by Azure (IaaS and PaaS) and Vmware vCloud Air. In what regards the companies with less than 1000 employees, the main providers are AWS, Azure and Google. The same report highlights the fact that the main private cloud providers for companies with over 1000 employees are VMware, Microsoft and OpenStack, and the companies under 1000 employees use services provided by Vmware, OpenStack and Bare-Metal Cloud.

It is to be mentioned that, in 2016 the adoption of the hybrid cloud has registered a significant increase among companies, which was caused by their awareness in what regards the advantage of this type of cloud in front of the public one. Moreover, an ascendant migration tendency of the cloud services is remarked, as well as the companies' opportunity to further reduce the costs for service use through investments in costs' management departments.

In 2017, RightScale has made a study in which innovations regarding cloud computing are presented, mainly at the level of the IaaS sample (infrastructure as a service). Interesting conclusions resulted following the study, in the sense in which private cloud use is decreasing, companies more and more pick to use the hybrid cloud (aspect resulted also from the RightScale 2016 study), and in what regards the public cloud, it is defined by several representative services providers. The study also shows the fact that persons who use cloud services for personal gain use in average 1.8 public cloud services providers.

Quantitative study. Methodology and Main Results

Within this work we have initiated a quantitative research that has targeted the identification of the advantages and disadvantages perceived by the employees from Romania regarding the cloud services that they use in their current activity, inside of the company where they professionally activate. The study has been conducted among 315 respondents, through the sample survey. It was posted on an online platform that would allow the potential respondents to access it during the entire

period assigned to data collecting, regardless of the time of the day or the utilized device. The obtained results were analyzed with the help of the IBM SPSS Statistics 20 software.

At the research level, almost all of the participants are full-time employees at the company where they work. (94,5%).

In this research, we have concluded that 2 out of 3 employees spontaneously associate the term "cloud" with a storage space, meaning a server, of data storing or with an external space of data storing. The respondents have also delimited the cloud in the area of the benefits obtained after using them, namely: access to stored data from any location (11,4%) and from any device (9,8%). However, it is also remarked through the way in which the access to these services can be made, via Internet (10,2%). Among the most common associations it is noticed an aspect linked to data safety, at which 8,3% from employees choose to store their data in cloud for additional safety. The employees from various domains have also associated this term with the one of "clouds", while the workers in the IT&C domain have given specific answers for the technical domain, as: public/ private/ hybrid data storage space, technology, on demand infrastructure, SaaS/PaaS/IaaS, API (Application Programing Interface) or Hosting (the allocated hosting space).

The notoriety of the cloud services' providers comes in the support of 7% of the employees to help them at the level of association with the cloud term; 6% of the respondents claim that the better association with the term cloud is the scalability feature (its capacity to sore a large volume of data).

Cloud computing is associated with the term "cloud" only by 3,2% of the employees, that especially come from the IT&C domain. Another aspect of interest that was identified among the answers was the fact that only 1,6% of the employees have chosen the "I don't know "option, which shows that almost all of the respondents know information about cloud.

Figure 1: Spontaneous association of the "cloud" term

Source: Statistical survey made by the authors

Approximately 9 out of 10 respondents know very well the term "cloud", meaning that they have the capacity to offer more details in this context. 11,1% of the total employees detain information about the researched subject, however without knowing its meaning. Only 1% of the employees that participated at the research don't know this term.

Figure 2: The spontaneous notoriety of the "cloud" term
Source: Statistical survey made by the authors

The notoriety of the cloud services is high due to the large variety of online sources at which the employees had access to and consulted them in this way.

Most commonly, the employees informed about cloud services by accessing providers' websites from the domain. The following two information sources preferred by the employees are the forums/ blogs from the domain and social networks, which have cumulated percent of 43,5, respectively 41,9. The knowledge received from friends/ colleagues/ family regarding cloud services represent an informational source for 38,4% of the respondents.

In this research, resulted that 3 out of 10 employees have found out about cloud services during their specialty trainings that they followed. Within some events as, specialty conferences, fairs and exhibitions from the domain, the employees have acknowledged information about cloud services.

Mass-media represent a high-potential informational source in what regards the communication of cloud services due to the fact that 16,8% of the employees acknowledged more information via this communication method. It is noticed that cloud services don't enjoy the high visibility in the traditional environment, only 2,2% declaring that they acknowledged information about the investigated subject via street advertising.

Only 1% of the employees don't know the method through which they acknowledged various information about the investigated subject.

Figure *3*: Information sources regarding cloud services
Source: Statistical survey made by the authors

All the participants at the research recognized the cloud services after visualizing the definition proposed in the research instrument.

All the respondents claim that they use cloud services in their professional activity, 7 out of 10 respondents use private cloud services, where the resources are managed by a private company and are exclusively allocated to companies where respondents work.

In what regards the use of public cloud services, where the resources are allocated by the providers only when it is necessary, it is observed that only 5,4% of the employees have this service at their disposal in the company where they work.

Approximately 1 out of 4 respondents use hybrid cloud services in their professional activity, having control only over data security.

Figure 4: The type of used cloud service, regarding on the data storing method
Source: Statistical survey made by the authors

In what regards taking decisions regarding data storage in cloud, it is noticed that the IT department's representant is the person appointed in percentage of 31,7%. The person with leading position and the IT department's representant equally decide, respectively in approximately 18,7% of cases and the person with leading position, but with support from the IT department in 16,5%. The

manager/department manager is responsible for taking decisions regarding storing data in a cloud in percentage of 15,9.

Figure 5: The person responsible for taking dictions regarding storing data in cloud
Source: Statistical survey made by the authors

From the type of used connection point of view, it is noticed that the one via cable (Etherenet) and the wireless one (Wi-Fi) are used in similar percentages 43,5%, respectively 46,3%, while the mobile data is used by 10,2% of the respondents.

Figure 6: Type of used connection
Source: Statistical survey made by the authors

In what regards the main cloud services used in general, it is noticed the fact that files sharing is used by 86% of the employees, the e-mail service by almost 3 out of 4 respondents, and data bases by 62,9% of the total employees.

58,1% of the employees use the applications, while 42,5% of the total employees use web hosting as cloud service. Only 37,1% use cloud services ass internal messaging service.

Figure 6: Cloud services used in general
Source: Statistical survey made by the authors

At the level of the most often used cloud services, the leader is the e-mail service accessed by the employees in their professional activity, being followed at short distance by the cloud files sharing (38,4% vs. 35,6%). 1 out of 10 employees use to work most frequently in cloud with various applications or data bases.

Figure 7 : The most often used cloud service
Source: Statistical survey made by the authors

By analyzing the main purpose for using cloud services it can be noticed that 4 out of 10 employees use cloud services to meet the internal needs of the company and only 1 out of 10 employees to meet the external needs. 47,3% of the respondents use cloud services both with internal purpose and external as well.

Figure 8 : The main purpose of cloud services use
Source: Statistical survey made by the authors

3 out of 10 employees use Google as cloud services provider in the company where they work, while 14 % of the total respondents use Microsoft. IBM offers cloud services for 9,2% of the persons that took part at the research, and Oracle for 5,4%. 3,8% of the respondents claim the fact that they use a cloud internally developed by the company where they work. It is remarked that approximately 2 out of 10 respondents don't know the cloud services provider used in the company where they work.

Figure 9: Used cloud services' provider
Source: Statistical survey made by the authors

Approximately 3 out of 4 employees get used to use cloud service multiple times per day, while the rest of the participants at the study use cloud services once per day or rarely.

Figure 10: The frequency of cloud services' provider use
Source: Statistical survey made by the authors

By analyzing the most representative benefits of cloud services, it is remarked that the great majority of employees, approximately 90%, agree with each of the ones written in the figure below.

Over a half of the research participants totally agree with the fact that cloud services allow them the access of multiple persons at the same time to visualize the stored data (59,7%), they give them the

possibility to access in real-time the stored data (58,1%), as well as their capacity to store a large volume of data (53,7%).

Almost 50% of employees totally agree with the statements regarding which cloud services allow the access to stored data to any device that has an Internet connection (48,9%), as well as eliminating restrictions regarding the locations from where the cloud services are used (47,9%).

38,7% of the total employees totally agree that the data stored in cloud is much better structure in a way that it is much easier to view, and 35,2% totally agree with the fact that cloud services allow a higher speed of work with the stored data.

Figure 11: The benefits perceived by the respondents regarding cloud services used in the company where they work

Source: Statistical survey made by the authors

By analyzing from the disadvantages existent at the cloud services' level, the opinions are divided among the persons who took part at the study. Most of the employees (78,4%) think that accessing data with the help of cloud services can be made only via a stable and fast Internet connection.

In addition, 43,2% of the participants agree with the fact that a cloud services disadvantage is represented by not knowing the geographical location of the servers that store data, while 11,7% of the total respondents didn't decided in this way, choosing the answer option "I don't know/ I don't answer". However, over half of the respondents don't have concerns regarding the security and integrity of data, and 47,3% of the employees are confident in what regards cloud integration in the activities used in the professional activity.

For 44,1% of the employees, the cloud services' providers made available specialty trainings and offered them the necessary support when they had difficulties in what regards the use of cloud services.

Figure 12*:* The disadvantages perceived by the respondents regarding the cloud services used in the company where they work

Source: Statistical survey made by the authors

Conclusions

Generally, when a research is made, regardless if it's quantitative or qualitative type, the limits are also mentioned, which the marketing researchers must take into account. In this context, the research made in the present paper, sums up a series of specific limits, that have to be mentioned.

The first limit of the research is represented by the method through which data was collected, meaning the research instrument was projected on an online platform and then distributed to the respondents. In this way, there is no guarantee on the fact that the person who takes the online survey is the respondent eligible for the study, regarding of the selection criteria.

Another important limit targets the fact that the research is not representative because from the secondary resources the general dimension of the researched collectivity. Therefore, a research on a sample with 315 respondents was made.

Taking into account the structure of the sample, mainly formed by persons that had graduated at least university studies and work in companies where cloud services are regularly used, the notoriety of cloud services is very high. If the sample would have a different structure, the cloud services wouldn't enjoy such a high notoriety. However, the main findings of this research was significant and had implications for the companies' activities which asked for the analysis of this report contained in the paper.

The future main research directions target the elaboration of certain research representative from a statistical point of view, centered on certain activity domains that are of interest for the beneficiary, segment delimitation of the cloud services' users so that the companies would integrate as efficiently the current web technologies and instruments, to offer very attractive, customized promotional solutions that would answer their needs even more and to overcome their expectations.

Abstract

Once with the accelerated technological evolution, the society needs to adapt to the changes that appear everywhere, through integrating new innovative technologies in the current activity. Although, the technological barriers of Internet are not precisely delimited, it is obvious that it will further represent an unlimited source of information, where new technologies fit very well in the great majority of the activity domains. It is noble the fact that, modern technologies play a very important role in the contemporary economy, which implies the idea that, it is hard to draw certain directions specific to their development, because they have an incredibly fast rhythm of development. In this paper I conducted a quantitative study at the level of which I've proposed to identify the perception of the employees from Romania regarding the cloud services they currently use. The research was made on a sample of 315 persons and the data was analyzed with the help of the IBM SPSS.

Keywords: Cloud Computing, Services, Quantitative Research, Web Technologies.

Introduction

In order to observe the difference between the services and applications that appeared over time on Internet, first it is necessary to define the Web 1.0, Web 2.0 and Web 3.0 concepts and definitions. The first generation of the Internet is referred to as Web 1.0 or WWW (World Wide Web) and it is defined as being the informational environment in which aspects of interest (called resources) are identified by global identifiers called Uniform Resource Identifiers (URI) (Davis, 2010, p.1). These are also found in the subsequent generations of the Internet, however, what distinguishes the first generation of the Internet from the others is that in that period the Web was static and it could be only "read" by the large public. The only persons who could add content on Internet were web designers or persons who had HTML knowledge.

The following step of the Internet was a transition period (Web 1.5), period in which Internet content started to be dynamical generated from databases. In this way, people began to interact with the Internet, and the concept was named reading/writing (Hend, Abdul Malik, 2006).
Web became in this way to transform itself in a platform and made its transition towards the Web 2.0 generation, which distinguishes through technologies such as blogs, RSS feeds and social platforms. The need for the machines to understand the information found on the Internet and not only process it

led to the apparition of the third generation of Web, called Semantic Web. This is an extension of the Web 2.0, being considered an evolution and not a competitor (Hend, Abdul Malik, 2006).

The Web 1.0 generation was represented by the unilateral concept of placing information on the Internet, while at the level of the subsequent generation, Web 2.0(Roebuck, 2011, p. 10), the main attribute was the connection between human beings. Nowadays, we fit in the subsequent generation of Internet development, Web 3.0 (Passin, 2004, p. 3), also called the Semantic Web. This is framed by the specialists as being the extension of the Web 2.0 generation, because it uses the previous web technologies that reached maturity, at which new technologies specific to Web 3.0 are added (Davis, 2010, p.3).

Of course, the "web services are both an evolution of distributed computing and the launch point for a revolution in the way we think about building large-scale systems." (Glass, 2002) The steps that lead to Cloud Computing are Cluster, Grid Computing, Generation 2 – with merging among Grid and Web Services.

At this moment, the Internet captures an ascendant tendency with an accelerated development rhythm in what regards the used band width, the number of interconnected users, the usage of different types of devices connected to Internet, the impressive volume of stored data, the used applications, various types of mass-media, etc.

From this perspective at the global level, the needs of the Internet users utterly exceed the communication technologies, the capacities and capabilities of the current information found on the Internet. In this way, the Web 3.0 generation offers intelligent connectivity solutions through some technologies that will support the current issue of the Internet (Pollock, 2009, p. 16) in which the system's capabilities (security, complexity and data mobility) are overcome (Davis, 2010, p. 4).

Presently, with the help of the Internet, any user has the possibility to access data stored in cloud from any location and at any moment. The infrastructure behind the applications used by the user is complex and consists of data centers located geographically different, that are permanently monitored by the cloud services provider. Cloud computing could be considered as being the use of the capacity for the digital transformation process.

The development of the processing capacity allowed the cloud services' providers to offer the users the possibility to install virtual machines (VM), with the purpose to allow any application wanted by the client. In this way, a client installs the virtual machine on the server, later he installs the wanted application and benefits of a very large processing power (both CPU and GPU), but also of sufficient storage space. The cloud services' providers as Amazon, Google, Salesforce, IBM, and Microsoft have data centers spread worldwide, to allow both the redundancy of the offered services, but also data safety through multiple storage in different locations. In addition, this way of using multiple data centers, geographically spread, allow a lower time to answer a request, the information not being required to cross great distances, only to the nearest data center or till the most performing one. Creating this type of cloud implies large investments and needs a complex application of administering data feeds (Buyya et. all, 2009).

Cloud computing is a must have in the framework of digital transformation of businesses, regardless of their size or the number of employees (Misra, S., Mondal, A., 2011). Using these services brings many benefits, among which we remember the lack of investments in the infrastructure, costs only at the use of services, very large storage and processing capacity, lack of maintenance costs of services and the availability of the services at any hour and from any location. Using cloud computing services also implies using some information encryption services, to have the safety of the data, those being stored/processed among other users' data by the cloud providers' servers.

Methodology research and key findings

In order to establish the perception of the employees from Romania regarding the cloud services they currently use in their activity domain, a quantitative study was made. Data collecting was made with the help of a survey that was posted on the LimeSurvey online platform. Data collecting was made during March – June 2017. The data was analyzed with the help of the IBM SPSS Statistics 20 programme. In what regards the process of data analyzing, it has to be mentioned that firstly the data base from the online platform was downloaded, lately the data base cleanup, eliminating the non-answers as well as the incomplete answers. After the data base cleanup process, the final number of respondents was 315.

Looking from the communication process perspective implied at the cloud services, used by employees in their professional activity, level they think that they received support, mainly from the company personnel (78,4%), that was supported by the personal documentation effort from the online environment (70,5%). Once again, the employees think that personal documentation regarding cloud services heads for analyzing some information particularly transmitted from the virtual environment and not from the traditional one, where the investigated subject is poor in visibility (46%).

62,2% of the respondents agreed with the fact that they received information from friends, colleagues or family about the cloud services that they use in the company here they activate.

The communication with the direct provider, respectively indirect of cloud services is benefic for 61,6%, respectively 52,1% of the respondents from considerations linked to the availability of some resources transmitted via e-mail, specialty trainings regarding the services used in the professional activity.
In what regards the communication process via online advertising, opinions are divided among experts, in the sense that 37,5% of the subjects think that in this way they managed to identify more information about cloud services, while 36,5% claim the contrary.

Figure 1: The perception of the respondents regarding the communication process implied at the cloud services level used in the company where they work

Source: Statistical survey made by the author

Looking from the respondents' work experience with cloud services perspective, more than half of them claim that the previous studies regarding the investigated subject, as well as conferences and socialization sessions from the domain supported them in the efficient use of these services in the company where they work.

Figure 2: Respondents perception regarding their work experience with the cloud services they use at their workplace

Source: Statistical survey made by the author

Another researched aspect captures the respondents' perception over the risks of the cloud services they use in their professional activity. From the figure below it is observed that almost 60% of the employees don't consider that the data stored in cloud have a lower safety, in the sense that there can be data losses or on the contrary, they could be stolen. Also, they don't think there are risks regarding the access of personal data stored in cloud by unauthorized persons. Moreover, 52,1% of the total respondents don't agree with the fact that data storage is made on a single server.

At the level of the server's functionality, it is noticed that 33,3% of the respondents agree with the fact that in the period when the server is unavailable, the data stored in clouds can be accessed, while 39,4% claim the contrary.

Figure 3: Risks perceived by the respondents in what regards using cloud services at their workplace

Source: Statistical survey made by the author

In what regards the demographical data of the employees it can be noticed that, 53,3% are women, while 46,7% are men.

Figure 4: Gender

Source: Statistical survey made by the author

8 out of 10 employees are between 18-39 years old, while the rest of the participants at the study are 40 years old or above.

Figure 5 -Age

Source: Statistical survey made by the author

The majority of the persons who took part at the study (57,5%) have post-graduation studies as last graduated educational form, 4 out of 10 being university graduates, and 3,2% of the employees claimed that they most recently graduated high school, post high school or middle school.

Figure 6: Last graduated form of education

Source: Statistical survey made by the author

In what regards the occupational status, 6 out of 10 participants are employees have higher education, 3 out of 10 have a managing position as managers or CEOs and only 6,3% of the total participants are entrepreneurs. Less than 3% of the employees have graduated secondary education or administer the company where they work.

Conclusions

The impact of modern technologies is vital is what regards the economic development of the current society and directly influences the capacity of the companies to resist on the market. The emergence of the Internet, a source with an incredible informational potential, has open new dimensions in what regards the discovery of development opportunities for the companies in the marketing communication process. This has led to the fact that the Internet is a very important influence factor when the marketing communication activities established in the companies is taken into account.

Web technologies among with advanced computer systems help to efficientize the process of tasks fulfilment from the marketing communication activities to give an immediate feedback to consumers and prospectors. Moreover, in the companies managers constantly appeal to Web technologies with the purpose of efficiently relation both with employees and consumers and prospectors. Companies want to promote as efficiently as possible their products and services available in the portfolio, via technologies and last generation Web instruments and initiates efforts to create the most suitable promotional mix so that it would meet the needs and the demand of the target public by offering some customized high-level solutions and also to obtain a high position in the competitive environment.

The quantitative study was established with the purpose of determining the employees' perception from various activity domains in Romania regarding the cloud services used in the professional activity. The research was made with the help of applying a research instrument, the survey, that was projected on an online platform and its URL was shared via e-mail to the respondents for answering. At the level of this study some limits were also identified.

One of the research limits is concluded by the fact that in the preliminary phase of the research there haven't been secondary sources found that will support the dimension of the researched general collectivity and in this way, the opportunity to make a research with representative character didn't existed anymore. Therefore, the efforts were directed to the achieving of an empirical study developed at the level of the companies that have their social headquarters in the country. Moreover, the survey was shared online and from this cause we don't have the certainty of the fact that it was written by the persons to whom it was assigned.

Abstract

Due to the growing number of actions and interventions reporting the effectiveness of vector control in malaria protection, there is a need to systematically review the literature on indoor residual spray and insecticide mosquito nets to examine the effectiveness and identify research coverages in the area of the topic. A systematic review of over 579 scholarly articles published since the year 2013 was conducted. The final dataset included 100 articles; consequently, the research shows significant improvements in the coverage of malaria intervention tools since 2000. This resulted in following the Abuja agreement that targeted to increase the coverage of insecticide mosquito nets by 60% for children under five years of age and pregnant women and target spray of households in malaria areas with indoor residual sprayings. While there is substantial heterogeneity in study characteristics and effect size, the decline in malaria mortality and morbidity rates achieved throughout the continent. However, malaria continued as a public health challenge, particularly in Sub-Saharan Africa. Lack of knowledge about malaria and its prevention methods, negative attitude on the use of interventions, and problems with intervention access to high malaria-endemic regions identified as a challenge in many study communities. Besides shape preferences and the limitations to protect malaria outdoors cited as a challenge with the intervention approach. Generally, the report recommended policymakers, and health planners think extra efforts with the existing strategy that fosters different vector habitats in different communities at various sites.

Keywords: Malaria, Indoor residual spray, Insecticide mosquito nets, Systematic review

Update about Malaria

With approximately 214 million cases in 2015, malaria is a global health challenge where most cases estimated to occur in the African Region (World Health Organization, 2015), with 88% cases, and causes an estimated death of 438 000 patients, of which 90% of death's reported to have occurred in African. Similarly, 198 million cases of malaria occurred globally in 2013, and the disease led to 584 000 deaths, with more than three quarters (78%) of malaria deaths occur in children aged < 5 years (World health organisation, 2015). Malaria is a vector-borne infectious disease caused by protozoan parasites of the genus Plasmodium, which is transmitted to human beings by the bite of infected female anopheles' mosquito (DFID, 2010). There are currently over 100 countries and territories where there is a risk of malaria transmission and visited by more than 125 million international travelers every year (World Health Organization, 2010). At which over 10,000 are reported to become ill with malaria after returning home; despite the real figure may be considerably higher due to underreporting. There were an estimated 660,000 deaths from malaria disease in 2010, where 81% of cases and 91% of deaths estimated to have occurred in the WHO African Regions, and globally 86% of the victims were children under five years of age (Animut, Negash and Kebede, 2014). Though the effectiveness of the IRS in controlling malaria has been reported (Johns *et al.*, 2016; Oxborough, 2016; PMI, 2016; Magaço *et al.*, 2019), the spread and intensification of pyrethroid resistance in malaria vectors and other factors hinders their long-term usefulness. Besides, the effectiveness of conventional ITN in malaria

prevention revealed (Arroz *et al.*, 2017; Ernst *et al.*, 2017; Taremwa *et al.*, 2017; Tassew, Hopkins and Deressa, 2017; Taffese *et al.*, 2018), problems regarding the continuous use of ITN, limited knowledge about malaria and its prevention and misperception reduces its efficiency in protecting malaria. Malaria is a maternal and child health global concern, with a high impact on the economy, which costs African nations alone $12 billion each year (Turgeman, 2011). This figure factors in costs of health care, absenteeism, days lost in education, decreased productivity due to brain damage from cerebral malaria, and loss of investment and tourism. Successfully addressing these threats will require strategies that expand access and use of existing control methods, and evaluating challenges regarding vector control tools. This paper investigates the effect of insecticide mosquito nets and indoor residual spray on malaria and its prevention. The result of the research is beneficial for policymakers, researchers, and other stakeholders working on this area for program development, and evaluation of its impacts.

Methods

Published reports and scientific publications reviewed. The web search engines Google, as well as the electronic databases PubMed and Springer Link of Systematic Reviews, searched for relevant documents. Keywords/phrases used in the web search included: “malaria,” “ITN,” “IRS,” and terms reflecting “topics of interest.” These keywords/phrases were used in a variety of combinations and included synonyms, alternative terminologies, related terms, and variation in word endings. Example of topics explored included: household, knowledge, treatment-seeking, knowledge, attitude, practice, perception, usage, indoor residual spraying, bed net, policy, community health workers, vector control, burden, transmission, prevalence, mortality, plasmodium, Ministry of Health, world health organization, and others. We included references published mostly from 2013 until 2018. But for guidelines, we used the 2009 and 2010 as well. All publications resulting from these searches were screened and pertinent records collated using Mendeley, a web-based bibliography database manager. Documents that met the inclusion criteria of the review paper were retrieved and evaluated by the authors. Inclusion criteria for this review: (1) it must be English-language. (2) published primary and secondary literature, guidelines, and technical reports, and. (3) Recent publications providing context on the following three pre-specified related topics in the area of malaria program: news about vector control strategies, global and sub-Saharan Africa, and the current challenges to malaria protection. The review primarily focused on Ethiopia and Sub-Saharan African though it gives insights to global vector control strategies. A data extraction form used to extract and record findings from each paper related to the topics. Fig. 1 illustrates the search strategy for this review from a pool of searches.

Fig.1 : Search strategy for systematic review

What is new in vector control strategies?

Countries must hit all persons at risk with insecticide mosquito nets and indoor residual spray to meet the malaria goals of world health organization-roll-back malaria. Also, provide laboratory tests for malaria suspected cases and effective treatment of all confirmed cases (Aregawi *et al.*, 2009). Insecticide mosquito nets (ITNs) and indoor residual spraying (IRS) identified as the principal methods used for the prevention and control of malaria. These strategies remain as the backbone of vector control intervention policies. Which are recommended by WHO as a key intervention in the critical reduction of the malaria disease and interruption of its transmission and accounts for 60% of the global malaria investment and control (PMI and Operations, 2009; World health organisation, 2013a, 2013b; World Health Organization, 2015; Madani *et al.*, 2017; Masaninga *et al.*, 2018). Insecticide-treated nets are mosquito nets that are treated with insecticides to repel, disable, or kill vector mosquitos that transmit malaria (OSSAI, 2014). Strong evidence exists about ITN at the individual level that its proper use substantially lowers the risk of contracting malaria (Nankabirwa *et al.*, 2014). The study also shows the low use of insecticide-mosquito nets by school-age children. This is due to the less control of the family to children while going to bed as they become older, which is the other challenge in malaria program to focus. The study in Nigeria reported substantial knowledge of study participants about ITN, IRS, and intermittent preventive treatment as malaria prevention methods. But the report shows a suboptimal practice of sleeping under ITN (Uv *et al.*, 2014). On the other hand, the study in Rwanda shows the community's knowledge about malaria and its prevention methods (Asingizwe *et al.*, 2015), the research also reveals an optimistic community for malaria elimination. The other study demonstrates the involvement of citizens in monitoring mosquito dynamics, habitats, nuisance, and malaria episode to create potentially more sustainable vector control interventions (Domina Asingizwe, P. Marijn Poortvliet, Constantianus J.M. Koenraadt, Arnold J.H. Van Vliet, Marilyn M. Murindahabi, Chantal Ingabire, Leon Mutesa, 2018). The other study also reported knowledge about malaria complemented with ownership and use of ITNs in the study sites (Onwuka, 2015). The finding of the study gives insights to policymakers on how appropriate knowledge impacts the prevention and control

of infectious diseases besides the malaria program. African heads of governments targeted achieving 60% coverage of bed nets to use by 2005 for pregnant women and children aged 5years following a summit in Abuja in 2000 (Odoko, Nwose and Igumbor, 2017). Using ITN has been shown to reduce malaria case incidence rates by 50% in a range of settings. And reduce malaria mortality rates by 55% in children under-5 years in Sub-Saharan Africa (World Health Organization, 2017). In 2015 the World Health Organization's (WHO's) Roll Back Malaria Partnership set a goal to reduce global malaria cases by 75% from 2000 base. And to reduce malaria deaths to near zero through universal coverage by effective prevention and treatment interventions. Likewise, WHO recommends the use of insecticide-treated nets (ITNs), particularly long-lasting insecticidal nets, which have shown to be cost-effective. Also, reduces malaria episodes among children < 5 years of age by approximately 50% and all-cause mortality by 17% (Willey *et al.*, 2012; Zhou *et al.*, 2014). The impact of ITN/IRS coverage for under-five mortality was significant among major child health interventions such as immunization. Showing a 10% increase in households with ITN/IRS would reduce 1.5 child deaths per 1000 live births (Akachi and Atun, 2011). Besides, remarkable achievement towards the reduction of malaria cases and malaria-related deaths explained in the global world due to the introduction of ITN and IRS (World health organisation, 2013b; Initiative, 2015). However, a low level of willingness to take up the IRS reported compared to the target (Wadunde *et al.*, 2018). The other study shows insecticide mosquito nets repellent with chemicals can protect the user and those who sleep around but not under the net (Ochomo *et al.*, 2013). The study conducted in Uganda reported that a 100% increase in the coverage of insecticide-treated nets was associated with a decline in the incidence of malaria by 44% (Ssempiira *et al.*, 2018). However, in other African countries such as Malawi, the report shows high coverage of insecticide mosquito nets, but malaria burden remains high(Coalson *et al.*, 2018). The Ethiopian study report also reveals, though, the Abuja declaration targets agreed to provide at least 80% of pregnant women with ITNs by the year 2005; only 63% of pregnant women presently make use of ITN, which hampered its effectiveness(Fuge, Ayanto and Gurmamo, 2015). And it expresses the idea that access to intervention doesn't mean its use, which needs another effort to take place (Russell *et al.*, 2015). Also, a significant reduction reported on malaria positive case, the magnitude of the disease as a public health challenge is alarming (Tesfa, Bayih and Zeleke, 2018). Which needs extra efforts to strengthen the prevention and control mechanisms in the community. The study in Malawi revealed that ITN was recognized as important malaria prevention generally, but the access and use reported as differed across various sites (Pell *et al.*, 2013). Despite the availability of ITNs, malaria remains a foremost public health concern in Uganda; this is due to respondents' negative attitude towards ITN and low usage to protect malaria (Taremwa *et al.*, 2017). Lack of education and non-use of insecticide mosquito net also associated with malaria prevalence (Fana *et al.*, 2015). Furthermore, challenges regarding attitudes towards ITN and its use to protect malaria also identified (Kramer *et al.*, 2009; Tesfa, 2012). The study conducted in Senegal demonstrates the complexity of the malaria context. Showing the need to study the genetic structure of Anopheles populations to evaluate the effectiveness of vector-control tools and the successful management of malaria vector control (Sougoufara *et al.*, 2017). Insecticide mosquito nets are the primary tool for vector control, and optimizing its use is a key concern of national programs. However, preferences of certain net shape attribute exits (Dhawan *et al.*, 2014; Koenker and Yukich, 2017). The study in Yemen reported low knowledge about the importance of insecticide mosquito nets and indoor residual spraying of malaria prevention (Bamaga *et al.*, 2014), which needs an effort towards awareness creation programs in the community. The study of Sudan also shows a negative attitude of ITN and low utilization, despite good knowledge about ITN (Tayseir T. M. Masaad, Yousif M. Elmosaad, Abd Elbasit Elawad Mohammed, Ahmed Elnadif Elmanssury, Mahmoud Jaber, Mustafa M. Mustafa, 2017). Distance from health facilities also affects the utilization of intervention tools in line with other contributing factors (Nkoka *et al.*, 2018). Furthermore, the government can solve the issue with the deployment of trained community health workforce at the local level. Good progress regarding the use and ownership of bed nets to prevent malaria reported in Ethiopia than had previously (Tassew, Hopkins and Deressa, 2017);. However, poor knowledge about malaria transmission mechanisms and symptoms were also reported (Delil *et al.*, 2016). Also, another study revealed good knowledge about malaria and strategic interventions, but the compliance rate was low in study communities (Animut, Negash and Kebede, 2014). On the other hand, problems regarding awareness about prevention and control of malaria reported in study participants (Karunamoorthi and Bekele, 2012). Low access to ITN and low utilization also reported in another study area (Watiro1 and Awoke2, 2016). Environmental management also reported as the most popular method to protect malaria in line

with ITN and IRS (Dejene, 2016). The other study in north-west Ethiopia reported the absence of the reduction of malaria prevalence annually (Alelign, Tekeste and Petros, 2018). And the result of this study paves the way for future researchers to explore intervention utilization in the area, to assess strategic impacts. Similarly, the study in Burkina Faso reported low knowledge about malaria prevention practices in a large proportion of study participants (Yaya *et al.*, 2017). The study in Colombia reported a high level of knowledge about malaria in study regions. but identified gaps persisted relating to practice (Forero *et al.*, 2014); also, ITN does not protect malaria infection outdoors. An impressive report showed by the study in Myanmar at which higher level of malaria-related knowledge reported with excellent use of intervention strategies, ITNs (Liu *et al.*, 2015). This is maybe due to the fact that the provision of reliable education to the community and sustainably using particular approaches. The other report in Iran shows awareness of the community about symptoms and causes of malaria, but the majority has misconceptions about LLINs (Soleimani-Ahmadi *et al.*, 2014), which calls for appropriate educational intervention to be developed by trained health workers. On the other hand, good awareness of the community towards means of malaria transmission and ways of prevention reported but the ownership and utilization were not as high as their knowledge (Fuge, Ayanto and Gurmamo, 2015) (Haile *et al.*, 2015), in addition myths and misconceptions about malaria reported as a challenge for ITN use (Tobin-West and Kanu, 2016). The other study finding shows the association of knowledge with the utilization of the prevention interventions, where good knowledge level leads to better use of insecticide mosquito nets to protect malaria(Kimbi *et al.*, 2014). For every infectious disease prevention and control, including malaria to succeed, the ownership and involvement of the society is at the forefront. As ITN programs depend on the acceptance and active involvement of individuals and communities, human behavioral and social factors impacts ITN use (Watanabe *et al.*, 2014; Nwokolo, 2015). Knowledge about the preventive measures of malaria reported as an important preceding factor for the acceptance and use of malaria preventive measures like Insecticide Treated Nets (ITN) by community members (Adebayo, Akinyemi and Cadmus, 2015), however, the result shows low knowledge about malaria prevention in study participants which is the challenge for the program success (Molla Gedefaw, 2013), and lower number of people who slept under ITN was revealed in study. As part of the efforts for universal coverage of vector control measure government of Nigeria, at various levels of governance, has embarked on free distribution of ITNs to caregivers of children younger than five years of age; however, research outputs have consistently shown limited access to ITN, and most parents across the different Nigerian communities have negative attitudes towards the use of the treated nets(Cecilia Van Zyl-Schalekamp, 2013; Ogbonna*, 2015), poor malaria knowledge also reported in the study sites (Inah *et al.*, 2017; Ukpai *et al.*, 2017). Likewise, insecticide mosquito nets explained the most preferred malaria prevention strategy, but a history of malaria still exists (Animut, Negash and Kebede, 2014). Similarly, the study showed ITN, IRS, and larval source management as malaria vector transmission reducing agent with differences in residual efficacy in indoor residual spraying at different housing standards, With high efficacy of painted wall surface and low effectiveness of rough surface housing standard (Eckert *et al.*, 2017; Desalegn, Wegayehu and Massebo, 2018). The study conducted in sub-Saharan Africa on vector control intervention effects reported that, in all countries, the probability of a decrease in parasitemia varied substantially between regions. Insecticide-treated bed nets were an important intervention for reducing malaria risk, according to different definitions of coverage, but, an overall effect of insecticide-treated bed nets at country level was significant only in Angola (–0·64, 95% credible interval –0·98 to –0·30) and Senegal (–0·34, –0·64 to –0·05); however, in all countries, we detected significant effects of bed nets and indoor residual spraying at local level (Giardina *et al.*, 2014), which may be due the differences in the coverage of interventions, or differences in information provision about the program, and other related determinants to affect the use and access. The other study in Nigeria pointed out associations between knowledge and intervention use to protect malaria, where those who know use of ITN can protect from malaria were almost two times more likely to use ITN than those who do not know (Nwokolo, 2015; Uzoamaka and Onyemaechi, 2016), this study shows that increasing the number of nets owned per household might not be a critical decider on whether the net will be used or not. The other study reported a negative attitude and low self-practice of pregnant women in the study sites(Adibe *et al.*, 2017). So, policymakers, program planners, and concerned stakeholders have designed the way to facilitate its use while providing ITN for malaria prevention. Perceptions and health-seeking behaviors are critical for malaria prevention and control. and can be achieved with valid and effective provision of information with trained health workers, and the study in Ghana reported how awareness of the

communities conducted by health professionals impacted the malaria preventive practices (Alexander Suuk Laar, Amos Kankponang Laar, 2013). Community engagement for malaria elimination also reported (Adhikari *et al.*, 2017), which can be achieved with the implementation of community mobilization from the ground level via trained health workers. The other study reported, the timing where malaria survey conducted influences the estimates of the geographical distribution of the disease risk, particularly in settings with the seasonal transmission (Tonye *et al.*, 2018). The other study in Nigeria reveals the decline in the use of insecticide mosquito nets from 86.2% to 71.5% in the study population (Ogunsanmi *et al.*, 2016), misconception about malaria transmission, and its cause also reported (Singh *et al.*, 2014). The result calls for urgent need to identify the barriers to use the intervention and the changes in the outcome of the malaria disease. The study conducted in four African countries pointed out that improving healthcare providers' knowledge and practices is an untapped opportunity for expanding ITN utilization and preventing malaria (Hoffman *et al.*, 2011). The study finding shows the association between malaria protection and the health workforce in such a way that strengthening the workers' capability facilitates the use and access of the community for an existing strategy. Though malaria identified as a major health challenge, particularly for children and pregnant women, only one-fourth of the study participants in India named malaria among top health issues for pregnant mothers (Sabin *et al.*, 2018). The study in Mali shows substantial improvement in access and ownership of the study community for malaria prevention and control measures. Also, the continuous decline in the outcome of malaria disease due to the intervention tools reported (Kayentao *et al.*, 2018). Though it is interesting progress to reveal, as discussed in various literatures in different parts of Sub-Saharan Africa, such cases are rare to generalize the findings. Hence mostly, various challenges reported with the access and utilization of intervention to protect malaria that needs novel efforts at grass root-level. The study in Ghana reported caregivers' understandings about malaria and its transmission modes, but the study reveals the need for education on preventive methods implementation (Ameyaw, Dogbe and Owusu, 2015). Likewise, the study in Bangladesh reported gaps in communities' knowledge regarding aspects of malaria transmission (Saha *et al.*, 2019), which need effort on increasing knowledge, attitude, and practice regarding malaria prevention methods in the society.

Challenges and Way Forward

Recent declines in malaria-related morbidity and mortality resulted due to the scale-up of ITNs and IRS. However, different factors like the behavior of the mosquitoes, which bite outdoors, problems with proper utilization of nets. Nets preferences in various communities and holes or tears in nets, knowledge of the community about malaria and its prevention have impacted the effectiveness of control interventions targeting mosquitoes entering houses. From 2001 to 2015 in Sub-Saharan Africa, the report shows 663 million an averting case malaria out of 943 million. At which 69% is averting rate reported to be due to ITN use (World Health Organization, 2015). The study of Nigeria reported problems with access and use of ITN in the high-risk region of the study community (Odoko, Nwose and Igumbor, 2018). The research in India also informed inadequate coverage of malaria intervention tools to households (Raghavendra *et al.*, 2017). Although morbidity and mortality due to malaria declining, malaria case incidence described being high in Ethiopia (Taffese *et al.*, 2018) (Alemu *et al.*, 2012), which occurred due to the gap in the ownership and obedience in malaria areas. Besides differences in the outcome, malaria species types reported where Plasmodium vivax improved in one site than the dominant plasmodium falciparum, which is unchanged in other study areas. The other challenge is low knowledge about net care and repair, besides negative perception to repair (Zewde *et al.*, 2017). So it needs to enhance education through different channels, and community health workers, as reported in the research, conducted Zambia (Shimaponda-Mataa *et al.*, 2017). Similarly, the study in Ethiopia reported poverty and socio-cultural diversity as the primary influence of the community to use the intervention in the right-way and other (Doda *et al.*, 2018). And housing structure also identified as a bottleneck for intervention use (Carter, 2014). The other study in Namibia pointed out the universal coverage of ITN and IRS supplemented by larval source management for malaria elimination (Chanda *et al.*, 2015), but the national capacity to plan, evaluate, implement and monitor will require adequate and sustained technical professional support. So, to solve the malaria issue in line with its prevention and control, the involvement of intersectoral collaboration and community

engagement is essential. To do this, the partnership of policymakers and program planners from governmental and non-governmental organizations as well as research development to show the gaps and recommend the strategies is substantial. It is also important to note the incorporation of major infectious disease programs, including malaria, into the education curricula to assure sustainable achievement in the wellbeing of the society. To improve the success in the malaria program, we have to assure the program related knowledge to the community level. Likewise, it must also be appropriate to approve the strategic implementation regarding the use of IRS and ITN. Supported by the study in Mali, with high national net use, at which comparatively higher in the region covered by the universal distribution campaign than in the region not yet covered with correct communication messaging (Leonard *et al.*, 2014). And the need to enhance information using available channels such as health facility and community health workers to improve utilization as reported in Zambian study (Shimaponda-mataa, Tembo-mwase and Gebreslasie, 2016). This is because, as cited in different studies conducted in Africa among non-medical students of higher education, knowledge regarding malaria preventive measures and practice reported (Saheed O Usman *et al.*, 2015; Saheed Opeyemi Usman *et al.*, 2015; EdetUtan *et al.*, 2016; Sumari *et al.*, 2016). Although various problems directly aligned with the community's practice regarding intervention strategies for malaria protection, access to the intervention is also another challenge for malaria programs to achieve. As cited underworld health statistics, though an impressive increase in malaria intervention coverage, in 2013, out of at malaria risk population of 840, an estimated 278 million was in Sub-Saharan Africa, lived without a single net in their house(World health organisation, 2015). Furthermore, various challenges regarding malaria and its prevention cited in different countries and within a country in different study sites. Similarly, numerous problems regarding intervention strategy for malaria protection raised in diverse populations discussed in the literature of various countries. As the study in Rwanda, identification of behavioral determinants about LLIN use, IRS acceptability, and health care seeking is a critical step. Supports the development of effective and targeted interventions, aiming to reduce malaria transmission and elimination (Ingabire *et al.*, 2015) further. So, the idea expresses and calls the policymakers and health planners to think beyond the traditional way of program implementation. Also, to believe in the expansion of extra efforts with new tools in line with the existing strategy, and to get out of one-fit all approach and customization can play an immeasurable role in attaining the malaria targets. Most of these researchers focused on the relationship between ITN and IRS in malaria protection, but they're in need to refer other dimensions in the relationship such as household income and knowledge role.

Conflict of interest

On behalf of all authors, I am declaring that authors have seen and approved the final version of the manuscript, and warrant that the article is original work.

Abstract

Technological progress is the basis for sustainable and inclusive economic development. It is possible to identify several needs to implement sustainable solutions in all sectors of the economy, such as eco-innovation and green jobs or environmental protection. The purpose of the article is to discuss and examine the environmental and business factors for the development of such solutions. A qualitative study was conducted based on a structured literature review to gather information on business ecosystem factors affecting the use of eco-innovation and their impact on sustainable development and transformation towards the green economy. This study will provide a hint for the understanding of business mechanisms of implementing eco-innovation that can allow them to build a sustainable business network. The article uses qualitative methods and contains ideas for future research. A quantitative study can be carried out to develop a business model for the eco-innovation system using inter-organizational network models.

Keywords: Business Ecosystem, Eco-Innovations, Inter-Organizational Network, Sustainable Development

Introduction

Currently, one of the fundamental objectives of the European economies is to reduce the negative impact of human activity on the natural environment (European Commission, 2020). European Union action towards a setting a balance between economic growth and environmental protection needs. One of its action is the creation of eco-innovation and green hobs that promote environmental protection and to restore the environment to its natural state (Sulich et al., 2020). Transformation towards the green economy is based on the multiple stages and one of their dimensions is progress (Sulich, 2018; Tarnawska, 2014).

Technological progress, measured by the Eurostat by the number of the patents dedicated to the Environmental Goods and Services Sector, is the basis for the sustainable growth and inclusive economic development (Cecere and Mazzanti, 2017). There are examples of the spectacular implementations of the newest technology to reduce the anthropopressure and enhance the innovativeness among green enterprises (Tutaj et al., 2019).

The purpose of the article is to discuss and examine the environmental and business factors for the development of such solutions. A qualitative study was conducted based on a structured literature review to gather information on business ecosystem factors affecting the use of eco-innovation and

their impact on sustainable development and transformation towards the green economy. This study will provide a hint for an understanding of business mechanisms of implementing eco-innovation that can allow them to build a sustainable business network (Bogusz and Sulich, 2019).

Eco-Innovations

The concept of ‘eco-innovation’ is relatively new. The prefix 'eco' comes from the word ecology, while by the 'innovation' we mean everything new (Tarnawska, 2014). It is generally acknowledged that the eco-innovations generate new products and processes which provide the consumer and business with values but also reduce environmental impact (Rutkowska-Podołowska, 2016).

The eco-innovation is the production method, assimilation or exploitation of the product, production process, service or management, or business method that is innovative for the organization, regardless of whether the organization is developing or adopting it (Tutaj et al., 2019). Eco-innovations at the design, research or trade stage also take into account the idea of sustainable development in environmental, social and financial aspects (Graczyk, 2013; Sulich and Zema, 2018). This, in turn, reduces the risk to the environment, pollution and other potentially negative effects of resource use (including energy consumption) throughout the life of the product, process or method cycle compared to traditional alternatives (Kemp and Pearson, 2007).

Fig. 1: Typology of eco-innovation

Source: (Yusuf et al., 2018).

It is possible to single out the category of eco-innovation based on the technological or non-technological purpose is involved. ET innovations include eco-product innovations and eco-process innovations, while non-technological innovations include marketing, social, organizational and institutional activities (Yusuf et al., 2018).

Eco-innovation compared to innovation requires more external sources of knowledge and information. Thanks to this, eco-innovations have a positive impact on the environment (Kammerer, 2009). Often the introduction of an eco-innovation policy can be seen as an introduction of environmental policy. Such policies can help reduce costs at the institutional and enterprise level and increase environmental efficiency (Rennings, 2000). Early research has shown that market demand, as well as scientific and

technological factors, are determinants of innovation (Mowery and Rosenberg, 1979). Currently, technological innovations are in high demand (Gontarz and Sulich, 2019; Yusuf et al., 2018).

According to many scientists, eco-innovations have the greatest impact on the energy sector (Leach et al., 2012; Popp, 2002; Wüstenhagen et al., 2007). Reports also emphasize the importance of implementing energy eco-innovations as "breakthrough energy technologies" with great innovation potential (Holliday, 2012).

Table 1: Innovations in energy technology examples

Solutions	Description and development forecasts
Public electric transport	Electric public transport has become a standard in many cities around the world. Although these eBuses have higher purchase prices due to upfront battery costs, their total cost of ownership is lower due to their independence from expensive diesel. They also eliminate local solid particles, including SOx, NOx and CO2, all major problems in most of today's cities.
Cheap energy storage	A new era of electric vehicles has rapidly expanded the lithium and cobalt battery market and drastically reduced its price. Industry and utilities are increasingly used as energy storage solutions. As battery prices fall sharply, they prove valuable to reduce energy costs, increase reliability and resilience, and make power systems more flexible.
Plastic recycling	The plastics industry is increasingly using a circular model that aims to eliminate waste in various sectors while providing economic, social and environmental benefits. The benefits are both economic and environmental, with a profit pool based on recycling estimated at 55 billion dollars for the next decade.
Solar energy available	Renewable energy is becoming cheaper and more available, it has serious consequences for almost 1 billion people around the world without access to electricity looking for renewable solutions such as solar energy to provide energy to millions quickly and cheaply. Innovative financing plans can make previously unavailable solar home systems an intelligent solution for communities that are too far from a reliable network connection.
Hydrogen in the energy transition	Hydrogen is projected to power over 400 million cars, 15 to 20 million buses and over 20 per cent of passenger ships and locomotives by 2050. Hydrogen fuel can help the world meet its goal of reducing carbon emissions by 60 per cent. Although the necessary technology exists today, the costs of hydrogen production must fall significantly, and the infrastructure that supports it needs growth. Hydrogen could facilitate a smarter use of other renewable energy sources by acting as a long-term solution for the transport and storage of electricity from renewable sources. It can be a key factor in the transition to energy.

The OECD report identifies ground-breaking eco-innovations from various industries (OECD, 2009). The authors point out the importance of comprehensive solutions consisting of individual eco-innovations, such as one of the earliest and best-known eco-industrial parks in Kalundborg in Denmark. As a result of the preparation process, eco-park developed gradually thanks to the cooperation of many neighbouring companies. The main participating companies are the coal-fired power plant (Asnæsværket), refinery (Statoil), pharmaceutical and industrial enzyme factory (Novo Nordisk and Novozymes), plasterboard factory (Gyproc), soil remediation company (AS Bioteknisk Jordrens) and the municipality of Kalundborg through municipal heating installation. This industrial cooperation has led to significant economic savings and reduced environmental impact (OECD, 2007).

Environmental Impact on Industry 4.0

Environmental problems such as air and water pollution and toxic waste disposal are common in all industrialized countries (Melchert, 2005). Research into the relationship between the environment and technology can be approached in many interdisciplinary ways. Many specialists in the field of social sciences also take part in these discussions, because the analysis of environmental changes mainly includes political and social causes (Tutaj et al., 2019). The extent of human intervention in the environment and its management are of particular importance since people are currently the main causes of environmental changes (Van den Bergh, 2001). The need to adapt care for the environment to social life was raised by research scientists, policymakers and consumers who change their consumption habits to more sustainable ones (Geels et al., 2016; Tutaj et al., 2019). In the 1990s, governments, businesses and consumers were increasingly worried about environmental protection, which accelerated social and environmental marketing research. However, research has been fragmented and needs to develop further (Saari et al., 2017).

The environment creates innovative needs. The needs result from the increase in population, urban development and growing energy consumption, and the main effects are deterioration of the environment, urban displacement and changes in urban infrastructure (Roosa, 2009). These needs can be met through sustainable integrated development between ET innovation-oriented business, authorities, society and the environment (OECD, 2009), and the use of technology as a tool to solve environmental problems (Pansera, 2016).

Fig. 2: The impact of the environment on innovations

Source: author own elaboration based on (OECD, 2009).

Technology companies are developing an eco-product for measurable business benefits (Yusuf et al., 2018). In general, customers do not have a natural need to buy eco products (Kearney, 2014). That is why companies must pay special attention to customer satisfaction and immediate needs towards their eco-product and gain a market advantage (Lin, 2019; Lin et al., 2014). Cost-saving also motivates companies to implement eco-innovation (Del Río and Linares, 2014). This can be achieved through an efficient process. However, saving must come later. The economic success of eco-innovation will be preceded by internal research and development and high investment intensity (Tarnawska, 2014).

Brand reputation and image enhancement also drive the implementation of eco-innovation (Ishak and Ahmad, 2011) or the implementation of the pro-ecological strategy (Macalik and Sulich, 2019).

Eco-innovations have a large social impact, whose mission is to promote organizational innovation and entrepreneurship and to provide solutions to social problems (Olsson and Galaz, 2011). An emerging eco-innovation society can be distinguished in which the knowledge triangle has been identified: Knowledge and Innovation Communities (KICs) (Constantinescu and Frone, 2014). These societies are in favour of the transition to ecological modernization of industrial societies through eco-innovation (Pansera, 2016). The factor that differentiates KICs from other research and innovation communities is the more traditional character, there is a clear link between all elements of the knowledge and innovation cycle, from education and new knowledge to market opportunities and support for innovative business (Constantinescu and Frone, 2014).

Governments and local authorities must take an active part in this eco-innovation process (Pansera, 2016). Pro-innovative legislation can contribute to this participation (Dillard, 2007). More and more initiatives of public-private partnerships are emerging regarding innovation as well as governmental and non-governmental partnerships (Lin, 2019). Such initiatives usually occur in sectors where initial capital is high, investments offering reimbursement are required, private funding initiative requires a wider risk-sharing option (Ministry of Foreign Affairs of the Netherlands, 2013).

Conclusions

Sustainable economic development includes, inter alia, promoting technological innovation. Particularly valuable are those that contribute to improving the environment. The basis for change is the mode of innovation (knowledge, science and research). Also, the attitude of the society conducive to eco-innovation conditions, as well as relevant political decisions regarding sustainable development, development and extension of the scope of economic opportunities for the technology industry. It is believed that technological innovation can provide added value through their role in global science, technology and innovation, but also in the delivery of public goods. It can also serve as a key factor in increasing the prosperity and competitiveness of the country.

Abstract

At present the issue of involving students in research and development activities is topical for every university. It is noted that mentoring is a well-known method of professional formation and development both for workers and specialists. In recent years it has also become applied in the system of student self-government: senior students help junior students. At the same time, even well-proven forms of work need to be updated and modernized. In this connection, a form of reverse student mentoring has been proposed for application: its essence and features have been revealed. The method of organization of this form of student mentoring is presented, each of the four stages of the method is revealed. The necessity of using the matrix of identifying potential mentors, which is based on two bases: the level of competence and motivation, is justified. The necessity to consider the competences for each particular type of research work is especially noted, since one type of work can be very well mastered by students, while the other cannot. An experiment was conducted in which 2-4 year students took part. The objective data obtained after a year of purposeful work allowed to ascertain the improvement of the number of research works of students, their quality, as well as the increase of interest and involvement of students in the scientific sphere.

Keywords: Mentoring, Student Mentoring, Reverse Student Mentoring

Introduction

Education in higher school is an important stage on the way of formation and development of a qualified specialist, a professional of his business. Changes in the world are also responsible for changes in higher education. For a long time, we lived in the world of "SPOD" (Steady, Predictable, Ordinary, Definite), in which universities have accumulated a giant psychological and pedagogical experience for effective education of students. Now our world is the world of Volatility, Uncertainty, Complexity, Ambiguity. And the pedagogical community of higher schools has to develop new models of education, to update the existing methods and forms of work. At present, the model 1.0 is still used in practice, which is a classic model (a teacher broadcasts information and students have to remember it by turning it into their knowledge). At the same time, model 2.0, which is a group work

on case technology, is intensively used. However, teachers are tasked with the transition to Model 3.0, according to which each student should have an educational route that outlines individual goals and selects the best ways to control their achievement. In a group learning environment, this is not easy, but possible.

Each higher education institution has student communities working in different areas: leisure, sports and physical education, tourism, creativity, meetings with interesting people, scientific conferences, volunteer work, master classes, etc. With such an intensity of collective work, many students would like to have the opportunity for personal, individual communication with more experienced people in matters of interest to them.

Student mentoring in this context can become a promising learning technology that will allow students to transfer special knowledge acquired by their peers in practice, to form new skills on the principle of "do like me", as well as create a basis for inter-departmental project teams.
Certain work is being done in this direction:

1) A curatorial institute has been creat
ed, which involves communication between senior curators and junior students. Experience shows that such communication is mainly related to general issues of life activities in the university;
2) A national project My-mentor.ru is being implemented, which expands the boundaries of its presence every year. However, this project is aimed at the development of capable, interested students, and quite a significant part of students (less active and motivated) remains outside its boundaries. This is not a minus of the project, this is the reality of competition in our world, which is also characteristic of the student environment;
3) The All-Russian School of Student Self-Government "Leader of the 21st Century" is held, including a competitive nomination "The best system of student mentoring".
However, the mentoring system itself does not change and, in our opinion, it does not always yield the expected results. Therefore, it is necessary to look for new forms of its construction.
One of the most difficult, but very important, areas of training of future specialists is the research activities of students. This activity is manifested in educational and extra-curricular research work. Academic research work is related to the subjects studied, where term papers, laboratory papers, academic projects and diploma theses are written. The extra-curricular research work of students is, as a rule, related to the scientific interests of the didactic staff or to the department scientific subject. As part of such work, students prepare reports, write essays and articles, and carry out project work commissioned by enterprises.

The tendency to involve all students in research work exacerbates the problem of teachers' time constraints, as it is in research work that personal meetings and consultations with an experienced mentor are so important for students. We believe that the establishment of a reverse mentoring system in the university environment will alleviate this problem.

The aim of the study – to develop and justify the feasibility of applying reverse student mentoring in the scientific field.

Objectives of the study:

1) to determine the types of students to choose a mentor;
2) to develop a methodology for determining a mentor;
3) to conduct experimental work;
4) to evaluate the success of applying reverse student mentoring in research activities of students.

Literature Review

The concept of "mentor" (from Greek: Μέντωρ: Men - "he who thinks", "tor" is a suffix for the male sex) *(Klein, 1967)* came to us from Homer's "Odyssey". The mentor was a friend of the Odyssey who was the tutor and guardian of his son, Telemah. The idea of mentoring as the transfer of experience to others was also present in the works of philosophers of ancient Greece. Thus, Socrates set the task of educating and awakening in the ward spiritual forces, conscious acceptance of the values of society. At the same time, an elderly man could be a mentor in this matter *(Maxwell and Runnette, 2014)*.

The modern use of the term "mentor" is associated with the book by Francois Fenelon "Les Adventures de Telemaque" (1699), which noted the importance of professionalism and experience of the mentor, while noting the importance of transferring the necessary skills to the ward.

Later on, mentoring was widely used at production enterprises, in which Russia was the first. The system of mentoring, didactically verified and justified, was created in the Moscow Technical School and gained international recognition in the late 19th century in Austria, France and the USA *(Fomin, 2013)*.

In Soviet times, mentoring was supported and encouraged by the state: "Youth Mentor" badges of honour were introduced (1975) and "Honoured Mentor of Youth of the RSFSR" (1981).

Scientists also paid much attention to the phenomenon of mentoring: in Russia it is Soya. Batiste *(Batyshev, 1985)*, V.A. Mitrofanov *(Mitrofanov, 2016)*, V.V. Nikitina *(Nikitina, 2013)*, A.R. Masalimova *(Masalimova, 2012)* and others. Abroad, such work was conducted by: G. Lewis *(Lewis, 1998)*, L. Gareth *(Gareth, 2002)*, J. T. Bennett *(Tepper, 1995)*, G. Crisp *(Crisp and Cruz, 2009)*, R. Collings *(Collings, Swanson and Watkins, 2014)*, B. Leidenfrost *(Leidenfrost et al., 2014)*, and others.

The analysis of the works of the above mentioned authors made it possible to state that the concept of "mentoring" is constantly evolving in its substantive aspect, and let us cite several fragments of the definitions offered by scientists:

– a set of useful behavioral methods *(Brod, p. 58, 2005)*;

– the complex of measures promoting professional formation *(Bevz, p. 10, 2011)*;

– social institute that transfers social experience *(Zolotareva, p.10, 2012);*

– "health of organization", investments in its long-term development *(Maister, 2014)*;

– the system of relations and a number of processes when one person helps, guides or supports another person *(Lewis, 1998)*.

In general, the definitions made by the authors do not contradict each other, they only reflect the specifics of mentoring application in a particular industry.

We were interested in the question of scientists' vision of the mentor. It should be noted that there have been no evolutionary changes in this issue. All authors note that the mentor is:

– an older person *(Bevz, 2011), (Brod, 2005), (Masalimova, 2012), (Mitrofanov, 2016), (Nikitina, 2013), (Zolotareva, 2012);*

– a more experienced person in solving a certain problem *(Bevz, 2011), (Brod, 2005), (Lewis, 1998), (Tepper, 1995), (Mitrofanov, 2016), (Nikitina, 2013), (Zolotareva, 2012).*

At the same time, the observations of D.D. Clutterbuck, who recorded the existence of two mentoring models: European and North American, are interesting for our study *(Clutterbuck, 2002)*.

