
Fig. 1: Matrix-cyclic model of substantiation of methods of management of payback of innovative products

(Source: compiled by the authors)

The vertical axis represents the main indicator - "balance level." The horizontal axis is a measure of time. The dashed line indicates the negative quality level of the innovative product.

The stages and content of the matrix-cyclic model of managing the payback of innovative products determine the characteristics of the life cycle of the balance of interests of producers and consumers.

Conflict as the ultimate mismatch between the goals of economic sustainability and the assessed quality of the product. It occurs when the utility of a unique product is not recognized. The quality level in this case is considered negative. The solution to the conflict is to form and apply a management mechanism in the payback project (phase 1 in quadrant 1). The result is a slight reduction in the inconsistency between the goals of producers and consumers, as shown by the dynamics of the indicator factors in step 2 in quadrant 2. At this stage, the project is started at the product manufacturer. Reducing the costs of producing innovative products and increasing their quality create opportunities to achieve a narrow and short-term "consensus of interest zone" (phase 3 in quadrant 3). Finally, consumer awareness of the value and increased production of innovative products allows for the achievement and maintenance of a long-term compromise of interests (phase 4 in quadrant 4).

The cyclical model ensures complete coverage of the phases, taking into account changes in the balance of interests of stakeholders. The implementation of a set of payback management methods ensures that changes are controlled by cycle stages.

The parameters of quadrant 1 are due to inefficient payback methods leading to stagnation due to the production of low-innovation products of basic quality and the use of standard control tools. This ensures a certain level of profitability and economic sustainability mainly on the basis of lower costs per unit of production (economies of scale). Methods that ensure the stability of indicators with a low level of innovation of products make the enterprise move towards a situation of crisis even with some improvement of its quality (quadrant 2).

It is logical to assume that the parameters in quadrants 3 and 4 are due to methods that can be described as effective and highly innovative. Indeed, a jump in quality estimates from negative to positive values is possible with innovative technologies for manufacturing products and managing the "breakthrough" level. The result is achievable in less time under conditions of compromise or (ideally - consensus) interests of producers and consumers of the corresponding products of unique level of competitiveness.

Thus, in order to effectively implement the proposed hypothesis, payback control methods corresponding to the parameters of quadrants 3 and 4 should be selected. In this case, some reduction in economic stability due to a decrease in the economies of scale of production (in quadrant 3) should be compensated by a significant increase in the quality of the innovative product (in quadrant 4) to the level of its utility characteristics, which meets the requirements of consumers in the extended range. For this purpose, it is necessary to apply intensive methods of managing the imbalance of interests.

As a result of the analysis, it can be concluded that there is no acceptable definition of an imbalance of interests in the payback process in the scientific literature. It is therefore proposed to supplement this concept.

Imbalance of interests is an unacceptable degree of their divergence in the production enterprise and in the interested parties-consumers of products from the level of their balance, or consistency in the area of compromise of interests *(Dmitriev, 2000)*. The degree of discrepancy should be expressed in the actual and planned targets of the level of balance of interests of the producing enterprise.

At the heart of the organization of an evolutionary regulated process to achieve compromise or consensus in the life cycle of the balance of interests of the consumer and the producer is a mechanism of payback management, formed in stages on the basis of a matrix-cyclic model of justification of methods of payback management of innovative products. The mechanism for managing the payback of innovative products is based on aligning the interests of innovation and product quality for consumers with the goals of quality management and cost reduction for manufacturers.

Analysis of industrial development experience shows that the desire to maintain stability at all costs often leads to rapid, unmanageable and undesirable changes. At the same time, the consequences are catastrophic. At the macro level, as well as at the micro level, not only the short-term efficiency of dynamic processes is important. It is desirable to take into account the prevailing focus of different factors on balancing the interests of producers and consumers in payback management.

Thus, it is necessary to take into account differentiated factors of coordination of interests of producers of innovative products and its values for consumers in the extended range of quality and innovation of products. Flexible management is the goal of the management entities, is achieved by methods of maximum coordination of the action of three groups of main factors of balance of interests in the complex of producers and consumers of products (Figure 2).

1) technical and technological characteristics of product quality evaluated by the consumer (1);
2) organizational and economic, affecting the capabilities of producing enterprises in reducing costs per unit of production (2);
3) quality of ROI management taking into account all factors (3).

This is the essence of improving the quality of payback management by the stages of minimum (a), medium (b) and maximum (c) levels of balance of interests in the evaluation of product quality and management indicators.

It has been established that enterprises with low characteristics of innovative potential and coherence of interests (at zero or small intersection of areas in Fig. 2 (a, b) the efficiency of the payback process will be small. This is due to the low level of coherence of interests of the participants in the process by factors. It is necessary to expand this area of productive payback management as a compromise of the objectives of the group of enterprises under consideration (Fig. 2 c, b).

Fig. 2: Process of interlinkages of factors, functions and indicators of balance of interest management in the payback management model

(Source: compiled by the authors)

In order to achieve and maintain a balance of interests in the compromise area, product quality and ROI management indicators, unit costs and other indicators must be adjusted according to the stages of their changes in the life cycle.

Figure 3 shows the evolution of ROI across the life cycle phases of the Product Balance of Interests between Manufacturers and Consumers.

Consider the expected shift in quality and time of curve 1 to represent the change process more realistically. It can be assumed that A0 time is required in Phase 1 of the cycle for the processes of forming and incorporating the mechanism into the existing payback management system and showing signs of increasing the quality of consumer-aware products. The need to inform consumers about them is due to inertia in the process of consumer awareness of the general utility of the innovative product. The consumer's negative perception of the quality level of a completely unknown innovative product is explained by the conservative inertia of thinking, the habit of existing technologies and the fear of losing the existing way of meeting the need. Therefore, at point 0 of cycle 1, the balance of interests in question is minimal; hence the production and consumption of low innovation products prevail. Curve 3 corresponds to changes in the balance level, or consistency of the interests of the producer (curve 2) and consumers (curve 1). The interests of the manufacturer are expressed through the indicator of the level of costs; the interests of the consumer are determined by the level of quality of the product. Since these facts and processes are repeated periodically, there is a cyclical nature of dynamics in the life cycle of changes in the balance of interests.

A slight decrease in the quality of products of the type in question at the middle or end of cycle 1 (curve 1 in step IV) is due to the fact that each additional increase reduces the expression of psychological responses of consumers with each assessment of the product value requirements. This means that the marginal utility of even an innovative product decreases and the imbalance of interests grows *(Babanova and Tomasheva, 2012), (Garaedagi, 2011)*. In order to maintain the level of consistency and transition to the compromise zone modernization based on low or medium innovation products (version 3.1) or transition in the next development cycle to a new product (version 3.2) and to a higher level of its quality is necessary. To do this, you should start the design of a new product (curve 2 ') with lead time.

Fig .3: Dynamics of ROI indicators in the presentation of the life cycle of the balance of interests of producers and consumers of products

(Source: compiled by the authors)

The developed concept and model of the mechanism of product payback management allow to justify the theory of life cycle of processes, which involves selection of innovative object of payback, stages of control of imbalance of interests, which are completed by transition to the subsequent payback cycle of the new product using tools of basic and additional control functions and indicators of quality of their application.

Results

When using the ROI quality criteria, it is necessary to define the ROI quality index indicators. To do this, the relationships of cause estimates, or actual values of indicator-results, to the goals or standards of the same indicators measuring interests are investigated.

The main resulting indicator of the process of improving the quality of ROI management in the study is the level of balance of interests, and intermediate - factors estimated by indices of quality of performance of management functions.

The direction of their action can be expressed in the form of a tree of goals for achieving planned (ideal or compromise) values of the main property - the level of balance of interests and factors - indices of quality of performance of management functions (IQj), dependent and determined by the corresponding indicators Xi, j (Fig. 4), organizational-economic and technical-technological types, taking into account the corresponding factors.

Fig. 4: Interrelation of factors and indicators of improvement of payback management quality according to the criterion of compromise of interests
(Source: compiled by the authors)

The task of determining quality index of j-th payback management functions (IQj) by indicators Xij of their application for each function j (j = 1,2,... n), i (i = 1.2,... m) is solved for groups of factors of two types:

$$IQ_{joe} = f_1(x_{ijoe}), IQ_{jtt} = f_2(x_{ijtt}), \quad (1)$$

where subscripts oe, tt - mean taking into account organizational-economic and technical-technological factors of interest imbalance, respectively.
Level of balance of interests is the resulting function of indicators of quality of management by the set of specified factors:

$$LB = f_3(IQ_{joe}, IQ_{jtt}), \quad (2)$$

The control subsystem is considered by us as a system of sets of operational dependencies of the type "input - process of performance of payback control function of innovative products - output, or result," included in the specified mechanism. The applicability or intensity of application of specific basic functions in the enterprise management system and additional management functions should vary. Variability will depend on the degree of imbalance between the interests of manufacturers and consumers of innovative products in an extended range of quality, taking into account the innovation of the products. In order to manage the transition towards balanced development of the system of producers and consumers of innovative products, concrete and measurable results are still needed.

Standards of higher order systems (meso- and macroeconomic systems) are among the external factors of the production enterprise activity, which are taken into account in the development of its own goals and plans. On the one hand, these standards can be considered development guidelines, on the other - they can be considered as some limiting indicators, limiting the range of changes in the indicators of application of management functions in the field of compromise of interests.

A common characteristic of satisfaction at these levels of management can be considered the degree of compromise as the consistency of needs and values (individual and corporate consumers, producers, etc.) with planned goals or regulated regulations. Sufficient satisfaction is reflected in the performance of

management in terms of indicators of achieving target levels of balance of interests and long-term sustainability of the relationship system.

Today, many industrial enterprises have developed a high degree of inconsistency between management targets and staff needs and values. This is primarily due to poor performance indicators for management functions. This leads to an increase in economic losses due to delays in management decisions and the presence of lag processes in their implementation.

The operation of the management mechanism ensures the sustainable transformation of the main elements of the enterprise producing innovative products in the direction of compromise of interests throughout the life cycle of the balance of interests. Each of the proposed functions will allow to organize the performance of standard basic management functions (general and specific) in case of changes in external factors and imbalance of interests, in addition, will allow to build rational relations between divisions of the enterprise.

The basic set includes management functions by directions: 1) main operational activity for production of products, works or services; 2) accounting; 3) technical and social development; 4) marketing; 5) development and implementation of strategies; 6) finance; 7) consulting activities; 8) practical; 9) sales, or sales; 10) economics, etc. Summarizing the above-mentioned factors and directions of improvement of quality and payback management by factors of reconciliation of interests can be presented in Table 1 (with indication of function numbers).

The analysis of basic management functions existing in most enterprises shows that they are sufficient to achieve satisfactory results of changes only in case of low and medium innovation challenges of the external environment. In the face of uncertainty and revolutionary technological change, additional special management functions are needed. In the work they are represented by a set of functions and indicators in the mechanism of payback management.

In order to regulate the relationships of dependent (LB) and independent variables (IQj, Xij), we propose an additional set of specific payback management functions and quality indicators for their application to basic functions. The simulation of control functions is carried out later using two kinds of mathematical tools.

According to the matrix cyclic model of justification of the set of methods, the dynamics of the main payback indicators in the life cycle of the balance of interests can be defined three coverage areas of the management functions. They are consistent with the conditions of imbalance, compromise and consensus of interest. In quadrant 1, poor control quality can be noted as the performance of applying basic specific control functions. Additional functions should be used intensively in the 2,3,4 quadrants (Table 1).

Table 1: continuum of functions of management of increasing the level of balance of interests of producers and consumers of innovative products

Distribution of the overall set of functions for managing the quality and effectiveness of the reconciliation of interests according to the characteristics of their balance sheet															
The levels of balance of interests															
Low (imbalance) or conflict									**Averages (compromise)**				**High (consensus)**		
Set of basic specific management functions									Additional specific functions for managing the payback on innovative products						
1	2	3	4	5	6	7	8	9	…	MQI	MQI 1	…	QM	QM 1	…

(Source: compiled by the authors)

Additional specific management functions take into account these groups of key indicators and the characteristics of the payback cycle:

1) a group of functions for managing reliability of relations within and outside the manufacturing enterprise and its subfunctions (MR1 - MR4);
2) a group of functions for managing the sustainability of the payback process on organizational and economic indicators of the balance of interests (management of quality indicators - MQI) and its subfunction (MQI1, MQI2);
3) group of elements for control of payback process stability according to technical and technological indicators and criteria of economic efficiency (quality management - QM) with its subfunctions (QM1, QM2).

The “Reliability management” function allows you to better implement the tasks of the control mechanism's early response to changes in the external and internal environment. It regulates the behaviour and state of the manufacturing enterprise, taking into account the stages of the life cycle of the balance of interests in the context of conflict, imbalance, consensus or compromise of the interests of the parties concerned. The inertia of processes depends on the manifestations of the organizational culture of the enterprise.

The “Reliability management” function solves a set of tasks, so it is implemented by this function itself (RM) and by a number of its sub-components (RM1, RM2, RM3, RM4) and their application indicators. Indicators such as the number of update incentives, the degree of flexibility of structures, the amount of delegation of authority, the availability of capabilities and the number of methods of quantitative modelling of change forecasts and others can be planned and measured as indicators of the quality of performance of Reliability management functions.

The continuity of the payback process, provided that the management mechanism operates on the basis of the RM function and its display, is improved due to the growth of stabilizing properties of the balance of interests. Consequently, the ability of the complex of producers and consumers to adapt to the diversity of the environment increases with increasing dynamics of innovation factors or to adjust the environment so that changes in the behaviour of their own subsystems and elements are not required. For this purpose, a number of "Reliability Management" sub-functions are additionally introduced and implemented, which perform the following sub-tasks (sub-functions) of ROI management:

– control of changes in external factors of consumer demand (RM1 subfunction) at stages 1, 2;
– management of development of personnel of the enterprise for factors of coordination with values of consumers (in abbreviated form - management of development of personnel) (reliability management – RL2) at stages 3, 4;
– management of development and realization of strategic objectives and problems of coordination of interests (RL3) at stages 3, 4;
– coordination of functions of management of coordination of the purposes of payback at the enterprise (RL4) at stage 2.
At stages 1 and 2 it is assumed to increase intensity of application of stabilizing subfunctions of RL1 and RL4, at stages 3,4 - subfunctions of provision of innovative flexibility of RL2, RL3.

Under quadrants 2 and 3 of the matrix model, the implementation of Reliability Management is no longer sufficient. In conditions of uncertainty, a specific management function is needed to enhance the sustainability of internal payback management processes (MQI).

Implementing ROI Sustainability Management on Business Balance of Interest (MQI) will improve product quality based on business factors and capabilities.

The intensity of application of sub-functions of leadership style regulation in areas of interest matching at payback of innovative products (sub-function MQI1 "leadership style") and compliance of structural elements and methods of payback with stages of life cycle of interest balance changes (sub-function of MQI2 "process") should increase.

For application of the function "ROI Stability Management by Organizational and Economic Indicators of the Balance of Interests" at stages 3,4, evaluation and regulatory indicators are used, which allow to determine quality and efficiency of ROI management according to the indicators of technical-technological and normative-criterion type: standards of quality of innovative products, which take into account consumer requirements; Degree of knowledge and resource efficiency of production of such products; Requirements to quality of payback management according to the degree of environmental friendliness and safety of the product, etc.

The set of functions "Control of payback process stability by technical and technological indicators and criteria of economic efficiency" includes subfunctions:

- management of payback quality by technical and technological factors of interest imbalance, taking into account parameters of specific costs, innovation (QM1);
- indicators of cost efficiency of process of payback of the manufacturing enterprise (QM2).

Indicators of QM1 are usually: the degree of conformity of the technology of producers, its competitiveness relative to the modern level of resource efficiency, knowledge intensity, environmental friendliness, safety; Growth rate of product innovation, intervals of technological and technological renewal. The indicators of QM2 subfunction regulate the economic efficiency of the payback management mechanism. For example, the existence or number of control procedures in the use of financial resources, their sources for assessing the focus on harmonization of consumer and technological characteristics.

Thus, interaction of organizational and economic factors of production quality, technical and technological factors of product quality and functions of payback management quality should be organized with their distribution in the extended range of product innovation quality. The structure of factors, management functions and quality indicators of the results of the complex of enterprises-producers and consumers is shown in Fig. 5.

Fig. 5: Interlinkages of process participants, factors and functions of improving the quality of management of payback of innovative products in the complex "enterprise-producer - enterprise-consumer" (Source: compiled by the authors)

Conclusion

As a result of the system analysis carried out, the relationship between laws, principles and methods in the concept of forming a mechanism for managing the payback of innovative products on indicators of harmonization of interests of producers and consumers has been established.

An approach based on the concept of "life cycle of balance of interest" has been proposed for implementation in evolutionary cyclical processes of regulation of the mechanism of payback management of innovative products. The cycle is defined as a period of time that includes the main stages of changes in the balance of interests of producers and consumers, estimated by the indicator-property "level of balance of interests." The cycle defines four stages of changes to the key figure-property "balance of interest's level." Depending on the level of balance of interests (low, medium, high) and 4 stages of the cycle, four zones of imbalance of interests of producers and consumers are distinguished: consensus; compromise; conflict; imbalance.

The Lead Balance Life Cycle Toolbox highlights four groups of methods. They correspond to quadrants and the direction of changes in the matrix cyclic model.

Special criteria indicators have been developed, which allow to quantify the quality of payback management of innovative products by indicators of harmonization of interests of producers and consumers: level of balance of interests, indices of quality of payback management and their indicators-factors.

La Mobilité Internationale Des Etudiants-Alternants Au Coeur De La Construction D'une Economie De La Compétence : L'exemple Du Territoire Corse

Christophe STORAÏ

Maître de Conférences en Sciences économiques et Directeur du Centre de Formation des Apprentis Universitaire (CFA UNIV) en région Corse, IUT de Corse, UMR LISA 6234-Université de Corse, BP 52 20250 Corte, storai@cfaunivcorse.fr;

Laetitia RINIERI

Assistante Ingénieure en Formation et Insertion Professionnelle au CFA UNIV en région Corse, Campus Grimaldi, Bât PPDB, 20250 Corte, lrinieri@cfaunivcorse.fr;

Résumé

A l'heure d'une globalisation exacerbée, l'éducation, et plus généralement la formation, représente un facteur clef pour notre société, au cœur de territoires mis au défi de se renouveler face à l'émergence tout autour du globe de nouveaux centres de gravité économiques et démographiques, avec leurs propres modèles. La formation, et son articulation avec la vie professionnelle, représente un véritable enjeu pour faire face, dans un futur proche, aux révolutions technologiques, économiques, politiques, environnementales auxquelles nous sommes d'ores et déjà confrontés. Au-delà de ce que l'on appelle l'alternance ou la formation professionnelle continue dans l'Enseignement Supérieur, le défi actuel se situe bel et bien autour d'une Formation Tout au Long de la Vie (FTLV), vieux concept mais dont les formes en appellent toujours à une actualisation dans la modernité. Au cœur d'un petit territoire ilien comme la Corse, ce challenge est d'autant plus crucial à relever qu'il préfigure son attractivité dans un contexte de *glocalisation* (Mair, 1991) désormais durablement ancré. Dans un environnement mondial en perpétuelle évolution, avec des repères mobiles, des vies personnelles et professionnelles toujours plus complexes, et où tout ce qui semblait bien compartimenté hier fait face à une porosité croissante, l'objet de cette contribution vise à expliciter que la mobilité internationale des étudiants-alternants, au cœur de la construction d'une économie de la compétence, constitue un enjeu stratégique majeur au service du développement et de la structuration d'un petit territoire comme celui de la Corse.

Mots-clés : mobilité internationale des étudiants-alternants – FTLV - formation / emploi – économie de la compétence - développement et structuration du territoire corse.

Introduction

La formation, et son articulation avec la vie professionnelle, représente un véritable enjeu pour faire face, lors les décennies à venir, aux révolutions technologiques, économiques, politiques, environnementales auxquelles nous sommes d'ores et déjà confrontés. Si l'on s'imagine déjà mal, aujourd'hui, comment une formation initiale pourrait suffire à un individu pour ses 40 ans de carrière à suivre, la rapidité d'évolution de nos sociétés (la nôtre mais aussi, voire surtout, celles qui nous entourent et qui ainsi constituent au plan mondial notre environnement, ou encore notre écosystème), les transitions numériques et énergétiques en cours, ne feront qu'accentuer l'obsolescence de cette représentation d'une formation découplée des formes d'apprentissage ultérieures.

L'enjeu pour les individus, le monde économique et in fine la place de notre pays au niveau mondial, est donc celui de l'actualisation des connaissances, de l'évolution des savoir-faire, du renouvellement des représentations, de la compréhension des enjeux macroscopiques.

Dans un petit territoire ilien comme celui de la Corse, peuplé de quelques 330 000 habitants et en quête de structuration d'une économie de la compétence bénéfique à son développement pérenne, cet enjeu revêt une priorité d'autant plus fondamentale. Après avoir démontré dans des précédents travaux (Storaï C., Rinieri L. et Boulenger M., 2014 ; Storaï C. et Rinieri L., 2016), comment le dispositif de l'alternance dans l'Enseignement Supérieur en région Corse peut constituer un outil stratégique au centre d'une politique territoriale de croissance du capital humain, nous portons aujourd'hui notre réflexion sur la problématique de la mobilité internationale des étudiants-alternants en qualité de vecteur générateur d'une économie de la compétence profitable au développement et à l'attractivité d'un espace géographique insulaire comme celui de la Corse.

Après avoir rappelé l'importance du concept de mobilité internationale des étudiants-alternants en matière de croissance des compétences relatives aux savoir, savoir-faire et savoir-être, notre analyse montrera comment une politique pédagogique d'un CFA[i] est susceptible de contribuer à valoriser l'insertion professionnelle et l'employabilité des ressources humaines qui structureront les entreprises locales.

La Mobilité Internationale Des Etudiants-Alternants : Un Concept Dual Et Novateur

En marche depuis une vingtaine d'années, l'internationalisation de l'Enseignement Supérieur a connu une croissance notable cette dernière décennie. L'Unesco[ii] a recensé 4,1 millions d'étudiants internationaux en 2013 et estime ce chiffre à 7,2 millions à l'horizon 2025. En Europe, les Universités ont inscrit au coeur de leurs offres de formation la mobilité des étudiants, fortement soutenues par l'ensemble des programmes proposés par l'Agence Erasmus. L'objectif clairement affiché est de contribuer au renforcement l'employabilité de leurs diplômés « *en les dotant de compétences académiques et non académiques, que l'immersion en environnement interculturel favorise* » (Brassier-Rodrigues C., 2016, p.59).

Cela étant, dès 2016, un rapport du député Jean Arthuis[iii] avait pointé les freins à la mobilité internationale des alternants. En effet, le dispositif de formation en alternance n'est pas harmonisé en Europe, comme c'est le cas depuis 2010, avec le processus de Bologne pour *l'espace européen de l'enseignement supérieur*. Pour mettre en place ce projet, il faut prendre en compte les pratiques de 28 pays différents. Pour chaque ministère de l'Enseignement Supérieur, les difficultés pratiques seraient, notamment, de mesurer quels sont les secteurs professionnels qui, à l'étranger, sont demandeurs tout en répondant simultanément aux critères d'enseignements nationaux.

En France, si la récente *loi pour la liberté de choisir son avenir professionnel* du 5 septembre 2018 a levé certains obstacles juridiques pour faciliter la mobilité internationale des étudiants-alternants (Storaï C. et Rinieri L., 2019), le focus que s'est fixé la ministre du Travail, Muriel Penicaud, d'atteindre 15 000 apprentis en Erasmus pro[iv], risque de ne pas être une sinécure.

Des Référents « Mobilité Internationale » Dans Les CFA Et Une Exonération D'une Partie Des Obligations De L'entreprise Prévus Par La Loi

Jusqu'en 2018, les rares apprentis qui ont bénéficié de la mobilité européenne étaient issus de centres de formation particulièrement volontaristes. Concrètement, la mobilité est effective lorsqu'il y a une équipe dédiée à cette problématique. Il est indispensable que la mobilité soit structurée autour de référents mobilité visibles et identifiables par l'ensemble des acteurs.

Le décret n° 2019-1086 du 24 octobre 2019 portant diverses dispositions relatives à la mobilité à l'étranger des apprentis et des bénéficiaires de contrats de professionnalisation[v] précise les modalités de mise en œuvre de la mobilité des alternants dans ou hors de l'Union européenne, notamment le contenu des relations conventionnelles qui lient l'apprenti ou le bénéficiaire de contrat de professionnalisation, l'employeur en France, l'employeur à l'étranger, le centre de formation en France et le centre de formation à l'étranger. Il prévoit également que l'organisme ou le centre de formation en

France se substitue à l'employeur pendant la période de mobilité, s'agissant du versement des cotisations relatives aux accidents du travail et maladies professionnelles, pendant la période de mobilité longue, exonérant l'entreprise d'une partie de ses obligations.[vi]

La mise en œuvre de projets de mobilité européenne et internationale pour les alternants dans les CFA nécessite de mobiliser une ingénierie dédiée. Cette ingénierie de la mobilité internationale, exercée autrefois souvent de manière informelle par les équipes pédagogiques et/ou administratives des CFA, s'est au cours des dernières années largement professionnalisée eu égard aux compétences spécifiques requises pour mener à bien ce type de projets.

Considérant cette réalité et en conformité avec l'article 24 de la loi du 5 septembre 2018, les CFA devront se doter de *« référents mobilité »* dont les caractéristiques principales du travail exercé recouvrent une gamme étendue d'activités (gestion administrative et financière, organisation, construction et animation des partenariats, coordination et communication…). L'implication des staffs de direction et la mobilisation collective des équipes pédagogiques et éducatives est une condition première du développement de mobilité longue des alternants. L'organisation de la mobilité requiert des compétences croisées de nature juridique, réglementaire, pédagogique ou organisationnelle qui devront être pleinement déployées au sein des CFA.

Au-delà d'une expérience de vie personnelle valorisant une employabilité future pour l'étudiant-alternant, le dispositif de mobilité internationale est également profitable pour sa structure d'accueil formatrice.

Une expérience internationale autant bénéfique à l'étudiant-alternant qu'à sa structure d'accueil

Beaucoup de travaux de recherche (Cours des Comptes 2019, Brandenburg et alii, 2014 ; Tarrant et ali., 2014) ont été menés sur les compétences acquises par les étudiants lors de la mobilité internationale, qu'il s'agisse de semestres d'études ou de stages en entreprises. L'essentiel de ces enquêtes sont des études quantitatives réalisées auprès d'un nombre élevé d'étudiants qui ont rempli, à leur retour de mobilité ou lorsqu'ils sont diplômés, des questionnaires. Fréquemment réalisées immédiatement, ces évaluations *à chaud* ont également été renforcées par des analyses traitant des effets à moyen et long termes de l'expérience internationale.

Dans cette optique complémentaire, Brassier-Rodrigues (2015) a sondé les étudiants, diplômés et en activité professionnelle, au sujet de leur expérience de mobilité internationale deux ans au moins après sa réalisation, afin de comprendre et analyser les compétences qu'ils associent spontanément à celle-ci.

Compétences relatives aux savoir et savoir-faire	Compétences relatives au savoir-être

	Compétences relationnelles 13. Communication interpersonnelle : compétences linguistiques et langagières 14. Intégration sociale : dans un groupe, constitution de réseaux de contacts, etc.

Source : Brassier- Rodrigues, ibid, page 47.

Au final, les réponses formulées par les répondants à l'occasion des différentes études confirment l'éventail des compétences acquises en communication interculturelle : compétences en langue, en adaptation, en empathie, en communication interpersonnelle, en intégration sociale et, enfin, en connaissance de la culture d'accueil en sus de l'adaptabilité et du gain de confiance issus de l'expérience internationale.

Dans le cadre du dispositif de l'alternance, aucune étude n'a démontré, à ce jour, le bénéfice potentiel acquis par la structure d'accueil de l'étudiant-alternant dans le cadre d'une mobilité internationale co-construite intégrant les référentiels de compétences propres à chaque cursus de formation suivi. C'est précisément l'objet de notre réflexion exploratoire et sa prospective globale au niveau de l'économie d'un petit territoire insulaire assimilable à celui de la Corse.

En effet, depuis septembre 2018 et en coordination avec l'évolution législative du 5 septembre 2018, le CFA Universitaire en région Corse s'est engagé dans une politique volontariste visant à construire des parcours de mobilité internationale des quelques 400 étudiants-alternants de l'Université de Corse, dans une perspective duale tenant compte simultanément des aspirations estudiantines et des attentes en matière de compétences complémentaires exprimées par les structures d'accueil (entreprises, associations et collectivités locales).

