- analysis of permissive documents, obtaining of which is necessary for carrying out entrepreneurial activity in the information environment, with a view to identifying the list of necessary documents required for obtaining permissive documents, state bodies and organizations that issue them, place and time of issue;
- identification of promising areas and key investment projects for entrepreneurship development in the information environment.

The subject of the study is the processes of providing online services and services on the global Internet, improving the efficiency of existing business structures and identifying promising areas for the development of entrepreneurship in the information environment.

The subjects of the research are Internet resources of the Republic of Kazakhstan and business community of information environment.

In conducting the research the authors of the article used the following methods:
- complex (continuous) assessment of the entire information environment as a complete system based on the study of statistical data, expert assessment by leading Kazakh specialists in the field of media, journalism, business and political science;
- continuous, selective, documentary, actual, analytical and combined verification of the results obtained.

Analytical procedures used in the study consisted in studying significant indicators and trends in the information environment processes, including the resulting interrelationships and deviations, as well as identifying the causes of possible deviations.

Main Part

The system approach to creation of structure of a chain of the added values of information resources demands to consider all set of problems of creation and functioning of Internet resources, maintenance of possibilities of their modernization, reconstruction and development at various stages of their existence. Justification of value chain development is based on the experience of developers and experts of this research in the development of information environment in Kazakhstan.

As a result of the present research, the following reasons were found out, which slow down the development of the industry:

a) Lack of reliable statistical information in the industry and financial costs;
b) Lack of trust of the Internet user in Internet shops in Kazakhstan;
c) Large territory of Kazakhstan and, as a result, difficulties in the logistics chain;
d) Lack of legal framework for e-commerce.

The findings of the Value Chain Survey will be of interest to entrepreneurs who apply a value chain approach to their business development.

In the context of identifying the structure of the value chain for the creation of Internet resources, one of the most relevant issues is to determine the composition of financial costs for the creation of Internet resources in the range of minimum and maximum values for the creation and operation of information resources. In the future, it is necessary to determine what types of services can be outsourced in order to reduce the financial costs of maintaining the business and, ultimately, to determine the full value chain for the creation of Internet business.

Feature of construction of a chain of the added value in the information environment is modularity of construction of the Internet project. The global nature of business information environment gives significant advantages over traditional types of business. For example, a significant reduction in costs for the production of goods and services, as well as the possibility of twenty-four-hour unrestricted trade allows you to never stop the business process. Increasing the number of consumers (users) requires only the improvement of software and technological equipment. In addition, it should be understood that the industry participates in the GDP of the country and is, at the same time, providing for many sectors of the national economy of Kazakhstan.

With regard to the information environment, the following feature of the value chain operates. If in traditional production or ICT-industry the final product is material, then in the process of information service provision the product is intangible and the term "virtual value chain" is used. In this case, value is added through working with information and applying certain technologies to work with information, through the knowledge of specialists in the field of these technologies. In this case, the value chain takes the form shown in the figure 1.

Fig.1: Internet project value creation algorithm

Source: composed by the authors

Services in the information environment represent a fast-growing business sector worldwide. And the development of related technologies allow to occupy an increasing number of niches in the market of information provision. Based on this, we can highlight the following features of value chain organization in companies operating in the industry:

1. Software development and information transfer technology is often sufficient for the successful functioning of the company;
2. The value chain in the field of information immediately brings them to the inter-corporate level;
3. the source of competitiveness is the availability of own developments and technologies.

For the information and communication technology and information environment industry, the most important factor is the technology and knowledge that provides the greatest value in the value chain. The examples of value chain construction discussed above provide the basis for the value chain construction in figure 2. For the first part of the project, as a rule, there are at least 60 working days (Step 1), information content can take 30 working days depending on the amount of content and its multimedia applications.

Fig. 2: Internet project value chain

Source: composed by the authors

Many performers are involved in creating the value chain, namely:

1. Directly influencing:
1.1 KazNIC -Registrar (domain name for the time period);
1.2 hosting provider (hosting and virtual equipment);
1.3 equipment supplier (own);
1.4 developers and technical specialists;
1.5 editors (team) of the resource;
1.6 providers of browsers and applications;
1.7 developers and technicians;
1.8 editors (team) of the resource;
1.9 providers of browsers and applications;
1.10 search engines.
2. Indirectly affecting
2.1 authorized body (regulatory, supervisory and executive authority);
2.2 marketing company;
2.3 PR-specialists;
2.4 technical specialists in Internet promotion;
2.5 statistical providers;
2.6 specialized systems for providing statistics;
2.7 payment systems, banks;
2.8 transportation and logistics companies;
2.9 cloud service providers.

For this purpose it is possible to note expenses for development of an Internet resource and expenses for maintenance of necessary infrastructure for input of the Internet project into pilot, and then into industrial operation. The mentioned works include the following expenses:

- pre-project survey and development of technical documentation, as well as costs for project management;
- development of graphic design and structure of the Internet resource;
- development of the software part of the information resource;
- preparation of materials (including advertising) and their subsequent placement on the information resource;
- providing technical, communication and organizational infrastructure, namely, placement on the Internet and ensuring the resource's operability;
- promotion and search engine optimization of the Internet resource;
- technical support and update the Internet resource during the period of trial operation.

In terms of complexity of creation, Internet projects in Kazakhstan can be divided into three categories:

1. Initial complexity;
2. Medium complexity;
3. Highest complexity.

Initial complexity category, which includes Internet projects of several (up to hundreds) interconnected pages with simple structure.

A category of medium complexity, which includes Internet projects that are up to a thousand interconnected pages with a complex structure.

As a rule, Internet projects of the ***highest complexity category*** are unique, or intended for limited adaptable replication.

Table 1 provides information on the structure of costs to create an Internet business in Kazakhstan based on the complexity of the project and the type of costs, without taking into account the purchase of software and hardware complex (a set of hardware and software tools that work together to perform one or more similar tasks), connections and communications.

Table 1: Structure of costs to create an Internet business in Kazakhstan based on the complexity of the project and type of costs, %

Costs to total infrastructure development and construction costs	Project complexity category		
	Initial	Medium	Highest
Project Management	5	5	10
Costs of development	45	50	45
Costs of content creation and placement	50	45	15
Costs of infrastructure creation without taking into account purchase of software and hardware complex, connections and communications			30
Total	100%	100%	100%

Source: composed by the authors

For projects on creation of Internet projects of initial and medium categories of complexity it is possible to result the minimum work costs expressed in natural indicators.

For projects of the highest category of complexity detailed financial costs are calculated individually when making business plans to create an Internet project, so this study examines the lower limit of the cost range, expressed in natural terms (man-hours) spent on the creation of an Internet resource.

Financial costs for creation of Internet business in Kazakhstan, expressed in kind (man-hours) are shown in Table 2.

Table 2: Costs of labor for creation of Internet business in Kazakhstan, man-hours

Specialist working costs in man-hours	Project complexity category		
	Initial	Medium	Highest
Project Leader	4	8	108
Development			
System Analyst		4	66
System Architect		16	66
Database System Architect		12	
Designer	32	64	86

Table 3 provides information on the structure of costs of creating the infrastructure required to develop and operate an Internet project in Kazakhstan. Costs are expressed as a percentage of development labour costs. For primary and secondary complexity categories, all the necessary infrastructure is provided by hosting companies. For projects of the highest complexity category it is provided that the necessary infrastructure, including engineering, is created by the customer or developer of the Internet resource. By infrastructure, we mean the hardware and software complex of an Internet resource. Engineering infrastructure means systems of guaranteed uninterruptible power supply, security systems (alarm systems, access control and environmental control, automatic fire extinguishing), industrial air conditioning systems.

Table 3: Information on the structure of costs to create the infrastructure of the Internet project in Kazakhstan, %

Costs of building the necessary infrastructure as a percentage of labour costs	Project complexity category		
	Initial	Medium	Highest
	20	40	80

The analysis of the composition of work on the creation of an information resource makes it obvious that the performance of all actions to create an Internet resource by the organization itself is virtually impossible, if this type of activity is not the main one for the organization. Development of information resource requires the organization to have competent specialists in the field of graphic computer design, software, significant financial investment in the purchase of hardware and software complex and install your own server on the site of a hosting provider with good bandwidth, payment for such hosting, which can afford not every small business. For qualitative performance of all the above works and saving money it is reasonable to use on a contractual basis the services of outsourcing organizations specializing in this area.

For the organization it is expedient to approach to the analysis of the composition of costs differentiated, based on the ratio of business object, purpose and requirements to the information resource. So, acquisition of own server and the accompanying equipment for accommodation of an information resource are necessary only in the event that the sum of financial expenses for a hosting exceeds the sum of financial expenses for performance of the above-stated actions. In addition, the organization can take advantage of alternative options such as renting a dedicated server, renting space for the server in the server room, etc. To develop the technical design and structure of the information resource, as well as to perform work on programming and promotion of the resource by the organization's own forces is appropriate if this type of activity is the main for the organization and the staff is staffed by highly qualified specialists in the field. In terms of financial costs of resource maintenance, we note that if there is a need for constant support and regular updating of information on the pages of the resource of the organization it makes sense to purchase software resource management system and provide human potential for this process. Value chain analysis will be used to evaluate the relationships between all actors within the chain, as well as to understand the economic, social benefits and costs of these relationships.

Experience of state support - results of the State Budget Program "Information Kazakhstan 2020"

As a result of the assessment of the implementation of the state budget program "Information Kazakhstan-2020" (with the period of implementation of 2013 - 2017), we found a lack of updated information on the availability and functioning of information systems of government agencies. There was no monitoring and control over their planning, creation and commissioning at the time of the state audit.

For example, 43,964.7 million KZT were envisaged in the national budget for 2017 for implementation of the State Program, out of which 43,769.5 million KZT or 99.7 % were executed. There were not performed 195,2 million KZT, out of which 48,8 million KZT were savings, 146,4 million KZT were not mastered due to the failed tenders for the government purchases.

Despite the allocation of significant amounts of budget funds, the achievement of key indicators of the development of information and communication technologies in certain sectors of the economy was not ensured, which indicates a weak elaboration of mechanisms for the implementation of the Programme.

The measures of the above-mentioned State Programme aimed at developing information and communication technologies in education and science, health care and tourism have not been fully implemented. The e-learning system "E-learning" developed by the Ministry of Education and Science of the Republic of Kazakhstan has not been put into industrial operation (cost 35 billion KZT).

In the health sector, it was planned to provide 60% of the population of Kazakhstan with "electronic maps" by 2017, but the work on the delivery and implementation of the platform for the informatization and interoperability of health information systems for the exchange of medical data and the creation of a unified medical space was not completed in time. In this regard, at the time of the audit, the integration of health information systems with a single integration platform had not been implemented.

The measures taken within the framework of the State Programme did not allow the tourist infrastructure facilities to be fully connected to the Internet (76.2%). However, only 39.7 per cent have their own Internet portal. It was noted that the tourism infrastructure is poorly integrated with international systems of Internet booking, which is 22.6% (65% plan). All this is a limiting factor in the development of tourism in Kazakhstan.

The tariffs applied by JSC National Information Technologies for lease of terrestrial digital communication channels are considerably higher than the tariffs of JSC Kazakhtelecom for commercial entities of the market, which leads to higher prices for telecommunication services for the state bodies and agencies, as well as their subordinate organizations.

For example, in 2017 JSC National Information Technologies leased from JSC Kazakhtelecom 9,822 land communication channels (republican and oblast ports IP VPN) for the amount of KZT 6,638.6 million at the agreed marginal tariffs.

Whereas, commercial entities of the market (JSC Samruk-Kazyna, including JSC KazMunaiGas, JSC Kazpost) leased the same number of land communication channels (9,822) for the amount of KZT 4,570.8 million.

Thus, the tariff of JSC "National Information Technologies" on rendering telecommunication services for state bodies and institutions, as well as their subordinate organizations is more expensive than for JSC "Samruk-Kazyna" by KZT 2,067.8 million.

Implementation of the state program "Information Kazakhstan-2020" did not ensure the growth of Kazakhstan's position in the rating of the WEF GIC, and on some indicators of information and communication technologies development there is a decrease.

Subsidies of universal services in the sector of telecommunications, provided in rural areas, is carried out without sufficient regulation of procedures and methods of calculation of their cost.

In general, implementation of the State Program "Information Kazakhstan-2020" was aimed at the transition to an information society, which in 2017 lost its relevance. Further development of the country is aimed at the introduction and application of digital technologies under the new program of the Central Committee.

At the same time, the Government did not ensure the continuity of policy in this area. As a result, certain indicators that allow an objective assessment of the development of the information and communications technology industry are not included in the state program "Digital Kazakhstan". (with implementation period 2018 - 2022).

In 2018, 42.5 billion tenge were allocated for implementation of the state program "Digital Kazakhstan", the execution on which amounted to 40.3 billion tenge, or 95%. Savings on the allocated funds amounted to 932.8 million KZT.

It should be noted that in 2018 the amount of allocated funds significantly exceeded the amount envisaged in the State programme "Digital Kazakhstan". (for 21 billion tenge, or almost twice).

The funds from the national budget in the amount of KZT 54.5 million were not used due to late submission of contracts for registration to the treasury authorities (KZT 47.2 million) and failure of the supplier to meet its contractual obligations for software supply (KZT 7.4 million).

The majority of the allocated funding was not executed by the quasi-government sector (own funds): KZT 1.1 billion out of KZT 13.9 billion due to the extension and change of contractual obligations.
Based on the above, it can be concluded that there is state support for the information sector in Kazakhstan, but the motivation of performers to achieve the target indicator and perform specific tasks is weak.

Conclusions and Recommendations

Currently, the information environment in Kazakhstan has potential opportunities for entrepreneurial initiatives. The virtual space provides business activities without any restrictions. The main parameter and factor affecting the profitability is the number of users on the Internet resource. That is why reliable statistical data is very important for business development in the information environment. On the basis of this data is based on the business model of the enterprise, the development of marketing strategy, selection and qualification of personnel and prospects for the development of the enterprise. Obviously, there is no need to stimulate the development of the entire value chain, but only those elements that contain the greatest added value, or those elements that provide an opportunity to enter the world markets and further move towards economic activity with higher added value. The approach to identified gaps in the value chain should be comprehensive, rather than focusing on individual elements. In other words, support should not be provided to an individual element or company, but across the entire value chain of enterprises or key enterprises in an industry linked by a single value chain.

Value chain analysis cannot be carried out without market-based analytical research. It is necessary to create a domestic market of consulting services in marketing and in-depth research of the information environment. Enterprises of the industry have a great need for analytical market research, carried out at the world level.

The identified niche areas in terms of the impact of the value chain on the company's competitive position in the information environment will allow to have a significant competitive advantage in the market. Building the company's processes from technology to the end user allows it to retain its competitive advantage.

The information environment industry allows companies to use free or unfilled niche areas. It is possible to note the following niche directions in the chain of added values, using the modularity and possibility to provide components for goods/services:

1. Outsourcing work related to software development for ERP, ECM and CRM systems;
2. Development and creation of modular visualization packages for various industries not only in Kazakhstan but also in other countries (engineering, aviation, energy, modeling systems, etc.);
3. Development and implementation of services for production of high-tech components for companies that specialize in the production of the final product. Delivery of constituent parts will allow entrepreneurs to enter into close partner relations with the companies-customers.
4. Development and creation of applications for mobile devices that provide services to the end user (car parking services, provision of statistics and operational data on new media, accounting and control of children's movement and much more).
5. Organizing the work of online stores.

No special permission documents are required for entrepreneurship in the information sphere of Kazakhstan.

Social Impact Bond – Outcome and Outcome Measurement on The Basis of Selected Sibs

Wojciech Krawiec

Wroclaw University of Economics and Business,
Faculty of Economics and Finance, Wroclaw, Poland
wojciech.krawiec@ue.wroc.pl

Abstract

The article introduces the essence of social impact bonds and presents the analysis of the outcomes formulated by SIBs, outcome metrics and evaluation methods of the achieved results, based on the example of SIBs functioning in the area of counteracting unemployment. The first part of the study presents the subject literature overview in the area of SIBs, including the important features of SIBs and the associated concepts. The second part of the study offers the respective analysis and assessment of the outcomes formulated by the selected SIBs, outcome metrics and the evaluation of the applied methods. The conducted analysis allowed formulating answers to the research questions presented in the introduction to the article as well as verifying the following hypothesis: Despite the discretionary system for determining outcomes, the presented outcomes and outcome metrics as well as the applied evaluation methods guarantee both independence and objectivity of the results achieved by SIBs and may contribute to the stakeholders' greater interest in SIBs.

Keywords: Social Impact Bonds; Impact Investing; Impact Measurement; Social Finance.

Introduction

Unemployment, homelessness, disability, poverty, civilization diseases and migrations represent just a few social problems faced by the societies worldwide. These problems generate the continuously increasing expenses from the budgets of states and local governments, which translates into the reduction of funds to be allocated to other purposes. Moreover, it is worth emphasizing that a single problem may determine the next to follow and thus generate additional costs for the entire society.

The outcome payers, i.e. state governments and local government units have been looking for years for the efficient and, above all, cost-effective tools to reduce them. It is true that the traditional tools for solving social problems result, on many occasions, in the desirable effects, however, they are frequently just the short-term ones, whereas the main reason for this situation is the fact that the results of individual actions are mostly measured only through the prism of the expenditure incurred or the number of interventions made, etc. Such approach is more an assessment of the "support provider's" effectiveness, which is often focused on the result alone and in no way addresses the impact assessment of such actions on the beneficiaries covered by this measure. Conducting trainings for the unemployed does not have to result in them finding either a temporary or a permanent job, resulting in e.g. the reduction of expenditure on benefits. As a consequence, the budget spending may continue to increase and the problems may still be present. The disadvantage of traditional problem solving methods is also the fact that the entire risk of ineffective operations has to be handled by the "owner of the problem" alone.

Social impact bond (SIB) can play the role of a tool to fight social problems more effectively – innovative ways of funding social services based on the payment-by-results mechanism, where a specific, usually a long-term result (e.g. finding and sustaining employment, permanent recovery from addiction, permanent or temporary recovery from homelessness) is paid for. Importantly, in this mechanism the outcome payer does not bear the risk associated with funding the project, because it is passed on to investors and the

return on capital, along with the possible interest, depends on the actually achieved – measurable and verifiable – outcomes affecting beneficiaries of the individual projects.

The purpose of this article is to diagnose the outcomes planned by SIB and the methods of their evaluation based on the example of SIBs functioning in the area of fighting unemployment. Achieving the defined goal is facilitated by providing the original author's answers to the following research questions:

1. Is there a uniform system, within the analysed SIBs, for defining outcomes which they intend to achieve?
2. Are the defined goals measurable and thus offer a greater guarantee for their verification (validation)?
3. How are the defined outcomes verified to form the basis for funds' payment to investors?

Following the adopted purpose of the article, the below research hypothesis was formulated: Despite the discretionary system for determining outcomes, the presented outcomes and outcome metrics as well as the applied evaluation methods guarantee both independence and objectivity of the results achieved by SIBs and may contribute to the stakeholders' greater interest in SIBs.

Social impact bonds outcome and outcome measurement – literature overview

Social bonds are based on the payment-by-results (PBR) mechanism, invented in 1988 by the economist from New Zealand – R. Horesh. It is a funding mechanism consisting in payment for achieving a specific – previously adopted – measurable outcome. The subject literature provides many terms referring to social bonds, however, it is worth highlighting that the term "bond" used in some of these terms is misleading, because SIBs do not represent traditional bonds, but rather future liabilities (contracts) depending on the obtained results.

SIBs cover the features of various financial instruments because, just as in the case of:

- derivatives, the profit payment depends on the occurrence of a specific event, i.e. the achievement of a specific social result,
- debt instruments, the investment has a specific timeframe, the maximum return rate is fixed in advance and, additionally, the capital can be fully or partially secured,
- shares, the invested capital is subject to risk,

therefore, they can be referred to as hybrid instruments (Bolton, Savell, 2010, Maier, Meyer, 2017, Edmiston, Nicholls, 2018).

As observed by Fox C. and Albertson K. SIBs should be the response to the problem of funding social services, while also contributing towards increasing the efficiency, effectiveness and innovation of the services provided (Fox, Albertson 2011). According to Chiodo V. SIBs are characterised by 3 important features, i.e.: focus on preventive actions (interventions), application of the PBR mechanism and the development of a complex network of stakeholders, including public and private organizations (Chiodo, 2015). In addition, Mulgan draws attention to the commitment of the outcome payers to return the capital with interest after achieving the adopted measurable outcomes and savings in public expenditure (Mulgan et al., 2010).

In the context of the above discussion, it should be noted that one of the key determinants of SIB's success is the clear definition of the intended social outcome, specified in the agreement between stakeholders. It is also important that this outcome is better than the ones achieved based on traditional interventions. The supporters of SIBs attach great importance to the robustness of the outcomes which, among others, results from the fact that payments to investors depend on these outcomes. In addition, the focus is also on the correct identification of the outcome metrics. (Dear et al., 2016).

In order to fully understand the importance of outcomes for the success of SIBs and to be able to indicate the advantage of SIBs over traditional mechanisms for providing social services, it is worth defining the terms used in describing these mechanisms. Following a classical approach, the discussed concepts can be divided into two groups. The first of them includes planned work and the related internal results, which a given entity has impact on – inputs and activities. The second group covers primarily the intentional, intended results of external nature, on which the entity implementing the task has either lower or insignificant impact. The following terms are used in this respect: output, outcome and impact. The aforementioned differences between modern and traditional forms of social services provision depend on these three concepts and the respective approach to them.

Thus, output should be approached as tangible products from the activity (measurable actions or conditions that assess progress against specific operational activities, e.g., number of people reached, items sold). Whereas outcome should be understood as changes resulting from the activity (measurable actions or conditions that demonstrate progress towards specific outcomes, e.g. increased access to education or increase access to employment). Depending on the horizon over which outcomes are measured, an intermediate outcome may be used, which specifies a result proximate to an intended outcome, but likely more achievable in the lifetimes of a project. For example: Teachers use the new teaching methods (intermediate outcome) to improve learning among students (final outcome). Impact means broader change occurring in communities or systems resulting from the activity (effects on broader target population, e.g. sustained drop in poverty, increase in literacy rates. (So, Staskevicius, 2015, Investing in social outcomes…, 2013).

As indicated earlier, the desired social outcome should be expressed by an appropriate metric, determined jointly by stakeholders while developing the SIB structure (Disley, 2011, Tsukamoto, 2017). In the process of determining the appropriate outcome metrics, attention should be paid to the following characteristics: measurability, avoidance of perverse incentives, ability to evaluate success, and the potential for independent verification of results (Investing in social outcomes…, 2013).

Outcome metric used to measure the success of a SIB should fulfil two functions. First, it needs to provide ongoing feedback on intervention progress. It is imperative that all parties with a vested interest in the bond succeeding be able to gauge how effective program interventions are prior to the completion of the program. This will allow any deficiencies to be corrected and provides a higher chance at the desired outcome. Second, it should be strongly correlated with the financial benefit that the program expects to achieve. Metrics that have too weak of a correlation may end up causing investors to be rewarded without any savings being realized to pay them with (Liang et al., 2014).

Since the outcome measurement determines the payment to investors, it is important that the presented outcomes are statistically significant and confirm that they result from intervention, rather than a coincidence. For this purpose, it is necessary to select the target group (cohort) for the given project correctly. As Mulgan indicates, small outcomes will require large cohorts to ensure statistically significant results, while large outcomes can have smaller cohorts (Mulgan et al, 2010, Floyd, 2017).

Of course in practice, the presented outcomes are subject to monitoring and evaluation, in many cases, by independent evaluators. These activities also play a significant role because they promote accountability and help keeping the projects at the right level. Close monitoring and regular evaluation also provide a mechanism by means of which projects can be stopped due to exceeded cost as well as facilitate the learning process in the context of the future implementation of SIB projects (Chamaki et al., 2019). Regardless of who carries out the evaluation process, one of 4 evaluation methods is used, such as: validated administrative date, historical comparison, quasi-experimental, randomized control trial (RTC). The last 3 are included in the group of comparative methods.

And so, in the administrative data model, the project result is evaluated based on the data submitted by the provider or, possibly, the specialized agencies. Historic data can also be used in this case, to determine the initial values for the needs of the scorecard. It should be remembered that this model does not offer the direct comparison between the outcomes achieved by SIBs' beneficiaries and those accomplished by

non-beneficiaries. This model is most often used in these SIBs, in which the payment of invested capital is based on a scorecard, where the individual outcome metrics are assigned maximum payment values for the investor. It is worth highlighting that in this type of solutions a large number of outcome metrics is quite often present.

In comparative models, the outcomes achieved by SIBs' beneficiaries are compared with the ones achieved by a comparable group of people, who were not subject to intervention by SIBs. Mostly historical comparison, quasi-experimental and randomized control trial are used in this case. These methods allow answering the following questions: What would have been if the program or intervention had not taken place? and What are the changes in outcome directly attributable to the implemented intervention or program? (Floyd, 2017, So, Staskevicius, 2015).

Research Methodology

The selected research methods were used to carry out the purpose adopted in the introduction to the study. Therefore, in order to address the essence of social bonds and the characteristics of their planned outcomes, as well as the measures used to evaluate these results, the critical subject literature review was applied and the data available on websites were used.

However, as part of the diagnosis of the planned outcomes as well as the outcome measures and the evaluation methods, the method of analysis and observation, including comparative analysis, was used. The main source of information was the data available at the website https://sibdatabase.socialfinance.org.uk/, which is the basic source of information about the launched and in development SIBs worldwide. However, it should be emphasized that the data provided by the abovementioned database, run by the Social Finance, were retrieved from the public domain materials and were not independently verified, which results from the fact that part of the information on the selected SIBs is not fully publicly available, thus the information presented below may be incomplete. In addition, the data from the available SIB reports were used, as well as the data published in the subject literature.

The actively functioning SIBs, focused on counteracting unemployment only, were adopted as the research sample. The argument supporting their choice was the fact that they constitute the most numerous group among the SIBs dealing with the broadly understood labour support. As at January 15, 2020, as many as 44 SIBs were functioning in this area.

As a result of data availability verification, 17 SIBs functioning in the years 2012-2019 in Great Britain, the Netherlands, Germany, Belgium, Switzerland, Finland, Portugal and France were selected for the analysis. Within the framework of SIBs a larger number of projects either were or still are being implemented, therefore the total number of analysed projects is 31. To describe the research sample used in the analysis, the following parameters were used, e.g.: outcome, outcome metric, evaluation methods.

Research Findings and The Resulting Conclusions

Within the framework of carrying out the adopted research goal, i.e. the diagnosis of planned outcomes and methods of their evaluation, the analysis of the selected SIBs' functioning in the area of counteracting unemployment was conducted. The analysis resulted in providing the author's answers to the research questions formulated in the introduction to the study. The results of the analysis are presented in Tab. 1.

Therefore, answering the first research question: is there a uniform system, within the analysed SIBs, for defining outcomes which they intend to achieve? It should be observed that there is no uniform system of defining goals for SIBs addressed to the same area of social activity, which translates into the differently defined outcomes. This situation results primarily from the characteristics of the target groups covered by SIB support, which differ from each other. Considering this criterion, the presented outcomes can be assigned to 4 following groups:

1. increasing the employment prospects of young people, in particular those at risk of becoming NEET,
2. gaining and sustaining a job to move off state benefits,
3. gaining and sustaining a job by persons with disabilities or emigrants,
4. finding a job in the form of self-employment.

It is worth emphasizing, however, that despite the differences in formulating main objectives, the activities implemented under individual SIBs may result in the outcomes which have not been explicitly articulated in specific SIBs. For example: the desire to improve employment prospects of young people, in particular those at risk of becoming NEET may result in reducing the number of people covered by benefits, although the outcome itself was not intended in any way. Also, the activities aimed at finding a job by persons with disabilities may, in consequence, contribute to the reduction in the amount of paid benefits or, e.g., health condition improvement, which can, e.g., result in the reduction of healthcare costs.

Obviously, in the case of some SIBs, the adopted outcomes as well as the outcome metrics are either the same or very similar. The British or Dutch SIBs can serve as the example. It should, however, be highlighted that often, despite the same goals, the manner of their implementation may differ, which is evidently confirmed by the example of SIBs from DWP IF group.

The differences between the main goals are also visible in the established outcome metrics for the individual SIBs, although also in this case there are SIBs with identical outcome metrics. The nature (form) of the adopted indicator depends primarily on the agreed outcome, but also on the method of combining the payment with the intervention outcome and its verification method.

There are two methods for defining outcome metrics in the group of analysed SIBs. The first one is based on the tariff model (using Rate Card) and forces SIBs to specify many outcome metrics in relation to a single beneficiary. As a result, payment by results depends on the achievement of specific outcomes and, most frequently, represents the sum of payments for the actually achieved outcomes related to a single beneficiary. This method is used by SIBs classified as DWP IF and Youth Engagement Fund. The same Rate Card is used in both SIBs, which evaluates 13 outcomes in 3 problem areas. Due to the lack of data, it cannot be unequivocally ruled out that a similar method is used by the Dutch Venlo SIBs and the French SIBs. However, in the case of these SIBs, the author believes they use the other methods – presented below.

The remaining SIBs most often indicated one outcome metric, which results from the fact that they adopted a separate method of determining payments for investors from those previously mentioned. These outcome metrics can be divided into the following groups:

1. number of days during which beneficiaries do not use benefits,
2. number of people who found either a permanent or a temporary job,
3. number of initiated (adopted) business activities and the number of jobs created,
4. other (e.g. number of people covered by support, covered by the test).

Regardless of the form of the adopted outcome metrics, they should be characterised by the appropriate, indicated earlier, features such as: measurability, avoidance of perverse incentives, ability to evaluate success, and the potential for independent verification of results. This is primarily covered by the following research question: are the defined goals measurable and thus offer a greater guarantee for their verification? As far as measurability is concerned, it should not be questionable. In fact, the analysed outcome metrics are measurable (expressed in value or quantity) and, most importantly, to a large extent, obtaining the data needed to evaluate SIBs' intervention outcome should not be a major problem or generate excessive costs for all parties to the contract. The more so, that part of the data needed for the verification represent the data provided by public agencies. This also refers to the outcome metrics applied by SIBs using the Rate Card. For selected SIBs, measurement and evaluation require more complex activities, being the consequence of both the adopted outcome metrics and the applied evaluation methods. In this case, e.g. Dutch SIBs are a good example.

In the author's opinion, the proposed outcome metrics are so clearly defined that they are also free of the intentional influence of any incentives which could contribute to their manipulation. In addition, they offer full opportunity to assess the success or failure of a given social intervention.

Finally, it is important that the adopted outcome metrics provide the possibility of an independent verification of the outcomes achieved by SIBs. This is related to the last research question, i.e.: how are the defined outcomes verified to form the basis for funds' payment to investors?

The conducted analysis shows that in 9 cases, SIBs used validated administrative data model to verify and evaluate the outcomes. It referred to British SIBs (DWP IF, Youth Engagement Fund) and Eleven Augsburg SIB. In the case of British SIBs, it resulted from the tariff model adopted for payment implementation. The German project additionally used the qualitative evaluation method carried out by the Faculty of Economics and Social Sciences at the University of Hamburg. In terms of Veldhoven SIB, Venlo SIB and 3 French projects - due to insufficient information - such an assumption was made based on their outcomes and outcome metrics. However, it is possible that they used (use) other methods of evaluation.

Other SIBs used comparative models. The Dutch SIBs used historical comparison. The Belgian Duo for Job and the Swiss Bern SIB applied quasi-experimental methods, whereas the least recognized Finland SIB used randomized control trial.

As it has been shown, none of the evaluation methods used by the analysed SIBs outweigh the others. It should also be considered that in the case of individual projects, the evaluators could have used mixed evaluation methods for better verification of the achieved outcomes. Unfortunately, not all information on individual SIBs is available in the public domain, which significantly impedes their analysis. The research conducted so far, covering a large number of SIBs addressing various social problems, shows that the majority of SIBs use a validated administrative data model for the evaluation purposes. The reason may be both cheaper and faster access to specific data, generated by the specialized public agencies. The remaining evaluation methods are more labour-intensive and, therefore, more expensive.

Conclusion

To sum up, in recent years, social impact bonds as an innovative mechanism for funding social services have been gaining popularity, which is confirmed by the development of these instruments in terms of quantity and quality. The further success of this tool will be determined by many factors having impact on payment-by-results contracts, among which the key role will be played by the correct determination of the intended outcomes, as well as the methods of their measurement and verification.

In the author's opinion, the conducted analysis of the presented case study, supported by the literature analysis, allowed formulating answers to the research questions presented in the introduction to the article as well as confirming the following introductory hypothesis: Despite the discretionary system for determining outcomes, the presented outcomes and outcome metrics as well as the applied evaluation methods guarantee both independence and objectivity of the results achieved by SIBs and may contribute to the stakeholders' greater interest in SIBs. Although the formulated outcomes differ in content and dimension depending on individual SIBs, they are fully measurable and, according to the author, free of the manipulation risk. In addition, the applied evaluation methods ensure full guarantee of their verification and confirmation, in particular by the independent evaluators.

The author approaches the considerations presented in the article as a voice in the discussion on the problem of social bonds and the starting point for further research and analysis focused on the role and importance of social impact bonds in funding social services. Certainly, the effectiveness of the already completed projects should be subjected to a more extensive assessment, both from the perspective of implementing the adopted outcomes and the funds paid to investors. It is worth emphasizing, however, that if this mechanism is to become one of the alternative ways for providing social services and turn out

a more common instrument used as part of social investments, the information on the current results of SIBs and their effectiveness for all stakeholders should be more available

Figures and Tables

Table 1: Selected SIBs operating in the area of unemployment

LP	Name of SIB, Target group, Evaluation methods	Outcome	Outcome metrics
1	**DWP Innovation Fund Round 1 GB** (6 projects) Disadvantaged young people (11 887) **DWP Innovation Fund Round 2 GB** (4 projects) Disadvantaged young people (4 120) *Validated administrative data – tariff model*	To increase future employment prospects for teenagers at risk of becoming NEET (Not in Employment, Education or Training) (Age 14+).	**Improvements at school**: Improved: attitude to school/education; school attendance; school behavior **Qualifications**: Qualifications and Credit Framework accredited Entry Level Qualification Basic skills First Level 1, First Level 2, First Level 3, First Level 4 NQF Qualification English for Speakers of Other Languages **Employment**: Entry to first employment (13 weeks / 26 weeks)
2	**Youth Engagement Fund GB** (4 projects) Disadvantaged young people (7 900) *Validated administrative data – tariff model*	as above in DWP IF	as above in DWP IF
3-5	**Rotterdam SIB** (2 projects) Unemployed young people (160) / Unemployed jobseekers (750) **Utrecht SIB** (2 projects) Unemployed young people (792) **Eindhoven SIB** Unemployed young people (400) *Historical comparison - based on the personal characteristics of an individual*	To enable unemployed young people to move off state benefits.	The reduction in benefit days saved from moving people into employment / reduction in unemployment is measured using a model that predicts an expected duration of unemployment based on personal characteristics for each individual.

6	**Enschede SIB** Adult jobseekers (138) *Historical comparison to relative to control group**	To find work in Germany over the next 2.5 years.	The reduction in benefit days saved from moving people into employment.
7	**Flemish SIB Antwerp** Young people unemployed (270) *Historical comparison to relative to control group**	To increase future employment prospects for NEET teenagers.	The number of the young people on the program who find work compared to a comparable group (10%).
8	**Veldhoven SIB** Refugees with a residential status (70) *Validated administrative data**	To increase language skills and gain employment.	The number of beneficiaries who remain employed for two years.
9	**Venlo SIB** Unemployed people in Venlo *Validated administrative data**	To help people with a big distance to the labour market return to work / happy participants and fewer people dependent on state benefits.	1. Better personal circumstances. 2. More stability. 3. Better health. 4. Increased social participation. 5. Better labour market position. 6. Paid employment.
10	**Eleven Augsburg SIB** Unemployed young people (100) *Validated administrative data. There is an additional qualitative process evaluation taking place, run by the Faculty of Economic and Social Sciences at the University of Hamburg*	To gain and sustain employment.	The number of members of the target group placed into work or apprenticeship for more than 9 months. 20 young people (20%) must reach this outcome
11	**Duo for a Job Brussels SIB** Unemployed migrants aged 18-20 (180) *Quasi-experimental (matched comparison group)*	To gain and sustain employment.	The one-year reemployment rate, defined as having accumulated more than 90 days of employment or obtained a permanent employment contract in the year following the program.
12	**Bern SIB** Refugees and applicants with temporary permits (120) *Quasi-experimental (matched comparison group)*	To provide a better opportunity for financial independence and sustained employment.	To place 60-70 beneficiaries in lasting employment after completing and apprenticeship. The agreed targets are based on similar, but non identical, integration programs.

13	**Finland SIB** Unemployed refugees and migrant (3000) *Randomized Control Trial and measured through differences in tax collections and unemployment benefit payments between control and target groups*	To gain and sustain employment / the integration and employment of immigrants and refugees.	*unknown*
14	**Porto SIB** Young unemployed adults (150) *Validated administrative data**	To gain and sustain employment.	The outcomes are both entry into employment (40%) and 6-month job sustainment (20%).
15	**France SIB Access to mobility for vulnerable people** Vulnerably individuals (10 000) *Validated administrative data**	To increase access to employment for 10 000 beneficiaries / To help to return to or remain in employment.	1. Number of realized Mobility Tests on beneficiaries (10 000). 2. Proportion of beneficiaries benefiting from mobility support following Mobility Tests (80%). 3. Proportion of Mobility Test performed by the prescribing structures (17%).
16	**France SIB Job creation in deprived areas** Entrepreneurs and jobseekers in deprived communities (1000) *Validated administrative data**	To reduce the barriers to entry for entrepreneurs starting franchised businesses in designated socially deprived areas.	1. The number of viable businesses created (200 to 300). 2. The number of jobs created (1000 to 1500). 3. The number of completed training qualifications (350 to 500).
17	**France SIB Rural unemployment** Job seekers those in unstable employment (1000) *Validated administrative data**	To access to sustainable employment.	1. The number of people funded and supported by the service (500). 2. The number of people permanently employed as a result of the program (320)

Business or Marriage?
The Review of Startups and Relationships

PIOTR M. KUPCZAK

Wroclaw University of Economics, Poland
Email: pio.kup@gmail.com

Abstract

The aim of the article is to present the essence of relationships in the process of the enterprise emergence in the perspective of strategic management. Based on the pilot of in-depth studies analyzing the most important aspects of mutual relations between entrepreneur (CEO) and Angel Investor (INV), the author attempts to analyze informal relationships as the basis for the successful exchange of resources between the business partners in the creation and development of start-ups. The results of the study lead to one conclusion: the success of a start-up is the result of a unique relationship of successful people.

Keywords: Start-up, relations, resources, multi-relations, inter-organizational relations, competitive advantage, strategy, entrepreneur, Angel Investor

Introduction

In the turbulent global business environment of the 21st century, impressive technology development, growing market saturation and increasing monopolization in individual sectors, the level of difficulty to create new successful enterprises and develop existing ones constantly grows. Despite this, there are business initiatives on the market that quickly allow their creators to achieve not only above-average financial results, but also to create global enterprises, making millionaires from their creators. Start-ups in the second decade of the 21st century along with their brilliant creators are presented as a synonym of entrepreneurship, and innovation. The most often discussed examples are these achieving a very high return on investment. Unsuccessful ventures, that the market has not accepted, are rarely analyzed. However, the question about the source of startup success, especially at the stage of establishing and initial rapid growth, is constantly repeated in the strategic analyzes of these projects. What do really causes that some startups quickly gain advantage not only on the local but also global market? What is the source of start-up success? Is it a competitive idea, the characteristics of the creator and his knowledge of the sector, or the size of investment capital at the beginning? Or maybe the market environment of the enterprise…?

The discussion about start-ups is very exciting, however discussion in strategic management perspective is a challenge, mainly because of its blurred boundaries of the venture and its partial ambiguity. The most often frequently indicated reasons for the fall of start-ups are errors made in implementing the market strategy, for ex.: poor marketing, lack of financial strategy and insufficient level of cash, no market need for the product/service, lack of business model, high competition in the sector etc.… In the first perspective the causes of the potential failures looks easy to obey. To succeed it is just enough to have innovative project and to try not to fly on the mentioned flanks. However, when we look at the variety of survival reports from different countries we can find out that about 90% of business initiatives does not survive for first 5 years… We also find out, that these are not engineers with innovative know-how that win that game -the majority of the most successful start-ups CEOs were studying the humanities and social sciences (Startup Poland, 2019) and they were matured experienced adults (60 year old entrepreneur is 3 times as likely to build a successful start-up than a 30 year old one (Embroker, 2020) with international business experience (ex. the 46% of Polish entrepreneurs lived abroad) and about 18% of them are scientists (Startup Poland, 2019)… The image of the successful new entrepreneur doesn't have face of young man in his 20s like in the start-ups advertising. More often it is face of mature, experienced, energetic gentleman who using his experience and personal

charm, enters into mature partner relationships with others building on his social networks. His relations lead to happy marriage and there is high probability, that "they live happily ever after". If an entrepreneur reminds a mature gentlemen who is the successful starts-up-marriage investor and what is the start-up relation?

In his several years of work with start-ups, the author of that paper noted that in the creation of new enterprises one of the most key sources of success are the relationships that arise between the entrepreneur and the investor. That was the inspiration for further dialog with business partners – investors (INVs) and entrepreneurs (CEOs), then to creation of the pilot-survey to confirm the observations. Two groups of respondents presented very interesting, however slightly different perspectives on relations in emerging new business ventures, that are presented in that paper.

Literature Review

Relations as Resources Bonding Organizations

Publications in the field of management are full of both examples of business success based on the ideal conditions of the external environment of the company (e.g. Porter, 1969), as well as examples describing the internal potential of the organization as a source of competitive advantage (e.g. Resource Based View (Barney, 1991, Barney and Clark, 2007; Barney at all, 2011), Core Competence Approach (Hamel and Prahalad, 1990), Dynamic Capabilities Approach (Teece et al. 1994, 1997) However, in the perspective of establishing new enterprises, special attention deserves a relational approach, which uses relational bonds (Dyer and Singh, 1998; Zakrzewska-Bielawska, 2011, 2014, 2016, 2019) Assuming that the elements of the organizational structure are people, technology and goals, it is only the relationships between them that form the binder that enlivens the construction (Zakrzewska-Bielawska, 2012, p. 251). These relationships are referred to as organizational ties complexity and diversity of elements in enterprises resulted in a variety of definitions of the organizational structure. The organization is presented as a set of structural elements used to shape the organization, a result of using in the form of a specific arrangement of organization elements and their connections, a way of dividing work into tasks, as well as coordinating those. The organization appears as formalizing the distributed relationships between responsibility for the tasks, people and resources of the organization, or as the functions of relations and functions which, as a whole, formalize the mission of individual organizational units in a formal manner, as well as organizational principles between individual parts of the organization. It is also treated as a set of relations between elements of the whole and between them and the whole, analyzed in a specific perspective, a functionally and hierarchically organized system of dependencies that occur between organizational positions, cells and higher-level units. The organization can be treated as a set of elements and specific relationships that occur between elements of the organization, without taking into account elements per se, and also as the entire relationship between elements of organization: people and material components, as well as the way they are ordered, which allows distinguishing the structure of things (organization elements) and structure of processes (sequence of events) (Gryffin, 2010; Mintzberg, 1993; Cliffs, Pearce and Robinson, 2007; Zakrzewska-Bielawska, 2012, p. 252).

Between the individual elements of each organization there is a wide and diverse number of identified and unaware relationships - organizational ties. Zieleniewski (1976) proposes variety of ties examples. First one is service bond (hierarchical, linear, vertical), which concerns the location of decision-making powers and expresses parental relations and subordination. Due to his verticality (one superior - one subordinate) he meets the rigor of the principle of unity of order: one source is the source of orders, instructions and prohibitions, decisions and suggestions. This bond organizes the organization, defining and assigning each workplace to individual cells. It also establishes service dependencies and distribution of power. The second bond is functional (advisory) bond is expressed by providing consultancy services between specialists in various fields and regarding the diversity of professional competences (mainly employees' knowledge and skills). Combining workstations occurs in different cells and at different levels, it can have two characters. The first of these is the functional-hierarchical character expressed in the business relationship between functional managers located in different places of the organizational structure who work with employees at lower levels, which leads to having many

superiors depending on the specifics of the implemented project (breach of the principle of unity of order). The second character of functional bond is functional and supportive, which is based on advising, reviewing and consulting tasks performed by managers and specialists who have been specialized in a given function and who have not received the right to make decisions. In this situation, the employee asks another manager or specialist for help and advice. This relationship contributes to the increase of knowledge at various levels of the organization. A technical bond (cooperation bond) third tie proposed by Zieleniewski (1976). It is a horizontal bond that occurs in the division of labor and describes the relationships between units involved in one technical process or one set of activities. It connects positions at the same level and is limited to the organizational cell framework. The fourth one is the information bond (the so-called Fayola footbridge / bridge) is another horizontal bond that is expressed in the exchange of information and knowledge, imposing an obligation to inform each other on all participants of the organization. In contrast to the technical bond, it goes beyond one organizational unit, which promotes learning and expanding knowledge resources in the organization (Zakrzewska-Bielawska, 2012, p. 257).

It is also worth paying attention to the ties presented in a different way from the classic. Such an example is Sikorski's synthetic approach (2006), which distinguishes cooperation, coordination and communication relationships. Cooperation relations arise as a result of division of labor, coordination as a result of division of power, communication as a result of information flow. On the other hand, Nalepka and Kozina (2007) creates a very extensive typology of bonds based on the foundation, which is the source of addiction or because of the characteristics of the relationship in relation to individual relations. In relation to the source of addiction, they distinguish hierarchical relationships (including commanding and regulatory ones) and functional dependencies (operational and informational advisory), and due to their characteristics they analyze features in the perspective of an addictive member, addicted member, subject of addiction, type of addiction, form the information provided, the form of feedback, the direction of addiction in the structural perspective, the formalization of addiction and its measures, and the sanctions that the addictive member uses in relation to the addicted member (Zakrzewska-Bielawska, 2012).

It is worth noting that relationships often overlap, and the type of dominant relationships can determine the nature of the enterprise's structure and the culture of its conduct. The level of formalism of relationships within an organization (e.g. formal, informal) may also affect the company's strategy. Depending on the proportion and nature of the relationship, an enterprise may gain or lose a competitive advantage. The proportions of formal to informal and informal relationships can also evolve at various stages of an organization's life.

Inter-Organizational Relations

Inter-organizational relationships are increasingly treated as a source of competitive advantage and a profitable source (Dyer and Singh, 1998; Uzzi, 1997; Grandori, 2012, Stańczyk-Hugiet, 2016). They deal with the relational approach, analyzing both relationship configurations and the direction of their development, especially in organizational networks (Stańczyk-Hugiet, 2016; Dyer and Singh, 1998). Unlike organizational relationships, inter-organizational relationships in the space between different entities. In an increasingly saturated market, where competitors with similar material resources and intra-organizational relationships provide almost identical products to the global market, and changes in the environment require flexibility and dynamics, inter-organizational relationships appear as sources of competitive advantage (Zakrzewska-Bielawska, 2017). Competition for products and markets, resources and competences cannot exist without relational resources (Stańczyk-Hugiet, 2012, in: Zakrzewska-Bielawska, 2017), and the multi-level organization, as well as an increasingly complex network of stakeholders along with dynamic changes in the environment have an impact on growing uncertainty of the environment (Romanowska, 2016), as well as forcing the creation of a relational strategy. In this perspective, relationships create the form of a relational strategy understood as "a continuous and dynamic process of choices regarding the establishment, development and withdrawal of inter-organizational relationships, made in conditions of uncertainty (constraints, pressures and opportunities) in order to create and capture value, maintain development potential organization and receipt of a relational pension“ (Zakrzewska-Bielawska 2017, p. 181). As indicated by Zakrzewska-

Bielawska (2017), the basis of relational orientation is the willingness to cooperate with other entities in order to obtain an economic rent (Niemczyk, 2013) or online (Krzakiewicz and Cyfert, 2014).

Inter-organizational relationships can occur between various entities, both in the market space (suppliers, competitors, customers) and non-market space (government institutions, non-profit, media, residents…). (Baron, 1995; Zakrzewska-Bielawska, 2016). The selection of a partner can have operational and strategic significance leading to competitive advantage. The relationship that arises, its type, determines the durability and length of cooperation. However, the formation of an improper relationship can be toxic to the organization. Emden, Calatone and Droge (2006) list three types of matching as the main factors affecting the quality of relationships: technological fit (resources, knowledge, skills), strategic fit (goals and motivation) and relational fit (culture, flexibility, perspective) (Zakrzewska-Bielawska, 2017).

However, trust seems to be the most critical in relationships, which reduces uncertainty and the risk of failure (Casciaro and Lobo, 2008; Kim at al., 2009). A competing or uncompetitive partner influences the level of trust and inter-organizational dynamics (Bengstsoon and Kock, 1999): competition, coexistence, coopetition and cooperation, and cooperation between partners is the main source of competitive advantage (Ritala and Ellonen, 2010). Relationships based on coopetition and cooperation are burdened with the least risk of failure, and relationships created on them have the chance to benefit both parties (Zakrzewska-Bielawska, 2017).

Just as choosing a partner is the first strategic choice when creating a relationship strategy, the next is how to build relationships. Relationships can be intentional and purposeful (planned and established), or they can naturally be formed during the cooperation of entities (Krupski, 2010). Due to the external environment of the organization, the choice of relationship partners is made both in a conscious and planned manner, as well as incremental (emergent), based on the use of emerging opportunities. The purpose of the relationship, partner, and inter-organizational dynamics that make up the content of the relationship strategy are mutually coupled (Zakrzewska-Bielawska, 2016)

An important element of relationship strategies is their non-market dimension. In the integration perspective, however, relational strategies are defined as complementary to market strategies (company dimension and market dimension), because in the approach of relational strategies an additional dimension defined as the 'external market dimension' becomes critical (STRATEGOR, pp. 262-268, Krupski, 2007, p. 42). It indicates the need to supplement the internal competences of the organization by the possibility of a large number of relationships with external objects and is a consequence of current competitive conditions, and is also the basic conditions formulated in the concept of strategic management as: "relationship portfolio" (Zakrzewska-Bielawska 2012, p. 20). The fundamental premise of research on the relationship between institutions and enterprises is, that they can create and use “personal and institutional links between companies and public authorities (Sun, Mellahi and Wright, 2012, p. 68 in Feinberg, Hill & Darendeli, p. 4), which is a source of benefits for the parties. An example of such links are political links, which can be a source of financial benefits and institutional change. Links between politicians and the business environment (Feinberg et al., 2015) may be derived from the shared past of entities (e.g. a joint university), family connections, belonging to the same political party or business group (Khanna and Pelepu, 2000). Links can also be part of corporate policy strategy (Feinberg et al., 2015). This is related to the phenomenon of revolving door - employing former politicians, placing them on supervisory boards as well as placing high-level managers in important institutions, co-financing events political lobbying (Feinberg et al., 2015). The value of a relationship for an enterprise depends on the severity of the problem. This type of relationship can protect the company against external risk (e.g. legislative change), or it can bring benefits (e.g. lowering taxes, lifting customs barriers). The depth of the relationship, the company's presence in political and social life can be a source of strategic advantage for the company (Wang and Jiang, 2008; Feinberg et al., 2015), but it can also lead to a catastrophe, e.g. cronyism and corruption that could lead to the collapse of the company (Feinberg and others, 2015; Doh et al., 2012).

Relationship in The Perspective of Building Competitive Advantage

Building an advantage in the dynamic, competence and positional views were based on a competitive struggle. In the increasingly turbulent 21th century, organizations began to combine their potentials "to more effectively counteract the negative effects of increased competition and to make the most of the opportunities of the modern economy" (Zakrzewska-Bielawska, 2014). Such examples are network strategies in inter-organizational relations or coopetition strategies, which are manifested in the processes of competition and collaboration that occur simultaneously (Dagnino et al. 2008; Zakrzewska-Bielawska, 2014). Zakrzewska-Bielawska (2014) draws attention to how complicated and equally unobvious the coopetition process can be, due to their opposite dynamics, boundaries, as well as different planarity. The dynamics of competition and cooperation may concern many aspects. The author (2014, p. 132) points to such aspects as the level of intensity of competitive and cooperative activities, value chain level, direction of relationships between partners (horizontal, vertical and mixed coopetition), the number of competitors, geographical coverage of competitors, the position of competitors in the hierarchy of economic systems (micro, mezo, macro, global), economic commitment, social bonds, purpose of coopetition, type of coopetition agreements. Coopetition is found in all sectors, but especially occurs in the high technology sector, the so-called high-tech, where coopetition is used to create a competitive advantage (Zakrzewska-Bielawska, 2014). High complexity and variability, resulting from a wealth of exo- and endogenous factors linked to each other, are characteristic of coopetitive relationships.

According to the author, the intensity of competitive and cooperative activities was the most commonly accepted criterion used to describe the types of coopetition. The proposal to divide coopetitive relations in the perspective of building competitive advantage is very interesting, adopted depending on the intensity of competitive and coopetitive activities (Zakrzewska-Bielawska, 2014, p. 134). Zakrzewska-Bielawska (2014) divides coopetitive relations due to the intensity of competition and cooperation, distinguishes four types of strategies. The first is the loners' strategy, which is used by narrowly specialized entities to protect their unique resources. There are often high-tech companies among loners who, adopting a passive attitude, expect a monopoly pension. In the opposite situation: the adopted adaptation strategy, there is a high level of cooperation and competition. An attempt to balance the competition-cooperation relationship is here the strategy of the integrator/adapter, consisting of a clearly defined and separated area of cooperation and competition. It is often found in the high-tech sector, in research and development (R&D), supply or production in the so-called activities inside the organization (input activities). On the other hand, competitive activities refer to the so-called outdoor activities regarding sales, distribution and marketing. In this case, a syncretic rent arises, which arises as a result of active competitive and cooperative activities (so-called elastic coopetition). The rival's strategy is based on significant aggression and the confrontational nature of competitors. The rival's strategy leads to the highest possible economic rent. In the higher technology sector, enterprises seeking innovative leadership in their sector introduce the rival's strategy. The convergence of competitors' goals, relying on the same sources of competitive advantage, product similarity and resource independence results in the domination of competition over cooperation, where coopetition is mixed (Zakrzewska-Bielawska, 2014).

The opposite situation to the opponent's strategy is the partnership strategy. It is characterized by a higher level of cooperation over the level of competition. The partner's strategy is found in relationships where companies with market separation have resources that are complementary. In this type of coopetition, it can lead to the creation of competitive barriers for other players in the sector. In the high-tech sector, there is a noticeable relationship between the amount of ownership of resources and their redundancy, as well as the desire to divide risk and costs, especially development (R&D), into an increased level of intensity of cooperative activities. Pressure on the integration of the global value chain and response to the impact of the institutional environment have an impact on the dominance of cooperation relationships over the relationship of competition. This leads to an increase in bargaining power and the creation of an annuity (Zakrzewska-Bielawska, 2014). As Zakrzewska-Bielawska (2014) writes, a critical determinant in coopetitive relations is the partners' trust in each other, and previous experience in the current relationship as well as existing relationships with other business partners (so-called path dependence), because conditions change due to the turbulence of the external

environment business environment and strategic moves of competitors. The greater the confidence, the greater the flexibility in a "relationship". Negative experiences, lack of trust, opportunism or insufficient rent (or lack thereof) can force the evolution of the existing partnership strategy towards a competition strategy or isolation strategy (loner).

Methodology

The pilot survey discussed below was adopted prior to the future, large-scale research to explore the basics of importance of relations in start-up strategies. Based on his own experience of working with start-ups, author of the article selected critical aspects of business partners' mutual relations and put them to the vote by respondents. The research sample includes twenty Polish-born enterprises that have been present on the market for min. 2 years.

The adopted research method for pilot study was a scaling (ranking) survey allowing the respondents to rank the available answers to the questions on the scale of 1- 4 (where the 1 was the lowest- “not important” and 4 was the highest “very important”). The survey was fulfilled by 20 CEOs and 20 Angel Investors (INVs) (Tab. 1). The weighted results are presented in the graph (Fig. 1).

Table 1: The pilot survey: the important issues in start-up successful relations. Two perspectives: CEOs & INVs

Using X describe the most important issues for start-up successful business relations	Not important (1)	Unconcerned (2)	Important (3)	Very important (4)
Available capital (cash)				
Business achievements				
Personality				
Business interests				
The industry of activity				
Sens of humor				
Temperament				
Internal discipline				
Ability to listen				
Communicativeness				
Personal values				
Openness				
Business connections				
Trust				
Start-up business idea				

The adopted research method for pilot study was a scaling (ranking) survey allowing the respondents to rank the available answers to the questions on the scale of 1- 4 (where the 1 was the lowest- “not important” and 4 was the highest “very important”). The survey was fulfilled by 20 CEOs and 20 Angel Investors (INVs) (Tab. 1). The weighted results are presented in the graph (Fig. 1).

Results

The results of the survey initially confirmed the author's observations on the relationship between CEOs and Angel Investors (INVs) in emerging competitive enterprises. What is very interesting and worth future investigation, that answers of both groups of respondents differ from each other (Tab. 2, Fig. 1). The personal issues were critical to create successful start-up relation from the investor’s point of view. The Angel Investors rated very high the openness (3,4), personal values (3,7), communicativeness (3,9), ability to listen (3,9), internal discipline (3,8), temperament (3,5), sense of humor (3,3), at nearly the same level as start-up business idea (3,5). In opposition, the CEOs valued quite low the “human

issues". The personal values (2), sense of humor (1,3), temperament (1,3), internal discipline (2), openness (1,5) have got very low grade. Only two phenomena were similarly important for both groups: trust and ability to listen. The trust was as important for CEOs as for INVs achieving the highest level (4). As we could assume, the ability to communicate is important for both groups of members, because both groups described it as very important (CEO- 3,3; INV- 3,9).

The features selected by:	CEO	INV
Available capital (cash)	3,7	1,3
Business achievements	3,7	2,9
Personality	2,7	3,5
Business interests	2,9	3,6
The industry of activity	3,7	2,9
Sence of humor	1,3	3,3
Temperament	1,3	3,5
Internal discipline	2	3,8
Ability to listen	3,7	3,9
Communicativeness	3,3	3,9
Personal values	2	3,7
Openness	1,5	3,4
Business connections	3,7	2,5
Trust	4	4
Start-up business idea	2,5	3,5

Table 2: The weighted results of the rating survey:
1- not important, 2- unconcerned, 3-important, 4-very important

The issues like available cash (INV-1,3; CEO-3,7), business connection (CEO-3,7; INV-2,5), the industry of activity (CEO-3,7; INV-2,9) looked much more important in perspective of entrepreneurs than their investors.

Fig. 1: Important issues in start-up successful relations: CEO and Angel Investor perspective

Discussion and Conclusion

When we look at the similarities and life cycle of marriage and entrepreneurship we can find out a variety of similarities from enthusiasm and hope on the beginning, through hard work and success or failure at the end. More they members have in common, more they share (time together, values, passion, excitement, hard work, engagement, support, trust, will, goals, dreams etc.) the probability of survival and success grows. The more you tie, the more likely you are to survive. Marriage needs tangible resources to exist, however based only on work and money it becomes only informal company- it will not survive storms without bonding, deep emotional engagement, sharing. Creating the new business entrepreneurs must also acquire a set of valuable resources. Critical become financial resources to develop the product/service, to deploy marketing strategy, to recruit and hire qualified staff. However, as Huang and Knight (2018) reminds, that the money and all it provides is not enough to create sustainable and competitive business. "Entrepreneurs must acquire social resources, such as access to partners and advice to help hone the strategic position of the venture" (Huang and Knight, 2018, p. 80). These social resources become critical especially for start-ups with their structure involving number of different partners helping to create business venture (business angels, accelerators, investors, advisors, mentors). These are the relations, their positive aspects of bonding, the flow, the exchange that builds the happy permanent marriage and successful sustainable entrepreneurship. "Relationships are conduits through which financial and social resources flow, promoting the growth of new ventures and aiding investors in profiting from their investments. […] Without the relations between investors and entrepreneurs, however, ventures lack access to the resources they need, increasing the odds of failure" (Huang and Knight, 2018, p. 80). Relationships allow for exchange process between the partners: for investors they allow for potential return on an investment in a venture and for entrepreneurs – for business growth (Cropanzano and Michel, 2005; Huang and Knight, 2018).

As the start-up ecosystem is quite complex, the type of relations depends on the type of investor. In start-ups we can find two major sides creating core of the company: the entrepreneur/s and investor/s: angel investors (AI) and venture capitalists (VC). Angel investors are wealthy individuals or groups

providing their own financial capital to early-stage ventures. They are more emotionally involved than venture capitalists and have more freedom in managing business- they are more focused informal signals from entrepreneurs (Huang and Knight, 2018). Venture Capitalists are institutional investors managing other people's financial capital. In comparison to the angels they are more focused on the market aspects of strategy (business models, profits etc.). The VCs invest in new businesses for earning a return for their clients and earn the margin of the profit for themselves. This intermediation aspect appearing in VC- entrepreneur context influences the relationships between the entrepreneur and two different styles of investors (Brander at al., 2002 in: Huang and Knight, 2018). This way the slightly different values are provided to the partners and exchange may appear at different levels of relationship. Huang and Knights (2018) selecting two different major exchanges: financial resource exchange and social resource exchange. They reminds that financial resource exchange is the most studied aspect of start-ups (Huang and Knight, 2018; Kerr et al., 2011) and it is mainly economic process based on formal transfers of tangible resources and controlled by negotiated terms (Huang and Knight, 2018; Takahashi, 1999). The value of exchange is physical- instrumental (despite the choice that cash provides in business growth). The second type of exchange proposed by Huang and Knight (2018) is social resource exchange. Building on Foa and Foa's (1980) the authors describe "social resources […] as relatively more particularistic and less concrete than financial […]. for example, the transfer of strategic advice (from an investor to an entrepreneur) in return for being and feeling involved in growing an impactful new business (from an entrepreneur to an investor. […]" In this perspective the trust and similar norms between the entrepreneur and investor are the fundament for creation and "serve as governance mechanisms" and allow for mutual commitment. The appearance of positive feeling, affection (Collins, 1990; Niedenthal and Brauer, 2012) the relationship embeddedness increase: the investor becomes a fiancé, ready to help, protect, guide, assist and advice. The protection of the business and positive emotional engagement appear (Lawler, 2001; Casciaro and Lobo, 2008). It allows for the openness and dialog, and the business problems are not hidden from investors anymore, only become challenges the couple face together in their business adventure.

The above-mentioned pilot studies proved to be a fascinating introduction to the study of relationships in emerging enterprises and their role in building a competitive advantage. The study showed, that experienced Angel Investors (INVs), who have achieved lasting success and thus can invest in new ventures, appreciate the most values that are characteristic of mature friendship or a happy long-term marriage based on dialogue, understanding, trust ... On the other hand, the results studies present the future entrepreneur (CEO) as focused mainly on material benefits, which the relationship treats more like "here and now" than "forever". Can we say in this connection, that the success of a start-up is the result of a synergy of mutual benefits: the investor introduces maturity, experience, capital to the relationship, and a novice entrepreneur with passion and willingness to profit while winding up the emerging business venture...? Why, then, the results of the studies Startup Poland (2019) and Embroker (2020) show, that the majority of the most successful start-ups CEOs were studying the humanities and social sciences (Startup Poland, 2019) and they were matured experienced adults (60 year old entrepreneur is 3 times as likely to build a successful start-up than a 30 year old one (Embroker, 2020) with international business experience (ex. the 46% of Polish entrepreneurs lived abroad) and about 18% of them are scientists (Startup Poland, 2019)? When we compare the most important issues in successful business relation provided by Angel Investors (INV) we could see the features of the successful entrepreneur presented by Startup Poland (2019) and Embroker (2020). Is it evolution of entrepreneur, that allow him for growth in relation with Angel Investor? Or maybe it is this readiness for rapid maturation in business, that is not only the basis for creating a good relationship with the investor, but also the source of building competitive advantage at an express pace? Maybe just a start-up that achieves quick and lasting successes is not a typical marriage? Maybe it is the great relational collision of two business neutron stars, resulting in the emergence of a successful enterprise taking over its external environment in order to create and sustain its competitive advantage..?

Abstract

The paper substantiates the need to create information security training technology, which will allow students to realize the importance and rigor of the implementation of legal and technical measures to protect information. Digital data is becoming the main carrier of professional, state, commercial and personal information. The mathematical algorithms provide high resistance to hacking in a reasonable time. However, the human factor is presented in ensuring information security is able to level all technical solutions. It is proved that the traditional teaching technology does not contribute to the awareness of the importance and vital necessity of fulfilling the requirements and rules of information security. The technology of conducting the lessons, developed by the authors, allows to solve the problem. The practical examples demonstrate the technology of building a lesson, focused on ensuring that all the questions studied are considered from the point of view of the student's personal safety; they confirmed the social significance and scale of the problem by the obtained data of a scientific experiment. The leading approaches, principles and methods in the development of technology are: a holographic approach, vitagenic training, heuristic training, the principle of interactivity, "inverted training", authentic assessment and observation included. All used pedagogical approaches and methods correspond to the modern level of development of digital education and the mentality of a modern student.

Keywords: Information Security, Updating Personal Experience, Digital Education, Vitagenic Learning

Introduction

The aim of the work is to present the technology of training developed by the authors for informational, programmatic, physical, and organizational and legal measures for protecting information, which will allow students to realize the need for compliance.

Currently, all sectors of the economy and household life of people undergo significant changes or transformations under the influence of digitalization. Digital data is becoming the main carrier of professional, state, commercial and personal information. The personal security of a person, the national security of the country and the financial profit of the enterprise depend on the degree of information protection.

The mathematical algorithms underlying the software and hardware information protection provide high resistance to hacking in a reasonable time. However, the human factor present in ensuring information security is able to level all technical solutions. The irresponsible actions of users of information systems or, conversely, their inaction, are caused by a lack of knowledge about the possible consequences of their actions and a lack of understanding of the seriousness of the situation.

The traditional teaching technology, which involves acquainting students with information in lectures and further solving problems in practical classes, does not contribute to the awareness of the importance and vital necessity of fulfilling the requirements and rules of information security. Therefore, we have developed a technology for conducting classes in such a way that all the questions studied:

- were considered in terms of the personal safety of the student;
- confirmed the social significance and scale of the problem not declaratively, but by the obtained data of a scientific experiment, independently initiated and conducted by the student;
- based on life situations that students, their friends or relatives encountered in real life;
- demanded the involvement of personal experience in solving this issue, both successful and ended in failure.

Up-to-date information and knowledge testing for each lesson is presented not as a set of files or text, but with the help of modern information and software of the educational process, which involves demonstrating text, images, videos with the possibility of organizing feedback in the form of consultations with the teacher, answers to thematic quizzes showing results, voting, organizing a brainstorming session.

The developed technology involves the constant use of computer technology. The main idea is not the introduction of information and communication technologies in education, but the use of pedagogical technologies that correspond to the modern level of digital technologies and allow using multimedia formats familiar to students from each other and the teacher in the process of preparing for classes.

Pedagogical Approaches, Methods and Principles Used to Implement the Goal and Objectives

To implement the goal and objectives, we used pedagogical approaches, methods and principles:

- holographic approach - an approach used for multidimensional modeling of an object and an object of study and involving the use of pedagogical methods and techniques in order to present the object of study in all its manifestations and from the point of view of different participants in the process (Belkin and Vozhenikova, 2004);
- vitagenic education (lat. Vita - life) - education based on the actualization and demand for the student's life experience for educational purposes (Kukushin, 2002);
- heuristic education (Greek heurisko - I seek, find, discover) - education, the purpose of which is to find and realize a student's own meaning, goals and content of education, the continuous discovery of new, often unexpected, aspects and aspects of the subject being studied;
- the principle of interactivity (eng. Interaction - interaction) - a principle based on the interaction between the participants in the educational process, the teacher and students, students among themselves using modern means of communication. The purpose of using this principle is to create comfortable learning conditions that encourage students to feel their success and intellectual viability (Lebedeva and Pavlova, 2010). The learning process involves discussions and dialogues leading to a joint solution to personally significant problems for each student;
- the principle of facilitation (eng. Facilitate - to facilitate, facilitate, create favorable conditions) - the principle implemented in conjunction with the principle of interactivity. When facilitating training, the teacher takes the position not "above", but "together" with the students, he forms the ability to draw conclusions, find new facets of problems in the situation in question (Tatarenkova and Kibets, 2015);
- included observation – a research method that allows you to conduct research in everyday life circumstances, to study the problem "from the inside", to find out the reasons for the internal motivation of people who have made certain correct or erroneous operations with information through their activities (Smyth, Bossu and Stagg, 2017);
- the technology of "inverted learning" - the technology of constructing classes that are based on previously studied material, viewed recorded lectures with their subsequent discussion in the audience. Educational materials and access to any information on the Internet allow students to advance on the topic at a convenient pace for them, to revise the record to review important points and skip the parts that are already familiar to them, to think about the required material. As a result, students come to classes prepared to participate in the discussion and solve practical problems (Broumi at al.,2018);
- authentic assessment - assessing the formation of skills of students to protect information by putting them in a situation as close as possible to real everyday or professional life.

In the process of implementing the technology, we used the following informational software of the educational process.

1. Google Forms (https://forms.google.com).

The purpose of using this application is ¬ to provide students with the opportunity to create surveys in on-line format for collecting data in order to conduct research on various aspects of information security.

The results:

- students see the real and current situation in the field of information security;
- make sure of the truth or falsity of their assumptions;
- can make scientifically based proposals to reduce the risk of information security threats.

2. Kahoot (https://kahoot.it/).

The service is designed to create online quizzes, tests and surveys. Questions or tasks are displayed on the projector, students answer the tests created by the teacher from tablet computers, laptops, smartphones, that is, from any device that has Internet access. Created tasks allow you to include images and video clips in them. Possible command mode for entering responses.

Purpose: conducting testing at the modern level of digital technologies, corresponding to the mentality of modern youth.

The result: a form of positive competition with other students motivates for further deeper study of the subject.

3. Dotstorming (https://dotstorming.com).

A tool for collaboration between students and a teacher in the “wall” mode with the ability to chat, add images and videos, group exchange of information, implement brainstorming technology and make decisions.

It is used to organize discussions in a group by posting ideas, suggestions, answers to a common panel (wall), discussing them in a chat, organizing voting and building ideas and suggestions by rank. Each student contributes to the discussion and can comment on other students' posts.

Purpose: to provide students and the teacher with a convenient environment for the exchange of information, ideas and work results.

Result: operational updating of information in formats familiar to students (texts, images and video with comments), the usual way of online communication with each other and teachers in the process of preparing for classes. Students become more motivated to further work, as they can make a personal contribution to solving the problem and get public approval.

The content and technology of the seminars. The achieved results

We give practical examples of seminars at bachelors of economics using the described technology in the framework of classes on the subject "Information Technologies in Professional Activities".

The seminar 1.

The essence of information security. Types of threats and methods of influence on information security objects. Methods of protection against each type of exposure.

Technology of the lesson

1. Presentation of the theoretical part of the topic by the teacher.

2. On the example of specific information systems in different fields of activity, students analyze existing threats and identify subjects who are interested in influencing objects of the information system, evaluate the approximate damage that occurs in the event of successful impacts. The teacher participates in the discussion and prompts if students themselves have not noticed the existing threat to information security.

3. Students offer specific ways to counter the identified threats and formulate recommendations to the leaders of the hypothetical organizations under consideration that will minimize threats to information security. For example, the rules for restricting user access to information system resources, conducting periodic training of personnel, organizing security and access to the system, organizing the accounting, storage, use and destruction of documents and information carriers, organizing explicit and hidden monitoring of users, creating physical obstacles to ways of penetration of violators, etc (Nagar at al., 2016).

Homework:

- interview, if possible, relatives or acquaintances about the real situation related to the topic being studied. Find out if there were cases of loss of information at their workplace, and what caused its loss;
- analyze the existing threats of your own home computer, perform operations to minimize risks;
- prepare a short report on the results of the mini-study and specific proposals for the protection of information.

The achieved results:

- the ability to identify internal and external causes of threats to information security of various types and eliminate the causes of their occurrence;
- awareness of the possibility of real damage if non-compliance with the simplest rules of information security;
- skills to minimize information security risks on a home computer. Understanding that the home computer also contains information, the discrediting of which can lead to financial and temporary losses;
- students who are interested in this topic continue their more in-depth study. The topic becomes the basis for future research and presentations at scientific and practical conferences.

The seminar 2.

Identification, authentication, user authorization. Varying attacks and mutating defenses. Password selection rules. Social engineering. Calculation of entropy and bit space of passwords.

Technology of the lesson

1. Students' reports on the results of a mini-study on the topic of the previous seminar.
2. Presentation of the theoretical part of the topic by the teacher.
3. Analysis of specific examples, ranging from fabulous (“Sesame, open”, to modern ones - the university’s information system, ATM, online store, bank, and identifier, authenticator, owner, authentication mechanism, access control mechanism. Students make and substantiate proposals according to the necessary and sufficient number and types of authenticators in each case (password, smart card, e-token, biometric data).
4. The study of the method of calculating the entropy and bit space of passwords. Determining the strength level of your own passwords used in email and social networks.
5. Familiarization with the psychological aspects and basic patterns of social engineering - methods and techniques of cheating people, which lead to the fact that they themselves provide passwords or other information that helps attackers to violate the security of the system.

6. Conducting a business game, during which students take turns playing the role of attackers trying to acquire the required information on the Internet by sending emails or making phone calls and users of information systems targeted by crackers (Ovsyanitskaya, 2015).

Homework:

– calculation of the entropy and bit space of passwords and justification, based on the received data, the required number and options of characters for various information systems;
– brainstorming: creating your own mnemonic rules for the ability to remember a password that is cryptographically resistant to hacking attempts (active use of the Dotstorming environment is provided);
– the beginning of compiling a questionnaire in Google forms for conducting a large-scale study, which is aimed at identifying the real current situation of literacy in the field of information security, with respect to compliance with information security rules, and compliance with copyright.

The achieved results:

1. Understanding that behind each case of the appearance of a malicious program or spam, there is a financially interested person financing this project. Virus creation and spamming is not an annoying factor, but a well-organized business.
2. Understanding the need to install modern licensed anti-malware software.
3. Skills for performing elementary actions that prevent viruses from entering the computer.

The seminar 3.

Cryptology. Protecting information by converting it. The main directions of using cryptographic methods: the transfer of confidential information through communication channels, the authentication of transmitted messages, the storage of information on media in encrypted form.

Technology of the lesson

1. Students' reports on the results of a mini-study on the topic of the previous seminar.
2. Presentation of the theoretical part of the topic by the teacher.
3. Electronic signature as the main tool for confirmation of authorship and authenticity of electronic documents.
4. The study of encryption algorithms used to organize a secure electronic document management.

The lesson is held in the format of a business game that simulates the process of electronic document management: students create electronic encryption keys, exchange self-encrypted and / or signed electronic messages, work out the behavior patterns of bona fide document participants, imitate the actions of intruders trying to replace the text or authorship of the document and using social engineering methods to access passwords (Mikhnev, Mikhneva and Salnikova, 2018).

Homework:

– substantiate the feasibility, requirements for the functionality and tariff of the certificate of an electronic signature key in certification centers and prepare a short message about the results;
– to continue to compile a questionnaire in Google forms, taking into account the knowledge acquired in the lesson, initiating the emergence of new ideas for the study;
– study independently in preparation for the next seminar materials on malware, viruses, spam and protection methods.

Results Achieved:

1. Understanding the simultaneously existing stability of mathematical algorithms for protecting transmitted information and the possibility of compromising it in case of violation by users of the elementary rules considered in the topic of Workshop 2.

2. Formation of a competent attitude to the generation, use, storage and destruction of electronic signature keys, which excludes the interference of the human factor in information protection algorithms (Dorozhkina, Dorozhkin and Shinkevich, 2019).
3. The ability to choose the best option certificate key electronic signature at the workplace.

Conclusions. The results of the implementation of technology in the educational process

The developed technology of teaching information security based on the actualization of personal experience using modern information software allowed us to consider all the issues studied from the point of view of the student's personal security, based on life situations that students, their friends or relatives encountered in real life.

The result is an awareness of the possibility of real damage if the simplest safety rules are not followed.

Presentation of training materials and knowledge testing was carried out in the usual multimedia formats for students. All pedagogical approaches and methods used correspond to the modern level of development of digital education and the mentality of a modern student.

The teacher got the opportunity to observe the discussion from the side and intervene at the moment when it is necessary to move the discussion into a new direction or, on the contrary, having heard an interesting proposal, not to let him get lost, to continue the conversation in this direction.

Students gained the ability to identify and eliminate the obvious internal and external causes of threats to information security and eliminate the causes of their occurrence; skills to recognize attackers and competent work with an electronic signature. Students realized that behind each case of malware or spam, there is a financially interested person financing this project.

The presented examples of technology for conducting seminars allow teachers of higher educational institutions to scale the experience of authors and implement it in the educational process.

Modern Ways to Build Good Reputation and High Recruitment. Case Study: Polish Universities

Marek ZIMNAK

University of Lower Silesia, Wroclaw, Poland
marek.zimnak@gmail.com

Abstract

Many researchers around the world have been devoting their attention to marketing education for years, but it is also of interest to specialists in the marketing and public relations industries. As a research area, we chose several dozen of the best promotional and information campaigns created at Polish universities over the years after 2010, proposing both the typology of these campaigns, analyzing their place and role among stakeholders, as well as the scope and impact of the campaigns themselves. Among the most important tools here are social media, and the variety of their applications, the ingenuity of the creators of selected campaigns and spectacular successes in recruitment and image seem to be a sufficient reason to subject this area of university operation to closer analysis.

Keywords: Marketing For Higher Education, Reputation, Recruitment, Promotion Campaign, Media

Introduction

The dominant belief that universities are entities that should finance their activities, as well as other entities present on the market, means that all marketing and image techniques that can provide this state have become everyday management in the university. Sometimes, universities are subsidized by the state to some extent, and the amount of this subsidy is associated with complicated calculations (1), but generally does not exceed - as in the case of higher education in Poland, 50 percent of the total annual costs of doing business, and the final amount depends on many elements, including cost intensity, number of students, scale of scientific research, etc.

The emergence of electronic media, and shortly thereafter social media, has given very wide opportunities to create new forms of promotion for universities around the world. And although the elite universities on individual continents oscillate within the same dozens of universities, the significant advancement of many of them in the global rankings is worth noting. To a large extent, this is due to a very efficient use of electronic tools, but also traditional forms are gaining in importance as a result of increasing professionalization of actions, extensive research into target groups and specialized public relations techniques. For example, more and more attention has been paid to consistency all university materials addressed to the international market when it was discovered that a few small graphic "peculiarities" were enough to prevent the essence of the promotional message from reaching a potential student from another cultural area (Zimnak 2018:129).

Many researchers around the world have devoted their attention to higher education marketing for years (for example, Hayes in the early 1990s and modern Lowrie research); it is also the object of interest for specialists in the marketing and public relations line of business as well as for bloggers gaining mainly practical experience, but also theoretical knowledge.

In highly integrated global economy, in which many companies operate across national borders, the strategy is by nature an international matter. Some theorists ignore the

international arena as irrelevant, uninteresting or too complex, but most theorists, especially those interested in the content of the strategy, recognize the importance of the international context and write extensively about international competition and global strategy (De Wit). It is mentioned here for a reason. Few texts from this part of the university world can be found in international science publications. Therefore, it may be worthwhile to confront observations regarding such a competitive area of economy from time to time. And although Poland records only 16 positions in the first thousand universities in the world, this parameter is growing every year (QS World University Ranking). Is this situation also influenced by modern marketing tools and what is this influence? We will try to answer this question. Several dozen of the best promotional and information campaigns created at Polish universities over the years after 2010 have been chosen as a research area; the typology of these campaigns has been proposed, their place and role among stakeholders as well as the scope and impact have been analyzed. This resource seems worth confronting with similar activities elsewhere in the world.

Since the beginning of the 21st century, universities in Poland have been increasingly investing in staff professionally involved in promotion, image creation, creating relationships with the outside world as well as managing internal communication. These processes are to ensure such a position for a university in the academic world at the international or national level that allows for improvement of the image and reputation in the face of identified threats. The demographic decline is just one of many (Antonowicz, Gorlewski 2011).

This phenomenon is not indifferent to recruitment processes around the world. While some question the value of branding in the higher education sector, in the Canadian community, for example, it has been suggested that the demographic trend in smaller social groups causes higher education institutions to increase their branding activity (Pringle, Fritz 2019:22).

The intense increase in the number of private universities at the turn of the century meant that they began to compete with one another. This is happening not only in Poland. Similar occurrences appear both in post-communist countries and on other continents (Guzman 2019). Shortly thereafter, they also competed with public universities, which in turn was influenced by the second factor - a smaller group of people wanting to study. After 2010, the first symptoms of a reduction in the number of private universities were observed due to their bankruptcy or consolidation into larger organisms, for example, the creation of network universities with many extension divisions. Despite the shrinking number of students, some types of universities are still increasing their enrollment. This category includes, first of all, universities in the largest urban centers, medical colleges and universities subordinate to the Minister of National Defense. The third factor limiting recruitment was Poland's accession to the European Union - it widely opened the door to foreign studies for Polish young people, although it had already been half-open thanks to various international exchange programs (wprost.pl). The abolition of compulsory military service probably also had an impact on the declining number of people interested in studying immediately after graduating from high school - studies ceased to be a place of escape from this controversial social commitment.

As a ubiquitous and democratic source of information from the last decade- social media, has been widely accepted by marketers as a viable marketing tool. This also applies to universities where social media, such as Facebook, Instagram, Twitter and YouTube, prove to be an effective tool to engage potential and current students, graduates and other supporters and donors (Lund). For several years, therefore, several hundred promotional teams in Poland (2) have prepared information and promotional campaigns, managed the university media, created the images of universities, created a message for the internal and external world, and avoided communication crises, including media crises. All these cases are an opportunity to demonstrate creative talent (Lucian et al. 2008, 90). PR begins with good media relations. If the university has something good and interesting to say about itself (new products and achievements), university specialists start to make sure that each professionally written press release is available and widely distributed. Of course, it is not the role of the marketer from the

higher education industry to create graphics, brochures and websites (it is advisable to limit the ambitions in this matter and whenever possible - leaving it to professionals) (van Rooijen 2008, 31).

Tens of thousands of such actions - to examine, measure and analyze - appeared in this period. They constitute an impressive research resource for every management theoretician or one of the management sub-disciplines - public relations (Thieme). Descriptive methodologies seem to be a more accurate research tool for the tasks discussed here. It is also worth trying to approach the topic in a more empirical way. An opportunity for such an approach is given thanks to analyzing applications for competitions for the best image promotion projects, namely science, university, faculty, field of study or researcher. This allows projects to be assessed in terms of impact range, selected technique or thematic area. And the methodology used, placed between empirical research and case analysis, turns out to be the only possible one with such an extensive topic (Babbie).

The main thesis, which the author will try to prove in this text, reads as follows: growing competition among universities has forced management teams to take university marketing as well as professional promotion and information about the university more seriously (Zimnak 2015). Let us also point out the supporting theses as they should accompany the above thesis:

- promotion teams at universities are hiring better prepared specialists, which allows them to create projects with a higher degree of professionalism;
- the phenomenon of digitization that changes all the aspects of our life has significantly increased the level of university promotional projects and strengthened the impact of these projects;
- the widespread use of social media has both increased the level of professionalization of created information and promotion campaigns as well as the field of competition among universities, which has resulted in the increased international recruitment for universities that use these tools most efficiently.

Bulotaite (2003) claims that despite criticism of the value of marketing and branding activities at universities, university names still have the power to evoke associations, emotions and images, suggesting that one of the roles of the university and the marketing department is to build, manage, develop and use these impressions for achieving your own competitive advantage, emphasizing the importance of choosing and passing on strong brand promises to external stakeholders.

Sources and Inspirations

At the turn of the century, only few universities in Poland (including University of Warsaw and University of Gdańsk) had the function of a spokesperson; marketing/promotion/ information offices were nowhere to be found. Today, 4,000-6,000 people work in this business at Polish universities. In this relatively short time, promotional teams had to learn the basic tools and techniques useful in their actions. This knowledge originated from several sources:

(1) Information and promotion departments, spokespersons and their offices have become, at the universities in Western Europe, centers of memory for these educational institutions about themselves. They store data about where, what, who, when and in what form said or wrote about the university. Archiving is their important, but side task. They are primarily a direct and everyday link between the university and the outside world (media, business, administration, and society). Thanks to their competences they know how to manage internal university media and how to neutralize possible media and communication crises. They stand directly by the university authorities, obtaining full information about the current condition of the university to be able to support and protect the university in a

manner adequate to the situation. The qualifications of these departments are respected and needed. And it was them that created the European Universities Public Relations & Information Officers Association (Euprio.com) in 1986 - an association in which people from many European countries exchange experience in the field of university marketing. EUPRIO invited colleagues from Poland to join the group at the beginning of the new century and since then employees of Polish universities have participated in trainings and conferences every year. It is difficult to overestimate the impact of EUPRIO on the community of Polish promotion specialists. It can be said that a certain elitism and fewness of the Polish representation in the European organization (for purely economic reasons these trips are strongly limited) caused the increased interest in solutions from abroad. Fortunately, it turned out that Polish specialists are talented students and today there are no significant differences in the pragmatics of university teams in Poland and abroad. The proof of this is the fact that a project from Poland, submitted by *PRom* Association in 2009 at the conference in Aveiro (Portugal), took the second place in the annual competition for the best promotional project from the university.

(2) When the first promotional teams were set up at universities between 2001and 2005, the line of business employing the discussed tools on the most demanding markets - in broadly understood economy, had already been professionally operating for several years on the Polish market. The social potential released after deep system changes in 1989, created the conditions for the emergence of many new business entities. Especially those of them based on foreign capital efficiently operated public relations tools. These lessons were painful for Polish business. Often, a Polish product lost to a worse foreign one due to poor communication with the surrounding world, poor advertising campaigns, and just any information folders. The differences were blurred quickly due to the active appearance of public relations agencies offering business assistance, thanks to the migration of specialists from these agencies to full-time jobs at companies, etc. The multitude of competitions organized by business media or chambers of commerce caused that some of the campaigns were widely known and discussed, creating a natural role model. University specialists just had to select good ideas and adapt them to the university reality.

(3) The digital revolution turned out - from the perspective of the author of this article in 2019/20 - probably the most serious inspiration. At the turn of the century, many universities already had websites, although many of them gave the user a headache. Communication via email was also struggling. Its more widespread use began between 2003 and 2005. Marketing departments were - for natural reasons - the forefront of new communication channels at those universities where there was excessive respect for traditional forms of communication. The first promotional and information campaigns were created using websites, the first newsletters addressed to the internal or external environment were created (3). However, it was only the emergence of social media after 2010 that gave campaigns organized at universities a completely new pace. The range, multimedia of the message and the change of the communication model - the possibility of instant contact between the sender of the message and its recipient - created the possibility of a different qualitative impact on the surroundings that had never been seen before. As we will see, many universities have managed to use these opportunities, sometimes in a model way.

Comparing more offers in order to choose the best one has its history in most civilizations and does not require special empirical research. The present day has shaped their form mainly in the fields associated with the concepts of “public tenders”, “design competitions”, “auctions”. They have the nature of a public promise - the organizer undertakes to hand over a specific prize for an act or work if they meet certain conditions (4).
However, the competitions for which entries are to be analyzed in this text, have a slightly different character. The appearance of this formula is the result of intensive development of public relations techniques in Poland, starting from the middle of the 1990s. The game is

about image, and the Polish Business Club as one of the organizers of this type of competition, awarding special medals to winners, explains the essence of the competition: "In business, the company's results, market position and reputation, successes in exports, possession of quality marks and certificates, etc. are assessed, while in other areas - creative achievements, social recognition and prestige, prizes and awards received, and promotion of European values." (5). This form of competition is therefore fundamentally different from offer-type competitions. The evaluation does not include the offer, at the end of which there is an option of implementation and - as a consequence - remuneration. There is no offer or project here, there is no remuneration in this sense. As a project, we submit existing achievements in the form of business results, role on the market, in a specific environment, the results of social, charitable educational and artistic actions. We subject them to public assessment. If the organizer of such a competition skillfully compares achievements sometimes difficult to compare, if they create reasonable regulations and the results can be publicized in social groups interested in the subject of the competition – there should be no shortages of those willing to participate.

In this text we are not to refer to image competitions in various other economic or social disciplines. We are interested in competitions for projects in the area of marketing and public relations implemented by universities in Poland. And although there are many such competitions in the discussed area in the country and in Europe (6), there are only two such events within the academic community in Poland. Both appeared on the stage of the universities' efforts to improve the image and to promote at a similar time - just after 2010. In Genius Universitatis competition, organized by Prospects Educational Foundation (*Perspektywy*), the submitted projects that "use the magic of the place in a creative way to promote their university" (7) are awarded. The competition focuses on employing marketing tools for recruitment purposes in several categories such as:

- press advertising,
- recruitment supporting event,
- social media campaign or
- online video.

However, it is the second competition that is used as research material in this article – *proMYKi* (8) – organized by *PRom* Association of PR and Promotion of Polish Universities (9). It aroused our interest for several reasons, but the most important is the fact that the submitted projects of colleagues - members of the Association - are evaluated by other colleagues - the winners of the editions from previous years - and by people from the board of the Association, i.e. colleagues from various universities performing their term functions. In the first five years, the jury of *proMYKi* was additionally supported by the Polish public relations senior Piotr Czarnowski and the organizer of Protons (*Protony*) competition (a known competition for Polish PR agencies) - Kinga Kubiak (10). This mode of appointment of the jury has two important advantages:

- the best projects are selected by people who are able to assess their value from the side of implementation in university conditions, which is decisive for the objectivity of assessment,
- no less important is the fact that the awarded projects are announced publicly to the entire community at the Association's annual summer conference, giving a sense of well-deserved pride in the group of "equals".

They are also an undoubted inspiration for other universities, which have missed honors in a given year.

Projects Categories – Methodological Challenge

The organizers of *proMYKi*, when creating the first version of the competition regulations, anticipated the upcoming difficulties related to heterogeneity (both thematic and scope), the scale of the project, the size of the university and many other factors.

That is why, two fairly broad competition categories were adopted, allowing for free assignment of each submitted project to one of them. These were:

- science promotion,
- university promotion.

Despite such a cautious approach, reality turned out to be even more complex. There were projects promoting the academic center or region:

- University of Szczecin,
- University of Economics in Katowice,
- Janusz Korczak Pedagogical University in Warsaw.

The essence of projects from:

- Gdańsk University of Technology and another project from
- University of Economics in Katowice

was promotion of the new media. Warsaw University of Technology dedicated its project to girls, and University of Silesia and Adam Mickiewicz University in Poznań presented important social campaigns. Anniversary and jubilee projects of Cracow University of Economics and Łodz University of Technology turned out to be a separate category. Should the fact that the first of these universities collected over PLN 400,000 from sponsors be assessed higher, or the fact that the second one presented striking possibilities related to one ordered faculty (bankier.pl)? And other universities subtly included concepts from the field of ecology (not ecology studies, but pro-ecological behaviors) to promote science or universities.

Not everyone took advantage of the opportunities created by the application form, for example, presenting measurable effects mixed with irrational ones or in the category "measurable" by writing "numerous press releases". In this situation, the applications that already assumed the evaluation were especially appreciated. However, it is worth remembering that evaluation alone does not make a project more valuable than other, it only allows you to measure the results. Considering the promises of a given brand in prepared and implemented campaigns, it turned out that future students take into consideration the following issues:

- attitude to student diversity (gender, race, religion),
- location of the institution,
- employability of graduates,
- image and its "atmosphere" (Ali- Choudhury, R., Bennett, R., & Savani, S.)

and this finding was broadly confirmed in the projects that are the research resource in this article.

Further methodological dilemmas appeared in subsequent editions. In smaller academic centers, the only university functioning there often performs not necessarily strictly scientific but also culture-creating and integration functions towards the city. Should this disqualify projects presented by them, and if not - how to evaluate such projects, since universities from large academic centers do not have such obligations? Can and should a project in which all the scientific and organizational potential of a great university is involved, supported by the actions of a promotion office compete with projects endorsed solely by the activity and ingenuity of individual people who created a work with strong promotional values basically on their own? Such examples were provided, for example, by the edition of *proMYKi* competition in 2013, when two projects from Wrocław University of Economics were small original projects; these were:

- a serial video blog on the dedicated YouTube channel showing the life of a couple of first-year students in a dorm, and
- a book with extensive indexes about the university - its history, characters, events, architecture, and development perspectives.

Although successful, they had no chance to compete with projects with a much larger scale. The introduction of the so-called independent projects category the following year was unsuccessful because in the subsequent years no such project appeared anymore - teamwork dominated. Perhaps this would be the field to organize a separately promoted competition for individualists.

As the years went by, more and more projects carried out solely using social media were submitted to the competition. The university teams working on them showed far-reaching ingenuity and included - in addition to Facebook - Twitter, Snapchat or Instagram into their actions, gaining significant audience share and positive reactions among young people - potential students. Blogospheres grouping thematically the creation of people associated with universities started to appear, many universities created their channels on YouTube and are still placing current promotional and information activity there. In this situation, the jury of the competition decided that a new category related to the use of the new media should be created. In the case of *proMYKi*, the category was called Andrzej Sołtysiak Award – to commemorate a prematurely deceased administrator of *PRom* Association website, a promoter of all the technical solutions enabling universities to optimize their actions on the Internet.

Projects and Implementations – An Attempt at Typology

During the analysis of the resource of projects submitted to *proMYKi* available to the author between 2011 and 2016, intersecting categories often appeared, which also cause some methodological cognitive anxiety. Their presentation below is the result of what reality, not the regulations of the competition organizers, brought. Assuming, however, that the methodology of the competitions is not the subject of this text, let us present the categories that have emerged as a result of this analysis.

1. *Communicating science* **-** universities submitting such projects assumed that a fragment of some scientific reality presented in an attractive way has such a strong promotional potential that the presenting entity gains the opinion of an expert and a university where it is worth studying. Of a dozen analyzed, three projects submitted in 2013 and 2014 by the Faculty of Materials Science and Engineering (*WIM*) of Warsaw University of Technology (inmat.pw.edu.pl) deserve special attention:

- As part of the first of them, invited children from Warsaw primary and secondary schools met "Tu*WIM* Engineer" (11), watched Warsaw University of Technology Theater performances, searched for the relationship of the subject with art, music and film. Fairytale characters inspired by Tuwim's poetry brought them closer to the issues of materials engineering. Tommy the locomotive talked about the history of trains and modern rail vehicles, and Paddington Bear about the weather and biomimetics. Children learned why polar bear and penguin inspired contemporary designers, then tested samples of outdoor materials from Wolf Gang company. Brainy Smurf in "Glasses" talked about "repairing" a man and bioimplants, and Floppy Bear - in the episode called "Bird Radio", about acoustic and sound emission. The employees of the Institute of Physiology and Pathology of Hearing presented an ear model, talked about hearing implants and showed how a piece by Antonio Vivaldi changes when we hear only low or high sounds.

- The second project – "Bio-*WIM*", involved the dissemination of knowledge about bioengineering and building the faculty brand as an expert. Desiring to reach various social groups, the authors used the press, television, radio, theater and the Internet. Contact with children was made using a simple language, for example, definitions such as "bioimplant is something you put on when something breaks down in your bones" were presented. The fables about pirates and the Flower Eater Dragon were written, an art contest and stylization of Richard the skeleton were organized. Older children were told about bioengineering during a picnic and a science festival, a bio-conference for high school graduates and an implant knowledge competition for students were held, and young women were encouraged to study

bioengineering at the faculty ("Girls to Universities of Technology"). Lifestyle magazines inspired the authors to prepare a lecture entitled "Medical Haute Couture", during which bio-implants were compared to nineteenth-century costumes created by the first tailors.

- Finally, the third project from the same authors, the inspiration of which were the International Year of Crystallography and the idea to show the great importance of this science for the development of materials engineering. Katarzyna Kołys, the creator of the aforementioned projects, also prepared this one, and it was aimed at making children and young people aware that crystallography enabled them to acquire knowledge about DNA structures, create proteins in cells, design modern materials, and develop electronics. The uniqueness of "BaWIMy się kryształami/ We play with crystals" project was based on a combination of chemical and physical aspects with art and design. The author created the project in cooperation with Maria Skłodowska-Curie Museum, the Polish Chemical Society, scientific journalists, an art restorer and designers. Interdisciplinarity definitely increased the interest of recipients in materials science, physics, chemistry, art, upcycling, and design. At the same time, the campaign promoted Professor Czochralski, called "the father of materials science", and his methods famous in science (janczochralski.com).

It should be mentioned that all the faculty projects from Warsaw University of Technology were implemented on many communication platforms:

- meetings,
- discussions,
- lectures,
- articles on the university website, and
- publications in traditional media)

and gained a significant number of recipients. No other faculty from Polish universities submitted such a competitive achievement - although it cannot be ruled out that they implemented various other projects within the university, but did not submit them to any of the competitions.

In this category, the author's attention was also drawn to two initiatives endorsed by University of Gdańsk:

The Year of Mathematics appeared in the 2015 edition of the competition. The assumption of the project was to present the importance of mathematics as approachable and accessible to everyone, helpful in self-development, necessary in the development of the region, and encouraging to study exact sciences. Actions planned as part of the Year of Mathematics at University of Gdańsk were targeted at children, students at all the levels of education, teachers and residents of Pomerania, regardless of age. A multitude of initiatives, specific results measured by the number of participants, events, competitions and volunteers earned the university a well-deserved prize in the competition.

- "The Brains Day" submitted in 2016 – a recurring event, organized and endorsed by University of Gdańsk since 2011, was equally appreciated by the jury. Thanks to skillful promotion, lectures, workshops and laboratory shows addressed to all that allow to deepen knowledge about the structure and functioning of the brain as well as to get to know the work of neuroscientists, neurosurgeons and psychologists, every year are of great interest to the city and region communities.

2*) Event for city and region* (12) – in this category, interesting proposals appear every year, indicating that universities understand their role in urban organisms much more widely than it would appear from the status of the university as a teaching unit or a research institution. The awareness that the university's logo can be used to mark an event that would not otherwise reach the local community is in such cases also supported by a specific image calculation - if a given university can create such an interesting and popular event, it is probably good and it is

worth beginning studies there. Such a message, reaching both young people and parents, can bring measurable recruitment results.

In this category, therefore, we include the project of University of Lower Silesia called "Promotion and education through culture" awarded in the first edition of the competition (2011). A series of lectures organized as part of it in Wrocław's Multikino, their attractive titles and interesting content attracted a large number of participants. We can also find here a project from a small town of Piła (73,000 inhabitants) awarded in 2012, and submitted by the local PWSZ (State Higher Vocational School), which is the initiator and sole organizer of science festivals in Piła. This largest public university in northern Greater Poland Voivodship has taken over the culture-forming and city-forming role as well as the mission of expanding the perspectives of the local community, whose needs (due to remoteness from large urban centers, post-collectivist traditions and - as a consequence - material deficiencies) have been marginalized so far. The event called "The Propaganda of Success – The Success of Propaganda" organized with a grain of salt, during which interesting guests also appeared, for example, Jan Miodek (tmjp.pl) or Michał Ogórek (pl.wikiquote.org), attracted crowds from Piła and from surrounding villages and towns.

In 2013, Opole University of Technology submitted two similar projects, this time addressed to the region, namely:

- "It railway's turn for orchestra, that is Opole wind express train" and
- "With the orchestra down the Odra River".

The assumption and expected result of the organizers of this artistic event with the participation of the university orchestra was to create the image of an open university that is not only focused on technical education as well as promotion through culture and art and, at the same time, supporting the recruitment process. In the same year another project appeared: a large university - University of Łodz - took on information obligations towards the city's inhabitants by launching and running the city's Cultural Portal. Two years later (2015) Koźminski University, which at that time overtook its competitors in public rankings of economic public universities, submitted a project well illustrating the methodological dilemmas of the competition organizers. YouTuber Sailing Championships of Poland were organized. It is hard to say what the event was. Promotion of the new media? Of the university itself? Because, after all, not of science that was not discussed during the competition. And yet the event should be assessed as a great success in terms of image, taking into account the number of entries, statements, links on social media, etc. Probably never before was there so much talked about one university on social media in Poland in such a short time. The organizers emphasized in particular that the tone of all the comments was friendly, properly deprived of hate that characterize Polish part of Internet. Within public relations actions at YouTuber Sailing Championships of Poland:

- 57 press publications,
- 32 video materials on YouTube,
- 95 mentions on Instagram and
- 80 Facebook posts with a total coverage of 17,935,186 impressions were generated.

3) *University recruitment campaigns* – in this category, universities have undertaken and continue to take on the greatest challenges. Generally, it is the senates of universities that decide to launch a campaign, and their hopes are directly linked to the results of recruitment, on which the existence of the university depends a lot, namely the number of student groups, the number of hours of classes, demands placed on the workers and filling the teaching load, the amount of budget subsidy, etc.

This kind of activity of specialists from university promotion offices requires careful preparation, considerable budget and reasonable deadline planning. As a rule, it turns out that there are too few people, too little money and too much work and too many expectations of

superiors. Achieving the set goals is uncommon, but it brings the implementers a lot of satisfaction.

In this category, it is worth taking a closer look at two campaigns that brought the expected results to the organizers and were also appreciated by the jurors of *proMYKi*.

- In 2013, University of Wrocław submitted its campaign called "Good to Know"(13). This promotional campaign was aimed at the candidates for undergraduate and graduate full-time studies, and its concept assumed a change in view on studying. It was assumed that this is a period in life that builds identity, develops competences, encourages consistent lifelong learning, that studying is the sum of the most important experiences, the best moment to make friends, a way to search for your place in the world. Furthermore, it was assumed that studies no longer give a restricted set of knowledge; studying is creating a specific attitude, lifestyle, and not "learning a profession" (so there are no references to various artifacts symbolizing specific types of study). It has been noticed that studies are diverse, as are study motivations and lifestyles. These assumptions were the basis for building a new line of advertising materials that show *studying as a lifestyle*. The production of these materials took place at the university with the participation of students. The Internet became the basic communication channel, also the versions for mobile devices (web versions of newspapers, professional websites, social media, video services, media packages of web publishers) were included; in addition, the press, outdoor advertising (murals, citylights), cinema and festival screenings were employed. Media purchases were made both directly and through agencies. As measurable results of the campaign, the organizers mentioned the following: halting the downward trend in the number of full-time students compared to previous years:

  - over 380,000 entries to the recruitment website of University of Wrocław,
  - over 13,000,000 views of various advertising forms prepared in the campaign,
  - over 23,000 views of "Good to Know" video on Vimeo.
- Two years later, the competition jury received an application from AGH University of Science and Technology. The title of the application was "#AGH - comprehensive social media actions promoting the university and science"(14). The organizers presented not only the impressive ranges of their presence on Facebook (40,000 fans), Instagram (2,100 followers), Twitter (1,800 followers) and YouTube (over 1,000 subscribers). Let's list just a few of the lots of promotional campaigns that resulted in a high turnout on the university's social media:

- launching the fastest supercomputer in the history of Poland;
- creating a place for discussion, exchange of opinions and comments (for example, 85 user comments on how to use space on the university campus);
- unusual, entertaining undertakings, for example, Miss of the Internet users and runner-up Miss Poland Paulina Maślanka (surname translated as *buttermilk*) visiting the Rector of AGH prof. Tadeusz Słomka (surname translated as *straw*) sipped buttermilk through a straw;
- playful and humorous posts, for example, "Jagiellonian University thinks that AGH is the first three letters of the alphabet";
- "I study" »at« or »on« AGH?" Or maybe on »AGieHu«? How to say that?" - Jan Miodek was asked to resolve this very emotional issue, and the video on YouTube channel had over 17,500,000 views;
- photos of the rectors of AGH during spring break;
- current events, sports achievements, students successes.

As a kind of subcategory, let us point out to the type of projects in which the university informs the surrounding world about a significant change in its way of functioning, which has a significant impact on its image. Such projects include the Press Center created for the needs of the media by SWPS University of Social Sciences and Humanities in 2011 (15), the new logotype book of Poznań School of Logistics or the successful project of merging two vocational universities - from Polkowice and Lubin - into one organism called Jan Wyżykowski University and their image-related activities. These projects required their

creators to use specialized sociological tools to check their ideas in a series of tests, try out the results on a selected group of stakeholders: what they think when they hear the proposed advertising slogan. Do their associations match the will of the creators? Especially for large enterprises, these preparatory works are of great importance (Marcos 2003, 9).

4) *New media* – is a category of projects showing forms of university promotion that would not have been possible without these media. Lund's study provides evidence of a link between popularity and interaction with the best university's Facebook fanpages and the attributes of these universities. As social media continue to evolve and serve as a source of marketing information, the prospect of identifying these relationships to increase the impact of university marketing campaigns is extremely important. Specific solutions can give universities a competitive advantage. Although Lund's study has not reached this level, it has presented preliminary findings that may be an interesting getaway in the future for more focused research (Lund, 14).

- Already in the first edition of the competition in 2011, Gdansk University of Technology submitted the blogosphere of scientists of one of the faculties,
- We have already mentioned the video blog presenting recurring episodes from the life of a couple of students of Wrocław University of Economics,
- Wrocław University of Environmental and Life Sciences submitted the film series – *Passions*, posted on the university's YouTube channel - scientific mini-biographies of a group of young scientists performing unusual professions,
- Warsaw University of Technology created a profile on Facebook, where candidates for studies could ask various, often even quite intimate questions to those already studying, with guaranteed response. This University of Technology also successfully included the Snapchat service in the promotion of the undergraduate studies.
-

In the opinion of the author of these words, the most successful "new media" project in the assessed resource was, however, the blogosphere submitted in 2015 by Koźminski University (Warsaw), containing blogs of foreigners - university students, addressed to their colleagues - other foreigners. They described their lives in Poland, their studies, new friendships, etc. The creators of the "Students in Warsaw" project assumed that young people do not trust the messages created by the institutions. They trust more Internet users, reference groups, and people similar to them. Simultaneously to the blogging platform, the authors of the project created the New Media Club - an English-language scientific club, in which participants got various incentives to engage in editing the blog - specialized photography workshops, video editing workshops, meetings with bloggers, etc. Recruitment for people involved in the project was conducted among the New Media Club participants, appropriate functions were also assigned, namely the editor-in-chief, a text editor, etc. Thanks to this, it was possible to select really engaged and willing to cooperate people, and to maintain a high level of motivation through monthly workshops and informal meetings. In addition, leaving students a large influence on the shape and development of the project meant that they began to identify strongly with it and naturally became its ambassadors.

- Thirty-six bloggers from the USA, Germany, Belarus and Ukraine,
- nearly 800 subscribers,
- first place in the browser when entering "students Warsaw"

- these are measurable results of the campaign(16). We can wish similar results many official actions supporting the internationalization of studying in Poland.

5) *Conventional media* – using traditional communication tools, universities inform about themselves, sometimes creating very successful projects.

- University of Warsaw prepared a calendar for 2013 - the roles of twelve monthly stars were played by mathematical equations.

- Two years later, Adam Mickiewicz University in Poznań published a series of volumes which were the first in Poland to promote science and the university, presenting memories of students, lecturers and studying.
- The academic yard is a metaphor of the subjective side of the university - people, personalities, emotions, values, and attitudes. The creators of the project decided to popularize unusual personalities, previously unknown to the wider audience. The volumes talk about serious issues of academic education in a light and friendly manner.
- State Higher Vocational School from Legnica submitted a CD with jazz recordings from the university club,
- Warsaw University of Technology prepared a series of articles about the greatest Polish innovators in exact sciences,
- Wrocław University of Environmental and Life Sciences presented a new concept of the monthly magazine which has been a university periodical for years.

- 6) *Other* – a few more categories appeared, represented by a few (sometimes two) submitted projects, so we are obliged to mention them. Sometimes these projects were very interesting. As for projects addressed to girls, Warsaw University of Technology showed probably the largest activity in the country,
- Children's books, in a graphically beautiful and linguistically clear way promoting science, were presented in the competition in various years by Nicolaus Copernicus University, Cracow University of Economics and AGH University of Science and Technology.
- There were projects addressed to a Ukrainian recipient,
- medical volunteering for Africa prepared as a comprehensive project by Collegium Medicum UMK from Bydgoszcz,
- Exemplary cooperation with business was presented in projects of Cracow University of Economics, Poznań School of Logistics and Warsaw University of Life Sciences - SGGW, which made an interesting promotional tool out of its internship program.
- And finally, projects related to the university jubilees - from the 650th anniversary of Cracow's Alma Mater to the 20th anniversary of University of Lower Silesia. The project of SGGW, which celebrated its 200th anniversary in 2016, could impress with the momentum, scope, financial resources, variety of actions and events (Kocoń 2009:498).

The jury of *proMYKi* could see that the seemingly unattractive anniversary celebration can be turned into a well-oiled mechanism for creating the image of the university.

Limitations of the Study

The use of modern forms of promotion and caring for the image of the university dates back only twenty years in Polish reality. Therefore, there is no important business continuity in this area that allows both to gather experience and make significant strategic adjustments. Almost every action is new and intuitive.

The adopted research methodology, located between empirical research and case analysis, has its limitations resulting from the different characteristics of the analyzed entities. Whether - from the point of view of marketing success - a few thousand visits to the social media profile of a small university in a city of 100,000 residents should be assessed higher than several thousand visits to a large university profile (over 20,000 students) from the capital of the country? And the variables may in this case also apply to the topic of information, how it is displayed, the author's reputation, date of publication, and how this supports the changes in the relative importance given by prospective students to three institutional attributes – course content, location and reputation (Moogan 181)?

Can a project in which all the scientific and organizational potential of a great university is involved, supported by the activities of a promotion office, and should it compete with

projects branded solely by the activity and ingenuity of individuals who have created a work with strong promotional values in principle alone?

How to compare the value of the university dissemination campaign among high school students in the city with the promotion of knowledge through open lectures of authorities invited by the university for all those interested in the city?

The need to indicate the winner in subsequent editions of the competition determined the jury and their decisions. One should hope that they made the right choices - as experienced practitioners, but we are aware that as a research category this approach may raise some doubts.

The student's general satisfaction with his or her educational experience has most often been measured by a simple yes or no question or by one question assessing overall satisfaction. (Elliott&Shin). Although this type of question can be easily answered and analyzed, students may not think about their previous responses to the questionnaire on satisfaction with individual educational attributes when asked to assess their overall university satisfaction based on one question.

Discussion

University leaders, that is university rectors and senates, when deciding on public actions such as higher education and research, make decisions with publicly felt effects, so it is right to expect that they will be accurate and purposeful, and the organization will demonstrate efficiency (Kieżun 1994:18-28). The basic conditions for this efficiency include completeness, reliability and speed of information. They require staff who can add these assets to the information process. What is more, if the university wants its projects to be circulated publicly to be considered fresh, innovative and dynamic, then you probably need to reach for lively and contemporary design and youthful language (Ries, Ries 2003, 31).

Promoting academic education comprises primarily routine activities - a complementary set of actions:

- maintaining media relations,
- traditional and digital publishing,
- organizing events around the university,
- lobbying,
- image advertising.

However, there is a narrow margin for non-standard actions, for creating your own narrative, message. If a university is able to stimulate dreams, create a vision of the future, trigger potential student's interest to study there - it probably meets the most important requirements on a competitive market. Consequently, those institutions unkown to the students will simple be disregarded or ignored (Moogan 180). Ewa Hope claims that "the 21st century will certainly be the age of the Internet and public relations, just as the 20th century was the age of television and advertising" (Hope 2010: 75). Conclusions must be drawn. As it results from the review of promotional and information actions at universities after 2010, Polish universities have drawn these conclusions. Today it can be said - and proven in many ways - that universities compete for their image (Iwankiewicz-Rak 2004:53) at the regional, national or even international level. It means the necessity to strive for full professionalization of:

- actions,
- selection of appropriate staff,
- application of recognized and effective techniques –

and in many cases it works. Balancing supply and demand is a real challenge. You must be extremely active in dialogue with the international market (Belch, Belch 1995, 10).

For a significant number of large, prestigious universities, matters of image, good press, visibility in spaces important for the place and line of business are unambiguous to impact on the expected level of recruitment. At the same time, awareness emerged that it could not succeed without a qualified team of specialists. The rest of these positive phenomena were forced by the market (Buszman-Witańska 2011:223), which many researchers predicted. The planned and sustained attempt to establish contacts showing good will eventually led to mutual understanding between the organization and the groups surrounding it (Kotler 2004, 6).

Every successful campaign on social media of a university is closely watched by others; promotional teams are maturing and raising qualifications at courses, conferences and training sessions, but above all, in everyday work that involves ever greater challenges. A significant part of these positive comments also applies to smaller and private universities, but their situation is definitely more difficult for reasons beyond their control. However, the game is about brand recognition in the surrounding world. A number of other non-academic factors, such as the student's feeling of 'belonging' and perceptions of the institution's responsiveness and concern, also contribute significantly to overall satisfaction (Gibson). Communication effects are relatively permanent mental associations, connected with the brand, in the mind of potential buyers. They are necessary to position the brand as inspiration for the expected action. Universities are trying to cause specific communication effects and, as a tool, choose any form of marketing communication - advertising, events similar to ads, promotional offers and personal sales presentations. These effects are the need for categories, brand awareness, brand attitude, intention to buy the brand and - finally - to facilitate the purchase (Rossiter, 1997:109), and thus - effective recruitment.

Future Directions of The Research

There are many studies analyzing the reasons for the satisfaction or dissatisfaction of students with their higher educational experience (e.g. Helgesen 2008, Douglas, Douglas, McClelland, Davies 2014, Elliot, Shen 2010, Gibson 2010). However, it is difficult to find an article analyzing the main attributes of the educational program plus various aspects of student life, which are most often significant predictors of student satisfaction. Academic factors: the curriculum, its quality and acquired knowledge and skills are the most important determinants of overall satisfaction, but they do not take into account non-academic factors such as the student's sense of belonging and perception of the institution's reaction and care. They contribute significantly to overall satisfaction. It seems that relevant research will appear in this area. No major university can afford noticeable imperfections in teaching or research. However, non-university factors also contribute to student satisfaction. A high level of satisfaction with life on campus, with the quantity and quality of cultural or sporting events in the immediate vicinity may become an important argument in the information and promotion campaigns of universities in the coming time.

According to the basic assumptions of Customer Relations Management, deeply settled in business, maintaining and developing cooperation with clients are of equal or maybe even more important to a business unit than acquiring clients. Due to the growing global competition between institutions offering higher education, ideas from CRM should be very interesting for university managers and marketers. The CRM approach means that great importance is attached to creating such values for students that determine their satisfaction, reputation and loyalty. To this end, various student surveys should be conducted and the collected data carefully analyzed so that managers and marketers can gain insight into processes and activities that will improve university-student relationships. Marketers need to know what creates value for students so that they can create relevant marketing campaigns. Managers must know which processes provide students with value to ensure their quality. (Helgesen 78).

A separate category of future research in a topic that interests us will be the measurement of those phenomena in which the change caused by the passage of time will have a significant impact on the tools of both creating the image of the university and recruitment tools. The theoretical foundations of the importance of the passage of time in educational processes have already been pointed out many times (eg Robertson 2017, Adam 1995) Both increasingly advanced IT techniques, big data and the use of artificial intelligence should be carefully observed in this area, as the quantity professions, where artificial intelligence has more to say, is constantly growing. (Frey 2013).

The communication crisis triggered at the university by activity in social media is a separate topic for broader research. Although their subject is very well recognized and described by public relations researchers, there is very little material regarding such situations at universities. It seems that as the social media's importance to university life differs, this type of research will become an important part of college marketing.

Abstract

The level of market concentration varies between industries. According to the findings of many authors, the level of market concentration is affected by many determinants. The previous empirical studies have tried to detect the determinants that have a crucial impact on the level of concentration. The findings of empirical researches are not particularly matched, and in some cases are even contradictory. We think that differences in findings result from methodological differences, and the difference of the data sets, which were analyzed. In this paper our attempt was, based on correlation and regression analysis, to detect the dominant determinants of market concentration. We used the data for US manufacturing industry.

Keywords: concentration ratio, Herfindahl-Hirschmann index, determinants of market concentration, manufacturing industries

Introduction

Market or industrial concentration varies in a very wide range, from very low levels in some industries to very high levels in other industries. Due to such differences, it is logical to ask why one industry is characterized by low and some other by high level of market concentration. After numerous studies, however, the findings are still different and even contradictory. These differences are partly due to the use of different analytical procedures and partly stem from differences in the data that were analyzed. We believe that the US manufacturing industry, given the size of the industry and high-quality statistical base, is a good base for exploring the determinants of industrial or market concentration.

Starting from the fact that between a concentration of the market, on the one hand, and variables such as size of the network, capital requirements, economies of scale, expenditure on research and development, advertising and many other variables, on the other hand, could be a connection, this paper presents the results of researches. This study was conducted on an example of the American manufacturing industry. The required data were taken from the US Census, and the analyzed years were 1997, 2002 and 2007. In order to visualize the observed problem as fully as possible, as indicators of market concentration we used the concentration ratio (CR) of four, eight, twenty and fifty largest companies in each industry and the Herfindahl-Hirschman Index (HHI) for fifty largest companies in each industry.

A special feature of this research consists in the fact that the connection between the observed variables was analyzed at all levels of aggregation of the data. Specifically, the analysis was performed at the level of aggregation that the NAICS code displays with three, four, five and six digits.

The Determinants of Market Concentration

Theoretical explanation of the determinants of market concentration

Many authors have analyzed the question what determines or influences the level of market concentration. This interest of scientists is motivated by the belief, largely supported by the results of empirical research, that there is a positive correlation between the level of concentration and market power, especially profit as the most direct expression of market power. In this sense, scientists have tried to identify and explain which variables determine the level of concentration. There are numerous variables on their lists, as well as explanations of their effect on concentration.

Among a number of variables that are connected to market concentration, some variables were especially interesting, such as market size, economies of scale, initial capital, advertising intensity, R&D expenditures, quality of competition, mergers and acquisitions, technological changes, private sector entry into the public sector and foreign direct investment.

Market size is one of the most commonly mentioned determinants of market concentration. This variable is considered to be negatively correlated with concentration. This view is based on the fact that a larger number of companies can always exist in a larger market than in a smaller market. In each market or industry, there is an optimal size of the plant, that is, a capacity size that minimizes the cost of production. At the optimal size, an increasing number of companies will exist on the market, when the demand curve is more distant from the origin. This variable is exogenously given.

Economies of scale is also often highlighted as important, in some cases even the most important determinant of concentration. The meaning of economies of scale derives from the behavior of the average cost curve with changes in output. There are three types of average cost behavior with changes in production volume.

One type is represented by an L-shaped curve, which means that at lower output levels, with increasing output, the average cost drops sharply, and then maintains the attained level with increasing output. In such industries, small businesses and small capacity plants can survive, resulting in low levels of concentration. The second type is characterized by a steadily declining average cost curve, so after a certain level of output, there is often only one company left in the industry. The third type of the average cost curve, which is also the most common in practice, is a U-shaped curve, that is, at lower output levels the average cost decreases with increasing output and increases at higher outputs. At a certain level of output, the curve reaches its minimum value. This means that in equal markets, greater concentration will be in that market where the average cost curve reaches a minimum value at a higher level of output. Similar to the previous one, this variable is exogenous.

The required initial capital, that is, the capital needed to build the capacity of the optimal size, can be a significant determinant of concentration. Industries that need large capital to build optimal size capacities are typically smaller in number of investors than industries where investors can more easily solve this problem. Examples of such differences are the cement or automobile industries, on the one hand, and the bakery industry or the hospitality industry, on the other. This variable, which is otherwise exogenously given, acts as an entry barrier, that is, it makes it difficult to enter those industries that require higher initial capital. In other words, the required initial capital and concentration are positively correlated variables.

Advertising intensity is also considered a determinant of concentration. However, unlike the previous variables, the impact of advertising intensity is not so simple or uniform. Different authors see the impact of advertising on concentration in different ways. Some see the intensity of advertising as a variable that is positively correlated with concentration, others are of the opinion that the intensity of advertising may increase until the concentration reaches a certain level, and thereafter the expenditure on advertising decreases as it does not lead to further growth of the concentration.[i] The third group of authors associate advertising intensity with product differentiation, holding that those companies that are more successful in product differentiation have the need for greater advertising intensity. In this sense, product differentiation requires advertising, which results in greater concentration. There are also attitudes that emphasize that advertising can affect concentration, but the direction of influence can be uncertain.

Differentiated or new products are generally in the function of R&D expenditures, ie the higher these expenditures, the more likely it is to expect that the process of differentiating existing and new product creation will be more successful. Any successful differentiation, especially a new product, increases the market share of such companies at the expense of those companies that have not invested in or failed in research and development, resulting in increased concentration. In other words, R&D expenditure is positively correlated with concentration, ie in industries characterized by a strong R&D preference, it is expected that over time they will reduce the number of enterprises in favor of those who will remain in the industry as more successful. In addition, those investors who do not have sufficient research potential will bypass industries where companies are forced to invest large amounts of R&D, such as the pharmaceutical industry, so this variable can also be treated as an entry barrier.

R&D, in addition to products, can also relate to technology. The development and application of new technologies is imperative to the increasing globalization. The ability of this type of development, especially in some industries, is inherent in large companies, which are becoming technology leaders, and further protect their competitive advantage with patents. This fact can be an entry barrier for new investments into the industry, and in this sense, technological development can also be accepted as a determinant of concentration, and in industries where patents are more common, higher market concentration can be expected.

Most countries in the world protect competition in different ways. One of the more effective ways is legal protection of competition. The higher the legal protection, the lower the concentration. Thus, some authors[ii] have linked the rise in concentration in the United States to, among other things, a decrease in the intensity of antitrust enforcement during the presidential term of G. Bush and B. Obama, which was supported by a decline in the number of antitrust cases. Based on their findings, they concluded that the concentration and number of antitrust cases were negatively correlated variables.

Mergers and acquisitions are also linked to market concentration, whereby mergers and acquisitions are undertaken not only to increase market power, but also for other reasons. For example, in the pharmaceutical industry, mergers and acquisitions are a common occurrence, and the key motive is to provide more funding for more serious research activities, although in this case the ultimate consequence is also a concentration increase. In any case, whether the effect on concentration is direct or indirect, there is a positive relationship between the number of mergers and acquisitions and the level of concentration.

In the last few decades, foreign direct investment has often been used as a means of entering a market. Foreign investors increase the number of enterprises in the industry and reduce the market share of domestic companies. In such a case, a decrease in market concentration, or a negative link between FDI and concentration, can be expected, as confirmed by some empirical research.[iii]

Empirical studies of Market Concentration Determinants

Many researchers are trying to determine the main determinants of the level of market concentration. Each study is an attempt to prove, confirm or contradict certain assumptions about the connection of the concentration and different variables. We present here researches that may help in better understanding of this issue, based on theoretical explanations, methodological approaches and empirical studies.

J. Bain[iv] explores the changes in the concentration in manufacturing industries in the United States in the period 1954-1966. He shows that from 1954 to 1963 there was a moderate trend of increasing concentration in individual manufacturing industries, both indicated by the relative frequency of increases and decreases in concentration and by the relative average sizes of increases and decreases. This trend continued and accelerated from 1963 to 1966. During the period 1954 to 1966 there was a notable relationship between the relative frequency rise and the fall of the concentration ratio of individual industry. The author concludes that there is a moderate centripetal tendency for individual-industry concentration ratios to become more similar or less disparate over the time.

T. Saving[v] discuss the estimation of optimal factory size by a survival technique, exploring the link between optimal factory size and various economic variables, including concentration. P.

Pashigian[vi]compares the concentration ratio in order to answer the question whether the differences between the United States and Great Britain can be explained by the size of the market. P. Pashigian[vii]in his other paper, tests how increasing market size decreases concentration.

W. Comanor and T. Wilson[viii] show that advertising has statistically significant impact on profit rates in consumer goods industries, which provides a measure of market performance, as well as indicates the existence of market power. L. Telser[ix] examines whether advertising is a source of monopoly and shows that there is little empirical support for the inverse relationship between advertising and competition. D. Greer[x]examines the impact of advertising on market concentration in the following types of goods: the standard "convenience" goods, luxuries or near luxuries and specialty-convenience goods.

Mann et al.[xi] base their research on the theoretical standpoint according to which the degree of product differentiation is positively correlated with seller concentration. L. Guth[xii] examines the effect of advertising on the market structure and the market concentration. M. Sawyer[xiii] examines the level and trends of concentration in British manufacturing industry in the period 1958-1963. This author tests the impact of certain economic variables to changes in the level of concentration. Ornstein et al.[xiv] analyze the impact of different variables on the concentration of four largest companies, using the regression model with different variables.

M. Porter[xv] investigates the determinants of concentration for two groups of goods, convenience goods and non-convenience goods. A. Strickland and L. Weiss[xvi] connect the level of industrial concentration (C) with the ratio between advertising expenditure and sales (Ad/S) and the ratio between the minimum value of the effective volume and sales (MES/S). The relationship is explained by the equation $C = 0.2638 + 1.1613\left(\frac{Ad}{S}\right) + 4.1852\left(\frac{MES}{S}\right)$ (R2 = 0.485).

B. Lyons[xvii] defines the relationship between the number of companies and the industrial concentration. Lieberman[xviii] asks what determines the number of competitors in the homogeneous production industry. D. Kamerschen[xix] tested empirically the thesis from Nelson[xx] and Shepherd[xxi] about industrial growth, which tends to reduce seller's concentration. S. Martin[xxii] explores the simultaneous causality between advertising intensity ($ASR = f(PR, CR, D)$), seller concentration (CR), profitability (PR) and demand side of the market (D). F. Jenny and A. Weber[xxiii] explore the determinants of concentration trends in the French manufacturing sector on a sample of 204 three-digit industries in the period 1961-69. M. Marcus[xxiv] studies the impact of advertising on the changes in concentration. Mr. Norman et al.[xxv] investigated the correlation among other advertising expenditure and market concentration.

R. Basant and P. Mishra[xxvi] investigate the role of market concentration in determining the cross-industry variations in terms of in-house investment in research and development in Indian manufacturing sector. T. Mamodia[xxvii] analyzed the determinants of market concentration such as age of the firm, firm size, R&D intensity, capacity utilization, leverage, margin, goods dependence, material import and export dependence. The results showed that the intensity of research and development has a positive relationship with HHI. L. Lien and N. Foss[xxviii] connect market concentration and the related industries.

G. Grullon, Y. Larkin and R. Michaely[xxix] concluded that US industries are becoming more concentrated. They also analyzed the effect of the size of the industry on the increase of concentration. The increase of concentration was the result of insufficient antitrust laws and technological innovations that created barriers to entry for new companies. R. Forte and P. Sarmento[xxx]analyze whether FDI increase market concentration. The authors found a significant negative impact of FDI on the concentration in the industry.

Based on previous researches, it can be concluded that many researches have tried to answer the question what affects the level of concentration in an industry or a market. Variables such as market size, economies of scale, industry growth rate, advertising intensity, absolutely needed capital, initial level of concentration, local market significance, product differentiation and number of companies in the industry were often included in the various research models. In addition, some authors have used composite variables such as, barriers to entry, as well as variables that represent the relationship or multiplication of two or more variables.

The ways in which different authors attempt to confirm or deny the influence of selected variable on concentrations also ranges widely. Mostly they use the form of single regression, for analyzing the individual impact of one independent variable on concentration, and multiple regression, trying to identify the simultaneous effect of two or more independent variables on concentration as a dependent variable.

The Model

Based on the results of numerous other studies presented, it one can conclude that there is no agreement as to which variables have the most significant influence on the level of industrial or market concentration. It can only be said that there is a general agreement that entry barriers, such as economies of scale, product differentiation, start-up capital, government regulation, often affect the concentration level to a greater extent than other variables. It is also important to emphasize that there is agreement that there is a positive relationship between the above variables and the concentration level.

Why are the results of conducted studies so different? Firstly, we believe that this is a very complex relationship, but it is very difficult to present it in a simplified way, especially without taking into account all the specifics of samples on the basis of which the research is conducted. We believe that a sample based on the data on the high level of aggregation, most often based on three- or four-digit NAICS, leads to various findings and additional confusion. Simultaneously with this, we think that differences can result from models by which the influence of selected variables on concentration was analyzed.

In order to remove the above shortcomings, we have conducted a research that differs from other studies in several important features. Firstly, we emphasize that our research is based on the data relating to the NAICS[xxxi], sectors 31-33: Manufacturing, which were taken from the US Census Bureau for 1997, 2002, 2007 and 2012. According to the NAICS, sectors 31-33 are displayed at four levels of aggregation, ie at the 3-digit, 4-digit, 5- digit and 6-digit codes. At the level of the 3-digit code, we have covered 21 subsectors, at 4-digit code 86 industry groups, at 5-digit code 184 industries and at the 6-digit code 225 industries, due to the inability to complete all the necessary data for each of 473 industries total.

The data on market concentration, as well as for all other variables, were taken from the US Census Bureau, 1997, 2002 and 2007: Economic Census. It is important, however, to say that this variable on each of the four levels of aggregation is observed through five indicators of concentration: the concentration ratio for 4, 8, 20 and 50 largest companies in the industry and the Herfindahl-Hirschman index for 50 largest companies in the industry.

The research of the determinants of concentration is based on the calculation of correlation between the selected variables and the calculation of the regression. The correlation is first established between each of the five measures of concentration, on the one hand, and each variable included in the research, on the other hand. Through this analysis, we wanted to detect the direction and intensity of the connection between market concentration and other selected variables. Correlation analysis has served as an introduction to regression analysis. In fact, based on the results of correlation analysis, we have made a regression model with the purpose to determine the direction and intensity of the impact of independent variables on the market concentration.

The correlation between the studied variables

In our research we have conducted correlation analysis based on the concentration ratio of four (CR 4), eight (CR 8), twenty (CR20) and fifty (CR50) largest company in the industry and the Herfindahl-Hirschman Index for 50 largest companies (HHI50). In this way, we wanted to eliminate the possible errors that occur due to the use of different indicators of concentration. Results of this study allow the comparability of our results with other studies that are based on only one indicator of concentration. In addition, this approach allows to detect certain rules in terms of differences that could arise from the number of companies according from which individual indicator of concentration is calculated. It is also important that we have conducted our analysis at the level of aggregation which is identical to NAICS classification, starting from 3-digit to 6-digit. This approach allows the comparability with

those studies that are based just on one of these levels of aggregation. Data on which we did the calculation refer to 2007, except in cases in which we have calculated changes over time.

Finally, it is necessary to point out that we have started our analysis with relatively wide list of independent or explanatory variable. The focus of our interest are variables such as the number of enterprises, value of delivery, number of employees, capital expenditures, expenditures for advertising and variables that were constructed from the combination of above-mentioned variables. In the latter case, we have created two indicators of the average size of the company. The first one is calculated from the ratio between the value of deliveries and the number of companies, while the other one is obtained from the ratio between employment and the number of companies.

Previous analysis was done using, on one hand, the concentration and, on the other, each of the nine selected variables. The correlation between the independent variable is determined based on the concentration ratio of the four largest companies, starting from three-digit to six-digit level of aggregation.

Observed for the four largest companies in the subsector, there is extremely high correlation between the average value of capital expenditures by the company and the average value of the delivery, as well as between the average value of capital expenditures and the average value of delivery. The correlation coefficient is greater than 0.9, positive and statistically significant. There are also four cases when the correlation is greater than 0.8, so that these variables in terms of their impact on the concentration should be paid special interest.

Compared to the correlation at the three-digit, the correlation level six-digit is very similar. The highly correlated variables at a higher level of aggregation are also highly correlated at the lower level of aggregation. The only difference is that it is at the six-digit correlation coefficients are slightly lower than at the three-digit level.

The analysis of correlations between variables that are highly correlated with concentration indicates that there is a high correlation between the number of companies and the average value of delivery, the number of companies and average capital expenditure per company, the average value of delivery and the average number of employees per company, as well as the average value of delivery and average value of capital expenditure per company. Their high correlation indicates the possibility for the existence of multicollinearity.

Regression between the analyzed variables

Our attempt to find the answer to the question what affects the level of concentration is based on various analytical methods and research models. We have used the regression analysis, single or multiple, non-linear or linear, and we have tried to explain the concentration as the dependent variable with different independent variables, such as economies of scale, size of industry, number of companies, required initial capital, growth of industry, investment in research and development, advertising spending and others.

Regression analysis was first conducted as a single, and then as multiple in terms of individual and aggregate independent variables that influence the concentration.[xxxii] Table 1 provides results of a single regression analysis. The calculation is based on the data for 2007, where the dependent variable represents the concentration ratio of the four largest companies in the six-digit level of aggregation.

Table 1: Regression Summary for Dependent Variable CR4

	Constant	Std. Error	p-value	Coefficient	Std. Error	p-value	R^2
N	2.408	0.051	0.000	-0.335	0.021	0.000	0.535
S	1.920	0.231	0.000	-0.048	0.034	0.158	0.009
L	2.615	0.156	0.000	-0.237	0.036	0.000	0.158
K	1.960	0.174	0.000	-0.069	0.033	0.035	0.019
A	2.045	0.093	0.000	-0.048	0.022	0.000	0.100
S/N	0.415	0.100	0.000	0.268	0.023	0.000	0.379
S/L	0.864	0.120	0.000	0.289	0.047	0.000	0.140
K/L	0.913	0.067	0.000	0.240	0.023	0.000	0.317
L/N	0.906	0.065	0.000	0.367	0.034	0.000	0.342

These variables, each in its own way, measure the average size of the company. Given their statistical significance and the value of the coefficient of determination, the conclusion is that the average size of the company significantly determines the concentration. The individual impact on the concentration of these composite variable is, except for the number of enterprises, greater than the influence of any other individual variables.

We have further conducted the multiple regression analysis to show the simultaneous impact of these variables on the concentration. Between numerous models, we have chosen four that best describe the effect of the concentration. Table 2 shows the results.

Table 2: Regression Summary for Dependent Variable CR4

Variables	Model 1	Model 2	Model 3	Model 4

R^2	0.605	0.599	0.605	0.599

$^{*}p < 0.1$; $^{**}p < 0.05$; $^{***}p < 0.01$

The results of the multiple regression analysis shows that all models are statistically significant and that their R^2, for both enter and stepwise method, are very similar. Given the fact that the second and

fourth model contain only statistically significant variables, we analyze these models more detailed. There are certain similarities and differences between these models. Similarities reflect the fact that all the variables included in the model are statistical significant at the level of 99% and that their coefficient of determination is identical.

The differences are the variables that are included in the model. Variables N and A are contained in both models, while the variable S is included only in the second model and S/N in the fourth model. We conclude that concentration is determined by a number of companies, advertising expenditures and the average size of the industry measured by the average value of delivery. These findings are similar to the findings of many other empirical studies.

Following these findings, we wanted to analyze if the results would be different if, instead of the concentration ratio of the four largest companies we use a different measure of concentration. In this sense, we have analyzed the impact of the above-discussed variables using stepwise method for the concentration measured by concentration ratio for eight, twenty and fifty largest companies, as well as HHI50. Table 3 shows the results.

Table 3: Regression Summary for Dependent Variable CR4, CR8, CR20, CR50, HHI50

Standard errors in parentheses
* $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$

Observed on the basis of the value of the coefficient of determination, the results of regression analysis are becoming slightly better with an increase in the number of covered companies, compared to the concentration ratio of the four largest companies.

Due to a disputable role of the number of companies as independent variables in previously analyzed regression models, we tested the situation that retained all the previously discussed variables except number of companies (N). Table 4 shows these results with the omitted variable N.

Table 4: Regression Summary for Dependent Variable CR4, CR8, CR20, CR50, HHI50

R^2	0.599	0.646	0.661	0.658	0.593

Standard errors in parentheses
* *p <0.1, ** p <0.05, *** p <0.01*

Omitting the variable N, we obtain the regression models in which variables S, A, and S/N determine the concentration in all analyzed cases except in the case of CR20, where one more variable appears – L. The sign with the variable S is in all cases negative, which means that with an increase in the size of the industry, concentration is decreasing. The sign of the coefficients with the variable A is positive in all cases, as well as that with the variable N in the models that included it, which confirms the hypothesis that the increase in advertising expenditures leads to the growth in concentration. The average size of company measured from the ratio of the value of delivery and the number of companies (S/N) has positive sign, which confirms the expectation that the industrial concentration will be higher in those industries with the economies of scale, or with higher minimally efficient volume.

Thus, it can be concluded in a certain way that the influence of the three variables is crucial to the level of industrial concentration. These are industry size (S), advertising expenditures (A) and economies of scale (S/N)

Conclusion

The question what determines the level of market concentration is one of the most important theoretical and practical issues, covered by many scientists. Their answers are often different, partly because of different economic models, and partly due to differences in the type and the size of the sample. In our research, we used correlation and regression analysis and we have covered four levels of aggregation: 3-digit, 4-digit, 5-digit and 6-digit, all this for the US manufacturing industry.

Correlation analysis included nine variables, and the objective was to determine the correlation between the concentration level and each of the selected variables. This analysis showed that there is a relatively high correlation between market concentration and the following variables: number of companies, average value of delivery, average number of employees per company and average value of capital expenditure.

Regression analysis was first carried out as a single, and then as a multiple regression analysis. Talking about individual impact on the level of market concentration, composite variables that display as the average size of company play an important role. The individual impact on the concentration of these variables, except for the number of companies as a single variable, is greater than any other individual variable.

Multiple regression showed that, among a number of different models, four models describe the determinants of market concentration well. Between these four models, the first two models are based on individual variables (number of firms (N), value of delivery (S), number of employees (L), capital

expenditures (K), and advertising expenditures (A)). Other two models include also the remaining four composite variables. Our calculations show that the concentration is determined by the number of companies (N), advertising expenditures (A) and the average size of the industry, measured by the average value of delivery (S/N). These findings are similar to the findings of many other empirical studies.

Previous findings are based on the concentration of the four largest companies in the industry, so we wanted to see what happens if we use some other measure of concentration. Regression results show slightly better results with an increase in the number of companies included in the concentration measure. It is interesting, however, that in the regression model for eight largest companies, we have variables N, S and A, while in the regression model for four largest companies variables are N, A and S/N.

Omitting the variable N, we obtained the regression models in which variables S, A, and S/N determine the concentration in all analyzed cases, except in the case of CR20, where one more variable appears – L. The sign with the variable S is in all cases negative, which means that with an increase in the size of the industry, concentration is decreasing. The sign of the coefficients with the variable A is positive in all cases, as well as that with the variable N in the models that included it, which confirms the hypothesis that the increase in advertising expenditures leads to the growth in concentration. The average size of company measured from the ratio of the value of delivery and the number of companies (S/N) has a positive sign, which confirms the expectation that the industrial concentration will be higher in those industries with the economies of scale, or with higher minimally efficient volume.

Abstract

The aim of the article is to identify and define changes in the importance of informal institutions to Generation Y from Central and Eastern Europe in the process of acquiring knowledge in several dimensions: trust, social groups and networks, social activity, as well as a comparison of informal institutions between young people of different nationalities. The article examines whether the knowledge gained by the Millennials from Central and Eastern European (CEE) countries during higher education is connected with the change of social competences reflected in the changes of informal institutions. The results of a survey carried out among Millennials who are educated at universities in Poland, Lithuania and Slovakia were used. The article takes into account such categories of informal institutions as social standards, trust, networks, informal social activities. The results of the research indicated that the social competences of young people in the dimension of informal institutions do not change significantly under the influence of academic education and remain at a low level in many dimensions. In addition, it was found that there is a diversity in the importance of informal institutions to CEE Millennials by country of origin.

Keywords: Informal Institutions, Institutional Economics, Social Capital, Central and Easter Europe

Introduction

In the analysis of economic phenomena and processes, models proposed by the neoclassical current are most often used. However, the model's assumption about a universal individual who makes decisions rationally regardless of the social, political or historical environment is criticised in literature. In opposition to the concept of homo oeconomicus, an institutional economy was created with the concept of homo - socialist, i.e. a unit functioning in an institutional environment and using institutional rules to allocate resources (Lloyd & Lee 2018). Taking into account cultural norms, tradition, conventions and law, Institutionalists treat the market as a process of behaviour based on principles, and to a lesser extent on free and rational decisions. The phenomena and processes concerned, the resolution of economic dilemmas and the effects of specific actions are attributed to a specific economy, social situation and historical period, so they are free from universalism (Ostój 2010). Every society has its own institutions which cannot be regarded as neutral in the economic process (Chavance 2002; 2008). As North (1990) indicates, institutions are not the same as organisations. Following it, this distinction is made by the authors in this article, for whom institutions are not identified with organizations.

Using the division of institutions proposed by North (1990), the subject of the article is informal institutions. Unlike formal institutions such as the Constitution, laws, regulations, regulations and other provisions which, by being transparent and quantifiable, are relatively easy to identify and analyse, informal institutions, i.e. values, habits and standards of behaviour and informal networks, pose a major research challenge for researchers (Wang 2000). This difficulty results from the

multidimensionality of informal institutions, the difficulty of separating and analysing separately and quantifying them (Ostrom 2008).

Literature shows that despite these difficulties, informal institutions are worth analysing because they are an important determinant in not only social but also economic relations (Meyer & Peng 2005; Lew 2013). It is worth noting their impact on the reduction of uncertainty in economic decisions, i.e. those related to entrepreneurship (Aparicio, Urbano & Audrestsch 2016; Escandón-Barbosa et al. 2019), in the choices made by managers (Halabi, Alshehabi & Zakaria 2019), including those concerning the strategy and efficiency of international business (Keig, Brouthersb & Marschall 2019; Bae & Salomon 2010) or illegal activities (Ramirez, Vélez-Zapata & Madero 2018). They determine economic growth (Porter et al. 2011; da Silva, Weins & Potinkara 2019), affect the efficiency of local government (Ananth-Pur & Moore 2010; Mohmand 2016) and bureaucracy (Gauchat 2012; Kaufmann, Hooghiemstra & Feeney 2018). As Helmke and Levitsky (2004) indicate, when informal institutions are ignored, then formal institutions become ineffective and exist only on paper.

Taking into account the above arguments and the hitherto areas of interest of the literature on the subject, the authors intend to focus on the analysis of informal institutions among young people, more precisely Generation Y, who at the beginning of their professional career have to face the challenges of the labour market, in particular its mobility, multiculturalism or globalization. It was found that there is a research gap in determining the impact of education on the development of non-formal institutions while taking into account the assumption of institutional economics that institutional environments differ from country to country. Interesting research questions arise here. First, does the period of academic education change the importance of informal institutions in the lives of young people? Second, are there differences between Millennials of different nationalities with regard to the importance of informal institutions in their lives?

Therefore, the aim of the article is to identify and define changes in the importance of informal institutions to Generation Y from Central and Eastern Europe in the process of acquiring knowledge in several dimensions: trust, social groups and networks, social activity, as well as a comparison of informal institutions between young people of different nationalities. The first is that academic education influences the importance of formal institutions among young people. The second is that in the Central and Eastern European region, nationality does not cause differentiation in the importance of informal institutions in the surveyed social group.

The research undertaken in the article should contribute to complementing existing literature for several reasons. Firstly, they contribute to the discussion on the importance of informal institutions among Generation Y. Admittedly, literature has so far studied the personality traits of the Millennials and their difference from other generational groups (Bencsik, Horváth-Csikós & Juhász 2016; Miłaszewicz & Nagaj 2018; Bento, Martinez & Martinez 2018). However, this social group was not studied from the point of view of changing the importance of informal institutions in young people's lives in the process of gaining knowledge. Secondly, the research takes into account not only the time aspect (two research periods) but also the spatial aspect. It shows a comparison based on a sample of 3 countries from the CEE region (Poland, Lithuania, Slovakia), which allows to enrich the study of institutional economics with a regional analysis of countries that have similar political and socio-economic conditions. All three countries share a common, not distant history that is related to their functioning in the doctrine of socialist states and institutional changes initiated in the 1990s (Stolle & Howard 2008; Maloney & van Deth 2010), deepened by the entry of these states in the EU structures in 2004. Nevertheless, based on the Hofstede model (2011), it can be assumed that there are differences between these nations and cultures. A third reason for the added value of this article is that these research results can be used to develop higher education curricula that would improve social competences in line with the Bologna process.

By analysing the collected statistical material, the authors provide empirical evidence relating to the importance of informal institutions to people of Generation Y and changes in this field. The obtained test results were subjected to statistical processing, including the use of the chi-square test of independence, as well as the U-Mann Whitney and Kruskal-Wallis tests. The analysis of the research

was preceded by a theoretical part, in which brief considerations on informal institutions were presented. It should be noted that the conclusions formulated here concern the examined group of populations. Furthermore, it is assumed, in line with the educational outcomes of the Bologna system, that the knowledge of people who leave higher education is higher than that of the same people when they started their education.