The European model - "Developmental mentoring" - is based on the fact that the mentor is more experienced in the relevant issues, and he builds partnership, equal relations with his wards. The mentor can apply different forms of interaction: coaching, tutorship, facilitation, and others.

The North American model - "Sponsoring goring" - is based on the fact that the mentor is a more status person, giving some patronage to his protégé. In this case, the direct leader is the mentor of his subordinate, and a one-sided training takes place, based on the unquestioned submission to the authority and power that the mentor has *(Clutterbuck, 2002)*.

For the organization of student mentoring it is more appropriate to use the European model, as it fully corresponds to the partnership between students, the possibility of learning from each other.

Methods

The proposed author's methodology consists of 4 stages. We will describe each of them.

The first - propaedeutical - stage is organized with the aim of promoting student mentoring, increasing students' confidence in their scientific strength and capabilities. Its recommended duration is 1-3 months, depending on the interest of students. The activities of this stage are as follows:

– lecture on "History of student mentoring in Russia and abroad";
– a business game "I am a mentor";
– quest-like game "What kind of mentor do you need?";
– seminar "Research work of students at the university: requirements, organization and probable problems";
– the "Let's Help Each Other" conversation-dispute;
– individual conversations (on request of students);
– information meeting on "Student Mentoring System".

The result of this stage is students' interest in the system of interaction in the form of mentoring.
The second - diagnostic - stage is held to assess and self-evaluate students' potential in research activities. For this work it is necessary to prepare handouts, which include:

1) questionnaire for recording the existing experience in conducting research activities (including school years), the results achieved and the desire to do such work in the future;
2) a SWOT-analysis form on the possibilities of scientific and research activities. This analysis allows students to assess their strengths and weaknesses in the field of science, as well as to show their views on the opportunities for continuation / beginning of such work, available at university, in addition, students can express their fears or doubts about the success of research activities.

Then, the competence tables are compiled in cooperation with the supervisor. Their number is determined by the student's area of interest, in other words, by the number of research areas in which the student has previously worked. If we evaluate the school years, the diversity of scientific interests can be found in most cases. The competence tables include the information on the available experience of each type of scientific research and development work of students: report, essay, presentation, message, article, essay, term paper, project, preprint, etc.

On the basis of all diagnostic procedures, consolidated matrices for scientific direction (corresponding to students' training) are compiled. The experience of such work has shown the expediency of compiling the matrix on two grounds: the level of competence and motivation for this type of activity (Fig 1).

Fig. 1: Consolidated matrix for scientific direction
(Source: compiled by the authors)

And each student is determined by his or her location in the matrix for each type of research work. For example, a student has prepared reports many times and his competence in this type of research work is high, but the student has never written an article, so his competence in this type of research work is low.

The third - activity - stage implies direct mentoring of a more experienced student (in a certain type of research work) over a less experienced one. Since each student appears to be both experienced in

some type of research work and inexperienced in another type of work, it is easy to select "paired students". By "paired students" we roughly refer to students who have mirror competences. For example, one is competent in making a presentation - the second is not; the second is competent in writing an essay and the first is not. In this case, their cooperation in research works is obvious: one of them helps and teaches to make good presentations, and the second one teaches the rules of essay writing. This is the essence of reverse mentoring.

The fourth - analytic-corrective - stage includes the assessment of the success of student mentoring and, if necessary, the construction of new pairs of students to master other types of research and development work.

Results

Testing of the described method was carried out on the students of the direction "Personnel management" two years (2017-2018 and 2018-2019 academic years). In total, it was attended by72 people studying in the 2nd-4th years.

It was unexpected for us that positive changes occurred among both students and mentors. We see the explanation for this in the fact that each student was both a trainee in one type of research work and a mentor in another. The changes are graphically presented in a table where we have recorded the behaviour of students as mentors in both academic research and extracurricular activities as well as the behaviour of students when they were students (mentors) in both academic and extracurricular activities. For convenience, the percentages received are presented in rounded form.

Table 1: changes in student behaviour one year after participating in student reverse mentoring (%)

№	Changes in student behaviour	Trainees (Guided)		Mentors	
		before	after	before	after
Educational research activity of students					
1	Compliance with deadlines	69	98	72	100
2	Quality of work	54	72	66	79
3	Performing tasks "as desired"	12	28	15	32
4	Acquaintance with scientific issues at thematic webinars	5	18	7	22
Extra-curricular research activity of students					
1	Preparation of report for conference	37	59	40	62
2	Preparation of scientific article	18	25	12	22
3	Participation in various conferences (listeners)	54	59	55	65
4	Participation in scientific seminars	5	19	9	22
5	Participation in scientific webinars	9	22	7	19

(Source: compiled by the authors)

If we compare the data, on average the application of student reverse mentoring in the educational process of higher education allowed:

a) to improve the performance discipline of students, in terms of compliance with deadlines and delivery of works by 28.5 per cent;
b) to increase the quality of performed research works by 15.5%;
c) to increase the interest of students in execution of additional works in the format "at will" by 16.5%;
d) participation in thematic webinars increased by 14%;
e) increased the number of reports prepared for student conferences by 22%;

f) a slight increase in the number of scientific articles written by students (8.5%);
g) students participated in various conferences with great interest, although the total number of participants increased by only 7.5 per cent;
h) there was a 13.5 per cent increase in involvement in scientific seminars;
i) participation in scientific webinars increased by 12.5 per cent.

Conclusions

Many universities have a student mentoring institute. The essence of it is that senior students organize and conduct trainings, thematic evenings, seminars, round tables with junior students. The benefits are mutual: senior students gain organizational, pedagogical and communicative experience, while junior students gain new competences or develop existing ones. However, the existing system can and should be updated with new forms of mentoring.

1. It was proposed to use reverse mentoring as a promising form of activating student research work.
2. The essence of reverse mentoring was revealed in the form of several statements:
– the mentor is selected for the task on two grounds: competence and motivation;
– the competence of the future mentor is determined by his successful experience in such tasks;
– the motivation of the future mentor is determined through conversation and personal observation;
– the mentor can be a student of any course and of any age, including the ones younger by age and from a junior course.
3. A reverse mentoring methodology has been developed consisting of four interrelated stages.
4. A matrix for determining students' readiness to be mentors has been made on two grounds - the availability of competence for the relevant research task and the available motivation.
5. It has been experimentally proved that the organization of the system of students' reverse mentoring at the university allows solving several tasks: activation of students' scientific research, stimulation of interests to modern scientific problems, involving students into the system of scientific exchange of opinions, involving them into the project work, development of business communication skills, etc.
6. Further research on the influence of reverse student mentoring on the training of modern specialists can be devoted to the formation of inter-departmental project teams, as well as the participation of such teams in the performance of contractual work with industrial enterprises.

Abstract

Cardiovascular diseases are one of the most common health and life threats in the human population. In the case of a patient with arrhythmias in the form of heart blocks, doctors implant a pacemaker. However, permanent electrostimulation is an important contraindication to many medical procedures - in particular, the Magnetic Resonance Imaging (MRI). The purpose of the article is to understand the mechanisms of cooperation in the field of magnetic resonance imaging between different elements of the inter-organizational network in the case of patients with pacemakers. The article presents the results of the author's survey among diagnostic units in Poland. Besides, the difficulties faced by patients with pacemakers are discussed, as well as the reasons for refusing magnetic resonance imaging procedures for these patients. The main finding of this paper is that there is no specified mechanism inter-organizational cooperation in any case which can be implemented in specific medical situations, although interactions between hospitals are extremely important nowadays.

Keywords: Hospital Units' Cooperation, Inter-Organizational Network, Network Performance

Introduction

There are two types of network structures: internal networks and inter-organizational networks (Niemczyk et al., 2012). The second network type refers to the concept of outsourcing and is considered rational in the case of enterprises or organizations, not only in the medical sector. Cooperation between organizations or between different units of different entities (it is assumed that units of the same organization work together in harmony, otherwise it is not one organization) is caused by the high variability of implemented processes. This is can be a result from the client's increased emphasis on change, innovation and creativity, knowledge creation and experience sharing, or dynamization of business model systems, combined with blurring organizational boundaries (Sus et al., 2019). Principles of building a process approach and related challenges are widely described in management sciences and do not cause major implementation problems in enterprises or organizations in the medical sector (Demir and Mukhlis, 2017; Fiałkowska-Filipek, 2019; Sus, 2019). These principles and mechanisms of cooperation can be more visible if the specific hospital departments or medical processes are investigated (Sus et al., 2019). On the other hand, specific health problems diagnostics like common obesity, heart-related diseases or cancer,

which are sometimes compared to the epidemics (Heymann and Shindo, 2020), and their treatments can be recognized as a set of medical processes (procedures) based on the cooperation multiple units of the same or different medical organization (clinic, hospital). A business process is a combined set of activities in an enterprise, along with a description of their logic, creating order and dependency (Bojewska, 2015, p. 34), the goal of which is to achieve the desired result, focused on building value for both the client or patient and the organization (Sus and Organa, 2020; Wawrzynek, 2019). In the case of hospitals involved in specific procedures dedicated to patients with pacemakers, medical processes (business processes) consist of plenty of elements related to the physics and mechanics issues. This specific sector requires then attention from all kinds of science, to solve serious and urgent problems, which needs to come up with an adequate and fast response.

The purpose of the article is to check if there is a mechanism of cooperation in the field of Magnetic Resonance Imaging (MRI) between different elements of the inter-organizational network. In the first part of the article, the definition of the inter-organizational network in the medical sector is presented. Then a chosen physical phenomenon revealing the nature of the Magnetic Resonance Imaging are introduced together with the medical procedure description. In the third part of this study, the results of the survey dedicated to the cooperation mechanisms between hospitals or their units dedicated to patient diagnostics and control are presented. In this paper, some limitations related to the difficulties faced by patients with pacemakers are discussed.

Inter-organizational Network

"The inter-organizational network, as it happens in every initial stage of development of the next paradigm, is a not fully defined concept. Authors writing about networks adopt such different viewing perspectives, it is difficult to state unequivocally whether everyone is writing about the same" (Niemczyk et al., 2012, p. 9). Inter-organizational networks emerged form autonomous units (enterprises) joined together to create coherent, sustainable and well-functioning business communities (Zema and Sulich, 2019a). It is in the networks located in the organization that one can look for opportunities to improve business processes, especially by identifying patterns of relationship systems and roles performed by individual organizations involved in processes, and then taking actions to shape network relationships analogously to the selected patterns (Daszyńska-Żygadło and Ryszawska, 2015; Wawrzynek, 2019). Then the cooperation patterns from internal perspective are transposed into cooperation in the external business environment.

Social networks, of interest to modern scientists, exist both at the organizational level and between organizations (Wawrzynek, 2019). Inter-organizational networks in the medical sector are created in search of organizational perfection and medical process excellence, which is focused on issues related to organizational resources and coordination of activities. Both indicated elements - organizational resources and coordination of cooperation - are part of the network approach to organizational analysis. This approach refers to observed trends in scientific research on the organization, its complexity and specific mode of operation, and is increasingly becoming the subject of research (Niemczyk and Stańczyk-Hugiet, 2014). Network research helps explain the essence of business phenomena, from organizational creativity to corporate profitability and risk analysis in a business environment (Kulhanek and Sulich, 2018). The increase in the number of studies and research areas related to the idea or definitions of the network, unfortunately, brings a great variety of use of this concept in research theory and practice (Wawrzynek, 2019). The challenge for both researchers and apprentices is the multidimensionality of understanding and ambiguity of the concept of network. In this paper, we assume that there are several approaches to a network organization that allow us to introduce our definition of an inter-organizational network and therefore a network organization. We assume the existence of a deliberately selected, durable and structured set of autonomous entities (hospitals are independent) involved in the creation of

goods and services, which is based on default and indefinite agreement (patient's wellbeing and health), ensuring flexible adaptation to changes in the environment and using coordination and protection mechanisms exchange transactions (the healthcare system is subject to many regulations and agreements).

Referring to the theory describing the operation of the organization, as well as looking at the activity of medical sector companies in a more pragmatic way, it can be assumed that today all areas of the organization contain references to the network and in its context, networks are or can be analyzed (Kulhanek and Sulich, 2018; Organa, 2018). Organizations create various types of networks and operate within them (Sus and Organa, 2020). In this sense, a modern organization is not isolated from surrounding entities (Stańczyk-Hugiet, 2012). Organizations are creating networks based on external and internal cooperation and based on relational relationships (Rashid, 2020; Zema and Sulich, 2019b). Organizations communicate via network-connected devices, and business processes, such as those in purchasing or sales, are often implemented through a variety of network connections (Niemczyk, 2011; Wawrzynek, 2019). Medical organizations and hospitals are characterized by the fact that they are particularly related because each of their activities results in influencing other elements.

The networking relationships found in medical sector organizations are so important that they form an integrated business structure - both strategic and operational (Wawrzynek, 2019) - of current businesses, and the perspective of the network affects business architecture (Sus, 2019; Sus et al., 2019). Not all activities of the organization are part of the inter-organizational network, however, it can be considered that the network serves to improve medical processes.

Adopting a broader approach to defining inter-organizational networks allows these networks to be defined as a mechanism for regulating relationships between companies that differs from both hierarchy-based coordination and market-based coordination (Stańczyk-Hugiet, 2012). According to this approach, networks can be distinguished based on 1) quasi-integration processes, assuming no control over the ownership of the process while maintaining control over the entity's assets; 2) using elements of cooperation based on a new production organization. It should be emphasized that the analysis of the organizational and management features of network structures is carried out in a narrow approach to individual scientific disciplines: economics, sociology of organizations and computer science or econophysics.

Characteristics of the Healthcare System in Poland

Many terms are referring to the “medical system” or “medical inter-organizational network”, the most popular are two: the health system and the healthcare system (Fiałkowska-Filipek, 2019). In the literature on the subject, these concepts are often used equally and refer to an inter-organizational network (Niemczyk and Stańczyk-Hugiet, 2011). Such a system is defined as a system of mutually coupled elements showing a specific structure, fulfilling a specific function and treated as separated from the environment for a specific purpose - health protection (Flieger, 2016; Klimas, 2014).

The primary purpose of the health care system is to provide medical services in response to specific health needs. This goal is implemented by, among others (Fiałkowska-Filipek, 2019):

1. ensuring access to the full range of medical/health services possible, resulting from the actual health needs of individual patients, circular populations and the whole of society;
2. ensuring the highest possible quality of health services, adequate to the state-of-the-art medical knowledge, respecting the dignity of patients and caregivers,

3. organizing healthcare in the best possible way, rationally using resources, including infrastructure and staff, so that it is effective and efficient;
4. systematic implementation of improvement actions.

Health care can be distinguished (Fiałkowska-Filipek, 2019) in two terms: a) the place of providing health services (outpatient/open and stationary/closed), b) the scope of health services (basic and specialist) and delivery time (short-term and long-term). Services are provided by directly or indirectly related healthcare organizations of so-called healthcare providers (Parkitna and Gądek, 2020). The service provider can be, for example, a hospital, a clinic, a nursing house, and care institution, or group practice of medical professionals (Figure 1). Health care organizations are also called medical facilities, health care facilities or medical entities (Fiałkowska-Filipek, 2019).

Medical Processes Related to Diagnostics of Patients with Pacemakers

One of the challenges of modern medicine is detecting lesions at an early stage of disease development. In this regard, the methods used during MRI imaging can meet the high requirements of diagnosticians and patients. “MRI (magnetic resonance imaging) is a noninvasive diagnostic test that takes detailed images of the soft tissues of the body. Unlike X-rays or CT, images are created by using a magnetic field, radio waves, and a computer. It allows your doctor to view your spine or brain in slices as if it were sliced layer-by-layer and a picture taken of each layer. This test can help diagnose tumors, strokes, and disc herniations” (Mayfield Brain & Spine, 2018).

An MRI scan works by using a powerful magnet, radio waves, and a computer to create detailed images. The human body is 80% water, then is made up of millions of hydrogen atoms, which are magnetic. When patients’ body is placed in the magnetic field, these atoms align with the field, much like compass points to the North Pole. A radio wave "knocks down" the atoms and disrupts their polarity. The sensor detects the time it takes for the atoms to return to their original alignment. In essence, MRI measures the water content (or fluid characteristics) of different tissues, which is processed by the computer to create a black and white image. The image is highly detailed and can

show even the smallest abnormality (Mayfield Brain & Spine, 2018). Similar to CT, MRI allows the doctor to see a patient's body in narrow layers, each about one-quarter of an inch thick. It is possible to view layers from the bottom (axial), front (coronal), or sides (sagittal), depending on what your doctor needs to see. A dye (contrast agent) may be injected into a patient's bloodstream to enhance certain tissues. The dye contains gadolinium, which has magnetic properties. It circulates through the blood stream and is absorbed in certain tissues, which then stand out on the scan. MR angiogram (MRA). MRI can be used to view arteries and veins. Standard MRI can't see fluid that is moving, such as blood in an artery, and this creates "flow voids" that appear as black holes on the image. Contrast dye (gadolinium) injected into the bloodstream helps the computer "see" the arteries and veins. Contrast is also used to view tumours and arteriovenous malformations (AVMs).

MRI is very safe, and there are no known health risks associated with the magnetic field or the radio waves used by the machine. Some people are sensitive to the contrast agent and may develop an allergic reaction. All contrast agents are FDA-approved and safe (Mayfield Brain & Spine, 2018). The patient is questioned if has diabetes or kidney problems. In some cases, a kidney function test may be needed before the MRI to make sure that the kidneys can clear the contrast agent from the patients' body. Some special circumstances limit the use of a magnetic field, so the patient needs to tell the doctor if any of the following apply:

- cardiac pacemaker or artificial heart valve;
- metal plate, pin, or other metallic implants;
- piercings (particularly body piercing);
- an intrauterine device, such as Copper-7 IUD;
- insulin or other drug pumps;
- aneurysm clips;
- previous gunshot wound;
- a cochlear implant or other hearing devices;
- employment history as a metalworker (had metal in the eye);
- permanent (tattoo) eye-liner;

Any metallic substance on the patient's body can affect the quality of the images. It can also cause discomfort or injury to patients when placed in the magnetic field and may exclude the patient from the exam.

A patient with a pacemaker who has a referral for an MRI following the recommendations of the Polish national radiology and imaging consultant should report to a cardiological consultation in the electrophysiology laboratory. The purpose of the consultation is to determine the safety profile of the pacemaker model during the test, e.g. having a CE safety certificate, setting for the duration of the SureScane test (if available) and the possible need for cardiological supervision. During the examination, the patient connects to the ECG device to monitor the heart rhythm and respond in the event of cardiovascular events. After the examination, the electrophysiologist inspects the device and restores the starter settings before the examination. After three months, the patient should report to an electrophysiology clinic for pacemaker control.

Artificial Pacemaker

A cardiac pacemaker (or artificial pacemaker, so as not to be confused with the natural pacemaker of the heart), is a medical device that generates electrical impulses delivered by electrodes to cause the heart muscle chambers (the upper, or atria and/or the lower, or ventricles) to contract and therefore pump blood. By doing so this device replaces and/or regulates the function of the electrical conduction system of the heart.

The primary purpose of a pacemaker is to maintain an adequate heart rate, either because the heart's natural pacemaker is not fast enough, or because there is a block in the heart's electrical conduction system. Modern pacemakers are externally programmable and allow a cardiologist, particularly a cardiac electrophysiologist to select the optimum pacing modes for individual patients. The specific type of pacemaker called defibrillator combines pacemaker and defibrillator functions in a single implantable device, which should be called the only defibrillator, for clarity. Others, called biventricular pacemakers have multiple electrodes stimulating differing positions within the lower heart chambers to improve synchronization of the ventricles, the lower chambers of the heart.

Difficulties Faced by Patients with Pacemakers

A patient's lifestyle is usually not modified to any great degree after the insertion of a pacemaker. There are a few activities that are unwise such as full contact sports and activities that involve intense magnetic fields (Hrynkiewicz and Rokita, 2013). The pacemaker patient may find that some types of everyday actions need to be modified. For instance, the shoulder harness of a vehicle seatbelt may be uncomfortable if the harness should fall across the pacemaker insertion site.

Any kind of activity that involves intense electromagnetic fields should be avoided. This includes activities such as arc welding possibly, with certain types of equipment, or maintaining heavy equipment that may generate intense magnetic fields (such as a magnetic resonance imaging (MRI) machine).

If this type of examination is provided to people with pacemakers, it is necessary to reliably document (in writing) what type of pacemaker / cardioverter / defibrillator has been implanted in the patient. This obligation lies with the referring physician and the patient. In addition, it is advisable that the magnetic resonance imaging should take place after cardiological consultation in the Laboratory of Electrophysiology cooperating with the Laboratory of MR. The purpose of the consultation is to determine whether the pacemaker allows magnetic resonance imaging and, if so, what the testing conditions are. First of all, it should be taken into account: should the implanted device mode be switched before magnetic resonance imaging and whether and in what mode the patient should report to the Electrophysiology Laboratory to restore the correct starter mode, and whether the presence of a cardiologist in the MR Laboratory is required during research. It should be noted that performing magnetic resonance imaging without consultation in the Laboratory of Electrophysiology may conditionally take place if the patient presents substantive documentation (confirmed in writing by the referring physician) clearly describing the admissibility and possible limitations as to the methodology of examining the MR examination.

Survey Construction and Results

Hospitals with varying degrees of reference an important factor that distinguishes individual facilities is the degree of reference of a given ward, i.e. the degree of specialized ward, and thus the possibility of providing care depending on the patient's condition. Patients with no complications and no major pathology are examined and treated in hospitals with the first degree of referentiality. Usually these are municipal and district hospitals. Hospitals with the second degree of reference are usually voivodship hospitals. In such units there is a specialized intensive care unit. Hospitals of the third degree of reference are clinical hospitals of state medical universities or state universities conducting educational and research activities in the field of medical sciences.

In addition to the so-called survey metrics, in which managers of medical units determined the level of reference, type (public, non-public) and basic data (voivodship, specialization), the survey examined the examination procedures, and the reasons for refusals of the MRI examination.

The 38 hospitals took part in the study, which number allow to just draw very careful proposition of cooperation mechanisms. 75% of surveyed organizations are public hospitals. Half of the surveyed units (50%) perform magnetic resonance imaging in patients with an implanted pacemaker. All surveyed hospitals have procedures to perform the MRI examination. However, only 50% of units know the procedure for dealing with patients with pacemaker. All organizations stated that there is a cooperation between the MR Laboratory and the Stimulator Control Clinic or the Cardiology Department. The unit carries out: Implantation of Pacemakers Heart (75% response) and Stimulator Control Outpatient Clinic Heart (25% response).

None of the 38 hospitals conduct an MRI examination in the presence of a cardiologist, and the radiologist is qualified for the examination, however, consultation and control of the pacemaker before the examination is required. In 50% of cases such control is performed in a cardiac pacemaker outpatient clinic. There is no information provided to patients whom examination was denied, because as survey presented there is no information exchanged between hospitals and there is no cooperation in this field.

Conclusions

Over the past months and years, the concept of integrated and networked activity has become one of the symbols of global changes in hospital management processes and processes that go beyond their walls. The essence of network structures and inter-organizational networks is reduced to departing from multi-level hierarchy structures and replacing them by clusters, or by specialized business units of hospitals in which market coordination mechanisms are used instead of coordination mechanisms by hierarchy.

When making an overall assessment of the concept of network structures in the medical sector, several conclusions can be made. First, using the concept of strategic networks of modern organizations (hospitals and clinics). Secondly, attempts to conceptualize strategic aspects of the network should be considered significant but considered through the prism of individual disciplines. The development of the network approach needs to combine, in the analysis of network structures, and organizational and economic approach with the rationality of process (procedural) activity. The rationality of the functioning of medicinal entities in the health care system should be the primary goal of all its participants. A well-functioning system and inter-organizational network affect the level of health security of citizens, creates the opportunity to carry out work, increases the desire and need to invest in the future. That is why a well-organized and open to all challenges medical entity is so important. Equally important is the cooperation of many medical entities to provide a specific service (examination, surgery, etc.).

Abstract

Sustainability development is considered to have a multidimensional perspective that results in the linkage of scientific knowledge to meet current and future basic needs. Integration between environmental, social, and economic aspects becomes a unity in terms of sustainable development. Agricultural activities are closely related to the three aspects that become sustainable development perspectives. The knowledge of agricultural actors becomes a social input that will directly influence the security of the environment. This research was conducted using qualitative methods with a focus on the share of agricultural actors and the government to support sustainable agriculture by receiving biopesticides. The research data were obtained through in-depth interviews and literature studies as supporting research results. The results of this study indicate that the contribution of agricultural actors and the government is essential in creating sustainable agriculture. Counseling conducted by the government becomes a provision of knowledge for agricultural actors as supporters in carrying out agricultural activities with an emphasis on environmental security. Acceptance of biopesticides by agricultural actors through counseling and training mentioned takes 3 to 4 months. Thus, agrarian activities began to prioritize environmental protection towards sustainable agriculture. This shows that to realize sustainable agriculture, agricultural actors and the government are key actors who play a role in maintaining the stability of environmental and food security.

Keywords: agriculture actors; government; knowledge; sustainable agriculture.

Introduction

Sustainability has been closely related to the theory presented by Miller & Spoolman (2010) to be able to meet the basic needs of the present and the future with community resources that are fair and just without having to sacrifice the ability of future generations. In the context of research, sustainable development is understood as a process of producing scientific knowledge that has a relationship with how to overcome the challenges of sustainability in the real world from concrete problems (Wuelser and Pohl, 2016). Thus, sustainable development is considered to have a multidimensional perspective, namely environmental, economic, and social aspects (Wichaisri and Sopadang, 2018).

Agricultural activities become one of the main topics closely related to sustainable development because balancing current and future needs depends on agricultural production (Mwalupaso *et al.,* 2019). The need for increased resilience of the production system to biotics and abiotic requirements to be considered in environmental aspects. However, to date, the intensification of agriculture in land-based production systems has experienced a degradation of land resources, which has caused productivity to decline (Kassam *et al.*, 2015). This causes the process carried out in agricultural activities to be directed towards sustainable results by combining and intervening from the government, markets, and civil society (Erbaugh *et al.*, 2019).

Generally, agricultural activities cannot be separated from the use of pesticides as a way to prevent and control crop losses due to damage to agricultural production caused by crop pests (Damalas and Koutroubas, 2016). Pesticide dependence on agricultural activities will cause an increase in the dose and frequency of pesticide use. Thus, pest resistance and damage to natural enemies of the environment will be even higher (Popp *et al*., 2013). Besides, intensive use of pesticides will cause ecological disturbances in the form of pesticide residues in the food chain such as fruits, vegetables, milk, dairy products, fish, poultry, and water (Sawant *et al*., 2018).

Farmers' knowledge and perceptions about the risks of using pesticides are a significant problem regarding sustainable behavior with pesticides (Petrescu-Mag *et al*., 2019). Understanding of agricultural actors is needed to achieve sustainable agriculture. However, several studies have shown that farmers in Indonesia still have a lack of knowledge. Several research results prove this based on research Minaka, *et al.* (2016) farmers who have worked more than ten years, 78.2% of farmers use pesticides that are not in accordance with the recommendations contained in the packaging. This will put farmers at risk of being exposed to pesticides, which has an impact on health. In addition, excessive use of pesticides will contribute to the pollution of non-agricultural sources in rivers that will flow from one point to the point of flow throughout the world. If this happens sustainably, it can paralyze drinking water resources and aquatic ecosystems (Jiao *et al.*, 2020).

One alternative to reduce environmental damage due to the use of pesticides in agricultural activities is to use biopesticides (Neshani *et al.*, 2019). Biopesticides provide options to traditional chemicals used in plant protection systems (Pavela and Benelli, 2016). Biopesticides are safer for plants and the environment because they do not leave harmful residues and can be made using natural ingredients (Agus *et al*., 2016). Thus, the use of biopesticides can reduce greenhouse gas emissions. The essence of sustainable agriculture is actually a specialization of engineering and natural sciences and agricultural science (Velten *et al.*, 2015). Sustainable agriculture is based on the concept of organic agriculture, which is agriculture that considers the efficient use of local resources and the use of technology that considers soil fertility, nutrition cycle, and pest control in a natural way (Willer and Yussefi, 2006) — making biopesticides an essential role in providing a picture of sustainable agriculture, including environmental security (Keswani *et al.,* 2019).

Farmers need the training to improve their knowledge of environmentally friendly agriculture. According to Hsu and Lin, people with more advanced levels of experience about carbon reduction have stronger environmental awareness, and this means that farmers' knowledge about the environment needs to be increased (Hsu and Lin, 2015) so that sustainable agriculture can work. To place agriculture in the perspective of sustainable development requires thorough thinking in agricultural orientation. Therefore, it is necessary to have information about the benefits of biopesticides in terms of environmental, economic, and social. Counseling in the form of knowledge about the impact of pesticides and perceptions about biopesticides for agricultural activities is crucial as a basic knowledge of agricultural activities. Knowledge and perception will influence the behavior to choose and apply it to farm activities (Lamichhane, 2017).

The government has a role in terms of knowledge for agricultural actors utilizing agricultural extension. Agricultural extension has a relationship with technical problems in the field and also has a position as a supporter of the social life of the community. Policies issued by the Government of Indonesia based on the Law of the Republic of Indonesia Number 16; 2006 agricultural extension is defined as a learning process for the main actors and business actors so that they are willing and able to help and organize themselves in accessing market information, technology, capital, and other resources, as an effort to increase productivity, business efficiency, income, welfare, and raise awareness in the preservation of environmental functions. This means counseling has a stake in helping agricultural development because this activity is in direct contact with the community, which has the purpose of delivering relevant information to farmers (Vintarno, Sugandi and Adiwisastra, 2019).

Provisioning to farmers with counseling can be said to have a contribution to maintain the quality of production and consumption. This is evident from the results of observations on agricultural activities in Cakung District, East Jakarta, using biopesticides taught by the government. The knowledge provided by the government is one of how agricultural practitioners receive biopesticides. This practice is one of the main concerns in the SDGs associated with the health sector (Pradyumna, 2018). Government support is one of the key factors in the formation and development of an innovation network that connects private components and the public. Thus, they not only focus on capital for development but to produce competitive advantage (Dodgson *et al.*, 2008). From here, the knowledgeable generation will be oriented towards understanding social phenomena to respond to environmental changes (Barragán-Ocaña and del-Valle-Rivera, 2016). The knowledge capital provided will synergize with sustainable agriculture to form a food security system.

Methods

The research method used in this study is a qualitative method with a focus on the contribution of agricultural actors and the government to support sustainable agriculture by receiving biopesticides. This research involved agricultural actors in the District of Cakung, East Jakarta, and the Government in charge of agriculture. Cakung Subdistrict was chosen as the research location because, at this location, the farmer groups were actively formed and used biopesticides in agricultural activities. Research data collection techniques carried out by in-depth interviews with selected informants from the focus of the study. Selected informants are divided into two parts, namely from the side of agricultural actors and related government officials. This is done in order to get views from both sides that are different from one focus of work. In-depth interviews were conducted by researchers within 20-40 minutes to get responses from informants.

In-depth interviews were chosen to answer research questions, namely 1) how agricultural activities are carried out, 2) acceptance of biopesticides in agricultural actors, and 3) the role of government in supporting agricultural activities. The researcher's question will be asked, and if the informant's answer is less relevant, the researcher will ask a question to attract the informant to return to the research topic. The data obtained were analyzed by thematic analysis to verify the recording results obtained. Secondary data were collected through literature studies that function as supporting research results.

Result and Discussion

This study discusses the participation of agricultural actors and the government involved in realizing sustainable agriculture through the acceptance of biopesticides in agricultural activities. This refers to the research question about agricultural activities carried out at the research location, according to the type of agricultural commodity in the data by Balai Pengkajian Teknologi Pertanian Jakarta (2013), agricultural land in Cakung District, East Jakarta is rice and vegetables. The data is in accordance with the current land conditions explained by informant 1, i.e

> *" This is the limit of paddys land ... water spinach, spinach, basil, there are also valves, long beans, eggplants, which are here, like water pumpkin, this is a water pumpkin"*

Agricultural activities at this research site use pesticides and vegetable pesticides (biopesticides) in the treatment process as stated by informant 1 when asked whether to always use pesticides,

> "*Always, even if we use pesticide, we don't always use this. So, we do with see the conditions in the field attacked. Has a attacked by pests or not? if not, we don't use it. If the attack, we are think again need to use pesticides or not. So, somethimes we don't always use what we use pesticides all the time. See the conditions in the field. 'Oh this attack is like this, using biopesticide can also disappear. Well, using biopesticide. If use it can't, we use pesticides"*

Acceptance of biopesticides that occur in farmer groups in the study location is based on the existence of counseling conducted by the relevant government authorities and evidence from the use

of biopesticides. The process of receiving biopesticides introduced through counseling takes 3 to 4 months. This was said by the head of the farmer group .

> "*it's also quite a long time...yes, it's not enough once or twice untuil 3 months and 4 months. Ijust believed. It's because of what vegetables are 25 days or 20 days."*

The statement shows that the acceptance of biopesticides occurs after 3 to 4 harvest seasons. Lack of knowledge is also one of the factors that influence the acceptance of biopesticides by agricultural actors.

In this case, the government plays an important role in increasing the knowledge of agricultural actors so that the process of receiving biopesticides can occur. Through in-depth interviews conducted with government staff in charge of the agriculture section that farmers in the study location get a field school. Informant 2 explains that:

> "*So, here they have been trained in how to make public education, because we also have extension agents and POPT. If the POPT fosters here to the group, like in terms of environmentally friendly control and so on. So that they know SLPHT is an Sekolah Lapang Pengendalian Hama Tanaman (Integrated pest control field school.".*

In accordance with the Policy issued by the Government of Indonesia based on the Law of the Republic of Indonesia Number 16; 2006 that counseling is conducted for learning media given to agricultural actors to increase awareness in the function of environmental preservation. Advice conducted by the government with a program that has been carried out in the form of delivering relevant information to agricultural actors is one alternative that supports agricultural development (Vintarno, Sugandi, and Adiwisastra 2019).

Counseling and field schools implemented by the government is one of the supports for the establishment of sustainable agriculture. This can happen because the government's contribution to provide knowledge and training to make biopesticides will build a perception so that it will affect the behavior to choose and apply it to agricultural activities (Lamichhane 2017). Basically, agricultural actors become key actors of the programs that have been run by the government. The results of counseling that is practiced in the form of the use of biopesticides will reduce environmental impacts such as ecological disorders that will pollute the food chain (Sawant *et al*., 2018). Thus, sustainable agriculture, by considering ecological conditions, will be achieved because of the efficiency that includes environmental security (Willer and Yussefi 2006); (Keswani *et al.,* 2019).

Encouraging sustainable agricultural practices is essential to realize a food system that is also sustainable. The knowledge given illustrates the temporal and spatial interaction can increase the security of resources. In addition, the provision of knowledge can facilitate how decision making between sectors and holistically leads to sustainability (Mahlknecht *et al.*, 2020). The combination and intervention of government, markets, and civil society will lead to sustainable results (Erbaugh *et al.*, 2019). With participation that takes into account institutional, ecological management, and environmental quality will support the second objective of the SDGs in the form of integrated food security solutions (Blesh *et al.*, 2019). The aim of the zero hunger on SDGs is to overcome the challenges of environmental sustainability and food security, simultaneously providing examples that components of the whole must be considered as integrated units. In accordance with the Chappell & LaValle (2011) which conceptualizes that food security is universal access, which describes adequate, safe, and acceptable food in a cultural aspect by considering the adverse effects that occur on interdependent biodiversity.

Conclusion

This research shows that agricultural activities carried out using pesticides and biopesticides. Biopesticides are introduced by the government as environmentally friendly materials through counseling and field schools as training media. The process of receiving biopesticides by agricultural

actors takes a long time after counseling until the agricultural actors finally use it. The knowledge that is used as input to agricultural activities is one way to change behavior in agricultural activities. Thus, agricultural activities that are concerned with environmental security will become a ladder towards sustainable agriculture. This shows that in order to realize sustainable agriculture, agricultural actors and the government are key actors who play a role in maintaining the stability of environmental and food security.

Abstract

Sentiment analysis is an area of great interest in research because of its importance and its advantages in many different domains. Many supervised methods and techniques are used in the existing literature to analyze the sentiment of texts, which usually needs manual labeling for training data that takes effort and time. In this paper, we propose a new sentiment analysis approach that uses unsupervised learning technique in sentiment analysis for labeling the Arabic text. The mechanism of this sentiment analysis approach is illustrated by applying clustering to detect the polarity of the text on Arabic multi-domain datasets that include positive and negative reviews across multiple domains. The approach involves different phases, preprocessing, feature extraction, applying K-means algorithms and dimensionality reduction. To evaluate clustering, we use external evaluation and apply different measures such as purity, f-measure, and Fowlkes–Mallows index. All experimental results indicate that this approach is promising to be used in labeling Arabic text which is highly desired across different domains.

Keywords: K-Means, Normalization, Stemming, Purity, External Evaluation.

Introduction

The Internet has become an integral part of our lives, and people are more eager to share and express their feelings and opinions on the web through blogs or social networking sites, and share their reviews with services or products offered to them by different sectors such as business and government and towards topics of interest. So with this user-generated content, such as reviews, recommendations, and blog posts, the demand for opinion mining and sentiment analysis is increased to understand and analyze this huge content to extract and discover patterns and aspects that may help in improvement and development in different domains such as business, education, and government.

Sentiment analysis (SA) has become an important field of research. It involves the use of natural language processing and machine learning to determine the polarity of the text, it is a process of detecting and determining whether a given text is positive, negative, or neutral. Sentiment analysis is a subfield of Natural Language Processing (NLP) which is a subfield of artificial intelligence that deals with human-computer interactions and explores how the computer can be used to understand a natural text and manipulate it for useful tasks (Hirschberg and Manning, 2015, Habash, 2010).

Sentiment analysis can be applied on three levels, it can detect the sentiment for the whole document, or for each individual sentence or extracting sentiments from different aspects of objects. In literature, there is a lot of work in the field of sentiment analysis and there are many techniques proposed to

enhance sentiment analysis and classification for document level, these techniques can be classified into two types, machine learning, and lexicon based as shown in Figure1. The machine learning is divided into three approaches, supervised, semi-supervised and unsupervised (Giachanou and Crestani, 2016).

Supervised learning involving the use of classification algorithms such as support vector machines, Naïve Bayes, and neural networks to generate a model based on training labeled data. Unsupervised is used when the information used to train is not classified or labeled, it finds a hidden structure from unlabeled data, The most common unsupervised learning task is clustering. Semi-supervised machine learning is a combination of supervised and unsupervised learning since they use both labeled and unlabeled data for training, typically lots of unlabeled data is combined with a few data which is labeled. The lexicon-based approach to sentiment analysis involves calculating polarity and orientation of the text or document from a predefined list of words or phrases in dictionary or corpus that they are associated with a sentiment value and the polarity of a text can be obtained from the polarity of the words that compose it (Taboada et al., 2011).

Supervised learning is a widely used solution for classification purposes and has been used in most of the sentiment classification techniques (Al-Saqqa et al., 2018, Duwairi and Qarqaz, 2014, Zhang et al., 2018). However, it needs labeled data, which may not easy sometimes to create training labeled data that require lots of human effort. Moreover, the process of data labeling is expensive and time-consuming, so taking advantage of unsupervised techniques can help overcome these flaws, and it can be used in automating processes to extract sentiments from a variety of sources that keep growing in volume. Some research has been proposed different unsupervised methods for sentiment analysis but it focuses on using the unsupervised approach to enhance and improve the classification using hybrid approaches such as using machine learning with lexicon-based approach (Abdulla et al., 2013, Al-Ayyoub et al., 2015) or using clustering as a prior step of classification. However, to the best of our Knowledge, there is a little focus on using a clustering approach in labeling the data for sentiment analysis especially for the Arabic language (Abuaiadah et al., 2017). This motivates us to propose a new unsupervised approach that can help in labelling the data for Arabic text since that the Arabic language is spoken by more than 400 million speakers in the Arab world, making it one of the top ten languages spoken in the world (Istizada, 2020), and it is different from the English language in that there are three main varieties in the Arabic language, which are: Classical Arabic, Modern Standard Arabic (MSA), and Colloquial (dialectical). Moreover, it is a morphologically rich language where the same root word can have several forms depending on its grammatical role, this making applying sentiment analysis on the Arabic language a very big challenge. In this research, we propose an unsupervised sentiment analysis approach for Arabic texts based on clustering, which can detect polarity and labeling the text automatically and does not need labeling effort to provide training data, this means that it is free of human intervention. This paper is organized as follows, background and related works are introduced in section 2. The proposed approach is discussed in section 3. The experimental results are presented in section 4, and section five provides the conclusion and future works.

Fig.1: Sentiment Analysis techniques

Background and Related Work

Arabic Language

The Arabic language is spoken by more than 400 million speakers in the world, making it the sixth most widely spoken language in the world (Istizada, 2020). It is a Semitic language with rich and complex morphology. The Arabic language is right to left orientation language that consists of 28 letters. The letters (ا و ي) are vowels, and the rest are consonants. Each letter in an Arabic word may be followed by a special mark called a diacritical mark, there are eight different types of diacritical marks in the Arabic language that are added after each consonant of the word and they play a very important role in fixing the meaning of words. There are two classes of Arabic words: derivative words, and non-derivative words. Derivative words are generated from basic entities called roots, according to a set of derivation rules or a predefined list of patterns called morphological balances or patterns. Non-derivative words are those words that do not obey the standard derivation rules. Functional words and words borrowed from foreign languages are examples of non-derivative words. Most of the Arabic language derivational, several kinds of words such as verbs nouns, adjective and adverb can be generated from one root according to appropriate patterns. The pattern is used for generating a word that determines its various attributes such as gender (masculine /feminine), number (singular/plural), tense (past, present, and imperative), etc. Affixes can be attached to a word to build more complicated derivations and there are three types of affixes: prefixes, suffixes, and infixes. Prefixes are a group of letters that can be inserted at the beginning of the word root or stem. Suffixes group of letters that can be inserted at the end of the word root or stem and infixes which is inserted in the middle. Removing prefixes in Arabic does not reverse the meaning of words this differs in the English language which is concatenative and removing prefixes may reverse the meaning of words (Awajan, 2007).

K-means Clustering

It is an unsupervised learning task that is used to extract hidden patterns from data and it is widely used to explore the data and grouping the data with similar characteristics, it detects the data objects properties and analyze how much these objects are similar or different to each other and then assigned them to clusters that already created based on the similarity relationship. There is various clustering application such as in search engine retrieval, business research regarding customer and products, and information retrieval. There are different algorithms of clustering such as K-means, Hierarchical clustering, and density clustering. In this research, basic K-means is used for the following reasons:

a. The document text is high dimensional data and sparse. Kmeans can be run sparse and high-dimensional data (Karypis et al. 2000).
b. It is a simple algorithm and more efficient and it has less computational complexity less than other clustering algorithms.
c. It is effective and most widely used for documents clustering (Karypis et al. 2000).

Kmeans is one of the partitional clustering methods. Data are classified according to a predetermined number of clusters and each cluster is associated with a centroid. It is prototype clustering techniques that define prototypes in terms of centroids which is usually the mean of a group of data points (Tan et al., 2016).

. The algorithm starts by determining the desired number of clusters, so the number of clusters K is specified and then K initial centroids are chosen. Each data object is assigned to closest centroid then all objects have been assigned, and the centroid of each cluster is then updated by recalculating positions of the K centroids again. This process is repeated until convergence is achieved and no point changes cluster or no longer move or change of centroids. This produces a separation of the objects into groups or clusters. The number of clusters that are considered in this study is two clusters, one for positive polarity and another one for negative. For a good choice of initial centroids instead of using random seeding, we applied kmean ++ proposed by Arthur and Vassilvitskii (2006), it is a variation algorithm of kmeans which is a technique to seed the initial centers for a K-means which would help to improve the results of kmeans clustering.

Related Work

Predicting sentiment orientation or polarity is the task of sentiment analysis. In literature, there are many techniques and approaches proposed to achieve this task. These approaches can be classified into different research tracks, supervised learning (Duwairi and Qarqaz, 2014), Lexicon based (Taboada et al., 2011, Al-Ayyoub et al., 2015), hybrid approach (Aldayel and Azmi, 2016), or clustering approach. Clustering-based approaches to sentiment analysis have been considered in a few research studies, however, there is more research in literature use of clustering to improve the performance of the sentiment classification (Alapati and Sindhu, 2016). This is due to several reasons as discussed in (Li and Liu, 2012). The low clustering accuracy and instability of clustering results due to random initialization of kmeans centroids.

However, they could prove that a clustering-based approach is a feasible approach. They proposed a novel clustering sentiment analysis approach to predict sentiment orientation, they used English movie review data and applied the TF-IDF weighting method with the adjective and adverb features and a voting mechanism. For term score, they used WordNet to enhance the performance they obtained challenging clustering results in comparison with symbolic techniques and supervised learning in terms of accuracy metric. An unsupervised and completely automatic method is proposed by AL-Sharuee and Pratama (2018) for classifying reviews. This method consists of two phases, contextual analysis, and clustering classifier ensemble. The authors could improve the clustering performance in terms of accuracy, stability, and generalization ability by deploying SentiWordNet 3.0 in the contextual analysis phase and ensemble learning method with modified k-means classifier as a base learner in the second phase. All experiments are held using two reviews datasets, Australian Airlines, and HomeBuilders. An experimental study was conducted by (Ma and Wu, 2017), compared some common clustering techniques with respect to the task of sentiment analysis showed that the Kmeans algorithm results differ in the case of the dataset is balanced or imbalanced, and it worked better with the balanced dataset. The effect of preprocessing steps on clustering is also studied. Experimental results indicated that the extraction of adverbs and adjectives positively affect the results, however, stemming and noise removal negatively affect the results. As far as we know, there are relatively few papers that apply clustering to automatically detect the sentiment orientation at the document level for Arabic texts, however, there is research that is related to Arabic text focus on using clustering in text summarization and document topics categorization. An evaluation of the impact of similarity functions and preprocessing such as stemming and stop words removal for clustering Arabic Twitter tweets has been

conducted in (Abuaiadah et al.,2017). To group tweets into two groups, positive and negative, a modified version of kmeans was applied. The research was to study the effect stemming as a preprocessing step and the effect of using different similarity measures. The results showed that root-based stemming is better than light stemming and averaged Kullback-Leibler divergence has an advantage over other similarity measures such as Euclidean distance, Jaccard coefficient, and Pearson correlation. Some research has used clustering as a prior step of classification to improve the performance such as the work done by Alotaibi and Anderson (2017). They applied word clusters that group the words that had the same semantic or syntactic relationship together and used the cluster id as a feature. Arabic corpus of five different domains is used, news, news reviews, user market reviews, restaurants reviews, and movie reviews and the Brown Clustering algorithm was applied to generate clusters for each data domain. They used the support vector machine to evaluate their approach and the results showed improved performance.

Clustering Approach

In this section, we discuss the clustering based sentiment analysis approach. As shown in Figure 2, the approach consists of four main stages, preprocessing, feature extraction, dimensionality reduction, and K-means clustering.

Preprocessing

The preprocessing stage is an important step, as it has the potential to significantly affect the final clustering results (Alotaibi and Anderson, 2017). It involves five main steps: tokenization, noise removal, normalization, stop word removal. In a tokenization step, the text is divided into multiple words, phrases, symbols (tokens) based on separator character such as comma, tab, white space, period, etc. Noise removal step involves removing short vowels and cleaning the text from some irrelevant words or symbols such as emojis, number, and non-Arabic text. Then, remove all stop words which are common words that do not contribute to analysis (such as in في, above فوق, to الى). After that, the normalization process is applied to letters. Normalization is the process of transforming the text in order to be consistent, thus putting it in a common form. In this step:

- Diacritics are removed
- Letters " إ ","أ" "and " آ " are replaced with " ا "
- "ة" is replaced with "ه"
- Letter "ى " is replaced with "ي "
- Letters "ئ", "ؤ" are replaced with "ء"

The reason for such a step is that many users often mistake these similar characters and use them interchangeably. Stemming is the process of removing all affixes (such as prefixes, infixes, and suffixes) from words and reducing the words to their stem. For stemming purposes, we used ISRI Arabic Stemmer (Taghva et al.,2005).

Feature Extraction

Before applying clustering, the text needs to be prepared and represented in a format that is suitable for the k-means to deal with. The document text is converted into a feature vector. The feature vector can be generated by different techniques such as using the term presence (TP), term frequency (TF) and term frequency-inverse document frequency (TF/IDF). In this research, we used TF/IDF which is a commonly used technique in clustering. It uses two techniques, the term frequency (TF) and inverse document frequency (IDF). TF refers to how many times that a word or term occurs in a text or a document while IDF measures the weight that representing how much information the word provides whether the term is common or rare across all documents. So if the word occurs in many documents then TF/IDF will decrease, however, if the word occurs many times in the same document the TF/IDF will increase. In TF/IDF, the terms that appear frequently in a document are less important than terms that are rare (Robertson, 2004). TF/IDF can be computed as:

TF/IDF (t, d) = TF (t, d). IDF (t)
Where
TF (t, d) = term t frequency in document d /total words in document d
IDF (t) = log (total documents/ documents with term t).

Dimensionality Reduction

TF-IDF produces high-dimensional sparse vectors which may not be ideal for K-Means clustering algorithm and may reduce the performance, so dimension reduction is important in clustering. It helps in making the high dimensional data addressable and reduces the computational cost. In addition, it provides the user with the ability to visualize and examine the data (Fodor, 2002). In our approach we reduce the dimensionality of data then we applied K-Means. There are different dimensionality techniques are used to reduce the number of data features. Singular value decomposition (SVD) is an unsupervised learning approach used for dimensionality reduction, it is a linear dimensionality reduction technique that attempts to find linear combinations of features in the original high dimensional data matrix to construct a meaningful representation of the dataset. It is reduced version truncated SVD is commonly used in natural language processing (Dhillon and Modha, 2001), it is efficient and able to handle sparse matrices and even more economic to compute. So for dimensionality reduction purposes we used truncated SVD is used on the TF-IDF vectors to reduce their dimension.

Fig. 2: Proposed approach

Experiments

In this section, the datasets that are used in the experiments will be described. And the experiments that are performed and the obtained results will be discussed to provide an evaluation of the effect of clustering on the Arabic sentiment analysis.

Datasets

We conduct experiments on different reviews datasets. We used five Arabic datasets with different sizes across different domains built by ElSahar and El-Beltagy (2015).They have included reviews across different domains such as hotels, movies, products, restaurants, and books. They are collected from different websites such as TripAdvisor, elcinema.com, and soud.com, their names movie reviews (MOV), product reviews (PROD), attraction reviews (ATT), restaurant reviews (RES), and hotel reviews (HTL). Table 1, shows the details of datasets, domain, source, the total number of reviews, and the total number of positive and negative reviews.

Table 1: Datasets

Dataset Name	Domain	Source	Total No. Of reviews	No. of Positive Reviews	No. of Negative Reviews
Movie Reviews(MOV)	Movies	elcinema.com	1353	969	384
Product reviews(PROD)	Products	souq.com	3964	3101	863
Attraction Reviews (ATT)	Hotels/ Restaurant	TripAdvisor.com	2154	2073	81
Restaurant reviews (RES)	Restaurant	tripadvisor.com/ qaym.com	10704	8030	2674
Hotel Reviews(HTL)	Hotels	TripAdvisor.com	13423	10775	2647

Results

Since all reviews are pre-tagged based on their sentiment classes we used the supervised approach for cluster evaluation which measures the extent to which the clustering structure discovered by a clustering algorithm matches some external structure (Tan et al., 2016). We compared the results of clustering to externally known results which are the class labels of reviews. The class tags for each document were moved at first because they are unnecessary in the k-means algorithm. We then applied the k-means algorithm with python Scikit-learn (Sklearn) library to cluster the documents into two clusters, positive and negative.

The distance measure method in this research is Euclidean distance. All reviews in each dataset were divided into two groups of clustering, cluster1 and cluster 2. We used the actual positive and negative labels of each document to build a confusion matrix. As shown in Table 2, where a, b, c, and d are the number of documents in each cell. Thus, if (a+d)> (b+c), group 1 will be regarded as a positive group, otherwise, group 2 will be regarded as the negative group. Certainly, in the real application, the actual class of the document is unknown. In this research, we used the actual label to evaluate the clustering approach and the following metrics are defined as the following:

$$\text{Precision} = \text{TP} / (\text{TP} + \text{FP}) \quad (1)$$
$$\text{Recall} = \text{TP} / (\text{TP} + \text{FN}) \quad (2)$$
$$\text{F} - \text{Measure} = (2 * \text{Precision} * \text{Recall}) / (\text{Precision} + \text{Recall}) \quad (3)$$

Where TP, TN, FP, and FN are true positive, true negative, false positive, and false negative, respectively.

In addition, we used Fowlkes Mallows Index (FMI), it is one of the methods that can be used in external clustering evaluation. Using this method the similarity between clustering and benchmark classification is calculated, a higher value for FMI indicates a greater similarity between the clusters and the benchmark classifications. FMI is also known as geometric mean (or G-measure) of the precision and recall while the F-measure is their harmonic mean

The Fowlkes–Mallows index is calculated as follows:

$$FMI = \sqrt{\mathrm{TP} / (\mathrm{TP} + \mathrm{FP}) * \mathrm{TP} / (\mathrm{TP} + \mathrm{FN})} \quad (4)$$

To measure the quality of clustering we used Purity measure which is simple and commonly used to measure the clustering algorithm quality (Abuaiadah et al., 2017). Purity can be defined as follows:

$$Purity = \frac{1}{N} \sum_{i=1}^{K} max_j |c_i \cap t_j| \quad (5)$$

Where N is the total number of data points, k is the number of clusters, c_i is a cluster in C, and t_j is the classification which has the majority count for cluster c_i.

In all datasets that are used in experiments, there is a different number of positive and negative reviews and only two clusters are considered. After clustering, we will have two clusters one for the majority of positive reviews and the second one has the majority of negative reviews. The purity is calculated by dividing the total number of correct grouping over the total number of reviews. The purity values must be higher than 0.5 and the purity of 1.0 indicates perfect clustering.

Table 2: Confusion matrix of reviews clustering

	Group1 (cluster1)	**Group2 (cluster2)**
Actual Positive	a	b
Actual Negative	c	d

All experiments were conducted on a PC with 16 GB RAM and Intel Core i7-8550U CPU 1.8 GHz. After applying the approach to all cross domains datasets, the results show that our clustering approach is feasible to cluster Arabic reviews into positive and negative categories for sentiment analysis across different domains as shown in Tables 3 and 4. Table 3 presents the results of the clustering evaluation in terms of precision, recall, and f-measure before applying dimensionality reduction and Table 4 presents the results after applying the dimensionality reduction. As shown in the tables, f-measure of both exceeds 65%, and the results indicate that applying SVD gave relatively good results compared to the approach with SVD not applied in terms of precision metric, however, using other metrics there is no indication of the difference in the results. But by using SVD we get the advantage because it helped to reduce runtime and this is reflected in the overall performance as shown in Figure 3.

Table 3: Clustering results without dimensionality reduction

Dataset	**Precision**	**Recall**	**F-measure**	**FMI**
MOV	0.740	0.881	0.805	0.807
PROD	0.781	0.967	0.864	0.869
ATT	0.962	0.739	0.836	0.843
RES	0.774	0.689	0.729	0.730
HTL	0.898	0.639	0.747	0.758

Table 4: Clustering results with dimensionality reduction

Dataset	Precision	Recall	F-measure	FMI
MOV	0.718	0.929	0.810	0.816
PROD	0.780	0.965	0.863	0.867
ATT	0.963	0.690	0.804	0.815
RES	0.775	0.624	0.691	0.695
HTL	0.899	0.642	0.749	0.759

The results of Fowlkes–Mallow's index (FMI) are represented in Figure 4. As shown from the Figure 4, FMI values indicate good clustering output and this appropriate the f-measure metric. As shown in Figure 5, the purity measure for all datasets is also above 0.5 and was relatively indicated good clustering. This fits with other evaluation measures results that are shown in the above tables. When comparing the results of the different datasets, it is shown that PROD dataset results are better than the results of other datasets, and the results of RES and HTL are worse than other datasets. This indicates that the size of the dataset has an effect on clustering results. As presented in Table 1, PROD dataset size is smaller than and HTL and RES. This can be explained from two different perspectives. From the first perspective, increasing the size of the dataset will increase the number of features and sparsity, which might affect the clustering results. From the second perspective, the large datasets in sentiment analysis especially which have long texts and documents increase the chance of noisy features that may not be handled in the preprocessing step. These features might affect negatively later phases results.

Fig.3: Run time Results of Clustering with Dimensionality reduction

Fig. 4:Fowlkes–Mallow's index results for each dataset

It is not possible to compare results with other current research, for the following reasons. First, there is very limited research applied to the Arabic text. The second reason is that the data sets are different. Clustering approach proposed by Li and Liu (2012) was applied to the English text, the performance that was obtained in terms of accuracy did not exceed 78%, however, in our approach, we obtained good results despite the challenges of the Arabic language.

Fig. 5: Clustering purity for each dataset

Conclusion and Future Work

Sentiment analysis is considered an important field in many different domains. It may help to know about people's satisfaction and may help in the development and improvement of the services. Due to the huge amount of user-generated content, such as reviews, recommendations, and blog posts on the web, the demand for sentiment analysis has increased. This needs to develop new methods to classify the sentiment of these content with low effort and time. In this research, we discussed the unsupervised approach for sentiment analysis for Arabic reviews across multiple domains based on using clustering

for labeling Arabic reviews with positive and negative labels. The approach encompassed four different steps, preprocessing, feature extraction, applying k-means and dimensionality reduction. Various external evaluation measures are applied to evaluate the quality of clustering, precision, recall, f-measure, FMI, and purity. The experimental results showed the goodness of the approach in categorizing the text with no manual intervention. The results indicated that this approach is promising to be used in labeling Arabic text which is highly desired across different domains.

As future work, we will consider the multiclass text and not only consider the positive and negative classes but also the neutral class.

Abstract

The higher school has not only large-scale educational tasks but no less ambitious educative ones. In this regard, there is a necessity to identify negative phenomena in students' behaviour with the aim of the correction and prevention of them. Academic procrastination is one of such negative phenomena; the essence of it is to postpone the implementation of training tasks. The purpose of this research is to conduct the theoretical analysis of procrastination, to identify the causes of its appearance and to propose the methods of its prevention. The analysis of the scientists' positions on this issue showed that a unified theory of procrastination has not yet been created. The article reveals the relationship between the reasons for procrastination, irrational beliefs and irrational students' attitudes. The authors propose options for replacing existing irrational attitudes with the new ones. The methods of irrational attitudes corrections in three directions are disclosed and substantiated: work with beliefs, work with emotional reactions and work with behavioural reactions. The experimental work was carried out among several groups of students studying Economics at South Ural State University. The results obtained made it possible to record a decrease in academic procrastination in experimental groups, which provides the basis for the application of the proposed methods in further pedagogical practice.