Fort de plus 1500 partenaires entrepreneuriaux et institutionnels ayant accompagné la formation de près de 3500 étudiants-alternants depuis sa création en 2009 (Storaï C. et Rinieri L., 2019), le CFA UNIV et ses équipes pédagogiques se sont évertués à aménager des référentiels de compétences intégrant des missions spécifiques relatives à la mobilité internationale des étudiants-alternants.

La construction d'une économie de la compétence véhiculée par la mobilité internationale des étudiants-alternants en quête de fondement

En Corse, la promotion et le développement de l'alternance de même que la problématique de la qualité de l'insertion professionnelle des étudiants-alternants de l'Université de Corse, notamment en matière de sensibilisation à l'entrepreneuriat, a révélé l'enjeu stratégique de la maitrise des fondamentaux

managériaux au cœur de la dynamique de développement et de structuration du territoire corse (Storaï, Rinieri et Rezzi, 2017), renforçant ainsi ce que d'autres auteurs ont démontré dans un cadre plus théorique (Marchesnay et alii, 2006) ou global (Drucker, 2016).

L'économie insulaire locale se caractérise par l'absence des grands groupes multinationaux qui dirigent et façonnent l'économie mondiale. On ne remarque pas davantage l'existence de moyennes entreprises qui, dans bien d'autres régions à l'instar de la Lombardie, constituent le fer de lance d'une économie dynamique. Le tissu économique corse est constitué majoritairement de très petites entreprises, de petits agriculteurs et producteurs, d'artisans, de commerçants. L'enjeu de la structuration d'un écosystème entrepreneurial spécifique par une politique régionale de FTLV adaptée revêt donc une importance stratégique dans la perspective de construction d'un schéma de développement local pérenne.

La mobilité internationale des étudiants-alternants au centre d'un dispositif de FTLV bénéfique à la structuration d'une petite économie insulaire

La Corse présente également l'exemplarité d'un territoire caractérisé par un vieillissement de sa population active impliquant un nécessaire ajustement à moyen terme des stratégies régionales de formation en réponse à cette réalité. Levier majeur du développement territorial et de la régulation sociale, le dispositif insulaire de formation doit adapter son offre dans la perspective ciblée de l'adéquation de la relation emploi-formation. Le dispositif de formation en alternance, la formation professionnelle continue et plus globalement la FTLV constituent ainsi les deux faces d'un même joyau au service d'un schéma de construction des compétences, des qualifications et de l'employabilité des ressources humaines disponibles et actives sur un territoire donné.

Dans un petit territoire insulaire caractérisé par un tissu économique composé de 95% d'entreprises de moins de 10 salariés, la vocation à la fois ancrée et intemporelle du CFA UNIV consiste à contribuer à la valorisation de l'insertion professionnelle des étudiants-alternants de l'Université de Corse, par le développement et l'adaptation des stratégies de formation fondamentales pour l'émergence et la stimulation de la disponibilité en ressources humaines qualifiées et de la logique entrepreneuriale qui repose sur les activités innovantes à forte croissance potentielle (Marchesnay et alii, *ibid*).

Dans ce contexte spécifique, la structuration du tissu économique local est largement impacté par le maillage des différents acteurs (les CFA, la région Corse, les entreprises, les associations, les collectivités locales, les Opérateurs de Compétences (OPCO), les maisons de l'emploi, les chambres consulaires) dans le cadre d'un Contrat de Plan Régional de Développement des Formations et de l'Orientation professionnelles (CPRDFOP) qui a fixé, sur la période 2018-2022, des objectifs clairement centrés sur la réponse aux besoins de acteurs locaux en matière de sécurisation des parcours vers l'emploi et d'acquisition des nouvelles compétences avérées via la mobilité des étudiants (inter-régionale, nationale et internationale).

Un processus de mobilité internationale des étudiants-alternants pragmatique et exploratoire à l'initiative du CFA UNIV

Dans son contrat d'établissement quadriennal 2018-2022, l'Université de Corse a inscrit, au cœur de ses axes stratégiques, l'approfondissement du développement de l'alternance et l'internationalisation accrue de son offre de formations. Néanmoins, la réalité actuelle révèle des situations hétérogènes selon les composantes pédagogiques : alors que l'Ecole de Management et d'Economie (IAE de Corse) impose la mobilité internationale des étudiants (stages) et des étudiants-alternants (dans le cadre d'un contrat d'apprentissage et de professionnalisation) pour accéder à la diplomation de ses Masters *Sciences du Management* (sauf si la césure internationale a été effectuée avant l'inscription dans un cursus proposé)[vii], les autres Instituts ou Facultés (IUT, INSPE, Ecole d'Ingénieurs Paoli Tech, Facultés de Droit, de Lettres et Arts, des Sciences, Département Santé) ont opté pour offrir l'opportunité de bénéficier d'une mobilité internationale estudiantine seulement à titre optionnel.

Ce constat n'engendre pas, pour l'heure à l'Université de Corse, la mise en place d'une politique générale homogène relative à la mobilité internationale des étudiants, ce qui a conduit le CFA UNIV à proposer un processus spécifique, pragmatique et exploratoire en la matière concernant les étudiants-alternants.

Partant du caractère obligatoire de la mobilité et de sa durée variable (8 semaines à 6 mois), les référentiels de compétences des Masters *Manager Entrepreneur, Marketing et Ressources Humaines* ont été remaniés dans un double objectif :

- apporter une plus value pédagogique et opérationnelle aux missions dévolues aux étudiants dans le cadre de leur mobilité internationale ;
- répondre aux perspectives stratégiques déterminées par les structures d'accueil en matière de développement international.

Par exemple, *l'Union des Vignerons de l'île de Beauté (UVIB)*, cave coopérative qui exporte 75% de sa production, souhaite développer une nouvelle marque *Terra Corsa* destinée en priorité aux marchés internationaux. Dans cette optique, elle proposera à trois étudiants-alternants de mettre en place un PMI[viii] et la création d'un réseau de distribution internalisé à cet effet.[ix]

La franchise *Cuir Center*, spécialisée dans la vente de canapés et de mobiliers haut de gamme, souhaite créer un cluster méditerranéen et soumet à deux étudiants-alternants une mobilité internationale au siège social européen du groupe *Roche Bobois* en Italie afin de décliner cette stratégie par grandes problématiques RH, fixer des objectifs généraux et spécifiques par site/population/département...[x]

L'extension d'un processus de mobilité internationale pragmatique et exploratoire des étudiants-alternants permettant de valoriser l'insertion professionnelle et l'employabilité des ressources humaines figurent désormais au nombre des prérogatives essentielles du CFA UNIV. La structuration, le développement et l'attractivité d'une petite économie territoriale insulaire inhérents à son évolution en particulier, et plus généralement à celles des centres de formation, en constituent un enjeu sous-jacent.

Conclusion

A l'heure où l'économie de la connaissance et de la compétence est véhiculée comme LA solution de sortie d'une crise endémique, le CFA UNIV s'efforce de contribuer, notamment, à la construction d'un schéma consolidé et pérenne de structuration du tissu socio-économique par la gestion optimisée d'un dispositif renforcé de formation/information, d'encadrement et de suivi individualisé de l'orientation professionnelle des étudiants-alternants de l'Université de Corse.

Si L'enjeu essentiel de la loi *pour la liberté de choisir son avenir professionnel* concerne la nature des compétences placée au centre du projet individuel de formation de chaque citoyen, mais également considérée comme la pierre angulaire de la réponse appropriée aux besoins des entreprises en matière d'embauches, rien ne garantit que la recentralisation du dispositif de FTLV assurera le pari de la confiance dans les acteurs, les entreprises, les salariés et les partenaires sociaux dans l'optique de lever les freins à l'embauche des entreprises et de sacraliser la notion de compétences comme un enjeu primordial au cœur du projet professionnel tant individuel que collectif (Storaï C. et Rinieri L., 2019). Quand bien même les branches professionnelles nationales co-construiront les diplômes des formations professionnelles avec l'Etat afin de mieux répondre aux besoins en compétences des entreprises, il n'en demeure pas moins que les liens, jusqu'alors concrets, entre les régions et les CFA encourront un risque de distension au détriment d'un développement propre des compétences indispensables aux entreprises locales.

Dès lors, il appartiendra aux CFA régionaux, en qualité d'agents développeurs de formations diplômantes et qualifiantes en symbiose avec les attentes exprimées par un tissu économique local, de développer une nécessaire capacité d'innovation dans l'ingénierie pédagogique des actions menées permettant tant la croissance de qualification des étudiants que la conversion ou la reconversion des parcours professionnels au bénéfice d'un petit territoire ilien en quête d'attractivité.

C'est là tout l'enjeu de l'émergence d'un nouveau modèle de FTLV, gage de l'évolution et de la sécurisation des parcours professionnels, auquel le CFA UNIV cherchera à contribuer par l'évolution de sa dynamique d'activité. Nul doute que l'opérationnalité de la mobilité internationale des étudiants-alternants, que chaque acteur de la formation appelle de ses vœux, en constituera la pierre angulaire particulièrement dans le cadre d'une économie locale spécifique et identitaire comme celle de la Corse.

Abstract

The paper explores the microeconomic and macroeconomic drivers of financial structure, for a sample of 30 companies listed on the New York Stock Exchange, which are part of the technology sector, over the period 2005-2018. The financial structure was assessed via long-term debt rate, short-term debt rate and total debt rate, whereas the size of the company, tangibility of assets, growth opportunity, effective tax rate and financial return were selected as microeconomic factors, alongside macroeconomic indicators concerning interest rate, inflation rate and gross domestic product per capita. The empirical outcomes by means of panel data regression models provided support for a positive influence on financial structure of natural logarithm of total assets, financial return, effective tax rate, interest rate and gross domestic product per capita. However, tangibility of assets showed mixed associations with financial structure, whereas sales variation and inflation rate proved the lack of statistical significance.

Keywords: Financial Structure, Microeconomic And Macroeconomic Factors, Panel Data Regression Models

Introduction

The financial structure of companies differs in the emerging and developed countries. In some countries, the financial system is oriented towards the bank-based market, while in other countries, it is oriented towards the capital market. In the specialized literature there are studies that capture the differences regarding the financial structure using culture, history, politics, legislation as analysis factors. And yet, the influence of these factors remains unclear, despite the existence of many empirical studies on this topic. One explanation could be that most studies focus on proving a certain theory, as proof. Nevertheless, up to the present moment, no clear delineation between the strengths and weaknesses of the theories can be made.

Most studies on financial structure have focused on non-financial companies with access to the American capital market or other international markets. These companies have a variety of financing sources to choose from and can be adjusted at a relatively low cost. Researching financing strategies emphasizes the importance of agency costs, information asymmetry and taxes. The question remains if these factors have a major effect on the debt / equity ratio. Most of the investments of the American companies were financed from internal funds. External financing covers less than 20% of investments, and a large part of this is represented by loans. Of course there are companies that focus strongly on the issue of shares, but they tend to be smaller, riskier and with a faster development rate.

The debt ratios of listed US companies vary by industry. For example, oil companies have relied on loans as external financing, while those in the pharmaceutical industry have negative debt ratios, which

have large holdings of cash and market securities. In general, debt rates are low or negative when profitability and business risk are high (Myers, 2001).

In the technology industry, where companies are constantly innovating and evolving, having to meet the needs of consumers, which are always changing, creates a high level of risk and profitability. Therefore, it is utmost important to study what financing strategies these companies choose to adopt given this highly competitive and volatile market. In this paper we set out to analyze what factors influence the financial structure of technology companies listed on the New York Stock Exchange.

1. Literature review

There are many theories in the literature regarding the financial structure, but only a part of them have been positively evaluated by critics. Trade-off theory (Kraus & Litzenberger, 1973), one of the most important theories, argues that capital structure is characterized by a trade-off between the benefits of borrowing and its costs. Thus, the company should balance the fiscal benefits, due to debt financing, with the related costs, which increase the risk of bankruptcy. From an agent theory perspective (Jensen & Meckling, 1976), indebtedness can reduce agency costs by disciplining managers to act in the firm's interest, to the detriment of their own interest. Although the debt mitigates, on the one hand, the conflict between managers and shareholders, it can intensify, on the other hand, the conflict between shareholders and creditors.

The pecking order theory is based on the ordering of the sources of financing, under the conditions of information asymmetry, namely: internal sources, non-risky debts and issue of shares. From the point of view of an external investor, the issue of shares is much riskier than the debt, he can perceive the company as a solid one. However, a rational investor should reassess the value of the shares when announcing the issue. From the employee's perspective, internal funds are a much safer and more favorable source, when it is possible to use them. If their level is not tailored to their needs, then they will have to reorient themselves to loans, the issuance of shares being used ultimately.

From the mid-1980s to the present, there have been many empirical researches that aimed to compare and distinguish the predictive powers of the famous theories, the most common being those formulated as a comparison between the trade-off theory and pecking order theory. While older works have focused on developed markets, such as the US, recent ones have focused on testing theories in the context of emerging economies. However, the evidence from both categories of studies is quite mixed, some supporting the trade-off theory, while others support the pecking order theory. The researchers tried to modify or improve existing theories, develop new ones, use different types of data and methods, in order to resolve this controversy between the two theories. Despite considerable progress, this subject has yet to be clarified.

A list of factors that claim to have some influence on the capital structure can be extracted from the literature. Rajan and Zingales (1995) used four independent variables in their paper: profitability, tangibility, size, growth. These firm-specific variables are explained below.

- Profitability

Trade-off theory supports a positive relationship between profitability and debt. Profitable companies have lower costs in terms of financial distress and consider that tax deductions are much more valuable (Han-Suck, 2005). The pecking order theory highlights a negative relationship between profitability and debt, as profitable firms tend to reinvest profit to sustain investments, to the detriment of external financing (Titman & Wessels, 1988), (Rajan & Zingales, 1995), (Krishnan & Moyer, 1996). From the point of view of agency costs, debts involve a smaller free cash flow available to managers.

- Tangibility

Trade-off theory supports a positive relationship between tangibility of assets and debt. This is due to the fact that tangible assets can be offered as collateral, and at the same time they suffer a lower value loss if the company faces financial distress (Rajan & Zingales, 1995). The pecking order theory considers that there is a negative relationship between tangibility of assets and debt (Demirguc-Kunt & Maksimovic, 1999). The low information asymmetry associated with the tangibility of assets causes a decrease in the issue of shares costs. Thus, debt rates should be lower for firms with high tangibility.

- Size

Trade-off theory states that there is a positive relationship between firm size and debt. Larger companies are more diversified, and thus have a lower risk of default. Older firms in the market with a better reputation have lower agency costs in terms of debt. Thus, this theory states that larger firms tend to have more debt (Rajan & Zingales, 1995), (Han-Suck, 2005), (Psillaki & Daskalakis, 2008). The pecking order theory opposes and supports a negative relationship between size and debt. Large companies have the ability to use internal funds, but also have the opportunity to issue shares more easily compared to small firms (Alipour & Mohammadi, 2015).

- Growth

Trade-off theory predicts a negative relationship between firm growth and debt. Intangible assets of growing companies may lose much of their value in the event of financial distress. At the same time, growth reduces the problems of free cash flow. In opposition, the pecking order theory states a positive relationship between the two variables. Internal funds are insufficient to support the investment opportunities of the growing companies, which causes an increase in the demand for external financing. Most empirical studies have shown that there is a negative relationship (Alipour & Mohammadi, 2015), (Cortez, 2012).

In addition to the firm-specific factors, macroeconomic factors are of particular importance, thus, many studies including Deesomsak et al. (2004) and De Jong et al. (2008) have shown that economic stability has a considerable effect on the financial structure.

- Inflation

According to Taggart (1985), the characteristics of the U.S. tax code determines the increase of the real value of the tax deductions regarding the interest expenses, when it is estimated that the inflation will be high. Thus, the trade-off theory predicts a positive relationship between debt and inflation. In contrast, it is difficult to observe the effect of inflation on financial decisions, according to the pecking order theory (Frank & Goyal, 2008).

- The gross domestic product

The growth of the gross domestic product can be regarded as a measure of the growth possibilities available for companies in an economy. In a developing economic environment, the shortfall of tangible assets in relation to the available investment opportunities, implies a large loss of value in the event of financial distress. Thus, the trade-off theory highlights a negative relationship between debt and gross domestic product growth. In contrast, the pecking order theory emphasizes a positive relationship between the two variables, because a large proportion between growth opportunities and internal funds implies a greater need for external funding (Köksal & Orman, 2015).

The objective of this paper is to analyze how the factors which were specified above, influence the financial structure of the company. For this, it is necessary to formulate hypotheses, which will subsequently be affirmed or rejected, as the case may be.

Hypothesis 1 (H1): There is a positive relationship between the size of the company and debt ratio;

Hypothesis 2 (H2): There is a positive relationship between the tangibility of assets and debt ratio;

Hypothesis 3 (H3): There is a negative relationship between the growth opportunity and debt ratio;

Hypothesis 4 (H4): There is a positive relationship between the tax rate and debt ratio;

Hypothesis 5 (H5): There is a negative relationship between the financial return and debt ratio;

Hypothesis 6 (H6): There is a negative relationship between the inflation rate and debt ratio;

Hypothesis 7 (H7): There is a negative relationship between the interest rate and debt ratio;

Hypothesis 8 (H8): There is a positive relationship between GDP and debt ratio;

Data and Methodology

To measure debt we used three indicators, namely, the total debt rate, long-term debt rate and short-term debt rate. According to Rajan and Zingales (1995), the ratio of debt to assets explains much better than the ratio of debt to liabilities, because it clearly indicates whether the company is about to collapse and at the same time provides a much clearer picture of past financial decisions.

The database consists of 30 companies listed on the New York Stock Exchange, which are part of the technology sector. Financial data was collected over the period 2005-2018, from Thompson Reuters and The World Bank databases, the last one being required for macroeconomic variables.

The following table shows the three dependent variables included in the analysis. The estimation of the equations on each variable highlights the influence of the independent variables on the debt structure

Table 1: Dependent variables included in the empirical study

Variable Name	Symbol	Description	Authors
Long-term debt rate	LTD	Long-term debt / Total Assets	Bokpin (2009), Chaklader & Chawla, (2016), Psillaki & Daskalakis (2008), Su (2010), Viviani (2008)
Short-term debt rate	STD	Short-term debt / Total Assets	Viviani (2008), Titman & Wessels (1988), Van der Wijst & Thurik (1993), Amidu (2007)
Total debt rate	TD	Total debt / Total Assets	Eldomiaty & Azim (2008), Ezeoha (2008), Hall, et al. (2004)

Source: Author's own work

The following table includes the independent variables, classified into two categories, namely, firm-specific / microeconomic and macroeconomic factors.

Table 2 : Independent variables included in the empirical study

Variable Name	Symbol	Description	Authors
Microeconomic Indicators			
The size of the company	Size	Natural logarithm of total assets	Psillaki & Daskalakis (2008); Chaklader & Chawla (2016); Su (2010);
Tangibility of assets	Tang	Tangible assets / Total Assets	Bokpin (2009); Chaklader & Chawla (2016); Cortez (2012); Su (2010), Titman & Wessels (1988)
Growth opportunity	Growth	Sales variation	Psillaki & Daskalakis (2008); Karadeniz, et al. (2009); Eriotis, et al. (2007); Ooi (1999)
Effective tax rate	Etax	Tax / earnings before taxes	Karadeniz et al. (2009)
Financial return	ROE	Net income / Equity	Chaklader & Chawla (2016)
Macroeconomic Indicators			
Interest rate	Interest	Interest rate	Bokpin (2009)
Inflation rate	Inflation	Inflation rate	Bokpin (2009)
Gross domestic product per capita	GDP_cap	Gross domestic product / number of inhabitants	Bokpin (2009)

Source: Author's own work

The influence factors will be studied based on the multiple regression model, using the least squares method, the data being panel type.

$$Financial_structure_{i,t} = \alpha_0 + \alpha_1 * Size_{i,t} + \alpha_2 * Tang_{i,t} + \alpha_3 * Growth_{i,t} + \alpha_4 * Etax_{i,t} + \alpha_5 * ROE_{i,t} + \alpha_6 * Inflation_{i,t} + \alpha_7 * Interest_{i,t} + \alpha_8 * GDP_cap_{i,t} + \varepsilon_{i,t}$$

where Financial_structure = TD, LTD, STD;

α_0 = constant;
$\alpha_1 .... \alpha_8$ = coefficients of the parameters;
ε = error term;
t = 2005....2018;
i = 1, 2....30;

Empirical Outcomes

The table below presents the descriptive analysis of the dependent and independent variables. The average total debt ratio stands at 20%, underlining the fact that firms use other sources of financing, such as internal funds or equity issues. The median is below the average for all three types of debt, this divergence being accentuated by the short-term debt rate. Thus, most companies prefer to borrow for short term rather than long term. Moreover, the growth variable has the largest variance, the mean being significantly higher than the median.

Table 3: Descriptive statistics

Variable	Observations	Mean	Median	Maximum	Minimum	Standard Deviation
TD	369	0,2042	0,1862	1,1913	0,0006	0,1501

Source: Author's own work in Eviews 10

The rate of financial return is around 12% and is positively correlated with all the three dependent variables, according to Table 4. The size variable, as well as the interest rate, are also positively correlated with the dependent variables. The tangibility of assets and growth opportunity are negatively correlated only with the short-term debt ratio. The technology sector is in full development, and from the statistical point of view, according to Table 3, the average growth is 106%. The inflation rate is negatively correlated with the total and long-term debt, while the gross domestic product per capita is negatively correlated only with the short-term debt rate.

Table 4 The correlation matrix

	TD	LTD	STD	Growth	Size	ROE	Tang	Etax	Inflation	Interest	GDP_cap

Source: Author's own work

The growth variable was positive in relation to the variables, but statistically insignificant, this assumes the rejection of the previously formulated hypothesis. Chaklader and Chawla (2016), Psillaki and Daskalakis (2008) also obtained an insignificant relationship, while Cortez (2012) obtained a negative relationship.

The inflation rate also presents a statistically positive and insignificant relationship with the three variables, which suggests the rejection of hypothesis H6. The variable of size has positive and statistically significant coefficients, in relation to the total debt and long-term debt rate. In relation to the short-term debt ratio, the coefficient is negative, but not statistically significant. Thus, we can accept the first hypothesis and support trade-off theory, according to which there is a positive relationship with the debt ratio, because the larger and more diverse firms tend to have more debt. The tangibility of the assets has positive coefficients, for the total debt rate, respectively for the long term, and statistically significant ones. The second hypothesis is accepted, and trade-off theory proves to be applicable again. Companies in the technology sector, which have an average tangibility of assets about 32%, according to Table 3, offer tangible assets as collateral for contracting bank loans. The financial return variable was statistically positive and significant compared to the three dependent variables. In this case, it is necessary to reject hypothesis 5 which supported a negative relation, and at the same time, to highlight the applicability of the trade-off theory. The effective tax rate has a positive and statistically significant relationship with all the three dependent variables, the fourth hypothesis being accepted. As a result of a high effective tax rate, companies will benefit from substantial tax deductions when they are indebted. The interest rate has positive and significant coefficients, less compared to the short-term debt ratio, hypothesis 7 is rejected. The gross domestic product per capita is also statistically significant and positive, in relation to the total and long-term debt ratio. Hypothesis 8 is accepted, but in this case the pecking order theory proves its applicability. However, companies with high investment opportunities also need external financing.

Conclusions

In this paper, the influence of the main factors on the financial structure, such as size, growth, profitability, tangibility, was sought. Our results show that tangibility, profitability, size, effective tax rate, interest rate and gross domestic product per capita are relevant determinants. The positive coefficients of the variables on total debt rate and long-term debt demonstrate that companies in technology sector rely on debt financing. These findings are consistent with trade-off theory. On short-term level, tangibility and gross domestic product per capita have a negative impact. In this case, we confirm the applicability of pecking order theory. Therefore, the firm-specific variables, but macroeconomic variables as well, impact debt ratios differently. Technology companies have various financing strategies to leverage, such as venture and bank debt. It seems that, companies, in order to financially support their operations, have no retainers to borrow.

The capital structure is determined by many more firm-specific factors, such as business risk, but also by industry-specific and macroeconomic factors, as we have shown in this paper. Economic stability is reflected in the proper functioning of companies and has an effect on their financial decisions. This empirical study is limited, because the database is made up of a small number of companies over a relatively short period of time. This topic can be extended in many directions in the future.

According to the literature, we have obtained mixed results regarding the applicability of theories. Of course, in this case, the trade-off theory has proven to be far more relevant than pecking order theory. Thus, the controversy of the two theories is far from clear.

Abstract

Curriculum 2013 in implementation implies that professional teachers in learning activities must be able to follow the learning process in the era of the industrial revolution 4.0 based on TPACK (Technology, Pedagogical, Content, Knowledge). However, learning in the era of the industrial revolution 4.0 requires teachers to utilize pedagogical abilities in integrating digital literacy technology and knowledge in developing creative content in accordance with the demands of the times. This study aims to describe the ability of teachers to implement the learning process of the 2013 curriculum based on TPACK which is focused on the countenance evaluation model: (1) antecedents, (2) transactions, and (3) outcomes. The method used in this research is a descriptive-qualitative approach by taking a population and random sampling from 100 teachers in one province in Indonesia. Data collected through questionnaire, documentation, observation, and interview methods. The results show that the ability of teachers to implement TPACK-based curriculum 2013 based on the Countenance Stake's analysis can be concluded that the lowest component among the components of knowledge, pedagogy, content, and technology is the ability to use technology. As a recommendation there needs to be serious attention to the procurement and improvement of school facilities and infrastructure especially those related to learning technology.

Keywords: Teacher Ability, K-13 based on TPACK, *Countenance Stake's* Evaluation.

Introduction

In applying the 2013 curriculum, professional teachers are not only required to master pedagogical content but are also expected to be able to master technology in learning, and be able to utilize/develop the latest technology in the learning process. TPACK-based curriculum 2013 is how the teacher's method/strategy in conveying knowledge to students in facilitating learning starting from planning certain content (subject matter) through pedagogical approaches and utilizing/developing learning technology. Moreover, the latest learning challenges in the industrial era 4.0 teachers must have the ability of Technological Pedagogical and Content Knowledge or abbreviated TPACK properly. TPACK is knowledge of how to facilitate student learning of certain content through pedagogic and technological approaches (Cox, S., & Graham, C. R, 2009; Mishra & Koehler, 2006; Shulman, 1986). TPACK is considered as a framework that can potentially provide new directions for teachers and

students in solving problems related to integrating ICT into teaching and learning activities in the classroom (Chai, CS, Koh, JHL, Tsai, CC, & Tan, LLW 2011). By integrating ICT into learning activities, teachers are expected to be able to answer the challenges of learning in the era of the industrial revolution 4.0.

One of the big challenges faced by teachers in the industrial era 4.0, is adaptation and digital literacy. Adaptation is about the effects that arise. For example; the basics of the correctness of knowledge and the status of each information authority at issue. The industrial revolution 4.0 made a time when technology and information provided billions of knowledge data to anyone who could access it, so that teacher status and authority could be questioned (Irawan, YS, & Koesoema, AP, 2015). In this era the value of knowledge is no longer a teacher's monopoly. Because, people live a world in which there are values of knowledge that can be accessed by anyone. The second basic ability for teachers in the industrial revolution 4.0 era is digital literacy, scientific literacy, cultural literacy, and citizenship, as well as critical thinking literacy. The communication space on social media that is so broad and easy, with a variety of patterns and issues, requires clarity of thought to understand it. The depth of analysis and clarity of mind, makes it possible to explore other aspects of the development of social media. Because if not, it is difficult for teachers and students to distinguish whether the received digital content is good and right on target for learning objectives.

This situation certainly makes the teacher's role as a teacher and transmits knowledge and knowledge needs to be revitalized again. Learning activities began to diversify, which used to be a lot carried out in the classroom (Synchronous), now it has become more flexible. Learning activities can be done anywhere, anytime, and with anything (Asynchronous). The emergence of the Learning Management System (LMS) program and the use of interactive and portable media and learning resources. And the presence of learning activities based on blended learning, hybrid learning, distance learning, web-based learning, open and distance learning. Changes to the curriculum in Indonesia, in fact, add new problems in education, especially for the readiness of teachers to implement it. The implementation of the 2013 curriculum which has been running for 5 (five) years is felt to be still not evenly implemented, including in the city of Banjarmasin. There are still many schools that will only be implementing the 2013 Curriculum starting in 2018 and there are still many schools that have not implemented the 2013 Curriculum in Banjarmasin. The results of the 2017 study showed that the ability of teachers to conduct 2013 Curriculum assessments and the ability of students to conduct material reasoning activities especially in concluding information was still relatively low (Mansur, H., & Mastur, 2018).