Literature Review

Institutionalists in the analysis of socio-economic phenomena use the research category which are institutions (Kaufman 2004; Furubotn & Richter 2005; Rutherford 2001). Due to the scope of the study, a sociological approach was used, according to which social institutions are "a set of established activities of an individual in the normalized activity of the group. Institutions allow for forecasting and anticipating future reactions of members of society in response to events they will be able to experience in the future". (Znaniecki 1988, p. 70). They are a combination of values and norms that are considered appropriate in a given society to act and build social relationships. These normative patterns define the expectation that individuals behave towards each other in a way that will perpetuate relationships between them (Lopez & Scott 2000). Turner (1998) points out that norms of behaviour are crucial in the creation of institutions, as they create values and beliefs common to a given community. Their aim is not to restrict people, but to create relationships based on accepted values, including those of an informal nature, which increase the ability to act (Searle 2005). As North (1990; 1991) indicates, institutions can be divided into formal and informal institutions. Informal institutions, which are the subject of this article, are the rules of the game of social life, rules shaping interactions facilitating social contacts, which are created, communicated and enforced outside officially sanctioned channels (Milgrom, North & Weingast 1990; Brinks 2003). These are social norms, religion, ethics, tradition, culture, customs, unwritten codes of behaviour, ideologies, taboos, networks and bonds that shape society (de Soysa & Jütting 2007; Tonoyan et al. 2010). Helmke and Levitsky (2004, p. 127) define informal institutions as "social, common rules, usually unwritten, created, communicated and enforced outside officially sanctioned channels". They are inherent in human nature and are needed to feel a sense of belonging to the community (Ariely 2017, Szkudlarek & Biglieri 2016). As Wirth et al. (2013) points out, informal institutions are not homogeneous in nature and are visible in many ways in information processing and ultimately in decision making. Due to the fact that informal institutional pressures arise mainly from history, traditional practices and culture (Peng, Wang & Jiang 2008), institutional economics assumes that each country has a unique set of these attributes for its community.

Given the interdisciplinary nature of institutions, they can be analysed using a social capital aggregate (Szczepkowska & Szkudlarek 2018). It is pointed out that social capital provides a forum for a better understanding of the relationship between social links and institutional change (Horak & Restel 2016). The issues of social capital raised by their leading researchers such as Bourdieu (1896), Coleman (1990), Putnam (1995) and Fukuyama (2000) take into account the categories that are the subject of research undertaken in the study. Bourdieu (1986) stresses the importance of sustainable networks, more or less institutionalised links of knowledge and mutual recognition. Coleman (1990) draws attention to social structures that facilitate the activities and achievement of the objectives of individuals within these structures if relationships are based on standards or trust. Also according to Putnam (1995), social capital, i.e. trust, norms and relations increase the efficiency of society and facilitate coordination of actions. He also points out that there may be other effects in the case of bonding social capital, i.e. family or friends, and others in the case of bridging capital, i.e. colleagues, neighbours and further surroundings. In turn, Fukuyama emphasizes the importance of trust that leads to the interaction of two or more units. It creates new people-to-people links and facilitates the establishment of civil society groups, associations and organisations (Fukuyama 1999). All the attributes of social capital indicated by literature are inseparable from institutions of an informal nature. Social capital does not produce goods or knowledge, because it is a function of physical capital. On the other hand, it helps to reduce the behavioural uncertainty of market players (Matysiak 2003, Manolova et al. 2007).

Literature shows that society is not homogeneous and there are generational differences in consumer behaviour and preferences (Lissitsa & Kol 2016), including those concerning social capital and attitudes towards the state (Nagaj & Szkudlarek 2019). For this reason, using research on social capital, the authors in this study attempted to assess the state and changes in the importance of informal institutions among Generation Y, called Millennials. This is the first wave of the digital generation to be born in the world of technology (Hopkins & Stephenson 2014; Garikapati et al. 2016). More often than previous generations, they use electronic word-of-mouth (e-WOM) through social media (Bento, Martinez & Martinez 2018). And within the framework of these virtual social media, a willingness to co-create is created in people of this generation. According to Krishnan et al. (2013), their circle of friends is mostly virtual and they present their relationships on social networks, besides they easily accept cultural differences and really like to live fast.

Followed the Brosdahl and Carpenter (2011), this is a generation that easily accepts change, live and keep their thoughts in "today" and they do not like planning ages ahead. They are focused on achieving their own life goals, regardless of others, and rather want to play in their own world (Bencsik, Horváth-Csikós & Juhász 2016). This is due to the fact that people of Generation Y have often limited contact with their parents due to their careers or their entering into numerous relationships. This results in a very low level of family relationships (Barford & Hester 2011). In the labour market, they are looking for challenges and an exciting and ambitious career path (Maxwell, Ogden & Broadbridge 2010), which will allow them to achieve high income in a short time (Tari 2010). Traditional values are much lower in the hierarchy of their needs (Bencsik, Horváth-Csikós & Juhász 2016; Nagaj & Žuromskaitė 2016). Thus, they are attributed individualism and self-reliance (Gursoy, Maier & Chi 2008; Murphy & Gibson 2010). They are characterized by multicultural and global thinking (Williams & Page 2011). A similarly high mobility concerns Polish Y Generation (Schmelter 2018).

Methodology

The aim of the article is to identify and define changes in the importance of informal institutions to Generation Y from Central and Eastern Europe in the process of acquiring knowledge in several dimensions: trust, social groups and networks, social activity, as well as a comparison of informal institutions between young people of different nationalities. This analysis was carried out on the basis of the results of surveys conducted among people of Generation Y of the first and last year of the bachelor's degree studies at the Faculty of Economics and Management University of Szczecin in Poland (1st year: n=267, 3rd year: n=229), at the Faculty of Faculty of Politics and Management Mykolas Romeris University in Vilnius in Lithuania (1st year: n=113, 3rd year: n=73) and at the Faculty of Economics Matej Bel University in Banská Bystrica in Slovakia (1st year: n=153, 3rd year: n=158).[1] Out of the total number of students enrolled at the indicated universities, in the case of each university, the proportions of the respondents were as follows: 58.0% and 88.1% (Poland), 51.4% and 63.5% (Lithuania), 51.0% and 52.7% (Slovakia). At the above mentioned universities, an invitation to participate in the survey was published, while participation in the survey was voluntary and fully anonymous. There were two criteria for participation in the survey research: the first was to undertake academic studies and the second was to be born after 1981 - followed the classification of generational presented by Brosdahl and Carpenter (2011). The research was carried out in the studied populations twice. First among people starting their academic education (in the first months of their studies), then after 2.5 years among the same research sample, at the end of their academic education. The survey consisted of a questionnaire for the characteristics of the respondent and a set of 36 survey questions developed according to the World Bank's logic model (Grootaert et al. 2004). For the purpose of this analysis, the authors chose 6 questions concerning informal institutions. The first two questions concern trust, understood as a belief or expectation built on personal experience and which depends on the credibility of others (Robbins 2016). The subject of analysis here is both general trust (Fig 1) and, using the typology presented by Sztompka (2007), personal (further and closer) and public trust (Fig 2). The third question (Fig 3) is used to evaluate networks and social integration among young people. The type of Millennials' relationships with other people was examined here, i.e. whether they have an exclusive dimension, resulting from primary relationships creating bonding social capital, or inclusive, i.e. resulting from secondary relationships and creating

bridging social capital (Putnam 1995). The last three questions (shown in Fig 4 and Fig 5) concern social activity, which informs about the degree of acceptance by young people of Generation Y of values and behaviour patterns building social bonds which are respected in a given society. It has been assumed that social activity is a process in which individuals influence in an individual or collective way the community in which they operate (André, Martin & Lanmafankpotin 2012; Mastalerz 2019). The activity of the Millennials was assessed in three dimensions: informal social interaction (informal community meetings), formal activity, manifested by participation in formal groups, i.e. NGOs (Fig 4), and individual activity for the benefit of society by helping others (Adams, Leibbrandt, and Moon 2011) (Fig 5).

The comparison made in the paper, taking into account the time aspect, allows to assess whether within three years (i.e. academic learning and acquiring knowledge) there were changes in informal institutions among the Millennials. It is assumed here, in line with the educational outcomes of the Bologna system, that the knowledge of those who leave academic education is higher than their knowledge when they began their education.

In addition to the survey and descriptive statistics, a statistical analysis of the relationship was carried out using the chi-square independence test, the Mann-Whitney U test and the Kruskal-Wallis test assuming a significance level of $\alpha=0.05$. The application of non-parametric tests resulted from the fact that the important assumptions for the application of parametric tests (including the normal distribution and equivalence of individual groups) were not met.

A general null hypothesis was adopted that individual populations come from the same population. Two different criteria were adopted for the division: level of study (year of study) and nationality.

It should be noted that all the above tests allowed one to determine whether there are statistically significant differences in informal institutions among Generation Y respondents in Central and Eastern Europe. However, they cannot be seen as tools to identify the causes of possible differences. Therefore, given the lack of unitary data on learning outcomes, statistical inference could not be used to verify the hypothesis about the importance of achieving particular levels of knowledge, in line with the classification of learning outcomes and the importance in the life of young informal institutions.

Research Results

The first key attribute of informal institutions that has been examined is trust. Figure 1 presents data on the overall level of trust among the Millennials surveyed.

Fig. 1: General trust in the environment of young people in Poland, Lithuania and Slovakia* (Q.1. Do you agree with the statement that people should be given limited trust? Answers "rather yes" and "definetely yes")

** PL1 - respondents in Poland, 1st year of study; LT1 - respondents in Lithuania, 1st year of study; SLV1 - respondents in Slovakia, 1st year of study; PL3 - respondents in Poland, 3rd year of study; LT3 - respondents in Lithuania, 3rd year of study; SLV3 - respondents in Slovakia, 3rd year of study.*
Source: own elaboration.

The results of the research indicate that the vast majority of young people believe that it is necessary to be cautious when dealing with people and to give others limited confidence (average for all respondents - 78.6%). It is worth noting that regardless of the level of academic knowledge, the lowest percentage of Millennials who give limited confidence to other people among the countries surveyed occurs in Poland and this percentage is below the average. Relatively more caution in relations with others is declared by respondents in Lithuania and Slovakia. Only in the case of respondents finishing academic education (third year of study) from Lithuania this percentage is lower than the average calculated for all the studied groups.

The next step was to examine whether the young people differentiated their trust according to their environment (Fig 2).

Fig. 2: Private and public trust of young people from Central and Eastern Europe* (Q.2. How much trust do you have in the following people? Answers "I trust strongly" and "I trust very strongly")

** The same markings for variables on the X axis as in Fig 1.*
Source: own elaboration.

Research results indicate that regardless of the research sample or level of education, people of Generation Y have the greatest trust in their friends, and much less in strangers. Interestingly, the trust in friends indicated by Lithuanian respondents is much lower than in other research samples (in this research sample, trust in friends on an average level dominates). On the other hand, however, trust in strangers is relatively the highest among research samples in this group, but it is still at a dramatically low level, just like in other research groups. The results of the research also indicate that the Millennials differentiate their trust by nationality. They have a higher level of trust in people of the same nationality than in people of a different nationality. It should be added that in Poland and Lithuania the majority of people declare an average level of trust in people of different nationalities, while in Slovakia the lack of trust in people of different nationalities dominates.

As regards public trust, it should be noted that a very low percentage of respondents trust the government, both at central and local level. A total lack of trust in public authority, regardless of the level, is declared by as many as 1/4 of respondents. This demonstrates a very low level of trust in government institutions. It should be noted, however, that a higher percentage of people do not trust the central government than the local government.

Another analysed dimension of informal institutions concerned networks and social integration among Generation Y (Fig 3). The results were intended to provide information on whether

respondents in the surveyed countries show greater adherence to informal institutions created by exclusive groups (parents) or by inclusive groups (neighbours).

Fig. 3: Social groups and networks of Millennials in Poland, Lithuania and Slovakia* (Q.3. Are you attached to the following people? Answers "rather yes" and "definetely yes")
** The same markings for variables on the X axis as in Fig 1.*
Source: own elaboration.

Millenniums most often form social groups in which bonds have an exclusive dimension. This pattern refers to research samples of all three countries and everywhere this attachment is at a relatively similar level. However, there are greater differences between countries with regard to inclusive relationships. In Slovakia the attachment to neighbours is at a much higher level than in Poland and Lithuania. Moreover, in Poland and Slovakia the attachment to inclusive relationships has decreased quite significantly during academic education, while in Lithuania the opposite trend was observed.

Although the attachment of Slovak students to their neighbours is much less than to their parents, it is on a relatively high level compared to the respondents in Poland and Lithuania. For example, among people who have started higher education, Lithuania is dominated by those who definitely don't trust their neighbours, Poland by those who rather don't trust their neighbours, and Slovakia by those who rather trust their neighbours.

The last part of the analysis of informal institutions will present the results of research on the activity of Generation Y people. Figure 4 presents data on two dimensions: informal social interaction (informal community meetings) and formal activity manifested by participation in formal groups, i.e. NGOs.

Fig. 4: Social participation of young people in Poland, Lithuania and Slovakia* (Q.4. Have you ever been active in an NGO? Q.5. Have you attended a community meeting during the year? Answers "yes")

** The same markings for variables on the X axis as in Fig 1.*
Source: own elaboration.

The comparison between activity in NGOs (formal aspect of social activity) and meetings of the local community (informal aspect of social activity) allowed to conclude that the respondents in Poland and Slovakia express their values and behaviour patterns mainly through informal forms of social activity. In the case of a research group from Lithuania, such an unambiguous assessment is no longer possible as both forms of social activity (formal and informal) are relatively favoured by these respondents. As in Poland and Slovakia, Lithuanians prefer informal social activity in most cases, although they also express their readiness to act for the benefit of the community through formal organisations, i.e. NGOs.

One form of social activity of young people of Generation Y is also participation in charity actions (Fig 5). Millennials' households quite rarely participate in charity actions (most often 1-2 times a year). Among the analysed countries, the lowest activity for the benefit of society was shown by the families of respondents from Slovakia, where over 40% declare that they never do it. According to the survey results presented, the percentage of people, regardless of their year of study and country, whose households participate in charity actions 5 and more times is negligible and amounts to only a few percent. Moreover, regardless of the year of study and country, the percentage of households that are willing to participate in charity actions at least 5 times a year is negligible and is only a few percent.

Fig. 5: Participation in charity actions by households of young people of generation Y in Poland, Lithuania and Slovakia* (Q.6. How many times during a year did your household participate in charity actions?)

** The same markings for variables on the X axis as in Fig 1.*
Source: own elaboration.

In the last part of the analysis of empirical data, the zero hypothesis that the communities come from the same population was verified, i.e. that there are no statistically significant differences between individual research samples in the context of individual informal institutions. The null hypothesis was verified in two dimensions:

a) between the Millennials of the first and third year of study in a given country,
b) between Millennials from the same year of study in all countries.

A compilation of data on values for the statistics and p-value for the first verified dimension (only for cases where differences between populations are statistically significant) is shown in Table 1.

Table 1: Statistical independence between the Millennials in their first and third year of studies in the analysed countries

Itemisation	Type of statistical test used	Country	Value of statistics	*p-value*
Q.2. (Fig 2) People of the same nationality	U-Mann-Whitney test	Poland	-2,057	0,040
Q.2. (Fig 2) Foreigners	U-Mann-Whitney test	Poland	2,023	0,043
		Slovakia	-4,749	0,000
Q.2. (Fig 2) Local authorities	U-Mann-Whitney test	Poland	-2,951	0,003
Q.3. (Fig 3) Parents	U-Mann-Whitney test	Poland	2,300	0,021
		Lithuania	-2,467	0,014
Q.3. (Fig 3) Neighbours	U-Mann-Whitney test	Lithuania	-6,234	0,000

Source: own calculations.

The results indicate that only in 7 out of 36 cases (16.4%) there were reasons to reject the null hypothesis, i.e. it was found that there are statistically significant differences between people entering and leaving academic education. This means that in these 7 cases, higher academic knowledge has changed the importance of informal institutions to Generation Y respondents. Four such cases concerned Millennials in Poland, two in Lithuania and one in Slovakia. These differences occurred in relation to private trust (towards persons of the same nationality and towards foreigners) and public trust (towards local government), as well as to social networks and integration (i.e. the nature of relationships that Millennials have with people from closer and further surroundings). On the other hand, no statistically significant changes in informal institutions with regard to the dimension of social activity were found in any of the surveyed nationalities.

A compilation of data on statistical values and p-value for the second of the dimensions to be verified, i.e. differences between countries, is presented in Table 2 (data are only presented for cases where there are statistically significant differences between populations).

Table 2: Statistical independence between Millennials of the first and third year of studies, taking into account the nationality criterion

**A – Poland; B – Lithuania; C - Slovakia*
Source: own calculations.

Comparing the populations according to the country of origin criterion, in 18 out of 72 cases (25.0%) the null hypothesis was rejected. It allows to conclude that in these cases there are statistically significant differences between young people of Generation Y representing different national groups. The most cases concerned the differences between the Millennials in Poland and Lithuania, and the least between the respondents in Lithuania and Slovakia. Taking into account the criterion of the year of studies, i.e. comparing people starting academic education with those finishing education, it was found that there are more statistically significant differences between Millennials being in the first year of studies than in the third year (18 and 11 cases respectively). It should also be added that statistically significant differences between respondents from different countries occurred in each of the analysed dimensions of informal institutions (only in one case concerning social activity in the dimension of informal social interaction, no statistically significant differences between nationalities were found regardless of the level of education).

Discussion and Conclusions

The research conducted has become a field for discussion about the importance of informal institutions to the people of Generation Y. The authors decided to identify the importance of informal institutions for Millennials in Central and Eastern Europe, their changes during the period of education, as well as to compare in this study the three analysed nationalities in this region (Polish, Lithuanian and Slovakian). Thus, the research gap with regard to informal institutions has been filled, contributing to completing the existing literature. It should be noted that the research contributes to the discussion on the importance of informal institutions to the Millennials. In addition, the research enriched institutional economics with a regional analysis of countries with a similar socio-political-economic environment, taking into account the time aspect related to the duration of learning.

Moreover, the results of the study also have an applicable value and can be used to develop higher education programmes that would improve social competences in accordance with the Bologna process.

Verifying the first research hypothesis, it was found that the knowledge and social competences acquired during 3 years of studies are in most cases not reflected in the change of informal institutions in Poland, Lithuania and Slovakia. The lack of grounds for rejecting the null hypothesis in most cases leads to the general conclusion that there is no link between the knowledge acquired in higher education and the importance of informal institutions to Millennials in Poland, Lithuania and Slovakia. Such a relationship was found in only 16.7% of cases relating to trust in people of the same nationality, foreigners, local government, networks and social integration (family and neighbours). In most cases, these changes occurred amongst the Millennials in Poland. It should also be stressed that the lack of statistically significant changes in informal institutions amongst students in Poland, Lithuania and Slovakia, which in most cases existed, coincided with their generally low level. The only exception is trust in the immediate environment and participation in the local community meetings. Thus, the authors called into question the implementation of educational results in terms of social competences. It can be assumed that the previously formed values, behavioural patterns and social activity patterns are so strong that a period of three years of academic education does not bring changes in this area. Thus, it can be concluded that when learning in higher education, there is no realisation of learning outcomes in the area of social competences. This should be a premise to draw attention in educational programmes to such didactic forms, which could create greater trust, build social relations based on inclusion relationships and promote behaviour which is directed towards social activity.

Verifying the second research hypothesis, it was found that in the CEE region, nationality does not result in a differentiation of importance of informal institutions in most cases. However, it should be noted that the results of the research allowed to reject the null hypothesis in 25% of cases. Thus, it has become possible to confirm the assumption, derived from institutional economics, that the institutional environment differs from country to country (Lissitsa & Kol 2016; Hofstede 2011). Thus it is possible to reject the hypothesis of similarity between Millennials of different nationalities. In a quarter of cases it was found that there are statistically significant differences in the importance of informal institutions to the Millennials in the analysed countries of Central and Eastern Europe.

The characteristics of young people participating in the research do not fully confirm the characteristics of Millennials presented in the literature in relation to informal institutions. The results of the research do not confirm, above all, the existence of weak relationships with the family. Research conducted amongst young people on personal trust indicates that they are rather cautious in their relations with people. At the same time, most of them have no strong relationships with people outside the family (Barford & Hester 2011). It must therefore be assumed that inclusive relationships are firmly rooted in their communities and their caution in relations with other people primarily concerns strangers. However, the Millennials characteristics presented by the literature (Bencsik, Horváth-Csikós & Juhász 2016) are confirmed by the results of the authors' research relating to helping others. This is the lack of a wide range of altruistic activities amongst the Millennials. The results of the research carried out by the authors also confirmed the individualism of the Millennials, as raised in literature (Gursoy et al. 2008; Murphy & Gibson 2010). Respondents (except Lithuanians) are not inclined to take an active part in formal organizations that provide an opportunity to create patterns of behaviour accepted in a given society.

The topic taken up by the authors requires further in-depth research. This is partly due to the research limitations. Therefore, it is recommended to undertake a research effort which would allow to identify the causes of limited importance of informal institutions to young people. The authors believe that the study can be extended to the analysis of other countries to assess whether informal institutions differ in there and change during education. In addition, it is proposed to carry out comparative research on informal institutions amongst students with different teaching profiles or among countries with different social and institutional contexts that might enrich the research results.

Notes

1. In Poland and Lithuania the authors conducted the study together with employees of the Department of Macroeconomics at the Faculty of Economics and Management University of Szczecin as part of statutory research financed by the Polish Ministry of Science and Higher Education. In Slovakia, however, the research was conducted only by the authors of this article.

Modelling of Digital Transformation Processes in Organizations

Artur ZIOLKOWSKI

WSB University in Gdansk, Gdansk, Poland
aziolkowski@wsb.gda.pl

Abstract

The aim of the article is to indicate research directions on the complex process of digital transformation in organizations. According to the assumptions of industry 4.0 and smart city most organizations from various industries will face the challenge of digital transformation in the next few years. This will mean a change in the current functioning through the use of information technology, the Internet of Things and the automatization and digitalization of many basic (including office) processes. The digital transformation process is a complex undertaking and requires the involvement of the entire organization. It covers a number of changes in the existing business and administrative activities. The transformation process changes not only the functioning of the organization in the environment, but also its internal processes and structures. Due to the scope of changes, the digital transformation process of an organization is tied with a high risk that is not fully explored and identified. Therefore, in this article there is an identyfication of key areas of changes (named "perspective of transformation") which should be analyzed and monitored during the organization's digiatal transformation. In this article there is characteristic of four currently identified perspectives: perspective of projects, processes, technologies and organizational culture. Identification and research on such perspectives is necessary to build a model of digital transformation process for better management of changes and transformation risk.

Keywords: Digital Transformation, Process Of Transformation, Organizational Transformation

Introduction

Gartner estimates that over 90% of companies will be implementing digital transformation over the next two years. This transformation means a radical change in functioning by increasing the level of computerization, use of data and IT solutions (systems and infrastructure). According to industry reports, the role of system suppliers (i.e. IT organizations) will also increase, distribution channels, as well as methods of creating and developing products will change, especially in the field of solutions using the Internet of Things (IoT). As a result of digital transformation, production or service processes will also change, and digital transformation processes will be applicable not only to companies but also to public sector entities. [2]

The organization's transformation process is always a complex, cost-intensive and high-risk process. It is estimated that over 50% of IT organizations have initiated transformation processes in recent years (e.g. in the field of agile transformation), but only a small percentage of them have successfully transformed. Data on unsuccessful transformations, interrupted or reinitiated ones, indicates that this process is a legitimate subject of scientific research. It seems that researching such an important process for organizations as digital transformation is of particular importance in the era of Industry 4.0 and smart cities. Companies and cities are changing their functioning more often, through the use of advanced technologies supporting both operational and strategic processes. [1]

Research Problem

The complexity (as defined by the Cynefin method) of the transformation process, its dependence on many organizational and external factors is the basic scope of the research discussed later. [5] The

author, using the experience in business modeling and process modeling, attempts to develop a model of digital transformation in organizations. Searching for the optimal model of transformation from the management point of view seems justified for two reasons. Firstly, organizations entering the transformation should assess the chances of successful transformation and minimize the risk of a failed transformation by accurately determining the level of transformation readiness. Secondly, the implementation of the transformation should be subject to constant monitoring based on a set of indicators and the manner of conducting the transformation, which none of the previously created models provides. Models such as CMMI are limited to determining the state (current or desired) but do not discuss the processes of transition from one state to another. When developing the digital transformation model, it seems reasonable to include both measures that allow you to estimate the success of the transformation (by determining its status) and determining the method of the transformation as a complex process interfering in the entire value chain of the company (including key resources and activities, suppliers and recipients).

Research conducted on organizational transformations allowed to classify the transformation process depending on the level of significance of the organization as well as in the context of formalization.

Table 1: Process level and formalization level (source: own study)

PROCESS LEVEL	FORMALIZATION LEVEL	Examples of the transformation process
Very high	Very general process description, rarely formalized, currently tested only in the macro scale , with no reference to the organization's state	Digital transformation of enterprises
High	Processes described in a system layout (input/output)	Agile transformation in the IT industry
Medium level	Processes described with the use of a model with graphic notations	Restructuring of a single organization
Low level	Processes described in a methodical way	Transformation in the field of project management methodologies
Very low level	Processes described in a procedural way	Team transformation

A clear lack of formalization of the digital transformation process leads to the search for ways to standardize or describe the process so important for the functioning of enterprises. The transformation model was used to conduct research as a starting point for the formalization of the digital transformation process.

Current status of work on the model

The current state of research is based on participant observations and qualitative research of nearly 100 companies in Poland. Based on experience and observations from two years, key areas of change were identified. The implementation of digital transformation processes is associated (in the author's assessment) primarily with a set of adaptation activities at all levels of the organization. From an inside of the organization point of view, transformation implies the following changes:

- **Changes in structure** – these changes are caused by the appearance of new roles in organizations. New roles result directly from those that are recommended in IT project

management methodologies, especially in the context of agile methodologies. Implementation of projects, often with external suppliers, requires the separation of project teams and in turn such roles as Project Managers, Project Portfolio Managers, Scrum Masters or Product Owners) appear.

- **Changes in project management** – the implementation of the digital transformation process requires agile techniques that naturally have the strongest impact at the operational level of the organization, causing changes in the way projects are carried out. Adaptation of good practices and new methodologies to project implementation and management results in reorganization in project management, their greater formalization and monitoring of compliance with the overall transformation plan.
- **Changes in processes** – transformation has a very strong impact on the internal processes of the organization, causing changes in existing processes or even their complete reengineering (designing from scratch). The use of modern technologies significantly changes production or service processes, very often leading to the automation of these processes. The transformation results in dimming some processes as well as in appointing of new ones (such as the ordering process based on the electronic product configurator or sales based on market-place systems).

Initial Model

Initial research on the model focuses on decomposing the digital transformation process to reduce its complexity. As an effect of these works transformation sub-processes are isolated. The research also includes the analysis of input parameters and resources that organizations should use to implement the complex process of digital transformation and study the results of these transformations (meaning changes in the resources or products of the organization).

Fig. 1: Initial model – digital transformation (source: own study)

The current state of research in the area of isolating transformation processes has enabled the identification of sub-processes within four key areas of the company's operation. These areas are called model perspectives. The perspectives of processes, projects, technology and organizational culture are currently distinguished. The perspectives gathers similar transformation sub-processes,

which summed up result in the implementation of digital transformation and achieving a new (post transformation) state by the company.

Fig. 2: Detailed model of digital transformation (source: own study)

Transformation perspectives gather sub-processes which cause a significant change in the functioning of the organization in a logically separated area of its functioning. In the case of organizations implementing digital transformations, the project perspective seems to be the first (and probably the main) that implies changes in the next ones. The relationships between change perspectives are also the subject of research. The current status of work on the model has allowed basic descriptive characteristics of transformational perspectives.

Project Perspective

Project perspective seems to be representative of any organization that, when implementing projects related to digitization meaning temporary action, completed with a specific result) most often uses specific methodologies for implementation and management. The significance of changes in the design area is symptomatic for digital transformation, therefore learning about changes within this perspective was considered fundamental. For the purposes of research of the model in this perspective there was main research questions about the role of changes in the perspective of projects [6] as an initiating other changes and the role of IT projects affecting change – from a classical organization to a digital organization (using ICT for advanced development purposes).

Technology Perspective

Organizations implementing the digital transformation process need a change in technology (IT tools, systems, applications). During the transformation process, a number of changes occur in the systems used and changes also occur due to the use of technology [3]. For transforming organizations, this means that they often need to look for completely new tools or develop existing ones with new functionalities. This, in turn, means the need to implement a number of sub-processes forcing changes in the approach to IT solutions that not only support company management but also support creation functions (e.g. analysis supported with sensors, which provides more knowledge about customer preferences and allows to change / modify the scope of the service provided).

New sub-processes for the selection of technologies and their application in organizations that appear in connection with the transformation and undergo the digital transformation process are of great importance for the market success of these companies. The sub-process of selecting technology to meet the needs of an organization, based on its functional expectations rather than a comprehensive tool seems to be particularly important [4]. This means that organizations are trying to take technology optimization actions by selecting or developing existing tools in a way that allows to obtain information for the development of the company, offer and sales channels.

Process Perspective

While computerization projects seem to be the basis of the digital transformation process, it is processes that change under the influence of implementing new IT solutions should be identified in the process perspective. Therefore, the examination of the process perspective in the context of digital transformation includes processes supporting the implementation of main processes in the organization. It should be noted that the examination of organizations in the perspective of processes is aimed at both identifying potential sub-processes of the digital transformation process affecting the radical change in the functioning of the organization as well as the possible dependence of these changes on previous changes in the project and technology perspective.

Organizational Culture Perspective

Conducting research in project, technology and process perspective has allowed to distinguish sub-processes significant for the course of transformational changes. During in-depth research and experiments conducted in order to verify the significance of these sub-processes for the course of transformational change, and thus the course of the complex process of digital transformation, a number of aspects related to the people and culture of the organization were observed, which seemed significant from the point of view of the success (efficiency?) of the transformation. Cultural aspects are mainly associated with certain organizational behaviors, best practices, norms and values. Therefore, it was considered necessary to look for the relationship between the perspectives of the previously separated sub-processes of the digital transformation process and the culture of the organization and the readiness of people for a change based on modern technologies. The cultural perspective is the most difficult to analyze but also inherent in the strategic change resulting from the implementation of the digital transformation process.

Next Steps

Identification of key perspectives for change resulting from the implementation of a complex digital transformation process does not close the research, but rather opens it. The author and his team try to identify other perspectives that would constitute groups of change processes resulting from the implementation of the digital transformation process. There also is an ongoing research on the detailed decomposition of each of the perspectives and isolation of key sub-processes in them. The purpose of identifying sub-processes is to be able to build an assessment model of the organization's readiness for change and assess the risk linked to project implementation. Current research on the process of digital transformation can be considered an early stage, but it is worth adding that the

author and his team have been researching the phenomenon of agile transformation for many years, therefore the research apparatus used is similar and allows quick identification of key areas of change. The following research will aim at identifying the transformation causes (change triggers) and creating a risk measure and a measure for the readiness of an organization for a digital transformation. The measure will be based on own and based on own and acknowledged in the literature rating models.

Start-Up Leaders in The Media – Results of Qualitative Content Analysis of Online Press News

Joanna MACALIK

Wroclaw University of Economics and Business, Wroclaw, Poland
joanna.macalik@ue.wroc.pl

Abstract

Start-up activities constitute a crucial area of modern economy. At the same time, a leader is an essential factor contributing to the success of a company, especially as young and dynamically changing as a startup. Also, like all enterprises, start-ups are expected to build their brand, and their leaders should create their personal brand. One of the factors that affect the perception of a brand, also a personal one, is its media image. This article diagnoses the problem of the media image of Polish start-up leaders, using the qualitative content analysis method. As a result, it was possible to identify categories of media coverage about start-up leaders, and to determine how they affect the image of these entrepreneurs.

Keywords: Entrepreneur, Media, Content Analysis, Personal Brand, Start-Up

Introduction

The challenge of creating a personal brand of an enterprise leader is a recognized scientific problem in the management sciences literature. It was found that the CEO reputation is directly linked to organizations' higher profits and their competitive advantages (Ranft, Zinko, Ferris, & Buckley, 2006) – in other words, the CEO is a crucial factor contributing to the corporation success. It was even suggested that the CEO personal brand is more effective in generating goodwill and brand equity than a business brand because society trusts people more than businesses (Montoya, 2002). It was attempted to measure scales for quantifying a CEO's personal brand (H.-M. Chen & Chung, 2018; H. M. Chen & Chung, 2016). However, this research concerned the internal context of an organization. It should be expected that start-ups, understood as young, innovative, and continuously changing enterprises, will regard the role of the CEO's personal brand as particularly important. The presented article addresses the issue of a start-up CEO image created by the media. In this study, the media image of a start-up CEO is considered from two angles – as an element of personal brand equity and as a factor of the company's brand equity.

It should be noted that start-up activity is a very popular topic, as start-ups represent "from rags to riches" myth and uniqueness. The "entrepreneurial myth" is particularly vivid in Poland, which, due to the ongoing changes in the political system, is a hospitable place to develop a start-up. Currently, there are about 3,000 of them in Poland (ExMetrix, 2018). In 2019, Poland was voted the seventh most friendly country in the world for start-ups, in a survey by "CEO World Magazine" (Westerby, 2019).

This favorable climate for start-ups is also visible in media publications. According to a report from 2017, prepared by the Press Service Information Agency, during the eight months of the year 2017, 37,537 publications on the start-ups activities appeared in the Polish media, whose coverage, expressed in the potential number of contacts, was 13 831 509 496, and estimated AVE, i.e. Advertising Value Equivalency, amounted to 347 215 625 PLN (~ 90 298 456 $). The vast majority, nearly 85% of all publications, were published online (Press Service Press Service Information Agency / Agencja informacyjna Press Service, 2017). To the best of the author's knowledge, no qualitative research on the content of media communications about start-ups has been undertaken so far.

Research Method and Assumptions

Method of Research

In the article, the method of qualitative content analysis was used. The content analysis is one of the research methods used mainly in sociology, communication sciences and related social sciences, which involves determining and describing the linguistic features of texts in order to explain the non-linguistic properties of their authors, such as attitudes, assessments or intentions. According to the classic definition by Krippendorff, it is *"a research technique for making replicable and valid inferences from texts (or other meaningful matter) to the contexts of their use"* (Krippendorff, 2004, p. 18).

There are two basic types of content analysis - quantitative and qualitative. They differ primarily in the research procedure and inferences based on the obtained results. Using qualitative content analysis, a researcher uses inductive reasoning: formulates research questions instead of hypotheses, and answers them, reads through the data and scrutinizes it to identify concepts and patterns (White & Marsh, 2006, p. 34). As White & Marsh note, *"conclusions from the content analysis can be drawn about the communicator, the message or text, the situation surrounding its creation-including the sociocultural background of the communication-and/or the effect of the message"* (White & Marsh, 2006, p. 27).

Despite the sociological connections, content analysis is a universal and highly flexible research method with varying possible research goals and objectives (White & Marsh, 2006, p. 22). Although the method is relatively rarely used in management sciences, it can provide interesting conclusions regarding, among others, image management of, for example, enterprises or entrepreneurs, which is the subject of the presented paper.

Research Questions

According to theoretical assumptions quoted above, in qualitative content analysis method, the research questions instead of hypotheses are formulated. They may relate to the sender of the message, the message he or she sends, the sociocultural background of the communication and expected effect of the message.

Considering the above assumptions and the research problem identified in the introduction to this article,
it was decided to formulate the following research questions:

1) Do press articles about start-ups contain information about their founders?

2) What kind of information about start-up founders is provided in general articles about start-up activities?

3) What image of entrepreneurs, start-up founders does such information create? Is it positive or negative?

Method of Sample Selection

In the methodological articles on the content analysis method, great attention is paid to the method of research sample selection. The first issue is the sample size. In qualitative studies, it is common that data is based on 1 to 30 unit of analysis (Bengtsson, 2016, p. 10). In this study, one online article is considered as one unit of analysis.

Another issue is the proper selection of a research sample. Methodologists note that the sampling should be theory-based and purposive, and *"it may have as its objective providing the basis for identifying all relevant patterns in the data or characterizing a phenomenon"* (White & Marsh, 2006, p. 36).

As part of the study, the content of online articles on start-ups was analyzed. The selection of analyzed start-ups was based on a summary prepared by the opinion-forming Internet portal MyCompanyPolska.pl entitled "25 best Polish startups", which was chosen because of its timeliness in relation to the situation on the start-up market in Poland (My Company Polska, 2019).
Due to a large number of such materials and the aim of the paper, the research sample was additionally limited to:

1) texts published in 2018, 2019 and 2020 and available online (free access),
2) texts written in Polish,
3) texts in the form of an informative article (articles in the form of an interview, short articles and articles describing more than one start-up were excluded from the research sample),
4) texts published in the opinion-forming portals with the highest viewership, according to PBI/Gemius Research [PBI/Gemius, 2019] and in popular business media.

The research sample includes no more than one article per one start-up. The selection was based on the date of publication, choosing the most recent text on each start-up (according to recent Google search results).

Due to the wide variety of start-up definitions, it should be noted that as part of the study, the accuracy of a start-up definition was not thoroughly analyzed and the specific criteria were not applied. The article focuses on the topic of start-ups primarily due to the fact that they are entities commonly identified with innovative, active entrepreneurship and in this study their business model plays a lesser role. In this article, texts on start-ups are treated as an exemplification of media reports about entrepreneurship and entrepreneurs in general.

Considering the above findings regarding the sample selection, a unified and coherent collection of 16 Internet articles was created. The list of the analyzed text is presented in the **Appendix 1**. A synthetic diagram of the research procedure is presented in **Figure 1**.

Fig. 1: Research procedure.
Source: own elaboration.

Results

The analysis showed that one can talk about a specific structure of the article about the start-up, which relates to the so-called "inverted pyramid". It is a metaphor used by journalists and other writers to illustrate how information should be prioritized and structured in a text. In the studied texts, information about the start-up leader can be found in all elements of this structure: **(Figure 2**):

1) in the lead – only surprising, eye-catching information is provided about the leader/leaders of the start-up,
2) in the body - fragments of interviews, statements about startup leader/ leaders, mainly related to the implemented projects, actions taken and funds obtained,
3) in the conclusion - information about the leader/leaders of the start-up, data on education, age, professional experience, character traits, attitudes; the information here is provided as a context, supplementing the start-up information.

Fig. 2: Placing information about start-up leaders in press texts, in relation to the so-called "inverted pyramid".

Source: own elaboration.

Categorizing content regarding start-up leaders was another element of the study. The qualitative content analysis enabled to identify six key categories of information about start-up leaders, which are presented in the analyzed media.

The following categories of information have been identified:

1) age,
2) nationality,
3) profession,
4) the past and experience,
5) relationship and teamwork,
6) plans and vision.

The categories identified above are presented in **Table 2**, together with its the most illustrative examples.

Table 2: Identified categories of startup CEO-related information in media

	Category	Examples
1.	Age	• "they are in their mid-twenties" • "young founders", • "he is 27 years old, manages a start-up worth 80 billion PLN", • "the 29-year-old leader has always shown a flair for the Internet of Things", • "became a serial entrepreneur long before his eighteenth birthday",
2.	Nationality	• "Ukrainian developers took the start-up market by storm", • "Poles bring a revolution in veterinary medicine",
3.	Profession	• "doctors and scientists", • "team of engineers",
4.	Past and experience	• "it was not their first adventure with business", • "they used previous work experience", • "one of them sold the business for several million zlotys, the other helped build a large technology company, now they are joining forces", • "they decided to use their experience in marketing, sales, printing and IT", • "company founded by engineers related to Warsaw University of Technology", • "it is possible thanks to their experience in scientific work", • "both founders: (...) have extensive experience in the industry", • "as a teenager, he built websites, created his own interactive agency and wrote the first internet game", • "a team from Krakow AGH (University of Mining and Metallurgy)",
5.	Relationship and teamwork	• "four friends founded the company", • "together with colleagues", • "behind the firm stands a team of engineers and doctors", • "there are currently 30 people on board",
6.	Plans and vision	• "has ambitious plans", • "is not enough for them", • "together with startup colleagues they have ambitious plans", • "an ambitious expansion plan", • "start-up intends to strengthen its position", • "we're going to change it" • "however, this is not all about ambitions - asked for further plans, he boldly makes a vision"

Source: results of own research. Author's translation.

Conclusions and Managerial Implications

It should be noted that, apart from exceptional examples, information about the start-up leader is additional, complementary and is usually found in the conclusion of the general info articles. Furthermore, the study allowed to identify six categories of information about start-up leaders that can be found in the analyzed media. This information, therefore, relates primarily to age, nationality, profession, past and experience, relationship and teamwork and plans and vision of the leader.

Particularly visible trends are:

1) highlighting the young age of many startup leaders, especially in the context of huge success and high profit achieved by the start-up (Age category),

2) highlighting their previous business and - often - scientific experience (Past and experience category),

3) showing the character and personality traits of leaders, especially traits such as perseverance, creativity and grit (Plans and visions category),

4) emphasizing the role of teamwork and relationships (Relationship and teamwork category).

The information presented in the analyzed articles builds a positive image of a start-up leader and an entrepreneur in general. Primarily, they focus on offering innovative business solutions that result from the creativity of leaders and the hard work that underpins the success of growing businesses. Therefore, it should be recognized that the media image of Polish entrepreneurs constitute the favorable conditions for them to build a strong and recognizable personal brand.

Managerial Implications

The above findings have a number of managerial implications. Primarily, the results of analysis confirm that the image of the startup leader is an important factor in shaping the image of the whole enterprise and it should be taken into account in start-up image-building activities and should be included in the start-up business strategy. They also show that the start-up leader is an interesting topic for journalists (especially their age, nationality, profession, the past and experience, relationship and teamwork and plans and vision). Therefore, it should be assumed that the conscious and strategic creation of start-up leader personal brand is important in the category of start-up success.

Further Research Questions

The study presented in the article is preliminary. The author of the article intends to continue the qualitative and quantitative research on the importance of the entrepreneur's personal brand in Poland and in the world. Another prospective study, currently in the initial phase, is quantitative research of start-up founders in Poland, which will examine their attitude to building their personal brand and their opinion on its role in the success of implemented business ventures.

Abstract

The Russian Federation is a country with significant inter-regional economic differentiation. the main macroeconomic indicators of developed regions-leaders and lagging regions-that determine the level and quality of life of the population differ tenfold. Managing changes in the functioning of lagging regions by creating a basis for their self-sustaining development, building competitive competencies, and digitalization can be an effective way to equalize territorial disparities. **The purpose of the study** is to reveal the specifics of the functioning of lagging Russian regions, systematize the problems of their functioning and determine the directions of their future self-sustaining development. **Methods used in the study:** economic and statistical analysis, grouping method, logical, induction and deduction, comparative-historical. **The information base of the research** is official materials and reports of the Federal state statistics service of the Russian Federation, analytical data and expert reports of Bankstoday, Fincan, Expert RA and the Analytical center under the government of the Russian Federation**. Research result**. Identification of lagging regions was made. for this purpose, the method of calculating the index of the current level of economic health of the region and its dynamics was applied. The key problems of lagging regions of Russia are systematized: budget restrictions; investment problems; employment problems, reduction of income of the population and reduction of quality of life. It is proved that the existing problems of lagging regions are reference points for their future self-sustaining development. It is determined that an effective way to equalize territorial disparities can be to manage changes in the functioning of lagging regions through the formation of a basis for their self-sustaining development, as well as building competitive competencies and digitalization.

Keywords: Region, Differentiation, Inequality, Lagging Region, Change Management, Digitalization, Macroregion

Introduction

The problem of territorial disintegration between economic centers and lagging regions is typical for almost any state. This is due to the obvious competitive advantages of some regions that have a

strong natural resource potential, greater capacity of the consumer market or their proximity to the centers of redistribution of financial flows (for example, developed Metropolitan regions) and unfavorable conditions for conducting economic activities in other regions (distance from developed infrastructure, unfavorable geographical location, lack of its own resource base). In turn, the disproportions of economic development between territories determine the emergence of a number of social inequalities.

Of course, this problem is more specific in Russia than in European countries. Thus, the value of the decile coefficient in Germany in the period from 2014 to 2017 on average remained at the level of 1.8, in France – 1.4, in Italy-2.1, while in Russia its value reaches the level of 7.1 (EMISS 2019).

In 2018, more than half (52.1%) of the total GRP of all Russian subjects of the Federation was formed by only ten regions (Moscow, Saint Petersburg, Moscow region, Sverdlovsk region, Khanty-Mansi Autonomous Okrug-Yugra, Yamalo — Nenets Autonomous Okrug, Krasnodar territory, Krasnoyarsk territory, Tatarstan, Bashkiria). Russia ranks 22nd among 28 countries in terms of inequality between urban and rural areas (the ranking leaders are Tajikistan, Georgia and Romania) (RBK 2018).

Of course, the uneven territorial development creates prerequisites for the inefficiency of the entire economic system of the country. The state should support lagging regions through regular Federal budget transfers, and in the event of crisis situations in the external world (sanctions restrictions, falling oil prices, etc.), the probability of future development in these regions is approaching zero.

The way out of this situation can be the search for new models and mechanisms for leveling territorial disparities, taking into account the ongoing changes in the global environment and digitalization.

Materials and Methods

The scientific hypothesis of the study is based on the assumption that in any economic system there is a socio-economic differentiation of territorial units. Managing changes in the functioning of lagging regions by creating a basis for their self-sustaining development, building competitive competencies, and digitalization can be an effective way to equalize territorial disparities.

H1: the existing problems of lagging regions are reference points for their future self-sustaining development.

H2: the formation of a new territorial structure is a vector of the state policy of spatial alignment.

H3: the mechanism for implementing the state policy of overcoming territorial disintegration between economic centers and lagging regions has both optimistic and pessimistic development scenarios.

Differentiation of spatial development is one of the problems that are relevant for almost any economic system, the world experience of smoothing socio-economic differentiation is reflected in the works Tyunen (1926), Kochnov (2011), Krivko (2012), Shtul′berg (1997), Seliverstov et al. (1996), Granberg (2003).

The authors studied works Zubarevich (2019), Atanov et al. (2014), Kim (2009), dedicated to the formation of the foundations of economic activity of lagging regions and the development of a strategy for their spatial development.

Models for managing changes in the socio-economic development of lagging regions are presented in publications of Filatov (2017), Karpunina et al. (2018a).

The information base of the research is official materials and reports of the Federal state statistics service, analytical data and expert reports of Bankstoday, Fincan, the Expert RA, the Analytical center under the government of the Russian Federation, and others.

Among the methods used in this study, we will highlight: economic and statistical analysis, the method of grouping, logical, induction and deduction, and comparative-historical.

The object of the study is lagging regions. In this regard, it is necessary to clarify the terminology used.

From the point of view of the theory of regionalism, problem regions are regions that have socio-economic difficulties and need external support. Regional problems can be of an economic, social, demographic, ethnic, or geopolitical nature. Among the problem regions, Granberg identifies two types - backward (underdeveloped) and depressive (Granberg 2003).

Depending on the Federal center's assistance, regions can be divided into donor regions (self-sufficient) and recipient regions (receiving subsidies). Note that the number of donor regions, i.e. dynamically developing regions, is constantly decreasing in Russia. According to official criteria, their number decreased several times in the period 1993-2019: in 1993 there were 35 donor regions; in 1997-8 regions; in 2001-25 regions; in 2015-14 regions; in 2019 – 13 regions (Bankstoday 2019).

Khanty-Mansi Autonomous Okrug – Yugra (2252 billion rubles), Moscow (1076 billion), Yamalo-Nenets Autonomous Okrug (855 billion rubles), St. Petersburg (499 billion), Tatarstan (329 billion rubles), Krasnoyarsk Krai (272 billion rubles), Moscow oblast (234 billion rubles), Samara oblast (224 billion roubles), the Orenburg region (199 roubles), Perm Krai (192 billion) are leaders in the contribution to the Federal budget in 2019 (Bankstoday 2019).

The most problematic regions receiving the maximum amount of subsidies from the Federal budget in 2019 are: the Republic of Dagestan (a total of 66,3 billion rubles), the Republic of Sakha - Yakutia (46.9 billion rubles), Kamchatka Krai (37.4 billion rubles), the Altai Krai (RUB 26.8 billion), Chechen Republic (30.4 billion rubles), Stavropol Krai (22,1 billion rubles), the Republic of Crimea (20.4 billion rubles), the Republic of Buryatia (19.9 billion rubles), the Republic of Tuva (16.9 billion rubles), Bashkortostan (15.6 billion) (Fincan 2019).

Thus, in 72 regions of the Russian Federation in 2019, the budget component is insufficient to Finance social and infrastructure expenditures on its own, so the Federal budget sends money transfers to the budgets of these regions to Finance additional expenditures.

However, the amount of subsidies from the Federal budget, in our opinion, does not fully reflect the current level of development of the region and the possibility of its classification as lagging regions.

For a more objective assessment of the level of development of the region and the changes taking place in it, as well as to develop a criterion for classifying the region as lagging behind, we use the method of calculating the index of economic «health» of regions, proposed by «Expert RA» (Expert RA 2019). In accordance with this method, indicators of the current level of economic health of the region and indicators for assessing the dynamics of the regional economy are calculated.

Indicators for assessing the current level of development of the region include: indicators that characterize the economic health of the region's population (purchasing power of average per capita income; the share of the population with monetary incomes below the subsistence minimum; retail trade turnover per capita; overdue loans to individuals); indicators of the state of economic health of regional business (investment in fixed capital per capita; housing commissioning per capita; income income tax in the consolidated budget of the region per capita; income taxes comprehensive income in the consolidated regional budget per capita); the indicators of the economic health of the consolidated budget of the region (direct debt of the consolidated budget of the region to tax and non-tax revenues of the consolidated budget of the region; the expenditures of the consolidated budget of the region for debt servicing to tax and non-tax revenues of the consolidated budget of the region; tax and non-tax revenues of the consolidated budget per capita).

Indicators for assessing the dynamics of the regional economy reflect changes in the same three groups of indicators - the economic health of the region's population, the economic health of regional businesses, and the economic health of the region's consolidated budget.

This approach allows, in our opinion, to more fully monitor both the current state of the region's economic "health" and the direction of its change.

Using the Expert RA method, we can conclude that the current level of development of Russian regions is characterized by a high degree of differentiation. Thus, the Sakhalin oblast has the highest index value of the current level of economic health of the region – 89%, while the lagging region is the Karachay-Cherkess Republic with an index value of the current level of economic health of the region -67,2% (the index of the economic health of the region's population is -92%, index of the economic health of regional business -89%) (Fig.1).

Fig. 1: Regions of Russia with the highest and lowest index of the current level of economic health of the region, 2018 (according to GKS 2019 and Expert RA 2019 methodology)

The calculation of the index of dynamics changes in the economic health of the region allowed to conclude that in 2018 the index value has improved for many Russian regions 29 regions showed a positive trend (significant improvement), 36 regions showed moderately positive dynamics. Neutral dynamics of indicators was recorded in 14 regions. Moderately negative dynamics were observed in 6 regions (including the Republic of Tyva (12%) and the Republic of Mordovia (-14%), which are among the ten regions with the lowest values of the current level of economic health). This confirms the assumption that the structure of the Russian regions ' economy as a whole is a fairly mobile substance that is prone to changes as a result of various factors, primarily regional policy.

In addition, there is a significant gap between the values of key groups of indicators of regions with high and low current levels of development. So, in 2018, 12 regions had the current level of development at the "high" level, 20 regions - "above average", 19 regions - "average", 20 regions - "below average", 14 regions- "low".

Thus, first, the object of the study will be lagging regions - regions that have the value of the index of the current level of economic health of the region "below average" and "low" with moderately positive, neutral and moderately negative dynamics of development, that is, 25 subjects of the Russian Federation. Second, the possibility of accounting for the dynamic (changes) in the process of

calculating the economic health of the region will assess the result of the changes as a result of the implementation of regional development policies in lagging regions, i.e., the effectiveness of change management.

Results and Discussion

To substantiate the H1 hypothesis "existing problems of lagging regions are reference points for their future self-sustaining development", we will diagnose the key problems and contradictions of lagging Russian regions.

Filatov (2017) systematizes the key problems of Russian regions on the following grounds: budgets; investments; income of the population, quality of life and the labor market.

As a rule, the budgets of lagging regions tend to slow down the growth rate of their own income, exhaust the sources of growth of the tax base, the state of deficit, debt dependence, imbalance and dominance of social obligations (Filatov 2017).

Investments in fixed capital in lagging regions tend to fall in growth rates due to stagnation of production, dampening of business activity, exhaustion of the reserve strength and resources of the region's basic enterprises, slowing down the growth rate of GRP, increasing the separation of production and economic potential from other regions.

As a result, there is a shift in investment flows in the direction of competitive regions with budgets that provide a high share of the development maneuverability resource. As practice shows, lagging regions increase the gap in the volume and share of priority sources of external, extra-budgetary, and foreign investment. In conditions of stagnation of the real economy, weakening of investment attractiveness and unbalancing of budgets of lagging regions, social inequality, wage differentiation, unemployment and informal employment of the population are growing. Table 1 shows a systematic view of the problems of Russia's lagging regions.

Table 1: Systematization of development problems of lagging regions (created by authors)

Budget constraint	Investment problems	Problems of employment, reduced income and reduced quality of life
1. Dynamics of the industrial production index. The volume of manufacturing production in lagging agricultural regions in 2018 decreased by 2.9%, a key role was played by a decrease in the Karachay-Cherkess Republic by 18.4%. Production volumes in the sphere of water supply and pollution elimination in regions with a raw material export-oriented economy decreased by 4.3%, the main impact was a decrease in output in the Khanty-Mansi Autonomous district by 8.4% (Analiticheskij centr pri Pravitel'stve RF 2019). At the same time, financial and	Eight of the sixteen regions (mostly lagging regions) in the first half of 2018 reduced investment in fixed assets (against the background of a 3 percent increase in Russia). In other regions, the rating was lowered against the background of positive investment dynamics, but in some cases this dynamics is lower than the national average, and in other cases it is the result of the "low base effect". That is, in fact, it is not a breakthrough growth, but only a recovery of investment activity after the strong failures of previous years. In particular, in Khakassia, a twofold increase in investment	1. According to the data published by Rosstat on labor productivity for 2015-2017, the share of industrial workers in employment in the country as a whole in 2017 was 19.0% (13.7 million people) and differed greatly by type of regions: the highest values of the indicator were observed in raw material regions with an export-oriented economy (25.5%), developed regions based on mining (22.9%) and manufacturing (22.2%), as well as in industrial and agricultural regions (22.5%).%); the lowest values are found in regions that lag behind in development - 14.1%, where a large share of the population is employed in the service sector, and in less developed agricultural regions

economic centers have become leaders in the growth of manufacturing production (+9.3%), and developed regions with diversified economies have shown maximum growth in the sector of electricity, gas and steam; air conditioning (5.7%). 2. Budget deficit: the maximum level of deficit in the consolidated budget in 2018 in the Republic of Mordovia (-7 billion rubles, or -24.5% of the national income tax), the Republic of Kalmykia -0.1 billion rubles, the Kurgan region -0.3 billion rubles, the Yaroslavl region -2.1 billion rubles (Expert 2019). 3. Tax and non-tax revenues of consolidated budgets in the Chukotka Autonomous Okrug (-14.6%), the Novgorod region (-13.7%) and the Republic of Kalmykia (-11.2%), the Kurgan region (-10.1%), the Ivanovo region (-7.6%), and the Pskov region (-6.8%) showed the largest decrease in real terms in 2012-2018. *4. The debt burden* on Russian regions is 2.115 trillion rubles. The highest state debt as of 01.02.2019 is typical for the following lagging regions: Kostroma region (20.5 billion rubles), Kurgan region -16.5 billion rubles, Pskov oblatsi (16.3 billion rubles), the Republic of Mari El (13.3 billion rubles). At the same time, in the period up to 2017, there was an increase in the debt burden of lagging regions, in 2017-2018, its reduction began (Fincan 2019).	activity in the first half of 2018 followed a steady and significant contraction in investment in 2016-2017. in the Bryansk region, the index of investment in fixed assets (1 half of 2018) was 76.1%, in the Kostroma region -77.1%, in the Tver region -82%, the Republic of Buryatia -68.9%, and the Republic of Dagestan-96.1% (for all regions of Russia-103.2%) (Ra-national 2018). The results of the 2018 rating are in good agreement with the statistics on the domestic distribution of fixed capital investments. The share of 24 regions whose investment attractiveness is rated as "high" in the NRA rating accounts for about 62.3% of the total investment in fixed assets. At the same time, 27 regions with "moderate" investment attractiveness account for only 10% of this volume.	(11.3%), where most of the population is employed in agriculture. 2. The average per capita cash income in Russia in 2018 is 32,609 rubles, and the average cost of living is 10,287 rubles. The ratio of the subsistence minimum to the monetary income is 31.5%. Each region has its own amount of income and its own subsistence level. For example, in the Republic of Tyva, the monthly cash income is 14,379 rubles, and the cost of living is 9957 rubles. The ratio of the subsistence minimum to the monetary income is 69.2%. The top 5 poorest regions in Russia include lagging regions such as the Republic of Dagestan (61.6%), the Jewish Autonomous region (53.9%), the Republic of Kalmykia (53.8), and the Republic of Karachay-Cherkessia (53.2%) (Zenyandex 2019) 3. Many indicators of quality of life in different regions of the Russian Federation differ at times. For example, the unemployment rate in October – December 2018 varies from 1.2% (Moscow) to 26.8% (the Republic of Ingushetia), the accrued salary in November 2018 varies from 101.7 thousand rubles per person (in the Magadan region) to 24.6 thousand rubles (in the Republic of Dagestan), the total area of residential premises per person on average – from 31.8 square meters per person (in the Moscow region) to 13.9 square meters per person (in the Republic of Tyva). The difference in life expectancy in Russian regions is 15.5 years. Infant mortality rates and many other indicators vary greatly in the regions. Outsiders of the rating of regions for quality of life in 2018 are the lagging regions: Kabardino-Balkarian Republic, Republic of Buryatia, Jewish Autonomous region, Kurgan region, Republic of Altai, Republic of Kalmykia, Republic of Ingushetia, Zabaikalsky Krai, Karachay-Cherkess Republic and Republic of Tyva (RIA 2019)

Conclusion: lagging regions characterized by decline in industrial production, slowdown in revenues, the deficit and the imbalance of regional budgets, rising debt burden and the dominance of social obligations expenditure budget.	Conclusion: in lagging regions, there is a slowdown in investment growth rates, their shift to regions with balanced budgets and a high share of the resource maneuverability of development, the lack of strategic investors and a decrease in the number of promising investment projects	Conclusion: in lagging regions, there is a decrease in the level of wages and incomes of the population (except for regions with a high share of employees of budget organizations, which are financed by Federal funds), a decrease in the level and quality of life of the population, an increase in unemployment due to the outflow of qualified personnel to more developed regions, an increase in informal employment, and a demographic and migration decline in the active population.

In addition, the analysis of scientific sources allows to identify the main inertial constraints thwarting the development of regional economy: significant disparities in the level of wages in various sectors of the economy that determine the generally low income levels; limited access to different types of capital; a limited number of enterprises with a high growth potential as targets for investment; the geographic remoteness and the poor transport infrastructure; imbalance in the structure of regional economic complex; low level of inter-regional and inter-municipal communication interaction; undeveloped institutional environment that has a decisive influence on the size of transaction costs, which determines the nature of contractual relations; lack of development strategy, low efficiency of individual projects and the regional economy as a whole (Karpunina et al. 2018b).

We believe that the reference points for the future self-sustaining development of lagging regions can be the existing problems of their development (Fig.2).

Fig. 2: Reference points for self-sustaining development of lagging regions

(created by authors)

Arguing the H2 hypothesis "the formation of a new territorial structure acts as a vector of the state policy of spatial alignment", we note that the process of managing changes begins with the formation of a new territorial structure in order to enhance interaction with neighboring more developed regions within the framework of the "open door" policy, which can contribute to the use of the lagging regions ' own resources to stabilize national development.

One of the forms of the new territorial structure can be a macroregion as part of the country's territory, which includes the territories of two or more regions and is formed for strategic planning purposes.

Japan has a positive experience of regional development based on the creation of a spatial structure of the economy based on autonomously developing macro-regions. Regional strategies are guided by the principles of mutual assistance and independence of regions, competition of ideas and innovations, creation of sustainable regional communities by stimulating the local economy and creating local jobs. The regions plan and act independently, and the national government performs a supporting function. At the same time, interaction between 8 macroregions (Kanto, Tohoku, Tokai, Kinki, Shikoku, Hokuriku, Chugoku, and Kyushu) is envisaged to minimize the negative consequences of a monocentric spatial structure (Atanov et al. 2014).

In South Korea, starting in the 2000s, the tasks of balanced development and mobilization of growth in the peripheral regions were also solved through a policy of decentralization. 5 economic macroregions were created within the framework of spatial modification, each of which has a population of more than 5 million people and consists of 2-3 provinces or provincial cities connected to each other by common historical, economic and social ties (Kim 2009).

In 2009, Autonomous regional headquarters were established for effective cooperation between provinces within the borders of one economic macro-region. They develop regional development plans for their macroregion and promote horizontal cooperation among local authorities. Thus, the advantages of regional development based on regional specialization, decentralization and local autonomy, interregional cooperation and joint development are obvious.

It is the formation of macro-regions that is referred to in the Decree of the President of the Russian Federation No. 13 of 16.01.2017 "On approving the foundations of the state policy of regional development of the Russian Federation for the period 2025" (Kremlin 2017).

New macro-regions can be based on the following strategies: strategy for the removal of production; the strategy of substitution production; incentive strategy; strategy of growth through domestic demand in the Federal district and regions; strategy of growth through demand from the national economy; strategy of growth through development programmes of natural monopolies and state corporations; strategy of growth through attracting foreign investment and joint ventures; growth strategy through the establishment of territories with special conditions for business activities (Filatov 2017). The choice of a particular strategy for creating a new territorial structure will be determined by the peculiarities of the geographical location, as well as the socio-economic potential of the lagging region. The result of the creation of macroregions should be the stabilization of territorial development and increase of budget independence due to the emergence of new opportunities to use the potential of the region.

The second element of change management in order to form the basis for self-sustaining development of the region is investment in R&D and digitalization.

The main principles of regional policy are the mobilization of unused sources of growth and innovative potential by stimulating bottom-up initiatives and the creation of new growth engines through R&D in key areas of the lagging region.

The experience of the Scandinavian countries shows that the sphere of research and development (R&D) was and continues to be an important recipient of budget funds (in the late 2000s, the share of R&D expenditures in Finland reached a record 3.7% of GDP, in Sweden-3.6%, in Denmark-3.1%). However, in addition to the state, private business should play a significant role in the development

of this area. For example, in the Scandinavian countries, almost every large enterprise is focused on creating its own research center or working in close connection with scientific and research centers, laboratories, and institutes. This system reduces the time period for innovation, i.e. the path from invention to commercialization (Demidova 2018).

An effective tool for building the region's innovation potential is the creation of industrial clusters and the promotion of innovative developments and venture capital in the regions. For example, the Ministry of education, culture, sports, science and technology of Japan has been promoting the creation of such clusters in the regions since 2001.

The third element of change management is the development of human capital based on a competency-based approach. At the same time, we are talking about groups of competencies that lagging regions have, and that function separately, often locally, without being involved in solving the problems of national economic development (Filatov 2017). The emergence of lagging regions as centers of competitive competence is a factor in the intensification of regional development.

Gennaioli et al. (2013), after examining a database of 1,569 subnational regions from 110 countries, provide evidence of the paramount importance of human capital and professional competencies in accounting for regional differences in development. In this analysis, human capital, as measured by education, is the most consistently important determinant of both regional income and the productivity of regional institutions.

Firstly, the human capital of employees is included as a contribution to the neoclassical production function, but the human capital of the entrepreneur/manager affects productivity at the firm level independently. In the models of allocation of talent between work and entrepreneurship (Lucas 1978, Baumol 1990) the return on entrepreneurship training may appear more as a profit than as a salary. Secondly, there are external effects of human capital for the region, resulting from the fact that people in a given place spontaneously interact with each other and learn from each other, so knowledge is transmitted through people without payment (Jacobs 1969, Lucas 1988). Thirdly, in different countries, the impact of education and regional development institutions is difficult to separate: both variables are endogenous, and potential tools for them are correlated (Glaeser et al. 2004).

The hypothesis of the conducted research H3: the mechanism of implementation of the state policy of overcoming territorial disintegration between economic centers and lagging regions has both optimistic and pessimistic scenarios of development.

Indeed, investing in R&D and developing competitive competencies, even if well-organized and funded, does not lead to quick and obvious results (a pessimistic scenario) for three reasons, which are limited to targeting only the academic and business environment: changes in basic science and education are focused on the long term; providing a favorable innovation environment in the region leads to innovation activity with a time lag; support for regional technology projects and startups has a limited effect in the absence of domestic demand (Key 2011).

Conclusions/Recommendations

The authors used the method of calculating the index of the current level of economic health of the region and its dynamics to identify lagging regions that are the object of the study. The authors determined that the possibility of taking into account the dynamic component (changes) in the process of assessing the economic health of the region will allow determining the result of changes occurring as a result of the implementation of the regional development policy of lagging regions, i.e., the effectiveness of change management.

The authors systematized the key problems of the lagging regions of Russia and divided them into three groups: budget constraints; investment problems; problems of employment, reduced incomes and reduced quality of life. The authors proved that the existing problems of lagging regions are reference points for their future self-sustaining development. It is determined that an effective way to

equalize territorial disparities can be to manage changes in the functioning of lagging regions through the formation of a basis for their self-sustaining development (the formation of a new territorial structure in the form of macroregions), as well as building competitive competencies and digitalization.

Abstract

One of the crucial function of packaging is communication with a potential client which shapes the customer product perception. Thus, knowledge on which factors and how influence buyers could be critical in gaining market share. In the face of high market competitiveness, companies are struggling to provide distinctive marketing messages. On the other hand, they may also face unfair activities from manufacturers trying to use packaging similar to those of a well-established brand. The present paper examines similarities of packaging products from companies that newly entered the market with packaging designs of a well-known drain cleaner. We take advantage of the cognitive psychology based methodology proposed by Luce (1963), determine consumers' perceived similarities, and estimate probabilities of correct and incorrect selections for all pairs of nine examined products ($n = 50$). The results shows that three products decidedly exceed recommended level of similarity. We also provide practical suggestions about possible interpretations of the outcomes. The presented methodology along with obtained findings could be theoretically and practically applied in various types of marketing activities, especially related to the design of graphical marketing messages.

Keywords: Marketing Message, Unfair Competition, Digital Presentation, Correct Identification, Multidimensional Scaling

Introduction

Communication with the customer is one of the basic functions of the product packaging (Robertson 2006). The importance of this role has already been noted in the middle of the last century. For example, Dichter (1957) described the packaging as the "*silent salesman*". Many modern research confirms the belief that packaging is invaluable in both attracting attention and shaping the propensity to buy among customers and transferring basic product knowledge (Littel & Orth, 2013; Orth & Malkewitz, 2012).

Shaping customer perception translates into the final purchasing decision and as shown in, for example, Bloch (1995), Orth et al. (2010), Reimann et al. (2010) is closely related to the quality of the packaging design. Therefore, much attention is paid to the analysis of factors determining the customer's perception of the packaging design. Much of this research concerns low engagement products – for everyday use. A broader review of the directions of these investigations is presented, among others, in the work of Grobelny & Michalski (2015).

The constantly growing competition in the area of production of the same or similar categories of goods is a special incentive to design original, distinctive marketing messages. In this perspective, it

is crucial to design products' packaging in such a way that they stand out among competing ones that are often placed on the common shelf in the market or in the same virtual store's web page (e.g., Ryynanen & Hakatie, 2013).

The other side of this context is, unfortunately, the market's inclination to unfair competition. If the products belong to the so-called low-involvement goods, that is, everyday use at a low price, consumers' cognitive engagement while shopping is small. In such a case, purchase decisions usually take a few seconds. The use of packaging similar to those of a known brand by an unknown company causes mistakes or activation of the mechanism of transferring positive associations from the original trademark. As a result, it facilitates the market expansion without spending on advertising, promotion, etc. Potential threats of this type are the basis for the research described in this work .

In the current study we analyze the similarity of packaging products from companies that newly entered the market with packaging designs of the well-known sewer pipe cleaner (Kret). The methodology and analysis of these similarities among packages of drain cleaners available on the Polish market is the subject of the present research. In addition to practical solutions, the research's special purpose was to show designers and companies the application of the cognitive psychology based methodology for determining consumer perceived similarity of objects and the possibility of using such analyzes in marketing activities.

In the following paragraphs, the idea of this methodology is first discussed, then the design of the experiment was described and the obtained results were presented. The discussion and conclusions section indicate, apart from the summary of the outcomes, possible practical consequences of using the results of these type in the marketing activities.

Method

Since the examined products, as mentioned earlier, belong to the so-called low-engaging goods, the consumers' cognitive involvement is also small. In this situation, it is possible to examine both the packaging similarities and determine the likelihood of incorrect identification, which leads to choosing competing goods instead of the proper one, using the selection model proposed by Luce (1963). A detailed description and justification of the conduct methodology is available in the works of Getty & Swets (1982) or Falkowski (2002). The general procedure is reduced to the following steps:

1. Subjects assign a level of subjectively assessed similarity to each pair of analyzed objects on the ordinal scale (i.e., 0 – absolutely different ... 10 – identical).

2. The obtained scores are averaged across all participants.

3. Similarity relations are presented in two-dimensional space using the multidimensional scaling method. The technique place points representing the examined objects in such a way that the distances between each pair of objects are proportional to their average degree of similarity.

4. For each pair of investigated objects their Euclidean distance $Distance_{ij}$ is calculated in the space used in the multidimensional scaling procedure.

5. Based on d_{ij} distance, a similarity measure is determined for each pair. The following exponential formula is used for that purpose: $Similarity_{ij} = \exp(-a \cdot Distance_{ij})$, where a is the coefficient of perceptual sensitivity in differentiating stimuli.

6. The calculated similarity measures allow for determining the probability of correct and incorrect object identification in the selection process regarding the pair of i and j objects. These likelihoods are calculated according to the formulas: $Probability_{Correct(i,\,i)} = 1 / (1 + Similarity_{ij})$, and $Probability_{Incorrect(i,\,i)} = Similarity_{ij} / (1 + Similarity_{ij})$, respectively.

This approach is a consequence of the practical application of the results of similarity research formalized as the Luce's theoretical choice model (1963). The starting point of this theory is an error matrix obtained by direct identification of objects. This confusion matrix includes probabilities estimated by frequencies of incorrect identification for each pair of compared items.

In a series of laboratory experiments Getty & Swets (1982), among others, showed that using procedure 1 – 6 described above, the probabilities of correct and incorrect identifications of objects reproduce those obtained in direct comparisons accurately. The percentage of a common real variance and the approximated error matrix, in 33 experiments, ranged from 96–99%). In addition, detailed practical research has shown (Getty et al., 1979; Nosofsky, 1986; Chlewinski & Falkowski, 1992) that the adoption in the multidimensional scaling procedure (Kruskal, 1964) employing a two-dimensional representation space with (–1, 1) range and parameter $a = 2$ (fifth step of the presented procedure) gives the best fit of the estimated error matrix to the matrix obtained in real consumer choices. Therefore, such parameters were used in present study analyzes.

Participants

Fifty adult subjects, aged 24–69, took part in the study, of which 60% (30 persons) were women and 40% (20 people) men. The results presented in the *Gender Consumer in Marketing* (2020) report, based on a sample of 986 adult Poles (50.8% women and 49.2%), show that in Poland mostly women (61.7%) are responsible for shopping in households. This outcome was taken into account when selecting the sample for the present investigation.

Almost all participants ran their own households and used chemicals to unblock pipes in the past. The respondents purchased household chemicals, most often in self-service stores, where products are selected on their own. Among the surveyed brands, they subjects, the most frequently, associated the *Kret* product with pipe clearing agents, followed by *Tytan*. None of the examined persons ever participated in such experiments before. Subjects did not receive any remuneration for participating in the study.

Apparatus

The paper-based survey used in the current research consisted of three main parts. The first part contained general questions characterizing the person completing the questionnaire: age, gender, and questions related to the use of chemicals for pipe unblocking, for example, *Do you run your own household*? or *Have you ever used chemicals for pipe unblocking*? The second and third parts comprised pairwise comparisons of nine packaging photos: two products from a leading manufacturer and seven being the natural context for a potential consumer. Sample page fragments from the second and the third survey parts are illustrated in Figs. 1 and 2.

In order to reflect the real differences in the sizes of the tested packages, the photos used for comparisons were taken in pairs at the same distance between the camera and products. The camera was fixed to the tripod. A uniform and neutral background was also used not to disturb the perception of the examined packages. Only photos showing the front of the packaging were used, which roughly corresponds to the situation in which a potential customer sees the products on store's shelf.

Fig. 1: Fragment of the sample page from the second part of the survey

Fig. 2: Fragment of the sample page from the third part of the survey

Experimental Design

Nine product packaging for drain cleaners used in households were considered in the study. Among them there were two packages leading in the market (Fig. 3), that is, 1. Kret (silver, KSr), 2. Kret

(red, KCz) and three disputed products entering the market (Fig. 4): 3. All (All), 4. Rater (Rat), 5. Wicuś (Wic).

1. Kret silver (KSr) 2. Kret red (KCz)

Fig. 3: Product packages of the leading manufacturer

3. All (All) 4. Rater (Rat) 5. Wicuś (Wic)

Fig. 4: Packages of new products being brought to market

In order to simulate the natural context of choice that consumers face in the store, the study also involved packaging from other companies that produce similar chemicals. The list of direct competitors included the following six products: Ludwik, Mr. Muscle, Rorax, Sansed, Tiret, and Tytan.

In our research methodology, the number of simultaneously analyzed objects should not be too large due to the rapidly increasing number of necessary pairwise comparisons. They are proportional to the number of examined objects squared. Therefore, the number of contextual products has been limited to four brands that successively have the largest share in the market of chemical pipe purifiers (Fig. 5), that is, 6. Tiret (Tir), 7. Tytan (Tyt), 8. Ludwik (Lud), 9. Sansed (San). According to the manufacturers data, 500 milliliters/500 grams containers are the best-selling, thus packages with this capacity were used in comparisons. The exception is Tytan because it was only available in a 600 or 250 milliliter bottle. In this case, the 600 milliliter version was chosen.

6. Tiret (Tir) 7. Tytan (Tyt) 8. Ludwik (Lud) 9. Sansed (San)

Fig. 5: Context product packages in order of decreasing market share

The research used a standard experimental within-subjects design, in which each participant evaluated all nine packaging variants by assessing similarity levels for all possible pairs. For nine product variants, the number of all possible pairwise comparisons amounts to 36. Four distinct sets of comparisons were elaborated. In each set, the order of comparisons was different and set at random.

The order of comparisons in the second part of the survey, presenting photos of the investigated product packages, corresponded to the order of similarity questions from the third part. To assess the, Subjects rated the similarity level for each pair of products on a 11 item Likert scale ranged from 0 to 10 (compare Fig. 2). Marking the leftmost square meant that the given pair of packages was completely different (value 0), and choosing the rightmost one indicated that the packages were identical (value 10).

Procedure

The subjects were informed about the purpose and exact scope of the examination. After obtaining the permission to participate in the study, a questionnaire regarding personal data and containing questions related to drain cleaners was filled in. Next, the examined person was asked to look carefully at photos of pipe unblocking products presented in the second part of the survey. Then, in the third part of the survey, respondents marked the degree of perceived similarity for each pair of products.

Results

Similarities based on all subjects

The summary of the obtained similarity results are presented as scores averaged across subjects and put together in the lower triangle of the matrix in Table 1 below. The presented outcomes were then subjected to the multidimensional scaling procedure supported by the PerMap program. The software allowed the creation of the so-called consumer mind map. This map is used to illustrate, in two-dimensional Euclidean space, how a potential customer perceives the differences in the packaging of all examined products. Perceptual distances provided by this procedure in the assumed coordinate system with values ranging from –1 to 1, for all possible combinations of the analyzed products, are given in the upper triangle of the matrix in Table 1.

Table 1: Average similarity ratings of the analyzed product pairs (lower triangle of the matrix) and Perceptual distances in Euclidean space for all combinations of products (upper triangle of the matrix).

	All	KSr	KCz	Lud	Rat	San	Tir	Tyt	Wic
All	×	0.33	0.60	0.99	0.08	0.97	0.69	0.91	0.55
KSr	6	×	0.40	0.97	0.39	0.81	0.96	1.03	0.54
KCz	1.7	6.5	×	0.64	0.62	0.40	1.00	0.84	0.32
Lud	1.4	1.6	3	×	0.95	0.45	0.92	0.43	0.45
Rat	8.5	5.3	2	2	×	0.97	0.61	0.84	0.52
San	1.5	1.1	3.5	2.7	1.5	×	1.19	0.82	0.50
Tir	1.9	2	1.5	0.9	1.8	0.8	×	0.56	0.72
Tyt	1.1	1.1	3.6	2.4	1.1	2.4	2.2	×	0.52
Wic	4.8	1.7	6.1	3.8	4.5	3.7	1.1	3.4	×

Graphical illustration of the multidimensional scaling results is provided in Fig. 6. These results should be interpreted as follows: the closer to each other the objects are on the map, the greater the similarity between them. In the analyzed case, the disputed packages of new products entering the market are in close proximity to *Kret* products that are the leaders. It is quite clear that *All* and *Rater* products are located the closest to the silver *Kret* packaging, while *Wicuś* is situated near to red *Kret*.

Fig. 6: Representation of packages' similarities of examined products in Euclidean two-dimensional space. The graph presents vales on a scale from -1 to 1 in both dimensions.

Products' distances computed by multidimensional scaling procedure and along with the application of Luce's similarity model (1963) allow to determine probabilities of incorrect identification, that is, the likelihood of choosing one product instead of the other, as well as probabilities of correct identification. The results of these calculations are presented in upper and lower triangles of the matrix from Table 2, respectively.

Table 2: The probability of correct (lower triangle of the matrix) and incorrect (upper triangle of the matrix) identifications for all possible combinations of investigated products

	All	KSr	KCz	Lud	Rat	San	Tir	Tyt	Wic
All	×	34.3%	23.0%	12.1%	46.0%	12.5%	20.1%	14.0%	25.0%
KSr	65.7%	×	30.8%	12.5%	31.6%	16.6%	12.7%	11.4%	25.4%
KCz	77.0%	69.2%	×	21.8%	22.5%	30.8%	11.8%	15.8%	34.4%
Lud	87.9%	87.5%	78.2%	×	12.9%	29.0%	13.7%	29.9%	28.9%
Rat	54.0%	68.4%	77.5%	87.1%	×	12.6%	22.8%	15.7%	26.1%
San	87.5%	83.4%	69.2%	71.0%	87.4%	×	8.5%	16.2%	27.1%
Tir	79.9%	87.3%	88.2%	86.3%	77.2%	91.5%	×	24.7%	19.3%
Tyt	86.0%	88.6%	84.2%	70.1%	84.3%	83.8%	75.3%	×	25.9%
Wic	75.0%	74.6%	65.6%	71.1%	73.9%	72.9%	80.7%	74.1%	×

The results presented in the above tabular form were used to illustrate likelihoods of correct and incorrect identifications for the disputed *All*, *Rater*, and *Wicuś* products with silver and red *Kret* containers. As it can be seen on these graphs, the chances for mistakenly selecting new products are quite significant – they exceed 30% in all three cases. This could be treated as an unfair facilitation in gaining consumers for companies entering the market.

Fig. 7. Probabilities of correct and incorrect identifications for a pair of *All* and silver *Kret* products

Fig. 8. Probabilities of correct and incorrect identifications for a pair of *Rater* and silver *Kret* products

Fig. 9: Probabilities of correct and incorrect identifications for a pair of *Wicuś* and red *Kret* products

Discussion and Conclusions

Likelihoods of products' misidentifications shown in Figures 7–9 can be interpreted as the predicted percentage of errors while choosing in individual object pairs. These values are relatively high. In Falkowski's paper (2002) it was pointed out that in the economic practice of highly developed Western countries, including the United States, the accepted decent limit for the error probability in similar situations amounts to maximum 15%.

The results presented in this report significantly exceed this threshold and suggest dishonest use of the *Kret* brand by the manufacturers bringing new products to market. From the practical point of view, the leading manufacturer could use these results for persuading its competitors to make significant changes in their disputed product packaging designs, before taking any more formal legal steps against them.

Another theoretical and practical perspective of taking advantage of the discussed research outcomes and methodology is to analyze the direction towards which designers of new packages should follow to distinguish their projects from the existing on the market spectrum of solutions. For example, it is easy to read from the graphic representation of the dimensional scaling (Fig. 6) that the position of *Tiret* in the perceptual space differs the most from all the others. Direct analysis of the visual features of this product's packaging indicates significant differences in colors applied in this solution.

Both directions of using the presented approach seem to be a promising proposal for methodological support in various marketing activities. A special area of application is the analysis and design of visual communication.

Challenges of Operational Business Excellence in Telecommunication Companies of Middle East

Dr. Muhammad Usman Tariq

Assistant Professor, Abu Dhabi School of Management, Abu Dhabi, UAE, usmankazi100@gmail.com

Dr. Shahzia Khan

Assistant Professor, Amity University, Dubai, UAE, shahzia.azad.khan@gmail.com

Abstract

Efficient operations management is key for delivering excellent customer services likewise any other industry. Telecommunication companies in the Middle East have more employees than the rest of the world with increased competition in the sector, which creates many issues of operations need to be resolved for achieving operational excellence. Numerous authors have conducted studies on operation management and have identified a large gap for delivering operational excellence by the telecommunication companies. The study employed both qualitative and quantitative methods of data collection. The primary data was gathered through a structured questionnaire from 500 regular customers of the telecommunication companies in the Middle East. The study also measured the respondents' satisfaction towards customer care service. The results helped to identify the key gap areas in operations of telecommunication companies which can help organizations in a simple way to understand and overcome the challenges of operational excellence.

Keywords: Operational excellence, telecommunication industries, customer services, operational challenges, Middle East business excellence

Introduction

The telecommunication industry plays a vital role in providing customer services to organizations and individuals with a dire need of managing operations efficiently. Operation management is considered as an area of management that ensures the efficiency and effectiveness of all the business operations in terms of resources of the organization and requirements of the customers (Slack, Chamber, & Johnston, 2010). For every organization, the satisfaction of the customers is the first step towards their growth. Thus, they need to resolve the existing issues in the operational services of the company to win the interest of the customers. In this study, the current operation management issues of different telecommunication companies in the Middle East have been analyzed.

Telecommunication companies in the Middle East have more than employees in all the branches of the world (Makhas, 2015). But because of the increased competition in the sector, the telecommunication companies are facing some issues that need to be resolved for maintaining the position. This study makes an attempt to analyze the situation of the company and the issues faced by the company with the help of primary as well as secondary methods. This research paper will provide real-time accurate challenges in the form of simple graphics from real-time data collected from customers of the telecommunication industry. Telecom Industries can use them further to overcome their challenges in their operational excellence (Susanti, Dachyar, & Yadrifi, 2015).

Literature Review

Various authors have conducted studies on operation management and have identified numerous issues in the operational strategies of the telecommunication companies (Ali, 2012). Operation management plays a significant role in every organization because it involves the management of resources for

production and transfer of products and services (Slack, Chamber, & Johnston, 2010; Al-Weshah, Alnsour, Al-hyari, Alhammad, & Algharabat, 2013)). Operational functions of every organization include two core activities product development and marketing of products. Many authors have expressed their views on the issues in operation management pertaining to the telecommunication companies. These operational management issues are believed to create hurdles in the growth of the company. Landry (1998) in his analyses of the operation management issues of the telecommunication companies has mentioned that the first problem faced by the companies is regarding the GSM facility which according to him is one of the biggest issues. He further mentioned that various consumers of the telecommunication companies have complained regarding the quality of service and network availability of the GSM services. Operational excellence requires excellence performance and combined management effort enabling organizations to achieve high capabilities to compete in the market and achieve operational excellence for the organization and customers (Armstrong et al., 2013; Barki, Henri, Ryad, & Celine, 2007). Operational excellence is one of the important issues raised by the business leaders on various forums since decades, and commonly debated to lower the financial impact on the organizations (AL-Harahsheh & Tareq, 2015; Azila & Noor, 2011).

Wu & Pagell (2011) explained that the other issues mentioned by various other authors in their studies are related to the problems related to internet connectivity in the Blackberry phones. Various consumers do not want to purchase phones because of these issues (Armstrong, Curtis, & Tor, 2013). Many of the consumers also complained regarding the locking code of the phones which is referred to as pin code most of the time (Wu & Pagell, 2011). Zuckerman (2002) in his study mentioned that the telecommunication companies have recently offered Smartphone's but the companies are not able to provide efficient services to the customers regarding this, thus the customers are losing interest in purchasing products from this company (Alnasar, 2014; Alghaswyeh, 2014; Cahe, Kim, Kim, & Ryu, 2002). It is essential for every telecom company to support the customers when they complain regarding the services of the products of the company. Hence, it is imperative to be active in support and complaint handling to attract customers (Upadhava, Munir, & Blount, 2014; Urbanskiene, Zostautiene & Chreptaviciene, 2008) But customers of telecommunication companies are not satisfied with the services provided (Mentzer, 2001). There are a large number of complaints regarding the support system of the company (Barki et al., 2007; Chang et al., 2012). Other competitors in this industry are becoming very active for their e-support service to win the interest of the customers (Al Weshah & Al-Zubi, 2012; Elkordy, 2014). Performance is another important factor that creates an integrated system for the organizations based on internal and external units of the organizations that helps to organizations to achieve their objectives and customer satisfaction within time limit (Deng & Chu, 2012; Fitzgibbon and White, 2004). Organization objectives are commonly based on the stakeholders requirements to analyze the success of strategies and processes used for achieving the operational excellence (Doll, Deng, Raghunathan, Torkzadeh, & Xia, 2014; Ekinci, Gillet, Stone & Stone, 2007; Everington, 2017). Telecommunication companies often require both tangible and intangible elements for efficient business, not only the organizations need latest infrastructure as well as software for efficient operations (Gavrea, Ilies, & Stegerean, 2011; Hung; 2013; Hsieh, Rai, Petter, & Zhang, 2012; Kim, 2010)). Telecommunication organizations rely on efficient storage and transfer of the data which is based on different devices using the Internet, and technology systems that require constant maintenance for providing consistent services to the customers (Karazijiene & Saboniene. 2013; Khalif & Jallouli, 2014; Khodakarami, & Chan, 2011). Customer service software's also have vital impact on the customer services and organizational performance focusing on the knowledge and customer management (Lebans & Euske, 2006; Mentzer, 2001; Muhammad, Feng, Naz, & Fahad, 2014).

The above literature review presents that most of the authors have tried to explore the different aspects of the operational issues of the telecommunication companies with the help of primary as well as secondary resources. Several authors in their studies have mentioned that the customers of the company can better reflect on the flaws in the services of the company (Rogers & Wright, 1998; Setia, Venkates, & Joglekar, 2013; Slack, Chamber, & Johnston, 2010). Different parameters like cost efficiency, customer satisfaction and process improvement are used to measure the operational excellence of businesses (Sun, 2012, Mentzer, 2001; Susanti et al., 2015). This study uses one such critical factor of operational excellence- 'customer satisfaction'. Satisfaction of customers is one of the most significant yet challenging goals for the organizations (Tsai, Chien, & Tasai, 2014). Hence, this study makes an

attempt to measure the customer satisfaction towards telecommunication service in the Middle East as one of the fundamental factor of business operational excellence.

Methodology

The study employed both qualitative and quantitative methods of data collection. The primary data was gathered through a structured questionnaire from 500 regular customers of the telecommunication companies in the Middle East. Only 435 customers returned the complete questionnaire, hence the response rate was 87 percent. The questionnaire consisting of 15 questions that aimed to assess the views of the customers regarding the issues in the operational services of the company. A convenience sampling method was used to select the respondents. Qualitative data were collected from the selected sample and the findings are presented with the help of bar graphs for better analyses of the responses of the customers.

Data Analysis and Findings

The collected data was analyzed with the help of Microsoft Excel and have presented the results of all the questions in the form of a bar graph. The results are plotted in a simple way for better understanding of the data on all levels of operations including from customer service to managerial level for achieving operational excellence.

Demographics of the Respondents

This section highlights the demographics of the respondents in terms of gender and age. It was found that 68 % of the respondents were male and 32 % were female (Fig1). Of the total sample, 25% of respondents were of age group 18-23, 20% of respondents were of age group 23-28,10% fell between 28-33, 35% of respondents are of age group 33-37 and 10% of respondents are of age group more than 37. The data revealed that the highest number of respondents is of age group 33-37 (Fig 2). People of this age group were recognized best to identify the operational issues of the company. Thus, it was assumed that the sample population would best recognize the operational issues of the company.

Fig. 1: Classification of respondents on the basis of Gender

Fig. 2: Classification of respondents on the basis of Age

Customer Preference

The study made an attempt to get an insight into the preference of the customers of the type of connection, the duration of the service period and also the type of internet service availed. Prepaid connections were found to be very popular among the respondents with 64% of the respondents use prepaid connections and 36% of the respondents use postpaid connections (Fig 3). Only 5% of respondents were customers of telecommunication services for more than 2 years. The study revealed that a large percentage of the respondents (40%) that participated the service was availing the services since 1-2 years, 30% of respondents from 6-12 months 25% of respondents were the new recipients of the telecommunication services and were using the services from less than 6 months (Fig 4). About 40% of respondents were the users of 3G mobile internet services, 45% of respondents used broadband internet services and 15% of respondents used prepaid and postpaid internet services (Fig 5).

Fig 3: Type of Connection Preferred

Fig. 4: Duration of Service Usage

Fig. 5: Types of Internet Services Availed

Customer Satisfaction

To better understand the level of operational efficiencies, the research endeavored to gauge the satisfaction level of the customers towards wireless operation, network service provided, SMS rates satisfaction, the overall customer care service and also Total Quality Management in Operational Services.

The result indicated that 35 percent of the respondents were dissatisfied with the wireless operation service whereas 30 % were strongly satisfied with the services (Fig 6). Further, merely 20 % of the customers were strongly satisfied with the provider's network service, 25% showed their satisfaction. and 20% of respondents were extremely dissatisfied with the network services (Fig 7). As far as the SMS rate satisfaction was concerned, it was found that 25% of respondents showed their strong satisfaction and 20% showed their satisfaction, the response of 5% of respondents was neutral, 25% of respondents expressed their strong dissatisfaction and 25% showed their dissatisfaction (Fig 8).

Fig. 6: Customer Satisfaction towards Wireless Operations Service

Fig. 7: Network Service Satisfaction

Fig. 8: SMS Rates Satisfaction

The study also measured the respondents' satisfaction towards customer care service and it revealed that 35% of respondents were strongly satisfied with the customer care services provided by the telecommunication service providers, 25% were merely satisfied, the response of 2% of respondents was neutral, 20% expressed their dissatisfaction and 18% of respondents were strongly (Fig 9).

Fig. 9: Customer Care Service Satisfaction Level

From the statistics provide (Fig 10), it can be analyzed that 30% of respondents were strongly satisfied with the implementation of Total Quality Management (TQM) in the operational services whereas 20% showed their satisfaction. The response of 10% of respondents was neutral. 20% of respondents are not in favor of the statement and showed their strong dissatisfaction and 20% showed their dissatisfaction.

Fig. 10: Total Quality Management in Operational Services

Figure 11 indicates that 32% of respondents were strongly satisfied with the overall telecommunication services in the Middle East and were willing to recommend it to other potential users. But 20% of respondents were dissatisfied and 25% were strongly dissatisfied with the telecommunication services and were not in the favor of recommending it to other customers. This reflects their lack of trust and poor satisfaction levels with the service providers.

Fig. 11: Recommendation of service to other people

Discussion and Conclusion

The above data analysis revealed that customers are facing various issues in the operation management process of telecommunication companies. Very few customers are satisfied with the internet services offered by the company. The customers also explained that the company was not able to provide reliable services as provided by its competitors. From the given analysis, the major operational issues of the company were identified. These issues included the price of the products offered by the company, operational viability, and risks. Due to improper operational management, the companies were not able to cut the cost of production. Thus, the prices of the products offered by the companies were high as compared to the existing competitors of the companies. The operational viability of the company is not so efficient to address the issues related to the optimization of tasks and cost-saving. Managerial key processes of the companies are adding no value to the profitability of the company. The companies also need to deal with risks such as errors from the service provider. These risks directly influence the sales of the company. Companies can use the above research to know the root cause locations of problems in their services. The data might look simple but provides a deep approach to recognizing the actual problems.

The main limitation of the research is that only one aspect i.e. customer satisfaction was used to measure the operation management of the company. There are various other aspects that can help in the measurement of operational business excellence. Further research can be conducted with the help of interviews with different operational staff and by considering other aspects of operation management.

Looming Sustainability Measures in Supply Chain Management of Oil and Gas Sector in the Middle East

Dr. Muhammad Usman Tariq

Assistant Professor, Abu Dhabi School of Management, Abu Dhabi, UAE,
usmankazi100@gmail.com

Dr. Shahzia Khan

Assistant Professor, Amity University, Dubai, UAE

shahzia.azad.khan@gmail.com

Abstract

The energy industry in the middle east has continued to witness rapid growth. The operations of the industry are often intensive, which prompts the need to apply the sustainability concept. Supply chain management is one of the utmost essential elements of an organization. Implementing sustainable supply chain management has proven to advance the social, economic, and ecological outcomes of a firm. However, there is a lack of research on the measures that can be used to measure SSC in the oil and gas industry, which necessitates the current research. The current study aims at understanding the most appropriate measures for SSCM. Further, the research aims at identifying the economic impacts of SSCM to a company. The current study is a cross-sectional qualitative study that will utilize secondary data to reach conclusions. The results of the study indicate that sustainable supply chains have positive economic outcomes for the company. Further, the results indicate that the best way to measure the effectiveness of SSCM is to use a zero wastage approach. However, more research needs to be done on the same to provide more measures.

Keywords: Sustainable Supply Chain Management, Oil, And Gas Industry, Sustainability, Social-Economic Effect, Economy .

Introduction

The energy industry plays a dominant part in the contemporary economy (Florescu, Ceptureanu, Cruceru, & Ceptureanu, 2019). The supply chain is a central element of operations management considered to be the most significant to the performance of an organization. For the success of a company, the supply chain must operate with optimum levels of efficiency. Companies that understand the importance of the supply chain utilize numerous strategies and models to achieve effectiveness. Achieving efficiency in the supply chain has grown into an overwhelming undertaking for companies in the modern business environment (Florescu et al., 2019). The current business environment requires that businesses embrace sustainability in their supply chain operations (Florescu et al., 2019). Available literature significantly ignores the importance of sustainability-related challenges in the SCM in the petroleum industry.

Sustainability of the supply chain is a vital topic because of the significant concerns of the petroleum industry's impact on the environment. The present topic of research is, therefore, important because it will provide solutions to an issue that is significant to the survival of the petroleum industry within the middle east.

Research Objectives

The current research aims to improve sustainability in supply chains in the petroleum industry. To achieve this aim, the objectives of the project are to collect data on sustainability in supply chains through the use of a literature review. The report will majorly focus on the management and evaluation of sustainability in the supply chain within the energy industry. The research will further focus on understanding their sustainability measures. The research objectives are as follows;

1. To evaluate the best sustainable supply chain management practices to craft a framework to help companies' achieve sustainability in their chains
2. To collect indicators to help organizations evaluate suppliers' sustainability practices.

Research Questions

RQ1: What impact does the employment of SSCM practices have on the economic outlook of an oil and gas company?
RQ2: What pointers do organizations utilize to evaluate sustainability in their supply chains?

Literature Review

The following literature review discusses significant changes in the energy sector value chain introduced by the need for sustainability. The review will start with a brief discussion on the notions of sustainability and SCM in the petroleum industry. The review will further discuss various theoretical frameworks to provide a comprehensive understanding of the utilization of scarce resources and supply chain operations within the middle east. It will further explore the critical elements required to sustain supply chain activities to achieve optimum effectiveness. The review aims at establishing the most effective model for optimal resource allocation while maintaining healthy profits and ensuring sustainability in the petroleum industry in the middle east. The current review will take the form of a systematic review. According to Touboulic and Walker (2015), a systematic review is a more methodical approach because it involves a detailed description of the process taken to choose, scan, and analyze literature to decrease bias and improve transparency. A systematic review involves the integration of different works on similar topics, proving a summary of common themes, and contrasting the differences (Touboulic & Walker, 2015). Therefore, it is an appropriate method to utilize deliberate future research inferences and proposals.

Supply Chain Management and Sustainability

SCM in the petroleum industry is highly complex. There is a lack of consensus on the definition of sustainable supply chain management (SSCM). There is a challenge in integrating the two concepts. Florescu et al. (2019) define SSCM as the efficient incorporation of a vital business process that lets organizations and their supply chain to realize cost-effective, ecological, and social aims. Ahmad, de Brito, Rezael, and Tavasszy (2016) define SSCM as the tactical integration of crucial business techniques in resource management and products and services delivery involving managerial decisions and actions aimed at ensuring an organization and the supply chain is efficient economically, environmentally, and socially. Toubloulic and Walker (2015) define SSCM as a system that meets all the social, environmental, and economic performance of a firm. SSCM is essential for the energy industry because of the intensive use of scarce resources within the industry.

Companies within the middle east, being the major oil producers in the world, need to apply sustainability in their supply chain. A sustainable supply chain in the petroleum industry is not only fundamental because of the scarce resources, but because the demand for energy will continue to rise (Ahmad et al., 2016). The ecological and social consequences of negligent exploitation of these resources can be damaging. For this reason, companies that choose to implement SSCM help reduce, if not eradicate, the adverse effects while enjoying success economically (Ahmad et al., 2016). The

integration of a sustainable chain within the energy industry will require cooperation from every stakeholder within the industry.

Theoretical Framework

There are numerous theoretical concepts that SSCM has used to explain their understanding of the field. Theories are vital because they represent the basis of knowledge creation, and helps readers and researchers assess any academic field (Touboulic & Walker, 2015). Stakeholder theory is one of the theories that researchers have used to explore the drivers and enablers of SSCM (Touboulic & Walker, 2015). Stakeholder theory was introduced in 1984 by Freeman (Touboulic & Walker, 2015). An organization's stakeholders play a crucial part in facilitating effective operations of the supply chain. Various stakeholders place pressure on sustainability in firms (Meixell & Luoma, 2015). According to Touboulic & Walker (2015), stakeholder theory emerged as a result of various groups impacted by business operations. Stakeholder holder has been used to evaluate the influence of parties or individuals towards the achievement of a firm's goals.

The stakeholder theory states that "values of the corporation and its managers, the expectations of stakeholders and the societal issues, which will determine the ability of the firm to sell its products" (Meixell & Luoma, 2015, p.70). For this reason, stakeholders have the capability of influencing decisions undertaken by the firm, in terms of sustainability. In the current business environment, a majority of stakeholders are concerned with the changes in the environment and the contributory operations of firms in the petroleum industry. The industry's consumption of raw materials is high, and its impact on the environment is detrimental. By adopting SSCM on the operations undertaken by a firm, it becomes easier for firms to realize their economic, social, and environmental goals (Meixell & Luoma, 2015). Every organization's stakeholders require it to introduce sustainable practices to improve its profits as well as social standing. Firms release information on sustainability to meet the needs of their stakeholder.

Methodology

According to Creswell (2014), research methodology is a technique that lets a methodical and rational understanding of the research question. A methodology offers a comprehensive tactic to procedures utilized to provide a solution to a research objective, and the aim for the approach taken (Creswell, 2014). For the current research, a research onion will be utilized to provide a reasonable and intelligible method. According to Saunders, Lewis, and Thornhill (2012), the research onion can be altered to various types of research methodologies because it can be applied to various contexts.

Research Approach

There are two kinds of approaches, namely deductive and inductive (Creswell, 2014). The former involves challenging an existent theory, while the latter deals are devising new theories acquired from data (Creswell, 2014). The primary purpose of petroleum organizations is to attain optimal outcomes from their activities. Therefore, supply chain management is a substantial element in the operations of the energy industry. An organization should have the ability to administer and achieve its supply chain operations in an optimum fashion with the objective of cost reduction. Further, these companies need appropriate solutions to guarantee well-organized supply chain activities. For this reason, the current research will utilize an inductive approach to come to provide new theories that can be utilized to increase sustainability to the supply chain (Creswell, 2014).

Research Choice and Strategy

Research methodology can be qualitative, quantitative, or mixed methods (Creswell, 2014). Quantitative research involves the use of numerical representations with statistical implications. On the other hand, qualitative methods involve methods of data collection that does not involve non-numerical data. The current research utilized qualitative methods (Creswell, 2014). Further, the cross-sectional study strategy, where data was collected at one point rather than a prolonged time. Further, the research

strategy sought to understand various methods that organizations utilize to gauge the sustainability of their supply chain within the region.

Data Collection and Analysis of Data Collection

The research utilized secondary data to attain, analyze, and reach conclusions. The use of secondary data is inexpensive and is not time intensive as compared to the collection of primary data (Creswell, 2014). Furthermore, secondary research provides researchers with a vast scope of data, which is easily accessible. The nature of this research favors the use of secondary data because of the evident advantages. The current study used multiple peers reviewed publications to gather information on the current topic. Peer-reviewed articles allow for consistency and quality in areas coveted in SSCM. Data was sourced from Annual Reports and Sustainability reports of different oil and gas organizations. Further, a search was carried out on internet databases such as Goggle Scholar. Scholarly materials and peer-reviewed articles were chosen based on their applicability to sustainability in supply chain management (Creswell, 2014).

Analysis Tool

Data used for this research was collected through electronic sources. The search process resulted in 220 papers, structured around the type of study, results, research methods, and aims. After the data was collected, the researchers started by evaluating the appropriateness of the data set. Creswell (2014) suggests that the first step of evaluation is to determine the purpose of a selected study. Secondly, identify the individual accountable for data collection and the type of information collected (Creswell, 2014). Thirdly, approaches of data collection, and finally, the consistency of data collected with other sources. For the current research, data collected was coded into various themes, which involve various categories and subcategories (Creswell, 2014). The next step was to identify any patterns and interconnections between the data collected (Creswell, 2014). The patterns were then mapped, which gave rise to different themes. The themes helped the researchers build and verify theories used for the current research to reach the required conclusions.

Data Analysis and Findings

RQ1: What impact does the employment of SSCM practices have on the economic performance of a company?

Over 70% of resources utilized found that SSCM greatly influenced the economic outcome of an organization. Younis, Sundarakani, and Vel (2016) found that only green buying had any significant effect on the economic performance of the firm. According to the researchers, companies within the middle east that embraced sustainable purchasing experienced better economic performances as compared to those that did not. 20% of the literature found that the introduction of sustainable supply has positive effects on the firms' performance on a social and environmental level. For firms with scarce resources and need to attain profits in the short term, they should practice sustainable buying. However, the research did not find a connection between other sustainable practices and the economic performance of the firm (Younis, Sundarakani, & Vel, 2016). Among other impacts of the application of SSCM include a reduction in costs, improved services, and increased revenues from the supply chain operations, as shown in figure 1 below. Florescu et al. (2019) further found that issues such as supplier selection played a vital role in the economic and social impact of the supply chain on a firm.

Figure 1: Economic impact of implementing SSCM in a firm

RQ2: What pointers do organizations utilize to evaluate sustainability in their supply chains?

There is limited research on factors that companies use to evaluate the sustainability of their supply chains, particularly in the petroleum industry in the middle east. For this reason, the secondary data utilized did not emerge from the middle east but was based on the energy company around the world. According to Lakhal, H'Mida, and Islam (2007), companies use various perimeters to determine the sustainability of the supply chain. Zero waste throughout a supply chain is one of the indicators that companies can utilize to gauge their sustainability. According to Lakhal, H'Mida, and Islam (2007), the zero-waste approach enables all resources used to be reverted at the end of their life as industrialized raw materials. The approach encourages zero wastage of resources and reduces the operating costs, reducing demand on natural resources, and ensuring higher productivity for all (Lakhal, H'Mida & Islam, 2007). While oil and gas organizations have not reached the zero waste stage, they are struggling towards reaching to the point of zero waste. Florescu et al. (2019) further provide other parameters that companies in the energy industry can use to gauge their sustainability. Zero emissions and the production of green products will result in more SSC.

Figure 2: Zero wastage approach, source Lakhal, H'Mida & Islam (2007).

Discussion and Conclusion

For this research, the economic performance of a firm is the monetary and marketing performance developments from applying SSCM that result in the improvement of a firm's position as paralleled to standard industry rates (Younis, Sundarakani, & Vel, 2016, p.223). A firm's financial enhancement refers to the lower costs of energy usage, lower expenses for waste discharge, and reduced costs related to environmental accidents (Younis, Sundarakani, & Vel, 2016). Organizations have introduced technology to ease the activities of the supply chain. According to their sustainability reports,

organizations should save on issues such as waste management as well as water management. Water is one of the main ingredients in the energy industry. With the looming shortage of water in the middle east, companies must adopt methods to reduce water wastage throughout the supply chain.

The organization's sustainability reports provide various ways that they have incorporated SSCM practices and the effect on their finances. According to the report, the companies should introduce technology such as Enterprise Resource Planning (ERP) and Vendor Relationship Management (VRM) to enhance operations of the supply chain. VRM provides the company's customers to have a relationship with vendors while helping assess their performance and

Satisfaction. The company's sustainability reports indicated that the company adopted upstream and downstream firms of production to increase profits and value, respectively. Organizations having registered high levels of success in the reduction of waste and water wastage in their sustainability report should take preventive measures for features.

As the stakeholder theory holds, stakeholders are always pushing the company to implement sustainable practices in all its operations. The organization should embrace SSCM by using local supply chains and managing greenhouse emissions. Most of the greenhouse gases happen through the various points of the supply chain. According to its sustainability reports, the organization is working towards increasing energy efficiency, decreasing flaring, venting, and reducing emotions in their activities. However, organizations further introduced technology to ensure value through its supply chain.

Recommendations

The energy industry is vital in the modern business world. Further, stakeholders have become more demanding on matters of sustainability. As witnessed from the above research, the introduction of SSCM has a positive effect on the environment and economic performance of a firm. Further, in the case study utilized, organizations have substantially integrated technology in their supply chain to ease the movement of their goods as well as ensure that their less damage to the environment. Introduction of technology to the supply chain management for any business in the middle east, either in the petroleum industry or other, will significantly improve its sustainability, which will, in turn, improve their environmental, social, and economic outcomes. However, some managers may not be fully aware of the importance of integrating technology into their systems and their importance. Therefore, senior managers and every participant of the supply chain must be educated on the importance of the introduction of the information technology system to streamline their supply chain activities to improve efficiency.

Conclusions

SSC improves a company's environmental, social, and economic outcomes. From the findings of the current studies, a majority of the studies found that companies that guarantee that their supply chain management operations are sustainable, they save financially and have a better social standing. There is a lack of a uniform way that companies in the oil and gas industry measure their level of sustainability of the supply chain. However, the most feasible way provided for by this research is the zero wastage approach. The zero wastage approach provides companies with the best way to understand how their activities are impacting their supply chain. Lack of literature that addresses how organizations in the petroleum industry can measure their sustainability within their supply chain prompts the need for further research. The energy industry is an important industry that is gradually growing, especially within the middle east. The activities of the industry have a massive impact on the environment, which makes it necessary to embrace sustainability. Future research should provide appropriate pointers for sustainability for supply chain management within the energy companies.

User Centered Human-Computer Interaction and Agile Development: A Systematic Model for Useable Product Case Study

Dr. Muhammad Usman Tariq

Assistant Professor, Abu Dhabi School of Management, Abu Dhabi, UAE,
usmankazi100@gmail.com

Abstract

Agile development has increasingly changed software development across all software industries by delivering highly productive results. Researchers have focused on different agile development approaches to achieve a high level of software development efficiency by enabling user-centered human-computer interaction (UC-HCI). Agile offers handling of software product development changes in an efficient way through incremental and iterative processes that offer various benefits to software industries. Although there are more significant advantages of using an agile development process, it lacks usability engineering, which plays a vital role in understanding different aspects of each software product. Usability has further deep roots with human-computer interaction as a core part of delivering quality software products. There is a dire need for a model that can combine both user-centered human-computer interaction approach with agile development processes. This paper focuses on proposing a model that will help to overcome the gap between both of the approaches with the assembly of various practices. Further, the proposed model will help to deliver useable products with a more enhanced software life cycle and user satisfaction.

Keywords: Agile methodology, Usability engineering, Human-Computer Interaction, User-Centered, UC-HCIAD, CASI

Introduction

The importance of software in daily life has increased a lot with rapid development approaches and practices which enable software development industries to overcome the shortcoming of quality and product development. The growing need for the approaches has provided the ability to the software industries to deliver the product in the shortest time and handling change requests. One of the issues faced by software production is the iteration of the changes during the software development process, which is often hard to handle during the intricate development process (Garcia et al. 2017; Bertholdo). The change handling process makes it more complex with each different type of software product that creates a drawback on the selection of the best-suited model for the software development that offers the shortest time with the efficient change management process (Cockton et al. 2016). Traditionally, the journey of the software development started with the waterfall model, which was further enhanced with the iterative models and introduction of iterative waterfall model that provided software houses a single-model approach to iterate back for the changes (Arar et al. 2018). However, that does not fully unlock the ability of the software development industries to handle the rapid changes in the development of technology and user requirements (Brhel et al. 2015; Ferreira et al. 2011). Agile development was introduced to overcome the gap of handling changes in the software development along with providing a rapid product delivery through an iterative and incremental approach (da Silva et al. 2015). The combination of the approach provided more enormous benefits over the previous approaches with an efficient change handling process. However, the rapid development lacks the usability engineering that is based on the concepts of human-computer interaction for increasing better usability with the end-users and delivering products that can handle change management with increased usability (Larusdottir et al. 2017).

Agile provided the basic usability handling and change management but was not able to provide a system that integrates both to deliver a highly efficient user-centered agile-based system (Rojas & Macias, 2015). Different systems were developed to address the gap, but it led to failure due to the uneasy approach of non-technical users (Begnum and Thorkildsen, 2015). The usability failure can be prevented by understanding the requirements of the users and providing a product that matches the goal of the end-user (Sfetsos et al. 2016). The integration of both areas of agile development and usability engineering will enable the software development industry to deliver a quality and usable product. Various authors have researched the issue, but a model was not developed, which is based on the integration of a user-centered human-computer interaction approach and agile development processes. A systematic, integrated model can be developed that will enable to overcome the gap and solve the existing model problems too. This paper proposes a model that is based on the UC-HCIAD (User-centered human-computer interaction agile development). UC-HCIAD is based on the integration of both fields in the most effective way of delivering a highly productive approach with efficient useable products. Further, coaching methods and CASI will be integrated into the proposed model and model with being validated through the case study.

Background

Agile Development

Agile software development methodology plays an active role in software development to overcome the barrier and deliver the required product to the end-user with complex change management (Zaina and Alvaro, 2015; Begnum and Furuheim, 2016)). Some organizations still focus solely on the usability analysis at the end of development instead of following a user-centered approach from the beginning (Caballero et al. 2016; Teka et al. 2017). Lack of usability, late interaction with usability, complicated interfaces, is probably the main reason leading towards the failure in the achievement of usability (Cayola and Macias, 2018). Figure 1 shows the abilities of agile and influencers.

Figure 1: Agile Influencers

Usability Engineering

Usability is about developing interactive and straightforward design interfaces that can be understandable, effectively, and efficiently used by the people (Costa et al. 2015). Usability deals with different aspects like memorability, learnability, and efficiency. The ISO 9241 defines usability as "The extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency, and satisfaction in a specified context of use". Usability engineering provides structured ways for achieving usability within the system development method (Arroqui et al. 2016). It is an iterative style and analysis that facilitate customers to produce feedback concerning the merchandising utility, usefulness, and design during the overall development cycle (Cockton, 2016). It emphasizes that UCD is the methodology for carrying out usability. User's experience (UX) can be measured by usability when communicating with the system whether or not it is an online website, a software application, or any user-operated mobile device (Forbig and Herczeg, 2015). The practices and theories agile and usability have much in common are: Both follow cyclic development cycles, human-centered, and emphasize on team coordination and communication (Blomkvist et al. 2015).

Literature Review

An authentic standard ISO 9241-210 is used by software development industries for different HCI process like HCD (Human-Centered Process) that consist of different phases, including the planning phase, which is performed iteratively. Figure 2 provides an overview of the HCD process, but unfortunately, it does not provide the complete description and understanding about the integration of Agile into HCD. It can be a great model if agile start giving attention to the HCD aspects.

Figure 2: The design process from ISO 9241-210– Human-centered design process

The design integrated model by Paelke et al. (2008) named as Agile UCD process. This process gives little explanation about the developer phase and HCI specialist, but it is not entirely clear about the sequence of activities. SBD (scenario-based design) starts with a comprehensive requirement analysis process followed by iterative evaluation cycle that was longer than XP iteration, and it focused more on requirement gathering and low-fidelity prototyping early in the development process. This design process results in an improvement in usability, but it is not suitable in many agile practices that focus on the continuous working of software and minimal upfront design. Agile practitioners need to explore the way that can incorporate usability engineering into Agile (de Freitas et al. 2016). However, there are many issues in integrating them because agile is incremental and iterative and does not support any kind of overview about architecture interface, which is the most important aspect to develop usable software with interactive interfaces. Kollmann et al. (2009) state that the fantastic methodology agile can deliver quality code, but it does not assure consistency interfaces, because its main focus is to deliver a working piece of software after each iteration. Microsoft also focused on the usability advantages in software development. The reason behind the involvement of usability engineering is to minimize the cost of training that is necessary for users to understand the software and enhance the life of software by getting long-lasting acceptance and satisfaction from

end-users (Lusky et al. 2017). Another issue is the identification of real end-users because in many cases others business representation presents their selves as end-user (Almughram and Alyahya, 2017).

Identification is essential because end-users are an essential aspect during requirement elicitation and over-all project development (Potts et al. 2015). Another model for integration was developed by Lee et al. (2007) named Extreme Scenario-based Design (XSBD). The main concept of this model was the central design record (CDR) to maintain communication between stakeholders, agile experts, and usability tester. Sharp et al. (2006) focus on the customer and Extreme programming collaboration and effectiveness of integrating UCD to improve usability in XP. McNeil (2000) states that low-reliability prototyping and storyboarding is an iterative approach that focuses more on interface design than code module, and it can be improved by involving the main topic of HCI (UCD) in agile. Therefore, agile needs to adopt usability engineering for the production of quality and usable products (Cockton, 2106). Although usability and agile have much in common, there are still some issues in merging them. It often substitutes the client as the user-advocate as it has multiple iterations. In Extreme Programming (XP), Software engineers value the" input from the on-site customer," but they do not focus on the concept of user-centered design. The agile development can be improved by incorporating the User Experience Design (UED) practices in it, and it can also improve product usability by involving the User Experience team due to which user research and testing can be utilized to prioritize features in the product backlog which will result refine and better usability of products (Blomkvist et al. 2015; Arroqui et al. 2016).

Proposed Model

We have proposed a model in our paper for the solution to previous problems. We have used different usability evaluation process to check the usability incorporation in our model. There are different phases includes in our model. We have discussed them one by one.

Figure 3: Proposed Model

Figure 4: Proposed Framework

A. Meetings

The first step in the process will be meeting. This step takes a lot of time and effort because all requirement gathering from different sources is held in this step, and real user identification will also be made in this step with the help of different open-ended questions regarding the project. Identification of real users in necessary because the working of the whole project depends upon requirements. Unlike the traditional software development process, agile has less documentation. It works iteratively and incrementally which is very helpful for dividing a large project into small modules. If any change occurs according to customer feedback will be added in the next iteration. This process will collect all the requirements of the first module to perform the task before efficiently meeting the deadline.

B. Mockups

In this phase, designers used the Mockups mainly to accumulate feedback from the user side regarding styles early within the process of design. It is a very early prototype made from low-fidelity materials or cupboards. The user power-associated by the designer might take a look at the model (imagining that it works) and therefore give valuable feedback regarding practicality, usability, understanding of the basic style plan. The design of mockups can be collectively changed by the user and designer using commonly used tools like scissors, pencils, and pens. As such, mockups are a discussion to help and bridge gaps between users and designers.

C. Specify the Context of Use

In this step, which is the actual practice of HCI, beneath that a given artifact/software product is employed or are employed in a traditional day to day scenario. It is vital to hold out usability related tests, meetings, prototyping sessions, user studies, and alternative user-dependent sessions within the context of use to include as high rationality of discoveries as doable.

D. Requirements Specification of User and Organization

The user necessities specifications define the desires of business for what user needs from the system during this step. They are written in an early phase within the validation method before the system is formed. Specifications are unit written by the end-users and system owner, with input from Quality Assurance. Public necessities in this step are usually tested by User acceptance testing and performance qualification. It must not be a technical document, so readers knowing the system solely ought to be able to perceive the necessities highlighted.

E. Requirement Prioritization

In this phase, requirements will be prioritizing which is used in software product management for outlining that someone needs a software package that must be enclosed and enforced in a very bound unharness. The leader of the team will collect all requirements of the customer, and then he will prioritize the elicited requirements according to the user level of interest. Prioritization is also done to minimize risk during development so that the designer will implement the most critical or high-risk requirements first.

F. Unit Testing, CASI (Cognitive Analysis of software inter-faces) and Coaching Method

The phase of software system testing in which individual units/elements of a software system are tested is termed as unit testing. The purpose of this testing is to validate that each unit of the software performs its tasks as designed. In the coaching method, we will allow participants to raise associate degree system related queries to a professional coach, and the coach will then answer to the best of

his/her ability. The basic goal of this system is to find the data as needed by the users to produce higher coaching and documentation. Moreover, as probably plan the interface to avoid the requirement for the queries which will enhance the usability. Tester and expert users will serve as a coach. After understanding users, CASI evaluation is started. CASI is an evaluation expert who checks all mockups according to user-defined requirements with the help of some questions. The process will stop working if the answer to any question will be NO from the user side. The mockup will send back to the previous iteration for modification according to the user perspective until all answers become YES.

G. Coding and implementation

In the coding phase development of code and implementation of interactive and straightforward design interfaces will be done that will be understandable and learnable for each user. The primary job of this part is to convert designing into source code using the programming language agreement/decided in the designing part. The well-developed code in this phase can help to reduce the efforts required in testing and maintenance

Methodology

In the methodology flow of framework is described.

Figure 5: Methodology

A. Deployment

At the end of iterations, the software is ready for deployment at the customer side. If a user wants any change,the proposed model can welcome and fix that change to reduce the failure chance.

B. Integration

The integration of the proposed model with an agile UI designer will enhance the working and usability of the software. It will also reduce the cost, which causes failure, short life of software, the occurrence of changes again and again due to lack of understanding. Table no.1 will show the integration of the proposed with Agile.

Table 1: Integration of the proposed solution with Agile

	Agile methodology	Proposed work
Requirement elicitation	Manuals, wish list	Meetings
Usability	Not defined	CASI, Usability Expert
Testing	Unit, Acceptance testing	CASI, Coaching Method, Unit and Acceptance test
Achievements	Working software	Working Software along usability
Deployment	Not Defined	Get users feed-back

Case Study

For the validation of our proposed model's feasibility, we have applied our model step by step in an organization project that was using Agile approaches, but they were unaware of usability. The main objective was to check the proposed model working according to its requirement and generating the project with usability features or not. The case study of Gophers project will be presented describing the integration of HCI practices in agile. The Gophers project successfully adopted the proposed model and generated positive results in contrast to the previous project. The one reason for success is the proper involvement of users with projects throughout the development. The main concern of the project was to create websites with attractive interfaces for online shopping because online shopping trend is increasing nowadays, but still some people especially women face many complexities in interfaces while placing their orders. Division of project was based on three iterations and had a team of five members, including Domain expert, UI designer, Coder, Tester, Usability expert.

A. Proposed Model in Action

The first step of our model was meeting with the client to gather data and extract requirements from different sources, including domain experts. Every requirement was noted in a wish list then the wish list got prioritized according to the stakeholder priority. In the next step, UI designer designed the mockups according to priority by keeping in mind the context of the project for which the user wants the software. The developer designed attractive interfaces for easy use and only having the essential features to make interfaces simple. After this, the mockup was evaluated through users and sent back those having errors or any difficulty in understanding. The evaluation part was done by tester and Usability experts using CASI and Coaching methods. These methods were considered as surety that the product is understandable and easy for the user. At the end of testing, Coder starts the coding and implementation of only those mockups which were accepted. Rejected mockups were returned to UI designers. The final phase was the deployment, and feedback from the user side was recorded to fix in the next iteration.

Results

When all the process is done results were concluded, which shows the difference. The project done by integrating HCI practices in Agile was much better than the old techniques. It also increases the life of software and decreases the failure rate with the achievement of usability features. Our proposed model made the product more impressive and useful. The graph shows the increasing success rate of usability with agile. More people can understand and use the web site.

Figure 6: Success rate with Agile

Figure 7: The success rate after integration of proposed work

Conclusions

In this paper, it was discussed that agile alone could not guarantee usable software. To increase the software life cycle, many HCI techniques should be incorporated in agile methodology, for example, a lot of unvaried/iterative approaches and testing of usability during the whole project lifecycle, which can enhance the usability. The agile method needs to work with aspects of usability, like developing mockups in the starting phase and usability specialist in the team. We have proposed a model (UCD-HCIAD) in which we have integrated the HCI methods in agile methodology, which will produce interactive software. With the help of the case study evaluation, that shows that our proposed model will contribute to achieving high usability. The future can still provide work for much elaboration about integration and fix /bridge the gap between HCI and Agile for better results in the development field.

Abstract

The main area of interest in this contribution is parental financial socialization, which includes the following two types of socialization: parental role-modelling and parental teaching. Of particular interest here is the tendency to repeat parents' patterns, in which the financial attitudes and behaviors imitate those of parents/guardians. The purpose of this paper is to identify the factors determining the adoption of saving attitudes by children, where it is identical to the attitudes of their parents/guardians - i.e. adoption of the propensity to save by children raised by parents/guardians with the same propensity. Based on the review of previous studies, the following research hypothesis was formulated: parental role-modelling and parental teaching determine the children's tendency to repeat parents' saving patterns. The following research methods were used to verify the hypothesis: CART algorithm, review and critical analysis of the subject literature and the descriptive method. The necessary empirical data of quantitative and qualitative nature were collected through surveys carried out in the middle of 2019 through CAWI on a sample of 800 Poles. The study results have demonstrated that the following instruments of parental teaching are particularly important in the context of the problem analyzed: the transfer of knowledge and skills regarding expenditure planning and money management by parents/guardians, encouraging saving and offering pocket money for performing household chores, as well as the children's perception of as people who managed the household budget well (parental role-modelling).

Keywords: Financial Parental Socialization, Parental Role-Modeling, Parental Teaching, Repeat Parents' Saving Patterns.

Introduction

Saving is an important area of personal finance management. The environment in which you grow up has a significant impact on your financial attitudes in adult life. This phenomenon is called socialization, which is defined by Zigler and Child (1969) as "a broad term for the whole process by which an individual develops, through transaction with other people, his specific patterns of socially relevant behaviors and experience". J.H. Turner (1994) presented the general principles of the socialization process. He stated that: 1) early socialization has a much greater impact on the formation of human characteristics than that in later life; 2) interaction with people with whom we have an emotional relation has a much greater impact than contacts with other people; 3) interaction within primary groups is much more important for forming personality and attitudes than contacts in secondary groups; 4) long-term relationships with other people have a greater impact on personality than short and accidental ones. Many authors prove that parents, peer groups and mass media play a very important role in the socialization process (among others, Bakir et al, 2006; Mandrik et al, 2005). Keranne and Hogg (2012) emphasize that the family is argued to be the primary socializing agent with the most influence on values, attitudes and practices, often throughout life.

The main area of interest in this article is parental financial socialization, which includes the following two types of socialization: parental role-modelling and parental teaching. Of particular interest here is the tendency to repeat parents' patterns, in which the financial attitudes and behaviors imitate those of parents/guardians. The purpose of this article is to identify the factors determining the adoption of saving attitudes by children, where it is identical to the attitudes of their parents/guardians - i.e. adoption of the propensity to save by children raised by parents/guardians with the same propensity.

Based on the review of previous studies, the following research hypothesis was formulated: parental role-modelling and parental teaching determine the children's tendency to repeat parents' saving patterns. The following research methods were used to verify the hypothesis: CART algorithm, review and critical analysis of the subject literature and the descriptive method. The necessary empirical data of quantitative and qualitative nature were collected through surveys carried out in the middle of 2019 through Computer Assisted Web Interview on a sample of 800 Poles.

Financial Socialization Versus Financial Education – Literature Review

In order to meet the increasingly demanding market conditions and correctly make complex financial decisions, households must have an adequate level of financial literacy. There are several definitions of this term in the subject literature. According to ANZ Banking Group (2008), it involves having the knowledge necessary to make informed judgments and make effective decisions regarding money management, i.e. budgeting, saving, investing and borrowing. A.C. Worthington (2006), in turn, defines financial knowledge as the competence for rational, informed judgment in the field of money management.

In a broader sense, financial literacy may include an understanding of economics and of relationship between the economic conditions and the decisions taken by households in the sphere of finance. Frączek (2013) points out also that financial knowledge, including the ability to understand financial terminology and conditions, translates into the behaviors of entities who possess such knowledge.

The concept of financial literacy is often used in parallel with the concept of financial capability and financial awareness. According to Policy Research Initiative (2005) financial capability has a broader meaning and refers to a combination of knowledge, skills and financial responsibility that enables an individual to make informed and effective decisions affecting his financial situation. Kuchciak et al (2014) emphasize that having financial awareness is construed as economic culture, i.e. a set of views and behaviors related to the management of own resources acquired as a result of one's own life experiences, upbringing and the influence of social environment.

Having the appropriate level of financial literacy and financial competences is a prerequisite for proper personal finance management, facilitates building financial resilience as well as achieving and maintaining household's financial stability. The results of scientific research prove that people with greater financial knowledge and skills are much more effective in the financial market [cf. Van Rooij et al 2007, Lusardi and Tufano 2009, Hastings and Mitchell 2001] while households with low financial awareness find it harder to multiply their savings effectively or more easily accumulate excessive debt.

Given the unsatisfactory level of financial awareness of the public, financial education should play an important role in managing personal finances. It is education that raises the level of financial knowledge and develops financial competences. B. Świecka (2016) defines financial education as a continuous learning process aimed at acquiring knowledge and ultimately using it in practice. It can and should be implemented from an early age, and its systematic implementation should contribute to raising financial awareness, developing appropriate habits and reducing the risk of making adverse financial decisions. Due to the fact that education is a new research area, it has no explicit, universally applicable definition in the subject literature. Selected definitions of financial education are shown in Fig. 1.

Fig. 1: Selected definitions of financial education

Source: OECD PISA (2014), M. Iwanicz-Drozdowska (2009), Frączek (2014), Solarz (2019).

As emphasized Maison et al (2018), in the context of the process of acquiring economic skills, including financial skills, the subject literature mentions not only the concept of financial education, but also the one of financial socialization. Danes (1994) claims that financial socialization means the process of acquiring and developing values, attitudes, standards, norms, knowledge, and behaviors that contribute to the financial viability and well-being of the individual. Financial socialization involves also five major concept areas: earning, spending, savings, borrowing, and sharing. Scientific research in the area of financial socialization was conducted by, among others, Ashby, Schoon, Webley (2011), Brown, Taylor (2016), Tang (2017), Afsar, Chaudhary, Iqbal, Aamir (2018), Zhu (2018), Antoni, Rootman, Struwig (2019).

The border between financial education and financial socialization is a bit blurred. Maison et al (2015) note that financial education is usually understood as a more formalized process - the transfer of specific knowledge through the child's environment: school, institutions, organizations or media - and is often systemic and based on syllabi and educational tools supporting this process. Roland-Lévy (2004) highlights, in turn, that financial socialization is defined more broadly and less formally, not only as acquisition of an understanding of the economic environment, but also as acquisition of the skills that guarantee proper functioning in it.

Parents are the most important socialization agent. Roberti (2014) proved that they represent an implicit role model that children can refer to, thereby learning to evaluate different consumption choices, as well as have the possibility of expressing direct and conscious indications, in order to explicitly share their values and consumption practices with their children. As Allen (2008) notes, parental socialization instruction usually involves modeling consumer behaviors, making rules about children's consumer behaviors as well as engaging in direct discussions.

Interesting research on parental socialization was also conducted by Webley and Nyhus (2006), Jorgensen and Savla (2010), Palaci et al (2017), Meuleman et al (2018), Dangol, Maharjan (2018), Antoni et al (2019), Yeung et al (2019). In these papers the authors examine various problems regarding the influence of parents on children. Research conducted by Moschis and Moore (1979), Clarke et al (2005), Webley, Nyhus (2006), Shim et al (2010) as well as Xiao et al (2014) shows that parents play a significant role in financial socialization of their children. In literature the terms "maternal" and "paternal" socialization can also be found - cf. Axpe et al (2019), Yi et al (2016). Violato et al (2011) distinguish two types of parental financial socialization: parental role modelling and parental teaching.

Parental role-modelling can be implicit, involuntary, and includes social interactions that parents and children engage in. As Sabri (2011) points out, this type of socialization focuses on acquiring financial

knowledge by observing parents' behaviors. In this context, we may refer to Bandura's (2007) concept of behavior modelling processes which assumes that observing parental behaviors can lead to their duplication by children. In the area of finance, for example, money spending styles can be transmitted when children, by observing the functioning of parents, adopt their financial management style, e.g. mismanagement or foresight. Webley and Nyhus (2006) prove that by observing the economic behaviors of mother and father, the child learns to manage money in a more or less rational way.

Observed parental behaviors may get misinterpreted by the children and, as a consequence, may lead to their inappropriate, irresponsible financial behaviors. Inadequate financial socialization in childhood can result in negative functioning of the individual in adulthood, including difficulties in income management, lack of saving skills, and incorrect assessment of financial risk while making investment decisions.

As Violato et al (2011) claim parental teaching is a type of financial socialization that involves parents' transferring their own knowledge and financial skills to their children. This direct approach helps young people understand many financial issues and motivates them to engage in specific behaviors. One of the instruments used can be parents' encouragement to save money (Webley and Nyhus 2013), as well as money control or giving advice about saving and budgeting (Bucciol and Veronesi 2014). On the basis of the study of wide literature regarding to: social learning theory as well as mechanism and instruments of socialization, in particular relating to problems of financial, family and parental socialization, M. Swacha-Lech (2020) points the following set of instruments of parental financial socialization in this area:

- open communication (e.g. discussion about money management, benefits and threats relating to saving, investing and debts),
- giving advices focused on budgeting, saving, investing and debt,
- establishing orders and prohibitions referring to children's financial attitudes and behaviors,
- giving allowance,
- keeping track of allowance spending.

As a result of the parents' employing financial socialization tools, children's behaviors and attitudes may be the same or different from those of their parents. Intergenerational correlations related to money management styles have been described in the publications of Clarke et al (2005) and Rettig (1983), while those related to saving and managing money in the article by Solheim (2011).

Method

The study was conducted in mid-2019 with the CAWI method applied to a sample of 800 people aged 15-50. The sample was selected in a random and quota-based manner. The structure of the sample was corrected with an analytical weight to match the population structure of Poles aged 15-50 in terms of key features related to the study subject. The weight construction process took into account such socio-demographic variables as gender, age, education and size of the town of residence.

With the gender criterion taken into account, the structure of sample analyzed was as follows: 50.57% were women and 49.43% - men. Fig. 2 shows the division of respondents into four age groups.

Fig. 2: Sample structure by age (in %)

Source: own study.

People with tertiary education accounted for 22% of the sample studied, the share of those with secondary education was larger by 15 percentage points, and the other respondents (41%) declared to have only primary, junior secondary or semi-secondary vocational education. Fig. 3., on the other hand, shows the structure of the same sample in terms of population size of their place of residence.

Fig.3: Breakdown of the respondent group by population of their place of residence

Source: own study.

Approximately 8.99% of the population sample were single-person households. Respondents who declared that their household consisted of two persons constituted 21.54% of the total. A similar proportion of respondents (20.9%) lived in three-person households. The other respondents declared that their households were shared by four or more people.

The sample structure by the income criterion is shown in Fig. 4.

Fig. 4: Breakdown of the respondent group by net income of their households

Source: own study.

Most respondents (19.62%) declared a monthly net income per household within the PLN 3,001-5,000 bracket. The percentage of respondents within the PLN 1,001-2,000 bracket of net income per household was similar (19.58%).

In this study, the Classification and Regression Trees Method (CART) was used to determine the classification tree. The calculations were carried out with the use of Statistica 13.0 software, with the assumptions as presented in Table 1.

Table 1: Assumptions adopted for the CART method

Specification	Assumptions
Costs of misclassification	Equal
Fit measures (partitioning rule)	Gini index
Stopping rule	If misclassification
Minimum number	80
Maximum number of the tree levels (depth)	10
Maximum number of nodes	20
Error estimation	10-fold test validation

Source: own study.

The dependent variable adopted for the classification of respondents who demonstrated a saving attitude, which is the same as the attitude displayed by their parents/guardians (Y) was coded on the basis of the answers given by the respondents to four selected questions about the propensity to save, about possessing some savings and about the similarity between their own style of home budget management and the one of their parents or guardians.

The propensity to save was determined on the basis of two answers – to questions Q1 and Q2 – in which respondents were put in two hypothetical situations. The first of these questions (Q1) concerned the choice of a method to finance the necessary expenses associated with Christmas. The respondents' tendency to save is manifested in the answer: "I start saving small amounts already during summer" (see Table 2). The number of such responses in the population studied was 461 (57.6%). Other options for answering required a loan decision.

Table 2: Responses to Q1

Imagine that your regular income is not sufficient to finance the necessary expenses associated with Christmas. What would you do in such a situation?	Response selected [%]
• I'd start saving small amounts already during summer	57.6%
• I'd cover the extra expenses for Christmas with my credit card	12.0%
• I'd borrow money from family / friends	24.2%
• I'd take a consumer credit	2.2%
• I'd use an offer of some lending institution, e.g. Provident	4.0%

Source: own study.

In question Q2, the propensity to save was determined on the basis of selecting either of the two options: I will put the money into a savings account with a view of future expenses, e.g. on holidays or car replacement" and "I will put aside money with a view of future retirement" (312 respondents). Detailed breakdown of responses to question Q2 is presented in Table 3.

Table 3: Responses to Q2

You're paying off a mortgage. Currently you still have PLN 150,000 to repay. Your employer has paid you a bonus of PLN 10.000. What will you do with the extra money you receive?	Response selected [%]
• I'll use the money towards repaying the mortgage	39.0%
• I'll put the money into a savings account with a view of future expenses, e.g. on holidays or car replacement	35.2%
• I'll save the money with a view of my retirement	3.8%
• I'll spend the money on current expenses	22.0%

Source: own study.

Putting respondents in hypothetical situations, where saving coincided with indebtedness, enabled identification of their propensity to save, while responses to question Q3, What financial products do you use?, disclosed their actual behaviors in the area of financial decisions (Fig. 5). Here, 62.1% (497 respondents) declared their current use of savings products.

Fig. 5: Financial products used by respondents (in %)

Source: own study.

The compliance of the respondents' home budget management style with the management style exhibited by their parents or guardians was determined on the basis of responses to question Q4: Is your personal budget management style similar to how your make financial decisions? Over 42% (337 respondents) indicated that their style of home budget management is similar in most cases, while approx. 12% (95 respondents) declared that it is definitely similar (see Fig. 6).

Fig. 6: Compliance of the respondents' home budget management style with the style exhibited by their parents/guardians

Source: own study.

To sum up, 269 respondents were qualified as showing the attitude to savings identical with the one displayed by their parents, and as those who:

- have demonstrated a propensity to save,
- actually have savings, and
- have declared that their style of managing the home budget is consistent with the one of their parents or guardians.

On the basis of a broad review of the literature on issues related to parental socialization, financial education and saving determinants, candidates for dependent variables of psychological, socio-demographic and economic nature were selected to build the model (cf. Table 3).

Table 3: Candidates for dependent variables

Nature of the variable group	Candidates for dependent variables
Variables relating to parental role-modelling	• children's perception of parents/guardians as persons who effectively managed the household budget
Variables relating to parental teaching	• encouragement from parents/guardians to earn money • transfer of knowledge and skills related to expenditure planning and money management by parents/guardians • receiving pocket money unrelated to household chores • receiving pocket money for performing home chores • encouragement to save
Socio-demographic variables	• age • gender • education
Economic variables	• monthly income per person in the household; • monthly levels of expenditure

Source: own study.

After verifying their degree of variability (variability coefficient Vx was above 30%), we proceeded to the selection of candidate explanatory variables. The significance of correlation was tested by means of the Yule's Q, Phi, Pearson's C and Cramer's V methods. Finally, eight variables were selected for further research, as they proved to be most strongly related to the dependent variable and at the same time the least related to each other. These included the following predictors:

- X1 - encouragement to save (non-parametric binary variable, where 1 - a person who in his/her childhood was encouraged to save by parents/guardians, 0 - a person who in his/her childhood was not encouraged to save by parents/guardians);
- X2 - receiving pocket money for performing home chores (non-parametric binary variable, where 1 - a person who received pocket money from parents/guardians for performing home chores, 0 - a person who did not receive pocket money for performing home chores) ;
- X3 - receiving pocket money unrelated to household chores (nonparametric binary variable, where 1 - person who received pocket money unrelated to home chores from parents/guardians, 0 - person who did not receive pocket money unrelated to home chores from parents/guardians);
- X4 – children's perception of parents/guardians as persons who effectively managed the household budget (nonparametric binary variable, where 1 - the person who perceived the parents/guardians as persons who effectively managed the household budget, 0 - the person who perceived the as people who managed the household budget ineffectively);
- X5 - transfer of knowledge and skills related to expenditure planning and money management by parents/guardians (nonparametric binary variable, where 1 - a person whose parents/guardians transferred the knowledge and skills related to expenditure planning and money management, 0 - a person whose parents/guardians did not transfer the knowledge and skills related to expenditure planning and money management);
- X6 - encouragement from parents/guardians to earn money (e.g. in odd jobs) (nonparametric binary variable, where 1 - a person who was encouraged by parents/guardians to earn money, 0 - a person who was not encouraged by parents/guardians to earn money);
- X7 - gender (nonparametric binary variable, where 1 - male, 0 - female).
- X8 - age (non-parametric multi-category variable, ordered by interval, where 1 - a person of 15-18 age group, 2 - a person of 19-24 age group, 3 - a person of 25-34 age group, 4 - a person of 35-50 age group).

The explanatory variables X1-X6 were coded based on the respondents' answers to questions about the parental financial socialization instruments used by in shaping a saving attitude in children (see Table 4).

Table 4: Respondents answers given to the question of: *Indicate which of the following statements apply to you* (total sample n = 800)

Indicate which of the following statements apply to you	Percentage of positive responses	Percentage of negative responses
• my encouraged me to save	44.28%	55.72%
• I received pocket money for performing household chores	12.46%	87.54%
• I received pocket money unrelated to performing household chores	40.90%	59.10%
• my parents/ guardians managed their home budget effectively	44.91%	50.09%
• my parents/guardians taught me how to plan expenses and manage money	29.24%	70.76%
• my parents/guardians encouraged me to earn money (e.g. in odd jobs)	35.49%	64.51%

Source: own study based on the results of own survey.

Other explanatory variables of a demographic nature - i.e. age and gender - have been described in the part of this paper which describes the surveyed sample.

Research Results and Discussion

As a result of the CART method application, sequences of 4 classification trees were obtained. In the next stage, based on the analysis of the graph showing the level of cross-test costs and the costs of resubstitution against the background of the tree complexity, the two best trees were selected (the smallest difference between the cross-check cost and the resubstitution cost was decisive). Then, both trees were evaluated for complexity and for the number and importance of predictors used; usefulness of the rules generated was also important. Ultimately, the classification tree with 5 split nodes and 6 terminal nodes was considered the best (Fig. 7).

Fig. 7: Classification tree

Source: own study.

The resubstitution cost was 0.24, and the error rate after 10 cross-validations - 0.26. The ranking of predictor significance indicated that the dependent variable was mostly affected by (see Table 5):

- transfer of knowledge and skills regarding expenditure planning and money management by parents/guardians,
- encouraging the propensity to save,
- sex.

Table 5: The significance of predictors

Predictors	Significance
X_5 - transfer of knowledge and skills related to expenditure planning and money management by parents/guardians	1.00
X_1 - encouragement to save	0.98
X_7 - gender	0.71
X_4 – children's perception of parents/guardians as persons who effectively managed the household budget	0.55
X_2 - receiving pocket money for performing home chores (non-parametric binary variable	0.53

Source: own study using the Statistica 13.0 software.

The risk level indicator and classification tables were used to assess the model quality. The risk was estimated at 0.248, which means that the category predicted by the model (propensity to make a savings decision) is inappropriate for approximately 25% of cases (risk of misclassification). The results collected in the classification table proved to be consistent with the estimated level of risk. The model correctly classified almost 75% of cases, while the correctness of classification for households with a propensity to save exceeded 80%. This means that the model obtained is well suited to the data.

Finally, on the basis of the survey conducted, two classes of people showing a saving attitude identical to the attitude displayed by their parents/guardians were selected (on the classification tree these are the terminal nodes, with label 1 indicating success - Fig. 7). Due to the low count at node 8, only node 15 will be further analyzed. It includes 169 respondents:

- perceiving their as persons who managed the household budget well;
- to whom parents/guardians passed the knowledge and skills of expenditure planning and money management;
- being female.

Most of them, i.e. 112 or 66.27%, are persons with a propensity to save, who in this respect follow the footsteps of their parents/guardians. The analysis of this group clearly shows that the most important factors determining the adoption of a saving attitude consistent with the one displayed by their parents/guardians include:

- parental role-modelling in the area of financial behaviors,
- attitude modelling by means of conversations on expenditure planning and money management (instrument of parental teaching).

Upon analyzing the data belonging to nodes 14 and 15, it should be noted that among people showing a propensity to save just like their parents (137), a vast majority (81.75%) are women.

The receipt of pocket money in exchange for the performance of household chores may also affect children's financial behaviors. Of the entire sample (n = 800), only 12.46% of respondents received pocket money in exchange for work, while among those exhibiting a propensity to save that is consistent with the attitude displayed by their parents (n = 269) they made a solid 19.23%. Analyzing the data belonging to the terminal node ID=8, it can be seen that this instrument of financial socialization by parents has also proved effective. However, due to the low count (34) of people classified into this node, this result cannot be considered statistically significant.

While analyzing the data presented in the classification tree (Fig. 7) attention should also be paid to the X4 variable, "children's perception of as persons who effectively managed the household budget", because it was the first to divide the entire sample into two groups. The first one includes respondents who perceive parents/guardians as persons who managed the household budget well (446 people). In the second group there were 354 people who thought that their parents/guardians had problems with effective budget management (liquidity problems, no savings whatsoever, excessive debt or even a debt loop).

Taking into account the assessment of financial behaviors of parents/guardians by the respondents, four types of children's financial behaviors can be distinguished. The possible variants of the relationship between the financial behaviors of parents/guardians and those of their children are presented in Fig. 8.

Fig. 8: Relations between the financial behaviors of and those of respondents (number of responses and percentage of all respondents)

Source: own study.

Fig. 8 also presents the percentage of people belonging to each of the four groups of respondents. Among the respondents who perceived their parents/guardians as effectively managing the household budget, 46.19% (i.e. 25.75% of the entire sample) showed the tendency to copy their parents' patterns.

Women constituted 77.67% (160 people), which may prove that they are more predisposed to duplicating family patterns.

The next group shown in Figure 8 included 240 people. These are the respondents who perceive their as effectively managing the household budget, but at the same time by themselves they do not show the propensity to save. A detailed analysis of this group of respondents revealed that the reasons for the lack of savings are the respondents' young age and the declared low net income per month. A vast majority of these respondents belong to the 19-34 age group (63.33%, which is 14.37 pp more than the figure for the entire sample). Only 23 people (i.e. 9.58%) indicated that their household's net income per person exceeded PLN 3,500. In the respondent group of 240 people, 73.34% declared that their monthly net income did not exceed the gross national average for November 2019. In addition, the answer "I don't know/hard to say" was given by 9 respondents (3.75%), and "I refuse to answer" – by 32 respondents (13.33%). According to GUS (2019), during the period analyzed, the gross national average was PLN 5,229 (i.e. PLN 3,775 net). For comparison, it can be pointed out that in 2019 the minimum wage was PLN 2,100 gross (i.e. PLN 1,530 net).