Keywords: procrastination, academic procrastination, prevention, irrational attitudes, students.

Introduction

"As long as we put off life, it passes."
Seneca

Currently, student life is very dynamic and diverse, due to the presence of several activities such as study, hobbies, additional education, and personal life. Each activity requires a significant amount of time, the resource of which is limited. Of course, if a person receives higher education, then it is appropriate to assume that it is his main goal. However, many students have a lot of interests and that provokes a lack of time situation. Besides the change in social status, the loss of protection by school

teachers, and the expansion of the range of activities cause emotional instability, internal confusion, and disorganization.

It is not easy for yesterday's schoolchildren to orient in student life. The multitasking of the educational process determines the desire of students to reduce workloads and solve problems as they occur. They postpone the tasks for the next day, especially if there is some time reserve. Such behaviour often provokes poor-quality assignments and, as a result, unsatisfactory or low rating points. Students worry about this, promise that "next time they will do everything in advance", however, time passes and everything repeats. This phenomenon is called procrastination.

Such behaviour entails emotional discomfort, stress and depression, which does not add to students' health and satisfaction with life. In this regard, the pedagogical community is looking for ways, means and methods of changing students' behaviour. Any human activity is performed consciously by following the irrational attitudes. It can be assumed that the change of them will entail the change in students' behaviour.

Literature Review

The term "procrastination" came from Latin procrastinationem which meant "putting off from day to day". The scientists study this phenomenon and offer different definitions:

- the voluntary postponement of the planned affairs, with the expected negative consequences due to the delay (Steel, 2007), *(Lay, 1986)*;
- the delay in making decisions, postponing the implementation of works "for later" *(Lay, 1986)*, B.G. Meshcheryakov *(Chun Chu and Choi, 2005), (Meshcheryakova, 2003)*;
- the mechanism for coping with the anxiety associated with the beginning or completion of a task or making a decision *(Ilyin, 2011)*;
- the neurotic form of behaviour in order to protect the personality *(Waitley, 1996)*;
- the irrational delay in behaviour *(Varvaricheva, 2010)*.

We follow the interpretation of procrastination made by Ya.I. Varvaricheva. Irrationality is a phenomenon characterized by emotional sufferings and impressions. If it is connected with activity then positive experiences (joy, enthusiasm, interest, etc.) will be stimulating factors. If experiences are negative (boredom, indifference, etc.), then they will be inhibitory factors of the performed activity. We can conclude that procrastination is one of the types of irrational behaviour, the peculiarity of which is the understanding of negative and undesirable consequences *(Varvaricheva, 2010)*.

Milgram, J. Batoria, and D. Mourer developed the classification of 5 types of procrastination (daily, neurotic, compulsive, academic, and the procrastination in decision making) *(Milgram, Batori and Mowrer, 1993)*. Later, N. Milgram and R. Tenne revised this classification and proposed 2 types: procrastination in the performance of tasks and procrastination in decision-making *(Milgram and Tenne, 2000)*.

The search for positive aspects in procrastination was carried out by A.Kh. Chu and J. N. Choi *(Dorodeyko, 2013)* who divided procrastinators into active and passive. Active procrastinators postpone their affairs due to negative experiences, and passive ones due to the tendency and preference to perform work in a time-constrained environment. In J.R. Ferrari's classification procrastinators are divided into 3 groups according to the type of behaviour: "indecisive", "avoiding", and "thrill seekers" *(Fishbein and Ajzen, 1975)*.

Thus, it can be said that a unified theory of the study of procrastination does not yet exist. In recent years, on-going research is most often associated with an emphasis on one of the three components of

procrastination: behavioural, cognitive, or emotional. And in such cases, the researchers relied on the theory of psychodynamic, behavioural and cognitive psychology *(Lay, 1986)*.

P. Steele in 2007 tried to integrate all existing opinions, creating an integrative theory of temporary motivation *(Steel, 2007)*. He suggested 4 factors that influence students' performance or postponement of activity: expectancy, value, delay, and the level of impatience. Thus, the author focuses on the attitude of the person to the case, in fact, and on the difficulties of this case.

Many scientists believe that procrastination is more characteristic of students. They studied factors contributing to procrastination *(Meshcheryakova, 2003)*; the types and specificity of tasks for learners, the implementation of tasks which tend to be postponed *(Ellis and Knaus, 1977)*; the conditions of fulfilment and requirements of teachers to the assignments for students *(Wolters, 2003)*; and students' motivation *(Karvasarsky, Ababkov and Isurina, 2006)*.

The authors note either negative or positive aspects of procrastination. When conducting practical studies of procrastination, it is easy to identify those students for whom it is a mechanism of protecting the body from excessive loads. The learners for whom procrastination is a consequence of the inability to organize their time or the lack of interest in the corresponding type of activity are also easy to be separated. That is why the numerous recommendations from various scientists to combat procrastination come down to a variety of methods of self-monitoring and written planning.

Procrastination manifests itself in a certain activity which gives grounds for scientists to propose their classification of procrastination or procrastinators. Our interest is connected with the behaviour of students, and this type of procrastination is called academic.

Several studies were conducted to determine the presence of the phenomenon of procrastination in the students' environment. Ellis and Knaus argue that 80-95% of students procrastinate to one degree or another *(Fiore, 2014)*. According to the results of V.S. Kovylin who examined Russian students, the figures vary from 46% to 95% *(Lay, 1986)*.

At the same time, researchers note a strong emotional discomfort from this behaviour:

- anxiety increases when the deadline is drawing on, this anxiety causes a "paralyzing" state *(Varvaricheva, 2010)*;
- gloomy foreboding causes negative feelings *(Ferrari, 1990)*;
- the self-dissatisfaction appears (Khukhlaeva, 2009), *(Lay, 1986)*.

A person's behaviour is caused by cognitive structures formed in his mind, which are his beliefs and "irrational attitudes" *(Kovylin, 2013)*. These two concepts are combined by the emotional behavioural reactions of a person to events, phenomena or objects. However, the internal structure of these concepts is different:

- the attitude include cognitive, emotional and behavioural elements *(Uznadze, 1997)*;
- beliefs can be considered synonymous with the cognitive component of the attitudes *(Karlovskaya and Baranova, 2020)*.

Therefore, it can be said that irrational attitudes are irrational beliefs, emotions, and fixed behavioural reactions. The emotions are the main in the structure. Some scientists combine the irrational attitudes and procrastination. E.P. Ilyin and V.S. Kovylin believe that procrastination is "an emotional reaction to planned or necessary things" *(Kovylin, 2013)*. We support this position and think that procrastination can be controlled by changing irrational attitudes, thereby exerting a preventive effect on possible manifestations of academic procrastination.

Proposed Changes to Irrational Attitudes

It is obvious that for each cause of procrastination manifestation, its own methods of prevention or elimination are required. To determine the causes of procrastination among students, we used the questionnaire method. After the analysis of the results, the four main causes of procrastination were identified:

- the lack of interest in the task or subject;
- the perfectionism with social anxiety (the desire for the perfect fulfilment of tasks, to be better than others);
- the impulsiveness manifested in the irresponsibility and helplessness of the independent fulfilment of tasks;
- the urgent dependence expressed in the desire of students to work in a strictly limited time.

Each cause of procrastination generates students' irrational beliefs, which are the basis for existing irrational attitudes. We have established the connection between the reasons of academic procrastination, irrational beliefs, and students' irrational attitudes. To prevent the manifestation of academic procrastination, we propose the replacement of existing attitudes with the new ones (see Table 1).

Table 1: the connection of the causes of procrastination with irrational beliefs and irrational students' attitudes

№	Causes of procrastination	Irrational beliefs	Irrational attitudes	New attitudes
1	The lack of interest in the task or subject	I do what turns out; I do what I want	Getting pleasure from life	Getting pleasure from activities; Giving the task a personal meaning
2	The perfectionism with social anxiety	I have to do better than anyone; I have to do perfectly	Life is a competition and only victory suits me; I'm better than all / many	Everyone has his own potential; Competing with myself
3	Impulsivity (irresponsibility and helplessness)	Everyone should help me; Every person must have a mentor	External assistance should be provided	I can work without outside help
4	The urgent dependence	All problems must be dealt with quickly; I am confident in my abilities	I can do everything; I can solve problems as they become available	There must be harmony between work and rest

(Source: compiled by the authors)

In other words, the existing irrational attitudes should be replaced by other rational attitudes based on self-acceptance, positive thinking, self-confidence, and self-control. The proposed replacement is quite complicated, as it involves the change of three components: beliefs, emotional attitude and behavioural reaction. However, it is quite feasible:

1) The work with beliefs. The students are encouraged to consciously change their speech constructs. For example, “I must ....” to “I would like .....”; “I owe ...” to “I can ...” etc. In other words, the obligation is replaced with the students' wishes. Beliefs are transformed only when value orientations change, so unobtrusive explanatory work should be done. It is most appropriate to do this at the courses “Introduction to the specialty” and “Personal management”. Discussion of cases, analysis of the successful managers’ activities, drawing up a diary and other written plans, identifying their

strengths and weaknesses, applying the method of SWOT analysis to the effectiveness of studying at the university has a significant impact on the correction of irrational attitudes;

2) The work with emotional reactions. In this case, the teacher plays a special role, since the emotional reaction of students depends on his positive attitude. The majority of students respect their teachers; therefore, the expression of the confidence in students' abilities, the belief in good final results will cause positive emotions among learners. Besides, the increased anxiety of some students can be removed using several methods:

- the fragmentation of the task and its performing in parts;
- an offer to complete tasks in pairs;
- the possibility to submit the assignment ahead of schedule;
- the support for students in the chat, with the provision of advisory assistance;
- the organization of an intra-group conference on the assignment, where students can communicate with each other on a given topic and, possibly, help each other.

The work of teachers is carried out regularly with feedback from both students and colleagues. The irrational attitudes are often replaced by others based on an emotionally positive attitude towards the teacher, to the passion of group mates, to a joint project, etc. Therefore, such irrational methods as infection, imitation, and suggestion in this work will become invaluable helpers;

3) The work with behavioural reactions. It is necessary to talk about the systematic implementation of the task. This problem should be solved by a student himself and his teachers. The teachers can offer a master class for students "Know how to praise yourself" where students should receive tools for self-control and self-promotion:

- "the tomato method" (the breakdown of working time into small segments of work and rest. For example, I work 20 minutes and rest 20 minutes);
- "the method of steaks from an elephant" (crushing a large case into small fragments;
- the ranking of on-going activities;
- the emotional contract with oneself;
- the defining of hated activity and allocation of limited time for its implementation;
- the reward for each completed task;
- the elimination of distractions;
- the use of the "whip" method (punishing yourself for disrupting planned activities);
- the definition of a mentor-student whose actions could be a guideline for the successful completion of tasks on time.

Also, students need to be introduced to the method of conscious switching in the case of breakdown. If this happens, it is necessary: either to sleep, or to go for a walk, or to go for a run, etc.

Reformulation of the goal often helps in the fight against procrastination. This applies to situations where students are not sure what they need. In this case, students should try to find personal meaning in the action being performed. A good effect is given by a daily plan with crossing out completed tasks. In this case, visibility allows you to see what is done and causes a feeling of self-satisfaction.

Results

The experiment was conducted in the period 2008-2019 at the Higher School of Economics and Management of the South Ural State University. The 2nd and 3rd-year students from three training programs (managers, economists, and personnel management) who were interested in the study participated in it.

At the first stage, the 3 experimental (75 people) and 3 control groups (72 people) were determined among the students from each training program. To diagnose the on-going changes in the manifestations of procrastination, the following methods were used: C.H. Lay "General

Procrastination Scale" *(Lay, 1986)*, Miklyaeva A.V., Bezgodova S.A., Vasilyeva S.V., Rumyantseva P.V., Solntseva N.V. "Procrastination assessment scale" *(Miklyaeva et al., 2020)*, as well as methods for observing and analysing performance results.

The comparative analysis of the data obtained before the start of the experimental work was carried out using the φ*Fisher criterion. According to it, the experimental and control groups did not have statistical differences, therefore, they are suitable for experimental work. Diagnostics was carried out 3 times: at the beginning of the academic year, after the first semester, and at the end of the academic year. The most significant differences were after a year of focused work, so the results before and after the experimental work are presented (Tab. 2-3).

Table 2: the change in the level of procrastination in experimental groups during the experiment

Training programs	Levels of procrastination (%)					
	Low		Middle		High	
	before the experiment	after the experiment	before the experiment	after the experiment	before the experiment	after the experiment
General Sample	18.6	36.0	50.9	44.1	30.5	19.9
Managers	15.4	34.6	53.8	46.2	30.8	19.2
Economists	22.2	37.0	44.4	40.7	33.3	22.2
Personnel Management	18.2	36.4	54.5	45.5	27.3	18.2

(Source: compiled by the authors)

Table 3: the change in the level of procrastination in control groups during the educational process

Training programs	Levels of procrastination (%)					
	Low		Middle		High	
	before the experiment	after the experiment	before the experiment	after the experiment	before the experiment	after the experiment
General Sample	19.5	16.7	54.1	51.3	26.4	31.9
Managers	20.0	16.0	56.0	52.0	24.0	32.0
Economists	16.7	12.5	54.2	54.2	29.2	33.3
Personnel Management	21.7	21.7	52.2	47.8	26.1	30.4

(Source: compiled by the authors)

To determine the statistical distinguishability of the results, the φ*Fisher criterion was applied again. According to it the changes that occurred in the experimental groups were statistically significant, while the changes that occurred in the control groups were not statistically significant.

Thus, based on diagnostic procedures the changes in the level of academic procrastination among students were found out. At the same time, the pedagogical observations showed that 87% of students began to do homework on time (before the start of the experiment, there were 68%). Such dynamics were traced in the accomplishment of small tasks, while the accomplishment of larger-scale tasks (term papers and projects) did not have such shifts. We explain this by the fact that the change in

irrational attitudes requires a longer period, possibly 2 years. Therefore we plan to develop a 2-year program and see its effectiveness. Nevertheless, it should be noted that in the control groups, the cases of procrastination manifestation in all positions became more frequent.

At the next stage of research, we compared student performance in experimental and control groups. It turned out that in the experimental groups, the average score according to the results of the session increased by 0.4, while in the control groups it decreased by 0.1. It can be assumed that the level of procrastination has an impact on the quality performance of students.

Conclusions

The analysis of the theoretical development of the phenomenon of procrastination, as well as the results of experimental work on its prevention in the student community, allow us to make the following conclusions:

1) the high dynamics of university life, the wide diversity of students' interests inevitably lead to a shortage of time, which causes procrastination;
2) the manifestation of procrastination in human life has been studied for the past few decades, but a unified scientific theory has not yet been created. That can be explained by the fact that scientists consider this phenomenon from the perspective of different scientific approaches;
3) the procrastination of educational activities is called academic procrastination;
4) the students' behaviour is dependent on a certain position regarding the current situation or subject. In the case of the primary emotional colour of this position, it is customary to speak of "irrational attitudes";
5) the causes of procrastination affect the formation of irrational beliefs that lead to the emergence of irrational attitudes;
6) the irrational attitudes of students that lead to academic procrastination, can be changed in the process of systematic, focused work. Such work should be carried out from two sides: pedagogical assistance and students' work on their behaviour;
7) the experiment has shown the effectiveness of such work and the prospects of its implementation in the student community.

Abstract

The article reflects the current retrospective situation related to the peculiarities of financial investments in fixed assets of Russian companies for the period 2010-2018. The structure of investments in fixed assets to sources of financing and by forms of ownership is considered. The factors that limit the investment activities of Russian organizations are identified.
A statistical analysis of fixed assets as an essential element of national wealth is relevant not only for solving traditional tasks related to assessing the availability, composition and dynamics of economic assets.

Keywords: fixed assets, investment value, financing of fixed capital, sources of financing.

Introduction and review of publications

Investments are the main source of implementation of the financing strategy. They provide movement in a certain direction. All investments need real money, that is, financing decisions are required to mobilize the required resources.

A sound financing strategy should solve the main tasks of managing the economy and ensure a long-term increase in the value of the company. The desired effect can be achieved through actions that, in accordance with traditional corporate finance management laws, can cause a negative reaction from investors. For example, this is a decrease, a complete rejection of dividends or the repurchase of shares that significantly exceed their market value.

A statistical study on the financing of fixed assets and the long-term capital market is the most important information component in the enterprise financial policy management system.

Materials and Research Methods

Financing the work of the organization is a system of forms and methods, criteria and principles of economic support for reproduction. Financing is the process of generating company capital in all its forms and types. The concept of "financing" is very closely related to the concept of "investment". By financing we mean the process of generating funds for further investment, and by investments we mean the accumulated funds and their application.

These concepts are interconnected, but the concept of "financing" precedes the concept of "investment". A company cannot plan any investments if it does not have the necessary sources of financing. But at the same time, the formation of corporate money is taking into account the preparation and preparation of plans for their use in the future.

Any company, choosing sources of financing activities, must solve the following main tasks:

- identify the needs for short-term and long-term sources of capital financing;
- find possible changes in the structure of assets and capital of the company in order to determine its ideal composition and structure;
- to ensure the financial stability of the enterprise and constant solvency:
- use borrowed and own funds of the enterprise with maximum efficiency;
- reduce the cost of financing the financial and economic activities of the company *(Mirolyubov, 2008)*.

The sphere of interaction of organizations with the capital market is financing. When making a decision on financing, you choose from a variety of possible options the sources of raising funds for the company in exchange for claim rights.

The innovative and economic development of the company depends on the effectiveness of investment activity, which at the same time gives the economy economic growth and is aimed at improving the welfare of society. Proper investment contributes to the dynamic development of the company and strengthens its financial stability *(Khalyapin, 2018)*.

A company that works efficiently is:
a) a reliable taxpayer in budgets of various levels;
b) a progressive economic entity in terms of introducing modern innovative technologies into the production process;
c) an active social subject in terms of labor supply *(Mirolyubov, 2008)*.
The importance of investment activity necessitates the analysis of sources of financing of investment activity, financial investments in fixed assets of the enterprise with a focus on own funds.
Investments in the form of investments are divided into financial and real. Investments in fixed assets of the company are real investments, which demonstrates their fundamental importance for the development of any economy *(Tuyakova, 2009)*.

The competitive functioning of organizations of all types of economic activity is the result of investing in fixed assets. The success of any company is of particular importance in modern economic sanctions against the Russian economy.

Result and Discussion

An analysis of statistics on financial investments in fixed assets of Russian companies for 2010–2018 is proposed. The purpose of the analysis is to identify existing trends to consider a set of measures that can increase the efficiency of investments. The analysis was carried out as a whole, as well as for companies of various forms of ownership, sources of financing, timing.
Table 1 shows the total capital investments of firms for the specified period.

Table 1: overview of investments in fixed assets of enterprises in 2010-2018

year	billions of rubles	% to the previous year (in comparable prices)
2010	9152.10	114.7
2011	11035.65	120.6
2012	12586.09	114.0
2013	13450.24	106.9
2014	13902.65	103.4
2015	13897.19	99.9
2016	14748.85	106.1
2017	16027.30	108.7
2018	17595.03	109.8

(Source: compiled by the authors on the basis of Investments in Russia.2018: stats)

Analysis of this table leads to the conclusion that the dynamics of investment is not stable enough. In 2010–2014, the volume of investments increased by 1.5 times, and in 2014–2018 - by almost 1.3 times. The most intensive investments grew in 2011 compared to 2010 - by 20.6%, and in 2018, compared to 2017, investments increased only by 9.8%. The decrease in investments occurred in 2015 (compared with 2014), by 0.1%.

Table 2 shows an analysis of the structure of investments in fixed assets by ownership, and also defines the shares of the state and the shares of foreign investors.

Table 2: structural review of investments in fixed assets of enterprises of the Russian Federation, distinguished by ownership, 2010–2018,%

	2010	**2011**	**2012**	**2013**	**2014**	**2015**	**2016**	**2017**	**2018**
Investments in fixed assets, total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
including:									
Russian property	86.2	87.8	84.5	85.8	86.1	84.3	83.1	83.8	85.6
including:									
state property	17.2	16.9	16.8	17.2	14.9	14.8	15.2	14.4	13.8
from her:									
federal property	10.9	10.8	10.1	9.7	8.9	9.4	8.8	8.4	7.7
property of constituent entities of the Federation	6.2	5.9	6.7	7.5	5.9	5.4	6.4	6.0	6.1
m municipal property	3.2	3.1	3.2	3.4	3.4	3.0	2.7	2.5	2.2
private property	57.0	54.2	50.7	53.9	56.3	56.8	55.9	58.1	60.9
mixed Russian property (without foreign participation)	7.5	11.9	12.1	9.5	9.7	8.2	7.8	7.5	7.4
consumer cooperative property	0.03	0.02	0.02	0.02	0.03	0.02	0.01	0.01	0.01
property of public and religious organizations (associations)	0.04	0.03	0.04	0.04	0.1	0.1	0.04	0.04	0.03
property of state corporations	1.2	1.6	1.7	1.7	1.7	1.4	1.4	1.2	1.2
foreign property	5.9	6.0	9.1	7.7	7.0	8.3	7.4	7.4	6.2
joint Russian and foreign property	7.9	6.2	6.4	6.5	6.9	7.4	9.5	8.8	8.2

(Source: compiled by the authors on the basis of Finances of Russia.2018: stats)

Analyzing Table 2, we see that the share of financing investments from Russian enterprises decreased slightly in 2018 compared with 2010 from 86.2% to 85.6%, and due to foreign enterprises increased from 5.9% to 6.2 %. We also note the growth of investments of joint Russian and foreign organizations, their share increased from 7.9% in 2010 to 8.2% in 2018. The highest investment rate of such organizations is 9.5% in 2016.

The largest share is made up of investments in fixed assets - from 2010 to 2018, this share increased from 57.0% to 60.9% of the total volume of financing of investments. The growth of this indicator indicates that private owners of various economic sectors are interested in programs for updating and expanding fixed assets of enterprises.

Figure 1 reflects the dynamics of investments relative to the types of fixed assets of the enterprise.

Fig 1. Change in investment by type of fixed assets, at constant prices, 2008-2017
(Source: compiled by the authors on the basis of Investments in Russia.2018: stat)

In the 1st half of 2018, the largest part of investments in fixed assets of large and medium-sized enterprises was directed to the construction and maintenance of non-residential buildings and structures – 48 %, slightly less – to the creation of machinery, equipment and vehicles – 35.6%. The investment downturn in 2015 had a sharp impact on the Machinery, Equipment and Vehicles group: investments decreased by 22% compared to 2008, and 31.5% compared to 2013 (38.8%). The growth of investments compared to 2008 occurred in 2010, primarily in the groups "Machines, equipment, vehicles" and "Buildings (except residential) and constructions" (102.1% of the 2008 level).

- Total
- Home
- Buildings (except residential) and structures
- Machinery, equipment, vehicles

The Housing group was least interested in investors. However, in 2011 and 2014 in this group there was a turbulent activation of investors and the level of investment rose to 115 and 114%, respectively, exceeding in 2011 indicators for other groups; in 2014, investment indicators for other groups were less than 100%. Since 2015, a drop in investments has been observed in the group of dwellings, a low change in the vector of which occurred in 2017.

In 2016, the volume of investment investments was higher than the level of 2008 for the group of buildings and structures (102.1%) in the first place - during this period, the group of dwellings and cars were lower than in 2008 by 6.0 and 0.2%, respectively.

In 2017, there was an increase in the accumulated increase in capital investments for all types of fixed assets of enterprises. The most attention of investors was occupied by the group "Buildings (except residential) and structures" (5.6%), then the group "Machines, equipment and vehicles" (5.4%), the smaller - "Dwellings" (1.6%).

In the 1st half of 2018, investments in capital (large and medium enterprises) decreased by 1.0% in annual terms. Investments in housing decreased by 1.5%, which was a huge decrease in annual terms and by 0.5 percentage points increased the decline in investments in the groups "Buildings (except residential) and structures" and "Machines, equipment and vehicles". 48.0% of the total investment volume under consideration was investments in the construction and maintenance of non-residential buildings (but in the 1st half of 2017 it was 51.1%), 35.6% - in the creation of machinery, equipment and vehicles (first half of 2017 - 34.1%).

Let us consider the structure of investments in fixed assets in Russia by sources of capital investments in the 1st half of 2014 - the 1st half of 2018 in order to determine their structure by own and attracted resources (Table 3).

Table 3: the Structure and dynamics of investment in fixed assets (large and medium-sized organizations) by source of funding, 2014-2018, %

Indicator	1 floor 2014 year	1 floor 2015	1st half of 2016		1 floor 2017 year		1 floor 2018 year		Change in constant prices, I half-year**

(Source: compiled by the authors on the basis of Dynamics and structure of investments in fixed assets)

The company's own funds (59.7%) are the main source of financing investment activities in the 1st half of 2018. In the 1st half of 2018, the amount of financing from own funds (large and medium-sized organizations) grew by 7.1% in comparable prices from the level of the corresponding period in 2016 and by 5.8% - relative to the 1st half of 2014.

The main elements of the raised funds are the federal and regional budgets, as well as bank loans of domestic and foreign institutions. In general, budget funds management is a socially significant project.

Despite the return of investments in fixed assets to growth at the end of 2016 and an increase in the share of attracted funds in the 1st half of 2017 to 44.0%, in the 1st half of 2018 there was a decrease in the share of attracted funds in the structure of financing investments to 40, 3% In the 1st half of 2018, the amount of borrowed funds decreased by 6.1% compared to the same period in 2016 in comparable prices; the decrease relative to 2014 was 21.1%.

The positive contribution of one of the important categories of external financing - bank loans (+ 1.4% in the 1st half of 2018 relative to the 1st half of 2016 after - 2.3% in the 1st half of 2016 relative to the 1st half of 2014 years) contributed to a slowdown in the volume of borrowed funds in the 1st half of 2017 and 2018. Compared to the period of the previous year (up to 8.0%), the share of bank loans decreased by 3.5 percentage points. The negative dynamics in the structure of funding sources also showed significant component - budget funds, this was due to stabilization of budget expenditures. In the 1st half of 2018, the volume of attracted federal budget funds decreased by 12.4% of the level of the 1st half of 2016.

In the 1st half of 2017, foreign lending of capital investments reached a high value, which is most likely due to a change in the scheme of transnational financing of projects, but according to the results of the 1st half of 2018, the share of this source of financing in the 1st half of 2017 decreased to 1.9% from 6.2%.

Based on the results of the analysis, we draw the following conclusion. In investment activities in the period 2010-2018, there has been some growth restriction. The following factors affect this situation *(Khalyapin and Maslova, 2018)*:
1) the country's economy is unstable;
2) the implementation of investment projects is limited by credit resources with a high cost and a complex mechanism for obtaining them;
3) the implementation of investment projects is also difficult due to the general risk;
4) products manufactured by organizations do not have sufficient consumer demand;
5) the regulatory framework that regulates the investment activities of enterprises is not ideal.
Thus, the reproduction of fixed assets is ineffective if the company does not carry out active investment activities.

First of all, it contributes to the growth of financial indicators and provides great opportunities for the company to use its own sources of financing for development. Secondly, the company is more open to external financing due to its investment activities.

Investment activity, therefore, is an indirect source of financing for the reproduction of fixed assets. The implementation of government contracts also acts as an indirect financial source.

Thus, indirect sources play a large role in financing reproduction processes, so they should be considered together with external and sources of financing. For this purpose, in Fig. 2, we will present a diagram of the formation of the most applicable financial sources in Russia under the conditions of reproduction of fixed assets of companies.

Fig. 2: Formation of financial sources for the reproduction of fixed assets of Russian industrial enterprises

(Source: compiled by the authors)

Fulfilment of the state order is a promising area of support for business development in modern conditions.

Ideally, government contracts for orders should be concluded only with companies that have a modern technological base that allows them to produce a certain amount of products that meet quality standards. In reality, however, supply contracts are often concluded by the state with intermediaries, and not directly with producers of goods.

Since the public procurement system is designed to solve certain social and economic problems, as well as to stimulate the creation of new jobs, increase the competitiveness of industrial enterprises and their development, this approach seems wrong. The same can be said about the approach, which is based only on price criteria, since the low cost of the product may indicate a low quality of the product.

In this context, the acute implementation of government contracts raises the question of which companies have high production potential and are able to sustainably finance reproduction processes. Legislative acts adopted to ensure support for Russian industrial enterprises do not contain clear tools for assessing the sustainability of financing fixed assets reproduction. In the scientific literature, financing of reproduction processes is considered primarily as part of the methods for assessing the innovative and investment potential of a company or analysing the effectiveness of investments and innovative activities. This item requires further study, since it is important to combine both approaches so that it is possible to take into account not only the impact of reproduction policies on the financial results of the company, but also its ability to provide sustainable financing for the reproduction of fixed assets of industrial companies.

At the same time, it should be clear that there is no single method for assessing the sustainability of financing of reproduction processes that would be effective regardless of who the users are and what their goals are.

Since each business entity has individual characteristics, the degree of influence of the same factor on different firms varies significantly. Therefore, this article offers flexible methods for assessing the sustainability of financing the reproductive process, which can be changed in accordance with the objectives of the study.

Conclusions

The analysis of factors affecting the course of reproductive processes showed that most of them change for the following reasons:

- the regulatory framework is imperfect;
- administrative obstacles;
- low return on investment in fixed assets and the lack of financial resources characteristic of industrial enterprises;
- it is difficult to get an investment loan;
- the lack of guarantees for many industrial liquid companies from the point of view of credit organizations;
- The economic situation in the country is uncertain and the risks associated with the market are high.

A change in the situation for the better requires a reorientation of state policy to stimulate expanded reproduction, including reform of the state tax and depreciation policy. The public procurement program, in the implementation of which the proposed methodology can be used, is one of the ways to support industrial companies.

As a brief analytical review of the regulatory results on attracting investments and the practice of using measures, tools and mechanisms shows, the effect on stimulating capital inflows, increasing the attractiveness of investments of producers and their associations is based on the following main points:

- financing based on the capabilities of the consolidated state budget;
- attracted sources of loans and long-term investment funds prevail in the structure of attracted sources;
- at the expense of investors, the amount of funds raised is limited.

Given the limited public resources necessary to support sectors of the economy, the formation and development of a mechanism for regulating the attractiveness of investments of direct producers of goods is an important direction for ensuring the development of the enterprise. To implement this mechanism, it is necessary to create investment institutions that focus on long-term capital investments, it is necessary to facilitate the placement of bonds of large producers to finance investment projects, taking into account the state guarantees provided, as well as guarantee the refinancing of such securities by the Bank of the Russian Federation and capital insurance.

Abstract

The method of measuring the value added of intellectual capital (VAIC) was proposed by A. Pulic in 2000 and is known both to practitioners and researchers. Its main advantages, firstly, include the objectivity of the data used, secondly, their accessibility for calculations and observations, and thirdly, their compatibility for comparison with other enterprises. The article presents the results of measuring the intellectual capital value of a large number of Russian small and medium-sized machine-building enterprises using this VAIC method. The obtained results gave an idea of the existing trends in the development of the intellectual capital of these enterprises in 2014-2018, as well as allowed us to make conclusions on the peculiar features of the intellectual capital development of individual samplings covering small and medium-sized enterprises. We concluded that the method is applicable not only for obtaining the data on the level of the intellectual capital of an individual enterprise but also groups of enterprises. The hypothesis of the research is that due to the increasing complexity of the business environment and production, enterprises will experience a growth of structural capital represented by company assets, such as business processes, digital assets, software products, etc. At the same time, the level of human capital can both remain at a stable level and fall. This assumption is based on the fact that over the past decade, an unfavourable trend of a drop in the actual household incomes was formed in Russia. The basis of the household income is wages as an indicator of investments in the company's human capital. These trends can be manifested differently in different industries and enterprises. The value added of human and organizational capital was measured according to the data on the activities of small and medium-sized industrial enterprises of one of the most industrially developed regions of Russia - Chelyabinsk region.

Keywords: intellectual capital, human capital, structural capital, methods of measuring intellectual capital, value added of intellectual capital

Introduction. Overview of the approaches to the scope and composition of intellectual capital

The concept of intellectual capital is one of the fundamental ones in the terminological field of the knowledge-based economy. Since the middle of the XVIII century, economists noted the role of a human being and his/her abilities to increase productivity. F. Machlup *(Babaev, 2015)* introduced the concept of the knowledge-based economy and identified its relevant fields (education, research, information technologies, and services). The term "intellectual capital" was proposed in 1969 by J. Galbraith *(Gelbrejt, 2008)*, as a set of intellectual activities.

In the modern sense, the concept of intellectual capital was first considered by the American economist T. Stewart; his research determined for many decades the prospect of studying the knowledge and competencies of company employees as a critical factor in the competitiveness of modern enterprises (Stewart, 1997). Further research already deals with the study of intellectual capital elements not in general by fields and markets, but primarily at the company level. Among the most eminent researchers, we should mention Swedish scientists L. Edvinsson and M. Malone (2001), who proposed the classic structure of intellectual capital elements, E. Brooking (2001), who did not only investigate but also put into practice intellectual capital management activities, demonstrated the connection of intellectual capital with intangible assets and indicated that its components are human assets, intellectual property, infrastructure and market assets. J. Roos, S. Pike, and L. Fernstem (2010) propose to consider intellectual capital as a non-monetary and intangible resource, which is controlled by the company, like any other asset, and adds value for it.

In the Russian economic literature, V.L. Inozemtsev (1995), B.B. Leontiev (2002), A.N. Kozyrev and V.L. Makarov (2003) and others paid attention to investigating this matter.

There are still discussions on whether we can separate intellectual capital from the knowledge holder - the company employee. In this connection, the dual nature is inherent in the concept of organizational capital (business processes, infrastructure, databases, etc.) as the part of intellectual capital in general, which remains in the company even when the people who created it left the company. This duality follows from the fact that today's intellectual labour does not produce material objects but intellectual assets, each of which embodies the past labour.

Similar studies were also carried out by Arab scholars in the field of economics and finance. For example, Al-Anzi (2001) defined intellectual capital as useful knowledge that can be used and invested properly in the company's interests. Avad and Ghaziri (2004) believe that intellectual capital is represented by a group of individuals who use mental capabilities to make a company unique.

Dr. Hani Abdu believes that intellectual capital is intangible assets which are part of the company's capital and include human, structural and relational components contributing to the generation of new and innovative ideas, helping to survive. Dr. Savsan Abdulhamid Morsi (2008) defined intellectual capital as "a unique set of assets and knowledge based on innovative human minds, business skills, and customer relationships, which leads to a continuous generation of ideas and new methods adding value to the company and maintaining its competitiveness". Hazem Ali Badarneh defines intellectual capital as actual investments in knowledge and information able to serve an integrated system *(Hazem, 2009)*.

The diversity of interpretations is explained by the fact that different companies of even one industry have a significant specificity preconditioned by its strategy, competencies, material assets, and business model. Therefore, the problem of some unification of approaches is relevant. After substantial research, the Organization for Economic Cooperation and Development (OECD) concluded that "intellectual capital is the economic value of two categories of intangible assets of a company: organizational (structural) capital and human capital" *(Canibano, 2019)*. This approach has become classic, and many researchers consider it to be the most practical and useful *(Petty and Guthrie, 2000)*. The company's infrastructure (software systems, distribution, sales and supply channels, etc.) is included in the composition of structural capital. Human capital consists of the

human resources of the company's personnel, as well as external human resources of buyers and suppliers. This allocation of elements of intellectual capital is necessary for its effective management and increase in the company value.

One of the conditions for the effective management of any asset is its measurability. This issue remains relevant because according to many economists, the complexity of measuring the value of an asset is a characteristic feature of an intellectual asset (Fig 1) *(Caddy, 2000)*. Thus, researchers note that intellectual capital cannot have a direct monetary value. Its other characteristic is the possibility to exist only within an operating business; therefore, such an asset cannot be sold separately from a company, and when the company ceases, the existence of such an asset also ceases. These properties of intellectual capital preclude its direct measurement methods.

Fig 1. Classification of assets by the measurability feature
(Source: Caddy, 2000)

The study of many intellectual capital measurement methods and models has led us to the conclusion that we can distinguish several groups briefly presented below. Direct measurement methods involve the identification and assessment of individual assets or elements of intellectual capital in monetary terms, while the total value of intellectual capital is summarized. Market capitalization methods define the difference between market value and the value of the company's net assets and are close to the concept of goodwill. Market value is measured by conventional assessment methods (direct capitalization or cash flow discounting). This method is preferable in the presence of market quotes. In particular, in practice, many companies use D. Tobin ratio as the most convenient and understandable. However, these methods are inapplicable to companies not present in the stock market.

The third group is based on measuring the return on assets. T. Stewart proposed a capitalized value of intellectual capital based on the excess of the return on assets over the industry average *(Stewart, 2007)*. The Value Added Intellectual Coefficient (VAIC) method proposed by A. Pulic belongs to this group of methods because the value of intellectual capital is calculated by analogy with the calculation of the return on assets. This model determines the efficiency of using three types of company resources: capital employed efficiency (CEE), human capital efficiency (HCE), and structural capital efficiency (SCE). The VAIC model includes the following formulas (1-4). The higher the VAIC indicator, the higher is the company's intellectual capital and its ability to create added value *(Pulic, 2000)*:

$$VAIC = CEE+HCE+SCE \quad (1)$$

$$CEE = VA/CE \quad (2)$$

$$HCE = VA/HC \quad (3)$$

$$SCE = (VA - HC)/VA \quad (4)$$

where **VA** is the value added,
VAIC is the value added intellectual coefficient (1),
CE is the capital employed (or invested capital),
CEE is the return on invested physical capital calculated by the value added (2);
HC is the human capital,
HCE is the return on invested human capital by the value added (3);
SC is the structural capital,
SCE is the effectiveness of creating the company value at the cost of structural capital (4).

The advantages of this model include the simplicity of calculations and the availability of financial data. The disadvantages include a failure to take into account the time element, which cheapens intellectual capital *(Flamholtz, Searfoss and Coff, 1998).*

This group may also include the managerial efficiency method, which allocates a part of the company's income created by the management's art and intelligence and calculates the ROM (return on management). This method was proposed by P. Strassman *(Strassman, 1987)*.

The fourth group (Scorecard Methods) assumes that various elements of intellectual capital are assessed by expertise, and indicators have the form of indices obtained by scoring. This is a well-known balanced scorecard of R. Kaplan and D. Norton (2003), Intangible Assets Monitor by K.E. Sveiby, IC Index of J. Roos (1997), Scandia Navigator of L. Edvinsson and M. Malone *(Edvinsson and Malone, 1999)*.

The fifth group (intangible asset assessment method) includes a set of methods based on the traditional approach to intellectual property valuation *(Flamholtz, Searfoss and Coff, 1988)*.

The sixth group is a model for Human Resources Accounting, HRA, while their economic value is calculated by capitalizing labour costs *(Flamholtz, Searfoss and Coff, 1988)*, J. Hekimian and C. Jones *(Hekimian and Jones, 1967)*, Baruch Lev and Aba Schwartz (1971, 2013).

Out of the above methods, we should choose a model suitable for measuring the dynamics of intellectual capital for large groups of enterprises and in the long term. This calls for compliance with the following conditions: firstly, necessary available information on a large number of enterprises, and secondly, compatible data for different periods and different enterprises.

The classic work of G. Smith and R. Parr (1994) "Valuation of Intellectual Property and Intangible Assets" gives a table ranging the approaches to assessing intellectual property assets (Table 1). If an asset is recognized in accounting, it is generally recommended to use the income approach. Such assets include patents, copyrights, trademarks, software products with market potential, etc. It is recommended to apply the cost method to assets united in this study by the concept of organizational capital (management's information software, skilled labour force, corporate practice and procedures, distribution networks).

Table 1: preference of approaches to assessing elements of intellectual capital and intellectual property

Types of assets	Primarily used approach	Secondly used approach	Poorly used
Patents and technologies	Income	Market	Cost
Trademarks	Income	Market	Cost
Copyright items	Income	Market	Cost
Skilled labour force	Cost	Income	Market
Management's information software	Cost	Market	Income
Software products	Income	Market	Cost

Distribution networks	Cost	Income	Market
Mineral assets	Income	Market	Cost
Franchising rights	Income	Market	Cost
Corporate practice and procedures	Cost	Income	Market

(Source: compiled by the authors)

Several works, in particular, T.M. Orlova and A.L. Gaponenko (2008), note that the purpose of creating intellectual capital is to provide a company with competitive market advantages and thereby to add value. Thus, the VAIC method is most appropriate for assessing intellectual capital within the framework of this study. It refers to cost methods, which does not conflict with the fundamental approaches to measuring such assets, and is based on the assessment of value added, which meets the goals of investing in the creation of intellectual capital. The method enables to evaluate the contribution of two elements of intellectual capital – human and structural – to add the company's value, which also corresponds to expert approaches to the allocation of elements of intellectual capital.

To identify the dynamics of the intellectual capital value of Russian enterprises, we made a sampling of over 70 machine-building enterprises with revenue from €5 to €50 million. The information was obtained from the SPARK-Interfax database of Russian enterprises for the period of 2014–2018. The use of the primary calculation methodology is shown on the example of TEMZ LLC, which is well-known in the Russian and foreign power engineering equipment market. The calculation algorithm is as follows:

- selection of the necessary data from the company's published statements;
- adaptive calculation of the value added according to the VAIC method (Table 2);
- calculation of the physical, human and structural capital value according to the formulas used in this method (Table 3);
- calculation of the total VAIC amount (Table 3).

Table 2: initial values of the indicators for calculating the value added of intellectual capital according to the VAIC model of TEMZ JSC, thousand rubles (Source: compiled by the authors)

Indicators	2014	2015	2016	2017	2018
1. Owned capital	380.672	397.312	421.981	430.900	425.627
2. Long-term liabilities	384	204	16	0	92
3. Receipts from sales	219.624	379.626	493.044	457.616	355.634
4. Product cost	203.041	315.968	398.041	356.664	305.245
5. Labor costs	84.285	116.822	148.743	206.673	170.069
6. Costs (cl. 4 – cl. 5)	118.756	199.146	249.298	149.991	135.176
7. Invested capital (cl. 1 + cl. 2)	381.056	397.516	421.997	430.900	425.719
8. Value added (cl. 3 – cl. 6)	100.868	180.480	243.746	307.625	210.458

Table 3: the results of calculating the value added of intellectual capital (VAIC) for TEMZ JSC over 2014-2018 (Source: compiled by the authors)

Indicators	2014	2015	2016	2017	2018
Physical capital (CEE)	0.26	0.45	0.58	0.71	0.49
Human capital (HCE)	1.20	1.54	1.64	1.49	1.24
Structural capital (SCE)	0.16	0.35	0.39	0.33	0.19
Value added of intellectual capital (VAIC)	1.63	2.35	2.61	2.53	1.92

The obtained indicators indicate that in the observed period, there is a significant increase in physical capital, while the dynamics of human and structural capital is unstable: after their growth in 205-2017, the indicators almost returned to the level of 2014. Further conclusions can be made when comparing these indicators with the competitors' and industry average indicators.

Results and Discussion

In the course of the study, we made three measurements of the value added of intellectual capital: for the entire sampling (72 machine-building enterprises, Chelyabinsk region, Russia), including small enterprises (49 enterprises with the revenue from € 5 million to € 10 million), and medium-sized enterprises (23 enterprises with the revenue from € 10 to € 50 million). The average indicators are calculated for all the enterprises ignoring their scale and other factors. We had to reject the calculation of revenue-weighted indicators, since the role of small enterprises became insignificant, and the average indicators actually reproduced the trends typical of medium-sized enterprises with significantly larger revenues. The enterprises having a drop in revenue and/or losses in any year of the studied period were also rejected. Thus, all the enterprises in the sampling are more or less focused on their development and growth, and such an approach corresponds to the essence of value added as an indicator characterizing the enterprise's contribution to adding value for the national economy.

The resulting dynamics of the indicators are presented in Table 4 and Figure 2. In the entire sampling of the enterprises over five years, we observed a general increase in the Value Added Intellectual Coefficient; however, this dynamics differs in its various elements. So, there is a slight increase in the Capital Employed Efficiency (CEE) and Human Capital Efficiency (HCE). Still, at the same time, there is a more significant increase in the Structural Capital Efficiency (SCE). On the whole, this confirms the hypothesis of the outrunning growth of structural capital and an increase in its role for the development of companies.

Table 4: the results of calculating the Value Added Intellectual Coefficient (VAIC) for a group of machine-building enterprises over 2014-2018 (Source: compiled by the authors)

	2014	2015	2016	2017	2018
Capital Employed Efficiency (CEE)	1.53	1.75	2.03	1.70	1.63
Human Capital Efficiency (HCE)	2.21	2.23	2.12	2.33	2.36
Structural Capital Efficiency (SCE)	0.39	0.44	0.43	0.51	0.54
Value Added Intellectual Coefficient (VAIC)	4.13	4.42	4.48	4.54	4.60

Fig. 2: The dynamics of the intellectual capital efficiency indicators for a sampling of machine-building enterprises over 2014-2018 in Chelyabinsk region, Russia (Source: compiled by the authors)

Then, we built corresponding diagrams for each subgroup in the studied complex. A fairly stable level of the return on value added on invested capital, with its slight growth in the middle of the period, is observed for the group of small enterprises (Table 5, Figure 3). However, there is a significant increase in the efficiency of both human and structural capital. It was difficult to propose this conclusion as a research hypothesis due to the lack of statistical measurements covering separately the groups of small and medium-sized enterprises. The Russian official statistics highlights only a group of small enterprises with revenues of up to 5 million euros, which refers to small business according to the Russian legislation. In our study, we used the approaches to the size of small and medium enterprises adopted in Europe (Annual Report on European SMEs 2013/2014).

Table 5: the results of calculating the Value Added Intellectual Coefficient (VAIC) for a subgroup of small machine-building enterprises over 2014-2018 (Source: compiled by the authors)

	2014	**2015**	**2016**	**2017**	**2018**
Capital Employed Efficiency (CEE)	2.06	2.31	2.36	2.01	1.90
Human Capital Efficiency (HCE)	1.60	1.63	1.72	2.67	2.50
Structural Capital Efficiency (SCE)	0.35	0.38	0.38	0.50	0.55
Value Added Intellectual Coefficient (VAIC)	4.01	4.32	4.46	5.18	4.95

Fig. 3: The dynamics of the intellectual capital efficiency indicators for a subgroup of small machine-building enterprises over 2014-2018 (Source: compiled by the authors)

An analysis of larger enterprises in the sampling (with revenues from 10 to 50 million dollars) led to other conclusions (Table 6). These enterprises are characterized by more substantial growth of the Capital Employed Efficiency (CEE); however, the Human Capital Efficiency (NSE) reduces, and the growth of the Structural Capital Efficiency (SCE) cannot be called significant. In general, the total indicator of the Value Added Intellectual Coefficient (VAIC) almost does not increase. An analysis of this group of enterprises confirmed the research hypothesis regarding the growth (albeit insignificant) of the Structural Capital Efficiency (SCE), however, worsening of the Human Capital Efficiency (NSE), unlike smaller enterprises, cannot be explained logically. In our opinion, we can interpret this situation taking into account the specifics of the analyzed period and suggest that at larger enterprises, the increase in personnel costs was insignificant or was not observed at all over this period. At the same time, the companies did not experience a shortage of labor resources because the employees preferred to work at larger (hence, more stable) enterprises, even at lower wages. On the other hand, smaller enterprises experienced a shortage of specialists, which tends to grow. For this reason, they are forced to raise wages and, therefore, added value to attract specialists.

Table 6: The results of calculating the Value Added Intellectual Coefficient (VAIC) for a subgroup of medium-sized machine-building enterprises over 2014-2018 (Source: compiled by the authors)

	2014	2015	2016	2017	2018
Capital Employed Efficiency (CEE)	0.93	0.78	1.30	0.91	1.27
Human Capital Efficiency (HCE)	2.47	2.45	2.05	2.08	2.12
Structural Capital Efficiency (SCE)	0.46	0.46	0.45	0.53	0.51
Value Added Intellectual Coefficient (VAIC)	3.86	3.69	3.80	3.52	3.90

Fig. 4: The dynamics of the intellectual capital efficiency indicators for a subgroup of medium-sized machine-building enterprises over 2014-2018 (Source: compiled by the authors)

Conclusions

The research results led to the following conclusions. The use of the method of economic added value of intellectual capital to assess the dynamics and quality of the growth of Russian enterprises gives satisfactory results, which are well interpreted and allow us to supplement the conclusions of other researchers regarding the growth quality of Russian machine-building enterprises over the past five years, as well as to identify problems. In particular, we can note that in general, the intellectual capital indicators evidence their high role for the growth of enterprises and their market success. The positive dynamics of all the indicators confirm this conclusion. The Structural Capital Efficiency indicator demonstrates the highest growth rates. However, we should note several problems. The Capital Employed Efficiency indicator shows an unstable dynamics; its level of 2018 almost does not exceed the level of 2014. It means that the return in the form of added value per 1 ruble of the invested capital does not have a steady upward trend. First of all, we should look for reasons for the under-capacity of equipment and other active elements of the companies' fixed assets and their inefficient use.

The Human Capital Efficiency indicator shows a weak growth, and this is an alarm signal for managers. This problem can be possibly caused by the lack of any increase in the earning power level. This, in turn, is caused by the lack of a sufficient growth of workers and specialists' wages, which does not create adequate motivation for professional growth. At the same time, the Structural Capital Efficiency indicator shows fairly rapid growth, and this confirms the central research hypothesis. Structural capital grows due to the spread of such a useful management tool as lean manufacturing, which has started to be rapidly implemented in the practice of Russian enterprises.

Finally, the use of the method allowed us to highlight the peculiar features of the development of small and medium-sized enterprises. Thus, small enterprises demonstrate higher and more stable growth rates of human capital (from 1.6 to 2.5 over five years) and structural capital (from 0.35 to 0.55). We can say that more than half of the value added is already created by structural capital (effective business processes, software products, etc.). At the same time, there is no growth in the Capital Employed Efficiency, which can be explained by an insufficient upgrading of equipment and technological processes due to the economic recession, sanctions, etc. However, this may create difficulties for business development in the coming years. An increase in the efficiency of invested capital is a priority task for small enterprises in the following period.

Enterprises with a large volume of revenue show other trends. First of all, the relatively high growth rates of the Capital Employed Efficiency indicator at a decrease in the Human Capital Efficiency (from 2.47 to 2.12 over five years) may indicate that enterprises with larger financial capabilities seek to make physical capital but not the employees qualifications and competencies the main growth factor. Besides, we also stated above that such a situation could be possibly caused by an insufficient growth of the wage level. We believe that this can create significant difficulties for this group of enterprises since human capital is the basis of intellectual capital, all the rest is considered as a result of its labour and qualifications. Therefore, a loss of competitiveness and a slowdown in development may occur in the coming periods. The absence of a noticeable increase in structural capital indirectly confirms this conclusion, since it is also a consequence of human capital development.

The use of the VAIC method has good prospects for measuring the growth quality of various groups of enterprises and timely adjusting of their strategies. Besides, the method allows us to add new variables to the existing models studying the growth and development factors of enterprises. We believe that building economic and statistical models based on the use of the results of the obtained calculations of the companies' human and structural capital effectiveness will be the main line of the further work on the development of this method and an increase in its information content and practical value.

Abstract

Corruption in the field of public procurement is of particular importance because approximately 20% of the European Union's gross domestic product (GDP) is spent each year by public authorities for the procurement of works, products and services. Fight against corruption is a priority for all governments, this being necessary for achieving the political objectives by spending public funds as efficiently as possible. The research examines the most important studies regarding the phenomenon of corruption in the United States of America and European Union. The article also presents the results of an opinion survey using a questionnaire. The questionnaire was designed by the authors, consisted of 15 questions and was applied on a sample of 61 Romanian purchasers. The survey analyzes the main characteristics of the phenomenon of corruption in public procurement in Romania, as well as the causes, consequences and main measures to combat corruption.
Also, the survey examines a number of specific topics about the phenomenon of corruption in public procurement, such as: the correctness of winning contracts by economic operators, the degree of supervision of the award of contracts by the state authorities, the efficiency of the use of public procurement funds, financing of political parties in exchange for winning public contracts, the most exposed contracting authorities to the risks of corruption, the procurement procedures most prone to corruption, winning public contracts by using bribery and connections, the most favourable cause of corruption, the pressures of the political factor on the public procurement system and the most effective anti-corruption measure.

Keywords: Public Procurement, Risks Of Corruption, Corruption, Bribery, Conflict Of Interest.

Introduction

Even though the phenomenon of corruption in public procurement is a particularly important one, the specialized literature has not sufficiently addressed this subject. Due to the hidden character, the fears of self-incrimination of the subjects questioned and the penalties provided by the law, corruption in public procurement still seems to be a taboo subject. However, due to the very large amounts spent, complex legislation and relatively reduced controls of the responsible authorities, the field of public procurement remains ideal for corruption.

The major political challenges at European level can be solved by carrying out efficient public procurement. These challenges are: fight against corruption, job creation, sustainable economic growth (social and environmental), the modernisation of central and local public administrations, improving fiscal discipline, facilitating the participation in the procurement procedures of small and

medium-sized entreprises, innovation and increasing citizens' level of confidence in public authorities (European Commission, 2017).

By the reform of procurement systems can be achieved important savings on central and local budgets, because of the size of public funds allocated for public procurement. For example, in the United States in the year 2000, the total of non-military purchases amounted to 1,031 billion dollars (approximately 20% of GDP) (Bureau of Economic Analysis, 2001) and for the year 2019 the United States Senate approved a defense budget of 716.3 billion dollars, growing up with 113.3 billion dollars compared to the 2018 budget, when the budget for the Pentagon was 603 billion dollars. Also, in the year 2002, public procurement in the EU totalled about 1,500 billion euros, which means 16% of EU's GDP, (European Commission, 2007), and in 2016 the total amount of public procurement (including those for utilities) was about 2,300 billion euros, representing 19% of EU's GDP (European Commission, 2017).

There are other areas in which the reform of public procurement systems can achieve important savings such as medicine, the oil industry, the aerospace industry, certain industries that are "reinventing" starting with utilized raw materials, and this interdependence is highlighted in the papers such as "Internal Medicine Papers" (Popescu, A.L., Costache, R.S., Savulescu, F., Jinga, M., Ionita-Radu, F., 2019), "Surgical team and surgical communication" (Dutu, C., Luchian, A., Starcu, E., Savulescu, F., 2015), "Theoretical Aspects, Modern Treatment Options and Practical Case Presentations in Hip and Knee Tumoral and Revision Bone Defect Reconstruction Surgery" (Dinache, G., Drignei, M., Ganatsios, S., Jovent, E., Costea, R., Savulescu, F., Lupascu, S., 2018), "ICT and its impact upon the globalization and the accessibility of the education in health domain" (Alexandru, A., Ianculescu, M., Parvan, M., Jitaru, E., 2007), "Patient-centered innovative monitoring system and smart personalized health care services using ICT" (Ianculescu, M., Alexandru, A., Radulescu, C/Z., 2018), "A Pilot Study on Management Systems Implemented within Romanian Organizations" (Popa, I., Stefan, S.C., Popescu, D.I., 2015), "An Exploratory Study on Knowledge Management Process Barriers in the Oil Industry" (Ceptureanu, S.I., Ceptureanu, E.G., Olaru, M., Popescu, D.I., 2018), "A Parametric Approach for Filling the Gap between Raw Data and Knowledge Based Engineering in the Aerospace Industry" (Alexandru, T.-G., Pupaza, C., 2018), "Green Fashion – a new possible lifestyle for Romanians" (Popescu, D.I., 2013), "Ways for Romanian clothing companies to perform whole exports in the international slump context" (Popescu, D.I., Bagu, C., Popa, I., Hancu, D., 2009)

Unfortunately, in the year 2012, according to governance indicators of the World Bank, from a total of 215 countries analyzed, Romania was in the last place in terms of governance efficiency and control over corruption, bribery being considered the most common form of corruption in public procurement, followed by rigged procurement and conflict of interest (LP, 2017).

Literature Review

The most well-known definition of corruption is "the abuse of power for private gain" (TI - Transparency International, 2015; EC - European Commission, 2014). Another definition mentioned in the literature is "using the public function for private gain" (Gray and Kaufmann, 1998).

The subjects of the acts of corruption in the public administration are the civil servants, who are granted (by election, appointment or law) certain obligations and rights in order to perform the functions in a public institution or public service (Păceșilă, 2004).

Acts of corruption can take place at various hierarchical levels: from state presidents or important politicians (political corruption) to the lowest levels of civil servants in local administration (bureaucratic corruption) (Rahman et al., 2015).

The complexity of the corruption phenomenon is high due to economic, political, cultural and social dimensions of it (Lefter, 2015).

Compared to private companies, the public sector has a number of political and social objectives. The modus operandi and philosophy of the corrupt civil servants are influenced by economic, political and social factors that are determined by the government and society in general (Han and Wild, 1991).

According to Buchner et al. (2008), bribery is a phenomenon difficult to prove and study, due to its illegal nature, which is a contributory factor for hiding it.

TIR - Transparency International Romania (2014) and Evenett and Hoekman (2005) estimated that, due to corruption, public procurement costs may increase by 20-25% (or even up to 50%).

These additional costs are explained by the fact that the bribe given by companies is recovered by increasing the value of public contracts, which leads to inefficient use of public funds.

Moreover, according to a study published in 2013 which analyzed five sectors of activity (waste and water, rail and road transport, vocational training, constructions, research and development) in eight EU Member States (Italy, France, Lithuania, Hungary, Poland, Netherlands, Spain and Romania) the direct costs of corruption have been estimated in 2010 to a value between 1.4 and 2.4 billion euros (Pricewaterhouse Coopers & ECORYS, 2013).

In Romania, the most exposed contracting authorities to corruption risks are local administrative authorities and the most vulnerable areas are waste management, healthcare, energy, telecommunications, information technology, constructions and urban development (Lefter, 2015; CJI - The Clean Justice Initiative, 2015). Furthermore, public procurement for the defense and security sector is considered to be sensitive due to the low degree of transparency (CJI, 2015).

According to Romanian Government Decision no. 875/2011, the most important fraud systems in Romanian public procurement are the following:

- corruption (kickbacks and bribe);
- failure to declare conflict of interest (favouring a certain tenderer);
- practice of secret cooperation which is carried out through submission of friendly/courtesy tenders, market sharing, abstaining from participation, rotation of tenders;
- very different offers;
- manipulation of technical specifications, so that the product specification established by a contracting authority matches the products tendered by a particular bidder or very few bidders;
- disclosure of data from procurement procedures (non-compliance with the confidentiality of tenders) from which benefits a certain tenderer;
- manipulation of offers by the personnel of the contracting authority after the submission of tenders. This system of fraud is eliminated in the case of procedures carried out online;
- fragmentation of procurement in two or more lots/procedures of smaller values to avoid a competitive procedure;
- unjustified award of a procurement procedure to only one bidder through the development of very restrictive technical specifications;
- combination of contracts by carrying out of non-competitive procedures which previously have been carried out as competitive procedures;
- establishment of incorrect costs which do not correspond to the reality or to the contractual conditions;
- price manipulation by offering high prices in comparison with similar contracts;
- failure to meet the contractual requirements by delivering lower quality products or failure to submit test or inspection certificates/documents;
- presentation by the supplier of excessive, fake or double bills;
- the existence of a fictitious service providers;
- product substitution which consists in the replacement of contracted products with others of inferior quality, without the knowledge of the contracting authority.