For the current conditions so that teachers are able to present learning that is relevant to the conditions of the all-digital era, teachers only need to be given continuous technological understanding or literacy. When all teachers have been technology literate and are no longer allergic to technological change and development so quickly, the challenges of learning in the era of the industrial revolution 4.0 or the ability of teachers to deliver technology-based learning (TPACK) can be faced to be better, right on target, and meaningful. Departing from the several descriptions above, this study aims to describe the ability of teachers in implementing TPACK-based K-13 learning processes that are focused on countenance stakes evaluation model: (1) antecedents, (2) transactions, and (3) outcomes and to find out problems in the application of the 2013 curriculum in the city of Banjarmasin. For this purpose, the results of this study in the form of data about the ability of teachers to integrate knowledge, technology, pedagogy, and content in the learning process.

A Literature Review

21st Century teachers must have knowledge as well as skills in using various technological devices both traditional and modern to facilitate learning and improve learning outcomes (Graham, RC, Burgoyne, N., Cantrell, P., Smith, L., St. Clair, L., & Harris, R., 2009). TPACK is a type of new knowledge that teachers must master to be able to integrate technology well in learning and measurement (Koehler, M., & Mishra, P., 2009). TPACK is an activity of assessing the level of mastery of TPACK carried out using the TPACK framework, and the development of TPACK is a continuation of the measurement process carried out to improve the mastery of TPACK itself (Archambault, LM, & Barnett, JH, 2010). TPACK can be used as a framework for designing teacher education curricula that

is more in line with the era and demands of 21st Century learning (Rahmadi, 2019). Role TPACK's in the ability to compile learning tools using the POST-PACK learning model (Niess, ML, 2011). TPACK has an important role and has a strong influence on the ability to compile learning tools. In addition, the results of the study showed that TPACK and the ability to compile learning tools showed a significant influence (Sholihah, MA, Yuliati, L., & Wartono, W., 2016). The integration of ICT into the curriculum certainly involves the three basic dimensions of TPACK, namely TK, PK, and CK (Sukaesih, S., Ridlo, S., & Saptono, S., 2017). In TPACK there are 3 main knowledge or foundation of TPACK itself, namely Technology Knowledge, Pedagogy Knowledge, and Knowledge Context. Which later will form interconnected slices that are Pedagogical Content Knowledge, Technological Content Knowledge, Technological Pedagogical Knowledge, and Technological, Pedagogical, Content Knowledge. According to the 2013 curriculum structure which also applies to junior high school education, according to Minister of Education and Culture Regulation No. 65 of 2013 concerning Basic and Secondary Education Process Standards, the learning principles used are the use of information and communication technology to improve the efficiency and effectiveness of learning (Iftitah, KN, 2017).

Methodology

The subjects in this study were junior high school teachers in Banjarmasin, who on average had received educator certificates. The distribution area consists of 20 Middle Banjarmasin District Middle School Teachers, 20 South Banjarmasin District Middle School Teachers, 20 East Banjarmasin District Middle School Teachers, 20 West Banjarmasin District Middle School Teachers, and 20 Middle Banjarmasin District Middle School Teachers with a total of 100 people consisting of 50 men and 50 women. Data collected through questionnaire, documentation, and observation methods. The questionnaire method contains 24 statements which partly adapted from the evaluation instrument of K-13 learning implementation and some researchers formulated to be able to obtain the required data related to the indications of antecedents, transaction, and outcome components. The documentation method is carried out by examining the teacher's teaching completeness documents, curriculum and syllabus, learning implementation schedule, and students' score recap. The observation method the researcher made a written record of the learning process in the form of transcripts of observations and records of the learning process every day. The three methods are used simultaneously with the aim of triangulating the data of this study, namely the comparison of data between those obtained through questionnaires (by participants), observations (by researchers), and re-examination of documents (examining the truth and completeness of physical evidence).

The collected data is then analyzed using data analysis techniques by Miles and Huberman, which includes data reduction, data presentation, drawing conclusions or data verification (Huberman, 2002). Data reduction is carried out starting from observing the completeness of learning material documents prepared by the teacher, then collecting data during the learning process, to observing the document data of students and teachers' grade scores after the learning process takes place. Presentation of data includes questionnaire data quantification and descriptive description. Data obtained through documentation and observation techniques are presented descriptively-qualitatively. While the data obtained through questionnaires are presented in descriptive-narrative form. The data presentation process is complemented by an analysis that includes empirical logical analysis. The conclusion or verification of data in this study is done by making a judgment or decision whether the K-13 learning activities that have been carried out are in accordance with the original expected goals and the criteria as standardized in drawing conclusions. The conversion of TPACK-based K-13 learning evaluation results is focused on the Countenance Stake's evaluation design which includes: (1) antecedents, (2) transactions, and (3) outcomes into qualitative form to determine the categories of achievement of the learning process. The range of values presented are as follows: Very good: 85% -100%, good: 70% - 84.99%, sufficient: 56% -69.99%, and less 0-55.99% (Arikunto, 2010).

Fig. 1: Data Analysis Techniques by Interactive Model Miles and Huberman

Results and Discussion

1. Antecedents (Learning Planning)

The first learning planning component includes technology knowledge (TK). In the technology knowledge (TK) questionnaire, it includes knowledge of whether the teacher knows and is able to overcome technical problems on the computer, whether the teacher is easy to use technology, whether the teacher follows the latest technological developments, does the teacher have an understanding of the basic components of the computer, whether the teacher is proficient using the program word processors, numbers, and presentation processing programs, whether teachers are proficient at using printers, scanners, projectors, and digital cameras, whether teachers store data on digital media, and whether teachers use the internet as a medium of educational communication. The second learning planning component is about content knowledge (CK). The CK questionnaire includes whether the teacher understands the concepts, laws, and theories taught, whether the teacher knows the history of the development of the material being taught, whether the teacher designs and implements learning, does the material use the latest sources such as books and journals, does the teacher attend the seminar or activity related to the field of science being taught.

From the explanation above, the researcher tried to meet several junior high school teachers in Banjarmasin. There were 20 schools that were successfully visited and 100 teachers that were successfully met. The aim is to determine the ability of technology knowledge (TK) and content knowledge (CK). The ability of technology knowledge (TK) is the ability of teachers to use technology in learning, such as operating computers and relevant software. Data obtained from the interviews show that teachers' understanding of ICT for learning is very diverse. As many as 30% of teachers in Banjarmasin City Junior High School have good ability to use ICT in schools. Then 20% of ICT skills are sufficient or moderate, and the remaining 45% of teachers do not understand or have never used ICT for learning.

The understanding of ICT referred to here is the ability to design and plan learning using computers, the internet, web learning, e-books, and smartphones. As a result of the lack of understanding and ability to use ICT, finally the use of e-learning learning is considered less applied in learning (if not said to be nonexistent). It was seen based on the results of field observations, often found the use of methods and media that are still oriented towards conventional learning. As for teachers who have good and sufficient understanding, this ability is seen in the developed learning design (RPP). The lesson plans developed by teachers who have good and sufficient ability in the use of ICT include the use of the internet, computers, smartphones and LCDs for their learning media. This is also the case with learning resources, they also use e-books and the internet as learning material.

From the above data it can be interpreted that teachers' understanding of the use of ICT is very diverse, but it is more dominant on the lack of ability to use ICT. This means that there are still teachers who

apply learning using conventional methods and media such as the use of lecture methods or also the use of drawing and whiteboard media only. This condition occurs because one of the factors is the involvement of the stakeholders who rarely conduct training of teachers. So that the impact on the lack of teacher understanding of the use of media and methods that are considered more modern. Teacher's understanding of content or what is called content knowledge (CK). Content knowledge (CK) is knowledge about the subject matter to be taught (for example, earth science, mathematics, language arts, etc.). The teacher must understand the subject to be taught including knowledge of facts, concepts, theories, and procedures in a particular field, knowledge of a framework that can regulate and connect ideas and knowledge about rules and also evidence of the content of the knowledge material.

In this section, there are four questions that are asked of teachers. Questions raised focus on the ability of teachers in mastering learning strategies. From the results of research in the field shows that the ability of teachers in understanding learning strategies is quite good. This condition was obtained because the schools which were the subject of the study had a program of learning strategy development workshops conducted at the beginning and at the end of the semester. The workshop was held so that teachers have the ability to modify strategies and have the ability to develop constructivist understanding of the material from the subjects in subsequent learning (Hamalik, O., 2007).

In addition to the foregoing, the ability of CK studied includes the breadth of the material, the depth of the material, the suitability of the material, and the development of the material. The extent of the material from the data produced 50% of the 10 subject schools studied and categorized as not good, this is because the teacher has been able to describe the material in accordance with the basic competencies that exist in the lesson plan. But the teacher has not been able to develop the material and provide the latest information related to the material, this is because the teacher's educational background. With the concept of integrative curriculum in the 2013 curriculum which eliminates the separation of cognate subjects and is integrated in the same family, this becomes a problem for teachers. This can be found in the field when the subject matter is related to biology in natural science subjects while the educational background of teachers graduating from physics education so the teacher does not understand the subject of biology.

Then for the depth of the material to get a score of 20%, the majority of the teachers have included the subject matter in the RPP, but there are still some teachers not including the material in detail. In conveying the material has been able to analogize the material in everyday life, so that the material will be easily accepted by students. The suitability of the material gets a score of 20%. In the lesson plan that has been made by the teacher shows the suitability of the material with basic competencies, objectives and indicators, but between the material and the time of lesson hours has not found any suitability. Material development gets a score of 40%. To develop a subject matter, it is necessary to have reference material. In the RPP the teacher has included reference material such as LKS books, textbooks and the internet. Overall, the ability of content knowledge (CK) gets a percentage of 80% which is included in the good category, while the remaining 20% of teachers do not understand the development of material in the lesson plan or even the teacher does not make any lesson plans at all.

Table 1: Results of TK-CK-Based Learning Planning

No	Antecedents (Learning Planning)	
	Technology Knowledge (TK)	*Content Knowledge* (CK)
1	50%	80%
	Poor Category	Good Category

Fig. 2: TK-CK Learning Planning

Transaction (Implementation / Process Learning)

The contents of the pedagogical knowledge (PK) questionnaire include whether the teacher implemented varied learning, whether the teacher was able to manage and master the class well, whether the teacher used various assessment methods and techniques, whether the teacher did reflective actions to improve the quality of learning. In addition, the PK ability research includes aspects of learning strategy knowledge, learning media knowledge, and evaluation knowledge. Based on interview, observation, and questionnaire data, the results obtained in the aspects of knowledge of learning strategies get a score of 30% for the sub-aspects of the learning approach, this is because in the RPP all teachers list what approaches are used, but there are still those that include but lack detail. Aspects of using learning methods and models get a score of 30%. The teachers in the sample include what methods are used in the lesson plans that have been made, namely using the method of discussion, problem-based learning, discovery learning, demonstrations, and other methods. While the aspect of learning media knowledge gets a score of 20% for the use of instructional media and types of learning media. The teacher has included several media in teaching both conventional and digital learning media such as using videos, power points, e-books, and appropriate media such as puzzles and school environments.

Evaluation of learning also needs to be done by the teacher to find out whether the learning objectives have been achieved or not, so that it can be used as consideration for improvement for teachers and students. Cognitive assessments are listed in each teacher's lesson plan, written assessments that are often used by teachers by attaching multiple choice questions or descriptions. Affective assessment is carried out using class journals and psychomotor assessments through performance observation sheets. Overall in the realm of assessment there are no standardized instruments made by the teacher. Selection of assessment techniques get a score of 30%. The lesson plan can be seen in making written tests, portfolio assessment techniques and non-written techniques. The written test is in the form of multiple choice and a description that is used for daily tests. The questions are made using bloom taxonomy from C1 to C4 which is considered to be suitable for junior high school students. Non-written assessment techniques are carried out by observing performance during exploration and practicum activities. Half of the teachers who were sampled did not make an assessment rubric, so there were no definitive guidelines for conducting an assessment, while half made an assessment rubric, but according to the results of a short interview with the teachers who developed it, the assessment rubric was not used in the implementation only for formality requirements in writing RPP only (Wahyudin, D., 2014). Suitability and improvement of the assessment get a score of 30%. Appropriateness of assessment can be seen from the making of daily test questions in accordance with the material

presented. Teachers often do daily tests or tests but are not accompanied by further actions such as enrichment and discussion of questions.

As a whole, the pedagogical knowledge (PK) ability of teachers gets 60%, which is included in the sufficient category and still needs to be developed further, especially on the appropriateness and improvement of assessments that must be adjusted to the ability of students. The results of direct observation when learning is done by teachers, ie teachers carry out learning activities based on the lesson plans that have been made, meaning that there is a match between the methods listed in the lesson plans and the implementation of learning. The selection of good learning methods is adjusted to the characteristics of students. The teachers have a pretty good strategy, it can be seen from the observations of teachers doing various learning methods that are adapted to the material and conditions of students.

The contents of the Technology Content Knowledge (TCK) questionnaire include whether the teacher uses technology to help understand the concepts, laws and theories of learning materials, whether the teacher knows computer applications related to the material being taught, whether the teacher has knowledge in developing activities and assignments. students involving the use of technology. The ability of meticulous technology content knowledge (TCK) is the integration of content knowledge and technology in learning. The TCK assessment results of teachers get 55% results which are included in the sufficient category, this is because teachers tend to use the worksheet as a learning medium compared to the use of ICT-based learning media. The results of direct observation when learning in class, teachers are very minimal using ICT-based media, teachers still often teach using blackboard media and the surrounding environment. The teacher includes the use of video and picture media on the power point to deliver the material to the lesson plan. However, the lack of LCDs owned by schools forced teachers to continue teaching conventionally. In addition to the LCD factor, the low electrical power also triggers a lack of use of ICT-based learning media. This condition is a serious problem that also requires the seriousness of various stakeholders to overcome them. Because LCD is the simplest example of learning media, while in addition to LCD there are still many other ICT-based media that also need to be held and developed in schools.

In addition to the ability to use ICT in learning as described above, the ability to understand learning materials that require ICT-based media to facilitate students in learning activities is also part of the focus of research. From the results of studies and research data, the ability of teachers to understand content that requires ICT-based learning media can be categorized as quite 55%. The teachers basically understand that to produce quality learning activities requires learning media, but due to limited access and lack of creativity the learning patterns undertaken instead rely solely on the lecture and group discussion methods.

The ability of technology content knowledge (TCK) to be studied is the integration of learning approaches with content in learning. The results of the teacher's TCK ability get 55% which can be categorized as sufficient. Before learning the two teachers have prepared a lesson plan as a guide in teaching. Based on the results of interviews with teachers, the lesson plan is not made by the teacher itself but is the result of MGMP, so there are still many discrepancies between the lesson plan and its implementation and the teacher does not make lesson plans that lead to learning in the classroom. Teachers tend not to use lesson plans as a guide when teaching, but teachers teach based on their experience of teaching for more than 20 years that has become a habit. Teachers still make annual programs, semester programs, syllabi, and lesson plans as administrative requirements for teacher assessment.

Table 2: PK-TCK Based Implementation / Learning Process Results

No	Antecedents (Learning Planning)	
	Pedagogical Knowledge (PK)	*Technology Content Knowledge 1* (TCK)
1	60%	55%
	Fair Category	Fair Category

Fig 3. Implementation / PK-TCK Learning Process

3. Outcome (Learning Products in the Form of Achievement of Learning Objectives)
The ability of TPACK under study is the integration of technology, content, and learning approaches. Overall assessment results for the ability of TPACK to get the highest score of 80% for the content knowledge component (CK) in the good category, for the pedagogical knowledge and technology content knowledge component, the score is between 55-60%, while for the technology knowledge component a score of 50% is obtained. included in the category of not good. After adjusting to the results of direct observation, the ability that teachers lack is the ability to use learning technology.

Table 2: Outcome / TPACK-Based Learning Products

No	Outcome (TPACK-Based Learning Products)			
	Technology Knowledge (TK)	*Content Knowledge* (CK)	*Pedagogical Knowledge* (PK)	*Technology Content Knowledge* (TCK)
1	50%	80%	60%	55%
	Poor Category	Good Category	Fair Category	Fair Category

Fig. 4: TPACK Learning Products

Conclusion

Based on the results and discussion above, it shows that the teacher's ability to carry out TPACK-based K-13 learning based on the Countenance Stake's analysis can be concluded that the lowest component among the components of knowledge, pedagogy, content, and technology is the ability to use technology.

Acknowledgment

As a recommendation there needs to be serious attention to the procurement and improvement of school facilities and infrastructure especially those related to learning technology. Then the ability to use learning technology can actually be trained by conducting training related to ICT-based learning media to assist teachers in the use of technology and be able to explore information creatively about the use of technology in learning.

Abstract

This study investigates the effects the interaction of labor standards and human rights that has become a key issue in the World Trade organization. Policymakers gradually developed new rules to achieve both trade and human rights objectives. England signed treaties with the U.S., Portugal, Denmark, and Sweden to ban trade in slaves ect. The trade labour linkage has a long history. It has become one of the most contentious contemporary issues in trade and labour policy circles and debates. The idea of using international labour standards to protect workers from economic exploitation was first promoted by individual social reformers in Europe in the first half of the nineteenth century during the early stages of the industrial revolution. Calls for international labour legislation increased dramatically during the second half of the nineteenth century and found expression in various international organizations that were formed (often international associations of trade unions). Besides, international trade policy and labor standards can also hurt the right to health directly or indirectly. As the result there are several problems can be identified regarding the International rules on trade as whole and from the public health perspective. Without the national or international action required international trade will not bring prosperity to all, but, on the contrary, is likely to result in more income inequality, social injustice, environmental degradation and cultural homogenization.

Keywords: human rights, world trade organization, public health.

Introduction

According to the S.Charnovitz (Charnovitz, 1987) the trade labour linkage has a long history. It has become one of the most contentious contemporary issues in trade and labour policy circles and debates (Langille, 1997). The idea of using international labour standards to protect workers from economic exploitation was first promoted by individual social reformers in Europe in the first half of the nineteenth century during the early stages of the industrial revolution. The work of these reformers was later taken over by various non-governmental organizations. Calls for international labour legislation increased dramatically during the second half of the nineteenth century and found expression in various international organizations that were formed (often international associations of trade unions).

Opponents of labor standards argue that international pressure on foreign countries is an unnecessary and counterproductive interference in the workings of the free market. In this view pressure for international labor standards represents either disguised protectionism or misplaced compassion. Proponents of labor standards argue that a set of minimal labor standards is necessary to promote fair competition and to facilitate efficient operation of the labor market. In industrialized countries there

has also been a growing undercurrent of resentment toward trade with countries with low labor costs, which threatens the viability of international trade agreements. The core areas of labor standards typically include freedom of association, collective bargaining, prohibition of forced labor, elimination of exploitative child labor, and nondiscrimination.

The International Labor Organization (ILO) has been the main institution concerned with international labor standards since its inception in 1919. The ILO establishes conventions that are binding only on the countries that ratify them. The ILO is not empowered to enforce compliance with ratified conventions; instead, it relies on international pressure, advice, and monitoring to encourage compliance. Additionally, several bilateral and multilateral trade agreements cover labor and environmental standards. For example, the labor side agreements were a critical element of the North American Free Trade Agreement (NAFTA). But how it s collaborate with public health?

The International Labor Organization and its role from the Human rights perspective

The (ILO) formally entered the trade labour interface debate in 1994 at the time of discussion of a possible inclusion of a social clause in the WTO, the establishment of link between trade and labour in differing forms within NAFTA and the EU, and the conditioning of trade preferences and concessions by some developed countries on respect for labour standards. The ILO set up a working party on the social dimensions of the liberalization of international trade, but in 1995 the ILO's governing body concluded that the working party would not pursue the question of trade sanction and that further discussions of a link between international trade and social standards or a sanction-based social clause mechanism would be suspended. With respect to trade an labour standards linkages in regional trading arrangements, within the EU the social dimension of European integration took concrete form in 1991 when 11 of the 12 Member States (excluding the UK) signed the community's Charter of Fundamental Social Rights. Another important step in the development of EU social policy was the adoption by the11 member (excluding the UK) of the protocol on Social Policy at Maastricht in 1991 (Trebilock, Howse, Eliason, 2013).

Recently, the debate over trade and labour rights has been extended to human rights more generally an entirely logical development. However, in the case of other human rights, the debate is much less focused on 'linkage', including sanctions, and much more on the effects of trade obligations on the ability of states, especially developing countries, to fulfill economic, social and cultural rights, such as the right to health or to adequate food. Here, developing countries, although wary about sanctions have been generally supportive of efforts to evaluate and interpret trade agreements in human rights terms (Alben, 2001).

Core labour standards (CLS) and human rights

Various CLS have been characterized as human rights the UN Universal Declaration of Human Rights, the subsequent international Covenant on Civil and Political Rights, and International Covenant on Economics, social and Cultural rights. The ILO's 1998 Declaration of Fundamental Principles and Rights at Work enumerates a short list of core international labour standards that are defined more fully in eight background Covenants incorporated by reference, namely, freedom of association and collective bargaining, the elimination of forced labour, the elimination of child labour, and the elimination of discrimination in employment, which is also consistent with the characterization of certain core labour standards or rights as human rights, especially that guarantee basic freedom of choice in employment relations (Michaeel, Trebilcock, Howse, 2005). Labour standards have been used in the Generalized System of Preferences a preferential system to provide duty free access to exports of developing countries by (most notably) the European Union and the United States of America. Currently, there is a revision of the EU's GSP scheme, the potential implications of which may be considerable given that the new GSP plus scheme appears to target not only ratification of the fundamental Conventions, but also application of Conventions in line with

comments from the ILO supervisory bodies. This has the potential to be very problematic for employers.

Anartya Sen argues in his book Development as Freedom that basic goals of development can be conceived of in universalistic terms where individual well-being can plausibly be viewed as entailing certain basic freedoms irrespective of cultural context:

1. Freedom to engage in political criticism and association;
2. Freedom to engage in market transactions;
3. Freedom from the ravages of preventable or curable disease;
4. Freedom from the disabling effects of illiteracy and lack of basic education;
5. Freedom from extreme material privation. (Sen, 1999).

According to Sen, these freedoms have both intrinsic and instrumental value. Importantly, in contrast to the unfair competition and race to the bottom rationales for linking international trade policy and international labour standards, the human rights perspective focuses primarily on the welfare of citizens in exporting, not importing countries. The assumption underlying this concern for basic or universal human rights is that failure to respect them in any country is either a reflection of the decision of unrepresentative or repressive governments rather than the will of the citizens or a sign of the majoritarian oppression of minorities, for example, children, women or racial religious minorities; alternatively, there may be paternalistic concerns that citizens in other countries have made uninformed or ill-advised choices to forgo these basic rights.

The linkage of international trade policy, including trade or other economic sanctions, with CLS that reflect basic or universal human rights is a cogent one. When citizens in some countries observe gross or systematic abuses of human rights in other countries, the possible range of reactions open to them include diplomatic protests, withdrawal of ambassadors, cancellation of air landing rights, trade sanctions or more comprehensive economic boycotts, or at the limit, military intervention.

Arguing that doing nothing is always or often the most appropriate response is inconsistent with the very notion of universal human rights. In extreme cases, such as war crimes, apartheid, the threat of chemical warfare in the case of Iraq, genocide in the case of Serbia, or the Holocaust in the case of Nazi Germany, excluding a priori economic sanctions form the menu of possible options seems indefensible. Whether it is the most appropriate option may, of course, be context specific and depend both on the seriousness of the abuses and on the likely efficacy of the response choice of instrument, issues to which we turn next. But it is sufficient for present purposes to restate the point that to the extent that CLS are appropriately characterized as basic or universal human rights, a linkage between trade policy and such labour standards is not only defensible but arguably imperative, in contrast to the other two rationales for such a linkage which, despite their much longer historical lineage, are largely spurious and inconsistent with the central predicates of a liberal trading system. However, CLS viewed as basic or universal human rights, by promoting human freedom of choice, are entirely consistent with a liberal trading regime that seeks to ensure other human freedoms, in particular the right of individuals to engage in market transactions with other individuals without discrimination on the basis of country of location (Molatlhegi, 2002). Having said this scope and definition of the class human rights viewed as sufficiently universal as to warrant potentially the imposition of trade sanctions for their violation is problematic in various respect. Even CLS are not susceptible to uncontentious understandings of their scope. The scope of many economic, social and cultural rights is controversial (Ignatiefee, 2001). These controversies do not obviate the normative force of the rights themselves, but do have implications for the choice of instrument and choice of institutional arrangement for addressing the trade policy-labour standards linkage, to which we now turn. As regards developing country: From a developing country perspective, the conventional wisdom is that unlike the case with developed countries, increased integration with the world economy will be beneficial to less skilled workers. However, this does not seem to be supported by the available empirical evidence, which suggests that many developing countries experienced rising wage inequality after opening to international trade. It appears possible that there is a pervasive skill bias in globalization. It is also uncertain what prospects international trade offers in creating jobs in developing countries, particularly those located in Africa and Latin America.

Human rights beyond labour rights

Since the end of the Cold War, two main visions have guided the evolution of international law and institution the visions of human rights and humanity and that of economic globalization. Both visions have offered challenges to traditional and understandings of sovereignty: they have given a new significance to non-state actors in the evolution and implementation of international law. Both have often given rise to demands and aspirations to global politics and constitutionalism as well as new relationship between local, national, regional, and global levels of governance. However, the legal, institutional and policy cultures of international human rights law and of international trade, financial and investment law have developed largely in isolation from one another (Howse, Teitel,2007).

As a matter of international law, the International Covenant on Civil and Political Rights (ICCPR) and the International Covenant on Economic, Social and Cultural Rights (ICESCR) and the WTO are, in the first instance treaty regimes. A fundamental structural characteristic of the international legal system is that of decentralization without hierarchy. Treaty norms in the ICCPR and ICESCR and other human rights instruments have an equal legal status to those in the WTO (a few such norms, related to prohibitions on torture and slavery have a higher status as ius cogens or preemptory norms of International law, trumping treaty obligations to the extent of inconsistence).

A large majority of states are signatories to both the WTO Single Undertaking (the core WTI treaties) and the ICCPR and ICESCR. The principle of decentralization without hierarchy, along with that of giving full effect to international obligations, implies the need to interpret and to develop these regimes in a complementary and consistent fashion to the extent possible. As the Report of the international Law Commission (ILC) on fragmentation of international law notes, 'In international law, there is a strong presumption against normative conflict (Koskenniemi, 2006).

The Declaration on Trade-related Intellectual Property Rights (TRIP) and Public Health and the Kimberly (Conflict Diamonds) waiver reflect an unacknowledged debt to human rights consciousness in the WTO. The current Director-General of the WTO, Pascal Lamy, has written about globalization with a human face, and his conception of the economic sphere, including the international economic sphere, is deeply routed in the notion of humanity. More recently, a joint study by the ILO and the WTO Secretariat explicitly refers to freedom of association and the right to collective bargaining as 'universally recognized Human Rights', urges their respects as such and not just for instrumental reasons of social peace, ad refutes with empirical evidence the notion that respect for such rights harms competitiveness (Knoll, 2003).

Sen vigorously challenges the view that human rights are 'luxury goods' that poor countries cannot afford until they have achieved a certain level of prosperity; instead, the improvement of economic welfare depends upon respect for rights in many and complex ways. More recently, Alan Sykes has noted that, generally speaking, there is a positive correlation between a country's openness to trade and its tendency to respect human rights. This puts into question the idea that poor countries should or must sacrifice human rights or postpone their realization for the sake of openness to trade, and an outward-oriented development strategy (Sykes, 2003).