An overwhelming majority (82.20%) of those 354 respondents who observed improper - in their opinion - financial behaviors of their did not demonstrate any propensity to save. Only 63 (including 45 women) out of those 354 people reveal a propensity to save and in fact have savings. These are the people who do not want to reproduce mistakes made by in the area of personal finance management.

Research on intergenerational correlations was also conducted by Solheim (2011), who proved the existence of three paths of financial socialization in the area of savings and money management, leading to varying outcomes:

1) the first, positive path – the students who watched their parents save money and manage their budgets well also appreciated the importance of saving and managing money;
2) the second path refers to the students who observe their parents' negative patterns of saving and budget management but do not reproduce their parents' mistakes;
3) the third path refers to people who duplicate the parents' patterns of non-saving and poor budget management.

As far as the importance of predictors is concerned, the results of research conducted indicate that the most important of them is the transfer of knowledge and skills regarding expenditure planning and money management by (see Table 5). Analysis of the results of previous research on financial socialization in the family suggests that parental teaching instruments prove to be more effective than parental role-modelling. Jorgensen and Savla (2010) proved that the college students who declared that their parents taught them budgeting skills had more financial knowledge than those who gained knowledge solely through observation of their guardians' behaviors. Grinstein-Weiss et al (2011) proved that parental teaching of money management skills early in life is associated with positive financial outcomes in adulthood.

Conclusion

Parents, their financial attitudes and behaviors play an extremely important role in forming their children's financial attitudes and behaviors. Shim, Barber, Card and Serido (2010) proved that the role of parents in this area is greater than the impact of both work and high school financial education combined. This paper focuses on the question parents' / guardians' influence on the formation of behaviors and attitudes identical to their own. The tendency to repeat parents' savings attitudes was selected as the subject of analysis.

As a result of the research, the hypothesis formulated in the introduction to the article to read 'parental role-modelling and parental teaching determine the children's tendency to repeat parents' saving

patterns' has been confirmed. The results of the study showed that the following parents' actions are particularly important in the context of the analyzed problem:

- the transfer of knowledge and skills regarding expenditure planning and money management by parents/guardians,
- encouraging saving and offering pocket money for performing household chores,
- property financial behavior in the context of managing household budget.

While the first two of these activities belong to parental teaching instruments, the last of them involves parental role-modeling. The conducted research proved that the perception of parents/guardians by children as persons who managed the household budget well is also a strong determinant for adopting a saving attitude by children in the future.

The results contribute to bridging the research gap in the area of identifying effective parental instruments to model the future behaviors and financial attitudes of their children in the area of saving.

Maison et al (2018) indicate that parents often lack the knowledge, skills and awareness to effectively carry out the process of financial socialization, hence, apart from various forms of financial education activities aimed at children, it is also worth considering the activities directed at parents. Such activities should be oriented towards increasing both their knowledge of finance and their competence for financial education of their children. In the authors' opinion, it also seems important to identify other barriers that limit the positive impact of parental instruments of financial socialization on children's financial attitudes and behaviors, as well as suggest corrective actions.

In the context of influence of on the financial attitudes of children, it is also important to thoroughly examine the tendency to repeat parents' patterns regarding debt. It is because mistaken credit decisions may lead to excessive debt, which can have a particularly negative impact on the financial situation of a household. This problem is an inspiration for the authors' further research.

Employer Branding in IT Industry – Research Findings

Michal CHMIELECKI

Spoleczna Akademia Nauk, Lodz, Poland
mchmielecki@spoleczna.pl

Abstract

Employer branding in IT industry has continued to gain popularity due to the significant position it occupies in the conscious efforts being made by Polish It companies to keep their best employees engaged and retained. There is need for new insight that would provide an explanation about the influence of employer's brand's over the construction of employees' identity in IT sector. The main objective of the article is to answer the question: What role does an organization's brand play in decision making by employees regarding a new job and the likely effect of a brand on individual job satisfaction, commitment as well as productivity.

Keywords: IT, empolyer branding, IT industry, Poland

Introduction

Employer branding is all about the process by which an organization presents a positive image prospective employees in the labor market so that the organization attractive to them (Chmielecki, 2013a). In this context, the image of the firm may not be considered in the singular form, but seen as " a plural form of individual identities consistent with the firm's own identity (Martin and Hetrick, 2006). Consequently, one can theoretically submit that there is need for new insight that would provide an explanation about the influence of employer's brand's over the construction of employees' identity, all within the literature of "employer branding". The role of the new insights are to give an explanation on whether or not positive /negative "employer brand image", significantly influences the preference as well as choice of employees to either continue working for an organization or leave.

Branding as a concept, cuts across so many disciplines. Special attention has now been placed on, rather than just goods and services, the organization, personnel as well as day to do business activity.

Employer branding has continued to gain popularity due to the significant position it occupies in the conscious efforts being made by Polish employers to keep their employees engaged and retained (Chmielecki, 2013b). It is also concerned with efforts aimed at securing the services of the very best employees. Employer branding that is effectively constructed is in a position to provide a strong support base for the corporate identity of a brand as well as aiding the improvement of the productivity of the brand in all aspects. The IT sector has been through several years of rapid growth coupled with major organizational challenges. These challenges significantly revolved around structural organizational policies as well as proper and effective staffing. The situation of the sector has brought to the fore, the need to concentrate on the opportunity as well as challenge inherent in the building of strong future teams. Notably as well, is the increasing demand for the best available IT talent. This trend has continued to take more concrete shape, despite the cautiousness exhibited by firms and various other corporate organizations in face of lingering focus on how to optimize productivity and values offered by the staff on ground. While there is steady increase in the demand for talent, a lot of IT employers continue with the struggle of delivering in line with what their employees as well as stake holders expect from them. Most organizations are very much interested in attaining lofty heights and reputation, such as being called the owner of the most popular and trusted IT brand in Poland. In this process, however, there are lots of such organizations whose attention are diverted from what their employees

really need. It goes without saying therefore, that there is a misunderstanding on the opportunities capable of bringing out the uniqueness of their brand.

Theoretical Background

There are many areas of consideration when assessing any organization with an operational base on the competitive market. These areas of consideration include, in addition to the image such an organization portrays as an employer, the products and services they offer the public. Another name for the image is employer brand. A company whose reputation on the market is very high is on the way to becoming a sought after employer and such an image makes it possible for to them to magnetize employees that are most talented and know what value they are capable of adding to the organization. As a result of this, the company is capable of maximizing product innovativeness and labor productivity. In time, their competitiveness on the market also increases. The image of a company has an effect on the perception of consumers on their products. Business owners for this reason are very concerned about the kind of image they are portraying and how potential employees view them. An organization which wants to have the best crop of talent has therefore to embark on a systematic building of employer brand. Recently employer branding as a concept came to the fore. According to Ambler and Barrow (1996, p. 187), employer branding functions as the package of functional, economic, and psychological benefits provided by employment, and identified with the employing company. Employer branding is the result of marriage between two disciplines: marketing and human resources management which mutually derive from one another. This notwithstanding, global surveys conducted during the downturn have provided data that indicate a close tie between employer branding and strategic management. There have been efforts by scientists to properly understand the concept of employer branding as highlighted in management concepts. These include customer relationship management and psychological contract (see: Dunmore, 2002, p. 195; Beaumont & Graeme, 2003, p. vii; Rosethorn, 2009, p. 4). Employer branding should be considered more in a broader context as a key factor in strategic management of human resources, successful leadership and competitive market strategy (Minchington, 2013, pp. 2–3).

There is a gradual change in the perspective of employees and employers relations (Sulkowski, 200). Gone are the days when employees were viewed as relatively inferior to employers. Any company interested in becoming highly competitive, market-wise has to secure the services of the very best talents available (Sulkowski 2012). Companies whose competence stem from the ability and productivity of their employees cannot afford to be left behind in this trend. An organization is assumed to become irresistibly attractive to employees when they have an attractive brand value. What then is employer brand? Definitions of this concept abound in the literature as attempted by various authors (see table 1)

Table 1 : Definitions of employer branding

Definition	Sources
"the package of functional, economic and psychological benefits provided by employment, and identified with the employing company"	Ambler and Barrow, 1996: 187
"the process explicitly designed to shape employees' expectations by establishing and nurturing an emotional connection to the firm"	Crain, 2009: 1205
"(…) the two-way deal between an organization and its people – the reason they choose to join and the reasons they choose – and are permitted – to stay,"	Rosethorn, 2009
"(…) a set of attributes that make an organization distinctive and attractive to those people who will feel an affinity with it and deliver their best performance within it,"	CIPD, 2006
"(…) the image of the organization as a great place to work in the minds of current employees and key stakeholders in the external	SHRM, 2008

market (active and passive candidates, clients, customers and other key stakeholders),”	
A sum of the key qualities current and prospective employees identify with organization as an employer, such as: economic (compensation and benefits), functional (e.g. learning new skills) or psychological (e.g. sense of identity and status)	Mosley, 2009, p. 4

Source: own compilation

It can be proposed that an employer brand is a set of attributes and qualities – often intangible – that make an organization distinctive, promise a particular kind of employment experience, and appeal to those people who will thrive and perform their best in its culture. It is a complex concept based on various intangible factors, including perception, image versus identity, and the ability to differentiate between them (Chmielecki, Sułkowski, 2014).

"Corporate brand" was the choice term used by D. Aaker to explain the concept of brand of organization, with emphasis on organizational values, communications and culture centered on workers capable of creating positive associations and bring about competitive advantages (Aaker D., 2003). D. Aaker and L. De Chernatony both submit that workers are capable of placing a corporate brand on a ladder of competitive advantage. The mission and values of the company then becomes a key factor in constructing desirable employees’ behavior. According to L. De Chernatony, the Human Resources Department (HR) has highly significant duties in the effort to shape corporate brand. "With corporate branding employees not only make a significant contribution to the value of the brand, they also signal about brand evaluation. In this case, the head of HR should be estimated as the main member of the branding team as it develops the policy that influences the creation of brand, in particular recruitment programs, adaptation of new employees, training and rewarding" (De Chernatony, L., 2006). Corporate branding therefore has to go hand-in-hand with staff branding.

Employer Branding and Building Competitiveness of An Organization

A conscious effort to build the competitiveness of an organization on the market also requires building of its brand as a notable and choice employer. Certain factors such as company’s reputation, sector attractiveness, products/services quality, work environment, location, employee benefits, pay, work/life balance, corporate social responsibility, economic conditions as well as people and culture can be key dominant factors in this aspect. An organization’s employer brand has always been in existence in one form or the other. It is not built out of nothing and has somehow existed, albeit spontaneously, by using or failing to use certain strategies. Failure of the company to take conscious steps in building an image could translate into a lack of influence on its public’s perception as an employer. Therefore, the quality of the products it churns out remains the only way to affect the customers.

Within the last few years, employers have come to recognize and acknowledge the “employer of choice” concept. For instance Moroko and Uncles (2009) describe “employer of choice‟ as a concept that Europe, U.S and Japan situated firms are highly concerned about. However, the benefits of being an “employer of choice” have been identified by many studies. Some of these identified benefits are: EoC helps organizations in retaining beneficial customer image, can increasingly retain their workforce as a result (Sullivan, 1998, cited in Lenaghan and Eisner, 2005), maximize financial performance (Becker and Huselid, 1999) as well as higher shareholders return (Shellenbarger, 1998). Scholars in marketing and human resource management (Ambler and Barrow, 1996; Moroko and Uncles, 2008) made an attempt to examine the factors responsible for attaining “employer of choice‟. According to their findings, the employer preferences of individuals were majorly tied to certain factors like the attractiveness of the employer, in-house identification level and individual-organization balance.

These findings are the foundation for previously presented definitions of employer branding. The focus of these studies was more on the external perspective on “employer attractiveness‟ than the perspective of in-house employees. Theoretically, this suggests that individuals would rather be employed by an organization that is seen as an “employer of choice‟ .Literature within “employer branding‟ was

therefore tilted towards building a positive framework which is easy for the existing employees to associate with. A sound argument therefore could be the effect which employer branding has on the gradual transitioning of the identity of employees until they conform with a set of stable and fixed values (Alvesson et al. 2008) these values are expected to blend with the organization's positive image that has already been reframed. Another point for consideration is brought to the fore by recent studies on "identity" as well as "identity work", these studies suggest that "employees identity" deals more about employees displaying an "individualized approach", which is basically a personal definition of their own role in an organization, and may act independently despite "managerial identity regulation" (Alvesson and Wilmott, 2002). In more precise words, it would be a safe argument to refer to employer branding as the new process of identity management, using managerial capacity. Alvesson and Wilmott (2002: 625) described "identity regulation" as "the more or less intentional effects of social practices upon processes of identity construction and reconstruction".

Employer Branding and Organizational Identity

Martin and Hetrick (2006) stated that "employer brand image" depends on "organizational identity". This he explained to be an answer collectively given on "who we are" by first, managers, followed by employees and finally, combination of individual identities that are not dependent on the "organizational identity. The focus of "Employer branding" is to make others see the organization in good light. Therefore, when there are elements of cynicism from some members of the organization, it might present a source of conflict to combine them with the identity of the organization. There have been no empirical studies recently conducted to explore the level of success recorded by "employer branding" within the context of the organization, nor reasons many people would rather pitch their tent with companies of no particular sound reputation and like to keep their jobs.

In recent years, some studies have sought to explain the reason for preference for some employers. These studies highlighted the significance of the identity mechanism to social construction. Some of the studies linked this preference to "employee's engagement with the development of self-image and work orientation to make a meaning of their work (Alvesson and Wilmott, 2002); individual's effort to portray a positive and distinctive identity independent of totalized managerial discourses (Kuhn, 2006); individual's ability to maintain discursive tensions without eliminating these and thus contributing towards an empowered occupational identity (Meisenbach, 2008). The studies presented a similar analysis framework on individual's engagement in the process of identity negotiation. The framework of "identity negotiation" was however presented in an empirical manner, failing to explore such concerns as the method of negotiating identity within organizational image context. Hatch and Schultz (2002) opined that, there is a significant influence which the image has on the organization's identity. Unfortunately, there was no organizational studies research to examine how organizational image and identity work relates. It is worthy of note that, as far as organizational context communication research is concerned, there is self significance in organizational association (Kuhn, 2002).

Working under the assumption that the concept of "employer branding" is deeply rooted within marketing literature, the studies carried out on the concept too remained equally deeply immersed in marketing literature. A good example is why this concept is important to prospective employers. Collins and Stevens (2002) hammered on why external marketing is important to the concept of "employer branding". On the other hand, Cable and Turban (2003) explained how an employer brand that is perceived as strong can positively impact the organizational membership of an individual. It is worthy of note, all these studies within "employer branding" failed to give any pointers on how it influences the construction of employee identity.

However, there have been only few studies on the influence of "employer brand" on employee's identity, empirically backed up with evidence in particular situations of negative corporate reputation. Dutton and Dukerich (1991) conducted a study about New York Port authority, subsequent upon which they provided a description on the crushing effect of the firm's negative external reputation on organizational identification which gave employees a hard time. Highhouse (et al. 2007) agrees that within an organization where negative corporate reputation prevails, employees reportedly had to grapple with accompanying embarrassment and shame. This shows that better corporate reputation of

an organization may be the antidote for negative reputation, preventing the resultant damaging effects on the ability of the firm to recruit and retain the best of hands. (Fomburn and Van Riel, 2007). Fomburn (et al. 2007), opined that an external reputation that is positive appeals to employees because they of the positive appreciation which they have on others. This suggests that a positive external employer brand can compel employees to act in line with organization values. The overall effect of this is that it uplifts the organizational identity, encouraging construction of positive images by employees. These arguments however failed to give an explanation on the damaging effect which "employee identity work" suffers from negative reputations from others, when such are not in tandem with the organization's values. To give an explanation on such issues, literature studies within the "Dirty Work" concept can be applicable.

Methodology, Results and Discussion

Distinct practices, whether well-known organizations or niche specialists, stand to benefit from employer brand's values. The main objective of the research was to answer a question: "What role does an organization's central brand play in decision making by employees regarding a new job and the likely effect of a brand on individual job satisfaction, commitment as well as productivity?"

The research was conducted in the last two months of 2017 and had a quantitative character. This article presents the unique results obtained from 231 employees representing 65 companies from IT sector in Poland. The 231 participants were mainly IT managers, project managers, business analysts, system analysts and developers. The sample was selected via non-probabilistic methods, i.e. purposive and snowball sampling techniques.

Table 3: The female and male participants' characteristics

Respondents' gender (number)	Female (42)	Male (189)
The average age	31 years old	29 years old
Higher education	42 people	172 people
The average work experience	6 years	5 years

Fig. 1: A reputable employer brand takes central stage when I need to make up my mind about a new responsibility.

A highly reputable employer brand plays a huge role in the consideration of a new job by vast majority of respondents. 78% employees respectively indicate that a highly reputable brand is crucial to the decision making process.

Fig. 2: A reputable employer brand comes first before pay and bonus in consideration of a new job

Although pay is usually a huge factor in consideration of a new job, 38% of employees would rather choose a trusted employer brand over pay and bonus.

Fig. 3: A reputable employer brand could have a positive impact on my job satisfaction

Majority of employees (81%) agree that a reputable employer brand could could have a positive impact on their satisfaction.

Fig. 4: A reputable employer brand could have a positive impact on my level of commitment as well as productivity

Majority of employees (75%) agree that a reputable employer brand could make them committed to their job and consequently be more productive. An insignificant number of employees, 3% respectively strongly disagreeA distinct and strong brand attracts candidates. These brands are viewed as having the total package comprising excellent employee welfare, salary and career development. Studies and statistics show that while financial rewards may be a factor, it does not solely guarantee the creation and sustenance of competitive advantage as far as the attraction of candidates is concerned. Top IT employers are keying into new understanding of the prospects, creating 'total reward programmes' in building a powerful employer brand that employees find irresistible.

While rewards have a critical role to play in employee behavior, regular check should be carried out to find out whether the employer brand derives additional value from the rewards package prepared for the staff. This can be determined with the use of HR metrics, including employee surveys and performance management data. Business metrics such as customer service and budget reductions can also be highly useful.

Employers with challenging working culture and great career plans are in a position to attract the best of talent in the market. An engaged worker will more probably than not, be motivated by an organization's well-laid out staffing arrangement, rewards and promotion plans through consistent appraisals and performance assessment.

It is therefore important that you keep staff in the knowledge circle of the kind of brand the company is trying to build (Chmielecki, 2015). Employees are the strongest supporters of the company brand and they are the ones who need to have an understanding of the internally-communicated brand ideas. While external marketing is important, internal marketing is not any less important. The millions spend on marketing campaigns will be fruitless if it has first failed in-house (Chmielecki, 2017).

In most instances, employees serve as the representatives of the brand in the presence of suppliers, customers and even potential employees, and every communication line and attitude must reinforce the organizations brand. It is very important too, that organizations keep their eyes fixed on the bigger picture and maintain the flow of brand strategy, whether the times are favorable or less. Consistency in brand building is a great way of providing staff with much needed confidence and security. The purpose

of communication as far as brand building is concerned, is to make clear what the organization is doing. This can also be effectively done through your actions. There is no single unimportant encounter which an individual might have with the brand. Even an advert which the consumer comes in contact with, the experience they get when they place a call to helpline, or the feedback they receive after they have sat through an interview conducted by the company. HR departments, recruitment partner as well as marketing functions all need to work with you so that every experience will be "on brand".

Organizations that are ranked high on the list of best employers usually offer tasking duties, attractive development and training prospects that make them go for only the best. On the other hand, it may be because of the leading market products they make available, and this external perception can be magnetizing. What these companies have done is to develop and communicate clear messages about the things they do and their position in the market. The survival and achievement of employer branding within the business strategy is highly connected to activities of senior management. The management of the firm has to be fully involved, actively and visibly in the strategies aimed at brand buildings. To build a great brand requires combining the strengths of various different teams, not by corporate communications or isolated marketing only.

Poor practices in the recruitment process are capable of harming the brand building efforts of an organization. One way this occurs for instance, is the use of rude interviewers or unqualified ones who leave job seekers with a bad first impression about the company. The impact of this kind of attitude on employer brand could be damaging, just like the one experienced by a consumer who gets a purchasing experience that is way below their expectations. It is therefore important that whether applicants are accepted or rejected, the experience they have is highly positive. When new staff is hired, they already have been given some measure of organizational goodwill at their first contact with the company, and this should be maintained. There is need for a blend between the external brand of an organization and the internal brand as well. A company that has a shinning external brand and weak workforce, absent training opportunities, poor management-staff interaction has contradicting values that may be hard for formerly impressed employees to reconcile. This may cause disappointment as well as cynical thoughts .

Contributions and limitations

The research contributions and limitations are as follows. This paper contributes to the research on employer branding in IT industry. With regards to the research limitation, it must be highlighted that it was a pilot study and the results cannot be generalized. The empirical findings serve as a starting point for further in-depth research in this area. It is recommended that in order to gain a complete picture of the issues underlying the results, both qualitative and quantitative research on a bigger sample should be undertaken. Additionally, further research could focus on a comparative approach to employer branding among different industries as well as between Poland and other countries.

Conclusion

For the past decade, there has been an increase in the number of human resource leaders who have embraced employer branding. Nowadays, markets are becoming more sophisticated, just as employers are on the lookout for outstanding talents, and making efforts to retain them for the value thy add to their firms. In IT industry in Poland a highly reputable employer brand is crucial to attracting the very best employees in matters of staffing. It covers everything the employee perceives about an organization, from the time they first come in contact with the job till their exit.

Résumé

La Slovaquie a connu un fort développement économique depuis son adhésion à l'Union européenne en 2004. Pourtant les inégalités territoriales se sont accrues durant cette période créant des frustrations venant nourrir les populismes et l'euroseptiscime. Certes les fonds européens de cohésion ont permis de financer de nombreux projets structurants qui ont aidé les régions les plus démunies à se développer mais cela n'a permis d'endiguer l'accroissement exponentielle des niveaux de développement notamment entre la région de Bratislava et certaines régions enclavées à l'Est du pays. Plusieurs facteurs structurels ont eu un impact négatif sur le processus d'utilisation des fonds et la rigidité des procédures a été néfaste au cours de l'actuelle période de programmation. Pour être plus efficace, la politique de cohésion devrait pouvoir octroyer plus de flexibilité aux pays membres afin de mieux prendre en compte les spécificités nationales.

Mots clés : Slovaquie, Politique De Cohésion, Union Européenne, Inégalités Régionales

Abstract

Slovakia has experienced strong economic development since joining the European Union in 2004. However, territorial inequalities increased during this period created frustrations that fueled populism and euroseptiscime. European cohesion funds have certainly made it possible to finance many structural projects which have helped the poorest regions to develop. Nevertheless, this did not stem the exponential increase of disparities of development, particularly between the Bratislava region and certain landlocked regions in the east of the country. Several structural factors have had a negative impact on the process of using the funds and the rigidity of the procedures has been harmful during the current programming period. To be more effective, cohesion policy should be able to grant more flexibility to member states in order to take better account of national specificities.

Keywords: Slovakia, cohesion policy, European Union, regional inequalities

Introduction

Dès le départ la construction européenne a été confrontée à d'importantes inégalités territoriales qui ont eu tendances à croître au fil et à mesure des différents élargissements. Le traité de Rome de 1957 qui soulignait la nécessité d'obtenir un développement harmonisé au sein du « Marché commun » (Buzelay, 2019) avait prévu des mécanismes de solidarité en matière sociale et agricole mais il faudra attendre l'adhésion du Royaume-Uni, qui connaissait à l'époque un grave déclin industriel et qui bénéficiait peu de la PAC, pour que soit créer en 1975 le Fonds européen de développement régional (FEDER) (Petit, 2019). Pour plus d'efficacité, ce fonds sera combiné avec ceux d'autres entités aidant indirectement à lutte contre les inégalités tels que le Fonds européen pour les affaires maritimes et la pêche (FEAMP), de l'initiative de l'emploi des jeunes (IEJ)

auxquels il faut ajouter les investissements de la Banque européenne d'investissement (BEI) et du Fonds européen pour les investissements stratégiques (FEIS), initié par le Commission européen de M. Jean-Claude Juncker (Buzelay, 2018). Ces financements sont aussi appelés Fonds structurels parce qu'ils aident, directement ou non, à l'amélioration des structures régionales d'activité (Buzelay, 2019). Plus de la moitié des fonds de l'UE transitent par les Fonds structurels et d'investissement européens (Fonds ESI) qui sont gérés conjointement par la Commission européenne et les pays de l'UE.

Les pays d'Europe centrale qui ont rejoint l'Union en mars 2004 ont largement bénéficié de ces fonds car une large partie de leurs territoires connaissait un développement économique largement en dessous de la moyenne de l'Union. C'est le cas en Slovaquie où la politique de cohésion a eu un impact très positif. Entre 2004 et 2006, première période de programmation pour la Slovaquie, cet Etat d'Europe central a pu réaliser de nombreux projets financés par les fonds de l'UE. Celle-ci a été suivie par la première période complète de programmation de 2007-2013 avec une allocation d'un montant de 13,2 Mrd d'euros. Pendant la programmation de 2014-2020 en cours, le montant total de 15,3 Mrd d'euros affecté à la Slovaquie permet encore de financer de nombreux projets structurants. Les autorités slovaques se réjouissent du renouvellement de cette politique pour la période 2021-2027 même si les montants alloués à la Slovaquie risquent d'être revus à la baisse du fait du Brexit et de la définition de nouvelles priorités d'investissement (Petit, 2019). Globalement les indicateurs macro-économiques de l'économie Slovaquie sont plutôt positifs et les fonds de cohésion ont contribué à cette « succes story » mais « le miracle slovaque » (Giansily and Mossé, 2009) ne doit pas occulter les inégalités territoriales grandissantes notamment entre l'Est et l'Ouest du pays.

Une Economie Qui A Connu Un Fort Développement Mais Qui Est Marquée Par De Fortes Inégalités Territoriales

Des Indicateurs Macro-Economiques Satisfaisants

La Slovaquie n'est pas un des grands pays de l'Union européenne, ni par sa superficie ni par sa population. Elle a une superficie de 49 000 mètres carrés et sa population est de 5.45 millions d'habitants. La Slovaquie est considérée par beaucoup d'économistes comme un pays ayant connu une « succès story » depuis les années 90. Les indicateurs économiques affichés ces dernières années par la République slovaque en sont la preuve. La politique de cohésion et les investissements directs étrangers (Lacová, 2016) ont largement participé à cette réussite.

La République slovaque a connu une importante croissance du PIB au cours des dernières années En 2018, le chiffre était de 4,2 %, en 2019 4,1 % et cette tendance devrait se poursuivre en 2020 avec une croissance prévisionnelle du PIB estimée à 3,5 %. Comparé à la moyenne de l'UE, qui est de 1,4 % en 2019 et de 1,6 % en 2020, ce sont des perspectives exceptionnellement favorables. Cet indicateur place la Slovaquie au 2ème rang de tous les pays de l'UE.

Nous pouvons également considérer la situation en ce qui concerne le niveau du chômage est plutôt satisfaisante. En 2018, le taux de chômage est descendu à 6,1%, ce qui représente un minimum historique. A titre de comparaison, le taux de chômage en 2011 était de 13,5%, le chômage des jeunes atteignant le taux effroyable de 33,5%. En comparaison, le taux de chômage en France en 2018 était de 9,1 %. Le troisième et dernier indicateur est le niveau de la dette publique, qui est en dessous de 47% du PIB. Cet indicateur place la Slovaquie au 10ème rang de tous les pays membres de l'UE. Dans le cas de la France, la dette publique représente plus de 98% du PIB.

Des Inégalités Territoriales Très Importantes

En 2011, une nomenclature statistique commune (NUTS) divisera le territoire européen en régions et territoires homogènes pour permettre une meilleure comparaison territoriale et de mieux concevoir les interventions européennes dans la cadre de la politique de cohésion.

Carte : Division de la Slovaquie en 4 NUTS 2

Le plus grave problème de la Slovaquie reste cependant les disparités régionales. Parmi tous les pays de l'OCDE, la République slovaque se situe quatrième par les plus grosses disparités régionales. La disparité entre la région la plus développée (celle de Bratislava), et la région avec le niveau de développement le plus bas (la région de Prešov) est d'un énorme 131 %. Dans le cas de la région de Bratislava, le niveau du PIB par habitant était aux alentours de 184 % de la moyenne de l'UE, alors que dans le cas des régions de la Slovaquie orientale, le PIB par habitant était seulement de 53 %. Pour illustrer cette situation, des disparités régionales plus grandes parmi les pays de l'OCDE se trouvent seulement en Turquie, en Israël et au Mexique (c'est-à-dire dans des états en dehors des structures de l'UE). Dans le cas de la France, la disparité la plus importante existe entre la région de l'Ile de France (175 % de la moyenne de l'UE) et le Languedoc-Roussillon (76 % de la moyenne de l'UE). Il est également intéressant de comparer les niveaux du PIB par habitant entre les régions les « plus riches » en France et en Slovaquie. C'est un paradoxe intéressant de constater que la région de Bratislava s'en tire mieux que la région française la plus riche, l'Ile de France.

Les succès et les difficultés dans la mise en œuvre de la politique de cohésion sur la période 2014-2020

Les Réussites De La Politique De Cohésion

En 2012, lors de la réelle préparation de la période de programmation 2014-2020, la République slovaque était confrontée à des défis majeurs. Le taux de chômage était de 13,5% (tout en dépassant les 20% dans plusieurs régions). La crise économique avait eu un fort impact sur l'économie slovaque ; la compétitivité générale du pays était très faible, à quoi s'ajoutait un environnement patronal également faible. Il existait à cette époque en Slovaquie un système insuffisamment développé de recherche et d'innovation. La fonction publique était peu efficace, et la pauvreté et l'exclusion sociale étaient répandues dans la société, en particulier dans les communautés marginalisées des Roms. Autrement dit, presque chaque branche de l'industrie nationale souffrait de graves problèmes structuraux, et la Politique de cohésion était l'un des moyens principaux pour remédier à ces problèmes. L'allocation pour la période de programmation 2014-2020 représentait plus de 15,3 Mrd d'euros pour la Slovaquie, et a servi aux onze objectifs thématiques de la Politique de cohésion. A titre de comparaison, l'allocation pour la région Grand Est est de 1,4 Mrd d'euros. Pendant cette période de programmation, la République slovaque soutient des projets dans onze domaines.

1. **Recherche et innovation –** l'aide à l'investissement pour cet objectif est de 1,8 Mrd d'euros. Des projets de modernisation de l'infrastructure de recherche, le développement de coopération entre entreprises, centres de recherche et universités ont reçu du soutien, tout comme des innovations de produits et de technologie, la recherche appliquée et le développement expérimental ;

2. **Technologies de l'information et de la communication** – l'aide à l'investissement représente 0,8 Mrd d'euros, utilisés surtout pour soutenir les services électroniques de l'état pour les citoyens et les entreprises (eGovernment) et la cybersécurité ;

3. **Aide aux PME** – l'aide à l'investissement représente 1 Mrd d'euros et finance des projets pour l'achat de nouvelles technologies dans les entreprises, la modernisation dans la production agricole et le soutien aux jeunes agriculteurs ;

4. **Aide à la transition vers une économie à faibles émissions de carbone** – une aide à l'investissement de 1 Mrd d'euros, utilisés pour soutenir des projets pour la production d'énergie de sources renouvelables, y compris la biomasse, et pour réduire la consommation énergétique des bâtiments

5. **Aide pour l'adaptation au changement climatique -** une aide à l'investissement de 1 Mrd d'euros, utilisés pour soutenir des projets de protection contre les inondations, des mesures préventives contre les incendies de forêt, des mesures de retenue d'eau et les systèmes de gestion de situations extrêmes ;

6. **Préservation et protection de l'environnement -** une aide à l'investissement de 2 Mrd d'euros, utilisés pour soutenir des projets de traitement de déchets, d'amélioration de la qualité des eaux, de l'air et du sol, pour la protection et le rétablissement de la variété des espèces animales et végétales;

7. **Transport** - une aide à l'investissement de 2 Mrd d'euros, utilisés pour soutenir des projets d'infrastructure ferroviaire, routière et fluviale et le transport public des personnes ;

8. **Aide à l'emploi** - une aide à l'investissement de 1,3 Mrd d'euros, utilisés pour soutenir des projets pour faire baisser le taux de chômage, éliminer les inégalités entre les sexes, renforcer la mobilité professionnelle et proposer des services publics à l'emploi;

9. **Aide à l'intégration sociale et à la lutte contre la pauvreté** - une aide à l'investissement de 1,4 Mrd d'euros, utilisés pour soutenir des projets destinés aux personnes menacées d'exclusion sociale et de pauvreté, au logement pour les communautés marginalisées de Roms et à la désinstitutionnalisation des services sociaux ;

10. **Aide à l'éducation** - une aide à l'investissement de 0,7 Mrd d'euros, utilisés pour soutenir des projets de construction et de reconstruction d'écoles maternelles, pour la formation de futurs enseignants, pour la création de liens entre les écoles et les employeurs;

11. **Renforcement de l'efficacité de la fonction publique** - une aide à l'investissement de 0,3 Mrd d'euros.

Les Difficultés Rencontrées Dans La Mise En Œuvre De La Politique Régionale Durant Cette Période De Programmation

Il est possible d'identifier quatre facteurs structurels qui ont un impact négatif sur le processus d'utilisation des fonds et créent des difficultés pour l'accès des demandeurs à ces fonds financiers. Il s'agit d'abord des retards récurrents dans la mise en œuvre de la politique régional, d'un manque de savoir-faire des demandeurs dans le montage des dossiers, la complexité de la procédure d'appel d'offres et d'attribution des marchés publics et enfin le non respect des délais par les organismes de gestion.

La mise en œuvre de la politique régionale en Slovaquie souffre de retards récurrents en début de période de programmation. Pour la période de programmation 2014-2020, la première réalisation de projets n'a eu lieu qu'en 2015, voire 2016. L'adoption tardive de la législation au niveau de l'UE a causé un retard dans l'adoption des textes en Slovaquie, ce qui a ensuite eu pour effet de retarder l'appel d'offres et l'approbation des projets de la part des organismes de gestion.

La faible capacité administrative des demandeurs dans le montage des projets est un handicap pour faire face à des procédures qui sont perçues généralement pour être administrativement lourdes. Les représentants des petits demandeurs en particulier (les petites communes, les PME etc.) souvent ne disposent pas des capacités administratives et des compétences adéquates pour monter un projet et en assurer l'administration. Ces demandeurs ont souvent besoin d'une aide externe, ce qui représente une charge financière supplémentaire. D'après les sondages effectués par le bureau du vice 1er ministre en charge de l'informatisation de la République slovaque, plus de 80 % des demandeurs ont recours à des agences externes pour monter leurs projets. Pour y remédier, ce service a créé en 2016 le réseau des « Centres d'Information et de Conseil ». Ces centres de conseil gratuits ont été ouverts dans les sept capitales régionales en dehors de la capitale pour donner des conseils gratuits et aider les demandeurs à monter leurs projets.

Il existe également des difficultés inhérentes à la complexité des procédures d'appel d'offres et processus d'attribution des marchés publics. Les différentes **r**éformes en conformité avec la législation européenne toujours plus exigeants dans ce domaine visaient à rendre plus transparent et plus juste ces procédures mais cela entraîné une complexité accrue. Les appels d'offre et les procédures d'attribution de marchés publics qui se matérialise par un formalisme rigoureux constituent aux yeux des demandeurs l'aspect le plus difficile à gérer surtout pour les petites structures n'ayant pas d'expérience dans ce domaine très technique.

Enfin, il y a le problème du non respect des délais par les organismes de gestion. Les problèmes de la mise en œuvre et de l'utilisation des fonds de l'UE ne sont pas uniquement le fait des demandeurs. Il s'agit souvent de manquements de la part des organismes de gestion qui ne respectent pas les délais définis dans le règlement, ce qui a pour résultat de prolonger le processus. L'exemple le plus marquant est le non-respect des délais pour l'approbation des projets. La réglementation prévoit que le processus d'approbation des projets ne devrait pas dépasser les soixante-dix jours, or ce délai n'est que très rarement respecté par les organismes de gestion. Seule la moitié de tous les projets a été approuvée dans un délai de 70 jours et le dépassement moyen de ce délai est de plus de 100 %. Cela a des conséquences négatives sous forme de report de la mise en œuvre et du non-respect du calendrier défini à l'origine.

Ces quatre facteurs ont de graves conséquences sur la mise en œuvre des fonds de l'Union européenne. Ils permettent notamment d'expliquer que la Slovaquie a perdu un total de 120 millions d'euros en 2018, qu'elle n'a pas eu le temps d'utiliser selon la règle N+3. En 2019 des fonds européennes ont été perdus même si les mesures adoptées au cours de derniers mois de l'année, tant par les organismes de gestion et par les différents ministères ont permis de limiter les pertes. Une autre conséquence négative des problèmes de la mise en œuvre est également un intérêt décroissant

de la part de plusieurs demandeurs pour les fonds de l'UE. Les contraintes administratives, ainsi que la lenteur du processus les découragent à monter des projets. Cela explique le faible taux d'utilisation des fonds européen en Slovaquie qui est inférieur à la moyenne de l'Union européenne. En novembre 2019 seulement 25 % de toute de l'allocation financière attribuée à la Slovaquie avaient été utilisés. A titre de comparaison, le taux moyen d'utilisation dans toute l'UE était de 33 %, et dans le cas de la France, ce chiffre est d'environ 41 %. Compte tenu de la fin proche de la période de programmation 2014-2020 et du début d'une nouvelle période, cette situation est inquiétante.

Les Perspectives Offertes Par La Politique De Cohésion En Slovaquie Pour La Période 2011-2027

Une Enveloppe Globale Revue A La Baisse

La République slovaque a intérêt au maintien de la Politique de cohésion après 2020 qui permet une solidarité économique, sociale et territoriale. C'est pour cela que la République slovaque soutient l'idée d'une politique de cohésion ambitieuse pour le prochain programme financier pluriannuel de l'UE. La Politique de cohésion devrait aider toutes les régions, tout en se concentrant naturellement sur celles qui sont les moins développées. Pourtant pour être plus efficace en Slovaquie, la politique de cohésion devrait cependant être simplifiée de manière fondamentale au niveau européen. Elle devrait également octroyer plus de flexibilité aux pays membres. La rigidité des procédures a été néfaste au cours de l'actuelle période de programmation. La nouvelle règle proposée de N+2 pour remplacer la règle existante de N+3 est également un élément négatif pour la Slovaquie, et les autorités slovaque militent pour son abandon. Malgré une baisse relativement forte de l'allocation allouée à la Slovaquie de 22 % par rapport à la période en cours (11,8 Mrd d'euros), la Politique de cohésion représentera un outil d'investissement clé dans la lutte contre les disparités régionales.

Des Evolutions Nécessaires Afin De Lutter Plus Efficacement Contre Les Inégalités Régionales

Il existe plusieurs problèmes structurels qui freinent le développement de la Slovaquie et ont un effet négatif sur la compétitivité du pays et sur la création de nouveaux emplois. Malgré un taux de chômage faible, certains économistes prévoient qu'un tiers des emplois seront menacés dans les années qui viennent par la numérisation et la robotisation. Cet indicateur fait de la République slovaque l'un des pays les plus vulnérables de l'UE.

La République slovaque a également du retard dans le professionnalisme et l'apolitisme de la fonction publique, ainsi que dans l'indépendance de la justice.

Le niveau de la corruption perçue est également exceptionnellement élevé en Slovaquie. Dans le cas de cet indicateur, la République slovaque occupe la peu flatteuse 23ème place parmi les 28 membres de l'UE. Le niveau de la corruption perçue est comparable à des pays tels que la Bulgarie, la Grèce ou la Roumanie qui occupent de longue date les derniers rangs avec la Slovaquie.

Conclusion

La République slovaque est sans aucun doute un exemple de transition réussie. Elle a su tiré de nombreux avantages de son adhésion à l'Union européenne. En termes financiers, la Slovaquie a obtenu plus de 18,6 milliards d'euros du budget de l'Union européenne. Déduction faite de la contribution de la République slovaque au budget européen, cette somme dépasse les 12,1 milliards d'euros. L'apport de la Politique de cohésion s'illustre également par d'autres chiffres. Les analyses et les évaluations démontrent que la Politique de cohésion a contribué augmenter le niveau de vie moyen en Slovaquie, le rapprochant peu à peu du niveau de vie des pays de l'Europe occidentale.

C'est également notamment grâce à la Politique de cohésion que le niveau du PIB est passé de 55 % de la moyenne de l'UE en 2003 (c'est-à-dire avant l'accession à l'UE) au niveau actuel de 77 %. Certes des changements fondamentaux des procédures s'avèrent nécessaires, en particulier dans le domaine de la réduction des lourdeurs administratives. Il semble nécessaire de tirer les leçons des erreurs du passé et de procéder à l'échange de bonnes pratiques entre les pays européens. Même si de grandes disparités demeurent, sans la Politique de cohésion le processus de convergence se serait probablement arrêté dans six des huit régions de la Slovaquie. L'impact de la Politique de cohésion a également été confirmée par lors de la crise financière car elle a contribué à en atténuer les effets. Enfin elle s'est concrétisée par la baisse du chômage, qui a atteint un minimum historique cette année. Il semble donc crucial pour la Slovaquie qu'une politique de cohésion ambitieuse perdure au déjà de 2020 malgré le ralentissement économique que semble annoncer la crise sanitaire liée au Covid-19.

Abstract

Ensuring security in local self-governments is becoming increasingly complex as negative effects increase in a globalized environment. Local authorities have an impact on safety by delegating certain tasks that are based on legislation. Local governments must strive to be prepared to deal with various crisis phenomena that have a negative impact on the environment and especially on the people themselves. These phenomena are earmarked for civil protection funding. The sub-program is included in the security program. The article focuses on the analysis and conclusions from the use of funds in eight regional cities in Slovak Republic. The funds for civil protection are compared with the share of funds in the security program. We have analyzed the period from 2011 to 2018. The year 2018 is currently the last closed year with the implementation of local government budgets. For a better comparison between cities, we have recalculated the share of funds per capita in those cities. These earmarked funds should help cities to handle various specific tasks.

Keywords: Security, Civil Protection, Local Government, Crisis Phenomena.

Introduction

Local governments have an impact on the daily lives of their residents. It also includes an assessment of how the urban environment affects human life. Security is one of the main indicators of quality of life. It can be characterized by subjective perception of citizens or by objective statistical indicators. Security has long been one of the strongest perceived human needs, and local governments have sought to provide it as a service to citizens. By investing in security, they try to minimize adverse determinants that would endanger citizens and have a negative impact on their lives. However, some negative phenomena are not always preventable. The earmarked funding in the civil protection sub-program should serve precisely to maximize the city's preparedness in times of crisis.

Local governments and civil protection tasks

Local territorial self-government can be defined as territorial self-government at a level lower than the region. In Slovakia, it is creating of municipalities as legal entities Act No. 369/1990 Coll. on municipal establishment. The Act defines the position of the municipality as an independent territorial self-governing unit of the Slovak Republic, which associates persons with permanent residence in its territory. Štofková, et al. (2019) writes, the municipality is also a legal entity that can independently manage its own property and its own income under the conditions laid down by law. Its basic role in the exercise of self-government is to take care of all-round development and the needs of its inhabitants. Act 369/1990 Coll. define it may be subject to restrictions and obligations only by law and under an international treaty. The municipality also has the right to associate with other municipalities in order to achieve a common benefit Figure 1 shows the hierarchy of local

government in Slovakia. In this article, we focused specifically on the financing of security from local government funds.

Fig. 1: administration scheme

Zánická Holla, K., et al (2010) writes in the territory of local governments, various crisis phenomena can arise which have a negative impact on their security. Crisis managers use different methods to overcome them. They need to try to anticipate their emergence and, in the event of emergence, be prepared for their early conquest. According to Mitasova and Soltes (2017) Crisis managers need to expand their knowledge and skills. That is why they should receive training on the subject. These training sessions should take place at regular intervals, but also with various new knowledge that experts should inform the public and managers. It is this education that helps them to more easily tackle crisis phenomena. Civil protection is the basic component. No. 42/1994 Coll. define Civil protection is a system of measures and tasks aimed at protecting property, health and life in particular. It consists in analyzing the potential threat and consequently taking risk reduction measures and, last but not least, the various activities and procedures used to remedy the consequences of emergencies. Zagorecki, A.T., et al. (2013) mentioned to better prevent crisis and disaster events, cities should also pay attention to event analysis and comparison of available data. It is through different methods that crisis managers can better anticipate and manage various emergencies. Havko (2017) writes than cities should be prepared for some emergencies. It is precisely some unpredictable events that can be foreseen and that is why cities should have the money earmarked to deal with these situations. Soltes (2016) mentioned than local governments have the funds they use to run. It is important that they are effectively divided and used as appropriate as possible. It is the optimization of the economy that enables the municipality to improve its services. Law 42/1994 directs them to participate in the financing of civil protection. Civil protection tasks and measures include:

- and carrying out rescue operations, which mainly consist of rescuing persons, providing pre-medical and medical assistance, rescuing persons and removing the wounded;
- organization and provision of reporting and information services,
- provision of emergency supplies and emergency accommodation,
- provision and execution of shelter and evacuation,
- implementation of anti-radiation, anti-chemical and anti-biological measures,
- organization, management and implementation of civil protection training,

- assessment of the location of buildings and land use and observance of civil protection interests in the territorial and construction proceedings and technical parameters of civil protection facilities,
- provision and implementation of editorial, scientific and research activities in civil protection.

Last but not least, it includes complementary activities such as planning, organizing, material security and controls. In the field of civil protection act defines the scope of the following municipalities:

- draws up a population protection plan, familiarizes itself with the emergency plans of companies and operations on its territory and informs the population and the public;
- coordinates the fulfillment of tasks in cooperation with legal entities, natural persons - entrepreneurs and other natural persons,
- manages rescue work if it does not fall within the competence of state administration bodies, legal entities or natural persons - entrepreneurs in the municipality; in the management of rescue operations may impose obligations,
- stores, cares for and secures the expenditure of civil protection material to the civil protection units established by the municipality and means of individual protection to the population of the municipality for which these funds are not provided by legal entities or natural persons - entrepreneurs,
- determined as appropriate personal protective structures useful for sheltering people and providing them the necessary adjustments.
- provides permanent reporting and civil protection information service, which is notified to the district office and provides the necessary and immediate emergency assistance, especially shelter, food or other material assistance to the population of the municipality and persons located in the municipality,
- plans, announces, manages and ensures evacuation and provides emergency accommodation and emergency supplies to the evacuated,
- creates civil protection units from the population of the municipality and ensures their operational capacity,
- ensures and carries out the preparation of civil protection units of the municipality and, in cooperation with public institutions with a humanitarian mission, ensures the preparation of the population for self-protection and mutual assistance,
- represents and refers emergencies and establishes a mode of life of the population in the municipality in the event of an incident and immediately inform the district office,
- keeps records of evacuated persons and lists the evacuated persons subject to conscription, giving the evacuation point to the relevant district office at the seat of the region,
- manage the allocated civil protection funds;
- requires the reimbursement of actual civil protection expenditure, which is financed from the state budget, from the budget of the local district authority.

Stofko (2015) writes, the municipality is obliged to cover from its own resources expenses related to the storage of civil protection material, preparation for civil protection and education. No. 42/1994 Coll. defines than it also spends funds associated with the maintenance of civil protection structures. Expenses do not include compensation for warehouseman, trainer, and spending on reconstruction, rebuilding protective structures, periodic inspection, replacement of technical equipment and the consequences of the damage incident. It is important that it is able to warn all its inhabitants in time of danger. Just early warning can minimize damage to property, health or life of people who are in the area (Buganova, 2013)

Use of The Funds of Regional Cities for Civil Protection

Malichova (2018) mentioned, all cities use funds from various sources for their activities. They also provide funding for individual programs and sub-programs. The municipality management must try to use all its resources effectively. It is necessary to use managerial skills and various methods that help them to make appropriate decisions in budget planning. In the paper we compared and analyzed the budgets of regional capitals in Slovakia. It is in these cities that the largest population. That is why the security and preparedness of these places should be provided at the highest level. Regional capitals have a different population. Therefore, it was necessary to make a comparison based on certain features.

Figure 2 shows a comparison of regional capitals for the period 2011-2018. The comparison was based on the earmarked funding for the Security Program from the overall budget. Not all cities had the same sub-programs in the security program. For this reason, we have tried to calculate security-related funding in the same way. Subsequently, the program included earmarked funding for the municipal police, civil protection, fire protection and public lighting. This ratio is displayed as a percentage. The least amount of money was spent by the city of Bratislava, which is also the capital. Over the years, the cities spent approximately a similar share of security. The increase in funding was mainly due to modernization and repair of public lighting. It was the modernization of lighting that caused the city of Žilina in 2018 to allocate the highest funding for security of all monitored cities and periods.

Fig. 2: The share of security finance from the expenditure part of the budget

Subsequently, we compared the percentage of security funding earmarked for civil protection. The least funds were spent by the cities of Bratislava and Žilina. The city of Trnava earmarked a higher share of civil protection than the majority of cities. More funds were spent by the city of Prešov for the years 2015 to 2018. The increase of these funds was due to investment in reconstruction and renewal of civil protection shelters. The city of Kosice had the largest annual spending on civil protection. These changes and the size of investments were also due to the fact that the city also earmarked funds in this program to cope with the declared crisis situations.

Fig. 3: The share of civil protection funding from the security program

The last comparison, which is shown in Figure 4, was focused on the conversion to civil protection per capita in euros. The least money was spent on average by the city of Bratislava and then by Žilina. The towns of Trnava, Prešov and Žilina spent much more. This comparison implies substantial different amounts of per capita earmarked funding.

Fig. 4: The amount of civil protection funding per capita

Conclusion

Local governments are trying to create a safe environment for their residents. In terms of security, it is important that they be prepared for crisis phenomena that have a negative impact on the environment of the towns and residents there. It is civil protection that addresses readiness for these phenomena. Cities allocate funding to this sub-program, which is included in the security program. We pointed out the money spent on security in regional capitals in the Slovak Republic. When analyzing the budgets, imperfections in the final budget reports were identified. In Slovakia, there are laws and methods that determine how to compile a budget in cities. The problem arises, but in the actual budgeting, where each city can choose which activity to include in each program. This makes it more difficult to compare cities with each other. A possible solution would be to develop a new methodology that addresses budgeting in more detail, and all cities complete the same programs with the same sub-programs.

Focusing on the earmarked funding in the security program as well as in the per capita spending ratio, high differences between cities were found. These differences were also caused by delegated tasks to the district office. Other differences were caused by spending money in dealing with emerging crisis phenomena and declared emergency situations. The municipality may use the funds from the reserve fund for their solution. Some cities count these funds directly to the civil protection sub-program, and others do not. Therefore, there is another irregularity in the spending of civil protection funds.

The solution would be in more sophisticated and uniform creation of individual sub-programs. Also the Decree of the Ministry of Interior of the Slovak Republic No. 599/2006 Coll., Laying down the details of expenditures on civil protection of the population from the state budget funds, determines which tasks are paid from the state budget funds through the budget chapter of the Ministry of the Interior of the Slovak Republic. These would be appropriate if they were registered at a specific point in the civil protection sub-program. It would also be appropriate to set a minimum amount of earmarked civil protection funding per capita.

Abstract

Employees' satisfaction with the New Media Usage in universities is the focus of this short paper. It shows the extent of corporate communication influence on the employees' usage of new media for internal interaction within six selected universities based in the southwest region of the country. The data were generated through the administration of questionnaire to 121 teaching and non-teaching employees of six universities in Nigeria. Analysis of Variance (ANOVA) was uses to process the data gathered. This paper is produced for potential team work with investigators from other universities all over the world.

Keywords: Corporate communication, Decision, Public relations, New Media

Introduction

Corporate communication is defined as a strategic management function that offers a framework for the effective coordination of all internal and external communication of an organisation (Ekanem *et al*., 2020; Amodu *et al*., 2019; Saha, 2014; Goodman, 2006; Argenti & Forman, 2002). It serves the purpose of establishing and maintaining mutually beneficial relationships, understanding and goodwill with all interested groups within and outside an organisation (Mohammad, et. al., 2014; Ekanem, *et al*., 2018). Communication is the kernel of universities' management, albeit with increasing complexities, especially in new media age (Fashiku, 2016; Anyakoha & Ezeike, 1995; Hussain, 2012; Abdulkareem & Gabadeen, 2015; and Olatunji, 2014).

This study can help communicators, university administrators, regulators of higher education all over the world to uncover how universities are able to factor in the new media as an internal tool of corporate communication. The study would show the level of acceptance and usage of available new media applications such as *Twitter, Facebook, Instagram, LinkedIn* and many others. Specifically, it would show the role of employees who with traditional mould in using the new media for the success of universities.

Subject area	Public Relations
More specific subject area	Corporate Communication and New Media Studies
How the study was executed	Survey through the use of a questionnaire
Study format	Quantitative
Experimental factors	The data for the survey was obtained from one hundred and twenty-one respondents that were teaching and managing communication in six public and private universities in Lagos, Ogun and Oyo States, Nigeria. The instrument-questionnaire- was designed by the researchers and the data was analysed using ANOVA and Coefficient model of interpretation.
Experimental features	Corporate communication is the offshoot of public relations which focuses on exchange of messages within an institution or organization. Universities rely on traditional media for internal communication but the advent of new media poses a challenge on how to replace or co-use new media channels between the management and employees. It is imperative to examine whether the employees of the universities are satisfied or dissatisfied with the use of new media as channels of communication within the university environment.
Preliminary study location	Nigeria
Data accessibility	Study is available for further collaborations

Value of this study

1. This preliminary study will reveal the perception of employees on internal communication management in universities.
2. It could serve as a basis for additional enquiry on the usage of new media of communication among the employees of universities.
3. It could serve as indicators of employees concerns about new media usage by corporate communication units in universities.

Experimental Design, Materials and Method

The data for the survey were obtained from teaching and non-teaching employees of six selected universities in Nigeria. Census was used for the administration of the copies of questionnaire to employees over a period of three months. The reason for using the census method was to avoid thin data since the employees were few in number. It was, however, observed that Nigerian universities were registered on new media platforms and the most used new media platforms were *WhatsApp* and *Facebook*. Other new media platforms that universities registered with were redundant. This could not be accommodated in the research considering that the subject is based on satisfaction with the use of these platforms. The instrument used to gather the data was designed by the researchers to elicit response on the variables under consideration. The data was analysed using the Statistical Package for Social Science (SPSS).

Preliminary Study Results

This study is based on the gender, age, level of satisfaction of teaching and non-teaching employees of six universities in Nigeria. Three were private and three were public universities. Analysis of Variance (ANOVA) and coefficients were used to process the data obtained through the questionnaire as shown in Tables 1 to Table 6:

Table 1: Gender Distribution

Gender Distribution									
			Universities						
			LASU	Caleb	FUNNAB	Babcock	UI	Lead City	**Total**
Gender	Male	Units	30	6	7	13	13	12	81
		%	73.2	66.7	77.8	52	57	85.7	66.9
	Female	Units	11	3	2	12	10	2	40
		%	26.8	33.3	22.2	48	44	14.3	33.1
Total		**Units**	**41**	**9**	**9**	**25**	**23**	**14**	**121**
		%	**100**	**100**	**100**	**100**	**100**	**100**	**100**

Though men were more, women were well represented in the survey.

Table 2: Age Distribution

Age Distribution								
		Universities						**Total**
Age		LASU	Caleb	FUNNAB	Babcock	UI	Lead City	
18 - 22 years	Units	1	0	0	0	0	0	1
	%	2.4	0	0	0	0	0	0.8
23- 27 years	Units	2	0	0	1	0	3	6
	%	4.9	0	0	4	0	21.4	5
28- 32 years	Units	6	0	1	9	4	3	23
	%	14.6	0	11.1	36	17.4	21.4	19
33 years & above	Units	32	9	8	15	19	8	91
	%	78	100	88.9	60	82.6	57.1	75.2
Total	**Units**	**41**	**9**	**9**	**25**	**23**	**14**	**121**
	%	**100**	**100**	**100**	**100**	**100**	**100**	**100**

Employees aged 33 and above constituted majority of the respondents.

Table 3: Employees' satisfaction with new media usage in universities

Universities		**Very Satisfied**	**Satisfied**	**Not Sure**	**Dissatisfied**	**Total**
LASU	Units	11	25	2	3	**41**
	%	26.8	61	4.9	7.3	**100**
Caleb	Units	1	4	4	0	**9**
	%	11.1	44.4	44.4	0	**100**
FUNAAB	Units	4	5	0	0	**9**
	%	44.4	55.6	0	0	**100**
Babcock	Units	5	13	5	2	**25**
	%	20	52	20	8	**100**

UI	Units	1	14	7	1	**23**
	%	4.3	60.9	30.4	4.3	**100**
Lead City	Units	2	11	1	0	**14**
	%	14.3	78.6	7.1	0	**100**
TOTAL	Units	24	72	19	6	**121**
	%	19.8	59.5	15.7	5	**100**

Majority of the employees were satisfied with new media usage in universities.

Table 4: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.198[a]	.039	.031	.64151
a. Predictors: (Constant), Corporate Communication				

R in the model shows the strength of relationship which is valued at 0.198. It suggests that significant relationship between corporate communication and employees' satisfaction with the new media usage is low.

Table 5: ANOVA

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	1.999	1	1.999	4.857	.029[b]
	Residual	48.972	119	.412		
	Total	50.971	120			
a. Dependent Variable: Employee Satisfaction with the New Social Media Usage						
b. Predictors: (Constant), Corporate Communication						

Following the p-value of 0.029 which is less than 0.05 threshold of ANOVA coupled with the fact that the F value is 4.857 at 0.029 significant level as shown in Table 5. It means that corporate communication has significant influence on employees' satisfaction with the new media usage in selected universities.

Table 6: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.076	.394		7.816	.000
	Corporate Communication	.534	.243	.198	2.204	.029
a. Dependent Variable: Employee Satisfaction with the New Social Media Usage						

The significance level below 0.05 implies a statistical confidence of above 95%. This suggests that corporate communication has significant influence on employees' satisfaction with the new media usage in selected universities. Therefore, the null hypothesis (H_{01}) was rejected and the alternative was accepted.

Conclusion

There are signals in this preliminary study that employees of the six universities surveyed are in tune with the new media usage in their institutions. One must also not be oblivious that the average employee wants to positively promote their university. There is the need to use this study as benchmark for examining same scenarios in any university anywhere in the world. It is for this reason, further studies through co-authoring collaborations are required to expand the scope, and multidisciplinary potential of this research.

The Role of Digital Competence in the Impact of Digitalization on Labor Productivity

Maria MARKHAICHUK
Vladimir State University named after Alexander and Nikolay Stoletovs, Vladimir, Russian Federation, e-mail: m.marhaychuk@gmail.com

Ilya PANSHIN
Vladimir State University named after Alexander and Nikolai Stoletovs, Vladimir, Russian Federation, e-mail: panshin@vlsu.ru

Abstract

The purpose of this paper is to investigate the role of digital competence in the impact of digitalization of economy on labor productivity in Russian regions. The dataset covers the data on 85 Russian Regions for the 2015-2017 years collected from Unified Interdepartmental Information and Statistical System (EMISS) and Federal State Statistics Service of the Russian Federation (Rosstat). We applied mediation analysis with structural equation models (SEM) to achieve research goal. The study showed the negative direct effect of digitalization on labor productivity in Russian Regions. The indirect effect of digitalization on labor productivity through the mediator variable digital competence is positive and significant with one-year lag. Our model showed small, but positive and significant total effect of digitalization on labor productivity.
The study results can find practical implications in suggestions development for adjusting Regional Development Strategies. Based on the study results new activities in the regional subprojects of the National project of the Russian Federation "Labor Productivity and Employment Support" can be proposed.

Keywords: digitalization, information economy, ICT literacy, regional development.

Introduction

The past decades have been characterized by a tremendous rise of computing power (Arntz et al, 2019). Information and computations technology (ICT) enhances productivity and GDP growth (Bloom et al, 2012; Ceccobelli et al, 2012; Dahl et al, 2011; Engelbrecht and Xayavong, 2006; Hofman et al, 2016; Jorgenson, 2001). However, it appeared that ICT becomes productive only if is supported by complementary factors, such as innovations (Arendt and Grabowski, 2017, 2018), ICT investment-specific technological change (Chung, 2018) etc. Some researchers find the productivity paradox: intensive digital-using industries are contributing most to productivity slowdown (Van Ark et al, 2016, October). However, based on the analysis of the causes of the productivity-growth slowdown, we have an opportunity to boost productivity growth through a focus on education and skills (Bughin et al, 2018).
Among authors who evaluated the influence of various factors on the dynamics of labor productivity at state and regional level of the Russian Federation the following should be highlighted: Bessonov et al (2009); Drobyshevsky and Glavatskaya (2005); Ilyin et al (2010); Mikheeva (2014, 2015); Polterovich (2014); Voskoboinikov and Gimpelson (2015); Zaitsev (2013, 2016); Panshin et al (2019). The relationship between intellectual capital (mostly between its elements, namely human capital) and labor productivity is also the subject of recent research (Benos and Karagiannis, 2016; Chalfin et al, 2016; Chang et al, 2016; Chojnicki and Rabesandratana, 2018; Koh et al, 2015; McGrattan, 2017; Mellander and Florida, 2018; Onkelinx et al, 2016).
A considerable effort has been devoted, in recent years, to the analysis of impact of ICT on labor productivity. Researchers' opinions differ. Some studies show that ICT implementation has a positive impact on productivity (Arendt and Grabowski, 2017, 2018; Chung, 2018; Dahl et al, 2011), other researchers note the decline in labor productivity (Van Ark et al, 2016, October; Akhvlediani, 2016; Antonioli et al, 2018), decrease in labor productivity growth (Cette, 2014), and lack of impact on labor productivity (Bertschek et al, 2013). Benesova et al (2016) confirmed the positive relationship only

partially. Capital productivity or return on invested capital decreases with the introduction of ICT. Indeed, in the fast-growing IT sector, investment growth is often faster than revenue growth, and returns are reduced. However, productivity per employee must increase, because digitalization usually reduces the number of employees. However, some studies report the reverse trend.

In conditions of limited investment resources, the most promising solution to the problem of increasing labor productivity should be to increase the contribution of labor resources to the generated value added by using the advantages of the digital economy. In this regard, it is interesting to study the relationship between the level of digitalization and labor productivity under the influence of the level of digital competence. The impact of digitalization on labor productivity is the subject of active discussion in recent years. However, the mediating role of digital competence in the impact of digitalization on labor productivity remains insufficiently studied.

The purpose of this paper is to investigate the role of digital competence in the impact of digitalization of economy on labor productivity in Russian Regions.

1. Research methodology

It is necessary to define the concept of digital competence in economics for the purposes of our research. Some authors use term ICT or digital literacy in their researches (Bolek et al, 2018; Nevado-Pena et al, 2019; Scherer and Siddiq, 2019). Other researchers call it digital competence (Cabero-Almenara and Palacios-Rodriguez, 2020; Guillen-Gamez et al, 2020; Ojeda et al, 2019).

International ICT Literacy Panel (Educational Testing Service, 2002) defines ICT literacy in the following way: ICT literacy is using digital technology, communications tools, and/or networks to access, manage, integrate, evaluate, and create information in order to function in a knowledge society. However, this definition does not adequately reflect the role of digital competence in economic processes, such as value creation. Therefore, we propose to define digital competence in economics as an evaluation characteristic of person's knowledge, skills and abilities to use digital technology, communications tools, and/or networks in all spheres of life in order to participate more effectively in social and economic processes.

In Figure 1, digital competence plays the mediating role in transmitting the indirect effect of digitalization level to labor productivity.

Fig. 1. Theoretical relation between digitalization level, digital competence, and labor productivity

1.1. Measurement of digitalization level in regions

The Ministry of Digital Development, Communications and Mass Media of the Russian Federation has developed a consolidated list of indicators used to assess the level of development of the information society in the regions of the Russian Federation. It served as the basis for selecting the indicators that we included in the study. It is not appropriate to use the entire list, since some indicators duplicate others.

In the process of selecting the indicators for assessing the level of digitalization of Russian regions we considered the suggestions of Kuzovkova et al (2019) who proposed the index, that contains such groups of indicators as the sufficiency and security of ICT infrastructure, the demand for digital technologies, platforms and networks, the level of electronic production of goods and services, and the impact of digitalization on economic growth.

The set of indicators for assessing the level of digitalization of Russian regions is shown in table 1. We chose these indicators because we made an attempt to cover most of the areas of digitalization of the economy: the population, organizations, the Internet, and television. It should be noted that Rosstat (Federal State Statistic Service of the Russian Federation) began to collect data on some indicators relatively recently, which is the limiting factor for our study.

Table 1: Digital development indicators

Variable	Description of the indicator
D1	Sufficiency and security of ICT infrastructure
D1_1	Density of active mobile subscribers, units per 100 population
D1_2	Digitalization level of telephone communications, %
D1_3	Digital TV coverage, %
D1_4	Degree of information security of the Internet, %
D2	Demand for digital technologies, platforms, and networks
D2_1	Density of mobile broadband Internet users, %
D2_2	Share of organizations using broadband Internet, %
D2_3	Share of organizations with a web site, %
D2_4	Share of population using the Internet, %
D3	Level of electronic production of goods and services
D3_1	Share of e-government services, %
D3_2	Share of e-procurement in organizations, %
D3_3	Share of electronic sales in organizations, %
D3_4	Share of population using the Internet for services, %

Source: authors' elaboration

We normalized the above indicators to calculate the digitalization level (D). Normalized indicators are calculated as follows:

$$y_i(x_i) = \frac{x_i - x_{min}}{x_{max} - x_{min}},$$

where:
y_i – normalized indicator,
x_i – indicator,
x_{min} – minimum value of indicator among Russian Regions,
x_{max} – maximum value of indicator among Russian Regions.
We calculated the generalizing indicators D1, D2, D3 based on individual normalized indicators of digital development. Next, we calculated the integrated indicator of digitalization level (D) as the arithmetic mean of the generalizing indicators of digitalization.

1.2. Labor productivity measurement

Rosstat does not calculate the indicator "Labor productivity level" in the context of the Russian Federation subjects, limiting itself to calculations of the labor productivity index. Therefore, we used the labor productivity index (iLP) as a dependent variable for testing hypotheses.

1.3. Digital competence level measurement

We calculated the digital competence index (DC) to assess the level of digital competence of residents and workers in the regions. The digital competence index is based on the indicators shown in table 2. These indicators were normalized and the digital competence index was calculated as an arithmetic mean.

Table 2: Digital competence

Variable	Description of the indicator
DC1	Share of employed in the ICT sector in the total number of employed, %
DC2	Share of population with digital skills, %
DC3	Share of ICT specialists in the total number of employees of organizations, %
DC4	Share of highly qualified specialists among specialists in ICT, %

Source: authors' elaboration

1.4. Estimation method

With the proposed theoretical and empirical research model, the study used variable DC as mediator, so this model is also known as the mediation model, which is a kind of Structural Equations Models (SEM) (Stata, 2017).

According to Baron and Kenny (1986), in a mediation model, an independent variable influences the dependent variable in two directions (direct and indirect) through the mediator variable, and the total effect of the independent variable on the dependent variable is equal the direct effect plus the indirect effect.

To estimate the SEM model, the study uses the method of "maximum likelihood estimation" and performs necessary model tests, such as goodness-of-fit.

2. Data and results

This research study is based on region-level data collected from Unified Interdepartmental Information and Statistical System (EMISS) and Federal State Statistics Service of the Russian Federation (Rosstat). The dataset covers the data on 85 Russian Regions for the 2015-2017 years. At the moment, it is all available data on some indicators of digital competence like share of population with digital skills, share of ICT specialists in the total number of employees of organizations and share of highly qualified specialists among specialists in ICT.

Descriptive statistics for the above indicators are presented in Table 3 below.

Table 3: Descriptive statistics

Variable	Observations	Mean	Std. Dev.	Min	Max
D1	246	.6876778	0.0935303	0.254643	0.998815
D1_1, units per 100 population	246	181.6732	57.82085	2.06	466.4
D1_2, %	246	89.86116	9.371814	41.76784	100

DC	246	0.448234	0.1325914	0.057293	0.989033

Source: authors' elaboration

We estimated two models. The first model assumes that digital competence is the mediator in the process of digitalization influencing the labor productivity at the current time. The second model assumes that in order for digitalization to have a positive impact on labor productivity in the current period, it is necessary to increase digital competence one year earlier. The digital competence index is used with the one-year lag in the second model. The results of SEM estimation are presented in table 4.

Table 4: Summary of regression results by SEM estimation

	Coeff.	**Std. Err.**	**z**	**P>z**	**[95% Conf. Interval]**	
MODEL 1						
iLP (dependent)						
DC	0.183206	1.554454	0.12	0.906	-2.86347	3.229879
D	2.263312	1.901195	1.19	0.234	-1.46296	5.989587
DC (dependent)

Source: authors' elaboration

Model 1 shows that the impact of digitalization on the labor productivity index is insignificant. This applies to both direct and indirect influence (taking into account digital competence).
Model 2 confirms the role of digital competence as mediator for the impact of digitalization on labor productivity. Model 2 was tested for goodness-of-fit. The results are presented in Table 5.

Table 4: Summary of regression results by SEM estimation

Test	**Result**	**Description of result**
RMSEA	0	RMSEA (root mean square error of approximation) of the model is less than 0.6, as suggested by Hu and Bentler (1999).
CFI	1	CFI (Satorra-Bentler comparative fit index) is greater than 0.9 (Hu and Bentler 1999).
TLI	1	TLI (Tucker-Lewis index) is greater than 0.9 (Hu and Bentler 1999).
SRMR	0	SRMR (standardized root mean square residual) is less than 0.08, as recommended by Hu and Bentler (1999).
CD	0.73	The CD value (equivalent to R^2 in the normal regression model) is 0.73. This means that the variables in the model account for 73.0% of the variance in iLP.

Source: authors' elaboration

The test variables in Table 5 show the overall fit of the model.

3. Discussion

Based on the results of the SEM model regression, the study discusses the effects of digitalization on labor productivity through the mediating role of digital competence.

3.1. The structural effect of digitalization on labor productivity

D has three types of structural impact on iLP: a direct effect from D to iLP, an indirect effect from D

to iLP through the mediating effect of DC, and the total effect from D to iLP (equal to indirect effect plus direct effect). These three types of effects are illustrated in Figure 2.

Source: authors' elaboration

Fig. 2. Structural effect of D on iLP

3.2. The direct effect of digitalization on labor productivity

The direct impact of digitalization on labor productivity index is statistically significant, but negative. This result can be explained as follows. Indeed, the effect of digitalization can be negative if the process of introducing advanced information technologies is not set up. It is well known that there is a tendency to resist innovation. People who have worked with certain technologies for a long time are not always easily accustomed to using new technologies. It happens for a variety of reasons. However, with appropriate training and the acquisition of necessary skills by people, digitalization should begin to bring great positive effects, significantly affecting the growth of labor productivity.

It is the lack of the necessary knowledge, skills and abilities of people (digital competence) that does not allow them to effectively use new digital economic tools to increase their productivity. The share of people with the right level of digital competence in the economy is insignificant. The complexity of digital technologies for this category of people can even lead to the drop in labor productivity.

3.3. The indirect effect of digitalization on labor productivity through the mediator variable digital competence

The indirect impact of digitalization on labor productivity index through digital competence is positive and significant. The hypothesis of the mediating role of digital competence in the impact of digitalization on labor productivity is confirmed.

3.4. The total effect of digitalization on labor productivity

The total effect of digitalization on labor productivity equals the direct effect plus the indirect effect. Our model showed small, but positive and significant total effect. It follows that labor productivity will grow faster with the growth of digital competence and the effect of digitalization will be greater.

4. Conclusions

The aim of this study was to investigate the role of digital competence in the impact of digitalization of economy on labor productivity in Russian regions. The main findings of the study are:

We proposed to define digital competence in economics an evaluation characteristic of person's knowledge, skills and abilities to use digital technology, communications tools, and/or networks in all spheres of life in order to participate more effectively in social and economic processes.

We developed a research model in which the digital competence plays a mediating role in the impact of digitalization on labor productivity. We also estimated the proposed empirical relationship using the SEM and found that it satisfied all the required goodness-of-fit tests. The regression results from the SEM yielded some noteworthy results.

In terms of the structural impact of digitalization on labor productivity, the study explored the direct impact of digitalization on labor productivity and the indirect impact of digitalization on labor productivity through digital competence with one-year lag. Digitalization had the direct impact on labor productivity with statistically significant coefficient of -8. Regarding indirect effects, the impact of digitalization on digital competence was very high (52), the indirect effect of digitalization on labor productivity through digital competence was 8.32. Then, we calculated the total effect of digitalization on labor productivity (0.32). Our model showed small, but positive and significant total effect. It follows that labor productivity will grow faster with the growth of digital competence and the effect of digitalization will be greater.

Mediation analysis with SEM confirmed the hypothesis of the mediating role of digital competence in the impact of digitalization on labor productivity.

The study results can find practical implications in suggestions development for adjusting Regional Development Strategies. Based on the study results new activities in the regional subprojects of the National project of the Russian Federation "Labor Productivity and Employment Support" can be proposed.

It should be noted, that our findings cannot be applied to each Russian region. They describe the average situation in the country.

Further research may be aimed at studying the impact of information security of labor resources on labor productivity.

Acknowledgment

The reported study was funded by RFBR, project number 20-010-00877.

Case Study of Tourist Satisfaction with Services in the Slovak Karst National Park in the Context of Sustainable Development

Jana MITRÍKOVÁ

University of Prešov, Faculty of Management, 16 Konštantínova Street, 080 01 Prešov, Slovak Republic, e-mail: jana.mitrikova@unipo.sk

Abstract

The main objective of our paper was to evaluate the satisfaction of tourists with selected services in the Slovak Karst National Park, in the Domica Cave and in the Ochtinska Aragonite Cave, both of which are on the UNESCO list of natural monuments. Given that these caves are located in the national park, the theoretical introduction deals with the terminology related to sustainable development and subsequently also in the context of sustainable tourism. In total, we addressed 146 respondents and evaluated the obtained data by appropriate mathematical-statistical methods. We found that visitors to the Domica Cave are significantly more satisfied with the information services as well as the infrastructure at this cave, as visitors to the Ochtinská Aragonite Cave. However, visitors to the Ochtinská Aragonite Cave are much more satisfied with the guide service at this cave than visitors to the Domica Cave. The dissatisfaction of the visitors in the case of Domica cave is caused by the price of souvenirs and the variety of its offer, while the negative response to the Ochtinská Aragonite Cave can be attributed to the quality of the access road, which was reconstructed after the survey in 2019.

Key words: the Slovak Karst National Park, Sustainability, Sustainable tourism, Domica Cave, Ochtinska Aragonite Cave

Introduction

The World Travel Organization (UNWTO) defines tourism as: "the activity of a person who travels and stays in places other than his usual place of work for no more than 1 year for entertainment, business and other reasons". It excludes day-to-day trips, regular and frequent trips between home and work and other routine trips (UNWTO 2018). According to this organization, tourism is one of the top five exported categories for 83% of countries and the main source of foreign currency for 38% of them. The size of a country's direct income depends on three variables: number of visitors, normal length of stay, average daily spending. Tourism has both positive and negative impacts on many areas. These depend on the quantity and characteristics of each of the tourists. It is the number of days spent on the site, the form and type of tourism, the chosen transport, etc. In economics, impact measurement has a long history, which does not include environmental and social impacts. The analysis of secondary and tertiary effects is largely lacking. Quantification of these impacts on tourism is also a problem. Where the numbers of tourists are too high, there has traditionally been a tendency to minimize negative impacts. The change in recent years has come to the conclusion that previous developments and growth have brought, among other things, negative environmental impacts (Bryden 1973, Eadington and Redman 2011, Amanthaswamy 2004).

Sustainability and sustainable tourism

The issues of sustainable living and consumption are not only of the interest of so-called "green" consumers, but of all conscious citizens. The financial crisis, compounded by social and environmental problems and an increasing sense of consumer responsibility, is changing the economic and business environment. Customers are more likely to direct their money towards purchasing goods for which they perceive values in excess of their financial cost. Consumers are increasingly demanding value for every product or service they buy. Sustainability issues thus also come into the tourism sector itself in the form of sustainable tourism. In particular, protected areas are under pressure to stimulate tourism in the context of environmentally friendly development. Tourism has a unique position in the sense that it is able to become an economic and social benefit for local

communities, and at the same time has the means to maintain and protect the environment. However, all stakeholders are responsible for sustainability (Tožička 2012).

Sustainability as such is a theme that translates into almost every area of human action. This is a very topical topic in a number of scientific conferences, and that is why there are so many different definitions from many scientists with a different focus. Sustainable development is an essential prerequisite for future generations that will be able to live in the same or similar conditions on Earth as they are today. There are many discussions not only at national level, but above all at international level, where various associations are being established to promote sustainable development. The emergence of sustainable tourism is therefore a practical outcome of the principles of sustainability in the everyday life of tourists and businessmen in this field (Ferencz et al. 2017; Huttmanová and Valentiny 2019).

The concept of sustainability arises from the idea that there is a "green" customer who wants to buy environmentally friendly and human society products. However, the idea of a homogeneous group of green customers is misleading and incorrectly simplistic. It is this group of customers that is the most diverse in nature. According to Horner and Swarbrook (2003), light green and dark green types of green customers can be distinguished according to their interest in green issues. ***Sustainable tourism is the application of the principles of sustainability to the field of tourism. It is a tourism concept that connects the needs of today's generation and future generations.*** Sustainable tourism underlines the need to minimize negative impacts and maximize positive impacts for society, the environment and other areas. The interest of tourism in the concept of sustainability is given logically. Tourism uses its environmental resources - both physical and human - for its product.

Sustainable tourism meets the needs of current tourists and host regions. It has a low impact on the environment and local culture, helps generate income and jobs for local people, and also helps to preserve local ecosystems. The aim is to maintain the economic and social benefits for tourism development while reducing or mitigating any adverse effects on the natural, historical, cultural or social environment (UNWTO 2018). Global Tourism (2005) defines sustainable tourism as a tourism that consciously uses and conserves resources to benefit from their long life span. Epstein (1996) draws attention to the potential dangers of a sustainable concept. What on the one hand looks like a sustainable concept, on the other, may not look the same. The global impact on tourism at local level is moderated by a number of processes and relationships that influence whether sustainable tourism will be successful or not (Grah, Dimovski and Peterlin 2020). The English Tourism Council (2010) defines sustainable tourism as managing the effects of tourism on the environment, the public and the economy, ensuring that the effects are positive rather than negative for the benefit of future generations. It is a management approach that applies to all types of tourism, regardless of whether it takes place in cities, cities, rural areas or on the coast. The WTO (2018) offers an economic-environmental definition: Sustainable tourism is the ability of a destination to maintain potential competition in competition with new, historically less-used destinations, attract both first and repeat visitors, maintain cultural uniqueness, and be in balance with the environment. Pásková and Zelenka (2002; 2018) argue that sustainable tourism is based on several principles. The first is the conservation of resources. Sustainable development is associated with the life of not only environmental resources but also economic, social and cultural resources. The second principle is the future. This means the future of future generations that could benefit from the resources, opportunities and opportunities that should last as long as possible. The third principle is justice. Some argue that fair play needs to be maintained in the distribution of economic, social, cultural and environmental benefits and costs of human activity (Global Tourism 2005). Determining whether something is sustainable or not can only be done in a retrospective. EIA (Environmental Impact Analysis) methods are often used for decision making. Long-term monitoring is important for management and strategic management (Wall, Mathieson 2006). With the demand for sustainability in tourism comes a fundamental change for managers of tourism businesses. While in the past the goal was to maximize economic gains, the need to balance all three aspects - environmental protection, benefits for human society and stable economic growth - will become increasingly important in the future. This requirement illustrates the "three P" scheme - PLANET - PEOPLE - PROFIT by prof. Donald Hawkins of George Washington University, New York (Burian 2010).

History of sustainability issues

The first international organization to focus its activities on studying the development of human civilization and addressing global issues was the NGO Rome Club. It was founded in 1968 in Rome thanks to Italian founder Aurelius Peccei. The Rome Club brought together scientists, statesmen and well-known personalities from the business community. It has focused on addressing the evolution of human civilization and global problems in the knowledge that the uncontrolled growth of anything (population, production, consumption, pollution) can have a huge impact on an environment with limited resources (The Club of Rome, 1968 cit. in. Black 2012).

The first conference on environmental issues took place in 1972. The Stockholm Human Environment Conference declared 26 principles on development and the environment (Slovak Environmental Agency 2004). The concept of Sustanability and Sustainable Development began in 1987 at the First World Summit in Stockholm (United Nations Conference on Human Environment) of the United Nations World Commission on the Environment. The result was an important document called the Brundtland Report (Black, 2012), which first defines this term - sustainable development - as a development that meets the needs of today's generation without jeopardizing future generations' ability to meet their own needs (Brundtland UN 1987 cit in Black 2012).

The second United Nations World Summit on Sustainable Development and the Environment (UNCED) was held in Rio de Janeiro in 1992. Documents on the environment and its development were adopted here. The resulting documents were:

- Framework Convention on Climate Change;
- Convention on the conservation of natural biodiversity;
- Declaration on the Environment and Development,
- Agenda 21 (universal care for the environment on Earth with a view of the 21st century)
- Principles on the use, protection and sustainable development of all types of forests (Offertalerová 2017).

The Third World Summit on Sustainable Development (WSSD) was held 10 years later in the largest city in South Africa, Johannesburg. The main themes were the evaluation of the overall development of the world, addressing the issue of poverty, the use of energy, access to drinking water and health care. The priority theme of the conference was the Integrated Approach to Nature and Natural Resources Protection, which comes from Agenda 21. The output documents of this summit were: the Johannesburg Plan of Implementation and the Johannesburg Declaration on TUR (Offertalerová 2013; Molnárová 2019).

Rio +20 The United Nations Conference on Sustainable Development was held again in Rio de Janeiro, Brazil in 2012. The resulting document outlines concrete practical measures for its implementation in national policies. The conference adopted basic regulations on green economy policies, a strategy for financing sustainable development, a policy forum for sustainable development. At the conference, they asked the United Nations Statistical Commission to launch a program of measures to inform and check that the political decisions of the entities were in line with the rules for sustainable development. The message of this conference was the statement: The future we want. (The future we want.) The starting point of this conference was A/ CONF.216/5 containing a 10-year program and models of sustainable production and consumption patterns. It contains the steps necessary to put these methods into practice. Rio +20 has also taken future decisions, including energy, food security, ocean and urban pollution (Offertalerová 2013; Molnárová 2019).

The last Sustainable Development Summit was held at the UN Headquarters in New York City in September 2015. At this summit, 150 world leaders adopted The Global Goals for Sustainable Development and the Agenda 2030 for Sustainable Development for 2015 - 2030. Agenda 2030's message is "People, from people, to people" (Zajac et al. 2016). This document serves as a starting document for international communities and national governments (Euroreporter 2015). Agenda 2030 activities focus not only on achieving the quantity of the objectives set, but in particular on the quality of the objectives set. The 2030 Agenda for Sustainable Development is the most comprehensive set of global priorities so far, consisting of 17 main objectives elaborated into 169 partial objectives (Statistical Office of the Slovak Republic 2019).

The ambition is to guide the political, economic and social transformation of individual countries in the world in response to the threats that humanity is currently facing. An integrated element of the agenda is the interconnection of economic, social and environmental areas. Countries are not legally bound by this document. The intention is that, when the 2030 Agenda is adopted, countries lead their development in a sustainable way and set policy, strategy, development and planning to ensure that global goals are achieved. At world level, the concept of implementing Agenda 2030 is based on the documents adopted by the UN in 2015, which are:

- 2030 Agenda for Sustainable Development
- Addis Ababa Action Program on Financing for Development
- Paris Agreement to the United Nations Framework Convention on Climate Change.

At the European Union level, the implementation concept builds on the European Strategy Papers, which are: Next steps for a sustainable European future and Revision of the European Development Consensus (Molnárová 2019).

People have become aware of the consequences of mass tourism and are therefore increasingly interested in softer tourism, but we must also be careful about it. Although the environmental impact of an individual is almost negligible, if the number of visitors increases 1000 times, the negative impact is more visible. In Slovakia has natural tourism has great potential, and is increasingly sought after by tourists. "We need to start from each of us". Holidays in protected areas, in rural areas or in historically and culturally places with the motto: "Experience experiences and protect values" offer a solution. According to some authors, there are forms and types of tourism that are sustainable in nature. Marketing activities and presentation of the destination is very important (Gallo et al 2017).

Materials and methods

The place of our research was the Slovak Karst National Park – Domica Cave and Ochtinska Aragonite Cave. In our contribution, we have used a questionnaire survey of visitors' satisfaction with the provided information services, sale of souvenirs, guide services, social facilities, parking and infrastructure in the area of interest. The total number of respondents was 146, of which 71 are men and 75 are women. Initially 173 questionnaires were distributed, 8 questionnaires were incorrectly filled and 19 questionnaires were not returned. We distributed the questionnaires personally to visitors of the Slovak Karst caves in Domica and Ochtinska Aragonite Cave during the summer and autumn months of 2018.

We have tested several hypotheses by statistical verification, but in this article we only mention two:
H1: We assume that there is a statistically significant positive relationship between the age of cave visitors and their degree of satisfaction with the various types of services provided when visiting the cave.
H2: We assume that there is a statistically significant difference in satisfaction with the services provided in the Domica Cave and in the Ochtinska Aragonite Cave.

We used SPSS for Windows version 21.0 to analyze and process the collected data. At the level of statistical inference, we used Spearman's correlation analysis to analyze ordinal variables. In the case of continuous variables, prior to the selection of adequate statistical tests, we determined the fulfillment of the normality of the distribution of the individual dependent variables, based on the skewness coefficients, and the coefficients of skewness, respectively. their z-score (Field 2013). Since the assumption of normality was confirmed for all continuous variables, we preferred parametric Student's t-tests for two independent selections, Student's t-tests for two dependent selections, and Pearson's correlation analysis.

Results

Visitors rated their satisfaction with the services provided on the numerical rating scale 1 - 5, where rating 1 meant very satisfied, 2 partially satisfied, 3 neither satisfied nor dissatisfied, 4 partially dissatisfied, 5 very dissatisfied. The results of visitor satisfaction with the different types of services provided in the Domica Cave are presented in Table 1 below.
On this issue, we were interested in the level of visitor satisfaction with the various types of services in the Domica Cave. From the answers we found out that the visitors not very satisfied with the price

of souvenirs and the variety on offer. They were very satisfied with the information available on the Internet, the way the guide is done, the cleanliness and order of social facilities, the quality of the access road and the walking distance from the parking lot.

Table 1: Visitors' satisfaction with the different types of services provided in the Domica Cave

Types of services assessed		assessment levels				
		1	**2**	**3**	**4**	**5**
		respondents' response rate				
Information Services	Information leaflets	18	60	35	5	0
	Information on the Internet	**26**	**70**	21	1	0
Sale of souvenirs	Price	2	54	46	9	2
	Variety of offerings	4	57	38	14	0
	Seller staff	10	61	36	6	0
Guide services	Approaching the guide	**21**	**60**	32	5	0
	Approaching other staff	7	65	38	8	0
	Interpretation quality	18	64	35	1	0
Social Department	Cleanliness and order	**23**	**72**	22	1	0
Parking	Price	21	61	32	4	0
	Parking capacity	8	63	38	9	0
Infrastructure	Access path quality	**20**	**67**	30	1	0
	Walking distance from the parking lot	**28**	**62**	27	1	0

(Source: own processing)

The answers given by visitors to the Ochtinská Aragonite Cave show that they are most dissatisfied with the quality of the access road to this cave. The greatest satisfaction was expressed in the area of information services, namely satisfaction with the quality and good availability of information on the internet about the cave. In the area of guide services, respondents are satisfied with the performance of the guide and with the quality of their interpretation.

Table 2: Visitors' satisfaction with the different types of services provided in the Ochtinská Aragonite Cave

Types of services assessed		assessment levels				
		1	**2**	**3**	**4**	**5**
		respondents' response rate				
Information Services	Information leaflets	6	62	38	6	0
	Information on the Internet	**25**	**57**	28	2	0
Sale of souvenirs	Price	4	64	32	13	1
	Variety of offerings	7	58	42	5	0
	Seller staff	10	60	32	10	0
Guide services	Approaching the guide	**27**	**57**	24	4	0
	Approaching other staff	8	75	22	7	0
	Interpretation quality	**29**	**67**	15	1	0
Social Department	Cleanliness and order	19	77	14	2	0

Infrastructure	Access path quality	0	38	28	**32**	**12**
	Walking distance from the parking lot	0	67	34	9	0

(Source: own processing)

H1: We assume that there is a statistically significant positive relationship between the age of cave visitors and their degree of satisfaction with the various types of services provided when visiting the cave.

The assumption of a statistically significant positive relationship between the age of cave visitors and the degree of their satisfaction with the individual types of services provided when visiting the cave was verified by Pearson's correlation analysis. Its results confirmed that the age of cave visitors is significantly positive with their satisfaction in information services, r = .164, p (1) =. 024 and guide services, r = .191, p (1) = .011. The relationship between the age of visitors and their satisfaction with the quality of other services - sale of souvenirs, sanitary facilities, parking, infrastructure - did not reach the required value of statistical significance (p <.05). It follows that the older the cave visitors, the higher their satisfaction with information and guide services. The satisfaction of visitors with other types of services was not related to their age. Based on the results of the analysis, the H1 hypothesis was not confirmed. The results are summarized in Table 3.

H2: We assume that there is a statistically significant difference in satisfaction with the services provided in the Domica Cave and in the Ochtinská Aragonite Cave.

The question of the existence of significant differences between the visitors of the Domica cave and the Ochtinská aragonite cave in satisfaction with the individual types of services provided during the visit of the cave was examined by means of a series of Student's t-tests for two dependent selections.

Table 3: Pearson's Correlation Analysis - Mutual Relationships between the Age of Cave Visitors and Their Satisfaction with Individual Types of Cave Visits

	Deskripce			**Age**	
Satisfaction in the area	***N***	***AM***	***SD***	***r***	***p(1)***
Information Services	*145*	*2,268*	*,4587*	**,164**	**,024**
Sale of souvenirs	*140*	*2,475*	*,4970*	**,089**	**,149**
Guide services	*145*	*2,166*	*,4881*	**,191**	**,011**

(Source: own processing)

Table 4: Student's t-test for two dependent selections - Differences between visitors of Domica cave and Ochtinská aragonite cave in satisfaction with individual types of services provided when visiting a given cave

Dissatisfaction with selected services		Domica cave		Ochtinska aragonite cave		Student's t-test		
	N	***AM***	***SD***	***AM***	***SD***	***t***	***df***	***p***
Information Services	85	*2,027*	*,5473*	*2,251*	*,4540*	**-3,19**	**84**	**,002**
Sale of souvenirs	80	*2,479*	*,5027*	*2,408*	*,4773*	**1,586**	**79**	**,117**
Guide services	85	*2,196*	*,5352*	*2,086*	*,4774*	**2,223**	**84**	**,029**
Social Department	85	*1,918*	*,6213*	*1,918*	*,6213*	**-**	**-**	**-**
Parking	85	*2,218*	*,6701*	*2,218*	*,6612*	**,000**	**84**	**1,000**
Infrastructure	85	*2,035*	*,6892*	*2,629*	*,6369*	**-6,08**	**84**	**,000**

(Source: own processing)

The results of the analyzes showed that the visitors to the Domica cave are significantly more satisfied with the information services, $t(84) = 3.194$, $p = .002$, as well as the infrastructure, $t(84) = 6.077$, $p < .001$, aragonite cave. On the other hand, visitors to the Ochtinská Aragonite Cave are much more satisfied with the guide services at this cave than visitors to the Domica cave, $t(84) = 2.223$, $p = .029$. From the point of view of the satisfaction of visitors to both caves with other types of services (sale of souvenirs, sanitary facilities, parking) there were no statistically significant differences between the Domica cave and the Ochtinská aragonite cave. The results are summarized in Table 4.

Discussion

Tourism is inevitably linked to the provision of services, the primary mission of which is to uncover the needs of customers, to make meaningful use of time, and to support the living standards of the local population. The importance of services is increasing in the target location due to the fact that visitors outside their home tend to increase their needs, which is also the significance of the services themselves (Jakubíková 2012). Tourism is currently one of the dominant, global social factors, acting directly or through all social activities (Tremboš and Trembošová 2014). Several authors agree that tourism services are multidisciplinary in nature (information, dietary, accommodation, transport, guide, spa, sports, recreation, etc.), which means that they can be delivered to customers individually or as a package of services through travel agencies or travel agencies (Gúčik, Gajdošík and Lencsésov 2016). Slovakia has a high natural and cultural potential for tourism development. As far as the most important natural monuments in our territory are concerned, there are caves whose research and protection are of a high standard. In such cases, an environmental approach is also important (Adamišin, Kotulič, Mura et al. 2018), e.g. negative consequences of tourism and so on. The main goal of our work was to evaluate and compare the satisfaction of visitors with selected services of natural monuments registered in the UNESCO list (caves of the Slovak Karst). In order to achieve this goal, we conducted a questionnaire survey in two caves, namely in Domica and in the Ochtinská Aragonite Cave. In the questionnaire survey we found out from visitors that while waiting for entry into caves they would like to use services in some restaurant or in a cafe. They would also welcome some children's activities or a short educational film about the visited cave. After talking to several visitors, we found that they visited the Baradla Cave in Hungary and are more satisfied with the services provided on the Hungarian side than on the Slovak side.

According to Gučík (2001), it is not possible to develop tourism without accommodation and catering services. The level of accommodation facilities significantly influences the quality of provided services and thus affects the satisfaction of visitors. There are no accommodation facilities near Domica Cave. The nearest tourists have the opportunity to stay in Rožňava approx. 25 km from the cave, or at Baradla Cave 4 km away in Hungary. The Domica Resort was closed in 2010. It was a modern building complex that, in addition to accommodation and catering services, also offered wellness stays for visitors. After two years of operation, the area has been closed for reasons not yet explained, and since then it resort has decayed. A significant difference between the caves located in the Slovak and Hungarian territories can be seen in the period of their operation during the year for visitors. Caves on the Hungarian side are all year round for visitors. Exceptions are periods when the cave is impossible for visitors to visit due to the high water level in the caves.

Conclusion

In Slovakia, natural tourism has great potential and is increasingly sought after by tourists. The current trend in tourism is to shorten holidays and actively use them to gain experiences, which predicts great development opportunities for sustainable forms of tourism. Sustainability issues are often seen in the context of the impact of tourism on the destination, and these impacts tend to be divided into environmental, socio-cultural and economic, depending on their impact on the environment. Regarding the negative impacts on the economic environment, economic leaks, seasonal inflation, excessive dependence on tourism income, seasonality of production and low return on investment are often mentioned. These are positively reflected in the growth of employment, an increase in living standards and investments. Among the negative impacts of tourism on the natural environment include eg. reduction of water quality, air quality, noise pollution, emissions, erosion, loss of animals or damage to natural values and biodiversity. Increasing awareness of the need for nature protection is considered positive. In contrast to the impacts on the natural environment, the impacts on the socio-cultural environment are harder to identify. The most frequently mentioned are:

dualization of society, increase in crime, tourist irritation, change in the value system and others. They consider positively strengthening regional values and traditions or increasing the level of local interest.

Based on the collected responses and their subsequent analysis, we found that visitors to the Domica Cave are significantly more satisfied with the information services as well as the infrastructure at this cave, as visitors to the Ochtinská Aragonite Cave. However, visitors to the Ochtinská Aragonite Cave are much more satisfied with the guide service at this cave than visitors to the Domica Cave. The dissatisfaction of the visitors in the case of Domica cave is caused by the price of souvenirs and the variety of its offer, while the negative response to the Ochtinská Aragonite Cave can be attributed to the quality of the access road. It was reconstructed after the survey in 2019.

New theme, new product, new possibilities. This is also how ecotourism can be defined as a modern market segment in the tourism sector. Revenues of this product grow year-on-year also because mankind is already aware of the consequences of insensitive human intervention in nature and landscape. An example is the numerous discussions on global warming and climate change.

Comparison of Satisfaction the Slovak and Foreign Visitors in the Slovak Paradise National Park in the Context of Ecotourism

Jana MITRÍKOVÁ
University of Prešov, Faculty of Management, 16 Konštantínova Street, 080 01 Prešov,
Slovak Republic, e-mail: jana.mitrikova@unipo.sk

Abstract

The main aim of the paper is a comparison of foreign and Slovak visitors contentment with accommodation, restaurant and transport services in the northern part of the National Park Slovak Paradise. The analysis was performed on the basis of personally collected data from the questionnaire survey conducted during the summer season from June to September 2017. We addressed the requested respondents personally in accommodation and restaurant facilities in the most famous tourist resorts of the northern part of the Slovak Paradise National Park - Podlesok, Čingov, Hrabušice and other nearby localities and car parks. The survey sample consisted of 211 respondents, of which 100 were Slovak and 111 foreign visitors. The questionnaire was developed in 6 language mutations. We found out from our survey that both Slovak and foreign visitors are equally satisfied or dissatisfied with the provision of accommodation, restaurant and transport services in the Slovak Paradise, which they used during their stay. Most visitors, however, were satisfied.

Keywords: The National Park Slovak Paradise, Ecotourism, Sustainable tourism

Introduction

Ecotourism is a type of tourism, which is focused mainly on learning about nature in order to avoid excessive disturbance. Characteristic attributes for ecotourism are sustainable, responsible, naturally oriented. In the early days of the development of ECOTURISM, the term was often identified with the terms NATURE TOURISM or WILDLIFE TOURISM, whose main aim was to move in a natural, unchanged environment. In the literature it is possible to meet with the designation GREEN TOURISM. At present, ecotourism is viewed as a symbol of alternative tourism, resp. access to current commercial forms of mass tourism. Terminologically, ecotourism is sometimes considered synonymous with natural tourism, but in this approach it loses its very important aspect, namely the cultural aspect (Matlovičová, Klamár and Mika 2015).

Sustainable tourism and ecotourism

Sustainable tourism is the application of the principles of sustainability to the field of tourism. It is a tourism concept that connects the needs of today's generation and future generations. Sustainable tourism underlines the need to minimize negative impacts and maximize positive impacts for society, the environment and other areas. The interest of tourism in the concept of sustainability is given logically. Tourism uses its environmental resources - both physical and human - for its product. Sustainable tourism meets the needs of current tourists and host regions. It has a low impact on the environment and local culture, helps generate income and jobs for local people, and also helps to preserve local ecosystems. The aim is to maintain the economic and social benefits for tourism development while reducing or mitigating any adverse effects on the natural, historical, cultural or social environment (Moreli 2011; UNWTO 2018). Global Tourism (2005) defines sustainable tourism as a tourism that consciously uses and conserves resources to benefit from their long life span. Epstein (1996) draws attention to the potential dangers of a sustainable concept. What on the one hand looks like a sustainable concept, on the other, may not look the same. The global impact on tourism at local level is moderated by a number of processes and relationships that influence whether sustainable tourism will be successful or not (Grah, Dimovski and Peterlin 2020; Ferencz et al. 2017). The English Tourism Council (2010) defines sustainable tourism as managing the effects of tourism on the environment, the public and the economy, ensuring that the effects are positive rather than negative for the benefit of future generations. It is a management approach that applies to all

types of tourism, regardless of whether it takes place in cities, cities, rural areas or on the coast (Navrátil et al. 2015). The WTO (2018) offers an economic-environmental definition: Sustainable tourism is the ability of a destination to maintain potential competition in competition with new, historically less-used destinations, attract both first and repeat visitors, maintain cultural uniqueness, and be in balance with the environment. Pásková and Zelenka (2002; 2018) argue that sustainable tourism is based on several principles. The first is the conservation of resources. Sustainable development is associated with the life of not only environmental resources but also economic, social and cultural resources. The second principle is the future. This means the future of future generations that could benefit from the resources, opportunities and opportunities that should last as long as possible. The third principle is justice. Some argue that fair play needs to be maintained in the distribution of economic, cultural and environmental benefits and costs of human activity (Global Tourism 2005; Burian 2010). The definition of ecotourism is not uniform, but it usually includes expressions such as: responsible travel, visiting the natural area, economic benefits for local people, consideration for the natural environment and culture, nature conservation, links to study or education. It also includes promoting recycling, energy savings and creating economic opportunities for local communities. It respects the cultural heritage, does not harm the environment, supports the local economy and cultural exchange. Ecotourism thus gives tourists the opportunity to support the local population, enjoy nature while respecting it and appreciating its beauty (Augustinová 2008). The history of ecotourism is very short. In the 1980s, the term did not appear in dictionaries and lexicons, as did the terms sustainable or alternative tourism (Page and Dowling 2002). This term was first used in 1983 by Hector Ceballos - Lascurain, a Mexican architect and environmentalist who drafted an often cited definition in the early 1980s: Ecotourism is traveling to relatively intact and unpolluted natural areas with the primary goal of studying, admiring and enjoying nature, plans growing plants and wild animals, as well as existing cultural expressions (both past and present) found in these areas (Fennel 2006). Its participants visit national parks, nature reserves, cultural monuments, events and various attractions. There are many ecotourism activities, often overlapping with activities of agrotourism or adventure tourism. These include e.g. hiking, photography, observation of wild animals and wild plants, cycling and participation in cultural events (Pásková, Zelenka 2002; 2018). According to Honey (1999), the origin of the term ecotourism can also be traced back to the growth of the environmental movement in the 1970s, as well as the increase in dissatisfaction with mass tourism (mass tourism or large-scale tourism), which is based on at a high level of comfort and convenience. A well-known example is "3S" from the English Sea, Sun and Sand, a large concentration of people in a relatively small area leads to mass tourism, and many developing countries around the world are beginning to perceive mass tourism as bad At first, only the richest traveled, but this “fashion” spread very quickly to other social strata, and these countries are concerned about the negative social and cultural byproducts of mass tourism - the black market, drugs and the leakage of tourist profits back to these destinations. Therefore, they are beginning to consider ecotourism as a cleaner, "greener" alternative, alternative forms of ecotourism are trying to be the opposite of mass tourism, several authors (Holden 2000; Page and Dowling 2002) agree on several characteristics of ecotourism, and eg: small scale, local property, mi minimizing negative environmental and social impacts, maximizing links with other sectors of the local economy (eg agriculture - reducing dependence on goods imports), active travel, reconciliation with nature, leaving much of the profits in place, locating power sharing, including participation in decision-making processes (Eadington a Redman 2011, Amanthaswamy 2004).

Materials, methods and results

Slovakia has a high natural and cultural potential for tourism development. As far as the most important natural monuments in our territory are concerned, there are caves whose research and protection are of a high standard. In such cases, an environmental approach is also important (Ko 2005; Adamišin, Kotulič, Mura et al. 2018), e.g. negative consequences of tourism and so on. The main goal of our work was to evaluate and compare the satisfaction of visitors with selected services in the National Park Slovak Paradise. A total of 211 questionnaires were collected and correctly completed, of which 47.4% were from Slovakia (100 respondents) and 52.6% were from abroad (111 respondents). Foreign visitors represent 21.8% from the Czech Republic, 13.3% from Poland, 7.1% from Germany, 2.8% from Hungary and 7.6% from other countries, ie. from Israel, the Netherlands, Italy, France, the US, and Ireland. We divided the age of respondents into 5 age intervals. 27.5% of respondents were 36-45; 46-50 (24.2%); 23.7% of respondents were 15-25 years old; 13.7% of respondents aged 26-35 and the

smallest age group (10.9%) were respondents over 56 years. The average age of domestic visitors was 35 years, of the foreign visitors was 42 years.

Evaluation of visitors' satisfaction with accommodation services

When are you staying at? respondents responded as follows: most in the locality Podlesok (the most famous tourist resort in the Slovak Paradise), 55.0% foreign and 52.0% visitors from Slovakia. In the village Hrabušice 38.7% foreign and 29.0% domestic visitors. In the Čingov resort 6.3% of foreign visitors and 16.0% of visitors from Slovakia. In Smižany there were only 3% of domestic visitors. We have selected the accommodation category in the next question. The most used accommodation facility was a hotel, where up to 44.1% of foreign respondents were accommodated. The second was camping (22.5%). Domestic visitors preferred accommodation in the camp (29%), compared to foreign visitors only 28% of domestic respondents were staying in a hotel. 19% of domestic respondents were accommodated in the cottage and 19% were in private. Least foreign respondents used the possibility of accommodation in the guesthouse (6.3%) and in the cottage (8.1%). To the question ***How satisfied are you with the quality of the accommodation services provided in the accommodation?*** Most respondents stated that they were very satisfied, with 68.5% of foreign respondents and 66.0% of domestic respondents giving this answer. Nearly the same number of domestic and foreign respondents were partially satisfied (approx. 28%). There was very little dissatisfaction with both domestic and foreign respondents (foreigners were less than 2% more dissatisfied than domestic respondents). According to the results of the answers to the question whether the quality of the provided accommodation services corresponds to their price, both respondents from abroad and domestic respondents answered. 91.9% of foreign respondents gave yes and 92% of domestic respondents also answered. Only 8.1% of foreign respondents and 8.0% of domestic respondents did not respond. Up to 89.2% of foreign respondents answered the question whether they would use the same accommodation facility again. Only 10.8% of them would not use the same accommodation. Domestic respondents responded similarly (92% would stay in the same accommodation and only 8.0% would use another).

Determining visitors' satisfaction with transport services

Asked: ***What kind of transport did you use to get to the National Park Slovak Paradise?,*** foreign visitors mentioned as a means of transport the car (73.9%) and the train (24.3%), who came to the Slovak Paradise. The main means of transport for home visitors was a car of up to 78.0%, only 14% of respondents came by train and 9.0% of respondents used intercity bus services. Up to 49.5% of foreign respondents and 52.0% of domestic respondents rated the transport accessibility as very good and 26.1% of foreign respondents and 30.0% of domestic respondents, respectively. It was partly assessed by foreign respondents (7.2%) and by domestic respondents (3.0%). Overall, transport accessibility is very good. 32.4% of foreign visitors were very satisfied with ***the price for parking services***, domestic customers were 6.6% more satisfied than foreign visitors. Also partially satisfied with the price was more by 6.3% domestic (27.0%) than foreign respondents (20.7%). 5.4% of foreign respondents responded partially dissatisfied. I cannot judge rated up to 39.6% of foreign respondents and 31.0% of domestic respondents. More domestic respondents (48%) than foreign (40.5%) were ***very satisfied with enough parking space in the Slovak Paradise***. This also applies to partially satisfied domestic respondents 28% and 20.7% foreign respondents. Overall, the respondents were satisfied with the services in the car park.

Determining visitors' satisfaction with catering services

What kind of catering facilities do you use?, respondents could give a number of options. The most frequently used catering facility was a restaurant. Up to 71.2% of foreign respondents and 66.0% of domestic respondents were eating in a restaurant. 68.5% of foreign respondents and 42.0% of domestic respondents used meals in the facility where they were staying. The buffet was attended by 27.0% of foreign and 25.0% of Slovaks. 10.0% of the Slovaks brought in, and therefore their own diet was sufficient. According to foreign (80.2%) and domestic respondents (73.0%), the supply of food and beverages in catering establishments was sufficient. 27.0% of domestic and 19.8% of foreign respondents were not satisfied with the offer. 67.0% of domestic respondents and 13.8% less foreign respondents (53.2%) were very satisfied with the quality of services in these facilities. The answer was partially satisfied by 32.0% of domestic and 36.0% of foreign respondents. Domestic (76.0%) and foreign respondents (79.3%) answered the question whether the quality of the provided catering services

corresponds to their price. Respondents according to which the quality of catering services did not correspond to their price were 24.0% domestic and 20.7% foreign.

Comparison of satisfaction of Slovak and foreign visitors

In this part of the thesis we analysed the established research hypotheses by means of Chi-square independence test. It is a statistical method used to determine whether there is a demonstrable significant relationship between two variables. We set out research hypotheses:

Research hypothesis 1

H1: We assume that foreign visitors prefer hotel accommodation and private visitors accommodation during their stay in the Slovak Paradise.

Part of the research hypothesis 1 is to find out the differences in the choice of accommodation between domestic and foreign visitors. From Chart 1 it is obvious that most foreign visitors (44.1%) prefer hotel accommodation and domestic visitors prefer camping accommodation (29%). The second most used facility of foreign respondents was camping (22.5%) and domestic respondents it was a hotel (28%). The same percentage (19%) of domestic respondents were accommodated in the cottage and used private accommodation.

Table 1: Chi-square independence test. Difference in choice of accommodation between domestic and foreign visitors

Null hypothesis	*$H1_0$: there is no difference in the choice of accommodation between domestic and foreign visitors.*
Alternative hypothesis	*$H1_A$: in the choice of accommodation there is a difference between domestic and foreign visitors.*
p-value	**p= 0,0502** > 0,05

(Source: own processing)

Given that the p-value is more than 0.05, we do not reject the null hypothesis; j. there is no significant difference in the choice of accommodation between domestic and foreign visitors. Our hypothesis has not been confirmed.

Research hypothesis 2

H2: We assume that foreign visitors consider transport accessibility to the Slovak Paradise National Park very good and that domestic visitors are not satisfied with the transport accessibility.

Up to 52.0% of domestic respondents and 49.5% of foreign respondents rated transport accessibility as very good. 26.1% of foreign respondents and 30.0% of domestic respondents gave a partially good response. It was partly assessed by foreign respondents (7.2%) and by domestic respondents (3.0%). Nevertheless, according to domestic and foreign visitors, the overall transport accessibility to the national park is very good. Given that the p-value is greater than 0.05, we do not reject the null hypothesis; j. there is no significant difference in the assessment of transport accessibility to the national park by domestic and foreign visitors. The hypothesis was not confirmed.

Table 2: Chi-square independence test. Traffic availability evaluation by Slovak and foreign visitors.

Null hypothesis	*$H1_0$: there is no difference in the accessibility assessment between domestic and foreign visitors.*
Alternative hypothesis	*$H1_A$: in the traffic accessibility assessment, there is a difference between domestic and foreign visitors.*
p-value	**p= 0,6915644** > 0,05

(Source: own processing)

Research hypothesis 3

H3: We assume that more foreign visitors than domestic visitors were satisfied with the quality of services in accommodation facilities.

Percentage 68.5% of foreign visitors and 66.0% of domestic visitors were very satisfied with the quality of accommodation services. Almost equally domestic and foreign respondents were partially satisfied with the quality of accommodation services (approx. 28%). There were very few dissatisfied foreign and Slovak respondents with the quality of accommodation services (foreign by about 2% more than domestic).

Table 3: Chi-square independence test. Quality assessment of services in accommodation establishments by Slovak and foreign visitors

Null hypothesis	*$H1_0$: there is no difference in the quality of service evaluation in accommodation facilities between domestic and foreign visitors.*
Alternative hypothesis	*$H1_A$: in the evaluation of quality in accommodation facilities there is a difference between domestic and foreign visitors.*
p-value	**p=0,393376175** > 0,05

(Source: own processing)

Since the p-value is greater than 0.05, we do not reject the null hypothesis, and the result is evaluated as not statistically significant, i. j. there is no significant difference in the quality of service in accommodation facilities by domestic and foreign visitors. The hypothesis was not confirmed.

Research hypothesis 4

H4: We assume that more foreign visitors than domestic visitors were very satisfied with the quality of the catering services.

Slovak respondents were very satisfied with the quality of services in catering establishments as much as 67.0% and foreign respondents 53.2%, i. 13.8% less than domestic visitors. 42.0% of domestic and 36.0% of foreign respondents responded in part to the answer. There were no dissatisfied respondents with the quality of services in catering facilities. Part of the research hypothesis 3 is to find out differences in the evaluation of the quality of services in accommodation facilities by domestic and foreign visitors.

Table 4: Chi-square independence test. Evaluation of the quality of services in the restaurant facilities by Slovak and foreign visitors

Null hypothesis	*$H1_0$: there is no difference in the quality of catering services between domestic and foreign visitors.*
Alternative hypothesis	*$H1_A$: in the evaluation of quality in catering establishments there is a difference between domestic and foreign visitors.*
p-value	**p= 0,853229517** > 0,05

(Source: own processing)

Since the p-value is greater than 0.05, we do not reject the null hypothesis, and the result is evaluated as statistically insignificant, i.e. j. there is no significant difference in the quality of catering services provided by domestic and foreign visitors. The hypothesis was not confirmed.

Discussion and conclusion

The high quality of service and guest´s satisfaction are important factors in the success not only in today's globalized tourism market and space, but also in small tourist regions. Given the current trend of customer orientation is the concept of quality in particular generated by guests. Examples of customer satisfaction surveys indicate that services as intangible quality indicators have a significantly greater impact on customer satisfaction than on tangible products. The main aim of the paper is a comparison of foreign and Slovak visitors contentment with accommodation, restaurant and transport services in the northern part of the National Park Slovak Paradise, which is a karst area with a great natural and landscape-aesthetic value and richly embossed relief.

The analysis was performed on the basis of personally collected data from the questionnaire survey conducted during the summer season from June to September 2017. We addressed the requested respondents personally in accommodation and restaurant facilities in the most famous tourist resorts of the northern part of the Slovak Paradise National Park - Podlesok, Čingov, Hrabušice and other nearby localities and car parks. The survey sample consisted of 211 respondents, of which 100 were Slovak and 111 foreign visitors. The questionnaire was developed in 6 language mutations. The results were evaluated using the mathematical-statistical method Chi-quadrate independence test. This testing has shown that all of our hypotheses have not been confirmed and that there is no difference between the satisfaction of slovak and foreign visitors in the northern part of the National Park Slovak Paradise with the services provided.

Both domestic and foreign visitors were very satisfied with the quality of accommodation services provided in this accommodation facility, with 68.5% of foreign respondents and 66.0% of domestic respondents providing this answer. Nearly the same number of domestic and foreign respondents (approximately 28%) were partially satisfied with the quality of accommodation services. There were very few dissatisfied respondents with the quality of accommodation services for both domestic and foreign respondents, while foreigners were less than 2% more dissatisfied than domestic respondents. Most respondents were satisfied with the accommodation services in their given accommodation facility. When asked if they would use the same accommodation again, up to 89.2% of foreign respondents would use the same accommodation and 10.8% did not. Domestic respondents say the same, with up to 92% staying in the same accommodation and only 8.0% choosing another accommodation.

Foreign visitors mainly used the car (73.9%) and the train (24.3%) as a means of transport to which they came to the Slovak Paradise. Likewise, the main means of transport for domestic visitors was the car, i.e. up to 78.0%, only 14% of respondents came by train and even 9.0% of respondents also used intercity bus services. Up to 49.5% of foreign respondents and 52.0% of domestic respondents rated the traffic accessibility as very good and 26.1% of foreign respondents and 30.0% of domestic respondents, respectively. It was partly assessed by foreign respondents (7.2%) and by domestic respondents (3.0%). Nevertheless, according to domestic and foreign visitors, transport accessibility to the Slovak Paradise National Park is good.

The most frequently used catering facility was a restaurant. Up to 71.2% of foreign respondents and 66.0% of domestic respondents were eating in a restaurant. 68.5% of foreign respondents and 42.0% of domestic respondents used meals in the facility where they were staying. The buffet was attended by 27.0% of foreign and domestic respondents (25.0%). 10.0% of the domestic respondents brought in, and therefore their own diet was sufficient.

According to foreign (80.2%) and domestic respondents (73.0%), the supply of food and beverages in catering establishments was sufficient. 27.0% of domestic and 19.8% of foreign respondents were not satisfied with the offer of food and drinks. 67.0% of domestic respondents and 13.8% of foreign respondents were very satisfied with the quality of services in canteens (53.2%). 42.0% of domestic and 36.0% of foreign respondents responded in part to the answer. Both domestic and foreign visitors were satisfied with the quality of services in the catering facilities. Domestic (76.0%) and foreign respondents (79.3%) answered the question whether the quality of the provided catering services corresponds to their price. Respondents according to which the quality of catering services did not correspond to their price were 24.0% domestic and 20.7% foreign.

We found out from our survey that both Slovak and foreign visitors are equally satisfied or dissatisfied with the provision of accommodation, restaurant and transport services in the Slovak Paradise, which they used during their stay. Most visitors, however, were satisfied.

Abstract

The aim of each country must be to care for the development of its territory, but also for the development of citizens living there. The development of the territory as a whole is influenced by a number of aspects, which can include natural, human, financial, infrastructure, but also security aspects. Uneven development of individual aspects may result in regional disparities in the country, which cause uneven development of regions and decrease of competitiveness of regions, which may lead to lower living standards of inhabitants in less developed regions. The role of the state is to support the least developed regions and reduce regional disparities through the implementation of strategy documents and fulfilling action plans. The paper deals with the analysis of the development of selected regional disparities and the determination of the main factors of regional development. The aim of the paper is to set priorities and goals of development strategies of individual regions.

Keywords: Regional Disparities, Regional Development, Support, Economic Growth, Standard of Living.

Introduction

The main task of each territorial unit is to take care of the development of the territory and the development of the population. As a separate territorial unit can be considered not only the city, the district, the region, but also the state as a whole. The regional policy of a modern democratic state must be based on reducing regional disparities through various measures stimulating the least developed regions. The regional policy of the Slovak Republic is based on this principle, which aims to balance regional disparities, increase the competitiveness of regions, increase the standard of living of the inhabitants of the least developed regions and thus contribute to the development of society as a whole.

Regional Development Policy

Regional policy should be one of the priority areas of each state. As Čadil (2010) writes, regional policy means a coordinated set of activities and practices of the competent authorities and organizations at national, regional and local level that contribute to the economic development, social development and territorial development of the regions. According to Oulehlová et al (2016), regional development can be understood as a set of social, economic, cultural and environmental processes and relations that take place in a region and which contribute to increasing its competitiveness, sustainable economic development, social development and territorial development and balancing economic and social disparities among regions. For this purpose, it is also necessary to

define the term region itself, which can be defined as a territorial unit defined according to The Nomenclature of Territorial Units for Statistics (NUTS).

The NUTS is a hierarchical division of the country into territorial units, which was introduced by Eurostat for the European Union member states in 1988. This classification is currently regulated by the Regulation of the European Parliament and of the Council no. 1059/2003. The NUTS consist of at least three regional levels - NUTS 1, NUTS 2 and NUTS 3, aiming to provide comparable regional statistics data within the European Statistical System. As Šoltés et al (2019) write, in the Slovak Republic this classification is determined by the Decree of the Statistical Office of the Slovak Republic no. 438/2004 Coll. The NUTS classification in Slovakia consists of three regional and two local levels as shown in figure 1.

Fig. 1: NUTS statistical regions of Slovakia

According to Act no. 539/2008 Coll. on support for regional development, the main objective of promoting regional development is:

- to eliminate or reduce undesirable disparities in the level of economic development, social development and regional development of the regions and to ensure the sustainable development of regions,
- to enhance economic performance, competitiveness of regions and development of innovation in regions while ensuring sustainable development,
- to increase employment and living standards of the population in the regions while ensuring sustainable development.

The main document of regional development support in Slovakia is the National Strategy of Regional Development of the Slovak Republic (National Strategy). Štofková and Štofková (2011) define the National Strategy as a strategic and conceptual document defining a comprehensive and systemic approach of the state to regional development of the Slovak Republic. Priority is based on the analytical framework of economic, social, environmental and territorial development needs of the state. Čorejová and Štofková (2007) writes, National Strategy defines a long-term vision of support of regional development of the Slovak Republic, strategic goals and priority areas, as well as concrete measures and activities that will need to be undertaken to ensure sustainable regional development

based on increasing economic performance and the competitiveness of the economy, including social stability and social cohesion. According to Výrostová (2010), the role of the National Strategy for the NUTS 3 level region is to:

- identify the internal potential of the region and specify its potential competitiveness within the Slovakia,
- to characterize its specific aspects and the resulting competitive advantages within the Slovakia as well as in the European context,
- identify its development strategic objectives and priorities.

Another generally binding legal regulation dealing with the support of the least developed regions is Act no. 336/2015 Coll. on support for least developed districts, which governs the conditions, system and forms of granting support to least developed districts. For the purposes of this Act, the least developed district is considered to be a district that is included in the list of least developed districts. As Repková Štofková et al (2018) write, a district is included in the list of least developed districts if the registered unemployment rate, calculated from the available number of job seekers reported by the Central Office of Labour, Social Affairs and Family, has been higher in the preceding twelve consecutive calendar quarters for at least nine calendar quarters as 1.5 times the average registered unemployment rate in Slovakia for the same period and at the same time reached at least 8%. Figure 2 shows the development of the number of least developed districts per quarter.

Fig. 2: Number of least developed regions in Slovakia

Figure 3 provides a view of a map of the Slovak Republic in which the pink color represents the geographical distribution of the least developed districts.

Fig. 3: Map of Slovakia with the highlighted least developed districts

The only criterion for inclusion of districts in the list of least developed districts depends on the development of the unemployment rate. Figure 4 shows the development of the unemployment rate of individual districts in the third quarter of individual years.

Fig. 4: Development of unemployment rate in least developed districts

Regional development is according to Act No. 539/2008 Coll. on regional development, financed by:

- the state budget, including funds from ministries' budget chapters;
- state special-purpose funds;
- budgets of higher territorial units,
- municipal budgets,
- financial resources natural persons,
- financial resources of legal entities,
- loans and contributions from international organizations;
- funds resulting from international grant agreements concluded between Slovakia and other states,
- other financial resources, if specified in a special legal regulation.

Hudáková et al (2018) provide, that in order to achieve the objectives of the National Strategy, it is necessary to provide financial resources from the state budget according to the following aspects:

- national resources should help to implement the National Strategy,
- domestic resources must be directed to areas not supported by the EU,
- by national resources help drawing of development resources,
- national resources should help realize the professional, local and territorial development policy tasks.

So far, almost EUR 1.8 billion has been earmarked for the least developed regions. This funds should help create more than 23 000 new jobs. Figure 5 shows the average amount of money spent per creation one job in each district.

Fig. 5: Money spent per creation one job in each district

Creating one job position will require an investment of over € 90,000 on average. According to NUTS, districts are assign among LAU 1 regions in Slovakia. These districts can be assign to a higher level - NUTS 3 level regions. Table 1 gives an overview of the financial assistance to the least developed districts assign to the NUTS 3 level.

Table 1: Support of the least developed regions at NUTS 3 level

NUTS 3	Total number of districts	Number of least developed districts	Estimated budget	Planned number of created jobs	Expenditure on the created job
Banska Bystrica region	13	5	538 908 000 €	6 412	84 047 €
Presov region	13	9	709 539 483 €	10 183	69 679 €
Kosice region	11	6	510 934 100 €	5 342	95 645 €

Slovakia has a total 8 regions of NUTS 3 level. However, all the least developed districts are located in only three such regions - Banska Bystrica region, Presov region and Kosice region. Most of the least developed districts in terms of the total number of districts are in the Presov region. These are 9 districts which should be supported from the state budget by a subsidy for regional development of more than 700 mils. €. This subsidy should create more than 10 000 jobs, which means that the creation of one job should cost almost 70 000 €. In the Kosice region, there are 6 least developed districts form the total number of 11 districts. The state should support the creation of more than 5,000 new jobs with a subsidy of more than 500 mils. €, which means that the creation of one job will cost approximately € 95,000.

Out of 13 districts, the 5 least developed districts are in the Banska Bystrica region. The state plans to support these least developed districts with funding of approximately 538 mils. €. These investments should create almost 6,500 new jobs. Thus, the price of a newly created job will reach almost € 58,000.

Analysis of NUTS level 3 regions with least developed districts

The Banska Bystrica region is a rural, slowly growing, more stagnant, low-level readiness for innovation, an average attractive and low-competitive region of Slovakia, outside the center of EU development activities and with the possibility of cross-border cooperation with Hungary.

Presov region is a mostly rural, slowly converging, industrial, slowly growing region, a more stagnant region of Slovakia, with a low degree of readiness for innovation, on average attractive and competitive, developing outside the center of EU development activities and with the possibility of cross-border cooperation with Poland and Ukraine.

The Kosice region is a rural, slow-growing, more stagnant region of Slovakia, industrial, with an adequate degree of readiness for innovation, on average attractive and competitive, but developing and converging outside the center of EU development activities and with the possibility of cross-border cooperation with the Hungary and Ukraine.

Priorities for Regional Development Support

As all the least developed districts belong to only three NUTS 3 level regions, regional development measures need to be taken, particularly for this three regions. The following proposed measures for individual regions should bring the arrival of new investors, increase the competitiveness of regions, create new jobs, increase the standard of living of the population and thus reduce regional disparities.

Within the framework of regional development, the Banska Bystrica region should focus mainly on:

- increasing employment, particularly in rural areas and new technologies,
- increasing the use of domestic resources,
- better quality of the environment,
- modernized transport infrastructure and improved road quality,
- improving transport accessibility by public passenger transport,
- Improving performance in agriculture and forestry, woodworking and logging,
- development of sustainable tourism with the aim of increasing the competitiveness of the region.

In order to support regional development, the Presov region should invest funds in:

- increasing the use of regional resources,
- increasing regional employment, export performance in new markets and competitiveness,
- improving the quality of the environment and increasing efficiency in the use of natural resources,
- modernized transport infrastructure, higher quality roads of local importance,
- improving transport accessibility by public passenger transport,
- creating new jobs in rural areas and rural development, increasing the share of organic farming,
- establishing new links among science, research, innovation, business community and educational institutions,
- improving the quality of human resources and improving social cohesion.

Within the framework of regional development, the Kosice region should focus on:

- economic growth, increasing export performance and competitiveness of the economy, growth of employment,
- increasing the educational structure of human resources,
- extension of research and innovation infrastructure,
- exploiting the innovative potential for regional GDP and productivity growth,
- strengthening the links between science, research, innovation, business and educational institutions,
- Introduction of new ICT applications for companies grouped in IT Valley
- rural development and rural employment through diversification of production, support for agriculture, processing of local products and their distribution,
- development of small and medium-sized enterprises and strengthening of their competitiveness, development of subcontracting networks,
- reducing long-term unemployment and social exclusion,
- increasing the use of renewable energy sources,
- improving transport accessibility by public passenger transport,
- modernized transport infrastructure,
- reducing the level of environmental pollution,
- increasing the quality of life by creating suitable conditions for the availability of quality education, suitable and sufficiently financially appreciated employment, quality social and health care, equal opportunities and leisure activities.

Conclusion

Supporting the least developed regions to reduce regional disparities is one of the key tasks of each state. The development of society can only be achieved if the standard of living of all inhabitants of the country is the same and there are no big social, economic, educational or other differences in society. Within the framework of regional policy, the Slovak Republic seeks to support the least developed regions through subsidies given to create new jobs. According to Act No. 336/2015 Coll. on the promotion of the least developed regions, a list of the least developed regions has been established. Currently, there are 20 least developed districts of LAU 1 level in Slovakia, all of which belong to three NUTS 3 level regions. Each such district has an approved action plan which sets out precise measures to promote employment in that district. The costs of implementing the measures related to the creation of new jobs are covered by the state budget in the form of subsidies. The total amount of subsidies for the 20 least developed districts reached almost 1.8 billion. €. Overall, more than 23 000 new jobs should be created in this way. However, the three NUTS 3 regions themselves, to which all 20 districts belong, should also support regional development. As each such region is specific, there are also specific measures that these regions should implement in their regional policy.

Abstract

Village development that uses community participation needs the commitment of all stakeholders. The process is a complicated matter and requires innovative strategies. Previously, the Indonesian government believed that improving the well-being of people through financial capability is the primary indicator to help people get a better quality of life. In contrast, the economic factor as a single approach leads to increasing inequality in the village. Financial aspect as single domain approach could risk the environment because people tend to achieve economic prosperity. However, the development process in Panggungharjo Village showed a different situation. The village government used multitude aspect to develop their area. Environmental sustainability approach was the main factor in changing socio-cultural and economic aspects in Panggungharjo Village.

This study used a qualitative approach, by collecting data through in-depth interviews, focus group discussions, observation and literature studies. Total informants were 18 informants, using purposive and snowball sampling. The finding showed that empowerment through environmental domain became a catalyst toward change in socio-cultural and economic aspects. Starting with waste management, Panggungharjo Village could overcome their unmet needs. The existence of waste management enabling collaboration of stakeholders in some issues: environmental, education, health, spiritual and economical for the wellbeing of people in the village.

Keywords: Environmental Factors, Social and Cultural Empowerment, Economic Empowerment, Government.

Introduction

Enhancing the quality of life of people living in rural areas is the primary goal of village development. The process of poverty reduction in rural areas requires a community's participation. Furthermore, the commitment of the stakeholders responsible for improving essential services for needy people is notable. To accelerate poverty alleviation, the government need to use the development scheme. Social security, as one of the development scheme, has become the central social policy. Social security is crucial to fulfilling the human rights of all citizens, every human being, and disadvantaged population should enjoy for a life in health and dignity, social security must be a national system so no one leave behind (Symonides, 2003; Hujo, 2017; ILO, 2019). Those benefits are essential to help needy people and prevent unwanted conditions, and this is especially true in the context of Indonesia, which has many hazardous areas that had a catastrophic event, such as landslide, flood, and volcano eruption (Wibowo et al., 2017).

Social security has some domains among others is economic empowerment scheme such MSME and has great potential for promoting rural women's economic empowerment, and reducing gender inequalities

(Campos, 2015; Setyonaluri, 2016). Additionally, a social development programme such social security and empowerment should use a sustainable approach. The implementation of economic empowerment scheme does not use 'profit-making' as the primary goal. The process of uplifting needy people also considers environmental factors. Thus, improving the well-being of people through economic aspects is not the only means. This perspective leads to the development of the village without exploitation of the environment to achieve economic prosperity (Hall and Midgley, 2012).

Panggungharjo Village, located in Central Java, Indonesia, is one of the villages that use social protection development through a comprehensive scheme. The village does not only provide social assistance and social insurance in providing social protection for its citizens. Panggungharjo Village also organizes community empowerment and protection for children where all the schemes are implemented based on economic empowerment activities through waste management. Starting from the change in society about irregular waste management, causing an increase in the volume of waste and polluting the cleanliness of the village environment. In 2014, garbage in the village of Panggungharjo received 55 m3 or the equivalent of 6 trucks each and received 92% of household waste. Rapid population growth and urbanization make waste production increase due to continuous welfare improvement. The waste management should consider various dimensions, such as from technical, economic, and social aspects on a sustainability basis. Panggungharjo village managed their households' waste through community organizing for fundraising (Lay, 2017).

There have been many studies on Desa Panggungharjo. However, previous studies have only identified the various potentials of the village. They described the possibility of local institutions, local culture, and the protection of children separately while this study examines multiple village potentials through the concept of empowerment in social protection schemes that emphasise sustainable development (Wulandari, 2008; Hasyim and Salam, 2015; Sudrajat, Wulandari and Wijayanti, 2015; Pratama and Pambudi, 2017; Edi and Wardhani, 2019).

Previous research examines sustainable community development and sustainable socio-economy development. One of those research focuses on the unwanted relationship of businesses matters with social and environmental development (Latief, 2016). The other discusses marginal farm households (Cole et al., 2019; Aeria 2016). To comprehend the importance of sustainable development, Oroma and Ali (2018) strengthen the existence of indigenous knowledge by using technology. Through technology, traditional wisdom from the past would help society in coping with their problems and the environment. For the social aspect, Okubena (2016) and Gupta and Basak (2016) discussed empowerment. However, they only focused on the economic domain.

There was a study that one discussed economic empowerment that also considering sustainability aspect over Pos Pemberdayaan Keluarga (Family empowerment post or Posdaya). The result showed that economic empowerment at Posdaya also considers environment aspect as one of a group-level indicator. Among other farmer group activities, the activity of woman farmers and farming cultivation activities (Muljono, Purwono, and Cahyadi, 2019) whereas Doorgapersad (2014) studied development assessment tool called Gender-based economic empowerment for sustainable development (Doorgapersad, 2014). However, the previous study did not come up with the descriptive analysis of sustainable development that considers the participation of all elements in society, such as local government, private sector, community, vulnerable people, and also a traditional system in the neighbourhood as a complex system.

As a complex system, we used a system theory to analyse our findings in Panggungharjo village. The application system theory has been in various scientific papers. One of the discussions related to international relations is how the relationship between the two countries using the central-peripheral Theoretical Analysis (Hanh, 2019). There are also other scientific papers discussing the critical part of the system theory that reveals the various actors involved in the organisational environment (Berit, Berg Tjorhom, 2019; Soni 2017).

The previous scientific paper discussed the system theory to explain the environment, especially waste management (Afolabi et al., 2018; Ebenezer 2019; Chhay et al., 2018). They used system theory to analyse the problem of solid waste management. Solid waste problems become crucial problems in developing countries, including in Africa and China. System theory could explain the problem comprehensively. Besides, system theory helped to simplify data among the complexities in the environment. This research also uses system theory to define sustainable development that involves all elements in a complex society, especially at Panggungharjo Village, Indonesia, which successes in managing their waste to be a valuable matter for social Protection in the local community.

Based on our research in Panggungharjo Village, environmental factor did not become a subordinate factor in development. Through Strengthening Environmental Factors, social development in the village became sustainable and facilitated the other aspect evolved. Furthermore, it answers the question of "can 'traditional system' in society reconciled with modern ideas of citizenship?" (Latief, 2016). Within comprehensive strategies, Panggungharjo Village showed that social development in a rural area is possible for enhancing the quality of life. While previous literature has stated that the economic aspect was the essential matter, this study showed that empowerment through environmental issues moved as a catalyst for empowerment in socio-cultural and economic aspects to encourage sustainable development.

Methods

The key informants were the chief of Panggungharjo Village; the Committee of BUMDesa (Badan Usaha Milik Desa or Village-Owned Enterprises) (three informants), KUPAS (Kelompok Usaha Pengelolaan Sampah or (Waste Management Enterprise Group) Bapel JPS (Badan Pelaksana Jaring Pengaman Sosial or executing agency of Social Safety Net) (two informants), and PAUD (Pendidikan Anak Usia Dini or Early Childhood Education) (two informants). We conducted Focus Group Discussion by involving the villagers who get benefits form waste management programmed through KUPAS (six informants). Moreover, we also included the members and beneficiaries of social security (five informants). In this study, we also conducted a non-systematic observation. We chose the method because non-systematic observation is an approach to study and help in developing a hypothesis.

Moreover, a non-systematic observation also helped us to learn the structure of findings. Understanding human behavior and environment need time (Farkas & Tharp, 1980). For three months, the non-systematic observation helped to develop the model of waste management in Panggungharjo Village.

In analyzing the data, we used steps of qualitative data analysis from Neuman (2014). The levels were sort and classify, open code, axial code, selective code, then interpret and elaborate. Before condensing the themes of our data, we sort and organize the data based on our purposes of research. Objectives of the study were examining the implementation of socio-cultural and economic empowerment at Panggungharjo Village. Then we step up to the first step of coding the data: open code. In open coding step, we got some of the main points of the data that became new themes as the first findings. Then, in the second steps, we examine the connection between the themes for developing the model of waste management in Panggungharjo Village. At the third phase, we check the data based on the themes at the model of waste management in Panggungharjo Village. Based on the selective code, we examine the trustworthiness of our findings. At the last step of our analysis method, we interpret and elaborate the result based on the system theory and the literature.

Results and Discussion

As a basic need, the people in Panggungharjo Village have the right to an education. To fulfil their essential obligations, the people in Panggungharjo Village developed PAUD (Pendidikan Anak Usia Dini or education for early childhood). The villagers used the social entrepreneur system from their waste management system. The Village-Owned Enterprise (BUMDESA) is the village institution responsible

for maintaining the waste management system in the village. As a valuable source, the profit of BUMDESA through the waste management system was used for many social security systems in many domains through economic and environmental aspects, that is, not only education but also health, social issues and culture.

Based on system theory, the waste management system in Panggungharjo Village has described a complex system. So, the actors involved are in various layers. So the layers in the community system are indeed a unified whole. The one part and the other are related to each other. Development of the environment must still depart from the development of individual aspects. Awareness of protecting the environment is part of the psychological and emotional issues. Where it develops based on the 'drive' which comes from the spiritual-religious aspect (Fitzpatrick 2005; Healy 2005; Payne 1991; Ritzer and Goodman, 2008)

Environmental Sustainability Approach Was The Main Factor In Changing Economic Aspects: Basic Services For Fulfilling Basic Needs

Based on the profit of the waste management system, the people in Pangungharjo village developed many programmes. In addition to PAUD, BUMDESA Panggung Lestari had another application called Smart Card. Implemented in 2013, Smart Card was supposed to help children in the village earn a higher education. Another programme was initiated by the government for villagers to increase their level of learning called ‘Satu Rumah Satu Sarjana’ (one house one scholar). ‘Satu Rumah Satu Sarjana’ provided support for children from needy families. In other words, with access to the social insurance scheme, disadvantaged families could have an opportunity to offer more years of education for their children.

In general, the waste management system subsidized social development programmes in the village. This is because the waste is managed and then sold. Profit from waste management is what can provide subsidies to the village government. By BUMDESA Panggung Lestari, the waste management system’s benefits were distributed to Anggaran Pendapatan dan Belanja Desa or Domestic Revenue at Village (APBDesa). APBDesa is APBDesa shared the donation with the local Social Safety Net who has a Smart Card program. Villagers could use the Smart Card for various purposes. The purposes were, for example, Kartu Pintar (Smart Card) for the education domain, Maternal and Child Health (MCH), and Kartu Sehat (Health Card) as in figure 2:

Figure 1: Waste management As Catalyst Toward Change in Socio-cultural and Economic Aspects

This research confirms the system theory in understanding waste management in Desa Panggungharjo. In developing the social welfare delivery system, Desa Panggungharjo shows that policy makers need to pay attention to all aspects of human beings especially disadvantage people or community. Fitzpatrick (2005) also stated that in the development of social policy always involves aspects of psychology, emotion and body. These three individual aspects are not only present in villagers. The policymaker itself has three elements that determine their perceptions, beliefs and values in developing where good welfare for villagers. In connection with the findings in the Panggungharjo village itself, "good welfare" is defined as a regional system that has social protection, economic empowerment, and protection for children. The social policy provides benefits for all service recipients. The interests do not only involve the body (biological) and psychological aspects of villagers. Expediency also includes the emotional issue by developing feelings of the beneficiaries. Thus, behaviours that support the implementation of empowerment activities in Desa Panggungharjo become a habit.

The local government endeavoured to reduce poverty in Panggungharjo Village. The primary means to achieve the vision was providing a better education for the villagers. The local government in Panggungharjo Village supported the basic notion that education must start in early childhood. PAUD also called PAUD 'Among Siwi', was implemented. By using the profit from waste management in the village, the Panggungharjo Village government helped fund early education for children. The Panggungharjo Village government operated the waste management in their area. The potential of smart cities in remediating environmental problems in general and waste management (Esmaeilian 2018). Individual concern on the environment, especially the waste, happened for cultural factor (Nash, Whitmarsh, Capstick, Gouveia, & Araújo, 2019). The culture became the central point in managing the waste. The awareness of villagers in Panggungharjo Village started from small matters. Every individual

care about the cleanliness at their home. They also became aware of the cleanliness at the public space. The "little matter" of altruistic behaviour was "valuable matter". It was even precious for the ability to finance PAUD Among Siwi.

The children at Panggungharjo village could get an early education. The institution responsible for administering waste management in the village was the village apparatus and employees of BUMDESA Panggung Lestari. The waste management system was under one of the business units of BUMDESA Panggung Lestari, namely, KUPAS (Waste Management Enterprise Group). The waste management system included organic waste and nonorganic waste. BUMDESA Panggung Lestari collected nonorganic waste as a valuable asset to earn a profit. They received dry waste (e.g., bottles and glass materials) three times per week: Monday, Wednesday and Friday. As mentioned previously, the surplus from those wastes was for the children who qualified for PAUD.

The waste management system in Panggungharjo Village, namely KUPAS, had a slogan: 'bersodaqoh'. 'Bersodaqoh' means 'be genuine in giving to the others'. Based on sincere behaviour, the people who performed 'bersodaqoh' were said to receive a precious return from God in future life. Based on the trademark of KUPAS, villagers were encouraged to put their waste in the appropriate place. Villagers had to sort their waste based on the type of wastes: organic and nonorganic waste. Their positive behaviour in separating the wastes became a behaviour of 'bersodaqoh'. Categorising the waste in advance minimised the operational costs of waste processing. Thus, the contributions to Bapel JPS were from the margin in the operation cost. In KUPAS, the needy people must be a member, so that they could get reliefs in paying social security contributions.

The development of the Village Revenues and Expenditures Budget or APBDesa received a real contribution from the spiritual-religious aspect. As stated by Payne (2005), the spiritual point of religion is actual. It is unity in the welfare delivery system. Without any spiritual-religious elements, the development of the organisation of social welfare is empty. The spiritual aspect is indeed individual. Its existence again explains that the individual part has a vital role in penetrating a broader layer: the development of social policy at the local level.

In complex systems (Healy, 2005), the description of the person in the environment becomes too simple to describe the problems and needs of the community. The findings in this study regarding Community Empowerment through the Sustainable Approach showed that every aspect of society crosses domain boundaries because of the strengths that exist in individual systems, communities and even central government support. With the collaboration of forces from various layers, the right of people to get a better education.

Waste Management Overcome Their Unmet Needs of The Villagers

Empowerment through environmental factor became a catalyst toward change in economic aspects of the stakeholders collaborates in some issues, not only environmental matters. The stakeholders also have to give attention to many elements, exceptionally fundamental aspect such as education and health. However, the findings in Panggungharjo Village showed that environmental factor became a crucial matter for the wellbeing of people in the village. The existence of KUPAS contributes financially to APBDesa (Anggaran Pendapatan dan Belanja Desa or Domestic Revenue at The Village.

APBDesa is village regulations that contain sources of income and allocation of village expenditure within one year. Village budget consists of village income, village expenditure and financing. One of source APBDesa is from The Village Funds Programme (Programme Dana Desa). Dana Desa supported many unmet needs in the rural area. Most notably, the social security function that became the responsibility of local government in Panggungharjo Village. The number of village funds was Rp.

800.000.000,00 to Rp. 1.000.000,00. APBDesa in the Panggungharjo Village government had a budget allocation to provide social assistance for the poor, unhealthy, and orphans, including unexpected expenses. However, the unmet needs were higher than the resources.

Environmental Sustainability Approach was The Main Factor in Changing Socio-Cultural Aspects

The environmental factor will become a catalyst toward change in socio-cultural if the stakeholders at the village collaborate in many aspects. The question is, why the stakeholders in Panggungharjo Village could make a collaboration to achieve wellbeing for people in Panggungharjo Village? The study showed that the existence of sustainable waste management in the village attract local governments, private sectors, communities, needy people to participate. They participated in every stride, including the first phase of community organisation: the assessment phase.

Every element in the village (i.e. local governments, private sectors, communities, needy people) participated in assessing their needs in social security. Regarding the provision of basic needs, some aspects had to be considerations: how to improve the provision of education, public health (social and health services for high-risk pregnant women and drop-out children from school), and services for senior citizens people with disabilities. Through empowering activities that used the waste management system in the village, local governments, communities and private sectors formulated their needs. The stakeholders involved were all villagers who met informal meetings. Panggungharjo Village also held village development deliberations. Pos Pelayanan Terpadu (Integrated Service Post) as an unofficial form also became one of the communication channels. Moreover, the villagers had Kampung Dolanan, nonbureaucratic activist institutions run by activists and people within the disability community.

Even though there were many stakeholders, the village government had a dominant role in identifying the needs of the villagers. The stakeholders in the village held Dukuh meeting. The agendas always led citizens to propose programmes that pay attention to humanism. The needs assessment intended to form an institution that provided social services for citizens. This institution was for all people: orphans, neglected elderly, malnourished children, high-risk pregnant women, disabled and drop out children from school.

Social planning is a process that involves the community to plan, coordinate, and fulfil social needs that use services and resources to the fullest (Ife, 2013). Based on research in Panggungharjo Village, including environmental aspects, could provide a positive effect. Panggungharjo Village was a good example. The programmed of the waste management system (KUPAS) could give villagers many social services. Those social services deliver some benefits that improved the quality of education and health for the villagers.

Implementation of village development in Panggungharjo Village used a locality development model. The villagers overcame their limited resources. The change started with the commitment to care for their environment, and as a result, the villagers could develop their social safety nets. Bapel JPS also undertook this effort, and they mobilized all the resources in the community. Moreover, Bapel JPS coordinated with stakeholders.