From the analysis of corruption risks of the three stages of the procurement process (planning of the procurement, actual conduct of the procedure and implementation of the contract) result the following:

- planning stage presents a high risk due to the manipulation of the contracting authority's needs, estimated value of the procurement, establishing technical specifications, award criteria / evaluation factors that are more favourable to a certain tenderer and do not reflect the advantages which the contracting authority seeks to achieve;
- actual conduct of the procedure, which is the most regulated stage in legal terms, has a lower corruption risk. The main risks of this stage are the manipulation of the selection board members, conflict of interest, disclosure of confidential information and agreements between the tenderers;
- contract implementation is the riskiest stage because the contracting authorities don't have control over the execution of the contract - the winning tenderer is responsible for fulfilling the contract. The main risks that may manifest in this stage are the delivery of non-conforming products or do not meet the specifications, using materials of inferior quality, invoicing unreal costs or deliberate and unjustified delay of the payment by the contracting authority.

A less known but highly criticized concept that has been analyzed by other authors was "efficient corruption". According to Leff (1964) corruption is an extra-legal institution that is used by groups or individuals to influence bureaucratic activities, which also has positive effects because it can "grease the wheel" of economic growth, especially where public institutions are weak. The mentioned author considers that the phenomenon of corruption can have a positive impact on economic growth because:

- can make bureaucratic civil servants work harder because they are motivated by bribes;
- can avoid bureaucracy, administrative formalities, because bribery works as money that speeds bureaucracy (speed money);
- can lend a "helping hand" in attracting foreign direct investments;
- can introduce an element of competition in the situation of closed markets (such as natural monopolies) (Leff, 1964).

Also, Lien (1988) believes that the corruption phenomenom can be efficient in the states with weak public policies.

The studies regarding the positive effects of corruption have been severely criticized by other authors. Shleifer and Vishny (1993) highlighted the hidden aspect of corruption that makes it difficult to manage, expensive and distorting. Corrupt civil servants can intentionally increase system delays hoping that they will get more bribes and companies will waste more time in meeting the requirements of the regulations in force (Kaufmann and Wei, 1999). History has shown that when corruption was very well organized or even centralized, the effects on the economy of the respective country were very harmful (Wedeman, 1997).

Wei (2000) studied the effects of corruption on foreign direct investment. The author has shown that corruption negatively affects the capacity of a state to attract foreign direct investment.

Mauro (1998) showed that between the phenomenon of corruption and the investment rate there is a negative correlation and the investment rate is correlated with the economic growth. The author also pointed out that corruption reduces expenditure on education which stimulates economic growth.

Lambsdorff (2003) analyzed the relationship corruption – productivity and determined that an increase of one point on a scale from 0 (reduced corruption) to 10 (high corruption) leads to a decrease in productivity by 2%.

Tanzi and Davoodi (1998) studied the link between project corruption and infrastructure cost and quality. The authors concluded that corruption is correlated with:

- higher public investments;
- inferior quality of the infrastructure;
- lower government revenues;
- higher costs for infrastructure maintenance (Tanzi and Davoodi, 1998).

The Causes of Corruption

According to Aidt (2003) there are three main conditions that favour corruption in any state:

- the discretionary power of civil servants to establish and manage policies and regulations (Ling and Tran, 2012);
- the economic benefits that can be obtained by manipulating decisions by the responsible factors;
- weak government institutions and political processes lacking dinamism (Shleifer and Vishny, 1993).

Unfortunately, the Romanian companies consider that the rules concerning fairness and transparency of the procurement procedures don't work efficiently.

In the year 2012, 90% of the companies considered that Romanian political regime establishes the rhythm of public procurement (IPP - Institute for Public Policies, 2012). The political factor intervened on the public procurement system especially through local politicians pressure over the political leaders and central authorities which resulted in influencing the procurement procedures and amending the legislation (Expert Forum & OLAF, 2014).

The first report on corruption in EU Member States was released in 2014, one of the horizontal themes being the corruption in public procurement. In the report have been included the conclusions of a survey conducted at European level during the period February – March 2013. In the case of Romania, 91% of respondents considered that the level of corruption is high (well above the EU average of 75%), 64% considered that the domain is characterized by clientelism and nepotism, 82% considered that the utilization of "connections" and bribery represent the easiest way to get public service, 42% considered that friends and family are favored in various public institutions and 38% considered that funding of political parties in exchange for influence or public procurement contracts represents a reality (European Commission, 2014).

The main causes of corruption are human greed combined with poor administration of the field of public procurement by the national regulatory authorities (TIR, 2014). A performing public procurement process requires a proper functioning of the ex-ante and ex-post controls, of the system of appeals and remedies and especially of the conflict of interest and corruption prevention system.

Lefter (2015) considered that the most important vulnerabilities of the Romanian public procurement system that emphasizes the corruption risk are the instability of the legislative framework, discrepancies between primary, secondary and tertiary legislation, the shortage of purchasers and poor training of them meaning low administrative capacity of the contracting authorities and quality of competition (reduced competition).

Measures to prevent and combat corruption

The eradication of corruption is one of the great challenges that all countries face.

Rose-Ackerman (1996) believed that the phenomenon of corruption can be diminished by increasing the possibility of identifying and punishing corruption, increasing the transparency of procurement procedures, increasing penalties and benefits for honest civil servants / purchasers.

Auti and Skitmore (2008) and Akbar and Vujić (2014) appreciated that the phenomenon of corruption can be significantly reduced by implementing cultural changes and raising the level of education.

There is also an inversely proportional relationship between the indicators characterizing corruption and those relating to professional standards, transparency, compliance with contractual clauses and the fairness of penalties (Tabish and Jha, 2012). As regards transparency of procurement procedures, Kenny (2012) considered this to be a key element in the fight against corruption.

Păcești lă (2004) considered that the following measures are needed to prevent and combat corruption in the public administration in Romania:

- adopting a clear and efficient legislative framework, eliminating the ambiguities and legislative gaps;
- employment and promotion of civil servants should be done only on the basis of professional criteria (merits and performance) and not on the basis of political criteria;
- promoting a transparent decision-making system accompanied by a correct and complete information of the citizens;
- establishing a decent level of pay that attracts competent officials;
- implementation of anonymous mechanisms for detecting causes of corruption by citizens;
- the selection process of civil servants must be rigorous (transparency of competitions and examinations for employment / promotion);
- training and professionalization of civil servants;
- correlating the level of pay with the responsibilities of the officials and the complexity of the work perform by them (Păcești lă, 2004).

A course of action in the fight against corruption is the professionalization of purchasers. Training procurement experts, which must be continuous, protects the public budget and the head of the contracting authority who signs the public procurement contract and firstly supports all the consequences for any deviations from the legal requirements (Expert Forum and OLAF, 2014).

Another direction of action in the fight against corruption is the establishment and the efficient operation of some mechanisms for reporting the acts of corruption and for the protection of whistle-blowers against any possible reprisals.

According to a study conducted by Milieu Ltd. for the European Commission in 2017, the potential benefits of the protection of whistle-blowers in the field of public procurement for the entire European Union have been estimated between 5.8 and 9.6 billion euros / year (Milieu, 2017).

Moreover, the Romanian National Strategy on Public Procurement regarding the reform of the public procurement system for the period 2015 – 2020 stipulates that a function will be developed on the site of Romanian Agency for Public Procurement (ANAP) by which it will be possible to file complaints anonymously (ANAP, 2015). Currently, this function doesn't exist on the ANAP website.

Research Methodology

The research was conducted by using a questionnaire.

The questionnaire is an investigative tool that consists of a set of written questions and graphic images, logically ordered, which determines answers from the persons questioned. These answers are then summarized and represented in writing. Establishing the order of the questions is made so that

the respondents are as relaxed as possible and the answers received are as sincere as possible (Chelcea, 2001).

The research methodology consisted of the following steps: analysis of literature on corruption, preparation of the questionnaire, identification of the persons to be questioned, submission of questionnaires and receipt of the responses, analysis and interpretation of responses and synthesis of results.

The questionnaire was designed by the authors, consisted of 15 questions and was applied on a sample of 61 Romanian purchasers. The answers are based on multi-variant grids, single-response grids and grading scales.

The target group of the questionnaire consisted of 61 respondents, of which 29 were purchasers from companies and 32 were purchasers from contracting authorities.

The questionnaire was sent to the target group by e-mail between 05.10.2019 and 14.10.2019. The completion period by the respondents was between 15.10.2019 and 13.11.2019 and the answers were also received by e-mail.

The main characteristics of the sample

The sample of 61 purchasers consisted of 55.74% women (34 respondents) and 44.26% men (27 respondents).

The distribution of the respondents by age group were as follows: age group 20-30 years - 8.20% weight, 30-40 years group - 37.70% weight, 40-50 years group - 49.18% weight and age group over 50 years - 4.92% weight.

Regarding the level of general education, 28 of the respondents have a bachelor's degree (46% weight), 6 have post-graduate studies (10% weight) and 26 have a master's degree (43% weight). Only one respondent has only high school education (2% weight) and no respondent has doctoral studies. Thus, the surveyed purchasers have a very good level of general training.

The training of the respondents in the field of public procurement was as follows: 5 purchasers (8.19% weight) have no training in the field, 7 purchasers (11.48% weight) have postgraduate studies in the area of public procurement and 49 purchasers (80,33% weight) have graduated from the Romanian National Authority for Qualifications (ANC) and obtained the qualification of "Public Procurement Expert".

As regards the experience of the respondents in the area of public procurement, 18.03% of the purchasers (11 respondents) have an experience between 0 and 5 years, 32.79% (20 respondents) between 10 and 15 years, 11.48% (7 respondents) between 15 and 20 years and 4.92% (3 respondents) have an experience over 20 years.

Findings

One topic that has been widely discussed in the field of public procurement is the correctness of winning the procurement procedures by economic operators. Although the answers can be "overshadowed" by the fears of the respondents, the question was: "Do economic operators correctly win public procurement contracts?"

11.48% of the respondents answered with total agreement, 40.98% agreed, 37.70% were undecided and only 9.84% expressed their disagreement (Figure 1). No questioned purchaser expressed the complete disagreement.

Figure 1: The correctness of winning the contracts

Source: author's conception

It can be concluded that most respondents believe that bidders are winning contracts correctly. However, the analysis of the structure of responses received separately by contracting authorities and economic operators reveals some interesting aspects (Table 1).

Table 1: The percentage distribution of the answers received to the question regarding the correctness of winning the contracts

Weight / response	Total agreement	Agreement	Undecided	Disagreement	Total disagreement
Weights contracting authorities	15.63%	50.00%	31.25%	3.13%	0.00%
Weights economic operators	6.90%	31.03%	44.83%	17.24%	0.00%

Source: author's conception

As can be seen, there are clear differences between the responses of the respondents within the contracting authorities and those of the respondents within the economic operators. Thus, 65.63% of the purchasers from the contracting authorities considered that operators win contracts correctly, while for the purchasers from the economic operators this share is 37.93%. Also, 34.38% of the purchasers from the contracting authorities are undecided or disagree, given that for the purchasers from the economic operators this share is 62.07%.

Therefore, it can be concluded that the respondents from the contracting authorities are more inclined to believe that the contracts are won correctly by the offerors, while the respondents from the economic operators are more inclined to believe that the contracts are not being won correctly by the bidders.

Of course, it must be borne in mind that a total agreement, agreement or indecisive response can also be given due to the fear of the respondents not to incriminate themselves. Thus, it is possible that a large part of the indecisive answers are actually answers of disagreement or even total disagreement.

The supervision of the awarding process by the state authorities can be an important indicator regarding the need to identify and implement additional control measures. Therefore, the following question was: "On a scale from 1 to 10, how supervised is the award of public procurement contracts by the state authorities?"

The answers were given by the respondents on a grading scale from 1 to 10 (1 being "unsupervised" and 10 being "very supervised"). The most awarded scores were 6 (22.95% weight) and 7 (19.67% weight) (Figure 2).

Figure 2: How supervised is the award of contracts by the state authorities

Source: author's conception

It is noted that 63.93% of the surveyed purchasers gave scores over 5, the average score being 5.92.

Thus, the respondents considered that the awarding of procurement contracts is supervised by the state regulatory and control authorities, but not very supervised.

The average score awarded by purchasers within the contracting authorities was 6.66, and the average score awarded by purchasers within the economic operators was 5.10. These results show that purchasers within the contracting authorities considered that the process of awarding contracts is more supervised, because contracting authorities are subject to ex-ante and ex-post controls carried out by various state authorities.

Another widely debated topic in Romania and the world is the efficiency of spending public procurement funds. In the field of public procurement, the efficiency of spending public funds translates into the term "value for money".

A procurement is efficient when the products / services purchased have the highest utility in relation to the amounts of money spent or when the purchase presents the best combination of durability, quality and cost.

In this regard, the respondents were asked the question: "On a scale from 1 to 10, how efficient public funds are spent?"

For the analysis of the answers, a scale of 1 to 10 was used, 1 being "inefficient" and 10 being "very efficient" (Figure 3). The most awarded scores were 5 (29.51% weight) and 4 (22.95% weight).

Figure 3: The efficiency of the use of public procurement funds

Source: author's conception

From the received answers we can observe that the scores awarded are low, the average score being 5.02. Therefore, the questioned purchasers considered that the efficiency of the use of public procurement funds is reduced, meaning that the most advantageous combination of quality, cost and durability was not always obtained or the products / services purchased did not always have the greatest utility in relation to the funds spent.

According to answers received on the two categories of respondents, the average score awarded by purchasers within the contracting authorities was 6.03, and the average score awarded by purchasers within the economic operators was 3.90. This difference is explained by the fact that companies participate in more procurement procedures and thus know more about situations in which public funds are not used efficiently (reduced competition, technical specifications that artificially restrict competition, restrictive conditions for qualification and selection, etc).

A broad topic debated in Romanian media is the financing of political parties through public procurement with increased / inflated prices. In other words, some offerors are favored in the evaluation process and win contracts in exchange for the subsequent support they provide to political parties through donations, promotional materials used in the election campaign, etc.

This issue was analyzed by the question: "The financing of political parties is done in return for winning public procurement contracts?"

Most respondents (57%) considered that the financing of political parties in Romania is done in exchange for winning public contracts, and 43% of the surveyed respondents replied that they do not know (Figure 4). Again, due to the fear of the respondents not to incriminate themselves, it is very likely that most of the answers of "I do not know" are actually "yes".

Figure 4: Financing of political parties in exchange for winning public contracts

Source: author's conception

It is important to note that no respondent replied that the financing of political parties is not done in return for winning public procurement contracts.

These results confirm the conclusions of the research carried out by European Commission (2014), which established in 2013 that 38% of respondents in a survey considered **that the financing of Romanian political parties is done in exchange for winning public procurement contracts.** One of the reasons why in this research 57% of the respondents answered positively is that the target group consists only of purchasers who know much more about this area and are aware of cases of financing political parties through public contracts.

The risks of corruption manifest differently depending on the type of contracting authorities. Given this fact, the following question addresses the risk exposure of central and local public authorities: "Which contracting authorities are most exposed to the risks of corruption in public procurement?"

78.69% of the surveyed purchasers replied that the most exposed to risks are local public authorities, and 21.31% considered that the most exposed are central public authorities (Figure 5).

Figure 5: The most exposed contracting authorities to the risks of corruption

Source: author's conception

The explanation for the high risks of corruption at the local level lies in the fact that in small towns, "local elected officials" (vice mayors, mayors, prefects) have a great influence on the beneficiary structures that develop the technical specifications and on the evaluation commissions, given that the vast majority of purchases are direct procurement (non-competitive) or simplified procedures (which have short deadlines for the submission of tenders).

However, it should be noted that a significant proportion of respondents (21.31%) answered that the most exposed authorities are central public authorities, where risks increase because centralized procurement takes place (large quantities of products), procurement procedures are of high value, the bargaining power of the contracting authority increases and is concentrated in the hands of several purchasers, etc.

The answers to this question confirm the conclusions of Lefter (2015) and CJI (2015) who established that the most vulnerable contracting authorities in Romania are local public authorities.

The risks manifestation in the field of public procurement also differs depending on the source of financing of the procurement. The following question analyzes the sources of financing with the highest risks: "Which procurement procedures are most prone to corruption?"

83.61% of the respondents considered that the most prone to corruption are the procurement procedures financed from the state budget, while 16.39% considered that the most prone to corruption are the procurement procedures financed from non-reimbursable European funds (Figure 6).

Figure 6: The procurement procedures most prone to corruption

Source: author's conception

It is normal to have such a distribution of responses because the procedures carried out from non-reimbursable European funds are controlled more strictly by a larger number of authorities (managing authorities, Romanian National Agency for Public Procurement - ANAP, Romanian Court of Accounts, Romanian Department for Anti-Fraud - DLAF, which is the national representative institution of OLAF - the European Anti-Fraud Office), so that the corruption risks are greatly diminished.

Often, in Romania, the evaluation commissions are "convinced" that an offer is best by using the bribe or the connections.

Therefore, the next question that needs to be addressed to the purchasers is: "In Romania, using connections and bribery is an easy way to win public contracts?"

63.93% of the respondents (39 persons) replied that the contracts are awarded using the bribe and connections, and 36.07% (22 persons) replied that they did not know (Figure 7).

Figure 7: Winning public contracts by using bribery and connections

Source: author's conception

No respondent firmly rejected the idea that contracts are not won by using bribery and connections. Again, due to the fear of self-incrimination, it is possible and very likely that a large part of the "I do not know" answers that were given by the questioned purchasers are actually "Yes".

Therefore, this research confirms the results of the study carried out by the European Commission (2014), which established in 2013 that 82% of the respondents of a survey considered that using connections and bribery is an easy way to win public contracts.

A number of elements / characteristics of supervisory institutions, contracting authorities, evaluation commissions and procurement processes influence corruption in the field of public procurement in different ways.

The question "Which element favors corruption the most?" tried to determine the most favorable element of corruption.

Not surprisingly, 69% of the respondents considered that the most favorable element is the economic advantages obtained by the responsible factors (granting bribes, goods, facilities, free trips) and 16% of the respondents considered that the weak government institutions (supervisory authorities, contracting authorities, other control institutions) favor corruption the most (Figure 8). 13% of the questioned purchasers considered that corruption is most favored by the discretionary power of public officials and only 2% considered that political processes are the most favorable element.

Figure 8: The most favourable element of corruption

Source: author's conception

These results indicate the need for measures to identify and sanction any illegal economic benefits received by purchasers, members of evaluation commissions, managers of contracting authorities and other responsible factors.

The answers received confirm the finding of Aidt (2003) who established that the economic advantages that the responsible factors can obtain favors corruption the most.

The pressures of the political factor on the public procurement system are manifested by influencing the needs of contracting authorities and the decisions of the evaluation commissions, the initiation and implementation of certain legislative changes, etc.

The following question addressed this issue: "On a scale from 1 to 10, how much the political factor puts pressure on the public procurement system?"

The answers were given on a rating scale from 1 to 10, 1 being "very little" and 10 being "very much". The most awarded scores were 6 (24.59% weight), 7 (21.31% weight), 8 and 9 (each with a weight of 18.03%) (Figure 9).

Figure 9: The pressures of the political factor on the public procurement system

Source: author's conception

95.08% of respondents answered with scores above 4, the average score being 7.10. **Thus, the finding of Expert Forum & OLAF (2014) is confirmed that the political factor is putting pressure on the public procurement system.**

The fight against corruption can materialize by taking measures by the regulatory authorities, control institutions or government.

The identification of the most effective anti-corruption measure was analyzed by the question: "What is the most effective measure in the fight against corruption in the field of public procurement?"

61% of the respondents considered that the most effective anti-corruption measure is to increase the probability of detecting and punishing corruption (Figure 10). 18% of the respondents considered that the most effective measure is the increase of the transparency of procurement procedures and raising the level of education. The increase of the benefits for honest purchasers has a share of 2% and the cultural changes account for only 1%.

Figure 10: The most effective anti-corruption measure

Source: author's conception

In the current socio-economic context of public procurement in Romania, the majority of respondents believe that the most effective anti-corruption measures are the intensification of controls and sanctioning of irregularities, which are coercive measures.

These results confirm the findings of Rose-Ackerman (1996) and Kenny (2012) that the most effective anti-corruption measures are increasing the likelihood of identifying and punishing corruption and increasing the transparency of procurement procedures.

Conclusions

The study includes an analysis of the literature and a survey examining a number of specific elements of the corruption phenomenon in the Romanian public procurement system.

The analysis of the responses found that the awarding of procurement contracts by regulatory authorities is not highly supervised, the efficiency of the use of public funds is rather low, political party funding is in exchange for winning public contracts and that the most exposed to the corruption risks are the local public authorities.

Also, most respondents believed that the most prone to corruption are the procurement procedures financed from the state budget, contracts are awarded through the use of bribery and connections, the most favorable cause of corruption are the economic benefits obtained by civil servants, the political factor is putting pressure on the public procurement system and the most effective anti-corruption measure is to increase the probability of detecting and punishing corruption.

Future research should analyze the correlation between indicators of procurement procedures that can be used as alarm signals and the intensity of the corruption phenomenon. Such alarm signals may be: small number of offers received, large number of clarifications requested by economic operators, reduced savings resulting from the procurement procedure, large number of contracts awarded to the same economic operator, etc.

Legal and State Liability in the Field of Environmental Protection

Gheorghe Durac

PhD Professor, "Al.I.Cuza" University of Iaşi, Romania
gheorghe.durac@uaic.ro

Abstract

The environmental issues that surge nowadays require higher responsibility in approaching the actions aimed to protect the environmental factors, which implies a need to adopt new policies and strategies, including legal ones, at an international, European, and national level. In our study, we shall focus on some of the problems generated by the deterioration of the natural environmental factors, as their resolution is an important challenge for the decision factors at a world-wide, regional, and national levels – a true test that humankind must successfully and timely solve – as well as on the concrete measures that have been taken and that those leading Earth's destiny have engaged to implement, with maximum responsibility. In nowadays' conditions, given the complex and global nature of climate changes, widespread and consistent cooperation actions are expected from the states and from international organisations, with the final purpose of adopting policies and strategies, a rigorous and efficient environmental legislation, meant to insure the protection of environmental factors, and optimal life and work conditions for present as well as future generations. The legal framework that we mention, the environmental policies and strategies must mainly include measures for reducing greenhouse gas emissions, with some of the main objectives being: consumption based on less polluting energies; ecological means of transportation; new urban planning policies; ecological agriculture, with balanced and rational consumption. In this context, the fate of humankind lies in the hands of those able to design long-term plans to reinstate the natural balance or at least to keep, to preserve the current environmental conditions without making it worse, with the only applicable instruments being urgent political and legal decisions, firmly taken and applied with no delays.

Keywords: Responsibility, Environmental Policies, Legal Protection Of The Environment, Environmental Strategies, Legal Liability, Sustainable Development

The Notion and Nature of Legal Liability in the Field of Environmental Protection

Generally speaking, legal liability is the set of rights and correlative obligations that streams from various deeds, acts, actions, or inaction, including the results of performing an illegal action that causes prejudice, thus requiring the intervention of state measures of coercion. The purpose of the institution of legal liability is to insure the stability of social relations and to stimulate the members of society so that they comply with legal norms. Treated in various branches of law, including in the law of environmental protection, legal liability can adapt according to the actions that trigger it, to their legal regimen, to the sanctions and purposes intended by the lawmakers.

The multiple, complex, and often severe aspects related to liability in the field of environmental law are of great importance from a practical and theoretical perspective; for this reason, we have considered it opportune and interesting to approach this topic, which is the subject of this article. In the field of environment, the issue of liability and responsibility has become ever more present, salvaging nature being a major and permanent concern for everyone, because by destroying the environment, man is destroying himself.

The issue of legal liability for the damage caused by the deterioration of environmental factors is more and more often approached in the legal doctrine and practice, determining the appearance and

consolidation of a new legal institution: ecological liability – whose main role is to prevent, and subsequently to repair the prejudices caused to the environment.

In this field, legal norms must contribute to attaining a concrete purpose, consisting in preventing pollution of any kind, preserving and improving life conditions on Earth. From the decisions and actions (including legal ones) meant to protect nature, a special accent must be placed on preventive, conservation, and ecological reconstruction measures, because once the environment is destroyed, very often it cannot be restored to its normal conditions.

Often, the application of sanctions, even severe ones, is not enough to prevent the deterioration of the environmental factors. For this reason, environmental legislation must establish a series of tough conditions for performing any activity that would imply a risk for the environment. We refer, first of all, to the procedure of authorising economic and social activities with an impact on the environment and responsibility towards the impact study. We can also mention other levers – economic and fiscal ones – for environmental protection, such as: a pricing policy in favour of preserving the environment, subsidies and tax discounts, pollution stipends, etc.

Starting from what already exists in national legislations, we can imagine a space for discussion on the subject of liability, where environmental law presents some differences in relation to civil or criminal law, for example, as a common law. These derogations, as well as the existence of numerous gaps, require jurisprudence to provide innovating interpretations in order to insure the efficiency of the legal and jurisdictional act. In this sense, we aim to identify the peculiarities of legal liability in environmental law, in relation to its classical meaning and to the mechanisms that have determined switching from subjective liability, based on guilt, to objective liability, according to the degree of danger of the produced result.

One of the characteristics of environmental law is that in this context, legal liability intervenes both in case a prejudice occurred through the deterioration of environmental factors, and when, although the environment was not polluted, illegal actions have been performed that infringe legal environmental norms, actions that may create favourable conditions for pollution (E. Lupan, 2009). Thus, legal liability will fall both on the polluter, who is guilty for damaging environmental factors, and on the public workers or any other natural or legal persons who, although not polluting the environment, infringe through their deeds the legislation of environmental protection.

We can thus say that in environmental law, the notion of legal liability has a much broader and widespread application. Legal liability in this sense aims not only to sanction those who are guilty of polluting environmental factors or who, though not damaging the environment through their actions, infringe environmental legislation, but also for the statesmen or state bodies, public or private institutions, to take all measures that would contribute to insuring optimal conditions for performing all economic and social activities, so that the risk for pollution is minimised.

We consider that the role that legislation must play in order to protect the environmental factors is, first of all, a preventive one. People, economic agents, the governmental and non-governmental bodies must adopt a behaviour that insures, guarantees, a healthy and clean environment, and avoid as much as possible any polluting activity. As we know, it is much easier and less expensive to prevent causing a prejudice than to repair it, not to mention that often times, it is impossible to restore environmental factors to their initial condition, to normal parameters.

At the same time, the norms of environmental law must also refer to repairs, in the sense that they must also include dispositions that would make it possible to repair the prejudices caused by the pollution of the environment and people. In this respect, as a guarantee for repairing the damage caused to the environment, economic and fiscal instruments have proven to be very useful: a series of funds constituted in anticipation, in order to improve environmental factors, and also various insurance systems that work in this matter. We can mention in this sense: the national environmental

fund, the fund for improving the land reserve, the water fund, the game protection fund, the special fund for the development of the energy system, afforestation bonuses, etc. (M. Duțu, 2007).

Also, naturally, environmental legislation must have a sanctioning nature, as in our opinion harsher punishment is needed than what is currently foreseen, especially for deeds that seriously and sometimes irreversibly affect various environmental factors.

In order to preserve, improve, and protect the environment, in case illegal deeds are done, which have brought prejudice to the environment or to people, we consider it opportune to increase the span of persons and bodies to whom the law offers active process legitimacy, including here non-governmental bodies, which, as we well know, play an active role in sensitising public opinion and decision factors in relation to the danger represented by various risky human activities towards the environment.

Peculiarities of Legal Liability in Environmental Law

Legal liability is triggered if the conditions foreseen by the law are met – in which the deed or event that negatively affects social relations is done – as well as the protected object or field, in our case, the natural or anthropic environmental factors. Starting from this idea, we consider that the most interesting specific aspects present liability in environmental law from the perspective of the conditions in which it applies.

In this respect, we believe that liability in the field of environmental protection belongs first of all to the state, represented by its specialised bodies. Thus, through constitutional provisions and not only, the state acknowledges the fundamental right to a healthy, high quality environment for all people, providing in this sense several guarantees, including the right to damage for any suffered prejudice.

Liability for environmental protection belongs to an equal extent to the public, central and local administration authorities. These authorities will also answer in case they do not comply with their attributions established by law in this field, or in case they do not take the required measures in order to avoid any situation that might lead to the deterioration of environmental factors.

In the hypothesis that damage is caused to the environment through pollution, the author of the illegal action – the polluter – will naturally be held responsible. This may be a legal or a natural person. We must stress the fact that in the field of environmental law, liability can be triggered both for polluting and non-polluting actions (E. Lupan, 2009). Thus, if a natural or legal person performs an activity that causes the effective pollution of the environment, they will answer – as the case may be – contraventionally or criminally and will also have to repair the ecologic prejudice they caused. Moreover, legal liability is also triggered by actions that, even without polluting the environment, infringe environmental legal norms, thus potentially leading to situations that favour the occurrence of ecological damage. Legal liability thus occurs only as a result of performing an illegal action, be it polluting or non-polluting.

In order to be legally liable, usually a prejudice must have been caused – in our case, *ecological damage*, a term formulated by and taken from the French doctrine (M. Despaux, 1980). In the wish to define the notion of ecological damage, we must ask the question: who can be seen as a victim of ecological damage: man or the environment? In a broad sense, if we consider that man is part of the environment, as an element of it, we are not wrong to say that the victim of pollution, of any destructive action, is the environment as a whole, or some specific affected factors. In any case, directly or indirectly, man will be the victim of any ecological damage and we can even say that often times, man is not only the victim but also the author of damaging the natural environmental factors. He is the victim of his own actions. This is how Romanian lawmakers define the notion of prejudice as the cost-quantifiable effect of damage on people's health, goods, or the environment, caused by pollutants, damaging activities, or disasters.

At the same time, we must point out that within the process of determining ecological damage, difficulties may appear because often, it is not possible to know all the causes and conditions that triggered it and also because numerous of the damaged or destroyed natural elements of the environment – sometimes irreparably – have an incommensurate value.

In a different order of ideas, another prerequisite for legal liability is default, or guilt. In environmental law, the issue of guilt acquires, ever more obviously, new values, in the sense that this subject means switching from subjective liability to objective liability – which is default-free.

At the beginning, the fields that implied objective liability were few; for example, in case prejudices were caused by aircrafts or in the context of damage resulted from activities in the nuclear field. The idea of objective liability in environmental legislation appeared the moment when, being forced to face the current and more complex problems of environmental protection and repairing the damage caused by industrial activities, jurisprudence and doctrine could both note the insufficiency of common law in the subject of liability. There could be noticed a lack of alignment between the conditions for triggering liability for polluting actions and shattering the traditional foundations of liability for polluting actions, with a special stress on the insufficiency of the civil law principles and norms, which are seen as a barrier on the path of finding more efficient solutions that could solve the legal conflicts and protect the environment (G. Martin, 1978).

Liability Specific to Environmental Law (Ecological Liability)

From the beginning, we must say that performing illegal actions that cause prejudice to the environment, and which infringe the norms of environmental law, must bear legal liability – which must be specific to this field, even if it resorts to other forms, already consecrated, of legal liability.

In environmental legislation, there already are institutions that constitute specific forms of liability in the context of environmental law, meant mainly to contribute to preventing situations that may endanger the environment, and also imposing various ways to encourage and insure, which would create opportunities to repair ecological damage.

Environmental law derives from a social compromise between the need for economic growth and the negative consequences of this growth for the natural environment and for the human population. Abandoning the notion of guilt for triggering liability can be applied precisely in the fact that the author of the ecological damage performs an activity that, in most cases, is not only legal but also socially useful, a characteristic that is actually acknowledged by public authorities (G. Martin, 1978).

Regulating the conflictual situation between the polluter and the victim rarely calls for the solution of repairing the prejudice in nature and stopping the dangerous activity. Most often, the activity continues, with some coercive measures, and the prejudice is repaired with a monetary compensation. From this perspective, we could even speak of a form of *expropriation for private needs* in the situation when the activity needs to be started and performed in an area that could present an inconvenient for neighbouring funds, but the activity is legally authorised by an administrative act and thus cannot be forbidden through a jurisdictional action (M. Prieur, 1996).

Repairing the prejudice with a monetary equivalent is a common practice, although it is unjust and inefficient with regards to its possibility to restore the ecological balance, and often repair in nature or bringing the deteriorated natural factor back to its normal condition is no longer possible (D. Marinescu, 2010). As a compromise solution, the legislation of many states institutes for the responsible person (who performs an activity with a risk for the environment) the obligation to contribute either to build specialised compensation funds, or to contract a civil responsibility insurance.

In the hypothesis that it is not possible to identify a subjective patrimonial right that was damaged, although deterioration to an environmental factor or the presence of an inconvenient is obvious, in which case it is not possible to resort to the insurance system, special compensation funds act automatically, facilitating at least a compensation, if it is impossible to repair the damage suffered. The following examples can be given in this respect: the Dutch fund for air pollution, which is in place since 1972; the United States coast protection fund for hydrocarbon pollution damage; the 1973 Japanese law of compensation for physical harm caused by pollution; the compensation fund for crop losses caused by hunting in France, provided by the National Hunting Office; funding operations of diminishing the damage suffered by the residents close to the Orly and Rossy airports (M. Prieur, 1996).

In order to be able to resort to the insurance system and to compensation funds, several conditions must be met: the author of the prejudicial deed must perform a legal activity, socially useful, and the decision to stop their future activity would have much more costly social and economic consequences than repairing the prejudice; the prejudicial deed has occurred in compliance with the legal framework for performing that specific activity; the compensation or insurance mechanism must not exonerate from responsibility and must not be used as a means for enrichment with no just cause, but a stimulant in avoiding or diminishing environmental damage.

Starting from the characteristics of criminal civil liability, with a broad application in the field of environmental protection, with a specific usage in a sustained evolution towards objective liability, independent from guilt, we can speak of constituting a new form of legal liability: ecological liability, a series of lines of reasoning with argumentative value being provided in this sense (Ph. le Tourneau, L. Cadet, 1996).

A first line of reasoning is that of the natural and accelerated evolution, also generated by industrial developments, marked by automation and enhanced digitalisation, which increases the risk for damage, a context in which the nature of the prejudice is often widespread, affecting an entire community or even the entire human population, which demands accepting the inconveniences by the whole group, in compensation for the benefits provided by growth (at all costs).

Another line of reasoning is based on the evolution of mentalities. The increasing value of human personality and its acknowledgement no longer allows accepting the status of non-compensated victim. As the life standards increase, the claim to the right for a compensation becomes natural, but it can only be materialised through the insurance system and a special compensation funds system.

In tight interdependence with the previous lines of reasoning, we bring the argument determined by the development of the insurance systems and their penetration in people's consciousness. Insurance is at the same time the cause and effect of the extension and objectifying of liability, including in the field of environmental protection. It is a cause because the legal courts will not avoid sentencing to repair, even in the absence of guilt, knowing that it will not be the doer to bear the cost of repair, but the insurance company. It is an effect because objective liability determines a responsible attitude, that of resorting to insuring the activity. In other words, the liable person brings insurance for the victim.

The appearance of new instruments for repairing environmental damage, the idea of compromise between the beneficial result of a useful economic activity and the adjacent inconveniences, awareness of and taking responsibility, all characterise the evolution of environmental protection law in current times. In this context, legal (ecological) liability is both a guarantee for fully exerting subjective rights and a means to impose general social interests, both with regards to the deed of the polluter and the right for action of the victim.

In conclusion, accepting the objectifying of liability in environmental law as a necessary evolution in the current stage of economic and social development, we can state that liability is more of an absorption mechanism for external costs generated by activities with a negative effect than an

instrument with an educational role of developing the doers' awareness (legal, if not moral) (G. Martin, 1978).

The Responsibility of States in Preserving, Improving, and Protecting the Environment

It is undeniable that the problems generated by the deterioration of environmental factors follow a rapid and severe evolution, and that their solution is only possible if all states take responsibility, through a combined and agreed will, as international public law subjects, in the direction of establishing and complying with firm obligations engaged at an international level.

In this approach, we are asking the question if, in a context where initiatives in the field are more and more taken by international bodies, based on conventions and other trans-national legal acts, the role played by the states diminishes. We can speak of a transfer of a part of sovereignty, following the model of treatises for joining the European Union, signed by the Member States, at an international level, from the states towards the international bodies, in order to promote and implement measures to fight cross-border pollution.

We can say that, to a certain extent, there occurs a voluntary transfer of the governing constitutional powers of the states towards international organisations. This opinion is supported and defended in the sense that there is a conciliation between constitutional law and international law, consecrating the fact that the states are the ones to support international law, since without them, there would be no international relations and bodies. International organisations would have no status and contents without their member states, which found them and insure their operation (V. Demers, 2005).

We consider that the role of the states, individually and as members of international organisations, is important, since from a legal perspective, their status, authority, and consent is the essential condition in the effort for cooperation and full engagement in the approach needed to protect the environment. At the same time, we cannot deny the role of international body, which, even if they cannot impose a specific sanction to the states, can determine a certain responsible behaviour in various situations and fields, including in the effort to insure real protection and preservation of the environmental factors (M. Duțu, A. Duțu, 2014).

We must stress the primordial role of states in the system of international relations, which is justified at present by other reasons than several decades ago. It stems from the need to insure a coherent and firm position in adopting and complying with norms and engagements concerning the protection of the environment, based on the principles of a tight cooperation between sovereign states.

Implementing the engagements with a role in environmental protection can be done, on the one hand, through international cooperation and shared responsibility between the states, as international law subjects and, on the other hand, through concrete protection measures, which can only be applied through internal mechanisms (political, administrative, legislative ones), which strictly depend on the will of the state, since the state has the constitutional mission to adopt internal measures to achieve its international engagements (S.M. Teodoroiu, 2009).

The responsibility of the states is essential in the combined actions for environmental preservation and protection, in fighting climate change, and is based on three essential pillars. First of all, states participate in the European and international mechanisms to design and adopt legal norms, policies and public strategies in the field, as well as in signing and approving international acts, agreements, conventions, and treatises.

Second, the measures of translating these norms at a national level are fundamental and are the exclusive attribute of each state, in the conditions in which international document offer a better freedom of appreciation, in this sense, of the state benefits. Thus, responsibility for meeting the

internationally set objectives and the manner in which they are attained is exclusively the decision of the sovereign states (V. Demers, 2005).

Third, states have the major responsibility to establish the degree and modalities to implement and correlate national interests with the interests of the international community. In this respect, the UN Framework Convention on Climate Change (UNFCCC) of 1992 mentions that states have the obligation to protect the climate in the interest of present and future generations based on equity, according to their common responsibilities, but differentiated based on the capacity of each one of them.

Considering the current worrisome state of the environment and the evidence of climate change, there is a need for a responsible approach and for taking concrete actions at an international, regional, national, and local level (C.R. Mitroi, 2019). The international community has initiated in time a series of meetings and discussions that finalised with signing international documents with which the member states took oath to implement concrete measures meant to insure the preservation and protection of the environment.

Of these documents, the UN Framework Convention on Climate Change (UNFCCC) of 1992 is the fundamental instrument for the management of this issue. The central objective of this framework convention is to stabilise all greenhouse gas concentrations at a level that would fit within the normal parameters of the climate system, so as to eliminate any risk or threat that would mean a danger for life and health, for food production or for sustainable economic growth.

Another important international document in the subject that interests us is the Kyoto Protocol on Climate Change. The Kyoto Protocol of the UN Framework Convention on Climate Change is the answer of the international community to environmental change. It was adopted, in consensus, within the third session of the Conference of the Parties (COP3) in December 1997. The Kyoto Protocol was closed as an international agreement concerning the environment, with the purpose of reducing the greenhouse effect. The first period of engagement under the Kyoto Protocol closed in 2012, and at the end of the same year, there took place the UN Conference on Climate Change in Doha, in which approximately 200 states participated. The Doha amendment, as the document adopted during this Conference is called, established a new period of engagement under the provisions of the Kyoto Protocol for the interval 2013-2020, when the greenhouse gas emissions should be reduced by 20% in comparison with 1990, as well as an action plan for preparing and closing a new global agreement.

In addition, on December 12, 2015, the Paris Agreement was adopted, within the Paris Conference of the Parties (COP21). The Paris Agreement came into force on November 4, 2016. 170 parties signed the agreement (of the 197 states participating in the Convention), including the European Union and its Member States. Romania signed the Paris Agreement on June 1, 2017. In August 2017, the USA notified the UNFCCC secretariat of their intention to withdraw from the agreement. In November 2019, the USA officially informed the UN of their withdrawal from the Paris Agreement on the fight against climate change. This key stage, which could not have occurred earlier because of a clause included in the text, requires a one-year delay before Washington can effectively exit the Agreement. As a result, their withdrawal will not take place before November 4, 2020, after the next presidential elections in the US.

The Paris Agreement is the first one of a universal nature in the field of climate change, which imposes legal obligations for all the Parties to achieve the objective of limiting the increase in the average global temperature to 2˚C compared to the level in the pre-industrial era, considering additional efforts for this limit to be set to 1.5˚C. The contribution of the European Union and its member states to meeting the objectives of the Paris Agreement is the target to reduce the internal EU greenhouse gas emissions by at least 40% compared to 1990, by 2030.

We must mention that on August 1, 2018, 27 UN member states joined to form a Group of Friends for Climate and Security, with the purpose of finding solutions for the impact of climate change on

the security policy, to improve the attitude and to stimulate the involvement of the United Nations' Organisation in this field.

The 24th meeting of the Conference of the Parties in the UN Framework Convention for Climate Change (COP 24) took place in Katowice in December 2018 and finalised with the adoption, on December 15, 2018, with a consensus, of the package of rules (the Katowice Manual) for the implementation of the Paris Agreement, whose objective is to maintain the increase in global temperature under 2ºC, and, inasmuch as possible, to 1.5ºC.

Under the slogan *A race we can win, A race we must win*, on September 23, 2019, there took place in New York the UN Summit on Climate Action, which gathered together world leaders, from the government, finance, business, and the civil society, in order to support the efforts to apply the Paris Agreement and to enhance the ambition and climate action activities. In December the same year, in Santiago de Chile there took place the Conference of the Parties to UNFCCC (COP 25).

Within the European Union, we can mention the meeting of the European Council in December 12-13, 2019, when EU Leaders approved the objective to make EU neuter from a climate perspective until 2050**,** in compliance with the Paris Agreement. It was stressed that the transition towards climate neutrality would generate important opportunities for economic growth, markets, work places, and technological development.

The European Council also took note of the Commission Communication on the *European Green Deal* requiring the Council to continue its work. The leaders acknowledged the need to institute a favourable framework, which would insure an efficient transition from a cost perspective, as well as fair and balanced from a social perspective, towards climate neutrality, taking into account the different national circumstances. The greatest challenge and opportunity of our times is to become the first continent climatically neuter in the world, by 2050. In order to meet this goal, the European Commission presented the *European Green Deal* as the most ambitious pack of measures that should allow European citizens and companies to benefit from a sustainable ecological transition. The measures, accompanied by an initial action fiche of key policies, varies from an ambitious reduction of emissions to investments in research and last generation innovations, as well as preserving Europe's natural environment.

Conclusions

The deterioration of environmental factors and climate change have become a fundamental priority in the world and on the agendas of European Union policies. Scientific data and public opinion agree that this problem is one of the greatest challenges for the future, from not only a political perspective, but also in the broader socio-economic context. Although seen as a threat for the future of humankind, climate change is nevertheless considered an instrument to stimulate economic growth, reopening the way for a transition towards new bases for socio-economic development.

Through their decisions and legislation, the states must integrate into the existing climate and trends in the field of environmental protection at a worldwide level. Thus, with the appearance in developed societies of the tendencies to improve living conditions and eliminate pollution, all countries should try to integrate and adopt firm measures, often much more restrictive, including in the related legislation, specific to the sectors of energy, transport, agriculture, etc.

Climate change is a global challenge implying a responsible approach, taking concrete actions at an international, regional, national, and local level. A realistic approach of this phenomenon requires the cooperation of all the international actors, in order to identify optimal action paths, the instruments necessary to stop the increase of global temperature, to eliminate all the factors that may negatively affect the environment and the existence of humankind.

Resumen

El artículo es producto de una investigación en las curtiembres, acerca de las prácticas administrativas y los efectos de estas. Se realizó una revisión documental de la normatividad del sector.
Mediante el trabajo de campo y una revisión de bases de datos, se estableció un censo de las curtiembres del barrio San Benito, estas se visitaron con el objeto de detectar procesos formales con actividades de planeación estratégica. Se realizó una sistematización de la experiencia con relación a aquellas políticas que fuesen resultados de las prácticas administrativas y prácticas empresariales comunes y lo efectos en los ámbitos socio ambientales.

Abstract

The article is the product of an investigation in the tanneries, about the administrative practices and the effects of these. A documentary review of the regulations of the sector was carried out.Through the fieldwork and a review of databases, a census of the tanneries of the San Benito neighborhood was established, these were visited in order to detect formal processes with strategic planning activities.A systematization of the experience was carried out in relation to those policies that were the results of common administrative practices and business practices and the effects on socio-environmental fields.

Palabras Claves: Planeación Estratégica, Normatividad, Efectos Ambientales.

Keywords: Strategic planning, Regulations, Environmental Effects.

Introducción

Como lo menciona (Martínez, 2018) la industria del cuero nació con las primeras civilizaciones. En América, las culturas prehispánicas ya usaban las pieles de los animales como medio de protección. En Colombia se empezó a desarrollar de manera industrial desde la época de la colonización antioqueña de los años 1920 y todo el transporte que se necesitó para ello, aumentó la demanda de las pieles de bovinos curtidas. No fue sino hasta la década de 1950 que se instalaron de manera incipiente las

primeras industrias en el municipio de Villapinzón (provincia Almeidas, nororiente de Cundinamarca) y en los años 1970 algunos de estos industriales se trasladaron al sur de Bogotá (Barrio San Benito, Localidad de Tunjuelito).

Cuando los industriales del cuero se acercaron a la academia lo que encontraron, como lo menciona (Malaver, 2016), fueron cátedras dictadas por docentes de otras profesiones como abogados y/o economistas, que incluían teorías administrativas como las de Taylor y Fayol. En contraste con lo anterior, las industrias del cuero creadas en la localidad de Tunjuelito son en su gran mayoría de carácter familiar y la administración de las mismas, en sus inicios se realizó de manera empírica.

(Omaña & Briceño, 2013) enumeran una serie de características de estas empresas: La Familia tiene el poder total sobre la propiedad y ejerce el control sobre ella, La Alta Gerencia en la organización está dada por una cesión de poder de la familia a un integrante y es una decisión fundamental sobre el futuro de la organización, determinar quién hereda este control y poder a las generaciones familiares venideras.

Las administraciones de estas industrias del cuero tienen efectos importantes en la sociedad y en el medio ambiente (aire y agua), por lo que el desarrollo de la presente investigación trabajó principalmente sobre el manejo e impacto de esta industria sobre el recurso agua.

En este sentido, es necesario mencionar que la ciudad de Bogotá en proporción al número de habitantes es la que más demanda y consume agua en Colombia, sin que en el momento se tengan estadísticas confiables del consumo de los barrios ilegales y los que detentan extrema pobreza. Por otro lado, los barrios ubicados en estratos 2 y 3 consumen el 50% del agua de Bogotá, teniendo en tercer lugar se encuentra el sector industrial con 5.8% del consumo total en cifras del año 2014 aunque con tendencia a la baja; de todas maneras este consumo representa 58 millones de metros cúbicos de agua (Peña-Guzmán, Melgarejo, & Prats, 2016), lo cual es suficiente para abastecer el consumo de agua del departamento de la Guajira (Norte de Colombia) durante todo un año; las cifras fueron calculadas por el autor a partir de estudios realizados por el (DANE, 2018) y (Solano-Vargas, 2014).

Existen iniciativas para el manejo de este recurso, las cuales hacen referencia a que los sectores industriales reutilicen sus aguas residuales mediante procesos físicos, químicos y biológicos que permitan obtener aguas casi potables como lo menciona (Peña-Guzmán, Melgarejo, & Prats, 2016, pág. 67) e iniciativa conocida como "Descarga cero sector industrial" lo que permitiría reciclar el consumo y reducir el impacto potencial sobre la reserva de agua de la ciudad y las fuentes de otras ciudades y municipios aguas abajo.

Fundamento Teórico

Diferentes estudios ambientales hablan de la contaminación del rio Bogotá y como una de sus causas principales el vertimiento de los desechos (sólidos y líquidos) hacia afluentes del río en las empresas que se dedican al proceso de curtición desde Villapinzón (Cundinamarca), hasta el barrio San Benito (Localidad de Tunjuelito, Bogotá), (Artuz, Martinez, & Morales, 2011) mencionan que es necesario crear guías de preservación del medio ambiente en las industrias del sector, pero también mencionan que la relación directa de la productividad con el estado de contaminación del río es importante y vale la pena ser revisada. Por otro lado, hacen referencias a las externalidades entre empresas, y el tipo de aprendizaje laboral de estas industrias como elementos importantes en el tema de la contaminación.
Los valores tomados por esos elementos y otros como la cultura y comunicación organizacional, así como la administración de personal, son consecuencia del tipo de administración que predomina en el sector, como se ha mencionado anteriormente.

Externalidades entre empresas

Son las relaciones que se establecen entre las empresas, (Proveedores – Empresa – Clientes), estos enlaces hacen que las acciones de una empresa tengan efecto en otra, (Olivera & Fernandes, 2014) mencionan que estas externalidades pueden ser negativas porque nadie es responsable por los costos

que eso conlleva pero las buenas intenciones de la gerencia pueden llevar a promover las externalidades positivas en favor del aumento de la productividad de una empresa, para que sea el motor del aumento de otra organización que se encuentre incluida en el proceso.

Aprendizaje laboral(AP)

Es en esencia un proceso que se lleva al interior de las organizaciones, con la intención de capacitar a los empleados en las labores específicas de la organización, métodos y metodología; una misma labor en dos empresas diferentes puede tener procedimientos muy diferentes. Pero para (Cano, Chamizo, & Martín, 2016) el AP, lo caracterizan dos aspectos, un aprendizaje de carácter informal, que se lleva a cabo en la organización de forma empírica, por imitación, por ensayo y error. Y los procesos de capacitación organizacional de carácter estructurado, con objetivos, metas y evaluaciones, donde una vez los empleados superan estas etapas están habilitados para desempeñar dichas labores, así como en el futuro se realizan procesos de reacondicionamiento o de reentrenamiento.

Administración de Personal

Otro de los elementos que se mencionan anteriormente como un componente del tipo de administración de las empresas es el que hace referencia a la administración de personal, en las industrias del sector de curtiembres este se maneja sin detenerse a revisar la actualidad que mencionan (Morales-Calderón & Salvador-García, 2006), donde comentan que las empresas deben estar preparadas para afrontar la era del conocimiento y con esta era, ver que la dirección de los empleados es la dinámica que involucran a las empresas en la vanguardia que les permita una transformación continua al ritmo de la tecnologías actuales.

La cultura organizacional-CO

Constituye en esencia todos los elementos de un sistema, se compone de órganos y enlaces. Si la cultura por sí sola es todo aquello que tenga registros, historia y folclor entre otros; la CO revisa estos elementos al interior de una compañía, (Alvarado-Muñoz & Monroy-del-Castillo, 2013) expresan que las conductas colectivas de toda organización pueden ser de carácter formal, expresadas en un plan estratégico, donde los registros e historia están representados en la misión, visión, metas, objetivos y políticas. En algunas organizaciones existen incluso himnos desarrollados por las organizaciones, así mismo la constituyen otras conductas de carácter informal, como las costumbres que se han anidado en las empresas y en un sentido más amplio, hasta hacen parte de los presupuestos y esquemas contables de las organizaciones.

Comunicación Organizacional

Un elemento integrado dentro de la cultura organizacional es la comunicación organizacional, como lo menciona (Saladrigas-Medina, 2005); la comunicación como disciplina empresarial se basa en tres componentes: la oralidad, la persuasión y el discurso. La oralidad es el día a día de una organización, como un ente social o una agrupación de personas, esta oralidad se transforma en escritura como memorandos y circulares en su aspecto más formal. El segundo componente es la comunicación entre la empresa y sus clientes, todos los elementos de mercadeo y publicidad para promover la persuasión de compra. El componente de discurso habla de la oratoria, este es el poder de “enamoramiento” que la empresa tiene sobre sus empleados

Metodología

La investigación realizada se constituyó a partir de un estudio de casos y análisis mixtos con el rigor y severidad de una investigación científica, de la manera como lo sostiene (Coria, Roman, & Torres, 2013). Donde se debe caracterizar con diferentes aspectos, tal como lo clasifica (Sierra, 2008). Una investigación de corte transversal donde se discurre el momento actual, descriptiva por su profundidad, con fuentes primarias en un enfoque cualitativo donde los autores interpretan los resultados como lo

menciona (Sandin, 2003) y fuentes secundarias de enfoque cuantitativo, en un estudio de tipo exploratorio, aplicado en su totalidad en el campo.

Después de seleccionar la población sujeto de la investigación, la redacción del estudio de caso ayuda a consolidar las buenas prácticas y opciones de mejora en la relación gerencia - entorno del sector de las curtiembres, a través de una muestra bola de nieve, en diferentes sectores geográficos, para lograr una mayor amplitud de la información y datos que fueron recopilados en el estudio.

Las técnicas de recolección de datos utilizadas fueron: observación estructurada, entrevistas, cuestionarios y la revisión panorámica de la información contenida en artículos científicos asociados. (Bernal, 2010). Mencionando las referencias de los temas que son aplicables a administración; se encuentran el estudio de la innovación empresarial de varias empresas y se combina con los estilos de dirección de las mismas, el cual es el objetivo del proyecto que da origen a este artículo

Resultados

A nivel mundial, la industria de las curtiembres es una de las más contaminantes, y cada año se deben destinar enormes sumas de dinero para reparar y en menor grado para prevenir los impactos causados por su actividad. Las sumas de dinero destinadas a la mitigación de dichos impactos tienen como propósito cumplir con parámetros ambientales y evitar sanciones que impliquen impacto económico para las empresas. (Corredor-Rivera, 2006). La investigación de Corredor-Rivera (2006) permitió referirse sobre el tratamiento de los vertimientos que generan las curtiembres y que a su vez contaminan la cuenca alta del río Bogotá desde el municipio de Villapinzon, Cundinamarca, hasta el barrio San Benito en Bogotá, al verter sus desechos líquidos al río Tunjuelito, que luego desemboca en el río Bogotá. En las figuras 1 y 2 se puede observar gráficamente la localización de las curtiembres, de acuerdo a la Corporación Autónoma Regional de Cundinamarca, quien es la autoridad ambiental para el departamento.

Tabal 1: Entrevistas con empresarios del sector

Entrevistado	Coincidencias	Divergencias	Observaciones
Vladimir Fernández (Gerente de Planta de Curtidos la Sabana Ltda.)	Documentación de los procesos para la construcción de los planes estratégicos.	Falta de trabajo colaborativo, mucha competencia desleal entre los industriales del sector	Los procesos industriales los tienen separados, una plata hace el 'wet blue' y otra los procesos secos.
Gloria Silva (Gerente, Cooperativa Integral de Curtidores)	Algunos industriales tomaron conciencia de los impactos en el medio ambiente.	Los costos tan elevados de los insumos, para obtener productos de primera calidad, hace que los empresarios no se fijen en los costos ambientales.	A través de los años la cooperativa ha cambiado su razón de ser, desde intermediación en la compra y distribución de insumos, pasando por 'outsourcing' del proceso industrial, hasta procesos de capacitación a los asociados.
Jairo Roa (Gerente General, Curtidos Universal)	La medidas tomadas por los industriales los hacen parte activa de la solución del proceso	Mucho celo industrial, a la divulgación de los procesos físicos y químicos de tratamiento de vertimientos	A pesar del celo, está promoviendo la creación de un parque ecológico ambiental, con un control de los vertimientos.

Construcción propia de las entrevistas (Fernández, Silva, Roa, 2019)

Figura 1: Localización Curtiembres Villapinzón Fuente:(CAR, 2018)

Figura 2: Localización Curtiembres Barrio San Benito (Bogotá) Fuente: (Google-Maps, 2019)

Bogotá está dividida política y administrativamente en localidades, las curtiembres del barrio San Benito se encuentran ubicadas en la localidad 6 (Tunjuelito), que delimita por el sur con la localidad 19 (Ciudad Bolívar). Esta localidad (Tunjuelito) cuenta con muy poca zona vegetal y con pequeñas vertientes de agua –arroyos- que sufren de una alta contaminación producto de la actividad humana, ya que se arrojan todo tipo de desechos sólidos y líquidos, como se describe en la figura 3. "La quebrada Limas con 10.5 kilómetros de longitud recorre gran parte de la localidad de Ciudad Bolívar y desemboca por la parte izquierda del río Tunjuelo. Desde 1994, se reporta la contaminación, en la parte media y baja de la quebrada." (Santos-Rayo, Niño-Sandoval, & Vargas-Puentes, 2017, pág. 98).

Estado Actual

Es indispensable mirar lo que hacen los países desarrollados económicamente en el sector de las curtiembres (Martinez, 2018) menciona que Italia es el país con más producción, abarcando el 60% de toda la producción de Europa y por tal razón, ha desarrollado políticas empresariales muy claras en cuanto a observar "los más altos estándares de calidad en la prevención de la contaminación; realiza buenas prácticas como: sustitución de sustancias contaminantes, integración de procesos, manejo y tratamiento de agua residual y disposición final del lodo." (Martinez, 2018, pág. 115).

Es posible evidenciar que la manera de aplicar la teoría administrativa tiene efectos positivos en la organización empresarial y en sus prácticas, por lo que se hace necesario una revisión de los efectos externos; Martínez (2018) también menciona que, de los costos productivos en las curtiembres italianas, el 30% lo usan en productos químicos, energía y tratamiento de desechos, lo cual permite evidenciar claramente que financieramente las empresas también se ven comprometidas con el entorno donde se desempeñan.