Liberalization of trade and Health Policy Perspective

Health care policy in common is one of the important rights. Healthcare as one of the freedoms is protected by human rights. In national as well as international legal systems, the expression of health policy is under high protection. (Palkova, Kudeikina 2020)

International trade also hurt the right to health directly or indirectly. In this case it should be mention that the Regional Committee for the Eastern Mediterranean of World health Organization discussed in its Forty-fifth Session the impact of the GATT Agreements on health and passed a resolution urging Member States to: A. Ensure that ministries of health are represented on national committees

entrusted with the task of studying the negative impact of World Trade Organization agreements on the health sector; B. Conduct studies to coordinate response to World Trade Organization health-related agreements in cooperation with the Regional Office. World health Organization expressed its concerns in a statement at the Third WTO Ministerial Conference as follows - trade and public health should not be discussed in isolation from each other. Decisions made outside the health sector have tremendous influence on health outcomes, especially in poor societies. World health Organization supports the main purpose of promoting trade, that is, to improve living conditions and to raise real income. It strongly reaffirms that health is central to this development goal. The benefits to be derived from expanding trade should further the goal of improving the health of the population, especially that of poor or marginalized groups who may find themselves excluded from the process of economic growth. (WHO, 2013).

TRIPS is the importance of interpreting WTO treaties from a health policy perspective. Health policy experts and organizations were able to promote the protection of the safeguards in TRIPS for parallel importing and compulsory licensing by stressing that the treaty text accorded WTO members these rights. In addition, health policy activism helped stimulate subsequent state practice in the form of the Doha Declaration on the TRIPS Agreement and Public Health which reinforced WTO members' rights to use TRIPS flexibilities and safeguards for public health purposes. Treaty interpretation from a health policy perspective remains important in other areas of TRIPS as well.

The question arises whether the provisions of GATS may also provide insufficient flexibility for health policy makers, transferring the issue from the realm of treaty interpretation into treaty implementation or revision. Health concerns often seem to have insufficient weight in decisions many governments make in international forums, such as the WTO. GATS forces WTO members to think about health in connection with the growing role of services in modern economies and the impact of globalization trends, particularly on the poor. In addition GATS establishes a process designed to progressively liberalize trade in services and health policy-makers must be prepared to participate in this process to ensure that such liberalization unfolds in a way sensitive to the needs of national governments in ensuring the provision and regulation of health-related services. GATS "institutional framework' and particularly dispute the dispute settlement mechanism, are also important parts of the GATS for health policy (Mattoo, Stern, Zanini, 2008).

Any liberalization under GATS should aim to produce better quality, affordable, and effective health-related services, leading to greater equity in health outcomes. Liberalization should also ensure the necessary policy and regulatory space governments require to promote and protect the health of their populations, particularly those in greatest need. GATS create health opportunities and challenges, especially for developing countries. GATS accords countries considerable choice, discretion, and flexibility so that proper management of the process of liberalization of trade in health-related services can adequately protect health. In key areas of GATS, governments face choices about the breadth and depth of liberalization of trade in health relatedservices and the impact of such liberalization on health policy. In fact, countries are free to decide whether liberalization in the health sector should be pursued or not and to what extent. Countries are not obliged to liberalize health services if they do not wish to do so. These choices make it imperative that health officials understand the structure and substance of GATS, collaborate with other government agencies on GATS implementation and liberalization, and act to ensure that the GATS process does not adversely affect national health policy. (Drager Smith, 2006).

As regards key provisions of GATS, it creates the multilateral legal framework for international trade in nearly every type of service. The Agreement's 29 articles establish the scope of its rules' coverage, impose general obligations, structure the making of specific commitments, construct a process for progressive liberalization of trade in services, and link the treaty to the WTO's dispute settlement mechanism. Although experts acknowledge that GATS has not, to date, significantly affected trade in health-related services, the potential for GATS to do so through the progressive liberalization process is tremendous. In the GATS 2000negotiations, countries may be receiving requests from and may consider submitting offers to other WTO members for market access and national treatment commitments in many different health-related service sectors.

On the basis of the above-mentioned very interesting subject is WHO's work on GATS and policy. WHO's work on GATS has, to date, focused on collecting evidence on the potential and actual impact of GATS on the functioning of health systems. These efforts involve:

1. Collecting data on trade in health-related services;
2. Undertaking a wide range of country-based studies;
3. Conducting regional and national training programs;
4. Supporting a legal review of GATS from the perspective of health policy;
5. Developing a Handbook on Trade in Health-Related Services and GATS; and
6. Tracking and disseminating information on the GATS 2000 negotiations (Adlung, Carzaniga, 2001).

Although the environment per se is not a WTO issue, several WTO Agreements and rules are relevant to environmental issues. There have been several environmental related WTO disputes often centering on the issue of "like product". In making a determination of "likeness", WTO rules permit health risks to be taken into account. In a recent case on asbestos, the Appellate Body found the objective pursued, i.e. the preservation of human life and health, to be "both vital and important in the highest degree", and concluded that an import ban on asbestos was a "necessary" measure to protect human health (WTO, 2002).

Summary

Summarizing the results of the dissertation research, the following conclusions are presented. T*he International rules on trade*, are necessary for four related reasons, Firstly, to restrain countries from taking trade-restrictive measures, both in their own interest of the world economy. Secondly, to give traders and investors a degree of security and predictability regarding the trade policies of other countries. Thirdly, to allow for the effective protection and promotion of important societal values and interests (such as public health, a sustainable environment, consumer safety, cultural identity and minimum labour standards), while at the same time ensuring that countries meaning only those measures that are necessary for the protection of these values and interests. And fourthly, to achieve a greater measure of equality economic relations. It should be noted, that the potential of international trade to be realized, there must be good governance at the national level, as well as further reduction of trade barriers and more development aid.

Without the national or international action required in these four areas, international trade will not bring prosperity to all, but, on the contrary, is likely to result in more income inequality, social injustice, environmental degradation and cultural homogenization.

Abstract

Information and Knowledge Society are transforming the habits of users; a phenomenon related to an increase in the quantity and availability of data. Within this context, the choice of a product or service is influenced by the information that exist about these in digital ecosystems. To do this, potential target audiences use the so-called Online Reputational Indexes, known as ORIs, that provide a user-generated valuation of the establishment, to select their products or services. The aim of this work is to propose a novel procedure to incorporate the user choice in the for business management, by generating the rules of choice of the public, to be incorporated into the decision-making process. The process has been applied in a real example, which has allowed to know, how is the of the stakeholder assessment respect to the three-star, four-star and five-star hotels, in North America, South America, Europe and Asia, to help in the decision process.

Keywords: Stakeholder; Sentiment Analysis; Social Networks Analysis (SNA); Tourism Destination; Hospitality Management; Competitiveness of Tourism Destination.

Introduction

The technological revolution of recent years has given rise to what is known as the "information society", which has not only brought about changes in purely economic aspects, but also in social and organizational aspects. (Novabos, Matias and Mena, 2015; Narangajavana *et al.*, 2017). The Information Society has become a phenomenon of transformation that has democratized information through social media; social networks, blogs or mobile social media that have developed peer-to-peer communication with an increasingly participative and influential audience. Tourism industry and particularly tourist destinations have not been oblivious to this transformation (Gulbahar and Yildirim, 2015; Kiráľová and Pavlíčeka, 2015). Since the 1980s, the development of tourism services and products and Information and Communication Technologies have evolved together (Jacobsen and Munar, 2012; Chung *et al.*, 2015; Narangajavana *et al.*, 2017), as well as interoperability between businesses and users. Buhalis and Law (Law, Qi and Buhalis, 2010) (Kotler and Gertner, 2002; Xiang, Magnini and Fesenmaier, 2015).

Different investigations have shown that during the 20th century the tourism industry mainly focused its development on the quality of services, while at the end of the 1990s and beginning of the 21st century, they introduced corporate reputation and the importance of managing it as an axis for their sustainability (Lusch, Vargo and Tanniru, 2010; Zeng and Gerritsen, 2014; Huang *et al.*, 2017; Assaf and Tsionas, 2018), as more and more users decide where to travel based on criteria of choice such as: the impact and footprint of the trip in terms of sustainable tourism, the capacity for personalization and accessibility in terms of tourist intelligence, and especially the reputation and notoriety of the destination.

In this context, the social media have represented a new advance in the management of tourist destinations, where stakeholders can obtain, share and process any information by technological means, from any place and in different media (Ho, Lin and Chen, 2012), giving users the opportunity to create their own experiences, going from one-way communication to two-way communication processes. These new trends go in search of the positive user experience. In the design of tourist destination strategies, Destinations Management Organizations (DMOs), seek that the user, with that experience

based on intangible values, gets excited, feels, enjoys, shares and remembers. (Barreiro, 2019; Rodríguez-antón and Alonso-almeida, 2019).

To measure experience in general, different tools and monitors have been defined (Casado and Peláez, 2014), which measure experiences, mainly by asking audiences or experts, through questionnaires. But this type of measurement presents problems such as the strategic aspect of decisions, the diversity of communication channels where audiences express themselves, or the availability of real-time valuations, among others. In order to solve these problems, companies and researchers have designed different indexes, called "Online Reputation Index - ORIs".

ORIs are built using models such as WOM (Word-Of-Mouth) and eWOM (electronic-Word-Of Mouth),(Gunawan and Huarng, 2015; Seker and Eryarsoy, 2015). They use ascending discrete value scales for the user to give their opinion, where accommodations with a higher rating reflect a better prescription. This rating is usually represented by several stars, or like mainly, that make it easier for users to see the indicator(Abubakar *et al.*, 2017). The ratings on the accommodations or services that are exposed to the user through the web serve as a form of prescription for the final decision making, that is, the reservation of the accommodation or service in question (Williams *et al.*, 2017). Therefore, it is possible to consider these valuations as an approximate representation of the value that the hosting delivers to the user.

The objective of this work is propose a novel procedure to incorporate the user choice in the for business management, by generating the rules of choice of the public, to be incorporated into the decision-making process. The work has been organized in the following way: in the second section the methodology used is presented, together with the examples of experimental validation, where the hypothesis was raised that "there are no statistically significant differences in the measurement of the Interval Reliability Index (IRI) depending on the number of stars in the hotels", and the business model for the construction of a rating system; in the third section, the results are presented; and finally, the discussion and conclusions are presented in the fourth section.

Materials and Methodology

In this section we present the business model proposed, and the different processes that make it up. Firstly, we present the initial data that the model uses. Secondly, the process for extracting and analyzing the data extracted from the digital ecosystems. Thirdly, the operator used for the construction of the opinion intervals. And finally, the proposed business model.

Initial Data

The baseline data needed by the model comes from the set $r = \{r_1, r_2, \dots, r_n\}$ where $r_i = (v_i, c_i)$, v_i are the value of the opinion expressed by the public in social media, and c_i, the cardinality of that value. For example, $r_i = (0.5, 50)$ means that the value 0.5 (represents a valuation of a comment or opinion), has been repeated 50 times. These data correspond to communications issued by the public in the social media, related to the products and services to be evaluated.

Extraction And Analysis Of Data From Digital Ecosystems

The extraction of information from social media can be done through several alternatives: public APIs, for example, those provided by Twitter, Reddit, YouTube, Foursquare and TripAdvisor; Scraping Algorithms; RSS news feeds.

Data analysis uses semantic analysis algorithms, which extract feeling about a product/service. In this work we have used the multi-agent system that incorporates two algorithms, the first based on neural networks; and the second, based on machine learning that calculate the polarity of the feeling of communications, which calculate the polarity of the feeling of the communications in an interval [-1, 1] (positive emotion (0, 1], neutral emotion 0 and [-1, 0) negative emotion).

Figure 1 shows the architecture that carries out the extraction and classification of public valuations. The information is obtained from digital ecosystems (in this case the Internet) through web scraping processes, then it is contextualized and finally, through a process of analysis, it is evaluated.

Figure 1. Extraction and Analysis architecture.

Opinion Interval

To construct the valuation interval of products and services, the model proposes to use the QV-ORI valuation index, defined by (Peláez, Martínez and Vargas, 2019). The Quorum Valuation Online Reputation Index (QV-ORI), as the tuple QV-ORI = (X, IRI), where X is a opinion interval and IRI is a reliability index of the assessment interval. Both values, provides more information to improve the decision-making process.

Business Model

Figure 2 shows the business model for the analysis of public valuations and the design of the selection guides of tourist accommodation. The model is built using the TOGAF enterprise architecture framework, which provides an approach to the design, planning, implementation and governance of an enterprise information architecture. The model is divided, at this level of abstraction, into three sub-models: the first is the one corresponding to the motivation and objectives of the model. In our case it is the design a general criteria guideline of tourist accommodation, the assessment does not depend in experts and use public social-media information. The second sub-model is related to the audiences involved in the business model. In our case, the clients of the hotels, who give their opinions. Finally, the third sub-model, shows the valuation process, hotel selection, semantic analysis, aggregation operators, and valuation indices.

Figure 2: Business Model to Generating the Rules of Choice of the Skateholder.

Application Example

Study population

The hotels considered have been selected from the list offered by the Word Tourism Organization (UNWTO). A total of 60 hotels of 5, 4 and 3 stars, located in Europe, North America, South America and Asia, and different cities have been considered (Annex 1).

Criteria for Inclusion and Exclusion Hotels

Located in cities and metropolitan areas with a high GDP in terms of purchasing power parity and global impact. For this purpose, the following rankings have been used: PwC PricewaterhouseCoopers Full listing of urban agglomeration GDP rankings in 2005 and illustrative projection to 2025 (using definitions and population estimates); Mastercard's 2018 Global Destination Cities Index; Forbes 2019 Emerging Travel Destinations.

Inclusion Criteria and Exclusion of Comments

Inclusion:

- Be between 18 and 65 years old, reported to services and data sources if it is available.
- The communication is public and can be viewed without the need to subscribe to the data source or explicit permissions of the issuer of the communication.

Exclusion:

- Opinions have been generated by bots (procedural methods).

Data sources: The data have been obtained from TripAdvisor's website.

Period: March 2019 - May 2019.

Data collection procedure: The collected data were processed in a procedural and automatic way. The data analysis algorithms were developed in Python 3 language, using the NLTK natural language analysis library and the SCIPY artificial intelligence library.

Semantic analysis is performed using a neural network that provides values between [-1, 1], being -1 totally negative, 0 neutral, 1 totally positive.

Results

The results obtained are shown below and have been segmented as follows:

- Global study of hotels.
- Global study of hotels grouped by category.
- Global study by continents.
- Global study by continent and category.
- Global study by country.
- Global study by country and category.

Finally, a statistical study is carried out to check the probability of variation of the IRIs, depending on the continent and the category of the hotel, five, four and three stars.

Global Study of Hotels

In Table 1, the interval and its IRI value for the total of hotels is shown. The results show that at a global level there is a polarization of user opinions.

Table 1: Rating Interval and IRI for Global Hotels.

Interval	IRI
[-0.753, 0.958]	0.1198

Global Study by Category

Table 2 shows the interval and its IRI value for the global hotel segment by category. This study also shows a polarization in user ratings.

Table 2: Valuation Interval and IRI for hotels segmented by category.

Category	Interval	IRI
5 Stars	[-0.752,0.997]	0.139
4 Stars	[-0.752,0.840]	0.055
3 Stars	[-0.752,0.958]	0.120

Figure 3: IRI for hotels segmented globally by category.

Study by continent

Table 3 shows the interval and its IRI value for global hotels segmented by continents.

Table 3: Valuation Interval and IRI for hotels segmented by continent.

Continent	Interval	IRI
Europe	[-0.740, 0.995]	0.146
South America	[-0.140, 0.958]	0.744
North America	[-0.752, 0.958]	0.120
Asia	[-0.753, 0.854]	0.063

Study by continent and category

Table 4 shows the interval and its IRI value for global hotels segmented by continents and categories. Meanwhile, figures 4, 5, 6 and 7 show the IRI values by continent and category.

Table 4: Valuation Interval and IRI for hotels segmented by continent and category.

Category	Continent	Inf	Sup	IRI
General	North America	-0.752	0.958	0.120
	South America	-0.140	0.958	0.744
	Europe	-0.740	0.995	0.146
	Asia	-0.753	0.854	0.063
5 stars	North America	-0.002	0.951	0.99
	South America	-0.649	0.95	0.187
	Europe	-0.554	1	0.286
	Asia	-0.669	0.917	0.156
4 stars	North America	-0.752	0.950	0.116
	South America	-0.285	0.935	0.531
	Europe	-0.615	0.840	0.154
	Asia	-0.634	0.840	0.139
3 stars	North America	-0.733	0.958	0.132
	South America	-0.429	0.958	0.381
	Europe	-0.382	0.958	0.429
	Asia	-0.751	0.954	0.118

Figure 5: IRI for hotels segmented by 5-star category and continent.

Figure 6: IRI for hotels segmented by 4-star category and continent.

Figure 7: IRI for hotels segmented by 3-star category and continent.

Global Study by Countries

This study analyses all the hotels in each country. Table 5 shows the different intervals and their corresponding IRI values. The study shows that the best hotels can be found in Japan and France.

Table 5: Valuation Interval and IRI for hotels by country.

Countries	Interval	IRI
Germany	[-0.607,0.997]	0.243
Argentina	[-0.246,0.739]	0.500

Brazil	[-0.264,0.958]	0.567
Canada	[-0.745,0.920]	0.105
Chile	[-0.182,0.958]	0.680
EAU	[-0.224,0.944]	0.615
France	[-0.121,0.864]	0.753
United Kingdom	[-0.555,0.968]	0.271
Spain	[-0.340,0.799]	0.402
Italy	[-0.569,0.954]	0.253
Japan	[-0.118,0.844]	0.754
South Korea	[-0.669,0.957]	0.177
Malaysia	[-0.747,0.865]	0.073
México	[-0.749,0.957]	0.122
Singapore	[-0.708,0.865]	0.099
Thailand	[-0.337,0.999]	0.495
USA	[-0.748,0.957]	0.122

Global Study by Country and Category

This study analyzes countries and their hotels by category. Tables 6, 7 and 8 show the assessment intervals together with their corresponding IRIS.

Table 6: Rating Interval and IRI for 5-star hotels.

Category	**Country**	**Interval**	**IRI**
5 Stars	Germany	[-0.187,0.999]	0.6838
	Argentina	[-0.209,0.868]	0.611

	USA	[-0.707,0.952]	0.147

Table 8: Rating Interval and IRI for hotels by 5-star countries.

Category	Country	Interval	IRI
3 Stars	Germany	[-0.506,0.929]	0.294
	Argentina	[-0.242,0.604]	0.426
	Brazil	[-0.619,0.958]	0.214
	Canada	[-0.628,0.960]	0.208
	Chile	[-0.246,0.958]	0.590
	EAU	[-0.647,0.958]	0.194
	France	[-0.647,0.958]	0.194
	United Kingdom	[-0.254,0.920]	0.566
	Spain	[-0.570,0.715]	0.112
	Italy	[-0.125,0.957]	0.768
	Japan	[-0.603,0.808]	0.145
	South Korea	[-0.456,0.957]	0.353
	Malaysia	[-0.632,0.836]	0.138
	México	[-0.704,0.944]	0.145
	Singapore	[-0.436,0.854]	0.323
	Thailand	[-0.301,0.882]	0.490
	USA	[-0.647,0.958]	0.194

Statistical Study of the Values of IRIs

Finally, we have carried out a statistical study to check the probability of variation of IRIs in terms of continents and stars. Table 9 shows the results obtained from the Friedman parametric test (Zimmerman and Zumbo, 1993) applied to the set of values emitted by users.

Table 9: Descriptive Statistics.

Figure 8: Mean and confidence intervals of IRI measurements by Continent and grouped by Number of Stars.

Discussions

The previous section has shown the different results obtained from the TripAdvisor data source in the study period between March and May 2019. The different studies carried out have shown the following behavior of the public, according to the different segmentations carried out:

The different studies carried out have shown the following behaviors, according to the different segmentation carried out:

Global Study of Hotels. This study has shown in table 1 and figure 1, that the ratings considering all hotel categories and continents are polarized.

Global Study of Segmented Hotels by Category. This study has shown in table 2 that considering global ratings, although segmented by category, does not provide information as the ratings are polarized, and cannot extract any guide to the behavior of the users of the same.

Therefore, from the comparison of ratings of hotels on a global level and segmented by categories it can be concluded that:

The comparison of hotels at the global level shows a polarization of user feedback at both the hotel and category level. This result confirms aspects of the decision-making processes, which establish that comparisons should be made between alternatives that are comparable. These results indicate that hotel valuation studies should not be carried out at a global level, since no information can be extracted from them. There are differences between hotels, categories that hide the characteristics of hotels.

The study shows that there is a similar proportion between positive and negative valuations, taken in the time interval of the study. This shows the importance of digital information, since it rejects the general opinion that only the public comments negative aspects in the social media.

Comparisons should be made based on defined criteria, and where alternatives can be compared based on such criteria.

Study by Continents. Table 3 shows the interval values for each continent and their corresponding IRI. From these values it can be concluded that:

The study shows that the ratings of hotels on the South American continent are the least polarize, with a value of IRI 0.74, which indicates that the opinions are consistent, for the period of studies.

The hotels with the best feeling are those located in the South American continent. The rest of the continents show polarize information, and therefore no general conclusions can be drawn from them.

Study by Continent and Category. In table 4, and figures 4, 5, 6 and 7, they show the values of intervals and IRIs of user ratings for the different continents and their respective hotel categories.

According to these values, the 5-star hotels with the best opinion in the world are those located in North America, according to the rating of the public (IRI: 0.99). While the rest of the continents have a more polarize rating. The ranking obtained has a relationship with the GDP (figure 9) of the continents, so that the higher the GDP, the higher the standards of quality in high value products or services, are. The following graph shows the GDP of the different continents in 2015, where North America predominates, followed by Europe, Asia and South America, the latter two with very similar values.

Figure 9: Map of countries by GDP in 2014, according to IMF estimates (October 2015). Source. Fond Monétaire International (IMF), World Economic Outlook Database, October 2015, http://www.imf.org.

This same study shows that the 4-star hotels with the best ratings are those located in South America, followed by Europe, Asia and North America. While the best rated three-star hotels are those located in Europe, followed by South America. From these ratings, the best hotels of medium category, three and four stars, are in Europe and South America.

Global Study by Country and Category. Table 5 shows the interval value and its corresponding IRIs. From these values it can be concluded that the best rated hotels in the country are in Japan, followed by France and Chile.

This same study shows that the five-star hotels with the highest ratings are those of South Korea, Mexico, Spain and Germany. The four-star hotels are in Singapore, Brazil and South Korea; and the three-star hotels are in Italy and Chile.

Conclusion

The objective of this work is propose a novel procedure to incorporate the user choice in the for business management, by generating the rules of choice of the public, to be incorporated into the decision-making process.

The model has been applied to a total of 60 hotels, with categories of 3, 4 and 5 stars, located in different cities of the European continent, North America, South America and Asia, showing its applicability, obtaining the rating of the different hotels, as well as the behavior of the public through their ratings. These comparisons have allowed us to have a general view of the audience's valuation behavior according to the classification criteria, which can be incorporated into business decision processes.

Forecasting the absorption rate of European funds related to Cohesion Policy 2014 - 2020 in Romania

Florian MARIN

Academy of Economic Studies, Bucharest, Romania
marinflorian_21@yahoo.com

Abstract

European funds are one of the main instruments used by the EU Member States to finance sustainable development. Absorption of European funds is an objective at Member States level which is part of the European Union. The purpose of the article is to bring to the attention of the stakeholders the issue of the absorption of European funds by using a methodology based on a composite indicator that integrates the functionalities provided by the management authority in absorbing the European funds. The article deals with a topic neglected by the specialized literature, namely identifying the absorption that can be achieved by a Member State, a process based on a methodology that uses the criteria that characterize the absorption process. The article addresses the situation of Romania and includes in the analysis of the operational programs that are financed from the Cohesion Policy 2014-2020. The article proves the modest results of Romania in the absorption of the European funds related to the programming period 2014-2020.

Keywords: EU funds, absorption, programming period 2014-2020, Cohesion Policy.

Introduction

Globalization, the mobility of the workforce, climate change, and a strong demographic decline are one of the most important challenges that need to be managed effectively and coherently by the European Commission. One of the instruments which the European Commission is using to manage the main development challenges are the European funds. The main objective assumed by European funds aims to reduce regional disparities as well as to promote sustainable and harmonious regional development, concepts found in the strategic and programmatic framework with which European funds operate. European funds are the main motivational element found at Member State level, also is the main pillar of the policies used by the European Commission. Both the Cohesion Policy and the Common Agricultural Policy are using European funds so that the importance of European funds for the success of these policies is significant. Ensuring a process of absorption of European funds requires compliance with a process governed by national and European law, this process is sometimes difficult. States deliver different performances in terms of the absorption rate of European funds precisely because performance in managing process specific to a significant absorption rate varies from one Member State to another. However, the first indicator that characterizes the performance of states in relation to European funds is the level of absorption. Literature focuses generally on the impact of absorption of European funds. In order to have a qualitative impact, it is necessary to have a level of absorption that is considered relevant to measure and assess their impact. The quantitative aspect of European funds is also very important. This aspect was neglected by the literature, the references are referring mostly to the impact of absorption rather than the absorption process itself. There is no such index to provide a prediction of absorption so that the absorption process can be optimized during the implementation period of the operational programs. This process is considered to be complex in the sense that the number of variables involved in the absorption of European funds is high and, last but not least, different from one operational program to another.

Romania is involved as a European Union Member State in the implementation of the 2014-2020 programming period, which is halfway through the implementation period, taking into account the N + 3 rule. Romania's performance in the first programming period was modest so that the actual

absorption rate achieved during the programming period 2007 - 2013 was about 80%, this being made on the basis of several procedural concessions made by the European Commission. Expectations regarding the current programming period are also pessimistic as the 2014-2020 programming period is much more complex than the first programming period managed by Romania. The existence of the Partnership Agreement, a comprehensive and difficult to follow the strategic framework, as well as significant economic and social challenges, justify the existence of pessimistic views regarding Romania's ability to capitalize on the opportunities offered by European funds. The funds allocated by the European Commission to Romania under the Cohesion Policy are 22.586.232.192 euro, the allocation being distributed based on 6 main operational programs. The absorption of European funds is an important objective for Romania, European funds represent a clear and direct investment in the sustainable development processes in the period 2014-2020. The identification of some methodologies capable of optimizing the absorption process and of ensuring an increased complementarity between investments made from other sources and European funds is a necessary prerequisite for Romania because the development deficits to other Western states are significant.

Methodology

In order to identify the level of absorption of European funds, we will proceed with using a methodology that systematically addresses the managerial process applied by the managing authorities in the implementation of the operational programs. The proposed methodology is based on the management system used by the managing authorities in Romania, focusing on the specifics of the Cohesion Policy 2014-2020 and the procedural rigors for the 2014-2020 programming period. The steps used in the implementation of the methodology are the following:

Step 1. Inventory of the entire set of variables, called criterias, that interfere with the European funds management system. 28 variables were identified with which the European fund management system manages, which are classified into 4 major classes of criterias, each class covering the functionalities of the management system.

Step 2. Each criterion class was assigned a weighting, the total amount being 100%, depending on the managerial effort imposed at the level of the management authority. Also, each criterion has a coefficient of importance from 1 to 10, 1 representing the minimum level, 10 the maximum level.
Step 3. To calculate the score obtained by each class of criteria using the following formula:

$$Po = \sum_{i=1}^{n} Cis \times PC$$

where,

Cis represents the coefficient of importance obtained at the level of each sub criterion

PC is the importance assigned to the criterion level

Po is the score obtained at the class of criteria

Step 4. Calculate the absorption prediction indicator by calculating it using the following formula:

$$Vpapo = \sum_{i=1}^{n} Po \times \text{financial allocation of the operational program}$$

where,

Vpapo = the predicted absorption value at the operational program level
and

the budgetary envelope allocated to that operational program represents the amounts allocated by the European Commission to the operational program concerned; they do not include national co-financing.