The basic principle of Bapel JPS membership was critical in nurturing the development of the village. The policy was simple: inclusivity. Thus, all villagers in Panggungharjo could participate. The beneficiaries were vulnerable groups such as women, children, elderly individuals and people with disabilities. Bapel JPS Panggungharjo Village became a vital tool of the village government to deliver social services to vulnerable people. The service delivery system that uses environmental caring as the

necessary activity makes the villagers' waste as a valuable asset. By using the waste management system, the local government could fulfill a villager's need for improved health, more years of education and healthier food.

Overall, participation is a fundamental principle in the development of empowerment. The sustainability of the program can penetrate the various layers that exist in the community system. It shows that the complexity in the Village of Panggungharjo does not break away from the "small" things that are in the individual aspect.

Waste Management Enabling and Reinforcing Stakeholders Collaboration

The state had an obligation to provide social security services. However, citizens could not always rely on what the state could provide. Citizens also had a notable role in social development. The purpose of the citizen as a community member and stakeholder in rural areas could prevail, such as in Panggungharjo Village. In this village, we observed a collaboration between stakeholders in social development: the village government, community and stakeholders. The collaborative governance in Panggungharjo Village strengthened the community welfare structure (Ife 2013, Midgley 2014; Payne 2005; Sunit 2014). The strength was within the government, who had the initiative to design a local institutional system that provided social security services: the Social Safety Net (Bapel JPS).

The local government realized the potential of the village. The promising capital consisted of many aspects of society: economic, physical, human and social. Next, the government had the initiative to strengthen those capitals to support social security for the villagers. Thus, in the future, the villagers could have a better quality of life.

Encouraged by Village Law No. 6 of 2014, strong beliefs began to develop regarding the local social security programme. The local government in Panggungharjo Village's actions corrected the state's applications that implemented the development of rural areas. Their innovation program flourished compared with the current model of development, which only focused on the concepts of local wisdom, self-reliance, democracy, participation, social capital, authority, village funds, and empowerment (Eko 2014; Zamroni 2016).

As an independent institution, Bapel JPS was entirely responsible for their financial needs. Although Panggungharjo Village had a lot of financial resources from the Village Funds Programme, it could not accommodate the number of people who qualified for social security. For that reason, Panggunghajo needed other sources to fulfill the needs of villagers. Another education insurance scheme was available for wealthy individuals in Panggingharjo Village: the premiums of education insurance, which were paid by Bapel JPS. The implementation of the programme used cooperation with the private sector, namely, Bumi Putera Education Insurance.

This education programme also assisted students that did not accept insurance. They could benefit from the plan occasionally, namely, a cash scholarship. The source of funding was APBDesa. The programme assisted by paying the school fees for needy people. The Head of the neighborhood, Head of Dusun and Team from Bapel JPS had to verify the beneficiaries. The beneficiaries received the funds from their school. The parents and students did not receive funds directly from Bapel JPS.

Bapel JPS provided additional assistance for the students. The students could obtain extra lessons from the Smartgama course. The students who could qualify for the services were in sixth grade (elementary school to junior high school), ninth grade (junior high school to high school/vocational high school), and twelfth grade (high school/vocational to university).

Other donation schemes were available, such as donation from community members. They could give it directly to the Bapel JPS office. The contribution was cash, and the goal was for specific purposes. The ultimate goals were for helping successful people in the village, but they unfortunate. Therefore, the needy people have to get some help to uplift their quality of life.

Social security program in Panggungharjo Village became a successful programme for communicating the social safety net programme regularly. Annunciated application was part of the organization in managing an open system. Furthermore, besides disseminating social security programme, local government in Panggungharjo Village and Bapel JPS reporting their agenda regularly to the society.

The Bapel JPS programme also accepted CSR funds. In 2018, Bapel JPS was receiving CSR funds from the Numani Food Stall and BUMDESA Panggung Lestari. Warung Makan Numani donated Rp. 1.000.000,00. every month. BUMDESA, based on the Articles of Association and the House Budget, allocated 5% of net income for social activities. Other funders provided health care. Healthy House (Rumah Sehat) National Zakat Institution (Baznas), Medical Center and Maternity Ward and Weni Midwife Clinic were some of the donors.

Notably, the providers of education services were not only Bumiputera. Leather Academy of Yogyakarta and the College of Economics AL Muksin also participated. Moreover, Bapel JPS also worked with Rumah Zakat, and they collaborated as business partners to become an accountable organisation. The village government was responsible for being the main guarantor in the process of collaboration.

Donations from Stakeholders and the Corporate Social Responsibility (CSR) Fund show that substantial aspects at the individual and community level will be a firm root for the process of social intervention to develop. This determination is inseparable from meeting the basic needs of individuals and communities so that the system in the Panggungharjo Village area is organic. As stated by Ritzer & Goodman (2008), organic systems tend to be open to various surrounding environments. Thus, the village of Panggungharjo becomes freer to receive feedback and develop itself (negentropic).

Conclusion

Empowerment through environmental aspect in Panggungharjo Village played the role of catalyst. The role of the catalyst was successful in changing socio-cultural and economic empowerment. Through the waste management programme, Through waste management, the villagers received some benefits. The children in the village could access a better early childhood education. Early childhood education will give many advantages for the villagers in the future.

Previously, The social security system from the government did not fulfil all the basic needs of its citizens. A waste management system, namely, KUPAS, became the leading provider of financial support that enabled the local government to overcome obstacles. The contribution of profit-making trough waste management system in the village became necessary to support in developing Bapel JPS. Waste management also helped the development of Bapel JPS and became essential services for fulfilling basic needs. The Bapel JPS itself gives many impacts on some programme. The local innovation is sustainable and becomes community-own assets. Moreover, the villagers get assistance from local sources, such as almsgiving and funder as individual and other formal organisation.

The programmes still arise and deliver much assistance to the whole society in Panggungharjo Village. If the stakeholders could make a good collaboration in many aspects, such as environmental, education, health, spiritual and economical, the villagers would have a better quality of life in the future.

Determinants of Collecting Voluntary Savings for Retirement: Evidence from Poland

Małgorzata SOLARZ

Wroclaw University of Economics and Business, Poland
malgorzata.solarz@ue.wroc.pl

Abstract

According to OECD forecasts for Poland, the retirement benefits paid out from the compulsory part of the universal pension system will be very low (replacement rate at approx. 30% in 2060). Meanwhile, only about 12% of Poles make voluntary savings for future retirement. The purpose of the article is to identify the factors which determine making voluntary retirement savings. The applied research methods included: critical analysis of the subject literature, diagnostic survey and logistic regression model. The data necessary to conduct the analysis were collected in the course of the nationwide survey studies conducted in September 2019 using the Computer-Assisted Web Interview method. The obtained results show that making additional retirement savings is more probable among people with a monthly net income equal to or higher than the national average, who have taken appropriate measures connected with retirement planning and their retirement awareness presents average or very high level.

Keywords: Retirement Savings, Financial Literacy, Pension, Retirement Planning, Pension System

Introduction

The disturbing forecasts regarding the financial situation of future pensioners in Poland result, e.g. from the unfavourable demographic situation illustrated by: one of the lowest fertility rates in Europe and the rapid pace of population aging. Retirement benefits paid out from the compulsory part of the universal pension system will be low, their amounts will not meet all the needs of retirement age population. It was confirmed by OECD (2017) or EU (2018) forecasts indicating the expected large decline in replacement rates from the base part of the universal pension system. According to various estimates, the respective ratio will reach the level of approx. 30% in 2060. Poland was ranked with one of the worst results among the OECD countries.

The risk of retirement exclusion, i.e. either complete or partial deprivation of financial resources affecting the retirement age population, is becoming more realistic (Kondzielnik and Majka 2019). Such exclusion can be caused by endogenous and exogenous factors. The latter are beyond an individual's control, whereas the endogenous ones include reluctant attitudes towards accumulating additional retirement savings within the framework of the pension system voluntary part. This problem scale and possible consequences in the socio-economic sphere make it worth analysing, diagnosing, determining its reasons and investigating solutions.

In the context of the above discourse, the primary purpose of the article was formulated, i.e. identifying factors determining the accumulation of voluntary retirement savings. The realisation of the aforementioned purpose was based on providing answers to the below research questions:

- What is percentage of Poles who accumulate additional retirement savings?
- How many respondents have ever tried to find out/calculate how much capital they should accumulate to receive the retirement benefit at a satisfactory level?
- What is the level of financial literacy presented by the respondents regarding the issues related to the pension system?
- What factors determine the accumulation of voluntary retirement savings?

The following research methods were applied in the course of writing this article: critical analysis of the subject literature, diagnostic survey and logistic regression model. The data necessary to conduct the analysis were collected by the author during the nationwide survey studies carried out in September 2019 using CAWI (*Computer-Assisted Web Interview*) method. The research was financed from the statutory funds of the Department of Finance and Accounting at Wroclaw University of Economics and Business.

Selected Aspects of Accumulating Savings for Retirement Purposes

The subject literature defines the pension system from the perspective of an individual as a tool for allocating income or consumption smoothing over the life cycle (Barr and Diamond 2006; Blake 2006; Góra 2003). This process is carried out by using retirement savings, accumulated in the period of an individual's professional activity with the perspective of using them during retirement. Unfortunately, many countries worldwide face the so-called crisis of retirement savings (Rhee and Boivie 2015), which are increasingly lower and inadequate to the existing needs.

Polish pension system was reformed in 1999 and, as a result, pension funding based on the defined benefit principle was abandoned in favour of the defined contribution. This change transferred part of the responsibility for retirement income from the state/public system to the individuals. Current pension system consists of two parts: pay-as-you-go (PAYG) system, which is compulsory and managed by the Social Insurance Institution (ZUS), and the capital system, which is voluntary and the accumulated funds are entrusted to and invested by the selected private financial institutions.

The efficiency of the pension system is determined by both state-made pension decisions regarding the structure and principles of the pension system's public part and the individual pension decisions at the discretion of the person involved. Among the latter, F. Chybalski (2012) lists the decisions regarding: the participation scope in the voluntary pension system, the form of making savings, the choice of a financial institution offering pension products, the savings rate in the voluntary pension system, or the length of the saving period, including the decision to start and stop making savings.

Determinants of Saving for Retirement Purposes – Literature Review

The subject literature pays much attention to the analysis of household savings determinants (e.g. Brown and Taylor 2006; Salotti 2010; Rószkiewicz 2014; Adema and Pozzi 2015; Kolasa and Liberda 2015; Le Blanc et al. 2016; Beckmann 2019). Researchers from various countries are seeking answers to the question about the reasons for wrong retirement decisions, manifested in the absence or insufficient retirement savings, and thus low retirement benefits not meeting the pensioner's needs at a satisfactory level. The factors most frequently mentioned as responsible for this situation are as follows:

- economic factors (e.g. current income, owned financial and tangible assets) – people with higher income and permanent employment are more likely to make retirement savings, while those without their own property either rent it covering the respective costs, or take a mortgage, thus reducing their financial surpluses for retirement purposes from their current income (Kowalczyk-Rólczyńska 2017; Marcinkiewicz 2018; Vivel-Búa et al. 2019);
- psychological factors – the individual saving rate is significantly influenced by the attitudes towards saving, e.g., willingness to save, saving habits, self-control, temporal orientation, risk aversion, retirement anxiety (Hershey and Mowen 2000; Neukam and Hershey 2003; Rey-Ares et al. 2015; Glasman and Albarracin 2006; Finke and Huston 2013; Topa et al. 2018);
- financial literacy – people presenting higher literacy level and financial skills make more frequent voluntary decisions about retirement savings and their choices of pension products or financial institutions offering them are more accurate (Lusardi and Mitchelli 2007; Van Rooij et al. 2011; Czapiński and Góra 2016; Hsiao et al. 2016; Nolan and Doorley 2019; Elinder et al. 2019);
- managing personal finance ability, including retirement planning – people developing long-term saving plans set clear goals, they are more effective in accumulating retirement savings

comparing to those who refrain from retirement planning (Stawski et al. 2007; Rabinovich and Webley 2007).

Research Method and Sample Description

The research purpose defined in the introduction to the study determined the selection of variables for the econometric model. Y dependent variable (a person collecting voluntary savings for retirement purposes, where 1-success, 0-failure) is of dichotomous nature. Therefore, nonlinear analyses should be applied. The regression model used for this type of dependent variables takes the form of logistic regression (logit model), a binomial one in this case.

The candidates for independent variables were selected based on the previous research and the author's similar observations in the field of personal finance management (Solarz 2019) and the subject literature overview presenting research results of other scientists analysing this area.

In September 2019 the author carried out a survey covering a representative sample of 818 Poles. The obtained results were adjusted, using analytical weights, to the population of Polish residents ensuring representativeness regarding gender, age category, residence size class and education. After eliminating the contradictory and incomplete answers, 616 correctly completed questionnaires were qualified for further analysis.

Gender was the first parameter characterizing the research sample. Women constituted 48.9% of the surveyed population, men 51.1%. Information about the respondents' age is important for later analysis. The survey was addressed to people of working age only. The questionnaire was completed by 168 respondents aged 30 and younger, 151 aged 31-40, 130 in the range 41-50 and 167 were 51 or older, however, not over 60. A detailed distribution of the research sample by age is presented in Fig. 1. In terms of education, the smallest group of respondents (1.5%) indicated they had primary or lower secondary education, 6.8% – basic vocational, 44.0% – secondary and 47.7% – university education.

Fig. 1: Respondents by age

Place of residence was the fourth parameter describing the research sample. Most respondents (40.1%) declared living in rural areas and slightly more than a fifth (20.3%) indicated a city of 20,000 up to 99,000 residents. 12.3% of the respondents represented the population of the largest cities, i.e. over 500,000 residents, while small (up to 20,000) and large (200-499 thousand) cities were represented by – 8.9% and 10.1%, respectively. The least numerous group (8.3%) lived in cities populated by 100 to 199 thousand residents.

Considering the amount of net monthly income, 8.9% of the respondents earned less than PLN 1000, 26.4% declared their income in the range PLN 1001-2000, 29.9% received monthly remuneration at the level of PLN 2001-3000, 24.4% indicated earnings from PLN 3001 to 5000 and 64 (10.4%) individuals answered that their salary exceeded PLN 5000 per month.

In the first part of the survey, the respondents answered questions about their expectations regarding future pensions and the respective retirement decisions. The question "Do you make additional

retirement savings?" was answered positively by 247 people, i.e. 40.1%. Negative responses were provided by 369 out of 616 respondents (59.9%). These answers were used to encode the dependent variable (Y) of the model, where 1 stands for a person making voluntary savings for retirement purposes, and 0 – a person not making any voluntary savings for these purposes.

Several independent variables of demographic and socio-economic nature were selected for the analysis. They included: expected replacement rate, retirement awareness, retirement planning, gender, age, number of years before retirement, education, net income, place of residence.

After verifying their degree of variability (coefficient of variation over 30%), the candidates for independent variables were selected. Pearson's C and Cramer's V methods were used in correlation analysis. Finally, three nonparametric variables (Table 1) were adopted for further study, the most closely related to Y dependent variable and, simultaneously, the least correlated with each other. Since independent variables represent qualitative variables, they were presented in the form of zero-one variable systems, i.e. the variable with *m* variants was represented by *m-1* zero-one variables (which allowed avoiding the collinearity phenomenon).

Table 1: Independent variables included in the logistic regression model

Variable		Categories
X_1	– retirement planning	1 – a person who developed or attempted to develop an individual retirement plan; 0 (reference) – a person who neither developed nor attempted to develop an individual retirement plan
X_2	– net income	1 – a person whose net monthly income is equal to or higher than the average national salary; 0 (reference) – a person whose net monthly income is below the average national salary
X_3	– retirement awareness	4 – very high retirement awareness ($X_{3[4]}$); 3 – high retirement awareness ($X_{3[3]}$); 2 – average retirement awareness ($X_{3[2]}$); 1 (*reference*) – low retirement awareness ($X_{3[1]}$)

The first independent variable (X_1) is of dichotomous nature and was coded based on the responses to the question "Have you ever tried to find out/calculate how much capital you should accumulate for the future retirement benefit to be satisfied?" Only 170 out of 616 respondents (27.6%) answered "yes" and the variable for this group equals 1, whereas the reference value (0) for X_1 variable was assigned to 446 answers, i.e. 72.4% of the respondents who presented the opposite opinion.

The next variable (X_2) is dichotomous and divides the studied population into two groups: people with monthly net income equal to or higher than the average national net remuneration, i.e. PLN 3,000 (according to the Statistics Poland data (2019) the average monthly gross remuneration in Poland in 2018 was PLN 4094.98 (median), i.e. approx. PLN 2919.54 net) and the people whose remuneration does not reach this ratio. The first group covered 37.3% and the second one 62.7% of the respondents.

The third variable (X_3) refers to retirement awareness. To assess and manage risks associated with retirement decisions properly, the knowledge about the pension system functioning remains crucial. Ignoring basic issues, e.g., the defined contribution vs. the defined benefit system, PAYG vs. capital system, contribution periods, average life expectancy, seniority, retirement age, replacement rate, etc., can result in unrealistic expectations about the amount of future retirement and "lull into a false sense of security", thus resulting in inappropriate decisions regarding the accumulation of pension savings.

In order to determine the surveyed Poles' retirement awareness level, they were asked, in the second part of the questionnaire, to evaluate the truthfulness of 7 statements. Table 2 shows the received answers.

Table 2: Truthfulness evaluation of the statements regarding retirement problems

No.	Statement content	Correct answer		Incorrect answer	
		Number of indications	%	Number of indications	%
1	Using the "Start-up relief" by an entrepreneur opening a business means exemption from paying social insurance contributions for retirement, disability, accident, sickness and health insurance	489	79.38	127	20.62
2	Projected replacement rate of 35% means 65% of the last salary at retirement age	523	84.90	93	15.10
3	Sickness benefit periods are non-contributory in determining the retirement entitlement and calculating its amount	151	24.51	465	75.49
4	Reaching the retirement age entitles to at least a minimum pension	406	65.91	210	34.09
5	A woman and a man retired at the age of 65 presenting identical seniority and amount of retirement contributions, therefore they will receive the same pension	530	86.04	86	13.96
6	Retirement and disability pension contributions of the individuals receiving maternity allowance are financed from the state budget	166	26.95	450	73.05
7	After Joe Public's death, the funds remaining on his account in ZUS are inherited by his wife and/or children	490	79.55	126	20.45

The first statement referred to the contributions collected and redistributed by ZUS. Entrepreneurs starting a business can use the so-called "Start-up relief" and refrain from paying retirement, disability, sickness and accident contributions for the first six months. This relief does not, however, waive the obligation of sickness contribution payment, collected by ZUS and transferred to the National Health Fund. Most respondents (79.38%) evaluated the first statement correctly. It is worth emphasizing that the "Start-up relief" period is non-contributory and not included in calculating future retirement.

The simplest was the second statement truthfulness evaluation regarding the "replacement rate". Approx. 85% of the respondents understand its essence (Table 2). Assuming Poles' awareness of the available expert forecasts for the coming years, indicating the expected significant decline in replacement rates from the base part of the universal pension system down to even 30% in 2060, it seems surprising that the risk awareness is not manifested in retirement decisions about accumulating retirement savings.

75.49% of the respondents are unaware that, under Polish regulations, the periods of receiving sickness benefits are treated as non-contributory when calculating the pension amount (statement 3). Thus, this amount may be disappointing for people who reached the retirement age, but often took sick leaves. Moreover, only every fourth respondent (26.95%) knows that the maternity allowance is financed by the state budget (statement 6).

Reaching the retirement age, in Poland 65 for men, 60 for women, entitles to receive a pension, however, to reach the min. amount guaranteed by the state – PLN 1,100 in 2019 according to ZUS (2020) data, it is necessary to prove the contributory and non-contributory periods (women – 20 years, men five more years), with non-contributory periods representing max. one-third of contributory periods. 65.91% of the respondents evaluated the fourth statement as false, proving their knowledge in this regard (Table 2).

Next statement "A woman and a man retired at the age of 65 presenting identical seniority and amount of retirement contributions, therefore they will receive the same pension" was to diagnose whether the

respondents are aware that the retirement benefit amount depends not only on the accumulated capital, but also on life expectancy and the number of months they will receive pension. Statistically, women live longer and finish professional activity earlier, thus receiving lower pensions than men. 86.04% of the respondents answered correctly, evaluating the fifth statement as false.

The first pillar of Polish universal pension system is based on the principle of intergenerational solidarity, so ZUS's funds accumulated on insured accounts are not inherited. Only 20.45% of the respondents were unaware of it, which should be assessed positively (statement 7).

The financial literacy indicator about the pension system, i.e. arithmetic mean of the respondents' statements presented a slightly higher than average 4.47 level. The answers provided allowed encoding X_3 variable. The entire studied population was divided into 4 parts. The first included 124 respondents with low retirement awareness who answered max. 3 questions correctly (Table 3). The highest percentage – 35.88% referred to those with high retirement awareness who evaluated correctly 5 out of 7 questionnaire statements.

Table 3: Variable X_3 coding method – retirement awareness

Number of correct answers	Number of respondents	Percentage of respondents	Retirement awareness level
0-3	124	20.13	Low [1]
4	168	27.27	Average [2]
5	221	35.88	High [3]
6-7	103	16.72	Very high [4]

The next stage of logistic regression model construction was identifying research hypotheses determining the impact of specific factors (independent variables) on an individual willingness to accumulate voluntary retirement savings (dependent variable).

- H_1: Probability of accumulating additional retirement savings depends on the individual retirement planning activities;
- H_2: Probability of accumulating additional retirement savings depends on the individual net monthly income;
- H_3: Probability of accumulating additional retirement savings depends on low ($H_{3[1]}$), average ($H_{3[2]}$), high ($H_{3[3]}$) or very high ($H_{3[4]}$) individual retirement awareness.

Next, zero hypotheses should be formulated, negating the aforementioned probabilities. They assume no significant impact of dependent variables on Y variable.

Logistic Regression – Research Results

The logistic regression model should be verified in three areas: adjustment quality, individual hypotheses' significance and the theory predictive power. First, collinearity has to be performed. Cross-correlations between predictors clearly indicate weak relationships, not exceeding 0.2. Moreover, variance inflation factor (VIF) for all variables is below the critical value (VIF<3). Therefore, the undesirable collinearity can be ruled out.

The results of three subsequent adjustment quality tests of the logistic regression model are presented in Table 4.

Table 4: The model's goodness-of-fit coefficients

Test	Coefficient
Likelihood ratio test	-2log(L)=751.60
	χ^2=78.04 (df=5; p=<0.000001)
Hosmer-Lemenshow test	χ^2=5.39 (df=7; p=0.61)
R^2Nagelkerke	0.17

G statistics for model deviance amounts to 751.60, whereas $\chi^2_{citical}$ for α=0.05 and five degrees of freedom equals 78.04, making the test result statistically significant. Therefore H_0 can be rejected and allow adopting that the model is definitely better than the random one. The second – Hosmer-Lemeshow test result (1980) also confirms good model adjustment as it remains insignificant at 0.05 level, because $\chi^2_{critical}$ for α and seven degrees of freedom equals 14.07, whereas in the analysed case $\chi^2_{received} < \chi^2_{critical}$ (5.39<14.07) for p>α (0.61>0.05). The determination coefficient R^2Nagelkerke shows that 17% of the dependent variable variance is explained by the independent variables' variance. It proves the existence of variance percentage explained by other predictors absent in the model. To sum up, the theory confirmed the adjustment quality being better than the random model and providing a new explanation for the dependent variable behaviour.

Model adjustment quality test is followed by hypotheses verification. Table 5 shows the logistic regression results.

Table 5: Logistic regression results

Specification	coefficient β	β error	-95% CI	+95% CI	Wald statistic	p-value	odds ratio	-95%CI	+95%CI
intercept	-1.4779	0.2272	-1.9231	-1.0326	42.3197	<0.000001	0.2281	0.1462	0.3561
X_1	0.8195	0.1944	0.4385	1.2006	17.7722	0.000025	2.2695	1.5504	3.3220
X_2	0.7540	0.1806	0.4001	1.1080	17.4332	0.000030	2.1256	1.4919	3.0283
$X_{3[2]}$	0.7466	0.2623	0.2324	1.2607	8.0995	0.004428	2.1098	1.2617	3.5281
$X_{3[3]}$	0.2329	0.2541	-0.2651	0.7309	0.8404	0.359294*	1.2623	0.7672	2.0768
$X_{3[4]}$	1.4637	0.2957	0.8840	2.0433	24.4944	0.000001	4.3217	2.4206	7.7160

**p>0.05*

Variable X_1 – retirement planning is statistically significant at a high level (p<0.001), which allows rejecting H_0 about no influence of this predictor on the dependent variable and accepting an alternative hypothesis H_1 ($\chi^2_{critical}$ for α=0,05 and df=1 equals 3.842, Wald statistics reached the value of 17.7722 in the model). Odds ratio (OR) for the analysed variable is 2.2695 (Fig. 2), i.e. greater than one, demonstrating the stimulating, positive retirement planning impact on the accumulation of additional retirement savings. OR value can be interpreted as follows: the probability of accumulating additional retirement savings more than doubled (2.2695) if an individual tried to calculate the satisfactory capital level for the future retirement benefit. The variable confidence interval ranges from 1.5504 to 3.3220.

Fig. 2: Odds Ratio

Next variable X_2 – is statistically significant at a high level (p<0.001), which allows rejecting H_0 about its no influence on the dependent variable and accepting an alternative hypothesis H_2 ($\chi^2_{critical}$ for α=0.05 and df=1 equals 3.842, Wald statistics reached the value of 17.4332 in this case). OR for the analysed variable is 2.1256, proving the predictor's stimulating and positive impact on an individual's willingness to make additional retirement savings. Hence, people whose monthly net income is equal to or higher than the average national salary are more than double (2.1256) willing to accumulate additional retirement savings compared to those earning lower monthly salaries. The respective confidence interval ranges from 1.4919 to 3.0283.

Variable $X_{3[2]}$ – average retirement awareness is also statistically significant (p<0.0001), allowing to reject H_0 about no influence of this predictor on the dependent variable and accept an alternative hypothesis $H_{3[2]}$ ($\chi^2_{critical}$ for α=0.05 and df=1 equals 6.635, Wald statistics value for this predictor is 8.0995). OR for the analysed variable is 2.1098, i.e. higher than 1, proving the predictor's stimulating and positive impact on an individual's willingness to make additional retirement savings. This value can be interpreted that the probability of making additional retirement savings doubles (2.1098) with an average against low retirement awareness. Confidence intervals show that 0.95 probability allows expecting OR ranging 1.2617-3.5281 regarding retirement savings accumulation at average retirement awareness.

Variable $X_{3[3]}$ – high retirement awareness is statistically insignificant (p=0.359294), which does not allow rejecting H_0 about no influence of this predictor on Y dependent variable ($\chi^2_{critical}$ for α=0.05 and df=1 equals 6.635, Wald statistics value for this predictor reached 0.8404).

The last analysed variable $X_{3[4]}$ – very high retirement awareness is statistically significant, since p is below 0.05, which allows rejecting H_0 about no influence of this predictor on the dependent variable and adopt an alternative hypothesis $H_{3[4]}$ ($\chi^2_{critical}$ for α=0.05 and df=1 equals 6.635, Wald statistics reached 24.4944). OR for this variable is 4.3217, i.e. significantly higher than 1 proving the predictor's stimulating and positive impact on the individual willingness to make additional retirement savings. OR can be interpreted as follows: probability of accumulating additional retirement savings increases over four times (4.3217) along with a very high, comparing to low, retirement awareness. Confidence interval of the analysed independent variable ranges from 2.4206 to 7.7160.

The hypotheses' verification is followed by the model predictive power analysis. Table 6 shows the theory's classification capacity. The model (ACC) accuracy at 0.4 cut-off is 66.7%, thus higher comparing to the model with an intercept alone, confirming its added value. Other coefficients, i.e. sensitivity and specificity are C=53.4% and S=75.6%, respectively.

Table 6: Classification

Classification		Observed value		
		1 (positive)	0 (negative)	Σ
Predicted value	1 (positive)	132	90	222
	0 (negative)	115	279	394
	Σ	247	369	616

The model classified successfully about 67% of the decision classes, with 53% positive and 76% negative cases grouped correctly. Therefore, while the theory can well predict the attitudes of individuals unwilling to accumulate additional retirement savings, it is less successful in predicting preventive behaviours.

Based on sensitivity and specificity, ROC curve was constructed (Hosmer and Lemeshow 2000). The area under the curve (AUC) was 0.694 at $p<0.000001$, i.e. greater than 0.5, proving the model to be classifying cases better than the random one (Fig. 3).

Fig. 3: ROC curve

In summary, making additional retirement savings is more probable for people with monthly net income equal to or higher than the national average, who decided to plan their retirement, presenting average or very high retirement awareness.

Discussion

The results of the author's empirical research allowed answering the question about the percentage of Poles accumulating additional retirement savings. Only 40.1% of the survey participants declared making savings on their own for the purposes of future retirement. The remaining respondents do not take up such activities, thus accepting the fact that their future retirement benefits will come from the public part of the pension system only, and according to the forecasts of OECD experts for 2060, it may amount to approx. 30% of the last salary. Therefore, their standard of living in retirement will clearly decline.

The fact that the savings accumulated by Polish households are growing should be assessed positively. At the end of September 2019 they amounted to PLN 1,518.9 billion – PLN 14 billion more than in the previous quarter. Approximately 70% of Poles declare making some savings which, for slightly over 24% of the respondents, range between 1-3 monthly net income (Pogorzelski 2019). Unfortunately, the study conducted by the Kronenberg Foundation at Citi Handlowy and the Think Foundation! (2018) showed that, in 2010-2018, only 12% of Poles saved additional retirement funds. According to the statistics of Polish Financial Supervision Authority (2019) regarding the voluntary part of the pension system, Poles accumulated PLN 25 billion for private pensions at the end of June 2019, of which PLN

12.8 billion is attributable to employee pension schemes (data for the end of 2018), PLN 9.5 billion for individual retirement accounts and PLN 2.7 billion for individual retirement protection accounts. For comparison, the total of PLN 2,000 billion was recorded in the public pension system. Concluding, the voluntary retirement savings made by Poles are still very small.

The next research question, presented in the introduction to the article aimed at identifying how many respondents have ever tried to find out/calculate how much capital they should accumulate to receive the retirement benefit at a satisfactory level. It turns out that only 170 out of 616 respondents (27.6%) provided positive answers. At the same time, it should be emphasized that among the decisive factors influencing the quality of individual retirement decisions was the retirement planning process (cf. Tab. 5), which facilitates taking optimal advantage of the available financial resources to accomplish life goals. In other words, financial planning means managing one's own money, allowing financial freedom and independence. Financial plan development helps in achieving financial, and also retirement, goals. It shows the pursuit and the individual's current situation (Samsel 2019). People who have a well-prepared retirement plan are aware of their decisions' effects, thus being more consistent and rational in their actions. Therefore, in the opinion of the article author, raising social awareness of retirement planning remains very important for future pensioners. It can be implemented individually or with the help of retirement consultants representing either public or private sector.

The respondents' assessment regarding the correctness of seven statements included in the questionnaire allowed determining their financial literacy level in terms of issues related to the pension system. On average, each of them assessed correctly the rightness of 4.47 out of 7 statements presented to them, thus the indicator of financial literacy level regarding the issues related to the pension system covering the analysed population was at a slightly higher than average level. In addition, the results of logistic regression clearly indicate that the probability of a given person saving additional funds for retirement does increase more than four times (4.3217) when their retirement awareness reaches a very high level, compared to the individuals presenting a low level of retirement awareness. The adequate level of retirement awareness provides the basis for making correct choices affecting the quality of future retirement. In this context, in the opinion of the article author, all information activities and the properly targeted comprehensive financial education are very important. They support individuals in understanding the essence of financial products and services to make informed choices, avoid traps and ask for advice to improve their current and future financial wellness (Musiał and Świecka 2016). It is desirable to intensify the activities carried out by various state institutions, offices, schools and universities providing retirement education for Poles.

The answer to the last research question, a most important one from the perspective of achieving the research objective, i.e. "What factors determine the accumulation of voluntary retirement savings?" was provided by the results of the analysis carried out using the logistic regression method. Based on an overview of domestic and foreign scientific research addressing the factors determining the accumulation of voluntary savings for retirement purposes, several demographic and socio-economic variables were selected. At the same time, the results of own research clearly show that the accumulation of additional retirement savings in the surveyed population depends on the amount of net monthly income, taking up activities related to retirement planning and the level of retirement awareness presented by future pensioners. Other factors, i.e. the expected replacement rate, gender, age, number of years till retirement, education or place of residence turned out to be statistically insignificant.

Conclusion

The end of professional activity and the subsequent retirement is an important moment in everyone's life. The amount of retirement benefit, directly determining the level and quality of the senior citizen's life, depends on the retirement decisions taken in the period of performing paid work. The presented scientific article is focused on the problem of insufficient retirement savings accumulated voluntarily by future pensioners, and the author seeks to answer the question about the factors determining such financial behaviour. The obtained results of conducted empirical research allow making the statement that making additional retirement savings is more probable among people with a monthly net income

equal to or higher than the national average (odds ratio 2.1256), who have taken appropriate measures connected with retirement planning (odds ratio 2.2695), and their retirement awareness presents average (odds ratio 2.1098) or very high level (odds ratio 4.3217). The answers to the research questions formulated in the article introduction act as an incentive for conducting further scientific research, which could cover assessing the risk awareness taken into account by Poles while making their retirement decisions.

Abstract

Relevance. In the context of the financial and economic crisis that has covered almost all areas of activity, the importance of internal audit in the commercial management system is growing. In this regard, the practice of companies forming an internal audit system deserves special attention. Research objective: Based on the data on the internal audit departments of four agricultural holdings operating in the Russian Federation, to identify the main constraints of the development of these services; identify perspective directions of their development with a projection on the vast majority of Russian companies. Research methods: In the research process, general scientific and economic-statistical methods were used: classification, grouping, method of expert assessments, comparative analysis, generalization. Achieved results and significance of the study: the features of the implementation of internal audit in Russian companies are revealed, the main obstacles and current directions of its development are identified. The authors of the study concluded that the determining requirement for the development and improvement of the internal audit system today is precisely the interest of owners and senior management of a company.

Keywords: Internal Audit; Internal Audit Service; Business Processes; Corporate Governance Planning.

Introduction

Sustained interest in internal audit is due to the absolute desire of owners and senior management to streamline the company's business processes. Despite the fact that today internal audit services exist in almost all large and medium-sized companies, the role of internal audit in the corporate governance system remains clearly underestimated. At the same time, an optimally built system of

internal control at the enterprise is an effective tool to identify promising reserves for improving business efficiency.

Materials, Methods and Research Conditions

For processing and systematization of information, classification method, grouping, expert assessment method, comparative analysis, and generalization were used. When conducting this study, we relied on educational materials, works of domestic economists on auditing, as well as international standards of audit. The information base was the internal regulations, methodologies, regulations, working papers of the internal audit and reporting service of a number of public companies.

Research Results and Discussion

The mission of the company's internal audit department is to assist senior management and the board of directors by providing them with an objective, independent judgment on the appropriateness of the implemented internal control and risk management system. Internal audit performs its functions based on a systematic audit of aspects of company's business activities.

The status of the internal audit service, the nature of its employees responsibilities, can vary greatly depending on the size and structure of organization itself, as well as the requirements of management and authorized representatives of company owner.

To conduct this study, we obtained data on the internal audit departments of four agro-industrial holdings operating in the Russian Federation. We evaluated the internal audit service in the companies we selected taking into account the responsibilities of its employees and directly the place of this service in the organizational structure of the enterprise itself.

Conducted research allowed us to draw the following conclusions.

The internal audit service is a function that confirms to shareholders through the board of directors and management that the Group's internal control systems are reliable and effective as a matter of principle and in practice, and is also the center of expertise for all aspects of internal control.

According to the policy, in recruitment, internal audit and control services hire specialists only with higher economic education and at least 3 year work experience in this field. From applicants for the position, mandatory certificates in internal control and auditing are not required. The staff turnover in the internal audit and control service is low, the staff of the internal audit service is constant. At the quarterly Audit Committee, internal auditors report on the work accomplished and the bad-faith actions identified, along with the measures taken to eliminate them.

The Audit Committee monitors results of the work of internal auditors by discussing the report on the work done.

After reviewing matrices of controls on business processes in these companies, we concluded that the internal audit department receives appropriate and sufficient audit evidence for making reasonable conclusions. The conclusions drawn and the prepared reports correspond to the actual results of the work, since the internal audit department is independent from other business units.

To assess the objectivity of the work of internal auditors, we considered the following issues:

1) The status of the internal audit service in the organization and its impact on the objectivity of the internal auditor's judgments – internal auditors of a number of companies are under the organizational control of the financial director, that definitely affects the objectivity of the information presented in the report.

2) Is there a duty on the internal audit service to report to authorized representatives of the owner or to persons with appropriate authority, and whether internal auditors have the direct access to these persons – internal auditors have unrestricted access to the board of directors and submit quarterly reports to the Audit Committee on the work done, identified misstatements, reserves for improvement and related recommendations.

3) Do the internal auditors have any responsibilities that contradict each other - the internal audit staff do not simultaneously hold positions in other functional units, we analyzed the organizational structure of the service and found that the responsibilities of employees are strictly delineated and do not contradict each other;

4) Do authorized representatives of the owner supervise the employment decisions regarding the internal audit service - the Audit Committee under the board of directors approves candidacy of the head of the internal audit department, who provides the financial director with employees;

5) Are there any restrictions or pressure on the internal audit service from the management or authorized representatives of the owner – this issue is difficult to evaluate due to the lack of information;

6) Does management act in accordance with the recommendations of the internal audit service, as well as the extent to which such recommendations are implemented and how this action is confirmed - the heads of the audited departments act according to the recommendations and, according to the adopted schedule, report to the internal auditors on the work done.

To assess the technical competence of internal auditors, the following issues should be reviewed:

7) Have the auditors completed the appropriate technical training and do they have the necessary professional skills – internal audit department employees regularly attend professional trainings and always have qualification certificates;

8) Whether there is an established policy for internal auditors hiring and training - companies have written conditions and criteria for employees recruitment in the internal audit department, as well as procedures for training new employees.

To assess the professional diligence of internal auditors, the following issues should be considered:

9) Whether activities of the internal audit service are properly planned, controlled, checked and documented - the internal auditors act according to the adopted plan, which sets out the goals that they pursue. Control over the activities of internal audit is carried out by Audit Committees;

10) Are there audit manuals or other similar documents, work programs and documentation on internal audit, and how appropriate are they - internal auditors have internal audit methodologies and procedures, a description of testing procedures (Plaskova, Mosoyan, 2019).

To assess the possibility of exchanging information between internal auditors with other divisions of the Group and external auditors, the following issues should be considered:

11) Are there regular meetings of internal auditors with functional units to discuss testing procedures;

12) Do they receive consultations and do external auditors have access to the relevant reports of internal auditors, do they inform them of all significant violations identified during internal audits.

Based on the information studied, we came to the conclusion that the internal audit service in the selected agricultural holdings was organized properly. Internal auditors act in accordance with the goals prescribed in the annual plans, regularly present reports on the work done to representatives of

company owners. Employees of the service have relevant economic and technical knowledge, skills for conducting their inspections, and do the necessary qualification trainings throughout the year. The internal audit function is independent of the functional units.

An internal audit activity is effective, if the service provides representatives of company owners and senior management with the necessary confidence, especially on such issues that management can rely on the systems and processes of the enterprise in the field of risk management to achieve their goals. This is equivalent to providing guarantees regarding the possible risks of the enterprise.

We assessed the performance of internal audit departments by calculating the quantitative indicators presented in table 1.

Table 1: Traditional evaluation methods

Criterion / Indicator	Accomplishment
Audit plan implementation rate	97%
Number of checked objects	Above 8%
Recommendations provided and implemented	92%
Survey results of audited departments (from 0 to 5)	4.4
Internal audit department budget	3% below budget

As we can see, the given example of quantitative indicators characterizes the work of internal audit services as effective. However, it is not correct to rely only on this data, since the risks may change significantly during the period and do not correspond to the accepted audit plan.

According to a survey presented by the PricewaterhouseCoopers audit company, only 48% of users of reports and performance of internal auditors do indeed consider internal audit to be a serious business consultant. This number has significantly declined compared to previous periods, which is mainly due to the fact that owners and management expect to receive more benefits from internal audit activities than were recorded (State of the Internal Audit Professional Study, 2017).

Our study showed that the main shortcoming of using internal audit in companies today is its use only in terms of verification and confirmation. In our opinion, for a proper assessment of the internal audit activity, it is necessary to consider the internal audit as a structure that is part of the company's management system and allows to influence the decisions made by the management and contribute to their forecasting.

We believe that in large enterprises, holdings, the internal audit department should be centralized. The centralization of internal audit provides a single management vertical on the part of owners and the board of directors. With centralization of internal audit, a unified department development strategy is introduced, which takes into account the group’s strategy, goals and coordinates activities according to its structure; unified methodology and criteria are used in the analysis of individual companies and divisions of a holding company.

Qualification of the auditor is highly important. Representatives of owners, top management consider it important that the internal auditors have specific, technical knowledge inherent to this business, in addition to their economic knowledge and professional skills. The internal auditor should become a specialist who identifies risks and implements appropriate systems and mechanisms for their control. We recommend creating subdivisions within the internal audit service that will specialize in particular issues and produce the best result in synergy. For example, a group responsible for information technology risks, a group specializing in accounting, etc. can be created within the internal audit department.

Definitely, discussing issues with senior management on the identification and management of strategic risks is a crucial stage for the head of the internal audit department. Regarding the issues of expanding the scope of activity of internal auditors and going beyond traditional financial, operational, compliance risks to the strategic level, the owners and top management of the enterprise should also be interested and prepared. Board of directors and senior management do not always recognize the role of internal audit in matters related to strategic risks. In this direction, internal auditors need to carry out active awareness-raising activities. In its development, internal audit should be one step ahead of business development, but not to be behind it.

Conclusion

In the context of modern economy, the role of internal audit and internal control in the system of commercial management is strengthened. Undoubtedly, the future of internal audit in Russian companies largely depends on whether it is able to deeply understand the company's business, whether it can play an active role in risk management, and whether it is able to reach a level of strategic risk management quality assessment in his activity (Golubeva, 2017). At the same time, in our opinion, the main and paramount condition for the development and improvement of the internal audit system is precisely the interest of the owners and senior management of the company.

Abstract

Medical universities in Poland are attended by students who are representatives of generation 'Z'. The first doctors of this generation are also preparing to enter the labour market. Academic literature as well as business practice provide evidence that the generation ‘Z’ differs significantly in many respects from representatives of generations 'Y', 'X' and 'Baby Boomers'. The purpose of this paper is to recognize the life values, motivations and expectations of future doctors who are representatives of generation 'Z'. These factors determined their choice of medical studies and the decision to practice medicine.
The authors of this paper used two research methods. In the theoretical part the applied method consisted in analyzing Polish and foreign state-of-the-art. In the empirical part the authors used the results of the survey conducted among final year medical students at the Wroclaw Medical University, Poland. The study was conducted in the second quarter of 2017 (n = 152) and in 2018 (n = 170). The obtained results allowed the authors to outline the profile of the future doctor 'Z'. The profile shows that individuals who are preparing themselves for the role of doctors are very different from representatives of previous generations. They have a different hierarchy of values and are guided by different needs and motivations. They exhibit a different approach to learning, work, leisure or development, etc. Gathering and using the knowledge on this subject is very important for health educators, policy planners and makers and health workforce managers.

Keywords: health care system, generation 'Z', motivation, expectations, medical students, Poland.

Introduction

Health is one of the basic goods valued in Polish society. Over half (57%) of Poles believe that maintaining good health, along with family happiness, is one of the most important values in life (Public Opinion Research Center, 2016). The country's health care system (HCS) plays an important role in delivering this value. The purpose of this system is to promote and maintain public health. The results of inspections carried out by Supreme Audit Office (2019) in recent years show that the HCS in Poland is in poor condition. It does not sufficiently ensure efficient use of public funds, creates problems for managers of medical entities and their personnel, and above all is not very patient-friendly. Unfortunately, the HCS in Poland is also reported to be taking one of the last places in the international rankings in European Union (EHCI, 2018; OECD/EC, 2018). Poles themselves also share negative feelings about the system. According to opinion polls, as many as 93% of Poles negatively assess the functioning of the health service (Public Opinion Research Center, 2018).

Doctors play an important role in the HCS. This profession in Poland falls into the group of professions of public trust. Thus, it is attributed with the requirement to complete university studies, continuously develop knowledge and possess very high competences (Barcikowska-Szydło et. al, 2014). These high requirements are difficult to meet while working in the conditions of the existing HCS in Poland. The community of doctors is almost always examined and presented in the context of its weaknesses. Over 60% of surveyed Poles say they appreciate the medical competence of Polish doctors, both in the diagnosis and treatment of diseases. Every fourth respondent presents the opposite opinion. Poles are strongly differentiated in terms of their assessment of doctors' commitment to work and in terms of trust and confidence in doctors. Only 43% of respondents believe that doctors are committed to their work, compared to 45% who disagree with this opinion. Over 40% of respondents say they have little confidence in doctors. Additionally, it is worth emphasizing that the respondents assess the level of soft competencies of doctors very low, including primarily their communication with the patient (Kilijanek-Cieślik, 2018).

Other serious problems concerning the environment of doctors include: their low number (an average of 2.4 doctors per 1,000 inhabitants (OECD/EC, 2018)) and the dynamic aging of this professional group - with the average age of 52 years (Statistic Poland, 2018). At the same time insufficient number of young doctors enter the Polish labour market, which is caused, among others, by admission limits to medical universities, difficult access to specialization and economic emigration of young doctors. Bearing the above in mind, the entities responsible for the quality of the HCS in Poland have to face numerous problems of various nature. Rational planning of medical staff becomes one of priorities. The cooperation of these entities with the education sector is of key importance, specifically as regards rational planning of the number of admissions to medical studies (Statistic Poland, 2019).

According to the authors of the paper the above issue is of particular importance as medical universities admit representatives of generation 'Z' these days and that the first graduates of this generation enter the labour market. Many researchers emphasize that generation 'Z' is very different from its predecessors - the 'Baby Boomers', generations 'X' and 'Y'. They were born in the 1990's and raised in the 2000's during the most profound changes in the century. The representatives of generation 'Z' form the first social group that does not know the world without computers, mobiles, internet or electronic gadgets (Singh and Dangmei, 2016). They are not familiar with the analog world and its logic. They can function alongside in the real and virtual worlds. In their opinion, these two worlds are complementary (Chomątowska and Żarczyńska-Dobiesz, 2014). Most representatives of generation 'Z' cannot imagine their lives without new technologies or internet to which they are connected 24/7. The literature on the subject underlines the high potential of this generation, related to its creativity and fluency in the use of modern technologies (cf. Hardey, 2011; Sidorcuka and Chesnovicka, 2017). Apart from 'Z's strengths, their weaknesses are also pointed out. They are addicted to modern technologies. Living online impairs their verbal communication skills as well as the ability to make interpersonal contacts in the real world. They also

have problems with concentration, their attention is diffused, and the analysis and assessment of information is very superficial (see Friedrich and Peterson 2010; Mizuko, 2008; Csobanka, 2016). For these reasons they are referred to as overwhelmed, overcommitted, overconnected (Elmore, 2016). According to Twenge (2019), the representatives of generation 'Z' are afraid that in such a competitive environment "they will not enter the game" and they will not have a good job. They go to college to get a better job and earn more. The representatives of generation 'Z' often raised by over-protective parents need similar behaviors on the part of teachers, lecturers, and superiors (Chomątowska and Żarczyńska, 2016), who will have to act like trainers, coaches expected to provide support, comfort and clear instructions and tips (Twenge, 2019). 'Zs' are frequently characterized by contradictory features, thus can be referred to as "the generation of paradoxes". At the same time they are: open and closed, brave and fearful, expecting a lot from others and "energy saving" on their part (Sladek and Grabinger, 2014; Tulgan, 2009; Chomątowska and Żarczyńska, 2016).

In view of the above it is important to get to know and understand the youngest generation of future doctors, to see what they are like, to learn about values and expectations they hold on to, to understand what motivates them and why they behave this of that way. It will directly influence the kind of doctor the representative of generation 'Z' will become and how this young doctor will find his way in the Polish HCS. Therefore, the purpose of this article is to recognize the life values, motivations and expectations of future doctors - representatives of generation 'Z' regarding their choice to study medicine and enter the medical profession. This article presents only a fragment of a more extensive research conducted by the authors among the students of the Medical University in Wroclaw, Poland.

Research Methods

Research methods consist of two parts. The reviewed literature posed a theoretical basis for conducting an empirical research with the aim to recognize and designate the problem. The method applied in the theoretical part consisted in reviewing the existing Polish and foreign literature, statistical reports and official reports published by organizations. The empirical part presents the results of survey conducted by the authors among the students at the Medical University in Wroclaw, Poland. The study covered a period of two years and was conducted in the second quarter of 2017 and in 2018. The selection of the research sample was intentional due to the authors' interest in the profile of people who graduate from medical studies. Their opinions, declarations and experience in the field of issues considered within the article can be treated as the most mature, thought-through and current. Hence, the respondents were students of the last, i.e. sixth year of study at the Faculty of Medicine, just before graduation, respectively in 2017 (n = 152 of 244 students registered in 2016/2017) and in 2018 (n = 170 of 218 students registered in 2017/2018). The respondents are representatives of generation 'Z'. The demographic characteristics of the research sample are presented in Table 1.

Table 1: Research sample characteristics

Variable	Percentage point
Total N	N=322
Gender	
Woman	57.8%
Man	42.2%
Mean age	25.3

Residence before entering University	
Rural areas	9.3%
Small city (<20 k.)	15.5%
Medium city (20-100 k.)	28.6%
Large city (> 100 k.)	46.6%

Source: study based on the self-conducted research.

Participation in the survey was voluntary and anonymous. Data shown in this article is based on students' responses/declarations. The object scope concerned selected issues related to the key life values of future doctors as representatives of generation 'Z', their motivations and expectations regarding the choice of medical studies and practicing medicine.

The questionnaire used in the research was complex. This article presents the results of only selected issues related to the topic under consideration. The part of the questionnaire, related to the issues, consisted of closed questions. The respondents used a 4-point type scale to assess several items asked in the questionnaire. Depending on the characteristics of the question the 4-point scale offered the following sets of answers *(1- 'unimportant'; 2- 'of little importance'; 3- 'important' 4- 'very important')* or *(1- 'definitely not'; 2- 'probably not'; 3- 'rather yes'; 4- 'definitely yes').*

For the purposes of this article the following research questions were formulated:

RQ 1. What life values, motivations and expectations drive future doctors who represent generation 'Z'?
RQ 2. Which of the identified life values, motivations and expectations may rise concerns from the viewpoint of practicing the medical profession?

Empirical Results

The first question addressed to future doctors concerned their life values. The respondents assessed each value on a 4-point scale: *very important, important, of little importance* and *unimportant* (Table 2).

Table 2: Evaluation of importance of life values by respondents in percent points

Value	Evaluation of importance			
	very important	important	of little importance	unimportant
work	15.5%	73.3%	11.2%	0.0%
family	72.0%	25.5%	1.9%	0.6%
health	75.2%	22.4%	2.5%	0.0%
religion	19.9%	23.6%	24.8%	31.7%
friends	49.7%	45.3%	5.0%	0.0%
personal development	49.1%	47.2%	3.7%	0.0%
pleasure	57.8%	27.3%	14.3%	0.6%
responsibility	34.2%	52.2%	13.0%	0.6%

Source: study based on the self-conducted research.

The analysis of table 2 leads to the observation that 3/4 of future doctors representing generation 'Z' attribute most value to: *health* (75.2%) and *family* (72.0%). More than half of the respondents consider *life pleasures* (57.8%) very important. Further places in the ranking of the most important values are taken by *friends* (49.7%) and *personal development* (49.1%). In view of the above *responsibility* is very important only for 1/3 of respondents (34.2%), and it is important for every second (52.2%) future doctor from generation 'Z', while for almost every eighth respondent *responsibility* is of little importance. Some analogy can be seen in the value of *work.* It is very important only for every sixth respondent (15.5%), and for almost ¾ (73.3%) of future doctors it is only important. Note that the indications regarding the last analyzed value, i.e. *religion*, were the most diversified. Analyzing the significance of *religion,* for ¼ (24.8%) of respondents it is of little importance, and for nearly 1/3 (31.7%) completely unimportant.

The next question addressed to future doctors concerned their internal beliefs about the choice of medical studies. According to the collected responses as much as 93.8% of respondents considered the choice to be thought-through and conscious. Only 6% admitted that the choice was incidental. The continuation of the above question was to identify the motivations that prompted students to undertake these specific studies. These premises are of particular importance in the faculty of medicine. Several motivations were analyzed in detail (Table 3).

Table 3: Evaluation of the validity of motivations determining the decision to choose medical studies according to respondents in percent points

Motivation	Motivation importance evaluation			
	very important	important	of little importance	unimportant
security of employment in the acquired profession	49.1%	47.8%	2.5%	0.6%
decent remuneration	32.9%	57.8%	7.5%	1.9%
high remuneration	20.5%	58.4%	18.0%	3.1%
appreciation/recognition by others	46.6%	39.1%	11.2%	3.1%
prestige of the profession	24.2%	52.2%	18.0%	5.6%
desire to help others	46.0%	42.2%	8.7%	3.1%
desire to fulfil own dreams	36.0%	39.8%	15.5%	8.7%
development of interest in natural science	54.0%	38.5%	6.8%	0.6%
suggestions from family members	8.1%	17.4%	40.4%	34.2%
suggestions from others	5.0%	7.5%	34.8%	52.8%

Source: study based on the self-conducted research.

While analyzing the degree of importance of individual motivations for the respondents it seems evident that some motivations are particularly distinguishable. The most important motivation was the *security of employment in the acquired profession*. Almost all respondents (96.9%) declared this assigning this premise to very important (49.1%) or important (47.8%). Equally high appreciation was gained by (Table 3):

- *development of interest in natural science*. As many as 92.5% of respondents considered this premise very important (54.0%) or important (38.5%);
- *decent* (90.7%) and *high remuneration* (78.8%). In this aspect, it is worth considering two issues. First, *decent remuneration* turned out to be more important for respondents compared to *high remuneration*. Secondly, there is a consensus of the opinions that both motivations are more frequently declared as important than very important;
- *desire to help others*. Despite the relatively high total indication of the importance of this motivation, amounting to as much as 88.2%, for almost half (42.2%) of future doctors from generation 'Z' this motivation is not very important but only important. In addition, for almost every

tenth of respondents, this premise is considered to be of little importance (8.7%) or unimportant (3.1%);

- *appreciation/recognition by others*. This premise proved to be at least important for 85.7% of respondents, including almost half of the respondents (46.6%) who marked it very important and 2/5 (39.1%) who marked it important. It is worth noting that such a percentage of indications makes this motivation almost as important for future doctors as the *desire to help others*. Therefore, it may seem justified that for more than ¾ (76.4%) of the respondents, another of the analyzed motivations i.e. the *prestige of the profession*, was of great significance while choosing the field of study.

In view of the above the following two motivations with definitely lower indications also deserve attention: *suggestions from family members* (25.5%) and *suggestions from others* (12.5%). For ¾ (74.6%) of the respondents, the *suggestions from family members* were of little importance (40.4%) or completely unimportant (34.2%). *Suggestions from others* had even lower impact on the respondents' decisions (respectively: of little importance (34.8%); unimportant (52.8%)).

The above research thread was followed through further questions in the survey. The questions concerned the respondents' satisfaction with the chosen field of study, as well as the evaluation of benefits achieved through the studies. The individual benefits were assessed on a 4-point scale: *definitely yes*, *rather yes*, *probably not* and *definitely not*. Despite the fact that over 80% (81.4%) of respondents were satisfied with their choice, nearly every fifth respondent (18.6%) did not share this opinion. The relatively high degree of satisfaction with the choice of medical studies is reflected in the collected indicators regarding the benefits obtained by the respondents (Table 4).

Table 4: Evaluation of the degree of benefits obtained from higher education according to respondents in percent points

Benefits from studying	Evaluation of obtained benefits			
	definitely yes	rather yes	probably not	definitely not
theoretical professional qualifications	6.2%	68.9%	21.1%	3.7%
preparation for practical work	2.5%	14.3%	57.1%	26.1%
preparation to an adult life	16.8%	51.6%	23.6%	8.1%
preparation to teamwork	10.6%	52.2%	29.8%	7.5%
development of the need for continuation of learning	17.4%	52.2%	22.9%	7.5%
development of personality	23.6%	42.2%	23.6%	10.6%

Source: study based on the self-conducted research.

Analyzing the 'definitely yes' and 'rather yes' indications, it is concluded that the respondents are mostly satisfied with: *theoretical professional qualifications* (definitely yes - 6.2%; rather yes - 68.9%), *preparation to an adult life* (16.8%, 51.6%, respectively), as well as with *preparation to teamwork* (10.6%, 52.2%, respectively). In addition, they strongly feel the *need for continuation of learning* in the medical profession (17.4%, 52.2%, respectively). In their opinion, the studies also helped them *develop and shape their personalities* (23.6%, 42.2%, respectively). It is worth noting that in Table 4 one can notice much higher indications of the 'rather yes' rating in comparison with other answers. As many as 83.2% of respondents believe that they are not well *prepared for practical work*. The last important question of the questionnaire was related to confirmation or denial of the desire to work in a learned profession. Despite anxiety and uncertainty about professional practice mentioned by the respondents, the vast majority (92.6%) would like to work in the medical profession. Only few people did not give an unequivocal answer, choosing 'I do not know' (5.6%) or 'intend to work in another profession' (1.9%).

Discussion and conclusion

Motivations that make young people decide to study medicine have been researched for many years. As emphasized by Gąsiorowski et al. (2015), in this respect researchers analyzed applicants to medical school (McManus et al., 2006), freshmen (Vaglum et al., 1999; Draper and Louw, 2007), final year students/graduates (de Vries et al., 2010; Dastjerdi et al., 2012) and students in selected years (Drinkwater et al., 2008; Amin et al., 2009; Pastor et al., 2009). The results of these studies are often inconsistent. Until now, no such analyzes have been carried out from the perspective of generations. No consideration has been taken about how the above-mentioned choices of medical students are influenced by the fact that they belong to a particular generation, e.g. generation 'Z'? How belonging to the generation will affect what doctors they will become? What challenges does it pose for decision-makers within the HCS, for the education system, but also for health workforce managers?

The authors believe this is an interesting research area. Particularly as the experience of both employers and the authors of the article shows that 'Z' is the most problematic generation of employees (Twenge, 2019). They need different methods of human capital management and working conditions than generation 'BB', 'X' and 'Y' (Deloitte, 2018; Chomątowska and Żarczyńska, 2014).

The research conducted by the authors of the article allows to outline the profile of the future doctor from generation 'Z'. *Health* and *family* are the highest rated values. Further places in the ranking of the most important values are occupied by *pleasures, friends* and *personal development* (Table 2). *Work* and *responsibility* are only important. Given the nature of the future medical profession, the identified hierarchy of values raises concerns. Similar conclusions can be drawn regarding the motivations that determined the decision to enter medical studies. While the very decision to study medicine was conscious for Dr.'Z', the motivations that governed him raised some concerns of the authors (Table 3). The biggest concerns pertain to a relatively low rating of *the desire to help others* in relation to relatively high ratings of *the amount of expected salary*, *the need for recognition/appreciation by others* and *the prestige of the profession*. These motivations may adversely affect the later professional life of Dr.'Z', especially as regards his attitudes and behaviors towards patients and building proper relationships with them. The future Dr.'Z' highly rated motivations such as: *security of employment in the acquired profession*, *development of interests in natural science* and *desire to fulfill own dreams*. *Suggestions from family members* and *suggestions from others* are of little importance to him in this context. It is worth emphasizing that the future doctor 'Z' is satisfied with his studies. He particularly appreciates being prepared for medical profession from theoretical standpoint (Table 4). Then in order: *preparation to an adult life* and *preparation to teamwork*. In addition, the studies developed his personality and made him aware of the need for continuation of learning. Unfortunately, the future doctor 'Z' rated low the degree to which the studies prepared him for the profession from the practical point of view, he is not quite sure of his competence. Hence, he feels some anxiety and stress resulting from the need to start working. The appearing image of the future doctor 'Z' falls under the general characteristics of generation 'Z' presented in the literature on the subject. The future doctors under study would like their professional life not to be burdensome and not to interfere with everyday comforts. They do not value work as the most important. They want to pursue their hobbies, interests and dreams. They expect a "return on investment" made during many years of difficult medical studies. Although they have precise expectations, they are apprehensive about their future as doctors.

It is difficult for the authors of the article to give an explicit answer to the question "What will you be like Dr.'Z'?". Undoubtedly, the professional group will be enriched by representatives of generation 'Z' in coming soon. They adhere to a different hierarchy of values, they are guided by different needs and motivations. They exhibit a different approach to learning, work, leisure or development. Therefore, will they find their way in the difficult conditions of the current HCS in Poland, will they meet the growing needs of patients? These questions intrigue and motivate the authors to conduct further, more in-depth research in this area. Finally, it should be emphasized that it is important not only to acquire knowledge

about representatives of generation 'Z', but also for older generations to try to understand them, search mutual compromises and learn each other. Ignoring or expressing disapproval of their differences brings about a risk of frustrated and demotivated employees, which in particular in relation to the medical profession can have serious consequences. This is a very important information for health educators, policy planners and makers and health workforce managers.

Due to the limitations of the research sample it is valid to underline that generalizing the research results must be done with caution.

Configuring Organisational Resources and Coordinating Business Operations in the Practice of Polish MNEs: Towards Excellence in International Management?

Marcin KUZEL

Nicolaus Copernicus University, Toruń, Poland
E-mail: mkuzel@umk.pl

Abstract

The starting point for discussion in the paper is the belief that being present on international markets offers only an opportunity, not a guarantee, of benefiting from internationalisation, in particular in relation to the most advanced transaction "Ot" advantages (according to the OLI paradigm). Thus, the following paper focuses on two main aspects of international management, i.e. the spatial configuration of organisational resources and the coordination of business operations, which both largely condition benefits from multinationality. The main purpose of this study is to assess the degree of resource configuration and activity coordination among MNEs representing the so-called latecomers in the global economy (in this case MNEs from Poland). In order to achieve this goal, we use firm-level data obtained from a survey conducted among Polish MNEs and their foreign affiliates. Our findings indicate that resource configuration and activity coordination are limited among the surveyed enterprises (they remain at a medium level). Although Polish MNEs report benefits from undertaking international activities, the majority of them are not yet able to maximise the results at the current stage of their development.

Keywords: Multinational enterprises, MNEs, Organisational resources, Business operations, Configuration, Coordination, International management, Latecomers in the global economy, FDI

Introduction

Internationalisation of enterprises is guided by various reasons (Jaworek et al. 2019: 2–9). However, looking at the motives driving foreign expansion, it can be considered in its four basic variants, i.e. as (Dunning 1998: 53; 1993: 56; 2000: 164–165): resource-oriented, market-oriented, efficiency-oriented, and strategic asset or capability-oriented. It must be stressed – as Dunning and Lundan (2008b: 68) point out – that many multinational enterprises (MNEs), especially the larger ones, frequently pursue multiple objectives when engaging in foreign expansion that combines more than one of the above categories. According to the eclectic theory of international production (the OLI paradigm), meeting these objectives will be possible mainly thanks to the appropriate use of the so-called specific ownership (or proprietary) "O" advantages, i.e. unique firm-specific assets, both tangible and (largely) intangible, which are not available or not available at such favourable terms, to other enterprises (Dunning 1993: 80; Markusen 1995: 174–175; Rugman 2010: 2).

The concept of "O" advantages has changed over time (Eden: 280–291; Eden and Dai 2010: 13–34), starting with the most traditional view (Dunning 1981: 27), through approaches that integrate different perspectives – including new forms of international business (Dunning 1995: 461–491), strategic management theory (Dunning 1998: 13) or institutional theory (Dunning and Lundan 2008a: 573–593; 2010: 1225–1246), to the least obvious ones which focus on the specifics of emerging market multinationals (Antalóczy et al. 2014: 47–61; Williamson and Wan 2018: 557–567). From the point of view of the internationalisation process logics and the consequences for international management, the identification of the asset "Oa" advantages and transaction "Ot" advantages was one of the more important approaches (Dunning 1983: 333–351) (later also institutional "Oi" advantages – Dunning and Lundan 2008a: 573–593; 2010: 1225–1246; Lundan 2010: 51–70). The first group of advantages relates to the protected ownership of specific enterprise assets in relation to the advantages held by other entities and are a consequence of structural market imperfections – they are mainly initial advantages that enable foreign expansion (Dunning 2001: 176). The second group

of advantages is a consequence of the hierarchical organisation of MNEs, which have the ability to generate transaction benefits (or reduce transaction costs) by managing assets located in different countries (Dunning 1988: 2). However, the most advanced "Ot" advantages are uniquely related to multinationality (Eden and Dai 2010: 17). Thus, they can become an attribute of enterprises with a higher level of internationalisation and relate to a situation in which MNEs are able to take advantage of "multiple sources of external authority and multiple denominations of value" (Sundaram and Black 1992: 729) or – in other words – discount benefits of international scale of operation and functioning in diverse socio-economic environments. At this stage, there is a possibility and legitimacy of targeting the expansion of MNEs not only on the previously mentioned acquiring resources (resource-oriented expansion) or gaining access to new markets (market-oriented expansion), but also using "foreign activities as means by which they can improve their global market position by raising their efficiency or accessing new sources of competitive advantage" (Dunning and Lundan 2008b: 68). In reality, however, it is neither simple nor obvious. It is essentially a challenge for managers rather than an absolute benefit of business activity internationalisation.

Guidelines and Literature Review

Although many studies highlight major benefits of foreign expansion (in terms of improving MNE performance, employment parameters, export, investment activities, productivity and overall competitiveness – UNCTAD 2006: 170–175; Sunesen et al. 2010: 31–34; Szałucka 2010: 5–13; Imbriani et al. 2011: 369–381; Gibb and Szałucka 2012: 49–80; Shiau et al. 2013: 184–196; Chen and Yang 2013: 17–38; Foster-McGregor et al. 2014: 244–257; Jaworek et al. 2018b: 137–152), Gupta and Govindarajan (2001: 45–58) state explicitly that being present on international markets, or even becoming a "global player", merely creates an opportunity to gain a competitive advantage. This opportunity can be used as long as MNEs are able to effectively discount benefits within the five key areas – potential sources of value creation, i.e. adjusting their offer to the specifics of local markets, using transnational scale and scope of activity, optimising spatial configuration of resources and implemented business processes as well as maximising knowledge transfer between units in different locations. In this sense, the internationalisation of an enterprise becomes a necessary condition, but not always sufficient for the full implementation of the objectives related to foreign expansion (Kuzel 2018: 387). It is worth noting that the lack of an absolutely positive relationship between the expansion and the results achieved by MNEs is highlighted by the results of the research conducted among enterprises representing the new European Union member states (Damijan and Decramer 2014: 1–49; Damijan et al. 2017: 74–97).

Looking at the possibility of gaining the most advanced "Ot" advantages by MNEs, the most important aspects are the ability to integrate dispersed resource management and the effectiveness of actions in order to optimise their spatial configuration (including relocation and reconfiguration) and the coordination of business operations (activity coordination) towards increasing global organisational efficiency. In literature, these two basic elements of international management (i.e. configuration and coordination) are most often considered from the perspective of value chains, understood by Porter (1985: 36–39) as a systematic set of activities of strategic importance related to project creation, the production process, marketing activities, deliveries and service. The expansion and spatial distribution of individual elements of the value chain and the entities participating in it describes the configuration, and the integration and harmonisation of activities at the transnational level make up the effect of coordination (Zorska 2007: 161–162). The condition for obtaining benefits from the spatial configuration is the location of the individual elements of the value chain in those locations where they bring the highest value added, while the results of international coordination depend on the appropriate shaping of the network of connections, cooperation and arrangements between enterprise units and its partners in different countries (Koźmiński 1999: 68, 76).

The above approach is fully described by Grunwald and Flamm (1985) and later on developed in the context of international business (Buckley 2004: 1–25; Buckley and Ghauri 2004: 88–89) in the concept of "global factory". According to it, modern MNEs are increasingly pursuing the postulate of hybridisation of various forms of foreign expansion, conducting flexible activity based on a network

of geographically dispersed units, related by capital relations and cooperation ties, but above all a bundle of goals whose implementation is coordinated by a central entity – a network integrator (usually represented by the parent company). Buckley (2011: 270) emphasises that MNE managers have already learned to a large extent how to decompose processes to optimise the location of their individual stages, as well as how to properly coordinate the entire course of the value chain, even if its individual phases are not implemented "inside" the company. Such activities – as indicated by the analyses (Rosińska-Bukowska 2016: 112–115; 2017: 323–326) – reveal mainly among the most powerful MNEs in the world. At the same time, however, it is clearly emphasised that their experiences are not obvious at all (Yamin 2011: 285–293). Moreover, the intensity of these processes may differ significantly in individual cases, also due to the degree of enterprise internationalisation, the specific nature of particular sectors, socio-economic, cultural or political conditions (Kuzel 2018: 439), as well as the consistency of previously adopted modes of action, experience gained or even historical considerations (Buckley 2009: 309–321; Fitzgerald and Rowley 2015: 449–456).

From the considerations carried out so far emerges a potentially interesting research question: ***To what extent is the postulate of spatial configuration of resources and activity coordination implemented by MNEs from the group of the so-called latecomers in the global economy*** (i.e. representing countries already partially advanced on their way to win the "developed" status – Storper et al. 1998: 1–9), ***in this case by enterprises from Poland?***

Before attempting an answer to this question, however, the specifics of foreign expansion of Polish MNEs need to be outlined briefly. First of all, their expansion has a relatively high growth rate. According to the last World Investment Report (UNCTAD 2019: 216), by the end of 2018, Polish outward foreign direct investment (OFDI) reached the value of $28,510 million, which is over 106 times more than at the end of 2000 ($268 million, nominal values). At the same time, the number of companies holding their shares/stakes in 3941 entities abroad was estimated at 1838 in 2017, which means an increase of over 27% compared to 2010 (Statistics Poland 2019). Secondly, despite an intensive growth in OFDI stocks, it must be emphasised that Polish MNEs concentrate mostly on European markets (NBP 2018; Statistics Poland 2019), and the level of their internationalisation (taking into account both the scale and the scope of their activities) is generally at a medium level (Jarosiński 2013: 173–179; Trąpczyński 2016: 283–306). Thirdly, the internationalisation of Polish enterprises is primarily market-oriented (Götz 2011: 47–70; Gorynia et al. 2013: 61–75; Kowalewski and Radło 2014: 365–374; Ciesielska et al. 2016: 80–81; Jaworek et al. 2018a: 19–30), their relationships with external entities remain limited (Sagan 2015: 249–258; Adamczyk and Sagan 2015: 38–53; Poland, Go Global! 2015), and expansion is carried out using mainly their own resources (Poland, Go Global! 2015).

Given the above characteristics of the internationalisation of Polish MNEs, below considerations were placed within the basic structure of the links between a parent enterprise and its foreign affiliates, i.e. ignoring their external relationships. This is consistent with an approach presented in the literature (Yaprak et al. 2011: 179–192; Sinkovics et al. 2011: 124), according to which the fundamental conditions for a successful integration and coordination of MNE business processes are within the ability to properly shape the architecture of intra-organisational relationships (i.e. between entities located in different countries, but tied by ownership relations).

Research Methodology

The results presented in this paper come from a survey conducted among Polish MNEs (the first part) and their foreign affiliates (the second part) as part of the project called "Investment Activity of Polish Enterprises Abroad: Factors and Effects", conducted between 2010 and 2013 at Nicolaus Copernicus University, Poland as Research Grant No. N N112 322 338, financed by the Ministry of Science and Higher Education. The first part of the study covered 622 companies – Polish foreign direct investors. The research was carried out using the CAPI (Computer Assisted Personal Interviewing) method. A total of 64 valid answers were obtained, which means a return of 10.3%. The respondents were mainly representatives of senior and top management. It must be stressed that companies that participated in this part of the study had completed 278 OFDI projects. Among them,

52% were M&A projects and 48% greenfield investment. The majority of completed OFDI projects (44%) were associated with commercial activities and another 37% with services, 11% with production and trade, 4% with production only, 2% with trade and services, and 2% with production, trade and services. The lion's share of OFDI projects (97%) was located in Europe, particularly within the European Union (45% in the EU-15, and 22% in the EU-12).

All foreign affiliates of Polish MNEs identified in the preparatory proceedings were invited to participate in the second part of the study (a postal survey). There were a total of 659. Fifty correctly completed questionnaires were received, which means a return of 7.6%. Most foreign affiliates surveyed were located in countries directly bordering Poland, mainly in the Czech Republic (24%), Ukraine (16%), Russia (10%) and Germany (8%). The activities of foreign affiliates focused mainly on trade (36% of enterprises), services (32%) and production (18%).

Research Results

The results of the survey confirm that the two elements of international management discussed in the paper (i.e. configuration and coordination) were reflected in the practice of Polish MNEs (Table 1). An appropriate configuration of organisational resources was confirmed in 92% enterprises and the coordination of business operations in 96% of the surveyed enterprises. It should be emphasised, however, that the level of both resource configuration and activity coordination proved to be rather limited.

Table 1: The configuration of organisational resources and the activity coordination among the surveyed enterprises – assessment of foreign affiliates (the second part of the survey)

The level of organisational resource configuration / activity coordination:	Resource configuration	Activity coordination
high (%)	14.0	24.0
medium (%)	58.0	50.0
low (%)	20.0	22.0
Lack of proper configuration / coordination (%)	6.0	2.0
Prefer not to say (%)	2.0	2.0
Total	**100.0**	**100.0**

Source: own study based on survey results.

A vast majority (63%) of entities that declared having an appropriate spatial configuration of organisational resources, described its level as "medium", while 21.7% of them considered it "low" and only 15.2% said it was "high". Similarly, the majority of enterprises (52.1%) assessed their activity coordination to be at a "medium" level. 25% described their scale of coordination as "high" and 22.9% declared that it was "low". Therefore, despite a significant amount of activity among the surveyed enterprises in both analysed areas, the assessment of its effects remains only moderately positive.

It is not so much the concentration of efforts aimed at obtaining an appropriate spatial configuration of resources or activity coordination that is of most importance for a more complete evaluation of the degree of management integration at the transnational level, but a combination of both these elements. Only together, they can form the foundations for a desired architecture of a company's internal system. Taking into account the above postulate, a summary of the study results seems to confirm the previously formulated conclusion about the limited (medium) level of resource configuration and activity coordination among the surveyed Polish enterprises (Table 2). The results of the study revealed that relatively the highest percentage of enterprises surveyed (13.8%) showed a "medium" level of both spatial resources configuration and activity coordination. On the other hand, a slightly smaller proportion of entities declared "medium" configuration and "high" coordination

levels (10.5%) or "medium" configuration and "low" coordination levels (10.2%). The results of the study indicate that a "medium" or higher level of both resource configuration and activity coordination was declared by 37.3% of the surveyed enterprises, which is definitely less than when considering these two key areas of international management separately. Only 4.8% of the entities participating in the survey said that level was "high". A similar percentage of respondents (5.4%) assessed the level of configuration and coordination in their enterprises as "low", and 1.0% declared a complete lack of effort in these areas.

Table 2: The level of organisational resource configuration with coordinated activities in the surveyed enterprises – an assessment of foreign affiliates (the second part of the survey)

Level of resource configuration:	**Level of activity coordination:**			**Lack of proper coordination (%)**
	high (%)	medium (%)	low (%)	
high (%)	4.8	8.2	4.6	2.0
medium (%)	10.5	13.8	10.2	7.7
low (%)	5.6	8.9	5.4	2.8
Lack of proper configuration (%)	3.8	7.1	3.6	1.0

Source: own study based on survey results.

Table 3: Actions aimed at optimising spatial configuration of organisational resources and their importance from the perspective of international competitiveness of the surveyed enterprises – an assessment of parent enterprises (the first part of the survey)

Actions taken:	**Frequency (%)**	**Importance Rating:**	
		Indicator	**Rank**
delegating to work in foreign affiliates/branches	54.7	3.69	6
transfer of knowledge and skills	51.6	3.89	5
recruiting employees from foreign affiliates/branches	34.4	3.55	7
moving business units abroad	29.7	4.43	1
transfer of production technologies	28.1	4.03	4
creating profit centres abroad	21.9	4.21	2
performing R&D abroad	17.2	4.09	3

Notes: the importance indicator has a weighted average arithmetic structure and takes the value from 1 to 5; respondents rated the importance of individual types of activities on a scale from 1 – "invalid" to 5 – "very important".

Source: own study based on survey results.

From the point of view of increasing MNE global organisational efficiency, activities aimed at optimising spatial distribution of available resources, i.e. their appropriate geographical relocation and configuration (or reconfiguration) are extremely important. However, the results of the study revealed that nearly half (48.4%) of the participating entities did not take such action at all, 18.8% refused to answer this question, considering the subject to be too sensitive, and 6.2% said they did not have sufficient knowledge to express an opinion. Therefore, only 26.6% of enterprises from the sample (the first part of the survey) confirmed the implementation of activities aimed at optimising spatial configuration of organisational resources. The activities undertaken included mainly (Table 3) delegating employees to foreign affiliates/branches (54.7% of responses) and the transfer of knowledge and skills (51.6%). As part of the efforts in sharing experience and raising skills, 34.4% of

the surveyed entities also posted employees from abroad to the parent company in Poland. Other activities undertaken by the surveyed enterprises included transfer of enterprise units abroad (29.7% of entities), transfer of production technologies (28.1%), creation of profit centres abroad (21.9%), and performing research and development (R&D) abroad (17.2%).

The results of the study revealed that the highest rated actions from the point of view of international competitiveness of the surveyed enterprises are, paradoxically, those that were undertaken least frequently (Table 3). From the point of view of competitiveness, the most important factors were the following: moving business units abroad (4.43 rating), creating profit centres abroad (4.21), performing R&D abroad (4.09), and transfer of production technologies (4.03). The other factors were considered to be important, but not the most important, so they ranked lower even though these actions were implemented most often by enterprises. They were as follows: transfer of knowledge and skills (3.89 rating), delegating employees to work in foreign affiliates/branches (3.69), and recruiting employees from affiliates/branches located abroad (3.55).

Discussion and Conclusions

Summing up the considerations presented in the paper, it must be pointed out that the spatial configuration of organisational resources and the coordination of business operations within the transnational structures of Polish MNEs remain limited (their level can be generally defined as medium). This means that Polish enterprises experience benefits from international activities, but at the current stage of development, most of them are not yet able to maximise the effects achieved or fully realise the most advanced "Ot" advantages. It seems that this state of affairs may significantly affect the level of their international competitiveness, all the more so nearly half of the entities surveyed did not take active steps in order to optimise the spatial distribution of organisational resources, i.e. their appropriate geographical relocation and configuration (or reconfiguration). Moreover, the identified initiatives focused primarily on better utilisation of human capital throughout the enterprise (mainly by delegating employees to foreign affiliates/branches and knowledge transfers). So they concerned potentially important activities, but – as it turns out – not the most important ones in the context of international competitiveness. Paradoxically, actions identified as the most important (i.e. moving business units, creating profit centres, and performing R&D abroad as well as transfer of production technologies) were undertaken the least often. They obviously require much more organisational effort than the primarily mentioned initiatives. Nevertheless, there is no reason to reject them without careful consideration and thereby to ignore possible economic gains for a company. Our observations suggest, first and foremost, that in the case of Polish MNEs there are many areas of international management that still need improvement. Their managers must be fully aware of the possibility of reaping benefits from multinationality, then identify and monitor emerging opportunities and integrate business activities around the postulate of MNE global organisational effectiveness. The bundle of tasks outlined above will probably constitute the most important challenge for managers in the near future.

Although the results cited here do not directly relate to the types of effects obtained by Polish MNEs thanks to foreign expansion, they correspond well with the work of other authors. Namely, according to a number of studies (Szałucka 2015: 125–149; Trąpczyński 2015: 129–137; Jasiniak 2017: 49–55; Kuzel 2018: 355–366) the benefits highlighted by Polish enterprises as a result of FDI are positive, although their scale remains rather moderate. It seems that the level and range of benefits obtained from the internationalisation of Polish MNEs are essentially related to the current (i.e. medium) stage of their internationalisation. Therefore, they correspond to present possibilities and take into account the consequences of being latecomers in the global economy. It can be expected that the pursuit of a fuller use of already existing resources, access to new ones offered by foreign locations and their appropriate absorption, compilation, reconfiguration and utilisation in the economic systems of Polish MNEs will most likely be one of the most important activities undertaken and intensified in the future. This is mainly so because it is a consistent and logical consequence of the changes accompanying foreign expansion and one of the key aspects of further development of multinational enterprises. Secondly, the results of research on Polish MNEs (Kuzel 2016: 44–53) already indicate that enterprises with relatively the highest degree of internationalisation are the most oriented towards

increasing international competitiveness through appropriate spatial configuration of organisational resources.

We hope that the presented considerations may be an inspiration for further in-depth studies on ways of obtaining and using the most advanced "Ot" advantages, in particular by MNEs representing emerging, developing and less-developed economies. Further research should concentrate on a fuller recognition of how enterprises operate, including the degree of their internationalisation, the scale and scope of their activities as well as their external relationships, the specifics of sectors, socio-economic, cultural or political conditions, as well as comparisons of management styles and MNE development in various parts of the world.

Globalization and Man

Jolanta MALINA

WSB University in Poznań, Poland
jolantam@poczta.onet.eu

Absrtact

Man is the inspirer of but also himself the subject of globalization. However, is this process always beneficial to him? It is sometimes worth pausing for a moment in the run and listening to the opinions of those - who are personally affected by the globalization process, those who participate in it - what do they think about this process? The purpose of this article is to propose joint research on the threats of globalization that people of different cultures living in different parts of the world pay attention to. The practical aim of such research would be to develop a dataset of problems and threats that the average person faces. In January 2020, pilot studies were conducted, using the diagnostic poll method, survey technique. The aim of the research was to find out students' opinions from Poland on the subject: How do they perceive the dynamically developing globalization process? In the opinion of the respondents, one should be open to external influences, enjoy and feel a part of the world, but also remember one's own roots.

Keywords: Globalization, Social Threats

Introduction

Globalization is an ongoing unavoidable process benefiting countries and societies.
This process concerns global economy, technology, trade, communication, transport, culture, tourism, etc., it perhaps influences every aspect of human life and in modern times has spread at a tremendous pace.

Man is the inspirer of but also himself the subject of globalization. However, is this process always beneficial to him? It is sometimes worth pausing for a moment in the run and listening to the opinions of those -who are personally affected by the globalization process, those who participate in it - what do they think about this process?

The purpose of this article is to propose joint research on the threats of globalization that people of different cultures living in different parts of the world pay attention to. The practical aim of such research would be to develop a dataset of problems and threats that the average person faces.

Research Goal and Methodology

In January 2020, pilot studies were conducted, using the diagnostic poll method, survey technique, on a group of 200 students majoring in pedagogy of the Wyższa Szkoła Bankowa, an off-campus branch in Chorzów.

The aim of the research was to find out students' opinions on the subject: How do they perceive the dynamically developing globalization process?

In particular: What general and individual benefits do they see and what threats does globalization bring with it?

Test Results

Based on the analysis of the research results, the respondents' opinion on globalization can be summarized in the following sentence: students from Poland believe that globalization is a process that brings many benefits, but also many costs and threats.

The details of the research results are as follows.

Firstly, students were asked to explain the term "globalization" in their own words.

The most frequently used terms:

- International trade development;
- Blurring of borders, mixing of cultures;
- Economic and technological development with the benefit for people and a chance for a better life;
- The flow of goods, merchandize, services, technology, capital and workforce;
- Ease of communication (transport, Internet);
- Integration of countries, societies, cultures, creating a common world with the benefit for people;
- Progress, development;
- Cooperation, inter-dependence, unification;
- Broadening of horizons.

As a result of globalization, many areas, functioning of countries, societies, individuals have improved, which was noted by the surveyed students.

Most respondents 115 (57.5%) noticed that the access to broadly defined information increased.
Further positives concern the development of the economy and inter-personal contacts.

Some of the respondents' statements are presented below:

- Access to goods and services has increased (exchange of goods, including culture, development of technology and medicine);
- There has been a development of goods transport, trade development, export increase;
- Increased competitiveness in the quality of products and services;
- New management methods have been introduced;
- New workplaces have been created;
- Life opportunities, possibilities for human development and their living conditions has increased;
- Fast and easy contact with people is possible, simplicity of movement, transport developed, tourism travel possibilities are great, infrastructure related to this has developed;
- There is noticeable development of communication with another man, improvement of interpersonal relations, opening up to diversity, increase of tolerance;
- There has been intercultural development (drawing on the experience of others);
- There has been an increase in people's awareness thanks to travel and the Internet.

Next, the respondents were asked to list the benefits of globalization they had personally experienced.

Statements of the respondents were usually focused on the following areas:

- Access to information at any place and time, e.g. by using a smartphone. Such answer was given by 140 (70%) respondents.
- Fast flow of merchandise, availability of technology, products and goods from distant countries (e.g. food, music). 125 (62.5%) respondents turned their attention to this aspect.
- The opportunity to travel, meet people and cultures (travel is not only available to the selected, so that ordinary people also broaden their horizons, it also allows the development of language skills). This is an important benefit for 158 (79%) respondents.
- Increased access to workplaces, especially in international companies and for people who are open to learning a foreign language. 97 (48.5%) respondents turned their attention to this aspect.
- Facilitated interpersonal contacts through new technologies, development of means of transport (e.g. good contact with loved ones during labor migrations). 109 (54.5%) respondents noticed this benefit.

Threats associated with the globalization process that the students in Poland pay attention to.

Fear of the disappearance of tradition and regional and family customs was in first place, among the threats related to globalization. Losing one's individual distinct cultural identity and replacing it with uniformity, universalism, introduction of new customs taken from other cultures. Blurring the concept of patriotism.

This threat is important for 139 (69.5%) respondents.

Further problems which respondents most often noted were:

- The disappearance of natural environments through global development and the wasteful exploitation of natural resources;
- Dependence on the Internet and over-digitization (everything can be done without leaving home. On the other hand, information chaos may exist - too much information on the Internet that may be turn out to be false and useless;
- Increased dependence of poor countries on wealthy countries, widening the gap between them;
- The development of capitalism and the growth of international corporations that may dictate terms to individual countries;
- Excessive economic migration, exploitation of employees, failure of employers to respect employee rights. Increase in unemployment in traditional sectors of the economy, decline of small businesses;
- Decline of private interpersonal contacts, weakening of family ties, breakdown of the family, online contacts;
- Mental illnesses, depression caused by the pace of life and inability to adapt to it;
- Spread of terrorism and increased access to weapons;
- Loss of control of the size of globalization.

Conclusions

Based on this research, it is clear that the spectrum of threats associated with the globalization process is very wide. The surveyed students from Poland, however, paid the greatest attention to the fact that it is good to have and cultivate their local traditions, customs, values related to the family and their small homeland, and in their opinion those values are most threatened by the rapid pace of globalization.

It can be concluded that, in the opinion of the respondents, one should be open to external influences, enjoy and feel a part of the world, but also remember one's own roots.

This is the opinion of respondents from Poland.

As mentioned above, a larger-scale study would allow for the discovery of opinions about the risks of globalization process from the point of view of people living in different parts of the world and coming from different cultures.

It is necessary to pay attention to the threats connected with the globalization process and speak out about them loudly.

Evaluation of the Influence Blockchain Technologies on the Development of the Financial System

Abstract

The world economic system is currently transforming due to the massive introduction of information and communication technologies that have permeated all sectors of economic development. Completely new areas of economic development arise under the influence of the development and application of innovative digital technologies in the traditional areas. They are based on the latest advances in information technology, which allows these innovative areas to form completely new organizational forms of management. One of the drivers of digital transformation is the financial sector. It was in it that fintech received a new innovative direction, which is a synthesis of financial and the most advanced innovative digital technologies, within which completely new forms of financial institutions are formed. Besides, new types of banking products and services are created to expand the horizons for conducting business in a new format. Today, big data, artificial intelligence, cloud computing are successfully used in the financial sector, and on the basis of blockchain technology, the world's first digital currency - bitcoin - was created. Blockchain technology is used with great success in many financial areas. In connection with this, the possible ways of developing a financial system under the influence of the development and application of blockchain technologies are analyzed in this study. The technology of blockchain as a new technological paradigm is analyzed in the article that will allow to achieve outstanding heights in innovation in the financial sector. The advantages and disadvantages are explored that hinder the rapid implementation and use of these technologies in financial institutions. Possible areas in the financial sector are considered and analyzed, within which the use of blockchain technologies will be as efficient and optimal as possible. A study of the global market of blockchain technologies in the financial sector was carried out, its quantitative and financial indicators were determined, the main players in this market were identified. Further directions and prospects for the development of the financial system are identified based on a comprehensive analysis of the development and application of blockchain technology in the financial sector.

Keywords: Information Technology Management, Digital Economy, Innovation, Blockchain Technology, Financial Institutions, World Market, Development Prospects.

Introduction

The widespread adoption of information and communication technologies has contributed to the digital transformation of the global economic system. The massive introduction of innovative digital technologies has contributed to the formation of a new economic direction - the digital economy. It is based on the introduction of the most advanced information technologies that can provide a new qualitative leap in economic development, which allows to move to a new stage of economic

development, creating the so-called “smart economy” that can adapt according to the needs and requirements of each individual.

In the past few years, under the influence of digital transformation, the completely innovative directions have been formed as a part of traditional economic directions that contribute to the digitalization of the economy.

In the industrial sphere, Industry 4.0 has become such a direction, implying a transition to fully automated digital production controlled by intelligent systems in real-time in constant interaction with the external environment, going beyond the boundaries of one enterprise, with the prospect of combining things and services into a global industrial network.

Another innovative direction in the field of finance, which emerged under the influence of the development and application of digital technologies, was the fintech direction. This is an industry consisting of companies using technology and innovation to compete with traditional financial organizations represented by banks and intermediaries in the financial services market. Currently, fintech includes numerous technology startups and large established organizations trying to improve and optimize the financial provided services.

Fintech uses the most advanced information and communication technologies to create new innovative banking products and services, as well as transform the financial system itself by creating completely different organizational forms of financial institutions.

Blockchain technology became one of the breakthrough technologies used in the financial sector, the development and use of which allowed in 2008 to create the world's first cryptocurrency – Bitcoin. Today it is the most capitalized virtual currency in the world. The emergence of cryptocurrencies has given impetus to the development and application of technologies in the financial sector. At present, many financial institutions are developing in the field of research and application of this technology in the financial sector. Entire banking consortia are being created, including leading financial institutions from different countries that are engaged in research in the field of blockchain. For example, in 2014, the R3 banking consortium was created, which brought together 45 financial institutions from different countries, the main task of which was to research in the field of blockchain technologies and the possibility of applying them in the financial sector. Today, the number of participants in the consortium has become more than 70 credit organizations. (Rybyantseva et al, 2017; Treleaven, 2017)

Along with private business, states are also investing in the development and application of blockchain technologies. For example, in China, about $ 6 billion has been allocated for the state program for the introduction and use of blockchain technologies.

Today, blockchain technologies in the financial sector began to be used not only to create new cryptocurrencies, which have been created more than two thousand different types around the world but also found application in other areas, for example, organization of payments, accounting of banking operations. In the future, all financial institutions are expected to switch to using blockchain technologies, which will allow them to become more flexible and transparent for running their business. This can ensure a new level of business process implementation within the entire financial system.

Key Research Findings

Features of the implementation of blockchain technology

Blockchain is a truly revolutionary, fundamentally innovative way of storing and transmitting information over the network, with many possibilities for practical use.

Blockchain is an incorruptible digital book of economic transactions, which can be programmed to record not only financial transactions but also almost any value.

Blockchain is a “chain of blocks” that accurately reflects the essence of the phenomenon. Information blocks are collected in a sequential chain and are protected by cryptographic encryption. Chains of information are not stored on any particular server, but exist simultaneously on all computers connected to the network. The widespread adoption of blockchain technologies is believed to change the entire world economic system, because a decentralized blockchain system cannot be changed, i.e., hacked or forged.

At the same time, there is no need for intermediaries to carry out operations related to the transfer of important information. Information is transmitted via peer-to-peer protocol - from user to user. In this case, each participant has information about other participants, as well as access to the entire history of transactions committed in the system. The blockchain is self-sufficient, but at the same time extremely open structure and for its operation, third parties are not needed.

Not only monetary operations but also any other operations in which there is a risk of one of the parties' inability to fulfill certain conditions, will be protected and ensured by a block procedure. Blocks are connected in a circuit using complex mathematical algorithms. Each new block is tied strictly to the previous one, has a unique signature and timestamp. Adding a new link to the chain is confirmed by each participant in the system and leads to automatic updating of the registry. If a new block appears, information about this appears in all databases. To crack this system, one needs to get access to more than half of all computers involved in the network, and this is technically unlikely.

Blockchain technology has many advantages - it is decentralized, almost impossible to crack, and all information that is formed into blocks is automatically encrypted. (Chatterjee and Chatterjee, 2017)
Transaction transparency. All data embedded in the network remains transparent - information about all operations is available to each user.

Lack of a central server. Due to the lack of centralized information storage, it is almost impossible to control the block system - to change data immediately throughout the network, unlimited computing power is required. The base is distributed among all participants, so it remains almost invulnerable.

Availability of a full copy of the database for each user. Since each member of the block network has an updated copy of the database, there is no need to coordinate information with other users.

Fast and accurate transactions. A decentralized system with built-in burglary protection allows carrying out operations quickly, accurately and without intermediaries. Banks, exchanges, payment systems, notaries are no longer needed - the authenticity of transactions is verified and confirmed by all participants in the system.

Data encryption. The data that is generated in the block is encrypted automatically. Cryptography is a guarantee of complete data protection. Hashing in blocks ensures the irreversibility of the entire transaction chain, and digital signatures and two types of keys make information inside the blocks inaccessible.

The main drawback in the field of blockchain technology is scalability problems: many participants have to keep updated copies in order to work with the blockchain. This means that the same database is stored on thousands of nodes. It is pretty inefficient.

The innovative potential of blockchain technologies in the financial sector

The modern banking system is not perfect. Customers pay banks high commissions. Banks must have a large staff and use the not always reliable SWIFT interbank transfer system. States carry risks of being sanctioned and financially blocked.

Using blockchain eliminates intermediaries in banking operations and automates many processes. The efficiency of the banking system is also enhanced by lowering costs. Banks can obtain additional sources of income, thanks to the emergence of new business models and products based on blockchain.

So in March 2019, German banks Commerzbank and Landesbank Baden-Wuerttemberg conducted test transactions on the new blockchain platform for trade financing Marco Polo, which offers services of factoring, discounting receivables and payment of obligations. Now it is one of the leaders among blockchain platforms for trade finance: its business model is aimed at rapid expansion, due to its low entry threshold and the ability to integrate with other blockchain platforms.

The main areas of blockchain application in the banking sector.

Fast and cheap transfers. This is particularly relevant for cross-border transfers and micropayments, where the banking commission may be comparable to the amount of the transfer. While in banks, such transactions take a long time (up to 3-5 business days) and are expensive (from 1% of the amount). Globally, this is a huge expense. In cryptocurrency networks, transfers take several minutes and cost significantly less. So, a transaction worth 45.5 thousand bitcoins (about $ 280 million) in the summer of 2018 on the blockchain cost only $ 0.04 and took several minutes to complete. The same amount cost a transaction on the Litecoin network for $ 100 million in spring 2018.

Ability to automate processes and quickly process operations. This allows reducing costs and staff. Blockchain makes it possible to get rid of a complex workflow, because any operation can be traced. The guarantee of the permanency of the data is the technology itself, the human factor is excluded. There are already projects on the blockchain in the field of loans, customer identification, and corporate finance.

Ensuring immutability of transactions. That is, the inability to make retroactive changes and falsify reports. The banking system is not transparent. Blockchain will make all operations transparent and increase the level of trust between all participants.

Despite the interest in blockchain technology from financial institutions decreased at some point, which was just related to the problem of scalability, nowadays, research is continued by banks in this area. In 2019, the International Association for Trusted Blockchain Applications - IATBA, the European International Association of Trusted Blockchain Companies, appeared in Europe, which included 9 banks. Its work should contribute to the creation of blockchain infrastructure in Europe in compliance with all security requirements and the elimination of regulatory uncertainty. The founder of the Association is the European Blockchain Partnership. (Ahram et al, 2017; Beck et al, 2017)

Despite the absence of a revolution on the blockchain, banks have not given up research on this technology. Financial institutions are actively registering blockchain patents. For example, the People's Bank of China has registered 40 such patents, the Bank of America - more than 50. Patents have Western Union, Visa and MasterCard payment systems.

The Global Market for Blockchain Technology in The Financial Sector

Today, blockchain technologies are used not only in the financial sector, but have found their application in the public sector, manufacturing, healthcare and many other industries. In 2019, the entire global market for blockchain technology was estimated at $ 1.02 billion, of which more than $ 0.78 billion was in the financial sector (Fig. 1). (Ibrahim, 2019)

Fig. 1: The global blockchain technology market in the financial sector, millions of dollars

The leader among the regions of the world in introducing blockchain technology in the financial sector is North America, which accounts for over 41% of the entire market (Fig. 2). (Meyer, 2018)

Fig. 2 : Breakdown of the global market for blockchain technology used in the financial sector by region of the world

The United States is the undisputed leader in implementing blockchain technologies in the financial sector, accounting for over 38% of the entire market (Fig. 3). (Bhargava, 2019; Szewczyk, 2016; Yoo, 2017)

Fig. 3 : Leading countries in terms of investment in the use of blockchain technology for the financial sector

Today, the number of financial institutions using blockchain technologies in one form or another is about 376 credit organizations (Fig. 4). (Kaiser and Kirton, 2019)

Fig. 4 : The number of banks using blockchain technology, units

Among the financial institutions implementing blockchain technologies, the Santander bank can be singled out as the largest UK bank, which uses blockchain to develop an international payment service or China Construction Bank, which implemented a cross-border transfer platform for small companies using blockchain technologies.

Using blockchain technology in Russian financial institutions is singular. One of the national projects is the Masterchain project. This is the Russian national blockchain network, which is designed to transfer digital values and information about them between the participants, organized with the direct participation of the Central Bank of Russia.

The market for using blockchain technology in the Russian Federation is expected to be about $ 24.7 million by 2020 (Fig. 5). (Chernov and Chernova, 2018; Yeoh, 2017)

Fig. 5: The volume of the Russian blockchain technology market in the financial sector, millions of dollars

Nowadays, in Russia, the market for the application of blockchain technology in the financial sector is at the very initial stage, its players are several leading financial institutions of the country, for example, Sberbank.

Areas of using blockchain technologies in the financial sector

Blockchain has the potential to solve many problems that exist in the financial sector. The blockchain technology has all the attractive features required for a reliable cash flow technology. It is safe, reliable, decentralized, transparent and relatively cheap.

Blockchain provides a very high level of security and reliability in the exchange of data, information and money. It allows users to take advantage of transparent network infrastructure and low operating costs through decentralization. These characteristics make blockchain a reliable, promising and sought-after solution for the banking and financial industries.

Financial institutions perform the necessary function of ensuring security and, therefore, processes require a large number of intermediaries, which makes banking operations more expensive. Moreover, with the participation of too many people and manual processes, the likelihood of errors and fraud always increases. Blockchain technology ensures transaction security and makes them less costly for customers.

Today, the banking sector is actively looking for new areas and applications of blockchain technology. The American multinational investment bank JP Morgan Chase has created Quorum, specifically for the research and implementation of blockchain technology. Quorum is a distributed accounting system and smart contract platform for enterprises that supports fast transactions and high throughput, solving problems for the financial industry, banks and companies.

Bank of America has filed a patent that describes the implementation of an authorized blockchain to protect records, as well as verify the authenticity of business and personal data. The system will allow only authorized participants to access data and keep a log of all records. In addition, the proposed

system will use blockchain technology to combine several existing storage platforms into one. This secure single platform will increase overall efficiency and reduce user storage space.

Another Goldman Sachs bank, which is actively researching and supporting distributed ledger technology, has invested in a cryptocurrency project called Circle. The project is considered one of the most well-funded startups in the blockchain space. It aims to solve the key problem of volatility in the space of digital currencies, which makes the financial sector more reliable with the help of cryptographic options.

In the future, using blockchain technology will go into four main directions (Table 1). (Bril, 2017)

Table 1: The main areas of blockchain technology application in the financial sector

Smart contracts	Digital currency	Record keeping	Securities
Escrow	Equity	Healthcare	Derivates
Wagers	Private markets	Title records	Crowdfunding
Digital rights	Crowdfunding	Ownership	Debt
	Derivatives	Voting	Private markets
	Debt	Intellectual property	Equity

With the further development of blockchain technology, the range of areas in the banking sector will expand if problems with scaling this technology are solved.

Prospects for Using Blockchain Technology In The Financial Sector

Today, financial institutions have begun to take a more pragmatic look at the development and application of blockchain technology in the financial sector. At the beginning of the development of these technologies, blockchain was considered as a means of completely transforming the banking industry. Now a more balanced approach has been outlined that determines the introduction of blockchain in those areas that may transform, taking into account developments in this area. In the future, with the development and improvement of blockchain technologies, they will find their application in other areas of the financial sector.

According to a study of leading world financial institutions, about 30% of banks today are involved in one way or another in the application of blockchain technology (Fig. 6). (Guo and Liang, 2016)

Fig. 6 : The willingness of financial institutions to implement blockchain technologies, in percent

More than 70% of credit organizations take a wait-and-see attitude, looking closely at the results of their colleagues and the possibilities of using blockchain technologies in the financial sector.

Nevertheless, despite most banks are being waited, those will be able to achieve impressive results who is the first to effectively realize the opportunities provided by the blockchain.

According to a Javelin study, financial institutions lose between $ 15 and $ 20 billion annually from just one identity fraud. Banks are also regulated by customer data protection regulations. The EU General Data Protection Regulation, which entered into force in May 2018, strengthened citizens' rights to access data and agreed on protection rules. Some European financial institutions have invested up to 30 million euros to ensure their implementation, to ensure the reduction of the problem of money laundering. A WealthInsight report said global anti-money laundering (AML) spending exceeded $ 8 billion in 2017, up 36 percent from 2013. The number of AML employees has increased tenfold at major US banks over the past five years. (Cocco, 2017; Morozova, 2017)

Retail banks are making significant efforts to combat fraud, protect data and prevent money laundering, invest in automation and standardization, implement real-time information exchange and create predictive models. These initiatives have increased efficiency, but have led to longer logging times and higher costs, reflecting significant changes in the operating model and increased manual work.

In this case, blockchain may be a potential solution. Blockchain technology allows customers to use a digital fingerprint to register or open an account, which, as a real fingerprint, can be used as a unique identifier. It can be stored in a distributed register and refer to any bank on the network. The owner of the digital fingerprint can use it to submit new applications for the account and universal proof of identity.

The decentralized blockchain structure eliminates duplication of compliance checks with the KYC (user identification) and AML (banks exchange authentication information) protocols, eases the information load and allows banks to distribute data as they are updated.

According to experts, blockchain solutions for connecting customers can provide up to $ 1 billion in operating expenses for retail banks around the world and reduce penalties by $ 2-3 billion. In addition, block solutions are expected to reduce annual fraud losses by $ 7–9 billion. (Table 2). (Li, 2018)

Table 2: Cost reduction for financial institutions in the implementation of blockchain technology in the field of personal identification

Type of operation	Range of values, $ billion
Regulatory fines	2.0-3.0
Customer on-boarding operating costs	0.5-1.0
Lost/stolen	0.5-1.0
Counterfeiting	3.0-3.5
Card not present	3.5-4.5

The blockchain is tested and implemented when fraud is detected using identifiers, for example, by creating digital identification networks. Bluzelle, a blockchain storage system, worked in 2017 with a consortium of three banks in Singapore - HSBC, Mitsubishi UFJ Financial Group and OCBC Bank - to test the platform for KYC. The project showed that a blockchain platform would increase efficiency, reduce the risk of financial crime, and raise the ability to respond to performance and planning needs. The expected cost reduction is 25-50% when using. (Adamenko, 2017; Kiseleva et al, 2017)

In this regard, a further expansion of using blockchain technologies in the financial sector and, as a result, an increase in the global market over $ 20 billion are forecasted by 2027 (Fig. 7)

Fig. 7: Forecast of the dynamics of the global market in the financial sector, billions of dollars

Further introduction of blockchain technologies in the financial sector will allow financial institutions to reduce costs in conducting business and expand the horizons for the implementation of innovative business processes.

Conclusions

The massive introduction of information and communication technologies in all economic spheres has led to the formation of a new type of economy - a digital one, based on the implementation and use of the most advanced innovative technologies. New areas have appeared within the innovative economy in traditional sectors of the world economic system: Industry 4.0 in industry and Fintech in finance;
The financial sector is one of the drivers of the development of the innovative economy. Nowadays, financial institutions are successfully developing and applying technologies of artificial intelligence, big data, cloud computing. One of the breakthrough areas in the development of information technologies in the financial sector has become blockchain technology, on the basis of which the first

cryptocurrency in the world - Bitcoin - was created in 2008. It is the most capitalized virtual currency in the world today;

During the development and application of blockchain from the field of cryptocurrency formation, it has become widely used in the financial sector. Today about 380 credit organizations use these technologies in one form or another to develop the banking business. In addition, the volume of the global financial market was about 0, 78 billion dollars in 2019;

The development and application of blockchain technologies in the banking sector open up broad prospects for business development. For example, only in the field of identifying customers of financial institutions, annual cost savings of banks can be from $ 9 to 13 billion, while more than 70% of financial institutions take a wait-and-see position on the implementation of this technology. First of all, this is connected both with legal issues of legislation and with technical issues, in particular, problems of scaling the blockchain associated with the storage of vast amounts of information;

Nevertheless, it is worth noting that despite the imperfection and incomplete development of this technology, the areas of application in financial institutions is quite large. In the near future, these technologies will find further development in the field of virtual money, securities, accounting for transactions and smart contracts. Expanding the range of areas in the financial sector will lead to further growth in the global market for blockchain technology in this sector, which is expected to exceed $ 20 billion by 2027.

Abstract

The development of the modern world economic system is accompanied by the massive introduction of information and communication technologies in all sectors of economic development. The development and application of innovative information technologies have led to the digital transformation of the economy; today the landscape of the global system is rapidly changing. The introduction of innovative technologies is very rapid, which ensures the high dynamics of technological development. In today's world, a completely new innovative direction of economic development has emerged - the digital economy, which is based on the use of the most advanced information and communication technologies. The basis of any economy is the manufacturing sector, on the basis of which the entire economic system is formed, it is no coincidence that the manufacturing sector is undergoing a powerful digital transformation. One of the drivers for the development of a modern innovative economy is Industry 4.0, a direction that has been developed over the past few years, which involves the innovative development of not only industry, but also related areas. One of the main components of Industry 4.0 is the development of robotics, designed to provide full automation and autonomy of jobs. The goals and tasks that have to be solved within Industry 4.0 are analyzed in this study, the main components of this area are considered and investigated, it is determined that one of the basic components of the development of Industry 4.0 is the introduction and application of modern robots that can provide opportunities for the development of the manufacturing sector in direction of full autonomy of management and organization. In this regard, modern trends in the development of robotics are analyzed, a study of the world market of robots and robotic systems within the concept of Industry 4.0 is carried out, the dynamics of its development, average annual growth rates are determined, market leaders are determined, both among countries and among world robot manufacturing companies. Such key indicators as the density of industrial robots in different countries were determined in this study; the dynamics of changes in the cost of robots were evaluated under the influence of the development of innovative technologies. Based on the comprehensive analysis, further prospects of the global robotics are identified, within further digital transformation, determined by the direction of Industry 4.0.

Keywords: Information Technology Management, Digital Economy, Industry 4.0, Innovation, Robotics, Industrial Robots, World Market, Development Dynamics, Development Prospects

Introduction

The introduction of advanced innovative information and communication technologies at the beginning of the twenty-first century contributed to the beginning of a large-scale transformation of the global economic system. The development and application of digital technologies have ensured the formation within the traditional economy of completely new economic areas that provide new opportunities for

doing business, expanding the boundaries of development in all areas and moving to a new qualitative stage in the global economic system. Industry 4.0 in the manufacturing sector and Fintech in the financial sector are the main drivers of the digital transformation of the global economy.

Nowadays, innovative technologies of cloud computing, processing large amounts of information, artificial intelligence, blockchain, cyberphysical systems are widely used in various areas of the global economic system. In today's world, there is not a single direction, which would not be subjected to change under the influence of digital technologies.

The basis of any economic development is the production sphere; it provides the basis on which the entire framework of the economic system is built. Further advancement is impossible without modern high-tech production; it can ensure the creation of a new innovative economy that can meet the needs of each individual in accordance with his or her wishes and preferences. Therefore, one of the main components within Industry 4.0 is the development of robotics, as the basis for creating smart manufacturing. “Smart manufacturing” is a convergence where the capabilities of several components converge. Its main goal is to increase productivity and efficiency, in which intelligent business processes are combined into one whole using “smart” operating processes and technological equipment, and the result is the release of “smart” products. (Kusiak, 2018)

In recent years, the global robotics market has experienced a boom in its development, demonstrating amazing growth rates. Many countries of the world have joined the race associated with the creation of autonomous industries capable of providing not only production but also the design of new products. Today, China is one of the leaders in the global robotics market, which in 2019 introduced more than 230 thousand industrial robots, leaving behind many countries of the world that were recognized leaders in this field.

The research of modern trends in the development and application of robotics in the world, the progressive movement of which is due to Industry 4.0 is an extremely important and urgent task, the consideration of which should help to understand the prospects for the development of "smart production".

Key Research Findings

Definition and main directions of Industry 4.0

The concepts Industry 4.0, the fourth industrial revolution are becoming more and more popular and they are no longer just words, they are backed by real projects that are part of our lives. The Fourth Industrial Revolution is a combination of industry and digital technology, leading to the creation of digital industries or smart factories where all devices, machines, products and people communicate with each other through digital technology and the Internet. Klaus Schwab, President of the World Economic Forum in Davos, formulated the concept of the fourth industrial revolution in 2011. Klaus Schwab saw the global changes of humanity in the fourth industrial revolution, not the products will change in this revolution, but the people themselves and, accordingly, the whole world. (Xu et al, 2018) The concept of "Industry 4.0" is a synonym for the fourth industrial revolution, under this name the projects of the fourth industrial revolution are combined and implemented in enterprises. This direction was created in Germany and was presented at an exhibition in Hanover, and this happened due to earlier the German government demanded a wider introduction of digital technologies in production. The term "Industry 4.0" is also called the state program of Germany for the development of the economy by creating automated, communicating with the external environment, as well as personalized digital productions. Nowadays, Germany is the leader in the pace of development of Industry 4.0. However, similar programs are being implemented in other countries, for example, “Made in China 2025” - in China, “Connected Factories”, connecting factories to the network - in Japan, Industrial Internet - in the USA, etc. These programs will greatly enhance the competitiveness of manufacturers in these countries, and become market leaders.

Industry 4.0 is a transition to a fully automated digital production controlled by intelligent systems in real time in constant interaction with the external environment, going beyond the boundaries of one enterprise, with the prospect of combining things and services into a global industrial network.

Industry 4.0 leads to the massive introduction of cyberphysical systems in production, to the automation of most production processes, the endowment of devices with artificial intelligence and the introduction of many other modern technologies. All of this significantly influences the increase in productivity and lower production costs. (Demidenko, 2018; Zheng, 2018)

In addition, Industry 4.0 allows to make the market personalized, i.e. development and production of products individually for each person become a priority.

The basic principles of Industry 4.0 are:

1. Compatibility - all devices and machines have to be able to communicate with each other in the same language through the Internet of things, i.e. they have to be compatible.
2. Transparency - creating a digital copy of the product, collecting data from microchips and sensors through which devices communicate.
3. Technical support - the software collects, analyzes, systematizes, visualizes the data received from sensors, and helps a person make decisions or makes them automatically, thereby freeing up human resources.
4. Decentralization of management decisions, automation of various decisions by systems, the most complete human substitution.

One of the important components of Industry 4.0 is not the product, but the data. Digitalization of production is associated with data, large amounts of data that need to be read, collected, analyzed, systematized, processed, stored, transmitted, presented in the right form and much more. This requires appropriate information systems, software, wireless data transmission, cloud services for the exchange and storage of data.

Almost all objects and devices will include microchips and sensors, through which they will communicate with each other. By 2025, it is planned to connect 75.4 billion items to the Internet. (Ślusarczyk, 2018)

The main components of Industry 4.0 are:
1. Additive technology, 3D printing
2. Modeling and visualization
3. System integration
4. Internet of things
5. Cybersecurity
6. Cloud services
7. Augmented reality
8. Virtual reality
9. Autonomous robots, robotics
10. Planning and analysis online
11. Artificial intelligence
12. Energy-efficient technologies
13. Alternative energy
14. Big data and analytics
15. Remote service

The combination of all these components of Industry 4.0 will make the enterprise as automated and competitive as possible.

Analysis of the Global Robotics Market

The first industrial robots appeared in the 1950s, their implementation was sporadic and their fields of application were related to the military sphere. After the appearance of the first microcircuits capable of providing a new high-quality level of control in robotics, it facilitated the mass introduction of robots in many industrial areas.

Despite the development of robotics, it was only at the beginning of the twenty-first century with the advent of new technologies in the field of artificial intelligence, the development of computer technology that the introduction of robots became widespread. (Boden, 2017; Landsiedel et al, 2017) All robots today can be divided into two large groups.

Industrial robots are used in the manufacturing sector and are designed to automate manufacturing operations.

Service robots perform tasks related to the automation of operations useful to humans or equipment. In turn, service robots are divided into two large groups.

Professional service robots whose task is to obtain material benefits in the provision of certain services. *Personal service robots* that are designed for use in everyday life.

The total volume of the global robotics market amounted to over 81.3 billion dollars in 2019 (Fig. 1). (Gorodetskiy and Tarasova, 2019)

Fig. 1 : The global robotics market, billions of dollars

At the same time, the average annual growth rate of the global robotics market was 11.8%. Today, industrial robots occupy about 68% of the global market (Fig. 2). (Dailami, 2020)

Fig. 2 : The global robotics market by segments, billions of dollars

It should be noted that service robotics is significantly ahead of industrial 32% versus 8%, respectively, in terms of growth rates.

Currently, sales of robots have grown significantly in 2019; about 484 thousand industrial robots were sold (Fig. 3). (Gorodetskiy and Tarasova, 2019)

Fig. 3: Sales dynamics of industrial and professional service robots, thousands of units

Sales of personal service robots around the world were estimated at approximately 17.4 million units in 2019.

The increase in sales in all segments of the robotics market is primarily associated with a decrease in the cost of manufactured robots, due to improved manufacturing technologies, cheaper materials, as well as automation of most technological operations. Today, the cost of one industrial robot averages about 40 thousand dollars (Fig. 4). (Bogue, 2016)

Fig. 4: The cost of one industrial robot in the world, thousands of dollars

Asia is still the fastest growing robotics market in the world: in 2019, sales of industrial robots increased to 351 thousand units (Fig. 5).

Fig. 5: The global market for industrial robots by region, thousands of units

China is the absolute leader in the market of industrial robots, whose sales exceeded 135 thousand units in 2018 (Fig. 6).

Fig. 6: Countries leaders in the implementation of industrial robots, thousands of units

Japan is the absolute leader in the market of industrial robotics for the production of robots. In the ranking of the largest robot manufacturing companies, seven out of thirteen are Japanese (Fig. 7). (Kaivo-Oja, 2017; Pagliarini and Lund, 2017)

Fig. 7: Companies of world leaders in the production of robots, released over the entire time of their existence, thousands of units

If Asia is the leader in the market of industrial robots, then America is the leader in the market of professional service robots. (Wolfgang, 2017) In 2019, the volume of sold robots of this type amounted to 140.8 thousand pieces (Fig. 8).

Fig. 8: Market dynamics of professional service robots by region, thousands of units

The situation is similar in the market of personal service robots, where the leading positions also belong to America. (Nikolova, 2017) In 2019, over 9.6 million of these robots were sold in this region (Fig. 9).

Fig. 9 : The market of personal service robots by region, millions of units

While China dominates the industrial robotics market, the United States holds absolute leadership in the field of service robotics. In 2019, 389 service robotics-manufacturing companies were registered in this country (Fig. 10).

Fig. 10: Countries by the number of companies in the field of production of service robotics, units

One of the most important indicators of industrial automation is the density of robotization, which is determined by the ratio of the number of robots per ten thousand people employed in production. In 2019, the average level of density of robotization in the world was 117 units (Fig. 11)

Fig. 11: The average density coefficient of robotization in the world, units

South Korea is the leader in robotic density, in which the value reached 740 units in 2019 (Fig. 12).

Fig. 12 : Leader countries in terms of density coefficient of robotization, units

For comparison, the density coefficient of robotization was at the fourth level in 2018.

The main areas of robot application

The spheres of industrial robots are expanding today, but, for all previous years, the leader is the automotive industry. The automotive and electronics industries consume almost two-thirds of all industrial robots manufactured in the world. These industries account for 34% and 33% of all sales, respectively (Fig. 13). (Van Wynsberghe, 2016)

Fig. 13: The main areas of using industrial robots, in percent

The automotive industry is undergoing major changes and therefore requires new, more advanced robots. In connection with the European Union emission reduction program, European automakers are planning to increase the production of cars with low carbon emissions by 2030 and are gradually switching to fully electric transport. All this against the background of high consumer requirements for quality and product customization. As a result, sales of robots in the automotive industry grew by 24% in 2018. (Chen, 2018)

Over the years, the demand for robots in the automotive industry has largely determined the overall flow of investment in installing robots in the world. However, the status of the main robotics market has moved to another industry in recent years. In the leading countries of the robotics industry - Japan, China, South Korea - the main driver of demand for robotics was the production of electronics. The electronics industry accounts for 33% of the world's supply of robots. Demand for robots in this industry is growing rapidly: in 2018, sales increased by 35% compared to 2017. (Agarwal, 2017)
It is the growing demand for consumer electronics and the need to automate the entire production that continues to be the main factor in the global growth in sales of industrial robots.

Along with the expansion of the areas of application of industrial robots, the areas of using service robots are also growing. The main area of application of these robots is the logistics sector, which accounts for about 63% of the supply of all service robots (Fig. 14). (Webster and Ivanov, 2020)

Fig. 14 : Areas of using service robots, in percent

In 2017, sales of such robots increased by 162% compared to 2016. We can say that in the market of professional service robots there are only two types of robots - logistics and all the others. According to IFR estimates, in 2018, sales of logistics robots increased by another 66%. High demand for mobile logistics robots will be supported by the development of all types of trade, including electronic. In particular, experts estimate that e-commerce has created more jobs in logistics than it has declined in offline stores. (Goncharova and Bezdenezhnykh, 2018)

Prospects for the implementation and use of robots in the modern economy

According to the WEF International Economic Forum, 29% of global production is automated. For comparison, in 2022, the share of machines and algorithms in working time will be 42%, 52% - in 2025. Robots will do more and more work for people, but they are not able to take on all the work, only part of the tasks. According to some estimates, only a quarter of jobs can be automated by more than 70%. Automation performance may vary depending on the application. For example, about 47% of all processes are currently automated in the field of data processing, there will already be 62% by 2022, and only 19% (up to 28% - by 2022) - in the field of managerial decision-making.

Using technologies that are available today, it is can be automated 45% of the tasks of an ordinary company. If we consider individual sectors of the market, then, according to experts, the hotel and restaurant business sector are considered the most vulnerable to robotization - about 75% of the processes there can be automated by existing technologies. Mining (63%) of processes is in second place. About 30% of all processes can be automated in production. A small percentage of automation in this industry is associated with a high current level of automation - production is close to saturation point in contrast to other industries (Fig. 15). (Wirtz et al, 2018)

Fig. 15: Rating of directions, where the percent of works that can be automated is indicated, in percent

Further expansion and deepening of the areas of automation contribute to increasing the volume of the global robotics market, which will exceed $ 505 billion by 2025 (Fig. 16).

Fig. 16 Forecast of the dynamics of the global robotics market, billions of dollars

The number of industrial robots sold in the world market in 2025 is supposed to be about 920 thousand units.

At current growth rates, the share of revenue of service robots in the world market by 2025 is expected to exceed the figure of 60% and amount to about $ 300 billion.

Conclusions

One of the drivers for the development of digital transformation of the global economic system is Industry 4.0; a “smart economy” should be formed within this concept, capable of adapting to the needs and requirements of each individual;

One of the fundamental directions within Industry 4.0 is the digital transformation of the manufacturing sector, which implies a transition to a new qualitative level of development, involving going beyond a single enterprise and moving to a single global production system. Therefore, one of the most important

components in the concept of Industry 4.0 is robotics, the main task of which is to provide full automation of workplaces;

In today's world market, which is estimated to be at $ 81.3 billion in 2019, there are two large groups of robots: industrial robots, which should provide automation of production technological operations, and service robots, which are designed to perform maintenance operations. Industrial robots account for 68% of the global market, but this ratio is projected to change by 2025 in favor of service robotics, which will occupy about 60% of the global market;

One of the main areas of using industrial robots is the automotive industry, which accounts for over 34% of all implementations. However, in the last few years, the emphasis has shifted from it to the field of electronics production, which currently occupies about 33%. The main application of service robots is the logistics direction, which accounts for over 63% of all implementations. In the future, service robots can be used in the military sphere, agriculture, medicine;

The development and application of Industry 4.0 will contribute to the expansion and deepening of automation processes not only in the manufacturing sector but also in other economic areas. Therefore, according to the forecast, the growth of the global robotics market by 2025 is supposed to exceed the figure of 505 billion dollars, and the number of implemented industrial robots reach a value of 920 thousand units.

Abstract

The development of the global economic system is in the trend of large-scale implementation and use of information and communication technologies. Innovative digital technologies are changing the entire landscape of economic relations, creating completely new forms of management and organization of economic entities. The development and use of digital technologies have contributed to the formation of an innovative type of economy, the main drivers of which are the most advanced information technologies: artificial intelligence, cloud computing, blockchain and many others. Entire innovative areas that provide a powerful digital transformation of the economy have appeared within traditional areas of the global economic system. One of the main directions in the digital economy in the manufacturing sector is the development of Industry 4.0. The main task of it is the creation of "smart manufacturing" that can provide a new qualitative transition in the development of industrial relations and building production to meet the needs and requirements of each person. One of the main components of Industry 4.0 is the development and application of robotics, without which it is impossible to fully automate technological processes. It is no coincidence that in the past few years, most countries have joined the process of creating and applying innovative robot models. Sales of robots around the world are growing very fast. In many countries, programs to digitalize the economy have been adopted at the state level, where one of the main points is the development of innovative robotics and the full automation of both industry and all other areas of economic development. Russia has also joined the process of digital transformation of the economy, the main aspect of which is the development of robotics in the country. Goals and main directions of digitalization of the Russian economy are considered in this study. The tasks for creating high-tech industries based on the introduction and application of industrial robots that can provide a sharp increase in labor productivity are defined as part of the digitalization of the production sector. In this regard, modern trends in the development of Russian robotics are analyzed, an analysis of the Russian robot market is carried out, its main parameters are determined: market development dynamics, average annual growth rates, and the main players of the Russian market are identified. Identifying areas of using robots in the Russian economy is paid great attention in this article; areas for their wider application are defined. The reasons that hinder the introduction of robots in the Russian economy are identified and analyzed in this research. Based on a comprehensive analysis, further prospects and development paths for the Russian robotics market are identified.

Keywords: Information Technology Management, Digital Economy, Industry 4.0, Innovation, Robotics, The Russian Market, Development Dynamics, Perspectives.

Introduction

The development of the modern world economic system is moving towards the creation of a new type of economy - a digital one, based on the latest achievements in the field of information and communication technologies. Despite the rapid introduction of innovations in all spheres of economic development of the world system, it is impossible to build an innovative economy without digital transformation of the production sphere. Production is the basis on which the entire economic system is built. Therefore, it is no coincidence that Industry 4.0 is one of the main directions in the digital economy, which provides for a qualitative change in the production sphere.

One of the main components of Industry 4.0 is robotics, whose task is to create fully autonomous robots that can independently make decisions within their competencies.

Today, robotics is one of the fastest growing sectors of the global economic system. China is one of the leaders in the market of modern robots, which increased the introduction of robots to 135.8 thousand units in 2018. It is increasing the production of its robots along with the purchase of foreign-made robots, both through the creation of purely Chinese companies, and through acquisitions of companies of world leaders in robotics. For example, the German company KUKA, which is now more focused on the Chinese market. Such a dynamic development of the Chinese robotics market is due to the development of the state program on digitalization of the Chinese economy, under which up to $ 6 billion is allocated annually for the development of promising technologies.

One of the leading leaders in the market of service robots in the US over the past few years has been creating its production of industrial robots, which has almost been minimized, seeing the possible prospects for the introduction and development of innovative robot models in this area.

In general, the global robotics market is developing with an average annual growth rate of about 20%, while maintaining the pace of development, the market volume from the current $ 81.3 billion should grow to $ 505 billion, and sales of industrial robots should increase from 484 thousand units in 2019 up to 920 thousand units in 2025.

At the same time, the market will be expanded due to the coverage of new areas for the introduction of robots. By 2025, the number of service robots in the global robotics market will grow from the current 32% to 60%, which exceeds $ 300 billion. (Smirnov et al, 2018)

Russia, positioning itself as one of the leaders in world economic development, is trying to find its way in the digital economy, implementing innovative technologies.

One of the areas of development of an innovative economy is precisely the production sphere. Therefore, research in the direction of development and application of modern types of robotics is an important and relevant direction, allowing us to assess the possibilities of digital transformation of the Russian economy within Industry 4.0.

Key Research Findings

Digital Transformation of The Russian Economy

Today, the digital transformation of the economy has reached a level where investors have begun to receive real dividends from the introduction and use of information and communication technologies, when innovative digital technologies from the field of research have moved to the real sector of the economy, which has contributed to the acceleration of investment by potential investors.

Today, in many countries that are world leaders in the development of the digital economy, there is an investment growth from both the private business and the state in the development of promising technologies. For example, over 40 billion euros are allocated for the development of Industry 4.0 in

Germany under the state -private partnership, which allows it to be one of the leaders in the digitalization of the economic sphere. (Borremans et al, 2018)

In Russia, in 2017, the national state program "Digital Economy of the Russian Federation" was approved, the implementation of which should be completed in 2024.

The main end-to-end digital technologies that are part of this Program are:

Big data;
neurotechnologies and artificial intelligence;
distributed registry systems;
quantum technologies;
new manufacturing technologies;
industrial internet;
components of robotics and sensors;
wireless technology;
virtual and augmented reality technologies.
One of the important directions in this program is the development of robotics as the basis of modern production, which gave hope for the accelerated development and use of robots in the Russian economy.

About $ 43.3 billion was allocated for the entire program in 2018, the federal government invested $ 20 billion of which, and the remaining funds would be received from extrabudgetary sources.

In 2019, the program was adjusted to reduce funding for the program to $ 24.6 billion, while the federal budget would allocate $ 17 billion for it. In addition to reducing the cost of the program for digitalization of the Russian economy by almost half, out of the twelve priority programs, the Digital Economy of the Russian Federation program takes the last place in terms of budget spending (Fig. 1). (Raevskaya and Stogova, 2018)

Fig. 1 : The level of budget spending on Russian government programs, in percent

Such parameters for the implementation of the state program “Digital Economy of the Russian Federation” suggest that today the digitalization of the Russian economy is not a priority area of the Russian government. Accordingly, the prospects for the development and use of robots in the Russian economy are foggy; one of the indirect confirmation of this is the decrease patent activity in the field of robotics in Russia (Fig. 2). (Korneeva, 2020)

Fig. 2: Patent activity in Russia in the field of robotics, units

In terms of patent activity in the field of robotics, Russia returned ten years ago, which may indicate a decrease in interest in this area, in plans for scientific and practical developments.

The Russian robotics market

The first industrial robots in the USSR appeared in the 1960s; their production was single and was used in space and military spheres.

Mass production of industrial robots in the USSR began in the 1970s. In 1972, work in the field of robotics took on a planned character on a national scale: the first 30 commercially suitable industrial robots were created, including universal ones for servicing machines on pneumatic, hydraulic and electric drives, stationary and mobile. In particular, they were created and introduced commissioned mobile industrial robots MP-1 and Sprut-1. To continue this work, a production program was designed for the next five years. As a result, more than 100 brands of industrial robots were created and mass production of 40 brands of robots was organized. By the end of the 1970s, the industrial robot park in the USSR covered the main industries. The largest concentration of industrial robots was observed in the Ministry of Defense Industry - 255 units. The forecasted need for industrial robots in the USSR was determined - more than 120 thousand units by 1990.

The development and application of robotics practically stopped because of the collapse of the USSR. The first major introductions of robots in Russia began at the beginning of the twenty-first century. Today's Russian robotics market is estimated at approximately $ 50.1 million (Fig. 3). (Zatsarinnyi and Korolev, 2019)

Fig. 3: The Russian robotics market, millions of dollars

Russia occupies one of the last places in the world in the number of introduced robots, their number amounted to 983 units in 2019 (Fig. 4). (Levina, 2019)

Fig. 4 : The dynamics of the introduction of industrial robots in the Russian economy, units

One of the positive trends in the Russian market of industrial robotics can be noted its positive dynamics for the third year in a row. Despite this, the share of the Russian market in relation to the world continues to decline (Fig. 5). (Tkacheva et al, 2017)

Fig. 5: Changes in the Russian robotics market in relation to the world, in percent

Nowadays, the share of the Russian market from the world is about 0.2%.

One of the main indicators in the field of automation of production is the degree of density of robotization, which is determined by the ratio of the number of introduced robots per 10,000 people employed in industry. In Russia in 2019, this indicator was 4 units, with a world average of 117 units (Fig. 6). (Ashmarina et al, 2019)

Fig. 6: The density coefficient of robotization, units

The growth of the density of robotization in Russia is primarily due not to an increase in the number of robots deployed, but to a reduction in jobs.

The leaders in the density of robotization are the countries of Southeast Asia, for example, this figure is 740 units in South Korea.

Attracting robots to production is an expensive investment, so if there is cheap labor, it makes little sense to install high-tech equipment. It would seem that it is for this reason that the number of industrial robots in Russia is so small. However, this is not the only reason why the country has such a low level of robotization.

There is another characteristic, where the number of robots per 10,000 production workers is normalized by the level of wages of these workers (Fig. 7). (Afonasova, 2018)

Fig. 7: The rate of introduction of industrial robots to normalize salaries, in percent

According to this indicator, the countries of Southeast Asia occupy a dominant position. The top lines are South Korea and Singapore with acceptance rates of about 2.4 and 1.7 times. The adoption rate is calculated relative to the average of what might be expected based on the current average wage. Even countries like Thailand, which has only 48 industrial robots per 10,000 production workers, have acceptance rates 159% higher than wage levels that could be predicted.

On the other hand, it turns out that most countries in America and Europe implement robots much more slowly than expected. The United States and Great Britain showed an acceptance rate of 49% and 68% less than expected, this is due primarily to the fact that the markets of these countries today have a high degree of automation.

Even after the normalization of wages, Russia occupies the last place in the ranking; here it is inferior even to India, although the degree of robotization surpasses it.

In the Russian robotics market, there are about five domestic companies that manufacture robots (Fig. 8). (Kozlova, 2019)

Fig. 8 : Robotic companies in Russia, units

Among domestic companies, one can distinguish "ARKODIM" has two production bases located in Kazan and Novosibirsk. The company has been manufacturing industrial robots since 2014. The first experimental model of the robotic arm appeared in 2015, and since 2016, the company has been supplying industrial robots to customers. (Rudskaya and Rodionov, 2017)

The AvangardPLAST group of companies carries out the development, production and implementation of industrial robots. The company cites simplicity of management and quick parameter settings as the key advantages of its products. The company produces robotic manipulators for working with injection machines (injection molding machines, with different maximum loads and different axial travels). The robots-manipulators of this company GRINIK are manufactured in series, but individual models can be designed by the customer.

Among foreign manufacturers, the Japanese company FANUC is the leader in the domestic market, which occupies about 43.5% of the entire Russian market (Fig. 9). (Zueva and Gorovoy, 2018)

Fig. 9: Global companies manufacturing industrial robots in the Russian market, in percent

In the field of service robotics, Russia occupies the twelfth position in the number of companies producing robots of this type (Fig. 10). (Veselovsky, 2018)

Fig. 10: Rating of countries by the number of companies manufacturing service robotics, units

Despite a large number of service robotics manufacturing companies in Russia, the market size is relatively small and amounted to about $ 17 million in 2019 (Fig. 11). (Iskhakov, 2019)

Fig. 11 : Volume dynamics of the Russian service robotics market, millions of dollars

Russia has better chances in the development of service robotics, than in the development of industrial robots.

Areas of robot application in Russia

The main field of application of industrial robots in the Russian market is the automotive industry, which occupies about 38% of the entire market (Fig. 12). (Balashova and Gromova, 2017)

Fig. 12: The main areas of application of industrial robots in Russia, in percent

The automotive industry is a traditional field of application of industrial robots, both in the world and in Russia. Today, the automotive industry in Russia is experiencing difficult times, car sales are falling for several years in a row, and, consequently, production is also declining, which affects the introduction of robots in this industry.

Nowadays, using industrial robots in the field of electronics production, which occupies about 33% of the global market, is in the global trend. In the Russian industry, this share is about 1%, which is primarily due to the almost complete absence of such industries.

The most performed robotic operation in Russian production is the welding process - approximately 47% (Fig. 13). (Ossewaarde, 2019)

Fig. 13 : The main operations performed by industrial robots in Russian production, in percent

As you can see, most of the operations are related to the automotive industry to one degree or another. Promising areas for using industrial robots in the near future can be agriculture, mining, nuclear industry, shipbuilding and aircraft manufacturing.

Prospects for the development and use of robots in Russia

From the analysis above, it follows that the prospects for the development of robotics in Russia at the pace of investment, both from the state and from the private business, are very sad. Given the continued growth rate of the Russian robotics market, there may be a further lag behind world leaders, which already reaches truly catastrophic proportions.

Nowadays, there are more problems than opportunities in the development of robotics in Russia. One of the main systemic problems in the development of robotics in Russia is the lack of a clear industry development program (Fig. 14). (Petrenko and Voronkov, 2018)

Fig. 14: Systemic barriers to the development of robotics in Russia, in percent

In addition to systemic problems that stand in the way of the development of robotics in Russia, there are practical difficulties. One of the main in this regard is the low level of R&D organization in domestic companies (Fig. 15). (Balashova and Gromova, 2017)

Fig. 15: Practical barriers that hinder the development of robotics in Russia, in percent

Further development of the Russian robotics market will go at a slow pace; in the near future, there are no reasons for its acceleration. According to the forecast, the volume of the Russian market of industrial robots may reach $ 108.3 million by 2025 (Fig. 16).

Fig. 16: Forecast on the dynamics of the volume of the Russian robotics market, millions of dollars

The service robotics market, despite Russia's stronger position in this segment, will also not show impressive results; its growth will be more likely to be progressive without any acceleration opportunities (Fig. 17). (Ronzhin, 2018)

Fig. 17 : Forecast of the dynamics of the market volume of the Russian service robotics, millions of dollars

In general, it should be noted that the development of robotics in modern Russia is far from modern trends in this area. The lag behind world leaders in this direction is increasing and is taking on threatening prospects associated with the inability to provide a new technological breakthrough in the manufacturing sector and to modernize its economy to the new standards proposed by Industry 4.0.

Conclusions

An innovative sphere of economic development - the digital economy - has emerged under the influence of the large-scale introduction of information and communication technologies within the global economic system. One of the main directions of this is Industry 4.0, which is designed to ensure the transition of the manufacturing sector to a new high-quality stage of its development, the creation of "smart manufacturing", which allows adapt to the needs of a single individual;

One of the main components of the development of Industry 4.0 is the development and use of modern robots that can provide full automation of production. Therefore, it is no coincidence that the process of introducing industrial robots is ongoing around the world. One of the world leaders in this field - China -introduced about 135 thousand industrial robots in 2018, and the volume of the robotics market is supposed to exceed $ 0.5 trillion by 2025. Therefore, now many countries of the world invest in this area as part of a public-private partnership;

A program to digitalize the economy is adopted in Russia. One of the main components of it was the development of robotics, about $ 43 billion was allocated for the entire program until 2024, but by 2019, it had already been cut to $ 24 billion. While the budget execution level of these programs is at the level of 8%, which shows the corresponding attitude from the state to the digitalization of the economy and robotics in particular;

The volume of the Russian market of industrial robots is negligible. Its volume is about $ 50 million, which is about 0.2% of the entire global market. Russia occupies one of the last places in the world in the number of introduced robots; about 980 robots were introduced in 2019, another indicator, the density of robotization of the economy is at level 4, with an average world level of 117 units. This indicates the almost complete absence of automation using robots at Russian plants;

It can be stated that the development and application of robotics in Russia are practically not going on. The Russian market will lag behind world trends in this area with the financial support provided by both the state and private business. Moreover, the country will not be able to transform its production sector and, consequently, the entire Russian economy without developing one of the main components of Industry 4.0.

Relational Capital in Cross-Sector Partnerships

Maja JOKIEL

Wroclaw University of Economics and Business, Wroclaw, Poland
maja.jokiel@ue.wroc.pl

Abstract

When the public administration (the first sector) started to feel a need or an absolute necessity of executing the public tasks by non-public entities (NGO sector - the third sector, and business sector - the second sector), a need of creating the formal - and sometimes informal - "associations" of organizations descended from these three various sectors. Such activities were firstly identified as cross-sector cooperations (mostly run as informal associations of these organizations) and later as cross-sector partnerships (associations created within a framework of formal regulations). Therefore, the author assumes that both internal and external relational capital is a necessary determinant of creation, functioning and, most of all, the legitimacy of cross-sector partnership existence. The author wants to justify the thesis with the analysis of formal solutions and based on almost 10 years (2009-2019) of empirical research which was conducted in NGOs and public institutions in Silesia, Lower Silesia and Greater Poland voivodeships, as well as during the work with students. The following research tools have been used: participatory observations, interviews, analysis of literature and Internet sources. The aim of this article is an attempt to identify the relational capital within the cross-sector partnerships. Creation of research conclusions and a postulative layer will undoubtedly enable the realization of the article's goal.

Keywords: Relational Capital, Cross-Sector Partnerships, Interorganizational Relationships

Introduction

Cross-sector partnerships are a "phenomena" or specific "organizational structures" which have been increasingly identified and explored to show a need of establishing them for a modern state, economy, and citizens. These activities have intensified at the time of faster and more dynamic development of NGO sector (the third sector).

The partnerships are often quite complex because of the complexity of matters they are established for. They are often run in unpredictable circumstances, and their members come from different sectors. Each of them has a different language, culture, interests and strategies. The knowledge about these processes is nothing new, yet it has been poorly analyzed so far, especially in the area of shaping the relational capital.

An important factor conditioning the creation and functioning of cross-sector partnerships is a trust which is a concept hardly to define and identify. It cab interpreted as a specific kind of expectation that eliminates fear of the partner's opportunistic attitude [Kale 2000], a belief that none will take the advantage of other partners' weaknesses [Barney, Hansen 1994]. Trust between the entities of cross-sector partnership can be based on their reputation. However, it often has an individual dimension - a specific kind of mutual trust, respect and friendship is made at the individual level between the members of these partnerships. This phenomenon can be defined as internal relational capital, while the external relational capital are the structures for maintaining the proper relations with the environment. They include the receivers search system, sales networks, R&D projects, customer bases, brand and company's reputation, and strategic partnerships among others [Wilk 2004]. But it most often means a set of relations with the stakeholders of the environment - both contractual and institutional [Perechuda, Chomiak-Orsa, 2013].

During the creation of the theoretical basis of this study and the identification of relational capital phenomenon the question has arisen: what is the origin, basis and foundation of this capital.

Modern organizations have started to notice the intellectual capital in their resources, which is the difference between the market and accounting value of the organization, and which consists of the following subsets [Herman 2008, Łopaciuk-Gonczarczyk 2008, Wróbel 2009, Kasiewicz, Rogowski, Kicińska 2006]:

- human capital
- structural capital

Structural capital is considered as the reflection of relational capital created by the organization.

The basic premise when identifying the relation capital is that the employees, their knowledge, experience and competences are the key resources in the organization. Organizations which enter the alliances are seeking to minimize the risk resulting from the cooperation with unknown partners. Therefore, creation of the relation capital becomes one of the processes reducing the uncertainty of taken actions. An incentive to establish safe relations is an employee's knowledge about partners or previous experience of recent cooperation.

Relational Capital - A Conceptual Analysis

What is the relational capital? In the preparation phase, the author has reviewed the literature in terms of conceptual and definitional analysis, and the result was a bit of a surprise. Each of researchers who analyzes the relational capital comes up with his own definition depending on the represented research field. Therefore, it is true to state that there is no one ruling definition. The question is: what does it mean? Before the answer, it is worth to highlight the most convincing ones. At this point, it is important to mention that the relational capital term occurs in many fields, like: sociology, economics, management, psychology - the social and business psychology in particular.

The relational capital is relatively new concept recognized by both researchers and entrepreneurs. From the management perspective, it was initiated by the "relation paradigm" which became the basis of analyzing the relations within companies and between organizations as the intangible asset of companies [Danielak, 2012; Hormiga et al., 2011]. At the initial phase of interest in analyzing the relational capital, the focus was on the customer relations [de Castro, Lopez Saez, Navas Lopez, 2004; Agostini, Nosella, Soranzo, 2016; Ryals, 2005; de Leaniz, Bosque 2013]]. Some of the theoretical approaches define the relational capital as the set of partnerships - bilateral or multilateral based on trust and common behaviors and values [Camagni, Caragliu, Perucca, 2011; Elfenbein D.W, Zenger T. R 2014]. The other part of definition concerns the network and systematic nature of relational capital. N. Przybylska defines the relational capital as a network of connections and its development is determined by the cooperation of its members. This network concerns clients, suppliers, employees, business partners, institutions, and also competitors [2015]. J.D. Garcia-Merino, L. Garcia-Zambrano and A. Rodriguez-Castellanos present a broader view considering the relational capital is a network of all connections of enterprise with its business environment. In this context, relational capital is known as the potential knowledge enabling the quicker access to necessary resources [2014]. The relational capital is similarly defined by E. Hormig, R. Batista and A. Sanchez [2011] underlining the relations with business environment which creates dynamic-driven connection systems which the companies operate in. Also, A. Barao and A. Rodrigues da Silva define relational capital as the value of all social relations of the organization, both external and internal, which directly or indirectly contribute to achieving the company's objectives [2012]. In other words, for the organization's relational capital, the relations between stakeholders are important which are determining each other, forming a system as a whole [Danielak, 2012]. The perspective of internal and external dimension of relational capital was also defined by D. Duparc [2012]. The internal dimension of relational capital includes relations between employees, while the external dimension concerns all stakeholders. A similar understanding of relation capital was proposed by K. Perechuda and I. Chomiak-Orsa [2013], citing the definition by J. Wilk. The internal relational capital is defined as a set of intellectual property of organizations, working methods and processes, executive procedures, databases, and the informative and communicative infrastructure. In addition, the internal relational capital of organization primarily are relational resources formed by stakeholders who sub-form the organization, create an atmosphere and

trust within the organization. The external relational capital is considered as the structure needed to maintain a proper relations with the environment including, among others, the search system of recipients, sales network, R&D projects, customer bases, company's brand and reputation, strategic partnership.

The concept of relational capital gains a new significance when the technological changes are taken into consideration, as well as the current possible rate of information exchange between the entities. Then, it turns out that the relational capital is an ability to form a relation network, and not the set of already existed relations. This approach is proposed by K. Still, J. Huhtamaki and M.G. Rusell [2015], while underlining that the relational capital works within a certain framework of dynamic ecosystem. The dynamics of relational capital is also emphasized by I. Chomiak-Orsa as an ability to form and maintain close and lasting relations based on trust and cooperation [2013].

Most of presented definitions of relational capital describe this phenomenon in terms of the phenomena occurring on the organizational level. Having regard to the analyzed matters in this article, it is worth to combine this approach with the relational capital in regard to the interpersonal relations.

To sum up, it is worth to specify the answer on the previous question: what does it mean that researchers use a few definitions of relational capital? The answer is quite complex and should be a subject of separate scientific discourses. In the author's view, such conceptual variety shows that this concept has actually endless interpretive and cognitive possibilities.

Cross-Sector Partnership as An Example of Forming the Relational Capital

Following the main theme, it is important to present its cognitive foundations.