La situación en América Latina es muy diferente, los costos operacionales se consumen en multas, trabajos de recuperación y reparación; sin embargo, la situación no mejora cuando se revisa la participación mundial en el sector, que para el año 2010 en el caso del cuero de bovino en relación a

la producción mundial efectiva prevista fue de 6.214 miles de toneladas, y para el cual América Latina participó con 1.439 miles de toneladas, que representa un 23.15% del total, y donde la participación mayoritaria de ese valor lo aporta en primera instancia, Argentina. (FAO, 2012)

Las prácticas empresariales de las empresas del sector en Colombia se ven afectadas por la producción nacional y la distribución geográfica de dichas curtiembres, entre Cundinamarca y Bogotá concentran el 80% de las industrias del país (Martinez & Romero, 2018), mientras que Barranquilla aporta el 0.30%. En cuanto a la producción nacional de pieles, para el año 2010 fue de 9.487 toneladas que apenas es un 0.66% de la producción de América Latina y un 0.15% de la participación mundial. Los dos primeros aportan el 36% y el tercero participa con el 7%. (CAR, 2015)

La producción del sector en Colombia, está concentrada en Cundinamarca y Bogotá con un 80% de las industrias (Martinez-Buitago & Romero-Coca, 2018), mientras que ciudades como Barranquilla aporta el 0.30% y entre Cali y Medellín un 1%. (Corredor-Rivera, 2006) mencionó que la falta de los tratamientos de los residuos que generan las curtiembres, contaminan la cuenca alta del rio Bogotá en el municipio de Villapinzon, Cundinamarca; Y en el barrio San Benito, Bogotá, que arrojan estos últimos, sus vertimientos al Rio Tunjuelito que desemboca en el Rio Bogotá. Como se vio en las figuras 1 y 2.

Revisión de los planes estratégicos

Las características administrativas de las organizaciones son la respuesta a las políticas adaptadas e implementadas de las teóricas administrativas, estas pueden ser de muchas tendencias, del tipo burocráticas, de bienestar de personal, de calidad total, de la administración científica o del ciclo administrativo. En Colombia hizo carrera el esquema de planeación estratégica como herramienta de control administrativo que está compuesto de los siguientes elementos:

- Misión
- Visión
- Objetivos (General y Específicos)
- Metas (Por área)
- Reglamento de trabajo
- Políticas
- Sistema de Gestión de seguridad y salud en el trabajo

Y cuando la empresa entra en los procesos de certificación de calidad, deben implementar alguna de las normas de los Sistemas de Gestión de Calidad (ISO[1] 9001), los Sistemas de Gestión Ambiental (ISO 14001), los Sistemas de Gestión de Riesgos y Seguridad (ISO 45001) y los Sistemas de Gestión de Responsabilidad Social (ISO 26000)

Características Administrativas de las curtiembres

Cuando los industriales se acercaron a la academia lo que encontraron como lo menciona (Malaver, 2016), fueron unas cátedras dictadas por docentes de otras profesiones como abogados y/o economistas, con las teorías de Taylor y Fayol. Las industrias creadas del sector son en una gran mayoría de carácter familiar y la administración de ellas en sus inicios fue de forma empírica. (Omaña & Briceño, 2013) enumeran una serie de características de estas empresas: La Familia tiene el poder total sobre la propiedad y ejerce el control sobre ella, La Alta Gerencia en la organización está dada por una sesión de poder de la familia a un integrante y la es una decisión primordial heredar este control y poder a las generaciones familiares venideras.

Las empresas aplican las teorías clásicas de la administración en cuanto a lo siguiente:

[1] ISO: International Organization for Standardization (Organización Internacional de Normalización)

- Especialización de las funciones del trabajador, aunque existen empleados de características de nivel de 'súper-numerario', que están capacitados para realizar funciones de diferentes áreas.
- Capacitación estrictamente de nivel práctico, no existen procesos formales de capacitación, en Colombia no existe estudios técnicos ni estudios superiores de la profesión de curtidor. Los procesos tienen unos operarios principales y unos operarios auxiliares, estos últimos mediante la observación y asistencia de los primeros, van 'aprendiendo' la labor.
- La necesidad de un supervisor es evidente, revisando procesos, resultados, seguridad de las labores, programando mantenimientos preventivos, suministrando los insumos (formulas químicas para el curtido).
- El control de tiempos y movimientos es fundamental porque el 90% de la nómina es a destajo, son los mismos empleados los que determinan

En el sector es clara la ausencia de planes estratégicos, falta la asociación, el trabajo se vuelve una solución diaria los problemas, no existe planeación ni presupuestos futuros, los costos de producción son completamente variables al alza.

Características Ambientales

Se identificaron 32 curtiembres dentro de la ronda del Rio Bogotá, 16 con afectación total de las instalaciones y 16 con afectación parcial. 25 de ellas están dispuestas a reubicarse y continuar con la misma actividad, y 7 estarían dispuestas a cambiar de actividad

Las fuentes de abastecimiento de aguas en las curtiembres son por acueducto (58%) y concesión de aguas (31%). Solo a dos empresas les han autorizado los permisos de vertimientos y de ocupación de cauce, el resto de curtiembres no lo tiene, está en trámite o fue negado. El 55% de las curtiembres les han aprobado el permiso de concesión de aguas. El 57% del total de curtiembres no han solicitado el registro Único Ambiental.

83% de las curtiembres descargan sus vertimientos en el Rio Bogotá de forma controlada a través de un sistema de recuperación de sólidos en albercas. 75% de las curtiembres manifestaron hacer clasificación de residuos peligrosos. Cerca de la mitad de las curtiembres (49%) declara vertimientos y un (46%) tiene un punto de control de los mismos. Un 58% de las curtiembres radicaron un plan de cumplimiento, pero al 89% les fue rechazado

Es por esto que el análisis legislativo gira entorno a la sentencia 479 del 2014 del Concejo de Estado, directriz legal principal, que ha permitido adoptar una serie de medidas que buscan la protección de la cuenca hidrográfica del río Bogotá. Conocida como la sentencia del Rio Bogotá. Esta contiene el diseño y la implementación de medidas para descontaminar el río y evitar la contaminación a futuro. La decisión se tomó frente a la catástrofe ambiental, ecológica y económico-social de la cuenca hidrográfica del río Bogotá, causada por el alto grado de contaminación debido a vertimientos de aguas residuales domésticas e industriales, malas prácticas agropecuarias e inadecuado manejo de basuras, por parte de los habitantes e industrias aledañas, así como la omisión de las autoridades frente a estas situaciones por más de treinta años. (Ministerio del Medio Ambiente, 2014)

La sentencia adoptó una serie de órdenes de carácter nacional, regional y local, que involucran diferentes autoridades. Algunas órdenes tienen carácter inmediato y otras se extienden por un plazo máximo de 3 años. La sentencia declara responsables a los habitantes e industrias de la cuenca por la contaminación del río y sus afluentes. También se declaran responsables las autoridades que no han tomado medidas para descontaminarlo y prevenir su contaminación.

Conclusiones Y Discusión

El desarrollo de un modelo de gestión ambiental en los procesos y productos del sector de las curtiembres, implica el conocimiento de los aspectos técnicos, operativos, comerciales, legales y financieros propios de la actividad y fundamentalmente, del impacto que genera la industria de las

curtiembres en el medio ambiente. Las pieles de animales han estado ligadas a la cotidianidad de los seres humanos desde los tiempos prehistóricos; han constituido un elemento fundamental, con múltiples usos en el hogar y en la industria, continuando vigente a pesar de los enormes avances en los procesos tecnológicos que determinan innovaciones en la fabricación y en las características de los productos, incluidos los de consumo masivo como el calzado.

La decisión judicial del concejo de estado busca proteger entre otros algunos de los siguientes derechos:

- Los derechos relacionados con el agua y el goce de un ambiente sano.

- La existencia del equilibrio ecológico y el manejo y aprovechamiento racional de los recursos naturales para garantizar su desarrollo sostenible, conservación, restauración o sustitución.
- La conservación de las especies animales y vegetales.
- La protección de áreas de especial importancia ecológica y de los ecosistemas situados en las zonas fronterizas.
- Los demás intereses de la comunidad relacionados con la preservación y restauración del medio ambiente.
- El goce del espacio público y la utilización y defensa de los bienes de uso público.
- La defensa del patrimonio público.
- La defensa del patrimonio cultural de la Nación.
- La seguridad y salubridad públicas.
- El acceso a una infraestructura de servicios que garantice la salubridad pública.
- El acceso a los servicios públicos y a que su prestación sea eficiente y oportuna.
- El derecho a la seguridad y prevención de desastres previsibles técnicamente.
- El acceso a los servicios públicos y a que su prestación sea eficiente y oportuna.
- Los derechos de los consumidores y usuarios.

(Sentencia del Rio Bogotá, 2014)

Aunque la sentencia con buenas intenciones busca: el mejoramiento ambiental y social de la cuenca hidrográfica, la articulación y coordinación institucional, intersectorial y económica, y la profundización de los procesos educativos y de participación ciudadana. Como se ve las normas jurídicas están concentradas sobre la descontaminación del Río Bogotá, y la responsabilidad es de todos los actores, pero la Magistrada del consejo de estado ha establecido una persecución exclusiva a las curtiembres, que denomina ilegales, que no han trabajado en la implementación de plantas de tratamiento de los vertimientos, cerrando de forma definitiva para agosto del 2018, a más de 40 empresas, sin un plan para mitigar las consecuencias sociales por el desempleo generado y las consecuencias tributarias por los pagos regulares de los respectivos impuestos.

A la fecha no hay planes educativos para la comunidad, sobre el manejo de los residuos del sistema de alcantarillado, y mucho menos sobre la disposición de basuras solidas directamente sobre el lecho del río.

Realidades Actuales De La Relación Entre Universidad Y Sociedad: De La Proyección Social A La Responsabilidad Social Universitaria.

John Fredy SÁNCHEZ MOJICA

Corporación Universitaria Minuto de Dios

Bogotá, Colombia

John.sanchez@uniminuto.edu.co

Abstract

El presente texto hace referencia a la consolidación de la información recaba en la primera fase de la investigación "comparación de los programas de proyección social en 3 universidades privadas de la ciudad a Bogotá". El escrito da cuenta de un análisis de la realidad actual presentada entre la relación subyacente entre la universidad y la sociedad desde los programas de proyección social y responsabilidad universitaria, se intenta indagar por esa relación desde la llamada tercera exigencia a la universidad y determinar cómo las prácticas y metodologías propias de las universidades impactan dicha relación. La metodología a utilizar estuvo basada en un método mixto de carácter dominante cualitativo, en dónde desde el análisis documental a partir de una malla de retención documental se revisaron los documentos normativos y demás propios de la universidad en relación a la temática y se contrastaron con encuestas y entrevistas realizadas a la comunidad educativa en general.

Keywords : Universidad, sociedad, proyección social, responsabilidad social universitaria.

Introducción

La universidad del siglo XXI está inmersa en un proceso de cambio profundo. A las responsabilidades tradicionales que se le han endilgado durante años, centradas en la docencia y la investigación, aparece en las últimas décadas una nueva exigencia que desborda lo meramente académico o investigativo, y que lleva a pensarla como un espacio más abierto a los procesos sociales y comunitarios que le rodean (Bueno & Fernández, 2007). Es lo que se conoce recientemente con varias designaciones que dan cuenta de un mismo fenómeno: responsabilidad social universitaria, tercera misión o el papel de la universidad en el desarrollo de la sostenibilidad. En últimas, termina configurando un nuevo espacio de exigencias a la universidad en donde, además de los ya tradicionales requerimientos, se demanda ahora la transferencia del conocimiento, la innovación y la contribución al desarrollo económico, social y cultural de las comunidades con las que se relaciona. Por esta razón las instituciones universitarias han requerido áreas o programas que atiendan este tipo de solicitudes y que den cuenta del impacto que tiene la universidad en la sociedad.

En tal contexto surge la necesidad de una investigación que reflexione sobre las dinámicas que se encuentran inmersas en las prácticas de responsabilidad social universitaria. Para ello, dos cuestiones resultan cruciales de ser respondidas: ¿cuál es la fundamentación de las prácticas de responsabilidad social en las universidades privadas objeto de análisis? Y ¿qué rol tiene la docencia en esta fundamentación? Preguntas que orientan las reflexiones a desarrollar en este texto y que son un resultado preliminar de la investigación Comparación de las prácticas en proyección social de tres universidades privadas en la ciudad de Bogotá.

Este artículo se nutre del análisis documental realizado a partir de un formato de retención de información aplicado a registros institucionales como líneas base, decretos de conformación, formatos de impacto, lineamientos generales, acuerdos y documentos generales sobre los aspectos teóricos y metodológicos de los programas de proyección social. Así mismo se complementa con la información recaba de una de encuesta de satisfacción realizada a docentes, estudiantes y administrativos pertenecientes a las comunidades educativas de las instituciones objeto de análisis. Del mismo modo, la reflexión se complementa con la bibliografía revisada, los diarios de campo y la observación sistemática, buscando identificar los fundamentos de los programas y prácticas de

responsabilidad social universitaria y su relación con la docencia como función sustantiva universitaria. Una función que demanda cada vez más de una conducta ética por parte de los profesionales que la ejercen (Kearns, 2019).

Siguiendo dicho objetivo la ponencia se estructura de la siguiente forma: en primer lugar, se realiza un análisis metodológico de la propuesta en el que se explicita la metodología utilizada y sus implicaciones dentro de la investigación; en segundo lugar, se efectúa un breve recuento teórico de los conceptos de responsabilidad social y responsabilidad social universitaria; en tercer lugar, se relacionan y discuten los resultados encontrados en el análisis de la fundamentación de los programas de proyección social; por último, se exponen las principales conclusiones del análisis desarrollado, haciendo la salvedad que aún es un proyecto en ejecución y que se está en proceso de implementar otro instrumentos de recolección de información.

La Apuesta Metodológica: De La Comparación A La Reflexión De Los Programas De Proyección Social

Al pensarse una apuesta metodológica para la investigación *Comparación de las prácticas en proyección social de tres universidades privadas en la ciudad de Bogotá* se pensó en un primer momento en la variable determinante en términos metodológicos "la comparación", de qué manera enfocar los instrumentos para que den cuenta de un proceso comparativo de investigación, pero que no solo quede en él, sino que posibilite reflexiones intrínsecas y ocultas dentro de las prácticas de los programas de proyección social; es así, como aparece en el panorama una fuente eficaz de recolección multivariada de información como la que existe en una investigación de la envergadura propuesta, que pueda dar cuenta de aspectos cuantitativos de los programas de proyección social, pero que al mismo tiempo se permita realizar inferencias y análisis que las meras estadísticas no lograrían dilucidar.

A este tipo de metodologías de reciente calado en los procesos investigativos se le denomina de diversas maneras: investigación integrativa (Johnson & Onwuegbuzie, 2004), investigación multimétodos (Hunter & Brewer, 2003; Morse, 2003), métodos múltiples (Smith, 2006, citado por Johnson, Onwuegbuzie & Turner, 2006), estudios de triangulación (Sandelowski, 2003), e investigación mixta (Tashakkori & Teddlie, 2009; Plano y Creswell, 2008; Bergman, 2009; y Sampieri & Mendoza, 2008). Para el entendimiento de este proyecto se sigue la denominación más común dentro de la bibliografía latinoamericana y los procesos académicos: investigaciones metodológicas mixtas.

Cada vez más investigaciones utilizan este tipo de metodologías ya sea por su elasticidad y multiplicidad técnica o por las mismas temáticas actuales que requieren repertorios más amplios y menos rígidos en la investigación.

Dentro de este contexto, en los años 60 y 70 se realizan una serie de investigaciones que, ya sea por su temática, por sus recursos o por las mismas disciplinas participantes, requieren la utilización de técnicas y métodos tanto cualitativos como cuantitativos. Lo cual lleva a que muchas investigaciones propicien métodos de utilización complementaria de técnicas desde ambos extremos metodológicos.

De esta manera, se comienza a hacer necesaria una reflexión profunda dentro de las mismas dinámicas de la investigación de este tipo de proyectos que integran técnicas y métodos de ambas metodologías, la cualitativa y la cuantitativa.

Con el pasar de los años se hace evidente y necesario nombrar y reflexionar sobre dichos estudios, los cuales comienzan a ser denominados de diversas formas como ya se afirmó, en donde la utilización de técnicas cuantitativas y cualitativas presentan problemas bastante complejos, puesto que, epistemológica y ontológicamente, la cuestión se muestra de formas diversas. Como señala Hernández Pina (2001, p. 54), los defensores de esta postura sostienen que "las diferencias no estriban tanto en los números y en las técnicas estadísticas como en cuestiones más sustantivas como son la objetividad, la validez, la fiabilidad y los criterios de verdad".

Para soslayar la discusión sobre la pertinencia objetiva e investigativa de las metodologías mixtas se postulan tres alternativas. Bericat (1998) identifica tres estrategias de integración metodológica: la complementación, la combinación y la triangulación. La complementación refiere el uso de metodologías cuantitativa y cualitativa con el objetivo de abordar, con cada una de ellas de forma separada, una dimensión diferente del objeto de estudio de una investigación. Esta estrategia conserva la independencia de métodos y de resultados ya que cada método se usa para responder a interrogantes diferentes de la investigación. La combinación indica el uso de un método de manera subsidiaria respecto al otro a los fines de aumentar la validez del último. Aquí sí hay combinación metodológica con el propósito de obtener un solo tipo de resultado, proveniente de la última metodología empleada. Finalmente, la convergencia o triangulación supone el uso de ambas metodologías para abordar el mismo aspecto de la realidad. En este caso, si bien hay independencia en la aplicación de los métodos, existe una convergencia en los resultados. Su utilización implica la aceptación de que ambas metodologías pueden captar iguales aspectos de la realidad.

Desde este tipo de análisis autores como Johnson & Onwuegbuzie (2004), Onwuegbuzie & Leech (2006) y el mismo Sampieri (2008) han entablado una reflexión en cuanto a la utilización de las técnicas, métodos y características propias de las metodologías mixtas en investigación. Resultado de estas indagaciones se ha perfilado la investigación con metodología mixta como un enfoque que propicia análisis fidedignos, válidos y objetivos, desde que su realización esté apegada a los estándares propios de la ética investigativa y de los parámetros generales de la investigación cuanti y cualitativa.

Para estos autores, la postura dominante de una u otra de las metodologías se hace inherente en la mayoría de las investigaciones, razón por la cual se debe desde un inicio postular dicha preponderancia en el proceso investigativo, para de este modo evitar sesgos y problemas metodológicos a posteriori en el curso de la investigación.

La metodología está así basada en un método mixto de recolección de información en donde, según los parámetros de Bericat (1998), se utilizan los métodos a modo de triangulación y se usan ambas metodologías para abordar el mismo aspecto de la realidad: los programas de proyección social de tres universidades privadas de la ciudad de Bogotá. Se busca así la independencia en la aplicación de los métodos, entrevistas y formatos de retención documental desde lo cualitativo y encuestas desde lo cuantitativo, lo cual fundamenta la triangulación.

Siendo así, el proyecto tiene presente dos cuestiones, por un lado, que la utilización de las dos metodologías implica la aceptación de que ambas pueden captar igual aspecto de la realidad, y que se espera que logren de esta manera realizarlo desde el control de los mismos investigadores a partir de la observación y los diarios de campo; por otro lado, se espera que la investigación sea en términos de Onwuegbuzie & Leech (2006) y Sampieri (2008), una metodología mixta con estatus dominante cualitativo, esto por varias razones: por un lado, la investigación, desde su formulación, espera dar cuenta de percepciones, intereses propios de un análisis de ciencias sociales y, unido a la metodología cualitativa, se espera que con las técnicas cualitativas se pueda responder cuestiones intrínsecas a los pormenores de fondo de los proyectos que técnicas de corte cuantitativo netamente no darían cuenta por sí solas.

Percepciones Sobre La Proyección Social En Las Comunidades Educativas

Las prácticas de proyección social son una estrategia que permiten visibilizar la formación integral, compromiso de todas las entidades educativas y bajo el manifiesto que tiene la universidad con la responsabilidad social universitaria, además que permite el retorno del desarrollo académico a la región, por su compromiso en la transformación social (Ziritt y Huerta, 2007) es la manera de evidenciar que la academia no es una esfera aparte de la realidad social, sino todo lo contrario, desde allí se visibiliza y se da respuesta a múltiples problemáticas que enfrenta la sociedad.

Con la intensión de conocer el nivel de satisfacción que percibe la comunidad educativa sobre el programa de proyección social de la institución universitaria a la cual pertenecen, en donde se incluyen profesores, estudiantes, administrativos y egresados se realiza una encuesta compuesta de 17 preguntas con escala de Likert, fue aplicada a 643 personas, de los cuales el 78,6% corresponde a

estudiantes, el 16,1% a profesores, el 4,5% a administrativos y un 0,5% a egresados, con este instrumento se mide las relaciones existentes entre la comunidad que al ser parte de la universidad son beneficiarios directos, pero se quiere transcender y explorar la percepción que se tiene por el trabajo que se hace cuando se realizan prácticas sociales en las diferentes localidades que cada universidad impacta; en este sentido esta la necesidad de reflexionar sobre los procesos que lleva proyección social de las universidades generando conclusiones a modo de recomendaciones que aporten de acuerdo al contexto y realidad de cada colectivo.

Este instrumentos hace parte de la investigación titulada "comparación de los programas de proyección social de 3 universidades privadas de la ciudad de Bogotá", misma que pretende determinar las prácticas, intereses, percepciones, alcances y limitaciones que se manejan en las instituciones estudiadas sobre los programas de proyección social, por ello estamos hablando de una investigación de tipo aplicada, y de carácter descriptivo en donde se recopila la percepción del programa de proyección social en la universidad vista por estudiantes, docentes, administrativos de las universidades Corporación Universitaria Minuto de Dios, Fundación del área andina y Corporación tecnológica de Bogotá.

En cuanto a la recolección e interpretación de los datos el trabajo de campo se orientó a conocer el nivel de satisfacción que tiene la comunidad educativa con respecto a la extensión de proyección social. Se consideró una muestra representativa y aleatoria cuya composición fue la siguiente:

Tabla 1: Muestra de participantes

	Frecuencia	Porcentaje
Corporación tecnológica de Bogotá	82	12,7%
Corporación universitaria minuto de Dios	273	42,5%
Fundación del área andina	288	44,8%

Fuente: elaboración propia.

Se puede destacar que el trabajo realizado por las universidades en cuanto a su responsabilidad frente a los problemas sociales se encuentra con una perspectiva de aceptación entre la población estudio, teniendo en cuenta que el 82,8% lo identifican de esta manera; Si el análisis se hace por universidad se logra evidenciar que es la Uniminuto en donde la gran mayoría lo califican en 5, resultado que está ligado a la misión de la institución, en donde esta explícitamente el compromiso social, mientras en la Andina la calificación se centra en 4; de todas maneras se percibe que realmente existe preocupación por los problemas sociales y a su vez se divulga las actividades que hace proyección social, consecuencia que la universidad cada vez se desliga más de sus aspectos estructurales paredes adentro y tiene un dialogo más real y contextual con la sociedad.

De otro lado, las instituciones educativas universitarias tienen como eje fundamental la formación integral, en donde se logre demostrar que sus estudiantes no solo reciben y generan conocimiento, sino que además tiene conductas individuales y valores que aportan a la sociedad reflejado en una toma de decisiones sociales, por ello se indaga si los proyectos que se desarrollan desde proyección social contribuyen a ese desarrollo integral de los profesionales en formación en donde se obtiene que el 83% de la población que lo visualizan como satisfactorio. No obstante, el 11,7% de la población presenta una opinión parcial sobre este ejercicio, lo que debe llevar a un cuestionamiento y constancia de la necesidad que los proyectos sociales estén inmersos en las competencias que se adquieren como profesionales. No se puede desconocer que el mayor porcentaje tanto profesores como estudiantes de la Uniminuto le dan una calificación de 5, es decir, que están plenamente de acuerdo que proyección social está contribuyendo a esa formación integral; sin embargo, en las otras dos universidades la mayor calificación se centra en 4, lo que indica se está haciendo un buen trabajo no se logra la satisfacción plena aún.

Continuando con la formación integral, no se puede dejar de lado el tema ambiental, elemento que constituye una problemática social a la cual también se debe dar respuesta, atendiendo el trabajo desarrollado se indaga el nivel de satisfacción que se tiene frente a la perspectiva de si la universidad está comprometida con la mejora de la calidad ambiental y actúa con proyectos en áreas protegidas o ambientalmente sensibles en donde se obtiene que la mejora continua como componente principal de la pertinencia y existencia que tiene la ejecución de los proyectos en los temas ambientales y sostenibles tiene un 46,1% como totalmente de acuerdo con su ejecución, adicional a un 32,3% tiene un nivel de percepción de parcialmente de acuerdo, lo que muestra una necesidad de seguir ligando los temas ambientales con la proyección social, garantizando un hilo conductor como respuesta a una problemática a nivel mundial.

Pasando a temas de calidad en la universidad, "En la acreditación Institucional, la calidad se determina por el logro tanto de los fines como de los objetivos de la Educación Superior, por la capacidad para autoevaluarse y autorregularse, por la pertinencia social de los postulados de la misión y del proyecto institucional, por la manera como se cumplen las funciones básicas de docencia, investigación y proyección social, por el impacto de la labor académica en la sociedad" (Consejo Nacional de acreditación , 2019). Por lo que en esta investigación se mide si la diversidad de los proyectos desarrollados desde proyección social no se tiene discriminación de ningún tipo y por ende todos pueden participar como beneficiarios o actores de los proyectos obtenido como resultado obtenido que el nivel de inserción de los proyectos de proyección social es el adecuado, pues el 83,5% no encuentra discriminaciones y si una alta participación de los actores y beneficiarios del mismo, esto indica que las universidades hacen trabajo conjunto estableciendo estrategias que potencia competencias en los actores de los diferentes proyectos sociales involucrando a todos sin que exista discriminación alguna, todo lo contrario el nivel de satisfacción muestra lo incluyentes que son los proyectos.

El abordaje que se está haciendo de proyectos sociales dentro de las universidades debe prologarse una vez se culmina con la formación académica propendiendo que egresados u graduados muestre aptitudes y actitudes de responsabilidad social y ambiental participando en proyectos de esta índole fuera de la Universidad, así que se indaga sobre esta percepción y se tiene que la imagen que tiene el egresado o graduado de la universidad es de personas participativos, que les gusta e interactúan en proyectos sociales esto se refleja en el 67,9% que obtuvo de favorabilidad. Sin embargo, no se puede desconocer el 23,8% que muestra una respuesta neutra, al analizar a toda la muestra participante. Pero es aún más relevante si se analiza las respuestas únicamente de las personas que respondieron y están en el rol de graduado o egresado en donde se obtiene que ellos se centran en el punto neutro, ninguno da respuesta de satisfactorio, lo que debe llevar a un cuestionamiento y resignificar lo que se hace desde proyección social con los estudiantes a lo largo de su carrera profesional y lo que se espera debe continuarse una vez se recibe un grado de profesional.

La articulación de la universidad con otras instituciones que también promueven la proyección social también fue objeto de estudio, y se quiso mirar el nivel de satisfacción que se tiene del contacto entre la institución educativa y actores claves del desarrollo social como lo son empresas, estado ONGs, y otras instituciones de educación, en donde se obtiene un 71,2% de favorabilidad, lo que se traduce en el cumplimiento de logros mancomunados entre proyección social universitario y actores de participación ciudadana, esto se puede traducir en cooperación, en identidad local o regional, en espacios de encuentro focalizados a la participación y trabajo colectivo.

En concordancia con la integración de la proyección social en los proyectos de desarrollo social se resalta que el 33,5% de la población encuestada califica con un alto nivel de satisfacción el manejo de las redes de desarrollo que tienen las universidades para dar solución a las problemáticas que se abordan desde las diferentes temáticas académicas y proyectos de aula, a través de foros, comités, mesas de trabajo, congresos que dan la oportunidad de reencontrar, reconocer la orientación, el apoyo y el trabajo en cada una de las actividades que se realiza desde proyección social universitario para tratar realidades sociales, políticas, culturales y económicas del contexto cercano.

Y cuando se habla de transformar entornos a través de la función de proyección social hace entrada un actor fundamental de todo el proceso formativo, y es el docente, por ello en la investigación también se indaga si los programas de proyección social prestan atención a las necesidades de los

docentes de la institución y promueven actividades encaminadas a ellos, encontrando que tan solo el 3% del total de la población lo ven como totalmente insatisfecho, lo cual puede resaltar el agrado al alcance que ha tenido el apoyo de las diferentes instituciones a sus académicos, aquí es de destacar que la encuesta fue respondida en un alto porcentaje por estudiantes, lo que también muestra una percepción favorable en cuanto al clima laboral al tener al docente en cuenta en proyección social genera motivos de reconocimiento, de apoyo y de sentido humano. Ahora bien, si se analiza solo las respuestas de los profesores participantes encontramos que su calificación se centró en 4, es decir que, aunque están satisfechos no lo están en un nivel pleno, esto es de analizar desde las dos perspectivas, la del estudiante que percibe que la institución presta atención a sus docentes, y la del profesor que si bien no está en desacuerdo tampoco muestra un nivel de aceptación completo.

Debe existir una pertinencia entre lo que enseña en un aula de clase y entre lo que espera la sociedad y el mundo laboral de los profesionales, por ello también se busca conocer la opinión que se tiene al considerar si los planes de estudio están enlazados con proyección social, y desde el ejercicio curricular se logra identificar el nivel de flexibilidad, integralidad, e interdisciplinaridad, con el que cuentan los planes de estudios de los programas académicos los cuales son bien percibidos por su población, pues el 77,5% lo perciben de forma muy satisfecho o pertinente para el proceso de formación.

Como expresión de la responsabilidad social universitaria y como una estrategia para poder asumir el compromiso social, surgen los grupos de voluntariado, "Una Universidad del siglo XXI no puede vivir a espaldas de la problemática global sin buscar solución al incremento de la pobreza, desigualdades, injusticia, violencia, etc. Como generadora de conocimiento, tiene la gran responsabilidad de enseñar a sus alumnos a reflexionar sobre estos problemas y generar investigación aplicada para solucionarlos de modo interdisciplinario". (Manrrique, 2014) por lo que con la investigación también se quiere conocer si conoce la existencia de estos grupos y la manera de poder pertenecer a ellos en donde se encontró que el 65,9% identifican grupos de voluntariado con los que cuenta la universidad, y su manera de acceder a ellos, además que la universidad facilita el tiempo y los recursos para la realización de iniciativas sociales.

Conclusiones

Desde la dirección de proyección social se trabaja y se logra una interacción e integración de la academia con la comunidad de la que se forma parte, en donde la responsabilidad social transciende de los programas académicos y los responsables de la formación profesional y se articula con la realidad social interpretando sus necesidades y generando estrategias de solución interdisciplinares.

Existe un alto nivel de satisfacción entre la comunidad educativa por el conocimiento y las experiencias que se generan desde el desarrollo de proyectos sociales, considerando el gran aporte que se tiene para la formación integral.

Potenciar los espacios de los grupos de voluntariado y visibilizar el trabajo desarrollado por la universidad hacia la comunidad es tarea constante, para cumplir con la misión de articular academia, investigación y proyección social en aras de dar respuesta al contexto y al mundo laboral que exige seres humanos comprometidos con su ser y su saber.

La Investigación En Los Planes De Doctorado En Educación De Las Universidades Peruanas

The Research On The Doctoracy Plans In Education From The Peruvian Universities

Hugo GONZÁLEZ

Universidad Autónoma del Perú, Lima, Perú

hugo_augencio@hotmail.com

Resumen

El presente estudio analiza la investigación en los planes de estudios doctorales de educación de las universidades peruanas licenciadas por SUNEDU que suman un promedio de 30 universidades e igual número de programas que han difundido sus planes a través de la web. Se ha realizado un estudio por categorías. Se concluye que los planes de estudio de los programas de doctorado en educación no están estandarizados respecto a los cursos de investigación y los ciclos respectivos, e impiden que exista movilidad estudiantil.

Palabras clave: Investigación, planes de estudio, ranquin, tesis, taller, seminario.

Abstract

The present study analyzes the research of the doctorate study plans in education from the Peruvian universities licensed by SUNEDU which reach at an average of 30 universities and the same number of programs that have disseminated their plans through the website. A study based on categories have been carried out. It concludes that the study plans of doctorate programs in education haven't been standardized with regard to the research courses and the respective academic terms, and stop from appearing student movement.

Keywords: Research, study plans, ranquin thesis, workshop, seminar.

Introducción

La presente investigación analiza, a través de categorías, el uso de la investigación en los planes de doctorado en educación de las universidades peruanas, licenciadas por SUNEDU. La investigación es relevante porque permite acrecentar el conocimiento y resolver problemas, según la naturaleza o los propósitos de esta.

La investigación permite el desarrollo del conocimiento en función de los propósitos de las instituciones o universidades, también con base en la realidad socioeducativa; asimismo, permite resolver los problemas educativos en sus diversos niveles con el propósito no solo de acrecentar la teoría, sino que permita formar un hombre con diversos valores para que construya una sociedad más justa, equitativa, humanizante.

En el nivel doctoral las exigencias son mayores ya que se trata de realizar tesis originales, con mayor profundización teórica o temática. Este nivel requiere competencias investigativas para diseñar proyector y ejecutar la investigación o tesis. Los temas deben ser relevantes, actuales y que aporten a la ciencia. En el posgrado se enriquece y profundiza la investigación que se inicia en el pregrado, como uno de los componentes relevantes en la función del docente (Mirabal y Caballero, 2018).

En este contexto, es importante realizar un análisis de los cursos de investigación que se desarrollan en el doctorado de educación de las universidades peruanas, teniendo en cuenta que no existe un estudio de esta naturaleza, y por tanto urge realizarlo.

Antecedentes Y Fundamentación

Los doctorados en España, a aparte de haberse adaptado a la ley, se orientan a la internacionalización, a la innovación y a la capacidad investigativa pluridisciplinar (Jiménez-Ramírez, 2017).

En los antecedentes, se han estudiado algunos problemas en la investigación doctoral: la falta de coherencia en la metodología, no se asume una postura crítica, inadecuada construcción de la operacionalización de variables (López, Leyva, Zambrano y Quiroz, 2019); la falta de evaluación de pares externos en las tesis, la carencia de investigaciones doctorales originales (Buela-Casal et al. 2011; De miguel, 2010; Álvarez, Mojardín y Audelo, 2014).

Otros problemas están asociados con la certificación de calidad de los programas, tal es el caso de chile que en un 65% no poseen dicha exigencia (Núñez-Valdés y González, 2019). Impide cumplir con estándares de calidad del doctorado en educación.

En función de lo descrito previamente, se ha establecido que se debe fortalecer la alianza universidad-empresa, vincular los conocimientos y la producción de bienes y servicios (Concepción, González, García y Miño, 2019); establecer redes académicas que desarrollen investigación multidisciplinar y que tengan presencia en otras redes o contextos (Sime-Poma, 2013).

En el caso específico del Perú, el doctorado en educación tiene una orientación más de profesionalización que de investigación científica (Dias y Sime, 2016); requiere ser fortalecido con las competencias investigativas para desarrollar trabajos originales y que aporten a la solución de problemas educativos peruanos. Esto se ve reflejado en el ranquin latinoamericano de facultades de educación, entre las 12, no se encuentra el Perú, a diferencia de Chile que cuenta con 4 facultades de educación (Pontificia Universidad Católica de Chile en primer lugar, Universidad de Chile en segundo lugar, Universidad de Santiago de Chile en octavo lugar, Pontificia Universidad Católica de Valparaíso en décimo lugar); Brasil también con 4 (la Universidad de Sao Paulo en quinto lugar, Universidad Estadual de Campinas en sétimo lugar, Universidad Federal de Rio de Janeiro en noveno lugar, UNESP en duodécimo lugar); Colombia con 2 (Universidad Nacional de Colombia en sexto lugar, Universidad de los Andes en undécimo lugar); y México con 1 (la Universidad Nacional Autónoma de México). Sobre revistas científicas, el Perú no cuenta con ninguna en Scopus.

La investigación doctoral como un eje transversal debe desarrollar en el estudiante su capacidad investigativa y la publicación de artículos científicos en revistas indizadas (Gómez, Deslauriers y Alzate, 2010); también competencias y habilidades que generen impacto internacional y permitan la aplicación de conocimientos científicos en contextos pertinentes (Pacheco, 2015 y Rodríguez, 2013).

Los principios y ejes fundamentales del doctorado están centrados en la internacionalización, la convergencia y homogenización de los estudios doctorales (Rodríguez, 2013); asimismo, las competencias en investigación, la interdisciplinariedad y el desarrollo conjunto con las empresas (Jiménez-Ramírez, 2017), es decir que la universidad no esté aislada de la sociedad ni de las empresas, como antes lo ha estado.

Las competencias que se deben desarrollar en el nivel de doctorado en educación se centran en tres: disciplinares: que aporte investigación de alta calidad a nivel nacional e internacional para contribuir a la comunidad científica; competencias metodológicas tanto cualitativas como cuantitativas; instrumentales: que permitan abordar con mayor precisión los fenómenos que se van a estudiar (Núñez-Valdés y González, 2019); no obstante, también sería bueno agregar la competencia comunicativa específicamente en la escritura de la tesis doctoral donde prime la coherencia, cohesión y adecuación del discurso de la tesis.

La tesis no debe estar aislada de la Ley Universitaria peruana nro. 30220, donde se establece que la obtención del doctorado debe realizarse a través de la aprobación y sustentación de un trabajo científico que tenga rigurosidad académica y sea original; asimismo, que aporte a la ciencia y que resuelva problemas del entorno o contexto, con el propósito de que no sea una tesis que solo cumpla el requisito para graduarse y sin posibilidades de que se publicable o carezca de relevancia social.

Método

El presente estudio es cualitativo. Se han seleccionado los programas licenciados por SUNEDU que ha difundido su plan a través de sus webs (consultadas desde enero de 2019 hasta el 25 de octubre del 2019). Incluye a universidades privadas y públicas (42 programas analizados). Se han estudiado los cursos de investigación de los 6 ciclos.

Algunas universidades tienen varias sedes o secciones (UCV cuenta con 4 Administración de la Educación y 4 en Educación; la Universidad de Huánuco 3, la PUCP 2, la U. Marcelino de Champagnat (2), aunque solo una funciona, pero en el portal de SUNEDU figuran 2, la U. Unión 2

Tabla 1: Relación de programas de doctorado en educación licenciados por SUNEDU

Nro.	Universidad	Denominación del programa	Lugar
1	Pontificia Universidad Católica del Perú (2)	Ciencias de la Educación (1); Gestión Estratégica con Mención Innovación y Gestión en Educación Superior (1)	Lima
2	Universidad Andina del Cusco (1)	Ciencias de la Educación	Cusco
3	Universidad Católica de Santa María (1)	Educación	Arequipa
4	Universidad César Vallejo (8)	Administración de la Educación (4, **no se difunde en su portal**), Educación (4)	La Libertad
5	Universidad de Huánuco (3)	Ciencias de la Educación	Huánuco
6	Universidad de Piura (1)	Educación	Piura
7	Universidad de San Martín de Porres (1)	Educación	Lima
8	Universidad Femenina Sagrado Corazón de Jesús (1)	Educación	Lima
9	Universidad Marcelino Champagnat (2)	Ciencias de la educación (1), en Filosofía con mención Educación (1), (**está en la base de SUNEDU, pero no se imparte**)	Lima
10	Universidad Nacional Daniel Alcides Carrión (1)	Ciencias de la educación (**no ha difundido su plan de estudios en su portal web**)	Pasco
11	Universidad Nacional de Cajamarca (1)	Ciencias de la Educación	Cajamarca
12	Universidad Nacional de Huancavelica (1)	Educación	Huancavelica
13	Universidad Nacional de la Amazonía Peruana (1)	Ciencias de la Educación	Loreto
14	Universidad Nacional de Piura (1)	Educación	Piura

15	Universidad Nacional de San Agustín (1)	Ciencias de la Educación	Arequipa
16	Universidad Nacional San Cristóbal de Huamanga (1)	Educación (**no ha difundido su plan de estudios en su portal web**)	Ayacucho
17	Universidad Nacional de San Martín (1)	Ciencias de la Educación	San Martín
18	Universidad Nacional de Trujillo (1)	Ciencias de la Educación	La Libertad
19	Universidad Nacional de Ucayali (1)	Educación	Ucayali
20	Universidad Nacional del Altiplano (1)	Educación	Puno
21	Universidad Nacional del Centro del Perú (1)	Educación	Junín
22	Universidad Nacional del Santa (1)	Educación	Ancash
23	Universidad N. Hermilio Valdizán de Huánuco (1)	Educación	Huánuco
24	Universidad Nacional Jorge Basadre Grohmann (1)	Ciencias de la Educación	Tacna
25	Universidad Nacional Mayor de San Marcos (1)	Ciencias de la Educación	Lima
26	Universidad Nacional Santiago Antúnez de Mayolo (1)	Educación y Docencia Universitaria	Ancash
27	Universidad Peruana Unión (2)	Educación con mención en Currículo y Docencia (1) y con mención Gestión Educativa (1)	Lima
28	Universidad Privada Antenor Orrego (1)	Educación	La Libertad
29	Universidad Privada de Tacna (1)	Gestión Educativa	Tacna
30	Universidad San Ignacio de Loyola (1)	Educación	Lima

Nota: Tomado de https://www.sunedu.gob.pe/lista-carreras-autorizadas/

Total: 42 programas; 30 universidades, de estas 3 no han difundido sus planes en sus webs: UCV con su doctorado de Administración en Educación (cuatro programas), Universidad Nacional Alcides Carrión, San Cristóbal de Huamanga, la Universidad Marcelino de Champagnat, según SUNEDU tiene 2 programas, pero solo imparte uno: Ciencias de la Educación. La Universidad César Vallejo en el programa de Doctorado en Educación tiene cuatro programas, pero para el análisis solo se ha considerado uno. En total son 30 programas analizados.

Análisis De Resultados

En análisis de contenido se ha realizado teniendo en cuenta las categorías, es decir agrupando los cursos que tienen un mismo propósito o fin: cursos orientados a la formación en metodología de la investigación científica (procesos, paradigmas, métodos); cursos que desarrollan la ciencia desde un aspecto analítico, crítico; cursos orientados al desarrollo de la investigación para la tesis doctoral; cursos que se interrelacionan con la investigación, desde un enfoque interdisciplinar; cursos relacionados con la búsqueda de información y la redacción científica o artículos científicos; cursos sobre identificación de problemas relacionados con la educación; cursos orientados a la gestión del conocimiento (tiene como propósito cómo transferir el conocimiento dentro de la organización).

Tabla 2: Primera categoría, cursos, universidad y ciclo

Nro.	Categoría	Cursos	Universidad y ciclo
1	Formación en metodología de la investigación	Metodología de la Investigación Científica	U. Andina del Cusco, Universidad de Piura, U. Nacional de Cajamarca, U. Hermilio Valdizán, Santiago Antúnez de Mayolo (ciclo I); Universidad Marcelino de Champagnat en su mención Ciencias de la Educación (ciclo II).
		Métodos Cuantitativos, Métodos Cualitativos	PUCP en su mención Gestión Estratégica en sus ciclos: I y II.
		Investigación Cuantitativa, Investigación Cualitativa	U. Antenor Orrego, ciclos I y II.
		Paradigmas Metodológicos en la Investigación Científica	La Universidad Nacional Mayor de San Marcos, ciclo I.
		Métodos de Investigación	PUCP (en su mención: Gestión Estratégica), ciclo I.
		Investigación I, Investigación II.	U. Nacional de Trujillo, ciclo I y II.
		Investigación Científica	U. Hermilio Valdizán, ciclo II
		Metodología de la Investigación Educacional, Metodología de Investigación Científica Cualitativa	U. San Ignacio de Loyola, ciclo I y II.

Nota: Elaborado en base a la información de la web de las universidades estudiadas

La primera categoría está relacionada con la metodología de la investigación científica, esta prevé al investigador de conceptos, leyes para desarrollar el proceso investigativo (Viñán, Navarrete, Puente, Pino y Caicedo, 2018). Asimismo, permite mejorar la enseñanza y la pedagogía, al tratarse de la investigación y su relación con la educación.

Tabla 3: Segunda categoría, cursos, universidad y ciclo

Nro.	Categoría	Cursos	Universidad y ciclo
2	Desarrollo de la ciencia desde un aspecto analítico, crítico	Epistemología	Universidad Andina del Cusco, U. César Vallejo, U. Marcelino Champagnat en su mención Ciencias de la educación, U. Nacional de Cajamarca, U. Nacional del Centro, U. Nacional del Santa (ciclo I).
		Epistemología e Historia de la Educación	U. Católica Santa María, ciclo I
		Epistemología y Educación	U. San Martín de Porres, ciclo I.
		Epistemología de la Educación	U. Femenina del Sagrado Corazón, U. Nacional de la Amazonía Peruana, U. Nacional del Altiplano, U. Hermilio Valdizán, UNMSM, U. San Ignacio (Ciclo I).
		Seminario de Epistemología de la Educación	U. Santiago Antúnez de Mayolo, ciclo I.
		Fundamentos Epistemológicos de la Educación	U. Nacional Jorge Basadre, ciclo I
		Epistemología transdisciplinaria y Corrientes Filosóficas en Ciencias Sociales y de la Educación	U. de Huánuco, ciclo I.
		Seminario de Epistemología de la Educación	U. Santiago Antúnez de Mayolo, ciclo I.
		Fundamentos Epistemológicos de la Educación	U. Católica Santa María, ciclo I.
		Epistemología transdisciplinaria y Corrientes Filosóficas en Ciencias Sociales y de la Educación	U. de Huánuco, ciclo I
		Filosofía de la Ciencia, Filosofía de la Ciencia y la Tecnología	U. Nacional de Ucayali, ciclo I (Filosofía de la Ciencia) U. Nacional Jorge Basadre, ciclo II (Filosofía de la Ciencia y la Tecnología

Nota: Elaborado en base a la información de la web de las universidades estudiadas

La segunda categoría se asocia con la epistemología que analiza de manera crítica los problemas que se presentan en la creación o producción del conocimiento científico, entre ellos la construcción de términos, la evolución de las teorías, su contrastación empírica (Damiani, 2005);

la epistemología de la educación estudia los aspectos curriculares, la relación entre disciplinas, la formación docente, la calidad del proceso educativo.

Tabla 4: Tercera categoría, cursos, universidad y ciclo

Nro.	Categoría	Cursos	Universidad y ciclo
3	Desarrollo de la investigación para la tesis doctoral	-Seminario de Investigación (I, II, III, IV, V) -Seminario de Tesis (I y II): -Proyecto de Tesis: -Tesis I: Elaboración del Proyecto de Investigación I -Tesis Doctoral (I y II). -Investigación Doctoral (II y III). -Asesoramiento de Tesis (I y II). -Taller de Tesis (I y II)	La mayoría de universidades las incluyen en sus programas, a partir del II ciclo, de manera gradual o secuencial, con excepción de la Universidad Hermilio Valdizán (no lo incluye ni en el III ni en el V ciclo); tampoco la U. Nacional de Ucayali en su III y IV ciclo; Antenor Orrego en su III, U. Privada de Tacna también no la considera en el III ciclo y la U. Nacional de la Amazonía Peruana en el III ciclo. En los ciclos mencionados no llevan ningún curso de investigación.

Nota: Elaborado en base a la información de la web de las universidades estudiadas

La tercera categoría está asociada con la realización de la tesis doctoral, en este caso específico están los talleres, estos permiten la relación entre la teoría y la práctica en la realización de la investigación (Fernández y Guevara, 2017); los seminarios que forman participantes para la investigación, desarrollan sus competencias investigativas (Universidad Industrial de Santander, 2007). En este caso también se incluyen los seminarios de tesis que es la ejecución de la investigación o del plan de investigación. También los proyectos de tesis, que pertenecen a la etapa previa al seminario de tesis.

Tabla 5: Cuarta categoría, cursos, universidad y ciclo

Nro.	Categoría	Cursos	Universidad y ciclo
4	Cursos con enfoque interdisciplinar	Estadística Aplicada a la Educación	U. Católica Santa María, ciclo II (Estadística Aplicada). U. Nacional del Altiplano, ciclo II; U. Nacional de Piura, ciclo IV. (Estadística Aplicada a la Investigación Educativa). U. Nacional de San Martín, ciclo VI (Estadística Inferencial).
		Ética en la Investigación Científica	U. César Vallejo, ciclo II.
		Responsabilidad Social e Investigación	U. César Vallejo, ciclo II.

Nota: Elaborado en base a la información de la web de las universidades estudiadas

La cuarta categoría está asociada con la investigación desde un enfoque interdisciplinar el cual implica la interacción de varias ciencias para estudiar o resolver los problemas científicos. Va

más allá de las disciplinas y construye un nuevo modo de existir o convivir (Arboleda, Garcés, Sepúlveda, 2018).

Tabla 6: Quinta categoría, cursos, universidad y ciclo

Nro.	Categoría	Cursos	Universidad y ciclo
5	Cursos relacionados con la búsqueda de información y la redacción científica o artículos científicos	Taller de manejo de Información y Redacción Académica	PUCP, Gestión Estratégica, ciclo I.
		Redacción de Artículos en Informes Científicos en Educación	U. Católica Santa María, ciclo II.
		Taller de Investigación I: Búsqueda de Información Científica	Universidad Marcelino Champagnat con mención en Ciencias de la educación, ciclo II
		Redacción Científica	U. Nacional de Piura, ciclo I
		Investigación I (Revisión de Literatura Científica)	U. Nacional de Trujillo, ciclo I.
		La Publicación Científica	U. Nacional de Trujillo, ciclo III.
		Elaboración y Publicación de Artículo	U. Católica Santa María, ciclo VI.
		Investigación VI (Redacción de la Tesis)	U. Nacional de Trujillo, ciclo VI.
		Taller de Producción Intelectual	U. Nacional del Altiplano, ciclo V.
		Seminario de Redacción y Publicación Científica	U. Nacional Santiago Antúnez de Mayolo, ciclo V.
		Taller de Tesis VI: Borrador de la Tesis	UNMSM, VI ciclo.
		Tesis IV: Redacción y Sustentación del Informe de Investigación	Universidad Antenor Orrego, ciclo VI.
		Seminario de Tesis V: Elaboración y Sustentación de Informe de Investigación	Universidad San Ignacio de Loyola, ciclo VI.

Nota: Elaborado en base a la información de la web de las universidades estudiadas

La quinta dimensión está relacionada con la búsqueda de información y la redacción científica. Se trata de una competencia comunicativa (completa) que implica el conocimiento de la competencia lingüística, sociolingüista, discursiva, estratégica y sociocultural (Gutiérrez-Artacho, Olvera-Lobo, Rivera-Trigueros, 2019), el cual incluye el dominio de la lectura y escritura científica.

Tabla 7: Sexta categoría, cursos, universidad y ciclo

Nro.	Categoría	Cursos	Universidad y ciclo
6	Cursos sobre identificación de problemas relacionados con la educación	Investigación Sobre la Problemática Educativa Peruana	U. Femenina del Sagrado Corazón, ciclo I.
		Investigación sobre Problemática Educativa Latinoamericana y Mundial	U. Femenina del Sagrado Corazón, ciclo II.
		Investigación Pedagógica	U. Antenor Orrego, ciclo IV.

Nota: Elaborado en base a la información de la web de las universidades estudiadas

La sexta categoría está asociada a los cursos relacionados con los problemas educativos. El cual permite al estudiante conocer los problemas relacionados con su carrera, en este caso educativa.

Tabla 8: Sétima categoría, cursos, universidad y ciclo

Nro.	Categoría	Cursos	Universidad y ciclo
7	Gestión del Conocimiento	Gestión del Conocimiento Científico	U. Femenina del Sagrado Corazón, ciclo I.
		Gestión de Conocimiento	UCV, mención Ciencias de la Educación, ciclo III.

Nota: Elaborado en base a la información de la web de las universidades estudiadas

La sétima categoría está referida a la gestión del conocimiento, permite mejorar las actividades de los integrantes de la comunidad educativa; en el caso de la educación es relevante porque se puede utilizar para mejorar los procesos formativos, investigativos.

Discusión

Del análisis de los cursos de los programas de doctorado en educación, presentan disparidad, no hay convergencia, homogenización (Rodríguez, 2013).

También, hay evidencias que las facultades y entre ellos los programas de doctorado no están en la escena científica internacional, no aparecen entre las 12 primeras del ranquin Scimago de 2019, en educación. Tampoco se tiene revistas de educación indizadas en Scopus.

Los cursos de investigación (Estadística Aplicada a la Investigación Educativa, Ética de la Investigación, etc.) que desarrollan la interdisciplinariedad, que es un eje fundamental del doctorado (Jiménez-Ramírez, 2017), son pocos, teniendo en cuenta que en la actualidad se requiere desarrollar este enfoque para resolver problemas complejos.

No existe estandarización en los cursos ni en los ciclos que se imparten; por ejemplo, se dictan cursos de redacción de artículos científicos al inicio de los semestres, cuando se deben desarrollar en los últimos ciclos porque tienen la investigación por concluir o finalizada.

Los planes o cursos que se imparten, al no estar estandarizados, impiden que exista movilidad (Rodríguez, 2013) que es otro principio del doctorado.

De los cursos de investigación analizados, tampoco se evidencia que exista o se establezca una alianza o relación de la universidad con la empresa (Jiménez-Ramírez, 2017; Concepción, González, García y Miño, 2019).

Los cursos de ética en la investigación también son escasos, tal vez se desarrollen las temáticas en algunas asignaturas, pero no se imparten como cursos.

Respecto a las competencias metodológicas de investigación cuantitativas, cualitativas (Núñez-Valdés y González, 2019), sí se imparten algunos cursos con ese alcance.

La escritura de artículos científicos muestra diversidad porque algunas universidades la desarrollan en los primeros ciclos y otras al término de la formación doctoral. En realidad, se debe estandarizar en los últimos ciclos que corresponde a la finalización de la tesis que sirve de base para la construcción de manuscrito.

Conclusiones

Los cursos de investigación en los programas de doctorado en la educación peruana no están estandarizados; existe disparidad entre cursos y ciclos.

Los programas de doctorado en educación están orientados a la comprensión de la investigación a través de los cursos de Metodología de la Investigación y de Epistemología, también los que están enfocados a conocer la problemática educativa.

Los cursos que consolidan el desarrollo de la investigación también son dispersos, se desarrollan a partir del segundo ciclo, y prevalecen los seminarios, talleres, tesis doctorales.

También existe presencia de los cursos que están orientados a la consolidación o la publicación de la investigación, como las asignaturas de elaboración o publicación de artículos (pero de manera reducida).

Presentan algunos alcances sobre la investigación interdisciplinar a través de la estadística y la ética.

Los cursos que se desarrollan en los programas de doctorado no evidencian que permitan realizar publicaciones en el ámbito internacional porque las facultades de educación no se encuentran en el ranquin de las 12 mejores universidades en educación de Latinoamérica, tampoco existen revistas educativas indizadas en Scopus.

La falta de estandarización de cursos y ciclos impide que exista movilidad académica.

Abstract

The relevance of the study is confirmed by the fact that the use of controlling potential increases the effectiveness of company management, and the bulk of the additional effect is provided in the production sphere thanks to innovations related to the implementation of controlling. Mutual enrichment of experience, which is actively promoted by controlling, turns it into a multifaceted universal management tool, which becomes an integral part of modern management, contributing to the qualitative improvement of management. The purpose of this study is to monitor the international experience of controlling evolution and its use in modern conditions of Russia. To achieve this goal, the following tasks were solved: to consider the most important fundamental principles, the essence of the development of controlling both in the country and abroad, taking into account the experience of specialists in this field; to reveal the tasks of controlling at the present stage and the problems of its implementation; to consider various approaches of the categorical-conceptual apparatus of controlling domestic and foreign authors; to systematize controlling categories by homogeneous groups. The methodological foundations of the study are the methods of system analysis. These methods are used as a theoretical basis in the works of domestic and foreign scientists on controlling. The result of this study is the conclusions made on the basis of international experience in the evolution of controlling and its use in modern conditions of Russia.

Keywords: Management, Controlling, Management Tool, Controlling Development Concepts, International and Practical Experience.

Introduction

Presence at the enterprise of the developed controlling system carry to one of its most important competitive advantages in the field of management.

Controlling as a business management tool is recognized and used in all developed countries of the world. As a result, there is a mutual enrichment of best practices in this area, although national differences are fully taken into account in practice, which is an important factor in improving the effectiveness of its application. In the context of globalization of the world economy, there is an active movement of capital from one country to another. For example, the Japanese-owned car factories in the United States are actively using controlling instruments developed in Japan, and in Germany at the same time adopted all the positive that has accumulated in this area in the United States of America.

In the modern scientific Arsenal has accumulated a lot of definitions of controlling, each of which reflects a particular concept in the range of a narrow understanding at the level of management accounting options or management tools to recognize its management philosophy. As a result, today in the presentation of the concept of controlling continues to exist variability of its definition.

The list of challenges facing the controlling task details presented by experts, to an even greater extent rassoglasovaniya, even within one and the same purpose. The most interesting is the formulation of tasks with their division into areas of action (strategic and operational).

At the present stage, many scientists pay great attention to the definition and study of the essence of the controlling category. Among the foreign authors are: Butch G., Buchanan J. Here , Van Horn J, Vaitilingam R., J. Gitomer. Daly Stigmator A., Mayer, E., Miles, D., Mann, R., Pietsch G., Sherm E., Robson M., Ullah F., Finkelstein, S., Teyla, Filmot..... Han D., Stigler H., Hofmeister, R., Eddowes M. etc. In their work detail is characterized by the theory and practice of controlling the main approaches to its study, but the authors primarily rely on the national experience, which is significantly different in different countries. Of course, there is an imprint on the theoretical framework and practical tools, which are sometimes very different from authors from different countries. The theoretical basis of the study consists of the works of Russian scientists in the field of controlling, accounting, planning, economic analysis, audit of business, management: Alekseeva O. V., officer Aniskina, Y. P., S. A. Varakuty, Bahrushina M. A., Danilochkina N. G., Egorov Yu. N., Kasyanov G. Yu., Kolesnikov S. N., Nikolaeva O. E., Pavlova A. M., Petrenko S. N., Plotnikov V. S., Sokolov Y. V., stukova, S. A. and Souza V. P., Falco, S. G., Sheremet A. D., Shestakova V. V., Shishkova T. V., V. B. Ivashkevich, etc.

The most important aspect that most authors pay attention to is the systematic approach required in the perception of controlling. So," control system " considers controlling V. B. Ivashkevich. Russian scientist , Professor S. G. Falco clearly formulated the philosophy of controlling, which determined its development for the decade ahead.

Results and Discussion

The reasons for the appearance of such diverse points of view, stem from the classification of controlling functions.

Thus, based on the analysis of the approaches to the definition of the essence of the "controlling" category presented in the scientific literature, it is advisable to systematize the set of controlling definitions, dividing it into the following groups of approaches:

1. System approach (V. B. Ivashkevich, E. Mayer, N. V. Palesheva, S. G. Falco, etc.), referring controlling to a specific systematic activity aimed at achieving the strategic goals of the enterprise.
2. Approach to controlling environmental management tool (I. V. Bartuska, E. K. Vasilyeva, P. Preissler, etc.).
3. A conceptual approach (A. M. Pavlova, Yu. p. Aniskin, A. M. Karminsky, A. G. Primak, HY, Falmouth, etc.), whose supporters include the controlling of the enterprise management concept.
4. Information approach (T. Reichman, S. Y. Yusupova) understanding the main purpose of controlling as information support of the enterprise management with the necessary data for the implementation of management functions.
5. Process approach (A. dyle, etc.), whose supporters attribute controlling to the process of effective enterprise management.
6. Functional approach (p. Horvath, etc.), relating controlling to the management function focused on management support.