Step 5. Calculate the absorption absorption value by using the following formula:

$$\text{Predicted absorption value} = \sum_{i=1}^{n} Vpapo$$

Literature Review

Specific literature has paid particular attention to European funds. It mainly focused on the impact that these funds have on regional development primarily because regional development and reducing development deficits are the main objectives for European funds. Although the literature adds significant exposure to European funds, there is no unanimously accepted opinion on the capacity and effectiveness of these funds to contribute to regional development, the opinions are being contradictory. Some authors do find evidence of a positive impact of structural funds on economic growth (Dall'erba, 2005; Ramajo et al., 2008), others only find a weakly positive (Esposti et Bussoletti, 2008), no statistically significant (Dall'erba et Le Gallo, 2008) or even a negative impact (Eggert et al., 2007). Regarding the economic impact of European Funds, the empirical literature (Boldrin et Canova, 2001; Checherita et al, 2009; Ederveen et al, 2006; Santos, 2008) generates different results. Boldrin and Canova (2001) find that European funds are on average ineffective. Checherita et al (2009) show that European funds help to reduce income disparities at the regional level but are incapable of promoting output growth. Other authors (Ederveen et al, 2006; Santos, 2008) find that European funds become effective only when accompanied by an appropriate institutional framework (strong institutional quality, lack of corruption, etc). Other authors believe European funds payments may increase one region's growth, which, in turn, may affect neighboring regions' growth rates. In particular, the new economic geography (Krugman, 1991; Krugman et Venables, 1995) highlights the importance of regional spillovers. If these spillover effects cannot be separated from the "original" impulse, the estimated effect of European funds payments is biased. There are also authors who consider that only certain types of funds have a positive contribution to regional development. For example, only funding on education and human capital has positive effects (Rodriguez-Pose et Fratesi, 2004). We can identify authors who consider that grants are not effective in stimulating private investment or improving general economies (Garcia-Milá et McGuire, 2001). European funds have a positive but not statistically significant impact on regional growth (Hagen et Mohl, 2008). European funds accelerate and region's convergence, but reduce the average growth rate (Eggert et al., 2007). The impact of European funds is synergistic with the level of absorption, in the sense that a significant impact is the consequence of an absorption process that provides for the approximate use of funds allocated to a Member State. The process of absorbing European funds is one that has proven to be complex, the ability of Member States to respond to procedural rigidities differs from one Member State to another, thus there are different differences in absorption performance. A high absorption process involves a mix of elements which be achieved at Member State level. Implement a project financed from European funds requires amending the legislation for harmonization with European standards (Bigioi, 2015), adapting accounting and fiscal policies of the entity, and improve the expertise of professional accountants (Bigioi, 2015). The absorption capacity in terms of supply is determined by three main factors, namely: macroeconomic absorption capacity, financial absorption capacity, administrative absorption capacity (Horvat, 2004). Berica believes that absorption capacity is mainly influenced by managerial and administrative capacities of co-financing. The relationship between the absorption capacity of the European funds and the regional economic situation is at least one paradox, demonstrating that the most disadvantaged regions face the greatest difficulties in absorbing these funds, although the need for financial support for the restructuring of the economy is paramount in these regions. The main explanation for this phenomenon is given by two factors: on the one hand, the difficulties faced by regional authorities lack the experience and qualifications, followed by the red tape and the slowness of EU decision-making in the circumstances where sequential programming at central and regional level in particular is not quite clear (Beric, 2010). According to the Commission's recommendations and best practices from EU countries, a golden rule becomes evident, namely the possibility of higher rates of absorption is directly proportional to the number of institutions in the new Member States involved in different levels of management and sectorial programs and regional (Horvat, 2009). The diverging results are also based

on differences in the research design. While earlier papers largely use cross-section analyses (Rodriguez-Pose et Fratesi, 2004), the recent findings are mostly based on panel data approaches (e.g., Esposti et Bussoletti, 2008). The estimation results might be biased due to the use of imprecise data. This problem is of special concern as the current literature often utilises structural funds commitments instead of actual payments. This results in a measurement error as commitments may not be entirely completed or be called up with a delay, e.g. due to missing absorption capacity (Mohl, 2010).

The performances registered by Romania in terms of the absorption of European funds are somewhat modest, much lower compared to other states in the European Union. The problems that Romania should approach in order to quantitatively, improve them, point mainly at the ability of the institutions of managing the process. Romanian authorities should improve the beneficiaries co-financing capacity more, since, despite the efforts made for the facilitating of the credit, this category of factors maintains its effect. (Valentin, 2013) Unfortunately, most empirical studies carried out in Romania pointed out a waring process of deepening the regional disparities started from the transition period and continuing up to now (Dachin, 2008; Goschin, 2008; Patache et al, 2011; Antonescu, 2010; Antonescu, 2012; Boldea et al, 2012). Despite the availability of European funds and significant cohesion funds, which should enhance the economic development for the underdeveloped regions, the European Union accession did not counteract the disparities for the regional based growth. On the contrary, the developed regions obtained the largest part of the post-accession benefits, based on their expertise in accessing European funds (Zaman et Georgescu, 2009; Goschin et Constantin, 2010). The main reason of the lack of absorption of European funds by Romania is the lack of transparency of the central government, particularly at the operational program management and also denial of existing vulnerabilities in this regard that prevents the identification of potential problems. Instead of analytical images an incomplete picture of absorption is presented, emphasizing only the positive aspects that ultimately make any scientific approach difficult. To be noted that during the implementation of a project (Zaman, 2009), absorption may be influenced by the macroeconomic vulnerabilities arising from both internal and external Romania (Zaman et Georgescu, 2009). The need for an approach that integrates the variables involved in the absorption process is justified precisely by the multitude of approaches and opinions, sometimes found at the level of the literature. However, up to now, the literature did not address the issue of absorption projection, which is imperative for any process of assessing the impact of European funds.

The level of absorption of European funds in Romania - the programming period 2014-2020

At the end of 2017 payments were made to beneficiaries in the weight of 8.96% of the total value, 16.1% on 03.08.2018, 23.98% at the end of 2018 and 24.1% in 01.02.2019. It is appreciated that the amounts of payments to beneficiaries are modest, given that at the end of 2018, 5 years have elapsed since the start of the programming period. It should be noted that payments to beneficiaries are potential absorption, with ineligible expenditure or suspicion of irregularity, all of which negatively affect the absorption. At the end of 2018 compared to 2017, payments to beneficiaries increased by 3.889.442.300 euro, the increase being by more than 100%. The year 2018 is the year when payments to beneficiaries doubled, a situation that positively influences future absorption. In fact, we can assume that the absorption of 2014 – 2020 programming period started in 2018. From a quantitative point of view, the current absorption rate was 3.355.106.939 euro at the end of 2017, 6.845.113.531 euro at the end of 2018 and 7.168.943.527 euro at 01.02.2019. The difference between 2018 and 2017, in terms of amounts sent to the European Commission, was 3.490.006.592 euro, and on 01.02.2019 compared to 31.12.2018 euro 323.829.996. As regards the amounts actually reimbursed by the EC, which are expenditure verified and assimilated as eligible by the European Commission, respectively amounts settled, we assert that at the end of 2017 they were 3.091.525.532 euro, 6.121.625.959 euro at the end of 2018, with 3.030.100.427 euro higher than the level of 2017 and 6.206.356.915 euro respectively on 01.02.2019.

Figure 1: Absorption rate reported to total allocation, Source: European Commission

Thus, we can see that European Commission reimbursements increased from 7.88% in 2017 to 20.1% in February 2019. The relationship between these indicators is important because it illustrates the speed at which the European funds transfers payments made to beneficiaries on the basis of a financing contract, implicitly based on a project in amounts settled by the European Commission. Analyzing the absorption rate dynamic, taking into account the links between the three indicators mentioned above, we can see that at the end of 2017 the percentage difference between the amounts paid and the amounts sent for reimbursement was 0.41% and the difference between the amounts reimbursed from the European Commission and the amounts sent for reimbursement by Romania was 0.67%.

At the end of 2018, the percentage difference between the payments made and the amounts sent for reimbursement to the European Commission was 1.81% and the one between the amounts sent for reimbursement to the European Commission and the amounts reimbursed by the European Commission was 2.34%. At the end of 2017, an amount of 423.794.570 euro was blocked on the reimbursement process, namely within the national management authorities or the European Commission, at the end of 2018 the sum being 1.283.136.443 euro. With the increase in the amount of payments to the beneficiaries, the amount blocked in the reimbursement circuit has increased significantly. Thus, if in 2018 compared to 2017 the value of payments to the beneficiaries increased by 110%, the value of the amounts in the reimbursement circuit increased by 202%. Hence the conclusion that the higher the amounts processed by the management authorities, the slower the response rate of the system is, the reason for the higher sums implicitly generating more documents to be analyzed and verified. Romania's performance in terms of absorption of European funds is reduced, therefore their impact is low due to the lack of absorption. Such a situation generates problems in ensuring the complementarity of funding sources to finance regional development.

Projections on the absorption of European Funds in the Cohesion Policy 2014-2020 in Romania

Using the proposed methodology, an inventory of the main operational programs which are part of the Cohesion Policy 2014-2020 found in Romania was made. For each operational program identified, the proposed methodology will be applied, such an approach is likely to ensure good integration of the operational program's specificities. The set of identified criteria are tailored and used according to the particularities and specifics of each operational program.

Table 1: Projected value of the Regional Operational Program

Absorption - euro			4.110.080.000,00

Source: Own methodology, Regional Operational Program 2014 - 2020

The Regional Operational Program benefits from an important allocation at the level of the Cohesion Policy, the needs covered by this operational program being complex and diverse. Urban development or revitalization, the environment, or the competitiveness of the business environment are some of the needs covered by this operational program. The absorption forecast indicator obtained 60.8% of the total allocation, whereas on 01.02.2019 the amount sent to the EC for reimbursement was 12.78% (876.649.527 euro) and the amounts actually reimbursed represented 8.09% (555.067.839 euro). Mentioning this absorption was a procedural exception, so the status of the program is a difficult one right now.

Source: Own methodology, Large Infrastructure Operational Program 2014 - 2020

The Large Infrastructure Operational Program aims at developing a large infrastructure, the central need of Romania. This is one of the most important operational programs in terms of allocation but also one of the most difficult to implement. Projects funded under the Large Infrastructure Operational Program are somewhat difficult to implement, the variables involved in such a project being significant. The absorption prediction indicator for this program is 60%, given that the actual absorption at the beginning of February was 15.79% (1.472.127.764 euro). Absorption value is unusually high compared to other operational programs because it was influenced by the previous programming period.

Source: Own methodology, Competitiveness Operational Program 2014 - 2020

Competitiveness Operational Program finances needs such as R&D, innovation or digitization, crucial needs for the competitiveness of the Romanian economy. Competitiveness Operational Program is a small program, its value being small compared to other operational programs, the number of beneficiaries with which the program interacts being reduced, generating an easy-to-manage absorption frame. However, the level of technical expertise required by the program is high but also expensive at the same time. The expected absorption value for this indicator is 65%. On 01.02.2019, the value of the absorption, in relation to the total allocation, was 15.31% (203.612.561 euro), referring here to the actual absorption.

Source: Own methodology, Operational Program for Administrative Capacity 2014 - 2020

The Operational Program for Administrative Capacity aims at developing administrative capacity of the public institutions, important elements for sustaining economic and social development in a sustainable manner. Sustainable development processes require an efficient public administration capable of supporting regional development processes in an efficient and effective manner. Program allocation is low, the program interacts mainly with central and local public authorities using the same procedural framework. Based on the proposed methodology, absorption of 69.65% is anticipated. On 01.02.2019, the Operational Program for Administrative Capacity recorded an actual absorption value of 7.84% (43.375.785 euro).

Source: Own methodology, Operational Program for Technical Assistance 2014 - 2020

The Operational Program for Technical Assistance is a support program for the management of European funds, aimed at providing the necessary framework for the implementation of other operational programs. However, the importance of the program is important because it affects absorption. The program delivers an average difficulty in terms of its modest allocation as well as the small number of beneficiaries the program interacts with. Also, the diversity of needs with which the program interacts is a small one. In view of the above, the absorption forecast indicator is 72.6% and 183.508.085,51 euro, respectively. The absorption value at 01.02.2019 was 32.07% (81,051,606 euro).

One of the difficult programs to implement and manage at the level of European funds is the Operational Program for Human Capital. It addresses 3 main needs, namely the labor market, education and poverty reduction. The difficulty of this program derives from the very large number of beneficiaries with whom the program interacts and from the operations financed. Also, the number of documents generated by a project funded from the Operational Program for Human Capital is significantly higher than for other operational programs, such as the Large Infrastructure Operational Program, for example. The expected absorption value calculated on the basis of the proposed methodology is 55.75% in the respective weight of 2.437.369.387,55 euro. Please note that on 01.02.2019 the actual absorption value was 13.38%, or 584.933.097 euro.

Table 7: Predicted absorption value

Operational program	Predicted absorption value euro	Predicted absorption rate %
Regional Operational Program	4.110.080.000,00	60,8
Large Infrastructure Operational Program	5.531.114.690,40	60
Competitiveness Operational Program	864.361.702,10	65

Operational Program for Administrative Capacity	385.297.872,09	69,65
Operational Program for Technical Assistance	183.508.085,51	72,6
Human Capital Operational Program	2.437.369.387,55	55,75
Predicted absorption - euro	13.511.731.737,65	63,97
Total value allocated – initial allocation	22.586.232.192,00	
% Predicted absorption rate	59,82%	
% absorption at 01.02.2019	2,940,168,652 euro	13,02%

Source: Own methodology

Based on the methodology approached, analyzing the situation of the operational programs that are an integral part of the Romanian Cohesion Policy, we can see that the expected absorption is at 59.82%, given that the value of the absorption at the beginning of 2019 was only 13.02%. The Human Capital Operational Program is the program that, based on the proposed methodology, will deliver an absorption rate of 55.75%, which is one of the lowest in the Cohesion Policy 2014-2020 in Romania. The situation is different in the case of the Technical Assistance Operational Program, where an absorption rate of 72.6% is anticipated. Large infrastructure and urban development are needs to be delivered at 60% and 65% respectively, which are small compared to the previous programming period. The references are related to actual absorption, namely the amounts actually reimbursed by the European Commission. References to actual absorption are generated by the fact that these expenses go through the entire procedural process imposed by the European funds management system.

Conclusion

Sustainability of development has become one of the most important features in development processes. The entire European strategic and programmatic framework addresses development in a sustainable context, with European funds being used to finance sustainable regional development and reduce regional disparities. Implementation of European policies, but also their success depends to a large extent on how to approach European funds. Above all, absorption is an imperative element to underpin these types of discussions. This article proposes to use a methodology that integrates an index composed of the entire set of variables that are involved in the management of European funds, depending on its importance. With different characteristics from one operational program to another, we adapted the methodology according to each operational program that we find in Romania, within the Cohesion Policy 2014-2020. At the end of 2018, Romania's performance in the absorption of European funds is reduced, given that it has been 5 years since the start of the programming period. A current absorption rate of 15.75% and an effective absorption rate of 13.02% represent the small percentages registered by Romania, which are lower than in the previous programming period. Although the programming period 2007 - 2013 was the first programming period administered by Romania as a Member State so that the level of experience was much lower, the absorption performance was higher than the current programming period, the situation considered unusual.

This article addresses an element little addressed by the literature, namely the prediction of absorption. The limits of this methodology refer to the level of high subjectivity, which is found at the level of the criteria integrated in the methodology and at the score awarded. Applying the proposed methodology, we can see that the forecasts for the absorption of European funds dedicated to Cohesion Policy in Romania are 13.511.731.737,65 euro, representing an absorption rate of 59.82%. This amount is exclusive of the European Commission contribution, excluding ineligible expenditure or national contribution. The applied methodology highlighted the existence of differences from one operational program to another. Programs with a small financial allocation have predicted greater absorption while higher allocation programs deliver lower absorption. This is caused by the number and diversity of beneficiaries and the needs with which large-scale programs are operating. Also, the financial and managerial effort required by programs such as the Regional Operational Program, the Large

Infrastructure Operational Program or the Operational Program for Human Capital is significantly higher than for the Operational Program for Technical Assistance or the Operational Program for Administrative Capacity. This is clearly revealed by the differences in the absorption forecast so that the Human Capital Operational Program benefits from a predicted absorption rate of 55.75% while the Operational Program for Technical Assistance benefits from a 72.6 %. The average absorption of funds dedicated to the Cohesion Policy 2014-2020 is 63.97%, which is lower than the one realized during the 2007-2013 programming period. Romania's absorption performance will remain low in 2014-2020, so sustainable development processes must find substitutes for other sources of funding than those funded by European funds.

Use of Social Media in Open and Closed Models of Building the Educational Institutions' Image

Waldemar JEDRZEJCZYK

Czestochowa University of Technology, Faculty of Management, Czestochowa, Poland,
waldemar.jedrzejczyk@wz.pcz.pl

Abstract

This article presents the issue of managing the image of the organization in an environment characterized by high level of saturation with modern Internet and mobile technologies. Significant role in the process of shaping the image is played by marketing communication. The new model of marketing communication is mainly based on social media. The attributes of social media predestine them to be used in the process of image creation. The process of building the organization's image may be conducted in an open system – according to a linear model, or a closed system – according to a feedback model. The method of building the image is largely translated to the effectiveness of the entire process. Market economy principles apply not only to business organizations but also, increasingly, to other types of organizations, including educational institutions. Educational institutions must also build a positive image of the organization. The main goal of this article is to assess the process of building the image of educational institutions in the social media era. In the presented results of empirical studies, the analysed entity was limited to one type of educational institutions – secondary schools. The research has shown that in the process of shaping the school's image, many schools still concentrate mainly on building their identity and communicating it to their stakeholders, and, to a much smaller degree, on obtaining and analysing feedback. Therefore, in theory, the image is built in a closed system – the feedback model, and, in practice, in an open system – the linear model.

Keywords: Image of The Organization, Marketing Communication, Social Media, Linear Model, Feedback Model, Educational Institutions, Secondary Schools.

Introduction

The key of market success of every organization is the satisfaction of stakeholders – various groups in the organization's environment. The image is the reflection of satisfaction. A positive image allows the organization to be distinguished amongst competition, build trust of recipients and gain their loyalty. Therefore, the image is of key importance in the organization-environment relation.
Building the organization's image is a complex process, which the organization controls only partially. This results from the essence of image. The organization's image is usually understood as a reflection of the organization's identity, its picture in the mind of stakeholders, an idea about the organization in the environment, in which it operates. The image management process should be focused on two aspects:

1) Shaping own image, i.e. deliberate influence on the shape of the image from the stakeholders' point of view;
2) Collection and analysis of opinions of stakeholders in order to undertake corrective actions, and to improve, strengthen and enforce the image.

The effectiveness of this process largely depends on the quality of marketing communication, both external as well as internal. The process of building the organization's image may be conducted in an open system – according to a linear model, or a closed system – according to a feedback model. The method of building the image is largely translated to the effectiveness of the entire process – building the image in a closed system is more effective. The contemporary model of marketing communication is mainly based on social media.

Social media are becoming increasingly popular not only in the society but also in business. This is an effect of progressing technological development and the growing potential of social media. The main benefits of present social media include: large range, general availability, low costs, mobility, interactivity and multimedia, higher level of effectiveness, better engagement of the user. SM allow existing in the virtual space, which is becoming important as much as the reality.

Market economy principles apply not only to business organizations but also, increasingly, to other types of organizations, including educational institutions. Similarly to enterprises, educational institutions must also build a positive image of the organization.

This article consists of two main parts. Part one includes a synthetic description of changes in the organization-environment relation under the influence of social media. Principal models of building the organization's image are presented. The distinguished elements were referred to the process of managing the image of educational institutions. In addition, part one also presents the most important characteristics of social media, which predestine them to manage the image of organizations. Part two presents the results of own research. This article has been prepared for analytical and research purposes. It was drawn up based on an educational approach, with the use of source literature and results of empirical studies.

The main goal of this article is to assess the process of building the image of educational institutions in the social media era. In the presented results of empirical studies, the analysed entity was limited to one type of educational institutions – secondary schools.

Relations of the Organization with the Community in the Hyper-media Environment

As a result of technological development, which led to the currently intensifying digital transformation, organizations are carrying out many changes covering mainly the organizational structure, manner of operation, and the work environment (Jędrzejczyk, 2019). Changes mostly relate to all organizational areas, including public relations (PR). PR shapes the relations between the organization and the external environment. An important role in PR activities is played by marketing communication, which is becoming virtual – and then by skilful combination of traditional and digital channels of communication with recipients, whereas the share of digital channels is increasing systematically (Kaushik, 2012; Chaturvedi and Gupta, 2014). The significance of the Internet, which is constantly evolving, and the related social media, is invaluable. The information flow environment, created in this manner, is defined as a hyper-media environment, and the new model of marketing communication, based on hyper-media, is characterized by a different type of interactions and a new interpretation of the function of a medium (Mangold and Faulds, 2009; Pavenkov and Rubtcova, 2019). Thanks to two-way and interactive communication, the position and the role of the message recipient is changing. The recipient has a possibility to generate feedback, e.g. through expressing own opinions. The traditional division of market players into organizations responsible for creation and promotion, and clients – who were passive recipients of marketing activities to date – is fading (Vescovi et al., 2010). Currently, recipients – consumers are more active in the Internet, which significantly affects the image of the organization and its services.

Most important changes triggered by the influence of social media on shaping the relations between organizations and clients are as follows (Kietzmann et al., 2011; Kaplan and Haenlein, 2012; Mazurek, 2012; Barker et al., 2013; Mazurek-Łopacińska and Sobocińska, 2017, p. 345):

- The paradigm of a media user is changing. A user is not just a recipient, but also a message author;
- The new role of the user facilitates more influence and control in terms of generating content. However, taking advantage of the potential of the Internet depends on the level of the user's competencies, and requires a sense of responsibility for the activity in the network;
- Content generated using social media increase information resources and may be useful both to organizations and clients;

- Information asymmetry is decreasing, thus the client's bargaining power is growing;
- The value and manner of distributing the message depend on assessment of the message, which is performed by users of social media;
- Communication based on social media requires a long-term dialogue with the client;
- Using social media by organizations increases the engagement of clients in processes happening within the organization.

The idea of using social media in the management process has already been named a "concept". Technical possibilities offered by SM and their easy accessibility caused organizations to start using the modern concept of managing relations with clients provided by Social CRM (SCRM). Social CRM is a concept of management consisting in creating the value of the organization through maintaining relations with clients using social media (Paliouras and Siakas, 2017).

The Model of Building the Organization's Image

Two basic models of building the organization's image may be distinguished: the linear model, and the feedback model – figure 1.

Fig. 1: Image building models

Source: own elaboration

The image building process according to the linear model consists of the following sub-processes: 1 – The organization builds its identity based on its strengths; 2 – Stakeholders receive/obtain information about the organization – its weaknesses and strengths; 3 – base on information held, stakeholders create the organization's image, whereas images of defined groups of stakeholders may vary; 4 – Development of a summarized image effect, defined as reputation, which consists of the sum of images of individual groups of stakeholders, maintained during a longer time horizon.

The linear model of building the organization's image is a non-closed system. This is a fundamental weakness of this model because information flow is conducted one-way only – from the organization

to stakeholders – one-way communication. The organization may have directly influence only dependencies 1 and 2 – processes, which should be initiated by the organization. Whereas dependencies 3 and 4 do not depend directly on the organization – these are autonomous processes.

In the feedback-based image building model, dependencies 1-4 have the same significance as in the linear model. Whereas in sub-process 5 the organization obtains information about its image, which may then be used in improvement activities. The organization may also directly influence dependency 5.

The feedback-based image building model is a closed model. The organization knows what are the effects of undertaken activities in the scope of building the image and, in case of a weak image, it can undertake corrective actions.

The process of continuously obtaining data from the surrounding environment by organizations, including information about the organization itself, is defined as monitoring (Draghicia et al, 2014).
Due to the application of two-way communication in the feedback-based image building model, it seems natural to use social media in the process of shaping the relations of the organization with its surroundings. A similar view is presented by other researchers, for example according to J. Leskovec (2011) social media allow obtaining feedback.

Businesses usually indicate the following principal benefits of using social media in relations with stakeholders (Stelzner, 2009, p.14-18):

1. Increasing brand awareness;
2. Increasing visibility/inquiries about the organization in the network;
3. Meeting new business partners;
4. Improving the results of the search for the business entity amongst users, who are seeking companies and other institutions near their location;
5. Winning new clients;
6. Decreasing total marketing costs;
7. Signing specific contracts.

The Potential of Social Media

Social media are a new method of communication based on Internet and mobile technologies, which transform communication into an interactive dialogue, which allows creating and sharing content generated by users (Bingham and Conner, 2010, p. 6; Kaplan and Haenlein, 2010). Social media are identified with a natural, unrestricted form of exchanging information in the network between users in the area of their common interests (Laroche et al., 2012). In all definitions it is clearly emphasized that communication in social media is based on network technologies. Most important characteristics, which differentiate social media from traditional media include (Kaplan and Hanlein, 2010; Gladwell and Shirky, 2011):

1. Range – SM can reach a larger group of recipients;
2. Access – SM are generally accessible for many recipients free of charge or against a minor charge;
3. Use – creating content via social media does not require any special skills, it is enough to be able to use new technologies;
4. Immediacy – SM form a space where reactions are immediate;
5. Impermanence – messages may change almost the minute they were published;
6. Usability – social media are mainly based on what most users are capable of.

The social media area includes: social websites/portals, blogs, social tabs, Wiki and Internet forums. Certain types of social media are characterized by special attributes such as (Mazurek-Łopacińska and Sobocińska, 2017, p. 345):

- Social portals – wide scope of functionalities, as well as general or specialized content. They allow building relations between users e.g. Facebook, LinkedIn, GoldenLine, Google+;
- Internet knowledge data bases – the value of a knolwedge data base results from the activity of users in the scope of creating, updating and verifying the content e.g. Wikipedia;
- Internet multimedia repositories e.g. YouTube, Snapchat;
- Communicators, which form an alternative to communication using telephone or e-mail, e.g. Skype, Messenger;
- Blogs – allow authors to publish various types of content, e.g. Blogger, WordPress, Photoblog, including microblogs, which facilitate publishing short messages created as a response to current events e.g. Twitter;
- Forums – for publishing opinions and views.

Available social media offer users various functions, whereas the functionality of the various types of social media availability is synonymous to a large extent.

The Specificity of Managing the Image of Educational Institutions

Educational institutions are divided into schools and educational establishments. Schools are in the definitive majority, and they are usually divided into primary schools, secondary schools, and higher schools. Sector-specific literature includes numerous elaborations on shaping the image of higher schools, e.g. by J. Ivy (2001), H. Alves and M. Raposo (2010), R. Ryńca and J. Radomska (2018), H.B. Akıncı and H. Serin (2020), and much fewer on building the image of secondary schools, e.g. by L. Eger et al. (2018). This is because higher schools have been battling for best students for years. Whereas the problem of growing competition on the market of educational services has affected secondary schools only recently. The main reason for this is the increasing demographic decline in many countries, coupled with a substantial increase of the importance of school education and the school as a social institution in the era of a dynamic technology development. In the Polish reality, there is an additional factor, namely the educational reform, which commenced in 2017. Based on the above it may be stated that there is a gap in the literature in regard to managing the image of secondary schools.

The process of managing the organization's image may be come down to the following stages (Schuler, 2004; Massey, 2016; Świeczak, 2017, p. 91):

1. Defining the goals of building the desirable image of the organization,
2. Defining the main stakeholders of the organization,
3. Analysing the present image of the organization,
4. Defining the determinants of the organization's image,
5. Selecting the instruments for creating the image and channels of communication with stakeholders,
6. Defining the team and persons responsible for executing image-related tasks,
7. Implementing and executing the image management strategy,
8. Supervision over results achieved.

The specificity of building the educational institutions' image is, however, different than in the case of companies (Ryńca and Radomska, 2018). This is due to the fact that educational institutions have different management characteristics, different funding rules and specific legal regulations. Execution of the process of managing the image of educational institutions, in particular managing the image of secondary schools is relatively easier than the analogical process carried out in business organizations. In case of educational institutions (Kazoleas et al., 2001; Alves and Raposo, 2010), it is easy to define the main goal of marketing activities. The main goal is to attracting candidates during recruitment. It is easy to precisely define the most important groups of stakeholders. Schools have strongest connections with own students and their parents. In turn, the group of stakeholders, which receives the school's largest attention, are potential students – graduates of lower level schools. To continue operation, schools must attract these stakeholders. It is relatively easy to define the most important determinants of the image. For this purpose, in its on-going marketing activity the

school should expose elements with the most importance for the student, such as: educational offer, teaching level, teaching staff, premises, technical facilities (Eger et al., 2018). The task concerning the selection of tools for image creation is also relatively simple. The portfolio of methods should definitely include social media. Usability of social media in educational institutions is increasing systematically. This is confirmed by numerous publications e.g. examples of good practices in using social media in higher schools presented in: V. Lavrusik (2009), F. Rosmala and D. Rosmala (2012), P.A. Tess (2013). It is relatively easy to define the persons engaged in image-related activities. They should include not only school principals, but also all teachers since they are in direct contact with the most important school stakeholders – the students.