Because the purpose of this article is an attempt to identify relational capital in the cross-sector partnerships, it is worth to delineate the basics of cross-sector partnerships functioning. In the author's opinion, the following definition reflects the essence of cross-sector partnership in the most accurate way: "Cross-sector partnership involves two or more organizations from public, private and non-governmental sectors which form an unique relation going beyond unilateral actions and conventional contracts due to complementary usage of the partners' resources, as well as the effective risk and benefits sharing.[1]

While analyzing the cross-sector partnership in terms of the implementation system of social policies, the author assumes that it is described comprehensively as self-adapting form in regard to environmental conditions, which takes existing resources into account and the fact that its functioning is determined by external and internal factors. Within the definition that the system can be described as the set of elements remaining in mutual relations [Von Bertalanffy L., 1984], it is also true to treat cross-sector partnership as a consistent form whose foundation enables the implementation of added values, i.e. achieving socially useful and justified goals.

Cross-sector partnerships are often quite complex due to their foundation reason to solve complex problems. Moreover, such partnerships are often run in unpredictable circumstances, as well as the partnerships' members are the entities derived from various sectors representing different strategies, cultures, and interests of actors. Therefore, it is important to realize the need of forming and "cultivating" the cross-sector and interorganizational relations, and transforming these activities into capital, which could be necessary and useful in some cases of cross-sector partnerships functioning.

As part of the author's long-standing cooperation with organizations participating in the cross-sector partnerships, some interesting activities have been observed, mostly to form and enrich the relational capital. Also, some intriguing research questions have been raised:

- are the actions taken to identify, form and strengthen the relational capital conscious, intentional, repeatable and consolidated?

- are these activities undertaken from an organizational perspective?

- or are they rather an individual resource of organization's member participating in the cross-sector partnership?

- what incentives should be brought to encourage a member of organization to share its own individual resource?

The answers are complicated particularly in the aspect of activities undertaken by and towards the individual. Therefore, it is important to present the perception and capabilities of relational capital identification through the prism of an individual.

When we are born as an infant laying in the cradle, we unconsciously start forming first relation networks with our relatives and broadening them when growing up. At the time of their formation, they become important for individuals and are based on trust and cooperation. During the growth, some bonds become less important, and the new ones appear which reflects in the dynamics of relational capital, and therefore it is in certain sense a potential, value, but only for ourselves, while for someone else our relational capital can be completely worthless. Those formed bonds remain in our memory and could be brought when needed. How many times have we wondered where do we know each other from? The relations, made by the man which have been appropriately preserved and nurtured, form their own individual and unique relational capital.

The neurobiological basis of social functioning clearly points that we are social individuals. In prehistory, a tribe consisted of about 150 people. Our brain, despite of the technology development and industrial revolution, remained a prehistoric need of staying in a group of about 150 people. Despite the fact that, for instance, we have thousands of Facebook friends, we can only identify, associate and allocate the mentioned 150 ones according to our brain's knowledge. Nowadays in the high-tech world, we tend to notice a kind of substitution of establishing relations in a real world by using the Internet technology, and social media lead the way as cognitive tools. Bloggers and vloggers are becoming increasingly popular with a high number of followers. But, is this a positive phenomenon? Is the substitutability of traditional way of making relations a positive process? And again answer is difficult as the older generation cherishes the moments from their childhood, for instance, writing postcards, sending Christmas cards etc., were the best, and the current state is just a destruction of humanity. The result is so-called "generation gap", and this phenomenon is nothing new. Plato has already warned about the phenomenon of writing as he stated that the writing skills cause people to stop care about their memories. Can any of us imagine that one could not write anything? Take notes at the lecture, write down an interesting thought of the research authority or prepare the shopping list. All those things we do more often on devices such as smartphones, laptops, and tablets which is beneficial for us and for our environment. And it is the same with our relational capital. Nowadays, we are comfortable that - within the boundaries of legal, ethical and moral norms - we can act accordingly to our will, preferences, interests, and nobody should deny us because of this.

Therefore, each of us should cultivate our real relations taking an advantage of the boon that the modern world offers.

The above thoughts bring us closer to the answer on raised questions.

When undertaking the activities within cross-sector partnerships, the attention is paid to the creation and consolidation of relational networks. In order to support undertaking activities within cross-sector partnerships, the benefits should be identify consciously, creatively and repatably. Such benefits include [Mendryk 2007]:

- an increased acceptance of environment to form partnership initiatives between members from various sectors

- a preservation of a positive image of such initiatives

- a creation of solid foundation to build a high reputation, which is reflected in the increasing social and donors awareness

- more effective acquisition of resources which are necessary to operate and create the unique resources

The above benefits show how the relational capital values is being made and noticed from the organizational perspective. They also indicate the relational capital as an ability to create and maintain close and lasting relations based on trust and cooperation. In such approach, relational capital is located at the frontier of networking understood as the information exchange process, resources, mutual support, and the capability of forming optimal network of mutual contacts.

Last but not least, the author would like to address the matter related to relational capital, which is somehow overlooked by the research community, namely the relational capital formed and generated by the individuals. They form, as mentioned before, their own individual relational capital. Can it be associated with pulling some strings? At this point, another connotation comes to one's mind regarding a widespread phenomenon of nepotism in Poland. Nepotism[2] [definition after the Management Encyclopedia] is understood as abuse and pathology of public life. It derives from the fact that it disturbs a fair and equitable relations in the democratic state by giving an unjustified advantage to relatives over other equal entities. The definition narrows the pathological activities to relatives, but in practice the concept is expanded to friends and fellows, and so on. References to formal and professional relations established in the past are completely different phenomenon and has positive connotations. In this context, relational capital defines resources related to interpersonal relations. Or more precisely - the ability to maintain close and lasting relations and openness to the others. In the simplest terms, it is important of how and what friends and fellows an individual does have and how those relations can be used in a professional life.

However, many people are afraid of describing their relations as “contacts”. They prefer terms like “reference” or “recommendations”. Why is that? - the reason is that contacts are still being associated one-dimensionally and pejoratively as protection or nepotism, which was mentioned before, while in a modern world the so-called networking is an important element of relational capital which have been built throughout the life, and affects our professional relations. When it is said that someone was hired thanks to his contacts, a conviction occurs behind this statement that if such individual relied only on himself, he would have never got this job. This belief is a result of low level of social trust in our country - Poles simply do not trust each other, they often look for intrigues and pacts even if there is none. Contacts we established during studies, scholarships, previous work, are valuable part of our relational which should one not be ashamed of and just use them.

Conclusion

From over 10 years of empirical research (participating observations, interviews, analysis of literature and internet sources) of undertaking initiatives and functioning the cross-sector partnerships, the author has drawn following conclusions and formed some postulates that can be treated as a set of importance basics of using the relational capital in such endeavors. They can also be a kind of proof of the existence of relational capital in cross-sector partnerships:

- relational capital is the basis of the existence of cross-sector partnerships, a kind of “collection” in its philosophy of different organizations that “merge” to achieve a common goal that requires a prior relation establishment

- relations between partners of cross-sector partnerships should be based on trust, honesty, and solidarity

- cooperation of partnerships’ leaders can assure a steady flow stream of relational benefits

- cooperation of “benefits” usually generates additional knowledge and resources

- a possibility to identify relation managing processes based on experience of other countries and previous collected experiences
- identification of activities may start while establishing the informal relations
- relational capital emphasizes the awareness of the necessity of taking a leadership, not managerial, role in cross-sector partnerships
- social relations provide partners with prospects of cooperation thanks to which the resources of individuals can be supplied
- recipients/beneficiaries of cross-sector partnerships can gain a support, new information, establish new relations and deepen the integration skills
- partners of cross-sector partnerships learn collective actions, trust, integration with partners and recipients.

The above descriptions, assumptions and postulates show the validity of author's thesis regarding a necessary determinant of creation, functioning and legitimacy of the existence of cross-sector partnerships, which is the relational capital.

Summing up, in the light of the author's opinion, we should notice a need of building, nurturing, and supporting the individual relational capital throughout our lives, which is a very valuable resource. Everyone, whether an organization's member or an organization, should form it as wide as possible, which is relatively easy, e.g. the number of friends, or as deep as possible, which has already been difficult because it shows a commitment (knowledge about interests, marriage status, or place of residence) and quality of relational resources which form the relational capital. How to make it happen? It is an individual choice, because everyone - organization or a man - are different so that is their relational capital.

[1] Definition of partnership from the Partnership declaration from September 25, 2006 in Cambridge by a group of 130 world leaders of partnership and corporate social responsibility

[2] "Nepotism" derives from Latin word "nepos" meaning grandson, nephew or niece. Nepotism was originally defined as privileged treatment of illegitimate children and relatives by church hierarchs [Jones 2011, Wypych-Dobkowska 2010]. Currently, according to the PWN Encyclopedia, nepotism means a favouring relatives by high-ranked and influential officials when awarding a dignity and filling the attractive job positions [Koralewski 2016].

Technological Innovation in Hotels: Open the "Black Box" using a Systematic Literature Review

Abstract

The goal of this paper is to perform a systematic literature review (SLR) on technological innovation research in hotels. Based on 47 papers published in refereed journals indexed to the Scopus database, it was possible to identify, explore and systematize the main themes of the topic technological innovation: 1) Information and communication technologies (ICT) in general; 2) Internet usage (clients vs managers/hoteliers); 3) Mobile technologies (e.g., mobile apps and mobile devices); 4) Automation/self-service technologies (SST); 5) Mix of technological innovations; 6) In room-technologies (e.g., music system, video gaming console and satellite TV); 7) Radio frequency identification (RFID); 8) Biometric technologies; 9) Sustainable management technologies (efficient technologies); 10) Intelligent agent technology (IAT); 11) Teleconferencing and 12) Technology revenue management system (TRM). The analysis shows a significant lack of scientific papers on biometric technologies and green/ sustainable technologies, which represent important opportunities for further research.

Keywords: Innovation, Technological innovation, Hotels, Systematic Literature Review

Introduction

Technological innovation is a source of service quality improvement in the tourism industry in general and in the hotel industry in particular (Cruz *et al.*, 2016). Technology is having a significant impact on all businesses, and the hotel industry is no exception. Hotels are facing an increasingly competitive market, continually inundated by many similar services (e.g., Öztayşi, Baysan and Akpinar, 2009). Thus, to differentiate themselves, they must innovate, focusing on customer preferences, quality, and technological interfaces.

The adoption and implementation of such innovation depends on the customers, managers and employees characteristics (e.g., demographic factors such as education and age and traveler type - business and leisure traveler), which influence their willingness (i.e., perceived usefulness and perceived ease of use), and, also, hotel features (e.g., size and star rating) (Varol and Tarcan, 2009; Kim and Bernhard, 2014; Kim, Connolly and Blum, 2014; Lim *et al.*, 2018).

Technology is becoming a critical source of sustainable competitive advantage in the hotel industry since it facilitates/improves the offer of personalized services, enhances customers' experience, customer satisfaction, market share and performance (e.g., Öztayşi, Baysan and Akpinar, 2009; Brochado, Rita and Margarido, 2016; Dar, Joshi and Bali, 2016; Šerić, I. G. Saura and Praniĉević, 2016).

The main purpose of this paper is to report the results of a SLR based on 47 papers focused on technological innovation in the hotel industry. Therefore, this paper provides significant contributions both to the technological innovation and hospitality literatures: (1) to the best of our knowledge this is

the first SLR performed in the field, (2) the review provides an overview of the past research, identifying, exploring, and systemizing the literature on technological innovation in hotels, and (3) the survey highlights some limitations and future lines of research. In other words, the paper systematizes the main conclusions of the past research, identifies the main gaps, and provides some opportunities to further research.

The remainder of this paper is structured as follows. Section 2 reports the methodological procedures followed to perform the SLR. Section 3 presents a sample description and a systematization of the main contributions and methodological approaches of the 47 papers selected and analyzed. Finally, section 4 provides the main conclusions, limitations, and directions for future research.

Methodological Procedures

As stated above, this paper aims to perform a SLR on technological innovation research in hotels. Contrary to the traditional narrative review, which is subjected to bias by the researcher, the SLR secures replicability for future researchers (Tranfield, Denyer and Smart, 2003). Given its more objectivity and replicability, this approach has been increasingly used by management and organizational researchers (see, for instance, Keupp, Palmié and Gassmann, 2012; Bocconcelli *et al.*, 2018; Castillo-Vergara, Alvarez-Marin and Placencio-Hidalgo, 2018).

According to Denyer and Tranfield (2009), the SLR comprehends the following five steps: (i) question formulation; (ii) locating studies; (iii) study selection and evaluation; (iv) analysis and synthesis; and (v) reporting and using the results. In accordance, on 18 January 2019 it has executed a search in the Scopus database, which according to Durán-Sánchez *et al*. (2019) covers more indexed publications in this field of research than Web of Science database, using as keywords "innovat*" AND "hotel*" in the fields of "title, keywords, and abstract". To ensure the homogeneity, the sample was restricted to articles written in English, and allocated to the subjected area of "Business, Management, and Accounting". In addition, the sample was restricted to articles published in international journals by the end of 2018. This process resulted in a total of 505 papers. After analyzing the title and abstract of the all papers, 264 papers were eliminated because they are not related with the field of innovation in hotels. Therefore, 241 papers remained.

Using the VOSviewer 1.6.8 software and the bibliographic coupling method those papers were analyzed in order to identify the current trends on innovation in hotels. The analysis enabled to identify nine research streams related to the innovation in hotels (Fernandes and Pires, 2019). One of these research streams is related with the technological innovation in hotels. Consequently, all the 241 papers were analyzed in order to select only the papers focused in the study of technological innovation in hotels. This process allowed to identify 47 papers focused in the study of technological innovation in hotels that constitute the sample of this paper.

Results

This section encompasses two parts. The first one presents a brief description of the sample, exploring the publications' evolution and the words (and terms) most quoted in the papers' title and abstract. The second one contains the classification and analysis of the papers according with the focus of study and approach adopted.

Sample Description

Figure 1 shows the number of papers on overall innovation and technological innovation in hotels published by year. As can be seen the first publication found was in 1982, the number of papers on innovation in hotels published until 2004 is small and the number of papers on technological innovation until this year is very small. Nevertheless, this trend changed and there is a substantial increase of the publications until 2018, which reflects the growing importance of this topic of research. Regarding the publications on technological innovation in hotels 2016 was the most productive year with 10 papers.

Figure 1: Number of papers on overall innovation and technological innovation in hotels by year

Using the VOSviewer software it was identified the words (and terms) most quoted in the title and abstract of the papers on technological innovation in hotels. Figure 2 highlights the results and represents the 37 words (and terms), from 47, quoted more than six times in the papers' title and abstract. 10 words (and terms), such as data, paper, research and study, were excluded because they are quoted in the majority of the studies independently of their focus. In other words, these words (and terms) are not specific of the field under study in this paper.

As Figure 2 shows, the words (and terms) that most stand out are hotel, technology, adoption and innovation, which match the goal of this paper. These words (and terms) appear interrelated with a secondary level of other words (and terms), with less emphasis in the Figure below, such as application, factor, guest, intention, service and hotel industry. Figure 2 also highlights words (and terms) related with some technological innovations used in the hotel industry such as information technology, internet innovation and Radio Frequency Identification (RFID).

Figure 2: Representation of the 37 words (and terms) most quoted in the title and abstract of the papers analyzed

As a whole, those words (and terms) suggest that the papers of the sample focus on the study of the adoption of technological innovations in hotels (e.g., Lim, 2009; Tarcan and Varol, 2010; Chan, 2012; Theodosiou and Katsikea, 2012; Pace, 2016), the intention to use some of these innovations (e.g., Aluri and Palakurthi, 2011; Morosan and DeFranco, 2016) and the factors that influence the adoption and intention to use (Aluri and Palakurthi, 2011; Fernández, Cala and Domecq, 2011; Kim and Bernhard, 2014). They also signal the study of some technological innovations such as information and communication technologies (e.g., Morosan and DeFranco, 2016; Ŝerić, I. G. Saura and Praniĉević, 2016; Sarmah, Kamboj and Rahman, 2017) and RFID (e.g., Aluri and Palakurthi, 2011; Cobos *et al.*, 2016).

Focus of technological innovations and approach of papers' sample

Table 1 presents the types of technological innovations identified in the 47 papers analyzed and the main theoretical and empirical contributions. The most studied technologies are information and communication technologies (ICT) in general, internet usage and mobile technologies (e.g., mobile apps and mobile devices). More recently, these latter technologies have been received increased attention from researchers and gained significant preponderance.

Table 1: Focus of the papers analyzed

Focus of technological innovations	Authors	Contributions
Information and communication technologies (ICT) in general	Jacob and Groizard (2007), Tseng, Kuo and Chou (2008), Karadag and Dumanoglu (2009), Varol and Tarcan (2009), Tarcan and Varol (2010), Fernández, Cala and Domecq (2011), Singh and Munjal (2012), Farsani, Sadeghi, Shafiei, and Sichani (2016), Ŝerić, Saura and Praniĉević (2016), Sen and Kaushik (2016) and Nikolskaya *et al.* (2018).	- Analysis of ICT innovation for management, provision and commercialization (e.g., manner in which customers interface with service providers and customer relationship management), for new services offer, productivity of guest-related ICT applications and their benefits (e.g., maximizing service effectiveness while keeping costs low for long-term sustainability). - Investigation of the internal and external antecedents of ICT innovation and the challenges that hotels face in their adoption.
Internet usage (clients vs managers/hoteliers)	Gregory, Kline and Breiter (2005), Hashim and Murphy (2007), Vadell and Orfila-Sintes (2008), Kang and Brewer (2009), Lim (2009), Simmonds and Lupi (2010), Chan (2012), Theodosiou and Katsikea (2012), Verma, Stock, and McCarthy (2012), Capocchi (2014), Hashim *et al.* (2014), Zeng, Gonzalez, and Lobato (2015), Brochado et al. (2016), and Dar, Joshi and Bali (2016).	- Understanding the determinants and hoteliers' intensity of internet technologies adoption and explanation of the main barriers to their adoption. - Investigation and discussion of the importance of factors determining the internet innovation for internal use (e.g., internal communications and administration) and for external relations (e.g., use of domain names for online branding, additional marketing channels to extend the offer to new markets, hotel search and selection and online reservations). - Analysis of the perceptions that hotel sales and marketing professionals have about Internet and Web integration in the group sales process. - Analysis of the relationship between the internet adoption and customer stay, customer satisfaction, customer loyalty and organizational performance.
Mobile technologies (e.g., mobile apps and mobile devices)	Verma, Stock and McCarthy (2012), Kim, Connolly and Blum (2014), Dar, Joshi and Bali (2016), Morosan and DeFranco (2016), Sarmah, Kamboj and Rahman (2017) and Morosan (2018).	- Study of the use of mobile technology, by travelers, to learn more about available hotels and their intentions to co-create value, as well as managers' willingness to use such technology and the factors influencing their willingness to use it. - Investigation of the individual roles of hotel guests' intentions to use hotel apps and also the impact of such apps and websites on customer satisfaction and customer loyalty.
Automation/self-service technologies (SST)	Chandrasekar (1988), Kucukusta, Heung and Hui (2014), Kuo, Chen and Tseng	- Investigation of the factors that influence the extent of automation in a hotel, such as keyless system and service robots.

	(2017), Lim *et al.* (2018) and Montargot and Lahoue (2018).	- Examination of business travelers' perceptions of SST adoption as well as sensemaking and acceptance of SST implementation from the perspective of the front-line employees.
Mix of technological innovations	Orfila-Sintes, Crespí-Cladera and Martínez-Ros (2005), Jacob and Groizard (2007), Sharma (2016) and Bowie (2018).	Analysis of the innovation activity (e.g., security, kitchens, dinning-rooms and bars, cleaning and laundry, gardening, health and nutrition, reception area) in the transformation of hotel industry, namely in the improvement of the customer experience.
In room-technologies (e.g., music system, video gaming console and satellite TV)	Capocchi (2014), Bilgihan *et al.* (2016), and Brochado *et al.* (2016).	Description of how hotels implement new in room-technologies to enhance competitiveness, namely, improving guests' stay. In particular, Bilgihan *et al.* (2016) analyze both leisure and business travelers' perceived importance and satisfaction of in-room technologies, which contribute to enhancing the customer experience and increase guestroom revenues.
Radio frequency identification (RFID)	Öztayşi, Baysan and Akpinar (2009), Aluri and Palakurthi (2011) and Cobos *et al.* (2016).	- Examination of the process of RFID adoption and implementation in the hospitality industry and investigation of the demographic factors' influencing consumer attitudes and their intentions to use it. - Study the use of RFID as a tool for increasing performance (e.g., service quality, customer satisfaction, market share).
Biometric technologies	Morosan (2012) and Kim and Bernhard (2014).	Examination of the factors that influence customer's attitudes and intentions to use biometric systems in hotels (e.g., fingerprint systems and iris image).
Sustainable management technologies (efficient technologies)	Jacob and Groizard (2007) and Pace (2016).	Investigation of how hotel industry combines its capabilities and learning in order to adopt and transfer efficient technology innovations (e.g., energy saving systems, water saving systems and treatment of wastage and recycling).
Intelligent agent technology (IAT)	Alsethoohy and Ayoun (2018).	Investigation of the influence of IAT on hotels' food procurement practices and food procurement performance.
Teleconferencing	Hansen and Knuff (1982).	Analysis of how teleconferencing works and suggests ways in which operations can profit from it.
Technology revenue management system (TRM)	Guadix *et al.* (2010).	Test of the TRM system, an advanced technology in the management of hotels' reservation, that sets the revenue maximization criteria, helping managers in the decision-making process.

As pointed out in the Table 1, the existing research analyses the internal and external antecedents, adoption and use, and, also, the influence of technological innovation, as well as the actors involved in this process: customers/guests, managers and employees.

The literature review highlights that mobile technologies have been captured the researchers' interest, particularly used in the process of co-creation to customize services and, consequently, to fulfil customer needs and expectations (Sarmah, Kamboj and Rahman, 2017; Morosan, 2018). Moreover, the literature survey also reveals the lack of studies focused on the biometric technologies and green technologies. Considering the topicality of such types of innovations, in particular the increasing pressure to reduce the impact of tourism firms' activities on the environment and adopt environmental innovations, further research is clearly needed.

Finally, Table 2 shows the types of approaches used in the 47 papers analyzed. The majority of papers are empirical (42), using quantitative (31), qualitative (7) or mixed (4) approaches, while the remainder apply a theoretical approach (5). The quantitative papers use, mainly, questionnaires to collect data (e.g., Orfila-Sintes, Crespí-Cladera and Martínez-Ros, 2005; Jacob and Groizard, 2007; Varol and Tarcan, 2009 Aluri and Palakurthi, 2011; Kim, Connolly and Blum, 2014; Zeng, Gonzalez and Lobato, 2015; Morosan, 2018) and a broad variety of statistical techniques to analyze them, such as structural equation modelling (e.g., Aluri and Palakurthi, 2011; Kim, Connolly and Blum, 2014; Zeng, Gonzalez and Lobato, 2015; Morosan, 2018). In turn, qualitative papers use interviews to collect more in-depth data (e.g., Chan, 2012; Cobos et al., 2016; Montargot and Lahoue, 2018) and some of them use

qualitative data analysis software to code the data (e.g., Cobos et al., 2016; Montargot and Lahoue, 2018).

Table 2: Types of approaches used in the papers analyzed

Types of approaches		References
Empirical	Quantitative	Chandrasekar (1988), Gregory, Kline and Breiter (2005), Orfila-Sintes, Crespí-Cladera and Martínez-Ros (2005), Hashim and Murphy (2007), Jacob and Groizard (2007), Tseng, Kuo and Chou (2008), Vadell and Orfila-Sintes (2008), Kang and Brewer (2009), Karadag and Dumanoglu (2009), Varol and Tarcan (2009), Guadix *et al.* (2010), Tarcan and Varol (2010), Aluri and Palakurthi (2011), Morosan (2012), Theodosiou and Katsikea (2012), Verma, Stock and McCarthy (2012), Capocchi (2014), Hashim *et al.* (2014), Kim and Bernhard (2014), Kim, Connolly and Blum (2014), Kucukusta, Heung and Hui (2014), Zeng, Gonzalez, and Lobato (2015), Bilgihan *et al.* (2016), Dar, Joshi and Bali (2016), Farsani, Sadeghi, Shafiei, and Sichani (2016), Morosan and DeFranco (2016), Ŝerić, Saura and Praniĉević (2016), Sarmah, Kamboj and Rahman (2017), Alsethoohy and Ayoun (2018), Lim *et al.* (2018) and Morosan (2018).

Conclusions, limitations and Avenues for Future Research

This paper performs a SLR on technological innovation in hotels based on 47 papers published in refereed journals indexed to the Scopus database. To our knowledge, it is the first SLR conducted in this specific field, and brings contributions both to the technological innovation and hotel management literature, providing an overview of the past research, identifying and systemizing the existing literature and detecting some gaps that may be addressed in the future.

The academic community's interest on the technological innovation in hotels seems to emerge in 1982, with a non-linear growing of publications. The review identifies 12 types of technological innovation presented in Table 1 and shows the methodological approaches used, in Table 2.

From a theoretical point of view, the review allows researchers to characterize the current state of art and identify future research streams (not mutually exclusive) – biometric technologies and sustainable/environmental technologies – not extensively analyzed in the existing literature.

From a practical point of view, the review allows managers to have a wider vision of the determinants of technological innovation adoption and implementation, not only their own characteristics but also the characteristics of their employees, and their benefits. This means that in a recruitment process managers should carefully consider the features of employees that, according to the academic research, better match technological innovation in hotels.

A limitation of this paper is that, as can happen with any SLR, in our selection process some references, related to the issue studied, may have missed. However, the SLR shows several types of technological innovation with impact on current and, predictably, on future hotel industry activity. So, this review may be an inspirational root for further research on such a relevant issue.

Abstract

The paper is addressing the issue of defective products, their returns, and their management. It is concentrated on the sample of micro, small, and medium-sized Polish production companies, as in these entities the defective products have the biggest percentage share as well as the responsibility for them. The research findings proved that the intensity and quality of the defective products management processes depend on the size of the manufacturing enterprise. They can be of considerable application significance when referred to the enterprises' practices, and the recommendations for managerial staff can be formulated on their base. However, it is necessary to adopt an individual approach here because of differentiated parameters of the enterprises. The presented research is the only study on the defective products management in manufacturing sector of Polish industry up to date.

Keywords: Management, Defective Products, Production Company, Reverse Logistics.

Introduction

The objective of the paper is to compare the intensity and quality of production enterprises divided in accordance to the employment size into micro, small, and medium. The used methodology covers the results of survey studies and their statistical analysis with the Mann-Whitney U test. Research results point out the significant differences and similarities in defective products management in micro, small, and medium production companies.

The paper is divided into five sections. The first section is the literature review, addressing the issue of defective products, their returns and management, and showing similar researches review. The second presents the research methodology used to investigate the issue of defective products management in production companies. This section consist of the research sample and the survey research in manufacturing companies, as well as the Mann-Whitney U test method. The third section of the paper is dedicated to the presentation of the results obtained and their comprehensive interpretation. The fourth part is a short discussion for the research results and direction of future studies. And finally the last section of the paper presents briefly the conclusions and summarizes the paper.

Literature Review

Production companies have always struggled with the diverse requirements of consumers, markets, economics, and/or business partners. One of such challenges are the defective products for which in most cases the producer is responsible.

A defective product is a product that is not waste, which however does not meet the quality and/or functional requirements against which it was manufactured in various stages of its life (Starostka-Patyk 2017).

Defective products appear in production companies in the form of returns. The category of defective product returns includes the used and no longer functional products that need to be disposed of in the form of market, manufacturing and/or distribution returns (Fleischmann 2001). Defective product returns present the value that is possible to be recovered and all or some part of that value might be used again in the market or for the production in the form of second value products, secondary raw materials, by-products or components after the appropriate processing (Nitkiewicz, Starostka-Patyk 2017). In general, there are five main recovery options for the defective product returns handling: repairing – returning the used products to working order, refurbishing – bringing the used products up to a specified quality, remanufacturing – bringing the used products up to the quality standards that are as good as those for new products, cannibalization – recovering a limited set of reusable parts from the used products or components, and recycling – the aim is to reusing materials from the used products or components (Grant et al. 2014).

In practice of production companies, a lot of defective product returns are present, so to recover their value manufacturing enterprises have to manage them properly (Nitkiewicz 2013). Management of defective products is defined as the management of all processes and operations related to returned defective products by final and original users to the supplier or manufacturer with the intention of cost-effective recovery and compliance with all legal standards (Shulman et al. 2011). This means that the management of defective products covers the full range of activities related to the implementation of processes aimed at value recovery from defective products to supply the same or other enterprise or its business environment with this value (Fig. 1).

Fig. 1: Products and defective products management in an enterprise and its business environment (own elaboration based on Monahan 2004).

The enterprises never function independently, but rather in cooperation with the business surroundings where they remain. Therefore, the defective products management covers not only the structure of a given enterprise, but also involves other participants of its surroundings. The groups of entities that participate in the defective products management can be listed as following (Jeszka 2014): base entities (manufacturer, agent, and retailer), specialized intermediaries (recycling points, recovery organizations, etc.), and public-private and charity organizations. These entities, by taking part in the

defective products management, deal with numerous types of returns towards which the defective products management processes are implemented.

In the literature thematically related to defective products, returns, and their management, it is evident that the use of its processes in business activities brings tangible benefits to diversified profiles and industries as well as entire sectors and branches of the economy (Nowakowska-Grunt, Kabus 2017). Examples of remains management in specific companies and industries (sectors) are presented in the following studies: Kodak and recovery from the market of construction elements of original final products (Jayaraman, Luo 2007); Dell and reverse logistics processes on the computer assembly line (Kumar, Craig 2007); publishing sector and possible, supposed benefits after implementation of reverse logistics (Wu, Cheng 2006); electronics industry in China and problems related to the implementation of reverse logistics processes (Lau, Wang 2009); manufacturing industry in China and the issue of development of products with a completed life cycle in reverse logistics flows (Subramanian et al. 2014); food containers and reverse logistics in their recycling and reuse (Jayaraman et al. 2003).

The implementation of remains management processes in various sectors is presented in the works: carpet production (Biehl et al. 2007); retail trade (Bernon et al. 2011); bottling and bottling industry (González-Torre et al. 2004); paper production (Ravi, Shankar 2006); enterprises packing goods (González-Torre, Adenso-Diaz 2006); production of mobile phones (Rathore et al. 2011); pharmaceutical industry (Narayana et al. 2014); recycling of batteries and accumulators (Wang et al. 2014).

Regarding the increasing importance of defective products management, many manufacturing companies began to take its processes as a strategic tool for gaining economic benefits and improving the social image of the company (Kannan et al. 2012). Enterprises have also noticed that better understanding and utilization of defective products management, as well as effective implementation, allow a competitive advantage (Stock, Mulki 2009). Although many industries now use defective products management processes in their activities (Bajdor 2017), perceiving them in terms of sustainable competition and gaining market advantage (Szkutnik 2010), there are still inaccuracies and lack of information regarding the adaptation and implementation of these processes (Richey et al. 2004; Grondys 2017).

Methodology of the research

Research sample

Within the project realization (details in acknowledgment), in the first quarter of 2014 a survey was conducted in Polish manufacturing enterprises from sectors with high potential for defective products, mainly from the automotive sector, household industry, furniture industry, electronic and computer equipment, toy and clothing production, etc. (Starostka-Patyk 2017).
While designing the research that would adopt the representative method, the goal was the maximum possible reduction in the sample size but at the same time to maintain the required certainty and accuracy of conclusions. Classic sampling schemes offer some formulas that allow to calculate an approximate size of such a sample. In cases of fraction estimation (structure ration, percentage) in the simple random sampling scheme, the minimum sample size can be identified from the following formula (1):

$$n = \frac{u_a^2 p(1-p)N}{u_a^2 p(1-p) + (N-1)d^2} \tag{1}$$

where:

α – statistical significance (0.1–0.01);

u_α – value from normal distribution tables for the assumed level of significance;

p – structure ratio (fraction) based on the pilot study; where the fraction value cannot be determined even as an approximate value, the least advantageous situation is assumed $p = (1 - p) = 0.5$;

d – maximum estimation error determined on the level of 1-5%.
The assumed significance level for the performed research was 0.1, and the maximum estimation error was 5%, thus the minimum sample size was identified with 267 companies. On this base, the sample of 302 enterprises identified for the research is the representative sample.
The next stage was where the researched population was stratified according to operational activities undertaken the enterprises, based on the Polish Classification of Activity (pl. Polska Klasyfikacja Działalności, PKD), into 13 strata identified from the following formula (2):

$$n_h = \frac{N_h}{N} n \tag{2}$$

where:
n_h – estimated size of the sampling units in subsequent strata,
h – number of strata,
N_h – size of subsequent strata,
N – size of the researched population (41,680),
n – sample size (302).

These 13 strata reflect the industries with high potential for defective products. In case of stratified sampling, a specific number of units sampled from each strata is searched for, so the average error of the parameter evaluation is as low as possible. Proportional allocation was selected in case of the researched sample out of other methods. It consists in sampling of subsamples from particular strata in such a way that the relation between each subsample's size to the general sample's size is equal to a fraction of particular strata, expressed in relation to the size of the whole general population. This results in a self-weighting sample that meets the requirement stating that probability of getting into the sample should be identical for all units that compose the general population.

Identification and surveying of the representative sample of 302 Polish manufacturing enterprises allowed the analysis of the collected results with interference extended to the general group of the enterprises. The sampling process consisted in selecting a certain number of Polish manufacturing enterprises, as this was the population of theirs that was the base for the research. Thanks to randomness of the sampling process, the sample is a mini picture of the whole population, reflecting the research features and variables (Zawada 2004).

The final sample structure is presented in detail in Table 1 providing the general characteristics of its operations and its size (with percentage share).

Table 1:Research sample's structure

Type of Major Activity according to PKD	Description	Size in the sample
14.13	Manufacture of other outwear	87 (28.8%)
14.19	Manufacture of other wearing apparel and accessories	11 (3.6%)
26.3 and 26.4	Manufacture of (tele)communication equipment Manufacture of consumer electronics	6 (2.0%)
26.7 and 26.8	Manufacture of optical instruments and photographic equipment Manufacture of unrecorded magnetic and optical media	4 (1.3%)
27.2	Manufacture of batteries and accumulators	1 (0.3%)
27.5 and 27.9	Manufacture of domestic appliances Manufacture of other electrical equipment	5 (1.7%)
28.0	Manufacture of machinery and devices, not elsewhere classified	45 (14.9%)
29.3	Manufacture of spare parts and accessories for motor vehicles	10 (3.3%)

30.9	Manufacture of transport equipment, not elsewhere classified	3 (1.0%)
31.0	Manufacture of furniture	120 (39.7%)
32.2	Manufacture of musical instruments	2 (0.7%)
32.3	Manufacture of sports goods	3 (1.0%)
32.4	Manufacture of games and toys	5 (1.7%)

Research Survey

A survey questionnaire was composed of 15 substantive questions, particulars, and a confidential part. In the first stage there was a pilot study, carried out on a sample consisting of 10 Polish manufacturing enterprises. Afterwards the main research was performed on a representative sample of 302 Polish manufacturing enterprises.

The main survey questionnaire was performed in the first quarter of 2014. It was carried out as an interview via a telephone, with the CATI method. The group of respondents covered representatives of the enterprises working in managerial positions on the level of whole companies or persons that they designated as responsible for management of the defective products' flows, i.e. receiving returns of products and developing the company's strategy and policy in that field.

The survey questionnaire was comprised of notions related to the defective products and their management. There were mostly closed and multiple-choice questions, such that it allowed scores to be ascribed to particular items. Other questions were also of a closed character, but with a single answer. While beginning the phone interview each respondent needed to specify whether there are any defective products in the represented enterprises, revealed via returns. Only a positive answer for this question allowed further participation in the research. Therefore it was possible to examine the whole group of companies, which the representative sample's size was specified for, and it was not necessary to eliminate the surveys out of formal reasons.

The main part of the survey questionnaire allowed acquisition of information about the management of defective products in Polish manufacturing companies. The raised notions were focused on the following thematic areas: (1) defective products (returns) categories, places of their emergence, their quantitative condition and occurrence intensity; (2) return period, duration of the returns processing cycle; (3) politics and motifs for acceptance of returns, influence of the return on the company's profitability and development of the competitive position; (4) problems related to processing of defective products - implementation of actions in reverse flows management, an analysis of barriers for effective management of returns, systems supporting the reverse logistics processes.

The Mann-Whitney U test

To determine the differences and similarities in the management of defective products in Polish manufacturing companies a study of the interdependence between variables related to the defective products management was made. To be more precise, in order to determine the significance of differences and similarities between the characteristics of the defective products management in groups of Polish manufacturing enterprises selected regarding the number of employees, the Mann-Whitney U statistical significance testing was carried out.

The Mann-Whitney U test (a non-parametric test for means significance differences) is intended to compare two independent groups of given samples. The zero hypothesis says that the samples come from the same population, i.e. there are no significant differences towards them, in comparison to the alternative hypothesis stating that the samples being compared come from various populations, i.e. they are significantly different (Szajt 2014). The testing statistics is as follows (3):

$$Z = \frac{\left(R_{\min(k)} - \frac{n_k(n_k+1)}{2}\right) - \frac{n_1 n_2}{2}}{\sqrt{\frac{n_1 n_2 (n_1+n_2+1)}{12} - \frac{n_1 n_2 \sum_{i=1}\left(t_i^3 - t_i\right)}{12(n_1+n_2)(n_1+n_2-1)}}} \tag{3}$$

where:

$R_{min(k)}$ – sums of ranks for the group where the sum is lower
n_k – number of observations in the group with a smaller sum of ranks
n_1 – first group size
n_2 – second group size
t – number of observations with the same rank

p (p-value) is the probability of making the I type error (rejecting the tested hypothesis). It is the lowest significance level leading to rejection of the tested hypothesis. If p (p-value) is lower than the assumed significance level, then the tested hypothesis is rejected to the benefit of an alternative hypothesis.

The Mann-Whitney U test was employed to the discussed research to find out whether the differences in evaluation of the main characteristics of the defective products management are statistically significant in the groups of manufacturing enterprises selected according to the number of their employees. The lack of statistically significant differences means that characteristics of the defective products management are similar in the groups of manufacturing enterprises selected according to the number of their employees. On this base the values of the Mann-Whitney U test allow to determine the differences and similarities in the management of defective products in Polish manufacturing companies.

The manufacturing enterprises that took part in the research were divided into groups regarding the employment level - i.e. micro, small, medium and large-sized enterprises. Participants of the research were mainly the representatives of production companies employing up to 9 persons (micro-sized enterprises) – over half of the respondents (54.1%). The next two groups in terms of its size were composed of small-sized enterprises – 10 to 49 persons (30.3%) and medium-sized enterprises – 50 to 249 persons (12.3%). The lowest percentage share was taken by big-sized companies that employ more than 250 persons (3.3%).

According to the Mann-Whitney U test methodology the large enterprises were not considered in the research because the share of their representatives taking part in the survey was too low. Therefore, the performed test compared: (1) micro and small enterprises; (2) micro and medium-sized enterprises; (3) small and medium-sized enterprises.

Results and interpretation of the research

The Mann-Whitney U test results with ranges and mean evaluations for particular variables in selected groups of Polish manufacturing enterprises are presented in a table form.

At first the emergence intensity (Tab. 2) and quality (Tab. 3) of particular returns categories were assumed as a variable. This data allows to assess the scale of the occurrence of defective products in manufacturing enterprises, and in the next step it will allow to analyse characteristics related to the management of these products.

Table 2: Mann-Whitney U test values, ranges and mean evaluations for emergence intensity of particular categories of defective products returns as variable in the assumed groups of the Polish manufacturing enterprises

Variable	micro/small		micro/medium		small/medium		Mean evaluations of the enterprises

**Ranges: 1-terrible, 2-poor, 3-satisfactory, 4-good, 5-very good, 6-perfect.*

Indicating the statistically significant differences for emergence intensity and quality of particular categories of defective products returns in micro, small, and medium-sized Polish manufacturing enterprises it is possible to point out that: (1) the emergence intensity of damaged products in the micro enterprises is significantly different (smaller) than in case of small enterprises ($Z = 4.7680$; $p < 0.0001$) and medium enterprises ($Z = 3.4766$; $p = 0.0005$); (2) quality condition of the damaged products returns in micro enterprises is significantly better when compared to returns of those products in the medium

enterprises (Z = 2.0243; p = 0.0429); (3) the products unsold in retail emerge significantly more often in the group of medium enterprises than in micro (Z = 4.1084; p < 0.0001) and small enterprises (Z = 3.0485; p = 0.0023); (4) the products erroneously taken as defective emerge significantly less often in the group of micro enterprises than in small (Z = 3.0221; p = 0.0025) and medium enterprises (Z = 2.9190; p = 0.0035); (5) the quality condition of the products erroneously taken as defective in micro enterprises is significantly worse when compared to small enterprises (Z = –2.4027; p = 0.0163); (6) the qualitative condition of the waste and by-products is significantly better in micro enterprises than in small enterprises (Z = 2.1017; p = 0.0356).

All the rest of the test results do not state statistically significant differences which means that it is possible to assume that they indicate the similarities for emergence intensity and quality of particular categories of defective products returns in micro, small and medium-sized Polish manufacturing enterprises. The emergence intensity and quality of outdated products, seasonal products, products withdrawn from sales, product components and packaging has the similar level in micro, small, and medium manufacturing companies in Poland. The same is in case of unsold products quality and waste and by-products emergence intensity.

The next Mann-Whitney U test was made for the following variables: the most frequent period for the defective product returns (calculated from the moment of handing it to distribution), duration of the average returns processing cycle in the enterprise, evaluation of the enterprise's policy in the scope of the defective products returns acceptance, impact of the returns on reduction in the enterprise's profits, and influence of the manner of defective products management in an enterprise exerted on implementation of the enterprise's objectives (Tab. 4).

Table 4: Mann-Whitney U test value, ranges and means evaluations for the return period, duration of the returns processing cycle, restrictiveness of the returns policy, impact of the returns to profitability and implementation of the enterprise's objective as variables in particular groups of the Polish manufacturing enterprises

Variable	micro/small		micro/medium		small/medium		Mean evaluations of the enterprises			
	Z	*p*	*Z*	*p*	*Z*	*p*	ranges*	micro	small	medium

**Ranges: (a) 1-up to 1 week, 2-from 1 week to 1 month, 3-from 1 to 3 months, 4-from 3 to 6 months, 5-from 6 to 12 months, 6-from 12 to 18 months, 7-from 18 months to 2 years, 8-from 2 to 3 years, 9-from 3 to 5 years, 10-more than 5 years; (b) 1-less than 1 day, 2-from 1 to 2 days, 3-from 2 days to 1 week, 4- from 1 to 2 weeks, 5- from 2 weeks to 1 month, 6-from 1 to 2 months, 7-from 2 to 6 months, 8-more than 6 months; (c) scale from 1 to 6 points where 1-very restrictive and 6-very liberal; (d) 1-significant reduction, 2-slight reduction, 3-no reduction; (e) scale from 1 to 6 points where 1-negative and 6-positive.*

The results of Mann-Whitney U test allow to state that the differences in the scope of variables: return period, returns processing cycle duration, restrictiveness of the returns policy, influence of the returns on profitability and implementation of objective in micro, small, and medium Polish manufacturing enterprises, are not statistically significant.

Lack of differences means there are similarities within the pointed out characteristics of defective products management activities in micro, small, and medium production companies. It is possible to assume that all groups of manufacturing enterprises most often receive the returns in a period from 1 week to 1 month, only in case of small companies the return period might be longer, but in rare situations. Duration of the average time for returns processing in researched groups of enterprises takes in general from 2 days to 1 week, in cases of micro and medium enterprises longer periods are possible, but not very often. The returns policy was rated by micro, small, and medium Polish production enterprises as liberal or even very liberal, only in case of some companies from each group its rating was at lower level, but still with the liberal direction at the scale. Similarly the reduction of profitability because of returns acceptance was rated by surveyed companies. Micro, small, and medium production enterprises pointed out no or slight reduction of profitability that is connected with returns of defective products. Also the defective products and their management activities have a positive impact on the implementation of enterprises objectives in micro, small, and medium companies. They rated its influence with 5 or 6 positive points on the scale.

Table 5 presents the Mann-Whitney U test values where the assumed variable was the motive for the defective products returns acceptance by the manufacturing enterprises.

Table 5: The Mann-Whitney U test, ranges and mean evaluations for motives of the defective products returns acceptance as variables in particular groups of the Polish manufacturing enterprises

**Ranges: 1-non-significant, 2-significant, 3-very important.*

The test results suggest two main differences between micro, small, and medium enterprises: (1) micro production companies perceive that getting rid of unnecessary products from the market motive is significantly less important when compared to evaluation of this motive for the defective products returns acceptance by small ($Z = –2.6472$; $p = 0.0081$) and medium enterprises ($Z = –2.0842$; $p = 0.0371$); (2) micro enterprises see that preventing displacement of new products by the secondary-market products is less important when compared to evaluation of this motive by medium enterprises ($Z = –2.3234$; $p = 0.0202$).

To highlight the similarities in micro, small, and medium manufacturing enterprises it is important to notice that none of the motives were evaluated as a very important one. All the mean evaluations of motives of defective products acceptance are around 2 points, i.e. significant motive. The best rates were given to the improvement in customer service quality, meeting the legal and environmental requirements, and reduction in the loss on value of unsold or defective products motives. The lowest attention seems to be paid to getting rid of unnecessary products from the market and prevention of displacement of new products by products from the secondary market.

While managing the defective products in manufacturing enterprises, the very important characteristics are the actions regarding this issue. Table 6 covers test values where the assumed variables are the actions undertaken in the scope of the defective products management by micro, small, and medium Polish manufacturing enterprises. Because some actions might not be undertaken by the enterprise at all, and some might be done independently and/or might be outsourced, respondents had to choose the way of the action realization while answering the questions.

Table 6: The Mann-Whitney U test, ranges and mean evaluations for actions related to the defective products management as variables in particular groups of the Polish manufacturing enterprises

**Ranges: 1-independently, 2-outsourced, 3-not undertaken.*

With the results of the Mann-Whitney U test the following differences may be concluded regarding the actions related to the defective products management micro, small, and medium Polish manufacturing enterprises: (1) micro enterprises undertake actions intended to defective products returns acceptance significantly less often when compared to small ($Z = 4.5058$; $p < 0.0001$) and medium enterprises ($Z = 2.8389$; $p = 0.0045$); (2) micro enterprises undertake actions intended to repackage the defective products returns and sell them as new products significantly less often when compared to the medium enterprises ($Z = 2.8587$; $p = 0.0043$); (3) micro enterprises undertake actions intended to sell the defective products returns as accepted significantly less often when compared to the small enterprises ($Z = 2.7307$; $p = 0.0063$); (4) micro enterprises undertake actions intended to perform production from recovered products or components significantly less often when compared to the small enterprises ($Z = 2.9245$; $p = 0.0035$) and medium enterprises ($Z = 3.3651$; $p = 0.0008$); (5) micro enterprises undertake actions intended to organize sale significantly less often than the small enterprises ($Z = 2.7153$; $p = 0.0066$) and medium enterprises ($Z = 2.7774$; $p = 0.0055$); (6) medium enterprises undertake actions intended to recover the components significantly less often than the small enterprises ($Z = 2.5344$; $p = 0.0113$) and micro enterprises ($Z = 3.6522$; p = 0.0003). Analysing the similarities in micro, small, and medium enterprises regarding the actions undertaken to defective products management, it is possible to assume that all researched groups do not realize independently the charity donations and scrapping. Only a small share of enterprises outsource these two actions. Activity of remanufacturing the defective products seems to be undertaken independently or outsourced in micro, small, and medium enterprises, and scrapping mostly is not undertaken at all or outsourced in small share.

The Mann-Whitney U test was also done for barriers of effective defective products management in the manufacturing enterprises as assumed variables (Tab. 7).

Table 7: The Mann-Whitney U test, ranges and mean evaluations for barriers of effective defective products management as variables in particular groups of the Polish manufacturing enterprises

Variable	micro/small		micro/medium		small/medium		Mean evaluations of the enterprises			
	Z	*p*	*Z*	*p*	*Z*	*p*	ranges*	micro	small	medium
Company's policy	-0.0330	0.9737	**-2.1413**	**0.0322**	-1.8786	0.0603	0-1	0.1	0.1	0.2
Aspects of competitiveness	0.0497	0.9604	0.3263	0.7442	0.2727	0.7851	0-1	0.1	0.1	0.1

Non-significance	-0.0584	0.9534	0.1175	0.9065	0.1466	0.8834	0-1	0.0	0.0	0.0
Lack of adequate organizational solutions	-0.5614	0.5745	-0.6521	0.5143	-0.1786	0.8583	0-1	0.0	0.0	0.0
Legal circumstances	0.7676	0.4428	-0.0759	0.9395	-0.6656	0.5057	0-1	0.0	0.0	0.0
No attention from the managerial staff	0.7495	0.4535	-1.1354	0.2562	-1.5684	0.1168	0-1	0.0	0.0	0.0
Incompetent personnel	0.7495	0.4535	-1.1354	0.2562	-1.5684	0.1168	0-1	0.0	0.0	0.0

**Ranges: 0-not selected, 1-selected.*

Results of the test confirm only one difference regarding the barriers of effective defective products management in the micro, small, and medium manufacturing enterprises: medium enterprises, when compared to micro enterprises, stress the company's policy significantly more often as the barrier for effective defective products management ($Z = -2.1413$; $p = 0.0322$).

At the same time the research points out one important similarity of production companies regarding the barriers issue - enterprises, regardless of their size, basically do not consider any of the mentioned barriers to be significant for the efficiency of defective products management.

The next test was done for variables related to evaluation of particular aspects significance in the scope of defective products management of manufacturing enterprises in development of their competitive position (Tab. 8).

Table 8: The Mann-Whitney U test, ranges and mean evaluations for particular aspects significance in the scope of defective products management in development of competitive position as variables in particular groups of the Polish manufacturing enterprises

Variable	micro/small		micro/medium		small/medium		Mean evaluations of the enterprises			
	Z	*p*	*Z*	*p*	*Z*	*p*	ranges*	micro	small	medium
Costs reduction	-0.1076	0.9143	-1.2983	0.1942	-1.0906	0.2754	1-6	3.0	3.0	3.0
Price	-0.1861	0.8524	0.5730	0.5666	0.6291	0.5293	1-6	4.9	4.9	5.1
Quality	-0.2731	0.7848	-0.1503	0.8805	0.0445	0.9645	1-6	5.3	5.3	5.2
Returns policy	-1.2931	0.1960	0.1830	0.8548	1.1500	0.2501	1-6	5.4	5.4	5.5
Delivery time	-1.3832	0.1666	-0.3581	0.7203	0.6230	0.5333	1-6	4.3	4.7	4.4
Diversity of products	0.0871	0.9306	0.2667	0.7897	0.1940	0.8462	1-6	5.0	5.2	5.2

**Ranges: scale from 1 to 6 points where 1-completely non-significant and 6-very important.*

Within the rest of the results it was found that the differences regarding significance of the aspects of defective products management in developing a company's competitive position in particular groups of Polish manufacturing enterprises are not statistically significant.

However, in this case the similarities are important. Micro, small, and medium manufacturing enterprises pay attention mainly to the aspects of return policy, quality and diversity of products in

defective products management, as they perceive these characteristics as significant in developing their competitive position. Less attention is paid to the delivery time and price, and cost reduction seems to be the aspect that does not influence the competitive position in opinion of surveyed enterprises.

The last Mann-Whitney U test covers the values for assumed variables that are the state of the implementation of hardware and software solutions supporting the defective products management in micro, small, and medium Polish manufacturing enterprises (Tab. 9).

Table 9: The Mann-Whitney U test, ranges and mean evaluations for state of the implementation of hardware and software solutions supporting the defective products management as variables in particular groups of the Polish manufacturing enterprises

Variable	micro/small		micro/medium		small/medium		Mean evaluations of the enterprises			
	Z	*p*	*Z*	*p*	*Z*	*p*	ranges*	micro	small	medium
Bar codes	**3.2437**	**0.0012**	**5.7304**	**0.0000**	**2.5677**	**0.0102**	1-3	2.9	2.7	2.3
2D codes	**3.4735**	**0.0005**	**4.2070**	**0.0000**	0.8642	0.3875	1-3	3.0	2.8	2.7
Computerized returns tracking system	**4.0477**	**0.0001**	**5.7283**	**0.0000**	1.7356	0.0826	1-3	3.0	2.8	2.5
EDI	**3.3305**	**0.0009**	**4.0032**	**0.0001**	0.9629	0.3356	1-3	3.0	2.8	2.6
RFID	1.6104	0.1073	**2.1586**	**0.0309**	0.6040	0.5459	1-3	3.0	3.0	2.9

**Ranges: 1-installed, 2-planned, 3-neither installed nor planned.*

In case of IT support of defective products management in micro, small, and medium production enterprises the following statistically significant differences can be observed: (1) bar codes existing or planned installation in micro enterprises is considered significantly more intensively when compared to small ($Z = 3.2437$; $p = 0.0012$) and medium enterprises ($Z = 5.7304$; $p < 0.0001$). This issue is also considered less often in small enterprises when compared to the medium ones ($Z = 2.5677$; $p = 0.0102$); (2) two-dimensional codes existing or planned installation in micro enterprises is considered significantly more intensively when compared to small ($Z = 3.4735$; $p = 0.0005$) and medium enterprises ($Z = 4.2070$; $p < 0.0001$); (3) computerized returns tracking systems existing or planned installation in micro enterprises is considered significantly less often when compared to small ($Z = 4.0477$; $p = 0.0001$) and medium enterprises ($Z = 5.7283$; $p < 0.0001$); (4) electronic data interchange (EDI) existing or planned installation in micro enterprises is considered significantly less often when compared to small ($Z = 3.3305$; $p = 0.0009$) and medium enterprises ($Z = 4.0032$; $p < 0.0001$); (5) radio frequency identification (RFID) existing or planned installation in micro enterprises is considered significantly less often when compared to medium enterprises ($Z = 2.1586$; $p = 0.0309$).

Also some similarities regarding IT support of defective products management in micro, small, and medium manufacturing companies can be observed. In general almost all surveyed enterprises, regardless of their size, do not have installed any IT system, as well as they do not plan to do so. Especially this trend is observed in case of micro enterprises, and next in small enterprises. Only a small share of medium production companies declare that some IT solutions are already installed or are in plans for future implementation.

Discussion of obtained research results

Presented research findings allow to determine some significant differences and similarities in the defective products management of Polish manufacturing enterprises, divided in accordance to the employment size. Because individual differences and similarities in micro, small, and medium-sized production enterprises have been detailed, identified, and discussed in the previous section, at this stage it is possible to summarize them in general.

First of all, attention should be paid to the fact that each enterprise, regardless of its size, functions in a given environment and on the basis of developed, individual patterns of activity. Thus, the

comparative analysis of differences and similarities gives only a general view of the functioning of enterprises in a given area.

Polish micro, small, and medium manufacturing enterprises in general undertake various activities to manage the defective products. Differences related to these activities result from the specificity of production in a given company, from the financial and human resources available to the company, as well as from the technical and technological development of the enterprise. And similarities in defective products management come from the economic, market, and legal environment of the company that may impose certain activities.

It is difficult to compare the results obtained with other studies, because so far in Poland such research has not been done until now. In fact the presented survey is the only study on the defective products management in manufacturing sector of Polish industry up to date. Jeszka (2014) made a similar research study according only to the clothing sector in Poland. There is also research made by Skapa and Klapalova (2012) from the Czech Republic that mainly refers to the results that the enterprises can obtain by employing reverse logistics processes.

In this paper content several worldwide studies should be also mentioned, besides these ones listed in the introduction as similar ones, which cover the returned products management issue. These would include Carter and Ellram (1998), Rogers and Tibben-Lembke (1999), de Brito and Dekker (2002), Chanintrakul et al. (2009), Mutha and Pokharel (2009) and Sheriff et al. (2012).

For this paper perspective the important research was made by Rogers and Tibben-Lembke in 1999. It is one of a small number of publications presenting the universal approach to the processes in reverse logistics and defective products management. It contains the general studies about the reverse logistics practices in the USA, as well as common recommendations for the entire economy, not only for the chosen industry branch.

On that basis, the presented research and obtained results should be treated as basic ones and should be deepen in the future. Especially some new similar research should be done in other countries to allow the detailed comparison of defective products management practices, as well as to indicate the differences and similarities. Also, the methodology of case studies could be used to explore the specificity of analysed issues in different types of industrial sectors.

Conclusions

Management of contemporary enterprises in the present economic reality undergoes continuous transformations. There is a need to consider the notions of sustainable development, globalization processes, changes in the social attitudes directed at ecologic preferences or dynamic development of markets in the management of enterprises. Therefore, it is crucial to seek, select, and employ the most innovative ways allowing to adjust the management of enterprises to those changing conditions. The production enterprises, as entities that are especially prone and sensitive to changes in the economy, have recently developed the concept of defective products management which provide significant support to the returns management. The issue of the defective products management receives big momentum for developing scientific and practical capacities to serve the industries in a more beneficial manner. The reasons for these opportunities are diversified and include: current policy making and regulations on goods, environmental information and performance, consumer rights and manufacturer duties, and business opportunities or scientific workshop development.

The studies performed and partially presented in this paper prove that the defective products management in Polish manufacturing enterprises is employed and the implementation and utilization of its processes allow to manage the defective product returns effectively.

Both the intensity and quality of the defective products management processes depend on the size of the manufacturing enterprise, which was proved by the performed statistical research.

The research results presented in this paper allow to determine some significant differences and similarities in the defective products in the Polish manufacturing enterprises, divided in accordance to the employment size. Based on the results, it may be concluded, among others, that the size of the Polish manufacturing enterprises influences the intensity and quality of the defective products management, as well as determines its effects.

The presented contents can be of considerable application significance when the presented results are referred to the enterprises' practices, and the recommendations for managerial staff will be formulated based on that. However, it is necessary to adopt an individual approach here, as otherwise, the differentiated parameters of enterprises, as well as specificity of the defective product returns will not allow indiscriminate adaptation of generally developed conclusions, only some illustrative use of their values.

Acknowledgment

The paper is written based on the research within project *"Logistics management of defective products in Polish manufacturing enterprises*" financed by National Centre of Science with decision number DEC-2012/07/D/HS4/02071.

Abstract

Nowadays, in the sustainable conditions of economy and logistics, the full operational cycle stands for a very modern and desired trend at the markets. As the market of fruit and vegetable is a specific one – fragile and quick actions demanding, the production cycle in this regard has a crucial meaning.
The paper aim is to present the production cycle on the fruit and vegetable market in the context of relations in the food supply chain management. It refers to the food sector in Poland, and is based on the research results.

Keywords: Food Supply Chain Management, Production Cycle, Full Operational Cycle, Fruit And Vegetable Market

Introduction

The most important role of food industry is providing all basic and necessary goods that support various human activities and behaviours. The food industry is one of the largest and most complex production sectors in the world economy. It covers the entirety of material production processes related directly and indirectly to the production and distribution of food.

Once harvested or produced, the food should be stored, delivered, and retailed so that they could reach to the final customers by due date. Meat, bakeary products or fruit and vegetables, such perishable food is wasted by millions tons worldwide every year due to the inefficient and ineffective food supply chain management. Therefore, food supply chain management is significant to save the food.

The purpose of this paper is the literature review research analyse about food supply chain management and its relations in the context of cooperation in production cycle.

Literature Review

The full operational cycle is part of the concept of logistics supply chains management. The supply chain covers every organization, regardless of the business profile, which has any contractors, because such a system provides appropriate raw materials and materials to produce and then deliver products and services to final customers (Wu et al. 2016).

In simple terms, the supply chain means the flow of raw materials, materials, semi-finished products or finished products, which begins at the moment of obtaining raw materials or materials, and ends at the moment when the finished product is delivered to the final customer (Genovese et al. 2017). The supply chain can be divided into three basic phases: mining (supply), production (manufacturing) and sales (distribution) (Kamalahmadi, Parast 2016). There are participants in the supply chain, among which can be distinguished their main groups: suppliers, producers, distributors, sellers and final

customers (Jraisat, Sawalha 2013). In addition, transport and storage play a key role within the supply chain, thanks to which a connection takes place between units participating in a given supply chain (Kilger, Reuter, Stadtler 2015). On the other hand, an integral part of the supply chain are three types of flows: material, financial and information (Chopra, Meindl 2007) (Fig.1).

Fig. 1: Supply chain basic structure. (own elaboration)

Supply chains function in the economy creating specific and unique structures depending on the specifics of a given industry, sector or branch (Zhou, Kai, Liang 2015). In recent years, studies on food supply chains have appeared in the literature (MacCarthy et al. 2016). These chains connect three important sectors of the economy - agriculture, food processing and logistics (Manning et al. 2016). Their structure is specific due to the specificity of the food industry (Gómez, Ricketts 2013), where the flow of materials and products must be fast and well-planned to reduce and minimize losses (Marucheck et al. 2011).

Once harvested or produced, the food should be stored, delivered, and retailed so that they could reach to the final customers by due date (Zhong, Yang, Chen 2015). It was reported that about one-third of the produced food has been abandoned or wasted yearly (approximately 1.3 billion tons) (Manning et al. 2016). Two-third of the wasted food (about 1 billion tons) is occurred in supply chain like harvesting, shipping and storage (Fritz, Schiefer 2009). Take fruit and vegetables for example, such perishable food was wasted by 492 million tons worldwide in 2011 due to the inefficient and ineffective food supply chain management (Gustavsson et al. 2011). Therefore, food supply chain management is significant to save the food.

Research Methodology

Research Background

The fruit and vegetable market is one of the most important segments of the food industry in Poland. Poland is one of the leaders on the European fruit and vegetable market. Fruit production in Poland in 2016 amounted to 4.6 million tons compared to 4.05 million tons in 2015. Pears and plums increased by 20%, apple production increased by 14.6%. The drop in production was recorded only in the case of strawberries and raspberries. As a result of the increase in the harvest, the production of fruit and vegetable products increased (by approx. 20,000 tons) in the 2016/17 season to 1.15 million tons compared to the previous season.

Poland is an important producer of fruits and vegetables in Europe. In 2016, fruit production in the European Union amounted to 39.5 million tons, where Poland's share was 4.6 million (an increase of 14.7% compared to the previous year). Poland has also strengthened its position as the largest producer

of concentrated fruit juices and frozen fruit in the EU. The Polish market is responsible for about 50% of production in the EU. Domestic vegetable production amounted to 5.9 million tons, which is over 9% share in EU production (64.2 million tons), and keeps Poland in the second place in the production of frozen vegetables. In 2017, as a result of spring frosts, the production of fruit and vegetables was lower than in the previous year. A slight decline in the harvest of fruit and vegetables was recorded, which had consequences in the form of a reduction in the production of fruit and vegetable preserves. Nevertheless, Poland has maintained its high position on the European and global market of fruit and vegetable products (www.portalspozywczy.pl).

Research Sample

For the reaching the purpose of this paper the results of the survey studies were used. The research was made in January of 2018 year in the form of the questionnaire. The study concerned the assessment of the food supply chain management characteristics and its aim was to determine the main practices of business entities operating within the food supply chain. The survey was addressed to polish manufacturing and/or trading companies in the sector of food industry. The selection of a research sample covered, according to the Polish Classification of Activities (PKD), entities operating in the area of food production and / or trading, so:

1. PKD 10.1 - processing and preserving of meat and production of meat products;
2. PKD 10.3 - processing and preserving of fruits and vegetables;
3. PKD 10.7 - production of bakery and farinaceous products.

According to Central Statistics Office data, these areas constitute the largest share in the Polish food market, therefore it is assumed that enterprises from these areas of activity constitute a sample representative for the whole population of food products.

Research Approach

For the purpose of this paper only a part of the research results was chosen to be presented, i.e. data covering the answers of representatives the entities operating within the area of processing and preserving of fruits and vegetables (PKD 10.3).

The research sample total size was equal to 250 entities, 11% (28 entities) of them was the representatives of processing and preserving of fruits and vegetables enterprises and they are the research base of this paper.

Among the surveyed enterprises, a significant part of them (71.4%) are micro-enterprises employing up to 9 people with the turnover ≤ 2 million Euro. Small sized enterprises employing 10 to 49 people with the turnover ≤ 10 million Euro were represented by 14.3% of respondents, medium sized enterprises employing 50 to 249 people with the turnover ≤ 50 million Euro were represented by 10.7% of respondents, and big enterprises employing more than 250 people with the turnover ≥ 50 million Euro were represented by 3.6% of respondents.

As the whole research sample was representative for the polish food industry, also this partial sample is representative for the polish sector of processing and preserving of fruits and vegetables entities.

Almost one third of researched enterprises has been operating at the market more than 16 years already (Fig. 2).

Fig. 2: Processing and preserving of fruits and vegetables entities structure according to the length of operating in the business. (own elaboration)

Around 30% of enterprises operate in business from 9 to 16 years, 21.4% operate in business from 5 to 8 years, and only 18% of companies are functioning in the business up to 4 years. This structure points out that the researched enterprises in general conclusion operate in fruit and vegetable business for many years, and they state the developed and experienced sample to give the overall inference.

Processing and preserving of fruits and vegetables enterprises were also asked to submit their main position in food supply chain. Half of the respondents pointed out the service providers' position, 25% state for trade position and 25% for manufacturing and trade position.

According to the information that polish food industry has a big share in foreign food market creation it is important to highlight the market where researched enterprises operate. It was a question of multiple choice answer and its results are presented in Tab. 1.

Table 1: Markets at which the processing and preserving of fruits and vegetables enterprises operate. (own elaboration)

Type of the market	Share of fruit and vegetables enterprises
Local market (city, province)	60.7%
Regional market (voivodship)	17.9%
National market (country)	21.4%
Foreign market (other countries)	100%

While all enterprises declared their activity at the international market it was checked for how long and where they do business. 43% declared operating at foreign market for 3-4 years, 29% for 5-8 years and 28% for 9-12 years. It means that all fruit and vegetables companies have a medium practice at the foreign market, as none declared 1-2 years section as well as 13-16 and more than 16 years sections.

In the same time respondents were asked to submit the countries where their business operate. Mainly fruit and vegetables enterprises pointed out the cooperation with European Union general market (75%). Than they also highlighted cooperation with such countries as Germany (10.7%), South Korea (3,6%), Norway (3,6%), Russia (3,6%), Hungary (3,5%).

Regarding the operating at foreign market of processing and preserving of fruits and vegetables enterprises, they are forced by the market powers to start the cooperation with other entities present at this market. It is a necessary activity to construct the food supply chain and to manage its functionality in a proper manner.

In this regard investigated enterprises pointed out the start of collaboration at the foreign market with different entities. It was a question with multiple choice answer possibility and the results are presented in Table 2.

Table 2: Collaboration of fruit and vegetables enterprises at the foreign market with different entities. (own elaboration)

Foreign market entity	Share of fruit and vegetables enterprises
Supplier	57.1%
Foreign distributor	25%
Logistics or/and distribution center	21.4%
Competitors	10.7%
Financial institutions	10.7%
Broker	14.3%
Foreign agent	3.6%
Foreign customers	7.1%
Exporters group	3.6%

Polish fruit and vegetables enterprises cooperate at foreign market with many different entities, but mostly with suppliers, distributors, logistics or/and distribution centers and brokers. They do not collaborate at all with food industry organizations or state institutions. Based on such a distribution of responses it is possible to notice the strong tendency of polish fruit and vegetables enterprises to create the food supply chains for their unique needs and requirements.

Research Results

The research among the processing and preserving of fruits and vegetables enterprises in Poland were made in purpose to present the full operating cycle approach. It is important to notice here that:

1. The length of operating cycle depends on the industry/sector/branch.
2. The research has a qualitative not quantitative form.

According to these restrictions two main parts of the research were taken into account:

1. The effects of the collaboration in the food supply chain.
2. The main characteristics of enterprises collaborating in the food supply chain.

For the first part of analysis the respondents of the processing and preserving of fruits and vegetables enterprises were asked to determine some effects of the collaboration in the food supply chain that have an impact (direct or/and indirect) on the full operating cycle. The effects with a share of the positive and negative answers are shown in Table 3.

Table 3: The effects of the processing and preserving of fruits and vegetables enterprises` collaboration in the food supply chain

Effect of collaboration	Positive answers share	Negative answers share
I. It reduced the operational/ investments costs	59.6%	40.4%
II. It improved the level of customer service	68.8%	31.2%
III. It influenced the strengthening of market position	64.8%	35.2%
IV. It contributed to the increase in profits or the reduction of volatility in the profit and loss account	62.8%	37.2%

All effects of the collaboration in the food supply chain were divided into four groups that into four groups that have the following extensions:

I. inventory rotation cycle costs, warehousing costs, inventory maintenance costs, information exchange costs; as well as such features as: managerial efficiency, improvement of forecasting and planning accuracy, improvement of cash flows, etc.
II. timely delivery, shortening the payment deadline, better monitoring of the flow of goods, services and finances, electronic processing of orders, duration of transport, reliability of deliveries, process innovations, etc.
III. increase the promotional service, timely repayment of liabilities, increasing the price advantage, increasing the potential and product innovations, extending the geographic range, access to modern technologies, etc.
IV. development, cyclical planning, seasonal planning, punctuality of settlements, stability of participation in a given market, sales volume, supply assurance, etc.
Researched companies assessed all the above effects positively, with responses shares 60% or more. It means that the processing and preserving of fruits and vegetables enterprises see the benefits of collaboration in food supply chains and they pay the attention to these activities. Also, regarding the full operating cycle the results of this assessment mean that collaboration in food supply chain has an impact on it.

Another, second part of the research proofs the above statements. In this part the main characteristics of enterprises collaborating in the food supply chain were investigated. Here, three aspects were taken into account:

- Respondents assessed if the collaboration in their supply chain has a smooth, non-problematic course. They had to specify it regarding the cultural and business aspects. Cultural aspect (1) means that all collaborating enterprises put emphasis on commitment, there is constancy of goals, employees are perceived in the long-term perspective, external shareholders are important for cooperating companies. This aspect was assessed by respondents in 82.1% positive. Business aspect (2) means that while collaborating in food supply chain there are consistent goals and strategic plans, commitment to creating common ideas and willingness to overcome change. Here, the respondents were also in 82.1% positive.
- Respondents were asked about the management of organizational structure (3) – commitment to continuous improvement, managerial support, the use of incentive incentives and the importance of teamwork – 85.7% assessed these features positively. Also, they were asked in regard to management about the collaborating partners (4): do they have a predisposition to build joint relations in the food supply chain, i.e. management is qualified in terms of mutual activities, defining common goals and expectations, predicting long-term mutual respect for partners, management expresses willingness to share financial information and system integration. 75% of answers were positive.

- Also, respondents had to assess whether companies cooperating in the supply chain show a similar perception of factors affecting the success of cooperation (5) in terms of sales volume, market share, financial strength, productivity or technological specialization. 85.7% of respondents gave here the positive answer.

Due to the fact that in the case of opinion research on cooperation in the food supply chain, a large majority of respondents were in favor of the positive side of such activity, a correlation was carried out to confirm the positive effects of cooperation in food supply chains. The correlation results are present in Table 4. Rows and columns are numbered accordingly to the features pointed out in the text.

Table 4: Correlation results regarding the effects of cooperation in food supply chains for the processing and preserving of fruits and vegetables enterprises. (own elaboration)

	I.	**II.**	**III.**	**IV.**	**(1)**	**(2)**	**(3)**	**(4)**	**(5)**
I.	1	0.466**	0.264**	0.311**	0.116	0.192**	0.187**	0.114	0.205**
II.	0.466**	1	0.317**	0.375**	0.190**	0.163**	0.246**	0.205**	0.248**
III.	0.264**	0.317**	1	0.646**	0.158**	0.175**	0.156*	0.235**	0.311**
IV.	0.311**	0.375**	0.646**	1	0.114	0.131*	0.156*	0.191**	0.188**
(1)	0.116	0.190**	0.158*	0.114	1	0.333**	0.242**	0.218**	0.320**
(2)	0.192**	0.163**	0.175*	0.131**	0.333**	1	0.380**	0.254**	0.380**
(3)	0.187**	0.246**	0.156*	0.156*	0.242**	0.380**	1	0.430**	0.249**
(4)	0.114	0.205**	0.235**	0.191**	0.218**	0.254**	0.430**	1	0.357**
(5)	0.205**	0.248**	0.311**	0.188**	0.320**	0.380**	0.249**	0.357**	1

**Statistically significant values on the level of 0.01
* Statistically significant values on the level of 0.05

According to the correlation results it is obvious that there are significant interdependencies between the effects of the collaboration and the main characteristics of enterprises collaborating in the food supply chain. The study indicates the presence of strong dependencies among the variables studied. These values of correlation are significantly strong as well as they indicate bilateral relations of investigated features.

Conclusions

Enterprises from the fruit and vegetable industry operating in Poland are increasingly expanding their activities to include international markets. However, they face intense competition on foreign markets, which forces them to seek solutions that allow them to gain a competitive advantage and a good position on the foreign food market.

Expanding business is inseparable from undertaking cooperation with other entities, which in turn leads to the creation of supply chain structures.

Food supply chains are specific due to the specificity of the products they concern. Therefore, cooperation in these chains is characterized by the necessity of significant involvement of partners.

The presented research highlighted the characteristics of mutual partner relations in food supply chains and their effects. On their basis, the necessity of undertaking such cooperation by enterprises from the fruit and vegetable industry is clearly visible, as well as the dependencies between this cooperation and the effectiveness of functioning on the foreign market.

Cooperation in the food supply chain also affects the efficiency of the full operational cycle in the financial area. Essentially, this cooperation determines the correctness of this cycle. Any disruptions in cooperation in the supply chain cause problems in the implementation of the full operational cycle. The more so because the cycle itself is dependent on the industry, so in the case of food products, where

supply chains are specific, so the cycle is also unique, managing relationships with supply chain partners is crucial.

Abstract

The level of globalization presented in the 21st century generates in the companies an extremely complex and competitive business environment, requiring efforts to improve the information disclosed, to ensure a higher level of transparency and comparability between different countries. In this context, the Non-Financial Reporting Directive 2014/95 / EU as implemented, since 2017, the obligation for public interest companies with more than 500 employees to disclose information with a description of the business model, policies, risks, environmental and social performance, as well as measures for workers, respect for human rights, gender equality and the fight against corruption and bribery. This study assessed the degree of compliance with Decree-Law (DL) No. 89/2017, which transposed that directive to Portugal, by companies listed on Euronext Lisbon, through an analysis of the content of their management reports, accounts and sustainability reports, based on a disclosure index, built on eight mandatory disclosure items. Through a linear regression model, we have also identified the explanatory factors for the disclosure index of each entity. The results allow us to conclude that the degree of compliance with DL 89/2017 is quite high, since the average disclosure index is around 0.875. The least disclosed items were the fight against corruption and bribery attempts, bodies diversity policies and human rights. From the linear regression model, we have concluded that only the size of the company and the type of report are statistically significant factors, explaining 30.40% of the value obtained in the disclosure index.

Keywords: Disclosure non-financial information, directive 2014/95/EU, Decree-law No. 89/2017

Introduction

Facing the global financial crisis, organizations have developed their activities in a climate of economic instability and uncertainty, focusing their attention on long-term viability and sustainability (Adams, 2011).

Currently, companies face an extremely complex and competitive business environment, which led to the need to improve the information disclosed in order to guarantee a higher level of transparency and comparability between different countries (Lourenço, 2017).

The annual financial report is no longer seen as a disclosure tool capable of meeting the new requirements of stakeholders. This stagnation in the financial reporting model led to the dissatisfaction of the information necessities of the different stakeholders, who needed to conceive expectations regarding the future of organizations, and for this reason, they have been requesting for concrete data on external factors (such as, political, environmental and social), risk management, business and management models, among others, that enable a properly grounded decision-making (PWC, 2013).

In this context, Directive 2014/95/EU, 22 October 2014, on the reporting of non-financial information marks the beginning of a new stage in reporting of companies in the European Union (EU). This directive had to be transposed into the legislation of the various EU Member States by the end of 2016, applying to large companies that are entities of public interest and that have more than 500 employees. In Portugal, these entities include companies listed on the stock exchange, insurance companies, banks, investment funds and venture capital companies and public companies.

Since it is a recent theme and given the scarcity of studies of this nature in Portugal, we believe that the chosen theme represents a contribution to the literature, through the development of a study that we consider innovative, but with great potential for future research.

In view of the above, it is therefore important to study the Portuguese reality with regard to non-financial reporting, especially after the transposition of Directive 2014/95/EU, through the Decree-Law (DL) No. 89/2017. In Portugal, public interest entities with an average number of employees over 500, are already obliged to disclose non-financial information since the 2017 financial year. That diploma represents a paradigm shift in terms of reporting, so it becomes appealing to understand how it was internalized by companies and how its practical application has been developing.

So far, the existing studies on the subject in Portugal are those of Lourenço (2017) and Ribeiro (2019). The first performs an analysis from the perspective of the directive, before being transported to our country. The second already includes the DL but considers few explanatory variables.

In this sense, the general objective of this work is to study the non-financial reporting practices adopted by companies listed on the stock exchange in Portugal, seeking to assess the degree of compliance with the DL 89/17 and its determining factors. In addition, we seek to ascertain which theoretical model of report/framework has been the basis for companies to make their non-financial report.

This work aims to contribute to international research in the field of non-financial reporting by providing empirical evidence in our country, Portugal, where existing studies are still scarce. The results obtained may contribute to the accounting regulatory bodies, with regard to potential enforcement mechanisms, in case of non-compliance with the diploma. They can also serve as a learning process for unlisted companies, or other types of companies not covered by the diploma, who are interested in implementing non-financial reporting practices.

Considering the above, after this introduction, the article is divided into 4 points. In the first point, we present a theoretical framework of the non-financial reporting theme, both in the European context and in our country, Portugal. The second point concerns the objectives of the study and the formulation of research

hypotheses. Next, the sample and the methodology used are presented, specifically the models developed and the operationalization of the variables, being, in point four, performed an analysis and discussion of the results. This article ends with the presentation of the main conclusions and limitations of the study, also pointing out some suggestions for future research.

Non-Financial Report

The last few years have been marked by a series of catastrophes associated with climate change and the international financial crisis, which has reinforced the need for the adoption of an economic development model - sustainable development - that allows the satisfaction of the needs of present generations without mortgaging the needs of future generations (Portuguese Securities Market Commission, CMVM, 2019).

This crisis has not only been a financial crisis, but it has also been a crisis of confidence that has driven the demand by interest groups for transparent information on the behaviour and future plans of the companies. In fact, within the scope of the strategy followed at international level to achieve sustainable development, it is increasingly recognized that the dissemination of information on matters of social responsibility/sustainability is a key element in the transparency and accountability of organizations.

Over the past few decades, the European Commission (EC) has adjusted its definition of Corporate Social Responsibility (CSR), presenting it in its Communication "Corporate social responsibility: a new EU strategy for the period 2011-2014", as "the responsibility of companies for their impacts on society". In order to fully fulfil their social responsibility, companies must adopt processes that integrate social, environmental and ethical concerns, respect for human rights and consumer concerns in their activities and strategies, in close collaboration with stakeholders, in order to: (a) maximize value creation for shareholders, other interested parties and society in general; and (b) to identify, avoid and mitigate its possible negative impacts (CE, 2011).

With the extremely complex and competitive business environment, the annual financial report no longer satisfies the demands of stakeholders, requiring a permanent capacity for adaptation, in order to guarantee competitiveness regarding competitors (Lourenço, 2017). The literature is unanimous in considering that traditional financial reports contain limited information for different stakeholders, who increasingly demand social and environmental information in financial reports.

Non-financial reporting has moved from a voluntary basis to a standardized and mandatory practice (Bedenik and Barišić, 2019). In fact, although the number of companies that have voluntarily published reports with non-financial information (namely sustainability reports and/or integrated reports (KPMG, 2017) is growing, in recent years, countries such as India, Brazil, China, Denmark, South Africa and Malaysia made the disclosure of non-financial information on CSR mandatory (Boodoo, 2016; Hoffmann et al., 2018). The same scenario is currently experienced within the EU, under Directive 2014/95/EU, which has been transposed into the internal rules of each Member State, establishing the obligation of non-financial reporting for some types of entities.

Therefore, it is important to present, in the following points, the developments in the field of non-financial reporting within the EU and in the Portuguese context.

European Context

At European level, the first effort of accounting regulation of the environmental issues arised with the Recommendation of the European Commission of 30 May 2001, concerning the recognition, valuation and reporting of environmental issues in the annual accounts and in the management report of the companies. Among other aspects, this recommendation intended to start demanding the disclosure of information of social character in the annual accounts of European companies covered by the IV and VII Community directives, in particular in the management report.

Afterwards, the topic of non-financial reporting was introduced by Directive 2003/51/EC of the European Parliament and of the Council, of 18 June 2003 (known as the Accounting Modernization Directive), namely with its article 46th, which establishes that the management report should "cover both financial aspects and, when appropriate, key indicators of non-financial performance relevant to the specific activities of the company, including information on environmental issues and issues concerning workers". This approach was in line with the Commission Recommendation 2001/453/EC of 30 May 2001, previously referred to.

However, in the same article 46th of the Modernization Directive was added that Member States could exempt smaller companies from the obligation to provide non-financial information in the annual report. Thus, according to Kinderman (2015) the measure introduced by the Accounting Modernization Directive had an insignificant effect on the quantity and quality of the non-financial reports produced, as it does not cover all entities.

However, after the economic crisis, in the context of the Europe 2020 Strategy and, more specifically, of the EU Strategy for Corporate Social Responsibility (2011-2014), it is recognized that the disclosure of non-financial information is a key element in the accountability provided by companies and for the development of a climate of trust. Facing social responsibility in a strategic perspective was increasingly important for the competitiveness of companies, allowing to build lasting relationships of trust with workers, consumers and citizens.

It was, therefore, important for social responsibility to encompass concerns about human rights, labour and employment practices (such as training, gender equality, health and well-being of workers), environmental issues (biodiversity, climate change, efficient use of resources, life cycle assessment and pollution prevention) and the fight against bribery and corruption.

Thus, at the beginning of 2013, the EC issued two reports, "Corporate social responsibility, responsible and transparent corporate behaviour and sustainable growth" and "Corporate social responsibility: promoting society's interests and a route to sustainable and inclusive recovery". These reports ensure that the current global economic crisis has resulted from fundamental errors in terms of transparency and accountability, as well as a short-term view.

Therefore, the commission recognizes the importance of disseminating information on sustainability, which should be based on generally accepted frameworks, such as those of the Global Reporting Initiative (GRI) - on sustainability reports - or the International Integrated Reporting Council (IIRC) - regarding the integrated reporting. It emphases, however, that any eventual dissemination solution should not comprise administrative burdens, especially for small and medium-sized enterprises (SMEs), since they represent more than 90% of the European business fabric. It considers, therefore, that a disclosure system based on the obligation to "comply or explain" is a useful tool.

It is in this context that, still in 2013, the European Parliament issued the Directive 2013/34/EU, of 26 June, on annual financial statements, consolidated financial statements and related reports of certain types of companies. Although it didn't yet foresee a specific document for non-financial information, it does mention that the information in the management report should not be limited to the financial aspects of the company's activity, including an analysis of the environmental and social aspects of the company's activity required to understand the company's development, performance or situation.

This is where a regulatory path begins, which again leaves SMEs free from the obligation to provide non-financial information, depending on the framework of each Member State. In this context, a series of debates and negotiations between the Member States begins, with the exposition of each Member States version, in order to create a regulation on non-financial reporting. According to Kinderman (2015), France and the United Kingdom were its main defenders, unlike Germany, who strongly opposed. About twenty-

four other Member States had no regulation for non-financial information, adopting a stance of indifference during negotiations.

With the negotiations over, in 2014, Directive 2014/95/EU, of 22 October, is published on the reporting of non-financial information, that marks the beginning of a new stage in the reporting of EU companies. The objectives of the Directive are linked to greater transparency, which makes companies more resilient and efficient, both financially and non-financially, which will progressively lead to more solid growth and employment, as well as enhanced confidence among stakeholders, including investors and consumers.

The directive applies to large companies that are entities of public interest and that have more than 500 employees, allowing the disclosures to be made at group level, and not necessarily by each subsidiary integrated in the group. However, the management of the parent company must ensure a strategic orientation of the company and an effective management control, as the group is considered as a whole and responsible for any adverse impact caused by its subsidiaries, even if it does not function as an integrated group. (Sorensen and Szabó, 2016).

As previously mentioned, in 2011, the European Council called for a reduction in the regulatory burden for SMEs. Thus, the new disclosure requirements should apply only to some large companies and groups. However, this does not prevent Member States from requiring disclosure to groups not covered by the Directive.

The directive states that companies must create a non-financial statement, to be included in the existing management report, or create a new statement for that purpose that contains information related, at least, to environmental, social and worker-related issues, to respect for human rights, corruption fighting and bribery attempts. This non-financial statement should include a description of the policies, results and associated and already registered risks. They should also disclose the policy of diversification in relation to the administrative, management and supervisory bodies, in terms of age, sex, qualifications or professional background. If no diversity policy has been planned, they are not required to create it, but they must include a clear explanation for that.

The directive considers that companies can rely on various frameworks based on national systems of the EU (such as the Eco-Management and Audit Scheme (EMAS)) or even international (such as the United Nations Global Compact, the OECD Guidelines; ISO 26000; the Tripartite Declaration of Principles of the International Labour Organization concerning Multinational Enterprises and Social Policy, the GRI guidelines or other recognized international frameworks, such as the IIRC.

In order to provide a methodology for the implementation of the directive, the EC (2017) published a document with guidelines on the communication of non-financial information. The document's objective is to provide balanced and flexible guidelines on the reporting of non-financial information, in order to help companies to disseminate relevant information, in a consistent and systematic manner. The Directive defines a concept of materiality to be taken into account when assessing the relevance of the information, stating that it must be "enough for an understanding [...] of the impact of its activities" on the company. Companies should explain the governance mechanisms and processes used to perform their materiality assessment, which should be reviewed periodically to ensure that those issues remain relevant.

Disclosure requires the use of simple and coherent language, as well as the formulation of definitions for technical terms, whenever necessary. Using a reference language from the business world, in addition to the official language of the company's country, will improve the company's transparency and make information more accessible to investors and other relevant stakeholders. However, according to Lourenço (2017), as these are not disclosures that can be easily translated into numbers, they can introduce distortions according to the objectives and image that organizations intend to transmit to the market.

The content of the non-financial report should be consistent with the other elements of the management report and systematic over time, allowing users to understand and compare changes, as well as having reliable information as a reference.

The report must also include comparability and consistency, as most of these companies operate in more than one Member State. Subsequently, investors demand an increase in the credibility of these disclosures through certifications issued by external and independent entities (Lourenço, 2017).

The legal mechanism that they created was to entrust this function to the Statutory Auditors, but they should only make sure that the non-financial statement or the report exists, without the need to analyse its content. However, it has become common, especially in the entities audited by the Big 4, to issue an opinion on the quality of the information, guaranteeing the reliability and transparency of the principles, practices and performance disclosed. It should also be noted that most of these audits are based on ISAE 3000, approved by the International Auditing and Assurance Standards Board (Lourenço, 2017).

Directive 2014/95/EU had to be transposed into the legislation of the various EU Member States by the end of 2016, to enter into force in 2017. It is, therefore, important to analyse its transposition to our country, Portugal.

National Context: Portugal

In Portugal, the first effort to regulate the reporting of non-financial information, more specifically environmental information, dates back to 2006, with the approval of Accounting Directive (DC) nº 29 – Environmental Matters, which transposed to the Portuguese accounting framework the precepts of the Recommendation of the European Commission of 30 May 2001, which we previously referred to. DC No. 29 was later revoked, when the Accounting Standardization System (SNC) came into force, which now includes Accounting and Financial Reporting Standard (NCRF) No. 26 – Environmental Matters, whose content does not depart, substantially, from DC 29. The Portuguese regulations establish a set of disclosures to be made on environmental matters, both in the Management Report and in the Annex.

Recently, the type of non-financial information to be disclosed by companies has been expanded, not being limited to merely environmental information. Thus, Decree-Law No. 89/2017, of 28 July, transposed the Directive 2014/95/EU to the Portuguese legal system, which proceeds, to this purpose, to the amendment of articles 65th, 451st and 528th of the Commercial Companies Code (CSC) and the addition of articles 66th -B and 508th -G, as well as the amendment to article 245th -A of the Portuguese Securities Code (CVM). The diploma creates two obligations for the presentation of non-financial information, one related to environmental, social and labour aspects, and the other centred on the diversity policies of members of the higher bodies of companies.

The diploma establishes that large companies and the parent companies of a large group, which have the legal status of public interest entities[1] and which have an average of more than 500 workers, must present annually, and as of the 2017 financial year, a non-financial statement, included in the management report or presented in a separate report.

The information requested in this non-financial statement includes an comprehension of the evolution, performance, position and impact of its activities, referring at least to environmental and social issues, as

[1] They are entities of public interest, those qualified as such by article 3rd of the Legal System of Audit Supervision, approved under the terms of article 2nd of the Law no. 148/2015, of 9 September. Large companies are those that exceed at least two of the three limits defined in paragraph no. 3 of article 9th, determined under the terms of article 9th -A, both from DL no. 158/2009, of July 13, with the wording given by DL nº 98/2015, of June 2.

well as measures aimed at workers, respect for human rights, gender equality and corruption and bribery fight.

In fact, Article 66th-B of the CSC, added with that diploma, provides that companies must include:
"a) A brief description of the company's business model;
b) A description of the policies followed by the company in relation to these issues, including the due diligence procedures applied;
c) the results of these policies;
d) The main risks associated with these issues, linked to the company's activities, including, if relevant and proportionate, its business relationships, its products or services that are likely to have negative impacts in these areas and the way these risks are managed by the company;
e) Key performance indicators relevant to your specific activity."

If the company does not disclose any of these items, it must present a clear and reasoned justification. It should also include a cross-reference to the amounts recorded in the annual financial statements and their additional explanations in order to be able to make a quantitative and qualitative interpretation and improve the quality of the report.

The key point will be the materiality of the information, identifying how to measure whether the information is relevant and appropriate, through a qualitative and non-quantitative analysis, always bearing in mind the recipients of the information. Content analysis can be carried out, resulting from questionnaires and meetings with stakeholders or the GRI materiality test, which is one of the most used methods both in Portugal and in the rest of the world (BCSD, 2016).

Portuguese legislation followed the guidelines of the directive, still leaving some indicators recommended in the various areas, namely in:

- "Environmental issues: current and predicted impacts of the company activities on the environment, health, safety, water use and air pollution;
- Social and workers related issues: equality between women and men and non-discrimination, application of the main international labour organization conventions, working conditions, social dialogue, respect for workers' rights, respect for union rights, health and safety at work, dialogue with local communities, and/or actions taken to ensure the protection and development of these communities, measures adopted in the context of promoting reconciliation between the professional, personal and family life of workers, as well as the exercise of rights of protection in parenting;
- Human rights: information regarding the prevention of human rights violations;
- Fighting corruption and bribery: instruments used to fight corruption and attempts at bribery,
- Description of the diversity policy that is applied to its management and supervisory bodies, namely in terms of age, sex, qualifications and professional background, (only required for large companies, issuers of shares admitted to trading on a regulated market in a member state of the EU" (DL nº 89/2017).

As mentioned, in addition to this DL, some articles were altered and added to the CSC, introducing the legal obligation for the members of the management to prepare the non-financial statement, or the separate report, with this information within three months from the closing date of each financial year or five months in the case of consolidated accounts. They must also disclose non-financial information on the company's public website, or published together with the management report, within a period not exceeding six months from the balance sheet date.

The models that entities should use to prepare this non-financial statement are described in the DL itself, which suggests that companies can use national, EU or international systems, in which case the system used must be specified. Refers to the Community Eco-Management and Audit System, or international systems, such as the United Nations Global Compact, to the guidelines of the Organization for Economic Cooperation and Development for multinational companies, the ISO 26000 Social Responsibility standard of the International Organization for Standardization, the Global Reporting Initiative (GRI) Initiative on the preparation of sustainability reports or other recognized international frameworks (such as that of "Integrated Reporting") and the methodological reporting guidelines prepared by the European Commission.

It also includes an indication to the company's Statutory Auditor to certify whether the annual management report includes the non-financial statement or whether it was presented in a separate report. However, these measures are only a verification feature if it exists, since the reviewers do not have any competence to issue an opinion on the quality, relevance and pertinence of the information disclosed (article 451 of the CSC).

There is an estimated fine of 50€ to 1500€ for the manager or administrator of companies that do not meet the established deadline or do not submit non-financial information in any of the reports (article 428th of the CSC).

Study Objectives and Research Hypotheses

Based on what was exposed in the first part of this article, it is important to study the Portuguese reality with regard to non-financial reporting, especially after the transposition of Directive 2014/95/EU, through DL no. 89/2017.

It was exactly in 2017 that public interest entities, with an average number of over 500 workers, became obliged to disclose non-financial information in Portugal. In this sense, the main objective of this work is to study the non-financial reporting practices adopted by companies listed on the stock exchange in Portugal, seeking to assess the degree of compliance with the provisions of DL 89/2017 and its determining factors. In addition, we seek to ascertain which theoretical model of report/framework (the GRI standards or the Framework IR, or other framework) has served as a basis for companies to make their non-financial reporting.

The studies by Lourenço (2017) and Caputo et al. (2017), with regard to the degree of compliance with Directive 2014/95/EU, in the Portuguese and Italian context, respectively, adopted the content analysis combined with the score analysis as a methodology. In our study, we sought to assess the degree of compliance with the Portuguese diploma, using a disclosure index, similar to other studies that deal with the degree of compliance with a certain accounting standard. This disclosure index will be built based on the mandatory disclosure requirements provided for in DL No. 89/2017, based on a dichotomous scale to identify whether a certain mandatory requisite/item is disclosed or not, based on the content analysis of the documents obtained, relative to the 2017 period. This disclosure index will be the dependent variable of the multiple linear regression model that will be developed, in order to identify the factors that explain the degree of compliance with the normative.

Thus, based on studies previously performed, the hypotheses of the relationship between the degree of disclosure of non-financial information by companies listed in Portugal and certain characteristics are raised, specifically:

a. Size

Used in most studies, size is one of the most common independent variables in explaining the degree of information dissemination. The main argument for its consideration is the fact that the largest companies

are obliged to provide more complete information and have more advanced information systems (Teixeira 2015).

The variable can be justified through the contingency theory, which argues that the company's dimensions have an impact on its control systems (Major, 2017). These improvements in the control systems contribute to more and better disclosures. This variable is also supported by the theory of stakeholders and legitimacy (Gaio and Mateus, 2014). In fact, larger companies, when subject to greater exposure and visibility, both before the media, society and regulators, face greater pressure from different stakeholders to disseminate more information, compared to small companies. On the other hand, larger companies are increasingly concerned with improving their public image and reputation before society, considering that communicating information about their environmental performance is a good way to legitimize themselves.

Thus, like other authors (Caputo et al., 2017 and 2018; Buitendag et al. 2017; Romão et al., 2018), we hope to obtain a positive relationship between the size of the company and the level of disclosure of non-financial information, so we formulate the following hypothesis:

> **H1**: The level of disclosure of non-financial information is greater the larger the size of the company.

b. Profitability

Teixeira (2015) states that as a way of crediting the values presented in the levels of profitability, the largest companies bet on the quantity and quality of the information provided, clearly showing the origin of their profitability. However, some authors present a contrary perspective, as less profitable companies may tend to disclose more information in order to defend less satisfactory results (Gaio and Mateus, 2014).

Although the literature is not consensual, we follow the logic of Buitendag et al. (2017), which had a positive association regarding this variable. Thus, we define the following hypothesis:

> **H2:** The level of disclosure of non-financial information is higher the higher the company's profitability

c. Indebtedness

According to Al Shammari et al. (2008, referred to by Teixeira, 2015) generally, indebted companies present greater risk to shareholders, since the scarcity of capital generates a need for financing, and as such arousing interest and trust with stakeholders becomes essential.

According to Mutawaa (2010, referred to by Teixeira, 2015), indebtedness is a variable unfrequently used in this type of studies on information dissemination. However, it should be considered because, in an attempt to show confidence in companies and in their financial structure, companies with a high degree of leverage feel obliged to disclose more information and with higher quality.

Thus, we define the following hypothesis:

> **H3:** The level of disclosure of non-financial information is greater the greater the company's indebtedness.

d. Auditor Type

According to Gaio and Mateus (2014), company audits thrusted higher levels of financial information disclosure, seeking to maintain and raise their reputation. Similarly, Branco et al. (2015) consider that with the increase in audits of sustainability reports (mainly in Big4), there has been an increase in the number of disclosures and associated quality.

Lopes and Rodrigues (2007) refer that the disclosure practices made by companies can also be influenced by their type of management, which is why independent people are needed to monitor and control. This variable fits into the agency's theory, since the auditor is our agent for controlling the information disclosed.

Although Caputo et al. (2017) and Fuster et al. (2019) have not found evidence to justify the influence of this variable, Gaio and Mateus (2015) and Caputo et al. (2018) obtained a positive association, with respect to financial and non-financial information, respectively. In this sense, we define the following hypothesis:

> **H4:** The type of audit company has an influence on the level of disclosure of non-financial information.

In this case, we will distinguish the companies that are audited by the BIG4 (EY, PwC, Deloitte and KPMG) as they are the four largest companies specialized in auditing and consulting in the world. These companies are world leaders in the sector, and as such they enter as a dummy variable, which is assigned a rating of 1 if the audit of the companies is performed by a Big4, and a rating of 0, if the audit of the companies is performed by another audit firm.

e. Internationalization Activity

Gaio and Mateus (2014) claim that entities operating in several international markets need to improve their management control systems due to the complexity of the operations. As such, the systems are designed to allow the production of more and better information.

Internationalization is measured according to its location, that is, companies with factories or stores operating in other countries are considered multinationals. National companies only produce in Portugal, although they can export their products or services internationally.

In the study by Romão et al. (2018), statistically significant results were obtained for this variable, even though the same wasn't verified in the study by Fuster et al. (2019). However, we formulate the following hypothesis:

> **H5:** The level of disclosure of non-financial information is greater the greater the entity's international activity.

f. Activity Sector

The main reasons given for the use of this variable are the existence of sectors with greater social and environmental impacts and, as such, to which higher levels of disclosure are required. Another reason will be based on the mimetic institutional isomorphism theory (DiMaggio and Powell, 1983), since companies tend to follow the examples applied in the same sector, and thus avoid distrusts/pressures from the markets.

The sector is also a variable that is widely used in studies and that normally has a positive association with the level of disclosure of social/environmental information (Buitendag et al., 2017; Romão et al., 2018), despite some studies (Caputo et al., 2018; Ribeiro, 2019; Fuster et al., 2019) have not proven their significant influence.

> **H6:** The activity sector of the companies has an influence on the level of disclosure of non-financial information.

We will assign a traditional classification to the economic sectors, specifically to distribute companies among services, commerce and industry. As it is not possible to predict the expected association signal for each of these sectors, we consider it relevant to separate the industry since at the environmental level they

have stricter and more demanding rules. The main argument underlying the Theory of Legitimacy is that industrial companies, with more potential environmental impact and greater exposure to the media, tend to publish more information.

g. Type of Report

Despite being a factor only considered by some of the other authors analysed (Ribeiro, 2019; Fuster et al., 2019), we consider relevant to analyse whether the type of report where non-financial information is disclosed influences the level of disclosure. We consider that when the company creates its own report for non-financial information, it dedicates more time to it, in order to prepare information focused on the theme, with the appropriate framework for its internal and external environment. It exposes its applied policies and methodologies, showing a more complete image.

When the information is included in the report and accounts, the information is more dispersed among the different chapters, namely the part of the framework is mostly found in the management reports. Despite being larger reports in number of pages, the quality and relevance of the information ends up being neglected.

So, we define the following hypothesis:

> **H7:** The use of an own report, where non-financial information is disclosed, positively influences the level of non-financial information disclosure.

h. Reference Framework

This variable is also not widely explored in the literature, only Caputo et al. (2018) and Fuster et al. (2019) considered it in their studies. However, we consider relevant to include it in our study, since, although the DL does not oblige to follow any model for non-financial reporting, it advises a series of them, of which the most used is the G4 version of the GRI. As such, we decided to test the use of the GRI framework has a positive effect on disclosure, even knowing its limitations, as previously mentioned.

Thus, we formulate the following hypothesis:

> **H8:** The use of GRI guidelines influences the level of disclosure of non-financial information.

In view of the above, it is expected that there is a positive relationship between all variables and the level of disclosure of non-financial information, according to the following table, where the way in which quantitative variables are measured is also presented.

Table 1: Independent variables, calculation formulas and expected association with the level of disclosure

Research Hypotheses	Independent variables	Calculation Formula	Expected Association
H1	Size	Total Assets logarithm	+
H2	Profitability	$\frac{\text{Net income}}{\text{Total Owner's Equity}}$	+
H3	Indebtedness	$\frac{\text{Total Liabilities}}{\text{Total Owner's Equity}}$	+
H4	Auditor Type	*Big4* = 1; otherwise 0	+

Research Hypotheses	Independent variables	Calculation Formula	Expected Association
H5	Internationalization Activity	0 - National; 1- Multinational	+
H6	Activity Sector	0 - Trade and Services; 1- Industry	+
H7	Type of report	0 - Report and Accounts; 1 - Separate Report	+
H8	Reference Framework	0 - No model or different from GRI; 1- GRI	+

Research methodology in the collection and processing of data

The sample and data collection

Within the scope of this study we will include entities listed on the Portuguese stock exchange, which meet the cumulative criteria required by DL No. 89/2017, that is, which have a legal status as a public interest entity and an average of more than 500 workers.

After consulting the Euronext Lisbon website[2], on November 16, 2018, we found that there were 47 listed companies. The collection of reports and accounts, sustainability reports, integrated reports or other type of report disclosed by the companies for the period of 2017 was performed, which corresponds to the first mandatory period for the adoption of DL 89/2017. These documents were collected on the websites of each of the companies.

After a brief search for their management reports, we found that about 10 companies did not meet the minimum requirement of 500 workers, so only 32 met the requirements for the analysis, those being our sample (see Appendix I - List of companies in the sample).
In the following table we can see how the sample is characterized, based on the variables previously identified, when formulating the research hypotheses.

Table 2: Characterization of the sample by sector

Size (total Assets)	N	%
Up to 1 billion euros	16	50%
>1 billion and <10 billion euros	11	34,38%
>10 billion euros	5	15,63%
Auditor Type	**N**	**%**
Big4	28	87,5%
Not Big4	4	12,5%
Internationalization Activity	**N**	**%**
Multinationals	22	68,75%
National companies	10	31,25%

[2] https://www.bolsadelisboa.com.pt/cotacoes/accoes-lisboa

The table allows us to verify that half of the companies have a total asset of less than 1 billion euros, with only 5 companies having more than 10 billion euros of assets. Most companies in the sample (87.5%) are audited by a Big4. With regard to the internationalization activity of companies, the sample is divided with 22 multinational companies (68.75%) and 10 national companies (31.25%).

In the following table we can see how the sample is constituted, framing it by sector.

Table 3 : Characterization of the sample by sector

Sector		N	%
	Banks	2	6,25%
	Consumer goods	3	9,38%
	Industry	9	28,13%
	Health	1	3,13%
	Consumer services	9	28,13%
	Communications	4	12,50%
	Energy, Gas and Oil	4	12,50%

When we carry out an analysis of the sectors of activity, we can see that Industry and Consumer Services are the most representative in the study sample with 28.13% each, which means more than half of the sample together.

Methodology: Dependent variable and model

In the first part of the study, we tried to study the non-financial reporting practices adopted, evaluating whether the listed companies make their non-financial reporting by including all information (financial, non-financial and management) in a single report or if divide between the report and accounts (for financial information) and the management report (with non-financial and management information).

Regarding the framework followed by the Portuguese companies that disclose their non-financial information, we will evaluate which of the theoretical references is the most chosen by the analysed companies.

The non-financial information reports issued by the companies were subject to a content analysis, in order to analyse the impact and applicability of the regulation in Portugal. To assess the degree of compliance with DL 89/2017, a disclosure index was created, based on a set of 8 items of information, corresponding to mandatory information by DL nº 89/2017, Article 66th -B of the CSC and the guidelines on the communication of non-financial information from the European Commission, as shown in the table below.

Table 4 : Disclosure items

Disclosure Items
1. Understanding the company's evolution (Business Model and associated risks)
2. Position of the company (Policies and due diligence)
3. Company performance (Results / Key Performance Indicators)
4. Impact of its activities on environmental issues
5. Impact of its activities on social and workers related issues, Equality between women and men and non-discrimination
6. Impact of its activities on human rights issues
7. Impact of its activities on anti-corruption issues and bribery attempts
8. Description of the diversity policy applied regarding its management and supervisory bodies

Thus, the value of the Index is the result of dividing the total score obtained by each company, by the maximum number of points awarded (8), as described below:

Table 5 : Formula for calculating the Disclosure index

$IND_j = \sum_{n=1}^{i} i_n / i$	IND_j	Disclosure index of non-financial information of the company j
	i_n	Non-financial information item i under analysis. Dichotomous variable (dummy) with value 1 if the company discloses information about the element and value 0 if the company does not disclose information about the element
	i	Maximum number of items (8)

The calculation of this index has two main characteristics:

- Dichotomous: when the item is disclosed, a score of 1 is assigned, otherwise the absence of information will be signalled with 0;
- Unweighted: the result is achieved through an unweighted sum, assuming that each item has the same relevance for the entity.

Thus, the index varies between 0 and 1, where 1 means that the company discloses information about all the items. This disclosure index will constitute our dependent variable, allowing us to measure the level of disclosure of non-financial information that we seek to associate with the independent variables present in the previously defined research hypotheses. For this purpose, a multiple linear regression model will be created, as described in table 6.

Table 6 : Multiple Linear Regression Model.

$$Ind = \alpha_0 + \beta_1 Size + \beta_2 Prof + \beta_3 Indeb + \beta_4 TAud + \beta_5 Inter + \beta_6 TSet + \beta_7 TRep + \beta_8 Ref + e_i$$

Where:
Size – Size, measured by the Total Asset Log
Prof – Profitability of owner's equity (ratio between net income of the period and total owner's equity)
Indeb – Indebtedness (ratio of liability to total owner's equity)
TAud – Auditor type, dividing into two groups (dummy variable):
0 – Auditor does not belong to Big4;
1 – Auditor belongs to Big4;

Inter – Internationalization activity, dividing into two groups (dummy variable):
0 – Company works at a national level;
1 – Company working in a multinational scope;
TSet – Activity Sector, dividing into two groups (dummy variable):
0 – Company does not belong to the industry;
1 – Company belongs to the industry;
TRep – Report type, divided into two groups (dummy variable):
0 – Non-financial information disclosed in the report and accounts;
1 – Non-financial information in a separate report;
Ref – Reference framework, divided into two groups (dummy variable):
0 – Does not mention any model, or other than the GRI;
1 – Mentions the GRI as the model used.

After compiling all the necessary information from the companies, we used the Statistical Package for Social Sciences (SPSS) software to create a database and carry out the respective statistical treatment and data analysis.

Analysis and Discussion of Results

Analysis of Non-Financial Reporting Practices

We now proceed to the analysis and discussion of the results obtained, as a way of answering the research questions. Thus, firstly, we begin by analysing the non-financial reporting practices adopted by the 32 companies listed on the stock exchange in Portugal and with more than 500 workers, and afterwards by looking to assess the degree of compliance with the established on DL 89/17 and its determining factors.

Report type

Since the main theme is the non-financial report, we start with an analysis of the type of report used by companies, and its form of disclosure, as we can see in the following graph.

Figure 1: Type of non-financial information report

To be noted that only 37,5% of the companies (12) chose to create their own report, separate from the report and accounts, usually called the "Sustainability Report". Of the 20 companies that include non-financial information in the report and accounts, about 16 dedicate their own chapter, unlike the other 4 companies that leave information dispersed throughout the report and accounts.

When the information is included in the report and accounts (62% of the cases), we can find a specific chapter for non-financial information, required by DL nº 89/2017, called "non-financial statement", "non-financial information" or also "sustainability" information. It should be noted that no company presents an integrated report.

Disclosure of Non-Financial Information Items

The figure below summarizes the number of companies that present information on each of the items under analysis (which are part of the disclosure index, to be analysed later), as predetermined in DL 89/2017.

Figure 2 – Number of companies that disclose regarding the information items

	Comprehension of the company's evolution	Company's position	Company's performance	Environmental	Social and workers related	Human Rights	Anti-corruption and bribery attempts	Diversity and bodies policy
Don't disclose	2	0	3	1	1	5	12	8
Disclose	30	32	29	31	31	27	20	24

With this figure we can see that the item "company's position", where companies refer to their policies and procedures, was disclosed by all companies included in the sample, since all companies had a maximum score in this item.

We can also verify that the item related to the fight against corruption and bribery attempts is the least disclosed by the companies, since 12 companies did not disclose about this item. Similarly, the items related to human rights and the diversity policy of the management bodies are also the items least disclosed by companies.

Reference Framework

Regarding the reference framework that companies followed to create their non-financial report, we used the GRI as a basis, since 53.13% of the sample mentioned it. This is especially visible in companies with multinational activities, where around 55% of these companies refer to the GRI in their non-financial reports, as we can see in the following graph.

Figure 3: Reference Framework used by companies

It should be noted that there is a very large difference in the number of pages, when the report is based on the GRI or not. The average number of pages in reports based on the GRI structure is 80 pages, with an average of 20 pages when there is no reference to GRI.

The same is reflected when comparing the company's internationalization, since national companies present an average of 34 pages of non-financial report pages, and at the level of multinational companies the value is almost double, around 60 pages.

Degree of Compliance with DL 89/2017: the disclosure index

As previously mentioned, our study aims to assess the degree of compliance with DL 89/2917, which is measured by our disclosure index, based on the 8 items of non-financial information mentioned above. This index varies between 0 and 1, representing the presence (1) or absence (0) of the disclosure of the item under analysis in the non-financial report.

After collecting and processing the data, we can see in the following table, that the disclosure index varies between 0.5 (minimum value obtained) and 1 (maximum value obtained), with an average of 0.88 and standard deviation of 0.15. Thus, we consider that the degree of compliance with DL 89/2017 is quite high, with an average disclosure of 7 items out of 8 possible.

Table 7 : Statistical measures of the disclosure index

	Minimum	Maximum	Average	Standard Deviation
Disclosure Index	0.50	1.00	0.875	0.1455

The table below allows us to observe that around 43.8% (14 companies) obtained the maximum score (index = 1), namely Altri, SGPS, Banco BPI, Cofina, SGPS, Corticeira Amorim, CTT Correios Portugal, EDP Renováveis, EDP, Estoril Sol N, Mota Engil, Semapa, Sonae, SonaeCom, SGPS, Teixeira Duarte, VAA Vista Alegre.

The company with the lowest score was Reditus, SGPS, which didn’t disclose 4 items in its non-financial report, namely the understanding of the company's evolution, human rights, fighting corruption and bribery

attempts, and the policy of diversity of management and supervisory bodies. We can also observe that the index does not present values below 0.5, that is, the minimum number of items disclosed is 4.

Table 8 : Disclosure of non-financial information

Disclosure Index	No. items disclosed	No. items not disclosed	N	%
0.5	4	4	1	3.1%
0.625	5	3	4	12.5%
0.75	6	2	3	9.4%
0.875	7	1	10	31.3%
1	8	0	14	43.8%
		Grand Total	32	100%

Determining factors of the degree of compliance with DL 89/2017: multivariate analysis

After a descriptive analysis of the results, we started to verify the relationship between the independent variables and the dependent variable, using a multiple linear regression model. According to Major et al. (2017, p.196) a regression consists of a "method of prediction or estimation between a dependent variable and one or several independent variables, such that the values of the variable can be explained by the values of the independent variable (simple regression) or independent variables (multiple regression) ".

As part of our multivariate analysis, based on the linear regression model previously outlined, we begin by analysing the correlations (and the respective level of significance) between each of the variables studied (see Appendix III).

Through the correlation matrix, we observed that the variables, size, profitability and report type correlate positively and significantly with the Disclosure Index, with a moderate association greater than 0.35 for a confidence level of 5%, which means that these variables have more than 35% of common variability.

According to Pestana and Gageiro (2008), the correlation coefficient between the variables studied must not be greater than 0.9 (in absolute value), as they indicate the existence of multicollinearity. However, by the correlation matrix, note that profitability and indebtedness exceed this limit. Therefore, we performed two linear regression simulations, removing each one individually. We concluded that the results were very similar, so we chose to remove the profitability of the model, since the net result for the period is more susceptible to changes depending on the year used in the study.

This way, we proceed with the model and the method used was the stepwise, since its main advantage is the removal of variables whose importance in the model is reduced. In other words, in its process it includes the significant variables, one by one, excluding all other non-significant variables.

Table 9: Results of the Linear Regression Model

Model		Non-standardized coefficients		Stand. Coef.	t	Sig.	Collinearity statistics	
		β	Standard Deviation	β			Tolerance	VIF
1	(Constant)	.831	.030		27.352	.000		
	TRep	.117	.050	.394	2.351	.025	1.000	1.000

2	(Constant)	.163	.270		.605	.550		
	TRep	.125	.046	.422	2.715	.011	.995	1.005
	Tam	.073	.029	.386	2.487	.019	.995	1.005

a. Dependent Variable: Ind

Along with the model, it is also relevant to make a diagnosis of the multicollinearity, which translates to the study of the relationships between the independent variables, in order to assess whether there are no linear relationships between them.

The multicollinearity intensity is analysed through the correlation between the independent variables and of tolerance and VIF (Pestana and Gageiro, 2008). Tolerance measures the degree to which a given variable is explained by all other independent variables. It varies between 0 and 1, and the closer it is to zero, the greater the multicollinearity. The VIF value is the inverse of tolerance and, therefore, the closer it is to zero, the lower the multicollinearity will be (Pestana and Gageiro, 2008). As we can analyse in the previous table, the VIF are 1.005, that is, very close to one, fitting the ideal values.

Through the stepwise we can observe (in the previous table) that it resulted in two models, that is, only two of the variables - size and type of report - proved to be statistically significant to explain the value of the disclosure index.

Table 1 : Summary Template

Model	R	R^2	R adjusted square	Standard deviation of the estimate	Durbin-Watson
1	.394[a]	.156	.127	.13591	
2	.551[b]	.304	.256	.12550	1.131

a. Predictors: (Constant), TRep
b. Predictors: (Constant), TRep, Size
c. Dependent Variable: Ind

The Report type variable explains about 15.60% of its value, which together with the size of the company, explains 30.40% of its result (R square = 0.304).

In view of the above, through the multivariate analysis we conclude that our results are in agreement with empirical evidence that indicate size as one of the main explanatory factors for the degree of disclosure of non-financial information (Caputo et al., 2017; Buitendag et al., 2017 ; Caputo et al., 2018; Romão et al., 2018 and Ribeiro, 2019). In the same way, similarly to Ribeiro (2019) and Fuster et al. (2019), the use of a separate report to disclose non-financial information influences its level of disclosure. Thus, it was possible to validate hypotheses 1 and 7.

Contrary to what was expected, in relation to the other independent variables, no statistically significant results were obtained, and, therefore, it was not possible to validate the remaining hypotheses formulated.

In the case of indebtedness, the positive relationship between indebtedness and the disclosure index, provided for in hypothesis 3, has not been proven. It should be noted that this variable is underused in this type of studies, as the empirical literature is not consensual as to its explanatory power. Likewise, we did not prove the association between the audit variable and the disclosure index, and consequently hypothesis 4 was not validated. Our results follow the same line as Fuster et al. (2019).

Regarding the internationalization activity, we were unable to prove the existence of a significant association with the disclosure index. Unlike Romão et al. (2018), which obtained statistically significant

results, our results are in line with the study by Fuster et al. (2019). To be noted that the fact that almost 70% of the companies are multinational, leads to some homogeneity of the sample with regard to internationalization, which may explain the difficulty in proving H4 statistically.

Similarly, the fact that the sample concentrates a large number of companies from non-industrial sectors has not allowed to prove the sector's influence on the advertising index, leading to the rejection of the research hypothesis 6. Our results are, however, similar to those of Caputo et al. (2018), Ribeiro (2019) and Fuster et al. (2019).

Finally, and contrary to the results of Caputo et al. (2018) and Fuster et al. (2019), in our study we were unable to prove hypothesis 8 that the framework used influences the degree of disclosure of non-financial information. However, our sample was quite divided, with 53% of companies using the GRI and the remaining 47% applying other models or even without mentioning any model suggested in the standard.

Conclusion

Through DL nº 89/2017, the Directive 2014/95/EU on the disclosure of non-financial information, mandatory in the 2017 financial year for public interest entities with an average number of employees above 500, was transposed to Portugal. This article sought to study the impact of that legal normative, ascertaining its degree of compliance in companies listed in Portugal, as well as its explanatory factors. This study sought to extend and complement the study by Lourenço (2017), which focused on the degree of compliance with Directive 2014/95/EU in 2015, as well as to expand the explanatory variables used by Ribeiro (2019).

Based on the content analysis of the 2017 period reports, we found three types of non-financial reporting: the use of own/separate report (in 12 companies, i.e., 37.5% of the sample) and the inclusion of information in the report and accounts (in the remaining 20 companies, i.e., 62.5% of the sample), with the majority (16 companies) presenting the information in a specific chapter or the remaining (4) dispersing the information across several chapters.

Regarding the degree of compliance with DL 89/2017, we conclude that it is quite high, since the average of non-financial disclosures is around 0.875, which means that, on average, companies leave only one of the items to be disclosed (of 8 items under review). We observed that the least publicized items were the fight against corruption and attempts at bribery, the diversity policy of the organs and human rights. The results of the disclosure index focus on four or more items disclosed, since no company discloses less than half of what is required by the DL. A very positive fact is that about 14 companies (about 44% of the sample), obtained maximum score in the index. This shows a concern on the part of companies in non-financial matters.

Another objective of this article was to identify the factors that determine the degree of compliance with DL 89/2017. For that purpose, using a multiple linear regression model, we related the disclosure index (dependent variable) with the following independent variables: size, profitability, indebtedness, type of auditor, internationalization activity, sector of activity, type of report and the reference framework.

From the linear regression model, we concluded that only the size and type of report are statistically significant, explaining 30.40% of the value obtained in the disclosure index. Thus, hypotheses 1 and 7 were validated. Although only these two variables are considered statistically significant, when we relate them individually to the disclosure index, we observe the limitations of our sample, since only 32 companies were considered and with very homogeneous characteristics. Aspects such as the type of auditor and the internationalization activity, follow a pattern of choice considered normal, since they are all listed on the stock exchange.

As for the sector, the sample ended up with few companies in the industry sector, about 28%, which negatively influenced the use of the sector variable. Although 53% of the sample refer to the GRI framework, and in the literature review it is considered an important variable, it was not proven with an explanatory factor of the degree of compliance with DL 89/2017.

As a general conclusion, we can say that the results were quite satisfactory, and prove the impact of the regulations on the reporting of companies that, increasingly, have other types of concerns besides financial ones. Thus, the high degree of compliance with DL 89/2017 demonstrates a process of institutionalization and homogenization of non-financial reporting practices on the Portuguese stock exchange, which is based on a coercive isomorphism, in light of the Institutional Theory. On the other hand, compliance with the law, i.e., the company's desire to be seen as complying with the law, is one of the assumptions underlying the theory of legitimacy. In coercive isomorphism, the main focus is to avoid the sanctions derived from the organization's non-compliance with the rules existing in the institutional environment (DiMaggio and Powell, 1983), so the company's legitimacy is obtained by complying with such rules.

One of the limitations found in the investigation is related to the methodology used, since we use a content analysis where we only confirm whether or not the item was disclosed, but we did not analyse the extent of its content or the quality of the information, and the information disclosed may add no value to its stakeholders (Gray et al., 1995). A score analysis could have been applied to identify the different dimensions of disclosure, as already applied by Caputo et al. (2017).

Given the fact that the analysis is related to the economic period of 2017, the first year of mandatory application of the DL 89/2017, it limits our study, making it impossible to compare and analyse evolution. Thus, we suggest, in the future, a longitudinal study that allows the evaluation of the evolution in the disclosure of non-financial information, specifically with regard to the framework model used. We believe that the future will pass through the increase of integrated reports, as a way to comply with the diploma.

Abstract

The Sustainable Development Goals (SDG) of the UN 2030 Agenda are an opportunity to improve the management of organizations, in order to seek solutions that add value and solve the greatest global challenges, by linking organizational strategies and global priorities. The SDG provide an integrated framework for future-oriented Corporate Social Responsibility (CSR) engagement. The way in which organizations evaluate their contributions to the SDG is the key to informing and shaping future engagement and action. Organizations will need to be able to assess their impact on the achievement of the SDG and review their strategies and practices, needing to collect and report new data. Thus, it is important to align the organizations' strategy and the corporate reporting with the SDG. Among the goals of Agenda 2030, we highlight target 12.6 that encourages companies to adopt sustainable practices and to integrate sustainability information into their reporting cycle. Although many companies mention the SDG in their annual or sustainability/integrated reports, particularly on topics related to climate change, sustainable water management or employment, organizations need a reporting approach that takes into account not only the importance of specific SDG, but also how to measure the level of progress against them. The aim of this study is to explore how Portuguese listed companies have started to engage with the SDG and how this expresses itself into their corporate reporting. Concerning the methodology, a content analysis of their sustainability reports was conducted, seeking to identify the companies that are concerned with SDG-related disclosure, disclosing information about theirs practices promoting SDG achievement.

Keywords: Sustainable Development Goals, Agenda 2030, Corporate Reporting, Sustainability Reporting

Introduction

The most well-known and quoted definition of Sustainable Development (SD) is that of the Brundtland Report which defines SD as "one that meets the needs of present generations without compromising the ability of future generations to meet their own needs" (World Commission on the Environment and Development, 1987:16).

Since the United Nations Conference on Environment and Development (UNCED) - ECO 92 or Rio Summit (1992), some structural documents have emerged from a sustainable approach to development, notably Agenda 21, which consolidates the SD strategy and its concept. The European Union (EU) has been present at ECO 92 and endorsed its declaration of principles for the SD. Sustainable development has been at the heart of the European Project for a long time. In the past, an EU Sustainable Development Strategy was launched in 2001 (COM, 2001), revised in 2009 (COM, 2009). Since 2010, sustainable development has been mainstreamed into the Europe 2020 strategy (COM, 2010).

In 2015, Member States of the UN adopted an ambitious agenda for poverty eradication and global economic, social and environmental development until 2030, known as Agenda 2030, containing 17 Sustainable Development Goals (SDG) and 169 targets. This agenda, adopted by almost all countries in the world, define the priorities and requires global action by governments, business, and civil society.

Agenda 2030 for Sustainable Development covers all areas and sectors of any country. The European Commission is fully committed to delivering the 2030 Agenda and, since 2017, regularly reports on the EU's progress in implementing the 2030 Agenda (COM, 2016). Thus, organizations will need to know how to assess their impact on SDG and review their strategies, accordingly, requiring the collection and reporting of new data, as well as how they relate.

In the European context, the EU Strategy for Corporate Social Responsibility (2011-2014) recognizes that the dissemination of information in this area is a key element in transparency and accountability, leading to the publication of Directive 2014/95/EU[1], of 22nd October 2014, on the provision of non-financial information with regard to social, environmental and corporate governance areas by companies.

The European Directive marks the beginning of a new stage in the reporting of large companies towards the non-financial reporting. However, within the EU, "The next steps towards a sustainable European future" are already being considered (COM, 2016). Based on the disclosure requirements of Directive 2014/95/EU, the guidelines proposed in that document make an important contribution to the SDG.

Among the goals of Agenda 2030, the target 12.6 that encourages companies to adopt sustainable practices and to integrate sustainability information into their reporting cycle. The development of sustainability reporting models in the last years leads companies worldwide to disseminate information related to sustainable development (KPMG, 2017). However, none of the sustainability/non-financial reporting frameworks (such as those of the Global Reporting Initiative and the International Integrated Reporting Council) include specific guidance on SDG disclosures. Thus, the linkage of SDG into corporate reporting is still at a very embryonic stage and it is, therefore, necessary to promote their progress.

A first UN report produced in 2019 by independent scientists, titled “The Future is Now: Science for Sustainable Development,”, assess the compliance with the SDG adopted four years ago. The 10 most sustainable developing countries are members of the EU, and Portugal is ranking among the 30 most sustainable countries of the world. A concerted and effective corporate action towards Sustainable Development is, therefore, possible if Portuguese companies align their activities to incorporate the SDG. Thus, it is important to analyse whether Portuguese companies are monitoring and reporting their impacts in relation to their alignment with the SDG.

The aim of this study is to explore how Portuguese listed companies have started to engage with the SDG and how this expresses itself into their sustainability reports. Concerning the methodology, it was

[1] In Portugal, the transposition of Directive was made to the Portuguese legal system by Decree-Law (DL) nº. 89/2017, of July 28. The diploma creates two non-financial reporting obligations, one related to environmental, social and labor aspects, and the other related to the diversity policies of members of higher corporate bodies. Specifically, DL nº. 89/2017 stipulates that companies must present a non-financial statement, as a general rule included in the management report, as from 2018, with reference to the financial year 2017, but may be presented in a separate report (either as an annex to the management report or thereafter, not later than six months after the balance sheet closure date). The information requested in this non-financial statement includes a description of the business model, policies, risks, environmental and social performance, as well as measures aimed at workers, respect for human rights, gender equality and anti-corruption and bribery.

used a content analysis, seeking to characterize the companies that are concerned with SDG-related disclosure, analysing the information about theirs practices promoting SDG achievement.

This paper is structured as follows: after this introduction, the first and second sections are related to the background on SDG reporting and some empirical literature review. The third section presents the research design, following by the empirical results and discussion. Finally, the main conclusions are presented.

Reporting on the Sustainable Development Goals

In 2015 United Nations approved 17 Sustainable Development Goals (SDG) within the UN 2030 Agenda. The SDG are an opportunity to improve organizations management, in order to seek solutions that add value and achieve the global goals. Organizations will need to assess their activities' impact on the SDG achievement and to review their strategies and practices. For that purpose, they need to be able to collect and report new data. It is important to align the organizations' strategy and corporate reporting with the SDG.

Over the past decades, frameworks have been developed to help assess and manage the current state of sustainability of an organization and communicate it to interested parties. The guidelines/standards developed by the Global Reporting Initiative (GRI) are identified as the main international benchmark for sustainability reporting, widely accepted and recognized worldwide (KPMG, 2015).

Since 1999, GRI has published a set of guidelines for the preparation of sustainability reports, a generally of voluntary adoption, initially contemplating performance indicators grouped by the economic, environmental and social areas. In a logic of continuous improvement, several versions of GRI´s guidelines have been published (in 2000, 2002 and 2006), and the G4 version, published in 2013, intended to give the report a higher level of information concentration and relevance (Adams, 2014).

More recently, in 2016, the GRI Standards was launched, representing the transition to a set of global standards that replaced the G4 version, which applies since July 2018. The GRI Standards, are basically a restructuring of the G4 for a new Standards architecture, in order to make the content clearer and more logical, based on a modular structure that can be kept up-to-date.

Despite the fact that sustainability reporting has acquired great importance in recent decades, as a result of the work developed by GRI, the information disclosed in sustainability reports is not always presented in the context of a business model or an organizational strategy, making it difficult for stakeholders to understand how sustainability (social, economic or environmental) can affect an organization's value creation process (Eccles and Serafeim, 2015). In this context, Integrated Reporting emerges as a viable alternative as it has the potential to make organizations' strategies and business models more transparent to stakeholders.

Traditionally companies have been publishing separate financial reports and sustainability reports because the strategic link between them was not recognized. In this context, the concept of Integrated Report emerges as a model that values the reporting of financial and non-financial information, under duly defined parameters, interconnecting investment decisions with the strategic and operational options and the conduct of the organization.

In 2013, the International Integrated Reporting Council (IIRC) published "The International <IR> Framework", with guidelines for the preparation of an Integrated Report, defining it as a concise document capable of evaluating the capacity to generate organizations' value, identify the main strategic points and anticipate risks and opportunities, internal or external, in business.

Integrated reporting allows organizations to think in an integrated way ("integrated thinking") about their strategy, facilitating more informed decision-making, good risk management, increasing the trust of different stakeholders, with the main objective of improving the performance of the organization as a whole (Guthrie et al., 2017). It is intended to increase the relevance, consistency and comparability of the information disclosed, adding in the same report all the components / "capitals" (manufactured,

intellectual and organizational, natural, human, social and relational) that contribute to business success and to creating value over time.

As we state before, considering the Agenda 2030, it is important to assess how organizational practices can be developed in order to meet the goals proposed in Agenda 2030, and how to articulate the organizations' strategy and reporting with the SDG. Integrating the SDG into the reporting process is, therefore, one of the major challenges for the organizations.

However, none of the above frameworks (GRI or <IR>) include specific guidance on SDG-disclosures. Thus, reporting needs to evolve in order to quantify, verify and effectively communicate the impact that companies have on SDG (KPMG, 2017).

In order to facilitate the integration of the Sustainable Development Goals in the Organizational Report, the UN Global Compact Network together with the GRI have developed two key[2] documents that should be used together as part of the business reporting cycle. It is not intended to create a new reporting structure, but to help companies to highlight their contribution to SDG and provide relevant information to stakeholders through qualitative and quantitative disclosures for the SDG targets (that are likely to be relevant to business, regardless of the size, sector or location of operations). Organizations can use these documents to disclose their impacts and contributions to the SDG, for example, reporting according to GRI standards and/or the 10 principles of the UN Global Compact.

However, Adams (2017) considers <IR> Framework is the best approach to disclose the organizations' contribution to the SDG, by integrating them into the strategy and the organizational report. Organizations can illustrate how and for whom they create value and can develop strategies that contribute to the 17 SDG, through the 6 capitals of <IR>.

The most recent development in this matter was promoted by the global accountancy bodies[3], with the report "The *Sustainable Development Goals Disclosure (SDGD) Recommendations"*, authored by Adams et al. (2020), which offer a new approach for organizations to address sustainable development issues aligned to the <IR> Framework (IIRC, 2013), the Task Force on Climate-related Financial Disclosure (TCFD, and the GRI. These recommendations are an opportunity to establish a best practice for corporate reporting on the SDG and enable more effective and standardized reporting and transparency on climate change, social and other environmental impacts. The disclosures are grouped into four themes, which converge with terminology used by the IIRC, GRI and TCFD: Governance, Strategy, Management approach and Performance and targets.[4]

The recommendations build on a suggested approach to contributing to the SDG aligned with long term value creation in Adams' (2017) report. The report set out a five-step process to align an organization's approach to the SDG with integrated thinking and long-term value creation for organizations and society as set out in the <IR> Framework.

Previous Empirical Research

Empirical research is still very embryonic in the scope of SDG reporting. A PwC (2017) study refers that a third (38%) of companies a global level (sample of 470) and more than half of the 35 Portuguese companies surveyed (57%) did not mention the SDG in their report. KPMG (2018) has developed a study to provide a base level view of SDG reporting majority among the G250 large companies worldwide. The KPMG study concludes that 4 in 10 (40%) of the world's largest companies already

[3] Namely, the International Federation of Accountants (IFAC), Association of Chartered Certified Accountants (ACCA), Institute of Chartered Accountants of Scotland (ICAS), Chartered Accountants Australia and New Zealand (CA ANZ), the International Integrated Reporting Council (IIRC) and the World Benchmarking Alliance

[4] Organizations might draw on the following the targets and indicators proposed by the GRI and UN Global Compact (2017).

reference the SDG in their corporate reporting (specially talking about their positive impacts on the SDG). The Annual Report Insights of Deloitte (2019) noted that 24 companies referred to the SDG in their annual reports – just under one quarter of their sample.

These results suggest that business interest in the SDG has grown quickly since their launch in 2015. However, there is not yet an established process, benchmark or standard for reporting on the SDG. Large companies from Europe (Germany, France and the UK) are significantly more likely to report on the SDG than companies in other countries. However, the numbers are currently too low to draw meaningful regional or sector conclusions.

Bebbington and Unernam (2018) highlight some of the large companies that have readily incorporated the SDG into their sustainability reports, for example Telecoms group, BT and Unilever. Also, Schramade (2017) mentioned Novozymes, as one of the few companies that has clear impact targets derived from the SDG. Another two leaders in SDG integration are Safaricom and Philips. Schramade (2017) found that only a minority of companies currently mention the SDG in their reports. He found that "40% of the Dow 30, 28% of the Eurostoxx 50, and 28% of the largest 30 companies in the Nikkei 225 mentioned the SDG in their 2015 reporting". The author concluded that one of the key challenges in terms of SDG and implementation is linking them with specific incentives that might influence the choice to invest in the SDG.

Calvo Centeno et al (2018) analysed the degree of contribution to the SDG of the groups listed in the IBEX 35, through the non-financial information disclosed in the consolidated non-financial report required by Spanish legislation (Decree-Law 18/2017 following 2014/95/EU Directive). A disclosure index based on the 17 SDG of Agenda 2030 was developed to measure the degree of compliance with the SDG. The results indicate that 6 of the 35 (17,14%) companies of the IBEX 35 do not mention any of the SDG included in Agenda 2030 and 2 companies (Telefónica and Iberdrola) include all of the 17 SDG. However, 50% of IBEX 35 companies incorporate less than 41.18% of the SDG in their reports.

Concerning the determinants factors of SDG reporting we can highlight the studies of Rosati and Faria (2019a and b). In their first study, Rosati and Faria (2019a) investigated the relationship between adoption of SDG reporting and some internal organizational factors. Using a logit model based on data from 408 organizations worldwide, the study concluded that only 16% of the sample addressed the SDG in the reports published in 2016. SDG reporting is related to a larger size, a higher level of intangible assets, a higher commitment to sustainability frameworks and external assurance, a higher share of female directors, and a younger board of directors.

The second study of Rosati and Faria (2019b) contributes to understand the relationship between an organization's willingness to address SDG in its sustainability report and some external institutional factors related to the organization's country. The authors conduct an analysis of the country-level institutional factors related to the decision to address the SDG in sustainability reports. The research was undertaken by considering 27 institutional factors belonging to six different national institutional systems, and it relies on data from 2413 sustainability reports published by organizations located in 90 different countries. The results show that SDG reporting are more likely to be located in countries with higher levels of climate change vulnerability, national corporate social responsibility, company spending on tertiary education, indulgence and individualism, and lower levels of market coordination, employment protection, power distance and long-term orientation.

Research Design

Sample and Methodology

The results the studies above suggest that business interest in the SDG has grown quickly since their launch in 2015 and have increased their reporting. However, the results are not enough to draw meaningful regional conclusions. In Portugal, as far as we know, our study is the first that provides insights into reporting's linkage with SDG from a Portuguese perspective. This study aims to verify if the corporate reports listed companies in Portugal mention the SDG.

Based on the companies listed in Euronext Lisbon, in November 2018 (in a total of 47) we have selected the companies that have published sustainability reports or integrated reports, referring to 2017. None of the companies had an integrated report, and 11 companies have published a sustainability report, but 3 of these reports did not have any reference to the SDG, so we have excluded them. Thus, we focused on those 8 reports (representing 17% of the sample).

We have also tried to assess whether in the following year, 2018, there was any significant evolution in the content of these reports. When collecting the reports, we found that a company (CTT) failed to present the sustainability report and has presented its first integrated report in 2018. Yet one entity (Sporting) did not present a sustainability report in 2018. Thus, for the analysis of the 2018 reports, we have focused our analysis on only 7 sustainability reports and 1 integrated report.

Concerning the methodology, it was applied a content analysis approach, as it is the most commonly technique used in disclosure studies.

Results and Discussion

Considering these 8 sustainability reports under analysis, in the period 2017, only 2 companies (25%) did not aligned their reporting with the SDG, as we can summarize in the table 1. This represents an higher percentage, compared to the results of Calvo Centeno et al (2018), in the Spanish stock market (only 17% companies of the IBEX 35 did not mention the SDG in their 2017 corporate reporting).

The table shows that in all the reports, the 8 companies have applied the GRI framework. Only 1 company used the G4 version; the others have used GRI Standards. Only in 2 companies (Navigator and EDP), the selection of the indicators was made in order to adopt the most demanding option of GRI, corresponding to the highest level of comprehensiveness: in Accordance-Comprehensive; the other companies use the option "In accordance – Core". In most cases, reports had an external verification by GRI. In our opinion, collecting data is important but request verification of that data to a competent entity makes the process more credible. In most of the cases, reports had an external verification by GRI. In our opinion, collecting data is important but request verification of that data to a competent entity makes the process more credible.

The companies of our sample are not all in the same stage of SDG reporting. In other words, most of the companies have their mission/strategy aligned with the UN goals, however three of them (SONAE, Media Capital and Sporting) do not prioritize their SDG. Three companies (EDP, Navigator and CTT) are at a more advanced stage, aligning the reporting with the SDG, considering them in their strategy and prioritizing the most important goals.

Considering the 2018 period, it should be noted that most companies maintain the type of report they had already done in the previous year, with the exception of Sporting (which does not present a sustainability report in 2018) and CTT (which, for the first time, prepares integrated report). Also noteworthy is Semapa, whose company strategy is now aligned with the SDG, and whose priority of some SDG was also proposed in the IIRC <IR> Framework (2013), while maintaining the GRI guidelines (version G4) for the calculation of environmental, social and economic performance indicators, with respective correspondence with the SDG.

Table 2 summarizes the content analysis of the 8 listed companies' reporting, in 2017 and 2018, demonstrating their linkage with the SDG.

Table 2: Summary of the SDG disclosures

Navigator	
2017	**Sustainability Report 2016/17** "The Company is aligned with the United Nations Sustainable Development Goals, which are identified and associated with the broad lines of action and objectives along its value chain" (page11). Presents its sustainability road map (pages 17-18). To do this, a table shows 27 commitments made for sustainability related to 10 most relevant topics (materials), establishing the action line, goals and key performance indicators (KPI) that allow monitoring the implementation of actions. It should be noted that each of the commitments associates the corresponding SDG (s). In the scope of its mission / vision it has "taken into account the major market trends and the needs of our stakeholders and is in line with SDG" (page 26). Under item 5: Challenges of the international agenda, a sub-item is dedicated to the 13 SDG identified as priorities for the company. It presents a detailed analysis of each material topic in identifying the applicable SDG, the goals to be fulfilled and what the stakeholders say.
2018	**Sustainability Report 2018** "The 2018 Sustainability Report is a reflection of work that is the result of the involvement of all areas of the Organization and is expressed in goals to be reached in the 2020-2025 horizon. The plans and goals outlined by Navigator are in line with the United Nations Sustainable Development Goals, particularly those that have been identified as priorities for the Company's harmonious growth, and seek to contribute to meeting sustainability challenges on a global scale" (message from management, page 5). The point 2.4. (page 34) refers to material topics and Navigator's response to the SDG, grouped into 4 axes: forest and industry, people, partnerships and innovation. Based on the Sustainability Roadmap defined in 2017, it includes 27 Commitments, broken down into lines of action, objectives/goals, and the 7 SDG considered to be priorities, that is, those where the Company has greater influence, in addition to also identifying other SDG to which the Company contributes. On pages 34-37 it describes the impact of each SDG on the Company and how they were responded to with concrete initiatives carried out in 2018. "The 2018 Sustainability Report was prepared in accordance with the Global Reporting Initiative Standards (GRI Standards2016 version), under the option 'Comprehensive'. It is in line with the United Nations Sustainable Development Goals and responds to the requirements of Decree-Law 89/2017 – about disclosure by large companies and groups of non-financial information and information on diversity" (page 94).
Sonae	
2017	**Sustainability Report 2017** "The activity report shows our performance at the level of the UNGC Principles and the SDG" (page 4). The GRI Supplement, which appears in the report, presents the indicators around a set of 5 axes, where the interconnection with the UNGC principles and the respective SDG are made.

2018	**Sustainability Report 2018** Presents the indicators around a set of 5 axes, where the interconnection with the UNGC principles and the respective SDG are made. “The report was prepared in accordance with the GRI Guidelines (GRI Standards) for the level "In accordance - Essential". The activity report highlights our performance at the level of the United Nations Global Compact (UNGC) Principles and the SDG …” Noteworthy is the 1st Scientific Council Meeting on the theme “Sustainable Production and Consumption” (objective 12 of the Sustainable Development Goals), which brought together all the Club's producers, members of the Scientific Council, Sonae teams, Zero Association and a UN representative.
Semapa	
2017	**Sustainability Report 2017** "Semapa assumes the sustainable development goals defined by the United Nations in its strategy, investments and operations" (page 28). Semapa assumes its responsibility towards society in this common project, committing itself to being an active part in pursuing these goals. It is our intention to align our sustainability strategy with the SDG, establishing goals and programs of action. “Point 4.3: Agenda 2030 states that a work program with short and medium-term actions, structured in 4 pillars and in the material topics identified, is being developed. The company undertakes to incorporating their approaches to the SDG. Bearing in mind the resources, value chain and evaluation of the material topics, will during the next exercise identify the goals to be prioritized and where to focus their efforts.
2018	**Sustainability Report 2018** Dedicates point 2 of the report to the SDG (pages 12-18): “Semapa assumes its responsibility towards society in this common project, committing itself to be an active part in the pursuit of these objectives. It is our intention to align our sustainability strategy with the Sustainable Development Goals (SDG), establishing goals and action programs. The United Nations SDG, ratified by practically all countries in the world, including Portugal, identify 17 objectives that aim to guarantee sustainable development. The SDG explicitly assume the importance of companies and economic agents so that their goals are achieved. Throughout 2018, the SDG were one of the topics under discussion at the meetings of the Strategic Sustainability Committee of Semapa, which identified 3 levels of application of these objectives in companies: Priorities (SDG 8.12 and 13), Aspirational (SDG 3, 4 and 9) and Instrumental (SDG 17). This exercise was based on the value chain of each of the subsidiaries, the assessment of their material topics and the mission of the group and each of the companies”. At GRI table (end of the report) shows correspondence with the requirements of DL 89/2017, but not with the SDG.
Media Capital	
2017	**Sustainability Report 2017** "Our contribution to the United Nations' 2030 Sustainable Development Goals is to empower all our resources in raising awareness and empowering consumers to respond collectively to the major environmental and social challenges facing the future" (page 1).

	The assessment of the material themes for Media Capital's stakeholders was based, inter alia, on "(...) the objectives defined by the United Nations in the context of its global sustainable development initiatives - Sustainable Development Goals (SDG) and United Nations Global Compact (UNGC) "(page 14). The GRI table, which appears at the end of the report, presents the different indicators, and is matched with both DL 89/2017 and their respective SDG. The report concludes by referring to "Media Capital intends during 2018 to define a sustainability governance strategy and model, aligned with the Group's business strategy for the next three years. In this first exercise, an initial approach is taken to map the Contribution of the Media Capital Group to the United Nations Sustainable Development Goals. However, in 2018 the Group will develop its internal approach, as well as a base of key indicators, objectives and targets for monitoring their contributions to the implementation of the United Nations Agenda 2030 "(page 97).
2018	**Sustainability Report 2018** The GRI table presents the different indicators matched with their respective SDG. Refers that, in 2019 the Group will develop its internal approach, as well as a base of key indicators, objectives and targets for monitoring their contributions to the implementation of the UN Agenda 2030. “Future developments: During 2019 Media Capital intends to review the most relevant topics for the organization by conducting a consultation with internal and external stakeholders. This survey will be the basis for defining a sustainability governance strategy and model, in line with the Group's business strategy for the next three years. In this report element, only the Media Capital Group's contribution to the United Nations Sustainable Development Goals is mapped. During 2019, the development of the sustainability strategy will define its approach, and constitute a base of key indicators for the pursuit of the objectives and targets of its contributions to the achievement of the United Nations 2030 Agenda”(page 75).
EDP	
2017	**Sustainability Report 2017** The report "Includes the commitments made to goals and targets and their relationship to the United Nations' 2030 Sustainable Development Goals" (page 4). In the framework of the strategy, "these objectives also correspond to contributions to the common agenda established by the United Nations Sustainable Development Goals (SDG), which EDP endorsed at the launch of this initiative in 2015" (page 39) “(…) EDP's commitment to 8 of the 17 Sustainable Development Goals "(page 101). It presents contributions to SDG 7,9, 12 (on the axis of economic value creation); SDG 5 and 8 (in the axis: developing people); SDG 13 and 15 (how to manage climate and environment); SDG11 and 17 (to strengthen confidence) (page 39) "Through its Social Investment Policy, EDP actively contributes to the United Nations Sustainable Development Goals, namely for SDG11, SDG13 and SDG15." (page 109)
2018	**Sustainability Report 2018** “In 2018, we extended our commitments regarding the Sustainable Development Goals of the UN Agenda 2030 (SDG) and included the ambition to contribute to the achievement of SDG 17 - Partnerships for the Implementation of the Goals, now covering 9 of the 17 SDG (message by the President, page 16)”. "EDP paid particular attention to the United Nations' Sustainable Development Goals, either through its activity in financing the third sector, or by promoting the SDG in international and national forums" (page 17).