It should be noted that the elements of the controlling system are planning, accounting, analysis, control and regulation, contributing to the formation of a more effective strategy of the enterprise, respectively, strategic goals and priorities.

His position is the essence of controlling is seen A. P. Gradov and B. I. Cousin, who define it as a new concept of effective management of the firm to ensure its long-term existence in the market Aniskin Y. P. Pavlov and A. M. consider controlling as a concept aimed at eliminating bottlenecks and future-oriented in accordance with the objectives and tasks to obtain certain results. A systematic understanding of controlling can be observed in The approach of S. G. Falco defines it as a long-term and effective development-oriented system of information and analytical, methodological and instrumental support of the company's managers to achieve their goals, ensuring the implementation of a full cycle of management in all functional areas and processes through the measurement of resources and performance.

However, regardless of the terminology, such a phenomenon as controlling objectively exists and develops under the influence of real factors both in Europe and in the United States (Table 1).

Table 1: Distinctive features of the European and American controlling system

American model	German model
Controlling	Controlling
Planning	Planning
Information management	Information management and reporting
Special economic tasks	Special economic tasks
Internal accounting, Internal audit	Internal accounting
Financial accounting, Taxes and insurance	
The information given	

The difference is in the content of the tasks identified in the controlling:

1) the American task catalogue focuses primarily on accounting, planning, information and analysis.
2) European directory focuses on counseling and coordination of budgeting; the management of internal information service; consultation and coordination in planning and investment; implementation of special economic studies.

Modern development in the Western countries of controlling is characterized by the complexity of the market orientation of the enterprise, which leads to an increasing role of management and a qualitative revolution in the structures and methods of management.

The process of transformation and integration of traditional methods of accounting, analysis, regulation, planning and control into a single system of obtaining, processing information and making management decisions on its basis, a system that coordinates the work of the enterprise, being focused on achieving not only the current goals of profit, but also on global strategic goals: the survival of the enterprise, its environmental neutrality, the preservation of jobs.

The results of the research show that the use of controlling potential increases the effectiveness of the company's management, and the main share of the additional effect is provided in the field of production due to innovations associated with the introduction of controlling. In some States, the most intensively used are some positive aspects of controlling, in others-others, but in all cases it receives positive feedback and good results. Mutual enrichment of experience, which is actively promoted by controlling, turns it into a multi-faceted universal management tool that becomes an integral part of modern management, contributing to the qualitative improvement of management.

The variation of the effect in the management and production reached the following foreign companies in connection with the use of innovative achievements in the field of monitoring and controlling: Sony , Samsung ,LG , Akai , Kodak , Nokia , Mazda , Siemens , BP , Shell , etc.

Otis GmbH plant (Berlin), for example, produces components for elevators. At the enterprise, controllers organize and accompany the management process of selecting goals, planning and regulation, and are responsible for achieving the goals. Controllers provide transparency of strategies, financial results, coordinate intermediate goals and plans within a single whole, provide service support, providing managers with the necessary information. In OTIS GmbH factory act controlling; controlling of the installation; controlling logistics, etc. The plant controlling service is responsible for the planning within the plant, for the calculation of profits and losses of the enterprise as a whole, for the performance of individual plant projects. However, it is not responsible for the balance, taxes, etc. Among the tasks of the factory controlling – planning, results analysis, reporting and development of corrective measures in case of any discrepancies. Otis ' controlling units accompany the company's products throughout its life cycle, from development, research, procurement, production to customer service and logistics.

At the same time, the application of practical controlling tools at different enterprises differs significantly. The organizational basis of such services is also different. Most of the German companies have controlling services primarily engaged in accounting and analysis of costs, as well as the results of financial and economic activities. Specific factual data for analysis are provided to the controlling service by the accounting Department. The controller receives statistical materials, data of the plan and results of comparison of actual values of indicators with planned values from planned and financial services of the enterprise. Based on the calculations, the controller offers recommendations to the top management of the company to reduce costs, increase profitability, profitability of production and sales. On the basis of such recommendations, the best management decision is selected from among the available alternatives. It is very common to use controlling in forecasting prices for products and services, to determine the maximum permissible limits of prices and tariffs, to calculate the estimated profit, tax payments and reserve funds. As part of controlling the effectiveness of different investment options is checked before and during their implementation, the conditions of the project are modeled. Generalized and systematized information provided by the controlling service to the management of the enterprise is of great importance not only for operational, but especially strategic.

Based on the above, in the German concept, the controller specializes in supporting the operational decision-making of the company's management and also provides strategic support to the head. It is focused on the company's development strategy and internal, production, cost accounting. The task of the controller is to ensure the effectiveness and efficiency of management and to support the Manager through the targeted provision of information for decision-making. The controller has a high responsibility, he acts as an internal adviser, consultant of the management team. The tasks of external, financial, accounting, as well as retrospective audit or control, tax audit, are not the tasks of the controller in Germany. In the practice of entrepreneurship, the Manager and the controller have different responsibilities.

The controller in Germany, according to the definition Of the international controlling group, forms, accompanies the processes of managing the achievement of the goal, planning and management and is thus responsible together with the Manager for achieving the goal. This means that the controller:

- responsible for the transparency of the strategies, profit and Finance and thus contribute to enhancing the effectiveness;
- coordinates, summarizes individual goals and plans and organizes a future - oriented report for management;
- moderates and shapes the process of managing the goal search, planning and management so that the decision maker can work towards the goal;
- provides economic data and information for this purpose.
- controlling as a process occurs in the dialogue between the controller and the Manager with the constant economic management of the enterprise. In this sense, the activity of the controller is active:
- to guarantee the effectiveness of management;

- revision of the strategy and its implementation for operational purposes; ensuring sufficient harmonization with the established reporting rules;
- risk and opportunity management;
- improving the efficiency of the enterprise on the basis of financial stability.
- The controlling process is characterized by fundamental principles: transparency, accepted assumptions and applied methods, systems and tools; reliability, reliability and availability of the analysis;
- the existence of relationships between assumptions, systems and results.

The main tasks that can be solved by controlling are to achieve business transparency (to show managers what is happening inside the company), to form an information basis for management decision-making, to develop the goals of the company as a whole and its structural divisions and to ensure the achievement of these goals.

Currently, controlling is implemented in large Russian organizations such as: JSC "Rostelecom", JSC "Russian Railways", JSC "AVTOVAZ", JSC "LUKOIL", JSC "Gazprom-Neft" and others.it Should be noted that the use of controlling covers various areas of business, makes a great contribution to the establishment and improvement of systematic control over the activities of all departments of enterprises for mutually beneficial cooperation with contractors in terms of customer focus.

However, there are a number of reasons preventing the introduction of controlling in Russian enterprises:

1) lack of sufficient information on the Russian practice of implementing controlling systems and its low efficiency;
2) insufficient number of developments in the field of complex information systems that meet the requirements of a particular organization (therefore, Russian enterprises are forced to buy information systems abroad, and this in turn is quite expensive);
3) instability of economic policy of many enterprises, lack of its target orientation;
4) inconsistency in the work of various departments of the enterprise, as well as insufficient transparency of information;
5) ignoring and underestimating the state of environmental problems;
6) high cost of implementation of the controlling system (training of specialists in this field, the acquisition of information systems, restructuring of existing units and the formation of a new Department);
7) the absence of a corresponding normative-legal support of controlling system;
8) the lack of specialists with the necessary knowledge and skills, despite the fact that the MSTU. E. N. Bauman since 1997 prepares students on a budgetary basis in the specialty " Controlling in the enterprise "in order to replenish qualified personnel in the field of"controlling".

Conclusion

Prospects of controlling development both in the medium and long term are connected with the coverage of new areas of activity (intangible assets, network organizations, etc.), as well as with the change in the status of controllers in the organization: the implementation of the functions of internal consultants of the enterprise management in the field of management.

Quite often, even specialists do not distinguish between the concepts of "internal audit" and "controlling". Of course, at first glance it may seem that in both cases there is control over the activities of any organization. However, this is not so, because, for example, internal audit is organized in the company in the interests of its owners control system over compliance with the established order of accounting and reliability of the internal control system of the organization. That is, specialists in the field of internal audit work with the final data (at the end of the quarter), checking and controlling all the economic facts of any activity of the organization. While controlling the main goal-the orientation of the management process to achieve all the goals facing the enterprise. To do this, controlling provides the following functions: coordination of management activities to achieve the goals of the enterprise; information and consulting support of enterprise

management decisions; creation and maintenance of a common enterprise management information system; ensuring the rationality of the management process.

Areas of management activity in the framework of controlling the interaction is a coherent balanced system that includes: Budgeting; Operational planning; Strategic planning; Management accounting and cost analysis; Tax planning; Investment planning and financing; Coordination activity; Insurance activity; Information support; Control of units; Interaction with tax authorities; Control of the production program.

Based on numerous studies, in recent years, controlling has become an integral part of the crisis management system of enterprises associated with the implementation of financial and economic commenting function in management for operational and strategic management decisions. Thanks to the introduction of the controlling tool in modern business practice, many enterprises tend to form an effective management system for all areas of their activities, strengthening not only their own positions, but also the industry as a whole.

It should be noted that controlling in Russia over the past 20 years has evolved from an accounting and analytical function to a provider of relevant information for the Manager. The theory and practice of Russian controlling developed mainly according to the "German model", although in a number of Russian companies, in particular, the fuel and energy sector, there are elements of the "American model".

Abstract

The relevance of the study is confirmed by the fact that iron ore deposits have been identified in 98 countries, and global forecast resources are estimated at 790.9 billion tons. Total iron ore reserves in the world are 464.24 billion tons; confirmed reserves are 206.9 billion tons. the three largest producing countries (China, Brazil, Australia) account for about 65% of global production. But the main leader in the world production of commodity iron ore is China. World consumption of commodity iron ore, including its own production, imports and exports, is distributed very unevenly across countries and is characterized in the leading countries by the following data: China 740 million tons, which is 46.8% of the world level, Japan-8.6%, Russia-5.7%. The purpose of this study is to analyze the extraction of iron ore raw materials in the world as a type of economic activity. To achieve this goal, the following tasks were solved: to examine the industrial types of iron ore; to study the world's resources and reserves of iron ore; to identify the largest producers of iron ore raw materials; to systematize the factors that affect the growth of basic iron ore prices. The result of this study is the conclusions made on the basis of the analysis of the extraction of iron ore raw materials in the world as a type of economic activity.

Keywords: Ferrous Metallurgy, Iron Ore Raw Materials, Iron Ore, Iron Ore Reserves.

Introduction

Iron and steel products are used in all areas of industrial production, but mainly in mechanical engineering and capital construction. Iron ore is a raw material for the production of ferrous metals. Iron ore extracted from the bowels is commonly called “raw ore” in mining. Iron ore raw materials (iron ore) - a type of metallurgical raw material that is used in the iron and steel industry for the production of pig iron and metallized product (DRI and HBI), as well as in small quantities in steelmaking.

Iron ores are natural mineral formations containing iron and its compounds in such a volume that industrial extraction of iron is advisable. Although iron is included in a greater or lesser amount in the composition of all rocks, the name iron ores refers only to such accumulations of glandular compounds, of which metallic iron can be obtained in large sizes and with economic benefits.
The following industrial types of iron ore are distinguished:

• Titanium-magnetite and ilmenite-titanomagnetite in basites and ultrabasites;
• Apatite-magnetite in carbonatite;
• Magnetite and magneto-magnetite in skarns;
• Magnetite-hematite in iron quartzites;
• Martite and martite-hydrohematite (rich ores, formed by iron quartzites);
• Goethite-hydrogetite in weathering crusts.

There are three types of iron ore products used in the iron and steel industry: separated iron ore (loose ore enriched by separation method), sinter ore (sintered, agglomerated by heat treatment) and pellets (crude iron-containing mass with the addition of fluxes (usually limestone); it is formed into balls with a diameter about 1-2 cm).

This section should follow keywords. This section should provide background of the study and highlight research motivation.

Rich iron ore has an iron content of over 57%, and silica less than 8 ... 10%, sulfur and phosphorus less than 0.15%. It is a product of the natural enrichment of ferruginous quartzites created by leaching of quartz and decomposition of silicates during long-term weathering or metamorphosis. Poor iron ores may contain at least 26% iron.

Analysis of the extraction of iron ore in the world

The world's proven reserves of iron ore are about 160 billion tons, which contain about 80 billion tons of pure iron. According to the US Geological Survey, iron ore deposits in Russia and Brazil account for 18% of the world's iron reserves.

Table 1 : The largest derivatives of iron ore in 2019

Company	Country	Productive capacity, million tons per year
Vale	Brazil	422,4
Rio Tinto	United Kingdom	282,8
BHP Billiton	Australia	193,7
ArcelorMittaln	United Kingdom	81,2
Fortescue Metals	Australia	55,5
Evrazholding	Russia	55,8
Metalloinvest	Russia	49,6
AnBen	China	49,2
MetInvest Holding	Ukraine	43,5
Anglo American	South Africa	42,5
LKAB	Sweden	39,7

According to U.S. Geological Survey, world iron ore production in 2019 amounted to 2.3 billion tons (an increase of 3.6% compared to 2018).

Table 2: World resources and reserves of iron ore as of 2019

	Proved + probable reserves	1020

Iron ore deposits have been identified in 98 countries, and world forecast resources are estimated at 790.9 billion tons. The total iron ore reserves in the world are 464.24 billion tons; confirmed reserves amount to 206.9 billion tons. The three largest producing countries (China, Brazil, Australia) account for about 65% of global production. But the main leader in world production of salable iron ore is China. The global consumption of salable iron ores, taking into account domestic production, import and export, is distributed unevenly among countries and is characterized in the leading countries by the following data: China 740 million tons, which is 46.8% of the world level, Japan - 8.6%, Russia - 5.7%. However, a significant part of the mineral resource base is represented by poor and medium-quality ores with an iron content of 16–40%, which account for 87.5% of explored reserves. In Russia, the share of rich ores with an iron content of about 60% or more (not requiring enrichment) in

explored reserves is only 12.5%. Over the past 10 years, iron ore output has increased on average by 1.8% per year, and over the past 5 years - by 9% per year. However, demand for iron ore in recent years has outstripped supply. There are a significant number of new iron ore mining projects around the world, the implementation of which will not only compensate for the withdrawing resources, but also ensure the necessary (from the point of view of the predicted expansion of world steel production) output growth. The iron content in industrial ores ranges from 16 to 70%. Given the significant depths of the quarries, the difficult conditions for the development of the underlying horizons, the significant amount of work on the reconstruction of very complex schemes of internal quarry transport and environmental problems, the production volumes of magnetite ferruginous quartzites at KMA quarries will practically remain at the achieved level until 2025, followed by a decrease in production volumes. Currently, the iron content in the developed Russian deposits is low and averages 30%, and this is in the presence of significant reserves of rich ores with an iron content of at least 60%. Therefore, a promising direction for the development of the iron ore sub-sector will be the development of deposits of rich iron ores (up to 70% of iron) located in the KMA region.

Today, the main companies that set iron ore prices are such large companies as: RioTinto, BHP Billiton, CVRD, and Baosteel, the leader in Chinese metallurgy. The trend of recent years is a gradual decrease in the cost of ore, which is extremely attractive for the Chinese. The forecasts of most investment companies and industry experts (even Chinese) come down to higher iron ore prices. But it should be noted that recently many forecasts have been revised in the direction of even greater price increases. And at the moment, the range of price predictions varies from 9% to 35%, which is at least no lower than last year's price increase of 9.5%.

Currently, an increase in basic iron ore prices is affected by:

- high demand from China;
- the increase in production costs of commodity companies;
- rise in price of freight for the delivery of iron ore;
- increase in prices for Indian iron ore.

The main and main reason for forecasting the growth of prices for iron ore raw materials is the steady and high demand for it, especially (and already traditionally) from China.

Conclusion

Despite the higher transportation component, Chinese consumers continue to significant purchases of iron ore in Brazil. This is due to the high quality of Brazilian iron ore.

Chinese metallurgical companies are interested in closer cooperation with Brazilian producers of iron ore. So, WuhanIronandSteel Corporation proposed the fourth largest Brazilian iron ore company MMX Mineracao & Metalicos S.A. redeem more than 9% of its shares. They show interest in cooperation with China and companies in India. GME4 plans to sell 80% of shares of Indian company SesaGoaLtd. announced its intention to buy back a controlling stake in GME4 in a project to develop an iron ore deposit in Piaui with reserves of 800 million tons.

Indian and Chinese steel companies also collaborate with mining companies in Canada. WISCO (China) in July 2009 acquired a 19.9% stake in ConsolidatedThompsonIronMinesLimited for $ 240 million. AdrianaResourcesInc. In July 2009, she signed a letter of intent with two Chinese companies interested in participating in the LacOtelnuk field development project, while the Indian company TataSteel acquired 19.9% of the shares of NewMillennium in 2008. In the future, TataSteel plans to acquire up to 80% of the shares in the project. Iron ore direct supply after the completion of the feasibility study. Canadian iron ore companies in their development projects are not limited to plans for the production of iron ore concentrates or pellets.

The economic crisis led to a decrease in iron ore production in Central and South America and slowed down the commissioning of new iron ore production facilities. JindalSteelandPower has postponed for six months the start of the development of a large EL Mutun iron ore deposit in

Bolivia. Nevertheless, the prospect of developing the production of iron ore in these countries is not bad.

At the same time, the implementation of iron ore projects in Africa is influenced not only by the global economic crisis, but also by the political situation in a number of countries. So, after the change of government in Guinea, RioTinto was practically forced to curtail the project for developing the Simandou field, although RioTinto planned to invest $ 6 billion and already from 2013 will begin production at the first stage of this project with a capacity of up to 80 million tons per year.

Income Sources of Individual Agricultural Holdings in Poland And the Determinants of Searching Them[1]

Elzbieta HAJDUGA

Wroclaw University of Economics and Business
Faculty of Economics and Finance
Department of Finance and Accounting, Poland
e-mail:elzbieta.hajduga@ue.wroc.pl

Abstract

Income is an important element of everyone's life. It allows meeting human needs. In the process of carrying out individual needs related to ambitions, independence or earning income, the decisions are taken to search for new income sources. There are many more incentives stimulating such decisions and everyone considers them individually. The standard of living in rural areas is lower than the one in a city, and hence the lower income level of the rural population and higher unemployment rate. Increasingly fewer farms obtain income from agricultural activity alone, thus the importance of other income sources is growing. In addition, a greater willingness to take up hired labour or run non-agricultural business activities is observed among farmers. The purpose of this study was to define and describe the basic income sources of individual agricultural holdings in Poland. In addition, the determinants influencing decisions about searching for other income sources by farmers were briefly characterized. The research problem was addressed based on the subject literature analysis. The basic research methods used by the author were: the critical subject literature review and formal methods including the tabular description method.

Keywords: Income Sources, Individual Agricultural Holdings.

Introduction

Income is an important element in everyone's life. It allows meeting human needs. In accounting terms, income is the difference between the generated revenues and the incurred costs. The category of income, in the legal sense, is defined by tax law and adjusted to the realization of fiscal goals. In the case of agricultural activity, it may be problematic to determine tax deductible costs remaining a part of the agricultural policy – e.g. through regulating the amount of tax support for agriculture. Under the current legal status, the income dependent tax burden rests on farmers conducting economic activity, as well as those running special divisions of agricultural production (the income obtained from such source of income as the special divisions of agricultural production constitutes the basis for calculating income tax. However, pursuant to the provisions of the Personal Income Tax Act, the income from special divisions of agricultural production, if the taxpayer does not keep the books recording income, is calculated using the income estimation standards from a specific utilised agricultural area or a unit of animal production. The minister competent for public finance, after consulting the minister competent for agriculture, announces, by the regulation, the estimated standards of the aforementioned revenues, changing them annually to the extent corresponding to the price increase index of the commercial farming, announced by the President of the Statistics Poland). For the Statistics Poland (https://stat.gov.pl/) purposes, the income earned by an individual agricultural holding was defined as the difference between the value of agricultural production (including natural consumption) and the respective current expenditure incurred (i.e. purchase of

[1] The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN

products and services, remuneration and compulsory social security contributions for hired labour). The discussed income is reduced by taxes resulting from running an individual agricultural holding and, since 2004, increased by the subsidies for agriculture. In accordance with the definition provided by the Statistics Poland (https://stat.gov.pl/), an individual farm, i.e. a farm of a natural person, is the one run by a natural person having 1 ha or more of the utilised agricultural area (UAA) or a farm smaller than 1 UAA (including no arable land), performing agricultural activity at a significant (defined by appropriate thresholds - thresholds for agricultural activities (excluding special divisions): 0,5 ha for: fruit trees plantations, fruit bushes plantations, field vegetables, field strawberries, hops, 0,3 ha fruit and ornamental nurseries, 0,1 ha for: vegetables under shelter, strawberries under shelter, flowers and ornamental plants under shelter, tobacco, 25 m^2 of edible mushrooms, 10 head of cattle total, 5 head of cows, 50 head of pigs total, 10 head of sows, 20 head for: sheep total, goats total, 100 total poultry, 5 total horses, 50 female rabbits, 5 female of other fur animals, 10 wild animals, e.g. wild boar, roe deer, fallow deer, farmed for meat production, 20 bee trunks) scale, including the special divisions of agricultural production. Statistics Poland also defines commercial non-agricultural activities connected directly with an agricultural holding. It was adopted as the production or service oriented activity conducted on one's own account aimed at earning a profit, which uses the resources of an agricultural holding (labour, land, buildings, machinery park, etc.) or the agricultural products it offers (e.g. agritourism, processing of agricultural products).

There are many reasons for running one's own business. Regardless of the type and nature of the business, the motives for undertaking this type of activity may result from positive or negative aspects. Entrepreneurs themselves, as the basic incentives, most often indicate their own ambitions, self-realization, personal fulfilment and satisfaction. In addition, they all point to the desire of increasing their own income and maximizing profit. These motivations are definitely of a positive nature, whereas among the negative ones the following can be listed, e.g.: losing the current job, no prospects for fulltime employment opportunities. In turn, the desire to earn higher income by individual farmers can be identified as the determinant for undertaking hired labour.

The purpose of this study is to define and describe the basic income sources of individual farms in Poland. In addition, the determinants influencing the decisions about searching for other income sources by farmers were briefly characterized. The research problem was addressed based on the subject literature analysis. The basic research methods used by the author were: the critical subject literature review and formal methods including the tabular description method.

All statistical data originate from the Statistics Poland publication entitled The characteristics of agricultural holdings. Due to the fact that they are published every three years, in the presented study the data refer primarily to the years 2010, 2013, 2016.

Income specificity of an individual agricultural holding

Agricultural income is a specific category, compared to the income of other groups of population. This specificity results from several reasons. Firstly, a farmer running an individual agricultural holding takes up a double role – owner of the means of production and, at the same time, an employee. Thus, a farm and a household are coupled in this case. Secondly, agricultural income takes the form of money (sales of goods and services) and also the form of income in kind (consumption for the needs of the farm and the farmer's own needs). It should be noted that along with the general socio-economic and agricultural development, the share of the second part is declining. Thirdly, the structure of farm income shows a clear share of the income earned outside the farm (income from paid employment and social benefits). Some farmers are forced to take up paid employment outside an agricultural holding or perform non-agricultural activity connected with the farm, e.g. agrotourism, agri-food processing, crafts. The final reason is the fact that agricultural income fulfils two functions: production function and a redistributive one. The production function is manifested in the level of agricultural income influencing the level of agricultural production, whereas the

redistributive function consists in the transfer of income (See: Pawłowska – Tyszko J., Soliwoda M., 2017, pp. 22 – 25).

When determining the income earned by an individual agricultural holding, two categories have to be taken into account (as in any other activity), i.e. revenues and costs. Farm revenues are influenced primarily by sales revenues, which can be supplemented by subsidies. In this case costs will mainly be defined as material and non-material costs, but also as expenses in the form of, e.g., taxation costs or other fiscal charges (e.g. social security contributions). The income of an individual agricultural holding will, therefore, depend on the nature of the farm, its economic size, type of production or the share of non-agricultural income.

General characteristics of agricultural holdings in Poland

According to the Statistics Poland data, the number of agricultural holdings in Poland, especially the smallest ones (below 1 ha) declines year by year (Tab. 1). Farmers are not able to make a living from farming activities alone, especially those of them who own small-scale farms. Hence, they are frequently seeking other profit-generating sources of income, thus giving up, in most cases, the entire agricultural activity.

Table 1: Number of agricultural holdings in the years 2010, 2013, 2016 and 2017 (thousand)

Years	Total	Utilised agricultural area of agricultural holdings in ha							
		≤ 1	1 – 2	2 – 5	5 – 10	10 – 15	15 – 20	20 – 50	≥ 50

Source: The characteristics of agricultural holdings in 2016, statistics Poland, Warsaw 2017 and Statistical yearbook of agriculture 2018, Statistics Poland, Warsaw 2019.

Among the agricultural holdings covering the utilised agricultural area of up to 20 ha (in each identified range), a decline in the number of such holdings was observed (2017 compared to 2010). An increase was recorded at the farms covering the area of over 20 ha of farmland. The dynamics of changes regarding the number of farms in individual years is presented in Figure 1.

Fig. 1: Dynamics of the number of agricultural holdings in the years 2010 - 2017 (w %)

Source: author's compilation based on Table 1.

The highest decline dynamics was recorded at the smallest farms (up to 1 ha). In 2016 compared to 2013 it reached almost 34%. In 2017 compared to 2016 the respective value was slightly above 10%. The farms covering the area ranging from 1 to 2 ha and from 2 to 5 ha recorded a decline over the years, i.e. (2017/2016) by 3% and 3,6%, respectively. Referring to 2010 as the base year, a decrease of approx. 18% was observed (2017/2010) at the farms up to 1 ha of farmland, a decrease by 12,5% – 1 to 2 ha of farmland, a decrease of approx. 8% – 2 to 5 ha and also 5 to 10 ha of farmland. The farms covering the area of 15 – 20 ha recorded the decline by approx. 5% in this period (2016/2013), whereas in 2017/2016 an increase by 5% was observed, and when comparing 2017 to 2010 a decrease by 2,3% took place. However, an increase in the number of the largest farms, i.e. over 50 ha of utilised agricultural area, as well as the ones covering the area of 20 to 50 ha was observed. In 2017, compared to 2016, the increase was by 6% (farms ranging from 20 to 50 ha of farmland), however, if compared to 2010, it was an increase of almost 12%. In the case of the largest farms, the increase in 2017 compared to 2016 presented the level of 2%, while the comparison of 2017 to 2010 shows an increase reaching 31,1%. In total, however, the number of farms was reduced by 6,9% (2017/2010).

Determinants of searching for earned income sources at individual agricultural holdings in Poland

According to the Statistics Poland data the standard of living in rural areas is lower than the one in a city, and hence the lower income level of the rural population and higher unemployment rate. Increasingly fewer farms obtain income from agricultural activity alone, thus the importance of other income sources is growing, such as e.g., hired labour or running non-agricultural economic activity. Among the determinants of searching for other income sources, the factors of micro- and macroeconomic can be identified (Tab. 2).

Table 2: Factors determining the search for additional income sources at individual agricultural holdings

Specification	Factors
Microeconomic factors	• human factor quality – the education level of agricultural population stands for the factor determining farmer's openness to the changing environment, better educated farmers are more inclined to seek and implement new solutions; • quality of economic, production and technical factors within an agricultural holding; • development of the agricultural environment and the situation on the labour market; • farmer's family life cycle phase; • planned and carried out investments in an agricultural holding; • agricultural type and economic size class of an agricultural holding (economic size is determined by the sum of standard direct surpluses of all activities performed by an agricultural holding).
Macroeconomic factors	• economic growth rate; • credit availability and interest rate; • regional location of an agricultural holding; • subsidizing degree of an agricultural holding; • agricultural policy; • taxation.

Source: author's compilation based on: Czudec A., 2009, Duczkowska – Małysz K., 2009, pp. 19-21, Hybel J., 2000, Kołodziejczyk D., 1998, pp.59-68, Kołoszko – Chomentowska Z., 2008, pp. 79-85, Pietrzyk I., 2006, see: Ostromęcki A., Zając D., Mantaj A., 2015, pp. 40-60.

It should be noted that farmers from mountain areas more often decide to search for additional/other sources of income by, e.g. undertaking non-agricultural economic activity, than those from lowland areas. In addition, younger farmers generally show greater interest in an additional source of income and are more willing to take the risk related to non-agricultural activities or searching for other sources. The planned or already ongoing investments at a farm depend on the type of an agricultural holding (dominating crop or livestock production). In general, the crop production farmers are more likely to take up non-agricultural activities which can support investments at their agricultural holding, whereas the farmers involved in livestock production are less willing to search for an additional source of income to finance investments at their farm (Ostromęcki A., Zając D., Mantaj A., 2015, p. 47). The agricultural policy may also remain an important factor – it is worth mentioning that the Common Agricultural Policy (CAP) supports the activities involving undertaking non-agricultural economic activities by farmers. The Rural Development Programme 2014-2020 (Rural Development Programme 2014 -2020, 2014). identifies the activity and sub-activity within the framework of support for initiating a non-agricultural economic activity in rural areas. After meeting the relevant conditions, it is possible to receive a bonus of PLN 100,000, payable in two tranches – 80% and 20%. This is quite a significant incentive for a farmer or his family to start a business outside agriculture. The agricultural type and the economic size class of the farm (economic size is determined by the sum of standard direct surpluses of all activities performed by an agricultural holding) have a great influence on the decision about searching for additional sources of income – as already mentioned above, farmers with predominating crop production are more willing to undertake, e.g. non-agricultural economic activity, or hired labour, whereas in terms of an economic size of an agricultural holding, this activity is, to a large extent, taken up at farms characterised by the so-called poor economic viability.

Income sources of individual farmers in Poland

Among the sources of income for individual farmers in Poland, two main trends can be identified: gainful and non-profit ones. Among the gainful activities, hired labour and running a non-agricultural economic activity should primarily be mentioned. Non-agricultural economic activity may be associated with an agricultural holding and use the resources of this farm (e.g. agritourism), but also remain completely unconnected from the farm. The development of additional and alternative income sources for farmers in the form of non-agricultural economic activity can be highlighted. The large diversity of agricultural holdings representing the surveyed enterprises indicates adapting to various market needs and realities. However, the dominant form, i.e. a natural person conducting business activity shows a small extent of such activity (Bórawski P., 2009, pp. 15-22*)*. The non-profit sources include pension entitlements and other allowances in the form of benefits (e.g. child-care benefit, benefit under the Family 500+ programme) and alimony. The "Family 500+" programme is the financial foundation to support families in Poland. The programme came into force on April 1, 2016 and contributed to a significant improvement in the financial situation of families. The Family 500+ programme is designed to achieve three basic goals: increase the number of births, reduce poverty, primarily among children, and constitute an investment in the family. Pursuant to the changes introduced in the "Family 500+" programme, starting from 1 July 2019 the parental benefit is granted for every child up to the age of 18, regardless of the total family income [see: https://www.gov.pl/web/rodzina/rodzina-500-plus].

Table 3 presents the number of agricultural holdings and their additional sources of income, apart from agricultural activity.

Table 3: Agricultural holdings and their additional sources of income including utilised agricultural area in the years 2010, 2013 and 2016 (thousand)

Agricultural holdings and their additional income sources from:		Total	do 1 ha	1-2 ha	2-3 ha	3-5 ha	5-10 ha	10-15 ha	15-20 ha	20-30 ha	30-50 ha	50-100 ha	area 100 ha

	2016	107,0	2,1	24,0	18,7	22,4	22,0	7,8	3,8	3,0	1,9	0,9	0,3

Source: Characteristics of agricultural holdings. General Agricultural Census 2010, 2012, Characteristics of agricultural holdings in 2013, 2014, Characteristics of agricultural holdings in 2016, 2017.

Generally, in the case of 1/3 of agricultural holdings including the farm user, the income earned by the agricultural holding is the basic source of income, i.e. accounts for over 50% of the entire income generated by the agricultural holding. It is noticeable that the farms with small utilised agricultural area – i.e., practically, up to 2 ha of UAA are primarily looking for additional gainful income sources. Moreover, additional income sources in the form of pension entitlements and the, so-called, other non-profit sources can be observed at the individual farms with the smallest utilised agricultural area. However, in each case – regarding both gainful and non-profit income sources – the smallest number of individual farms is present among the largest agricultural holdings, i.e. over 100 ha of UAA, but in practice, this trend is already noticeable at the agricultural holdings having more than 10 ha of UAA. The percentage of agricultural holdings earning income on agricultural activities only presents a continuous decline year by year. The structure of agricultural holdings by the source of income is presented in Figure 2.

Fig. 2: Households including a farm user by the source of income in 2010, 2013 and 2016 (%)

Source: Characteristics of agricultural holdings. General Agricultural Census 2010, 2012, Characteristics of agricultural holdings in 2013, 2014, Characteristics of agricultural holdings in 2016, 2017.

It can be observed that, apart from agricultural activity, the largest share in the income earned by agricultural holdings is taken by hired labour, followed by pension entitlements, whereas other non-

profit income sources take the smallest share. However, at this point it should be indicated that in this particular case the largest increase was recorded. Having analysed 2016 against 2013, a growth by almost 70% was observed. Payments of benefits under the Family 500+ programme are responsible for such situation. Pension entitlements are the only source of income characterized by an upward trend in the analysed period. It may be the evidence of an aging society in Poland, especially in rural areas, where young people more frequently decide to move and live in a city.

Conclusion

Raising the standard of living is the most frequent reason for seeking additional gainful income sources in Polish agriculture. Among the motives for undertaking, e.g. non-agricultural economic activity by farmers, those resulting from the desire of becoming an entrepreneur can be distinguished, e.g., the need for recognition, personal development, independence, or achieving financial success. Hired labour is most often chosen by the farmers characterised by a much lower willingness to take risks associated with running their own business. Some of the factors determining such choices depend solely on the farmer (e.g. education, size of the agricultural holding, production type) and some remain beyond the farmer's influence, e.g., farm location, distance from large cities. It is clearly visible that the share of income from hired labour and non-agricultural economic activity earned by farmers is becoming increasingly significant in the structure of their household's income sources.

Based on the conducted analyses, it can be concluded that hired labour and non-agricultural economic activity carried out by a farmer are important for the functioning of small agricultural holdings (mainly up to 2 ha of UAA, in some cases 5-10 ha of UAA), constituting additional income source. For the agricultural holdings presenting the same area type, i.e. the smallest ones (up to 2 ha of UAA), non-profit income sources, i.e. pension entitlements and other benefits are listed as an additional source of income.

It is noticeable that, in Polish agriculture, an increasingly smaller number of people are making their living solely from agricultural activity. The number of families whose correlations with agriculture are very small and their interests are no longer focused on the common agricultural policy, but on the rural policy instead, where the multifunctional village development, and thus the development of non-agricultural functions, is growing. Employment outside agriculture in their home or neighbouring municipality is becoming the dream of many rural residents. New jobs are traditionally provided by such institutions as: school, kindergarten, health-care centre, municipal office, etc., but the growing hopes are associated with small rural companies. Rural entrepreneurs and their companies are becoming the essential factor of local development (Kłodziński M, 2009, pp.91-98).

Interview with Customers in Management of Logistics Customer Service

Marta KADŁUBEK

Czestochowa University of Technology, Faculty of Management, Częstochowa, Poland
martakadlubek@wp.pl

Abstract

Research background: Communication with customers on the proper execution and assessment of logistics service is the basis for deepening customer needs, understanding the reasons for customer satisfaction or dissatisfaction with service, conditions accompanying the assessment of logistics customer service. **Purpose of the article:** The purpose of the article is to present the results of research on the implementation of a selected logistic management task of customer service, i.e. conducting of interviews with customers in order to determine the importance of the service itself and its individual components in commercial cargo transport enterprises in the Silesian Voivodeship. **Methods:** The paper is predicated on the survey results of the research realized on a sample of 147 commercial cargo motor transport enterprises situated in the Silesian Voivodeship. Also there has been made an attempt to examine the dependence of the selected areas of logistics customer service, occurring in the surveyed freight transport companies of the Silesian Voivodeship, on the size of these entities. **Findings & value added**: The respondents' answers depending on the size of enterprises usually confirmed that with the increase of the size of the surveyed entities, they showed an increasing tendency to carry out the logistics customer service measurements. Entrepreneurs of larger business units more often and more accurately carry out research determining the scope and level of logistic customer service both among the recipients of their services and within the enterprise, thus they are more determined to perform the task in question, managed by logistic customer service.

Keywords: Management; Logistics Customer Service; Transport Enterprises.

Introduction

Specifying the requests related to logistics customer service in the company preferred by customers and considering their point of view involves identifying customers' expectations towards particular elements of this service. The major assignment areas of management (Krzakiewicz and Cyfert, 2014; Lichtarski, 2015; Nogalski and Ronkowski, 2007) of logistics customer service (Nowicka-Skowron, 2017), suggested by inter alia Ballou (2003), Christopher (2011), Kempny (2001), Kramarz and Slupina (2017), Price and Harrison (2013), Rushton, Croucher and Baker (2014), include:

- establishing the most significant purchase choices and decisions made by customers,

- conducting interviews with customers to establish the importance of service itself and its particular elements,

- conducting group interviews due to the same principles.

Communication with purchasers on the appropriate achievement and assessment of logistics service is consequently the base for intensifying customer requirements, elaborating the motives of satisfaction or dissatisfaction with customer service, circumstances associated with the service assessment (Hasan, 2014; Niemczyk and Stańczyk-Hugiet, 2014; Wiktor, 2016). The aim of the paper is to present the results of research on the performance of a chosen logistic management task of customer service, i.e. conducting the interviews with customers in reference to settlement of the significance of

the service itself and its particular elements in commercial freight transport enterprises in the Silesian Voivodeship region in southern Poland.

Literature Review

The multitudinous area of customer service encompasses the spheres of marketing, finance and other strategic fields of company's management (Murfield et al., 2017; Murphy and Knemeyer, 2018), though, a principally imperative function in providing proper service is realized by logistics (Figure 1). The attentiveness on the dilemma of right customer service is acquiescent with the approach of logistics management which is continually searching for assistance from other areas of the enterprise's activity in reference to offer the right product or service, in the right quantity and quality and at the right place and time, therefore at the same time realizing the most important rules of logistics customer service (Hemmasi, 2015; Mesjasz-Lech, 2015). Customer service adds meaning to the whole activities and logistics processes, as a result currently it is identified as 'customer logistics' (Kempny, 2001).

Fig. 1. Multitudinous area of customer service

Source: Own study.

One of the most often quoted definitions of the term of customer service by theorists of logistics subject is the citation of Beier and Rutkowski (2004): "... the aptitude of the logistics system of the enterprise to satisfy customer requests in state of time, dependability, communication and comfort". Consequently, logistics customer service focuses on the physical distribution of products and services accordingly to offer them in the accurate quantity and quality, enabling to acquire advantages from their delivery at a determined place and time. In reference to customer service the products and services of the enterprise obtain the distinctiveness of space and time convenience if, due to proper processes of the logistics system, they are proficient to attain the customer at the required time and space and this aptitude of the logistics system relates to the area of product or service availability (Curcic et al., 2008; Hu et al., 2016; Micu et al., 2013). It is frequently acknowledged with the description of

logistics customer service regardless it is more indiscriminate as it is moreover related to features such as information flow or flexibility of the logistics system and others (Jelonek, 2015; Ritter and Andersen, 2014).

Due to Christopher (2001) the subject of customer service in the area of logistics is to encourage the buyer with the correct product at the correct time and at the correct place. Specifically the goods have no value in anticipation to possibility of being available to the buyer at the correct time and the correct space.

Three directions of perceiving of the fundamentals of customer service in logistics were introduced by La Londe (1985), namely:

1. logistics customer service as an activity, i.e. achievements the enterprise should complete to satisfy the needs of the buyer,

2. logistics customer service as performance levels, i.e. quantifiable standards (norms) of the service features, acquiescent with buyer anticipation,

3. logistics customer service as a management philosophy, i.e. the most extensive explanation of the idea, increased to the stage of obligation of the enterprise to present more advanced level of service than competitive enterprises.

The three-direction approach of awareness of logistics customer service should not be recognized as alternatives to select from however it is indispensable to join them all. The enterprise motivated for achievements in the market in the management progression should implement customer point of reference (Verhoef & Lemon, 2013) consequently indicating its mission whereas simultaneously supervising its accomplishments in the area of standards and arranging the program of the service development with division for precised assignments (Huang, 2008; Rauyruen and Miller, 2007; Zbierowski, Bratnicka and Dyduch, 2014). The quoted distinctive descriptions of logistics customer service do not obtain an extensive variety of preferences of interpretation of this idea. For that reason, it is very complicated to obviously conclude the significance attitude representing proper criteria of logistics customer service for assorted buyers' requirements.

Methodology Research

In reference to establishing the level of accomplishment of the chosen assignments of management of logistics customer service in the performance of commercial freight transport enterprises in the area of the Silesian Voivodeship in southern Poland, the own research was performed. The functional apprehension method was the survey method with reference to the foundation of which the classified technique of attaining primary data was used, i.e. the survey questionnaire.

The survey was conducted among 147 commercial freight transport companies located in the area of the Silesian Voivodeship in southern Poland. As a effect of the attainment, estimating and analysis of the empirical data acquired in the survey, there were obtainable the circumstances in the area of the scope of logistics customer service in the surveyed commercial freight road transport enterprises.

Afterward, whilst taking into account the complete of the accomplished research process, on the basement of the assembled primary data, the trial was made to determine the reliance of the spheres of logistics customer service arising in the surveyed commercial freight transport companies of the Silesian Voivodeship on the size of these enterprises. Due to this principle, in conditions of the highlighted terms, in the accomplished statistical analysis, the following measures were applied (Triola, 2015): the Pearson correlation coefficient, the χ^2 test of independence, φ-Yule'a, Yates' χ^2 and Q – Kendall's coefficient.

Results and Discussion

Conducting interviews with customers in order to determine the significance of customer service in the surveyed entities

The distribution of the attained answers for the question about performing interviews with customers by entrepreneurs in reference to determination of the importance of the service itself and its particular elements is presented in Figure 2. The statement of performing interviews with customers of all business market segments was achieved only from 15 enterprises (10.2%). Most managers of the enterprises, i.e. 84 (57.2%) of the total number of responses, analyzed the importance of logistics service and elements with chosen customers. Contrarily, the method of interview was not practiced at all in 48 enterprises (32.6%). The complete perception of the requirements related to the level of logistics service preferred by the buyers and including their perspective was consequently designated by the smallest number of enterprises' representatives. A total deficiency of insight of the require to identify the anticipations of customers towards particular elements of logistics customer service articulated by nearly a third of the surveyed enterprises is rather alarming.

Fig. 2. Interviews conducted with customers in reference to determination of the importance of the service and its particular elements

Source: Own study.

Another three questions were addressed to those 99 respondents who, in response to the first issue mentioned above, confirmed conducting interviews with customers in order to determine the significance of the service itself and its individual components. Therefore, the amount of shares was determined in relation to the number of the obtained responses, limited to 99.

In the first point of the highlighted ones, the question was asked about the frequency of conducting interviews with customers in order to determine the significance of the service itself and its individual components in the surveyed companies. The distribution of the obtained responses clearly indicated the advantage of occasional discussions with customers on the significance of logistics service and its components, conducted by 63 representatives of the surveyed entities (63.6%). The declaration of regularity in the application of the technique of direct interview with customers was made by 36 entrepreneurs, i.e. 3.4% of the total number of responses. The distribution of responses obtained from the surveyed entrepreneurs to the question about the frequency of conducting interviews with customers in order to determine the significance of the service itself and its individual components is presented in Figure 3.

Fig. 3. The frequency of interviews conducted with customers in order to determine the significance of the service and its individual components

Source: Own study.

The subsequent issue related to in the questionnaire is the development of the previous problem by inquiring the respondents as to the way of conducting interviews with customers in order to determine the significance of the service itself and its individual components in the surveyed companies. Among a total of 99 obtained responses there were recorded only 5 economic entities (5.05%) that admitted using the services of the company specialized in the application of the direct interview technique. The other 94 entities (94.95%) conducted interviews with customers on the significance of logistics service and its components on their own. The distribution of responses obtained from the surveyed entrepreneurs to the question about the way of conducting interviews with customers in order to determine the significance of the service and its individual components is presented in Figure 4.

Fig. 4: The way of conducting interviews with customers in order to determine the significance of the service and its individual components

Source: Own study.

The closure of the considerations on the problem of the components of logistics customer service in the surveyed enterprises is the fourth point of the questionnaire, concerning the application of the critical incident technique (CIT) method in order to identify the key components of logistics customer service in the surveyed companies. Interviews with customers in order to determine the significance of the service and its individual components using the CIT method were conducted regularly only in 2 companies (2%) and occasionally in 3 entities (3%). As many as 94 enterprises (95%) never used the indicated method. Low popularity of the CIT method may result from the lack of knowledge among entrepreneurs, anticipating difficulties in conducting it or disproportionally low benefits from the effects of its application in relation to the incurred expenditure. The distribution of responses obtained from the surveyed entrepreneurs to the question about the application of the critical incident technique (CIT) method in interviews with customers conducted in order to determine the significance of the service and its individual components is presented in Figure 5.

Fig. 5. The application of the critical incident technique (CIT) method in interviews with customers conducted in order to determine the significance of the service and its individual components

Interviews with customers and the size of the surveyed companies

As specified by the indication of the demographics attached in the survey questionnaire, among all 147 surveyed enterprises, micro entities predominated, with the amount of 76% of the research entities (112 companies). The division of small-sized entities was also considerable, with the amount of 16.5% of the entire quantity of respondents (24 companies). Simultaneously, medium and large entities, with join amount of 7.5% of the research representatives (11 companies), confirmed a small division in the research.

The maintenance of the reflections on the sphere of conducting interviews with buyers in reference to establish the importance of the service itself and its particular elements is correlating to the size of the surveyed enterprises (Table 1). In relation to the structure of the answers of the respondents, in the research into the participation of the representatives of the companies in realization of the interviews with customers in reference to establishing the importance of the service itself and its particular elements, the negative correlation was anticipated. The accomplished examination established the statistically significant clear correlation at the level of – 0.493. For that reason, it can be deduced that the representatives of the companies in larger entities execute the investigation among buyers more frequently and more systematically. Approximately 40.2% of micro entities do not make efforts to conduct interviews with the buyers.

Table 1: Interviews conducted with customers in reference to establishing the importance of the service and its particular elements due to the size of companies

Are interviews with customers conducted in the company in order to determine the significance of the service itself and its individual components?	Type of the company			
	micro	small	medium	large
yes, among customers of all market segments	2	6	5	2
yes, among selected customers	65	15	3	1
no	45	3	0	0

Source: Own study.

In the subsequent point, the inquiry was carried out as to the frequency of conducting interviews with customers in order to determine the significance of the service itself and its individual components in the surveyed entities. The relationship between the frequency of interviews conducted with customers and the size of the company, although statistically significant, is at the level of - 0.198, which indicates its very moderate strength. Therefore, there is only a symptomatic direction of impact which is stronger with larger enterprises (Table 2).

Table 2: The frequency of interviews conducted with customers in order to determine the significance of the service and its individual components in relation to the size of enterprises

If interviews with customers are conducted in order to determine the significance of the service itself and its individual components, how often are they held?	Type of the company			
	micro	small	medium	large
regularly	24	3	6	3
occasionally	43	18	2	0

Source: Own study.

Another issue discussed in the survey form is the development of the previous issue by inquiring the respondents as to the mode of conducting interviews with customers in order to determine the significance of the service itself and its individual components in the surveyed companies. In accordance with the information included in Table 3, in the group of enterprises carrying out the aforementioned research, the majority conduct it on their own. The predominant part is micro- and small-sized enterprises, whose budget for this type of activities – if specified at all – does not allow the services of external institutions. Therefore, a positive correlation is observed, at the level of 0.640 between the size of enterprises and the willingness to address specialized institutions to undertake market research. At the same time, it should be pinpointed that conducting interviews with customers individually by the surveyed entities also has numerous benefits, among others, correspondingly lower costs, practically any repeatability, much greater flexibility in changes in the type of the collected information, an easier access to customers, the ability to obtain real data through informal contacts. Obviously, there is a risk of errors of interpretation in terms of reasoning, however, they mainly do not depend on the way of collecting information but its subsequent processing and this, in turn, on the skills of the hired staff.

Table 3: The mode of conducting interviews with customers in order to determine the significance of the service and its individual components in relation to the size of enterprises

If interviews with customers are conducted in order to determine the significance of the service itself and its individual components, who conducts them?	Type of the company			
	micro	small	medium	large
the company on its own	67	21	6	0
a specialized company	0	0	2	3

Source: Own study.

The closure of the considerations on the problem of interviews with customers in the surveyed enterprises is the fourth point of the survey form concerning the application of the CIT method in order to identify the key components of logistics customer service in the surveyed companies. Table 4 shows the distribution of the obtained responses to the question about the frequency of using the CIT method in the surveyed entities. In statistical terms, one may talk about a strong negative correlation of –0.635 between the frequency of use of the CIT method and the size of enterprises. This correlation was determined using the Q-Kendall's coefficient, therefore, its value is only of an ancillary nature whereas its direction is more important. It is easily perceived that only few medium and large enterprises apply the CIT method. Single results in the group of microenterprises indicate the existence of enterprises run by people with greater power in terms of the opportunities to use the aforementioned method. Moreover, it can be concluded with a high probability that many respondents did not use this method due to lack of knowledge of its existence.

Table 4: The use of the CIT method in interviews with customers conducted in order to determine the significance of the service and its individual components in relation to the size of enterprises

The frequency of use of the CIT method	Type of the company			
	micro	small	medium	large
regularly	0	0	0	2
occasionally	0	0	2	1
never	67	21	6	0

Source: Own study

Conclusion

In reference of the above deliberations concerning the dilemma of the accomplishment of the chosen assignments of logistics customer service in management processes, i.e. conducting interviews with buyers in reference to establishing the importance of the service itself and its particular elements, it can be achieved that in the habituates of the activities of commercial freight road transport companies located in the Silesian Voivodeship in southern Poland, it endures at the coincidental stage of advance.

The division of the answers of the respondents, relying upon the size of companies, typically acknowledged that along with a raise in the size of the surveyed enterprises, they designated a increasing trend to execute the measurements in inquiry. The entrepreneurs in larger economic units more often and more thoroughly conduct the research into the scope and level of logistics customer service, both among the customers of these services and within the enterprise, at the same time being more determined to perform the discussed task of management of logistics customer service.

The effort made to scrutinize the reliance of the scope of logistics customer service in the surveyed commercial freight road transport enterprises of the Silesian Voivodeship in southern Poland on the size of these companies gathered acceptable result in reference to most of the examined occurrences. The analysis of the primary information, achieved from the answers of the respondents to the questions introduced in the survey questionnaire, in reference to the size of the surveyed enterprises, by means of chosen statistical measures, affirmed the statistically important relations. Considering low values of the achieved statistical measures, the completion remarks are of a relatively hypothetical constitution while the overview originated on the basement of the above information can be analyzed as remarkable research theses, comprising the beneficence to further principle research.

Abstract

This article presents the state of knowledge in the field of entrepreneurship development in the North-East region; furthermore, indicators of newly created active enterprises in the North-East Region of Romania are evaluated and the evolution of entrepreneurship development in the selected region is studied, through the indicators analysed in the period of 2007-2017. This paper is based on scientific research methods, such as literature review analysis and exploratory research conducted from secondary sources, respectively online accessed data provided by the National Institute of Statistics. The contributions of the article consist of the presentation of the key elements of entrepreneurship and of the link between entrepreneurship and sustainable development, as well as the presentation of the indicators that contribute to the description of the evolution of entrepreneurship in the North-East region. Moreover, the paper offers perspectives for future research in the field of entrepreneurship.

Keywords: Entrepreneurship, Sustainable Development, North-East Region, Rural Areas

Literature Review

At EU level, entrepreneurship is an essential vector for economic growth and the creation of new workplaces, being a generator of economic competitiveness and innovative spirit of all the member economies of the European Union, participating in the fulfillment of several European sectoral policies (European Commission, 2013).

For Romania, the year 1990 signified the freedom of the economic market correlated with the development of democratic political institutions, which supported the development of entrepreneurship. Thus, old communist economic enterprises were restructured - through privatization, re-profiling or closing, and, on the other hand, new entrepreneurial initiatives were realized - most often on the small or medium scale (Rusu, et al., 2015).

The authors (Philipson et al., 2011, Newbery and Bosworth, 2014) note that rural entrepreneurship fosters archaic communities by creating workplaces and supporting a community spirit.

Likewise, Jepson (2007) emphasises that the growth and development of a community is the result of the inextricable interconnection of four factors: population, environment, organization and technology.

The enterprise represents "any form of organization of an economic activity, with patrimonial autonomy according to the laws in force to engage in trading activities, in order to obtain profit by producing material goods and selling them on the market or by providing services, under conditions of competition**",** in accordance with the Explanatory Dictionary of the Romanian language (2016).

In addition, Nicolescu (2001) considers that the enterprise represents "an organization made up of one or more persons who carry out economic activities, usually using economic means, in order to obtain a profit".

At EU level, small and medium-sized enterprises (SMEs) represent the backbone of the economy (European Commission, 2014).

In the Romanian view, SMEs are characterized by innovation, flexibility, close links with the community, optimal use of resources (Ișfănescu, 2005).

According to Istocescu (2003), entrepreneurship is defined as a dynamic process, initiated by people who take important risks, essentially aiming for the establishment of organizations and the creation of workplaces.

The authors (Philipson et al., 2011, Newbery and Bosworth, 2014) state that entrepreneurship furthers sustainable development.

Scorus (2017) considers that innovation plays an important role in the business environment, supports the rise of performance of the goods and services offered, increases competitiveness and creates new markets.

The author Belyaev (2010) points out that there are areas around the world that, in recent decades, have changed their economy from activities mainly in the primary sector (especially agriculture) to activities mainly related to tourism, i.e. from the tertiary sector.

A special contribution in tourism is provided by the cultural capital, this aspect being supported by the authors Saunders and Dalziel, (2010). They underline the importance of cultural capital within rural communities, namely the values, traditions that define certain groups of people, which are passed down from generation to generation.

Moreover, Chang and Huang (2004) believe that a sustainable local community needs a long-term integrated approach to economic, social and environmental issues, both at the microeconomic level of individual characteristics (e.g. tourism which, according to Bălan et al. (2010), has played a major part in the sustainable development of local communities worldwide) and at the macroeconomic level (regarding the community as a holistic system).

The significance of sustainable tourism is highlighted by the authors Nistoreanu et al. (2003), who define "sustainable tourism as an opportunity to develop all forms of tourism, tourism management and marketing, by respecting the natural, social and economic integrity of the environment, while ensuring the exploitation of natural and cultural resources for future generations as well."

An important factor of local sustainable development is represented by non-governmental organizations (Sobol, 2008).

According to the North-East Regional Development Strategy 2014-2020, the development of entrepreneurship and the promotion of entrepreneurial culture in the rural area might be a viable solution for revitalizing the areas that have gaps compared to the urban environment, by diversifying the economic activities carried out, bringing added value and creating new workplaces for the inhabitants of rural areas.

The authors, Mihalache and Croitoru (2011), consider that the lack of entrepreneurial initiatives impedes the development of rural areas, while the scarcity of employment opportunities leads to emigration.

Research Methodology

This article contains an exploratory research based on an analysis from secondary sources, the purpose of which is to interpret indicators that present the situation of newly created active enterprises in the North-East Region and the evolution of entrepreneurship development in the selected region.

The analysis will also make visible the profile of an entrepreneur from the North-East region of Romania.

As far as the origin of the data is concerned, they were taken from the official statistics at regional level, provided by the National Institute of Statistics. Regarding the actuality of the data, they were accessed in December 2019, the most recent indicators being those of 2017.

The analysed indicators of the newly created active companies are: residence areas, gender of the founders, the level of training of the founder and the sectors of activity.

The study is carried out between 2007-2017, the choice of the period having the role of observing the evolution of entrepreneurship over a longer, more recent and relevant period.

Results and discussions

Within this section the results of the exploratory research are presented, the data are displayed in four figures, which are analysed and explained; additionally, are presented certain ways to avoid the negative aspects resulted from the analysis.

According to the National Institute of Statistics (2019), the newly created enterprises comprise the companies and the individual entrepreneurs (individuals, individual enterprises, family businesses, liberal professions) that carry out non-agricultural activities, created in a certain period of time. The notion of "newly created" refers to the inclusion of an enterprise in the statistical register of the enterprise, which is updated monthly on the basis of the fiscal register.

The analysis begins with, the distribution of newly created active enterprises according to residence areas, during the period 2007-2017 at the North-East Region level as shown in Fig.1**.**
The examination of the entire period, as show in the figure below, points to a major discrepancy in the distribution of newly created active enterprises in the rural area compared to the urban environment at the level of the targeted region.

Fig.1: Distribution of newly created active enterprises in the North-East region, by residence area

Source: Authors' conceptualization based on the information extracted from National Institute of Statistics

As emphasised in Fig.1 during the analysed period, the biggest difference was registered in 2007, when 74.6% of the total of newly created active enterprises were established in the urban area and only 25.4% in the rural area. At the opposite end, the lowest difference was registered in 2017, when 60.8% of the newly created active enterprises in the region were registered in the urban area and 39.2% in the rural area. There is an increasing trend in the analysed period of newly created enterprises in rural areas. This may be due to several causes, such as: increasing entrepreneurial spirit in rural areas, increasing involvement of young people in rural areas, participation of rural population in entrepreneurial development courses, possibility of accessing European funds for agriculture and rural development, improving living conditions in certain villages or communes.

A solution to encourage entrepreneurship in rural areas can be its promotion, which would support the economic development of rural communities.

Another analysed variable is the gender of entrepreneurs in the North-East region. Fig. 2 shows that in the North-East region, the highest percentage of entrepreneurs, out of the total active, newly established enterprises in 2007, was that of male entrepreneurs (69.7%). Regarding the female subjects it can be seen from the graph below that in 2014 they had the highest percentage of 48.4% from the total of the analysed period.

Fig.2: Distribution of newly created active enterprises in the North-East Region, by founder's gender

Source: Authors' conceptualization based on the information extracted from National Institute of Statistics

Furthermore, Fig. 2 displays time spans in which there was no major discrepancy between genders,, such as in 2012, 2013, 2014, when the difference between men and women was of only 8.4%, 6.4% and 3.2%, respectively. A possibility to increase the number of women entrepreneurs could be to provide free funded courses for people interested in starting a business.

An important feature in the creation of the entrepreneur profile in the North-East Region is the education`s level of the founders. In order to interpret the education`s level of managers, we considered the primary, secondary, vocational, high school and university studies. From Fig. 3 it appears that most entrepreneurs have studied at high school and university level with a percentage between 40.8% (2015) and 68.9% respectively (2014).

Fig.3: Distribution of newly created active enterprises in the North-East Region, according to the founder's training level

Source: Authors' conceptualization based on the information extracted from National Institute of Statistics

In addition, the percentage of people with secondary education varies during the analysed period. Thus, the highest percentage is registered in 2015 (44.1%) and the lowest percentage is from 2014 (23.1%). The lowest percentages are held by entrepreneurs with primary education, namely between 0 (2014) and 1.3% (2011).