Assessment of the Process of Creating an Image of Educational Institutions – Research Results

Research Method

The main goal of the conducted empirical studies is to prepare a model approach to effective management of the image of educational institutions[i]. Three principal research questions are asked in relations to the main goal, in order to facilitate achieving this goal:

1. Is the potential of social media in the management of the image of educational institutions used in an effective manner?
2. What are the main reasons of ineffective use of social media in managing the image of educational institutions?
3. How to manage the image of educational institutions using social media, so that the process of creating the image was effective?

Responses to such questions were sought in a survey addressed to defined groups of respondents. Research was conducted in the years 2015-2019. In search for the answer to the research question in empirical studies, emphasis was placed on those elements of the process of shaping the image, which depend on the organization and which should be combined with the use of social media: sub-process 1 and 2 in the linear model, and sub-processes 1, 2 and 5 in the feedback model (look Figure 1). Three sub-processes were analysed:

1. Building of organization's identity – sub-processes 1,
2. Communicating the organization's identity to stakeholders – sub-processes 2,
3. Obtaining feedback from stakeholders on the current image of the organization – sub-processes 5.

Within each sub-process, attempts were made to define and assess activities undertaken by analysed schools in the image building process with the use of social media.
This article presents results of research, which allowed obtaining a partial answer to the first research question. The main goal of this article is to assess the process of building the image of educational institutions in the social media era. Educational institutions are divided into schools and educational facilities. Schools are in the definitive majority. Due to the substantial differentiation of types of schools (every educational level has its specificity) it was adopted that the subject of the research will cover secondary schools.
Empirical research was conducted on two principal research populations. The first population comprised employees of secondary schools (principals, vice-principals, teachers), and the second one – main stakeholders – students and their parents. Schools were located in Poland in the Łódzkie voivodeship. 201 employees participated in the research, including three principals, five vice-principals and one hundred and ninety three teachers from thirteen secondary schools, as well as 1465 students from these schools and 467 parents of students. Research was conducted in 13 schools – in schools where principals agreed to conduct this research. In every school the study population included both school staff as well as current students and their parents.

Research Results: Employee's Perspective

All school staff, including the management as well as teachers, should be engaged in the process of shaping the school's image. Teachers play an extremely important role because they have direct contact with students. From the teachers' perspective, things are looking good. In their opinion, they are engaging in the school's promotional activities, which aim at presenting and promoting information about the school's strengths (94% of respondents). Many of them use social media to support these activities (68% of respondents). Most engaged teachers undertake numerous activities in social media. They check information placed by the staff, students and graduates, analyse opinions and comments, as well as post information, photographs and films on daily life at the school. Many teachers also follow the activity of other schools in social media (55% of respondents) – they view teaching materials made available to students and parents, analyse Facebook profiles, follow discussions on forums attended by students and parents as well as blogs created by teachers for students. An analysis of strengths and weaknesses of other schools makes it easier to undertake activities aimed at strengthening own position on the market.

Schools also attempt to obtain information about the quality of their work from main stakeholders. Unfortunately, theses activities are not sufficient. Teachers indicated that opinions about the functioning of the school from students are usually obtained in direct discussions (85% of respondents). The greatest disadvantage of this manner of obtaining information is the questionable objectivity of received feedback due to the nature of the teacher-student relation. Additionally, opinions and comments posted by students on social media are analysed but to a much smaller extent – 28% of respondents declared to be obtaining feedback in this manner – figure 2.

Feedback from the second most important group of the school's stakeholders – parents of students – is obtained mainly during parent-teacher meetings (92% of respondents). The greatest disadvantage of this manner of obtaining feedback is significant inertia resulting from the low frequency of meetings – usually four time a year. In addition, opinions and comments of parents posted in social media are analysed but to a much smaller degree – 13% of respondents declared to be obtaining feedback in this manner – figure 2.

Fig. 2: Methods used by schools to obtain information about the quality of their work from main stakeholders

Source: own elaboration

In the opinion of school staff, the schools where they work are positively assessed by in the local environment (91 % of respondents).

Research Results: Main Stakeholders' Perspective

Some activity in social media is directly related with the school. Students are eager to share opinions about the school (46% of respondents). Before making the decision on choosing a school, students review content posted by schools in social media (51% of respondents). They also rely on opinions

on school students in social media (38% of respondents). The main determinants of selecting the particular school included: offered class profiles (43% of respondents), teaching level (30% of respondents), opinion about the school (28% of respondents), exam passing rate (25% of respondents), and peers (18% of respondents) – Figure 3. This indicates that principal determinants are composed of the school's identity and the ability to communicate it to stakeholders.

Fig. 3: The main determinants of selecting the school by students
Source: own elaboration

Opinions generated by current students and their parents significantly contribute to the school's image in the eyes of future students and their parents. Therefore, the process of monitoring these opinions, in particular in social media – where young people feel completely no restrictions – is incredibly important from the point of view of managing the school's image. Negative opinions should trigger corrective action.

Discussion

The process of building the educational institutions' image may be conducted in an open system – according to a linear model, or a closed system – according to a feedback model. In the linear model, information flow takes place one way only – from the organization to stakeholders. In the feedback model, information flow also takes place in the reverse direction – from stakeholders to the organization. The linear model is highly ineffective in the era of agile methodologies. A school, which bases its image on the linear model, does not assess its image, does not obtain information from students about the factors which would most likely persuade them to choose the school, does not track information shared between various groups of stakeholders.

In the process of shaping the school's image, many schools still concentrate mainly on building their identity and communicating it to their stakeholders, and, to a much smaller degree, on obtaining and analysing feedback. Therefore, in theory, the image is built in a closed system – the feedback model, and, in practice, in an open system – the linear model. The linear model uses classical public relations tools, based on one-way communication such as: the press, television, radio, open days. The effects of such activities, however, are characterized by a substantial inertia, whereas recipients of messages usually look for additional sources confirming the truthfulness of provided information. These restrictions are not present in case of social media. In the process of image management, schools do use social media but the results of studies demonstrated that activities in this area are insufficient. To take full advantage of the potential of social media, a system approach is required, which consists of including social media in the general school management strategy. School principals must remember this.

Conclusions

To meet market challenges, contemporary organizations are forced observe the changes in expectations of buyers, and quickly adjust to them. Organizations are interested in modern types of

communication, which allow monitoring the changes in expectations, in the manner of thinking, and to maintain and deepen relations with clients.

In the era of digital transformation, monitoring the Internet and social media is gaining significance and popularity. Monitoring the Internet and social media is becoming common business practice. It is used to track feedback from consumers, to better understand consumers, and to monitor conversations. Reports from Internet monitoring constitute one of the elements of the assessment of the effectiveness of the organization's marketing and public relations activities.

Educational institutions are also necessitated to undertake the same activities. Schools should concentrate, to a greater extent, on obtaining and analysing feedback from the environment, as well as take better advantage of the potential of social media. In case of using social media in public relations activities, the relations between the organization and its stakeholders are based on two-way communication and may have interactive nature. Social media are characterized by speed – immediate reactions between the sender and the recipient are possible. Feedback may be provided in comments, opinions, posts etc.

The model of creating the image applied to date – i.e. a one-way flow of information about learning and the offer of the given school, provided to the local community, is no longer sufficient. The need to compete for the student means that schools cannot ignore what is written and said about them. Therefore, they must radically change the manner of communicating with their stakeholders – and transform it into an interactive dialogue. In technical terms, this is enabled by social media.

[i] Research is conducted by a research team managed by Waldemar Jędrzejczyk, the author of this article. The principal study area concerns the issue of competences, both those currently desirable as well as prospective, referring to sectors, kinds and types of organizations, professional groups, and key positions in organizations. In the area of the organization's competences to create the image using social media, the main owner is Marta Konieczna-Kucharska.

Determinants of The Development of Family Businesses in Poland. Regional Aspect

Krzysztof SAFIN

WSB University, Wroclaw, Poland

krzysztof.safin@wsb.wroclaw.pl

Abstract

In the analyses of determinants for the development of family businesses, regional determinants of their development are usually neglected. The majority of research focuses chiefly on internal determinants. The present article constitutes an attempt to identify and assess the impact strength of local (regional) determinants on the development of family businesses. The analyses are based on empirical research conducted at the turn of the years of 2017 and 2018 on a sample of nearly 15 thousand Polish family businesses.

Keywords*:* Family Business, Determinants of The Development, Family Firm Heterogeneity

Introduction

Family businesses, according to the definition proposed by the EC (European Commission, 2009), which is accepted both in theory and practice, are treated as a separate category with their own distinct characteristics.

The source literature highlights the different motives of family enterprises for establishing these (Donckels and Fröhlich, 1991, Wangen, 1995); a broader range of strategic planning is emphasized (Ward, 2000) which takes into account the need to plan a generational change, intra-family and inter-family conflicts, almost inscribed in the structure of the family enterprise (Degadt, 2002, p. 459), and the mystery that surrounds many family enterprises and their owners (Simon, 2009). There is no stronger focus on the global market and there is a stronger focus on the local market (among others, Gallo and Sveen, 1991), conservatism in the use of external sources of financing (Redlefsen and Eiben, 2006), emotional behaviour especially on the managerial level (Alderfer, 1988, Pieper, Astrachan and Manners, 2013), an ability to take quick decisions, being ready for bold and risky solutions (Cohn, 1992).

From among these characteristics, relatively the least attention is paid to the regional (local) rooting of family businesses, while attempts to identify the regional determinants of the development of family businesses and their impact on the businesses are not included in the main research issues. According to the research conducted by C. Quintan-Garcı, V. F. Guzma'n-Parra (2013, pp. 41-57), those problems that are most frequently explored by researchers in this area are related to internal development factors. In research into family businesses, it is generally agreed that it is internal factors that determine the ability of a family business to survive and develop. These are usually related to the owner's position and the succession process (Sharma, Chrisman and Chua, 2003, Kammerlander and Zellweger, 2019), the nature of funding sources and financial management (López-Gracia and Sánchez-Andújar, 2007), innovation (Classen, Carree, van Gils and Peters, 2014), personnel management (Astrachan and Kolenko, 1994) and owner supervision (Hülsbeck at al., 2012). An important role in ensuring the competitiveness of family businesses is also attributed to strategic management (Sharma et al. 1997) or internal entrepreneurship (Kellermann, 2006) and the ability to overcome internal crises (Ruessen and Schlippe. von, 2007). The discussion oscillates around the dilemma as to whether the influence of the family on business behaviours is positive or negative.

Successful succession is regarded by the vast majority of the authors as the main determinant of the development and survival of family businesses. Their analyses refer to the classical research by Ward (1987), who indicates that a properly planned and conducted succession process increases the company's chances of survival. This diagnosis, although being erroneous as it fails to take into account any other factors of company mortality or comparisons with non-family companies (Rossaro 2007, pp. 162), is accepted without any proof as a result of unsuccessful succession.

Meanwhile, the context of the impact of external determinants, especially regional determinants for the development of small and medium-sized enterprises, is of a great importance: not only cognitive but also practical importance. It is cognitive, as the knowledge about the strength of this influence in relation to family businesses, especially small and medium-sized ones, is slight, while its practical significance is connected with the possibility and need to manage those instruments that serve to support their development (Stiftung, 2018). We treat regional (local) determinants as those that do not fall within the competences of the central government.

Particularly over the last two decades, the source literature has been raising the issue of the importance of regional environmental factors for the development of enterprises (Wach, 2008), especially the smallest ones. What constitutes a guideline for many researchers is not merely general reflection that what happens in the environment is more important for the survival of an organization than what takes place within its framework (Nizard, 1998), but also the conviction, supported by research results, that precisely SMEs are more closely related to and "anchored" in the local environment, as they are dependent on the regional environment due to their weaknesses. Many researchers conclude that the quality of the regional business environment is not sufficiently taken into account both by researchers and local authorities (Porter, 2003), and many questions concerning the impact of regional environmental factors on entrepreneurship remain unanswered. An attempt to understand the appropriate sources of competitive advantage requires an analysis on the meso-economic level (Wach, 2008), as the competitiveness of business entities is co-created by the determinants of their immediate environment (Janiuk, 2004), and they are of a permanent rather than temporary nature (Fritsch and Schmude, 2007).

As regards family businesses, this type of issue escapes scientific reflection, although it is perceived. It should be recognised, as it seems, that any research that limits observations to one (several) regions (provinces) will, in principle, recognise that the regional specificity is an important distinguishing feature of the sample selection. (Safin, Pluta and Pabjan, 2014). These determinants are often included among those factors that determine the success of a family business (Koładkiewicz and Wojtyra, 2014).

The asymmetry revealed here between the influence of regional determinants on the development of enterprises (especially small and medium-sized ones), which can be observed on the basis of theory and practice, and scarce attempts to conduct systematic research in this area, is the main reason for the analyses presented here. This article is based on the results of the experimental research conducted by the Central Statistical Office, and it constitutes an attempt to identify and assess the strength of the impact of regional determinants on the behaviour of family businesses.

Research Methodology

The research which became the grounds for the analyses presented below was carried out within the framework of the following project: *Determinants for the development of entrepreneurship in the SME sector* (Łobos and Stańczyk, 2019). The primary source of empirical data constitutes selected results of an experimental questionnaire survey conducted by the Central Statistical Office throughout Poland, in the period from December 2017 January 2018. The questionnaire survey was conducted using an electronic form via the Central Statistical Office Reporting Portal. The survey covered the opinions presented by entrepreneurs on the assessment of the importance and strength of the impact of the proposed groups of factors on development and achievement of success in business.

The survey covered non-financial sector enterprises with 10-249 employees (i.e. small and medium-sized enterprises). The research was conducted with 72.6 thousand entrepreneurs, in the period from 18.12.2017 to 31.01.2018. If we take into account the fact that according to the BDL database, 57,198 small enterprises (in the non-financial sector) and 15,251 medium-sized enterprises (in total, 72,549 enterprises of both types) were registered in Poland in 2016, this means that the research covered all (sic!) enterprises from this category. In total, 44.9 thousand questionnaires were received from the respondents. This represented 62% of the total number of the entities covered by the survey. Out of the total number of the respondents, 14.7 thousand considered their businesses to be family businesses (cf. Table 1). The identification of family businesses was done using a subjective criterion, i.e. the respondents decided on the basis of the definition provided whether or not their own business could be considered as a family business. The definition adopted was taken from the previously conducted research on a nationwide sample (Kowalewska, 2009). As a family enterprise, the study considered an economic entity where at least two members of the owners' family or those related to this persons work; at least one of them has an influence on the management of the enterprise, and the family or persons related to them own more than 50% of the shares in the enterprise. Those entities that operate in the form of a single-person business are classified as family businesses provided that they employ workers (Kowalewska, 2009).

Table 1: Profile of family enterprises against the background of other (no-family) in 2017

Specification	**Family enterprises**	**Non-family enterprises**
	in % of total enterprises in a group	
By size classes		
small (10-49 employees)	84.0	78.3
middle (50- 249 employees)	16.0	21.7
By years of conducting activity		
less than 3 years	3.8	4.1
3 years and more	96.2	95.9
of which 6 or more years	88.3	86.0
of which 9 or more years	79.0	75.0
By legal form		
natural persons conducting economic activity	43.7	28.4
civil law partnerships	10.4	4.2
commercial companies	45.7	60.3
of which limited liability	23.1	46.8
By type of relationship that an enterprise could have with another		
ownership (autonomous)	90.6	80.2
partnerships	3.8	3.7
linkages (linked enterprise)	5.6	16.1
Activity range - market:		
Local	30.2	31.9
Regional	17.3	14.8
country-wide	34.8	36.0
international	17.7	17.2
Type of principal activity		
manufacturing	35.2	24.5
Construction	11.7	12.5
trade; repair of motor vehicles	30.4	26.3

transportation and storage	7.4	6.0
accommodation and food service activities	3.5	2.7
information and communication	1.1	3.7
real estate activities	0.9	4.3
professional. scientific and technical activities	2.6	5.7
administrative and support service activities	2.1	3.7
human health and social work activities	2.4	3.8
Selected elements of financial condition		
Entities with net profit	54.5	59.1
Enterprises in which the net turnover did not exceed EUR 10 million	86.1	85.4

Source: (Safin and Stańczyk, 2019)

Results

In accordance with the methodology adopted, the following variables included in the questionnaire were included among the main determinants of the development of the SME sector: (1) factors related to the local environment and institutional support on the local level, (2) factors related to the personal and personnel aspects of the functioning of enterprises, (3) factors related to the management of the enterprise, relations with the market and the closer (competitive) environment, (4) factors related to management systems, management methods and IT support for operations (Łobos, Stańczyk, 2019). Considering the purpose of the article, the subject of the analysis will cover mainly factors related to the local (regional) environment.The results of the research demonstrate a large spatial diversification of the various aspects of business operations. The diverse economic structure in spatial terms is reflected in data concerning both the percentage of family businesses in individual provinces and detailed data related to their behaviour.

From among the total number of the respondents, 33.9% declared that they run family businesses. The highest percentage of family businesses was observed in the Wielkopolskie, Podlaskie and Łódzkie Provinces, and the lowest one in the Mazowieckie Province. In the case of entities where the number of employees ranged from 10-49 persons, family enterprises constituted 35.4% and, in the case of larger entities with the numbers of employees between 50-249 persons, this was 27.4%. There were 32 family businesses per 100 entities operating mainly on the local market, while there were ca. 40 family businesses per 100 entities operating mainly on the regional market.

It is also worth noting that the percentage of family enterprises in (urban) districts, which are the capitals of provinces (in two cases, these are additionally the seats of local government provincial authorities) is lower than the provincial average. This concerns all the provinces and their capitals. For example, in the Mazowieckie Province, the percentage of family businesses (in the small and medium-sized group) is 29.2, while in the District of the Capital City of Warsaw this is 18.8 (a difference of over 10 p.p.), in the Dolnośląskie Province, the percentage of family businesses is 30.2 and in the district of Wrocław this is 22.5 (a difference of almost 8 p.p.). It seems that this is yet another proof of the impact of the specific determinants of the local environment on the activities of small and medium-sized businesses. This may mean that large urban centres are not a friendly environment for the establishment and development of small and medium-sized family businesses. There may be many reasons for this state of affairs: the neighbourhood and competition of corporations, operating costs, alternative opportunities for career development, etc.

Another manifestation of the impact and importance of the regional environment for the operation (and success) of the family business was revealed when analysing the replies to the question concerning the

main market where a given company operates. More than 47% of the family businesses described their market as local and regional. It can therefore be assumed that all the social, legal and economic parameters that describe this market are particularly analysed by companies, and their impact is predominantly noticeable.

When analysing the environment as a success factor, the company's approach to legal or social management determinants and its openness to cooperation as well as its openness to business environment institutions were assessed. This is an important aspect of development determinants especially from the perspective of family businesses. They are considered to be "locally oriented", while situating their market in the immediate vicinity, using the resources of the local environment and cooperating intensively with local environment institutions (Zellweger, 2017).

In the assessment of the strength of the local orientation, a cumulative measure was used based on six factors and their impact on the success of the company as assessed by the respondent. These factors included the availability of local education and training centres, favourability of the local community / good relations with the local community, the absorption capacity of the local market, local service institutions (e.g. accounting offices), and the possibility to use local advisory institutions.

The local orientation of a company was considered to be high when 5 or 6 of these factors were significant (by a subjective measure) for the success of the company; it was considered to be average if 2, 3 or 4 factors were significant; and low if at most one factor was significant. Respondents made assessments according to the following scale: key factor, significant, neutral, completely insignificant, rather insignificant, no factor

The family businesses under examination, regardless of their sizes, are much more likely to have a strong local orientation than non-family businesses. In total, nearly ¼ of the family businesses surveyed indicated this direction of their development, while among non-family businesses, this was slightly over 18%. At the same time, ¼ of the family businesses exhibit a low local orientation; a similar attitude is presented by over 30% of non-family businesses (cf. Table 2).

Table 2: Strength of local orientation of companies surveyed (percentage of companies surveyed)

Evaluation of the strength of local orientation	Family businesses			Non-family businesses		
	low	medium	high	low	medium	high
Total	24.6	50.8	24.6	30.7	51.2	18.1
Small businesses	24.7	49.7	25.6	31.6	49.4	19.1
Medium-sized enterprises	24.2	56.2	19.5	27.6	57.9	14.4

The interpretation of these results is not explicit. It seems that the strength of local orientation measured by the measure proposed, although high in relation to family businesses, seems to be lower than it could be expected on the basis of an analysis of the results of previous foreign studies referred to in this article. It seems that micro-enterprises may be of a great importance for this perception of family businesses (as extremely attached to local areas of operations). The lack of their representation in our research corrects this picture significantly.

With regard to small and medium-sized companies, this space is significantly much wider. The companies surveyed define their market of operations largely as national and international (cf. Table 3.) Local orientation in relation to family businesses is important regardless of the main market of operations. However, with respect to companies for which the market of operations is national or international, their local orientation is by several p.p. weaker. At the same time, it is clearly weaker in relation to non-family businesses.

Table 3: Evaluation of the strength of local orientation by the main market where the company operates (% of respondents)

Main market	Family businesses			Non-family businesses		
	assessment of the strength of local orientation					
	Low	medium	high	low	medium	high
Local	24.2	49.5	26.3	29.3	52.6	18.1
Regional	19.1	53.5	27.5	25.8	53.7	20.5
National	26.2	51.0	22.8	32.6	50.0	17.4
International	27.6	49.8	22.5	33.2	49.4	17.5

A detailed analysis of the impact of individual determinants: a decomposition of the indicator on the factors of the local environment, the factors of the institutional environment and the factors of institutional support, makes it possible to assess which factors and, to what extent, affect the importance of the regional (local) environment. The research took into account the factors of the local and institutional environment as well as the scope and nature of external support.

Local Environment Factors

Those factors that characterize the local environment, which in the light of the respondents' opinion were of a great importance for the development of the enterprise, included the following: the level of telecommunications services provided, local demand for goods and services, and the favour on the part of the local community. A relatively high importance of local demand frequently resulted from the location of an entity in the vicinity of large urban centres, which may be a significant source of a competitive advantage for entrepreneurs. The favour on the part of the local community, in turn, is important in times of a high importance of reputation as one of the most important intangible resources of enterprises.

What is interesting is that for family businesses, these factors are usually more important than for non-family businesses. A particularly important determinant of development for family businesses is favour from the local community. The percentage of family businesses that consider good relations with the local community to be of an importance for development was by almost 7 p.p. higher than in the case of non-family businesses. This attitude is not surprising. Family businesses are strongly rooted in local communities both through the descent of their founders and employees as well as a geographically close circle of business partners. The importance attached by family businesses to the road infrastructure (proximity to expressways and motorways) may be surprising here. Ca. 51% of the family businesses surveyed and ca. 43% of the non-family businesses considered this factor as a key and important determinant of development. The technical and telecommunications infrastructure is similarly important, and this is much more important for family businesses than for non-family businesses (50.5 and 63.4% of indications respectively).

Factors of Institutional Environment

From among those factors that characterise the regional (local) environment of the enterprises surveyed, the respondents attributed these to efficient public administration entities. This factor was considered by 16.6% of the small and 20.6% of medium entities to be a key to their own success. (Safin, Stańczyk, 2019) It may be considered that any administrative facilitations are not only important, but they will remain so for a long time to come, to entrepreneurs in a situation where their institutional environment is still complex (a large number of entities and regulations that should be taken into account when conducting a business activity). It is worth noting that in these assessments, family and non-family enterprises are consistent, although family enterprises emphasize the behaviour of administrative services as an important factor of development more frequently than non-family enterprises (the difference here is almost 9 p.p.). What is equally significantly different for both groups

is the assessment of the impact of the local business environment as a success factor. For family businesses, the possibility to use local accounting and bookkeeping offices, or local consulting companies in order to obtain EU funds and other sources of external financing is significantly more important than for non-family businesses (the difference here is about 7 p.p.). The information efficiently provided by local governments on tenders, compliance with the rules of public procurement and the adopted spatial development plans and economic development plans also held a high position. Each of these areas was significantly more important for family than non-family businesses.

Institution Support

The most important component of institutional support was considered by the entrepreneurs surveyed to be the possibility to take advantage of tax credits, reductions in taxes and local charges. Ca. 20% of the entrepreneurs assessed it as crucial for their enterprises, regardless of the main market where they operated (local, regional, national or international ones). The possibility of gaining support from employment agencies and from those institutions that counteract unemployment was rated very high by the entrepreneurs. (15.8%).

The instruments of support adopted in the study were generally more important for family businesses than for non-family businesses. More than 55% of the family enterprises surveyed considered the possibility of receiving support from labour market institutions as an important or key success factor, while among non-family enterprises, this opinion was expressed by 46%. In turn, more than 46% of family enterprises consider the possibility of obtaining financial support from territorial local-government units (39.4% of non-family enterprises) as a key or important determinant of development. The possibility of obtaining support from business environment institutions is crucial or important for 40% of family enterprises (for 32% of non-family enterprises). One of the characteristics of the success factors included in the concept of the regional (business) environment is to assess the behaviour of companies in the search for opportunities to establish partnerships and cooperation with companies and institutions in general.

The companies examined avoid quite commonly formalised, long-term cooperation of a cooperative (network) nature. Both small and large enterprises, regardless of their ownership structure, admit that such relationships do not function well. Only ca. 30 per cent of them admit that they have such agreements; in the case of medium-sized enterprises, this is around 35 per cent. The differences in this respect between family and non-family businesses are minimum (cf. Table 5).

Table 5: Companies that are in formal network cooperation with other entities (percentage of the companies surveyed)

	Family businesses		Non-family businesses	
Enterprise type	**yes**	**no**	**yes**	**no**
Total	29.4	70.6	29.1	70.9
Small sized enterprises	28.4	71.6	27.3	72.7
Medium sized enterprises	34.7	65.3	35.6	64.4

Incidentally, it is worth noting that those companies that declared network cooperation exhibited a significant improvement in the value in those areas that were considered as the measures of company success. Thus, among other, an increase in the number of customers serviced was recorded by 44.4% of the family companies, demonstrating the existence of network cooperation with other entities, compared to 37.5% of those companies that did not have such cooperation (in the case of non-family companies, 41.8% of companies cooperating with other entities were noted, compared to 32.5% of those companies that did not cooperate).

Those companies which declared that they conduct such cooperation as a key (decisive) activity, recognise cooperation with suppliers and customers, while they only occasionally consider cooperation with research and development units or consulting companies to be of a key importance. The profiles of these preferences in relation to family and non-family companies are similar (cf. the fig.1.).

Fig.1: Areas of formal cooperation of a key importance for the company (percentage of companies that declare having formal and long-term agreements)

Discussion and Implications

Although it is quite commonly accepted that people's lives are lived within the framework of general macroeconomic and political determinants, on the level of local natural and infrastructural determinants, with a certain level of safety, the determinants of the environment or a specific level of relations, ties and trust, the issue of regional determinants for the development of businesses and entrepreneurship is addressed only rarely (Wach, 2008). The reviews of the source literature available (e.g. Busenitz, 2003) demonstrate that those articles that take into account the environmental context constituted 14% of all the articles on entrepreneurship and entrepreneurial behaviour.

They furthermore demonstrate that there are such areas, which remain outside the mainstream, that emerge at their intersection, (B. Glinka 2008. p.53), known as "slot areas" because they reveal themselves at the intersection of issues/dominant areas. It is the regional determinants of business development that these include. The validity of undertaking research on regional context is also confirmed by the results of the study presented in the article. The influence of the variables adopted in the model on the operations of enterprises is spatially diversified, and the results between provinces differ from each other even by 8 p.p. (nota bene, in the case of non-family companies, these differences were even greater). Detailed research confirms this general suggestion.

Use of research results in scientific and practical aspects

It also seems that the research results can be perceived as a voice in the discussion related to an old dilemma: whether family businesses can be considered as a relatively homogeneous category of business (Simon, Wimmer, Groth 2005, p. 24) or whether "family businesses worldwide follow the same logic and are basically similar in terms of their constituent elements, the processes that occur in them and the existing barriers and problems, as well as possible ways of solving them" (Gallo, 1994).

Studies show that both the size and age of the enterprise are important variables that differentiate the behaviour of family businesses.

The model of observations adopted in the research contained variables characterizing the company's environment, variables characterizing its management and variables related to human resources. The research demonstrates that in the opinion of respondents, for the development and competitiveness of enterprises, external factors are as important as internal factors. What is more, the research shows that the economic situation of companies that emphasize the importance of the environmental factors (hence, they analyse external factors and makes efforts to use the advantages of the environment) is better than that of those that treat it as a neutral or insignificant factor.This type of research seems to be of a great practical value. It provides reliable data and assessments of the impact of certain regional determinants, and thus it verifies the usefulness of using specific development support tools: it is entrepreneurs themselves who define the scope of their needs.