	“The EDP Group's sustainability goals and targets, an integral part of the Business Plan and updated periodically, align with strategic priorities and detail around the 4 axes below. These objectives also correspond to contributions to the common agenda established by the United Nations Sustainable Development Goals (SDG), which EDP subscribed to in launching this initiative in 2015” (page 51). It presents contributions to SDG 7,9, 12 (on the axis of economic value creation); SDG 5 and 8 (in the axis: developing people); SDG 13 and 15 (how to manage climate and environment); SDG 11 and 17 (to strengthen confidence).
CTT	
2017	**Sustainability Report 2017** In the President's message it refers "We were one of the first Portuguese and industry companies to integrate the United Nations Sustainable Development Goals (SDG) into their business strategy." (page 5). “In the case of CTT, we mapped and prioritized the SDG to our value chain using the SDG Compass methodology developed by the WBCSD, UN Global Compact and GRI. We have identified the SDG targets that can contribute to promote positive impacts or minimize / avoid negative impacts and allocate them to each stage of the value chain, taking into account risks and opportunities "(...) Consultation with SDG Compass supported the identification and selection of the specific indicators and objectives of CTT "(page 20). They present targets for SDG 3, 4, 7, 8, 13 and 16. The 3rd edition of the participatory carbon offset initiative in 2018 "confirms the alignment of CTT with UN SDG 12 and 13, which CTT subscribes to" (page 14). Among other initiatives (conferences, trainings, workshops ..) there is also the "publication of two case studies of CTT (SDG 12-Ecoportfolio and SDG 13-Drivers' Challenge), in a document BCSD Europe on SDG." (page 58)
2018	**Integrated Report 2018** CTT publishes its integrated report for the first time. The Integrated Report contains information on strategy, management and performance of the Group's main business drivers, from the perspective of creating sustainable value. The inherent risks of the activity are also analyzed and the way CTT incorporates the various capitals (financial, human, intellectual, social and natural) is addressed, according to the guidelines proposed by the International Integrated Reporting Council (IIRC). The structure and content of the report respect the GRI Guidelines (version G4) and the respective protocols for the calculation of indicators. CTT, in addition to also aligning its environmental management strategy with the priority SDG for the sector, mapped and prioritized the SDG for it’s value chain, using the SDG Compass methodology. They have identified the SDG targets that can contribute to promoting positive impacts or minimizing/avoiding negative impacts, allocating them to each stage of the value chain, taking into account risks and opportunities. Most of the goals are already part of the Company's activities and programs, under several aspects, and are part of the Sustainability Commitments framework. The SDG Compass has supported the identification and selection of specific CTT indicators and targets. It presents an index of Environmental, Social and Economic performance indicators organized according to GRI4, with respective correspondence with the SDG.

Corticeira Amorim	
2017	**Sustainability Report 2017** "This circular profile of Corticeira Amorim contributes in a very relevant way to the SDG 12 ... However, from the crossing of the SDG with the areas of operation of the organization we verified that the sustainability strategy is clearly in line with other 10 SDG... "(page 103). This is reinforced on page 117: "The sustainability strategy of Corticeira Amorim is particularly aligned with 11 of the SDG". The strategic priorities .... taking into account the alignment with the United Nations SDG "(page 117). "(...) the company has begun a detailed analysis of its practices, which is still ongoing, and therefore considers it appropriate not to proceed in this report to the concrete definition of objectives and targets for the following years "(page 117). During the year 2017 (...) it took the first step towards aligning its sustainability strategy according to the 17 SDG, crossing them with its material areas of action."
2018	**Sustainability Report 2018** "We believe that our efforts contribute to the 2030 Agenda and the United Nations Sustainable Development Goals (SDG) (...) During the last year, after listening to the most participated stakeholders ever, we have reviewed our sustainable development strategy and have identified priority goals that are in line with the SDG "(message from the president, page 102). The Strategy is aligned with 12 of the 17 SDG. "In 2018, Corticeira Amorim has revised its sustainable development strategy based on the analysis of materiality in order to promote alignment with stakeholder's expectations and feedback. It also proceeded to identify the most related to material issues SDG, selecting performance indicators and key targets for each relevant SDG. Thus, 12 SDG and 44 goals were identified as being the priorities for Corticeira Amorim's sustainable development strategy" (page 120).
Sporting	
2017	**Sustainability Report 2016/17** In his message, the President states that it is a strategic concern, "... to ensure that we are aligned and committed to the United Nations Sustainable Development Goals. In the GRI table, which appears at the end of the report, it presents the different indicators and is matched with the respective SDG.

Conclusion

Major challenges are faced by companies in identifying priority SDG for their operations/activities and stakeholders, incorporating them into their strategy, setting goals for their success, and measuring and reporting on their progress. Integrate the SDG assessment in the report to show the stakeholders their effective performance, using the emerging non-financial reporting models.

The results of our study indicate that from a sample of 46 listed companies, in 2017 none published integrated reports, and only 11 published Sustainability Reports, using the GRI framework, and 8 of those companies refer to the SDG in their reports. In other words, most of the companies have their mission/strategy aligned with the UN goals, however three of them (SONAE, Media Capital and Sporting) do not prioritize their SDG. In 2018, the company Semapa is added to this group, which now considers its strategy aligned with the SDG, identifying those that are a priority. The most significant differences to be noted, in terms of reporting on the SDG, compared to the previous year, concern the company Sporting (which does not produce any sustainability report) and CTT, which have prepared their first sustainability report, following the IIRC Framework (2013) with respect to the various capitals (financial, human, intellectual, social and natural), continuing to adopt the GRI framework for the preparation of indicators, with respective correspondence to the SDG.

The companies are not in the same stage concerning the SGD reporting. Although the majory of the reports made a linkage with the SDG, only 3 - EDP, Navigator and CTT - can be considered at a more advanced stage: align the reporting with the SDG, consider them in their strategy and prioritize the most important goals.

A PwC study (2017) concludes that 37% of companies globally (in a sample of 470 companies) selected specific SDG as priorities in their reporting. But when compared to Portugal, they found that only 26% of the 35 companies surveyed selected specific SDG as a priority in their financial or sustainability reporting. We share PwC's (2017) view that in companies that fail to prioritize their critical goals, this may suggest that there is no significant level of commitment to them. PwC add that it is therefore a challenge for Portuguese companies to identify which objectives are most relevant to their business and then prioritize it and define how to approach it.

Mapping the SDG represents an essential source of inspiration for improving the structure and presentation of both sustainability and integrated reports. The integrated report can be considered as another step to be developed in the near future, but there is still a long way to go. Whether through sustainability reports or integrated reports, we believe that what is important is to align these reports with the structure and scope of the SDG and should, therefore, be a research area to be explored in the future.

This paper represents a starting point for deepening the research on SGD-related disclosure. By analysing the SDG reporting from Portuguese listed companies, this study can help non-listed companies to benchmark their own reporting. We expect that listed and non-listed Portuguese companies will increasingly report about their contributions to the goals in the next few years. Thus, in the future we intend to explore the relationship between SDG disclosure and corporate governance attributes (like size, economic performance, board of directors, etc.), in order to understand the characteristics that are related to the decision to engage SDG in corporate reporting.

Resumen

El presente documento sintetiza el desarrollo de la investigación realizada con respecto a la identificación de la problemática y las necesidades de las pequeñas y medianas empresas de la ciudad de Bogotá en Colombia en su funcionamiento y operación integral orientada a formular estrategias de acción en la formación de los profesionales en ciencias empresariales de la educación superior, como insumo para atender dichas necesidades por parte del futuro egresado de las ciencias mencionadas.
A través de una metodología con enfoque cuantitativo, de tipo descriptivo y mediante el muestreo aleatorio probabilístico, se diagnosticaron las necesidades en materia de gestión organizacional de las empresas de los sectores económicos industrial, comercial y servicios con el fin de postular a futuro posibles estrategias educativas a ser aplicadas por las instituciones de educación superior en la atención a los requerimientos del sector productivo. Finalmente se describen algunas de las estrategias recomendadas a las universidades para cubrir las necesidades de las empresas en las diversas áreas funcionales de las mismas.

Abstract

This document synthesizes the development of the research carried out with respect to the identification of the problems and the needs of small and medium-sized companies in the city of Bogotá in Colombia in their operation and comprehensive operation aimed at formulating action strategies in the formation of professionals in business sciences of higher education, as an input to meet these needs by the future graduate of the aforementioned sciences.Through a methodology with a quantitative approach, of a descriptive type and through probabilistic random sampling, the organizational management needs of companies in the economic, industrial, commercial and service sectors were diagnosed in order to apply possible future educational strategies. to be applied by higher education institutions to meet the requirements of the productive sector. Finally, some of the strategies recommended to universities to meet the needs of companies in the various functional areas of the same are described.

Palabras Clave: Sector Productivo, Estrategia, Pymes, Educación Superior.

Keywords: Productive sector, strategy, SMEs, higher education.

Introducción

El desarrollo económico de un país y el origen de su riqueza se genera a través de diversas fuentes siendo una de ellas la creación y fortalecimiento de su estructura empresarial. Por esta razón es necesario en el día a día de las ciencias empresariales generar nuevas estrategias que contribuya al

fortalecimiento del sistema productivo empresarial; orientadas todas al crecimiento, desarrollo y proyección de las organizaciones que lo componen. Para la generación de dichas estrategias es necesario que de manera estructurada y en forma periódica se identifiquen las necesidades y problemáticas del sector empresarial en sus diversos niveles y actividades económicas con el objetivo de reconocer y formular alternativas de solución y enriquecimiento a la gestión de las mismas.

Dentro de las alternativas a considerar como insumo de apoyo al fortalecimiento empresarial se destaca el rol de las instituciones educativas que desde su interior deben ser generadoras de procesos de acompañamiento a cada una de las áreas organizacionales en las cuales se desempeña los profesionales egresados de las mismas. Ante esta situación una de las tareas de las instituciones de educación superior consiste en reconocer que requieren las organizaciones que esperan a los profesionales en formación; no solo para actualizar la oferta educativa institucional, sino para diseñar estrategias efectivas de gestión que les permita a dichos estudiantes; cumplir puntualmente la atención de las necesidades y problemáticas que dichas organizaciones poseen a su interior.

Bajo esta premisa surge el desarrollo de la investigación realizada con el objetivo de contextualizar la realidad del sector productivo colombiano específicamente de la ciudad de Bogotá como insumo de la formulación de estrategias educativas que contribuyan al fortalecimiento del sector empresarial; el proyecto desarrollado se centró en el diagnóstico de las necesidades y problemáticas organizacionales del sector productivo; y específicamente el de las pequeñas y medianas empresas de las actividades económicas industrial, comercial y de servicios de la zona sur de la ciudad de Bogotá; así como del análisis de las actuales estrategias educativas de formación estudiantil y proyección social de las instituciones de educación superior (IES), identificando algunas de ellas como: convenios, contratos, pasantías y en general todas las formas de la práctica profesional, su dinámica, su alcance y operatividad como un espacio de acercamiento efectivo y apoyo por parte de la institución a través de sus estudiantes; a la generación de soluciones a las problemáticas organizacionales de las empresas a atender por los futuros egresados.

El desarrollo de dicha investigación desde su planteamiento, así como el diseño metodológico empleado, se reseñan en el siguiente documento, presentando de manera explícita los resultados alcanzados al realizar la contextualización y la descripción de las posibles estrategias, susceptibles de ser aplicada en cualquier contexto educativo, siendo simplemente ajustadas a las necesidades del mismo; y al cumplimiento como es obvio a las normativas no solo institucionales sino legales en materia educativa y laboral [1] Así pues y mediante un diseño metodológico de enfoque cualitativo, de carácter descriptivo y soportado en la revisión documental y trabajo de campo (grupos focales y cuestionarios [2,3,4]se identificaron aspectos claves que permitirán a futuro plantear una propuesta de espacio de acercamiento en el cual las organizaciones se beneficien del saber, del hacer y del ser del estudiante que allí realiza su práctica, siempre con el sentido social e inclusivo que se requiere.

Como aspecto introductorio para abordar el proceso investigativo desarrollado, es importante destacar las siguientes concepciones que como contexto del entorno en el que se ejecutó el proyecto; se hacen necesarias para entender su alcance e importancia; siendo adicionalmente conclusiones de la investigación realizada. Las pequeñas y medianas empresas objeto de estudio del proyecto, a nivel mundial se han convertido en un tema relevante en la actualidad económica para muchos países; los cuales, generan interés en la creación y fortalecimiento de empresas cada vez competitivas como motor de desarrollo de sus gobiernos [5] Dicho interés se refleja en el incremento porcentual que de manera considerable ha tenido el empleo, la producción y el comercio gracias al desarrollo de las Pymes [6]; razones todas válidas para entender que el sector educativo debe abordarlas investigarlas y proponerles soluciones desde su alcance.

Metodología

La investigación realizada fue de tipo descriptiva con un enfoque cualitativo, que permitió conocer el contexto general de las pymes en su gestión, como insumo para el análisis de su situación interna en los sectores de industria, comercio y servicio. Se realizó un análisis general utilizando la técnica de revisión documental con relación al estudio de las pymes en Colombia específicamente en las

ubicadas en el sur de la ciudad de Bogotá; para dicha revisión se consultaron fuentes secundarias de orden cibergrafico y bibliografíco tales como informes, investigaciones y estudios de carácter gremial, público y privado a nivel internacional, nacional y local de los años de los últimos cinco años de vigencia. De la misma manera en el proceso investigativo se utilizó la técnica de Grupo focal para el trabajo de campo, pues esta permite identificar desde la fuente empresarial las necesidades de las pymes en la gestión organizacional para la búsqueda de soluciones; tal y como lo afirma [7] quien afirma que para el desarrollo de un producto o servicio, es útil probar el mismo en el contexto real; de igual es importante destacar que a través de los grupos focales se puede trabajar con instrumentos de análisis en profundidad y detalle, donde la discusión grupal se utiliza como un medio para generar entendimiento profundo de las experiencias de los participantes.[8]

Para la recolección de datos de los Focus Group se trabajaron: memorias en audio, notas de campo durante la sesión donde se identifican las ideas principales y observaciones relevantes y grabación en video [9]

Para la selección de la muestra se utilizó el muestreo probalistico aleatorio simple en el cual, cada una de las pequeñas y medianas empresas tuvieron la posibilidad de ser elegidas del total poblacional de las mismas ubicadas en el sur de la ciudad de Bogotá. Los participantes son seleccionados porque tienen alguna experiencia en común en grupos homogéneos para que se produzcan fácilmente el intercambio de ideas. [10] Considerando lo anterior se determinó realizar un total de 12 grupos focales abordando la problemática en cinco localidades del sur de Bogotá, con el fin de conocer conductas y actitudes de los pequeños y medianos empresarios en cada sector y de acuerdo con la actividad económica que desarrollan. Adicional a los grupos focales se aplicaron encuestas semiestructuradas a los empresarios, para la recolección de la información de conocimientos explícitos necesarios para analizar las características socioeconómicas, laborales y empresariales; con el fin de complementar la información recolectada en la investigación cualitativa para el análisis con mayor profundidad. [11] Para el análisis de la información se toman los documentos relacionados con el tema, y los resultados obtenidos en el estudio; que tienen como objetivo documentar las experiencias de los empresarios en su gestión empresarial a partir de los aspectos administrativos, contable y financiero, de tal manera que permita desde la realidad elaborar supuestos que aborden la problemática. Una vez aplicados los instrumentos de recolección de información; se procedió a tabular y sistematizar la totalidad de datos recolectados para lo cual se utilizó la técnica de triangulación metodológica, en la cual y mediante la observación directa del investigador, el cuestionario semiestructurado y el grupo focal se generaron las conclusiones conducentes a identificar el contexto de gestión organizacional de las pymes analizadas. La aplicación de diversos métodos para obtener información que pueda ser comparada y retroalimentada entre sí como insumo para llegar a conclusiones. [12]

Resultados

Una vez sistematizada la información luego de haber aplicado la totalidad de los grupos focales con forme al diseño metodológico planteado se presentan los siguientes resultados en las respectivas categorías definidas:

Aspectos Relevantes De La Revisión Documental A Nivel Internacional

Varias organizaciones no gubernamentales adelantan estudios sobre el comportamiento de las PyMes o pequeñas y medianas empresas en los países, como es el caso del Grupo del Banco Mundial y la Corporación Financiera Internacional [13] quienes realizaron encuestas a 45.000 empresas en 106 países en desarrollado, en función de la medición basada en la percepción de indicadores ampliamente utilizados para la clasificación y calificación crediticia e inversionista a nivel internacional, estos resultados dan a conocer los principales obstáculos que atraviesan las Pyme en el sector privado; se identifican las 15 dificultades más relevantes: el acceso al financiamiento con un 16.5%, el acceso a la electricidad 13.5, informalidad con casi 12%, tasas impositivas 11.3%, inestabilidad política 8.2%, mano de obra calificada 8%, corrupción 6.5%, robo y crimen asociado

5.3%, reglamentos, licencias comerciales, permisos, transporte, administración de impuestos, regulación personalizada y laboral un 3% y tribunales 1% como se muestra en la Figura 1.

Figura 1: Principales restricciones que afrontan las empresas para sus operaciones.

Las Pymes en Colombia constituyen un grupo sobresaliente de empresas, considera que: "Su estructura productiva se caracteriza por la existencia de pequeños establecimientos que contribuyen significativamente a la creación de empleo, a la generación de riqueza y a satisfacer necesidades de mercados poco atractivos a las grandes empresas" [14, p.33]. Como se ha dicho en el mundo las PyMes o pequeñas y medianas empresas representan un sector empresarial importante para la economía de cada país y requiere un estudio detallado para conocer su comportamiento. El sector empresarial de las pequeñas y medianas empresas, desempeña un papel importante en el desarrollo actual del país, ya que influye en el crecimiento de la economía; en cierto modo, este sector de pequeños empresarios es uno de los más vulnerables frente a las exigencias del mercado que los obliga a ser cada día más competitivos, enfrentándose a problemas como escasa capacitación técnica y empresarial, así como su gestión administrativa, financiera y operacional entre otros, son algunas de las dificultades por las cuales atraviesan las pymes actualmente, tal como lo afirma la Universidad Escuela de Administración de Negocios EAN en la investigación realizadas por el grupo de investigación en PyMes o pequeñas y medianas empresas.

Según el grupo de investigación G3Pymes de la Universidad EAN, las pymes representan el 99,9% del total de las empresas en Colombia, cerca de 1,6 millones de unidades empresariales las cuales de igual manera han aportado cerca del 38% del PIB total, teniendo una importancia muy relevante en la generación de empleo. Sin embargo, el tiempo de sostenibilidad de las mismas es muy corta; solamente el 50% de ellas sobreviven el primer año y solo el 20% al tercero, debido a la poca importancia que le dan a la innovación y al conocimiento; lo que genera falta de competividad y permanencia en el mercado [15]. Entre las grandes debilidades de las pequeñas y medianas empresas que se han identificado en Colombia se encuentran: capacitación, programas de emprendimiento, falta de proyección operacional, desconocimiento legal para exportación, manejo logístico entre otros [16]. De igual manera las pymes colombianas presentan dificultad en la proyección de su negocio de manera global, muy pocas exportan porque cuentan con limitaciones organizacionales, financieras y técnicas, desconocimiento de normas de otros países para exportar rezagándolas al mercado local; las operaciones logísticas se considera otra limitante referente a canales de distribución y volúmenes de producción, De esta forma como lo mencionan Codina, Pagan, Brown, Carmona, Cursi, Dorsey del Ángel, Sandoval. (2005) citado en [17]. la administración de las Pymes demanda un profundo conocimiento de las áreas que afrontan problemas por la globalización, ya que no solo se trata de manejar empíricamente un negocio, sino también es necesario tener conocimientos de administración

para enfrentar el mercado actual en las áreas de: gerencia y planeación estratégica, mercados, recursos humanos, comportamiento organizacional, análisis financiero y evaluación de proyectos y adopción de las tecnologías de la información y comunicación Tics. En este orden de ideas otros aspectos de la problemática de las Pymes son: obstáculos del entorno, problemas macroeconómicos, barreras institucionales de infraestructura y de servicios y dificultades a nivel empresa; limitaciones que impiden llevar a cabo procesos de fortalecimiento para su crecimiento económico [18]

En lo que respecta a la diferentes problemáticas que los empresarios enfrentan, se puede decir, que según un estudio de la Asociación de Emprendedores de Colombia ASEC, radica en la falta de capacitación en lo que se refiere al emprendimiento; tal estudio revela que el 56% de los colombianos consultados creen que en las instituciones de educación superior no se brinda suficiente formación en emprendimiento, lo que indica que el empresario busca la forma de crear un mercado más competitivo pero la falta de oportunidades en adquirir las herramientas suficientes para competir y obtener resultados a largo plazo, radica en las falencias en la academia.

Resultados Significativos Por Sector Económico

Según el análisis de las experiencias de la gestión de los empresarios analizados en los diferentes grupos de enfoque y encuestas aplicados a los mismos se puede concluir que hay aspectos propios para cada actividad económica posibilitando identificar las principales necesidades de cada grupo de empresarios dedicados al comercio, industria y prestación de servicios como se muestra en la Figura 2.

Figura 2: Aspectos relevantes de las necesidades según actividad económica de las mipymes de las localidades del sur de Bogotá.

Fuente: Elaboración propia resultado de la investigación. Triangulación de caracterización económica, empresarial y laboral, Focus Group y encuestas

Así mismo después de la triangulación de la información de revisión documental, grupo focal y encuestas realizadas se evidencian las necesidades de los empresarios que predominan en cuanto a temas administrativos, contables, y financieros. Ver figura 3

Figura 3: Principales necesidades en gestión empresarial mipymes del sur de Bogotá

Fuente: Elaboración propia resultado de la investigación. Triangulación de caracterización económica, empresarial y laboral, Focus Group y encuestas.

Conclusiones

Una vez analizado los resultados ya presentados de manera global, se puede concluir entre otros aspectos con relación al contexto del sector productivo evaluado, los siguientes elementos:

1.A nivel interno la problemática se genera principalmente por falta de apoyo de entidades financieras, que les permitan a las pequeñas y medianas empresas adquirir créditos para la ampliación de su negocio, debido a que no tienen capacidad de endeudamiento, respaldo o vida crediticia.

2. Las necesidades mencionadas en los resultados se basan en capacitación oportuna y asertiva en los campos relacionados con el área administrativa, contable y financiera, puesto que el principal interés de los empresarios se ha limitado a la comercialización de productos.

3. En aspectos financieros y comerciales se destacan como relevantes, la deficiente estrategia para la fijación de precios, así como la ausencia de gestión en mercadeo ventas y publicidad.

4. De igual manera la influencia del entorno externo como por ejemplo las políticas del gobierno en materia laboral, fiscal y tributaria, la competencia desleal, la incursión de productos extranjeros en el mercado colombiano entre otros factores ha generado disminución en ventas considerablemente afectando la estabilidad de sus negocios.

Finalmente, a partir de los resultados obtenidos se genera la necesidad de proponer estrategias de gestión para fortalecer la formación de los estudiantes universitarios de Ciencias Administrativas específicamente desde la visión de la práctica profesional en el sector real productivo.

En países como Colombia y dentro de su modelo educativo, se contemplan desde la normativa institucional leyes y decretos que amparan el fomento del emprendimiento, la creación de empresa y generación de empleo; legislaciones que desde el gobierno central buscan atender la proyección del sector empresarial y especialmente el de las pymes quienes representan un protagonismo significativo en la economía nacional. Pese a ello, es muy general lo mencionado por lo cual y frente a las necesidades detectadas se sugiere que desde los ejes de la educación superior de proyección social, investigación y docencia se deben generar espacios de acercamiento de los estudiantes de pregrado a la realidad del sector productivo; dichos espacios se materializan en alternativas como la práctica

profesional, dinámica en la cual el estudiante de último semestre de formación se incorpora a una organización empresarial bien sea con o sin vínculo laboral y de manera temporal; para desarrollar tareas de diagnóstico, apoyo y gestión a la dirección de la empresa; aportando desde su disciplina respectiva soluciones y alternativas de mejora al empresario esperando la implementación de las mismas a criterio de la organización.

Junto a la práctica mencionada la cual es avalada tanto por la gerencia de la empresa como por la institución de educación y que cuenta con un docente tutor que guía el proceso, existen otras alternativas generados desde la educación superior que sin duda marcaran la tendencia en los años venideros y que buscan todas ellas atender las necesidades del sector productivo al que finalmente llegan los egresados profesionales, entre ellas se mencionan:

- Revisión de contenidos curriculares y fortalecimiento de los mismos en las áreas de asesoría y consultoría en temas organizacionales, técnicos, comerciales, legales y financieros.
- Formulación de proyectos de investigación orientados al diagnóstico y caracterización de los diversos sectores empresariales con el ánimo de atender sus necesidades.
- Creación de laboratorios y consultorios empresariales y contables que permitan acceder a las empresas a dichos servicios prestados por las universidades.
- Desarrollo de habilidades emprendedores y de empresarialidad en los estudiantes como insumo para la creación de emprendimientos reales y generación de empresas competitivas.
- Fortalecimiento en la formación de áreas como innovación y desarrollo empresarial enfocados a las tendencias de los negocios.
- Incorporación a los procesos de formación de didácticas tales como simuladores y juegos de roles reales aplicados al sector productivo.
- Seguimiento a los graduados y egresados en sus aspectos laborales, empresariales y profesionales para establecer indicadores de generación de emprendimientos y creación de empresas.

Abstract

Collaboration between the public and private sectors is important for promoting the economic development of a country, the adoption of this process being present in a wide range of activities in the field of infrastructure and services. Practicing the public-private partnership in financing the various projects is accompanied by the attraction and promotion of Foreign Direct Investments, these being an important source of private capital and, at the same time, an engine of development through the contribution of advanced experiences. The study highlights the beneficial role of the policies of practicing the public-private partnership with the commitment of Foreign Direct Investments, and the relevance of the involvement of the two sectors in the economy, by the advantages brought (the fulfilment of the investment flows needed for new objectives or for the development of others, the creation of new jobs etc.). The issues of the penetration of foreign capital, through the Public-Private Partnership, in the Romanian economy, is shown, with some examples regarding the impact on some fields of activity. The purpose of the paper was to point out some issues regarding the cooperation of the two sectors, public-private and the effects of their action in the economy, the public-private partnership being an important instrument for attracting and promoting of Foreign Direct Investments. The limits of the survey reside in the fact that the situations presented in the study, supported by concrete examples are representative for the impact of foreign direct investments, without exhausting all the forms manifested, during the analyzed period. The conclusions present, in short, the importance of achieving public-private partnerships by accessing Foreign Direct Investments, with an impact on the development of the economy and of increasing competitiveness in the host countries; noting, therewith, the likelihood of risk that may occur, which implies appropriate measures from the host country governments. The method used to carry out the study was the documentation from the foreign and domestic specialized literature, the synthesis and processing of the relevant ideas, by capturing the interaction - Foreign Direct Investments – Public-Private Partnership.

Introduction

In promoting the economic development of a country, it is important to know the potential contribution of collaboration between the public and private sectors, in the context of the participation of a wide range of actors, belonging to central/local governments, private agents.

The objectives of the partnership are aligned on a wide range of infrastructures and services achievement, this form of cooperation aiming at optimizing the experience of the two entities. The adoption of this procedure, in ensuring the provision of certain public activities, is not new; during the evolution of society, the forms of cooperation between the public and private sectors have manifested since ancient times, continuing and evolving until now. The first and most known form practiced throughout history was the concession, with a role in the development of infrastructure and services.

In the last three decades of the last century, the public-private partnership got involved in the economy, in the context of the decrease of the economic governmental performances and of the penetration of the techniques of the New Public Management (Savas, 1982).

The specialty literature concerning public-private partnership, at the end of the last century, integrates it into the New Public Management phenomenon, (Osborne and Gaebler, 1992), considering it as the one of the basic element of the public administration reform, alongside other processes, such as privatization, decentralization, emphasis on results, customer orientation (Osborne, D. et Gaebler, T., 1992) [1].

Involved, initially, in projects aimed to urban development and infrastructure works, the concept of public-private partnership evolved, subsequently, by its using in other fields, too, comprising technologies, ecological projects, education, health (Vaillantcourt, 2000) [2], thus, enriching the range of forms of collaboration between the two sectors.

Practicing the public-private partnership is an instrument for attracting and promoting Foreign Direct Investments, the method being widely used in financing different projects in sustainable sectors (infrastructure, environment, services) (Wang, 2017; Ruwo and Makarudze, 2015). Since the end of the ninth decade, yet, Foreign Direct Investments have become an important source of private capital, especially, in the case of developing countries, being preferred to other forms of capital (Negrițoiu, 1996).

Policies of promoting public-private partnership and encouraging Foreign Direct Investment are beneficial to an economy, from the perspective of creating a possible balance, between the role of the public sector in relation to the private one, the involvement of the two processes, in the economic activity, being useful, through the advantages brought (Wang, 2017).

Through the contribution of advanced experience, the Foreign Direct Investments are constituted as a mobilizing factor of the development, being able to determine a better harness of resources and an increase of added value (Negrițoiu, 1996).

The Importance of Public-Private Partnership Development by Attracting Foreign Direct Investments

One of the significant premises for the development of an economy is represented by Foreign Direct Investments, a means of promoting them, being through the instrumentation of the public-private partnership, a method widely used in financing different global infrastructure projects (Wang, 2017, Bernardinetti, 2018).

The prospects of co-operations achievement between public authorities and the business environment, in order to develop public-private partnership projects, are due to the challenges that the economy is aware of: the shortage of public funds in relation to the capital requirements needed to promote investments in sustainable sectors (infrastructure, environment, services). In this context, governments are determined to resort to the private sector, for the participation with funds, the orientation being both towards the domestic and international investors (Ruwo and Makarudze, 2015).

One of the definitions given to Public Private Partnership considers that it represents:*"A long-term contractual arrangement between a government entity and one or more private entities, whereby the resources, capabilities and core competencies of each party are combined with the aim of designing, financing, building and operating a facility for the use of the general public"*[3].

Practicing public-private partnerships and policies to incentive Foreign Direct Investment are beneficial to an economy, for the possibility of creating a relative balance, between the role of the public sector in relation to the private one. The involvement of the two sectors, public-private, in the economic activity is relevant for the expected economic advantages (Wang, 2017):

- the public sector – ensures the production of public goods, regulations in the economic field, respect of the consumer rights;
- the private sector – contributes with the resources needed for the project (partially, totally), efficiency in their allocation, meeting market requirements, infusion of experience in a specific field, modern technology, customer-oriented services, all being actions motivated by the interest of maximizing profit.

In the category of *public partners*, central administration bodies, local authorities, public enterprises, other public institutions are included; domestic or international investors, relevant to financial resources and technical experience*,* are found among *the private partners*.

The mechanism of public-private partnership enhances the financial capacity of a country, given the potential it has, by attracting private investments in infrastructure, services, increase the efficiency of the public sector, balancing public and private investments, internally (Wang, 2017).

Regarding the cooperation relations of the two parties, according to the typology of the World Bank, having as a reference, the level of risk assumed by the private environment, the public-private partnerships of infrastructure investments are differentiated on the following categories of contracts [4]:

- *of management and leasing*:
  - in the *management contract*, the private partner has management responsibilities and the risk transfer is reduced, the operational risk belongs to the public sector;
  - in the *leasing contracts*, the private partner takes over the operational risk, too, if it is granted a right of use over the public good, with the payment of a tariff;
- *concessions* - are subject of the contracts: Rehabilitation-Operation-Transfer (ROT). Rehabilitation-Leasing/Rent Transfer and Construction-Rehabilitation-Operation-Transfer.
- *greenfield projects* - are the subject of contracts with a mixed company - joint venture that executes a new infrastructure work, and at the end, the sector can choose, yes or no, to take it over in its heritage.
- *privatization* - refers to the situations in which the shares of a state unit are sold to a private unit (operators, investors) in whole or, in part, achieving total privatization, respectively partial privatization.

Therewith, the public-private partnership schemes bring their contribution in stimulating economic diversification and attracting foreign direct investments, planting foreign companies on the internal market, interested in new contracts and expanding on new markets. Thus, reciprocal relations favourable to both parties (regarding the risks assumed and the benefits obtained) can be created, the public actor benefiting from the service provided by the competent experienced international

operator, and the latter having the perspective of a stable source of income and of extension, over time (Bernardinetti, 2018).

The concern of the governments to promote the Public-Private Partnership in order to attract Foreign Direct Investments and to obtain the financing from private actors is motivated by the perspective of opening long-term external investment flows, needed to achieve new major objectives or to continue the development and modernization of infrastructure works, of the possibility of creating new jobs.

At the same time, both for the large investors and for the small and medium-sized ones, who obtain funds from syndicated loans, the public-private partnership arrangements with foreign bodies have proved, in the long term, profitable, stable and attractive. These have meant an element of support in making attractive investment decisions, in economies of some host countries where they have found the opportunity to hire contracts, to expand into new markets.

Taking into account the gradual increase in the volume of transactions, in the last years, it is the task of governments to implement and consistently improve, the legislative framework associated with investments, through public-private partnership, ensuring a favourable environment for Foreign Direct Investment (Bernardinetti, 2018).

Certain aspects concerning the penetration of foreign capital through Public-Private Partnership, in the Romanian economy, after 1990

In Romania, the restructuring of the economy after 1990 consisted of integration the specific risk determined by internal factors and, also, by the risk of the implications of the world economy on the Romanian economy (Popescu and Ciucur, 1995).

In this context, one of the possibilities considered useful for the restructuring of the economy was the *Foreign Direct Investment through the public-private partnership*; from this perspective it was possible to favour the process of optimizing the allocation of resources, of establishing market economy behaviours, increasing competitiveness and access to the external market (Prelipceanu, 2006).

The introduction and expansion of market forces in the public sector field, as a result of the substantive changes initiated by governments, since the last decades of the last century, has occurred on the basis of some political mechanisms and institutional structures, in which the public-private partnership is also aligned.

Developed both at European and international level, during the last fifty years, the public-private partnership is constituted as an advantageous solution for the implementation of some major importance projects in the economy of a country, the cooperation of the two sectors being profitable for both parties: investors, public authorities.

The manifestation of the public-private partnership, in Romania, unfolded in the context of the structural changes in the economy during the transition period, of the restructuring of relations between the governmental sector and the non-governmental one, as an echo and response to the social and economic problems, characteristic of the stage.

The introduction and materialization of this concept has been made gradually, both through the creation and the efforts of the parliament and government to improve the legal framework, as well as through projects achievement in some areas of the economy.

The penetration of private capital, through investments in various fields, concretized in partnership forms, by the development of some capacities or the fulfilment of new investments, concessions to private, foreign, but, also, domestic investors. The transfer of public capital to the private one,

usually, led to the majority stock holding by the private investor, this taking over the control of the company's activity.

Among the first actions initiated, considered efficient for the restructuring of the economy, there was the privatization, whose development was carried out in close correlation with the flow of Foreign Direct Investments (Popescu and Ciucur, 1995; Prelipceanu, 2006).

The privatization in our country took place gradually, begining with 1991, by the adoption of the Privatization Law, covering several methods: mass privatization (the years 1991-1995), direct selling (1996-1997), auction sale (beginning in 1998), privatization through the capital market (Prelipceanu, 2006).

Overall, the privatization process achieved successes, firstly, in the case of small enterprises and as concerns large companies, the pace was slower.

In the first stage of the transition (1991-1996), there were significant disparities concerning the volume of Foreign Direct Investments attracted, between Romania and the other Eastern European countries, future members of the European Union (Prelipceanu, 2006).

After 1997, the flow of foreign direct investments accessed by Romania achieved increases compared to the previous period, the form supported by foreign investors, being the creation of *joint-venture* enterprises, for example, Daewoo with Oltcit (Rudoševic și Dycker, 1996) [5], continuing the tradition prior to the 1990s (RENAULT and DACIA - 1970) (Prelipceanu, 2006, p. 110).

The liberalization of the capital flow and the launch of privatization constituted a favourable element for the penetration of foreign direct investments; after the years 1997-1998, a number of major companies entered the Romanian market, which meant a significant impact in the process of market formation. A number of large investments are involved, such as the privatization of ROMTELECOM, DACIA Pitesti, privatization of banks and others (Prelipceanu, 2006, p.114).

Along with acquisitions, investments through new registrations, capital increases appear, the external investors existing on the Romanian market, aiming to increase the market share and strengthening the position held.

The stake of foreign investments in the Romanian economy reside in the comparative advantages that it offers, from the considerations [6]:

- the size of the internal market, attractive for foreign investors interested in capitalizing on the possibilities existing in some segments of the economy, respectively industry, services, trade;
- the possibilities of access to the export markets, favoured by Romania's relations with European markets;
- the quality of the workforce, capable of assimilating and developing technical skills that give them competitiveness.

The assessment of the impact of foreign direct investments instrumented through the public-private partnership, on the economy, takes into account:

- *the quantitative contribution* - through the financial infusion of supplementing the internal investment resources having favorable consequences on the development of the economy and employment (Negrițoiu, 1996, p. 177);
- *the qualitative contribution* through the contribution made to overcome and regulate some distortions of the economy, as effect of technology transfer, expertise in management and marketing, increasing the level of training of the workforce;
- *increasing the volume of investments domestically* in the form of direct and portfolio investments (Negrițoiu, 1996, p. 17; Moise, 2005, p. 69).

The penetration of foreign capital was carried out on several segments of the economy, its intervention being relevant through the favourable impact, corresponding to the objectives pursued, respectively:

• ***Transfer of high-performance technologies, machines and equipments***, with effects on production results, for example:

- technologies of deep sea exploration in the Black Sea used by Enterprise Oil led to the reduction of the checkout period (about ten times) compared to those practiced by the Romanian industry (Negrițoiu, 1996, p. 177);
- the companies Alcatel Lucent - a French company in Romania and Siemens - its parent company - have transferred modern technologies for the manufacture of interurban digital stations (Negrițoiu, 1996, p. 178-179);
- Romanian-Canadian factories IKOS Conf SA and NORADA SA belonging to the Seroussi factories group [7] have built modern clothing companies, equipped with ultra-modern and performance machines, used in garments (Negrițoiu, 1996, pag, 179).
- at the industrial complex "Petromidia-Constanța" (refinery and petrochemical plant), there was achieved a decrease in fuel consumption, by 50,000 t/year, as well as the increase of the processing capacity from 3.5 million t/ year to 4,8 million t/year [8] (Moise, 2005, p. 69); the technologies of the companies UOP, Mitsui, Snam Progetti, Heat Research are used. The company was privatized on October 31, 2000, by taking over 70% of the shares, by ROMPETROL Group, BV Rotterdam - $ 50.5 million [9].
- MATIZOL Ploiești company - controlled by the Swiss group - Swisspor-Romania – endowment with a new technological line for bituminous waterproofing materials has led to an increase in labor productivity (by 300%) and, at the same time, a decrease in energy consumption (by 20%) [10].

- ***Creating new jobs***

  - The American company The COCA-COLA Company is present on the Romanian market; through the investments made, jobs were created, both in the production activity and in the distribution network [11] (Moise, 2005, p. 70).

- ***Transfer of experience and managerial training***, by using some modern methods of qualifying the workforce, such as: organizing personnel training courses on various activities: market research, financial management, human resources development, distribution (for Colgate - Palmolive and Coca-Cola companies) (Negrițoiu, 1996, p. 179).

- ***Integration of the activity of foreign investors in the local economy***, significant by contribution to the development of the horizontal industry. The action was carried out by involving the local suppliers of goods and services in the activity of foreign capital firms unfolding. The process materialized in the delivery, by the Romanian producers, of some components and raw materials or the provision of transport services, by the Romanian suppliers, to the multinational companies (Negrițoiu, 1996, p. 177-187; Moise, 2005, p. 69).

- ***Contribution to the development of commercial services***

There was a special interest of foreign investors for commercial activities evolution in Romania, immediately, after 1990, being considered an attractive, profitable area.

The impact of foreign capital in this sector has been felt quantitatively, through the contribution of financial resources in complementing the national ones, for the achievement of profile investments, jobs ensuring and creation, as well as from a qualitative perspective, by transfer of modern

technology, of the experience. in the field of management and marketing, with favourable effects on the qualification of the workforce.

From the cooperation of the foreign capital with the domestic one, an increase and diversification of the services supply to consumers has resulted in, such as (Moise, 2005, p. 83):

- specialized stores by product categories (clothing, footwear, domestic appliances, electronics);
- units of "supermarket" type on food profile, developed all over the country;
- large size commercial complexes, organized for the sale of a wide range and in large quantities of products, as for example, the retail networks.

There are commercial services which resulted from the investment of foreign capital intertwined with the domestic one, relevant through a series of advantages (Moise, 2005, p. 83-84):

- economic relations of collaboration by also, using of products provided by the Romanian producers;
- a superior managerial technique, aimed at ensuring the prestige of the company and a good satisfaction of the client's requirements;
- a diversified supply of products intended for consumer choice.

- ***Contributions to changes and developments of the Romanian banking system***

The involvement of foreign capital in the Romanian banking system occurred gradually, after the year 1990, simultaneous with the internal structural changes, brought to the sector. The initiatives of the privatization of this field of activity have attracted the interest and confidence of foreign investors who have oriented themselves towards the Romanian capital market. The assets of the state-owned banks were partially acquired, with foreign investors becoming co-owners.

By involving the foreign capital, a series of changes and improvements were brought in the activity of the Romanian banking sector, among the novelty elements, being (Moise, 2005, p. 85-86) [12]:

- the recapitalization of commercial banks;
- measures initiated to resolve the debts of the insolvent debtors;
- orientation of labour force qualification according to the new approaches regarding banking products and services;
- using new software (information and computer systems which to ensure a working environment suitable for good customer servicing).

There has been a continuous concern of banks for approaching those strategies (opportunity management, risk management) oriented towards new services and banking products supply, with their diversification. The aim was to: increase the competitiveness, maintain a favourable position in the sector's competitive market.

Representative for the involvement of foreign capital in the banking sector, using the form of Public-Private Partnership, was the privatization of some Romanian state-owned banks (Moise, 2005, p. 84).

It can be appreciated that the development of public-private partnerships with the contribution of foreign direct investments, in the Romanian economy, has proved beneficial, with favourable expectations of growth for medium and long-term. This implies, forward, concerns at the level of the government, as well as of the Romanian business environment, in order to ensure a stable and attractive economic and political climate, to the external investors.

Conclusions

The impact of Foreign Direct Investments in relation to the public-private partnership, on the Romanian economy can be appreciated from several perspectives:

- the achievement of the public-private partnership with the participation of foreign direct investments can be considered advantageous compared to the private domestic participation, since there is the probability of a higher contribution of the volume of capital;
- the instrumentation of the public-private partnership having greater resources of funds through the contribution of foreign direct investments (relative to those from internal resources), presents prospects of achieving important investments, through the committed values, leading to the creation of new objectives or development of those existing (Wang, 2017).

Fulfilling partnerships with the participation of Foreign Direct Investments is important in the perspective of economic growth, given the significant role that the involvement of Foreign Direct Investments has in development.

It should be noted that for the receiving countries, foreign investment flows mean advanced technology, modern management techniques, increasing employment and qualification, export development, therewith, offering the possibility of integration into the regional and global economy.

By the impact exerted, Foreign Direct Investments accessed in public-private partnerships, represents a significant potential, for the economic development and the increase of competitiveness in the host countries, but, also, presents some risks, among the disadvantages being: changes that occur in the structure of the business environment, the loss of market positioning of local companies, sometimes, the elimination of local producers or even their bankruptcy, as an effect of foreign competition (Horobeț & Popovici, 2017).

Also, it must be taken into account that the presence, in excess, of foreign capital in the economy of a country may create it, dependence. The situation would imply a high share of the foreign, prosperous companies present in the host country, the national ones having a lower investment capacity. Therefore, it is advisable to maintain a correspondence between the volume of investment flows attracted and the development potential of a country (Șerbu, 2007).

The policies supported by the governments of the host countries can be oriented according to the interests of the national economies, through actions that should increase the positive impact of the public-private partnership with the participation of Foreign Direct Investments (Trufin, 2016, Horobeț & Popovici, 2017, Șerbu, 2007)

Abstract

Human visual activity has been investigated by researchers from various scientific fields for many years. It has been shown many times that eye-tracking studies can be helpful in objectively evaluating usability of interacting systems. The present paper study extend this direction of research by examining visual scan characteristics registered while performing search tasks in mock-up web pages. For this purpose, four different, simple web pages were prepared. They differed by two factors specified on two levels: the background and text color combination (black text on white background and the other way round) and the text layout (one or two columns). Male participants performed 16 experimental tasks on each web page variant. A stationary, infrared eye-tracking system was employed to gather visual activity data of subjects placed in an isolated room with Venetian mirror. The data were further examined qualitatively by analyzing heat maps, and quantitatively by applying three- and two-ways ANOVAs for fixation durations, saccades' durations and amplitudes. The results showed the combined, interactive impact of the analyzed factors on information is searched characteristics. They also suggest the most efficient combination of factors: white background and two-column layout of paragraphs. The presented findings are valuable for designers of information such as web pages or visual marketing messages.

Keywords: visual activity, message effectiveness, digital presentation, marketing

Introduction

Human visual activity has the subject to investigation in the field of psychophysiology of vision for many years (e.g., Wolfe, 1994; Zelinsky et al., 1997; Findlay & Gilchrist, 2003). The research is aimed at understanding the mechanisms that govern acquisition and visual information processing strategies in humans. It is also the area of interest for designers of all kinds of visual communication artifacts. Knowledge of relationships between the features of information communication projects as well as its effectiveness and efficiency is a condition for creating optimal interaction and information systems such as broadly understood human-machine systems, marketing communications or computer interfaces. The eye-tracking technique has recently been gaining more and more interest in this type of research. The ability to record parameters of the visual scanning path in various contexts allows for analyses regarding search strategies.

A number of parameters related to the nature of the visual scan path may form the basis for an objective assessment of the usability of visual information conveyance designs (Goldberg & Kotval, 1999; Morimoto & Mimica, 2005; Grobelny et al., 2006). Learning about relationships between factors that shape this message and visual activity indicators characterizing the scan path is, in fact, an element of expanding knowledge about effective and efficient design of visual communication.

Research on the influence of factors shaping visual messages in various areas and contexts are focused mainly on performing factorial experiments to study the impact of individual factors and their interactions on the spatio-temporal nature of the visual scan path. Studies on graphic factors in virtual product packaging designs were presented by, for example, Grobelny & Michalski (2015) or Michalski & Grobelny (2016). Other, recent examples include the works of Ozkan & Ulutas (2017) or Muñoz Leiva et al. (2018). A broad literature review covering similar examinations in the area of marketing applications is presented in the work of Huddleston et al. (2018).

The field of human-machine interaction occupies a special place in eye-tracking research, which mainly concerns graphic interfaces' usability. On the one hand, it deals with control systems for modern industrial machines, and on the other, for example, regards human interaction with graphical interfaces operated commonly on a daily basis. The layout and shape of graphic elements in the virtual machine interface were the subject of experiments described in the works of Grobelny & Michalski (2017) and Michalski (2017, 2018). Pernice et al. (2014), in turn, using eye-tracking experiments revealed strategies of reading texts on websites depending on their context and content.

The main inspiration for the current research were the results of Schaik & Ling's (2001) experiments. The authors examined the effectiveness and efficiency of searching for information on websites varied in terms of the background-text contrast and layout. The obtained outcomes showed that the location significantly affects the accuracy and speed of information retrieval. However, the contrast is only relevant when interacting with the layout. These studies did not include any visual activity analysis.

In the present study, we attempt to analyze the visual activity while searching for information on websites differentiated by two factors: the background and text color combination and the text layout. Due to the large amount of information gathered in eye-tracking examination, factors were limited to two levels and, hence, four design variants were investigated. The main goal of the research was to answer the question of whether and how the examined factors affect the spatio-temporal nature of the visual path. We were in particular interested whether the effect of these factors' interaction significantly influence visual path parameters, as it was the case in Schaik & Ling's research (2001).

Method

Experimental Design

The experiment included two factors: background-foreground color set and paragraphs' layout. They were examined on two levels each. The design involved white background and black text and black background and white text for the first factor. The latter examination effect was specified on the following levels: one-column layout of the presented paragraphs and their tabular-like two-column arrangement. All combinations of the examined factors provided four experimental conditions according to which four graphical panels in the form of mockup web pages were designed. They are illustrated in Fig. 1. Four questions regarding contents of paragraphs were elaborated. Each question corresponded to one paragraph. A full factorial, within-subject design was employed. Therefore, all participants tested four experimental conditions and searched for answers for all four questions, which resulted in 16 trials per person.

Fig. 1. Mockup web pages used as stimuli

Apparatus

The experiment was conducted in the Laboratory of Information Systems Quality of Use which is a part of a BIBLIOTECH project co-funded by the European Union through the European Regional Development Fund under the Operational Programme Innovative Economy 2007–2013. There is a separated room where the examination takes place. It is equipped with the SMI RED500 eye-tracking device, a computer screen, as well as a typical keyboard and computer mouse. The interior is uniformly lit and resembles a classic office work station (see. Fig. 2).

Fig. 2. Experimental setup

On the other side of the Venetian mirror, there is a place for examiners who have a computer with software controlling the whole eye-tracking system and registering all tracked data.

Procedure

At first subjects were informed about the goal and the general procedure of the investigation, and after completing the written informed consent they were asked to enter the isolated chamber. The examination started with answering some typical background questions as gender, age, eye-sight problems. The proper eye-tracking study began with a five-point calibration, then subjects were presented with one of the four questions. When the question slide disappeared after 3 s, a white panel with a back ✖ at the center of the screen showed up. It was visible for 1.5 s, and then followed one of four examination conditions. Participants were to find the paragraph with the answer for the presented question and click on it with a mouse. After selecting the appropriate area, the next question appeared, and the procedure repeated itself (see Fig. 3). The examination was finished after answering all four questions for all four experimental conditions. The order of appearance of both questions and designed panels were randomized individually for all subjects.

Fig. 3: Full page presenting the stimulus with a white background and paragraphs presented in a tabular form

Participants

Nine male subjects participated in the examination. Their age ranged from 19 to 24 years, with the average of 20.9 and a standard deviation 1.83. They all were students of Wrocław University of Science and Technology and reported normal or corrected to normal visual acuity. Three subjects wore eye-glasses, however it did not affected the quality of gathered eye movement data. The mean tracking ratio

was as big as 96.1% with a standard deviation 6.11. The minimum value of this parameter equaled 80.2 whereas the maximum – 99.2%

Results and Discussion

Qualitative Analysis

The qualitative analysis of the obtained eye-tracking data is usually based on the so-called heat maps that graphically present mean fixation durations superimposed on examined graphical stimuli. More reddish colors denote longer average fixation durations. Colder colors correspond to shorter mean durations. Heat maps related to the examined conditions are provided in Figs. 4-7, they present results for all examined subjects.

A fairly clear difference in the nature of the colorful areas can be seen between projects with a white and black background. Generally, because fixations are associated with overt attention and conscious information acquisition, it can be said that this process was relatively slower on black background interfaces. However, the process of searching for information as suggested by the heat maps shown is similar for single- and two-column layouts.

In the first layout for both color variants, attention is drawn by a bulleted paragraph, which is significantly distinct from other graphic elements. In two-column designs, attention is generally focused on the left edges of the paragraphs and their centers except for the bulleted paragraph, which is processed only left-handed. The obtained qualitative data are further examined in the following section.

Fig. 4: Heat map for black background, one column layout condition

Fig. 5: Heat map for black background, two column layout condition

Fig. 6: Heat map for white background, one column layout condition

Fig. 7: Heat map for white background, two column layout condition

Quantitative Analysis

Basic visual activity statistics for all experimental conditions (full pages) were averaged across subjects and trials and are put together in Table 1. These data were categorized as measures of processing and search associated with fixation and saccade parameters, respectively. The first group includes fixation count and duration along with the fixation to saccade ratio. In the second category there are saccade count, duration, amplitude as well as scan path lengths.

Fixation durations confirm partly informal, qualitative analysis of the heat maps described in the previous section. Average values of this parameter for stimuli with a black background are longer than those obtained for designs with a white background but within the same layout.

Table 1: Basic visual activity statistics for all experimental conditions (full pages) averaged across subjects and trials

No	Experi-mental condition	Measure of processing			Measure of search			
		Fixation count	Fixation duration [ms]	Fixation to saccade ratio	Saccade count	Saccade duration [ms]	Saccade amplitude [°]	Scan path length [pixels]
1.	Black_Col	27 (3.4)	204 (12)	0.56	47 (7.4)	44 (1.1)	4.1(0.38)	4139 (531)
2.	Black_Tab	31 (5.1)	219 (16)	0.58	54 (9.5)	42 (1.2)	3.1(0.13)	4598 (809)
3.	White_Col	43 (6.6)	198 (13)	0.63	68 (9.2)	45 (1.8)	6.2(2.7)	6949(1138)
4.	White_Tab	25 (3.8)	209 (15)	0.54	47 (11)	44 (1.4)	3 (0.14)	3725 (592)

Values in brackets denote *SEM*s.

From quantitative characteristics of saccades, it can be deduced that their amplitude depends mainly on the way information is distributed. Saccades for tabular layouts (four paragraphs in two columns) are shorter than those in a single-column arrangement. The examination condition with a white background turned out to be the best in terms of visual search efficiency. This is clearly demonstrated by the shortest scan path shown in the last column of Table 1.

Detailed relationships between visual activity parameters and factors differentiating the examined designs were examined by performing a number of multi-way analyses of variances. The influence of paragraphs, colors, and layout on mean fixation durations were investigated by a three-way analysis of variance.

The obtained results, put together in Table 2, revealed than none of the examined factors was important alone. However, all two-way interactions, that is, *Paragraphs* × *Colors*, *Colors* × *Layout* and *Paragraphs* × *Layout*, occurred to be statistically significant. These meaningful interactions are graphically illustrated in Figs. 8, 9, 10, respectively.

Table 2: Results of the three-way Analysis of Variance *Paragraphs* × *Colors* × *Layout* for mean fixation duration. Data registered only in the AOIs specified on paragraphs

Effects	**SS**	**df**	**MS**	**F**	**p**	**η^2**
Paragraphs (P)	33 025	3	11 008	0.521	0.668	
Colors (C)	1497	1	1497	0.071	0.790	
Layout (L)	1515	1	1515	0.072	0.789	
Paragraphs × Colors	*214 898*	*3*	*71 633*	*3.39*	*0.017**	*0.0027*
Paragraphs × Layout	*316 660*	*3*	*105 553*	*4.99*	*0.0018**	*0.00398*

P × C × L	54 435	3	18 145	0.86	0.462	
Error	79 225 035	3748	21 138			

Fig. 8. Mean fixation durations for the *Paragraphs* × *Colors* interaction

Fig. 9. Mean fixation durations for the *Layout* × *Colors* interaction

Figure 8 illustrates the dependence of average fixation duration times on their location in individual paragraphs separately for conditions with white and black backgrounds. The almost symmetrical graphs suggest that during the information acquisition from paragraphs 2 and 3, subjects' attention was concentrated for a shorter time in interfaces with a white background. This fact can indicate more efficient reading for these cases. Such a result is consistent with many experimental results in the field of psychophysiology of vision.

The reverse relationship for paragraphs 1 and 4 is quite unexpected. It may result from the location of these paragraphs in the first and last positions of the Western civilization cultural reading model.

For a light background, visual information analysis strategies of paragraphs might have been influenced by surrounding objects like, e.g., right menu. Though these items were in the peripheral field of view, they were more distinct in white background conditions than their black equivalents. This, in turn, could affect attention distribution differently for these two cases.

The relationship from Fig. 9 supports for such a view. For tabular designs it was easier (shorter fixation duration times) to obtain information on a black background interface than on the white one as direct surrounding is less distracting. On the other hand, in the single-column organization, peripherally processed distracting environment is generally, on average, much farther away than in the previous case.

Table 3: Post-hoc mean fixation duration analysis results for the *Paragraphs* × *Colors* interaction. Data registered only in the AOIs specified on paragraphs

Colors		**Black background**				**White background**			
	Paragraph No	P1	P2	P3	P4	P1	P2	P3	P4
Black background	P1	×							
	P2	0.93	×						
	P3	0.17	0.14	×					
	P4	0.60	0.64	0.098**	×				
White background	P1	0.94	0.87	0.18	0.55	×			
	P2	0.38	0.41	0.028*	0.87	0.32	×		
	P3	0.27	0.30	0.020*	0.70	0.23	0.77	×	
	P4	0.40	0.36	0.73	0.24	0.42	0.13	0.09**	×

** $\alpha < 0,1$; * $\alpha < 0,05$;

The detailed post-hoc analyses of differences between consecutive factor levels from Table 3, shows that the biggest contribution to the significance of the relations illustrated in Fig. 8 have differences between scanning information strategies for P3 on black and P3 on white background, as well as between P3 on black and P2 on white interfaces.

Relations demonstrated in Fig. 9 mainly result from the differences between the search in white background conditions with one and two columns, and single-column designs with different backgrounds. Therefore, the suggested hypotheses require further detailed research.

Table 4: Post-hoc mean fixation duration analysis results for the *Colors* × *Layout* interaction. Data registered only in the AOIs specified on paragraphs

Color		**Black background**		**White background**	
	Layout	One column	Two columns	One column	Two columns
Black background	One column	×			
	Two columns	0.65	×		
White background	One column	0.053**	0.13	×	
	Two columns	0.74	0.43	0.024*	×

** $\alpha < 0,1$; * $\alpha < 0,05$;

Figure 10 and the post-hoc analysis from Table 5 present the relationships between average fixation durations in paragraphs P1–P4 and the stimulus layout (one-column, tabular). The data show differences in search strategies in paragraphs P1 and P4. In a single-column design, fixations in P1 last the shortest while in P4 the longest.

This relation can be justified by the fact that the P4 area in a one-column layout is the most probable area of the first fixations in the experiment. It lies near the position of the reference starting point (see Fig. 3). The first fixations are usually longer (compare zoom-lens hypothesis [xx]). In general, the differences in fixation durations between paragraphs P1 and P4 are the most important reason for the obtained interaction (Fig. 10).

Fig. 10. Mean fixation durations for the *Paragraphs* × *Layout* interaction

Fig. 11. Mean saccade durations for the *Background color* effect

Table 5: Post-hoc *Paragraphs* × *Layout* for mean fixation duration. Data registered only in the AOIs specified on paragraphs

Layout		**One column**				**Two columns**			
	Paragraph No	P1	P2	P3	P4	P1	P2	P3	P4
One column	P1	×							
	P2	0.17	×						
	P3	0.53	0.60	×					
	P4	0.027*	0.28	0.16	×				
Two columns	P1	0.001*	0.036*	0.024*	0.48	×			
	P2	0.50	0.51	0.96	0.11	0.009*	×		
	P3	0.042*	0.42	0.24	0.74	0.25	0.17	×	
	P4	0.84	0.29	0.54	0.09**	0.019*	0.53	0.13	×

** *α < 0,1;* * *α < 0,05;*

The examination of factors affecting the duration and amplitude of saccades was carried out using a two-factor analysis of variance taking into account the layout and background color factors. The results are presented in Table 6 and 7 and received data are illustrated in Figs 11, 12, and 13. The average saccades' lengths reflect the ease of searching for subsequent places of analyzed experimental conditions, it is easy to notice that tabular projects and those with a white background color are more effective. However, the effect of color is reduced in tabular layouts.

Table 6: Two way Analysis of Variance *Colors* × *Layout* for mean saccades duration

Effects	**SS**	**df**	**MS**	**F**	**p**	**η^2**

	Two columns	0.0015*	0.76	0.39	×

Conclusions

The results obtained in the experiment described in the present work document primarily the possibilities offered by the eye-tracking technique in the field of human visual activity research. The computer

interface context studied here is an example of the practical application of this technique. The main advantage of this pragmatic application is the precise and objective relationship between the factors that shape the interface design and the nature of the users' search strategy.

The study outcomes showed, for example, the combined, interactive impact of the analyzed factors (background color and layout) on the way information is searched in this type of visual stimulus. This result confirms the effect obtained earlier in studies Shaik and Ling (2001) made without visual activity analyzes. The obtained results suggest clearly the most efficient combination of factors, that is, white background and two-column layout of paragraphs. Such an experimental condition led to the shortest visual scanning path of the interface. This is valuable information for designers of visual information messages, e.g., in various marketing activities.

In addition to the design practice, the obtained results and analyzed relationships suggested interesting and more universal phenomena. For instance, the received relatively long fixations for paragraphs located at the center of the screen (Fig. 10) seem to confirm the hypothesis of the widespread occurrence of zoom-lens strategies (Wolfe, 1994; Findlay & Gilchrist, 2003) in visual search mechanisms. Furthermore, according to the authors' best knowledge, the eliminating influence of tabular layouts on the statistical significance of the background color factor for mean fixation durations (Fig. 13), has not yet been documented in the literature. Of course, the pilot nature of the current investigation requires further studies to confirm and explain these findings.

An interesting eye-tracking research perspective is the ability to identify human behavior in a given context based on visual path analyses. The present paper findings and various relationships shown in this study suggest that one could probably infer about designs' graphical characteristics from recorded and computed visual activity parameters. The formal analysis of such possibilities is undoubtedly an interesting research direction.

Acknowledgments

The research was partially financially supported by Polish National Science Centre Grant No. 2017/27/B/HS4/01876. The experiment was conducted with an eye-tracking system made available by the Laboratory of Information Systems Quality of Use which is a part of a BIBLIOTECH project co-funded by the European Union through the European Regional Development Fund under the Operational Programme Innovative Economy 2007–2013.

Abstract

The global healthcare system is currently facing an increasing technological swift, also driven by the need to engage the patients and other stakeholders in developing healthcare products and services. Knowledge Translation (KT) is getting increasing attention both from scholars as well as managers and professionals, due to its crucial role in fostering innovation, when most actors share different backgrounds, competencies, and skills. Such features represent severe challenges to the sharing and transfer of knowledge. The various actors need effective KT enablers to share, transfer, and create new knowledge. This paper aims to investigate such dynamics through a qualitative case, analyzing how KT is managed at IHU Strasbourg, the Institute of Image-Guided Surgery, one primary research, clinical, and educational centre, together with the Research Institute Against Digestive Cancers (IRCAD), the surgical minimally-invasive training centre. At such Institutes, several digital technologies are implemented and adopted to foster innovation in new surgical tools and methodologies. Findings demonstrate that KT at IHU Strasbourg/IRCAD can be defined at four different levels, corresponding to the Institutes' aims: education, innovation, technological transfer, and care. For each dimension, a galaxy of stakeholders, KT processes and flows, and instruments emerge. KT enablers vary, from the ones more linked to digital technologies and procedures to the ones that are more creative and based on the soft and interpersonal skills of the professionals involved. Results suggest a mix of different methods, and the search for always new techniques.

Keywords: Knowledge Translation, Surgery, Healthcare, Technologies.

Introduction and Research Question

Nowadays, the healthcare ecosystem is undergoing a relevant change. Being initially a closed system, it is now turning to an open one, in which different professionals (beyond physicians), industrial organizations, research centres and universities, policymakers, citizens, and patients must cooperate to reach the outcome, the increasing wellbeing of the society (Schraagen *et al.*, 2011; Bowser *et al.*, 2019). Such stakeholders need to engage in different ways, and there is a call for effective tools to

share, transfer, and create new knowledge (Ardito and Messeni Petruzzelli, 2017; Secundo, Toma, *et al.*, 2019; Biancuzzi, Dal Mas, Barcellini, *et al.*, 2020).

Within such context, the process of Knowledge Translation (KT) is gaining attention both from scholars as well as managers and professionals due to its crucial role in fostering and enhancing innovation in several sectors (Lander, 2016). KT can be defined as "the synthesis, exchange, and application of knowledge by relevant stakeholders to accelerate the benefits of global and local innovation in strengthening health systems and improving people's health" (Wallace, 2012). Keeping up and innovating new products and services can indeed be challenging since most actors involved feature varied backgrounds, competencies, and expertise. Such differences can represent severe obstacles and challenges to the sharing and transferring of knowledge and thus, the creation of new ideas and outcomes (Dal Mas, Massaro, *et al.*, 2019).

KT is crucial in many business fields. Said that it is even more predominant in the healthcare and medicine sector, for a variety of reasons. There is a call for clinical researchers to translate scientific research into clinical practice (Cobianchi *et al.*, 2016; Turin *et al.*, 2018; Vitolo *et al.*, 2019). Stakeholders include not only professionals with several backgrounds but also the patients, who often need to be directly engaged in the cure or treatment to co-produce the healthcare products and services (Batalden *et al.*, 2016; Biancuzzi, Dal Mas, Miceli, *et al.*, 2020). According to the literature (Savory, 2006), there is the need for a complete translation, recalling the concept of an unknown language which is translated into a different language in another context (Simeone, Secundo and Schiuma, 2017, 2018; Secundo, Del Vecchio, *et al.*, 2019)

Moreover, digital transformation and new technologies are changing the whole healthcare scenario. Artificial intelligence, robotics, augmented, mixed and virtual reality, cloud computing, cybersecurity, big data analytics, additive manufacturing, wearables and sensors, genome-sequencing, and blockchain-based technologies (Bagnoli *et al.*, 2018; Bagnoli, Dal Mas and Massaro, 2019; Rippa and Secundo, 2019; Massaro *et al.*, 2020; Ruzza *et al.*, 2020) are affecting the way surgeons and healthcare professionals work, the way the healthcare processes are managed, the resources to be monitored, the methodology to educate and train young physicians and residents, and to ensure lifelong learning to all healthcare professionals (Dal Mas, Piccolo, *et al.*, 2019; Dal Mas *et al.*, 2020; Dal Mas, Piccolo and Ruzza, 2020; Presch *et al.*, 2020). Digital technologies are pushing an increased performance of main healthcare business processes, particularly those that can be simplified with the adoption of information technology. More specifically, digital technologies could increase efficiency (IBM, 2013; Gordon, Perlman and Shukla, 2017; Siemens, 2018; Chen *et al.*, 2019) and, at the same time, allow for the delivery of better quality and reduced response times, with many benefits for several stakeholders, such as national health systems, clinicians, and patients (Brubakk *et al.*, 2019; Barach and Johnson, 2020).

While several previous studies have investigated how the scientific research can be translated into clinical practice, no prior research has deepened, to our knowledge, how KT works in highly skilled healthcare environments, meaning what types of KT flows emerge and which digital technologies and tools are employed to facilitate the dialogue and knowledge sharing among the various actors. Thus, our study aims at investigating such dynamics, also considering the evolving digital transformation scenario, by answering the following research question (RQ):

RQ. What are the knowledge translation dynamics and technologies adopted within a highly skilled educational research, and clinical centre?

Methodology

The paper employs a qualitative case study approach (Yin, 2014). According to Massaro et al. (2019) “qualitative methods allow researchers to discover to reveal and understand relationships between variables even within complex processes, and to illustrate the influence of the social context.”

Hereafter, we present the research context, the data collection, and the analysis process followed by the researchers to ensure transparency (Massaro, Dumay and Bagnoli, 2019).

Research Context

Our paper aims to perform a qualitative case study concerning the KT dynamics within a primary research, educational and clinical centre, IHU Strasbourg, the Institute of Image-Guided Surgery, and at nearby IRCAD, the minimally-invasive training centre. Both institutes are located in Strasbourg, France. At such centres, several digital technologies are implemented to foster innovation in new surgical tools and methodologies. According to Eisenhardt (1989), researchers ought to select case studies in which the action of observation is "transparently observable," representing, therefore, polar types, avoiding random selection. Taking into consideration the mission of the selected institutes, and their results in innovation, education, and clinical practice, we may argue that IHU Strasbourg/IRCAD may represent a critical case study to investigate our research question. Therefore, the case meets the notion of a polar type permitting finding transferability (Shah and Corley, 2006).

Data Collection and Analysis

Data acquisition and analysis entailed several actors from both organizations. Data was collected from multiple sources, as reported in Table I to ensure validity and data triangulation (Yin, 2014). Several researchers are part of both institutes; others are external with different competencies (business and management, engineering and new technologies, surgery, and medicine). One of the researchers attended all the steps of the process. All the results were discussed within the project team with an iterative approach, repeatedly moving between the concepts identified and the theoretical framework of KT.

Analysis	The Institute's website
	Presentations given by the various chiefs
	Participation in the Master class of "Image-guided Therapy" (February 2020)

Findings

KT's dynamics at IHU Strasbourg/IRCAD are strictly related to the different aims of the Institutes as well to the stakeholders involved and are supported by several tools implied in digital technologies. IHU and IRCAD are jointly active in four main areas:

1. education
2. innovation
3. technology transfer
4. patient care.

KT at Education

The institutes are active in training physicians and surgeons from different specialities, employing different training methodologies:

- ***In-person training***: More than 4.300 healthcare professionals have attended in-person training in Strasbourg. The Institute runs several courses every year; most programs are intense and last for one week. Moreover, the Institutes, together with the University of Strasbourg, run a two-year master class called The Business Engineering Surgical Technologies Transfer (B.E.S.T.T.) devoted to multidisciplinary students who are willing to work as innovators in the field of healthcare. The program applies a blended teaching methodology, mixing e-learning and virtual classes with five weeks/year onsite workshops. Innovation, project management, entrepreneurship, team building, are included in the studied subjects. One intense B.E.S.T.T. week devoted to university students is usually organized between August and September every year.
- ***Online training***: The Institutes are active in online training and knowledge sharing. Besides managing online classes within the Institute's program (as the B.E.S.T.T.) Prof. Marescaux, the founder of IRCAD, launched in 2000 the free platform "WebSurg," a website specialized in minimally invasive surgery fully dedicated to the promotion of clinical and surgical training skills. The site is translated into seven languages, and it is accessible from every type of device. Every month, multimedia contents are uploaded on the platform, targeting ten different specialities (from general and digestive surgery to gynecologic surgery) and five technologies. Videos include surgical procedures (interventions), operative techniques using interactive videos, expert opinions from conferences, debates, ... and contributions submitted by the 371.000 community's members. WebSurg represents the largest community of surgeons worldwide.

KT flows at education involve not only lecturers and students, with a mutual relationship (most of the students are expert surgeons and physicians), but also industrial customers and experts.
A variety of different tools is used (Table II). Design elements (such as videos, images, graphs, sketches, …) and digital tools (such as platforms, simulations, image tagging, mobile electronic records) are prevalent.

KT at Innovation

The IHU Strasbourg commits in R&D to develop new therapeutic approaches using tools for image-guided minimally invasive surgery.

IHU Strasbourg's research strategy relies on the inclusion and integration of multidisciplinary stakeholders: clinicians professionals, researchers, industrial engineers, and IT experts take active parts in project teams.
The project portfolio is assessed yearly using a rigorous and transparent methodology by the International Scientific Committee of the Institute. Priority research areas include computer-assisted surgery, flexible endoscopy, hybrid instrumentation, and chemistry applied to medical imaging.

Besides the internal R&D teams, stakeholders include private industrial companies and partners, experts in niche technologies, not part of IHU, policymakers, universities and research centres worldwide. Students from master courses are also involved as innovators, experts, or potential users of surgical technologies.

KT flows concern the processes within multidisciplinary teams, which include physicians and surgeons, vets, IT experts, researchers, engineers and industrial partners, among others. The efforts can be connected to the most traditional definition of KT, trying to translate scientific research into clinical practice and processes. Moreover, IHU's best practices are often translated into validated clinical policies for hospitals and clinical centres all over the country. Again, KT tools and techniques vary (Table II). Digital tools include the use of web portals and the latest technologies, social media channels, mobile medical records, and online apps, simulations, and forums.

KT at Technology Transfer

The IHU Strasbourg works actively to translate its research findings into industrial applications, providing technologies that could improve outcomes. Social sustainability to give patients a better life melts with the financial sustainability of the Institute.

In doing so, IHU Strasbourg actively promotes patenting and intellectual property rights, encourages entrepreneurship and boots industrial partnerships.

The Institute cooperates with two business incubators, SATT Conectus Alsace (supported by the University of Strasbourg) and SEMIA business incubators. Healthcare industrial companies, investors and venture capitalists, and incubators engage with IHU's multidisciplinary project teams in translating the outputs of the scientific research into clinical practice, tools, and thus outcomes for the patients. Among the various KT tools, as described in Table II, problem-based approaches, boot camps, and clinical immersion, stand as relevant creative methods to ensure effective KT.

KT at Patient Care

At IHU Strasbourg, physicians work in digestive and endocrine diseases such as those gastro-oesophageal (e.g. reflux, cancers), morbid obesity (e.g. bypass, sleeve), colorectal (e.g. tumours), hepatobiliary (e.g. calculus, tumours), endocrine (e.g. tumours, thyroid and parathyroid). Patients are treated within the gastroenterology and digestive surgery department of the nearby University Hospital (Nouvel Hôpital Civil of Strasbourg). The two buildings are connected through a bridge. Interventions are carried out by a multidisciplinary clinical-surgical team with a personalized therapeutic approach, providing less invasive procedures and counting on high-quality imaging.

In this scenario, the patients and their families engage directly with healthcare professionals of different specialities. Although there is no direct contact between patients and researchers, experts of IHU follow the clinical cases, get engaged with the physicians in spotting the best and less invasive solutions, and are inspired for new potential innovations. KT flows include the dialogue from the medical doctors to the patients and their families and reverse, within a Narrative Medicine approach. Other flows concern the debate between the physicians and the multidisciplinary research teams, aiming to find the best solutions for the patients, but also the most promising research and innovation avenues that may lead to new projects. KT methodologies, as reported in Table II, encompass tools more related to soft skills, such as the use of ethics, a less technical language, kindness, metaphors, and examples, leading, whenever possible, to co-production processes. Again, digital technologies such as electronic clinical records, image tagging, simulations are employed.

The following Table II summarises the stakeholders involved, the types of KT, as well as the main KT techniques employed for each of the Institutes' aims.

Table II: KT at IHU Strasbourg and IRCAD – An overview

	Education	Innovation	Technology Transfer	Patient Care

Discussions and conclusions

More than ever before the topic of KT is relevant, as it helps to foster and to enhance innovation. KT techniques can facilitate the way the actors involved can transfer, share, and create new knowledge, despite their various backgrounds, skills, and expertise. The healthcare and medicine sector need to face the introduction of new technologies, and an increasing variety of stakeholders, who need to engage in innovating and co-producing healthcare services and products. A new open system requires healthcare professionals, researchers, innovators, industrial partners, patients, and policymakers to work together to reach the outcome, the wellbeing of the whole society.

We decided to investigate such KT dynamics, in terms of stakeholders involved, KT flows, and KT methodologies in a unique healthcare environment, analyzing the case of IHU Strasbourg and IRCAD.

In replying to our RQ: *"What are the knowledge translation dynamics and technologies adopted within a highly skilled educational research, and clinical centre?"* our findings suggest the presence of a variety of actors, with different features in terms of backgrounds, education, aims, age, passions, and routines. The open ecosystem now includes thus healthcare professionals; researchers coming from engineering, information technologies and computing, life sciences, and management; the patients and their families; investors; incubators; industry partners; governmental policymakers; universities, and students. KT flows are thus not limited to the need to translate the scientific medical research into clinical practice and tools but involve almost all actors. A long list of methodologies emerges. Such techniques vary from the more technological ones (such as online medical records, platforms, social medias, image tagging, simulations and prototyping, …) to others which aim to foster creativity and engagement (like bootcamps, clinical immersion, brainstorming, debates, ideation, strategic focus, strategy development). Hard-skill-based tools, like the use of best practices and clinical cases and guidelines, are used together with soft-skill-base methods, like ethics, kindness, empathy, and the use of interpersonal attitudes. New methodologies are always added to the ones that are in place, with a learning-by-doing approach. A galaxy (Edvinsson, 2000) of different methods emerge, and a blend of different approaches is required to facilitate adequate KT flows.

Being our case of polar nature, results may be transferred to other institutes or different business environments (Shah and Corley, 2006).

Our initial study opens up to further research avenues. Specific KT flows would deserve an in-depth analysis, especially those less present in the healthcare literature, like the ones in executive and higher education, or those involving policymakers and industrial partners. Moreover, unique tools like boot camps, strategy focus, concept generation, and their role in the evolving digital scenario may deserve attention. Matching with other clinical centres could also represent a valid new research implication.

Abstract

Entrepreneurship is one of the main factors of production and it plays a key role in determining the level of production and employment. When the more the entrepreneurship culture is common in the society, the less unemployment occurs. Nowadays, together with globalization process, entrepreneurship has become a fundamental determinant of economic growth and development.
Currently, according to many organizations, Vietnam is an emerging economy with a golden population structure and a low unemployment rate. The entrepreneurship has been seen as driving power on develop of state. Incentive policies of the state in investment in entrepreneurship help investors take risks making it easier. Provided supports, exemptions, exceptions, and reductions tax to the entrepreneurs by the state make entrepreneurship sustainable. In this paper, the importance of investment in the entrepreneurship in Vietnam will be emphasized. Status of investments in the entrepreneurship in Vietnam be described and solutions will be discussed to resolve this issue.

Keyword: Entrepreneurship; Venture Capital; Investments; Startup; Innovation.

Introduction

Entrepreneurship plays a vital role in a country's growth and overall economic development by creating new jobs, supporting emerge of new products and sectors, introducing innovation, spurring competition and productivity, and promoting knowledge dissemination (Audretsch, 2007).

Many studies have shown that along with macroeconomic factors and business regulation (Djankov et al., 2002; Klapper, Laeven, Rajan, 2006), investment is one of the crucial determinants to evolve the entrepreneurship (Evans, Jovanovic, 1989; King, Levine, Finance, 1993).

Therefore, we should understand the reality of investment in the entrepreneurship from that determining the necessary policies to increase the level of economic growth and development of the country.

The Vietnamese Government sees the technology sector as the linchpin of the country's economic growth. Vietnam has invested heavily in many high-tech parks. The Government has also passed economic policies encouraging both domestic and international entrepreneurs to start businesses.

Vietnamese cities are becoming fast-paced innovation hubs especially Hanoi, Ho Chi Minh City and Da Nang. They have created acceleration programs, incubators, and co-working spaces. With a young population, Vietnamese citizens are tech-savvy and digital activism. High rates of internet connectivity

and mobile penetration are driving e-commerce and enthusiasm for digital startups. Today, Vietnam's innovative ecosystem provides special opportunities for technology investors.

Entrepreneurship and financing entrepreneurship

Entrepreneurship has been defined by many researchers, but there is no unified definition for the entrepreneurship in literature. Schumpeter (1934) defined entrepreneurs as innovators that create entrepreneurial change in markets, in which entrepreneurial change has 5 manifestations: the introduction of a new (or improved) product; introduce a new method of production; opening a new market; exploitation of a new supply; restructuring/organizing business management processes. This definition equates entrepreneurship with innovation in the business sense; which is identifying market opportunities and using innovative approaches to exploit them. For Schumpeter, the entrepreneurial process is a major reason in economic development and the entrepreneur is the key to economic growth. This definition equates entrepreneurship with innovation in a business sense; which is identifying market opportunities and using innovative approaches to exploit them. For Schumpeter, the entrepreneurial process is a major reason for economic development and entrepreneurship are key to economic growth.

But Drucker has argued that entrepreneurship merely creates a new organization and that any person who starts a new business venture is an entrepreneur; even those that main target is not to make a profit (Drucker, 1985).

And Ireland (2003) said that entrepreneurship is a process of identifying potential business opportunities and exploiting them through combine existing resources or create new ones to develop and commercialize new products and services.

According to the Commission of the European Communities (2006), entrepreneurship is the individual's ability can turn ideas into action. It includes creativity, innovation, and risk-taking, as well as the ability to plan and manage projects to achieve objectives. This supports people in their lives. It makes employees more aware of the context of their work, to seize opportunities, and provides a foundation.

Also, according to research Kuratko, entrepreneurship is dynamic process of vision, change, and creation through application of energy and passion toward the design and implementation of innovative ideas and solutions for entrepreneurs establishing a social or commercial activity (Kuratko, 2016).

Drawing on the above analysis and arguments, the following definitions are therefore proposed:

Entrepreneurs are people who seek to generate new value. They are creation or expansion of economic activity, by identifying and exploiting new products, processes or markets. Entrepreneurship is a phenomenon associated with entrepreneurial activity. And entrepreneurial activity is the enterprising action in pursuit of generating value, through the creation or expansion of economic activity, by identifying and exploiting new products, processes or markets.

According to the Global Entrepreneurship Monitor 2008, there is a high agreement of important entrepreneurship to economic development. Entrepreneurs promote the creative process: they strengthen changes in the structure of the economy and companies in the old industry have to reform to create an indirect contribution to productivity.

There are 5 main factors affecting entrepreneurship: infrastructure; research institutions and human capital; entrepreneurial finance; culture and amenities, and policies and governmental environment (Delgado, Porter, Stern, 2014).
A startup often has difficulty in financing. These companies are generally riskier and failure rates are high. Therefore, the access to debt financing through bank loans is a challenge for a startup.

Equity capital provided by outside professional investors like venture capital (VC) is considered the most popular solution (Mina, Lahr, Hughes, 2013). VC investor is those who have superior screening capability startups. They have required several contractual clauses to protect their investment (e.g., veto power, super majority voting, etc.). And work along the founders to increase the value of the venture, by providing managerial competencies, networking, marketing advice. Most of the empirical shows a positive impact of VC on startups companies' performance (Kortum, Lerner, 2000; Puri, Zarutskie, 2012). On the other hand, it is often linked to technological innovations by firms (Chemmanur, Krishnan, Nandy, 2011). Many academics and business leaders believe that the prosperity of places like Silicon Valley owes much to the considerable amount of VC and entrepreneurship in those places.

When assessing lending applications and evaluate investment opportunities in startup companies, the problem banks and investors face is information asymmetry. Because differences in investment type so the risks of banks and venture capitalists are not the same.

The benefit the bank receiving is contractually determined interests and the paid back principal. But losses will happen if the startup companies fail. Because banks are unable to monitor entrepreneur activity after the loan concession. So, they must consider two important issues before lending: exist a collateral and the ability for the company to generate cash flows to pay back the principal and the interests.

Unlike banks, venture capital is equity capital. On the one hand, if startups fail, they will lose all and face the debt. But on the other hand, if the startups succeed, they enjoy all the upsides. So, they would appreciate high risk high return projects. And the bank could be more prone to finance startups with a steady and foreseeable growth path.

The success of startups often depends on whether they can find external investors who are willing to fund their projects. Startups' strategy often relies on taking advantage of early mover advantages. If, delayed execution may not succeed. Therefore, the initial capital is especially important. Banks rarely to lend to startups. And always require collateral, business plans, little repayment history, and negative cash flows. This is a huge challenge for startups.

The financial issues are an important driver, but investors in their investment criteria put great emphasis on the capability of the management team, product characteristics, market characteristics and potential returns.

Investment in the entrepreneurship in Vietnam

The government policy of the entrepreneurship support

Entrepreneurship and innovation have been key to implementing growth strategies. The Vietnamese government has tried to provide a better environment for the entrepreneurship and innovation by lowering barriers, strengthening public services and encouraging students, scientists, and engineers join to startup.

In May 2016, the Vietnamese Government issued Project 844 to build a platform to support the national startup ecosystem through to 2025. Project 844 was established in order to create a national startup portal to link policy making agencies, ministries, localities, startup incubators, investors and startups. It provides full details of the results of scientific and technological research, technologies transferred to Vietnam, and tens of thousands of domestic and foreign inventions. In addition, it includes state policies and procedures to establish startup and a list of experts and consultants. The portal is especially useful in helping to promote connectivity within the national innovative startup ecosystem.

Currently, state policies have begun to encourage investment in startups. The Ministry of Justice of Vietnam has issued Official Letter 1154 / BTP-QLXLVPHC & TDTHPL on the plan to monitor the implementation of laws in key and interdisciplinary fields in 2017 and the database of legal documents

with content related to startup. The list of documents is divided into two subjects: Group of general adjustment documents and Group of documents with specific characteristics. In total, there are 100 legal documents related to investment activities and the establishment of innovative start-up businesses.

In Article 17 of Law on support of small and medium enterprise also contains provisions on support for entrepreneurs: will be supported in technology, training and information; support the commercialization of results of scientific research and technological development, exploitation and development of intellectual property; interest subsidies for loans granted to small and medium sized enterprises innovative startups.

A special tax scheme was also approved to provide the following incentives for eligible startups: Startup in the high tech sector and/or in high tech zones are eligible for preferential tax rates of 10% and 17% for 15 years and 10 years, respectively, as opposed to the regular rate of 20%; A two year to four year tax exemption and a four year to nineyear, 50 percent reduction for those operating in certain areas. These tax incentives are attractive to investors.

In June 2017, the Law on Technology Transfer was revised to promote technological advances and the commercialization of technologies. The new Decree No. 38/2018 / ND-CP has added regulations on investment funds for innovation activities. Since then, increasing capital for innovative startups with new investment channels and more diversified investment forms.

In general, Government policy is quickly changing in favor of investment. The current legal policies of the Vietnamese government are quite comprehensive and cover all aspects of the startup sector. They are in Investment Law, Enterprise Law, and Securities Law. However, they are still inconsistent, non-specific, and contradictory. The procedures are ambiguous leading to difficulties for investors in the implementation process.

Policies related to start-ups in Vietnam are still at a very new level, to complete the legal framework as well as supporting policies, it needs more time. So, necessary to have more specific laws on investment and protection of investor interests in the field of entrepreneurship to create dynamism, the new force for the development of quantity and quality of entrepreneurs.

Situation of investment in entrepreneurship in Vietnam

In recent years, the startup movement in Vietnam has increased rapidly. Therefore, the year 2016 was chosen by the Government as "the year of national business start-up" and the Government continued to implement the Ecosystem Business Support Project for National Innovation and Innovation until 2025. Although experiencing the challenges and results recognized by the international. According to the 2019 Global Innovation Index, Vietnam has made significant progress, from 59th out of 128 (in 2017) to 42th out of the total 129 countries (in 2019). This is the highest ranking that Vietnam has organized and ranked first on the innovation index among low-income countries. This is the first time Vietnam has ranked so high in a global ranking.

The Vietnamese government has identified four key priority industries by 2050, including: Emerging technologies (AI, robotics and smart system); education and training; high-tech agriculture and food processing; green energy, environment, health & tourism.

Global Entrepreneur Monitor's assessment of Vietnam's startup ecosystem over the years shows that, among the 12 indicators, the entrepreneurial finance index is a relatively low score. In 2017, this index of Vietnam reached 2.27/5 (ranked 39/54) the fourth lowest index. However, this index has improved much compared to 2015. In 2015, the entrepreneurial finance index of Vietnam reached 2.12/5 (ranked 50/62), is the second lowest index.

Currently, there are 3 types of financial support for startups in Vietnam: The State support fund, venture capital fund, and bank credit fund. In total there are about 70 investment funds including state, private and foreign. Typical foreign funds are IDG Ventures Vietnam, Cyber Agent, Mekong Capital, DFJ

(VinaCapital), ESP Capital, and Innovatube. Domestic venture capital funds have been established and participated in the venture capital market such as SeedCom, FPT Ventures, CMC Innovation Fund, VPBank Startup, VIISA, ESP, VSV, 500 Startups Vietnam. Of the three types of support, government funding follows policies to promote entrepreneurship. However, the state's assistance funds operate with the principle of "preserving capital" and complicated mechanisms and procedures, thus, it is difficult to effectively influence the entrepreneurship movement of Vietnam. So, support from the state will be to gradually reduce, increase venture capital funds and capital from banks. The government needs to create a financial mechanism to create funds in line with market rules and not necessarily increase the financial resources from the budget to support entrepreneurship.

The events connecting the startup ecosystem such as the National Innovation Day (Techfest Vietnam) and regional, local linking events are organized aims to create a playground for startups to call for international investment, help Vietnam introduce and promote an innovative startup ecosystem, as well as attract high-quality experts to return to promote connectivity internal and international resources of the ecosystem startup.

The National Innovation Startup Portal is in beta. It is a favorable online environment that provides information to investors about potential startups in particular and the Vietnamese startup ecosystem.

Vietnam has the third highest rate for startups in Southeast Asia, trailing behind only Indonesia and Singapore. The amount of invested capital and the number of startup deals done have grown six fold from H1 2017 to H1 2019.

In 2016, the major financial sources of domestic investors came from three major venture capital firms: IDG Ventures Vietnam, Cyber Agent, and DFJ VinaCapital. Altogether, they invested over 100 million USD in funding and consulting for several brands. Vietnam startups raised a total of 246 million USD in H1 2019, of which, 3 largest investments (Tiki, VNPay, VNG) captured 63% of the funding.

Fig. 1: Investment capital in Vietnam in 2013-2019

Source – Cento Ventures and ESP Capital Research 2019

Currently, the economy of Korea and Southeast Asia is growing at an average of 3%, Japan does not even grow. Japanese and Korean funds do not have too many opportunities to invest in big markets like Indonesia or Malaysia because of the number of investors is too much, the company value is too high. Vietnam's market is currently attractive because of good growth, more than 6%, and a moderate start-up project valuation. So together with the same amount of money, they have a great advantage

when investing in Vietnam. Therefore, in 2017-2018, most deals were from Singapore and Japan investors. In 2019, Korean investors have participated in almost 30% of the deals. The Vietnamese investors were active in 36% of the deals.

Vietnam has experienced a surge in both the amount of capital invested and the number of deals done since the beginning of 2018, with 2018 totaling 444 million USD and in 2019 is expected to reach 800 million USD. Startups operating in Fintech, E-commerce, TravelTech, Logistics and Edtech are attracting many venture capitalists. Despite the rapid growth, the total investment in Vietnamese startups is still much lower than that of other countries in the region.

State funding will only be provided to support startups in their initial stages. Subsequently, support from private investors and organizations will play a vital role in ensuring the efficiency and sustainability of the startup ecosystem in Vietnam. Despite the positive development, however, it is hard to convince local investors to take risks and invest in early stage startups. Early stage startups may rely heavily on funding from angel investors, but to date, this type of investor is new to the scene and has not had much impact.

The protection of intellectual property rights is particularly important for startups. There are currently too few startups focusing on intellectual property registration as well as brand management. Because in Vietnam, the registration procedures for intellectual property protection are time consuming, without high efficiency (poor protection). That leads to, startups having trouble facing disputes and litigation; effort to create technological barriers to compete. And reduce attractiveness to investors.

On the other hand, venture capitalists are always looking for attractive start-up projects to invest in. They are not only concerned with the creativity of the idea but also other issues such as the feasibility and profitability of the project. Therefore, to persuade the venture capital firm to make a decision to invest in its business quickly, the startup needs to prepare a business plan, financial plans, cash flow forecasts detailed, clear and convincing. However, Vietnamese startups lack the ability to plan and the quality of startup projects is not high, so it is difficult to attract capital from venture capitalists.

In short, the investment capital market for entrepreneurship in Vietnam is diverse and relatively active from both domestic and foreign capital. However, the scale of capital, as well as the cooperation in entrepreneurship investment in Vietnam, are still small, not commensurate with the potential and needs of the entrepreneurship ecosystem in Vietnam.

Discussion and conclusions

Central Government policies and programs are designed to help connect individuals and organizations in investment. Overseas capital and enterprise are welcome. Foreign venture capital funds and international technology organizations are growing their own footprint in Vietnam's innovation economy. However, Vietnam needs to make further changes to encourage investment in the entrepreneurship.

The first, most startups in Vietnam are in the initial stages of the startup process. They need capital. At this stage, besides equity, capital from family and friends; Capital from angel investors, venture capital is the highest rate and most important. Because they themselves cannot mobilize capital by bank credit. Many individuals and organizations want to invest in potential startups but there are no regulations on venture capital. Fund formation and operation are extremely difficult. Therefore, Vietnam lacks the Law on Venture Capital. The introduction of the Law on Venture Capital will make the startup capital market in Vietnam more developed. Bankruptcy law needs to be more complete to create psychological peace of mind for individuals to accept risks, fail at startups, created conditions for startups to return to operation after failure. Examples of regulations on asset liquidation or business restoration. This should probably refer to the US bankruptcy law model.
The second, Vietnam also needs to enhance its legal framework around protecting Intellectual Property. Vietnam is a member of the World Trade Organization and World Intellectual Property Organization, and the country's Intellectual Property legislation covers most aspects of IP protection required by the

Agreement on Trade Related Aspects of Intellectual Property Rights (TRIPS Agreement). However, Vietnam needs to strictly enforce the provisions of these agreements. Government should to reforms to make the registration process of intellectual property rights clear, specific and fast. And raise awareness of the importance of IP issues to Vietnamese startups.

The third, the provisions of the law also need to be clearer to simplify investment procedures. Supplements content of protection and encouragement of foreign investors. Improve the investment environment. Because the current FDI of Vietnam FDI capital is not commensurate with its potential. Investment value is not high, mainly focusing on processing industry. High-tech industries and innovation have not yet attracted foreign investors. Some countries have developed stock exchanges for startups, helping startups access to lower standards capital, more flexible market, which is beneficial for both startups and investors. For example, Korea's KONEX trading platform for startups has been successful after more than 2 years of operation.

The fourth, venture capitalists often look for startups with promising projects. Startups in Vietnam are many but not really attractive and attract investors. Most important is to support the development of the quantity and quality of startup through universities. It is the place to create many scientific research results. The main forms are nurseries and technology transfer training centers. Business incubators and advisory services are one of the most ubiquitous and persistent forms of university support. They may stimulate the entrepreneurship, attract venture capital, and promote innovation to the extent that coaching and support services fill a needed service. On the other hand, these programs may be more likely to be put into economically depressed areas and attract entrepreneurs that are in greater need of support. Incubators help to encourage entrepreneurial births, mitigate deaths, and facilitate venture capital investing, and patenting activity. When educational levels are deficient, entrepreneurs will not have the necessary skills and access to information that will help them to start new firms. University R&D may give rise to spillover benefits associated with high quality new firm creation, thereby in a pronounced way attracting venture capital and stimulating patents.

Startups have a strong relationship between regional and local economic development. In addition to making a positive contribution to GDP, startups create jobs for society and establish increased business opportunities. In emerging economies like Vietnam, small and medium sized startups are the main and essential type of business for the development of the economy. Despite the potential for great growth, Vietnam's entrepreneurship has not yet grown. Because Vietnam has not yet formed a comprehensive and effective start-up ecosystem, including founders, networks of investors, consultants, service providers, and capital mobilization channels... The financial support for startups is mainly implemented through separate programs with goals and criteria vastly different, lack of cohesion, sharing and support among participants of ecosystems. On the other hand, the quality of startup projects is not really attractive. Entrepreneurs lack the management, finance and marketing capabilities to grow their businesses and attract investors. As a result, it is difficult for a startup to access venture capital. The paper discusses and provides some key recommendations for reforming the investment environment through the government's legal system. And improve the quality of startups through education and support from the university. With population, increasing prosperity, and a rapidly rising number of people using mobile phones and the Internet. Vietnam has attracted considerable attention among local and foreign venture capitalists as a new-frontier market. Positive changes in the future will help Vietnam become an attractive investment market for venture capitalists in Asia.

Analysis of The Level of Expenditure on Food and Superior Goods in The European Union Countries

Mateusz JANKIEWICZ

Nicolaus Copernicus University, Toruń, Poland
m.jankiewicz@umk.pl

Abstract

The aim of this paper is to analyse the level of household expenditure on food and superior goods in the European Union countries. The research is based on expenditure data on these goods in the period of 1996 - 2017 in 27 European Union countries (excluding Croatia). When the society becomes wealthier, the overall consumption increases and the spending structure of households changes. Therefore, the analysis covers the changes in the level of expenditure and their equalization. Higher goods include expenditure on restaurants and hotels as well as expenditure on recreation and culture. In order to assess the consumption possibilities of households, the Working demand model was estimated for each country for both groups of goods and boundary values for the level of expenditure on food and superior goods were determined. In addition, income elasticity of demand for both types of goods was calculated in order to identify their nature. Then, the paper proceeds with the analysis of convergence process of EU households spending using the dynamic β-convergence model based on panel data with constant effects. The study only considered the absolute convergence approach.

Keywords: Convergence, Elasticity, Food Expenditure, Superior Goods Expenditure.

Introduction

Expenditures on food and superior goods are the elements of the households expenditure plan that indicate the level of their wealth. The level of expenditure is certainly dependent on household income. Richer households spend more regardless the category of consumed goods (Jankiewicz, 2018b). Both expenditure on food and superior goods increase in line with an increase in disposable and the possibilities to generate surpluses and savings (Trębska, 2018; Verba & Kudinova, 2019; Kusairi et al., 2019). However, according to Engel's law, the share of food expenditure under these conditions is reduced (Engel, 1985; Jankiewicz, 2018a; Jankiewicz, Pietrzak, 2019). This means that expenditure on superior goods increase with a higher pace than food expenditure.

The level of household consumption expenditure depends on the socio-economic situation of the country (Balcerzak, 2016; Hadaś-Dyduch et al., 2016; Šoltés & Nováková, 2016, Szopik-Depczyńska et al., 2017; Miłek, 2018; Nowak, 2018; Pietrzak, Jankiewicz, 2019), the enrichment of society and building structures for long term sustainable growth (Bilan, 2013; Fogarassy et al., 2018), where the process of income distribution supporting the social stability is considered as one of basic factors (Tvaronavičienė & Gatautis, 2017; Malkina, 2019; Landmesser, 2019). Therefore, in the case of effective long term policies, increasing consumption, as a driver of the national economy, leads to the socio-economic development of the country (Balcerzak, Pietrzak, 2017b; Simionescu et al., 2017, 2018; Szopik-Depczyńska et al., 2018a, 2018b; Pietrzak, 2019; Kuc-Czarnecka et al., 2020). The increase in consumption is also associated with an improvement in the macroeconomic situation of countries, level of trade (see Pietrzak, Łapińska, 2015; Łapinska, 2016;), entrepreneurship and innovation (see Pietrzak et al., 2017; Bieszk-Stolorz, Dmytrów, 2019; Jakimowicz, Rzeczkowski, 2019; Kijek, Matras-Bolibok, 2019), institutional changes (Balcerzak, Pietrzak, 2016; Hadaś-Dyduch et al., 2019; Balcerzak, 2020; Balcerzak et al., 2019). In addition, digitization processes, globalization also affect the increase in consumption (Balcerzak & Pietrzak, 2017a; Bilan et al., 2019; Pietrzak & Ziemkiewicz, 2018a, 2018b, 2019; Victor et al., 2019, Sánchez-López et al., 2019). The level of international cooperation of countries, including growth and problem of interdependencies between capital markets, is also a very important factor (see Meluzín et al., 2017, 2018a, 2018b, 2018c;

Skalickáet al., 2019a, 2019b). The ongoing process of increasing socio-cultural similarities (Horáková, 2015) and economic convergence of states means that the level and their consumption structure should also be harmonised.

The aim of this paper is to analyse the level of expenditure on food and superior goods in European Union countries (excluding Croatia) in the years 1995-2017. Therefore, there is a limit set for each country on the level of expenditure in the analysed groups of goods. The average income elasticity was determined over the entire period in the examined group of countries. In addition, the process of harmonizing the consumption level of food and superior goods in selected territorial units was analysed.

Data

The analysis was based on data from the database of the European Statistical Office (Eurostat). The level of expenditure on food was directly taken from the database, while the level of expenditure on superior goods was determined by adding up expenditure on restaurants and hotels as well as recreation and culture. Figure 1 shows the average level of expenditure on food goods throughout the entire researched period.

The highest average level of expenditure on food goods in the period of 1996-2017 was recorded by households of Luxembourg. The Nordic countries (Denmark, Sweden and Finland), as well as the other Benelux countries (Belgium and the Netherlands) and neighboring France were high in the spending ranking for this type of goods. Bulgaria, Romania, the Visegrad Group countries (Hungary, the Czech Republic, Poland and Slovakia) and the Baltic States (Lithuania, Latvia and Estonia) spent the least on food from the European Union countries. The difference between average food expenditure for EU households was EUR 4,163.99. The Pearson's linear correlation coefficient between the level of expenditure on food goods and the rate of their growth is negative and amounts to -0.7615 (with a p-value close to 0). This allows to set the hypothesis on the level of expenditure on these goods between EU countries. Figure 2 shows the spatial differentiation of average expenditure on food goods in the European Union in 1996 and 2017. It is worth noting that in both extreme years of the study there is a distinction between expenditure in the eastern and western parts of the analysed area. Households from its eastern part spend less on food than northwestern countries.

Fig. 1: Average household expenditure on food in 1996-2017

Source: own elaboration

Fig. 2: Spatial differentiation of household expenditure on food in 1996 (map on the left) and 2017 (map on the right)

Source: own elaboration.

Figure 3 shows the development of average expenditure on superior goods in the European Union countries. The highest level was recorded in British households. Austria and Ireland are ranked higher than in the case of expenditure on food expenses. Belgium, France or Finland were placed further away from the country with the highest level of expenditure on superior goods.. The lowest level of expenditure on superior goods, similarly to previous group – expenditure on food goods, was recorded in the Visegrad Group countries as well as Bulgaria and Romania. The difference between the country with the highest and the lowest level of expenditure on superior goods is EUR 11876.96, which is a much larger difference than in the case of food expenditure. The Pearson's linear correlation coefficient between expenditure on superior goods and their growth rate is -0.7038 (with a p-value close to 0), which may indicate a convergence process for this type of goods. Figure 4 shows the spatial differentiation of the expenditure level on superior goods in the European Union countries in 1996 and 2017. An analogous trend in space that has occurred for food expenditure can be observed. Households in the western part of the EU spend more on restaurants and hotels as well as recreation and culture than those in the eastern part in both extreme years of the study.

Fig. 3: Average expenditure of households on superior goods in the years 1996-2017

Source: own elaboration

The most important determinant of the level of household expenses is the level of disposable income per capita. It is the only determinant of expenditure that can be found in the most commonly used microeconomic models to study demand - the Törnquist model and the Working model. The very strong relationship between the two processes is confirmed by statistically significant values of the Pearson linear correlation coefficient, which are: 0.8830 for food expenditure and 0.8966 for expenditure on superior goods.

Fig. 4: Spatial differentiation of household expenditure on superior goods in 1996 (map on the left) and 2017 (map on the right)
Source: own elaboration

Methodology

In the first part of the study, the level of expenditure on food and superior goods is to be analysed. To determine the level of expenditure for individual types of goods, the form of the Working function was used, given by the formula:

$$Y = e^{\alpha_1 + \beta_1 \frac{1}{X}}, \tag{1}$$

where: Y - the level of household expenditure on the selected type of goods, X - gross disposable income of households per capita.

The function form (1), in order to estimate the model by the method of least squares, has been reduced to a linear form given by the formula:

$$lnY = \alpha_1 + \beta_1 \frac{1}{X}. \tag{2}$$

The horizontal asymptote of the function, which is also the level of expenditure saturation, was determined from the formula:

$$\alpha_0 = \lim_{X \to +\infty} e^{\alpha_1 + \beta_1 \frac{1}{X}} = e^{\alpha_1}. \tag{3}$$

Income elasticity of demand for food goods and superior goods for the Working function was determined in accordance with the formula:

$$E(X) = \frac{\partial Y}{\partial X} \cdot \frac{X}{Y} = \frac{-\beta_1}{X}. \tag{4}$$

In the next step of investigation, the panel data model is used for convergence process analysis (absolute) (Kuc, 2017a, 2017b). The panel data model for absolute convergence is estimated in the following forms (see:):

$$y_{i,t} = \gamma + \delta y_{i,t-1} + \eta_i + u_{i,t}, \quad (6)$$

where: $y_{i,t}$ – dependent variable Y, η_i – individual effect for i[th] spatial unit, $u_{i,t}$ – error component model. The model (6) – *fixed effects* model is estimated using least squares dummy variables (LSDV) method.

The δ parameter serves to calculate the $t_{\text{half-life}}$ value, which presents the time needed to reduce the difference by half. It is expressed as follows (see:):

$$t_{half-life} = \frac{\ln(2)}{b}, \quad (10)$$

where: : $b = -\ln(\delta)$ expresses the convergence rate.

Empirical Results

Empirical analysis starts with the modeling of expenditure on selected types of goods in 27 European Union countries. Therefore, the model was used in order to show the relationship between the level of household expenses and their disposable income, proposed by Working. Table 1 shows the results of estimation and verification of models for the level of food expenditure. Luxembourg has the highest saturation level of food expenditure, EUR 5169.18, then Greece (EUR 5076.92), which does not have the highest average level of expenditure for this group of goods during the considered period (see Figure 1). This means that with a further increase in disposable income of households in Greece, food expenditure will increase at a higher pace than in countries with a higher level of disposable income. Denmark and Sweden may be placed much lower in the future (ahead of Finland and Belgium and others) if the current trends are maintained. In all models included in Table 1, the coefficients indicating the impact of disposable income on the level of expenditure on food are negative and statistically significant. In addition, it should be noted that Working's models are well suited to empirical data and parameter signs consistent with the economic theory.

Table 2 presents the results of estimation and verification of Working models for household expenditure on superior goods. The statistical properties of the models for all 27 countries are analogous to those estimated for food goods. Parameters indicating the impact of disposable income are statistically significant and, according to theory, have a negative sign. In addition, the fitting of models to empirical data is as high as in the case of the models in Table 1. Austria (EUR 12527.19) has the highest level of saturation of superior goods expenditure, which in comparison with the place in Figure 3, was ahead of Great Britain (10438.72). This may indicate a higher growth rate of both disposable income and expenditure on this type of household goods in Austria than in Great Britain in the near future. Luxembourg recorded a significant decrease compared to its place presented in Figure 3. At the bottom of the table, no other countries appeared than those which so far had the lowest level of superior goods expenditure.

Based on the results of the Working model estimation, average income elasticities for food expenditure and superior goods were determined for the period 1996-2017. The results are presented in Table 3.

Table 3: Average income elasticity values of expenditure on food and superior goods in the European Union countries

Country	Food Elasticity	Higher-order elasticity	Country	Food Elasticity	Higher-order elasticity
Belgium	0,8922	1,0639	**Luxembourg**	0,7290	0,5563
Bulgaria	0,6916	1,2204	**Hungary**	0,6983	0,9282
Czechia	0,7759	0,8777	**Malta**	0,5864	1,1373
Denmark	0,6914	0,9826	**Netherlands**	0,8676	0,8418

Source: own calculations

The average income elasticity of food expenditure in all countries, except for Greece, is below 1, which means that each additional increase in disposable income by 1% causes an increase in expenditure on this good by less than 1%, which confirms the theory that food is a basic good. Income flexibility related to expenditure on superior goods is higher than for expenditure on food. The fact that the average level of this elasticity is below 1 in many countries indicates a progressive change in the nature of these goods. In 1996, in almost all European Union countries (excluding Spain, Cyprus and

Luxembourg), income elasticity of superior goods expenditure was above 1, and in many countries even close to 2 and above.
In the next part of the study, absolute β-convergence models were estimated in order to check the hypothesis about the leveling of household consumption expenditure on food and superior goods. The results of the estimation and verification of these models are presented in Table 4.

Table 4: Estimation and verification results of convergence models of expenditure on food and superior goods

Food convergence			**Higher-order convergence**		
Parameter	**Estimate**	**p-value**	**Parameter**	**Estimate**	**p-value**
γ	80,845	0,000	**γ**	175,219	0,000

$t_{half\text{-}life}$		26,303	$t_{half\text{-}life}$		12,497

Source: own calculations

The parameters behind the lagged dependent variable in the models in Table 4 (δ) are statistically significant and smaller than 1, which means that there is a convergence of the level of expenditure on the analysed groups of goods. The models are characterised by a very good fit to empirical data. Every year, the differences decrease by 2.6% in the level of expenditure on food, which means that the reduction of inequality by half will take place only after about 26 years. In the case of the level of expenditure on superior goods, the differences will be reduced by half after about 12,5 years, which results from their annual convergence rate by 5.5%. A faster pace of convergence than in the case of food goods may be associated with the allocation of a larger portion of additional disposable income to superior goods (as evidenced by higher values of income elasticity).

Conclusion

The level of household consumption expenditure reflects their wealth. Both in the case of expenditure on food and superior goods, households from developed countries spend more than households from less developed countries. Undoubtedly, the macroeconomic situation of countries is one of the most important determinants of the society's wealth. It causes changes not only in the level of consumption, but also in its structure (Jankiewicz, 2018a; 2018c; 2019). Institutional changes in countries and the openness of economies to international cooperation (see: Cheba, 2015; Cheba, Szopik-Depczyńska, 2017) are also important determinants of the level and structure of consumption. Moreover, they are also affected by the level of digitization and globalization (see: Hadaś-Dyduch, 2017; Pietrzak, Ziemkiewicz, 2018b). Households in relatively high developed EU countries also have greater potential for spending their incomes in the future, as shown by the analysis of the limit values of the expenditure level on food and superior goods using the Working function. The economic potential of countries from the lowest positions demonstrates that it is going to be less likely that there will be the leveling of spending levels over the next few years.

Nevertheless, as a consequence of the convergence of EU economies (see: Kuc, 2017a, 2017b) and the convergence of disposable income, the process of leveling of expenditure level on both types of analysed goods is progressing. The analysis showed a faster convergence rate for superior goods, households spend on their consumption more extra income units. With a further increase in disposable income, the differences in the increase in expenditure on the analysed goods will increase, which works in favor of the leveling of expenditure on restaurants and hotels as well as recreation and culture.

Getting wealthier can mean that restaurant consumption will slowly displace traditional home consumption.

Abstract

The current study focuses mainly on characteristic behaviour of young tourists representing generation Z. The survey was conducted on Polish and Ukrainian students and particular interest was given to the differences between aforementioned consumer groups. Factors which dominated the area of research included destination preferences, accommodation, satisfaction during the stay as well as recommendations shared with others after the travel. The survey was adopted for data collection. To analyse the data pair wise correlations were inferred and a logistic regression classifier with a binary target was used. The results, however, do not reveal any significant discrepancies between the surveyed groups.

Keywords: Generation Z, Tourism Industry, Tourism Consumption, Millenials

Introduction

According to the data of the WTO, tourism represents approximately 10% of global GDP, creating a comparable percentage of work places (UNWTO Tourism ... 2017). Young people should be considered to be an important segment on the market. Tourist market of young people in 2009 was estimated at nearly 190 billion dollars while in 2014 at 286 billion (Richards, 2016). Such a significant change confirms both the size of the segment and the increase in its importance.

Tourism undertaken by young people have its specificity, which is highlighted by the definition, stating that those are journeys lasting less than a year, motivated, partially or wholly, by the desire to learn about new cultures, gain life experience and/or the possibility of formal or informal learning outside their environment (Dionysopoulou and Mylokanis, 2013, p. 23). Presented definition indicates two features of such tourism - curiosity about the world and willingness to learn. Additionally, young people seek novelties as they can discover new destinations. Young people will not be discouraged by inconveniences as social unrest, illness or natural hazards (Vukic, Kuzmanic and Stankovic, 2015, p. 482). They want to become acquainted with new customs and cultures, be close to nature but as well as local communities (Buffa, 2015, p. 14051).

Young people belong to the so-called Generation Y and Generation Z. The authors deliberately decided to focus on the latter due to the assumption that both of these groups have different characteristics in terms of tourism consumption. In the case of Generation Y, there is still small amount of research dedicated to tourism (Buffa, 2015, p. 14046). In the case of Generation Z, the

shortage of sufficient research in the area of tourist consumption analysis is to a large extent related to legal restrictions concerning the examination of representatives of this group (Sauthgate, 2017, p. 227).

The purpose of the research is the preliminary identification of factors determining choices of young people on the tourism market and their behaviour both during and after tourist consumption. The above analysis is important from the perspective of marketing activities both for businesses and tourist regions. A special focus was given to search for differences between consumer behaviours of representatives from two countries in Central and Eastern Europe - Poland and Ukraine. The selection of target group was deliberate. These are the countries in which numerous changes have been made in the last two decades. At the same time, situation of each country is diverse. Poland is a country that undergone social transformations, nonetheless after political and economic transformation was able to grow in entrepreneurial sense (Marjanski, Sulkowski, Marjanska-Potakowska and Staniszewska, 2019; Sulkowski, Seliga and Wozniak, 2019). However political and economic situation in Ukraine does not facilitate the development of tourism, therefore making it interesting to analyse how it affects tourist habits of young, mobile consumers.

In order to achieve the aims, the following layout was adopted. The paper first analyses literature, focusing on the presentation of research results showing the specifics of young people's behaviour and consumption in the field of tourist consumption. Second, the research model is presented. In the further part of work, the research methodology is described and the respondents of the study are analysed. The article is summarized with conclusions and discussion.

Literature Review

The term "generation" might be defined as "cluster of people who were born at a similar time, are shaped by the same events and are affected by similar social, economic, technical and political circumstances" (McCrindle and Wolfinger, 2010; Lazanyi and Bilan 2017, p. 79). Kachniewska (2014) suggests to identify members of the generation on the basis of the year of birth, assuming that each generation has different interests, expectations, beliefs and features common to all its representatives influenced by the conditions of life during their maturation and personality development. However, it still remains unclear what age range should be taken into account in order to identify young people. Kachniewska (2014) adds that the timeframe of births of representatives of particular generations is arbitrary, there is lack of consensus among researchers about the correct version of this division. Anderson and Sharp (2010) suggest that young people are those under 30 years old. According to a common classification, they belong to Generation Y as well as Generation Z.

The literature defines representatives of these groups using various characteristics and academics have mentioned different age rage to categorize them. For instance, Generation Y included people born between 1978-1994 (Walsh, Mitchell and Henning-Thurau, 2001), 1981-2001 (Black, 2010), 1979-2000 (Garikapati, Pendyala, Morris, Mokhtarian and McDonald, 2016). Additionally, they are described as well-educated, mature, advanced in the use of technology and individualists (Syrett and Lammiman, 2003). They have high purchasing power and are more powerful than their predecessors in terms of the Internet usage. (Farris, Chong and Danning, 2002). However, reaching this community with an effective message is not an easy task (Lester, Forman and Loyd, 2005). They are consumers that to a lesser extent than their predecessors are susceptible to communication generated by traditional media, including advertising (Cimitillo, 2005), while favouring some forms of online advertising (Smith, 2012). Another important feature of young people was the need for quick access to information (Pendergast, 2010), which is associated with the strong use of social media used also to seek opinions about products (Bilgihan, Peng and Kandampuly, 2014).

Several features of the Generation Y have deepened into the so-called Generation Z. The study of intergenerational differences is in itself the subject of research (Grencikova and Vojtovic, 2017). As an example, both groups make strong use of new technologies in communication processes, but representatives of the generation Z are more eager to accept video communication. It includes people

born between 1995 and 2010 (Lazanyi and Bilan, 2017, p. 79; Vallone et al, 2016). The adoption of such an approach means that these are people between 10 and 25 years old, which clearly translates into a deficit of research describing them. What is more, there are no unambiguous criteria describing the following groups: Generation Y, Millennials, Generation Z, which may result in vagueness of studies, in one study people belonging to the youngest among generation Y in others will be included in the generation Z (Skinner, Sarong and White 2018, p. 95).

Representatives of the generation Z are called "digital natives" (Jones and Shao, 2011) - for them the Internet or mobile devices are the natural environment (Zajadacz and Kugiejko, 2016). These people expect that everything happens immediately. Consequently, they also expect a quick reaction, which is vital for marketing activities (Description and Cenusa 2017, p. 683). The use of new technologies by young users, means that promotional communication should also adopt an innovative approach (Hamed, 2017, p. 2).

Independence is one of the traits that defines them (Desai and Lele, 2017, p. 802), more than adults, they trust their peers, which affects their relationships at work. Superiors are not granted automatic respect. However, using capabilities of technology, young people are very happy to share various information (Lazanyi and Bilan, 2017). Especially, the last feature is important from the business perspective, entrepreneurs must be aware that young people very quickly share opinions about products. It is also harder to build their brand loyalty compared to the generation Y (Gutfreund, 2016-2017, pp. 246-247).

For many economic sectors young people are an attractive segment of the market. There are also, though not many, studies focusing on the tourism market. According to the general characteristics of young people, they strongly use the Internet when planning trips in which they desire intense experiences (Vukic, Kuzmanovic and Stankovic, 2015). They want to be more travellers rather than ordinary tourists, looking for unique and authentic experiences (Santos, Veiga and Aguas, 2016). This characteristic for the generation Y is also underlined by other researchers (Leask, Fyall and Byron, 2014). Xiang, Magnini and Fesenmaier (2015) put strong emphasis on independence in organizing trips. It has been observed that starting from the generation of Baby Boomers, through Generation X and Y, tourists seek independence during trips and more people organize their travels without the help of travel agencies (Nusair, Bilgihan and Okumus, 2013). It seems that looking at cultural changes and increasing access to information, we can expect a deepening of this trend for Generation Z. It is also pointed out that online tools are an effective method of building loyalty for hotel enterprises (Prayag and Del Chiappa, 2014) and the creation of word-of-mouth marketing - e-WOM (Litwin, Goldsmith and Pan, 2008; Styven and Foste, 2018), which is of key importance for them when deciding about tourist consumption (Kim, Xiang and Fesenmaier, 2015). According to Skinner, Sarong and White (2018), even small tourism enterprises can take advantage of new technologies to meet the needs of young customers.

It seems that the feature of the Generation Z, which is strong use of the Internet and related tools, is the area most often analysed in relation to young people. It is suggested that young tourists are responsible for the highest percentage of people using new technologies (Bizirgiannia and Dionysopouloub, 2013, p. 653; Zajadacz and Kugiejko, 2016). The Internet, including social media, is particularly important for tourism (Pan and Fesenmeier, 2006). Rudez and Nemec (2015) analysed students' use of social media during travel processes. The results showed that they use social media the most before leaving, at the planning stage, but less during and after the trip. These researchers identified two main dimensions of the use of social media: "search for opinions" and "information and comparison". Another important source of information about destinations are their websites (Hamed, 2017). The concept of the use of online tools in the tourist consumption was also discussed by other authors. It is argued that young travellers with higher education are receivers but also producers of information on the web, which would confirm previous observations (Ip, Lee and Law, 2012).

Yousaf, Amin and Santos (2018) suggest that new needs emerge for young people related to tourism. This may be striving to experience an adventure and taking risks associated with it (Williams and

Balaz, 2015). Even the need to experience the feelings of adrenaline is hidden behind the thefts in hotels conducted by the representatives of the generation Z (Goh and Kong, 2018). In addition, it is argued that young people can treat travel as part of their education and personal development (Veiga, M. Santos, Aguas and Santos, 2017, p. 605).

It is also worth paying attention to the results of Han, Kim and Kiatkawsin (2017), which may contradict certain stereotypes about young people. Their results provide evidence to support the hypothesis that they care about the environment and are prone to pro-ecological behaviour. As studies show, young people, including those who have been part of the generation Z, have their own characteristics and are worth analysing.

Conceptual Model

This study focuses on issues related to preferences, methods of searching for information and making choices. For the purposes of analysis, a conceptual model was developed (Figure 1) in which three phases of tourism product consumption process were identified. This structure also appears in other studies, for example Rudez and Vodeb (2015) or Huertas and Marine-Roig (2018).

The identified phases of tourism are as follows:

1. Before the trip - in this area the identification of preferences and the way of choosing the destination as well as the place of accommodation is of key importance. Knowledge about them would make it easier to prepare and promote an attractive product.
2. During the trip - in this area the identification of preferred forms of spending time during the trip and related factors that build the satisfaction with the stay become the most significant. Knowledge about them would make it easier to prepare a product that would generate satisfaction with consumption.
3. After the trip - learning about the behaviour of consumers at this stage of consumption process would help to optimize the process of building relationships with clients and stimulate word-of-mouth marketing.

Methodology

The study attempts to identify the tourism behaviours in two target groups: (1) Poles belonging to the Generation Z and (2) Ukrainians belonging to the Generation Z.

The data was collected with the use of questionnaires, which were correctly filled in by 137 Poles and by 204 Ukrainians. In total 341 responses were collected. Questionnaires are commonly known as a survey strategy to gather data, and is widely used in business studies (Oppenheim, 2000). The survey offers a useful way in describing the characteristics of a larger target population (Saunders, Lewis and Thornhill, 2015).

Results

The main purpose of the analysis was to identify preferences in both groups of respondents and, as a consequence, their comparison. In order to compare two groups, the data was analysed by φ_K correlation test (based on Pearson's χ^2 contingency test) (Baak, Koopman, Snoek and Klous, 2018) and by means of building a binary classifier based on logistic regression.

Data overview

After initial cleaning of the raw questionnaire data, answers from 341 subjects were selected as the input for further analysis. This sample includes individuals between 16 and 23 years old, which belong to the generation Z (Lazanyi and Bilan, 2017, p. 79; Vallone et al, 2016), and are residents of Poland or Ukraine. From the total of 88 questions in the survey, 7 open-ended questions ("other, please fill in") where excluded from the further analysis as it was filled in less than 10% of cases. For the other questions percentage of missing values was under 4%, with the only exception of question 2b, where 24% answers were missing. Hence, 81 questions in total were considered: 79 behavioural questions with answers recorded with Likert scale (0-5), age (answers represent whole numbers from 16 to 23), and the country question with two possible answers – "Poland" or "Ukraine".

It should be noted that Ukrainians were over-represented in the sample with 60% versus 40% Poles (204 and 137 cases correspondingly). Further, looking at the age distribution in the sample, significant imbalances become apparent (see Figure 2).

Fig. 2: Age distribution of Poles and Ukrainians in the sample.

Thus, the youngest age groups (16, 17, 18) are represented almost exclusively by Ukrainians, at the same time Poles are prevailing in nearly all other age groups (18 to 23). These imbalances may play an important role in case of possible differences in the attitudes of different age groups within the generation Z itself.

Overall, the attitudes of the two groups demonstrate many similarities, which are usually attributed to the generation Z (Lazanyi and Bilan, 2017). Thus, both Poles and Ukrainians use Internet as the main source of information beforethe trip (Figure 3.1). Possibility of active rest, security and comfort of the place were equally found highly important by both groups (Figure 3.2).

Fig. 3. 1: source of information when planning a trip: a) Trip Advisor and Booking.com, b) website of the accommodation, c) reviews on the Internet, comments on forums; 2: most important during a trip a) possibility of active rest, b) security, c) comfort.

Pair Wise Correlations

In order to test the proposed hypotheses and answer the question about differences in tourist consumption between Poles and Ukrainians, the inference has to be made into the mutual statistical dependence between the country variable and the other variables (age and the answers to the 79 survey questions). Usual choice in testing differences between two or more groups is ANOVA or MANOVA (Fisher, 1925; Stevens, 2002; Warne, 2014), other possible choices could for example include rank correlation tests Spearman's ρ (Spearman, 1904), Kendall's τ (Kendall, 1938), Goodman-Krustall's ϒ (Goodman and Krustal, 1954), or Pearson's χ^2 contingency test (Barnard, 1992). Given the number of variables in our set (81) MANOVA, and the following post-hoc paired tests appears cumbersome. Other multivariate tests could be a good choice, tough continuous (age) and ordinal variables, strictly speaking, would have to be treated separately. Another similar and also elegant test is φ_K correlation test, which is derived from Pearson's χ^2 contingency test and can be uniformly applied for interval, ordinal and categorical variables (Baak, Koopman, Snoek and Klous, 2018). Additional advantage of this test is its good interpretability – the correlation coefficient has the same meaning and range (but positive only) as Pearson's ρ, at the same time it is able to capture non-linear patterns.

The results of φ_K test are provided in the form of two 81x81 correlation and significance matrices. There, in correlation matrix pairwise correlation coefficients should be read in a similar way to the Pearson's ρ (0 for no correlation and 1 for complete correlation between two variables). Significance of the correlations, presented in significance matrix, is given in terms of Z-values (number of standard deviations from the mean).

For finding answer to the main question about the differences in questionnaire answers between Poles and Ukrainians, the matrix row, which corresponds to the "country" variable in both matrices is of interest. A quick glance at the correlations between our target and the rest of the variables in the data

set gives that such pair-wise correlations are in general very weak, if present. This is with the exception of the high correlation with the age variable, 0.68, which just confirms our concerns regarding age-imbalanced between two groups. The two strongest correlations between variables of interest (79 questionnaire answers) were found as 0.3 and 0.265 for the questions 3d: "*What factors determine your choice of destination: the opportunity to brag about staying somewhere*" and 7c: "*Do you share information and how … about your stay: report my stay in social media*" correspondingly. These two pair wise associations also show relatively high significance of 6.16 and 5.17 correspondingly. Despite these correlations are relatively weak in absolute values, they deserve further investigation. It can be seen from bar charts in Figure 4 that the major difference between answers of Poles and Ukrainians to both these questions is the following: a) more Poles in comparison to Ukrainians give their answer on the lower side of Likert scale (1-no importance), and b) more Ukrainians than Poles choose the middle (3-average importance) and upper middle (4-quite important) of the scale. It should be noted that these differences per scale step were also found significant in outlier significance evaluation (Figure 5).

Fig. 4: Barcharts questions 3d ("*choice of destination: the opportunity to brag about staying somewhere*") and 7c ("*share information about your stay: report in social media*").

Fig. 5: Outlier significance questions 3d and 7c (shown in Z-values).

It is important to mention here that this difference between Ukrainian and Polish parts of the sample is apparently not unique for these two questions, a quick glance at the bar charts for most of the other questions in the survey suggests rather universal character of such pattern. Indeed, it can be noticed that overall for the given survey questions Ukrainians more than Poles tend to choose either the middle "no difference" answer (3), or the next fairly positive (4). At the same time Poles more readily give negative (1) answer. That to be said, for many questions the Polish and Ukrainians answers were found to be overall fairly similar.

Despite such "tiny" differences in the answers it seems reasonable to speculate that exactly this pattern manifests the key difference between the Polish and Ukrainian Gen-Z population in given questionnaire. That is, young Poles tend to more readily demonstrate a more assertive attitude in the answers, whereas Ukrainians show slight preference for middle "all equal", or somewhat positive type of answers. Such pattern, if proven to be significant as a general trend, could be possibly explained by a comparatively higher level of travelling experience in young Poles. However, such speculations could hardly be seriously scrutinised within the framework of this paper and the collected data. This kind of analysis would shift the goal from finding observable differences in consumption patterns of two groups to a casual analysis of such differences, which is outside of scope of this paper. At the same time authors would recommend this kind of research, as it could doubtfully provide valuable insights into the touristic consumption behaviour and its differences between Poles and Ukrainians.

Logistic Regression model

Although pair wise correlation analysis helped to visualise some (tough relatively small) differences in touristic consumption attitudes between Poles and Ukrainians, it did not give clear answer whether these two groups can be clearly distinguished based on the constructs in focus – surveyed in the questionnaire.

When a large number of multi-dimensional observations are coming from two or more different groups, a classification model can be built, which is able with certain accuracy to assign each observation to one of these groups (Bishop, 2006; Geron, 2019). The more information about differences between classes is captured in the variables, the better classifier would perform (e.g. measuring shape and weight to distinguish between apples and pears). Opposite, if the observed variables are not carrying groups differentiating information (e.g. only looking at colour when trying to separate apples from pears), a classifier would perform not significantly better than random guess.

Our survey observations, together with the goal of assessing possible differences between Poles and Ukrainians from generation Z, essentially represents binary classification problem. Thus, 79 questionnaire answers as independent variables, or features can be used to predict binary target variable – observation subject belonging to either Polish or Ukrainian group. Without unnecessarily complicating the procedure, a simple linear model can be built with 79 independent and 1 (binary) dependent variable. Assessing an elevated with respect to the base line (random guess) performance of such model would show whether the two groups significantly differ. Measuring features importance would allow to identify exactly which variables capture the differences between the groups.

Before proceeding with this analysis, two important hindrances should be addressed. First, regression model can be built on continuous independent variables, but not ordinal, which is the case in the given data set. Second, a procedure for dealing with missing values should be defined.

Addressing the first issue, it can be noted that treating ordinal variables as continuous is often used in statistical analysis of applied problems (Johnson and Creech, 1983; Norman, 2010). It seems to be a good choice for Likert scale measurements given the assumption of the equidistant spacing between the categorical variables (Pasta, 2009). Considering answer options provided in all the questions in the given questionnaire (Likert scale 1 to 5, which goes from 1 being "not important" or "do not do

this" to 5 - "very important" or "do this often"), it can be assumed that the equidistant spacing assumption holds well. It can be also noted that a uniform scaling (1-5) used in all 79 questions eliminates the need of additional re-scaling of the variables.

For the treatment of missing values, the easiest and arguably most "unbiased" method is imputing the missing answers with the middle, "neutral" value 3.

After the missing values imputing, a series of experiments were performed. Logistic regression with L1 regularization was used as a model of choice (Python scikit-learn implementation (Bishop, 2006). L1 penalty λ was found as a hyperparameter in k-fold cross-validation with k=10 and prediction accuracy as a performance measure. In order to account for age imbalances in the data set and also to evaluate possible effect of these imbalances, two different samples were created. First sample included entire data set of 341 cases (age-unbalanced sample), in the second sample the number of cases in each age group was equalised in both target groups (age-balanced sample). Thus, 80 records, mainly Ukrainians in the youngest age groups and Poles in the older age groups (see histogram in figure 2) were randomly removed from the initial data set to create age balanced groups.

In the first stage of the experiment, the logistic regression model included all 79 independent variables. Model was trained on 85% of the records in the sample (training set), then trained model accuracy was measured on the other 15% of the records (test set), which were not used in the training. The model performance - accuracy of assigning the test set records to Polish or Ukrainian group, was compared with the accuracy of a random choice base line. For the base line, the group assignments were made by drawing a random number from the left or right side of a uniform distribution. In this experiment two different models were independently trained and tested, one on the balanced and the other on unbalanced samples.

The major weak point in our experimental design is the relative scarcity of data. Thus, the linear model in 80-dimensional space (80 independent variables) is trained on as little as about 300 data points (observations). Naturally, we can expect the model to be seriously unstable and thus demonstrate high variation in accuracy for different train-test divisions of the data. To address this, random splitting of the data into training and test set with consequent training and evaluation of the model was repeated 20 times, mean accuracy over 20 repetitions was calculated and further used as a more reliable estimate of model performance. This procedure was carried out for both unbalanced and balanced samples, resulting accuracies of the model and the base line, together with the corresponding mean accuracies are shown in Figure 6.

The accuracy fluctuates considerably in from one trial to another. Remarkably the fluctuations are high also for the base line, which clearly originates from the small size of the test sample. Indeed, increased range of such fluctuations is observed in the balanced sample, were the test size is smaller than unbalanced.

The model, despite high fluctuations in accuracy, appears to perform better than the base line in the case of age-unbalanced sample. It shows average accuracy of 0.7, at the same time the base line fluctuates about 0.5, as expected. In case of age-balanced sample model mean accuracy drops to around 0.6, which appears to be only marginally above the base line.

Fig. 6: Accuracy of the age-imbalanced (a) and age-balanced (b) models compared to the random base line in 20 trials.

Although the above findings seem to provide the answer to the question about differences between Polish and Ukrainian groups, it would be premature to draw reliable conclusions without attempting to improve our model.

To increase model stability, we could either increase the number of cases in our data set, or reduce the number of model parameters. With no new questionnaire data, only the second option is feasible. Dimensionality reduction was done using 3 methods: 1) PCA and 2) Factor Analysis with the number of components determined based on the best performance in explaining variance, and 3) PCA with the number of components determined by maximum likelihood estimation (MLE) method (Minka, 2000). Resulting accuracy in 20 trials graphs are present in figure 7. Despite significant dimensionality reduction (from 80 to around 10), the balance and the average accuracy of the models hardly changed in both age-balanced and age-imbalanced samples.

Fig. 7: Accuracy of the age-imbalanced (a) and age-balanced (b) models with reduced dimensionality.

Summarising these results, the regression model performs poorly on the age-balanced sample, where it is doing only marginally better job than the random guess assigning observations to the two categories. The model performance improves significantly in the original sample with significantly unbalanced age distribution. This seem to point at the age as a mediating variable, and as such possibly the major difference factor between Polish and Ukrainian groups in the given data set.

Conclusions and Discussion

The literature analysis shows that young people, including those from the generation Z, play a significant role in creating tourism demand and are important area of research. Another interesting area are Ukrainians and their behaviour in Poland (Sulkowski, Przytula and Migdal, 2020).

Based on the findings, two elements should be taken into account particularly. Firstly, young people take advantage of the Internet while searching for tourist options. This takes place at the stage of travel planning, and then subsequently during and after the travel when the participants share their experiences in social media, which may be an important source of recommendations. Therefore, it seems advisable to continue research in this area in order to compare the behaviour of representatives of the generation Z with other age groups. Strong use of the Internet at the stage of trip planning is related to the fact that young tourists are independent, which is not good news for travel agencies. The second element that the results of the analysis indicated is the fact that the responders did not really reinforce the stereotype that young people strive to minimize travel costs. On the contrary, the responders take the comfort, hygiene or convenient transportation into consideration rather than the cost. Entrepreneurs organizing trips should take these issues into account.

The aim of the analysis was to look for differences between young Poles and Ukrainians. Differences in the level of income as well as certain cultural differences were the premise for assuming their occurrence. However, greater mobility of generation Z and easy Internet access, make this generation more similar. Also, the disproportions between the countries will not be significant as it would be in the case of older people.

The results showed no significant discrepancies between the two studied groups. They have similar preferences, they look for information about the destination in a similar way and similar factors create satisfaction. It is vital information for people responsible for creating tourist products as well as their promotion.

The results should be approached with caution. This was an explorative pilot study. There were some disproportions in the size of both groups, which were not characterized by high numbers. The selection of the sample was intentional, it concerned students of selected fields of study, which consequently limits the quality of assumptions.

The received result can be the subject to further analysis. Is there a similar situation compared to other nationalities in the region? Are there any differences regarding the representatives of the so-called Western Europe? What is the situation with regard to representatives of other age groups, for example Generation X or Generation Y.

Resumen

En el presente artículo se hace un análisis del comercio exterior del acero de Estados Unidos con sus principales socios comerciales a partir de una presunta guerra comercial en el año 2018. Para ello, se estudió el desempeño de las distintas variables: Comercio Exterior del Acero Estados Unidos con los principales socios comerciales (variable independiente), Distancia, PIB, producción del acero, arancel, inflación, exportación e importación de metales (variables dependientes). La técnica de econometría utilizada para el procesamiento de datos fue un panel de datos. Los datos empleados para el desarrollo del modelo econométrico utilizado abarcan el periodo comprendido entre el año 2001 y 2016, para un país importador y diez exportadores. Los datos fueron recolectados de las bases de datos del Banco Mundial y del World Steel Association. Se concluye que la variable distancia tiene un efecto significativo al 10% y negativo, donde un aumento de un kilómetro genera una disminución en las toneladas de acero importada del 119.27 toneladas. De igual manera, se verifica la importancia de los acuerdos internacionales en el comercio del acero, lo cual afecta si hay un aumento en el arancel, incitando presuntas guerras económicas en el comercio internacional, como lo vemos hoy en el mercado.

Palabras Clave*:* Modelo Gravitacional, Comercio Exterior, Estados Unidos, Guerra Comercial.

Abstract

This article presents an analysis of US foreign trade of steel with its main trading partners of an alleged commercial war in 2018. To this end, the performance of the different variables was studied: Foreign Trade of Steel of the United States with its main trading partners (independent variable), Distance, GDP, steel production, tariff, inflation, export and import of metals (dependent variables). The econometrics technique for data processing was a data panel. The data used for the economic development model covers the period between 2001 and 2016, for an importing country and ten exporters. The data was collected from the databases of the World Bank and the World Steel Association. The difference between distance had a significant effect at 10% and negative, where an increase of one kilometer generates a decrease in imported steel of 119.27 tons. Similarly, the importance of international agreements in the steel trade is verified, which gives an increase in the tariff, inciting alleged economic wars in international trade, as we see it today in the market.

Keywords*:* Gravitational Model, Foreign Trade, United States, Commercial War.

Introducción

La investigación que se presenta a continuación tiene por objetivo explorar la validez de la teoría gravitacional en el comercio exterior del acero de Estados Unidos con sus principales socios comerciales, en el marco de la guerra comercial del año 2018.

La guerra comercial en el año 2.018 nace como consecuencia de la protección de Estados Unidos a su sector de metal y acero, respondiendo a los empresarios y trabajadores siderúrgicos que han exigido que se disminuyan las importaciones para estos productos, debido a los precios más económicos de los mercados externos, que son difíciles de afrontar. El presidente Donald Trump impone el arancel 25% para las importaciones de acero y un 10% para el aluminio, con el fin de disminuir el comercio exterior con los países, afirmando que "si no tenemos acero, no tenemos país" y tacha de "prácticas comerciales injustas "a países que subsidian y dan productos con precios más bajos al establecido por el mercado nacional (Mir de Francia, 2018)

Causa de lo anterior es el acelerado crecimiento desde el año 2.000 de la producción de acero en el mundo aumentó el comercio intrarregional, tal como lo expresa Camacho (2.011).
Así mismo es importante tener en cuenta que las industrias desde el año 2.000 impulsaron la reconversión productiva, la disminución de precios y la incursión de nuevas tecnologías para hacer frente a la globalización, procesos que ocasionaron una disminución de la industria del acero en países como EEUU, Japón y la Unión Europea, permitiendo el surgimiento de la industria en India, China, Corea del Sur, México y Brasil. (Restrepo y Taborda, 2017).

La comercialización del acero de Estados Unidos frente al mundo, demuestra una constante interdependencia con sus principales aliados regionales Canadá y México, y un aumento a su dependencia con China, con el cual no cuenta acuerdo regional. Si bien es cierto que trae beneficios como la diversificación de productos y la posibilidad de intercambio más eficiente cuando el país no cuenta con todos los recursos, este intercambio comercial puede afectar el mercado por las pérdidas de producción en el mercado nacional, déficit en la balanza comercial y aumento de desempleo.

Posiblemente estas son las razones por las que Estados Unidos decide intervenir para la protección de su mercado aumentando aranceles, en este caso el del acero. Contrarrestando la llamada globalización de mercado para favorecer su mercado nacional.

En consecuencia y en respuesta a la protección del mercado, los países productores de acero y aliados principales de Estados Unidos en el comercio exterior de acero, apelaron ante la Organización Mundial del Comercio, para reclamar por la aplicabilidad de los acuerdos firmados y por el derecho y fomento del libre comercio.

De acuerdo a la presunta guerra comercial y a los datos de intercambios comerciales de los países demandantes ante la OMC, surge el cuestionamiento, sí es totalmente válida la teoría gravitacional - la cual mide PIB y distancia al país destino-, o realmente hay algunos factores que han influido a que esta relación comercial con Estados Unidos llegué a tal punto de afectar la economía nacional.

Razón por la que resulta de interés estudiar el fenómeno de la guerra comercial desde la perspectiva de la teoría gravitacional tomando información de las base de datos de Banco Mundial y del World Steel Association; a partir de las variables objeto de estudio: Producción en toneladas, inflación, Flujo de insumo al mundo, Acuerdo comercial, Porcentaje de exportación de metales y PIB per cápita. Estas variables se estudiaron mediante un modelo econométrico para mostrar relaciones entre variables con efectos positivos, sin efecto y negativos.

Marco Teórico

Modelo Gravitacional: Definición Y Uso Para Explicar La Dinámica Del Comercio Exterior

Este modelo consiste en la adaptación del concepto físico de Newton a los métodos econométricos, utilizando la ecuación de gravedad, en la cual la atracción entre dos cuerpos es directamente proporcional a la masa de los mismos e inversamente proporcional a la distancia que los separa, en la presencia de una constante gravitacional (Bolívar, Cruz, y Pinto, 2015; Rodríguez y Dávalos, 2017; Díaz y García, 2016)

Este concepto resulta ser una analogía, en la cual los cuerpos corresponden a los países; la masa de los mismos equivale al tamaño de la economía o su nivel de producción; y la distancia que los separa es medida tanto desde lo geográfico como de otras variables. Así, en la práctica, el modelo se construye con el uso de las principales variables de comercio, producción nacional, población y características culturales, geográficas y político-administrativas (Bolívar et al., 2015, p.249).

En este sentido, se puede considerar que este modelo muestra de forma resumida la relación existente entre el volumen comercial y las variables asociadas a los costes comerciales (Ulloa, 2017), prediciendo la existencia de una relación directa entre el comercio y el tamaño de los países, debido a la atracción generada por los intereses que existente entre ellos, e inversa con relación a la distancia, debido al aumento de los costos de transporte de las mercancías. (Bolívar et al., 2015).

La ecuación general del modelo, expresado en logaritmos, puede especificarse de la siguiente manera:

$$\ln Xijt = \ln\beta 0 + \beta 1 \ln Yit + \beta 2 \ln Yjt + \beta 3 \ln Dij + \beta 4\, \Gamma ijt + \varepsilon ijt$$

Donde,
$Xijt$ es el comercio entre los países i y j en el año t,
Yit es el producto del país i en el año t,
Yjt es el producto del país j en el año t,
Dij es la distancia entre el país i y el país j, es un vector de variables explicativas adicionales, y
εijt es el error, normalmente distribuido y con media cero.

A estas variables, se pueden sumar otros factores que afectan el comercio, tales como las características institucionales, culturales, económicas e históricas existentes entre los diferentes países (Gil-Pareja, Llorca-Vivero y Martínez-Serrano, 2018, p.202).

Se ha demostrado una relación gravitacional en casi cualquier modelo de comercio que incluya costos comerciales que aumentan con la distancia, permitiendo estimar la estructura del comercio internacional, a partir de factores geográficos y espaciales, convirtiendo al modelo gravitacional en una herramienta que se ajusta a los postulados teóricos (Bolívar et al., 2015; Díaz y García, 2016, Herrera, 2018, Díaz 2017)

Las diferentes formas y variaciones del modelo econométrico pueden ser utilizadas para lograr diferentes objetivos de investigación económica, en pro de obtener efectos predictivos y explicativos en aspectos como el comercio, el crecimiento económico y la evaluación de política monetaria, entre otros (Bolívar et al., 2015). De manera que el modelo de gravedad se puede considerar como una herramienta exitosa en la explicación del comportamiento del comercio internacional frente a la influencia de diversas variables de interés (Gil-Pareja et al., 2018, Aguirre, Candía, Antón, y Beltrán, 2018, Ahcar ,2018)

Evidencia Empírica De La Aplicabilidad Del Modelo Gravitacional

Se realiza una revisión de los antecedentes investigativos frente al uso del modelo gravitacional en comercio exterior, encontrándose que pueden ser agrupado en tres categorías principales, relacionadas con: el análisis de las exportaciones hacia países con quienes no existe un tratado comercial; la incidencia de los tratados de libre comercio en las exportaciones; y las relaciones comerciales entre países donde existe un tratado comercial.

En cuanto al uso general del modelo y el análisis de las exportaciones hacia países con quienes no existe un tratado comercial, encontramos por ejemplo la investigación realizada por Fuenzalida-O'Shee, Valenzuela-Klagges, y Corvalán-Quiroz (2018), quienes analizaron los efectos de la facilitación del comercio en las exportaciones chilenas durante el período 2006-2014, a través de revisión de las evidencias existentes y la estimación de un modelo gravitacional ampliado relativo a flujos del comercio exterior bilateral chileno con 89 países.

Por su parte, Rodríguez y Dávalos (2017) utilizaron un modelo gravitacional para estimar el impacto de una disminución de las barreras comerciales del Perú frente a potenciales socios comerciales con los que aún no tiene un acuerdo establecido, analizando el periodo 2005 a 2015 en busca de identificar a los posibles socios con el mayor potencial exportador. El análisis dio como resultado que el crecimiento económico de los socios comerciales tendría un efecto positivo en el potencial de comercio, sin embargo, no presenta evidencia que indique que la reducción de las barreras comerciales permitirá el aumento significativo del comercio bilateral con los países estudiados como potenciales socios.

Por otra parte, la investigación realizada por Aguirre, Candía, Antón, y Beltrán (2018) tuvo como objetivo encontrar los factores determinantes de las exportaciones agrícolas nicaragüenses, para lo cual formularon un modelo de gravedad y realizaron una estimación utilizando los mínimos cuadrados ordinarios, analizando 12 países, 8 de los cuales tienen acuerdos de libre comercio con Nicaragua. En los resultados tuvieron en cuenta tanto la evaluación de la bondad del ajuste global como la evaluación individual de los parámetros utilizados; llegando a la conclusión de que los tratados de libre comercio han mejorado el desempeño económico de las exportaciones agrícolas nicaragüenses.