We believe that level of studies should not be an obstacle to entrepreneurs, but they are certainly beneficial for business development. Thus, simple guides which present the steps in launching a business can be instrumental in the development of entrepreneurial initiatives.

An indicator of interest in identifying the profile of the entrepreneur from the North-East region is the activity sector. According to Fig. 4, we can observe that most people became entrepreneurs in the trade sector, the highest percentage being 56.2% in 2010 and the lowest, 22.3% in 2007. The following positions are held by entrepreneurs from other services (51% in 2007 and 3.4% in 2010) and industry (21.8% in 2017 and 10% in 2007).

Fig.4: Distribution of newly created active enterprises in the North-East Region, by activity sectors

Source: Authors' conceptualization based on the information extracted from National Institute of Statistics

The research outlines the main characteristics of entrepreneurship in the North-East region, as well as, the profile of the entrepreneur from the selected region.

Thus, from the specialised literature analysed in the article it appears that tourism is a part of the tertiary sector of the economy that has contributed to the sustainable development of local communities. In addition, the article emphasised how the development of entrepreneurship and the promotion of entrepreneurial culture in the rural area can be a viable solution for revitalising the areas that have gaps compared to the urban environment, by diversifying the economic activities carried out, creating added value and providing new workplaces for residents of rural areas.

The weak progress of entrepreneurial initiatives in the rural area can have negative effects on the quality of life of the inhabitants of the rural area. Also, this can cause the stagnation of many rural areas at the stage of underdevelopment.

According to research findings, a potential target group that needs to strengthen the entrepreneurial spirit in the rural area is represented by women.

It can be concluded that, to a large extent, entrepreneurial spirit can be formed, and entrepreneurial education in pre-university and university programs might shape entrepreneurial spirit.

Sustainable development of urban and rural areas is an activity of great importance for Romania; the development of urban and rural economy must be achieved in a sustainable manner through entrepreneurial initiatives and by fostering economic, social and ecological benefits that will be of use to individuals.

Abstract

This study tried to optimize the energy consumption of an electric vehicle on a path where there are several available paths. This has been carried out based on metaheuristic methods or more precisely on ant colony algorithms. The used algorithm in this study was implemented in python language or what is called the numpy and matplolib libraries. At first, a schema that contains several paths of different lengths and energy values was proposed. Results demonstrated that the optimal path that can be traveled by the vehicle has two main constraints. The first one concerns having energy consumption although the distance is optimized. The second one has to do with parallelizing the program using the joblib library under python. In general, this provided better results from the point of view of the execution time.

Keywords: Smart City, Logistical Transport, Energy Optimization, Electric Vehicle, Ant Colony Algorithms, Optimal Path, Library Joblib.

Introduction

The Smart City concept knew a great success. In fact, it is used to describe the city where everything is connected in order to provide many advantages for citizens. This facilitates their life giving them more safety and more new economic development opportunities. It seems to be great but it has been very few researchers who interested to the prerequisites of the Smart City model, actually they missed to take into account several things. For instance, the environment sustainability, the individual's health issues, and studies about those people. This has led us to think about an alternative approach that aims not only to optimize the routing, but also to improve the energy consumption of an electrical vehicle which will have an effective impact on both people health and environment.

In these recent years, the emission of environmentally harmful gas and the consumption of energy have triggered some of the recent studies on our transport system. At this stage, scientific research on automobiles has guided researchers' work towards improving and optimizing these two criteria which have become crucial for the design of new vehicles. To meet the challenge of further reducing consumption and emissions, the automotive industry has turned to electric vehicles that eliminate combustion on board and thus no longer produce polluting emissions. However, their main handicap

is the battery, which is still very heavy and very expensive. Even a low-cost driver can expect to achieve only 200 km of range for a very long charging time (6 to 8 hours). In addition, electric vehicles require the installation of specific infrastructure for charging the battery both in private garages and in public stations to allow long journeys.

Based on what was mentioned, two questions arise:

Is it possible to control the energy of an electric vehicle?

What is the right strategy to minimize the journey of a charging station with minimal energy?

Big Data and Logistics

The success of any company stands on the effectiveness as well as on the efficiency of its supply chain and its logistics operations. Companies started to rely on huge sets of extensive and rapid data generated on different stages of their supply chain and logistics operations. For instance, this includes the need to gather data about customers, inventory, commodity, state of road, etc...

For this purpose, professionals and companies realized the considerable impact of data analysis to optimize the different stages of their Supply Chain. They noticed that behind each movement, commodity, or system, bits of information can be collected, stored, analyzed and exploited to draw conclusions that automate processes, facilitate services, or generate annual forecasts. They introduced Big Data in almost all their business domains as it is displayed in Table 1 below.

TABLE 1: BUSINESS DOMAIN BIG DATA

Business Domain	Big Data Contribution (%)
Marketing	45
Operations	43
Sales	38
Risk Management	35
IT Analytics	33
Finance	32
Product Development	32
Customer Service	30
Logistics	22
HR	12
Other	12
Brand Management	8

Source: Forrester Research Inc. How Forrester Clients Are Using Big Data, September 2011.

In This work, we focused on the logistical transport field and tried to implement an optimizing routing system which takes into account the ecology principle by establishing a rationalized way to minimize the energy consumption at the same time.

Methods

Routing Algorithms

Definition

The purpose of routing is to determine a route that meets certain constraints to establish a connection from a source node to a destination node. The purpose of a routing algorithm is to allow the calculation of the route between these two nodes within the meaning of a certain criterion in addition to the dissemination of the information necessary for that calculation. The routing algorithm must find the "best" path to go from a source point (A) to a destination (B).

There are several criteria for defining the notion of a better path (also known as the shortest path): the cheapest (money), the fastest (in time), passing through as few knots as possible, and the shortest (in distance). There is no reason why these different criteria should have the same optimum. It is important therefore to look for a multicriteria optimum such as a more difficult problem which, in general, has no exact solution. Besides, the algorithm of the ant colony developed in a PYTHON environment is the subject of this work.

Mathematical Modeling

The Ant Colony algorithm was used to perform the routing of electric vehicles, which means that this study looked for the optimal route with a minimum level of energy and distance to reach the destination.

A schematic road network with a graph (V, E, C) was considered. Figure 1 demonstrates the travel topology with:

- **V: set of nodes $\vartheta 1, \vartheta 2, ..., \vartheta\, n$ that represents load stations.**
- **E: sets of stops that represent the distance from an i node to a j node.**
- **C: battery power.**

Figure 1: Travel Topology

Different settings were used to find the best path from a source to a destination.

The parameters are as follows:

- **Number of nodes ($\vartheta 1, \vartheta 2..., \vartheta\, n$)**
- **Distance between two nodes**

- **The energy consumed by the electric vehicle battery**

Each node has a set of neighboring nodes defined as follows:

$$N(vi) = \{vj \mid v\,j \in V,\ dij > 0\}$$

With d ij as the distance between "Vi" and "Vj", when the vehicle is in node Vi, the following node must be selected with a maximum probability "Pij" which is calculated using the following formula:

$$Pij = \frac{[\mu ij]^\alpha * [\rho ij]^\beta}{\Sigma[\mu ij]^\alpha * [\rho ij]^\beta}$$

With "μij" as the energy function defined by: μij=1/cij, cij is the energy to reach the node vj from "Vi" and "ρij" which is the location function defined by: ρij=1/dij, "dij" is the distance from "Vi" to "Vj".

α and β are respectively the parameters of factors influencing cost (respectively distance).

Routing Optimization Algorithm

```
Initialization: i, j, count
Inputs: n, dist, energy
Output: probabilities P (ij)
Probe function (m[0][0])
for (i=1; i<=n; i++) doing
for (j=1; j<=n; j++) do
if (m[i][j] = 0) then
x= probability calculation using the formula
node [count++]. φi =i
node [count++] .φj=j
node [count++]. value=x
end if
end for
end for
store (node value)
return i,j
∀ i,j, prob (m[a][b])
```

The above algorithm provides the optimized route from a source to a destination. The number of nodes, distance, and battery power are the input for the algorithm while the probability is the output.

Parallelism of Routing Algorithm Under Python

To parallelize the program in python, the joblib library was used which is a set of tools designed to provide a lightweight python pipeline.

For simple and easy parallel computing, joblib is optimized to be fast and robust, especially for large data. In addition, it has specific optimizations for numpy arrays. Its main role is to provide tools to easily obtain better performance and reproducibility in long term jobs.

Results

The following table shows the different paths taken with their probabilities:

Point i	Point j	Energy	Distance	Probability
0	1	50	40	0.75
1	2	20	40	0.66
2	4	10	30	0.53
4	5	50	60	0.58
5	6	20	30	0.61
6	8	40	10	0.58
8	10	10	50	0.82
10	11	60	30	0.52
11	12	10	20	1

This is the optimal route and way from a source to a destination.

Figure 2: The optimal path/way

After parallelizing the ACO Algorithm, this result was obtained

Figure 3: Comparison between sequential and parallel

Discussion of the results

There are several possible paths from a charging station "i" to a charging station "j". The path is chosen according to the one with the highest probability by using the expression mentioned above.

The path found is obviously the most optimal and always considers the two constraints of battery energy and distance.

The adopted path model or way in our project is simple. However, let us imagine that it is a very complex model. This is where the execution time becomes crucial and that is why the used algorithm was parallelized under python.

Conclusion

Battery-powered electric vehicles (EVs) will play an important role in the future's road traffic. The unique characteristics of these electric vehicles - limited cruising range, long recharging times and the ability to regain energy during deceleration require new routing algorithms as the challenge now is to determine the most economical rather than the shortest route. This requires extensions to the general shorter path algorithms that address the problem of energy-optimal routing or more specifically energy-efficient routing.

Resumen

Objetivo: Proponer un esquema de clasificación conceptual (ECC) con el fin de determinar brechas en el conocimiento en cuanto a la medición de la sostenibilidad al interior de las organizaciones. **Materiales y Métodos:** Se estableció un procedimiento estructurado de la revisión de la literatura (RS). Este tipo de revisión fue aplicada usado ecuaciones de búsqueda y la ayuda de los operadores Booleanos. Se diseñó un esquema conceptual de clasificación (ECC) que consideró 41 artículos comprendidos entre 2009 y 2019, a partir de los cuales se estructuraron diferentes categorías de búsqueda y un esquema conceptual basado en preguntas. **Resultados:** Se obtuvo como resultado una estructura detallada de las variables, técnicas empleadas, lugares de aplicación, hallazgos relevantes, ventajas y desventajas de los diferentes estudios encontrados en la revisión de literatura. **Conclusiones:** A partir de dicha revisión se pudo concluir que las investigaciones relacionadas con la sostenibilidad han aumentado en la última década, siendo el período comprendido entre 2009 y 2010 el de mayor incremento de publicaciones con el 61,18%. Este incremento se refleja en los continentes europeo y asiático, encaminándose a ser los pioneros a nivel mundial en desarrollar nuevas técnicas de medición y contribuyendo a un planeta más sostenible. En cuanto a la industria (250 empresas evaluadas), solo el 8% ha establecido acciones relacionadas con los Objetivos de Desarrollo Sostenible (ODS), de ese 8%, el 39% incluyen objetivos globales con los ODS.

Palabras clave: Desarrollo sostenible, sostenibilidad social, sostenibilidad ambiental, sostenibilidad financiera, medición, indicadores de desempeño.

Introducción

La sostenibilidad es una oportunidad de cambio para las empresas, en las cuales ocurre un proceso de transición hacia negocios innovadores, respetando el medio ambiente, ofreciendo nuevas formas de convivir con la sociedad y brindándole bienestar al trabajador (Figge, 2002). Medir el desempeño contribuye a que las empresas mejoren su rendimiento financiero, identificando los procesos internos más eficientes y a su vez aprender de la experiencia de otras organizaciones para no caer en los mismos errores, focalizando esfuerzos en los aspectos medioambiental, social y económico.

El desarrollo sostenible es "el desarrollo que satisface las necesidades de la generación presente sin comprometer la capacidad de las generaciones futuras" (FAO, 1988). En las empresas es, esencialmente, la sostenibilidad económica del negocio, a largo y mediano plazo, lo que permite mantener la rentabilidad económica de sus actividades productivas, contemplando nuevos conceptos de riesgo y oportunidades, asociados a los aspectos medioambientales, al impacto social de la producción o a la calidad de las relaciones laborales (Neredo, 1996), por tal motivo, se evidencia la importancia en la implementación de políticas encaminadas a un desarrollo sostenible, estableciendo

continuamente si se cumplen o no los objetivos propuestos a través de una serie de indicadores de desempeño, contribuyendo a la mejora continua de los procesos.

El presente artículo tiene como objetivo establecer los resultados de investigaciones hechas en los últimos 10 años sobre las mediciones de la sostenibilidad al interior de las organizaciones a nivel mundial, estipulando aspectos como: métodos de recolección de información, metodologías de evaluación, áreas de la sostenibilidad medidas, países con mayor número de investigaciones, y así contrastar dicha información con el compromiso real de medir, evaluar y mejorar las condiciones sostenibles que plantea la industria. Para este propósito se estableció un procedimiento estructurado de la revisión sistemática de la literatura (RS) o meta análisis (MA) con el fin de identificar las investigaciones relevantes e ir descartando las que no lo son. Díaz (2009) propone el siguiente procedimiento: (1) Leer los nombres de los autores, (2) Año en el que fue escrito, (3) Interpretar el título del artículo, (4) Identificar las secciones en que está dividido, (5) Observar los gráficos, figuras, tablas o fotos y (6) Revisar si la bibliografía es reciente o relacionada con el tema. Este tipo de revisión sistemática de la literatura (RS) o meta análisis (MA) fue aplicada usado ecuaciones de búsqueda y la ayuda de los operadores Booleanos en varias bases de datos académicas para seleccionar los artículos más relevantes y aquellos que aportaban al tema de investigación, por último, se diseña un Esquema Conceptual de Clasificación (ECC), para determinar las brechas en el conocimiento e inducir nuevas líneas de investigación.

Metodología

El desarrollo del estado del arte en cuanto a las mediciones de la sostenibilidad al interior de las empresas se realizó de la siguiente manera:

Revisión sistemática de la literatura (RS) o meta análisis (MA)

"Una revisión sistemática se define como una manera de evaluar e interpretar toda la investigación disponible relevante respecto de un interrogante de investigación particular, en un área, temática o fenómeno de interés" (Kitchenham, 2004). Siguiendo el procedimiento propuesto por el autor, se establecieron los siguientes criterios:

- La primera etapa consistió en establecer el tema de investigación a través de una revisión sistemática (RS), fijando como primera medida el problema de la investigación y definiendo los objetivos, luego se instauraron los antecedentes del tema bajo los cuales se derivó la búsqueda investigativa, posteriormente se definió el tema a tratar, haciendo énfasis en su relevancia en el mundo empresarial e investigativo.
- La segunda etapa se basó en cuatro aspectos que garantizan las dimensiones de la revisión sistemática (búsqueda, valoración, síntesis y análisis). Como primera medida, se definió cómo se iba a llevar a cabo la búsqueda de los trabajos objeto de revisión, utilizando criterios bien definidos de exclusión e inclusión para evaluar cada potencial de estudio primario, utilizando la selección de palabras claves y ecuaciones de búsqueda con los operadores Booleanos, además se tuvieron en cuenta los siguientes criterios: fechas de publicación, estableciendo si la bibliografía es reciente o no, títulos y resumen para garantizar que los temas tratados tienen concordancia con el tema de investigación, observación de gráficos, figuras, tablas o fotos, para verificar resultados, así como las tendencias de autores que han investigado sobre la temática.

Cabe destacar que la literatura proviene de bases de datos académicas como Scopus, ScienceDirect y Scielo, seleccionando artículos de alto impacto (revistas científicas indexadas) y utilizando palabras claves para la búsqueda de artículos, como: sostenibilidad, medición, organización y producción, estas fueron interconectadas con cuatro operadores Booleanos: and, or, xor y not, generando las diferentes ecuaciones de búsqueda. La búsqueda aplicó para un período de 10 años, de 2009 a 2019.

Procedimiento De Exclusión De Artículos

Para la exclusión de artículos se realizaron dos filtros, el primero indagaba el cumplimiento de 3 criterios a saber, año de publicación, revisión de títulos y lectura de resumen de los artículos. Una vez pasado el primer filtro de búsqueda, el contenido de los artículos debía responder a dos interrogantes básicos: ¿la investigación establece como tema esencial la sostenibilidad empresarial? y ¿la investigación establece indicadores para medir el desempeño empresarial en cuanto a la sostenibilidad? Teniendo en cuenta los criterios de exclusión para la selección de artículos en las bases de datos académicas antes mencionadas, se obtuvo una revisión inicial de 216 artículos, de los cuales fueron seleccionados 41 artículos relevantes, es decir, solo el 19% aproximadamente de los artículos revisados aportaban como antecedentes al tema de mediciones de sostenibilidad empresarial. El Anexo A muestra los resultados de búsqueda con los operadores booleanos.

Esquema conceptual de clasificación (ECC)

Como fase previa a los resultados de la investigación realizada, se establece un esquema conceptual de clasificación (ECC). Este esquema, como se muestra en la tabla 2, fue creado durante el análisis de los 41 artículos seleccionados, con el fin de proveer a los investigadores un acceso rápido y mayor comprensión de la literatura relevante. Este esquema se planteó para responder a los interrogantes presentados en la Tabla 1:

Tabla 1: Lista de preguntas y posibles respuestas en la metodología ECC propuesta

1. ¿Qué áreas de la sostenibilidad se están analizando? a. Económica, social y ambiental b. Social y económica c. Responsabilidad Social Corporativa con otros aspectos de la sostenibilidad d. Responsabilidad Social Corporativa e. Social y ambiental
2. ¿Qué herramientas se están utilizando para obtener información para el desarrollo de la investigación? a. Búsqueda sistemática de la literatura b. Encuestas c. Recolección de datos cuantitativos d. Entrevistas cualitativas y cuantitativas e. Otros métodos
3. ¿Qué herramientas se utilizan para el análisis y evaluación de los resultados? a. ANOVA b. Regresión lineal c. Análisis cualitativos d. Otras herramientas de estadística inferencial y/o descriptiva
4. ¿En qué lugares a nivel mundial se realiza la investigación? a. Europa b. Asia c. Latinoamérica d. Oceanía e. Norteamérica
5. ¿Cuáles son los resultados relevantes de la investigación? a. No existe un compromiso marcado por parte de la industria a nivel mundial para medir la sostenibilidad de manera interna. b. El alto número de investigaciones realizadas en los últimos años sobre la sostenibilidad a nivel mundial y el aporte que éstas han tenido en cuanto a metodologías utilizadas para la obtención de información y el análisis de resultados.

Resultados

Como primera medida se observaron las tendencias de la sostenibilidad en general durante los últimos diez años a nivel mundial, teniendo en cuenta el número de publicaciones por año, autores principales y países que más investigan sobre el tema, para así relacionar el compromiso a nivel nacional y mundial por el desarrollo sostenible, utilizando como fuente de información la base de datos académica SCOPUS. El gráfico 1 muestra la tendencia de publicaciones realizadas sobre el desarrollo sostenible a nivel mundial en los últimos diez años, para el período comprendido entre 2009 y 2019.

Gráfico 1: Tendencia de publicaciones por año. Elaborado a partir de información extraída SCOPUS.

Como se puede observar, existe una tendencia creciente a la investigación en el tema de la sostenibilidad, teniendo en cuenta el número de artículos publicados por año, lo que demuestra el interés de preservar el medioambiente a nivel mundial, junto con el compromiso social. Para el primer período comprendido entre 2009 y 2010 se obtuvo el mayor incremento de publicaciones sobre sostenibilidad con el 61,18%, y el incremento más bajo fue el comprendido entre el período 2014 y 2015 con un 3,16%, los demás períodos tienen un incremento relativamente constante, mayores o iguales al 10%, lo que evidencia la preocupación y compromiso de la comunidad científica de aportar al tema de la sostenibilidad (medio ambiente, los trabajadores y la sociedad, y las finanzas de la empresa).

A continuación, se responden las preguntas establecidas en el esquema conceptual de clasificación (ECC), establecido anteriormente:

¿Qué áreas de la sostenibilidad se están analizando?

De los 41 artículos revisados, en 15 artículos (36,6%) las empresas miden los tres pilares de la sostenibilidad (ambiental, social y económico), en 15 artículos (36,6%) miden la sostenibilidad ambiental como beneficio económico, en 8 artículos (19,5%) miden la responsabilidad social corporativa teniendo en cuenta otros aspectos de medición a parte de la sostenibilidad empresarial, como la tecnología, recursos productivos, compromiso, innovación, academia, gestión de control, presentación de informes de sostenibilidad, así como normativas nacionales e internacionales y los derechos de los trabajadores, en 2 artículos (4,9%) miden la responsabilidad social corporativa y un solo artículo (2,4%) mide la sostenibilidad social y ambiental, teniendo en cuenta el retorno sobre la inversión. De lo anterior se puede concluir que las empresas tienen un compromiso más marcado por la sostenibilidad, midiendo y evaluando sus tres pilares de forma general, mostrando una responsabilidad con los trabajadores, sin descuidar la parte financiera. Otro aspecto a tener en cuenta es el compromiso de las empresas con el medio ambiente, el 97,6% de las empresas objeto de estudio miden la sostenibilidad ambiental.

¿Qué herramientas se están utilizando para obtener información para el desarrollo de la investigación?

De los 41 artículos revisados, en 6 (14,6%), se utilizaron entrevistas cualitativas y cuantitativas como método para obtener información para la creación del modelo de sostenibilidad, en 9 artículos revisados (21,9%), se realizaron encuestas, las cuales fueron realizadas a diferentes empresas para obtener una información global desde diferentes puntos de vistas, siguiendo modelos de cuestionarios como el hierarchical analysis processes (AHP). En 7 artículos (17,1%), tomaron una recolección de datos cuantitativos a través de indicadores de desempeño ambiental para el análisis del ciclo de vida del producto, estudios y generación de energías renovables, entre otros. En 12 artículos (29,3%), se utilizaron búsquedas sistemáticas de la literatura a través de sistemas meta-buscadores y/o explorando las bases de datos académicas multidisciplinarias (Google Scholar, ScienceDirect, Scopus, entre otras) indagando áreas como la gestión, academia, ambiente, compromiso e innovación, esto se hizo usando palabras claves de la gestión sostenible como economía, medio ambiente, impacto social y tecnología. Por último, en 7 artículos (17,1%), se utilizaron otros métodos para la obtención de información tales como: evaluación relacionada con los productos e instrumentos de evaluación integrados, la evaluación empírica, donde se estudiaron ocho indicadores específicos de eficiencia basados en la relación entre la entrada y la salida de los datos orientados a insumos, comparación cualitativa y cuantitativa, de las revisiones de indicadores ambientales de un grupo de pequeñas y medianas empresas (PYMES), el análisis de inventario, en el que se examina el proceso de recopilación de datos para calcular los efectos ambientales, evaluación exhaustiva y parcial de varias cadenas de suministro (Hassini et al., 2012), y recopilación de información a través de la evaluación de criterios y búsqueda de información en páginas web.

¿Qué herramientas se utilizan para el análisis y evaluación de los resultados?

En la revisión de los 41 artículos seleccionados, Polanco et al (2016) implementaron estándares internacionales a través de la identificación y priorización de aspectos que intervienen en el desempeño de la organización, evaluando las alternativas según el retorno de la inversión aceptable y definido por la compañía. Por otra parte, en un estudio de investigación realizado por Martínez Ferro (2014) se utilizaron datos de panel, es decir, datos que combinan una dimensión temporal con otra transversal por medio de un análisis entre dos variables a lo largo del tiempo, con el estimador propuesto por Arellano y Bond. Sesma et al (2014) establecieron como herramienta estadística, un análisis de regresión en el estudio de big data para correlacionar la responsabilidad social con los stakeholders como parte fundamental en las utilidades de la empresa, estableciendo el papel que desempeñan cada uno dentro de la organización.

En una investigación realizada en responsabilidad social sostenible (RSE) por López et al (2017), se analizó el impacto de la responsabilidad social sostenible midiendo variables tales como: derechos humanos, prácticas laborales, medio ambiente, prácticas justas de operación, asuntos de consumidores, participación activa y desarrollo de la comunidad, teniendo en cuenta el capital humano como medida de valor económico, es decir, los trabajadores como capacidad productiva. Ellos establecieron que dentro de la práctica RSE se debe tener en cuenta aspectos como la globalización, tecnología, enfoques globales sobre la preservación del medio ambiente y compromiso social.

Ghenai et al (2019) plantearon la toma de decisiones multicriterio, para evaluar los cinco criterios de sostenibilidad ambiental en el caso de estudio en cuanto a energía renovable y el método híbrido de análisis de la relación de pasos/evaluación de la relación aditiva (SWARA/ARAS).

Para estudiar la sostenibilidad se pueden considerar tres puntos de vista dentro de la empresa: industria de mercado, basados en recursos y basados en instituciones, para adaptarse rápidamente a las restricciones impuestas por las tres áreas de la sostenibilidad, en aras de buscar valor agregado a sus procesos, a partir de esa premisa Antonio Lloret (2016) creó un modelo netamente analítico para la medición de la sostenibilidad, utilizando como base investigaciones previas, en este se estudiaron diferentes puntos de vistas aplicando información empírica, para saber cómo perciben las industrias la sostenibilidad, teniendo en cuenta las partes interesadas (stakeholders), el liderazgo sostenible y el gobierno corporativo para abordar dichas restricciones. Bajo ese mismo modelo analítico, los autores Sala, Ciuffo y Nijkamp (2015),

establecieron un procedimiento estructurado que abarca diferentes métodos y modelos analíticos específicos de campo, para aplicaciones y contextos de decisión específicos, basados en la revisión bibliográfica, los cuales establecieron como insumos externos de la metodología los "valores" para el análisis y los límites definidos, incluyendo el marco de la sostenibilidad relevante; y los elementos internos comprenden el enfoque que se debe adoptar, como el diseño de posibles escenarios sin descartar los desafíos políticos para el desarrollo sostenible, y a su vez la utilización de un modelo analítico e indicadores medibles para un análisis más operativo, más cuantificable.

En cuanto al análisis y evaluación a través del sistema de indicadores, Ness, Urbel-Piirsalu, Anderberg y Olssonse (2007), encontraron una metodología que se basa en tres áreas: categorización, establecimiento de indicadores o índices (integrados o no integrados), y evaluación del producto, teniendo en cuenta: los flujos de materiales y/o energía del producto desde la perspectiva del ciclo de vida y la evaluación integrada (multicriterio, análisis de incertidumbre, análisis de vulnerabilidad, costo-beneficio, sistemas dinámicos y el modelo conceptual), que son un conjunto de herramientas que normalmente se centran en el cambio de políticas o en la ejecución de proyectos.

Es claro que la medición de la sostenibilidad es una herramienta poderosa para saber qué tan bien se encuentra una organización con respecto a la gestión ambiental, social y económica, tanto interna como externamente, autores como Wan, Mohd y Johan (2017), utilizaron bajo otro enfoque nuevamente el concepto Green Project Management (GPM) P5 para desarrollar su modelo matemático de medición, basados en múltiples estudios de casos (juicios de expertos, entrevistas a los altos directivos, entre otros), el cual va más allá del principio 3Ps (planeta, beneficios económicos y personas), sino que además incluyeron productos y procesos para recoger la mayor cantidad de información posible, la cual fue analizada con una regresión lineal múltiple, para posteriormente realizar el proceso de normalización de los datos como resultado final.

¿En qué lugares a nivel mundial se realiza la investigación?

La revisión arrojó los siguientes resultados en cuanto a la pregunta planteada anteriormente, de los 41 artículos revisados: 17 artículos (41,46%), fueron realizados en Europa, 12 artículos (29,27%), en Asia, 7 artículos (17,07%), en Latinoamérica, 4 (9,76%), en Oceanía y uno en Norteamérica (2,44%). Se puede concluir que los continentes europeo y asiático son los más preocupados por investigar sobre el desarrollo sostenible, encaminándose a ser los pioneros a nivel mundial en desarrollar nuevas técnicas de medición contribuyendo a un planeta más saludable, empresas más eficientes que aumenten sus utilidades a lo largo del tiempo y empleados más seguros y felices. Adicional, sus investigaciones llevan a la creación o modificación de métricas e indicadores, análisis y mediciones de la sostenibilidad, generación de una cultura sostenible, creación de políticas de sostenibilidad, entre otros. De los artículos revisados, España realizó cuatro publicaciones de medición de la sostenibilidad empresarial, lo cual lo hace el país europeo de habla hispana con mayor número de aportes en el tema. En Latinoamérica, países como Colombia y México (4 y 3 artículos respectivamente). De toda la búsqueda realizada, EE.UU. es el país del que menos se encontró investigaciones relacionadas a la sostenibilidad, esto debido a su poco compromiso con los objetivos de desarrollo sostenible (ODS) que contrasta con su desarrollo económico. Según un nuevo informe supervisado por Jeffrey D. Sachs y publicado por la Red de Soluciones Sostenibles de las Naciones Unidas y la Bertelsmann Stiftung de Alemania, EE.UU. ocupa el puesto 42 de 157 países que han puesto en marcha los objetivos de desarrollo sostenible (ODS). En el estudio se estipulan tres colores para las diferentes ejecuciones de los ODS, el color rojo es para aquellos países que no han ejecutado ningún objetivo, amarillo el que los ejecuta de manera parcial, y el verde para aquellos que los ejecutan de manera total, y EE.UU. no tiene el color verde en ninguno de los 17 objetivos de desarrollo sostenible (ODS).

¿Cuáles son los resultados relevantes de la investigación?

Según el estudio realizado por la firma KPMG (Klynveld, Peat, Marwick, Goerdeler) a las 250 mejores empresas a nivel mundial según la revista Fortune (2017), menos del 10% de las grandes empresas se enfocan en los objetivos de desarrollo sostenible y las mediciones de estos aspectos, el 2% no reportan los casos de estudio para tomar acciones (preventivas o correctivas). Se puede afirmar que las empresas

no están midiendo la sostenibilidad, de esas 250 grandes empresas seleccionadas, solo el 8% ha establecido acciones relacionadas con los objetivos de desarrollo sostenible (ODS), de ese 8%, el 39% incluyen objetivos globales con los ODS, es decir, direccionan estratégicamente a la empresa con los objetivos de desarrollo sostenible; y de ese mismo 8% el 75% de las empresas solo discuten el impacto positivo que tienen los ODS en su negocio, pero la parte negativa no la incluyen en sus informes. Además, encaminan los objetivos estratégicos de la organización y los ODS por caminos diferentes.

Basado en la revisión de la literatura realizada en los últimos 10 años (2009 – 2019), se puede afirmar que existe un contraste bastante marcado con el compromiso que tiene la ciencia y la investigación con el medio ambiente y la sociedad, existe una tendencia creciente en la investigación y publicación de artículos científicos con respecto al tema, lo que demuestra un gran interés de preservar el medioambiente a nivel mundial de la mano con el compromiso social, siendo Asia y Europa los continentes que más aportan al tema con un 41,46% y un 29,27% respectivamente. Estas investigaciones utilizaron herramientas para la generación de información relevante para su posterior evaluación y generación de metodologías de análisis a través de las herramientas de estadística descriptiva e inferencial (como el análisis ANOVA, regresión lineal simple, toma de decisiones multicriterio, datos de panel y otros métodos), ayudándose con encuestas, entrevistas, revisiones bibliográficas, metodologías híbridas, entre otras, para obtener datos confiables.

Conclusiones Y Recomendaciones

En la presente investigación se utilizó una metodología de búsqueda basada en un meta análisis (MA), con la ayuda de la metodología de Kitchenham (2004), la cual se centra en el procedimiento de la revisión de la literatura. En dicha búsqueda se utilizaron los operadores booleanos como herramienta de apoyo para ser más eficientes en la obtención de la información. Se revisaron 216 artículos de los cuales 41 fueron relevantes, aportando la información suficiente para identificar, analizar y clasificar la información referente a la medición de la sostenibilidad al interior de las organizaciones. A partir de esta, se obtuvo como resultado una estructura detallada de las variables, técnicas empleadas, lugares de aplicación, hallazgos relevantes, ventajas y desventajas de los diferentes estudios encontrados en la revisión de la literatura. Por tal motivo, el principal aporte de la presente investigación es convertirse en un referente valioso para estudios y aplicaciones asociadas a la medición de la sostenibilidad, con el fin de mejorar la preservación del medio ambiente, el bienestar de los trabajadores y las finanzas de una organización. Dichas investigaciones sirven como base para el mejoramiento continuo dentro de la industria, las cuales no tienen ningún compromiso real para medir y estipular procedimientos de análisis de las condiciones de sostenibilidad internamente.

El contexto de la investigación y la medición de la sostenibilidad al interior de las organizaciones, contrastan, por una parte, las investigaciones que han ido en aumento en los últimos años sobre la sostenibilidad a nivel mundial y países que se han interesado en la investigación del desarrollo sostenible, como lo es el caso de España, Colombia, México, Cuba y Ecuador. Y en el otro extremo, se encuentra la industria a nivel mundial, las cuales no tienen el compromiso real de entrar en un desarrollo sostenible, midiendo, analizando y mejorando la situación problema.

Por último, los lectores deben ser cautelosos en la interpretación de los resultados de este estudio, debido a que las conclusiones se basan en artículos publicados en el ámbito académico y profesional, dejando de lado otro tipo de publicaciones, puesto que se asume que la alta calidad de las investigaciones es finalmente dada a conocer por medio de revistas indexadas nacionales e internacionales.

The Development of the Entrepreneurship Initiatives in Romania Based on the Principles of the Collaborative Economy

Adrian PETRE

The Bucharest University of Economic Studies, Bucharest, Romania
E-mail address: adrian.petre21@gmail.com

Abstract

The purpose of this scientific article is to empiricaly analyze the situation of Romania in terms of collaborative economy, the challenges and opportunities related to the development of innovative entrepreneurial initiatives in this field, as well as the role of the new 5G information technologies in supporting them. The research results highlights the benefits that can be obtained within the collaborative economy, as well as the very important role of 5G technology in supporting the development of this type of economy. On the other hand, the research shows that the collaborative economy is not yet well developed in Romania, especially due to the lack of regulation by the national authorities, the increased sense of ownership of the citizens, and also because the companies are still linked to the traditional production model and consumption. Romania has the logistical framework necessary for the development of the collaborative economy, and the main solutions to stimulate it are represented by the creation of a well elaborated legislative framework, the support of the entrepreneurial initiatives in this field and the education of the consumers / users.

Keywords: Collaborative Economy, 5G, Business, Romania

Introduction

Collaborative economy (CE) models have been developed with an accelerated rate globally, especially after the international financial crisis of 2008. This evolution is not only due to people's willingness to spend less, but also to changing consumers' attitude towards ownership of a good.

More and more people, especially from developed countries, are embracing this model of economy, transforming from consumers into users of goods and services. Given these aspects we can consider that this type of economy will become the foundation on which the new entrepreneurial initiatives will be developed.

Thus, the main objective of this scientific research is to analyze what the collaborative economy means, the advantages of innovative entrepreneurial initiatives in this field, supported by the implementation of 5G technology, and what is the situation of Romania in terms of adjustment to this type of economy.

To achieve this objective, the article is structured as follows: in Section 2 we will discuss theoretical issues regarding the principles and benefits of the collaborative economy, and in Section 3 we will try to determine the implications of the new 5G technology in supporting business development within this economy.

Further, Section 4 contains an empirical analysis of Romania's situation regarding the convergence to the principles of the collaborative economy, as well as the determination of the main challenges and opportunities arising from this transition. Finally, in Section 5 we will present the main conclusions drawn from this scientific research.

Collaborative Economy

Although the concept of *collaborative economics* is a debate in many scientific articles, there is no unanimously accepted definition of it.

According to Lamberton and Rose (2012), the collaborative economy represents a complex economic and social system that is based on the principle of shared use of physical and human resources.

Hacker and Pierson (2011) assert that the collaborative economy model appeared in the western countries, with the decrease of the middle class incomes, and implicitly the decrease of the aggregate consumption. People have realized the cost of owning the property and have started to consider their usefulness.

They are authors, such as Sheth et al. (2011), who believe that the basis of the collaborative economy is precisely the responsible attitude of the people towards the consumption practices.

There are several types of business that can be developed in the field of CE, classified according to the type of transactions that are established between the parties involved: rental, loan, sharing, donation, collaboration, exchange, sale or resale.

As Lisa Gansky (2010) states, in the category of the collaborative economy are also registered those businesses that use data from a wide variety of sources (eg social media, web, mobile data) to provide high quality and personalized goods and services to people when they need it. Basically, through these channels the demand is shared at a certain time, and the suppliers are prepared to meet it in accordance with the client's needs.

According to Hamari et al. (2016), the CE evolved due to the innovation in the field of information and communication technologies (ICT), which allowed, through digital platforms, the fulfillment of sales, sharing, rental and exchange activities world wide at very high speeds.

Onete and Plesea (2018) also confirm the importance of ICT in the field of entrepreneurship, saying that access to new technologies motivates small entrepreneurs to reconsider how they manage the relationship with consumers.

A study conducted by the European Commission in 2016, entitled *"Flash Eurobarometer 438 - The use of collaborative platforms"*, showed that the standard user profile of digital collaborative platforms is made up of young people who are employed, with an above average education, and who live in the urban area. The study developed by the European Commission also shows that among the most important advantages of using these platforms we find: more organized and convenient access to services, the fact that it is cheaper or in some cases free, offers the possibility to exchange products or services instead the payment of some money and offers new or different services.

Looking deeper into the benefits of this type of economy, we can see how it support sustainable and inclusive economic growth in the long run through the efficient use of resources, as well as the environmental benefits, especially in the context of crowded cities, where sharing of goods and services would contribute for reducing traffic or pollution. Thus, the CE can make an essential contribution to the development of smart cities and to the living standards of local communities.

On the other hand, the collaborative economy also helps in times of crisis or recession as it contributes to the reduction of expenses especially for those with below average incomes and gives the possibility for the entrepreneurs to rent certain goods, thus saving part of the income lost as a result of the purchasing power decrease.
Besides these advantages, there is another quality advantage, namely that CE supports social interaction. Often, people turn to services associated with the collaborative economy just for the simple fact that in this way they interact with other people in the community or with members of different communities (eg Airbnb).

Furthermore, Park et al. (2016) presents the example of transport companies operating on the basis of collaborative platforms (eg Uber) to highlight another important advantage offered by this type of economy, namely the reduction of sexual crimes with the introduction of the services of these companies.
Given these considerations, we will continue to determine why the new 5G technology is important for the development and innovation of entrepreneurial initiatives in the field of collaborative economy.

The Importance of 5G Technology for Business Development within the Collaborative Economy

Due to the information and communication technologies, access to data and information is unlimited, as well as the ways of processing them. The implementation of the new 5G technologies represents a major upgrade in terms of how the world is connected. 5G is an emerging technology that promotes virtualization, artificial intelligence and process automation.

This new technology will play an extremely important role in the smart cities development by creating new IT systems and improving existing ones, which will revolutionize innovation, communication, learning, health system, transportation, entrepreneurship and the standard of living in general.

The widely spread of 5G technology will support the innovation of traditional industries and many types of businesses, which will lead to the creation of extraordinary facilities for society: smart homes, autonomous cars, virtual reality, telemedicine, artificial intelligence and so on. Regarding the business field, the 5G digital revolution will have three major priorities. The first one is instant connectivity, which allows people to control information in real time.

The second priority is to achieve a high level of decentralization. Given that today's cloud systems are still too centralized, they are not in line with how the global economy is developing, which emphasizes decentralization, because consumer trends suggest instant access to the desired product or service.

Finally, the third priority is the efficient use of data. Once the connectivity is increased and the cloud technologies are more complex, the data will be available in real time, allowing them to be instantly analyzed and used.

Businesses on the Internet that have appeared in recent years, including online commerce and social media, were possible due to the characteristics of 3G and 4G technologies. These types of businesses have created innovation in the areas in which they operate, and this is expected to continue with the introduction of 5G on a large scale (which will offer a speed 10 times higher than the one currently offered by 4G technology).

Thus, the new artificial intelligence will lead to the development of the new type of sustainable and inclusive economy in the long run, namely the circular economy. It is expected that about 70% of the new value created through digitization over the next 10 years will be made up of ecosystem-based businesses. In this way, the companies that operate alone on the market will have to enter into partnerships with companies from other industries, agencies and the state.

According to a report by Infosys (2019), 5G is not just a technology, but an essential component that entrepreneurs will use to create virtual IT environments and software that responds exceptionally to the demands and users experiences.

The new innovative IT environments must achieve a convergence between the need for speed and the user experience, on the one hand, and on the other hand, the level of security and compliance, and the main solution will be offered by 5G.

Thus, the companies that will succeed in establishing themselves in the market will be those that will permanently use innovation to develop their diverse, safer, greener and more sustainable ecosystems for all users.

The Situation of Romania

Romania is currently at the stage where it has many aspects to improve in the field of collaborative economy, a sector that is not yet sufficiently exploited. Currently, most of the collaborative digital platforms in Romania is based on business models run by foreign companies, such as Airbnb or Uber.

In Romania, there isn't any well-defined national strategy to support the development of this type of economy, the sustainability of the collaborative economy being based in particular on the non-profit organizations operating under this concept.

This reality is due, among others, to the fact that the owner mentality in Romania is still very developed, and this is evidenced by the Eurostat statistics, which places this country first in terms of the percentage of the population living in their own dwellings (Chart 1).

Chart 1: Percentage of population living in private dwellings, EU, 2018

Source: chart made by the author, based on Eurostat data

As we can see from the chart above, Romania far exceeds the average registered in the European Union (EU), where only about 70% of the citizens own a house.

Also, in Chart 1 it is emphasized that the highest percentages of the population living in private dwellings are registered in developing states, such as Romania, Slovakia and Croatia, while at the opposite side are developed states: Germany, Austria, Sweden, France and the United Kingdom.

This allows us to understand that in developing countries there is still a developed sense of ownership, which influences the slow transition to the collaborative economy.

Regarding the Romanian legislation in the collaborative economy field, we note that the national authorities act rather for limiting the digital platforms for collaboration. An example of this fact is the legislative vacuum faced by local authorities regarding the regulation of some platforms, such as Uber or Airbnb.

On the other hand, companies continue to be linked to the traditional production and consumption model. Eurostat statistics show in this case that Romania is the second lowest in the EU in terms of circulating materials utilization (see Chart 2).

Chart 2: The utilization rate of circulating materials, EU, 2016

Source: chart made by the author, based on Eurostat data

The percentage of 1.5% registered by Romania is well below the EU average (11.7%), and the gap is even greater than the most performing states from this point of view: the Netherlands (29%), France (19, 5%) and Belgium (18.9%).

All these facts are some of the key issues that Romania faces in the process of transition to the collaborative, modern and circular economy, which ranks this country 88th in the world, according to the *Timbro Sharing Economy Index 2018*, calculated by the European Policy Information Center.

As we stated earlier in this article, the collaborative economy is supported by the innovation of the information and communication technologies.

According to the *Speedtest Global Index (2019)*, Romania has the fastest fixed broadband among all European Union states (147.87 Mbps) and ranks 18th among EU states in terms of average mobile Internet speed (37.76 Mbps).

This shows that in terms of logistics, Romania has the necessary means to support the development of the collaborative economy in the near future, as well as the businesses carried out in this field, especially in the context of the introduction of the new 5G technology.
Starting from the results of the *"Flash Eurobarometer 438 - The use of collaborative platforms"* study, described in Section 2, and considering that the use of the Internet is an essential condition for being a consumer / user of the goods and services offered within the collaborative economy, next we will try to determine the profile of the main users of these goods and services in Romania, in order to see who should be predominantly addressed to this area.

Eurostat data shows that, in terms of age, the frequency of Internet use is higher among people between 20 and 24 years old (Chart 3).

Chart 3: Percentage of individuals using Internet daily, by age, 2018

Source: chart made by the author, based on Eurostat data

We notice that frequency of Internet usage decreases with age, the percentage of Internet usage for people over 55 years old being quite low.

In the case of young people, there are registered small differences between the two areas regarding the percentage of Internet users, but considerable differences are in the case of people over 35 years old.

On the other hand, from the level of education point of view, the data published by Eurostat indicate a high frequency of daily use of the Internet in the case of people with high formal education (Chart 4).

Chart 4: Percentage of individuals using Internet daily, by education, 2018

Source: chart made by the author, based on Eurostat data

In this case, we observe that Romania's gap with the EU 28 average is very small among people with high formal education.

Regarding the classification of Internet users according to the level of income, Eurostat statistics shows that persons belonging to households with income in the fourth quartile register the highest daily use rate of the Internet (Chart 5).

Chart 5:Percentage of individuals using Internet daily, by income, 2018

Source: chart made by the author, based on Eurostat data

Thus, from the chart above it can be observed that the percentage of the population that uses the Internet daily increases directly in proportion to the increase of incomes, but in the case of this indicator the gap with the data recorded by the EU 28 average is high for all 4 categories indicated.

Finally, the last characteristic that we analyze is the percentage of the population that uses the Internet daily, depending on the area where they live (Chart 6).

Chart. 6: Percentage of individuals using Internet daily, by living area, 2018

Source: chart made by the author, based on Eurostat data

In the case of this indicator, the data presented in Chart 6 shows that people living in major cities have the highest frequency of Internet use, the difference from the EU 28 average being the smallest for this category.

Summarizing the results presented in charts 3, 4, 5 and 6 we can say that the profile of the main users of the goods and services offered within the collaborative economy are young people between the 20 and 34 years old, with high formal education, who live in big cities and belong to households with income in the fourth quartile.

All these results shows that in Romania there is, on the one hand, the logistical framework necessary for the development of the collaborative economy, and on the other hand the user profile of the goods and services offered by this economic model is in line with that of the users from the developed states.

The problems that arise are related to the way in which the Romanian consumers are educated in order to participate to the development of the circular / collaborative economy, the way in which the entrepreneurs are involved in creating innovative and sustainable businesses in this field and the involvement of the political decision makers in supporting this field.

Thus, for the transition to the collaborative economy to grow, it is necessary for the national authorities to create a well-developed legislative framework to regulate this field, to carry out social awareness campaigns of the benefits of the collaborative economy and to support innovative entrepreneurial initiatives in this field, both financially and bureaucratically.

In turn, according to the main profile of users, entrepreneurs must identify and meet the requirements / needs, thus contributing to changing consumer habits.

They can use best practices from developed countries, but they must be implemented in Romania only after are adapted according to the local specificity.

Conclusions

The statistical data shows that, globally, there is a clear tendency of transition to the circular economy and the development of the collaborative economy, and the pace of this change is accelerating. Meanwhile the gap between Romania and the developed countries is increasing, and this trend will continue if we do not act, both individually and at the enterprise level.

The main solutions to recover this gap are education and investments in innovation, which once realized will help Romania to benefit from the great advantages offered by the sector of the collaborative economy and to increase its degree of competitiveness, generating important benefits for all the economic agents. In Romania, there is the logistical framework for developing entrepreneurial initiatives in the field of collaborative economy, especially in the context in which 5G technology will be implemented soon, as well as the fact that there are potential users / consumers.

The Romanian authorities must proactively analyze the ways in which entrepreneurship can be stimulated in this field, because if no new rules will be implemented in its favor, failing to achieve a favorable ecosystem, there is a risk that entrepreneurs will relocate their businesses, and this is to be avoided.

At the same time, creating a well-developed legislative framework to regulate collaborative entrepreneurial initiatives will help to increase consumer confidence in these businesses, implicitly changing consumption habits.

On the other hand, we consider that all these advantages produced by the large-scale implementation of innovative entrepreneurial initiatives in the field of the collaborative economy are very important sources for supporting the objectives of developing smart cities in Romania, and also cultural-creative communities.

Abstract

The paper presents a spatial approach to the analysis of the phenomenon of contagion, i.e. the so-called spillovers, in the analysis of the financial markets. The spatial spillover effects realized in the form of indirect impacts of a given explanatory variable in a specific spatial location on the explained variable in all other locations are discussed. In the context of identifying the relationships between Treasury bond yields in the world, these effects should be interpreted as information on the extent to which changes in the level of bond yields issued by countries from a given area are caused by change in a specific explanatory variable in the *i*-th country. The dynamic spatial models for pooled time series and cross-sectional data (TSCS) together with dynamic spatial panel models as a tools of determining these effects were considered. The models of government bond yield issued by forty selected countries from different regions of the world in the period of 2008–2017 were estimated and verified. The yield to maturity (YTM) was used as the dependent variable in the models. Indirect effects have been determined in relation to the selected spatially lagged explanatory variable, namely the inflation rate measured in the neighboring regions. Based on the research we have found a clear impact of the inflation rate observed in a given country on the yield of government bonds issued by the other countries.

Keywords: Spatial Spillover Effects, Indirect Effects, Dynamic Spatial Models.

Introduction

The need to cover the objects making up the global financial market with a broader spectrum of analyses, has intensified with the consequences of global financial crisis of 2008-2010. The empirical analyses carried out so far have considered them primarily in terms of functioning and changes over time. Meanwhile, the system of spatial relationships between financial market entities may become a source of systemic risk materialization. The emergence of spatial relationships may undermine the stability of the financial system, increasing the risk that a single economic shock will spread to other interdependent institutions and economies through various channels, thus leading to the phenomenon of 'contagion'.

The susceptibility of economies to the absorption of economic shocks may increase, among others due to the process of diversifying the sources of income in individual countries. National economies, by adjusting the structures of their investment portfolios through acquiring assets from various geographical segments of the world, on the one hand, benefit because of the often higher rate of return, but on the other, as a result of the risk sharing process, they are exposed to an increased risk of the absorption of negative economic impulses.

A rapid increase in yield spreads observed during the period of an outbreak of the subprime crisis of 2008-2009 and its expansion onto international financial markets did not find an adequate or exhaustive justification in the level of real economic growth, the inflation rate or the development of the fiscal situation of indebted countries. Therefore, the question arises as to whether there were any additional factors at that time that could justify the interdependence observed during this period in the

rapid changes in the levels of ten-year government bond yields. A certain spatial pattern of transferring negative phenomena to other countries, signalled at that time, in the absence of premises that can be identified and justified by fundamental factors, can be explained by the occurrence of spatial relationships between them.

In various studies of the phenomenon of contagion, especially with regard to finances, the analyses that use the spatial approach are among few. Meanwhile, the advantage of such approach is the possibility of an interesting and transparent analysis, in the interpretative sense, along with the so-called direct effects, and also indirect effects, which enable spatial spillover effects to be identified.

Empirical analyses which extend the classic approach to the phenomenon of contagion by a spatial aspect derive inspiration from the methodology developed by e.g.: Anselin (2003); LeSage and Pace (2009); Elhorst (2011; 2014); Debarsy, Ertur and LeSage (2012); Gibbons and Overman (2012); LeSage and Chih (2016); Lee and Yu (2016).

One of the more interesting, newer studies that emphasize the legitimacy of using spatial models in the analysis of the contagion phenomenon is the work by Elhorst, Gross and Tereanu (2018). The authors compare two methodologically independent approaches to the contagion phenomenon, i.e. using spatial econometric models, so by identifying spatial indirect effects on the one hand, and using the global vector autoregressive model (GVAR) and impulse response analysis on the other.

One of the first practical applications of the concept of spatial contagion effects is the work of Ertur and Koch (2007). By asking about the reason for the differences in the well-being of individual countries at the very beginning, the authors joined the debate on economic growth that had been going on for decades, while seeking the logical justification for the disproportions observed in this respect. The theoretical construction on which the authors based their research was the spatial Durbin model.

In the context of financial applications it is worth mentioning the work by Kelejian, Tavlas and Hondroyiannis (2006) which examines the impact of contagion arising from a single economy on other emerging economies, as well as the work by Muratori (2015) on contagion in the area of bond market.

The analyses of the financial phenomena that take into account the spatial relationships[1], due to which the spillover effect may occur, constitute a less recognized research direction. Insufficient insight into the analysed issues in rather scant literature on that subject has become the main motivation to prepare this paper, and thus to join the discussion on this important topic.

The paper concerns the interaction between the yields of 10-year government bonds issued by selected international economies (see Table 1) in the period of 2008-2017.

Table 1: Spatial scope of the analysis

Country				
Australia	Austria	Belgium	Canada	Chile
China	Colombia	Croatia	Czech Rep.	Denmark
Finland	France	Germany	Great Britain	Greece
Hungary	India	Indonesia	Ireland	Italy
Japan	South Korea	Malaysia	Netherlands	New Zealand
Norway	Pakistan	Peru	Philippines	Poland
Portugal	Russia	Singapore	Spain	Sweden
Switzerland	Taiwan	Thailand	USA	Venezuela

The purpose of the study is to assess the spatial spillover effects realized in the form of indirect influences of the established explanatory variable in a given spatial location on the explained variable, in this case the yield to maturity of 10-year government bonds, in all other locations. The explanatory variable has been determined by estimation and verification of various spatial models. Therefore, the issue of the occurrence of spatial spillover effects between the analysed markets has been considered.

Methodology

In the investigation there were used the dynamic spatial models for pooled time series and cross-sectional data (TSCS) as well as dynamic spatial panel data models. The justification of the use of the spatial models, i.e. the models containing spatial lags of dependent or/and explanatory variables comes from the specific interpretation of the parameters of these models, which measure the impact of the changes of the variable values in neighboring observations/regions, i.e. y_j, x_{kj}, on the dependent variable observation y_i (LeSage and Pace, 2009, p. 34). The construction of the spatial models in dynamic terms additionally allows us to take into account the time lags of the dependence. In turn, the argument in favour of the construction of spatial panel data models, also of spatial panel models of dynamic character, is supported by the heterogeneity of studied economies (Elhorst, 2011, p. 7).

The construction of dynamic spatial models in the analysis of the Treasury bond market enables a thorough understanding of the spatial patterns of the cause-and-effect relationships between the yield of bonds issued by various countries over time but it also allows us to consider the possibility of delayed reactions.

The following specifications of government bond yield have been considered [2]:

– LM

$$YTM_{it} = \tau YTM_{it-1} + \alpha + \beta_1 Integration_t + \beta_2 VIX_t + \beta_3 Rating_{decrease_{it}} + \beta_4 Rating_{increase_{it}} + \beta_5 Inflation_{it} + \varepsilon_{it} \quad (1)$$

– SDM[3]

$$YTM_{it} = \tau YTM_{it-1} + \rho \sum_{i \neq j} w_{ij,t}\, YTM_{jt} + \eta \sum_{i \neq j} w_{ij,t}\, YTM_{jt-1} + \alpha + \beta_1 Integration_t + \beta_2 VIX_t + \beta_3 Rating_{decrease_{it}} + \beta_4 Rating_{increase_{it}} + \beta_5 Inflation_{it} + \theta_1 \sum_{j \neq i} w_{ij,t} Rating_{decrease_{it}} + \theta_2 \sum_{j \neq i} w_{ij,t} Rating_{increase_{it}} + \theta_3 \sum_{j \neq i} w_{ij,t}\, Inflation_{jt} + \varepsilon_{it}, \quad (2)$$

where: YTM_{it} and YTM_{it-1} denote the yield to maturity of government bonds in country i at time t and t–1, respectively; $\sum_{i \neq j} w_{ij,t} YTM_{jt}$ represents values of the variable in the countries related with i according to economic distance defined by formula (3), at the same time, and $\sum_{i \neq j} w_{ij,t} YTM_{jt-1}$ denotes lagged values of this variable; the others variables are: the inflation rate ($Inflation_{it}$), the

level of integration of government bond markets measured by β-convergence ($Integration_t$), the index reflecting the anxiety in the global financial market (VIX_t), and two binary variables respectively regarding the positive and negative changes in the rating of bonds issued by the *i*-th country of the forms:

$$Rating_decrease_{it} = \begin{cases} 1, \text{downgrading compared to previous year,} \\ 0, \text{maintaining rating or raising it,} \end{cases}$$

$$Rating_increase_{it} = \begin{cases} 1, \text{aising the rating in relation to the previous year,} \\ 0, \text{maintaining rating or downgrading.} \end{cases}$$

The assessment of the impact of the announcements published by the credit rating agencies regarding the positive and negative changes in the credit quality of bonds issued by *j*-th country on the *i*-th country's yield bonds was possible due to the introduction of two additional spatially lagged explanatory variables of the zero-one form, i.e.: $\sum_{i \neq j} w_{ij,t} Rating_decrease_{jt}$ and $\sum_{i \neq j} w_{ij,t} Rating_increase_{jt}$.

The symbols $w_{ij,t}$ appearing in model (2)[4] come from a connectivity matrix **W** quantifying the spatial relations between the yield of bonds issued by countries included in the investigation. The basis for their construction was the economic distance measured by the value of the ratio of a public debt to gross domestic product along with a decrease of which the strength of spatial connections between objects increases.

The procedure of constructing the matrix **W** we repeat after Szulc and Wleklińska (2019, pp. 142-143). The starting point for determining the elements $w_{ij,t}$ consisted in the determination of the economic distance between pairs of objects (economies/countries) according to the following formula (and other formulas see e.g.: Claeys, Moreno and Suriñach, 2012; Asgharian, Hess and Liu, 2013; Asgharian, Larsson and Liu, 2014; Muratori, 2015):

$$d_{ij,t} = \left| \frac{debt_{it}}{GDP_{it}} - \frac{debt_{jt}}{GDP_{jt}} \right|, \tag{3}$$

where: $\frac{debt_{it}}{GDP_{it}}, \frac{debt_{jt}}{GDP_{jt}}$ – public debt share in GDP in country *i* and *j* in the period *t*.

Subsequently, the components $d_{ij,t}$ were inversed and entered into the connectivity matrix, based on which a block matrix of cross-sectional and temporal connections between the yield of government bonds of various countries was constructed.

The models, thanks to the inclusion of spatial and time lags of the dependent variable and independent variables, allow us to quantify the magnitude of the so-called direct and indirect effects, both in the short and long term (see Elhorst, 2011, p. 11). In the paper we are interested primarily in the indirect effects which use to test the hypothesis whether in global government bond market spatial spillovers exist.