Limitations and Avenues for Further Research

The research served to confirm the situation diagnosed in earlier studies (Safin, 2014), namely that micro-enterprises have a deforming effect on the results of the entire population defined as SME sector enterprises. An important element of the research concept was to narrow down the research subject to a group of small and medium-sized enterprises. Micro-enterprises account for ca. 96% of all the enterprises in this category. Their specificity, which is determined by the scale of operations or the number of employees, has a significant impact on the assessment of the behaviour of the entire micro, small and medium-sized enterprise sector. At the same time, it is difficult to unambiguously qualify this group of enterprises as family (non-family) enterprises. These enterprises are often single-person businesses: both formally and actually run not by families but by those persons who are not in any partnerships. Therefore, undertaking research on the basis of representativeness understood in terms of the necessity to generalise conclusions on the so-called populations does not seem to be effective.

Such sampling also has an advantage of comparability. In countries with different legal systems, the inclusion of micro-enterprises (especially in the form of an individual activity) as family businesses raises doubts and lack of understanding of the fact that in Poland "one-person activity" may mean an enterprise that employs even as many as a thousand people.

In the present studies, the problem of assessing the family nature of an enterprise was solved by referring to the self-assessment on the part of the respondents. Limiting the impact of subjective assessments consisted in informing the respondent in advance about the manner in which the study defined the family business. The effectiveness of this type of approach was confirmed in many studies also conducted in Poland (Kinast, 2000), Pricewaterhouse Coopers (2009), Kowalewska (2009). Nevertheless, this approach is questionable among some researchers. As a rule, "objective" criteria and more unambiguous assessments are expected.

Conclusions

The conditions under which family businesses operate is a neglected research problem and, at the same time, one of the most important practical challenges for local authorities and for entrepreneurs themselves. The article constitutes an attempt to identify the significance and to measure the strength of the impact of these determinants on the functioning of family businesses, and at the same time to inspire further research, including comparative studies. The research conducted on a different (international) scale by *Familienuternehmen Stiftug* proves the importance and practical significance of the assessment of the determinants for the functioning of family businesses, especially if we compare these with the specificity of this group.

Social Business Incubator as an Example of an Innovative Social Service

Katarzyna BRENDZEL-SKOWERA
Czestochowa University of Technology, Częstochowa, Poland, katarzyna.brendzel-skowera@wz.pcz.pl

Abstract

The objective of the article is to analyze the phenomenon of social entrepreneurship in relation to social business incubators. On the basis of the national and foreign literature review, the research gap was identified, related to the functioning of social business incubators. Admittedly, a lot of attention is paid to the traditional understanding of business incubators. On the other hand, there are no suggestions for using them to activate entrepreneurial attitudes in groups at risk of social exclusion. For this reason, the research problem focuses on innovative social services allowing for the individualized approach to solving social problems. The following were used as the research method: literature review, documentation analysis and direct interview. As a result of the conducted research, the idea of the Social Business Incubator model emerged. Its functioning is based on the cooperation of the three partners: Housing Management Department (ZGM TBS) in Częstochowa, Faculty of Management of Częstochowa University of Technology and Foundation for Development in Częstochowa.

Keywords: Incubator, Social Business Incubator. Social Entrepreneurship, Social Services

Introduction

Social entrepreneurship is a specific type of entrepreneurship which has become increasingly noticeable. An increase in the interest in this subject matter is indicated, among others, by Yildiz, Çelik and Aykanat, who analyzed the set of nearly 1800 scientific papers from the Web of Science (WoS) Core Collection database, using text mining and scientific mapping methods with the SciMAT and VOSviewer software. The results show that the number of publications has been increasing since 2006 to reach the number of 316 scientific papers in 2017 (Yildiz, Çelik, Aykanat, 2019). Moreover, the concept of social entrepreneurship is even considered as the appropriate solution to the latest social problems. Therefore, any attempt which investigates the evolution of social entrepreneurship in the existing literature may provide valuable information.

The objective of the paper is to analyze the phenomenon of social entrepreneurship, i.e. to present the way in which it is defined and, on the basis of the above, to discuss selected interpretation problems in relation to social business incubators. On the basis of the literature review, the existence of the research gap concerning social business incubators was identified. The research problem, which focuses on innovative social services allowing for the individualized approach to social problems, was formulated. The value added is the presentation of the Social Business Incubator model, which was developed in cooperation with Faculty of Management of Częstochowa University of Technology and ZGM TBS in Częstochowa.

Social entrepreneurship and the social enterprise – the review of definitions

In the subject literature, there are many definitions and approaches to the three synonymous terms, i.e. social entrepreneurship, social enterprise and social entrepreneur. The concept of social entrepreneurship is explained in many different ways. The discussion on finding the proper definition

is still being held both among academia and other entities involved in this field. Generally, one may identify four components of the concept of social entrepreneurship: it implements social value; it takes place in or with the participation of the civil society – then, it adopts a critical attitude; it contains a novel component and it is important for the economy.

Initially, the definitions of social entrepreneurship mainly focused on the characteristics of social entrepreneurs (Alter, 2004; Alvord et al., 2004; Martin and Osberg, 2007; Thompson, 2002). In most definitions, the characteristics, such as ethical principles of social entrepreneurs, orientation to social development, constant adjustment, innovation, resourcefulness, flexibility and visionary are highlighted (Bornstein, 2007; Dees, 2001). However, many of these characteristics are also in line with the characteristics of traditional entrepreneurs (Sohel, Shamsuddoha, 2019).

There are three different ways of understanding social entrepreneurship by researchers. Firstly, as the search for alternatives for financial strategies for *not-for-profit* initiatives or management programs for creating social value. Secondly, as practices of the business socially involved in cross-sectoral partnership. Thirdly, as a way to mitigate social problems and to catalyze social change (Mair, Martí, 2006).

The social enterprise is analyzed as an outcome of social entrepreneurship. In comparative studies devoted to social enterprises in Europe and the United States, different origins, institutional and legal aspects of operation, management style and the role (involvement) of public authorities are indicated (Defourny, Nyssens, 2010; Kerlin, 2006). In Europe, social enterprises are perceived within the framework of the idea of social economy, the driving force of which is s*ocial benefit*. The following are typical in here: democratic organization management mode, involvement of customers in activities of entities and involvement of public authorities. Except for Great Britain, the social enterprise usually takes the form of social cooperatives or associations providing employment or certain care services with the involvement of beneficiaries (Kerlin, 2006, p. 249). The concept of the social enterprise in Europe focuses on the way in which the organization is managed and the objective rather than the fact whether it strictly respects the limitation of profit sharing in relation to formal *non-profit* organizations (Pacut, 2010, p. 433, [after:] Kerlin, 2006, p. 249). In turn, in the United States, the social enterprise is basically each type of a *non-profit* organization involved in income generation. As pinpointed by Janelle A. Kerlin (2006, pp. 248–249; 2008, pp. 120–122), there is no concept of social economy in here, and the operation of the social enterprise of the *non-profit* type is often perceived within the framework of the market economy. The category of the social enterprise includes every type of a non-profit-oriented initiative, aimed at generating income. They can take different organization forms. This group includes both entities oriented to profit which engage in social activities within business operations and philanthropic activities or corporate social responsibility as well as hybrid forms: enterprises which combine both the pursuit of profit and the social objective as well as *non-profit* organizations which conduct their business activities supporting the implementation of their mission. The economic activity of social enterprises in the United States was to fill in the gap left after the loss of State funds. The European understanding of social entrepreneurship is closer to the latest proposal for defining social entrepreneurship in relation to the typology by Mair and Martí (2006), whereas the American definition relates to the first and second approach (Spear, Bidet, 2003).

Social value as the key component of social entrepreneurship

Social entrepreneurship can also be defined through the prism of differences in relation to the traditionally understood entrepreneurship. To put it simply, this means that, while the traditional entrepreneur is primarily defined by their ability to run a company and generate profits which constitute the criterion of success in here, the social entrepreneur is mainly characterized by the willingness to create social value for the target group or the society as a whole. Social entrepreneurship has, therefore, two unique characteristics – the motive of the entrepreneur to "change something" in the society (Alvord et al., 2004; Certo and Miller, 2008; J. Thompson et al., 2000) and the proposal for social value (Sohel, Shamsuddoha, 2019). The researchers, such as Mair

and Marti (2006) or Trivedi (2010), suggest evaluating social value proposition on a scale, from purely social to socioeconomical, rather than dichotomous outcomes (purely social or purely economic). J.G. Dees (2001) listed the creation of social value as the "clear and central" criterion of social entrepreneurs. On the other hand, he recognized wealth for social entrepreneurs as the means to accomplish the objective. This suggests that the social entrepreneur cannot consider their financial profit as one of their objectives. This view was supported, among others, by Dees, Emerson and Economy (2001), Guclu, Dees and Anderson (2002), Austin et al. (2006) and Urban (2010).

In the light of the above considerations, the creation of social value and profit making are the objectives which are situated at the opposite ends and distinguish social entrepreneurship from traditional entrepreneurship (Fig. 1). Only ventures directed to the entirely social objectives can be recognized as social entrepreneurship. Therefore, it is possible to distinguish a group of entrepreneurs who are completely and exclusively guided by the objective of creating social value (Sundin, 2011). Such entrepreneurs do not engage in any commercial exchange. Another group is constituted by entrepreneurs who engage in commercial exchange, but only to raise funds for the implementation of social projects (Nicholls, 2006). There are also entrepreneurs who give priority to social value creation, but at the same time they intend to generate economic benefits for themselves and stakeholders. In their case, social objectives are the main objectives of the activity, but they do not exclude generating profits to survive. In the long run, however, they may choose to generate an increasing profit and thus bring social projects to the secondary objective. Therefore, the last group includes entrepreneurs whose main objective is to generate profits and social value creation may become a by-product or an additional result (Sohel, Shamsuddoha, 2019).

Fig. 1: The continuum of social entrepreneurship

Source: Sohel, H. and Shamsuddoha, M. (2019), 'The Essence of Social in Social Entrepreneurship, 'Society & Sustainability, 1 (1), 42.

The model of the social enterprise developed in Europe, against the background of the ongoing considerations, is very different. It is primarily characterized by the objective hybridization (Defourny, 2005). Emergence of Social Enterprise in Europe (EMES) suggested their own definition of the social enterprise. It describes the activity of the social enterprise using nine indices (criteria). Four of them are economic in nature (production/sales of goods and services, autonomy, a significant level of economic risk, employment of paid staff), and five are social (the primacy of social objectives over economic ones, bottom-up nature, participation in decisions not based on shareholding, participatory management, limited distribution of profits) (EMES). EMES reserves the right not to treat this proposal as a test or pattern for social enterprises. The area of operation of social

enterprises in Europe is wide. In the subject literature, there are three types of initiatives: (Pacut, 2010)

1. Initiatives in the field of socio-occupational reintegration for groups affected by social exclusion (people able to work but professionally inactive).
2. Social services (e.g. elderly care, pre-school education for people, tourism, services for households).
3. Local development (e.g. agritourism, social revitalization, waste disposal).

In the literature devoted to social entrepreneurship, the term of social business incubators emerges, but mainly in the context of supporting the functioning of social enterprises and organizations (Ariza-Montes, Muniz, 2013; Sahu, 2018). There is no mention of incubators which would focus on solving the problems of specific social groups. Traditionally understood incubation of entrepreneurship is not oriented to the accomplishment of social objectives. Social value can be found only in the tasks of incubators, such as reduction in unemployment or creation of cooperation networks. Incubation is most of all the process of supporting enterprises, which accelerates the successful development of newly created economic entities by providing entrepreneurs with targeted resources and services (NBIA 2016). This development consists of two components, namely, on the one hand, it allows enterprises to survive, on the other, provides them with an opportunity for expansion in the period in which their existence in the market is most at risk (Katz 2010). Incubation of entrepreneurship is the process most frequently lasting for 2-5 years (Goddard 2005). In practice, however, there are no rules for how the incubator is to operate. Each center itself decides how intensively to support enterprises and to which stage of their development.

In the subject literature, there is a lot of segmentation of business incubators. The multitude of these classifications is primarily due to the number of entrepreneurship support institutions and their specificity, including unique characteristics assigned to individual organizations. Despite the attempts made by numerous authors, one standardized segmentation of business incubators which would apply all over the world has not been adopted so far, which is also associated with the dynamic development of these organizations over several decades, and also multiple changes, among others, in their organizational and legal forms (Ingram, Luo, Eshun 2010, pp. 135-138). The most common one is the division into academic business incubators, business accelerators, centers for entrepreneurship, incubator foundations, corporate incubators, virtual incubators, community incubators, entrepreneurial initiative centers (Klonowski, 2010). In the Polish practice, there are also social entrepreneurial initiatives, which focus on supporting the activities of social organizations and most frequently take the form of foundations and associations (Górka, 2013, p. 114).

Research Method

Taking into account the above considerations presented in relation to the theory, the research part relates to the innovative method of solving social problems, in the form of social business incubators.

In view of the above, the main research problem in the field of the analyzed subject matter focuses on the identification of the need for and the way of providing innovative social services allowing for the individualized approach to social problems. Consequently, the following research questions, being the basis for the accomplishment of the research objective, were formulated:

P1. What social problems do the residents of the municipal resource cope with?
P2. Are the applied solutions to social problems of the residents of the municipal resource effective?
P3. Is there a demand for innovative social services allowing for the individualized settlement of social problems?

Zakład Gospodarki Mieszkaniowej Towarzystwo Budownictwa Społecznego Sp. z o.o. (ZGM TBS) (Housing Management Department Social Housing Association, Ltd.) in Częstochowa was selected as the subject of the research. The choice is determined by the several-years-cooperation of the author

with the municipal entity managing apartments and commercial premises owned by the Municipality of Częstochowa.

In the first step, in the period of February – June 2019 the author and the appointed team conducted the analysis of the documentation of ZGM TBS, concerning the initiatives undertaken for the benefit of the residents. In the subsequent step, the search tests were carried out and only those who were in a difficult personal situation and thus had difficulty in the timely payment of the rent were selected for further analyses. On the basis of the above, a group of 130 debtors of ZGM TBS was identified.

The analysis of the collected material indicated that nearly 54% of that group amounted to people who, after the settlement of debts, got into debt again. Those people were qualified for the next stage of the research. Therefore, in the course of elimination, a group of 70 people was identified with whom direct interviews were conducted in the period of August – December 2019. At this point, it should be pinpointed that the interviews, according to the preferences of the respondents, were held at the office of ZGM TBS and had the form of individual meetings and their objective was to identify the reasons for the re-incurrence of debts.

The results and the proposal for the Social Business Incubator model

The conducted analysis of the documentation enabled the indication of the main problem which is debt in rental charges of the residents of the municipal resource. Generally, the people using municipal resources are the economically weakest group of city dwellers since they face a difficult financial, family and personal situation. Regardless of the above, among those occupying social housing, there are people permanently in debt, who do not take up legal employment due to the physical lack of an opportunity to take up employment or escape from creditors. The problem of housing indebtedness in Poland affected 11% of residential units in 2015, which amounted to a total debt of PLN 1282 million. The most arrears are of a lasting nature, threatening with eviction from premises. This amounts to 68.9% of a total debt held by 30.2% of debtors. Taking into account the ownership structure, the most indebted are municipal premises, of which 37.5% showed the largest debt in 2015 (Napiórkowska-Baryła, Witkowska-Dąbrowska 2018). Such a situation arises directly from the statutory solutions, according to which the Municipality is to provide the conditions to satisfy the housing needs of its residents, however, the primary objective is not income-based (Pałka 2019). The obligation imposed on the municipality to provide premises within the framework of social rent, i.e. premises for people with particularly low income meeting the criteria of poverty, is crucial in here.

The structural nature of the debt of tenants poses particular challenges to entities managing housing resources of municipalities. The classic “hard” debt enforcement faces obvious problems resulting from the fact that debtors do not have assets which could be the subject to satisfy the creditors. Additionally, they earn income below the enforcement thresholds and most frequently they do not take up the legalized forms of employment. The efficiency of the conventional forms of debt enforcement is therefore low in this group of debtors.

Another very important issue is social costs of debt recovery activities (Dziadkiewicz, Pabian 2017, p. 33; Bengston 1995, p. 4). Enforcement against the basis of existence, which the house is, carries a range of negative consequences:

- increased housing poverty of this group of residents (Sikora-Fernandez 2018, p. 106),
- social exclusion of debtors and their family members (Kozera, Stanisławska, Głowicka-Wołoszyn 2017, p. 78),
- generating actual homelessness – some of the proceeding end up moving people to the shelter,
- exacerbating problems occurring in this group of people, such as addictions and crime.

In order to help solve the debt problem, ZGM TBS developed the program of tenant debt deleveraging - “Work for rent”. The initiative lies in the fact that the indebted person repays their

financial arrears to the Administrator in the form of labor, which, among others, includes cleaning stairways, maintaining cleanliness around buildings or delivering correspondence. This idea was approved by the debtors who willingly report to the program. The data shared by the Company indicate, however, that nearly 54% of the program participants (the data for June 2019) get into debt again, which indicates the temporary nature of the suggested solution.

Individual interviews carried out with 70 people from the group of debtors for whom the applied solutions proved to be inefficient allowed for the indication of reasons for re-indebtedness. These are:

- low income in relation to expenses (65% of indications),
- no steady income (19% of indications),
- family problems (11% of indications),
- health problems not allowing for a permanent job (8% of indications).

Low income was often accompanied by the indication of family problems mostly associated with the illness of a family member, the abuse of alcohol by one of family members and single child raising. As the reason for low income and lack of steady income the respondents indicated the problems with finding a satisfactory job. As many as 45 people have specialized skills but also, they have problems with finding themselves in the labor market. The interviews also paid attention to a very important aspect. Most people (61) claimed that the solutions applied by ZGM TBS (the initiatives "Work for rent", "Clean yard", "Be safe, senior citizen!", neighborhood picnics) created local communities where one may find support and help. It was also pinpointed that systemic solutions, such as the Labor Office or career guidance services have limited possibilities to act and services are of a mass nature.

The result of the search for a long-term solution is the Social Business Incubator (SBI) model. The suggested initiative mostly focuses on the socio-occupational reintegration for groups affected by social exclusion (people able to work but professionally inactive) and, subsequently, it assumes the implementation of diversified social services.

Fig. 2: Social business incubators as a social initiative

Most of all, SBI may constitute an innovative method for solving social problems and, by activating entrepreneurial attitudes, it may help those at risk of social exclusion and their families (Fig. 3). The primary objective of SBI is to activate indebted people and help them set up and run companies based on the labor of the owner and/or family members (Path I). However, not everyone will be interested in establishing their own company or they will not have relevant predispositions or skills. SBI

assumes providing individual support to such people so that their potential could be used in line with the conditions of the local market (Path II).

Figure 3: The map of processes of Social Business Incubator

The activities of Social Business incubator include free assistance:

- for Path I – determining the potential of customers in terms of setting up and running the company, continuous analysis of the local market and its environment, supporting customers in activities associated with the preparation and creation of companies, defining the possible scope of activities of the entity being created and necessary preparatory actions, selection of an adequate business model for the needs and expectations of the company's founder, consultancy in the adaptation of the business model in the specific local conditions, assistance in obtaining funds essential for the establishment and operation of a new company, support in terms of formal aspects associated with starting a business activity, current advisory services and coaching;
- for Path II – determining the needs of customers, identifying the potential of customers, i.e. qualifications and skills, counselling and coaching adjusted to individual customer needs, assistance in adaptation to the requirements of the local market;
- for Path III - determining the needs targeted at a wider range of customers going beyond debtors.

The customers of the Social Business Incubator will be primarily the indebted residents of the municipal resources who, in spite of their participation in the program "Work for rent", do still have problems with current settlement of financial obligations. Paths I and II are dedicated to them. In Path I, the initiative to set up a company is in the hands of customers – founders, whereas, in Path II, the incubator takes the initiative to use and adjust the customer potential to the local market conditions. The SBI model also assumes the activation of Path III, within the framework of which the ideas will be searched for to solve social problems and adjust the existing solutions to local conditions. These will be activities targeted at a wider range of customers going beyond debtors – the people at risk of social exclusion due to age, loneliness, health, financial standing.

The main partners in the operation of SBI are: Housing Management Department (ZGM TBS) in Częstochowa, Faculty of Management of Częstochowa University of Technology and Foundation for Development in Częstochowa. ZGM TBS provides the technical infrastructure and legal service to the customers of the incubator. The employees of Faculty of Management of Częstochowa University of Technology provide support in terms of business, economic, marketing and management counselling, whereas Foundation for Development provides the organization of coaching and psychological assistance. It is assumed to extend the group of partners to provide the individualized approach to customers of SBI. This need was often highlighted during the individual interviews.

Conclusions

The above considerations confirmed the existence of the research gap concerning social business incubators. There was also identified the need for innovative social services allowing for the individualized approach to solving social problems. The concept of Social Business Incubator presented in the article results from the assumptions of social entrepreneurship. The basic conditions "to change something" in the society and to propose social value are met. In this case, social value is addressed to the target group created by the indebted residents of municipal resources of the city of Częstochowa. The presented research results indicate that there is some space for operations aimed at restoring at least some of the indebted people to business networks of the local community by helping them to set up their own company and embed it under contracts with the immediate environment, e.g. condominium, other property managers or local service users. The objective is to prevent the phenomenon of re-indebtedness. The solutions applied by ZGM TBS are not effective enough since the problem arises again once the support is completed. The success of the incubator can be determined by the individualized approach to solving social problems, which systemic solutions lack. The research indicates that it is very important to create the local community, which creates the atmosphere which is conductive to solving social problems. Therefore, the suggested concept also assumes the activities aimed at prevention of social exclusion, among others, of lonely and elderly people. It is assumed to continue research on the effects of implementing the model of incubator. The aim will be to indicate a catalog of good practices for the implementation and functioning of this model. It should be pinpointed that the model of Social Business Incubator can be also applied in other cities or regions in which it is necessary to socially and occupationally reintegrate the groups affected by social exclusion.

Dandyism – A New Trend on The Fashion Market Or Just A Blast from The Past?

Abstract

Dandyism is a notion related to fashion, aesthetics and philosophy. This phenomenon, that has its roots at the beginning of the 18th century, has undergone strong changes over the years, losing its unique reasoning. Dandyism in the new millennium has been reduced to a relatively small, yet thriving market niche, that adapts a form of an online consumer community. Contemporary dandies fit into a broad image of the metrosexualism, fusing the trends of postmodern hyper-personalization, prosumerism and deconsumption, but also far-reaching hedonism and narcissism. This article is based on the analysis of a secondary data, including the historical roots of dandyism, as well as on observations made among online dandies' communities. The results can be used by clothing companies, especially those offering sartorial menswear, in order to better understand the very essence and fundamental concepts behind dandyism. By showing the heterogeneity of styles and aspirations of its representatives, the article also indicates the direction of a further research on the characteristics of the modern-day dandies, which perhaps should no longer be referred to as with this name.

Keywords: Consumer Behaviour, Fashion Market, Trend, Dandyism

Introduction

Fashion is an inseparable element of the clothing market, but its idea is not limited solely to an economic dimension of consumption (Crane & Bovone 2006). Fashion is a social norm that affects not only clothing, but also many areas of social life (Fang et al. 2012). A distinction should be made between an outfit, that is a result of physical conditions (such as a weather), and clothing, that depends on a psychological sphere, e.g. social status (Boucher 2003). Therefore, a garment on the clothing market is bought not solely because of its physical features, but also symbolic ones, which is a result of an individual's desire to obtain high status and social prestige (Grandys & Grandys 2013). In economics, a conviction of irrationality of fashion (above all its luxury segment) is widely held, with the prime example of the concept of ostentatious consumption created by Veblen in 1899 (Aspers & Godart 2013). Luxury goods, however, are not necessarily purchased just because of the vain need to outstand with one's wealth. The consumer may look for aesthetic pleasure or originality of a product, in order to present their own, unique sense of style (Amatulli & Guido 2011).

A potentially new, poorly developed niche in the clothing market may result from the return of dandyism, which paradoxically seems to combine contemporary trends of hedonistic and sustainable consumption. Originally inseparable from a particular worldview, the 21st century dandyism seems to derive primarily from a distinctive sense of aesthetics in clothing and self-worship (Ferrero-Regis 2017), which evokes some associations with metrosexualism. Products dedicated to dandies may be

put in the category of luxury clothing and accessories. The largest markets for this type of goods in Europe exist in Italy and France, where in 2018 they reached value of 9.4 billion EUR and 9.8 billion EUR respectively. Moreover, the luxury segment accounted there for over 20% of the clothing market in general. In Central and Eastern Europe, such a segment is relatively small and underdeveloped – in Poland in the same year it was worth less than 700 million EUR (www 1). Only 28% of Poles declare possession of a luxurious piece of garment in the wardrobe, with an average value of approximately 1400 PLN (~ 330 EUR) - in 30% of cases an outwear (mainly coats, www 2). However, it can be predicted that this segment will develop along with an increase in the wealth of the society.

An important challenge for marketing is therefore to identify the portrait of a modern-day dandy as a consumer of luxury goods. The purpose of this article is to present the rise and current image of dandyism in an interdisciplinary approach, as well as its interpretation from the perspective of economics and marketing. The article is based on results of an exploratory research, that was carried out on the basis of analysis of secondary data sources.

Trends in the clothing market - at the crossroads of hedonism and deconsumption

Increasingly diverse needs of customers require an individualized approach in companies' marketing (Dibb 1998), as exemplified by customer segmentation, which is an idea implicitly present in activities of entrepreneurs since they have begun to differentiate their methods of struggle for the buyer (Dickson & Ginter 1987). Contemporary seeds of segmentation can be found in the article by W.R. Smith (1956), where he presented its outline as an alternative marketing strategy. It is based on the assumption of the existence of homogeneous groups of entities (e.g. consumers), that possess some common features, that can be identified and classified (Walesiak 2000). It should be noted that although markets can be segmented in many ways, some of them appear to be completely useless (Beane & Ennis 1987). There is also a danger of segmentation for segmentation's sake (Green 1977).

A slightly narrower group of consumers with similar needs is the market niche (Dalgic & Leeuw 1994). The company's focus on operating in a niche limits the number of potential customers, but allows to gain a relatively large share (Kotler & Armstrong 2004, p. 228), which paradoxically may mean expanding the market (Trzmielak 2003). Niche marketing concentrates on meeting the needs of consumers in a possibly complete manner (Toften & Hammervoll 2013; Slavik & Bednar 2014), which is why they are willing to pay a higher price and are characterized by higher loyalty to the company. Such a customer's attitude towards the brand may be particularly important on the clothing market, dominated by cheap products from China (Parrish, Cassill & Oxenham 2006; Maciejewski 2016a). A major challenge for manufacturers appears to be building a global cooperation network, that provides opportunities to deepen knowledge, internationalize business and - as the main goal - expand markets. However, cultural idiosyncrasies between nations, that may affect fashion preferences, should also be taken into thorough consideration (Vaiginiene 2011, Wróblewski et al. 2018).

The postmodern consumer, more and more often living in single-person households, is characterized by the desire to individualize their own consumption, which manifests in looking for unique products. In response to these needs, manufacturers are increasingly offering customers the opportunity to exert far-reaching influence over features of a final product, which leads to the phenomenon known as the mass-individualization (also called hyperindividalization, Maciejewski 2014). Such possibilities are characteristic of prosumerism, in case of which a client of a brand becomes at the same time its active partner, having a real impact on the shape of the final product (Szul 2013, Wróblewski 2017). This partnership comes into being thanks to consumers' activity in social media, where interactions such as discussions, exchange of opinions or ideas between fans of a given brand are possible (Zalega 2016).

Within the clothing market, there are many parallel and often opposing trends, defined mathematically as general direction of changes in time of given phenomena (Altkorn & Kramer ed.

1998, p. 261). In case of fashion, cyclical and classic trends are distinguished. The former are subject to constant changes - first in one direction, then in the opposite. On the other hand, classic trends remain relatively stable, being subject to very slow changes in the long run, as exemplified by the relative stability of men's suits' cannons (Miller, McIntyre & Mantrala 1993). Since the 1970s, the manufacturer's large and well-visible labels have been observed on clothing. Counter to this trend are products dedicated to connoisseurs, where garment's quality is more important than its brand (Svendsen 2006, pp. 124-125).