De igual manera, Olegário, Monteiro, y Almeida (2017) realizaron un estudio que les permitió analizar el comercio internacional de algodón, con énfasis en las principales políticas comerciales adoptadas y en sus efectos, basándose en el modelo gravitacional. Donde los resultados apuntaron a la necesidad del establecimiento de políticas comerciales equitativas que permitan a los países menos desarrollados competir de forma justa y continuar ganando participación en el mercado internacional de algodón.

Otra investigación al respecto es la realizada por Ahcar (2018), la cual identifica el potencial comercial entre Colombia y la Unión Europea, teniendo en cuenta el acuerdo de libre comercio que entro en vigor en 2013, a través de la realización de predicciones dentro de la muestra sobre la base de estimaciones realizadas con el método de pseudo-máxima verosimilitud de Poisson aplicado a un modelo gravitacional. La muestra tomada fue de 153 países y se tuvo en cuenta el periodo comprendido entre 1980 y 2012, llegando a la conclusión de que existe potencial sin explotar para las exportaciones de Colombia a algunos países de la Unión Europea y viceversa.

Por otra parte, Méndez, Gómez, Romero, y Fajardo (2017) realizaron un análisis de los efectos económicos de las relaciones comerciales entre Colombia y Chile a partir de la implementación del Tratado de Libre Comercio, a través de la estimación de la ecuación de un modelo gravitacional que representa la influencia de las relaciones comerciales entre los dos países, en el periodo comprendido entre 1998 y 2016, lo que permitió estudiar el desempeño de las importaciones y exportaciones por sectores económicos y explorar la dinámica de la inversión extranjera directa efectuada entre los dos países. Este estudio llega a la conclusión de que el acuerdo comercial ha permitido el incremento en el comercio bilateral, las inversiones y la producción, y por tanto ha favorecido a los dos países.

Siguiendo los principios del modelo gravitacional para construir un modelo econométrico que le permita identificar los determinantes que influyeron en la variación del volumen de exportaciones entre Colombia y sus socios económicos, Ávila (2017), analizó el periodo comprendido entre los años 2000 a 2015, tomando como muestra 49 países. Llevó a cabo pruebas de diagnóstico que le permitieron elaborar un modelo que ofrece una estimación cercana a la realidad. También, destaca la relevancia adquirida por la ecuación de gravedad para la estimación de flujos comerciales y su uso para examinar los resultados de los acuerdos de integración económica regional.

Así mismo, Cardoso, Schneider, y Bechlin (2016) analizaron los efectos de la constitución del Mercado Común del Sur - MERCOSUR en los flujos de comercio de los países miembros en el período de 1994 a 2009, para lo cual utilizan un modelo gravitacional extendido, que permite analizar los diferentes sectores de la economía y a cada país. Concluyendo que el MERCOSUR logró aumentar el intercambio comercial, siendo de relevancia para los países miembros, principalmente en la exportación de productos del sector agrícola.

Metodología

Esta investigación es eminentemente cuantitativa, la estimación econométrica que se efectuó, esta cimentada en los modelos de datos numéricos. La literatura revisada en la disciplina de economía internacional ha situado a los modelos de Gravedad, como una alternativa para evaluar los flujos de comercio exterior entre distintos países sin importar su ubicación geográfica, por ello la utilidad de ese modelo para alcanzar los objetivos propuestos en esa investigación. Al respecto, se desarrolló un modelo econométrico gravitacional como herramienta para el estudio del comercio exterior del acero en EEUU, por lo que se procedió al análisis sobre la dinámica de ese sector industrial, mediante un modelo de panel de datos para determinar las variables más significativas.

Estimación Del Modelo

La técnica econometría utilizada para el procesamiento de datos fue un panel de datos, que permite relacionar una variable dependiente que contiene información de varios individuos en diferentes momentos del tiempo con variables independientes que cuenta con las mismas características. Es decir, los paneles de datos combinan dos tipos de datos: (a) datos de sección transversal y (b) datos de series de tiempo. En este estudio la ecuación que conforma el modelo tiene las siguientes características.

$$Y_{it} = \emptyset_{it} + \emptyset_t + B_1X_{1\,it} + B_2X_{2it} + B_3X_{3it} + B_4X_{4it} + B_5X_{5it} + B_6X_{6it} + B_7X_{7it} + B_8X_{8it} + B_9X_{9it}$$

Donde:

$\emptyset_{it}$= Es el coeficiente que absorbe efectos específicos para cada país e incorpora las variables específicas de cada país como la cultura, lenguaje, etc.

$\emptyset_t$ = Es una variable que intenta absorber efectos que ocurren en cada año.

Y_{it} Es el flujo de acero el país exportador i hacia Estados Unidos en el año t.

$X_{1\,it}$ Porcentaje de exportaciones de metales y minerales respecto al porcentaje de mercaderías.

X_{2it} Distancia en km desde la capital del país exportador i hasta la capital de Estados Unidos en el año t.

X_{3it} Producto interno bruto en dolares per cápita del país i en el año t.

X_{4it} Exportaciones de las cantidades de acero del país i hacia el resto del mundo en el año t.

X_{5it} Producción de toneladas de acero del país i en el tiempo t.

X_{6it} Inflación reportada del país i en el tiempo t.

X_{7it} Variable binaria que muestra si el país i tiene un acuerdo comercial con Estados Unidos en el tiempo t.

X_{8it} Variable que representa el Producto Interno Bruto (PIB) de un país en el tiempo t.

X_{9it} Número de habitantes que residen en la zona urbana del país i en el tiempo t.

Resultados

Los datos empleados para el desarrollo del modelo econométrico abarcan el periodo comprendido entre el año 2001 y 2016, para un (1) país importador y diez (10) exportadores. Los datos fueron recolectados de las bases de datos del Banco Mundial y World Steel Association (2019).

Como primera medida, se optó por emplear las técnicas de panel de datos fijos y datos aleatorios. Luego, se procede a utilizar el test de Hausman con la finalidad de identificar cuál de dos técnicas es la adecuada. En el primer modelo, se obtuvo un valor de p igual a -6.64[1], por lo tanto, existen problemas con el supuesto de asintoticidad del modelo. Por ende, se decide ejecutar un segundo modelo que extraiga la variable PIB per cápita y se opta por mantener la variable PIB, debido a que estas dos variables están relacionadas. Además, las variables población, PIB, flujo de insumos, distancia y producción fueron logaritmizadas en este modelo con el fin de reducir la escala de estas variables.

Del segundo modelo, se obtuvo un valor de p igual a 0, entonces, la corrida del segundo modelo muestra que la técnica a utilizar es la paneles de datos con efectos fijos. Al aplicar la prueba de Factor Inflación Varianza (VIF) se obtuvo que todas las variables que fueron aplicadas logaritmos tenían un VIF[2] mayor 350, por lo tanto, existen problemas de multicolinealidad. En la tabla 3 se puede apreciar los valores de los factores para cada variable.

Tabla 1: Factor Inflación Varianza no centrado para el segundo modelo

VARIABLE	VIF	1/VIF
Logaritmo de la población	2872.58	0.000359
Logaritmo del PIB	1817.88	0.000550
Logaritmo del flujo de insumo	1085.43	0.000921
Logaritmo de la distancia	787.40	0.001270
Logaritmo de la producción	359.38	0.002783
Acuerdo comercial	9.68	0.1032

[1] Si el valor de p es negativo significa que dentro de los datos existe una variable que viola los supuestos de asintoticidad del modelo, por lo tanto, hay un error en la aplicación del test de Hauman. Por otra parte si el valor p es mayor a 0 pero menor a 0.05 se asume que los datos de paneles de tipo fijo son el modelo de estimación adecuado para la corrida econométrica. Si el valor p es mayor a 0.05 de se utilizan los paneles de datos con efectos aleatorios.

[2] Valores superiores a 10 en el Factor de Inflación Varianza (VIF) indica que dicha variable tiene problemas de multicolinealidad.

Porcentaje de exportaciones	8.54	0.1157
Porcentaje de importación	5.58	0.1790
Inflación	3.64	0.2749

Nota: El cálculo del factor fue realizado en el software Stata 14.

Con el fin de arreglar los problemas asociados a la multicolinealidad, se opta por trabajar con las variables sin aplicación de logaritmos. Además, como los logaritmos de la variable población y PIB, tuvieron los factores de inflación varianza más altos se decide extraer las variables población y PIB sin logaritmos en tercer modelo. El test de Hausman de este modelo muestra que el valor de p es igual a 0, por lo tanto la técnica utilizada es panel de datos con efectos fijos. Posteriormente, se aplica el test de multicolinealidad y se observa que la variable porcentaje de importación presento un valor de factor mayor a 10, lo que permite concluir que esta variable está aumentando la multicolinealidad del modelo. En la tabla 4 se aprecian los diferentes valores de los factores obtenidos para cada variable.

Tabla 2: Factor Inflación Varianza no centrado para el tercer modelo

VARIABLE	VIF	1/VIF
Flujo de insumo	3.49	0.2865
Distancia	8.16	0.1225
Producción en toneladas	4.96	0.2015
Acuerdo comercial	1.64	0.6110
Porcentaje de exportaciones	4.49	0.22227
Porcentaje de importación	11.47	0.0871
Inflación	2.30	0.4346

Nota: El cálculo del factor fue realizado en el software Stata 14.

Se decide construir un cuarto modelo que no tenga en cuenta la variable porcentaje de importación, PIB y población urbana, pero se decide incorporar nuevamente la variable PIB per cápita, debido a que se considera necesario analizar los efectos de alguna de las dos variables relacionadas con el producto interno bruto sobre la cantidad de acero exportado hacía Estados Unidos y se desea observar los efectos que tiene sobre la multicolinealidad. Al nuevo modelo se le aplica el test de Hausman y el valor de p obtenido es 0.27, es decir, que la técnica de econometría a aplicar son los paneles de datos con efectos aleatorios. Luego se aplica el test de multicolinealidad y se observa que ninguna variable obtuvo un factor de inflación superior a 10. Tabla 5.

Tabla 3: Factor Inflación Varianza no centrado para el cuarto modelo

VARIABLE	VIF	1/VIF
Flujo de insumo	4.21	0.2376
Distancia	5	0.20
Producción en toneladas	2.91	0.3441
Acuerdo comercial	1.61	0.6199
Porcentaje de exportaciones	6.54	0.1528
PIB per cápita	4.21	0.2376
Inflación	2.77	0.3661

Nota: El cálculo del factor fue realizado en el software Stata 14.

Por lo tanto, el cuarto modelo tiene la siguiente forma $Y_{it} = \emptyset_{it} + \emptyset_t + B_1X_{1\,it} + B_2X_{2it} + B_3X_{3it} + B_4X_{4it} + B_5X_{5it} + B_6X_{6it} + B_7X_{7it}$. Luego del análisis de los test estadísticos se procede a analizar los coeficientes arrojados por la regresión que están organizados en la Tabla 5.

Tabla 4: Resultados de estimación del modelo de panel de datos aleatorios

Número de observaciones	160	
Número de grupos	10	
Flujo de acero	Coeficiente	Estadístico z
Porcentaje de exportaciones	212383.2	6.01***
Distancia	-119.27	-1.72*
PIB per cápita	14.06	2.31**
Flujo de insumo	0.041	5.14***
Producción en toneladas	-0.4798	-0.70
Inflación	11129.69	0.82
Acuerdo comercial	1374298	2.81***

*Nota: *** significativo al 1%, **significativo al 5%, * significativo al 10%*

Con respecto a la interpretación de los coeficientes:

- La variable producción e inflación en toneladas e inflación no tuvieron efectos significativos sobre el flujo de acero del país exportador a EEUU.

- La variable producto interno bruto per cápita se mostró significativa al 10%, y se observa que un aumento unitario de un dólar en el PIB per cápita genera un aumento de 14.06 toneladas de acero sobre el flujo comercial del país i con respecto a EEUU.

- La variable distancia tiene un efecto significativo al 10% y negativo, donde un aumento de un kilómetro genera una disminución en las toneladas de acero importada del 119.27 toneladas.

- La variable porcentaje de exportación fue significativa al 1% y positiva. Se muestra que un aumento porcentual en las exportaciones de metales respecto a las exportaciones de mercaderías genera un aumento de 212383.2 toneladas de acero exportado del país i a EEUU.

- Tener un acuerdo comercial con EEUU genera, a lo largo del tiempo, un aumento de 212383.2 en las exportaciones toneladas de acero respecto a aquellos que países que no lo tiene. La variable acurdo comercial fueron significativa al 1% y positiva.

- Un aumento en las toneladas exportadas de acero del país i hacia el resto del mundo generan un aumento de 0.041 toneladas de acero exportados hacia EEUU. La variable tuvo un efecto positivo y significativo al 1%.

Conclusiones

Se ha trabajado con el modelo gravitacional, a fin de extraer conclusiones sobre las principales variables que caracterizan el comercio internacional del acero con los principales socios comerciales de EEUU.

El modelo gravitacional confirma una vez más que la distancia tiene un efecto negativo, donde a mayor distancia menor es el intercambio comercial del acero. Así mismo un aumento del PIB afecta positivamente el comercio de acero con EEUU.

Al considerar otras variables como la inflación y la producción de acero, se demostró que tienen un efecto nulo sobre la variable intercambio comercial. Por otra parte, se encontró que los acuerdos comerciales con el transcurso del tiempo es una variable significativa para el aumento del intercambio comercial con EEUU. Lo cual nos indica que, al hacer un aumento de arancel, podría contraer el flujo comercial afectando de esta manera la economía de los países socios, principalmente Canadá y México, como países más cercanos a EEUU.

Effective Methods of Project Management – between the Coercion and Subsidiarity

Abstract

The article presents a critical analysis of project management methods. The evolution of these methods against the background of development of Management and Organization studies is discussed. Pressure methods, characterized by the usage of coercion and even violence in project and organization management, are contrasted here with the supportive methods. Despite favoring the modern methods (which exclude the coercion and violence) of project management in source literature, the parallel and simultaneous usage of various methods is noticeable though. The thesis that the effective project management requires the usage of flexible tension between the pressure and supportive methods is being defended in the article analogously to the Aristotle's Golden Mean rule. This is confirmed by the following concepts: Six Action Shoes by E. de Bono; situational leadership by K. Blanchard or D.McGregor's and W.Ouchi's theories which are a strong backup to the project management. Research methods used in the article are based on the literature study and case studies included in the previous cited articles of the author.

Keywords: Project Management, Coercion and Violence in Management, Subsidiary Methods in Management

Introduction

Elements of the coercion and even the violence in management can be found in every organization. Using the analogy of organization as a machine, a hierarchy, a culture and a political system (Morgan 1996), the various forms of the usage of coercion and violence can be indicated. In case of the mechanistic and hierarchical approaches to the organization, a coercion is inscribed in the idea of the functioning of these formations which reveals in the form of strict procedures, structures determining the roles of supervisors and subordinates, or the governance approach. Two subsequent analogies concern the coercion as an important element of the management; however, it is manifested in more veiled form. The cultural analogy is about developing consistent objectives of the organization's members to define a distinctive culture of this organization. Manipulation (a form of violence) in persuading people to behave in accordance with the external goals was interestingly depicted by F.Hayek (2003, p. 169,173). There is no better way than convincing people to believe in these goals, and the most effective method is to show these purposes as values which they have always recognized but had wrongly perceived or had not understood them before.

Coercion in the political analogy appears in the decision-making process by the majority of votes or compromise. This is usually not the win-win case for all involved parties, and not even the win-win-...-win case. This results in open or hidden opportunism among stakeholders who feel lossy in the final compromise (Jokiel 2016).

On the other hand, management concepts, methods and techniques, which emphasize the role of bottom-up initiatives of employees and require the loyalty and taking responsibilities, are developed. The examples of such concepts are: the theory of Y D. McGregor, brigade systems, management by objectives (MBO), empowerment (Conger, Kanungo 1988), and the turquoise organizations (Laloux 2014).

The aim of this article is a reflection on the evolution of project management methods. The methods which use the coercion (direct and indirect), as well as those using the supportive approach (subsidiarity) to employees/subordinates will be analyzed and evaluated in terms of their effectiveness in project management.

Pressure Methods (Based on Coercion)

Scientific methods of management and organization using the coercion and even the violence have a long time theoretical basis. The homo oeconomicus concept of Adam Smith is an unnatural model of human behavior particularly harmful in the field of management. Adopting this behavior model as a human nature, leads to a man's objectification in the result. Because the human nature is the same and is marked by a native egoism, it is easy to predict the motives behind the individual's behavior. Based on the selfish motives the one can easily control the man's behavior by stimulating the economic incentives. Employees lose their subjectivity and individuality becoming an impersonal workforce. This approach results in demands to pay sufficient salaries to enable them working the next day (Ikonowicz 2014). Works by O.A. Jermanski (Martyniak pp.244-252) have developed in the same vein – the author tried to normalize the work by calculating the intake of calories needed to perform physical activities. This mindset about employees had a significant impact on the management and organization at the end of 19th and the beginning of 20th century. An administrative approach by M.Weber was analogous to mentioned above. The concept of bureaucratic theory (Weber 2002 pp.160-168) is the basis for the systemic formation of any organization and is designed to ensure efficiency by procedures and instructions regulating the behaviors of the members. Therefore, it moved the interest of management and organization studies to systemic regulations (rules, procedures, etc.), and tuned out the mental sphere of employees at the same time. The mechanistic approaches to the organization of human work were only weakened after the Hawthorne Experiment. (Weber 2002).

One more example which links the past and the modern times is a matter of organizational structures. The functional structures introduced by F.W. Taylor at the beginning of the 20th century (Nalepka 2001 p.71), based on the division of labor and the concentration of job positions per functions, have survived in many companies to date. They are still doing well despite the criticism from many sides: a process approach, development of process-based business IT, logistics as an integrating approach, project optics, and others. The most common consequence is a strong position of CFOs due to their closeness to the main business efficiency measure which is a profit.

Coercion was implemented to the management methods based on these theoretical assumptions. 10 out of 14 management principles, which derive from H.Fayol, assume the authoritarian approach of superiors (Fayol 1947 p.56-58):

- Division of labor
- Authority
- Discipline
- Unity of order
- Management uniformity
- Subordination of individual interest to general interest
- Rewarding employees with fair and motivating salary - satisfactory, but not unduly high
- Centralization
- Hierarchy
- Governance - ensuring the right place for everything and every individual in the organization.

Only the last four emphasize the human face of management:

- Humane treatment of employees

- Staff stabilization - employees can achieve a proficiency in carrying the tasks
- Initiative - supervisor should partially give up his ambitions, so his subordinates can take the initiative
- Staff harmony - cooperation

In the 1960s, D.McGregor formulated the management theory X based on the assumptions of a bad human nature not without reason. Management based on the coercion has not passed the project management. Two types of such coercion can be indicated: direct coercion and indirect coercion.

1) Direct coercion

a) An autocratic management style. It is used not only in crisis conditions when the quick and indisputable decisions are made, but also in other projects. It depends on the superior's personality, rather than the project status. Orders are preferred then (which are one of the management functions deriving from H.Fayol).
b) Strict procedures, rules and regulations, and responsibilities as per some project processes are conducted (e.g. compliance with the tender procedures). In addition, the procedural correctness is often a smokescreen or a shield for those responsible for the project, its stage or a task. Formal arrangements and orders are the basis for proving one's arguments in conflict situations, which form a kind of protection and legitimization of made decisions.
c) Control and periodic appraisal of an employee's job performance, which in case of projects is related to the assessment after the completion of the entire project, stage or milestone. Is related to the results check. Prior to this check, controlled employees can feel the fear and take initiatives to hide the failures from the inspectors. The game starts and the controller and the controlled individual often take schematic roles. Even if the fear is rejected, the information about the work progress in relation to the plan will be exposed to deformation in the controlled one's favor, as the individual will always try to present and interpret them in more positive light. Also, such control can evolve into pathological cases of seeking dirt on colleagues etc. In case of failed projects, the common audit purpose is to look for someone to blame or so-called witch-hunting.
d) Overload and overtime. The unpredictability of projects and scale of the new cause that - as the proverb goes - each project lasts... two weeks, two days and two nights. The common crisis in many projects appears when the management or project managers realize that the schedule, scope and quality are at high risk. This moment usually appears at the end of the schedule. The simplest solution is to catch up with the works and take overtime hours with non-stop work for 48 hours. A business command or psychological pressure are used by management "for the good of the project".
e) Linear organizational structures which can also be found in projects. Coercion and the power resulting from the supervisor-subordinate relation often turns into an open violence - mobbing, financial and disciplinary penalties, reprimands, ignorance, humiliation, etc.

2. Indirect Coercion

a) Deadline. Project management through deadlines is a veiled coercion because it is basically limited to setting these deadlines. Project management limited only to defined deadlines and the task execution is convenient and not time-consuming. It enables the manager to manage several and sometimes a dozen of projects simultaneously, and the manager's work efficiency increases in such case. However, management based on deadlines could be a cause of many pathologies which have an impact on the task implementation and the work efficiency of subordinates. First of all, the situation of managing a dozen of projects simultaneously, which are supervised quite rarely (on deadline days), results in a decrease of management quality and thus the acceptance of "crumminess". Secondly, a demand for high probability of completing the task (e.g. 99%) to the fixed deadline, can activate protective efforts which are sometimes not even realized by the individuals. One of such mechanisms is a formation of time buffer to preserve contractors when the circumstances are unfavorable. This buffer is greater when the desired probability of meeting the deadline is also greater, and when more risk factors are included. Studies show that

the size of such buffer is statistically formed within the 100-200% efficient time level of work, that is the time required by contractors to complete the task (Goldratt 2000 p.54). Much of this time buffer is wasted at the beginning of the projects due to a phenomenon which was called in Management and Organization studies a "student syndrome", while in the health sciences a "procrastination" (King 1998). Even if the phenomenon does not occur (when the individuals who act according to the "no time to waste" rule are present), the task which is finished before the deadline is not being delivered with completed status. Responsible for such behavior are defense mechanisms which preserve the buffer for the future. In given situation, a slack time was not needed because the circumstances were favorable and the task was done before the deadline, however, there is no guarantee that such favorable conditions will occur in the future. Also, a bad time planning is a case, and one can expect that the similar time buffer might not be negotiated in the upcoming projects and which could be needed then. In addition, it is worth to mention a peer pressure, i.e. managers of parallel and similar tasks which missed the deadlines due to the student syndrome or were affected by the risk factors. The effect of mentioned behaviors of implementers who work on fixed deadlines is a significant level of time waste which has a direct impact on the cost perspective.

b) Formalized bonuses and penalties system. Interestingly, reward can be considered one of the coercion methods. A.Kohn, the author of "Punished by Rewards: The Trouble with Gold Stars, Incentive Plans, A's, Praise and Other Bribes", noticed that any rewards for higher efficiency is doomed to fail. He indicates four reasons why: 1) Rewards are a kind of punishment. Failure to receive a reward can often be seen as punishment, while receiving it often causes a sense of control resentment 2) Rewards can damage a relations between the people, and instead of cooperation, the competition to gain a reward or avoid the punishment starts 3) Focus is on the results, and interest of what have triggered the results is reduced 4) Rewards can discourage to take risks (Kohn 1993 p.61). Similar arguments are brought by A.Blikle (2016 p.81-96) who calls such acts a "carrot-and-stick". They are responsible for turning off the ethics and moral attitudes among employees interested in achieving the prize in fixed conditions. Also known and widely used are the methods of avoiding the control indicators by employees like (Sasin 2015 pp.268-272): periodic appraisals, the Parkinson's law, fraudulent taxi driver syndrome, etc.

c) Focus on the errors and imperfections. Project control and evaluation is focused on the identification of deviations from the planning assumptions. The attention is focused on the negative deviations (exceeding the timeline, budget, incomplete tasks, or low quality). These are important factors as they threaten the implementation of the project. It means that positive deviations such as early execution, cost savings, high quality or extra work are less important for project managers than the negative deviations

Methods to Humanize the Process Management

The result of Hawthorne experiment was placing a human in the center of interest of Management and Organization studies. Mechanistic paradigms have lost their explanatory power, while the following roles have been recognized in the specialist literature:
a) informal interpersonal relations (Czupiał, Karaś 2001, p.42)
b) bounded rationality (Kahneman 2012)
c) emotional intelligence (Golemann 2005)

If the main actor of Management and Organization studies is a human individual, the management methods should be adapted to the character of a person. Based on the theory of Y.D. McGregor, but also on many other recognized theoretical approaches such as: Theory of Constraints by E.Goldratt, where one of the basic pillars is a good nature of human, or 14 principles by E.Deming, many management methods excluding the coercion and violence have been defined. In the literature, those methods are known as humanized (Mendel 2004):

a) a Management by Objectives (MBO) concept developed and published by Peter Drucker (Carroll 1973)
b) Aggressive task planning in projects at the 50% probability level of completion within given time brackets (Jokiel, Marciszewska 2019). The Critical Chain Project Management concept assumes the "aggressive task planning" (Marek-Kołodziej, Łapuńka, Jagoda-Sobalak 2017

p.320) secured with a buffer at the project manager's disposal and not in the hands of executors of single stages. The concept of critical chain is a recognized solution to implement projects within set criteria such as time, budget, and scope. It eliminates phenomena such as student syndrome (procrastination), Parkinson's law, or multitasking.

c) Supporting control (Koził 2015 p.27). The concept makes sense only if the one could identify all threats related to completing the tasks. And again this is only possible in the full trust conditions between the supervisor and subordinate, which is determined by the lack of negative consequences for not completing the plan by the auditee.
d) Projects evaluation. Instead of control, the concept of evaluation is used nowadays. It is primarily intended to reveal problems and deviations from the set purposes, and not to seek the wrongdoers to punish them, but rather to improve the project management in the future. Problems and errors revealed in the evaluated projects are important for future ventures to not commit the same mistake again.
e) Supporting management/reverse leadership. The problem was noticed by Ch.Handy (1996 p.114) and proposed the reverse delegation as solution. The idea is to make way for individuals, who are lower in the structure, to ask the higher ones for help (delegate the rights or responsibilities), when they cannot find a solution alone.
f) Trust in the company or manager that they will share the end benefits of a project. The lack of rules of how the bonus pool is divided causes a confusion among employees and can lead to pathological and discretionary bonuses granting, but on the other hand it also has a positive impact. All interested parties should participate in the process of bonus funds distribution. The benefits of such method are a better information flow, participation in management decision-making process, knowledge of arguments and different points of view, necessity of cooperation within a team, group integration, etc. The best and most obvious way to divide these funds is through a dialogue.
g) Self-managed brigades. Forming teams managing their own work, taking over the responsibilities of planning, self-control, and self-evaluation. As well as the quality circles and Kaizen teams.
h) Empowerment. Encouraging people to be involved in decision-making process, developing the real impact of employees on the organization functioning, increasing employees' rights (Conger, Kanungo 1988, Mantel, Meredith, Shafer, Sutton, p. 107).
i) Replacing penalties with the motivating tools such as profit sharing or differentiated values of contracts, e.g. depending on the time of project execution. Higher rates for the execution within the "aggressive" time range, lower rates for late project execution.
j) Introducing the range of tasks instead of regulations. It is not possible to form completely closed procedures and instructions due to inability to predict all situations that might occur. That is why a general description of rules is sufficient to adapt a conduct to the needs of a specific problem situation (deBono 1997). Similar conclusions are drawn by K.Blanchard (2016).
k) Turquoise organizations as the management model in which the level of organization management awareness is the most decentralized and equal for all members of the organization. The concept was proposed and popularized by the Belgian author F.Laloux in 2014. This system was called a "partner democracy" by A.Blikle (Blikle 2017).
l) Positive Organizational Scholarship (POS). Instead of focusing on the identification and solution solving, it is worth to get inspired by best practices of successful projects. POS is based on the analogies to positive psychology by M.Seligman (Seligman, Csikszentmihalyi 2000).

Table 1 compares the coercion and supportive methods

Table 1: Pressure and supportive methods in project management

Pressure methods – coercion	Supportive methods (subsidiary)
1. Deadlines assume the 99% execution probability within set time frame	1. Aggressive planning of the 50% execution probability within set time frame
2. Appraising control	2. Supportive control, project evaluation
3. Authoritarian management	3. Supportive management, manager acts subsidiarily, reverse leadership by Charles Handy
4. Penalties and rewards, "carrot-and-stick"	4. Trust in the company or manager that they will share the end benefits (the bonus pool)
5. Set of duties, procedures and instructions, performance appraisals	5. Self-managed brigade, Empowerment self-assessment, quality circles, Kaizen teams, internal know-how
6. Contractual penalties	6. Share in savings, various contract values
7. Detailed regulations	7. General and flexible rules, situational leadership, developmental coaching
8. Linear structures	8. Turquoise organizations
9. Focus on errors and failures	9. Positive Organizational Scholarship

A Pragmatic Approach

Criticism of both pressure and humanized methods can be found in the source literature. There is no only one right and the best method, technique or tool in the Management and Organization studies. Recognizing any management method as the leading one in the theory (which would be equal to achieving a paradigm) would deny the sense of competition between companies because any organization which would follow these methods would be eventually successful (Jokiel 2006, p.61).
Context, environment and specific situation are of significant importance in the Humanities. Hence, the following concepts have been developed:

1) Theory Z, initiated by D.McGregor and completed by W.Ouchi. It was a synthesis of company's interest and the individuals' aspirations for self-realization. The theory includes both needs of low and of a high order, and combines some elements of theory X and Y. Companies which have implemented this approach are characterized by teamwork, organizing trainings for their employees, strengthening the employees' involvement in the company's affairs, high care for their employees, permanent employment, an excellent information flow (Ouchi 1981).
2) Six Action Shoes by E. de Bono (1997)
3) Situational leadership by K.Blanchard (2016)

Mentioned researchers indicate that different situations require the use of different action models - orange wellies for crisis situations or pink slippers when the sympathizing efforts focused on the other person's feelings are needed. However, the existing conditions do not usually match the ideal situations described by the specific color of shoes. Therefore, the action styles should be mixed and modified as well as include a hybrid of two or more styles, because one usually wears a pair of shoes.
Similarly, K.Blanchard postulates the matching of leadership styles [S-1 (Instructing) high performance-based and low-relational; S-2 (Selling) high performance-based and high-relational; S-3 (Supporting) low performance-based and high-relational; S-4 (Delegating), low performance-based and low-relational] to the level of employee's readiness [R-1 low competences and high willingness, R-2 low competences and low willingness, R-3 high competences and low willingness, R-4 high competences and high willingness].

To effectively manage the projects, it is necessary to compose an appropriate mix of pressure and humanized methods according to existing circumstances and the context. Similarly to the Aristotelian postulate of the Golden Mean, a flexible tension should be formed between the pressure and

supportive methods in accordance with the principle: "a subtle coercion is a basis of the spontaneous commitment".

In addition, projects are carried out in different countries, cultures, environments by various managers. Sometimes pressure methods work and sometimes they don't. It means that an effective management requires various methods. Chronologically, the pressure methods were the earliest developed ones in Management and Organization theory. A sign of our times is a focus on the humanization of project management processes, because the basis of project management is a process approach (Trocki 2012, p.50). However, it does not mean that the old pressure methods have definitely been abandoned. There are projects carried with pre-scientific, forcing, and authoritarian methods, e.g. in the army, and not only in the underdeveloped countries. Also, there are projects implemented by the turquoise organizations not only in the highly developed countries. These projects are successfully implemented simultaneously. It is feasible due to the fact that only some organizations/projects move to the next era of Management and Organization studies development - this is the avant-garde of changes, and the rest remains in the realities of their development stage, especially when they are not forced by the external factors.

Conclusion

Organizations are just like people - not all of us have evolved into the postmodern era yet, e.g. in the field of literature. The vast majority of people read the last fiction book at school time and stopped their literary development at this stage of life. Functional illiteracy is also the case in society - and sometimes a person who is illiterate gets along - which for the literacy development means the 0 level. Analogously, primitive organizations possibly exist in the economy, and can do well on the market. The use of literary periods as a metaphor for subsequent organizational concepts has one more advantage. The phenomenon of certain manner, of vogue for writing, has accompanied the passing of old one and the beginning of the new literary period. The same phenomenon occurs while popularizing the management concept. Some of them were fashionable in the past, e.g. Taylorism, the cascade model of IT projects (waterfall model), linear model (Wysocki 2019, p. 409) or project life cycle (e.g. PMBoK 2017), and some are currently promoted, e.g. knowledge management or agile methodologies in project management. (Morris 2013 s. 90). Ch. Bredillet (2008) lists until Nine Schools of Project Management Research.

When reviewing the latest management literature, the researchers' attention is focused on improving the management in a group of organizations/projects belonging to the avant-garde of changes. One can get the impression that other organizations/projects do not exist in modern economies of highly developed countries. Meanwhile, a number of agile projects or learning organizations is relatively low when compared with a total number of organizations. However, the focus of researchers on the modern organizations is justified. Many studies have been carried out, for the sake of organizations/projects which are managed with the spirit of previous organizational periods, and can be found inspirational and useful. This is why moving forward is the only development path for Management and Organization studies. Considering these observations, it is true to say that we live in many eras of scientific thoughts of Management and Organization studies at the same time, however, more in the concept of agile project management (Jokiel 2012).

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN

Work-Life Balance - Employees' Private Lives as An Element of The Concept of Corporate Social Responsibility

Joanna GAJDA

Czestochowa University of Technology, Czestochowa, Poland
joannagajda@vp.pl

Abstract

In the current socio-economic conditions, people may experience a fusion of work and family life. This situation may lead to a disturbance between key areas of human life. Therefore, new challenges are emerging for Polish organizations in the field of work-life balance related to the organization of work and working time and the expectations of employees. The selection of CSR tools should be a response to the needs of diverse employee groups.The paper presents the issue of balancing professional work with non-professional life in the context of CSR strategy. The first part of the paper is theoretical and was based on a literature analysis of the main issues and assumptions of the concept of corporate social responsibility in relation to employee issues. The second part is the presentation of the results of the survey. Its purpose was to obtain information on the expectations of employees of different generations towards the organization in terms of facilitating the reconciliation of professional and personal life.

Keywords: Corporate Social Responsibility in Organization, Employees of Different Generations, Expectations, Stakeholder, Work-Life Balance

Introduction

At present, corporate social responsibility is widely recognized by both theoreticians and management practitioners. Business entities, realizing the positive impact of CSR on the environment, more and more often decide to undertake practical activities related to its implementation. It is now believed that CSR is a major factor that has a significant impact on achieving long-term business success because it draws attention to the needs of various stakeholder groups.

The concept of corporate social responsibility indicates the importance of including prosocial, economic and environmental issues in the organization's activities. It applies to all areas of activity. One of them concerns employment and responsibility in the workplace. CSR requires employers to create work conditions that meet the needs and expectations of employees. Nowadays, efforts to balance work and private life are particularly important, as we are dealing with the invasion of work "on a life outside work, whose time is constantly shortened. As a result, employees are completely focused on professional duties, and work is seen as an autotelic value. The cult of work is growing, because being busy is one of the highest values, it is an indicator of status and prestige, and is also a testimony of dedication of employees to the organization employing them" (Pluta 2014, p. 181).

Organizations adopting a proactive strategy in the field of creating working conditions should implement solutions aimed at reconciling two spheres of life - professional and private. Maintaining harmony between them requires an open attitude of both employers and employees leading to the achievement of the desired state.

The implementation of this task requires the support of the company's management, manifested in activities focused on the proper organization of working time, so that employees can make individual choices. To find solutions, it becomes necessary to shift the focus to alleviating the conflict related to work-life balance, rather than focusing on maintaining an ideal state of balance between these spheres of human life (Gotowska 2014, p. 64).

The aim of the study was to recognize the expectations of employees of different generations towards organizations in terms of facilitating the reconciliation of work and personal life.

The concept of CSR and Stakeholder Theory

In contemporary literature on the subject, many definitions are explaining the term corporate social responsibility. When interpreting it, the author of the study refers to the definition proposed by K. Anuszkiewicz, according to which corporate social responsibility means the voluntary obligations of entrepreneurs to include social and environmental issues in business activities and to take responsibility for decisions made and their impact on relations with the environment in which the organization is functioning (Anuszkiewicz 2012, p. 34). This view is shared by G. Wolska, who writes that "the social responsibility of the organization is based on the voluntary, ethical and responsible implementation of the principles contained in this concept not only in the own interest (...) but in the interest of all stakeholders with whom the organization conducts business" (Wolska 2015, p. 86).

Stakeholders are a key concept in creating and implementing corporate social responsibility activities. Stakeholders are defined as people or groups that can influence the organization or are influenced by its activities (Buczkowski 2014, p. 17). Stakeholders can be divided into two categories. The first category includes people associated with the organization based on formal contracts or agreements that have an impact on building its market position. It includes employees, managers, and shareholders whose interests are connected with the functioning of the organization. The second category of stakeholder group includes clients, suppliers, recipients and other groups located in the external environment of the organization (Hąbek 2009, p. 78).

According to the basic assumption of stakeholder theory that employees are the most important part of an organization, specific expectations should be expected from them. It is emphasized that meeting these expectations determines the survival of the organization. Therefore, the relationship between the organization and its stakeholders should bring measurable benefits to both parties. By building positive relationships, which are based on the principle of acceptance of the organization’s goal, it becomes possible to succeed in business (Furmańska-Maruszak, Sudolska 2017, p. 254).

It is worth noting that the theory of stakeholders prompts the organization to focus attention on all interested parties expressing readiness to engage in its activities. This approach is consistent with maximizing value, and this means that efforts should be made to acquire stakeholders capable of taking initiatives to increase the value of the organization (Wójcik-Karpacz 2018, p. 10). The increase in requirements for organizations in the context of the implementation of CSR principles leads decision-makers to seek answers to the question: Which actions towards employees as key stakeholders should be undertaken by socially responsible organizations so that they can be considered consistent with the needs and expectations of employees?

The answer to the above question requires determining based on which relations with employees, organizations are ready and should realize their own goals in business. The theory of stakeholders assumes that values are a necessary condition for the proper functioning of an organization. The organization's activities should be implemented based on the highest standards of corporate social responsibility so that they are a source of inspiration for their stakeholders and create relationships that are beneficial to all parties (Zbierowski 2012, p. 33). A responsible organization should conduct a dialogue with employees as key stakeholders, enabling the organization to recognize and meet employees’ needs and expectations.

An important area of activities of socially responsible organizations towards employees is to provide them with proper working conditions conducive to the reconciliation of work and private life. Managers have a special role in this aspect. As part of their role, they should engage in identifying the needs of employees and seeking opportunities to meet them. This can have a positive impact on the development of mature relations between the supervisor and the employee, based on a sense of mutual understanding and trust. Strong professional relationships can lead to the formation of bonds

with subordinates in the long term, which is usually reflected in an increase in employee's involvement in the performance of assigned tasks. Maintaining work-life balance is beneficial for both employees and the employer.

An employee whose professional and personal life is in harmony has a better frame of mind and health, eagerly pursues passions, and uses the opportunities for development. According to their preferences and needs, the employee properly divides time and energy to professional and private life (Walentek 2019, p. 20). From the employee's point of view, the benefit is also the ability to perform work-related activities without feeling guilty towards one's family. In turn, the employer gains greater work efficiency of employees who are not at risk of burnout. A more rested and relaxed employee can perform the tasks in a shorter time, which in turn leads to a greater job satisfaction.

Work-life balance as a Manifestation of Corporate Social Responsibility

In literature, the term work-life has various definitions. The lack of agreement in the interpretation of this wording results from the ambiguity of the concept of "life", which consists of many human activities not related to work. These include areas such as family, social and personal life (Hildt-Ciupińska 2014, p. 14). As suggested by S. Borkowska, the condition for achieving a work-life balance is the ability to maintain communication between work and other dimensions of human activity. Generally speaking, this balance occurs when work does not conflict with non-professional functioning and vice versa (Borkowska 2011, p. 18).

L. Machol-Zajda, talking about maintaining a work-life balance, takes into account the possibility of human influence on when, where and how much time to spend on the implementation of tasks in the quest to integrate these two spheres of life. Achieving a state of satisfactory balance can take place when the right proportions in the relationship between work and private time are maintained (Machol-Zajda 2008, p. 29). It should be noted that there are different individual proportions in which people engage in particular spheres of life, they may even change depending on the phase of the life cycle (Sadowska-Snarska 2014a, p. 35).

When considering the issue of a healthy balance between professional and family commitments, D. Clutterbuck believes that a person can deal with problems related to the separation of work from the rest of life, striving to achieve security and stability in individual spheres. Among the main determinants of synergies in the relationship between work and private life, an important place is occupied by (Clutterbuck 2005, p. 26):

- becoming aware of different requirements and making informed choices about investing time and energy,
- selecting the values on which these choices should be based.

If the above conditions are not met, there is a risk of conflict between the sphere of professional and non-professional life. D. Clutterbuck points to the existence of complicated relations between these spheres by describing five states concerning the interaction of professional and personal life (Lipińska-Grobelny 2014, p. 52):

- "existence, that is, a state of continuous work in the absence of resources to invest in other areas of life;
- conflict, when one part of life excessively or even dysfunctionally enters the other;
- integration, which describes the situation of greater or lesser reconciliation of various aspects of life;
- inactivity, i.e. involuntary or voluntary reluctance to engage in work;
- hedonism, which means no desire to work and devoting all energy to play".

Only the state of integration influences the balance between work and private life.

In the context of the discussed issues, there are terms referring to the issue of reconciliation of work and time for the family. According to the concept of P. Voydanoff, work-life balance is closely

related to the quality of professional and family roles. It allows to assess the extent to which labor resources help meet family needs and the positive impact of family resources on carrying out tasks related to professional responsibilities (Lipińska-Grobelny 2014, p. 52). In turn, according to the theory of J.H. Greenhaus, K.M. Collins and J.D. Show, in maintaining balance, great importance is attributed to certain factors that include (Smoder 2015, p. 134):

- balance of time which means the same amount of time allocated to commitments related to fulfilling professional and family responsibilities;
- balance of commitment, closely related to commitment to work and household responsibilities;
- balance of satisfaction, which is associated with the same level of satisfaction with the role of the individual in the professional and family sphere.

Everyday life can cause many difficulties in maintaining balance. In the opinion of C. Sadowska-Snarska, the assumption that we should show equal commitment in various spheres of our life is not sufficiently justified. This is because the balance between work and family life varies from person to person depending on age, gender, education, and family situation (Clutterbuck 2005, p. 35; Sadowska-Snarska 2014a, p. 35). Throughout life, social roles and obligations change. Therefore, employees need support in various forms in the field of balancing professional and family roles. Support provided to them should be tailored to their individual needs and everyday situations (Smoder 2015, p. 135). One can speak of achieving a work-life balance at a satisfactory level when it provides satisfaction and joy to a specific person at a given time (Sadowska-Snarska 2014b, p. 52).

Research Methodology

The survey was conducted from September 2018 to March 2019 among people working in Poland in the Śląskie Voivodeship. The study aimed to identify the expectations of employees of different generations towards organizations in terms of facilitating reconciliation of professional and personal spheres. The questionnaire was conducted in electronic form (CAWI) available through a web browser and completed by the participants of the study. Each participant received an e-mail invitation containing a link to the survey and individual and one-time access to the questionnaire. The survey used a questionnaire, which consisted of closed or semi-open questions and metrics. 820 invitations to participate in the survey were sent. The survey was anonymous and voluntary. The author received 734 correctly completed questionnaires. The author used stratified sampling and included in the study employed people only, therefore the number of employees is equal to the sum of people participating in the survey.

The analysis of the socio-demographic characteristics of the respondents participating in the study was based on such variables as: age, gender, and seniority. Women dominated in the population of working people in the Śląskie Voivodeship who agreed to take part in the survey. It can be assumed that this was due to a greater desire to answer survey questions.

The characteristics of the research sample are presented in Table 1.

Table 1: The characteristics of the research sample

Specification	Baby boomers	X	Y	Z
Women	9%	19%	15%	8%
Men	8%	16%	18%	7%

up to 1 year	0%	0%	1%	5%
2-5 years	0%	0%	6%	9%
6-15 years	1%	2%	13%	1%

16-25 years	2%	20%	12%	0%
26+ years	14%	13%	0%	0%

Source: author's own research

$\chi 2$ independence tests were performed for the given test sample. They were to determine whether there is a statistically significant correlation between individual answers and the respondent's age, gender, and seniority.

The null hypothesis (H0) assumes that there is no statistically significant relationship, whereas the alternative hypothesis (H1) indicates that such a relationship exists. The tests were carried out with a significance level of α=0.05. The results are presented in the tables 3 and 4.

Expectations of employees of different generations towards the activities of organizations supporting reconciliation of work and personal life in the light of empirical research

Nowadays, society is exposed to difficulties in reconciling work and personal life. The reason for the conflict between work and private life may be the lack of adequate amount of time as well as its improper planning during the day or week, which in turn leads to the overlap of certain obligations. The average weekly working time in Poland compared to the average for all EU Member States in 2010-2015 is presented in Table 2.

Table 2: Weekly working time by distinguished categories in Poland and the European Union (in 2010 - 2015)

Year	Employed		Self-employed		Helping family members	
	EU	Poland	EU	Poland	EU	Poland
2010	36.5	39.7	43.8	45.3	34.5	35.5
2011	36.4	39.7	43.4	44.8	34	35.2
2012	36.4	39.8	43	45.2	33.7	35.9
2013	36.3	39.8	42.7	45.3	33.8	36.7
2014	36.3	39.9	42.6	45.2	34	36.6
2015	36.3	39.9	42.5	44.8	33.8	37.4

Source: (Jarmołowicz, Kuźmar 2017, p. 88)

The table above shows that the highest number of hours per week was for self-employed workers (in the EU). Fewer hours were reported for employed persons and for helping family members. Similar trends could also be observed in Poland. Considering the ongoing changes in working time among the specified categories, the working time of employed persons remained at a relatively constant level not exceeding 40 hours during the week. In turn, the working time in the group of self-employed persons gradually decreased. In addition, it is worth noting the increase in the average working time among helping family members, which increased from 36.7 hours a week in 2013 to 37.4 in 2015. On the other hand, a decreasing trend occurred (in this category of employment) in the case of the average for EU countries.

One of the main instruments for reconciling work and personal life is undoubtedly the organization of professional work. Respondents were asked to indicate the solutions they expect in order to achieve a balance between both spheres of human life. Table 3 presents the results regarding the expected solutions from employees of different generations. Column headings are constants.

Table 3: Expected support from the organization, conducive to reconciliation of work and personal life

	Flexible schedule	Partial work from home	Flexible break hours	Possibility of leaving work in case of emergency	Task-based working time	Additional paid leave	Part time work

Source: author's own research

The obtained research results will be presented based on the occurrence of statistically significant relationships between the expected solutions in the field of work-life balance, and variables regarding age, gender and seniority.

One of the factors differentiating the results obtained is the age of the respondents. People representing generations Y and Z more clearly articulate their expectations for activities supporting the reconciliation of work and personal life in terms of the ability to decide on the start and end times of work, compared to previous generations. The differences between generations Y and Z in this matter were not large and were within 3 percentage points, while much larger compared to the baby boomers' generation where the difference amounted to 38 percentage points. Here, a greater number of positive responses were also identified among employees of generation X, and the difference between them and generation Y was 15 percentage points. It is worth comparing the above results to those obtained by American scientists from the University of New York. Studies conducted among graduates of this University have shown differences between individual generations in beliefs regarding the work-life balance. Respondents from the baby boomers' generation group admit that

they are less likely to use Work Life Balance programs compared to representatives of generation Y. The younger generation, describing their attitude to WLB, expressed their will to use the facilities designed to combine both areas of human activity - work with family life, despite the belief that their implementation involves risk. This approach can result in raising the level of employee control in achieving a balance between work and private life (Parker, Citera 2010, p. 37). In the light of the above, the literature on the subject expresses the position according to which there is a direct relationship between the employee's control over working time and the reduction of imbalances between the professional and private spheres. This control reduces the negative impact of working time (including long working hours) on work-life balance. Employees who have an impact on making decisions about their working time and free time schedule are less likely to neglect their family obligations because of work (Geurts et al. 2009, p. 231).

The results of the study conducted by M. Uba, J. Dark, M. Duquette, M. Yendt, M. Gnatek, and B. Gallanti confirm that the age criterion is important for the perception of flexible working conditions and that generation Y in comparison with other generational groups, perceives more benefits resulting from their implementation. Flexible working time is a priority for generation Y. It is a good solution to meet family expectations, take care of one's health and maintain relationships with others (Uba et al. 2012).

Analyzes have shown that the expectation of partial work at home is positively correlated with age if the profession allows it, as it enables remote contact and sending information to the company. It turned out that this solution was also most expected by generation Y. This type of solution is seen as an advantage especially by young parents caring for a small child and other people of this generation who could not be in the company every day. The smallest differences in expectations regarding this type of support were recorded between generation Y and Z, and they amounted to 8 percentage points, while the differences in expectations between generation Y and the baby boomers were very noticeable and amounted to as much as 34 percentage points.

Task settlement of work turned out to be another popular solution among respondents of different generations. Employees of generation Z (70% of responses) and Y (69% of responses) feel the need to apply this solution to a comparable degree. They believe that it is a beneficial solution for them, because they can plan their work time and can be accounted for effects, i.e. tasks. The advantages of this type of support are noticed by the oldest of generations - baby boomers. The differences between representatives of baby boomers and employees belonging to the youngest generation in terms of expectations associated with this type of support were not significant, they were within 9 percentage points. Attention should be paid to the high level of awareness of these generations regarding the expectations related to the possibility of leaving work in case of emergency (generation Z - 79% of indications, baby boomers - 79% of indications). Older employees, on the one hand, play an important role in the family - caring for dependents (children, grandchildren, disabled family members), on the other, care is often a barrier to their professional activity – its continuation or resumption (Hildt-Ciupińska 2016, p. 6). Therefore, combining work and care, according to older respondents, would be significantly facilitated by their ability to leave work in case of an emergency.

Another issue related to age was the part-time employment. It could be observed that expectations regarding this dimension of working time were at a high level among employees of the baby boomers' generation (81% of responses) and generation X (53% of responses). In turn, there was a large disparity in expectations between the older generation of baby boomers and employees belonging to generation Y. The older generation, achieving a high result, exceeded generation Y by 53 percentage points. Feeling the need for them to perform work on a lower hourly basis may result from the need to organize work and working time in various ways according to the individual preferences of the employee and their family obligations.

Another solution conducive to combining family and professional life is the possibility of taking additional paid leave, which is most strongly indicated by representatives of two generations - X (96% of responses) and baby boomers (93% of responses). Such high indications of respondents may result from the fact that these employees are often more burdened with care obligations than younger

people. It can be observed that people aged 50 plus take care of their own children, grandchildren and older parents at the same time. This study shows that this solution is also expected by employees from the generation - Y (44% of responses) and Z (41% of responses). Especially in the group of employees from generation Y, the fact of taking care of younger children deserves special attention, which is often associated with the need to take additional paid leave.

Statistically significant correlations between the gender of respondents and the selected answer in the area of the expected action supporting the maintenance of work-life balance were also confirmed. The obtained research results show differences in the assessment of flexible working conditions among men and women. They show that women (most often from generation Y) would appreciate the possibility of flexible working hours more than men. Similar conclusions were obtained by research conducted by Greek scientists S.K. Giannikis and D.M. Miahail, which indicates that women need more time flexibility than men. Positive opinions about work characterized by flexibility of time are perceived among women through the prism of benefits resulting from the possibility of better reconciliation of work and personal life, employment and being more productive. In contrast, men's perceptions show the risks associated with work in alternative forms, which most often include: the possibility of lowering income, reducing opportunities for career development, limiting the possibility of building good relationships with colleagues (Giannikis, Miahail 2011, pp. 417-432).

In this study, the author attempts to verify the hypothesis about the effect of the gender factor on the perception of flexible working conditions in the context of work done at home. Research results indicate that the perception of flexible working time solutions varies according to gender. Polish women (51% of responses) would like to perform their professional duties remotely more than men (33% of responses). Women from generation Y and Z pay more attention to this aspect than men. The differences amounted to 18 percentage points in favor of women. The undoubted advantage of this solution, especially noticed by women, is the possibility of avoiding the need to stop working, even in connection with temporary obstacles resulting from personal situations. (e.g. childcare obligations).

Similar findings result from research conducted by C. Sullivan and J. Smithson. They point to a different approach to this issue in terms of gender. This is due to the multitude of roles that a woman takes as a wife, mother, housewife. Women who fulfill their professional obligations as part of flexible solutions use the time saved for taking care of children and performing housework, while men show greater interest in complying only with obligations arising from professional work even when they do it at home (Sullivan, Smithson 2007, pp. 448-461).

The obtained results show that men clearly prefer task-based work settlement. There were significant differences between men and women in terms of expectations associated with this type of support. The differences amounted to 13 percentage points in favor of men. The results of the analyzes confirm the importance of solutions regarding the social roles of women and men related to childcare. Childcare absorbs women and men to a high degree, especially from generation X and Y. The involvement of men in caring for children or grandchildren is relatively high compared to women. Combining work and care would greatly facilitate their part-time work - women (49% of responses), men (41% of responses).

Seniority is another variable that significantly correlates with expectations for solutions that can help maintain a balance between work and personal life. Persons with seniority over of 2-5 years most expect the use of flexible hours (63% of responses). On the other hand, people with over 25 years of experience (19%) reported lower expectations in this respect. The difference in expectations in this case was 44 percentage points. A similar situation occurred at the level of the relationship between seniority and work from home. Visible disproportion should also be confirmed between the expectations of people whose seniority was in the above specified range, and people with seniority in the range of 16-25 years. The difference between them was at the level of 46 percentage points. It has been observed that with increasing seniority, expectations regarding the use of flexible break times are increasing. The highest percentage of respondents awaiting the implementation of this solution was recorded in persons with more than 25 years of experience (87% of responses), 16-25 years of experience (83%), 2-5 years of experience (54% of responses), and the lowest among employees with

up to 1 year of experience (3% of indications). The highest percentage of respondents expects the possibility of leaving work if necessary in the group of people with 16-25 years of experience (99% of responses) and 6-15 years of experience (91% of responses), and the lowest among people with up to 1 year of work experience (41% of responses). In the group of people with the lowest seniority, there is a tendency to increase the percentage of positive statements in response to the analyzed questions about task settlement of work (76% of responses). This solution also maintains a high level of indications in the group of respondents with 2-5 years of experience (64% of responses) and 6-15 years of experience (69% of responses). In addition, it was noted that the demand for part-time employment increases along with the increase in seniority. The advantage of this type of solution, as indicated by respondents, is the ability to perform work in a constant or flexible working time. This gives them great flexibility, because it avoids exceeding the daily working time norm.

Employees of different generations also expect solutions to support families with children. Table 4 shows the solutions enabling achieving the synergy effect between family life and work. Column headings are constants.

Table 4: Expected forms of support for families with children

	Longer maternity and paternity leave	Part-time work	Reduction of employment hours or overtime work	Telework	Help in finding a childcare facility	Organizing company kindergartens	Partial coverage of the cost of the child's stay in kindergarten	Financial or material help for the holidays

Source: author's own research

Analyses show that there were statistically significant relationships between the selected solutions in the field of work-life balance and variables regarding age, gender, and seniority. Studies show that there is a positive correlation between:

- age of respondents and indications for longer maternity and paternity leave (generation Y 40%, generation Z 37%, generation X – 23%, baby boomers – 6%);
- respondents' gender and indications for: longer maternity and paternity leave (men 35%, women 24% - difference of 11 percentage points), part-time work (women 44%, men 28% - difference of 16 percentage points), reduction of employment hours or overtime work (women 57%, men 19% - 38 percentage points difference), telework (women 74% , men 38% - 36 percentage points difference), help in finding a nursery or kindergarten for a child (women 91%, men 63% - 28 percentage points difference), organizing company kindergartens (women 42%, men 31% - 11 percentage points difference);
- seniority of respondents and indications for: longer maternity and paternity leave (the largest number of indications among employees with short seniority up to 1 year - 58%, the smallest - people with seniority over 26 years - 2%), part-time work (employees with 16-25 years of experience - 61%, and people with 6-15 years of experience 21% - 40 percentage points difference), reduction of employment hours or overtime work (people with work experience in the range of 6-15 years - 58%, and people with 1 year of experience - 17%, the difference of 41 percentage points), telework (a slight difference in percentage indications was observed between persons with a seniority of 26 years and older - 48% of indications and persons with short seniority up to 1 year - 43% of indications, the difference between them was 5 percentage points), help in finding a nursery or kindergarten for a child (a slight difference in percentage indications was noted between persons with 26 years of work experience or older - 46% of indications, and people with 16-25 years of work experience - 40% of indications, which gives a difference of only 4 percentage points), organizing company kindergartens (a similar percentage of indications was obtained among people with 2-5 years of experience and 6-15 years of experience - the difference between them was only 1 percentage point), partial coverage of the child's stay in the kindergarten (the highest number of expectations is signaled by employees with work experience in the range of 26 and more years of work - 99% of indications and from the 6-15 years of experience - 97% of indications - the difference between them amounted to 2 percentage points), material or financial assistance for the holidays (high and similar results were obtained among employees with 16-25 years of work experience - 86% of responses and with seniority of 26 years or more - 88% of indications - a difference of 2 percentage points and between persons with 2-5 years of experience - 75% of indications, and persons with seniority in the range of 6-15 years of work - 73% of indications - difference 2 points rates).

In conclusion, expectations reported by employees concern many aspects, such as the organization of working time, solutions facilitating childcare, maternity and paternity leaves, and social assistance. In the context of implementing facilities to provide support in solving problems related to work-life balance, the question arises - who should benefit from these solutions? As A. Smoder notes based on of R. Gerlach's statements: “(...) are their purpose really to ensure the balance discussed here, or maybe more to facilitate the employee's better / more engaged performance of professional tasks by providing child care, health care, recreation, rest and social assistance" (Smoder 2015, p. 145). Research shows that flexible work organization is primarily subordinated to the needs of employees, from which they derive many benefits. It is conducive to the proper distribution of tasks and responsibilities among family members, helps to synchronize working time with facilities providing childcare (Ratajczyk 2010, p. 57). Only employees who are satisfied with the working conditions will repay with effective work. One cannot ignore the fact that these solutions make it possible to satisfy the interests of business entities. In the opinion of H. Foltyn, flexibility in the organization of working time can be understood as "an adaptation of working time to the various needs of business organizations expressed by both employers, employees and various external entities interested in the activities of the organization" (Fołtyn 2012, p. 298). It is worth noting that these solutions can be mutually beneficial to all stakeholders.

Conclusions

According to the concept of corporate social responsibility, business organizations should take into account the expectations of their key stakeholders, including employees. Based on the research carried out by the author of this paper, it should be stated that employees are aware of the problem of maintaining work-life balance and set their expectations for organizations. In the aspect of expectations reported by employees, the most visible are those that indicate solutions that are supposed to support solving problems between personal life and work. In this context, solutions regarding many aspects - organization of work and working time, organization of childcare, social assistance, extension of paid maternity and paternity leave - become particularly important. Work-life balance initiatives should be an integral part of human resource management strategies. Employers need to be aware that private time is now perceived by employees as a value. Disturbance of harmony between private time and work is associated with resignation from work, and thus loss of knowledge and experience of an employee.

Public Direct Financial Support for Organic Farming and Its Development in Poland – The Assessment Based on The Empirical Study

Andrzej GRACZYK and Karol KOCISZEWSKI

Department of Ecological Economics, Wroclaw University of Economics and Business, Faculty of Economics and Finance, Wroclaw, Poland,
E-mail addresses: andrzej.graczyk@ue.wroc.pl; karol.kociszewski@ue.wroc.pl

Abstract

Public support for sustainable agriculture is one of the priorities of the European Union's Common Agricultural Policy. Organic farming is an important part of this type of production. It contributes to the delivery of public goods and generates positive external effects from agriculture. That is why the EU and Member States implemented the system of subsidies for organic farms. The goal of this study is to assess the subsidies for organic farmers as factors influencing the development of the supply side of the organic food market in Poland. These were evaluated in the context of other factors of profitability of production. The authors characterised the system of these payments in the years 2003-2019 and presented the results of two rounds of empirical surveys (in 2011 and 2019) held with farm owners, holders of organic agriculture certificates. In the years 2003-2013, the payments contributed to a 1240% increase in the number of organic farms, and a 1078% increase in the utilized agricultural area. From 2014 to 2020, the production potential has been in regress - largely due to political failures (poorly designed regulations) related to the system of subsidies. In the opinion of the majority of respondents, difficult and unstable procedures were recognised as the most important barrier to the development of organic farming. The second obstacle was the low profitability (yields and revenues in organic farming are lower, while costs are higher than those in conventional production). Growth in the profitability of organic farms should be based on increased rates of subsidies but it must go hand in hand with the improvement of the procedures (including systems of certification and control), to reduce the bureaucratic burden and to improve its effectiveness. The largest opportunity for the development of organic farming can be seen in the increase in demand, growing environmental awareness of consumers and appeal of organic consumption patterns.

Keywords: Organic Farming, Ecological Products Markets

Introduction and Methodological Aspects

The development of organic farming contributes to the sustainable development of agriculture under the conditions of EU membership (Kociszewski 2013). The main goal of the study was to assess the subsidies for organic farmers as the factors influencing the development of the supply side of the organic food market in Poland. For this purpose, the authors used a descriptive and comparative analysis of the system of subsidies implemented in Poland in the years 2004-2020, based on the factual evidence, strategic documents, legal acts, and statistics. These, along with surveys of data and figures representing changes in Polish organic agriculture, were used as basis for construction of two rounds of empirical studies (the results were presented in the section 4 and 5). The first survey study was initiated in 2011 and was addressed to 70 individual organic farms (certified organic producers) with acreage of more than 1 hectare each, and with production as their declared form of activity. The second round was conducted in 2019 among 65 owners of organic farms with the same characteristics. Questions concerned factors of organic production profitability, in relation to regulations of the present financial support system. The respondents also assessed the level of subsidies. The results were useful in identifying barriers and factors conductive to the development of the supply-side of the market. The research was conducted by means of CATI (*Computer Assisted Telephone Interview*), using

questionnaires prepared by the authors. The distribution of the number of surveyed farms between Polish voivodeships was proportionate to the distribution of source data. The respondents were also selected in such a way that the number of respondent farms, divided by size (UAA - utilized agricultural area), was similar to the actual structure observed on the national level. Lastly, the authors' intention was to formulate policy and regulative system recommendations in relation to organic farming subsidies.

Justification of Environmental Subsidies

Public goods may be supplied without public intervention if they are produced incidentally (i.e. as a by-product) in the course of other activities or driven by other motives (for instance, a farmer may decide to limit the use of nitrogen fertiliser to reduce cost; as a result, nitrogen run-off to the local river may decrease, thus leading to an unintended effect of tangible improvement in water quality). Similarly, no public incentives are required in relation to goods produced at marginal cost or at no cost whatsoever (e.g., yields from a patch of low-value unproductive land characterised by high biodiversity). However, there are risks associated with relying on these conditions to deliver the public goods for society needs (Kipling 2019).

The markets alone are often not sufficient to ensure that all farms deliver a full suite of positive and socially commendable environmental and socio-economic outcomes expected from them. Therefore, if markets fail to fully reward these public goods, it is up to the public policy to intervene in support of such goods by means of dedicated financial incentives (Meredith, Lampkin, Schmid 2018). Consequently, governments are expected to conduct public policies designed to support the implementation of subsidies and related regulations.

As the average costs of organic production are higher than in conventional production, their cost-effectiveness is conditioned by the higher level of final prices. When external benefits occur and the level of prices is not sufficient to cover production costs (as in the case of insufficient demand), public regulation is considered necessary. In light of the principles of external effects internalisation, such types of produce require some form of subsidisation. In this context, the main instrument for supporting organic farming is the system of payments, which are intended to compensate for the additional costs and for the lost income (Kociszewski 2013). To justify huge expenditures for CAP budget, its reforms were directed to deliver more public goods from the EU agriculture (Hart et al. 2011). This was reflected in these reforms' priority areas, which included viable food production, sustainable management of natural resources, and balanced territorial development throughout the EU (European Commission 2013). Public goods associated with agriculture include the provision of environmental and social goods such as farmland biodiversity and animal welfare which cannot be adequately supplied by the existing markets (Cooper, Hart, Baldock 2009). This is why the CAP reform was primarily focused on the integration of environmental concerns as part of the governmental policy. The above trend is manifested in the support for organic farming which was recognised as a contribution to public goods (Stolze et al. 2016).

The first aspect of the intervention is the EU organic regulation which has a major impact on organic farmers, processors, traders, retailers, certifiers, researchers and consumers. This type of the EU policy framework for supporting organic sector development consists of legally defined production and labelling rules for production and supply chain development. The second aspect is the financial support for farmers. Compensation is provided for the costs of managing farmland under the organic production regime, with benefits for the environment and animal welfare as well as additional environmental and land management actions through the CAP (Meredith, Lampkin, Schmid 2018).

In the area of the environment, payments for converting or maintaining farmland assigned to organic production are multi-objective measures that offer a more cost-effective solution for sustainable agriculture than the one offered by single-objective agri-environmental measures. This is because organic farming results in more synergies as well as trade-offs with other environmental actions, and has lower transaction costs compared to individual interventions. These efficiencies are further complemented by greater market returns (Sanders 2013). Lohr, Salomonsson (2000) found that farmers

requiring subsidies tend to manage large and diversified farms and are more concerned about organic inspection, quality, and adequacy of technical advice compared to conventional farmers.

Subsidies for organic farming and its development in Poland

Between 1990 and 1998, Poland offered no subsidies for organic farms. During this period, their number increased from 27 to 417, and the area from 300 hectares to 5.5 thousand hectares. There were no strong impulses for market growth in this segment. In 1998, Polish government introduced subsidies for farm control costs during the conversion to organic production. In 1999, subsidies for organic production (per crop acreage) were implemented. During this period (1998-1999) the number of farms increased by 34.1% and the utilized agricultural area (UAA) by 27.1%[i]. In 2000, the rates of payments were increased by 200-300% (depending on the type of crop). As a result, the number of farms increased by 156%, and UAA by 66% compared to the previous year.

In 2004, after Poland joined the EU, organ ic farming received extra financing from the II Pillar of the CAP, as part of the Rural Development Programme 2004-2006 (RDP 2004-2006). There was another large increase in rates of payments (by 96-208%), resulting in a 95% increase in farm number and a 99% increase of UAA in 2005, compared to 2004. It is worth noting that these increases were much higher than in the years preceding Poland's accession to the EU (2002-2003), when the growth rate in the number of farms was 16.7% per year, with the growth rate of UAA at 14%, annually. The rates of subsidies for organic farming were much higher than for other RDP packages, which had the effect of strengthening their stimulus function. We can observe a clear impact of the introduction and subsequent increase in the rates of subsidies on the growth in the number of farms and organic farming areas. Public support until 2004 was conducted as part of the national agricultural policy. After integration with the EU, it was funded under the Agri-Environment Programme (AEP), one of the most important instruments of the II Pillar of the CAP. Further increases in the rates of subsidies were observed in the subsequent perspective of CAP funding (Ministerstwo 2011) and ranged from 23% (agricultural crops) to 38% (vegetable crops). In its present form, the system should be favourable for organic production, however, some irregularities in the financial support have been observed, limiting the effectiveness of discussed measures – i.e. the stimulation of increased production and provision of environmental services. Apart from cases of fraudulent use of subsidies, problems were also found with respect to ineffective and erroneous RDP control systems and low efficiency of certification bodies in organic agriculture. In effect, owners or tenants of large agricultural areas applied for agri-environmental payments often without actual cultivation (primarily walnut and raspberry production)[ii]. In 2013 these errors were limited through the use of more restrictive requirements for farmers. This had the effect of weakening the stimulus function responsible for the increase in the number of organic farms.

In 2014-2020, the CAP reform singled out a specific instrument to support organic farming (Ministerstwo 2017). It was decided to incise support for organic production and separate it from other environmental activities of farmers. Changes in payment rates were more differentiated than in previous financing periods[iii]. For horticultural crops, they were reduced by 2.5%. In relation to agricultural and vegetable crops, the rates remained unchanged in nominal terms. They were increased for permanent grasslands – by 30% (during the conversion period) and by 64% (for certified holdings). It was due to the fact that they have not been actually raised since the beginning of the EU membership. It is a good example of effective support for public goods delivery. The financial support for organic farming within the RDP 2014-2020 was over 200 EUR million, of which 150 EUR million was from EU funds and 50 EUR million from domestic funds[iv].

The years 2003-2013 brought rapid development of organic farming, following the implementation of subsidies under the agri-environmental programme, and, later on, as the 'organic farming support' measure of development. The number of farms increased by 24.8 thousand during this period (1078%), and the UAA increased by 62,000 hectares (1240%) (Najwyższa 2019). Between 2013 and 2018, this trend was reversed - the number of organic producers fell by 6000 (by 24.3%) and the acreage by 18.5 thousand (by 27.6%)[v]. In comparison, in the EU (the years 2012-2017), the acreage increased by 25% to 12.8 million hectares (7.2% UAA) (Willer, Lernoud 2019). In Poland, organic crop acreage was 0.484 million hectares (3.4% UAA) in 2019 (IJHARS 2020). The above decrease in organic production potential was partly due to the tightening of the rules applicable to grant beneficiaries. Procedures for

obtaining organic certification, or participating in agri-environmental programmes, were designed to prevent frauds and other pathologies in applying for subsidies, but they had a discouraging effect on farmers. Problems in the grant system were also caused by the lack of coherence and orderliness in the content of the governmental policy. Procedures have been subject to frequent modifications (seven major changes between 2014 and 2020)[vi], producing further obstacles for farmers intent on applying for the subsidies and, consequently, reducing the effectiveness of the Agricultural Restructuring and Modernisation Agency (Polish organization responsible for the management of the agricultural payments system). Some of the beneficiaries of the RDP 2014-2020 had to deliver 80% of the crop to the market, and not less than 30% under later provisions (Najwyższa 2019). Other farmers (in years 2015-2017) received financial support without such a requirement (under the regulation implemented before 2014). One of the results of frequent changes was the delay in payments. These factors reduced farmers' willingness to start organic production, but they should not be seen as evidence of unfavourable prospects for development. Between 2013 and 2018, the number of organic processors increased by 90% due to 210% growth in imports of organic raw materials from other EU countries and third-party suppliers (Najwyższa 2019). Polish organic food market does not fully utilize the possibilities of domestic production. Therefore, it may be interesting to identify and examine factors that affect its cost-effectiveness, with special consideration for subsidies.

Factors influencing the profitability of organic production, on the basis of empirical findings

Subsidies for organic production contributed to the increase in the incomes of farmers. This is confirmed by studies of changes in yields, revenues, and costs associated with conversion to organic methods of production. In the opinion of 45.6% of respondents, the year 2011 saw an increase of revenues after conversion. Most farmers declared a parallel decline in yields - as basis for their revenue (Figs. 1 and 2). At the same time, the majority of respondents reported increases in most of their cost categories after the conversion (Fig. 3).

Fig. 1: Comparison of yields in organic and conventional production according to opinions of organic farmers from 2011 and 2019 (% of responses).

Source: Authors' own study

This suggests that market-led profits are decreasing after conversion (smaller yield); thus, the increase of farm revenue and income can be attributed to the impact of subsidies. In 2019, the answers were different, but clearly indicative of the fact that yields and revenues had not contributed to the increase in profitability of production. According to 60% of farmers, their yield remained unchanged after conversion. At the same time, 66.15% of farmers reported no change in revenues.

Fig. 2: Comparison of revenues in organic and conventional production according to opinions of organic farmers, (% of responses from 2011 and 2019).
Source: Authors' own study

The second factor influencing the profitability of production is the cost (fig. 3). In 2011, in the opinion of most farmers (51.19%), organic farming resulted in cost increase (relative to conventional agriculture). In 2019, this view was shared by 35% farmers (55.64% of responses indicated no change).

Fig. 3: Change of production costs after conversion to organic farming (% response)
Source: Authors' own study

In terms of response frequency, the most important categories of inputs associated with an increase in production cost are: coping with documentation and other requirements associated with organic farming procedures (bureaucracy in Fig. 4), and labour – 82.9% indications in 2011 and 43.08% in 2019 (fig. 4).

Bureaucratic burden hinders the operation of organic farms; however, it is necessary in many cases, due to the requirements of the certification process, designed to ensure the credibility of the product in the eyes of consumers. On the other hand, administrative procedures could be unstable, chaotic and overcomplicated – as was the case in the years 2013-2018 (see section 3 above). Under such conditions, they serve as effective barriers to development of the supply side of the market, as confirmed by organic farmers taking part in the surveys both in 2011 (91.4% of responses) and in 2019 (the third most frequent answer indicating factor, which contributed to the increase of a production cost – 49.23% of responses).

Expenditures associated with the fulfilment of environmental standards were the third (in 2011) and the second category (in 2019) - in terms of frequency – related to the increase in the cost of organic business. Accepting the legitimacy of such transaction cost, it is necessary to ensure the effectiveness of regulations, so as to eliminate or reduce the pathologies in applying for subsidies (as mentioned above). Furthermore, environmental measures are also necessary to deliver agricultural public goods (rural amenities). It should be noted that the study showed a significant difference between answers from 2011 and 2019 related to the cost of fertilisers and plant pesticides. 2011 data show prevalence of responses indicating the decline in expenditures on fertilizers and plant protection products (after

conversion) over the number of responses attesting to an increase of these expenditures. This may be seen as evidence that organic farming was characterised by lower external environmental costs than in conventional agriculture.

Fig. 4: Change of expenditures related to selected categories of production costs after conversion to organic farming (% response)

Source: Authors' own study

In 2019, the majority of respondents saw no change in the level of expenditures for fertilisers (60% of responses), together with an increase in the level of expenditures for plant protection products after conversion (69.6% of responses). This may suggest that, along with the development of production, farm holders were not only required to limit the use of conventional pesticides and fertilisers (decreased cost) but also to invest in specific, more expensive products approved under the organic farming regime (increased cost).

Fig. 5: Evaluation of the level of price of organic products (% responses among the owners of organic farms)

Source: Authors' own study

It should be remembered that organic fertilisers and pesticides present no harm or hazard for the natural environment, including soil and water, so the associated external environmental cost remains low. In

the previous survey (conducted 9 years earlier), the above factors of production were not that prominent, due to a notably lower volume of production. At that time, farmers were much more focused on producing organic goods for captive use.

Another element included in both studies was the evaluation of the price of organic products. Most of the respondent farmers assessed it as too low. Its level should be higher according to 84.3% of responses in 2011 and 63.23% in 2019. These results are suggestive of a decrease in revenues and yield from organic production in comparison to conventional agriculture. Since the cost increased and the price remained low, it may be assumed that the profitability of organic farms is conditioned by the level of support from EU subsidies. This observation was also confirmed in a study by Runowski (Runowski 2012).

Subsidies as A Factor Influencing the Development of Organic Farming

A large part of the owners of organic farms (64.3% in 2011 and 75.38% in 2019) – believed the rate of subsidy per hectare from the CAP II pillar to be excessively low. Similar evaluations were found with reference to the level of support offered to farmers for their conversion into organic farming. This opinion can be weighed against the unfavourable assessment of the level of prices (as being too low) and retail margins. In 2011, this factor was too high in the opinion of 75.80% of responding farmers, because a significant part of the added value from organic production – particularly in relation with poorly-developed distribution systems – is being captured by commercial intermediaries. The present distribution system is much better developed than it was in 2011, offering potential for a decrease in retail margin (thanks to the economy of scale) and, consequently, is perceived by farmers as more acceptable. In 2019, 15.4% of responses placed it as too high, while the remaining ones perceived it as adequate. An increase in subsidies could effectively counteract such disincentives to organic production development as the low price and the loss of a part of the added value (after retail margin).

Fig. 6: Evaluation of the level of payments for organic farming (% of responses among the owners of organic farms)

Source: Authors' own study

In the opinions of farmers (both in 2011 and 2019), the biggest prospect for the development of organic farming is placed with the growing environmental awareness of consumers (Fig. 7). Respondents expect a growing demand and popularity of organic consumption patterns.

Fig. 7: Prospects for the development of organic production (% of responses)
Source: Authors' own study

In terms of frequency of answers indicating opportunities for the development of organic farming, these two factors were placed on the second and third position. The EU subsidies were indicated by a relatively small number of respondents. This may confirm the previously presented evaluations of payment rates. Perhaps the farmers are not expecting any effective increase of subsidy rates in the future. Similar conclusions are suggested by the assessment of the policy of Polish authorities. In 2011, it was perceived as an opportunity by 60% farmers. In 2019, the opinion was only shared by 12.31%. The majority of producers may have been disappointed in the policy's performance in the years 2014-2020 (as explained in section 3 above). This conclusion can also be justified in the light of the results of the study related to bureaucracy (as described in section 4).

Some of the previously presented observations of factors negatively influencing the profitability of organic farming are confirmed in the evaluation of barriers to its future development (fig. 7), particularly those related to the cost of production. The most important barrier, according to responses to both studies (2011 and 2019), is that of bureaucratic obstacles.

Fig. 8: Barriers to the development of organic farming (% of responses)

Source: Authors' own study

Taking into account the fact that the procedures related to organic farming have proven to be ineffective in many cases, their improvement should be regarded as one of the conditions for the development of organic production. Other barriers were identified in relation to the poor design of the distribution system and the low profitability. The former factor has seen some improvement over the last few years (Najwyższa 2019). The latter may be addressed through an increase in subsidy rates.

Conclusions and Recommendations

Organic farming contributes to the supply of public goods and positive environmental externalities. In the light of the social well-being in general, it is justified to support its development from public funds. In Poland, the subsidies were initially financed from the Polish state budget. Following Poland's accession to the EU, subsidies were implemented under the second pillar of the CAP. The programme contributed to a dynamic increase in the potential of organic production between 2003 and 2013 (1240% increase in farm number and 1078% increase in utilized agricultural area). From 2014 to 2020 there is a decrease in the number of farms and areas of cultivation (UAA). This is largely due to political failures and wrong regulations related to the system of subsidies. Changes to procedures introduced by the Polish government were too frequent, and their poor implementation had discouraged farmers from involvement in organic production. Based on empirical studies conducted by the authors, the tediousness of documentation and other requirements connected with organic farming procedures (bureaucracy) was recognised as the most important category to contribute to the increase in organic production cost. At the same time, most of the respondent farmers also perceived bureaucracy as the main barrier to the development of organic farming. The second place in the ranking of obstacles was

attributed to low profitability. In the opinion of the majority of respondents, yields and revenues in organic farming are lower but costs are higher than in conventional production. That is why, in 2011, the need for an increase in the prices of organic foods was indicated by 84.3% of the owners of organic farms (and by 63.23% in 2019). Higher prices could be a barrier to the increase of demand, so the main source of growth in the profitability of organic farms should be based on public support for organic farming. An increase in the subsidy rates is demanded by most of the surveyed farmers (64.3% of responses in 2011 and 75.4% in 2019). However, farmers do not perceive it as a chance for the development of organic farming. This opinion may be influenced by their negative experiences related to the former failures of the Polish system of subsidies in the years 2014-2020. Farmers generally expect an increase in demand for organic products arising from changes in consumer attitudes and ecological awareness. These were recognised as the biggest prospects for further development of the market.

Results of the study suggest that the current level of rates of payments is too low to act as an adequate stimulus for organic farming development. A rise in the rates of subsidies may be affected through certain changes in the CAP in the years 2021-2028. Support for organic farming and agri-environmental instruments should receive a larger share in the expenditures from the RDP and entire CAP budget, as the present value for the years 2014-2020 (Ministerstwo 2017) is much lower than in it was in the years 2007-2013. Such prospective increase of subsidies must go hand in hand with improvements of the certification and control system, designed to ensure greater efficiency, effectiveness, and reduction of the bureaucratic burden. Such a scenario would be beneficial for the market - in the context of improving the efficiency in the use of public funds, in the light of building potential for organic production, and in the context of increasing consumer trust for organic products.

Abstract

Development of the Industry 4.0 conception does not only refer to the technological aspect, but also to the procedural-organisational and human aspect. Therefore, implementation of the Industry 4.0 conception means undertaking measures in various areas and multi-faceted approach to the issue from the viewpoint of business processes. It poses specific challenges not only to the management in organisations operating on the market, but primarily, to schools and universities aimed at proper preparation of graduates to professional work. One of the most significant aspects influencing the development of this conception consists in developing awareness regarding its potential, including consideration of threats and opportunities and proper creation of competences and skills of prospective employees 4.0. These factors influence the role and significance of contemporary education, especially in the areas of shaping future engineers. The aim of this study is to present results of own research regarding future engineers' awareness of the 4.0 conception and the assessment of developing specific skills within current didactic classes. A survey method has been used in the research conducted among Polish students of technical faculties. An actual assessment of these skills conducted on the basis of specific works' performance by the students participating in the research would constitute a valuable supplementation of the research. Obtained results indicate that students participating in the research have knowledge on the selected technologies constituting the foundation of the Industry 4.0 and the hitherto classes conducted within studies develop both, technical and soft skills.

Keywords: Industry 4.0, engineer 4.0

Introduction

There are many factors that determine implementation of the Industry 4.0 conception. They include development of IT and information infrastructure, knowledge and ability to use new technologies, as well as education and development of competences, soft skills and the use of a relevant procedural-organisational approach. The implementation of the ICT technology itself and digitalisation of many areas of the organisation's activity will not ensure its effectiveness or competitive advantage. There are visible effects of using digital technologies which have impact on changing business models or requirements of digital transformation from employees and managers (Buchi G. and others, 2020, Ślusarczyk B., Herbuś A., 2014; Haseeb, and others, 2019). Furthermore, the Industry 4.0 conception has a significant impact on work and employment terms and conditions, skills, roles, duties and strategies of soliciting employees (Johansson J. and others, Ch. Prinza and others, 2016). Creation of the Industry 4.0 conception predominantly requires acquisition of relevant knowledge and awareness of threats and opportunities resulting from implementation thereof and specification of significant elements creating its proper implementation. Irrespectively of the fact, whether the question is to improve qualifications, recruitment or retraining, knowledge transformation has impact on the

workplace culture, community of practice and identity (Wenger, 1998, Fenwick, 2006, Johansson J. and others, 2016, Shpak and others, 2019). The first and basic element in the light of the Industry 4.0 conception's implementation consists in preparing employees to function in a digital world, which concerns both, those who are already working and those, who just start their professional lives. Preparation of employees 4.0 should include not only undertakings in the area of technology, but also human and procedural elements (Iwaniuk M., 2019, Smoląg and others, 2016, Ślusarczyk, 2018; Ungerman, Dedkova, Gurinova, 2018).

It seems legitimate that the first significant step in the development of the Industry 4.0 conception constitutes knowledge on the concept itself and the scope thereof. In the subject literature many authors attempt to define the concept of Industry 4.0 and stipulate the framework encompassed by this conception (Culot, G. and others, 2020). The conducted research on Industry 4.0 implies that this conception, irrespectively of an organisation, is characterised with several common features. These features include: development of competences of managers, engineers and line employees, care for operational excellence, development of digital infrastructure and digital flow of information, as well as policy and tools in the area of cybersecurity (Gracel, 2019).

The study presents characteristics of Industry 4.0 by leading technologies that enable implementation of the conception in business practice. Furthermore, the issue of educational processes of future engineers has also been characterised. The methodology of own studies and obtained results of studies have been presented. The aim of the research was to assess the awareness of future engineers of the 4.0 conception and the assessment of developing specific skills within current didactic classes.

Basis of the Industry 4.0 conception and preparation of engineers 4.0

The term Industry 4.0 (German: Industrie 4.0) was first used in the public domain in 2011 at fairs in Hanover as a name for the common initiative of business, politics and science representatives promoting the idea of reinforcing the competitiveness of Germany's industry (Müller and others, 2018; Rao and Prasad, 2018). From the technological point of view, the concept of Industry 4.0 is inseparably related to various technological solutions including, among others: Internet of things, Cloud Computing, Big Data, 3D printing, Augmented Reality or multi-purpose production lines (table no. 1) (Dalmarcoa G. and others, 2019).

Table 1: Technological aspect of the Industry 4.0 conception

Technology	Characteristics
Internet of things (IoT)	Interrelation of material objects through the agency of a computer network, mainly the Internet. Due to the use of IoT it is possible to communicate between devices and between devices and humans. Application: • as equipment of intelligent houses, among others, in household appliances and electronics, lightening, heating, meters; • in the industry, primarily as detectors built in various devices; • in an intelligent city as detectors optimising energy networks, intelligent management of water consumption or parking meters.
Cloud Computing	Processing model based on using services provided by external organisations. A cloud is a technologically advanced IT infrastructure (servers, software, optical fibres), which is accessed via the Internet. It is a symbol of Industry 4.0, without which solutions in this area would not be available. Application of Cloud Computing is related to Cloud Computing models, including: IAAS - Infrastructure as a Service, PASS - Platform as a Service and SASS - Software as a service. Depending on the customer's need, it is possible to provide IT infrastructure as a service, that is, equipment, software and servicing, a set of more or less developed applications or specific, selected software functions.

Big Data	In other words, large sets of data that cannot be processed with the use of commonly available technologies. This term refers to searching, downloading, collecting and processing available, heterogeneous data in real time from various data sources. Technologies of processing large sets of data from various sources are used in many areas of economic and social lives. Big Data allows getting to know customers, their needs and expectations, as well as the organisation's environment better, and is more and more often treated as a crucial production factor.
3D printing	The process of producing three-dimensional, physical objects on the grounds of a computer model. 3D print is used in, among others: industry, architecture, medicine, education and advertising.
Augmented reality (AR)	Technology that connects digital reality (virtual world) with the world in which we physically exist (real world). AR techniques can be classified by used devices to three categories (Azuma and others, 2001): • using head-mounted displays (HMD), protective equipment such as googles or helmets; • using mobile screens such as smartphones and tablets, or stationary screens such as monitors to display virtual objects; • using projectors to project virtual information directly to real objects (Azuma and others, 2001), enabling user's interaction with a virtual object. The AR technology is applied both, in everyday situations, such as e.g. shopping or analysing road conditions, as well as in tourism, marketing, sales, entertainment or education.
Multi-purpose production lines	Universal production lines aimed at performance of various elements, e.g. assembly of different elements without the need to modify machines. Due to the use of such solutions, it is possible to provide flexible production, support for the employee at the workplace (personalised instructions for tasks concerning currently manufactured product).

Source: own study on the grounds of Oriwoh E. and others, 2013; Ferber S. 2019; Fernando de Souza Cardosoa L and others, 2020; Azuma R. and others, 2001; Lioutasa E. D. and Charatsaric Ch., 2020; Ibanez M. B. and others 2020; Loebbecke C. and Picot A. 2015; Loureiro S. M. C. and others 2020; Smoląg K., 2011.

An important element in creating the Industry 4.0 conception is understanding the issues, challenges and assumptions which have to be faced by the organisation in the transformation process resulting from the use of solutions of this conception. One of the most significant challenges constitutes proper preparation of employees. Competences of an employee of Industry 4.0 include not only hard competences in the scope of using digital technologies' solutions, but soft competences are also very important. Until recently, an engineer was a person with strictly specific technical skills (Gracel and Stoch, 2019). Technology development significantly contributed to the change concerning the once learned competences and skills. Thus, the need of life long learning is growing every year and it promotes a change of trends also in the education of engineers. As underlined by D. Guerrero, M. Palma, G. La Rosa technical competences of an engineer will not be enough in today's world (Guerrero and others 2014), where a dynamic development of organisations and commonness of ICT technologies forces prospective employees to acquire the skill of continuous learning, soft skills (Gracel and Stoch, 2019), including, in particular communicative skills, as well as digital competences. It especially refers to engineers 4.0. Also M.S. Saad stated that both, technical skills and soft skills of engineers related to solving problems, communication, teamwork and leadership are important for graduates-engineers (Saad and others, 2013). Therefore, including technical and non-technical, soft skills in the educational process of engineers 4.0 can contribute to acquiring bigger ability to employ graduates (Saad and Izaidin, 2014, Prifti and others, 2017, Baenaa and others, 2017, Siddoo and others, 2019). Therefore, the most important task of education is to shape and develop competences of engineers 4.0 (Tsankov, 2017) related to work in an interdisciplinary team and openness to changes and variety both, in contacts with people and performed tasks (Gracel and Stoch, 2019).

The issue of developing competences and skills of engineers for the needs of the contemporary labour market, including the Industry 4.0 conception, requires joining the theoretical and practical knowledge at each level of education. The targeted cooperation of science and business and properly drawing up a curriculum taking into account developing skills and competences of engineers 4.0 constitute grounds for their proper preparation to professional work (Smoląg and others, 2015, Durana and others, 2019).

Research Methodology

The aim of the conducted research was to assess the knowledge on assumptions of the Industry 4.0 conception and present how competences are shaped in the opinion of respondents (students). The following theses were formulated in the research:

T1. Students know assumptions of the Industry 4.0 conception (Industry 4.0).

T2. In the students' opinion, the university properly educates in the scope of hard and soft competences in the context of the Industry 4.0 conception (Industry 4.0).

For the purposes of this research, own studies have been conducted. The research tool constituted an independently drawn up survey questionnaire consisting of two basic parts and an imprint. The first part included 9 questions and concerned only the assessment of the knowledge on assumptions on the Industry 4.0 conception. The other part concerned developing soft and hard competences. The 5-grade Likert scale was used this part. The survey was anonymous. The research can be treated as a pilot study, as such a trial was not fully representative. The study was conducted in the period between November and December 2018 on a group of 201 students of technical faculties of the Czestochowa University of Technology, i.e. IT, electrical engineering, engineering logistics, management and production engineering. The sample selection was layered. Students were randomly selected from these groups where education finishes with obtaining the engineer degree.

The knowledge of Industry 4.0 Concept

According to the research, only 8% of respondents admit knowing of the Industry 4.0 conception. The knowledge of the concept of Industry 4.0 itself is not correlated with the technical knowledge on its aspects. Therefore, the survey respondents were asked to subjectively evaluate the knowledge of basic technical solutions that constitute the foundation of Industry 4.0 development. Many more students know and use technological solutions constituting foundations of the Industry 4.0 conception (Fig.1).

Fig. 1: Knowledge on the Industry 4.0 conception

Source: own study

A statistically significant dependency between knowledge on the majority of issues in the area of the Industry 4.0 conception is observed (table 2). The smallest number of statistically significant correlations has been indicated for knowledge on 3D printing and other categories. Virtually all studied elements are statistically significantly related to knowledge on Cloud Computing. It is similar with regard to knowledge on the concept of Big Data, however, here, methodological limitations did not allow confirmation of significance of the correlation with one of the features.

Skills of Future Engineers and The Knowledge of Industry 4.0 Concept

At the next step, the impact of conducted didactic classes on the respondents' assessment of own hard competences and knowledge on the Industry 4.0 conception was studied (table 3). While analysing the soft and hard competencies these skills were considered that are common and result from implementing the assumptions of higher education curriculum in particular courses.

Table 3: Values of coefficients gamma (Γ) and the level of rejecting their significance for elements of conducted classes in the scope of hard competences and particular elements of knowledge on the Industry 4.0 conception

The analysis of relations between knowledge on issues in the area of the Industry 4.0 conception and having hard competences indicates interesting conclusions:

- Knowledge on 4.0 conception correlates basically negatively with all hard competences, including, in two cases, in a statistically significant manner. We probably deal with a lack of identification of this concept by the respondents.
- The best known concept related to hard competences (positively) turns out to be cloud-computing.
- Analytical skills are positively correlated with the knowledge on some of the elements of Industry 4.0.

Source: own study.

In table no. 4, the impact of conducted didactic classes on the respondents' assessment of own soft competences and knowledge on the Industry 4.0 conception was studied (table no. 4). The teamwork

and cooperation skills correlate positively (significantly) only with the assessment of knowledge on 3D printing. Other statistically significant correlations concern negative dependencies with regard to the knowledge on the concept of Internet of things, augmented reality and cloud computing. Positive correlations of particular elements of Industry 4.0 in this compilation also refer to the skills of solving problems and in the case of the knowledge on the concept of Big Data - flexibility. What is strange, the skills of own-time management correlate negatively with the knowledge on the concept of Cloud Computing. The results indicate significant discrepancy in relations between particular soft competences and particular elements that make up Industry 4.0.

Conclusion

Implementation of the Industry 4.0 conception seems to be an inevitable process for contemporary organisations. Of course, the level of implementation of solutions in the scope of Industry 4.0 is different, however, several common features can be distinguished, among others: knowledge on the conception itself and modelling relevant competences of employees. Shaping competences has a particular meaning for engineers 4.0, whose education has until recently been mainly focused on technical skills. Our contribution to the discussion consists in underlining that development of the Industry 4.0 conception requires further research oriented on studying the dependence between knowledge of technological solutions and developing skills important for this conception. Research results presented herein indicate that:

- knowledge on selected technological solutions constituting the basis of Industry 4.0 is not satisfactory (Fig. 1 and table 2);
- soft and hard skills do not translate directly into better knowledge on the characteristics of Industry 4.0. Significance of this relation has been confirmed for a relatively bigger number of areas within hard competences, although, in the case of soft competences, these correlations more often had a positive direction (table 3 and 4).

The conducted research contains certain limitations. In the present research it has not been indicated to what extent participation in classes, level of courses and their types have an influence on perceiving the concept of Industry 4.0 and developing soft and hard competencies.

Furthermore, research results mean the necessity of undertaking relevant activities aimed at levelling off differences presented in the research results (table 3 and 4). Future research should cover not only subjective assessment of the respondents, but also actual assessment of their skills conducted on the grounds of performance of tasks specified by the respondents.

Abstract

Corporate training is one of the most important factors in the sustainable efficiency and competitiveness of an organization based on human capital development. In this context, the attention in the presented paper is paid to the possibilities of coaching as an educational tool for sellers. Accentuated is not only the selection of suitable people for the position of sellers, but above all the continuous training of these people. Coaching is one of the important tools of comprehensive development of work potential of sellers that respects the individual specifics of coached persons. Connected with it, the paper presents the results of the assessment of coaching using the AC-BEC method. The analysis conducted was based on a comparison of the responses of coached and non-coached sellers. The results confirmed the existence of statistically significant differences between the responses of the coached and non-coached sellers in terms of Behaviour, Emotions and Cognitions. The coached sellers assessed the impact of coaching on their willingness to change their habits, develop their potential, behave more efficiently, and realize their own responsibility for themselves and their lives more positively than the non-coached ones.

Keywords: Coaching, corporate training, sellers.

Introduction - Coaching as a Method of Human Capital Development

The development of human capital through coaching is one of the main methods to help people utilize their potential (Thorne, Pellant, 2007). It is necessary to listen to people if we want to manage them (Nejedlý, 2015) When asking questions, listening and learning, managers acquire answers on what is inevitable to change to be successful. Successful people become great leaders when they have learned to convey attention from themselves to others (Goldsmith, et al., 2012).

Haberleitner et al. (2009) claim that coaching means developing potential of all workers according to their current level of development to optimize their performance while considering their aims, interests and needs. It involves revealing potential, developing and formulating tasks and goals, exchanging mutual expectations and providing a reciprocal feedback. Suchý, Náhlovský (2007) add that coaching can reveal not only our existing potential but also develop it.

The results brought by coaching are based on a supportive relationship between a coach and the coached person and on the communication style the coach uses. A coach has to be a strong personality, mature and positively oriented that is eager to work on himself/herself and is willing to develop. A coach needs to be well experienced and enthusiastic so that he/she has energy to give it to

the others (Suchý, Náhlovský, 2007). The coached one requires facts not from a coach but from his/her inside (Whitmore, 2009).

A coach shares his/her knowledge and skills to improve the performance of those he/she coaches. A coach gives a part of himself/herself, time, effort, and ability to help others to improve it (Clegg, Birch, 2004). A coach is primarily a person who, through continuous work with himself/herself, enables the development of others.

Each qualified coach should be able to demonstrate the skills defined by the International Coach Federation (ICF, 2009; 2011). A coach can be a manager at all levels of management.

Coaching can be described as an aid to the development, learning, and performance of the other person. Developing potential is a common element for all coaching approaches. It provides a certain form of "accompaniment" for the coached ones in their personal lives as well as working situations and issues. Coaching helps to learn something rather than teaches something (Crkalová, Riethof, 2012).

The process of coaching allows people to discover and use solutions that are the most appropriate for themselves personally. It is used as an effective approach in corporate training of managers, but also for example, sellers who make up our research sample. Coaching is carried out in a form of a dialogue enabling the coached people to see new perspectives, acquire greater clarity in their ideas, emotions, deeds, situations, and the people around them (Wilson, 2007). According to Downey (2003), coaching is an art, practical inspiration, energization, facilitation, performance, learning, and development.

Critical thinking, feedback and coaching are reflective methods used in the process of learning. They are used to support the development of managers, sellers, and other professions, improve their ability to individually analyse situations and subsequently make a decision on an appropriate solution (Hudec, Suhányi, Urbančíková, 2014).

The issue of supporting the development of the potential of individuals in different areas is addressed by several authors in their research. Kot and Pigoń (2014) talk about verifying the level of competence of individuals' potential, Gavurová et al. (2018) focus their attention on performance related to loyalty, Kubák et al. (2019) describe efficiency improvement. In this context, Antony et al. (2017) analyze the prediction of tourism development, Kot et al. (2017) stress the need for self-education.

Corporate Training

It was already mentioned that coaching can be applied as an effective approach to corporate training. As it results from their research, Savery and Luks (2004) claim that corporate training is a highly profitable and thus the most important investment for an organization.

The primary goal of corporate training is to provide conditions for the effective fulfilment of the organization assignments by intentional and constant development of labour potential. Investing in human resources results in increased performance of people, their self-fulfilment, satisfaction, and loyalty to their organization, as well as saving time and costs in placing the working force (Kachaňáková, Nachtmannová, Joniaková, 2008).

In the development of people through coaching, it is necessary to comprehend the fundamentals of human learning. Learning is a process of gaining experience, knowledge, attitudes, and habits based on which we change our behaviour. In a broader sense, learning can be perceived as the adaptation to gradually changing conditions (Koubek, 2014).

The goal of corporate training is to provide an organization with the prerequisites so that the organization can manage the tasks coming from the internal environment and that arise from the

external environment. It is learning in the process, learning through experience, and searching for new options. If an organization wants to learn, it needs to operate as an open dynamic system. It needs to be open to external and internal incentives (Hroník, 2007). This can be also reached through coaching.

Training can help organizations to solve problems that hinder to reach their objectives (Babić, Boljanović, 2013). In analyzing needs, training determines current gaps in skills and knowledge that affect managers' performance.

As Vodák, Kucharčíková (2011) state, corporate training is targeted on the creation of working capabilities in a broader sense allowing also to develop social competences of individuals significant for making good interpersonal relationships among people employed in an organization.

As already mentioned, the main goal of corporate training is to create a suitable environment with good terms for successful fulfilment of organization assignments. Investing in human resources results in their appreciation. One of the main organization goals is to offer conditions in which a hidden potential of individuals will be revealed and their loyalty to the organization will be assured. This hidden potential can be developed through coaching. It must be seen as an ability to gain and apply new knowledge and skills as well as the so-far unused amount of thoughts and suggestions for better operation of an organization (Armstrong, 2007).

Coaching offers particular capabilities (knowledge and skills) that are directly related to participants' actions. But under completely changed conditions, the procedures learned by participants in the reality-oriented programmes can be unusable. In such a case, it is necessary to believe in the ability of people to generalize the knowledge they have gained (Plamínek, 2008)

Coaching can be described as a training process used at a workplace that aims to increase and enhance the potential of people (Belcourt, Wright, 1998). Kachaňáková, Nachtmannová, Joniaková (2008) explain coaching as a long-term, planned instigation, and heading towards initiative and desired results. It takes place in the working environment and involves meeting special assignments, specifying personal responsibilities etc. These activities are recorded in a long-term plan and are in compliance with the long-term objective of one's career development.

Corporate Training of Sellers

Bass, Vaughan (1967) describe corporate training as a permanent change in behaviour that is acquired through practice or experience. Information, skills and knowledge of sellers are inevitable in business today. Brum (2007) claims that the business environment is changing rapidly and that the most successful sellers are capable to adapt most effectively. Armstrong, Taylor (2005) present that corporate training means investing in sellers to achieve their better performance and to make the most of their natural abilities.

Vodák, Kucharčíková (2011) claim that work ethics and general satisfaction of employees, and thus also sellers, are considered very important. Satisfied sellers increase their productivity, are more responsible and improve the quality of sales. Heyes, Stuart (1996) found that sellers are more involved in trade when they approach to their lifelong learning responsibly. Support and evaluation create an environment in which sellers are more involved and able to achieve better sales results (Bartlett, 2001).

Čopíková, Bláha, Horváthová (2015) describe the benefits of corporate training that can be applied to the area of trade (Horváthová et al., 2014), such as improving the qualification, knowledge, skills, and abilities of sellers, improving their motivation, work performance and labour productivity. Increasing their productivity will increase the overall performance of a company, and according to Krueger, Rouse (1998), this should be reflected in higher wages and career growth opportunities.

Armstrong (2007) claims that corporate training can take the form of coaching. This method is mainly used because it is possible to achieve a high quality of sellers' potential development through coaching.

Research Project

The main goal of the research was to enlarge the state of knowledge in the field of corporate training of sellers through coaching.

The data were acquired using the questionnaire method of AC-BEC – Assessment of Coaching from the point of view of Behaviour, Emotions, and Cognitions (Birknerová et al., 2020). The methodology includes 23 statements related to the assessment of coaching. Each statement has 6 possible ways of responses to the level of identification and agreement with a given statement (1-definitely no, 2-no, 3-rather no than yes, 4-rather yes than no, 5-yes, 6-definitely yes). The following statement can be used as an example: "I am willing to try new things or different ways of doing things at work". In looking for and evaluating different dependences and differences of coaching assessment and its three attributes, the lowest value 1 means the lowest degree of agreement with a given statement of the coached persons and the value 6 means the maximum degree of agreement with a statement.

227 sellers were addressed, out of whom 166 did not undergo coaching activities and 111 participated in coaching activities. The group of respondents included 144 women and 81 men aged from 20 to 60 years. Their average age was 28,6 years (standard deviation was 5,115).

By factor analysis using the Principal Component method with Varimax rotation, 3 factors of coaching perception were extracted. Birknerová et al. (2020) named and described them as following:

- F1: COGNITIONS. The respondents who scored higher in this factor are willing to change their usual behaviour, try new manners of behaviour at work, develop their potential, perform in a more effective way, alter their conventional working procedures and their aim is to acquire better outputs at work (Cronbach's alpha 0.818).
- F2: BEHAVIOUR. The respondents who scored higher in this factor realize their own responsibility for themselves and their lives, show higher degree of self-reflection, think about their behaviour and relationships with other people, they show higher degree of empathy and transfer the acquired knowledge into their private lives (Cronbach's alpha 0.940).
- F3: EMOTIONS. The factor is connected to how individual persons experience coaching. It is aimed at the joy from a relationship between a coach and a coached person, whether these persons are full of expectations before coaching and are looking forward to it, on the balance and relaxation during a coaching session and positive emotions after it. It also focuses on whether they like to work on themselves through coaching and perceive it as a way that helps to work more effectively. This factor is saturated with eight items (Cronbach's alpha 0.931).

Results

The selection of mathematical-statistical procedures for the analysis of the data obtained was based on the verification of the normal distribution of the data obtained. Based on skewness and kurtosis values, the normal distribution of data was confirmed (Table 1).

Table 1: Distribution of data – testing normality

	Cognitions	Emotions	Behaviour
Skewness	-,446	-,369	-,246
Kurtosis	-,064	,372	,396

The results of the research confirmed the fact that coached and non-coached sellers perceive the coaching working meeting differently. This differentness was reflected in the assessment of the factors of Cognitions and Behaviour (Table 2, Graph 1).

Table 2: Assessment of coaching by coached and non-coached sellers

Factors	Coached sellers	Non-coached sellers	U test	Significance
	Median values			
Cognitions	5,20	5,40	3043,500	,175
Emotions	4,75	4,50	2862,500	,045
Behaviour	3,70	4,00	3162,500	,325

Graph 1: Assessment of coaching by coached and non-coached sellers

Coached sellers are more willing to change the established manners of behaviour, develop their potential, and behave more effectively. Their aim is to achieve better results at work. Coached sellers are more aware of their own responsibility for themselves and their lives, show a greater degree of self-reflection, reflect on their own behaviour, relationships with other people, show a greater degree of empathy compared to non-coached sellers. It should be noted that both coached and non-coached sellers rated each coaching attribute positively. Interpreted statistically significant differences were found only in the degree of positivity of the assessment of the factors of Cognitions and Behaviour.

Discussion and conclusion

Coaching can be seen as a useful managerial tool for the development of human capital because it is aimed at awareness and actions (Emerson, Loehr, 2008). This concept was also reflected in the presented research, in which the perception of coaching was identified on the basis of three factors Behaviour, Emotions and Cognition (Birknerová et al., 2020).

The results of the conducted experiment confirmed the fact that the sellers who have had working meetings with coaching elements scored higher in the factors of Cognitions and Behaviour. Compared to the control group of the non-coached sellers, these coached sellers showed higher self-reflection and empathy after completing these meetings. These competencies are essential for improving the quality of seller's behaviour (Bass, Vaughan, 1967, Brum, 2007, Heyes, Stuart, 1996, Bartlett, 2001, Armstrong, 2007 and others).

In relation to the information gathered, we can say that the coaching session is perceived more positively than the working meeting where the supervisor gives feedback, recommendations, and fixed tasks. Coaching can have thus a significant impact on the performance of individuals and consequently on the success of the organization (Shaw, Linnecar, 2007). Self-reflection and empathy are important attributes of the quality of the work environment which is related to the performance of the individual and the whole organization (Fleming, Taylor, 2004). Coaching is the key to creating an open and friendly organization that can appreciate the skills and ideas of its people.

As already mentioned, currently, coaching is an effective method of developing human capital and the potential of individual sellers. According to Green, Grant (2003), coaching improves communication among employees, improves performance and reduces fluctuation.

The results achieved are another contribution to the theory, methodology and practice of human capital development with the use of coaching methods. The necessity to accept a holistic theoretical and methodological approach to the research and application of coaching techniques was confirmed. At the same time, the presented methodology of finding out the feedback on coaching respects the individual specifics of the coached persons. Limitations of the interpretation of the results obtained are related to a specific sample of respondents, the number of respondents. With regard to limiting the level of generalization of knowledge, it should be emphasized that the presented concept of coaching assessment is one of the possible concepts that can be discussed in this context.

Annotation

From a financial point of view, competitive advantage is the ability of a company to beat the competitors on the key indicator — profitability. Formulating corporate strategy, management identifies the markets and industry in which the company competes, the main sources of profit. In the formation of business, strategy (competitive strategy) is the most important question: how the company competes in selected industries and on certain markets, i.e., here we consider its competitive advantage. There are two basic types of competitive advantage: cost advantage and differential advantage.
If the company has a goal to capture a certain market share, the company must set the price for these products based on the calculation of the current cost and the calculation of cost, which will be achieved when the amount that will meet projected penetration of the market. This so-called price of the introduction (penetration pricing) as opposed to the traditional price based on all costs (full cost pricing). However, if all players do it, they will incur losses because of excessive investment in equipment and a price war. To maximize sales to achieve economies of scale, it is necessary: to sell certain, but not excessively wide range of; to expand its presence in new markets, going into other regions and countries. There is a correlation between market share and cost per unit of production, but if sales growth is accompanied by discounts and aggressive advertising, a situation may arise achieve market share at the expense of reducing profitability. So today the practice of strategic management is considered unreasonable to consider market share as the main goal in isolation from the financial goals of the company and assess the success of the company as a whole, in achieving financial and non-financial goals.

Keywords: Cost, Competitive Advantage, Ccost Advantage And Differentiation Advantage.

INTRODUCTION

From a financial point of view, a competitive advantage is the company's ability to beat competitors in terms of the main indicator - profitability. Formulating a corporate strategy, management defines the markets and industries in which the company competes, the main sources of profit. When forming a business strategy (competitive strategy), the most important question is how does a company compete in selected sectors and in certain markets, i.e. It examines its competitive advantage. There are two main types of competitive advantage: cost advantage and differentiation advantage (Figure 1).

Figure 1: Competitive advantage of the company

Methods of Research

If a firm is considering the cost advantage as the basis of competitiveness, its goal is to become the cost leader in the industry or a particular segment of the industry. Distinctive advantage (differentiation) is achieved if the company offers something unique, more valuable to buyers than the supply low price (focus on brand, creative idea, design, and quality, service).

Regardless of, whether the company relies in its strategy on cost or differential advantage, there is first-mover advantage. First-mover advantage gives the company the first to enter the market, preferential access to market opportunities, information, resources and benefits, while following those competitors will not have. The simplest form of such benefits — a patent or copyright. Savings training (economy of learning) is an additional competitive advantage because it is assumed that because of greater production experience and accumulated knowledge of the firm-a pioneer can achieve a cost advantage over followers. Active advertising and promotion of the company as a pioneer, despite the additional costs can lead to an increase in market share that will allow you to take advantage of economies of scale to create cost advantages.

Consider first the cost advantage as the basis for price competition. Price is an important mechanism of competition, but competing on price is possible only under the condition of cost effectiveness. In the twentieth century, the strategy of big corporations, including transnational, fueled by the desire to achieve cost advantages through economies of scale. As a result, companies have made substantial investments in mass production and mass distribution. In the 80s and 90s of the twentieth century, cost efficiency remained a priority but the focus has shifted towards cost reduction through restructuring, reduce the size of the business (downsizing) and outsourcing, sources of cheap labor and raw materials, reengineering of business processes (re-engineering) etc. Even if the company's strategy is based on differentiation and strong, competition forces companies to strive for cost-effectiveness as a necessary condition for survival and profitability.

If the company has a goal to capture a certain market share, the company must set the price for these products based on the calculation of the current cost and the calculation of cost, which will be achieved when the amount that will meet projected penetration of the market. This so-called price of the introduction (penetration pricing) as opposed to the traditional price based on all costs (full cost pricing). However, if all players do it, they will incur losses because of excessive investment in equipment and a price war.

To maximize sales to achieve economies of scale, you need to:

- To sell certain, but not excessively wide range;
- expand presence in new markets, going into other regions and countries.

There is a correlation between market share and cost per unit of production, but if sales growth is accompanied by discounts and aggressive advertising, a situation may arise achieve market share at the expense of reducing profitability. So today the practice of strategic management is considered unreasonable to consider market share as the main goal in isolation from the financial goals of the company and assess the success of the company as a whole, in achieving financial and non-financial goals.

The main driving forces cost advantages are:

1) Economies of scale;
2) save learning;
3) New technology and automation (robotics);
4) Effective use of raw materials;
5) Sources of cheap raw materials and labor force;
6) Managerial / organizational effectiveness (at the level of management and line staff).

Let us consider them in detail.

Economies of scale: if increase in output reduces the unit cost of production. This savings is achieved within the production. With the growth of volume of production the cost of equipment, research and product development, brand building, advertising campaigns, distribution shall be distributed among a larger volume of production, respectively, the total cost per unit of output is reduced. For example, the cost of production and the demonstration of commercials on television will not change, will release the company 5000 or 25 000 tonnes of products per year. To achieve economies of scale in manufacturing are practiced specialization and division of labor. Specialization helps learning, reduces the time cost associated with changing activities and helps in mechanization and automation of processes.

Consolidation in the global automotive industry was caused by the enormous costs that are associated with the development of new models. Companies had to recruit the required production volume on which to allocate costs associated with the development of new models. It is the quest for economies of scale became the main driving force of globalization.

Literature Review

The theoretical and methodological prerequisites for the emergence and development of existing theories of value were the scientific works of the largest researchers in the theory of value, such as: W. Petty, D. Ricardo, A. Smith, J.B. Say, J. St. Mill, K. Marx, V. Lenin, McConnell K., Bru S., O. Cournot, V. Pareto, W. S. Jevons, A. Marshall, C. Menger, O. Bem-Baverka, F. von Wieser , L. Walras, J. B. Clark, C. Wicksell, J. Hicks, M.I. Tugan-Baranovsky, A.N. Rich. Subsequently, the main principles of the classical school of value theory were reflected in the theoretical concepts of Russian and foreign scientists studying the formation and transformation of modern value theories, theories of company value management in the post-industrial economy: E.K. Vasilyeva, N.I. Vedernikova, A.L. Dmitrieva, T.G. Evdokimova, V.E. Esipova, I.A. Zheltjakova, S.A. Kotlyarova, A.D. Krykanova, G.A. Makhovikova, E.E. Pavlova, S.V. Preverzeva, N.Yu. Puzynia, M.S. Abryutina, Kapelyushnikova R., Tambovtseva V.L., V.M. Halperina, Elster U., North D., Davis L., Eggertesson T., J. Commons, Stigler J., Williamson O., E. Glyn, J. Itwell, M. Milgate, P. Newman.

The pursuit of economies of scale inherent in new industries. The main feature of most digital products is that the initial costs to develop them are very high, but once created; these products may be reproduced and distributed at negligible cost. In such sectors of the economy, profitability depends significantly on market share.

Savings training (economy of learning): according to the theory of the curve of experience with increasing number of products reduced the time required to produce a unit of product, reducing unit cost of production. As learning and performance, increase reduces the number of errors and defects, improved coordination between different areas of work. Learning can happen at the individual level (mentoring) and group (through the development and improvement of management system and routine procedures in the organization).

New technology and automation can radically reduce costs. In late 1912, to assemble the car model "Ford T" was required 106 hours. A year later, after Ford introduced the moving Assembly line and interchangeable parts for this Assembly was to require only six hours of working time. From luxury, items to rich man the car turned into a means of mass transportation. However, in addition to mechanization and automation, the biggest improvement of productivity derived from innovation, was the result of improvements in the field of work organization.

PROBLEM STATEMENT

In the 1990s, years of widespread re-engineering of business processes — fundamental rethinking and radical redesign of business processes to achieve dramatic improvements in critical indicators of the company such as costs, quality, speed, service. The purpose of these events is to give an answer to the question "If we were starting from scratch, how would we have organized this process?" The result should be recommendations to improve business processes, for example:

- combine several jobs into one;
- execute milestones in their natural sequence;
- To allow the line staff to make decisions;
- Effectively use raw materials, to optimize the interaction between production and warehouse;
- reduce reporting, bureaucracy and control to a reasonable and justifiable level from the point of view of efficiency.

It should be noted that many of the results of reengineering events have been disappointing. This is because often the recommendations at the beginning of reengineering give external consultants or specially hired professionals. However, the decision to optimization of processes requires a deep understanding of all operations, the specific business and industry. This requires more than one year of work at the enterprise, often at several sites. Reengineering without a full understanding of the processes of functionality of each Department and the complete value chain can become useless and in some cases even harmful.

Possession of cheap sources of raw materials and labor can be the main source of cost advantages, particularly in sectors with intensive use of raw materials or labor. In addition, to achieve cost efficiency organizational efficiency is the ability of staff to do everything quickly and without errors compared with the staff of competitors.

Need to identify opportunities for cost reduction. For example, can reduce payroll costs by reallocating responsibilities or by moving production to another location? If any activity cannot be effectively implemented within the company, can it be carried out by an external contractor (outsourcing)? The desire and pressure to cut costs more in those industries where strong price competition. Currently, however, the pursuit of cost effectiveness must be inherent in varying degrees to all companies, especially those in new high-tech industries.

Important dynamic rather than static approach to cost-effectiveness, i.e. the need to constantly analyze costs, sources of cost. In 1980-ies in Japan in the management of the widespread theory of "continuous improvement" (continuous improvement — kaizen) along with the widespread commitment to "total quality". The methodology of continuous improvement contributes to a dynamic approach to cost-effectiveness and encompasses elements such as process simplification, training, delegation of rights to the level of masters, foremen, direct executors.

In addition to continuous improvement, there is a more revolutionary way of corporate restructuring (the corporate restructuring). The term "corporate restructuring" refers to a radical and often dramatic changes in strategy, structure and management systems of the company, such occurred in the number of Mature corporations in the period of 1980-1990.Such measures aimed at reducing costs are:

1) The closure of factories or industrial sites in order to more efficiently use capacities or abandon obsolete technologies;
2) Staff reduction;
3) Redistribution of functions;
4) Reduction of duplicate units (in case of a merger or within the holding);
5) Getting rid of units that are not of strategic importance (when changing corporate strategy);
6) Outsourcing of components, services, personnel in cases where it is cost-effective.

These organizational changes aimed at getting rid of the junk and inefficiencies, greater accountability, transparency and speed and, as a result, increase business profitability.

Cost control is today a necessary but not sufficient condition of profitability of the business. In the dynamic and highly competitive external environment to reduce costs, it is important to focus on those activities where it has a cost advantage, and translate other works on outsourcing, the regularity of rethinking and improving production and administrative processes. Companies today must look for opportunities to implement innovative management approaches and redesign business processes in order to obtain new sources dynamic cost-effectiveness.

In the last decade, the lack of effectiveness of costly policies led to the collapse of thousands of firms. The resource cost advantage is limited because of the possibility for cost reduction is not infinite, there will always be a company that may have higher productivity based on new technology, large scale of production and, consequently, lower costs per unit of output. It must be emphasized that price wars between competitors is detrimental to all parties except the buyer, but it is not a victory if together with the price of reduced quality. Therefore, experts in the field of strategic management do not recommend teaching customers to a low price, unless it is the standard mass product, for example, a local milk producer. If this premium unique or branded product perceived value, people are willing to pay more. High quality products should cost more.

Let us now focus on the distinguishing advantage. If the company bases its strategy on the distinctive competitive advantage or differentiation, this means not only the offer of some special goods (services), but also relates to all possible ways of interaction between the firm and its buyers, the firm and other stakeholders of the business. You need to constantly reflect on how these interactions can be improved or changed in order to create and increase value.

The analysis used in the selection of differentiation strategies requires a careful look on the very firm (supply-side) and its customers (demand side). Supply analysis allows us to estimate the firm's potential to create uniqueness. Does this unique product / service offer create value for consumers and does the created value cover the costs of differentiation? On the other hand, correctly understanding what consumers want, how they make their choice, what their motives are, a company can determine the possibilities for profitable differentiation. Thus, differentiation is the science of understanding consumers and what needs the proposed product will serve.

To assess what a consumer wants, it is important to understand what product features are important to him. This requires not traditional market research and consumer surveys, managers involved in the decision-making process. Many firms involve consumers directly in the process of product creation. Use hotlines, interactive websites, the possibility of ordering product for individual performance, for example, machine design or Assembly of the computer, etc. In consumer electronics, representatives of firms-manufacturers often get a job in specialty stores in order to understand current and evolving needs of customers. Identifying needs, competitive companies need to provide quick response and result.

The potential for differentiation of a product is partly determined by its physical characteristics. However, as a rule, the differentiation goes beyond physical characteristics of the goods and covers everything that affects the value of the product in the eyes of the consumer, is an innovative idea, status, emotion, style, and quality of life, additional services, unique location, etc. regarding the mass standard products (e.g., food), and complex (car, vacation, etc.), the opportunities for differentiation are limitless

and depend on the power of the human imagination.

Differentiation is not only the activities related to the design and marketing of the product is the combination of all of the activities of the company, and this alloy is embedded in its identity and corporate culture. With the corporate brand acts as a guarantor of quality, the "umbrella" corporate identity and with the success of the Reaper "fruit of glory" and power steering growing reputation and fame of the company.

There is no material (tangible) and immaterial (intangible) differentiation. Material differentiation is associated with the visual and tangible characteristics of the product (services) that affect the preferences and choices of consumers (size, shape, weight, color, design, material, technology). Material differences include the reliability, consistency of quality, taste, speed of service, security. When you create the differentiation potential of important products and services that are complementary, for example, before - and after-sales service, free repair, accessories, spare parts, availability of goods in stock and the speed of delivery, the loan and the ability to improve the product (or exchanged for a better future).

Opportunities for intangible differentiation arise because the value that consumers see in the product or service is determined not only by the material aspects of the proposal. Social, emotional, psychological and aesthetic aspects are present in a wide variety of products and services and influence the decision to purchase. The desire for status, exclusivity, expression of individuality, the need for love, security, communication are extremely powerful motivational forces that affect the subconscious of consumers.

Differentiation is different from segmentation. Differentiation answers the question “How, with what help does the company compete?” Segmentation answers the question “Where does the company compete?” I.e. Consumer groups (target audience), geographical location and product type are considered. A segmented market is one that can be divided into shares in accordance with the characteristics of consumers and their demand. Differentiation is responsible for the positioning of the company within the market (market segment) depending on the parameters of the product, image characteristics that affect the choice of consumers. The company can position itself in the mass market (not necessarily in the niche or premium segment), and nevertheless practice a differentiation strategy.

There is now a trend towards focusing and differentiation, which gradually replaces the wide differentiation. Indeed, it appears that the consumer should prefer targeted product offer that meets exactly its preferences and tastes, compared with a product created to satisfy the widest tastes. On the other hand, this segment-focused approach to differentiating risky. In addition to the higher cost per unit of production characteristic of service is narrow, not broad market segment, there is a risk that the firm incorrectly will determine the market segment or market segments can change over time (e.g. some consumers will not want to be associated with this segment).

Working in mass segment producers know that too wide range is not the best way of differentiation. The wealth of choice often complicates the purchase decision. In this regard, but also because of the additional costs and complexities of managing a wide range, many companies have gone the way of substantial reductions of range.

Michael porter has identified the drivers of uniqueness, which the manufacturer can control is:

- Features of product performance;
- Additional services (repairs, shipping, credit);
- Intensity of marketing activity (the level of spending on advertising and promotion);
- Technology in design and manufacture;
- The quality of raw materials and components;
- Professionalism and experience of staff;
- Location;
- Degree of vertical integration.

Differentiation is only then efficient and effective when it is consistent and constant and when she communitywide and communicated to the consumers. Consumers are not always well informed and understand the special properties of the products they buy. Brand names, guarantees, original and expensive packaging, guaranteed payment, sponsorship of sports and cultural events, unique retail environment of the product — all these non-verbal signals of quality that may be acquired by the consumer. If you want to say about the high quality combination of premium prices and advertising are more effective than the high price and the is separately.

Results

Brand names and is particularly important as signals of quality and consistency. For most consumer goods, the brand is their most valuable asset. Brands fulfill multiple roles. Brand identificeret of the product manufacturer. He communicates to the market that the manufacturer is legally and morally responsible for the products supplied to the market. In this case the more expensive product category, the more important for the consumer reliable brand name. Those firms that were able to make their brands international and work in many markets, earn more than companies focused on a single market do.

Differentiation adds costs. Direct costs include higher quality raw materials, training of employees. Increase the cost of advertising, branding, after-sale service, special design of places of sales. The indirect costs of differentiation are manifested differently. For example, if differentiation involves the narrowing of the market segment, it limits the potential for economies of scale. If differentiation requires continual product improvement, it would interfere with saving from training, as the staff will constantly technologically to be retrained.

Thus, the company can achieve higher level of profitability compared to competitors either through deliveries of similar goods produced with lower cost (cost advantage), or offering products that are different so that the buyer is willing to pay a premium to the price that exceeds the extra costs associated with differentiation.

Low costs showed a less durable basis for competitive advantage than differentiation, since in a global dynamic market, the cost advantage can be easily and unexpectedly disturbed because of the emergence of new technologies or strategic innovation. In most industries, firms establish market leadership that best respond to consumer demands, successfully combining differentiation strategy with reasonable and effective policy in the area of costs. One of the ways of linking differentiation with cost efficiency is to schedule a differentiation at a later stage of business development.

Conclusion

In the modern economy, the growing intensity of competition and increasing price sensitivity of customers, as a result, beneficiaries often become consumers, not companies and their shareholders. The Internet has provided a new way for communication and distribution, leading to opportunities for rapid entry into markets, enhancing competition, reducing costs of customers to search and switch from one supplier to another and increased the transparency of prices (market participants are constantly comparing the prices).

Currently, the problem for top management of companies is that the main traditional sources of increasing profitability (cost reduction, dumping of non-core assets and reengineering) are already exhausted. These “low-growing fruits” are already ripped off, and in the future, creating benefit will require access to other less accessible sources of profit.

For many companies, the solution may be to switch behavior from the “cost reduction” model to the “revenue growth” model, as a rule, by creating and operating a competitive advantage. This path is not easy in modern conditions. The main thing is that the long-term attention of top managers should be constantly focused on factors that lead to long-term profit: operational efficiency, customer satisfaction, development of new products, and demand.

Annotation

This paper aims to propose an algorithm of formation of price policy as an integrated system, which includes data on individual prices, the specific variables and fixed costs, the proportion of operating profit to specific types and groups of goods (works, services). The construction of price policy and price control is based on financial, marketing, factor analysis of the activities of the company. The final brief version of the pricing policies is based on the integrated result. Of particular importance in marketing activity has an analysis of the implementation of goods, works, and services and forecast the level of monopoly power in the market. This is because an increasing role in determining the volume of demand for a product play client-oriented pricing factor. When conducting accounting and preparation of financial statements in accordance with the provisions of accounting standards, companies receive information about the results of activities in the reporting period. Based on retrospective information, the drawing up of forecasts about changes in major financial indicators of the company. Implementation of the strategy of pricing involves the preparation of forecast data on pricing, cost structures, volumes of realization of goods (works, services). Building a competitive card market, the company aims at determining the correlation of forces in a particular market, allowing you to select the model of the strategic position of competing firms, to conduct a situational analysis and design of competitive strategy of the analyzed company on the market.

Keywords: Pricing Policy, Pricing Strategy, Index.

Introduction

The construction of price policy and price control is based on financial analysis of the company's activities. According to methodical recommendations of the Ministry of Finance on the development of pricing policy of the company is a collection of one or more pricing strategies. The final version of the pricing policies is based on the basis of the results of the segmented market analysis, including definition of the level of competition and the determination of the degree constraints as a result of state price regulation in the field of activity of the analyzed company.

Of particular importance in marketing activity has an analysis of the realization of goods, works and services. This is because an increasing role in determining the volume of demand for a product is played by such factors as the preference of consumers; the level of effective demand from real and potential consumers; the presence of possibility of expanding existing market share with an index of concentration; potential and re-Alina the capacity of the market.

For the formation of the algorithm of analysis of the market environment in the price management system in the first phase of development pricing strategy of the company monitors and collection of baseline information, surveys are made in the following areas: assessment of costs; clarification of the financial goals of the enterprises; identifying potential buyers; a detailed marketing strategy; identify potential competitors. It must be borne in mind that the search for competitive advantage may not be meaningful if the market has growth potential. The capacity of the market, the nature of its distribution among the competitors, intensity of competitive struggle is, on the one hand, the key factors determining the attractiveness of business — the basic para-meters that determine competitive advantage. Their assessment is needed to identify potential growth opportunities on the investigated commodity market.

Methods of Research

To assess the degree of monopolization of the market, which is inversely proportional to the intensity of competition, the following factors, as reflected in the table. 1.

Table 1: Aggregated factors that determine the nature of the distribution of the market between competitors

Indicator	The contents of the index	Disadvantages of using
CR4 CR10	Four-digit concentration coefficient, which characterizes the total share of the four firms with the maximum volume of goods in the analyzed market A ten-digit concentration coefficient that characterizes the total share of the ten firms with the maximum volume of goods in the analyzed market	Indirectly, it can increase the level of monopolization of the market, since it does not take into account the import of the product, the effect of high concentration among buyers The complexity of using goods and services in a market formed by vertically integrated mining and manufacturing enterprises, the number of which may not exceed ten
IL	The Linda index is calculated only for a few of the largest companies that have formed the core of the industry	It does not take into account the market situation on the "periphery", which significantly distorts information about the market as a whole
IHH	Herfindal — Hirschman index, which assesses the uniformity of distribution of market shares of firms in the analyzed market	This is not the final result, but further analysis of the concentration coefficients in the product section is required

In the conditions of market relations, establishment of the producer prices of products is influenced by internal and external factors. Accounting and analysis of environmental factors in determining prices contributes to a more accurate establishment of inter-shaft variation of prices on the goods (work, service) in the conditions of market relations. To external pricing factors, include:

- ✓ the sensitivity of consumers to changes in the price level;
- ✓ stage of the life cycle of the goods (work, services);
- ✓ the degree of elaboration (originality) of product: traditional, improved (modified), innovation;
- ✓ level of inflation expectations (forecast, actual);
- ✓ the degree of market concentration;
- ✓ The level of development of institutional environment in the country.

The price level is the generalizing indicator characterizing the absolute or relative weights of the magnitude of individual price reflecting the level of public costs and revenues in a particular period. When predicting price changes in the current market conditions the starting point is the observation with respect to the individual current prices for goods (works or services). The next stage of monitoring you-stepping the calculation and assessment of average prices for selected groups of goods (works or services) over a certain time interval. The obtained results affect the financial indicators such as revenues, total expenses of the population for the purchase of consumer goods and services, the costs of purchase of inventories, capital expenditure on the acquisition, modernization and reconstruction of fixed assets, etc. of the following statistical methods to determine the average prices of goods (work, service) simple chronological average; weighted chronological average; the average price of the goods to the specified name. You can use them as a reference point for the forecast.

Discussions

The main provisions of the classical school pricing was reflected in the concepts of scientists studying the issues of formation and transformation of modern theories of value, theories of value management in the post-industrial economy: E. K. Vasilyeva, N. And. Vedernikova, A. L. Dmitriev, T. G. Evdokimova, V. E. Esimova, I. A. Jeltkovo, S. A. Kotlyarova, A. D. Krikunova, G. A. Mahovikova, E. E. Pavlo-ing, S. V. Pereverzeva, M. S. Abryutina, R. Kapelyushnikov, L. V. Tambovtseva, V. M. Gal-feather beds, Elster J.,North D., Davis L., Eggertsson T., John. Of Commons, Stigler J., Williamson, O. E. Clay, George. Itwell, M. Milgate, And P. Newman.

Author Bykovskaya, N. In. (2014) draws attention to the analysis of the commodity market and the procedure of selection of goods-representative. Author Kovalenko A. I. (2012) notes the importance of social networks in marketing policy in shaping pricing policy. Authors Alexandrova L.Yu. (2015) and Guseva M.I. (2017) draws attention to the role of factors of the international market and imported inflation.
Consider the example of finding a simple chronological average price for a product (work, service).

Example. The following data on the price of goods for 12 months are available, see table 2.

Table 2: Data on the price of sales of goods

Period	1	2	3	4	5	6	7	8	9	10	11	12
Price	48	42	45	45	48	50	50	50	55	55	57	60

A simple chronological average price will be 50.09 monetary units.
Let's consider an example of finding a weighted chronological average price for a product, according to table 3.

Table 3 : data on the sale price of the product

Period	1	2	3	4	5	6
Price	50	52	54	55	58	600
Multiplicity of registration of this price level	3	1	1	4	1	2

The weighted chronological average price will be 54.5 monetary units
The price index is a relative indicator that allows you to combine disparate values and analyze price dynamics. As you know, the following types of price indexes are used: individual price indexes; summary price indexes.
The following formulas in table 4 serve as the methodological basis for calculating aggregate price indices:

Table 4: Content and methods for calculating aggregate price indices1

Index formulas	The name of the index	
	volume index and other primary features	price index and other secondary features
According to the Laspeyres formula (based on base weights)	$I_q^л = \frac{\sum q_1 p_0}{\sum q_0 p_0}$	$I_p^л = \frac{\sum p_1 q_0}{\sum p_0 q_0}$
According to the Paasche formula (according to the reporting weights)	$I_q^п = \frac{\sum q_1 p_1}{\sum q_0 p_1}$	$I_q^п = \frac{\sum p_1 q_1}{\sum p_0 q_1}$
Fisher Index	$I_q^ф = \sqrt{I_q^л x I_q^п}$	$I_p^ф = \sqrt{I_p^п x I_p^л}$

Note. q1 — quantity of the product sold at the individual price in the current period;
q0 — quantity of the product sold at the individual price in the base period;
p1 — individual price of the product (work, service) in the current period;
p0 — individual price of the product (work, service) in the base period.
The level of inflation expectations is shown in an indicator such as the consumer price index (CPI) that has developed in the country, as shown in table 5. As a rule, the Laspeyres price index is used in the form of an average arithmetic index.

Table 5: consumer price Index for goods and services in Russia for the period 1991-2018[2]

Years	**1991**	**1992**	**1993**	**1994**	**1995**	**1996**	**1997**

Forecasting price changes in modern market conditions, as part of the company's pricing policy, is based on the structural elements of the price and its factors [3].

The activities of organizations in a market economy are aimed at achieving goals such as cost recovery (production and overhead) and achieving the established level of profitability (profitability), i.e. Profit from sales as a key result of the operating (current) activities of the company. The company's profit function tends to the maximum in the short and long term. The goals of forming a profit indicator in the company are: obtaining the possibility of paying taxes; the needs of the educational sector of the economy to cover the costs of maintaining the housing stock; obtaining potential and real opportunities to expand operational activities as part of a self-financing strategy; increasing the financial stability of the company and minimizing the risk of a bankruptcy; the ability to cover operating and non-operating expenses of the company, in particular, payment of interest payments on borrowed capital, rent and lease payments, etc.

PROBLEM STATEMENT

In accordance with the requirements of financial statements, the following types of company profit are determined: gross profit; sales profit; profit before tax; net profit.

The structure of the company's expenses, including taxes, recorded and displayed in the statement of financial performance, includes: cost of sales; commercial expenses; management expenses; Percentage to be paid; other expenses; Current income tax.

The movement of goods from the manufacturer through the wholesale intermediary organizations to the retail trade is accompanied by the summation of the full cost of the manufacturer of the wholesale and trade allowances, as well as tax charges.

The pricing strategy developed by the company directly depends on the structure and composition of the price, its legal regulation in relation to the establishment of the recommended levels of profitability (profitability) indicators, the value of tax rates in value terms, various types of premiums and discounts to the price.

Normative legal regulation presupposes, first, tax elements in price. Methods of analyzing the market environment, which determines the upper bounds of the price when implementing the pricing strategy, are presented in table 6.

Table 6: Comparative characteristics of pricing methods in forecasting price changes

Factors	**Cost plus methods of pricing**	**Market pricing methods**	**Value pricing methods**
Basic price level	Production cost based on accounting for total and variable costs	The prices of your competitors	Price of a technologically new product
Type of market	The manufacturer (seller)	The consumer (buyer)	The consumer (buyer)
Price level	Low (basic)	The average (equilibrium)	Tall
Price discounts	Wide system of discounts as a result of refusal of additional options	Flexible discount system to meet the customer's need for the product	Absent
Quality management	Assumes a marriage rate of 10%	Assumes a marriage level of 1-2%	The lack of marriage (the

3 Information on CPI values for the Russian Federation for the period 1991-2018. URL : http://www.gks.ru/free_doc/new_site/prices/potr/tab-potr1.htm

			theory of "6 Sigma»)
The level of risk in forecasting financial results	Low	Average	Tall

The combination of the above methods for setting the sale price of a product (work, service) (table 7) depends on the company's position in the market segment. One of the tools for determining the company's competitive advantages in setting the sales price of a product is a competitive market map.

Companies must take into account the actions and opportunities in the market of their main competitors in order to assess the price-forming factors. An example of building a competitive map for the chemical segment of the Russian economy is presented in tables-7-9

Table 7: structure of indicators for building a competitive map

№	Company name	Q-revenue, thousand rubles		market share of the company (d), %		growth Rate d, %	Square of the market share	
		Database	Report	Database	Report		Database	Report
1	PJSC "Akron"	50 382 355	50 216 034	0,04	0,04	103,32 %	0,00159	0,00170

Building a competitive card market, the company aims at determining the correlation of forces in a particular market, allowing you to select the model of the strategic position of competing firms, to conduct a situational analysis and design of competitive strategy of the analyzed company on the market. The algorithm for constructing competitive card market is based on the following processes:

1. grouping firms depending on their market share;
2. grouping firms depending on the growth rate of the market share;
3. The construction of the matrix "competitive map of the market".

METHOD AND METHODOLOGY

Consider the algorithm for the main stages.

Step 1. Definition of outcome parameters evaluation criteria market shares of the companies
Define the boundaries of groups of firms in terms of market share. The market leader, as seen in table 7 is PJSC "SIBUR", its share is maximum and is:30,10%.
The outsider market is PJSC "Shekinazot, he has a minimum share of 1.36%.
Find the arithmetic mean market share for all firms in table 7 (on the condition the method should be not less than five companies), in our case the arithmetic mean equals: 10.
Step 2. Divide the company into groups.
In the group of weak firms includes companies with: R<10. This is a company number: 1,4,5,7,8,10.
In the group of strong firms included companies with: R>10. This is a company number: 2,3,6,9.
Step 3. Find the arithmetic mean market share for the group of companies
Find the arithmetic mean market share for the group of weak firms: n=6=2,95%.
Find the arithmetic mean market share for the group of strong firms is n=4=of 20.58%.
Step 4 building a competitive card market

Mapping occurs according to the following parameters:

- The market leader (112,39%) - PJSC "SIBUR";
- Market outsider (72,64%) of JSC "Togliattiazot";
- Average growth rate of market share 96,30%;
- Weak players in the market company number: 2,5,7,8 in table 7;
- Strong players in the market company number: 1,3,4,6,9,10 in table 7;
- Average growth rate of market share in the group of weak firms 84,92%;
- Average growth rate of market share for the group of strong firms 103,88%.

Table 7: Outcome assessment criteria of growth market shares of the companies

Characteristics of the situation	Average rate market share growth	The company
The company	84,92-122,86	EuroChem, PhosAgro, KuibyshevAzot, Nevinnomysskiy Azot, Dorogobuzh, Shchekinoazot
with the deteriorating	72,64-84,92	Uralkali, Togliattiazot

Stage 5. Calculation of aggregated coefficients that determine the nature of the distribution of market parts between competitors
Market concentration index by CR3 companies (table 1): base -0.65755; reporting-0.69847. As you can see, the market is competitive, but the dynamics of concentration are negative.
IHH Index (Table 1): basic — 0.18526; reporting-0.20096
As you can see, the market is highly concentrated and concentration is increasing.
The calculation of the coefficient of relative market concentration is summarized in table 8.

Table 8: coefficient of relative market concentration

B	0,3	30	
a(database)	66	a(report)	70
K(database)	1,67287078	K(report)	1,57486001

As you can see, the market is concentrated
Stage 6 Accounting for competitive positions in pricing using the porter model, table 9

Table 9: porter Model for the leader company of Akron PJSC"

Competition level	High threat	Medium threat	Low threat
The competitiveness of goods			
	3	2	1
The goods are substitutes		2	
Price-quality		+	
Intra-industry competition		7

Price sensitivity		+	

Customer dissatisfaction with quality			+
Threats from suppliers			
Market power of suppliers		5	
Number of suppliers			+
Resource constraints			+
Switching costs			+
Priority of the direction for the supplier		+	

The market is concentrated and competitive. Dynamics of index of congruence in the negative, indicating that the decrease in attractiveness of the industry. Indeed, the average gain in the market is small. According to the model of five forces of Porter Company PJSC "Akron" has a medium level of threat: small threat of substitute products, so the quality of fertilizers is negligible. but different; the presence on the market of intra-industry competition; the possibility of market entry of new players in connection with open distribution channels and the ability to differentiate the product in terms of quality; work in the sector-linked with a small dependence on the consumers consistently buyers purchase large volumes of goods.

According to the results reported in tables 7-9, a large company that occupies the largest volume market, with a growth in market share and weak ability to dictate prices, so the price level in the chemical industry are often below market for the past three years. Therefore, in establishing the sales price can be the strategy of active pricing, particularly given the magnitude of costs.

Depending on the degree of concentration of market the company — an economic entity can implement various models and strategies pricing strategy of "follow the leader", "skimming", "and focus on the actions of competitors."

At the stage of development of pricing strategy of the company "Financial analysis" carrying out research in the following areas:

Liquidity and solvency the company's activities;
Business activity and financial stability of the company;
The profitability and yield of the main activity of the company;
Factorial analysis of the main indicators of profitability of the main activity of the company.

Further, according to the methodical recommendations, development of price policy of the company and forecasting the level of prices assume the use of the received results of the financial analysis of the company's activities. When conducting a financial analysis of the company using the actual data on the prices of goods (work, service) the reporting and previous periods:

Formed price levels (price options) in the implementation of various scenarios of company development depending on the stage of the life cycle of products (works, services);

Qualitative and quantitative characteristics of the goods;

The structure of the production cost, forming of production and full se-bastakoti an item;

The conditions that determine the market segment and the achievement of planned sales volumes in the presence of competitive advantages.

CONCLUSIONS

The financial analysis allows you to determine companies that market segment, which allows meeting the effective demand either due to increased costs in terms of value, either through optimization of the cost structure through the optimization of organization and technology of production, which will lead to a decrease in the total unit cost of production of goods. This assumes a definition:

• The value of the net profits of the company from the production and sale of each type of commodity when the actual price level of the implementation.

• The likelihood of increased sales volumes in quantitative terms, with a reduction-Institute of sales price;

• marginal drop in sales of all goods in the event of a price increase implementation, in which the total amount of net profit of the company will be reduced to the existing level.

In the result of price control for a given level of profits and the availability of information about the cost structure may determine the selling prices of goods.

When compiling balance sheet management key indicators revenue, costs and profit metrics are classified by main activity (industry, construction, retail trade, wholesale trade, social services) or the main groups of goods (works, services). In pricing in the first place is the factor analysis of the activities of the company. The assumption in factor analysis is the prices and was part of the price. The impact of direct and indirect taxes on the sales price of the product is not taken into account in the factor analysis.

Annotation

Pricing in the product market depends on the fluctuations of currencies. Insignificant purchasing power of citizens becomes a cause of limiting the growth of prices by retailers on the value of the volatility of the currency, so the price dynamics are not comparable with the imported inflation. However, the pricing policy is necessary to forecast exchange rates. You must know the factors that affect the rate of the national currency. You should be able to use in practice hedging instruments that give the opportunity to generate forecasts of prices in the future. You must master the skills of assessment of price dynamics and its trends, given the variability of the exchange rate of the national currency, which is closely related to the rate of inflation in the country.

Keywords: Currency, Forecasting, Pricing, The Price Of Oil.

INTRODUCTION

Let's start with the preparation of the forecast impact of exchange rate on the pricing process. Often the task of making a forecast of the price dynamics in a market economy. Thus, it is necessary to take into account the change rate of the Russian ruble against the U.S. dollar. The Russian ruble is the numerical expression of his price using that currency in a specific period.

STATEMENT OF THE PROBLEM

The national currency becomes known after carrying out of currency trading, which are carried out on the foreign exchange market. Players that carry out trade relations, face the problem of making a prediction of the behavior of the national currency. While actors of trade relations face serious problem related to establishing measures of impact of numerous factors on the course.

The rate of the national currency against the key currency is highly dependent on the dynamics of prices of oil. The Russian ruble has a significant impact on the dynamics of prices on imported goods.

The price of oil is the current price for one oil barrel. Oil in different grades and sold in conditions of the futures market. The most famous grades of oil are WTI crude oil US oil and Brent North Sea. The price of oil exports brands such as Siberian Light Urals REBCO is determined based on the price of Brent crude oil. The exchange rate of the Russian currency against the US dollar significantly affects the prices of foreign goods, as well as the level of budget revenues. The course affects the price of Russian oil abroad.

Figure one shows how the exchange rate of the Russian ruble depends on oil prices that have developed on the world market. We can draw conclusions of this kind: the trend lines have a similar direction, which allows us to conclude that the changes in oil prices and the Russian currency exchange rate are rather closely.

Figure 1: Dynamics of URALS oil price ($ / barrel) and ruble to dollar exchange rate, 2015-2017

Source: Thomson Reuters.

The exchange rate of the Russian currency, which according to the figure is decreasing in relation to the US dollar, affects the macroeconomic state of the Russian economy. Moreover, it is worth noting the indirect and direct influence of exchange rate differences on the Russian economic system. With the growth of the dollar against the Russian ruble, national products produced in the domestic economy become cheaper compared to imported ones. Imported products for Russian consumers are becoming more expensive. This state of affairs with the exchange rate leads to the following: the output of goods in Russia is increasing, which can be said about the volume of foreign currency earnings expressed in Russian currency.

The budget of the Russian Federation is formed from the revenues that exporting companies generate from the sale of oil for US dollars. Revenues received at the current rate are converted into Russian rubles. The national currency exchange rate depends on the amount of revenue generated by oil exporters in US dollars. If the exchange rate of the domestic currency against the US dollar rises, then this leads to the fact that the revenues of the Russian budget are reduced. In case of depreciation of the national currency, the budget revenues of the Russian Federation are growing.

Figure 2 shows the dependence of the Russian currency on inflation. It should be noted that there is an indirect conditionality of the Russian ruble rate of inflation.

Figure 2: The relationship of the ruble / dollar to inflation

Source: Bank of Russia.

The insignificant purchasing power of citizens makes it impossible for retailers to raise prices by the amount by which the US dollar has changed. Import prices are not caused by inflation, which can be compared with the dynamics of the US dollar.