To see the way in which the mentioned effects are obtained the general expression of the dynamic model has been transformed, i.e. the model (4)[5]:

$$\mathbf{Y}_t = \tau \mathbf{Y}_{t-1} + \rho \mathbf{W} \mathbf{Y}_t + \eta \mathbf{W} \mathbf{Y}_{t-1} + \boldsymbol{\alpha} \boldsymbol{\iota}_N + \mathbf{X}_t \boldsymbol{\beta} + \mathbf{W} \mathbf{X}_t \boldsymbol{\theta} + \boldsymbol{\varepsilon}_t. \tag{4}$$

By transforming the model to the form:

$$\mathbf{Y}_{\mathrm{t}} = (\mathbf{I} - \rho\mathbf{W})^{-1}(\tau\mathbf{I} + \eta\mathbf{W})\mathbf{Y}_{\mathrm{t}-1} + (\mathbf{I} - \rho\mathbf{W})^{-1}\boldsymbol{\alpha}\boldsymbol{\iota}_N + (\mathbf{I} - \rho\mathbf{W})^{-1}(\mathbf{X}_{\mathrm{t}}\boldsymbol{\beta} + \mathbf{W}\mathbf{X}_{\mathrm{t}}\boldsymbol{\theta}) + (\mathbf{I} - \rho\mathbf{W})^{-1}\boldsymbol{\varepsilon}_{\mathrm{t}} \tag{5}$$

and excluding from the matrix $\mathbf{X}_t$ the vector regarding the variable X_k, i.e. $\mathbf{X}_{kt}$, it is obtained:

$$\mathbf{Y}_{\mathrm{t}} = (\mathbf{I} - \rho\mathbf{W})^{-1}(\tau\mathbf{I} + \eta\mathbf{W})\mathbf{Y}_{\mathrm{t}-1} + (\mathbf{I} - \rho\mathbf{W})^{-1}\boldsymbol{\alpha}\boldsymbol{\iota}_N + (\mathbf{I} - \rho\mathbf{W})^{-1}\left(\dot{\mathbf{X}}_{\mathrm{t}}\boldsymbol{\beta} + \mathbf{W}\dot{\mathbf{X}}_{\mathrm{t}}\boldsymbol{\theta}\right) + (\mathbf{I} - \rho\mathbf{W})^{-1}(\beta_k\mathbf{I}_N + \theta_k\mathbf{W})\mathbf{X}_{kt} + (\mathbf{I} - \rho\mathbf{W})^{-1}\boldsymbol{\varepsilon}_{\mathrm{t}}, \tag{6}$$

where $\dot{\mathbf{X}}_{\mathrm{t}}$ stands for the matrix from which the $\mathbf{X}_{kt}$ has been removed.

The expression $(\mathbf{I} - \rho\mathbf{W})^{-1}(\beta_k\mathbf{I}_N + \theta_k\mathbf{W})$ allows us to determine direct and indirect effects resulting from impact the *k*-th explanatory variable X_k on the dependent variable *Y*.

The short-term effects are designated as the matrix of partial derivatives of Y with respect to the *k*-th explanatory variable of **X** in spatial unit 1 up to unit N at a particular point in time, i.e.:

$$\left[\frac{\partial \mathrm{Y}}{\partial x_{1k}} \cdots \frac{\partial \mathrm{Y}}{\partial x_{Nk}}\right] = (\mathbf{I} - \rho\mathbf{W})^{-1}(\beta_k\mathbf{I}_N + \theta_k\mathbf{W}), \tag{7}$$

which denote the effect of a change of a particular explanatory variable in a particular spatial unit on the dependent variable of all other units in the short term. Similarly, the long-term effects can be determined as (Elhorst, 2011, p. 11):

$$\left[\frac{\partial \mathrm{Y}}{\partial x_{1k}} \cdots \frac{\partial \mathrm{Y}}{\partial x_{Nk}}\right] = [(1 - \tau)\mathbf{I} - (\rho + \eta)\mathbf{W}]^{-1}(\beta_k\mathbf{I}_N + \theta_k\mathbf{W}). \tag{8}$$

Let $S_k(\mathbf{W})$ mean the matrix $(\mathbf{I} - \rho\mathbf{W})^{-1}(\beta_k\mathbf{I}_N + \theta_k\mathbf{W})$. The diagonal elements of the matrix define the direct impacts of change in *i*-th observation x_k (denoted by x_{ik}) on y_i, i.e. on the values of the dependent variable in the same *i*-th spatial unit. The average of the sum across the *i*-th row of $S_k(\mathbf{W})$ represents the average impact on individual observation y_i resulting from changing the *k*-th explanatory variable by the amount across all observations – *Average Impact to an Observation.* In turn, the average of the sum down the *j*-th column of $S_k(\mathbf{W})$ yields the average impact over all y_i from changing the *k*-th explanatory variable by an amount in the *j*-th observation – *Average Impact from an Observation* (see LeSage and Pace, 2009, p. 37). To sum up, indirect effects as the spatial spillovers are identified on the ground of the non-diagonal elements of the matrix $S_k(\boldsymbol{W})$.

Results of the empirical analysis[6]

Empirical Models

The verification of the occurrence of spatial spillover effects realized in the form of indirect influences of a given explanatory variable in a specific spatial location on the explained variable in all other locations was based on the models containing elements of space-time dynamics: a dynamic Durbin spatial model for pooled time series and cross-sectional data, and an appropriate model for panel data. The results of estimation and verification of these models entitle us to formulate the following conclusions[7].

The construction of the empirical linear model was the starting point for assessing the legitimacy of taking into account the spatial relationships between the economies considered in the modeling of the Treasury bond yields issued by them. Based on the results of the estimation and verification of the linear model (LM_pooled), it was found that this model does not meet the basic requirements of statistical verification. The results of the Moran test confirm the occurrence of autocorrelation in the model residuals. This justifies the need to extend the models without spatial effects towards the models that take into account the spatial relationships between the considered markets. The autocorrelation of model residuals constitutes a weakness of the panel data model as well (in this analysis the model with individual effects – LM_FE_IND was considered), which was used to take into account the heterogeneity of the analysed economies.

Taking into account the spatial structure of the relationship between the considered markets, defined on the basis of the economic distance matrix and its inclusion in the construction of spatial Durbin models, in the SDM_pooled version, resulted in the elimination of autocorrelation in the random component, which is confirmed by the lowering of Moran's I statistics and its statistical insignificance. In the panel model (SDM_FE_IND) residual autocorrelation is observed. The abandonment of the SDM_FE_IND model, in spite of the test F result, is justified by the insignificance of the autoregressive parameter ρ and the Chow F test result. Among the statistically significant non spatially lagged explanatory variables, the SDM_pooled model included: the level of integration of the global Treasury bond market and two binary variables reflecting the increase and decrease of rating, respectively. Non spatially lagged inflation rate turned out to be insignificant, while this variable spatially lagged shows statistical significance. The value and significance of parameter ρ indicates some impact on the yield of Treasury bonds issued at a given time by a given economy made by the yield of bonds issued at the same time by neighboring economies. In the light of the results obtained, the statistical significance of the delayed dependent variable was also confirmed, which gave the model a dynamic character. However, among the significant explanatory variables there was no dependent variable lagged simultaneously in space and time ($\mathbf{W}Y_{t-1}$).

Table 2: Results of the estimation and verification (selected diagnostics) of the models considered – the models after reduction of the insignificant variables

Variable	LM_pooled	LM_FE_IND	SDM_pooled	SDM_FE_IND
$Constant$	3.390 (0.000)	-	2.322 (0.000)	-
YTM_{t-1}	-0.069 (0.158)	-0.037 (0.253)	-0.091 (0.049)	-0.057 (0.054)
$Integration$	-30.185 (0.010)	-29.651 (0.000)	-34.419 (0.004)	-34.382 (0.000)
$Rating_{decrease}$	2.893 (0.000)	0.410 (0.401)	2.668 (0.000)	0.242 (0.590)
$Rating_{increase}$	2.388 (0.001)	-0.344 (0.487)	2.163 (0.002)	-0.548 (0.231)
$Inflation_{lag}$	-	-	0.111 (0.001)	0.086 (0.000)
Autoregressive parameter ρ	-	-	0.152 (0.049)	0.063 (0.291)
Autocorrelation of residuals Moran test	0.063 (0.013)	0.064 (0.007)	0.022 (0.206)	0.063 (0.011)
Significance of individual effects Test F	-	17.517 (0. 000)	-	17.789 (0.000)
Spatial dependence Chow test (F)	-	-	2.241 (0.049)	2.044 (0.053)

Note: p-values in parentheses.

Interestingly, there is a significant value of the coefficient standing behind the spatially lagged inflation, which means that changes in the inflation level of countries recognized as neighboring in accordance with the adopted criterion lead to a change in the level of yield to maturity of Treasury bonds issued by other countries related their structure of spatial dependence. The obtained result is confirmed in the theory of economics, because as a result of accelerating price dynamics, and thus an increase in the level of inflation, the competitiveness of a given economy deteriorates, and this, in turn, can stimulate the current account deficit to widen, and thus also the level of the country's debt to increase (De Grauwe and Ji, 2013). This is measured, for example, by the ratio of a public debt to the gross domestic product, and it was this variable that was used to build the economic distance matrix quantifying the links between the Treasury bond markets under consideration.

Due to the inclusion of the elements of the dynamics in the modeling of Treasury bond yield, indicated by the significance of the parameter standing with the time lagged dependent variable, it has become possible to isolate short-term indirect effects as well, next to the so-called long-term indirect effects.

Short-Term Indirect Effects

In this sub-section, we present the results of the empirical short-term indirect effects analysis for the years of the examined period (*t*=10), carried out on the basis of the following transformation of the model obtained in the previous sub-section:

$$\begin{aligned}\mathbf{Y}_t = \mathbf{Y}_\mathbf{t} = (\mathbf{I} - \rho \boldsymbol{W})^{-1}\tau\mathbf{Y}_{t-1} + (\mathbf{I} - \rho\mathbf{W})^{-1}\alpha_0 + (\mathbf{I} - \rho\mathbf{W})^{-1}\beta_1\mathbf{X}_{1t} \\ +(\mathbf{I} - \rho\mathbf{W})^{-1}\beta_2\mathbf{X}_{\mathbf{2t}}+(\mathbf{I} - \rho\mathbf{W})^{-1}\beta_3\mathbf{X}_{3t} + (\mathbf{I} - \rho\mathbf{W})^{-1}\theta_1\mathbf{W}\mathbf{X}_{4t},\end{aligned} \tag{9}$$

where $\mathbf{W}\mathbf{X}_4$ represents the spatially lagged inflation rate values[8].

The $(\mathbf{I} - \rho\mathbf{W})^{-1}\theta_1\mathbf{W}\mathbf{X}_{4t}$ matrix was used to designate the short-term effects with respect to the selected explanatory variable, i.e. the spatially lagged rate of inflation, separately at a particular point in time.

For each of the years covered by the analysis, indirect effects were determined in the form of the average values in the cross-section of rows and separately in the cross-section of columns of a given matrix, excluding diagonal elements. In this way, a measurement of the average impacts (in terms of the analysed variables) of individual countries on a given country, and a given country on other countries, respectively, was obtained.

Figures 1−2 present spatial distributions of indirect effects obtained. Figure 1 shows the distributions of average inflows via the inflation rate in individual countries on the yield of Treasury bonds issued by a given country in 2008 and 2017. It is worth noting that the US and Chinese economies were among the 12 economies that received transmission impulses from other countries in 2008 with moderate strength.

The economies whose Treasury bond markets were least affected by all other economies through the transmission of inflation in 2008 included e.g.: Belgium, Netherlands, Indonesia, Norway, Singapore, Switzerland, Thailand and Great Britain. The above-average indirect impact of average changes in the level of inflation in all other countries on the yield of the Treasury bonds issued by a given economy should be mentioned in the case of half of the countries under consideration, such as e.g. Canada, India, Russia or Australia.

In 2017 there was a slight increase in the sensitivity of individual countries to the external impulses. Moderate feedback was found in fourteen out of forty markets analysed (12 such countries were noted in 2008). For half of the economies under consideration, such as e.g.: China, the Netherlands,

France, Great Britain, Canada and Russia, there is a strong average impact of changes in inflation in all other countries on the yield of the government bonds issued by these countries. It is particularly interesting that while in the United States there was a decrease in the sensitivity of this economy to the average, relative to other economies, changes in the level of inflation on the yield of Treasury bonds issued by them, the reverse trend was observed in the case of China.

(a)

(b)

Fig. 1: The distributions of the average impact of the spatially lagged inflation rate on the government bond yield issued by individual economies in (a) 2008 and (b) 2017

Figure 2 shows the distributions of average impacts of a given country's inflation rate on the yield of the Treasury bonds issued by all other economies for the first and last year of the analysis. Among the economies whose impact on other economies was the largest in 2008, we can mention: France, Indonesia, Colombia, Taiwan and the United States. In the case of most of the European economies taken into account, as well as China, there are above-average indirect influences on other countries. In 2017 Australia, Belgium, Indonesia, Thailand, the United States and Venezuela were among the countries most strongly affecting other countries. The impact of the Chinese economy on other

economies has decreased compared to 2008. A similar situation applies to, e.g. Russia, France or Poland.

(a)

(b)

Fig. 2: The distributions of the average impact of a change of the inflation rate in a particular economy on the government bond yield issued by all other economies in (a) 2008 and (b) 2017

Figure 3 shows the impact of the United States on all the other countries, in the range of the variables considered in 2008 and 2017. In 2008 the US economy had the strongest impact on the following economies: France, Greece, India, Japan, Canada, Germany, Pakistan, Portugal, Thailand, Hungary and Italy. Despite the stabilization of the global economic situation, the sensitivity of economies to the absorption of impulses originating in the US economy had not declined significantly. In 2017 the number of economies under the 'strong' influence of the US economy decreased by one, although their composition slightly changed (Belgium, France, Greece, Spain, Japan, Canada, Portugal, Singapore, Great Britain and Italy).

Fig. 3: The distributions of the impact of the inflation rate in U.S. on the government bond yield issued by all other countries in (a) 2008 and (b) 2017

Long-Term Indirect Effects

In this sub-section we present estimates of long-term indirect effects, obtained on the basis of the expression $((1-\tau)\mathbf{I}-\rho\mathbf{W})^{-1}\theta_1\mathbf{W}\mathbf{X}_4$. Figure 4 illustrates the distributions of average long-term impacts achieved through the inflation rate in individual countries on the yield of Treasury bonds issued by a given country in 2008 and 2017.

In 2017 there was a growth in the sensitivity of the global Treasury bond market to impulses originating outside the borders of a given country (compare the maps (a) and (b) in Figure 4). As many as nineteen of the economies under consideration were among the countries with the strongest sensitivity, including e.g.: Austria, Chile, China, Japan, Canada and South Korea. In 2008 there were seven such economies. It is worth emphasizing that China's sensitivity, compared to the initial year of the analysis, increased, while in the United States there was a decline in the sensitivity of the yields

of its treasury bonds to average inflation changes in all other countries. In addition to the American economy, the group of countries with the weakest sensitivity included: Austria, Belgium, Croatia, Indonesia, Portugal, Thailand, Venezuela and Italy.

(a)

(b)

Fig. 4: The distributions of the average cumulative impact of the spatially lagged inflation rate on the yield of the Treasury bonds issued by individual economies in (a) 2008 and (b) 2017

Figure 5 presents the distributions of average impacts of a given country's inflation on the yield of the Treasury bonds issued by all other economies in 2008 and 2017. In 2017 it was ten (rather than nine, as in 2008) economies that had the strongest impact on the yield of the Treasury bonds issued by all other economies, i.e.: Australia, Austria, Belgium, Croatia, the Czech Republic, Denmark, Indonesia, Thailand, the United States and Venezuela. Twelve economies were characterized by the least impact on other countries. Among them, just like in 2008, there was Russia.

(a)

Fig. 5: The distributions of the average cumulative impact of a change of the inflation rate in a particular economy on the yield of the Treasury bonds issued by all other economies in (a) 2008 and (b) 2017

Figure 6 shows the strength of the United States' impact on all other countries in terms of the considered variables in 2008 and 2017.

In 2017, compared with 2008, the composition of the group of countries under the strongest influence of the United States slightly changed, and their number decreased by one. This group included: Belgium, France, Greece, Spain, Japan, Canada, Portugal, Singapore, Great Britain and Italy. Nevertheless, most of the European economies considered were still strongly influenced by the United States.

Conclusion

Based on the empirical results obtained, it should be stated that the hypothesis about the occurrence of spatial spillover effects in the area of the Treasury bond markets has been confirmed. These effects were realized in the form of indirect impacts of the inflation rate, observed in a given country, on the yield of government bonds issued by all the other countries. The short-term and long-term indirect effects showed up for the markets analysed to varying degrees at different times.

In further researches on this topic we would like to use next model specifications, and to consider the indirect effects in relation to other explanatory variables.

[1] The matter of importance of space, or more precisely of the distance between entities contributing to the financial market, is not willingly taken topic of theoretical discussion. The few studies in this area are mainly focused on the activities of banks. Among them Coval and Moskowitz (1999), Grinblatt and Keloharju (2001), Knyazeva and Knyazeva (2012) can be mentioned. The theoretical and empirical justification of the role of geographical factors in fiscal policy was sought by e.g.: Cohen (1998), Martin (1999), Laulajainen (2005), Lee et al. (2009), Martin and Pollard (2017).

[2] Model (1) and its panel LM_FE_IND counterpart (in which instead α there is decomposed α_i) only constitute a starting point for the justification of their spatial development.

[3] And its panel SDM_FE_IND counterpart.

[4] Model (2) represents the dynamic spatial Durbin model.

[5] Our attention will be limited to the model TSCS. Transformations relating to the dynamic spatial models for panel data are analogous.

[6] The annual frequency data from the Bloomberg website (https://www.bloomberg.com) were used. The graphs have been prepared using MapViewer program.

[7] The presentation of the results in Table 2 is limited to the final model which contains only the statistically significant explanatory variables.

[8] The spatial spillover effects, both in the short and in the long term, were determined only for the spatially lagged *Inflation*.

Comparative Analysis of The Impact of Labor Market Efficiency on Economic Growth in Kazakhstan And Developed Countries

Seisembay JUMAMBAYEV

Dr, Assoc. Prof., Almaty, Kazakhstan
s.jumambayev@gmail.com

Abstract

The Kazakhstan model of the labor market is formed in the conditions of dominance of the export-raw model of economic development. The problem of modernizing the labor market as a potential driver of economic growth has become relevant in connection with the exhaustion of the potential of the existing model and the reorientation of economic policy towards the industrial and innovative development of the country. The study attempts to conduct a comparative analysis of the labor market efficiency impact on economic growth in Kazakhstan and developed countries. The goal of the paper is to determine what their similarities and differences are on this basis, and to identify opportunities for modernization of the labor market that could potentially qualify as a driver of economic growth in Kazakhstan.

Keywords: labor market efficiency, economic growth, comparative analysis, developed countries, Kazakhstan

Introduction

Developed countries adhere to various models of socio-economic development and in connection with it, corresponding models of the labor market are developing (Kudrov V.M., 2011). In most studies of labor market problems, individual authors are often limited only to the effects of GDP on employment and unemployment (Vakulenko E.S., Gurvich E.T., 2015). Some authors pay considerable attention to the existence of a reverse causal relationship, namely, that the labor market may be a necessary condition for economic development, but without a sufficient quantitative assessment of this influence (Gimpelson, R. Kapelyushnikov, S. Roshchina, A., 2017) .

The developed countries are undergoing technological modernization, structural and institutional restructuring of their national economies under the influence of Industry 4.0. Scientific and technological progress in developed countries leads to a significant change in the "look" of the labor market. It is statistically impossible to establish a direct correlation between measures to modernize the labor market and economic growth due to the large number of factors that determine the growth of the economy. But the practice of a number of leading developed countries shows that as a result of reforming their labor market, they were able to realize its potential for transitioning the country's economy to a development trajectory.

A preliminary analysis suggests that per capita GDP above a certain level is observed only in countries where the labor market is becoming a driver of economic growth. In other words, without improving the mechanism of the functioning of the labor market, development can go to a certain level, but further growth is possible only where the labor market is undergoing modernization.

The potential benefits arising from the export of energy resources and their high prices have declined significantly in Kazakhstan. Slowing economic growth, especially during the crisis of 2015-2016, actualized the problem of finding new drivers of economic growth. The need to transform the existing economic model into a more effective one, characterized by a departure from rent-oriented behavior and an increased role of market incentives, became apparent.

For Kazakhstan, these processes are of strategic importance, it is very important to focus on the study of the relationship between technological modernization of the economy and labor market modernization in Kazakhstan, as well as their impact on economic growth.

Methodology and Analysis

A successful solution to the problem of Kazakhstan joining the cohort of developed countries will be determined by the ability of the country and its institutions to ensure sustainable economic growth. Economic growth is determined by diverse factors affecting the economic systems of the countries in different ways. As practice shows, the economies of those countries that take into account the whole range of factors and the relationship between them achieve successful growth. Labor market efficiency is one of the institutional factors, the strengths and weaknesses of which largely determine the priority areas of economic growth policy.

The problem of the impact of labor market efficiency on economic growth is not adequately addressed in methodological terms. The ultimate goal of Kazakhstan's labor market modernization is to use its future potential to overcome the lag in socio-economic development from the leading developed countries of the world. Therefore, a comparative analysis of the impact of the labor market on the economic growth of developed countries is extremely important.

An examination of the literature on this topic shows that when considering the issue of effectiveness, many researchers often resort to a simple comparison of the implemented measures of state policy in the field of labor and the obtained socio-economic results. The approach is widespread, which consists in comparing actual indicators characterizing the labor sector of the national economy with similar indicators of developed countries. To assess the level of socio-economic development often used the indicator of GDP per capita and the Human Development Index.

To assess the country's advancement in terms of socio-economic modernization, the Index of Economic Freedom (IEF) is used. According to the authors of this index, the country's economic development is directly related to the dynamics of this IES. But as it turns out, the level of protection of property rights has the most noticeable effect on the IES, while other private indices, including the component of freedom of labor that interests us, have a weaker effect. The threshold method proposed by the Russian researcher to assess the effectiveness of policy in the market is also of significant interest (Sobolev E, 2013). In his opinion, threshold values should cover such blocks of the world of work as employment, remuneration of labor, coordination of interests, etc. These and other approaches that consider the problems of the connection between the labor sphere and economic development don`t specify the degree to which the efficiency of the functioning of the labor market affects the dynamics of indicators of economic growth.

The study assumes that the data for determining the Global Competitiveness Index (GCI) provide an opportunity to reflect the ability of the country and its institutions to ensure stable economic growth (The Global Competitiveness Report). Along with macroeconomic stability and technological improvements and others, the indicator “labor market efficiency” is one of the 12 components that determine the value of GCI. Their interconnection is shown in figure 1.

Fig. 1. Interconnection of research variables

Measurement of labor market efficiency by the GCI methodology as a whole shows the presence of certain patterns that reflect the relationship between the parameters characterizing the labor market and the long-term economic dynamics of a country. Thus, the author's hypothesis states that on the basis of the available statistical base it is possible to quantitatively determine to what extent the differences in the dynamics of economic growth of different countries are due to the efficient functioning of their labor market.

If this hypothesis is confirmed, then the next step should be the identification of those variables that determined the high efficiency of the labor market and correspondingly high economic growth. The results of the analysis will also make it possible to determine how far Kazakhstan lags behind developed countries and outline concrete measures to bring the current state of these variables to the levels of leading developed countries.

The proposed comparative analysis technique is as follows:

- to determine the circle of developed countries with different models of the labor market;
- to highlight the quantitative value of labor market efficiency for the analyzed countries from reports on global competitiveness;
- to take indicators of economic growth of the analyzed countries;
- to identify the relationship between the above indicators.

For a comparative analysis, the study tooks six developed countries that represent the most well-known models of labor markets. All of them, along with common features, differ from each other in important features and functioning mechanisms.

In compiling the tables in this study, was used data from OECD.org, The Global Competitiveness Report, The Committee on Statistics of Kazakhstan. The table reflects data on GDP per capita and the rank of labor market efficiency of the analyzed countries in the post-crisis period from 2010 to 2018. As can be seen from it, developed countries are characterized by high levels of GDP per capita. Kazakhstan is significantly behind in this indicator. Previously, Kazakhstan was among the countries with a high level of per capita income (from $ 12,616 and above) for two years (2013-2014). But gradually he lost ground and in this a consistent decrease in the efficiency of the labor market played a role. The study also notes that the labor market in the USA is the most flexible, and labor markets in Spain and Italy are one of the most regulated. Kazakhstan occupies an intermediate position on this indicator.

Table 1: GDP per capita and labor market efficiency rating of developed countries and Kazakhstan (Created by the author based on data from the OECD, Global Competitiveness Reports and the Committee on Statistics of the RK)

	2010	**2011**	**2012**	**2013**	**2014**	**2015**	**2016**	**2017**	**2018**

Labor market efficiency (Rank)	97	115	119	108	115	100	92	69	70
Italy:									
US dollars / capita	34 857	36 183	36 003	36 068	36 195	36 909	39 918	41 785	42 798
Labor market efficiency (Rank)	117	118	123	127	137	136	126	119	116
Kazakhstan:									
US dollars / capita	9071	11635	12387	13891	12807	10510	7715	9248	9813
Labor market efficiency (Rank)	18	21	21	19	15	15	18	20	35

A high level of GDP per capita is combined with a high rank of their place in terms of labor market efficiency in developed countries such as the USA, Germany, Japan, Sweden. At the same time, there are several examples of countries where such a dependence is not clearly visible. Calculations showed that there is no significant correlation between GDP per capita and the labor market efficiency of developed countries.

The data in Table 2 provide important information that makes it possible to assume that there is a correlation between the growth rate of real GDP and labor market efficiency.

Table 2: The annual growth rate of real GDP (%)and labor market efficiency score of developed countries and Kazakhstan (Created by the author based on data from the OECD, Global Competitiveness Reports and the Committee on Statistics of the RK)

	2010	2011	2012	2013	2014	2015	2016	2017	2018	Annual average

Japan:										
The annual growth rate of real GDP (%)	4,19	-0,12	1,5	2	0,37	1,22	0,61	1,94	0,79	1,4
Labor market efficiency (Score)	5,1	5,1	5	4,9	4,8	4,7	4,8	4,8	4,8	
Sweden:										
The annual growth rate of real GDP (%)	5,95	3,11	-0,32	1,03	2,84	4,16	2,2	2,67	2,41	2,7
Labor market efficiency (Score)	4,9	4,9	4,8	4,8	4,9	4,8	4,8	4,9	4,9	

Spain:										
The annual growth rate of real GDP (%)	0,16	-0,81	-2,96	-1,44	1,38	3,84	3,03	2,89	2,35	0,9
Labor market efficiency (Score)	4,1	3,9	3,8	4	3,9	3,9	4	4,2	4,2	
Italy:										
The annual growth rate of real GDP (%)	1,67	0,85	-3,01	-1,86	0,07	0,66	1,39	1,78	0,65	0,2
Labor market efficiency (Score)	3,7	3,8	3,8	3,7	3,5	3,3	3,5	3,6	3,7	
Kazakhstan:										
The annual growth rate of real GDP (%)	7,3	7,4	4,8	6	4,2	1,2	1,1	4,1	4,1	4,5
Labor market efficiency (Score)	4,9	4,9	4,9	5	5	4,9	4,9	4,8	4,6	

The higher the labor market performance indicators, the more noticeable is the success of countries in economic growth. In other words, the effectiveness of the labor market as one of the drivers of economic growth can`t be neglected. The value of labor market efficiency rose from 4.3 to 5 and the average annual growth in real GDP was 2.2% during the period under review in Germany. On the example of Spain and Italy, one can see that without improving the mechanism of the functioning of the labor market it is impossible to achieve high GDP growth rates. Dynamic economic growth is possible when the labor market is undergoing modernization.

Table 3 shows the changes in the efficiency indicator of the labor market and its sub-indicators over a ten-year period in Germany and Kazakhstan. As well-known, Germany has taken serious measures to reform the labor market and this has had a positive effect on economic growth indicators.

Table 3: Change in the rank of Germany and Kazakhstan in terms of labor market efficiency and its sub-indicators (Created by the author based on data from Global Competitiveness Reports)

Country	Ranking by indicators:							
	Labor market efficiency	Labor market performance sub-indicators						
		01 Cooperation in labor-employer relations	02 Flexibility of wage determination	05 Hiring and firing practices	07 Pay and productivity	08 Reliance on professional management	09 Country capacity to retain talent	10 Female participation in the labor force ratio to men
1	2	3	4	5	6	7	8	9
Germany:								
GCI 2008-2009	58	27	131	130	51	9	26	34
GCI 2017-2018	14	21	114	18	7	17	13	39
Kazakhstan:								
GCI 2008-2009	12	63	44	4	33	79	57	13
GCI 2017-2018	35	68	105	41	50	105	80	28

The study reveals a significant deterioration in the situation for almost all sub-indicators that shape the efficiency of the labor market in Kazakhstan. This, at least, allows us to say that opportunities were missed to accelerate economic growth by taking measures to significantly improve the values of such sub-indicators as “Flexibility of wage determination”, “Reliance on professional management” and “Country capacity to retain talent".

Summary

The level of economic development of Kazakhstan so far seriously lags behind the countries that have chosen for analysis, where great importance is attached to the reform of domestic labor market. A comparative analysis of the labor market efficiency of leading developed countries and its impact on the dynamics of economic indicators of these countries revealed a fairly stable relationship between these indicators for the post-crisis (since 2010) period.

The reform of the labor market in these countries towards greater liberalization in the long run had a positive effect on the growth rate of GDP, and the higher the degree of liberalization of the labor market, the better these indicators look. In this regard, Kazakhstan lags behind the leading countries of the world in many variables of labor market efficiency. This affected the underutilization of additional opportunities for economic growth through the modernization of the labor market. The modernization of the labor market in Kazakhstan should incorporate certain elements of the best practices of the functioning of the labor market of developed countries and be carried out simultaneously with the adoption of a new model of economic growth.

Results

An important result is to take into account the close relationship between models of socio-economic development and labor market models during their modernization. Kazakhstan is significantly lags behind developed countries in terms of technological modernization and the development of an innovative economy. Meanwhile, only in the conditions of accelerated introduction of the latest technologies will the reverse effect of the modernized labor market on ensuring economic growth increase sharply. Without labor market modernization, ensuring high economic growth is virtually impossible. The study identified factors that can provide a higher level of labor market efficiency in Kazakhstan. On this basis, specific measures to modernize the labor market can be outlined. The implementation of them will contribute to an additional increase in Kazakhstan's real GDP.

Acknowledgment

The study was carried out by a grant of the Committee of Science of the Ministry of Education and Science of the Republic of Kazakhstan 2018-2020, project number AR 05135300.

Social Media and Small Firm Entrepreneurial Network

Piotr TOMSKI

Czestochowa University of Technology, Czestochowa, Poland
piotr.tomski@wz.pcz.pl

Abstract

The objective of the paper is to explore the impact of the use of social media by entrepreneurs on the frequency of discussions about the economy and business with the members of their social network. The subject of the research has been selected small enterprises (including micro-enterprises) due to their share in a total number of enterprises in Poland (nearly 99%) and also a steady increase in their number as well as an increase in the value of production, revenues, number of employees. The research tool was the questionnaire. The results show that the impact of the frequency of the use of social media by the entrepreneur on the frequency of interactions with the members of the analyzed sub-networks of the personal network is statistically insignificant in the case of most sub-networks. Such a situation applies to 10 out of 13 sub-networks. It is worth pinpointing that despite the existence of statistically significant relationships in the case of 3 sub-networks at a low level, it should be assumed that one cannot speak about the existence of relationships of the frequency of the use of social media with the frequency of discussions on the economy and business. Social media are undoubtedly used, to a much larger extent, for formalized communication of the company with the environment, not for holding informal discussions on issues significant for conducting the business.

Keywords: entrepreneurship, Internet, social media, relationships, social network, small and medium enterprises (SME).

Introduction

Information and communication technologies (ICT) are currently the key aspect of communication between people and they also enable the expansion and intensification of relationships as well as movements of capital, people, goods and ideas beyond cultural and state borders. The dynamic development of interpersonal communication using digital technologies is the fact and one may observe an extremely dynamic progress in the information society model. The Internet has become the social space in which most human needs are currently being satisfied (Ingaldi, Ulewicz, 2018; Labajan, Koomsap, 2019).

The co-existence of entrepreneurship and the information society indicates the need for an interest in potential relationships between them. Additionally, globalization, as the common basis for both processes, provides entities with specific operating conditions and directs them to continuous development. In the case of entrepreneurs and entrepreneurship, this development can be implied mostly by the acquisition of information from increasingly new sources which increasingly rapidly and efficiently lead to the transfer of messages to customers. At this point, the issue of the impact of the contemporary ICT on entrepreneurship emerges, and particularly on recognizing, exploring, assessing and grasping opportunities. The mechanism providing information on entrepreneurial opportunities in the contemporary world is, among others, social media. The participation in them is associated with the IT support for personal networks of relationships of the entrepreneur, in the area of both strong and weak ties. The resource of "acquaintances" is a valuable source of information for the entrepreneur, which can be used directly (direct information on opportunities) or indirectly (information allowing for the creation of an opportunity, innovation) in exploiting an opportunity. The existence and use of new dimensions of communication may constitute a valuable addition to "traditional" communication for the entrepreneur.

The rise of social media has led to changes in carrying out day-to-day activities by entrepreneurs. As Olanrewaju et al. (2020) point out, studies on social media and entrepreneurship are relatively new and fragmented in their focus, however there is an increasing interest from academia and practitioners in further research and investigation within this area.

At the same time, many studies concerning the use and role of social media in business relate to professional aspects. However, the area of the significance of social media for informal relationships, created and maintained by entrepreneurs, is also interesting. The question arising in the course of the analysis of the available literature relates to the fact whether, in practice, social media contribute only to generating official effects and publishing information by enterprises or whether they are the medium enabling interpersonal contacts of entrepreneurs, associated with acquiring information and resources essential for the conducted activity (through discussions), which might be of use to get a competitive advantage.

The objective of the paper is to explore the impact of the use of social media by entrepreneurs on the frequency of discussions about the economy and business with the members of their social network. The subject of the research has been selected small enterprises (including micro-enterprises) due to their share in a total number of enterprises in Poland (nearly 99%) and also a steady increase in their number as well as an increase in the value of production, revenues, number of employees. The research tool was the questionnaire. The statistical analyses were conducted using the R Package - a free software environment for statistical computing and graphics. The test probability of $p<0.05$ was found as significant whereas the test probability of $p<0.01$ as highly significant.

Social bonds in the Internet space

The contemporary world is subjected to a variety of changes, in particular socio-economic and civilizational ones, known commonly as the so called information revolution (Rosak-Szyrocka, Blašková, 2016), the immanent component of which is the Internet. The Internet may contribute to restoring the community by providing space for people sharing common interests, while simultaneously overcoming the limitations of time and space (Baym 1997; Wellman 2001). *Social media* have gained immense popularity, among others, due to the fact that they are the response to the social nature of the man.

Online communities may promote an open, democratic discussion (Sproull and Kiesler 1991), promote the diversity of views (Kapor 1993) and mobilize joint actions (Schwartz 1996; Tarrow 1996). Although early explorations of the social role of the Internet focused primarily on creating the *online* community (Rheingold 1993), it became clear soon that most relationships established in cyberspace are continued in the physical, real space, which leads to the emergence of new communities the common feature of which is mixing *online* and *offline* interactions (Müller 2000). Interactions taking place in the network fill in communication gaps existing in the real world (face to face meetings). In addition, the Internet extends the tendency of bonds to expand beyond the local area (Wellman 2001). Therefore, the Internet intensifies both *online* and *offline* communication, thus creating opportunities for the rise of the low-cost contact between friends and relatives and simultaneously expanding direct face to face communication as well as the one using the telephone. The Internet may also contribute to an increase in organizational commitment by supporting the flow of information between direct personal meetings and by arranging such meetings itself.

As stated by Culnan and Markus, communication networks established via computers may create the communities based rather on interests than geographical location, social status or previous acquaintanceship (Culnan, Markus 1987). On the basis of interests, common needs or a commercial venture, weak ties may emerge. The networks of researchers or social or medical support groups may serve as an example (Alexander, Peterson and Hollingshead 2003) as well as discussion groups (Baym 2000), online universities or courses (Haythornthwaite 2005). There are also the cases of transformation of weak ties into stronger ones, due to the Internet, which may take place in virtual communities and through community networks (Baym 2000; Cohill and Kavanaugh 2000). In such

circumstances, some additional connections appear, e.g. direct meetings, synchronous online meetings or sharing private e-mail addresses as a part of a public discussion.

In addition, Haythornthwaite (2005) pointed out that, at the time of the emergence and initiation of the use of a new medium of communication, which connects different entities, it has the potential to create weak ties. It takes place by means of initiating a new social contact between previously separate units. The impact of the new medium or new communication practices relates to the creation of new ties, not existing so far. As a result of the need for communication, strong ties are willing to adapt a new medium. Regardless of the emergence of changes or disappearance of a new medium, strong ties remain unchanged (there is no impact of a new medium). Weak ties may be subjected to destruction as a result of the disappearance of the only medium which is their carrier.

Social media and entrepreneurial networks

All entrepreneurs, while seeking to achieve their own goals, are in permanent interaction with the environment and thus cannot be treated in isolation from others. Daily, entrepreneurs contact their family members, friends, employees, business partners, advisers who form their personal (social) networks, considered as one of the most important sources of resources for the entrepreneurial firm (Bratkovic et al., 2009; Soetanto 2019). The term 'entrepreneurial network' refers to the personal network of information contacts and exchange relationships used by the entrepreneur for creating and nurturing the business (Witt et al., 2008). Entrepreneurs are also linked to people and organizations that interact with each other and these contacts can widen the availability of resources that sustain a business (Hansen, 1995).

The prior research stresses the role of networks as a set of resources that provide a competitive advantage to the firm (Eisenhardt, Schoonhoven,1996; Gulati et al., 2000). According to the resource-based view (RBV), the firm's competitive advantage originates in the resources and capabilities the enterprise controls, specifically the valuable, rare, imperfectly imitable and not substitutable ones (Barney, 1991). Resources obtained through networks share the features consistent with the criteria suggested by the RBV. Other benefits of networks include the access to important and timely information (Adler, Kwon, 2002), financial support, labor and psychological aid (Sanders, Nee, 1996). Moreover, networks provide opportunities for acquiring and exploiting new knowledge required for innovation (Yli-Renko et al., 2005) which is vital for the entrepreneur and the entrepreneurial process. Firms can obtain information, resources and status through network connections, and the understanding of how these ties work is an important goal of the strategic management research (Kim et al., 2016). Additionally, social networks influence internationalizing SMEs business models (Musona et al., 2020).

The most important technological trend of the last ten years has been the rise of social networking systems to social phenomena involving billions of people all around the world, attracting users from several social groups, regardless of age, gender, education, or nationality (Franchi et al., 2020). From the point of view of the operation of small enterprises, it is important that the use of social networks by entrepreneurs can be currently supported just by the use of the Internet communication platforms which social media are.

Social media have changed the way people communicate and overcome restrictions imposed by geographic locations. Social media may provide additional information and broaden the views of users. People can collect information from different resources both domestically and internationally. The influence of social media is also noticeable in how it can shape people's perception of modern business practices. The basic functions of social media are for free, and more and more people rely on social media to communicate and collect information. Information posted on social media can potentially quickly become trendy and influence people's purchasing decisions and career choices (Xu et al., 2019). The arrival of social media has not only transformed the way firms relate to customers. It has also changed internal processes and thus is becoming an important strategic tool. Firms are using these tools increasingly to facilitate intra- and inter-organizational activities with customers, business partners, and suppliers - activities such as collaborative product development, creation of knowledge-

sharing communities, market research, and collaborative learning and creativity (Martin-Rojas, 2019). Social media are the phenomenon that has changed the way the business environment works. Firms are able to gain access to resources that would be otherwise unavailable to them. It has also helped businesses to increase their worthiness, cultivate strategic partnerships and increase their contact with customers and suppliers (Jagongo, Kinyua, 2013). Mangold and Faulds (2009) recognize that social media allow enterprises to connect with both existing and potential customers, engage in them and reinforce a sense of community around the enterprise offering(s).

Social media are being adopted by a growing number of entrepreneurs who seek to deploy them for the benefit of their business. In the relatively few scholarly studies that consider how such social media may benefit firms, the majority have focused on social media as marketing tools. Little is known about how the use of social media may affect entrepreneurs themselves (Fischer, Reuber, 2011). The popularity of online websites for networking is increasing and they provide a new platform for socialization and business. Due to the emergence of online social networks and social media, there are more opportunities for entrepreneurs. Online social networking sites enable the maintenance of existing relationships and also the formation of new connections (Song, 2015).

Social media help conversations to reach a wider audience leveraging the "long tail" concept, which means conversations that can be conveyed to different forums. There are several communication channels in the organization that include meetings, phone calls and emails. The use of social media web sites has increased the channels of communication and its effectiveness in the organization. Social media have also improved collaboration between team members in an organization, which has resulted in a better outcome. The key factor for the success of social media is conversation. When a social media site is used for the business, it enlarges the conversation through buzzes that would call out the brand name. The company must be truly dedicated towards conversation through social media, as much as the customers are (Edosomwan, 2011).

Olanrewaju et al. (2020) state that entrepreneurs use social media for several reasons and purposes, which is vital to their business activities. Social media's openness and connectivity overcomes the inability or difficulty entrepreneurs experience in identifying and reaching out for expert advice, which is particularly crucial in the early stages of entrepreneurship. Furthermore, entrepreneurs use social media mainly to market their products /services. The ability to interact and network with co-entrepreneurs is another vital factor.

Social media enable entrepreneurs to connect and establish relationships based on similar interests (Quinton, Wilson, 2016). The use of social media platforms also improves firm performance (Alarcón-del-Amo et al., 2018) Social media (Edosomwan, 2011): promote open communication between employees and management; allow employees to share project ideas and work in teams effectively, which helps in sharing knowledge and experiences; promote better content, such as webcast and videos, than just simple texts; help to communicate collaboratively between current and potential customers in receiving feedback, product definition, product development or any forms of customer service and support; become a good venue for discussions and become a classic goal of marketing and communication, but companies must ensure that employees are adhering to the rules and etiquettes of social media. Additionally, Drummond et al. (2018) pinpoint that the impact of social media extends that of a virtual communication platform to a resource layer in the creation and maintenance of activity structures in business-to-business relationships and networks.

Research problem and hypothesis

Recognizing the specificity of social media in the context of the issue of the social network of the entrepreneur has led to the formulation of the following research question: RQ: *What is the impact of the use (commitment to social media) of social media by entrepreneurs on discussions on the economy and business which they hold with the members of their social network?* The analysis of the specificity of social media has led to the formulation of the following hypothesis *H: There is a positive impact of the use of social media on the frequency of discussions on the economy and business with the members of the social network of the entrepreneur.*

Materials and Methods

The research, the results of which have been depicted in the present paper, was based on the method of conducting empirical studies by means of managerial perception (Miller, Friesen, 1978), in which data are obtained using the questionnaire.

The respondents of the research were the owners-managers of the analyzed enterprises. The research tool was spread among the randomly selected organizations – due to easy access – from the areas of the provinces: Kuyavia-Pomerania, Lublin, Łódź, Mazovia, Podlachia, Silesia and Holy Cross. 143 copies of the completed questionnaires were received, 14 of which were rejected due to incomplete data. In these circumstances, the research sample amounted to 129 small enterprises.

The majority are the companies running their business activity in cities. These enterprises amount to 84.5%, whereas the companies operating in the country constitute 15.5%. The enterprise operating on the market for the shortest period of time is eight months old. The oldest one has been operating on the market for 26 years. The enterprises under consideration are both the companies characterized by self-employment, the ones not employing workers and the ones employing even 46 people. On average, the level of employment in the analyzed companies amounts to 4 employees (an entrepreneur + 4 employees).

For most of the surveyed companies, the basic activity is production (30.2%). The activity associated with trade was identified as the domain of 33.3% of the surveyed companies. 24% of the surveyed entities operate in the sector of services. The other 12.5% of the companies run their business activity in the field of the following sectors: construction, hotels and restaurants, transport, storage and communication, education and agriculture, hunting and forestry.

The vast majority and simultaneously nearly half of the entrepreneurs declared their age range as 36-45 (46.5%). The people aged 46-55 amount to 20.9% of those questioned whereas the people aged 26-36 amount to 15.5%. The people aged 56 and more as well as the ones aged 25 and less respectively amount to 14% and 3.1%.

Variable Measurement

Entrepreneurial Network Member Interactions

According to Tomski (2016), there were identified the member groups of individual sub-networks of entrepreneurial networks. As a result of the conducted factor analysis, two basic sub-networks of entrepreneurs were identified: the one including entrepreneurs' family members (NET_FAM) – strong ties and the one including other people (NET_OTH) – weak ties.

For the purposes of the thorough analysis and solving the research problem formulated in this study, the decision was made to carry out the analysis of individual sub-networks, constituting two aforementioned groups. The conducted research indicated the existence of the following groups (categories) of people, creating the social network of the entrepreneur: (1) Spouse or partner, (2) Parents, (3) Other family members and relatives, (4) Friends, (5) Acquaintances from former school, courses, present and former place of residence, (6) Customers, (7) Suppliers, service providers, (8) Acquaintances - entrepreneurs, owners and people related to other companies that are not competitors, (9) Acquaintances - entrepreneurs, owners and people related to other companies being competitors, (10) Acquaintances connected with administration, authorities and public sector etc., (11) Acquaintances connected with business support organizations (investors, consultants, bankers, accountants, lawyers etc.), (12) Former co-workers (colleagues), former boss, current co-workers (colleagues), current boss (in the case of simultaneous employment and running a business activity), (13) Acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors.

In the subsequent step, the frequency of holding general discussions with individual members of the sub-network by the entrepreneurs, concerning issues related to the economy and business, was identified. It was possible to respond using the eight-point Likert scale, where 1 amounted to the fact that the relevant discussions were held rarely, 7 – very often, whereas 0 amounted to no interaction of the entrepreneur with the specific group in terms of discussions on issues associated with the economy and business. Descriptive statistics for the variables characterizing the frequency of interactions of the entrepreneur with the members of individual sub-networks are presented in Table 1.

Table 1: Descriptive statistics of the variables concerning interactions of the entrepreneur with the members of individual sub-networks of the social network of the entrepreneur

Variable – network member group	Variable ID	Median	Mean	Std dev	Min	Max
Spouse or partner	C_MALZ	5	4.57	2.34	0	7
Acquaintances connected with administration, authorities and public sector etc.	C_ADM	4	3.41	2.01	0	7
Acquaintances connected with business support organizations (investors, consultants, bankers, accountants, lawyers etc.)	C_WSP_BIZ	4	3.95	1.92	0	7
Former co-workers (colleagues), former boss, current co-workers (colleagues), current boss (in the case of simultaneous employment and running a business activity)	C_EX_WSP	4	3.55	2.19	0	7
Acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors.	C_DOSW	4	3.91	2.15	0	7
Parents	C_RODZ	2	2.51	2.3	0	7
Other family members and relatives	C_INNI_RO	4	3.35	2.16	0	7
Friends	C_PRZYJ	4	4.19	2.03	0	7
Acquaintances from former school, courses, present and former place of residence	C_INNI_SL	3	3.47	2.24	0	7
Customers	C_KL_ZL	5	4.4	2.06	0	7

Variable – network member group	Variable ID	Median	Mean	Std dev	Min	Max
Suppliers, service providers	C_DO_US	5	4.38	2.02	0	7
Acquaintances - entrepreneurs, owners and people related to other companies that are not competitors	C_PB_NKON	4	4.19	1.91	0	7
Acquaintances - entrepreneurs, owners and people related to other companies being competitors	C_PB_KON	4	3.88	2	0	7

Social Media Commitment

The commitment of entrepreneurs to social media (the use of social media) was operationalized by recognizing the frequency of their use. The entrepreneurs responded to the question concerning the use of social media on the five-point scale, where the value of 0 meant that the entrepreneurs did not use social media, 1 – that the frequency of their use was so small that it was difficult to determine, 2 – that the entrepreneurs used social media very rarely, 3 – about once a month, 4 – about once a week, whereas 5 – that it was the same as daily use of social media. Descriptive statistics concerning the variable describing the use of social media by the entrepreneurs are presented in Table 2.

Table 2: Descriptive statistics for the variable of SOC_MED

Variable	Variable ID	Median	Mean	Std dev	Min	Max
Social media	SOC_MED	3	2.9	1.88	0	5

Research Findings

In the first stage of the analysis the correlation between the variables under research was identified. The results of the analysis of the correlation coefficients are listed in Table 3.

Table 3: Correlation coefficients of the analyzed variables

	SOC_MED	C_PB_KON	C_ADM	C_WSP_BIZ	C_EX_WSP	C_DOSW	C_MALZ	C_RODZ	C_INNI_RO	C_PRZYJ	C_INNI_SL	C_KL_ZL	C_DO_US	C_PB_NKON
SOC_MED	1	0.101	0.046	0.145	0.149	**0.224**	0.041	**0.290**	0.082	**0.223**	0.101	0.076	0.070	0.060

The obtained results indicate that, in the case of the use of social media, there is a statistically significant relationship exclusively with the frequency of holding discussions with the members of three sub-

networks within the social network of the entrepreneur, i.e.: acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors (C_DOSW), friends (C_PRZYJ) and parents (C_RODZ).

For the relationships identified in this way, the in-depth analysis based on the results of the linear regression analysis was carried out. Tables 4 and 5 contain the results of the regression analysis for the sub-network of acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors (C_DOSW).

Table 4: The relationship between the frequency of the use of social media and the frequency of interactions of the entrepreneur with the members of the sub-network of acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors (C_DOSW) – the regression model assessment

R	0.22428607
R^2	0.05030424
Adjusted R^2	0.04276697

n	128

Table 5: The relationship between the frequency of the use of social media and the frequency of interactions of the entrepreneur with the members of the sub-network of acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors (C_DOSW) – the regression model

	Coefficients	Std dev	t Stat	p-value
Intercept	3.17027032	0.34263942	9.25249743	7.199E-16
SOC_MED	0.25661833	0.09933273	2.58342177	0.01092382

The obtained results of the statistical analysis indicate that 5% of changes in the level of interactions with the sub-network of acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors (C_DOSW) can be explained by the variable characterizing the commitment of the entrepreneur to the use of social media (SOC_MED). The use of social media positively affects the level of interactions of the entrepreneur with the members of this sub-network. These relationships are statistically significant. The values of the parameters are positive, i.e. along with an increase in the frequency of the use of social media, there is an increase in the frequency of interactions of the entrepreneur with the members of the analyzed sub-network in terms of holding discussions on the economy and business. An increase in the level of the variable of SOC_MED by the value of standard deviation increases the level of the frequency of contacts with the members of the sub-network of C_DOSW by 0.256 of its standard deviation. Summing up the results of the conducted regression analysis, it can be concluded that SOC_MED has a positive impact on the level of interactions of the entrepreneur with the members of the sub-network of C_DOSW of its personal network, operationalized as the frequency of discussions on the economy and business.

Tables 6 and 7 contain the results of the regression analysis for the sub-network of friends (C_PRZYJ).

Table 6: The relationship between the frequency of the use of social media and the frequency of interactions of the entrepreneur with the members of the sub-network of friends (C_PRZYJ) – the regression model assessment

R	0.22314367
R^2	0.0497931
Adjusted R^2	0.04225177
Std error	1.99450464
F	6.60269906
p	0.01134706
n	128

Table 7: The relationship between the frequency of the use of social media and the frequency of interactions of the entrepreneur with the members of the sub-network of friends (C_PRZYJ) – the regression model

	Coefficients	Std dev	t Stat	p-value
Intercept	3.48543706	0.32515941	10.7191642	1.8862E-19
SOC_MED	0.24222118	0.09426519	2.56957177	0.01134706

The obtained results of the statistical analysis indicate that 4.9% of changes in the level of interactions with the sub-network of friends (C_PRZYJ) can be explained by the variable characterizing the commitment of the entrepreneur to the use of social media (SOC_MED). The use of social media has a positive impact on the level of interactions of the entrepreneur with the members of this network. These relationships are statistically significant. The values of the parameters are positive, i.e. along with an increase in the frequency of the use of social media, there is an increase in the frequency of interactions of the entrepreneur with the members of the analyzed sub-network in terms of holding discussions on the economy and business. An increase in the level of the variable of SOC_MED by the value of the standard deviation increases the level of the frequency of contacts with the members of the sub-network of C_PRZYJ by 0.242 of its standard deviation. Summing up the results of the conducted regression analysis, it can be concluded that SOC_MED has a positive impact on the level of interactions of the entrepreneur with the members of the sub-network of C_PRZYJ of their personal network, operationalized as the frequency of discussions on the economy and business.

Tables 8 and 9 contain the results of the regression analysis for the sub-network of parents (C_RODZ).

Table 8: The relationship between the frequency of the use of social media and the frequency of interactions of the entrepreneur with the members of the sub-network of parents (C_RODZ) – the regression model assessment

R	0.28974306
R^2	0.08395104
Adjusted R^2	0.07668081
Std error	2.2101325
F	11.5472335
p	0.0009087
n	128

Table 9: The relationship between the frequency of the use of social media and the frequency of interactions of the entrepreneur with the members of the sub-network of (C_RODZ) – the regression model

	Coefficients	Std dev	t Stat	p-value
Intercept	1.50243443	0.36031271	4.1698069	5.628E-05
SOC_MED	0.35495524	0.10445629	3.39812205	0.0009087

The obtained results of the statistical analysis indicate that 8.3% of changes in the level of interactions with the sub-network of parents (C_RODZ) can be explained by the variable characterizing the commitment of the entrepreneur to the use of social media (SOC_MED). The use of social media positively affects the level of interactions of the entrepreneur with the members of this sub-network. These relationships are statistically significant. The values of the parameters are positive, i.e. along with an increase in the frequency of the use of social media, there is an increase in the frequency of interactions of the entrepreneur with the members of the analyzed sub-network in terms of holding discussions on the economy and business. An increase in the level of the variable of SOC_MED by the value of standard deviation increases the level of the frequency of contacts with the members of the sub-network of C_RODZ by 0.354 of its standard deviation. Summing up the results of the conducted regression analysis, it can be concluded that SOC_MED has a positive impact on the level of interactions of the entrepreneur with the members of the sub-network of C_RODZ of their personal network, operationalized as the frequency of discussions on the economy and business.

The obtained results indicate that the hypothesis is confirmed only partially. The listing of individual groups/members of the sub-network for whom the hypothesis was supported and not supported is presented in Table 10.

Table 10: The verification of the hypothesis for individual groups/members of the sub-network of the entrepreneur

Variable – the network member group	Variable ID	Hypothesis
Spouse or partner	C_MALZ	Not supported
Acquaintances connected with administration, authorities and public sector etc.	C_ADM	Not supported
Acquaintances connected with business support organizations (investors, consultants, bankers, accountants, lawyers etc.)	C_WSP_BIZ	Not supported
Former co-workers (colleagues), former boss, current co-workers (colleagues), current boss (in the case of simultaneous employment and running a business activity)	C_EX_WSP	Not supported
Acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors.	C_DOSW	Supported
Parents	C_RODZ	Supported

Variable – the network member group	Variable ID	Hypothesis
Other family members and relatives	C_INNI_RO	Not supported
Friends	C_PRZYJ	Supported
Acquaintances from former school, courses, present and former place of residence	C_INNI_SL	Not supported
Customers	C_KL_ZL	Not supported
Suppliers, service providers	C_DO_US	Not supported
Acquaintances - entrepreneurs, owners and people related to other companies that are not competitors	C_PB_NKON	Not supported
Acquaintances - entrepreneurs, owners and people related to other companies being competitors	C_PB_KON	Not supported

The analysis of the above results indicates that, from the formal point of view, the hypothesis was confirmed only for 3 out of 13 sub-networks. Therefore, on the whole, it can be concluded that the hypothesis formulated in this study is not supported, thus, in the case of the surveyed enterprises, there is no positive impact of the use of social media on the frequency of discussions on the economy and business with the members of the social network of the entrepreneur.

Conclusions

Summing up the results of the conducted research, it should be concluded that the impact of the frequency of the use of social media by the entrepreneur on the frequency of interactions with the members of the analyzed sub-networks of the personal network is statistically insignificant in the case of most sub-networks. Such a situation applies to 10 out of 13 sub-networks. The exception is 3 sub-networks: acquaintances having significant experience in starting new businesses and running a business activity, scientists, inventors (C_DOSW), friends (C_PRZYJ) and parents (C_RODZ). However, in the case of these sub-networks, despite the statistically significant positive impact of the frequency of the use of social media on the frequency of interactions with the members of the sub-network, a very small proportion of this factor in forming the level of interactions with the members of the sub-network can be indicated. This impact is at the level of 4.9% to 8,3%. In all the cases, more than 90% of variability in the frequency of interactions with the members of the sub-network is explained by the factors other than the frequency of the use of social media. An interesting result is an 8.3% impact (the largest among the three sub-networks for which the statistically significant relationship was identified) of the use of social media on the frequency of interactions with the entrepreneur's parents. Parents were identified as a group with whom the entrepreneurs hold discussions on the economy and business the most rarely (the average of 2.5, with the maximum possible level of 7).

It is worth pinpointing that despite the existence of statistically significant relationships in the case of 3 sub-networks at a low level, it should be assumed that one cannot speak about the existence of relationships of the frequency of the use of social media with the frequency of discussions on the economy and business. Social media are undoubtedly used, to a much larger extent, for formalized

communication of the company with the environment, not for holding informal discussions on issues significant for conducting the business.

In the context of the rejection of the hypothesis put forward in this study, it is worth pinpointing that Rosa (2013) claims that, in the Polish culture, social media and forums are not business channels. They are used primarily for entertainment and staying in touch with acquaintances. The primary means of communication in Poland is face to face conversations, phone calls, short text messages SMS/MMS, whereas the activity in social media is located in the 8th position in terms of popularity as a means of communication. The development of new communication channels does not result in the disappearance of personal contacts – all the respondents found personal meetings the most essential form of contacts with people. The significance of personal meetings is associated with the conviction of the power of the first impression, an opportunity to respond to non-verbal behavior of the speaker, discretion of the ongoing conversation. This statement, to a certain extent, explains the fact of the rejection of the hypothesis in the case of the surveyed group of Polish small enterprises and justification of the fact that the use of social media does not affect the frequency of discussions of entrepreneurs on the economy and business with the members of their social networks. These subjects are mainly discussed by them directly, without using the Internet communication.

The conducted research does not completely exhaust the problem. Among the directions of the future research, the following can be indicated: the research broken down by age groups, international cross-examination, taking into account the characteristics of individual cultures, which can be significant in the process of informal communication of the entrepreneur with the environment.

Non-Proportional Allocation of Indivisible Goods

Abstract

Fair division of goods has been an issue since people began forming communities. This applies not only to physical goods but also to participation in the profits, costs or work. Continuous social and economic development creates further needs to seek new solutions. Diverse forms of shared properties involve using various methods as well. Different solutions have to be applied, among others, while the division of indivisible goods among agents with different claims for the goods is required. In many cases the main emphasis is put on the optimal representation of the structure of claims made by agents participating in division. The exact reflection of this structure is generally impossible, because most often the proportional division is not integer. However, in some instances the structure of claims made by participants in division does not allow to apply the principle of proportionality. In such cases some modified solutions are searched for. One of such modifications is degressive proportionality, which allows unequal representation of the structure of claims. However, this idea turned out to be understood differently, even in its main recent area of application – the apportionment of seats in the European Parliament. Currently the problem of degressively proportional division of indivisible goods is being studied in the framework of fair division theory, with many questions still open.

The paper presents different interpretations of the idea of degressive proportionality together with its practical source, i.e. the allocation of mandates among Member States of the European Union in the European Parliament. Each of the interpretations is formalized and briefly analyzed.

Keywords: Fair Division, Allocation, Degressive Proportionality, Indivisible Goods.

Introduction