In order for such a dependence to acquire a small scale, it is necessary to establish a full cycle of production and sale of goods within the country. Only in such a case, the price of them will be less dependent on the dynamics of the national currency. In the case of rising prices for imported substitutes for goods, national producers raise prices at a constant cost of production.

The key rate set by the Russian mega-regulator affects price dynamics. Owning a similar tool of monetary policy, the Bank of Russia regulates interest rates that are traded in the economic system. This approach allows you to gradually reduce inflation and control it. The key rate is the lower limit of the interest rate. Guided by this indicator, the regulator provides loans to banking institutions. The key rate is also the upper limit of the rate at which the regulator accepts deposit funds from banking institutions.

Figure 3 shows the results of the change in the key rate of the Central Bank of the Russian Federation.

Figure 3: Dynamics of the key rate of the Bank of Russia.

Source: Bank of Russia.

The Bank of Russia used key rate to regulate the level of prices in the economy. However, prices on specific products are beyond its influence. The key rate is an important tool to create value of money using interest rates applied by banking institutions. By adjusting the key rate controller corrects the level of interest rates. By reducing, the key rate reduced interest rate used by the credit institutions. This allows the economy to develop sustainably because a growing amount of money circulating in it. This becomes the cause of the weakening of the domestic currency. Rising inflation and prices.

Increase the regulator's key rate leads to an increase in interest rates of banking institutions. The situation is complemented by a reduction in the circulating money supply. The Deposit rates of credit institutions also increased. The market gets rid of free money. Is moving on Bank deposits. Inflation takes a downward trend, prices are stable or declining. This is an increase rate of the domestic currency.

Against Russia are introduced in 2014, Western sanctions – measures of a restrictive nature, has imposed a serious negative impact on the activity of enterprises and separate physical entities. Sanctions pressure makes the situation in Russia is unstable. The Russian ruble is also in stable depends on the pressure of sanctions. You must take into consideration these factors. This approach significantly increases the accuracy of forecasting the prospective price movements. Also used the results of this forecast for economic decision-making. All these factors lead to the need for hedging of currency risks.

LITERATURE REVIEW

In an economic system, in a market, prices show significant volatility. The authors Petrov, S.S., Medvedev, MV., Kashina, OI (2013) write that according to the classical theory, equilibrium asset prices add up as a result of optimizing the structure of investor portfolios; a mechanism for restoring stable equilibrium in the case of a small deviation of prices from equilibrium. The change in the overall exchange activity of large participants carries information about the stability of the market situation. The subjects of the economy create effective mechanisms that help protect themselves from stressful price dynamics, which helps to minimize this impact. Author Azarova A.I. (2012) notes the presence of more than 40 different indicative prices, which vary greatly in level at the same point in time due to factors such as the quality, density and location of crude oil. Companies carry out their activities, undergoing financial risks that accompany all their operations. However, there is a significant risk of impairment of invested capital. Many enterprises have a risk of losing business or may generate a small profit, despite the amount of investment. Profit may decrease because the prices of assets used in carrying out commercial operations will suddenly change. The author is Glubokova, N.Yu. (2010) notes that such situations may arise in an organization when transactions are concluded not for profit, but to minimize risks, including tax ones.

THEORETICAL BACKGROUND

If a hazard can take place as loss and gain in the form of unexpected income growth. Many entrepreneurs do not want to risk it. They like to reduce the risk of loss that leads to the inability to obtain large amount of profit. Risk reduction is possible with the use of derivative financial instruments. The most widely used derivatives are options, forwards, and futures. Operations for the reduction of the level of risk using these derivatives is called hedging.

Risk is the probability of loss of financial capital for carrying out some operations with them. Assets and cash flows are subject to risks of impairment over time. These risks can be classified on interest and price. There is also the risk that contractual obligations will not be performed. This is due to the nature of the financial instruments, which are in the form of contracts. This risk is called credit risk.

Hedging gives an opportunity to use some tools that will reduce the level of risk. The risk due to the negative impact of market factors on the value of the related financial instrument or on cash flow, which was created with his direct participation. Hedging is an insurance risk of volatility in prices of assets, currency exchange rates, interest rates with this derivative.

Under the financial risk, understand the risk to the operations or assets of the exchange rates, interest rates and prices of products and services. Financial risks are hedged by transferring them to other financial market participants. Hedging is carried out in efficient and developed markets. The basis risk hedging is the strategy of minimizing risks of undesirable character. Because of the operation reduces the potential volume of profit generated due to the inverse nature between profit and risk. Conversion operations are operations related to the purchase and sale of non-cash foreign currency and are directed towards non-cash and cash Russian currency. Operations that are characterized by immediate delivery are mainly carried out.

Table 1: Advantages and disadvantages of hedging instruments

Exchange instruments	OTC instruments
Advantages 1. Significant market liquidity due to opening and closing a position in any period. 2. Significant reliability due to the presence of a counterparty to transactions represented by the exchanges. Clearing house. 3. Minor overhead costs for transactions. 4. Financial transactions due to their availability can be carried out anywhere thanks to advanced telecommunications technologies.	Advantages 1. The instruments take into account to a large extent the client's requirements for the terms and type of financial transaction 2. The period for concluding a financial contract can be long 3. There are no daily requirements to ensure that the operation is financially or financially secured 4. There are no restrictions on the market share 5. Excessive secrecy
Disadvantages 1. There are significant restrictions on the terms of operations 2. Additional security requirements are made every day. This is done after the quote price is set. 3. There is an illiquidity of a large number of exchange instruments. Some exchange instruments are only liquid within a certain time frame	Disadvantages 1. Low level of liquidity. Termination of financial transactions is associated with high costs 2. Significant overhead costs 3. Restrictions on the minimum possible batch size 4. It is difficult to find a counterparty for financial transactions 5. There is a significant risk that the parties to a direct financial transaction will not meet their obligations under it

The operation of the type "TODAY" is a transaction, with the conversion characteristics. The transaction differs in that the value date coincides it with the time of its conclusion. The operation of the type "TOMORROW" is a transaction, characterized in that the value date for her in the next day that the day. Operation of type "SPOT" is a special transaction conversion type, characterized by the value date, coming on the second day of the transaction banking day. The share of such operations accounted for 90 % of all Forex transactions. Currency according to transactions acquired on the second working day from the date of conclusion. The counterparties to take into account the course that was installed at the time of signing of the contract. In the calculation, take into account the working days in the context of all currency transactions.

Currency risk is the potential loss of funds caused by the dynamics of the exchange rate. The cause is the fact that the composition of each currency, the assets and liabilities unbalanced among themselves and on the amount and period. In the process of trading instruments and currency, money market is protected from the dynamics of interest rates and exchange rates.

The basis of the exchange quotation is the cross-rate. Under the cross rate understand the relationship that there is between currencies. The cross rate comes from the rate of these currencies in relation to the third currency. Use the following example to describe such a situation. It is necessary to determine

the level of spread in the cross rate of the Euro against the Swiss franc. It was found these quotes in the dollar for these currencies:

BID		ASK
USD/CHF	1.1810	1.1820
USD/EURO	0.9810	0.9820

Then:

EURO/CHF bid = USD/CHF bid/ USD/EURO ask = 1.1810/ 0.9820=1.2026

EURO/CHF ask USD/CHF ask/ USD/EURO bid = 1.1820/0.9810 = 1.2048

Two-way quote of the EURO/CHF 1.2026 – 1.2048 cross rate

To determine this value, you need to make a cross-division of rates. This will allow you to get the cross-rate value that is typical for currencies with a direct quote. The exception is the definition of a cross-rate with the currency "pound sterling". In relation to the pound, the quotation of any currency is as follows: the pound is the base currency (pound/other currency). You should multiply the dollar exchange rates to determine the cross-rate of the English currency. Let's give the following example:

GBR / USD 1.5920 – 1.5925

USD/EURO 0.9810 – 0.9820

GBR/EURO = GBR / RUR bid * USD/EURO bid = 1.5920 * 0.9810 = 1.5617

GBR/EURO = GBR / RUR ask * USD/EURO ask = 1.5925 * 0.9820 = 1.5638

GBR/EURO = 1.5617 - 1.5638

A currency can be quoted at a certain premium. This situation occurs if the forward rate exceeds the spot rate. The currency is also quoted at a discount if the forward rate is set at a level lower than the spot rate. There is such a scheme for calculating the level of the forward rate:

Forward rate = spot rate + / - forward points

The amount of bonuses and discounts on a forward contract is determined as follows:FD (Pm:Dis) = fr – sr /sr ×100% × 360 / t forward rate, (4.1)

where: FD (Pm:Dis) is the forward differential (premium or discount);

Fr-forward rate;

Sr-spot rate;

T – term (in days) of the forward contract.

Under a futures contract is an agreement, which provides for the supply of a certain volume of foreign currency on specified conditions in the future. Futures contracts are similar to forward transactions. Futures is a standard financial product. The futures circuit is carried out in conditions of special exchanges. In a futures contract are clearly spelled out name of the currency its value, the value of the orbital period. There are dates of the period of treatment of futures transactions on exchanges: December, March, September, June.

Futures markets have their advantages. First, they are liquid. Cost cheaper futures forwards. However, the forwards have the ability to solve specific customer issues. A futures transaction involves as a partner the client the estimated exchange chamber. The Bank acts as intermediary. The task of the Clearinghouse is supervising such activities.

Futures exchanges have a difference. The difference of these exchanges lies in the peculiarities of the procedures of carrying out of such operations and the scale of the contracts that are there to make the circuit. There are advantages of futures agreements:

- The price is set just in the implementation of trading. The implementation of arbitration is subject to the preservation of the price level, which is close to the current market. Forward contracts do not provide this.
- Futures transactions are easy to implement and relatively low cost compared to forward;
- The price of the futures transactions is determined each day automatically.

- Risky operations are hedged in the futures market is not particularly expensive, so there is considerable advantage, which enjoyed the market operators.

There are some disadvantages of futures hedging:

- Remains uncovered is the difference in the case of inequality, the standard value of the future value of the hedge. In some cases, this difference is subjected to hedging under the terms of the forward contract;
- In case of a mismatch of the hedging period and the period of turnover of futures for forward contract starts carrying basis risk.

Futures are traded within the exchanges and act as a standardized tool to hedge financial risks. Banking institutions and private brokers do not act as actors in these operations. These actors serve as mediators between the exchange chamber and the client.

In the calculation of the exchange chamber, the client shall Deposit the value of the initial margin. Reassessment of contracts for futures are provided daily. In the case of a contract, establishing the loss put a certain requirement. Requires the additional amount of security. Thus, the essence of the requirements is that the margin was less than the amount that is required.

Currency swaps are also widely used for hedging risks. Operation swap provides for the conduct of banking transactions. In the structure of such transaction, there are two opposite conversion transactions for the same amount. Moreover, these operations are enclosed in one day. One of the deals you will be urgent in nature. The second operation acts as transactions with immediate delivery.

Conclusion of spot transactions occurs on such conditions: a calculation of the transaction will be made after 2 days after the operation will be performed. There are ultra-short-term swap, which reduces the calculation time and sets the period at 1 day. The currency, which becomes essential when it is purchased in the spot market. There is a condition – implementation of the calculation in 2 days.

There is an implementation of the swap transaction related to the purchase of a currency for delivery the term "tomorrow". The sale is with the supply set at "date spot". Such operations are called ("torn next" tomorrow – next day). The essence of such operations – to postpone the settlement date under the contract for the day ahead. Swap points are used to reduce the difference in interest rates. All of the above illustrates the following example. The contract was signed on 6 March. For USD/CHF. Value date for this contract is March 8.

	Buy rate	**sell Rate**
Spot	1.5005	1.5015
Tom-next swap on March 7	+1	+2
Forward course for March 7	1.5006	1.5017

To make a decision on the need to conclude a currency swap, the following should be done. Comparison of the interest income from the swap with the possible income, which is generated in another way.

Customers in different markets are characterized by varying degrees of creditworthiness. The differences in this indicate that some transactions will allow you to receive significantly more income than others. In this case, the effect of the equalization of arbitration does not occur.

Forward exchange rates are based on interest rates on the European market. The base of deposits and loans is made up of national rates. The term for forward transactions is no more than five years. Rarely are such contracts concluded for a period of more than one year. A significant problem is that there are no indicative rates characterized by reliability, which are used to determine the difference in interest

rates and swap points. Another problem is that you need to look for accurate hedging instruments that allow you to pay interest and capital on financial transactions.

Holders of options have the right to carry out certain operations. They have the right to buy or sell a financial asset at a certain date at a specified price. The buyer in this case is called the option holder. The option seller is the writer. His duty is to buy or sell assets in the future at a fixed price earlier.

The premium is the cost paid by the option buyer to the option seller. There is the following classification options:

Options type Put (the sale of an asset);
- Options Call-type (right to acquire asset).

There are European options, which are executed on the expiration day. Takes place one day for delivery and payment on the underlying assets. According to the American call, option can be purchased or you can implement the underlying asset at any period remaining until the date of expiry.

American options are characterized by a significant level of flexibility and provide for the payment of high premiums. Moreover, the amount of this award on the American option exceeds for European options. The options are implemented on the following conditions: option type of Call (prospective price is below the strike price of the option). The option of this type is not realized in the case that a promising spot price will be less than the exercise price of the option. The holder of the option acquires the asset in the spot market at an affordable price. In this case, lost the prize that will be given to the option seller.

Option type of Call (prospective price is greater than strike price). In case of exceeding the spot price above the exercise price, the holder sells the option. The asset is bought at a price cheaper prices operating in the spot market. The profit the option holder is not generated in the case of not exceeding the difference between the spot price and the strike price of the award on it option type put (prospective price exceeds the strike price).

The option of this type is implemented in case of exceeding the promising spot price over the price of its execution. The option holder can realize it in the spot market and receive a good income. Premium goes to the seller of the option type put (prospective price of the option is below the price of its execution).

In case of determining the spot price of the option at the level of the strike price, a put option the following will occur: the holder of the option sell his requesting a price higher than the option price. Before calculating the final amount of profit is deducted the amount of the premium. Option transactions are asymmetric. The purchaser of the option assumes the risk of loss, but it can also get profit in unlimited amount.

The profitability of the option is limited to the premium. The risk of loss when such an operation is not limited. Loss of option holder may receive in case of adverse price changes. The premium reflects the profitability potential. The seller will be willing to take the risk of loss in the event of a significant profit. The low premium convinces the buyer that he can make a good profit.

The value of the premium is due to the action of several factors. The intrinsic value of an option is the profit that the holder receives if the option is immediately exercised. When using European options, the determination of the intrinsic value of an option is as follows. The forward price of the asset and the price at which the option is exercised are taken into account. If there is a positive difference, the option is considered an option by type ("inthemoney"). If the strike price of the option is equal to the price of the forward contract, the option is considered to be "atthemoney". Moreover, the intrinsic value of such an option is zero. If there is a negative difference, the option is called the option "outofthemoney". The prize was not taken into account.

It depends on the duration of the option that the price of the asset will become positive for its holder. How long this period is, the greater the likelihood. In this case, the seller's risk level increases. If the option is characterized by a long term of execution, then a significant premium is paid. The price of time is an important element of the option price. The shorter the exercise period, the lower the price of the option. The time price on the exercise date of the option is considered equal to zero.

CONCLUSION

In conditions of instability, the price deviates from its average value over a certain period. More mobile than the price of the asset, the greater the probability that the option is exercised and the holder will get the profit. The higher the volatility, the larger size should have a prize.

The increase in costs associated with interest payments, leads to the fact that growing and opportunity costs, which are charged to the buyer of the option. The money that was paid for the award, can alternatively invest in a certain asset, which can generate income. The buyer in this case as before is not ready. The award provides the opportunity of earnings for seller's interest. If interest rates rise, you can reduce the value of the award. This will give you the opportunity to get some net profit. Raising interest rates has a downward effect on the value of the option awards.

The smaller value takes the difference between the option execution price and the spot price of the asset, the greater will be the probability that spot price will increase and exceed the exercise price of the option. The magnitude of this difference depends on the value of the award. The smaller it is, the higher such an award.

Widespread options "retail". These options are negotiated between the banking institution and the client. They do not participate in trade. Despite that, such positions will be closed at any time. While in the Bank is the reverse deal. An example of such options are European options. This option is the last day of action. The last maturity of such option falls on the third Wednesday of September, March, June and December.

The media continually publish information on the value of premiums on options.

On the Chicago, international money market has made the treatment of such options:

Options GBR/GBR USD 62,500; 1 step = 12.5 USD

Options DEM/USD to USD 125,000; 1 step = 12.5 USD

The calculation of the initial margin is based on the requirements for the size of margin for futures. The sum of these demands multiply by a risk factor. The dynamics of the premium depends on the trends of the contract. These changes then have to be debited or credited to the parties to the contract.

In case of reduction of the balance on the client, account is below the margin that is not reduced, it is necessary to make additional provision.

Annotation

Transfer pricing is increasingly becoming in demand in the implementation of operations by companies within their structures. In Russia, unlike foreign countries, there are problem
s in ensuring effective interaction between company structures, as well as with entities that control these operations. The study clarifies the conceptual and categorical apparatus, indicates the importance of the proper organization of intra-group financing. Based on the results of the study, the main methods for regulating intra-group transactions in modern Russian companies are determined taking into account foreign experience. Foreign tax systems ranked for priority in choosing methods for regulating internal corporate transactions.

Keywords: Transfer Pricing, Transfer Price, Transactions Between Related Parties, Tax Base.

INTRODUCTION

Currently, such definitions as transfer price, transfer pricing, beneficial owner are not clearly contained in the Russian legislation, which leads to a different interpretation of these concepts in the expert community. Thus, in the current conditions of regulation of transactions between interdependent companies, this leads to an increase in the level of financial risks in the implementation of intra-group transactions, which indicates the importance of specifying these concepts.

Analysis of transfer prices used in controlled transactions is a new type of tax control and is carried out based on the provisions of the Russian legislation on transfer pricing, and is also built taking into account international standards. However, there are a number of differences from classical international practice.

The transfer price appeared in the 1960s, when transnational corporations began to open in developing countries, which were aimed at producing a product in one company and transferring it to another interdependent company. The prices at which goods (services) were sold between interdependent companies were called transfer prices, and the process of setting them was transfer pricing.

Methods of Research

Functioning in the 1990s offshore companies represented by countries (territories, states), which attract the capital of foreign companies by providing the latter with special tax and other benefits, allowed

significant savings on taxes, using the transfer price in the calculations. It did not match the market price level. Thus, companies moved taxable profits between states, with profit centers located offshore. However, transfer pricing according to Mambetaliev A.N. (2010) - this is primarily an objective market need and a powerful incentive for the development of the economy.

The first studies on transfer pricing were published in 1950-1960. scientists such as J. Hirshleifer and Ch. Argyris. Scientists have studied transfer pricing as a tool for the internal distribution of financial flows in multinational corporations. Transfer pricing was considered in the form of a financial instrument that allows generating profit for each structural unit of such companies, which contributes to increased productivity and increased profitability of the entire corporation (Anthony R.N., Dearden J., 1984).

Foreign researchers interpret the transfer price largely as the price that is set between different divisions and branches belonging to one company (Milgat, M., Newman P., Eatwell J., 1998). There is another identical definition: the transfer price is the price at which divisions of one organization transfer goods (work, services) among themselves.

In Russian studies, many authors adhere to the point of view that the transfer price is a certain internal price at which one unit of the company (workshop, department, etc.) transfers products or services to another (Kuznetsova E., 2011).

Thus, M.A. Bakhrushina (2000) interprets the transfer price as the price at which one center of responsibility transfers its products or services to another center of responsibility, while the author indicates that transfer pricing is the process of establishing internal settlement prices between segments of one company.

According to the generally accepted OECD standards applicable in many countries, transfer prices are the prices at which the transfer of goods, including intangible assets, work is performed and services are provided between related parties (associated enterprises).

The normative concept of the transfer price is reflected in the Protocol on the exchange of information on control of transfer pricing between the tax and customs authorities of the EurAsEC member states of June 6, 2006: “The transfer price is the price of goods, work, services, which differs from the objectively formed market (free) prices for international transactions.”

From the point of view of tax regulation, the transfer price is a price that may differ from the objective market price.

Thus, there is no single approach to determining the transfer price.

Analysis of approaches to the term "transfer price" and "transfer pricing"
To clarify the term “transfer price”, several approaches to the definition were summarized (table 1). From the point of view of the authors, the transfer price in this study refers to the price set between interdependent persons in cross-border and in-country transactions for the sale of assets (works, services).

Table 1: Transfer Price Definition Approaches

Approach	Source	Interpretation
Economic	Foreign sources	Transfer price is the price at which divisions of one organization transfer goods (works, services) among themselves.
	Russian sources	Transfer price - the internal price at which one unit of the organization (workshop, department, etc.) transfers products or services to another.
Tax	Foreign sources	The transfer price is a price that differs from market prices that are applied by unrelated parties in the open market.
	Russian sources	Transfer price is the price formed in a non-market way at which goods (works, services) are sold in transactions between related parties
Legal	OECD: Transfer Pricing Guide	The transfer price is the price at which goods, including intangible assets, are transferred, work is performed and services are provided between related parties.
	UN: Transfer Pricing Guide	Transfer price is the amount a segment of a company receives by delivering goods, assets or services to another segment of the same organization
	EAEU: Protocol on the exchange of information on the control of transfer pricing between tax and customs authorities of states of June 6, 2006	The transfer price is the price of goods, work, services that differ from the objectively formed market (free) price in international transactions.

A source: based on research.

Under the market price of a product (work, service) is understood the price that has developed during the interaction of supply and demand on the market for identical similar goods (work, services) in comparable economic and commercial conditions.

The transfer price is formed not based on supply and demand, but primarily based on the goals of the company when setting it. Thus, the deviation of the transfer price from the level of market prices does not depend on market conditions, but on internal corporate processes.

Transfer pricing is the variation in the contract price of transactions between related organizations in relation to its market values.

According to, Mukhina G.A. (2012) transfer pricing refers to a method of tax evasion, and in business, practice refers to one of the classical optimization schemes for tax planning.

Foreign authors (Velloso F.C., Brigagao G.A., 2012) interpret transfer pricing as manipulating expenses and revenues in transactions between related parties in a way different from that, which would be applied in market conditions, in order to obtain tax benefit.

In the United Nations Guide for Transfer Pricing, this definition is interpreted as the process of setting prices in cross-border, intra-company transactions between related parties related to the sale of property or services.

The most important distinguishing features of transfer pricing are:

1) acts as a method of tax evasion;
2) Is realized between interdependent persons;
3) Leads to financial losses of the state in the form of non-receipt of tax revenues;
4) Is subject to state regulation.

In this study, transfer pricing will be understood as the process of setting prices in cross-border and in-country transactions between interdependent persons for the sale of assets (works, services).

In the process of determining the transfer price, the subjects of transfer pricing interact with the internal and external environment of the organization.

In this study, the external environment of the transfer pricing process will be understood as a set of factors at the macro level that directly (e.g., tax regulation) or indirectly (e.g., the political situation in the country) influence this process.

By the internal environment of the transfer pricing process, we understand the totality of factors at the corporate level that directly affect this process.

It is advisable to formulate an approach to the mechanism of transfer pricing, which implies a set of methods for setting the transfer price in cross-border and (or) in-country transactions between interdependent persons for the sale of assets (works, services) in such a way that common objectives are achieved under the influence of environmental and internal factors such persons.

In this regard, it is necessary to define goals. The financial objectives of the company when applying transfer pricing include:

• Reduction of financial losses in the form of tax and customs payments in the whole group of the corporation;
• Operational financing of subsidiaries (intra-group loans);
• Management of financial indicators of subsidiaries (profit (loss)).
Organizational goals of companies include:
• The need to manage the company's decentralized structures;
• cost control due to the effective distribution of fixed and variable costs throughout the production chain of goods;
• Assessment of the activities of managers and departments for the subsequent increase in their motivation;
• Other goals of corporate management.
Thus, we can say that at present, the effective organization of transfer pricing in Russian companies is one of the most important tasks of financial activity.

PROBLEM STATEMENT

It is customary to single out the mechanism of transfer pricing, which involves the use of a set of methods for determining transfer prices (table 2).

Table 2: International Transfer Pricing Methods

№	Method name	Method essence	Method Group
1	Comparable uncontrolled price method	Comparison of transfer price with market price range	Traditional methods
2	Cost plus method	Comparison of the gross cost-effectiveness of the analyzed person with the market level of gross cost-effectiveness	
3	Resale price method	Comparison of the gross profitability of the analyzed person with the market interval of gross profitability	
4	Transactional net margin method	Comparison of operating profitability with market indicators	Methods based on analysis of profitability of transactions
5	Profit split method	Distribution of the total profit of the subjects of a controlled transaction in proportion to their share in such profit	

Source. Designed based on: OECD Transfer Pricing Guidelines for Multinational Enterprises and Tax Administrations 2010. URL: http://www.oecd-ilibrary.org

The use of transfer pricing by companies leads to the formation of controlled transactions, which in Russian practice are called controlled transactions.

Summing up, it should be noted that transfer pricing is a special mechanism for mutual settlements between interdependent persons with transfer prices. At the same time, transfer pricing is not a market process, since this process is not formed based on supply and demand, but based on the goals of interdependent organizations.

TRANSFER PRICING REGULATION

The Organization for Economic Co-operation and Development (OECD), the United Nations (UN) and the European Union, represented by the European Commission, the Directorate General of Taxation and Customs Union (EU), play a significant role in the foreign practice of implementing international regulation of transfer pricing.

In many countries, national legislation is gradually being improved, which regulates the principles and methods of regulating transfer pricing. In Russia, the term "deoffshorization" is increasingly used.

The first country in the mid-1960s to introduce special provisions for transfer pricing into national law was the United States.

Moreover, the financial law and tax laws of the United States of America are significantly different from the laws of other countries. This led to the search and development of transfer pricing standards and institutions that would be acceptable to most countries.

In 1976, the issue of regulating transfer pricing was first agreed internationally. OECD countries have approved the Declaration on International Investments and Transnational Corporations, containing recommendations for corporations on the inadmissibility of using financial schemes that may distort the tax base in the country where such a multinational corporation operates. Later, in 1979, the Organization for Economic Cooperation and Development issued a corresponding document, in which

corporations were recommended to refrain from using internal corporate financial flows for dishonest purposes (O. Golovchenko, 2013).

In 1995, the OECD approved the Transfer Pricing Guidelines for international corporations and tax administrations or, as it is called in business circles, the OECD Transfer Pricing Guidelines, the provisions of which are fully or partially taken as the basis for the development of national legislation on the regulation of controlled transactions in most countries. This guide is regularly supplemented (revised) by the OECD based on information on the current economic situation in the global economy, modern mechanisms for optimizing financial costs and other aspects of the international regulation of financial flows in controlled transactions.

In international practice, the concept of "transfer pricing" is closely related to controlled transactions. Moreover, in the economic literature transfer pricing is often formulated as a way of manipulating cash flows between interdependent companies in order to avoid tax payments, fees, customs duties and in business practice refers to one of the classical optimization schemes of tax planning (G. Mukhin, 2012). In international documents, the provisions that are used in many countries as part of tax legislation, intra-corporate transactions are transactions that transfer goods, including intangible assets, carry out work and provide services between related parties (associated enterprises).

In the framework of this study, intra-corporate transactions (or transactions between interdependent companies) are the movements of tangible and intangible assets, including monetary resources, between separate but interconnected business entities.

Results

Imagine groups of documents that regulate transfer pricing and controlled transactions.

Group 1. Documentation on the development and application of international rules for regulating transfer prices and transactions between related parties both for tax administrations and for transnational corporations. They include the main approaches to regulating transfer pricing in order to comply with the "outstretched hand" principle, as well as signs of internal corporate transactions, methods and tools for analyzing internal corporate financial flows (functional, economic, financial analysis of controlled transactions, comparability procedures for controlled and independent transactions).

Group 2. Conventions aimed at avoiding double taxation of the same income in different jurisdictions, which is extremely important in the conditions of activity of both transnational corporations and companies engaged in foreign trade activities. International conventions serve as the basis for the formation of interstate bilateral treaties (agreements) on the avoidance of double taxation. For example, the Russian Federation, when concluding bilateral agreements, takes into account the OECD Model Convention on Income and Capital Taxes.

Group 3. Documents containing information on the conclusion of preliminary agreements on the principles of pricing transactions between related parties (Advance Pricing Agreements, APAs). For example, between a company and the tax administration or a tripartite agreement between the tax administrations of different countries and one multinational corporation. The main goal of APAs is to prevent arbitration disputes by creating fair financial flows for previously known transactions between related parties, taking into account the analysis of data on upcoming transactions provided by the taxpayer. First, APAs are concluded for several years and are necessary to resolve current and potential disputes regarding such transactions in cooperation with the tax administration.

Group 4. Documentation explaining certain issues of regulation of transactions between interdependent persons, causing the greatest difficulties for both tax administrations and taxpayers. For example, the European Union approved a single (standard) package of documents for such transactions, having prepared the EU Code of Conduct on the effective application of the double taxation avoidance convention in connection with the adjustment of profits of associates (2009). The standard allowed for

certainty in the regulation of transactions between interdependent companies and reduced the risks of financial losses of transnational corporations in connection with additional costs and penalties in the preparation and submission of tax documentation.

The latest editions of the Organization for Economic Co-operation and Development and UN Guides recommend the use of the most appropriate method for a particular case. This method in business circles is usually called the "best method" (the best method rules). However, only some countries have such a rule in their legislation. Most of the laws of foreign countries provide a special order of priority (gradation) of transfer pricing methods.

In order to improve the legislative regulation of transfer pricing in the structure of the Federal Tax Service of the Russian Federation, the Transfer Pricing and International Cooperation Office has been formed, which checks the completeness of the calc
ulation and payment of taxes in respect of transactions between related parties committed by Russian taxpayers.

In connection with the active development of foreign trade, the regulation of transfer pricing and internal corporate transactions is becoming especially relevant.

INTRACORPORATE TRANSACTIONS OF COMPANIES

As noted earlier, transfer pricing and transactions between related parties are closely related. Let us examine in more detail the essence of these transactions.

In the first studies (50-60 years of the XX century), intra-corporate transactions were considered as a financial mechanism that allows generating profit for each structural unit of the company, which helps to increase productivity and increase the profitability of the entire organization.

In modern conditions, a transaction between interdependent entities means the movement of tangible and intangible assets within a single economic entity in the absence of movement of the relevant cash flows.

The objects of a transaction between interdependent entities are financial flows that are generated as a result of the movement of tangible and intangible assets, including cash between interdependent economic entities. At the same time, the subjects of such transactions are interdependent entities that may influence the financial flows in these operations.

The subject of an internal corporate transaction is the movement of tangible and intangible assets, including cash, in order to obtain related benefits for related parties.

After analyzing internal corporate transactions, it was determined that in the process of implementing this operation, interdependent persons interact with the internal and external environment.

The external environment of the transaction between interdependent parties is a combination of factors at the macro level that directly (financial, tax, currency regulation, etc.) or indirectly (the political situation in the country, etc.) influence the process of its implementation.

The internal environment of such a transaction is a combination of factors at the corporate level that directly affect the process of implementing an internal corporate transaction.

An important aspect in interstate relations is the formation of common international standards for state financial regulation of internal corporate transactions.

In the study, under the state financial regulation of controlled transactions it is customary to understand the continuous process of activities of state institutions that analyze, control and oversee the financial

flows of interdependent companies in order to counter irregularities in the movement of financial flows and eliminate imbalances in their concentration.

In the legislation of the Russian Federation, state regulation of transactions between related parties is implemented based on the provisions of the Tax Code of the Russian Federation, corresponding to OECD documents. At the same time, in this area, Russian companies face serious financial and tax risks associated with the peculiarities of national legislation. An example is the method of intragroup cost allocation on the principle of cost sharing, provided for by the OECD Guidelines, but not reflected in Russian law. As a result, some companies incur significant financial costs for litigation due to the use of this method in their financial strategy[1].
Intracorporate transactions are understood as a separate type of economic relations between interdependent persons, focused on the development of vertically integrated structures in the national and world economy. This means an increasing need for economic entities to develop a system of internal corporate financial regulation of transactions between related parties.

Despite active work to improve legislation-governing transactions between related parties, one should not allow the creation of an excessive tax or other burdensome burden on bona fide taxpayers when introducing new rules and regulations, especially in Russia.

The international and national methods for regulating intra-company transactions are based on the arm's length principle. This principle is to establish market prices in transactions between related parties that correspond to prices used in similar transactions between independent parties.

The risk of double taxation of corporate income on financial flows in internal corporate transactions arises if such companies use prices other than the market level. Therefore, in the conditions of activity of multinational companies, if the tax administration of one country adjusts the tax base of a resident of such a country, the multinational company will incur financial losses for double taxation of the same income in different jurisdictions.

The subjects of international regulation of internal corporate transactions include interdependent persons and tax administrations of the states of which such persons are residents.

The object of international regulation of internal corporate transactions is the size of internal corporate financial flow, which is determined in transactions between interdependent companies in the conditions of national regulation of such financial flows.

The subject of international regulation of internal corporate transactions are economic relations between related parties to the operation.

Let us single out the elements of the process of international regulation of internal corporate transactions:

- identification of a controlled transaction;
- functional, economic and financial analysis of a controlled transaction;
- information for further comparison of a controlled transaction with uncontrolled (market) transactions;
- methods of calculating the market price (profitability) according to the "outstretched arm" principle;
- tax sanctions in case the transfer price differs from market indicators;
- mechanisms for adjusting the tax bases of companies in the absence of double taxation of their income;
- documentation of companies on controlled transactions;
- Tools to minimize financial and tax risks in controlled transactions.

[1] Source: Determination of the Supreme Arbitration Court of the Russian Federation of July 15, 2013 No. VAS-7048/13. URL: http://kad.arbitr.ru.

The following is a ranking of foreign tax systems for priority in choosing regulatory methods (table 3).

Table 3: Ranking of foreign tax systems for priority in choosing methods for regulating internal corporate transactions

Group	Priority method	Country
1	-	France, Ireland, Brazil
2	Comparable Uncontrolled Price Method (CUP)	Venezuela, Spain, Italy, Kazakhstan, Bulgaria, Mexico, Montenegro, Russia
3	Best method rules	Argentina, India, Peru, Singapore, USA, South Africa, Chile, China, Japan, Portugal, South Korea, Norway
4	Conventional OECD Guidelines	Germany, United Kingdom, Latvia, Denmark, Israel, Netherlands, Norway, Poland, Finland, Sweden, Malaysia
5	Method that provides the highest degree of certainty for the determination of an arm's length	Austria, Belgium, Canada, Czech Republic, New Zealand

A source. Formed based on research by international companies PWC, KPMG, EY.

The choice of the method of regulation of internal corporate transactions is one of the most important stages in the determination and justification of schemes of internal corporate financial flows. In foreign practice, two groups of OECD methods have gained international recognition: traditional and methods that are based on an analysis of the profitability of transactions.

The financial regulation of transactions between interdependent companies (controlled transactions) is a form of state control in Russia over the financial flows of interdependent persons, the introduction of which is directed by Federal Law No. 227-FZ of July 18, 2011 "On Amending Certain Legislative Acts of the Russian Federation in Connection with Improvement pricing principles for tax purposes. " This law is based on the OECD Recommendations, which have received international recognition and are applied in most developed countries.

A particularly important change in Russian legislation on the regulation of controlled transactions is the introduction of a comparative analysis. Such an analysis makes it possible to analyze the commercial and financial conditions of transactions, to assess the risks and functions that are performed by the parties to such transactions in order to make a decision on the compliance or non-compliance of the conditions of the controlled transaction with comparable transactions.

Let us formulate the definition of internal corporate financial flow, which is understood as the movement of financial resources in connection with the inflow and (or) outflow of tangible and intangible assets in transactions between related parties.

In addition, we note that an internal corporate transaction is a process of moving tangible and intangible assets within a single economic entity in the absence of movement of the corresponding cash flows.

In turn, controlled transactions of companies are cross-border and domestic transactions between interdependent entities subject to state regulation.
So, controlled transactions of companies and transfer pricing are closely related. Essential in ensuring effective intragroup transactions is the use of the transfer pricing method.

Conclusion

Because of the study, attempts were made to clarify the terms included in transfer pricing, including intra-group financing, in Russian practice. The relationship between transfer pricing and transactions between interdependent parties (intra-corporate transactions) is indicated. The paper presents groups of documents regulating transfer pricing and controlled transactions. The ranking of foreign tax systems was also carried out for the availability of priority in the choice of methods for regulating internal corporate transactions. Taking into account the analysis of international practice, the need for refinement of transfer pricing procedures in the activities of Russian companies is shown.

Abstract

The article shows the topical issues of financing higher education institutions. The study includes general estimates of higher education indicators in Ukraine and abroad. The analysis of the current state and trends of financing higher education institutions has identified the problematic aspects and threats to its further development in the light of experience. The author has offered the ways of further development of the mechanism of financing of higher education institutions. And this allows to expand the range of sources of attraction of financial resources for activation of their economic activity, as well as to achieve greater autonomy. The purpose of the article is to deepen theoretical and methodological foundations and to develop practical recommendations for financing higher education institutions that will give the opportunity to provide the necessary prerequisites for their development.The article is based on general scientific methods of cognition: analysis and synthesis, functional and system analysis, induction and deduction, historical-logical method, system-structural method, analogies and quantitative and qualitative comparisons, graphic, economic-statistical methods of information collection and processing, in particular sample studies, groupings, statistical comparisons of absolute and relative values, the method of logical generalization, the method of analysis of hierarchies. Results. Financing of higher education institutions is a process of providing the necessary financial resources for subjects of all institutional sectors of the economy, types of economic activity, in particular education and its institutions. The stages of evolution of the development of higher education institutions in Ukraine have been identified and it has been made an appropriate forecast. There were highlighted the threats to the functioning of institutions of higher education according to the level of risk (from the lowest to the highest) which was based on the method of hierarchy analysis. According to the particular groups of threats there were proposed the appropriate mechanisms and tools for their elimination.

Keywords: Institutions of Higher Education, State Ownership, Financial Resources, Estimates.

Introduction

Nowadays all spheres of social life providing are getting more and more developed so that need for research and scientific substantiation of methods of state influence on economic development is increasing. The issue of state participation in the financing of higher education is of particular importance, as practice shows that every year the conditions of activity of higher education institutions (hereinafter referred to as HEI) are becoming more complicated.

The main reasons are that, firstly, the reduction of budgetary funding for higher education requires the HEI to constantly look for alternative sources of financial resources for its sustainable development; secondly, Ukraine's entry into the European educational and scientific space exacerbates the competition between domestic and foreign defense law, and as a result the first ones are absolutely uncompetitive comparing with the others; and finally, the strict selection of HEI which want to work in the market of higher education services [1]. In addition, it is worth to note that more and more higher education institutions are joining that is happening thanks to their mobility, advanced logistics and, to some extent, more flexible pricing policies provided for a gradual increasing their share of the higher education services market [2].

Determining the value of the scientific achievements of scientists from different countries in the development of the theory and practice of HSI financing, the modern processes and phenomena in the conduct of educational activities call for a scientific rethinking of existing conceptual approaches to improving their financial provision, in particular, they need to change the financing model and find promising ways of forming their budgets.

In our work we will focus on the coverage of theoretical and methodological foundations and the development of practical recommendations for financing higher education institutions to provide the necessary prerequisites for their development.

The Main Part

The essence of higher education according to S. Bergan can be grouped into 4 categories: 1) preparation of specialists for the labor market; 2) preparing active citizens for life in society; 3) personal development; 4) development and support of the accumulated knowledge base [3]. It is worth to note that all four categories are equally important and should complement each other.

At the same time it is worth to consider J. Horyn's definition who says that “higher education is a market for educational services… supply and demand, their interaction, the existence of a mechanism for forming a market equilibrium and establishing an equilibrium price for educational services” [4]. The author emphasizes that higher education is a type of economic activity and its result is a service or product. Many foreign scholars, such as J. Philip [5], R. Barnett [6], L. Zhu [7], Yu. Messiad [8], hold this position. Thus, the production of higher education services is a key requirement of the economic relationships of all stakeholders and is the result of educational activities. According to this there is a definition of higher education as a system, which includes the process of production of educational services by educational establishments and the result of obtaining specific knowledge, skills that form a number of general and professional competences in the applicant for such education.

According to all official documents, Ukraine has moved to the principles of a free market economy, so the authorial team with the leadership Y. Vitrenko [1] found out that it is natural to move financial relations in higher education to the principles of a market economy. This is particularly emphasized by the fact that in a market economy, each type of activity has its own result. This result is a product (service). We think this practice in a market economy is logical and correct. According to the standpoint of the System of National Accounts (SNA-2008), education is one of the equal 21 types of economic activity that makes the country's GDP. In Ukraine, we use the Classification of Economic Activities (CEA-2010), according to this education has the code P [9] (Table 1).

It is important to note that higher education is one of the key programs which makes the professional training for professionals in our society, provides the constant activity and development of not only the individuals but also the whole state.

Table 1: Position of Education in y CEA–2010

Code	Name	CEA (Rev. 1.1)	ISIC (Rev. 4)
P	Education	–	P
85	Education	–	85
85.4	Higher education	–	853
85.42	Higher education	80.30	8530

The source: based on [9].

Researches of scientific approaches, which are used to understand the nature of financing HEI, have shown that mainly it is a process of providing the necessary financial resources for subjects of all institutional sectors of the economy, types of economic activity, including education and their institutions. Concerning the state financial resources of HEI, they are budgetary and extra-budgetary funds (with the formation of general and special funds) at their disposal, determined for the smooth functioning of HEI and contribute to improving its competitiveness and autonomy within the current legislation. In this context, they are classified as following: 1) types of services; 2) the method of formation; 3) activities; 4) the form of ownership; 5) consistently income; 6) belonging.

Research Methodology

The founders of the concept of human capital, T. Schultz and G. Becker [10], pointed out that education is an investment in individuals that generates a return, like any other investment.

One of the representatives of neoclassicism, Nobel laureate R. Schiller (2013), in his work Finance and a Good Society [11], stated: "… government intervention… should not adversely affect market decisions. In this case, the task of the state is to establish clear rules that protect consumers, promote actions that are in the public interest and allow players to compete in areas where they have the most advanced business capabilities and provide the best goods and services.

Mentioned rules should have an international dimension, as the different features of today's markets are global reach and instant impact "[12]. Issues related to economic relations in the field of higher education are addressed in some way in the chapters "Educators", "Finance Specialists in the field of public goods" and "Managers of non-profit organizations and trustees". Particularly, it is noted that teachers are one of the central places in view of the functioning of the financial system as a whole, there are also offered recommendations to improve the teaching of finance and business in colleges and universities, and on the implementation of economic activity by universities in the status of non-profit organizations.

M. Friedman, the winner of the 1976 Nobel Prize in Economics, in his work "Capitalism and Freedom", in the Chapter "The Role of the State in the Field of Education", admitted that the role of the state in the field of education is "thoughtlessly" expanded even on private enterprises in the countries which have their own organization and philosophy [11]. In his opinion, state intervention in economic activity in the field of education should be limited only in cases where it is impossible to provide "free exchange" and in "paternalistic" care of children and other incapacitated individuals. As a result M. Friedman proposes to the state "… to provide a certain minimum compulsory level of education, which would be financed by the issuing "vouchers" to parents/ And according to this each child would get certain annual financial sum and would use it only for "officially approved" training.

Adam Smith was the first who realized that the methods of organizing economic cooperation which we came across could not be only in limits of our knowledge and perception.

So that, the post-Keynesians (J. Robinson, N. Kandor, P. Sraffa), and first of all J. Robinson, directly pointed to the reorientation of military expenditures on health care, education, and social insurance. When we characterize Keynesianism, neo-Keynesianism, and post-Keynesianism, we have to admit that we have not been able to find jobs that deal with the problems of economic relations, both in education as a whole, and in higher education in particular, that have received considerable attention that does not give us reason to use Keynesianism, neo-Keynesianism and post-Keynesianism is the theoretical basis of our study.

J.M. Mayer, D. E Rauch and A. Filipenko in their study "The main problems of the development economy" said "There are several ways to determine the rates of return on investment in education and they are following: type of investment (private or public); level of economic development of the country; type of curriculum – general or vocational secondary education; type of economic sector in which the worker operates (modern wage or self-employment), and also gender way" [13].

Results of the Research

Education is the basis in the development of national economies. Success is achieved by those countries which have been able to provide high levels of educational development, produce new knowledge, use new technologies. For many of them, higher education is a priority area of the economy, where considerable financial resources are invested in order to ensure its development. So Fig. 1 shows the share of education expenditures in Ukraine and some other countries in 2018.

Fig. 1: Share of education expenditures in Ukraine and some other countries in 2018
The source: based on [14].

The main result and product of education is an educational service and which, in our opinion, is the production of a specific intellectual product of some value, with its satisfaction of the consumer's needs to obtain an appropriate level of theoretical knowledge and practical skills for their further using in the field of professional activity. It includes the production of pre-school, secondary and tertiary education services. As a rule, the Ukrainian theory is based on the fact that the services are provided to the consumer. But according to the foreign theory they are sold to the buyers (consumers), although CEA-2010 is the exception, because production of services is provided in all institutional sectors of the economy. Fig. 2 shows higher education services according to the levels of ISCE (2011) in some countries in 2018. Data show that the contribution of higher education services output to GDP in 2018 in Ukraine and the United States exceeds the values of the analyzed countries and was 2 , 65% and 2.68% while it was 1.81% in the UK, 1.23% in Germany, 1.48% in France, 1.26% in Spain, 0.97% in Italy.

The source: based on [14].

On Fig. 3 we can see the higher education services according to the source of payment in some countries in 2017.

Fig. 3: Higher education services according to the source of payment in some countries in 2017, % of GDP

The source: based on [14].

We believe that the evolution of the development of HEI financing in Ukraine took place in several stages, depending on the changes in its institutional and financial support, in particular: 1) the formation of the regulatory framework (1991-1995); 2) modern foundations of educational activity (1996-2001); 3) implementation of the Bologna system (2002-2014); 4) informatization and innovation (2015-2017); 5) reforming. New High School (2018 – present days).

During the collapse of the USSR in 1991, there were 742 HEI of the II-II accreditation levels (AL.) and 149 - III-IV (AL)., and in 2018 - 370 and 282, so that is almost twice the reduction of the number of the former, while the number of HEI III-IV (AL) has a steady tendency to increase their share in

the total number of HEI. At the same time, there is a decrease in the contingent of higher education applicants, and this fact leads to a loss of individual funds of educational services and, consequently, to a reduction in the number of HEI (Fig. 4). Trend analysis of the amount of HEI has illustrated that in the future there will be a stable tendency to decrease the forecast indicators. Thus, in 2021-2022 there will be 327 HEI I-II and 247 HEI III-IV (AL).

Fig. 4: Dynamics of the number of HEI and Higher Education Applicants in 1990-2018 in Ukraine

The source: based on [15].

To implement the effective educational activities, modern HEIs need adequate financial support. Currently, there is a growing trend in financing education (Fig. 4), which is rather nominal in nature due to the merger of public funds and private sector revenues as well as inflationary processes by the State Treasury.

According to the percentage of total expenditures, the amounts of funding fluctuate insignificantly. We have the same situation with the part of higher education budgets to GDP (Fig. 5).

Fig. 5: Dynamics of expenditures on education and higher education in Ukraine, 1991-2018, % of GDP

The source: based on [15]

According to the current legislation, the state is obliged to provide at least 7% of GDP on education at the expense of state, local budgets and other sources of financing, which are not prohibited by law. Instead, in 1991, the figure was 5% and in 2018 was 5.9%, with the lowest one in 2000 (3.6%) and the highest one in 2010 (7.4%). As a result it leads to a significant decrease in the competitive advantages of Ukrainian HEI, inhibiting the development of educational and scientific activities.

Determining the effectiveness of using the budgetary funds for their main managers and subordinate HEI revealed the need to formulate a comprehensive methodology for such assessment. Besides, when we determine the forms of budget financing of HEI, we should apply the differentiated approach because of the specifics of their general and specific tasks. With regard to capital expenditures, budget investments should be increased to further stabilize public finances.

We believe that it is important to carry out threat modeling and to build an economic and mathematical model that will cover different parameters and identify the problematic aspects of educational institutions financing. Timely identified threats that can have a negative impact on the functioning of educational institutions, as well as prompt measures taken to eliminate or minimize the negative impact contribute to the effective and stable development not only of individual higher education institutions, but in the whole educational field. Using the method of analyzing the hierarchy of threats to the effective functioning of these establishments, they can be ordered by the importance of influencing the process, and the Saati method will identify the components to strengthen or weaken the effect of the causative factor.

Suppose that the set $Z = \{z_1, z_2, \ldots z_m\}$ contains threats to the functioning of higher education institutions in today's economic, social and political realities. Therefore, it is necessary to identify the key threats by which the set $Z1 = \{z_1, z_2, \ldots z_n\}$ of the set Z ($Z_1 \subset Z$) is given. We form a table showing the list of factors (threats) and their mathematical designation (Table 2).

We show a subset of factors Z_1 and possible causal relationships between them by means of an oriented graph (Fig. 6) consisting of 13 points where the edges connect adjacent pairs of vertices (zi, zj). The arrow is pointing from factor z_1 that depends on the factor zj (end of arrow). For example, the low level of training of graduates of the HEI is caused by insufficient financing of innovative needs of these institutions and development of scientific and pedagogical potential.

Table 2: List of factors and their mathematical notation

Mathematical notation	Factor name	Mnemonic name
Z_1	low level of internationalization of domestic higher education institutions	LLI
Z_2	inconsistency of the positions of scientists and politicians on the development of education	IPSP
Z_3	moral and physical deterioration of fixed assets and intangible assets in higher education institutions	MPDFA
Z_4	the relative slowdown of the rates of development of education in comparison with the rapid modernization of modern society	RSRDE
Z_5	the gap in the quality of education in comparison with the educational systems of the developed countries of the world	GQE
Z_6	low level of training of graduates of higher education institutions	LLTG
Z_7	imbalance of higher education funding sources (significant over-balancing of the state share)	IHE
Z_8	oversaturation of the labor market by graduates of higher education institutions	OLMG
Z_9	separation of training from practice	ST
Z_{10}	insufficient financing of innovative needs of higher education institutions and	IFIN

	the development of scientific and pedagogical potential	
Z_{11}	lack of clear strategy of financing higher education institutions	LCSF

Z_{13}	competition of domestic higher education institutions with foreign educational institutions	CDI

Fig. 6: Graph the causal link between the major threats of effective HEI financing

Using the data of Fig. 6 it is possible to construct a binary dependence matrix $B = (b_{ij}, \quad i,j = \overline{1,13})$ where each of the elements of the matrix

$$b_{ij} = (0,1) \tag{2}$$

1, if vertex I depends on the vertex J
0, if vertex I doesn't depend on vertex J
According to the results of the binary relation "depends on" all the elements in the matrix can take two values of 0 and 1.

Table 3 shows a binary dependency matrix, where the first column and the first row of the table indicate the threat number and the second row and the second column indicate its name. The created matrix satisfies the condition of transitivity.

Table 3: A binary matrix of the relationship of causal relationships between the major threats of effective functioning of higher education institutions

	Mnemonic Factor name	1	2	3	4	5	6	7	8	9	10	11	12	13
		LLI	IPSP	MPDFA	RSRDE	GQE	LLTG	IHE	OLMG	ST	IFIN	LCSF	SI	CDI
1	LLI	0	0	0	0	1	0	0	0	0	0	0	0	0
2	IPSP	0	0	0	0	0	0	0	1	0	1	1	0	0
	MPDFA	0	0	0	1	1	1	0	1	0	0	0	0	1
4	RSRDE	0	0	0	0	0	0	0	0	0	0	0	1	1
5	GQE	0	0	0	0	0	1	0	0	0	1	0	0	1
6	LLTG	0	0	0	0	0	0	0	0	0	0	0	1	1
7	IHE	0	0	0	0	0	0	0	0	0	1	0	1	0
8	OLMG	0	0	0	0	0	0	0	0	0	0	0	0	0
9	ST	0	0	0	0	0	1	0	0	0	0	0	0	0
10	IFIN	0	0	0	1	0	0	0	0	0	0	0	1	0
11	LCSF	1	0	1	0	0	0	0	0	1	0	0	1	0
12	SI	0	0	0	0	0	0	0	0	0	0	0	0	0
13	CDI	0	0	0	0	0	0	0	0	0	0	0	0	0

We construct a reach matrix I + B, where I is a single matrix of order 13. The obtained matrix corresponds to the condition:

$$(I+B)^{k-1} \leq (I+B)^{k} = (I+B)^{k+1}, \quad (3)$$

where k is an integer.

From the set Z1 we have previously defined, for each of the thirteen factors, there are two subsets: R (zi) is the reach set, and A (zi) is the previous set (the set of previous vertices). The achievable vertex can be considered provided that the vertex zj can be reached from the vertex zi n in the graph (Fig. 6), there will be a path leading from the vertex zi to the vertex zj. The vertex zi is the vertex zj the precursor if it can reach its vertex.

Formed sets R (zi), A (zi), as well as their cross section are presented in Table. 3. From those vertices of the graph for which the condition is satisfied

$$A(z_i) = R(z_i) \cap A(z_i), \quad (4)$$

the first (lower) level of the hierarchy is formed. These vertices can be considered as out of reach of all other vertices of the graph.

It is necessary to determine the first level in the threat hierarchy (the lowest in terms of the greatest impact on the object under study). For this we construct the table (tab. 4), according to the above algorithm.

The fulfillment of condition (4) is clearly presented for the threats: Z2 - inconsistency of the positions of scientists and politicians in the development of education; Z7 - imbalance of higher education funding sources (significant over-governmental share). The next step is to remove from the table the rows that correspond to the selected vertices (Z2, Z7), as well as to remove the numbers 2, 7 from the entire table. According to the Oriented column, all vertices that meet the identified threats are removed.

We have got results in seven levels of hierarchy (from smallest to largest) thanks toc computer-aided modeling: 1) imbalance of financing sources (significant prevalence of government share); the inconsistency of the positions of scientists and politicians on the further development of higher

education; 2) lack of a clear financing strategy of HEI; 3) separation of training from practice; moral and physical deterioration of fixed assets and intangible assets; low level of internationalization and academic mobility; 4) oversaturation of the labor market by graduates of ZVO; the gap between the quality of education and the educational systems of developed countries; 5) insufficient financing of innovative needs and development of scientific and pedagogical potential; low level of preparation of graduates of HEI; 6) the relative slowdown in the development rate of education in comparison with rapid modernization of society; 7) inconsistency of the status of "budgetary institution" as a subject of economic activity with the principles of market economy; competition with foreign HEI in attracting entrants. HEI are constantly forced to seek additional sources of financing for their own needs for sustainable development, which is a decisive factor in ensuring their competitiveness. This will contribute to the integration of HEI in the international market. [18].

Table 4: The first iteration of the causal link between the major threats of the effective functioning of higher education institutions

Z_i	$R(z_i)$	$A(z_i)$	$R(z_i) \cap A(z_i)$
Z_1	Z_1, Z_5	Z_1, Z_{11}	Z_1
Z_2	Z_2, Z_8, Z_{10}, Z_{11}	Z_2	Z_2
Z_3	Z_3, Z_4, Z_5, Z_6, Z_8, Z_{13}	Z_3, Z_{11}	Z_3
Z_4	Z_4, Z_{12}, Z_{13}	Z_3, Z_4, Z_{10}	Z_4
Z_5	Z_5, Z_6 ,Z_{10}, Z_{13}	Z_1, Z_3, Z_5	Z_5
Z_6	Z_6, Z_{12}, Z_{13}	Z_3, Z_5 , Z_6, Z_9	Z_6
Z_7	Z_7, Z_{10}, Z_{12}	Z_7	Z_7
Z_8	Z_8	Z_2, Z_3, Z_8	Z_8
Z_9	Z_6, Z_9	Z_9, Z_{11}	Z_9
Z_{10}	Z_4, Z_{10}, Z_{12}	Z_2, Z_5, Z_7, Z_{10}	Z_{10}
Z_{11}	Z_1, Z_3, Z_9, Z_{11}, Z_{12}	Z_2, Z_{11}	Z_{11}
Z_{12}	Z_{12}	Z_4, Z_6, Z_7, Z_{10}, Z_{11}, Z_{12}	Z_{12}
Z_{13}	Z_{13}	Z_3, Z_4, Z_5, Z_6, Z_{13}	Z_{13}

Currently, all state higher education institutions are in the status of “budgetary institution”, which according to the Budget Code of Ukraine “is fully maintained at the expense of the state or local budget” and is not profitable. In this context, we agree that the “budgetary institution” status makes it impossible for higher education institutions to obtain economic (including financial) autonomy (autonomy)” [1]. Autonomy needs to be expanded as it works abroad. Therefore, in this context, the Cabinet of Ministers considers it is necessary to change the system of financing and “predicts that within 5 years at least 70% of state higher education institutions will withdraw from the status of budgetary institution”. It is necessary to choose the target buyer and use the positioning scheme with a focus on the "hero" for successful positioning of educational services [19].

Higher education institutions need to carry out economic activities in a status that will give them full financial autonomy. These include statuses such as a nonprofit organization and a non-financial corporation. The status of a non-profit organization, in accordance with the SNA-2008, implies that the profit earned by an educational institution may remain completely at its disposal [1].

We have proposed appropriate mechanisms and instruments for their neutralization according to the given identified groups of threats, in particular: transition from the principle of retention at the expense of the state budget to state support of the HEI in practically possible sizes; ensuring efficient allocation of financial resources from state and local budgets with appropriate control; development of financing standards with minimum social standards; enhancing the prestige of intellectual work; development of educational crediting system; stimulating effective demand for quality educational services; formation of educational and scientific clusters, creation of attractive conditions for receiving promoter’s funds; assistance in raising funds through investment programs in the form of grants; granting to HEI tax privileges for income from the realization of independent profitable

activity, etc. So higher education funding is important because it affects the GDP of a country. It should be noted, GDP is one of the main indicators determining the level of economic growth in countries and regions across the globe [20].

Conclusion

HEI financing is a process of providing the necessary financial resources to subjects of all institutional sectors of the economy, types of economic activity, in particular education and its institutions. The main sources of HEI financing include funds from local and state budgets, receipt of HEI resources from educational, scientific, industrial activity, rental property payment, proceeds from the sale of property, preferential state loans for higher education, payment for applicants training at the expense of firms and enterprises. , charitable contributions, grants and gifts, funds received for the execution of specific assignments from legal entities and individuals.

When we study the stages of the evolution of the HEI in Ukraine and the corresponding forecast, it has been established that they require financing increasing. There is a growing trend of financing education in absolute and relative terms, but inflationary processes are outpacing funding. At the same time, the increase in the amount of education expenditures was achieved by combining public and private expenditure on education through the State Treasury. Education budgets, including higher education, as a percentage of GDP are remaining too low and have no steady upward trend.

We have to pay attention to the impact of threats to their sustainable development improving a mechanism of financing the activities of the HEI. The main threats to the effective functioning of the HEI are the problems of general development as well as financial problems. We have developed threats according to the degree of risk which were based on the method of hierarchy analysis. And as a result it is possible to propose appropriate mechanisms and tools for overcoming them for the sustainable financial development of HEI.

Asset Tokenization and Trading Using Blockchain Technology
- Strategic Use of Technology in The Financial Sector -

Dan C. CEARNAU

The Bucharest University of Economic Studies, Bucharest, Romania
dan.cearnau@gmail.com

Abstract

This paper is analyzing the use of Blockchain technology to issue and trade digital tokens representing real-world assets. From the beginning of trading (in ancient history) to the modern stock exchange, technology made a powerful impact on how this industry works. Until very recently (the 2010s), the technology only affected the trading itself and how assets are priced and traded, but now, digital assets are reinventing the commodities themselves (like Bitcoin). The paper will present in-depth how asset tokenization is done, as well as what are the advantages of using digital assets in accomplishing settlements between buyers and sellers on a free market. An in-depth analysis of the real-estate tokenization will be presented, diving into the process itself as well as the advantages and disadvantages over the traditional market.

Keywords: Blockchain, Decentralized Finance, Tokenization.

Introduction

The financial world, as well as the digital world, have come up with two different types of assets. Traditional assets (like gold, oil, etc.) that started being traded as real physical assets (like gold bars, Brent crude oil, etc) have slowly evolved into being digitalized in the 20th century with the introduction of CFDs and other derivatives. Trading in ancient history meant that a value was established between the goods traded, without any central monetary system (in the form of money). Trading also meant that goods were physically transferred from one person to another. (Bernstein, 2008)

Starting in the 1970s, a more significant portion of transactions have shifted to electronic trading platforms. These include electronic communication networks, alternative trading systems, "dark pools" and others. The first electronic trading platforms were typically associated with stock exchanges and allowed brokers to place orders remotely using private dedicated networks and computer terminals. During the period from 2001 to 2005, the development and proliferation of trading platforms saw the setup of dedicated online trading portals, which were online electronic venues with a choice of many electronic trading platforms rather than being restricted to one institution's offering. (Lins, 2013-2014)

One of the first and most popular electronic stock exchange is NASDAQ (was initially an acronym for the National Association of Securities Dealers Automated Quotations). Stock exchanges trade securities (as shares/stocks in companies), but investors can also buy commodities (such as gold and oil) through ETFs (Exchange Traded Funds). An exchange-traded fund (ETF) is an investment fund traded on stock exchanges, much like stocks. An ETF holds assets such as stocks, commodities, or bonds and generally operates with an arbitrage mechanism designed to keep it trading close to its net asset value. (Investopedia, 2004)

Trading assets electronically are raising a number of issues regarding the security and market practices done by exchanges. Stock exchanges are using a centralized ledger (database) to store order books and make settlements (matching orders) between buyers and sellers.

Introducing Digital Assets

Digital assets (like Bitcoin and other cryptocurrencies) have appeared in the early 2010s. They have rapidly been taking a share of the financial market, reaching a total market cap of over 800 billion dollars in 2018. Digital assets are powered by blockchain technology to ensure the validity and immutability of transactions. (Stringham, 2015)

Digital assets are a new emerging asset class of digital, virtual, and cryptocurrencies that share characteristics and operate in similar ways. Cryptocurrencies are the most common form of digital assets that are traded on digital asset exchanges. Cryptocurrencies record transactions on public ledgers known as "blockchains". They are the first form of digital money where an intermediary is not required to send funds from one person to another person.

Comparison with Traditional Assets

In order to analyze digital assets against traditional assets, we need to compare the most popular item of each class. In the table below we compare one of the most popular commodities (gold) against the most popular currency (USD), and against the most popular digital asset (Bitcoin):

Table 1: Gold vs FIAT vs Cryptocurrency (iHodl, 2018)

Traits of money	Gold	Fiat (US Dollar)	Crypto (Bitcoin)
Fungible (Interchangeable)	High	High	High
Non-Consumable	High	High	High
Portability	Moderate	High	High
Durable	High	Moderate	High
Highly Divisible	Moderate	Moderate	High
Secure (cannot be counterfeited)	Moderate	Moderate	High
Easily Transactable	Low	High	High
Scarce (Predictable supply)	Moderate	Low	High
Sovereign (Government issued)	Low	High	Low

Decentralized	Low	Low	High
Smart (Programmable)	Low	Low	High

The main advantages of digital assets are the transparency and ease of use. A straightforward comparison can be made between one of the oldest and most known real-world assets (gold), and the first and most popular digital asset (bitcoin). Bitcoin is developed to act as a digital gold and has many of its attributes: scarcity, being a medium of exchange, source verification, intrinsic value (because of the mining cost).

In the last decade, Bitcoin has attracted a lot of interest from investors since it offers some benefits when compared to gold.

Precise Existing and Total Supply

Mathematics/algorithmics power Bitcoin and its total supply is limited to 21 million units. At this moment, there are around 18 million bitcoins in existence. The number is exact and can be independently verified on the public Bitcoin blockchain. One of the most popular Bitcoin blockchain explorers is http://blockchain.info/.

Gold has been used for thousands of years as a store of value. The exact quantity of gold mined through the centuries is not well-known. A figure that is widely used by investors comes from Thomson Reuters GFMS (formally Gold Fields Mineral Services), which produces an annual gold survey. Their latest figure for all the gold in the world is 171,300.00 tonnes, but not everyone agrees with the GFMS figures. Estimates range from 155,244.00 tonnes, marginally less than the GFMS figure, to about 16 times that amount - 2.5 million tonnes. Part of the reason is that gold has been mined for a very long time - more than 6,000 years, according to gold historian Timothy Green. (Prior, 2013)

The amount of gold mined each year is not foreseen or well-known. This situation creates an issue for potential investors, as they don't know if certain actors control vast amounts of gold that can drive the price down.

Verifying and Sourcing

The gold is usually verified by using X-Ray machines that are very expensive and not widely available. X-Ray machines can only penetrate a few centimeters of the gold bar, so fraudsters can replace the interior of large gold bars with Tungsten (an element that has the same density as gold but only costs one-fifth of the price). (Wile, 2012)

Bitcoin can be easily verified in a few seconds from any internet-connected device in the world. The verification of a transaction is free, safe, and instantaneous. Bitcoin balance or transactions can be verified by running a node or by using a public explorer.

Another big difference between gold and bitcoin is the traceability of the asset. Sometimes gold has been stolen or mined under illegal conditions, causing the proceedings to finance organized crime or terrorism. Gold can be re-minted, and new bars can be issued from existing ones. A new technology called "gold fingerprinting" has been used to lay claim to stolen or relocated gold. This method is used to characterize gold or a gold-containing item by its trace elements, fingerprinting the sample by mineralizing event, and to the particular gold mine or bullion source.

There are well-known issues with stolen gold over the centuries. Some of these examples are:

Gold stolen by Nazi Germany from the occupied countries that were never recovered (around 1,000.00 tons). The criminal proceedings are used to finance terrorism, or organized crime with gold has thus created a name called "dirty gold".

Bitcoin can be easily traced and cannot be "re-minted". Once a bitcoin was involved in illegal activity, it can be marked any future buyer will be notified of this illicit history.

Cost and Security

Storing gold is expensive, as well as transporting it.

Bitcoin is free to be stored, and transactions only takes minutes and is almost free (a transaction costs only a few cents). This means that investing in gold also comes with a management fee that needs to be covered by the investor. Such a fee doesn't exist for Bitcoin investments.

How Asset Tokenization Works

In order to issue digital assets that represent real-world assets, an in-depth analysis of the process needs to be done:

1. Real-world asset fungibility
2. Blockchain platform
3. Governance

Asset Fungibility

There are 2 main types of assets that can be tokenized: fungible and non-fungible assets.

- *Fungible assets*

Fungibles goods refer to items that are equivalent or consist of many identical parts such that, for practical purposes, they are interchangeable. Material items, securities, and other financial instruments may be considered fungible goods. If goods are sold by weight or number, then they are probably not fungible goods. (Kenton, 2019)

Tokenizing fungible assets means issuing a single digital token that represents an asset of it's kind. The most straightforward token representing a fungible asset is a digital gold token. Gold, in a specific form, like LBMA (London Bullion Market Association) standard, is a fungible asset since any gram of gold is identical to any other gram of gold of the same quality. Certain cost elements like bar size, the location, or the minter of the bar can make a small difference in the price of the asset, but this difference is small when compared to the price of the underlying asset.

One of the most significant tokens is called ERC-20, which has emerged as the technical standard used for all smart contracts on the Ethereum blockchain for token implementation.

- *Non-fungible assets*

Non-fungible assets are items that cannot be replaced between them. Some examples are real-estate assets, collectibles, paintings, rare gold coins, etc.Tokenizing a non-fungible asset means issuing a token for each asset individually. Non-fungible tokens are usually called collectibles.

ERC-721 is a free, open standard that describes how to build non-fungible or unique tokens on the Ethereum blockchain. While most tokens are fungible (every token is the same as every other token),

ERC-721 tokens are all unique. (@dete, n.d.). After the fungibility of the asset is determined, a standard is selected for issuing its digital counterpart.

Blockchain Platform

Because the newly issued digital asset needs a distributed ledger (blockchain) to store its transactions. A blockchain platform has a few characteristics that are important for the tokenization process:

- *Public or private blockchain:*

If the transaction ledger is public, all the information can be independently verified by 3rd parties. If the transaction ledger is private, only certain parties can verify transactions.

Table 2: Public vs Private blockchains

Public	Private
Open, anyone can join the network.	Restricted and permissioned, a new member joins the network via invitation.
Each node has equal transmission power (distributed)	Only certain nodes can create new transactions.
Low speed of transaction accomplishment due to network size/latency.	Fast speed of transaction accomplishment.
Long transaction approval frequency.	Short transaction approval frequency.
High cost of each transaction.	Comparatively cheap cost of each transaction.
Proof-of-work, proof-of-stake consensus protocols for the adding of a new block.	Pre-approved participants initiate adding of a new block.
Anonymous	Identified parties.
Trustless environment. Members don’t need to trust each other.	Trustful environment. Members need to trust each other.
Large energy consumption.	Low energy consumption.

- ***Anonymity:***

Certain blockchain technologies offer users the anonymity of their transaction history and balances. Projects like Monero or Zcash use cryptographic technologies such as ring signatures or zk-SNARKs (Zero-Knowledge Succinct Non-Interactive Argument of Knowledge). This enables the blockchain to verify transactions without knowing what its origins are and thus not enabling the tracing of the tokens.

Most popular blockchain platforms for issuing tokenized assets are: (Laurent, n.d.)

- Ethereum: *Ethereum* is an open-source, public, blockchain-based distributed computing platform and operating system featuring smart contract (scripting) functionality. Ethereum ecosystem uses the ERC (**E**thereum **R**equest for **C**omment) methodology to issue standards for tokens on its platform.
- Bitcoin: Transaction ledgers for tokens can be stored on the public Bitcoin blockchain.

Governance

A tokenized asset represents ownership of the underlying real-world asset. This means that a set of rules (Governance) needs to set in place in order for the digital asset to be trusted. Usually, a digital asset is created as a smart-contract, and most of the contractual aspects of the financial instrument are built in the source code.

For a tokenized asset governance to work, a few characteristics need to be determined:

- *Issuance rules*

The smart-contract needs to be developed, so only certain players can issue new tokens. For example, in the case of a non-fungible token that represents the ownership of a building (real estate asset), after the initial minting of tokens, no new tokens should be minted.

In the case of a fungible gold-backed digital token, new tokens can be minted by adding more gold reserves.

- *Burning rules*

Certain digital assets enable the burning (destroying) of tokens under certain conditions. For example, withdrawing a gold bar from a vault requires the burning (destroying) of its digital counterpart.

Fig. 1: Real-estate tokenization flow

- *Advantages of asset tokenization*

There are multiple advantages of asset tokenization. Trading digital assets that represent real-world assets enables investors to manage their portfolio more easily and eliminates the trust between them and the brokers.

Liquidity of an asset represents the ease of converting the respective asset to cash, with cash being fully liquid. Certain asset classes have different liquidity, as well as assets in the same class can have a big variation in liquidity in certain markets and at certain times. (Damodaran, n.d.)

The main factors that influence the cost of illiquidity is the Cost of Trading. The cost of trading in a certain asset class has a couple of components such as:

Table 3: Comparison of asset class

Cost Component	Fungible Asset (gold, oil)	Non-fungible Asset (real estate)	Tokenized non-fungible asset
Brokerage cost The transfer cost for the asset.	**Low**	**Medium** *(notaries, land titles)*	**Low** *(no intermediaries, low to no transfer fees)*
Bid-Ask Spread The difference between the price at which you can buy the asset and the price you can sell the asset at a certain point in time.	**Low**	**Large** *(limited number of buyers/sellers)*	**Low** *(small minimum order size reduces the bid-ask spread)*
Price Impact The price impact that a buyer or seller has on the trading price. Large orders can move the price of assets with small liquidity.	**Low**	**Medium** *(the market is localized in a city/country)*	**Low** *(asset can be sold/bought in traches without)*
Opportunity Cost This cost component covers the difference in price due to waiting to trade the certain asset.	**Medium** *(prices can move swiftly)*	**Low** *(market is reacting slow)*	**Low** *(token is backed by the underlying asset, market is stable)*

Fig. 2: Liquidity and illiquidity discount by asset class

[1]*EM: Emerging Markets*
[2]*OTC: Over-the-Counter trading*

Tokenization Impact of Illiquidity Discount

Highly illiquid assets like real-estate or art can be tokenized using blockchain technology in order to reduce the discount of illiquidity in their respective markets. The illiquidity discount is even more noticeable on non-fungible assets since trading such an asset often involves its entire value. One of the most discounted markets because of the illiquidity is the real estate market. Since most buildings cannot be split and sold individually, the only option is to sell the entire asset. Selling the asset as the whole means asking the full price, and thus, reducing the potential buyers to only entities that have the necessary capital.

Even fungible assets such as gold can have a higher discount because of their physical structure. Larger gold bars can be sold at a premium because any buyer needs to buy the entire bar. Re-minting gold bars is often and can solve part of the issue, but it comes with additional costs.

Investing in non-fungible assets can also lead to liquidity issues for investors. Since non-fungible assets can only be sold as a whole, if the investor needs urgent liquidity, he cannot sell parts of his investment. Selling the whole property also comes with a discount, and this reduces the yield of the investment in a non-fungible asset. Tokenizing assets can reduce both the transaction costs, as well as the holding costs of these assets.

One of the essential features of the blockchain technology is the elimination of intermediaries in making transactions. Especially in real-estate, deals come with considerable fees since both notaries and land-title companies need to keep ledgers of past sales and current owners.
Trading tokenized real-estate securities on a digital asset exchange platform removes most of these intermediaries and dramatically reduces the transaction fee.

Digital Asset Exchanges

Tokenized assets are traded on digital asset exchanges, the act as intermediaries between buyers and sellers. Since tokenized assets are registered on a blockchain, the digital assets exchanges are also

powered by blockchain technology to enhance the discovery of price and settlement between involved parties.

There are two main types of digital asset exchanges: centralized (CEX) and decentralized exchanges (DEX).

- *Centralized Digital Asset Exchanges (CEX)*

The first digital asset exchanges are CEX (Centralized EXchange). These are traditional exchange platforms similar to Forex (FOReign EXchange market). They work by maintaining order books and intermediate settlements between buyers and sellers. Since a central authority does not control digital currencies (cryptocurrencies), accounts cannot be blocked. This is a big issue with the security and custody of digital assets. Numerous exchanges have been hacked, and user funds have been lost.

In the past, the word "centralized" was given to all institutions that managed finances.

To be centralized means that there is a trusted middleman to handle whatever asset may be in a trade. In a bank, for example, a customer gives their money over to the bank to hold for them. This one institution is now in complete control of the customer's money.

In many cases, this is much safer than a person finding some way to manage themselves. Banks have many securities and a team to watch over their customers' money. The bank can also offer a variety of services, such as loans because the bank has a large amount of money and has created a trust relationship with the customer. (Dedi, 2018)

- *Decentralized Digital Asset Exchanges (DEX)*

Besides powering token transfers and storing, the blockchain technology is also enhancing trading those securities on decentralized exchanges. Decentralized exchanges have appeared in late 2010s as a measure to combat the cybersecurity risks of operating centralized cryptocurrency exchanges. (Jeong, 2018)

A DEX operates in a decentralized way, without a central authority. Decentralized exchanges allow peer-to-peer trading of cryptocurrencies as well as tokenized securities. Because users do not need to transfer their assets to the exchange, decentralized exchanges reduce the risk of theft from hacking of exchanges. Decentralized exchanges can also prevent price manipulation or faked trading volume through wash trading, and are more anonymous than exchanges which implement know your customer requirements.

Tokenized FIAT

Most of the time, trading assets (utilities or securities) on a blockchain platform means exchanging its value to traditional currency. The term *fiat* derives from the Latin *fiat* ("let it be done") used in the sense of an order, decree or resolution. (Mankiw, 2014)

Fiat currencies are managed by banks using traditional centralized ledgers and central authority (usually a central bank). A wire transfer or ACH (Automated Clearing House) transfer usually involves several intermediary organizations (banks or payment institutions).

Blockchain technology is about removing the intermediary in financial transactions and giving the customer custody and control over his assets. Managing traditional currencies on a blockchain platform is not possible without using a so-called "stablecoin".

Stablecoins represent the digitalized version of traditional currencies deployed on a distributed ledger (blockchain). They are one of the most relevant developments in the crypto ecosystem and one that has been increasingly getting traction.

At a high level, stablecoins can be divided into three main categories:

- *Fiat-Backed Stablecoins*

This type of stablecoins is typically pegged to a fiat currency or other real-world assets. Projects such as Tether or TrueUSD as examples of stablecoins backed by fiat currencies, while tokens such as Digix Global represent a commodity-backed stablecoin. (Rodriguez, 2019)

- *Crypto-Collateralized Stablecoins*

This type of stablecoins are backed by pools of crypto-assets. Typically, crypto-collateralized stablecoins tend to over-collateralized in order to address market volatility. Projects like Maker are notorious examples in this category. (Rodriguez, 2019)

- *Non-Collateralized*

This type of stablecoins are not backed by any real-world or cryptocurrency asset, and instead, it maintains value by people expecting it will maintain a specific value. The most-common non-collateralized method is seigniorage shares, which uses smart contracts that automatically expand and contract the supply of the non-collateralized stablecoin using algorithms to maintain its value. Projects like Carbon are relevant examples of this category. (Rodriguez, 2019)
The most important stablecoins on the market are:

Table 4: Comparison of major Stablecoins

Stablecoin	Type	Blockchain Platform	Marketcap/ Volume
Tether First stablecoin launched on the market powered by the Bitcoin blockchain. Started operations in October 2014. (https://tether.to)	**Fiat-backed**	**Multiple** *(Omnichain, Ethereum, Tron)*	**$4.6b** *(24h volume: $44b)*
USD Coin CENTRE stablecoins are issued by regulated and licensed financial institutions that maintain full reserves of the equivalent fiat currency. (https://centre.io/usdc)	**Fiat-backed**	**Ethereum** *(ERC20 token deployed on Ethereum platform)*	**$434m** *(24h volume: $457m)*
TrueUSD The first regulated stablecoin fully backed by the US Dollar. (https://trusttoken.com)	**Fiat-backed**	**Ethereum** *(ERC20 token deployed on Ethereum platform)*	**$138m** *(24h volume: $1b)*
DAI Crypto-collateralized algorithmic stablecoin backed by a number of cryptocurrencies. (https://makerdao.com)	**Crypto-Collateralized**	**Ethereum** *(ERC20 token deployed on Ethereum platform)*	**$111m** *(24h volume: $17m)*

Résumé

La fonction achats a occupée depuis longtemps un rôle marginal, réduit à l'approvisionnement, dans l'entreprise. Le changement de l'environnement et sa complexité a imposé depuis le début des années 1970 le passage d'une fonction support à une fonction stratégique. Dans les faits, elle est considérée comme source de valeurs ajoutée et de compétitivité pour l'entreprise. Actuellement, la place et le rôle de la fonction n'est plus à démontrer. Parallèlement à cette transition, le rôle de l'acheteur à beaucoup évolué, ses relations avec les acteurs internes et externes de l'organisation se sont multipliées. Ses interactions continues avec les acteurs déterminent largement la performance de la fonction achats et l'entreprise. L'objectif de cette communication est de dégager les déterminants relationnels de la performance de la fonction achats dans le contexte des PME marocaines. Pour ce faire, une étude exploratoire qualitative a été entreprise pour un échantillon constitué de 36 intervenants de services achats. Le choix de la méthode qualitative, fondée sur l'entretien semi-directif, est motivé par la pertinence cette approche à la compréhension des phénomènes complexes. Les résultats obtenus permettent de constater que dans le contexte marocain, les déterminants relationnels jouent un rôle important et influencent la performance de la fonction achat.
Cette communication est structurée en deux sections. Dans un premier temps, le rôle de la fonction achats et les déterminants relationnels de sa performance sont présentés. En second lieu, les résultats obtenus de cette exploration qualitative sont présentés et discutés.

Mots clés : Fonction Achats, Performance, Relation Acheteur-Clients Internes, Relation Acheteur-Fournisseurs.

Introduction

Les déterminants relationnels de la performance de la fonction achat ne cessent de s'imposer dans la littérature et dans la pratique, il prend de l'ampleur dans la littérature marketing et dans le domaine professionnel.

L'objectif de ce papier est de présenter une revue de littérature sur les déterminants relationnels de la performance de la fonction achat. En effet, la relation responsable achat et client interne ne cesse de s'affirmer en tant que relation de premier ordre en marketing relationnel.

Nous cherchons à travers notre article à expliquer le rôle de la fonction achat sur la performance de l'entreprise marocaine tout en passant par une analyse de la revue de littérature en relation avec les concepts clés de notre article.

Notre recherche se situe dans une posture épistémologique positiviste aménagée. Nous cherchons à travers cette thèse à expliquer le rôle des déterminants relationnels de la fonction achat sur la performance de l'entreprise marocaine. En premier lieu, nous passerons par une analyse de la revue de littérature en relation avec les concepts clés de notre thèse afin de formuler le modèle théorique. Pour s'assurer de la pertinence du modèle théorique, une étude exploratoire sera effectuée suivant une démarche inductive dont l'objectif est d'enrichir notre modèle théorique des observations issues du terrain. En deuxième lieu, une démarche hypothético-déductif sera adoptée pour formuler des hypothèses et les confronter par la suite à la réalité. C'est en combinant une démarche hypothético-déductive et une approche inductive que nous nous positionnons dans un courant positiviste aménagée.

Problématique :

Nous cherchons donc à comprendre et à expliquer comment les déterminants relationnels la fonction achats participent à la création de la performance de l'entreprise ?

Hypothèses :

.**<u>L'objectif principal poursuivi par cette recherche est:</u>**

- Mettre en évidence les déterminants relationnels de la fonction achat sur la performance de l'entreprise marocaine.

<u>A cet objectif, s'ajoute des objectifs spécifiques que sont :</u>

- Identifier l'évolution dela fonction achat.
- Déceler et apprécier le rôle de l'acheteur avec les clients internes et les fournisseurs.
- Préciser le rôle de la fonction achat et sa participation à la création de la performance de l'entreprise.

Section 1 : Revue De La Litterature

I- Evolution De La Fonction Achat.

La fonction achat est de plus en plus considérée comme une source d'avantage concurrentiel, qui ne peut être réduit à un simple outil de maîtrise des coûts, permettant la performance de l'entreprise.

1- FONCTION ACHAT SUPPORT.

Longtemps la fonction achat considérée comme une simple fonction support mobilisant en priorité un savoir-faire administratif, Les achats ont été vus comme un mal nécessaire au sein des entreprises. En1916, Henri Fayol n'hésite pas à présenter les achats comme une sous-fonction de la fonction commerciale, qui consiste alors selon lui à acheter un peu et à vendre surtout. Même Mickael Porter, pourtant visionnaire, présentait les achats, dans sa fameuse chaîne de valeur 1986 comme une simple fonction support.

La fonction achats a tardé à prendre une importance majeure dans le management des entreprises industrielles. Ammer (1989) note qu'avant le choc pétro- lier de 1973-1974, le top management la

voyait comme ayant un rôle passif dans la conduite des affaires. En France, Barreyre (1976) tente très tôt dévaloriser l'image d'une fonction achats moderne en précisant sa contribution à l'élaboration et à la mise en œuvre de la stratégie globale.

2- FONCTION ACHAT STRATEGIQUE.

La fonction achats revêt dorénavant une forte dimension stratégique. Effectivement, dans un monde de ressources rares. L'expression est empruntée à Erik Orsenna (2007), qui décrit bien, dans le livre éponyme, les problèmes que ne va pas manquer de poser la raréfaction de toute une série de ressources essentielles aux activités économiques, mais aussi à la survie des populations.

Par ailleurs, la rencontre entre le personnel de l'entreprise et le client trouve toute son ampleur dans le domaine des services. En raison du caractère intangible de ces derniers, les aspects humains sont particulièrement à l'épreuve pour vérifier la capacité du management de faire rencontrer les attentes du client interne et externe autour d'une expérience de qualité (Couzon, 2011).

Ii – Le Role De L'acheteur.

La fonction achat n'est plus considérée depuis un moyen de recherche et de sélection des fournisseurs ou un simple outil de maîtrise des coûts, mais plutôt chef d'orchestre des interactions de la firme avec son écosystème, et plus précisément la satisfaction du client interne. La perspective dyadique – acheteur-client trouve son origine et sa définition dans les travaux de Homans (1974) qui considère l'interaction entre acheteur -client comme un échange de biens matériels ou immatériels (Homans, 1974). Cette définition se base sur *la théorie de l'échange social* (Homans, 1958, 1974)). *La théorie de l'échange social* est un des premiers cadres théoriques employés pour examiner les relations d'affaires (Rao et Perry, 2002).

1- ROLE CLASSIQUE DE RECHERCHE ET SELECTION DES FOURNISSEUR.

Les rôles de l'acheteur peuvent être définis à l'aide de la matrice des achats, définie par Kraljic (1983) pour déterminer les différentes stratégies d'achats développées à l'égard du marché des fournisseurs (voir figure 1). Ces axes sont l'importance de l'achat réalisé (coût de l'acquisition sur le coût total, valeur ajoutée dans le produit vendu, etc.) et la complexité du marché des fournisseurs (marché oligopolistique/ monopolistique, maturité de la technologie, etc.).

Nous prolongeons cette approche en déterminant pour chacune des cases le rôle type de l'acheteur associé. Quatre catégories sont ainsi identifiées : l'acquéreur, le négociateur, le technicien et le stratège. Selon le rôle tenu par l'acheteur, les activités à réaliser et les compétences attendues ne sont pas les mêmes. Si l'acquéreur effectue pour l'essentiel des activités opérationnelles (accompagnement des salariés dans leurs demandes d'achats, suivi et gestion des problèmes courants avec les fournisseurs), qui nécessitent des compétences que Cavinato (1987) désigne par « techniques achats » (maîtrise des aspects contractuels, de l'outil informatique, etc.), le négociateur passe davantage de temps sur les activités en amont de l'acte d'achat ;

Enfin, le stratège réalise les rôles du négociateur et du technicien qui nécessitent, au-delà des connaissances et savoir-faire précités, des compétences stratégiques que Giunipero et Pearcy (2000) nomment « world-class purchasingskills » : capacité à orienter ses actions selon la stratégie de l'entreprise, savoir-faire en matière de gestion des processus, compétences de travail en équipe, etc. Si ces quatre catégories correspondent à la représentation habituelle de la fonction, l'élargissement du périmètre d'intervention des acheteurs depuis quelques années et la complexification de leurs tâches les conduit à adopter de nouveaux rôles.

2. EXTENSION DU ROLE RELATIONNEL DE L'ACHETEUR

La littérature en marketing place la confiance dans le cadre de l'échange établissant « le développement et le maintien de relations entre les partenaires comme rôle essentiel d'un réseau de distribution (Anderson et Weitz, 1989; Anderson et Narus, 1990; Morgan et Hunt, 1994) ou notamment entre vendeurs et acheteurs de biens (Ganesan, 1994; Ganesan et Hess, 1997; Schurr et Ozanne, 1985) .

La satisfaction de la relation est souvent considérée comme une variable relationnelle cruciale lors de l'analyse des comportements post-achat. Elle correspond à l'état affectif ou émotionnel du client vis-à-vis la relation (Oliver et DeSarbo, 1988). Alors que, la satisfaction de la relation ne reflète que la satisfaction du client interne envers la relation et ne tient pas compte de la satisfaction globale dans son ensemble (Palmatier et alii, 2007). Enfin, l'état émotionnel du client envers la relation est mesuré de façon cumulative en se basant sur l'historique de l'échange alors que la satisfaction globale tient compte de l'échange dans sa globalité (Palmatier et alii, 2006).

Selon Palmatier et alii (2006), la performance objective d'un vendeur est principalement influencée par la qualité de la relation, suivie de la confiance, de la satisfaction de la relation et de l'engagement.

Ainsi, la réputation de l'acheteur sera construite par l'exposition d'actions réalisées par celui-ci, actions évaluées comme pertinentes par les clients (Gardberg, 2006; Gardberg et Fombrun, 2002; Ponzi, Fombrun et Gardberg, 2011).

Section 2 : Etude Exploratoire

1- Présentation De La Méthode

Grâce à la collecte des données primaires sur les pratiques des 12 entreprises qui disposent d'un service achat, leur 12 client interne et leur 12 client externe ; via des entretiens semi directifs avec les responsables, objet de recherche.

1- Resultats Obtenus

Les six variables conditionnant la bonne conduite de la fonction achat selon le guide d'entretien sont les suivantes:

- La satisfaction.
- La collaboration.
- La sincérité.
- La communication.
- La confiance
- L'engagement

Les résultats obtenus sur le terrain, permettent de confronter les hypothèses de recherche théoriques aux résultats empiriques afin de les vérifier si elles sont tous confirmées et évaluer leur degré d'acceptation. Après avoir présenté et analyser les résultats dans les 36 répondants qui évoluent dans des secteurs différents, on observe que les résultats de l'analyse qualitative ont permis d'apporter un certains nombre d'éléments significatifs et de confirmer les hypothèses de départ sur trois angle de vue :

- Responsable achat.
- Client interne.
- Client externe.

Sur les 12 entreprises étudiées, l'engagement est un facteur de croissance de chiffre d'affaires conformément aux travaux de nombreux auteurs qui soutiennent que les entreprises, pour être

performantes, doivent avoir des pratiques satisfaisante et collaborative [PERRETI, 2004;HONDEGHEM et PERRY, 2009 ;NASSE, 2012]. La perception de la sincérité par l'individu l'amène à adopter des comportements confiants et avantageux pour l'entreprise ; Au contraire la conception d'opportunisme l'amène à adopter des comportements qui ne sont pas bénéfiques à l'entreprise [PERRETI, 2004; NASSE, 2012].

Conclusion

La recherche a permis de mettre en avant des résultats principaux : elle précise la notion de la satisfaction en général et plus spécifiquement celle de la collaboration perçue par le client interne et permet de constater que l'orientation globale à une influence sur la confiance du client interne. L'intégrité a bien des effets sur la croissance du chiffre d'affaires des entreprises au Maroc .

La sincérité a bien des effets sur la satisfaction des clients interne d'une entreprise. Cette recherche montre que la confiance a des effets sur la satisfaction du client. [PERRETI, 2004 ; NASSE, 2012].

Enfin en s'efforçant d'éliminer les pratiques malsaines les entreprises augmentent la qualité de leurs produit et service. Cela contribue à renforcer leur compétitivité et améliorer la relation acheteur client interne et client externe [AKOUERABOU et BAKO, 2014].

Abstract

Being based on the analysis of existing definitions, the article gives the authors' clarification of the notion of globalization. Globalization is considered as the objective process of internationalization of the world economy, which is based on scientific and technological progress and the growth of the international division of labor, liberalization of the economy and its transnationalization, environment. The subjective side of globalization is considered as the policy of highly developed countries, pursued by them in their interests concerning other countries. The reasons for globalization slowdown in recent decades are identified, while the positive and negative consequences of globalization for the economies of the world are classified. Classification of existing points of view on the essence of regionalization is presented, and the authors' refinement of this category is given. The reasons for the intensification of regionalization processes in the global economy and the Eurasian region are identified. The characteristic features of modern regionalism are determined, the peculiarities of a closed and open model of regionalization are defined, and it is noted that the countries of the Eurasian region are moving to a model of open regionalization. is proved that regionalization creates the prerequisites for the transition from a unipolar to a multipolar world.

Keywords: Globalization, Regionalization, Region, Regional Integration, Eurasian Region, Unipolar and Multipolar World.

Introduction

The relationship between globalization and regionalization is the most debated in modern economic science. The problems of globalization are investigated by such scientists as Alle M., Arigi D., Wallerstein I., Castells M., Levitt T., Ome C., Rutland P., Fukuyama F., Huntington S, Held D., etc., including Russian economists: Akopova E., Buzgalin A., Gubanov S., Delyagin M., Nekipelov A., Ovchinnikov V., and others. Economists devoted their problems to regionalization and regional integration: Balash B., Weiner J., Meyer K., Pinder J., V. Repke, Schiff M., Winter L.A. and so on,

including Russian scientists: Vardomsky L.B., Kotlyarov N.V., Krotov M.I., Mirishli F.R., Mikheev V.V., Ryazanov V.T., Stepanova S., Shishkov Yu.V., Schegoleva N.G., etc. The problems of regionalization have become of particular interest in the last decade in connection with the global financial and economic crisis of 2008-2009, the slowdown of globalization processes and the growing contradictions between developed and developing countries. Regionalization was a kind of protective reaction of countries of the same region in the current situation of the global economy. Regionalization processes are actively going on in the Eurasian region, where a new world economic development pole is being formed and new integration unions are emerging. The processes of regional integration in this region are subject to general laws but have their specifics. Regionalization creates the prerequisites for the transition from the unipolar world to a multipolar one, which makes the concept of world order more fair and harmonious. That is why the topic of this study is the most relevant issue.

Statement of the Problem

In the context of the slowdown in globalization processes, the slowdown in the global economy and the growing contradictions between developed and developing countries, the increase in regionalization processes, it becomes necessary to find out the essence of globalization and regionalization, the relationship between them, to show the reasons for the intensification of regional integration processes in the Eurasian region, and to identify their features.

Research Questions

To give a more precise definition of the category "globalization" based on the analysis of the existing ones.

2. To identify the causes of the slowdown in globalization in the XXI century.

3. To determine the basis and the reasons for the growth of regionalization in modern conditions.

4. To demonstrate the features of regionalization in the Eurasian region.

5. To prove that the growth of regionalization creates the prerequisites for the transition from a unipolar to a multipolar world.

The purpose of the study

The purpose of the study is to determine the reasons for the regional integration process growth, their peculiarities in the Eurasian region, based on determining the essence of globalization and regionalization, and to demonstrate that the growth of regionalization creates the prerequisites for the transition from a unipolar world to a multipolar one.

Research Methods

1. The method of dialectics makes it possible to present globalization and regionalization as the unity of opposites and reveal the essence and internal contradictions of these processes.

2. The evolutionary and systemic methods allowed us to identify the main trends of globalization and regionalization in the modern world economy.

3. The method of the comparative analysis revealed the characteristic features and peculiarities of the regionalization process in the Eurasian region.

Results of the study

The essence, the stages, and the consequences of the economy globalization

The problems of globalization and regionalization are the current subject of the discussion by scientists, politicians, and practitioners. The essence of the category “globalization” is treated ambiguously. Firstly, the scientific term was offered by the American scientist T. Levitte (1983), designating it as “the phenomenon of the markets of the individual products manufactured by large multinational corporations merging.". Nobel laureate J. Stiglitz (2002) defined it as the removal of the barriers to free trade and the closer integration of national economies. American scientists: I. Wallerstein (1987), Russian economists: Asaul A.N. (2010), Bulatov A.S. (2019) and the others consider globalization as the form of the global economy modernization. Globalization, in their opinion, is a new stage in the internationalization of the world economy, which is the result of shifts in the economy in the conditions of scientific and technological progress, thanks to which mankind is drawn into a new technological era associated with the latest achievements of science and technology. In the interpretation of world financial organizations, the World Bank and the IMF, globalization is the rapid integration of rich and poor countries in terms of trade and investment, enhancing the merger of markets due to the cross-border movement of goods, capital, information, technology, and people (Reinert, 2014). There is an interpretation of globalization as “planetary domination of market principles and information and communication technologies that make up the global economic and information space” (Dendac, 2014). Russian scientist Yu.V. Shishkov (2001) defines the essence of globalization of the world economy as a new quality of internationalization at the stage of its maximum possible development in breadth. There is a point of view that “globalization occurs in the form of international flows of goods and capital in the framework of global supply chains and the value of transnational corporations” (Kondratyev, 2018).

Summarizing the existing points of view, the authors of the article interpret globalization as the objective process of internationalization of the world economy, which is based on scientific and technological progress and the growth of the international division of labor, liberalization of the economy and its transnationalization, of the environment; globalization is manifested in the free movement of production factors, capital, information, goods and services and is contributed to interaction increase and interdependence of national economies. At the basis of globalization at any stage of its development, three patterns are observed: the emergence of new technology; the presence of "core" countries (or "economic pole") which own this technology; the formation of supranational global governance institutions (IMF, World Bank, UNCTAD, UNIDO and others).

The internationalization of production and capital, as the components of globalization, is an objective and progressive process, because increase production efficiency, contributes to the accelerated spread of scientific and technological achievements in the world. At the same time, the degree of a positive influence of the internationalization of production and capital on the economy of individual countries depends on their place in the hierarchy of the world economy. The largest winners are industrialized countries, which can reduce production costs by focusing on the output of high-tech sectors of the national economy. These countries transfer labor-intensive and environmentally dirty production to developing countries.

Globalization, on the one hand, acts as an *objective process*, which foundation is laid on the geo-economic segment of world space; on the other hand, globalization has a *subjective side* and appears in the form of economic policies pursued by the developed countries of the world, global financial organizations and transnational corporations in their interests (Stiglitz, 2002). This gave rise to some scientists to consider globalization as an effective tool for establishing a "new world order" by highly developed countries. The ideology of globalism is based on a clear underestimation of the role and importance of non-European peoples. (Delyagin, 2003).

The question of the positive and negative effects of globalization is debatable. Table 1 attempts to summarize these ideas.

Table 1: Positive and negative consequences of the economic globalization process

The positive impact of globalization	The negative effects of globalization
Strengthening international competition and, as a result, improving the technological level and product quality. The development of hypercompetition.	The benefits of globalization are not evenly distributed: several leading countries control the significant part of production and consumption.
The emergence of transnational corporations operating in the financial and information markets and creating 80% of the latest technologies, including hyper technologies. Speeding up the spread of new technology.	The de-industrialization of the economies of the semi-periphery and periphery countries is arising due to the growth of openness of economies and increasing the international co-competition. Vanek-Reinert effect.
The growth of foreign direct investment, far exceeding the growth rate of world trade, contributes to the transfer of technology, the formation of global enterprises.	The transfer of the parts of production capacities by firms of countries with high labor costs to countries with low wages and the formation of unemployment in countries where capital is exported.
The rapid development of financial markets, which makes it possible to develop the real sector of the economy.	Strengthening financial globalization is becoming the most important cause of the vulnerability of the global economy.
The global value chain formation, leading to economies of scale and contributing to cost reduction and lower prices, resulting in increased labor productivity and sustained economic growth.	Placement of environmentally dirty production by the “core” countries of globalization in developing countries.
The consumer wins, having the opportunity to buy more goods and services of higher quality at a lower price due to increased competition.	The socio-economic inequality between the countries of the world is growing.
The specialization and the international division of labor are deepening.	80% of the planet’s resources are used by the countries of the “golden” billion, where 20% of the population lives.
The ability to mobilize more significant financial resources for the use of wider financial instruments in an increased number of markets.	The countries of the periphery are turning from the subject into the object of globalization.
More and more global problems can be solved by combining the efforts of the world community.	Globalization strengthens the unipolarity of the world, which strengthens the dependence of underdeveloped countries on the "core" countries of globalization.
The emergence of supranational institutions of environmental regulation can contribute to solving global environmental problems.	Localization of environmental problems in the territories of countries of the world periphery as consequences of negative external effects of anthropogenic impact on nature.
Increased involvement of developing countries and countries with economies in transition into international trade, processes of international lending and investment, international labor migration.	The advantages of development are obtained by industries supplying products for export, while other industries are losing competitiveness.
The income growth of all worldwide countries.	The socio-economic inequality between developed and developing countries, the threat of instability of the world order are strengthening.
The capital flows liberalization contributes to	The external debt of developing countries to

the rapid integration of national capital markets of developing countries into the global financial system.	international financial organizations is growing.

Resource: compiled by the authors based on a review of literature concerning the problem of globalization

As can be seen from the table. 1, globalization, as an objective phenomenon of the global economy, contributes to economic development. Globalization, as a subjective phenomenon, as the policy of the "golden billion" countries, is carried out in their interests and has negative consequences for developing countries (countries of the periphery). This was one of the reasons for the strengthening of regionalization processes in the global economy. There are also economic, political and military reasons for the intensification of regionalization processes in the modern world. The crisis state of the global economy stimulates regionalization. The powerful processes of digitalization of the world economy serve as a kind of catalyst for regional integration.

The essence, forms, and consequences of regionalization of the economy

The 1st point of view**:** regionalization is an element of globalization (Slutsky, 2018), (Wardomsky, 2008). Russian scientist Ryazanov V.T. (2019) defines regionalization as "small globalization", as a kind of alternative to "big globalization". Shishkov Yu.V. (2008) argues that globalization itself stimulates the massive regionalization of the global economic space to counter rising risks.

The 2d point of view: the essence of regionalization is that its representatives interpret regionalization of the economy as a form of interstate integration, as a response to increased competition and uneven development of the global economy: (Schiff, 2005), (Dendac, 2011), (Starodubtseva, 2015) and others.

The 3d point of view: lies in the fact that the essence of regionalization of the economy is interpreted as the integration of geographically separate markets: (Liebman, 2011), (Lenkov, 2015) and others.

The 4th point of view: lies in the fact that regionalization is seen as a form of integration of economic activity in a certain region of the world: Rozov (2014), Schegoleva (2019). The German economist M. Bree (2005) considers regionalization of the economy as "the process of integration of large regions and their closer cooperation with each other", bearing in mind the ethnic, civilizational, socio-cultural and economic specifics of integrating countries.

The authors of the article, summarizing the existing points of view, define regionalization of the economy as the association in the economic block of states of the same region of the world that have similar civilizational, ethnic, national-historical, sociocultural characteristics, political structure, based on close and stable economic ties between business entities of these countries.

According to the authors of the article, regionalization does not oppose, but rather complements globalization, which at the present stage, due to the processes described above, requires the solution of existing contradictions. At the same time, globalization and regionalization cannot be equated, since as a result of regional integration processes, the close interdependence of individual states in a certain region of the world is formed.

A feature of the current competition stage in the global economy is the following: the interstate competition is complemented by a new form of competition - competition between interstate integration associations (blocs).

The process of regionalization involves improving the geo-economic situation for integrating countries: stabilizing economic growth, strengthening the competitiveness of national economies; expansion of sales markets, sources of raw materials, capital, technologies; strengthening the economic and communication interconnection of integrating countries; the growth of their political benefits and institutional homogeneity; security enhancement. This is now well explained with the help of the geo-economic law of "autarchy of large spaces", which was deduced in the 19th century by the German economist Frederick Liszt (1891). According to this law, only a sufficiently large,

economically integrated space is capable of full-fledged economic development; at the same time, the most developed country receives a positive effect.

The institutional forms of regionalization are agreements on free trade, customs, and economic unions, etc. The formation of regional groups, in our opinion, is an attempt by the countries of the region to resist jointly the negative consequences of globalization and the policy of globalism pursued by highly developed countries. In the formation of regional economic unions, specific ethnic, cultural, historical, religious, national and other features of the countries of the region are taken into account. At the same time, new institutions are being formed which help to harmonize the interests of the economic union countries members.

Features of regionalization in the Eurasian region

The ideology of globalism, as the policy of highly developed countries, is based on a clear underestimation of the role and importance of non-European peoples (Delyagin, 2003). In particular, the processes of regionalization are intensively going on in the Eurasian region.

A feature of the current stage of regionalization for the countries of the Eurasian region is the transition from the model of "closed regionalism" to the model of "open regionalism". This is due to the current level of liberalization of international trade, lower tariff restrictions, and the presence of supranational institutions for regulating the global economy. Closed regionalism restricts third-country access to the regional market. It aims to protect against the negative effects of globalization, which is essentially protectionism (Streltsov, 2019).

The Russian Federation at the present stage is the member of several regional integration unions with Eurasian states: Shanghai Cooperation Organization (SCO); Eurasian Economic Union (EAEU); BRICS and others. When creating the SCO, regional security was a priority. The goal of the creation of the EAEU is regional economic integration.

The countries of Eurasia are characterized by the specific patterns of development and this is reflected in their model of regional integration. Today, the study of Eurasian economic integration, its relationship with globalization is gaining special importance. One can agree with the opinion that "the Eurasian-liberal-conservative course is replacing the western - radical-liberal course of globalization" (Slutsky, 2018), that at the present stage, *a new type of Eurasian integration is emerging* (Glazyev, 2016).

Before the global financial and economic crisis, many Russian researchers believe that the post-Soviet integration should follow the path of the European Economic Union and emphasize integration on a global rather than regional level. However, later scientists began to argue that the dominance of the Anglo-Saxon model in the world economy in the 1990s was fiercely competitive by new centers of economic power, which are rapidly developing within the framework of "their unique models," where they primarily note economies of China, Russia, and other Eurasian countries (Dykin, 2018).

In the late 1990s, after the Asian crisis, concepts of Asian regionalism began to take shape. The specificity of regional integration associations in Asia, in contrast to European regionalism, lies in the absence of the European Union type interstate structure.

There are several points of view on the essence of Asian regionalism:

- the first: Asian economic and financial integration is seen as an alternative to American and West European dominance in the world and Asian markets;

- the second (represented by Japanese scientists): Asia-Pacific economy is seen as a single economic and financial space, which is not opposed to North American or Western European integration and will allow to move to a single world market in the future;

- the third: the phased development of Asian economic integration at a subregional level (Mikheev, 2002) of regionalism, lies in the absence of the European Union type interstate structure.

Features of regionalization in the Eurasian post-Soviet space

The evolution of regionalization in the post-Soviet space is associated with the main integration groups transformation: CIS, EurAsEC, Union State of Belarus - Russia, Customs Union, Common Economic Space, Eurasian Economic Union (EAEU).

The following features of economic regionalization in the Eurasian post-Soviet space can be distinguished:

- the participation in the integration of the former union republics (now independent states), which previously cooperated as elements in the USSR single national economic complex;

- the integration processes take place on a vast territory and sparsely populated Eurasia with an underdeveloped infrastructure;

- the contact of the post-Soviet Eurasian space in the west with the countries of the European Union, in the east - with the most dynamic economy of the world - China, which imposes its characteristics on the processes of the regional integration of the former union republics;

- the lack of historical experience of interaction at the interstate level among the administration of the former union republics, now independent states;

- the principal role of the political factor in the process of post-Soviet regionalization;

- different scales of economies and levels of socio-economic development of integrating countries;

- the tendency to copy institutions of foreign countries;

- the inter-civilizational association of the Eurasian post-Soviet countries;

- the possibility of rhe clash of national interests integrating countries, that hinders integration;

- the economic dominance of Russia;

- the various models of reforming the economies of post-Soviet countries;

- the different level of government intervention in the economy.

At the end of 2011, Russian President V. Putin stated that the post-Soviet integration (an attempt to jointly enter globalization) passed into Eurasian integration, to form a large regional economic association as a part of the new world architecture.

A striking example of regional economic integration in the post-Soviet space of Eurasia is the Eurasian Economic Union (EAEU), which was created in 2015, and in 2020 celebrates its fifth anniversary. Its creation was the result of the evolution of regional post-Soviet integration. The EAEU is the largest integration association in the territory: an area of more than 20 million square kilometers (14% of the world's land), the total population is 182.7 million people (2.5% of the world population), the market capacity is 3,7% of global GDP (Selishcheva, 2017). Over 40 countries have expressed a desire to enter into negotiations on the creation of a free trade zone with the EAEU.

The member countries of the Eurasian Economic Union have formed a huge market, within which the free movement of goods, services, capital, and labor is ensured. According to the law of “autarchy of large spaces”, one can expect an increase in the functioning efficiency of all five countries that are members of the EAEU. With the entry into force of the agreement on the EAEU, about 80 various barriers were eliminated: from free movement of citizens, to freedom of choice in employment on the territory of the union with recognition of educational documents (pedagogical medical, legal and pharmaceutical diplomas became an exception), but problems still remain.

The heterogeneity and uneven development of the Eurasian socio-economic space determines the specifics of the Eurasian market, particularities of national economies integration, socio-economic policy, institutional transformations in the countries of the region.

Within the EAEU, a system of supranational institutions has been created: the Eurasian Economic Commission; EAEU Court; Eurasian Development Bank, designed to implement projects to strengthen mutual trade and investment; The Eurasian Fund for Stabilization and Development, whose tasks include crisis management and financial stabilization in the region. The most important element of the integration model in the post-Soviet space should be the formation of a common not only economic, but also socio-cultural space, a kind of "security community" which may help to increase the pace and improve the quality of economic growth.

One of the features of regionalization in the Eurasian region in 2015 was the Chinese mega-project "One Belt - One Way", which combined two projects: "The Economic Belt of the Silk Road" and "Sea Silk Road". Chairman of China Xi Jinping formulated 5 main directions for the implementation of the considered megaproject: the coordination of political guidelines for development between countries; the cooperation in transport infrastructure; trade and investment freedoms; finance and humanitarian contacts.

In 2015, Russia and China signed the Agreement on the pairing of the EAEU and the Chinese project "Silk Road Economic Belt" (SREB). This is a new model of Eurasian integration, from which the participating countries can derive number of economic benefits: Russia and other EAEU countries - investments, infrastructure projects, enhanced industrial cooperation, accelerated regional development, etc. China, promoting a new model of regional integration, gets an opportunity for the country's economy to receive resources and develop further, expand its sales markets, and strengthen its influence in Eurasia. The EAEU and the SREB could become the core of a more ambitious cooperation project - "Greater Eurasia", which could turn into a new centre of global economic development.

Conclusion

We can thus conclude that the slowing down processes of globalization, its conflicting consequences and the crisis state of the global economy stimulate, in its tern, the processes of regionalization. The digitalization processes of the global economy serve as a kind of catalyst for regional integration. Economic, political, military reasons may underlie regionalization. The processes of regional economic integration are particularly active in the Eurasian region, where a new geo-economic development pole is being formed. The processes of regionalization in the Eurasian region are characterized by general patterns, but there is also its specificity. It is characteristic of Asian regionalism which cultural and civilizational factors, along with economic and political ones, play a more significant role than in the regional integration of European countries. The peculiarity of the Eurasian model of regional integration is that it unites not only individual countries, but also civilizations, and the inter-civilizational association creates the prerequisites for the transition from a unipolar to a multipolar world, to a fair and harmonious concept of the world order.

Abstract

The article considers the conditions of the fifth neural-network technological revolution and the development of a new generation global network - Neuronet. The features of the network human capital formation using highly qualified specialists in the digital economy are disclosed. The basic principles of organizational interactions in the global network are formulated. The contents of the concepts of “network value”, “network effect” are revealed and their characteristics as new elements of the institutional structure of the digital economy are given. The provision of the action in the digital economy of the law of increasing marginal productivity is justified. The principles of the emergence and accounting of network effects in the modern digital economy are formulated. The theoretical views of scientists on the interpretation of the concepts of "network capital" and "network effects" are considered. Methodological approaches to the assessment and measurement of network effects are presented. The methodological approach to accounting and evaluating neural network effects as new objects of intellectual network property are substantiated. It is concluded that it is necessary to include the magnitude of network effects in the value of the gross national product.

Keywords: Digital Economy, Technological Revolution, Network Human Capital, Institutions, Value, Neural Network Effects.

Introduction

Today, processes of total informatization, digitalization and networking are unfolding around the world, an active form of a new generation of the global computer Internet network, called "Neuronet", is underway. Under the influence of the modern fifth neural-network technological revolution and Neuronet, a qualitative change in the principles of organizing the global economic system in all spheres and institutions of the world and national economic systems is taking place. Today, under the influence of the digital neuro-network technological revolution, an active form of a new technological structure and institutions of the digital economy is underway. The main characteristics of all processes and phenomena in the digital economy, which are of an informational nature (Dyatlov, 2017), are digitalization, networking, integration, convergence, and mass use of neurosociomorphic interfaces.

In the digital economy, various networked institutional management structures are being formed, including government institutions at global, federal, regional, and local levels. The leading place in the structure of the management and regulation institutions of the globalizing digital economy is occupied by the electronic network management, regulation, and control institutions, the most important of which is the electronic (digital) government. There is a transformation of all spheres and

elements of the world and national economies, all state, public and private institutions, a digital cyber-state and a digital government are being formed. The rapidly developing global neuro-computer network "Neuronet", which includes network socio-neuro-morphic interfaces, digital cloud platforms, blockchain technologies and universal ecosystems based on self-learning artificial intelligence, qualitatively transforms the nature and content of relationships between people in modern information and network society. The emergence of qualitatively new, breakthrough energy-network technologies and network effects is designed to decisively ensure the realization of the advantages of leading countries and leading companies in the face of increasing global innovation hypercompetition.

Statement of the problem

In the modern digital neural network economy, it is important to study some new phenomena, which include network values and network effects, which are important elements of the institutional structure of the digital neural network economy. In this regard, the urgent, important and difficult task is to disclose the content of these concepts and develop theoretical approaches to assessing and accounting for neural network effects and the need to take into account their value (network added value) in the value of the gross national product produced.

Research Questions

- The deployment of the fifth neural-network technological revolution and the development of the global network of the new generation Neuronet.

- Formation of new institutions and regulatory mechanisms for the digital neural network economy.

- The transformation of human capital into the network human capital of highly qualified specialists in the digital economy.

- Network values and network effects as new elements of the institutional structure of the digital economy.

- Methodological approaches to the assessment and accounting of network (neural network) effects in a digital hyper-competitive economy.

The purpose of the Study

Digital Economy operates with Smart Big Data. According to GIV-25 analysts, the digital economy is estimated at 23 trillion US dollars. By 2025, 85% of services will be in digital clouds, 86% of the largest companies will implement artificial intelligence, the share of big data will grow to 80%. 180 billion terabytes of data will be generated annually, which will become a source of innovative intelligent technologies and the creation of new added-value (Huawei, 2018).

In the digital economy, based on the emerging global network of the new generation Neuronet, there is a dynamic formation and development of new institutions, new activities, new types of network employment and network training. As a result of a qualitative change in the substantive characteristics of labor, a new employment model arises, which is called "Work 4.0". Education is becoming a leading area of production of networked human capital, which is becoming a critical factor in the development of the digital economy. In the Digital Economy of the Russian Federation program, which was put into effect on July 28, 2017, it is planned to allocate 46.2 billion rubles to finance the federal project "Personnel for the Digital Economy" in 2019-2021. By 2024, 120 thousand people will study at higher education programs in the field of information technology; 10 million people will be trained in online digital literacy development programs; most public universities implement the digital university model (Digital Economy, 2019).

In the global digital economy, traditional human capital is transforming into a new kind – a network human capital. The network human capital is a system of network abilities, skills and competencies of highly qualified specialists, used for effective interaction through global networks with network government structures, network business structures, scientific and educational structures, and with social networks that are used to obtain a variety of public goods, market benefits and network effects (Dyatlov, 2017).

The network human capital in the modern digital economy is the main driver of dynamic and sustainable innovative development. The digital economy places increased demands on the network knowledge abilities and competencies of workers. In the digital neural network economy, based on neural networks with a socio-neuromorphic interface, a modern specialist is multidimensionally included as a creative element into an integrally-distributed neural-network intellectual-cognitive environment, is more and more involved in neuro-cognitive processes and acquisition mechanisms and the multiplication of new knowledge, the use of neurocomputer interfaces, the use of virtual and augmented reality elements, hybrid devices, expert intellectual systems, and artificial intelligence. In modern conditions, the training of specialists should include the development of network cognitive thinking.

In the digital economy, a highly qualified specialist must possess the skills and competencies of flexible interaction with the network structures of electronic government, electronic business, electronic commerce, as well as with social networks. Functions such as digital literacy, cognition, creativity, multifunctionality, network flexibility, and mobility, focus on achieving career growth and status success, are the basic competencies of a modern specialist.

Within the framework of the Gig-economy concept, the employer forms a demand for the hiring of such an employee whose work is of a design nature, aimed at the final result. Today a new network model of the labor market and employment is being formed. There is such a modern form as a virtual team, which is a network of workers who work together through global networks without traditional market intermediaries. Such a structure of the network organization of labor is flexible and is formed from specific specialists uniting to carry out certain joint projects. At the same time, the responsibility of employees and specialists included in such network associations increases for the results (Fleming, 2017).

Currently, the principle of “national innovation capacity” inherent in highly skilled employees is the most important indicator-driver of development. R. Florida calls network workers “the creative class” (Florida, 2012). Modern employees are carriers of national innovative ability, become universal specialists, turn into multifunctional workers with developed digital abilities and competencies, which are characterized by high network mobility and focus on achieving results. At the same time, there is a reduction for specialists to make decisions while increasing their effectiveness, which, in turn, leads to an increase in the combined effect of joint activities on the Internet.

It is necessary to distinguish between the concepts of "human capital" and "network human capital". In an industrial market economy, the ability of workers to work is realized in the form of human capital. In the digital economy, the ability of employees to work is realized in the form of network human capital. At a mature stage in the development of the digital economy, the neuro-network human capital is being formed within the framework of the new system of socio-neuro-network education, a whole class of new scientific-educational neuro-network effects is emerging, the cognitive and analytical abilities of the specialist are being strengthened, the volume and speed of information transfer are increasing, knowledge acquisition and integration into a universal ecosystem. New forms of training and advanced training through neural networks will arise and be widely developed; virtual research and modeling; application of neuro-virtual reality (virtual smart spaces, libraries, databases). It should also be borne in mind that a modern network specialist must be able to work and make effective decisions in the face of rising risks, uncertainty and increased innovation hyper-competition in local, regional, national and global markets.

Research Methods

Within the framework of the information paradigm, it is substantiated that various economic phenomena and the relationships between them are of an informational nature, i.e. the substance of socio-economic relations and ties is information (Dyatlov, S.A., Lobanov, O.S, Selischeva, 2017). The connection between virtual network spaces and their participants has an information-network nature. One of the distinguishing features of information is that it realizes its properties only by receiving the opposite answer through a system of multi-level direct and feedback connections. That is, a communication based on information is multilateral and multilevel. Computer theorist Manuel Castells points to the genesis of knowledge and information as the main source of productivity. He believes that the “information society", a society of a new, modern type, is based on networks activated by technology (Castells, 2000).

To research the concept of “value”, the basic approaches of the theory of value of Adam Smith, who wrote about the separation of the value of goods in consumption from value in exchange, as well as the concepts of well-known institutionalists John Rogers Commons, Torstein Veblen, Clarence Aires, who wrote about the impact of social and institutional processes on the individual preferences of consumers of goods and their value. The notion of “network value accumulator” introduced into circulation uses the idea of T. Veblen as its basis, who noted that technology and industrialization themselves are a source of value since production develops with their help (Veblen, 1984). We should also use the idea of A. Commons that “the reasonable value of the good” (Commons, 1990).), that is the intrinsic value assigned to a product or service in an exchange is determined during the transaction process, supplemented today by a significant increase in the role of global network institutions.

The scientific literature (Dyatlov, 2018) substantiates the position that “in the conditions of the latest electronic neuro-network technological revolution, neuro-network intellectual capital arises with completely new unique properties and functions that contribute to the production and receipt of a variety of neuro-network effects” (neural network effects). In the global digital economy, there are various information-network effects. Information and network effects are effects of innovations, network interaction, business integration. In fact, these are synergistic network (integral) effects, expressed in various forms. H.R. Verian identifies two main types of network effects: direct network effects (directnetworkeffects) and indirect network effects (indirectnetworkeffects) (Verian, 2005).
There are several approaches to assessing intellectual capital and network effects in economic literature. A synthesis of various methods for measuring intellectual capital has been carried out by Karl-Eric Sveiby (Sveiby, 1997). The appraisal of the cost of technology, research and development were carried out by Boer F.P. (Boer, 2007). Currently, there is no one universal method and methodology for assessing the value of intangible assets, intellectual capital, network effects.

Results of the study

Network value in the Digital Economy

In the modern neural network economy, a new type of value "network knowledge value" (the value of network knowledge) is emerging. Network knowledge value arises in the Internet and is an integral network effect. In the conditions of the fourth industrial revolution, and after it and the upcoming fifth neural network technological revolution, the main accumulator of value is human capital (the neuro-network human capital), which has hyper-competitive network competencies, which allows creating added value and neuro-network effects. The process of development of the global market for goods and services implies the need for a newly created object to appear exclusively in the form of a conversion of the existing accumulator of value based on the accumulated monetary and network effects acquired with the help of the latter. The information gave rise to technologies for its efficient distribution and storage, which proved to be suitable for transferring not only traditional resources and data but also a special kind of resource - network value as a general utility category in the digital economy.

Therefore, as the digital integration of the global market for goods and services develop, the point of determining the intrinsic value of a product shift from production to consumption. At the moment, the world economy is just beginning to begin the transition from the stage of determining value in the sphere of production and exchange to the stage of its determination by the consumer in the field of consumption. In this regard, the following fundamental methodological position available in the scientific literature can be noted. In the global neural network economy, in which integrated network effects take place, a completely new quality of the process of social production and determination of value arises: the opposition between production, distribution, exchange, and consumption is overcome, and a new network value is created simultaneously by all participants in neural network interactions (manufacturers, intermediaries, and consumers) (Dyatlov, 2018).

In the neural-network economy, value has an informational multifunctional nature, which is expressed in the fact that it exists in itself - in the form of an accumulator of value, representing the costs of universal human labor in the information sense, embodied in innovative technologies, goods, services, knowledge, and is at the same time a means of incrementing the value of other objects and participants in neuro-network interactions. At the same time, achieving the optimal level of costs (reducing costs) for the production, distribution, exchange, and consumption of the "new" accumulator of value leads to an increase in its internal network knowledge value, which is the basis for the growth of capitalization and potential monetary profit in the future for those who invested and participated in the production, use, and appropriation of this immaterial digital value.

It should be emphasized that in the neuro-network economy, the main carrier and accumulator of this network knowledge value is a person(s), their network human capital. At the same time, transaction costs are minimized. In the neuro-network economy, through the integrated network interaction in the production, distribution, exchange, and consumption of information, production, distribution, exchange, and consumption of network knowledge are simultaneously occurring. Based on the foregoing, it is logical to draw a conclusion about the emergence of the Internet of neural-network knowledge values and network effects, which replaces the traditional Internet and which is called Neuronet.

The transition from the Internet of Information to the Internet of Values is marked by the emergence of the possibility of exchanging values with minimal costs. At the same time, it is important to note that while value in an industrial market economy was mainly understood as money, then in a digital neural network economy we are talking about a wide range of knowledge network values and integrated network effects. For example, "smart contracts" and network interactions allow to minimize transaction costs associated with the exchange of any kind of assets, including electronic financial and public services.

The Law of Increasing Returns in The Digital Economy

The current stage of development is characterized by the dynamic deployment of processes of integration and convergence of technologies, regulatory and accounting methods, companies, institutions, information spaces, and databases. Additional network connections arising in the process of integration and convergence can be defined as the synergy of convergence of information spaces, characterized by the appearance and receipt of network synergetic effects (Dyatlov, S.A., Lobanov, O.S. and Zhou, W.V., 2018).

In the context of global information and network economy, it becomes possible to receive and assign various networks, information, and intellectual effects. In the industrial market economy, the law of diminishing returns (returns) applies. In the information economy, as a result of large-scale innovations, the efficiency of the use of production factors increases, and under the influence of ICT, the law of increasing returns begins to apply. The effect of this law is due to a number of factors: digitalization, the dominance of information products and services, innovation, productivity growth, business integration, the emergence of social networks, the emergence of network effects.

The production and distribution of information products and services differ from the production of traditional industrial products. C. Shapiro substantiates the important point that information is expensive to produce but cheap to reproduce and copy (Shapiro, 2000). The production of an information product (service, a network effect) is associated with high fixed costs, but with low (constantly decreasing) marginal costs. In the conditions of innovation and information production, there are high fixed costs and low marginal costs. Under these conditions, the manufacturer should strive to produce and sell the maximum possible volumes of information products (for example, software products for computer systems) to make big profits and compensate for the high initial costs of developing an original information product. As R. Vaiber notes, in the information and network economy, in contrast to the industrial economy, it is not the law of diminishing marginal returns that dominates, but direct network effects and positive feedback, which is expressed in increasing marginal returns (Viber, 2003).

Multifunctional incomes of participants in network interactions can be expressed in various forms - in the form of public goods, market goods, and neuro-network effects. An important but extremely complex problem is the assessment of neuro-network effects, which as phenomena of socio-economic reality have an immaterial, intangible, informational nature. The most difficult problem is how, along with the assessment and taking into account the market value of the provided network service (effect), to evaluate and take into account its non-market, social-network component, which cannot be directly estimated in monetary units at a given time in a linear way. For example, the possible additional occurrence of a capitalized monetary effect (direct and indirect, linear and non-linear), which can be obtained in the future, depends on the number of users of this energy network service in a social network both in the present and in the future. In this regard, it is important to determine the principles for evaluating multifunctional neural network services and effects, their inclusion and accounting for GNP, an income of firms and citizens.

The Concept of "Network Effects"

The concept of “network effects” was introduced in 1908 by Theodore Vail, who studied the optimization and distribution of telephone services. Network effects, on the one hand, express specific effects arising from the introduction of ICT, the implementation of electronic business and interactions in global networks, and, on the other hand, contribute to the growth of efficiency and productivity in the economy. These effects can also be obtained as a result of applying advanced methods of hypercompetition, integration of ICT business, coordination of network interactions, anticipating programming and managing the economic behavior of competitors and consumers, using hypercompetitive creative neuromarketing, management, logistics, etc.

The network effect takes on a significant value when a certain number of users of an information product (service) is reached, which is called the “critical mass of users”. After this point, the value obtained from the use of an information product (service) becomes more than the price paid for it. The network effect is a phenomenon of growth in the consumer value of a network as the number of nodes in this network grows, as the number of its users and the number of connections between users increase. The greater the number of users involved in the network, the more significant the fact of use becomes for consumers, the more loyal the consumer, the less willingly he switches to alternative products (networks). Using the loyalty of consumers and their significant number, manufacturers or providers are connected to this network and provide additional goods and services. As a result, a huge number of people who carry out transactions and spend significant resources can be involved in the network. including financial resources, time resources, etc.

H.R. Varian noted the important side of the integration effect, which is expressed in the fact that “the combined effect of Moore’s law, the Internet, computer awareness and financial markets led to a period of“ rapid innovations ”(Verian, 2005). Sebastian Knol identifies a special type of cross-business synergy - information synergy, which is generated by the use of common information channels, the wide availability of these channels and their effectiveness, a significantly greater opportunity to obtain reliable and complete information about competitors, national and regional stock markets and business initiatives (Knool, 2008).

The basic principles of network interactions, the emergence, and receipt of network effects should be formulated:

1. The principle of polysubjectivity and multifunctionality of the network.
2. The principle of free access to the network.
3. The principle of the critical mass of network participants.
4. The principle of growth and complication of relations between nodes, elements, and network participants.
5. The principle of privileges and bonuses to network members.
6. The principle of transaction security and the protection of personal data of participants (users) within the network.
7. The principle of retention and complexity of leaving the network.
8. The principle of significance (status) of the network.
9. The principle of optimizing costs and benefits.
10. The principle of the possibility of determining and accounting for network effects.
11. The principle of valuation, capitalization (monetization) and assignment of a network effect.
12. The principle of registration and protection of rights to the network effect as a specific object of intellectual-network property (Dyatlov, 2018).

Information and innovation activity is extremely complex, multi-aspect and non-linear, contains much direct communication and feedback, direct and indirect network effects. In the modern digital economy, there are processes of integration, networking, and convergence of manufacturers, generators, marketers, and consumers of network intelligence and information benefits and innovative knowledge technologies, as well as the commercialization of various network effects.
It is necessary to justify an important theoretical position. In the global neural network economy, hybrid neural network effects – the effects of interaction between human intelligence and artificial intelligence-become an important value. The technological basis of these hybrid neural network effects is integrated digital platforms and socio-neural-morphic interfaces.

Methods for Evaluating Network Effects

An important regularity characterizing the production of information products (chips) in 1965 was formulated by one of the founders of Intel, Gordon Moore. According to Moore's law, the computing power of microprocessors and the density of memory chips doubles approximately every 18 months at a constant price, i.e. unit prices are halving every 18 months.

The content of the concept of “network value” was introduced by Robert Metcalfe, who was one of the developers of the Ethernet network system. He formulated a law called Metcalfe’s law, according to which the value of any network for a user is equivalent to the square of the number of connection nodes, that is, if there are n users in the network, then the value of the network for each is proportional to the number of other users (Reingold, 2006). Following Metcalf’s law, the utility or use value of networks rises sharply with an increase in the number of subscribers (users). The usefulness of networks as a direct network effect begins to increase only after reaching the so-called critical mass, which is understood as the minimum number of users, starting from which the system acquires a certain level of utility that ensures long-term operation of the network. In general terms, Metcalf's law can be expressed as follows:

$$Ц_n = (n-1)\, w\,,$$
$$P_n = n\,(n-1)\, w\,,$$

Where:

$Ц_n$ - the value of the network (n - nodes) for each subscriber;
P_n - the total value of the network (n-nodes) for all its subscribers;
w – the assessment of the ability to negotiate with one subscriber.

So, if the value of the network for one user is $ 1 for each of the other users, then the total value of the network of 10 users is approximately $ 100, and the total value of the network of 100 users is about $ 10,000.

For production and network systems that require the accumulation of a critical mass of users (participants), starting (basic) support is required, which consists in creating a basic number of users, providing special conditions for network activities, services, differentiating services and tariffs, influencing the formation of favorable consumer expectations and etc. After reaching a critical mass, new users will perceive the value of an information service more than its price due to the action of positive network externalities. It should be noted that network externalities can also be negative, for example, in the event of a malfunction or slow down when the computer network is overloaded.

Another law regarding IT effects is formulated, called the Zipf Law. Its discoverer is George Zipf, an American linguist from Harvard University. Zipf's law expresses the empirical regularity of the frequency distribution of words in a natural language: if all words of a language (or just a long text) are ordered by decreasing frequency of their use, then the frequency of the nth word in such a list will be approximately inversely proportional to its ordinal number n - the so-called rank of this words (Zipf, 1949). Formally, Zipf's law expressing an estimate of the increase in network utility (NE) can be defined as follows:

$$NE = n \log (n) ,$$

Where:

NE – the network utility;
n - the number of network elements (nodes).

The American engineer and scientist Claude Shannon in 1948 published a fundamental article, "The Mathematical Theory of Communication" (Shannon, 1948). In this article, he, solving the problem of transmitting information through a communication channel subject to noise, proposed a probabilistic approach to the amount of information transmitted and introduced a measure of the discrete probability distribution over the set of alternative states of the transmitter and receiver of messages. C. Shannon proposed a formula for determining the amount of information, defined as the reciprocal of the entropy:

$$IH(q) = -\sum_{j=1}^{n} q_j \cdot \log_2 q_j ,$$

Where:

IH – the information entropy, which determines the amount of information;
n - the number of characters from which a message (alphabet) can be composed;
q_j – the probability values; the probabilities can be replaced by their statistical estimates: $q_j = \frac{N_j}{N}$,
which represent the relative frequency of the jth character in the message;
N - the number of all characters in the message;
N_j - the absolute frequency of the jth symbol in the message, i.e. the number of occurrences of the jth character in the message.

The formula proposed by C. Shannon is used to measure the amount of information, defined as a negative value of entropy. Boltzmann had previously proposed a formula for measuring entropy.
In our opinion, for the integrated assessment and measurement of various network effects and network benefits arising in a certain complex network-type system, the following components should be taken into account:

- the number of elements, the amount of information and the number of links;
- the nature and method of network connections;
- the level, type, structural and functional organization (architecture) of networks;
- the quality and measure of internal information links between elements and their functions within the system;
- the target dominant (main target function) of the development of this system;
- the entropy-synergy network balance of this system.

Based on the dependencies formulated by Zipf and Shannon, we propose a methodological approach to determining the information network effect, which in the most general form we define as follows:

$$INE = C \times (IH \times NE) ,$$

Where:

INE – the information network effect;
IH - the amount of information (information negentropy);
IH – the network utility;
C - the dimensionality coefficient that determines the choice of a specific unit of measure for the network effect (Dyatlov, 2018).

In the modern digital economy, as a result of the law of increasing returns (growth of integrated productivity), neural network effects bring integrative value distributed in space and time, the evaluation and accounting of which leads to an increase in the value of the gross world and gross national product and the distributed neural network interaction income of the participants.

Conclusion

It should be concluded that a new generation of global networks has emerged - the Neuronet of network knowledge values and network effects, which replaces the traditional Internet. In the modern digital economy, the network human capital is the main driver of dynamic and sustainable innovative development. In the context of the upcoming fifth neural network technological revolution, the main accumulator of value is human capital (the neuro-network human capital), which has hyper-competitive network competencies, which allows creating added value and neuro-network effects. In the industrial economy, the law of diminishing marginal returns applies. In the digital economy, in contrast to the industrial one, the law of increasing marginal revenues (returns) applies, which is due to network effects and positive direct and feedback links between participants of the global network.

In the global hyper-competitive information-network economy, the most important and most difficult task is the specification of various rights to new neural-network objects of intellectual-network property. We offer a general authors' approach, which is being developed as part of the information paradigm of social development and which defines a new, promising direction in the search for a solution to this complex problem. The essence of our proposed methodological approach is disclosed in the following provisions. In the context of the emerging neuro-network economy, there is a whole class of new neuro-network effects. Multifunctional neural network effects are embodied in various objects of intellectual network property (materialized and personified, material and non-material, linear and non-linear, localized and cloudy). In our opinion, the general methodological principle is as follows: all the integrally distributed in time and space results and effects from production-supply-consumption-assessment (accounting) of multifunctional neural network goods and services aimed at real satisfaction of actualized and verified needs of people and the resulting new specified rights to neural network objects of intellectual network property are subject to accounting and evaluation.

Emerging new neural network effects require specification and classification as new objects (elements) of intellectual network property, should be adequately evaluated and taken into account when calculating the expanded (taking into account the integrated network benefits and effects) GNP. This implies the expansion of the traditional system of national bookkeeping by including new

integratively distributed multifunctional neural network effects, as well as the need to adjust (increase) the GDP estimate by their value, in particular, by the value of the specification of rights to new neural network objects of intellectual property (Dyatlov, 2018).

In a global hyper-competitive information-network economy, an urgent, important and difficult task is to develop a methodology for assessing and accounting for the magnitude of neuro-network effects as new objects of intellectual-network property, as well as to develop a universal methodology for identifying and specifying various rights to new neural-network objects of intellectual network ownership and ensuring their legal protection. In this regard, it is quite natural to propose the creation of a completely new section in the international law "Protection of rights to network intellectual property".

Abstract

The article summarizes and formulates the main principles of sustainable development. The interrelation of economic, social and environmental goals of sustainable development is revealed. Theoretical views of scientists on the interpretation of sustainable development goals are considered. The analysis of the main economic instruments for achieving sustainable development in Russia, including economic measures to promote cleaner production, reduce risks of environmental pollution, create markets for organic food, taxation of natural resources, insurance, investment in environmentally hazardous production. Indicators of sustainable development are presented: Environmental performance Index, Resource - Adjusted net Domestic Product, and Green gross national product.

Keywords: Sustainable Development, Concept, Ecology, Environment, Indicators, Green National Product

Introduction

In modern conditions, ecology becomes the most important factor limiting the limits of economic growth based on the use of traditional factors. The Economics of sustainable development and environmental conservation is a new field of research that reveals the relationship between natural ecosystems and socio-economic systems. The concept of sustainable development and ecological economy is based on the principles of close relationship between economy and ecology, which consider people, economy and ecology as important elements of a common geo-ecosystem. People in this system occupy one of the key places, because they are responsible for understanding their role in the global biosphere system, for its maintenance and management to ensure sustainable development. This ideology is closer to the ecological worldview of the biosphere, where natural resources are not considered unlimited, and humanity is one of the biological species. (Our general the future, 2018).

Environmental Economics believes that human preferences, perspectives, technologies, and culture should develop in conjunction with nature and reflect the expansion of environmental opportunities and environmental constraints. (Bobylev, Girusov 2019).

The environmental situation in the world, which can be described as a state of environmental crises combined with the aggravation of global social, economic and political problems, requires a change in the course of development of modern civilization. One of the main contradictions is the struggle between economic growth and the need to reduce its intensity in order to preserve the environment. To solve this complex problem, it is necessary to combine political will, international efforts and a

paradigm shift in the economy, which consists of a transition from the economic system of civilization to the ecological and economic system.

Every time economic interests clash with environmental requirements, we are referring to the human impact on nature, the consumption of natural resources, and environmental pollution. Natural resources, conservation of natural values, and adaptation of the human environment are elements of the economy. The development of the modern economy has led to a large amount of consumption of technological resources and environmental resources. These factors, along with a large number of people, have become the main causes of natural imbalances and environmental degradation.

Statement of the Problem

Sustainable development is development that implies the ability to meet the needs of humanity without putting future generations at risk of also meeting their own needs. This concept shows the inextricable link between the socio-economic environment and the environment. Environmental sustainability refers to the ability of an ecosystem to maintain its structure, features, and functions when exposed to external and internal factors. This concept is also referred to as "environmental stability". The model of long-term sustainable development is based on the idea of equal environmental interests for present and future generations.

Today, the study of complex problems of sustainable development has a number of features related to the formation and development of the digital economy. A separate area of research should be identified that reveals the relationship between the goals (tools) of digitalization of the economy and the goals (tools) of sustainable development (Dyatlov, Didenko, 2019).

The main contradiction between economic and environmental development is that, on the one hand, the economy must develop, on the other-this development has an adverse impact on the environment. The development of a monitoring system and a system of indicators for sustainable development in the regional, national and global economy is particularly important.

Research Questions

The main directions (issues) of research in the field of sustainable development and environmental Economics are:

- Sustainability as the content of life support systems;

- Criteria for sustainable development;

- Assessment of natural resources and natural capital;

- Macroeconomic accounting in the environmental system and economy;

- Creation of innovative environmental management tools;

- Environmental and economic instruments at local, regional and global levels;

- Indicators and indicators of sustainable development in the regional, national and global economy.

The purpose of the study

The concept of sustainable development has become a new qualitative approach to economic, social and environmental balanced development. R. Costanza and K. Folke identify three interrelated hierarchical problems, the solution of which is associated with sustainable development:

- sustainable economy that is compatible with the life support system;
- Equitable distribution of resources and opportunities not only among the current generation of people, but also between current and future generations, as well as between people and other species;
- Efficient allocation of resources over time, allowing for proper examination of natural capital.

It is important that the problem of size and distribution cannot be solved using a market mechanism. These problems must be addressed outside the market, and the market can be used as a tool for implementing these solutions. (Karakean, 2018).

The main ideas of sustainable development were developed at the UN conference on the environment in Rio de Janeiro. They include the following provisions:

- both the natural and human environment are important for the existence of society and for ensuring basic human rights, including the right to life;
- the preservation and improvement of the environment is primarily an important responsibility of local authorities and all national governments, which should be responsible for implementing policies and activities in this area within their jurisdiction;
- pollution and environmental degradation have reached dangerous proportions;
- the human environment must be protected and improved for present and future generations by the joint efforts of countries and peoples in accordance with the main goals set for international and global socio-economic development.

These provisions were developed and set out in the Stockholm Declaration on the human environment, adopted at the Conference, which is related to the formation of special environmental norms of international law. For the first time, it provides for special principles of international law that are directly aimed at regulating state cooperation in the field of environmental protection. These include the following principles: protection and improvement of the environment for present and future generations, and the inalienable sovereignty of States over their natural resources, without causing damage to the environment beyond the limits of national jurisdiction. (Korobkin, 2019.

The documents developed by the International Commission on environment and development under the chairmanship of the Prime Minister of Norway, H. H. Brundtland, are of great importance, in particular, the task of developing proposals for long-term environmental strategies that will ensure sustainable development for a longer period of time, as well as identifying ways and means by which the international community can effectively solve environmental problems. The result of the Commission's work was the report "Our common future", which focused on the concept of sustainable development, which means development that meets the needs of the present, but does not compromise the ability of future generations to meet their own needs.

Documents adopted at UN conferences on environmental issues are a source of international law and recommendations in the field of sustainable development. It contains principles for the conduct of individual States and the international community in relation to environmental protection. These documents serve as guidelines for developing the most important areas of environmental protection in States, as well as for defining, observing and protecting the environmental rights of people and society.

At the present stage of transition to sustainable development, all the necessary conditions are created to ensure the balanced functioning of nature, population, and economy. At the same time, decision-making mechanisms should be focused on environmental priorities and take into account the consequences of implementing these decisions in the economic, social and environmental spheres.

The sustainable development mechanism ensures that environmental effects are prioritized and that costs, benefits and risks are fully assessed in accordance with the following criteria: no economic activity can be justified if the benefit from it does not exceed the damage caused; environmental damage must be as low as can reasonably be achieved, taking into account economic and social factors.

An urgent and complex task is to identify, define and evaluate various synergistic effects that arise from the integration and sharing of human, economic and environmental factors based on digital convergence (Dyatlov, Selischeva, 2017).

Research Methods

The basic principles enshrined in the Rio Declaration of sustainable development are the basis for creating a new institutional and environmental-economic mechanism for global partnership aimed at concluding international agreements that ensure respect for the interests of all and guarantee the integrity and development of the global system of environmental protection. The most important of these principles are:

- the inalienable sovereignty of States over their natural resources, taking into account the principle of non-harm to the environment beyond the limits of national jurisdiction (principle 2);
- meet the needs of present and future generations in the areas of development and the environment as an integral part of the right to development (principle 3);

- addressing environmental issues with the participation of all concerned citizens and ensuring that everyone has access to environmental information and its wide dissemination to the public (principle 10);

- international cooperation in the field of environmental protection in the context of sustainable development with a view to eradicating poverty (principle 5); recognition of common responsibilities and responsibilities in the field of environmental protection (principle 7); building scientific capacity (principle 9); creating a favourable and open international economic order (principle 5); countering or preventing the movement and transport of harmful activities, hazardous and environmental substances (principle 15);

- adoption of effective legislation in the field of environmental protection (principle 11);
- development and adoption of national laws on liability for damage caused as a result of activities that harm the environment (principle 13) (Kuznetsov, 2018).

Economic mechanisms for solving problems of sustainable development should be based on interrelated principles of Economics and environmental management. Balanced environmental and economic regulation of market relations has two goals:

- limiting inefficient competition in order to remove non-environmental products, technologies and equipment from the competitive environment;

- development of appropriate market mechanisms (environmental insurance and trade in various types of quotas in nature management).

Results of the study

Economic tools for achieving sustainable development goals

The main economic instruments for achieving sustainable development goals in Russia can be classified into four groups:

I. Formation of a system of economic measures to stimulate the greening of production. It should gradually move from existing mainly indirect taxation to direct taxation of natural resources. The latter has several advantages:

- contributes to the conservation of resources and the preservation of the natural environment; contributes to better tax collection;
- creation of effective funds for the protection and reproduction of natural resources;
- increases the commercial effectiveness of environmental protection for all owners, as resource conservation is promoted;
- creates the necessary prerequisites for improving the system of national accounts. (Lukyanchikov, 2018).

Direct taxation of natural resources should take into account rental indices in payments for traditional natural resources, rather than quasi-equivalent ones (as is now done); accounting for payments for environmental pollution. Changes to the tax system may include:
- consistent replacement of budget revenues at various levels with income tax, personal income tax, value added tax, excise taxes, and income from natural resource taxation;
- implementation of measures for gradual adaptation of taxpayers to new tax conditions by developing a tax credit and benefits for individual natural tax payers;
- taxation of allotment of land plots and other types of real estate, taking into account the shift of the center of gravity of taxation from buildings and structures to allotment of land plots as part of real estate;
- formation of reserve funds in higher budgets to support lower budgets for the period of transition to the new tax system.

Tax reform should be carried out gradually in order to adapt taxpayers to the new tax conditions. Tax restructuring should first of all be based on the principle of "tax neutrality".

II. Creating markets for environmentally friendly products, technologies, and equipment.

Promote activities for the creation of markets involves a number of economic and administrative measures:

- improvement of national accounts microeconomic;
- international bans on the export and import of certain goods is not environmentally friendly;
- the introduction of quota trading on the permissible impact on the environment;
- creation of environmental innovation programs and projects. A special role is played by the gradual tightening of standards and control over the impact on the environment.

The introduction of environmental technologies and equipment is stimulated by improving microeconomic indicators, using the principles of "tax and credit neutrality", increasing the effectiveness of payments for pollution, introducing trade in pollution rights, creating environmental innovation programs, and so on. Waste management plays an important role. A competitive environment should be created in the environmental equipment market by selecting the most cost-effective types of equipment with comparable environmental indicators (Makar, 2017).

Excessive payments for pollution are the main environmental and economic tool that affects business profits. In most cases, enterprise emissions are determined by a balance sheet method based on the values of technological education, waste management, and waste release to the environment. Payments are made based on the information that the polluters provide about themselves. The possible uncertainty in the balance sheet and the lack of direct control over emissions create a demand for consulting services to understate excess payments. This phenomenon can be prevented by directly controlling the emissions of regional environmental authorities using special tools.

III. Consideration of the environmental factor in privatization. Neither the current environmental legislation, nor the proposed new draft legislative documents on privatization, nor the methods of