On the fast fashion clothing market (brands offering many rapidly changing collections), an opposite movement has developed. The slow fashion opts for consumer rationalism: buying more expensive and higher quality products, but using them for a longer period (Sempruch-Krzemińska et al. 2016), which evokes connotations with the ethical fashion (ecofashion). Ecofashion results from the growing awareness of the impact that the fashion has on the natural environment and man (Beard 2008, Wasilik 2014). Counterrevolutionary deconsumption (which proclaims the need to limit and even reject consumption) is composed of the ideas of "Reduce" and "Reuse". According to them, it is recommended to buy products of the highest utility value - without unnecessary, flashy and only temporarily fashionable elements - and exchange them in society as to use them for the longest possible time (Frątczak-Rudnicka 2011, Mazurek-Łopacińska 2011). A combination of these trends can be found within the modern dandyism, beginnings of which contain some analogies to the modern fashion market.

Historical background of dandyism

Dandyism is a phenomenon inextricably linked to fashion, but also to customs. The movement arose in the nineteenth century and can be described as a closed circle of truly elegant men, where certain rules prevail (Howells 1996, p. 25). The very meaning of dandyism is multidimensional and has evolved over the years. At its core, it is characterized by a unique aesthetics of clothing and its recognition as the highest value. One may maliciously say that a dandy lives only to dress up (Okulicz-Kozaryn 1995, p. 39).

However, it is a stereotype that dandyism is based only on clothing, and each of its representatives must be a homosexual. In former centuries dandyism constituted a complete personal philosophy, being ahead of its time and constantly generating innovations, above all in fashion (Visser 2011). Back in the days (but also nowadays) "sprezzatura" has been a key-concept to this trend: artificial and trained behaviors or a certain dose of nonchalance in breaking the rules of elegant style are to give an impression of a full naturalness to an outside observer (Goeller 2014). Although dandies aroused strong feelings among high society, they were usually characterized by stolid character and truly English cold blood (Przybylski 1986).

Beau Brummel (1778-1840) is considered the ancestor of all dandies, being kind of an exemplar for subsequent generations of his followers, although some believe that dandyism is older than its oldest representative (Visser 2011). Brummel's dandyism was based on several fundamental principles: neatness, simplicity, high-quality clothing and attention to every, even the smallest detail. Brummel adhered to the principle that one should not follow fashion too eagerly, and clothing should be above all natural and comfortable (Nalewajska 2010, pp. 14-15). He also raised the importance of garment's perfect fit and cut to the perverse level (Okulicz-Kozaryn, p. 24), which was possible only thanks to close cooperation with personal tailor. This specific dandy-tailor relationship is associated with the still vivid concept of sartorialism, manifested in profound knowledge and interest in the methods of tailoring. High quality elegant clothes and accessories, in harmony with the classic art and cannons of tailoring, are considered sartorial (from Latin *sartorius* – pertaining to a tailor), while people who take delight in this style are called sartorialists (www 3).

Dandies should be contrasted with other types of smart dressers who are not characterized by equally high level of perfectionism (Okulicz-Kozaryn, p. 14). However, it is particularly difficult to divide a dandy and a gentleman. The characteristics of the latter include, above all, conformism without any deviations from the savoir-vivre (Okulicz-Kozaryn, p. 38). Gentleman is a heir to the knightly ethos:

honorary and hardworking. Nowadays - a businessman, a capitalist, whose elegant clothes are to emphasize his appearance and good manners, but not overshadow them (Skucha 2012). It is noted that a dandy could have been a gentleman, but a gentleman could not have been just a dandy (Przybylski 1986).

Oscar Wilde, an Irish poet from the second half of the 19th century, is considered the person who redefined dandyism. He opted for a widespread use of luxurious materials (such as silk) in clothing, as an expression of an opposition to the pessimistic and decadent vision of the end of the century (fin-de-siècle, Visser 2011). Dandyism began to fade after the death of the poet in 1900. Various types of 20th-century smart dressers did not have much in common with real dandyism, being slaves to fashion rather than its masters (d'Hamilton 2015).

Modern-day dandyism

Nineteenth-century dandies may be viewed as "clotheshorses", more or less attentively following fashion, but not being in a stark contrast with the latest trends. It is hard to say that about people who today consider themselves dandy, as modern fashion distances itself from elegant style. The spread of the internet has granted dandies around the globe an opportunity to communicate, exchange opinions and knowledge. There are online forums and thematic groups on Facebook dedicated to contemporary elegance, where it is possible to discuss sartorial brands, details and design of garments, as well as user for advice in the field of clothing, size selection or recommended brands (see www 4, www 5, www 6).

Fashion bloggers associated with this trend also participate in the spread of knowledge about the elegant style. They describe the basic principles of formal dress and present own photo sessions, which are intended to be an inspiration for readers (while also an advertisement of sponsored products - see www 7 and www 8). Photos from the session are often also posted on Instagram, where the largest channels have over 100,000 followers (see www 9 and www 10), which creates an original type of fashion icons with power to start new trends and influence their observers (Gregor & Kaczorowska-Spychalska 2014; Wiażewicz & Zatwarnicka-Madura 2016). Activities and recommendations of the so-called opinion leaders have a measurable impact on their followers' purchasing decisions. However, bloggers must maintain their credibility, so as not to loss own authority (Mazurek 2008, pp. 148-153).

In the case of traditional tailors, there are generally no marketing campaigns, while the emphasis is on personal, informal contacts and the reputation in entourage – a positive word of mouth may mean more than an expensive advertisement. It is noted that the process of tailoring for some customers may take the form of an almost mystical ritual, and a final product - a pass to a closed club of *true* dandies (Gautrand 2011; Shirkhodaie & Rastgoo-deylami 2016).

Dandyism in View of Economics

Given the historical background of dandyism and its current shape, we propose to consider this phenomenon from the perspective of economics and marketing at two levels. Firstly, as a highly specialized and thoroughly informed virtual community, that fits into the characteristics of consumer e-communities. Secondly, as a movement, which has certain common features with metrosexual trends.

The concept of metrosexualism was created in 1994 by journalist Mark Simpson, who, however, attempted to define this trend only after 8 years. Metrosexuals are described as young, well-off men from large cities, spending a significant portion of their salary on shopping for clothes. For this reason, they can be considered as "dandy narcissists". It is rightly pointed out that dandyism was an intellectual fad of the social elites, while the metrosexuality – of the masses (Gębala 2008). Metrosexual's obsessive interest in own appearance and hours spent in front of the mirror connect with the desire to consume only unusual products, in order to outstrip the mainstream and mark own

sense of a good style and taste. Such efforts are characteristic of gay aesthetics, although metrosexuals are almost by definition heterosexual (Masi de Casanova, Wetzel & Speice 2016).

Moreover, metrosexuality, despite its name, is not at all related to the sexual sphere. It is rather an attempt to fill an emotional void through hedonistic pleasures (Skrudupaitė, Virvilaitė & Kuvykaitė 2006). There is no women's version of this trend, so it can be viewed as a strictly male strategy of seduction based on impeccable presence - just like in dandyism (Halligan 2011). It is also noted that the affliction of both dandies and metrosexuals may be so-called Narcisstic Personality Disorder, that consists of a lack of empathy, sense of entitlement and preoccupation only with beauty, power and success (Gheorghe 2015).

Due to its numeric variations, metrosexuality as the core is believed to be a market segment. Its successor is the über style, whose representatives are (or at least are to be) the real, harsh men, but equally stylish and addicted to the best quality fashion (Rinallo 2007). The similar type of macho should be distinguished from übersexualism. Although the macho has no suffix “-sexuality”, it focuses on male (hyper)sexuality - aggressive and strictly physical. One can get the impression that for macho, the aesthetics of clothing is of a marginal importance, as long as it does not undermine his image of a warlike and dominant alpha male (Mosher 1991).

To some extent countering the above characteristics, it should be noted that in postmodernity the relation between individual’s consumption of specific goods and social position has been lost. The latter no longer determines clothing: a man in a suit no longer has to be a gentleman, obliged to such a style by his profession or social norm. Postmodernism is also marked by a new form relationships, that are built virtually. Virtual spaces have replaced traditional, personal meetings and have taken over the role of "places" for creating relationships, e.g. mutual consumer communities (Leszniewski 2007). They are “electronic tribes” bringing together individuals with similar interests (Kozinets 1999), for example related to the dandy style. The main goal of such a community is to transfer a knowledge, opinions, experiences and thoughts. Its members have the opportunity to actively learn by participating in interesting discussions (Lee, Vogel & Limayem 2003).

Efficient and sound consumer e-communities can successfully attempt to affect brands’ decisions and wield influence over development of new products (Maciejewski 2016b, p.23). An economic symbiosis is possible, as community members gain real influence on features of the products they desire (Kaczorowska-Spychalska 2012), while companies gain access to unique information provided by one of the most valuable, well-informed clients. Although customers’ posts are often emotionally charged, they usually remain objective and highly factual (Mazurek 2008, p. 121). What's more, an e-community may adopt the function of a brand's virtual customer service for free, even advising with choosing a correct product size or suggesting an item that best meets the given expectations (Mazurek 2008, pp. 124-127). According to the observations made, such actions take place on forums and groups devoted to dandyism.

Conclusion

Dandyism has been subject to many changes over the years, gradually losing its philosophical foundations. What has remained inherent in dandies, is their fascination with male elegance and distinct aesthetics of clothing. In the era of postmodernism, the main trend is to move away from an elegant style in favor of a more casual approach, which is particularly visible in professions with traditionally restrictive dress code. Paradoxically, this may entail a new dawn of dandyism and presence of its sympathizers on city streets. Due to the fact that suits or ties cease to be symbols of coercion, resulting from social conventions, their perception by consumers may change.

The roots of modern metrosexual trends can be traced back to dandyism, although such a connection seems to have almost reversed. While metrosexuality is an independent market segment, dandyism has been reduced to just a niche, dedicated to a relatively small group of enthusiasts, that fit into the characteristics of the broadly understood metro style. However, thanks to their active discussions and

good organization on Internet forums and thematic groups, contemporary dandies may be considered as a thriving electronic consumer community focused on elegant style.

The question remains to what extent present-day representatives of this stylistic current are really successors of classic, nineteenth-century dandies. Perhaps they should be called at most just sartorialists, that focus on semi-rational (less garments, but of better quality) and strictly hedonistic (new fabrics and cuts every now and then) premises in their consumption.

Abstract

The discussed issues are aimed at characterising the challenges for modern enterprises in the field of continuous improvement of employee competencies in the face of dynamic technological progress. Based on the literature review, the authors of the paper presented the issue of skill mismatch and indicated the reason for this state of affairs. For many years, enterprises have been struggling to find suitably qualified employees whose competencies would be closely correlated with the needs of the labour market. The problem area is very broad and requires in-depth analysis not only on the scale of the enterprise but the entire education system. Enterprises, despite the undertaken actions, are constantly looking for a way out of this situation, recruiting candidates within their own organisation. However, the problem remains unsolved. Based on the conducted research, the authors of the paper considered this problem from the perspective of the employee. While analysing the research results, an attempt to answer a number of questions was made and future directions of actions aimed at solving the above-mentioned problems were outlined.

Keywords: Skill Mismatch, Talent Shortage, Education

Introduction

Globalisation and development of modern information technologies result in consequences (Pypłacz, Liczmańska-Kopcewicz, 2018) that have a huge impact on changes in the enterprise management system. Innovations in the field of products are emerging, which in turn create new output markets and new types of services (Ismail, et al., 2019). The organisation of the company functioning is also changing (Ślusarczyk, 2018). As a result, the introduction of a change in the organisation system in the enterprise leads to the emergence of new jobs and, above all, the emergence of demand for new skills.

The difficulty in filling jobs increases year by year. In the period 2014-2020, this indicator more than doubled, which was influenced by the still decreasing unemployment rate and widespread digitisation of business processes. The development of information technologies forces employees to constantly acquire new skills, and this leads to an increase in the group of people who do not match the needs of the labour market.

To acquire, develop and retain the most talented people in a company, it is necessary to know the demand for and opportunities to develop specific skills. Undoubtedly, this requires changes in the approach to staff training and a flexible way of responding to market demand. This is because the dynamics of market changes is so huge that fossilised education systems are not able to adapt curricula so quickly to the needs of the labour market, and thus equip future graduates with current

professional competencies. The education system in Poland, unfortunately, cannot keep up with changes, educating in professions that are not reflected in job offers.

On the basis of this statement, the following research question was posed *The issue of a mismatch of qualifications and a lack of employees with appropriate competencies determines the need to build an efficient education system in the workplace, which will allow obtaining the desired skills on the dynamically changing labour market.*

The undertaken research issues seem to be important due to the need to constantly monitor processes occurring in the area of education and the labour market, and to update information on the demand for specific professions and qualifications, and in particular in the context of meeting these expectations seen from the angle of Polish enterprises.

As a result of the conducted literature review and own research, data was obtained, which allows for a broader look at the challenges of modern enterprises in the field of skill mismatch and the need to constantly improve the qualifications of employees. The presented data and research results used do not allow for a comprehensive analysis of the research problem, however, they may become a contribution to more detailed research in the future.

Professional qualifications and competencies

Professional qualifications are both knowledge and skills that are needed to perform a specific profession. Professional qualifications form a set of individual messages, skills and attitudes conditioning the completion of specific professional tasks. Thanks to appropriate skills, as well as psychophysical characteristics, it is possible to perform tasks that belong to a given speciality. Qualifications are shaped by the configuration of various factors, which include the level of general and vocational education, job seniority and psychophysical characteristics (Nagel, 2016). These are some more or less measurable characteristics reflecting the potential of a given person, which is closely related to the expenditure incurred for its creation, and their usefulness is verified by the changing environment in which a given entity functions (Orczyk, 2009). Therefore, qualifications are knowledge, skills, education and experience necessary to perform a given profession. They have a formal dimension and are modified through changes in a given environment. Employers learn about specific qualifications on the basis of diplomas, attestations or certificates. In turn, professional competencies include individual and cognitive skills, professional predispositions, such as communication skills, teamwork skills, flexibility, adaptability to changes and risk taking, and above all the ability to use acquired qualifications (Pinkowska, 2011). On this basis, it can be concluded that qualifications are learning outcomes that are documented, e.g. through a diploma with an academic degree or acquired during training, while competencies include the ability to acquire knowledge and its proper use, professional experience, dealing with corresponding situations, as well as cognitive and physical skills.

From the perspective of the company operation, competencies play a significant role because they enable, among others, product development, implementation of new solutions, building authority. It is so-called hard competencies. On the other hand, soft competencies are becoming more and more important, allowing for a more complete and effective implementation of the company strategy (Varkoly et al.,2019).

Possessed qualifications shape competencies, but competencies determine the possibility of undertaking and implementing the tasks posed by the employer in a responsible manner (Orczyk, 2009).

When applying for a job, the employer checks the compliance of qualifications with competencies qualifications do not always reflect competencies. This is mainly due to the process of acquiring knowledge, which is outdated and requires radical reorganization, and which contributes to the emergence of an ever-increasing skills mismatch gap.

Research Context

The issues related to the skills mismatch to the needs of the labour market are presented in the source literature in various ways (Altindağ, et. al. 2018; Radu, et. al., 2019). Although it can be analysed in various dimensions, it is usually the result of a complex interaction between labour demand and supply, which are influenced by delayed adjustment processes and market imperfection. Referring to the source literature, different types of mismatches to the labour market can be distinguished (CEDEFOP, 2014), however, the authors will mainly focus on the mismatch resulting from the lack of proper qualifications (skill mismatch). A mismatch of skills in the labour market occurs when there is an imbalance in the labour market resulting from the failure to adapt the level or type of available skills to the requirements of the labour market or requirements related to a specific job, analysed at different levels (individuals, enterprises). And here overskill when there is a surplus of skills or qualifications compared to those desired in a given position or profession, underskill, shortage in skills or qualifications compared to those desired in a given position or profession can be distinguished (CEDEFOP, 2010).

The source literature and results of research conducted so far in Poland (Work Service, 2019), as well as in market economy countries, clearly indicate that one of the reasons

for the imbalance in the labour market is a mismatch in the structure of supply and demand for work, especially associated with the profession, qualifications and education. A synthetic approach to these mismatches and determination of their causes is illustrated, among others, by the Hays Global Index (Hays, 2019), or the results of studies presented in ManpowerGroup reports (Manpower Group, 2020). The relative demand for highly qualified staff has generally increased and the relative importance of skill types has also changed. Both Information and Communication Technologies and soft skills have gained in importance in the context of many professions. The demand for the most desirable skills changes fundamentally. Qualifications, to which employers did not pay attention a few years ago, are at the top of the most desirable skills ranking today. According to the latest LinkedIn work trend report, blockchain technology, which was not included in previous rankings (LinkedIn, 2020), has outperformed other emerging technologies this year, such as cloud computing, analytical reasoning and artificial intelligence. This only confirms the point that the demand for skills is dynamically changing, which is why both educational units and employers should constantly adapt their education and training offer to the constantly changing market environment.

According to the Manpower Group report, the most sought-after employees are employees with very high qualifications and professional competencies, as well as people with professional experience that determines their professional competencies, but often requires confirmation with appropriate certificates (Manpower Group, 2020).

The shortage of qualified employees is also shown in the Hays Global Index according to which companies in 2019 had much more difficulty finding employees with specific qualifications in the IT and technical sector. The Hays Global Index takes into account the flexibility of the education system and the labour market as well as the mismatch of qualifications (Hays, 2019). The main pressure on the market is caused by the problem of mismatch, especially since from year to year, the gap between the skills of job seekers and the skills sought by employers is constantly growing.

Results

In view of the growing problem of skills mismatches and staff shortage, as well as the lack of effective tools that eliminate this gap, and at the same time prevent the adaptation of skills to the needs of the labour market, the authors of the paper tried to answer many burning questions and make a diagnosis of the current state.

A shortage of employees with the desired qualifications may indicate a lack of an appropriate education structure, which in turn is manifested in a skill mismatch (McGuinness, et al., 2018; Kriechel,et al., 2019; Battu, et al., 2020; Schweri, et al., 2020). In turn, the lack of effective training

tools has a negative impact on the possibility of permanent improvement of employees' competencies, which is necessary to meet the challenges of a dynamically changing business environment (Manpower Group, 2020; Silvaggi, et al., 2019; Attaran, et al., 2019; Hays 2019).

So what strategy should enterprises adopt? Should they implement internal education systems? What is the situation in Polish companies and what actions are taken in this respect? Are employers aware of the continuous improvement of their employees' qualifications, what tools do they use and are they effective? The authors attempted to answer these questions by analysing the results of the conducted research and outlined future directions of actions aimed at solving the above-mentioned problems.

In order to diagnose the current state, a survey was conducted in which people employed under an employment contract in the SME sector and entities belonging to the group of large enterprises took part. The research was conducted in the fourth quarter of 2019 using CAWI online surveys and direct interviews. Answers were obtained from 526 employees, but due to inconsistency or lack of some data, less than 60% of the collected responses (312 respondents) were included in the analysis. 68% of answers came from employees of micro and small enterprises, 23% from medium ones and 9% from employees employed in large business entities.

Research shows that many employees perceive the need to improve their own professional competencies (Fig. 1).

Figure 1: The need to improve own professional competencies
Source: Own analysis

Over ¾ of respondents have participated in a training in the last 12 months (Fig. 2).

Figure 2: Number of employees who have participated in a training

Source: Own analysis

Large enterprises strictly focus on the development of their employees, which may be evidence of the high awareness of employers as to the need to improve professional qualifications of their subordinates. Respondents who did not participate in a training most often indicated a lack of financial resources, of a proper training offer and too high training costs. These trends occur mainly in small enterprises. Employers sent their employees for training, most often due to changes in regulations, too low employee competencies and the possibility of co-financing training, which ultimately did not burden the company budget.

Figure 3: Main reasons for participating in training

Source: Own analysis

According to respondents, the best form of training are workshops that enable the acquisition of practical knowledge. E-learning trainings are also very popular. However, in most opinions, the trainings in which they took part were ineffective and did not significantly contribute to the improvement of their professional competencies (Fig. 3). In order to take full advantage of the acquired knowledge, they need additional time, support and counselling after the training process.

Figure 4: Percentage of employees who, after completing the training, were able to fully use the acquired knowledge

Source: Own analysis

In turn, the factors that cause that the information obtained during the training are not fully used are, above all, lack of commitment during the training, lack of motivation, as well as problems with implementing the acquired knowledge in practice. Factors that can have a positive impact on the effectiveness of training are the adaptation of training to the individual needs of participants, the use of modern technologies, as well as verification of results and achievements (Fig. 5).

Figure 5: Factors increasing training effectiveness

Source: Own analysis

In most enterprises, there is no assessment of employees' professional goals or assessment of their professional skills (Fig. 6).

Figure 6: Assessment of employees' professional goals and skills

Source: Own analysis

Unfortunately, in the opinion of employees, companies do not conduct them with the right conditions to improve professional qualifications (Fig. 7).

Figure 7: Does the company provide conditions for improving professional qualifications for its employees?

Source: Own analysis

Research results clearly show that lifelong education and training are key to development, but they are not the only point in shaping professional competencies. From the employees' point of view, it is very important to increase the scope of professional opportunities of own teams by assigning tasks from various areas to different positions. Employers can also implement projects involving all employees and ensure efficient cooperation of various teams. Employees would like to get involved in numerous projects, which would allow them to gain new experience, knowledge and skills (Fig. 8). Employees are aware of the need to increase their value in the labour market and expect opportunities for professional development.

Figure 8: Factors supporting the acquisition of new knowledge and skills

Source: Own analysis

In the group of respondents highly assessing their professional competencies, over 90% declared that the company provides them with the right conditions for their development. However, in the group of people with medium or low level of competencies – 86% did not participate in any training in the last 12 months.

Figure 9: Assessment of the level of professional competencies
Source: Own analysis

Employees are interested in improving their own professional competencies, especially in medium and large enterprises. At the same time, they expect more engaging tools for professional development oriented at continuous improvement of qualifications (Fig. 10).

Figure 10: The need to implement modern tools for improving professional competencies
Source: Own analysis

Employee development plans are implemented in less than 8% of the surveyed entities, which includes 25% in large enterprises and 15% in medium enterprises. Less than 3% of employees say that such plans exist in small enterprises (Fig. 11).

Figure 11: Percentage of companies with employee development plans
Source: Own analysis

According to employees, only few enterprises have internal career management programs, which may indicate the low maturity of Polish enterprises (Tansley, et al., 2006).

Conclusion

From the perspective of the current talent shortage, activities aimed only at acquiring relevant candidates within the market are insufficient nowadays. To build their competitive advantage, companies must expand their development programs and increase employee mobility in organisations.

The conducted research gave a clear picture of Polish reality. Professional competencies are at a low or very low level. Employees expect support and more effective tools for professional development, such as the implementation of an internal career management program. Thanks to such a solution, the company could gain a motivated and committed employee who has competencies relevant to the organisation and, as a consequence, efficiently achieves the goals on their position. In addition, by increasing the efficiency of their activities, they could bring measurable benefits to the company. They would gain more self-confidence, as well as responsibility for building their career and awareness of independent career path management. The benefits of implementing such a tool are also the security of further professional career development as well as acquiring and developing the competencies needed in the company. Such a solution would also increase the efficiency of activities undertaken to develop competencies. This is because despite the fact that most of the surveyed companies focus on the development of their employees, there is a significant problem with the effectiveness of educational activities. Lack of motivation and commitment on the part of employees are an effective barrier in the development of professional competencies.

Based on the analysis of the obtained research results, the research question can be confirmed. The respondents' answers confirm the assumptions of the authors of the study. There is a great need for professional development of employees. However, they need more flexible tools for raising competences. It is necessary to propose new tools and methods to improve employees' competencies. It is important that they engage participants and are effective enough to enable them to examine their impact on achieved business results and give specific results. This requires a completely new approach and implementation of solutions that will not only allow collecting data on the educational behaviour of employees, but also enable the use of this information to personalise the learning process. In combination with the employee performance data, the system will be able to verify the effectiveness of planned training activities and update them accordingly.

In the opinion of employees, the future of developing professional competencies also includes internal career management systems that enable employees to independently assess their interests and opportunities, match them to jobs and facilitate the development of personalised career paths. In practice, they will enable employees to assess their professional goals, find a future role, assess their current skills and create development plans. This is because every employee should be able to constantly improve, develop and implement their professional goals. From the perspective of enterprises, it is important to skilfully use the potential and knowledge of employees and manage their careers in such a way that the retention rate remains high.

Enterprises should focus their efforts on developing their own employment strategies, while also providing their employees with the opportunity to retrain or even change their profession. Implementing innovative solutions and focusing on the competencies of candidates as well as undertaking initiatives to encourage wider participation in the labour market, especially within inactive groups and mature employees, will be of key importance for companies. This is particularly important from the perspective of demographic change and the need for enterprises to be open to employ older employees, as well as to provide them with opportunities and possibilities for professional development.

The future of staff training, due to the variability and dynamics of the business environment, should be directed towards workplace training and apprenticeships so that the education effect meets the needs of enterprises, while giving young people valuable first experience. Ensuring appropriate development paths requires individualisation of the training process, supported by modern technology, which will make the process more flexible and will positively influence the commitment and training quality. An effective solution may also be demand-driven training, which would not only fill the educational gap, but would be a tool for quick retraining for people who are professionally inactive or have insufficient qualifications.

In order to reduce skills mismatches to the needs of the labour market, it is necessary to focus on greater professional mobility, which allows enterprises to find the talents they need, despite the shortages in the local labour market. Currently in global companies, internal mobility of employees is one of the most important human resource management strategies. A recent LinkedIn survey (LinkedIn 2020) has demonstrated that over 70% of organisations currently focus on internal recruitment, and companies with active internal career management programs have 41% greater ability to retain employees.

Skill mismatch is today one of the main challenges faced by the economies of the entire Central and Eastern Europe region. It not only has an impact on the productivity and efficiency of enterprises, but also can be an effective obstacle to the pursuit of prosperity in developing countries.

In order to keep up with global trends and to further reduce differences in the level of development and standard of living between Poland and Western European countries, it is necessary to change the way of thinking about preparing young people to enter the labour market as soon as possible and provide them with tools that will allow them to shape competencies tailored to market needs. Therefore, it seems that the implementation of a workplace education system that will manage employee development will allow the development of desired skills in a dynamically changing labour market.

This is because only continuous access to properly trained and motivated staff will provide enterprises with development opportunities and will allow for long-term economic success.

Abstract

At the turn of the 20th century, the transformation of terrorism from a means of power struggle at the country level to a global threat took place. The rapid development of new technologies has significantly expanded the ability of terrorist organizations to manipulate the people's mind engaging them in terrorism. The purpose of the work is to study the place and role of information technology in the activities of terrorist organizations and to determine a set of measures for the prevention and detection of threats of contemporary terrorism. It is concluded that there is a special information and communication strategy of terrorism that distinguishes it different from rebel or sabotage actions. Cyber terrorism is not just aimed at harming the interests of certain states, but also at growing the political, economic, and ideological influence of international terrorist groups in the world community. Effective counteraction to contemporary terrorism requires coordination of efforts based on public exchange of information on national and world achievements in cyber security.

Keywords: Terrorism, Information Technology, Cyber Terrorism, Counter-Terrorism Activities.

Introduction

The widespread introduction of modern information technologies into all spheres of public life has significantly increased the dependence of society on the functional reliability of the information infrastructure, information actuality, and information protection from unauthorized modification. The use of new technologies for criminal and antisocial purposes is becoming increasingly relevant. At the same time, a huge gap remains between the accelerating pace of technological innovation and change on the one hand, and the delayed reaction of political and legislative institutions, on the other. Nowadays, terrorist groups use a wide range of new technologies in planning and implementation of their attacks.

The purpose of the work is to study the place and role of information technology in the activities of terrorist organizations and to determine a set of measures for the prevention and detection of threats of contemporary terrorism.

Research Material and Methods

The global problem of terrorism and its manifestations are analyzed by philosophers, historians, politologists, sociologists, lawyers, economists and other scientists. B. Hoffinan (1999), D. Byman (2005), B. Crazier (1975), Alex P. Schmid (1984, 1988) and Yu. P. Kuznetsov (1998) offer in-depth studies on understanding the essence of terrorism and its definition as a social and political phenomenon.

Many scientific works are devoted to the study of the causes of terrorism and its main components - violence and aggression: M. Crenshaw (2007), W. Laquer (1999), D.C. Rapoport (2004), and P. Bergen (2006).

Methodological background of the research is based on philosophical, general scientific and special methods. The general scientific methods used in the work include analysis and synthesis, induction, deduction, ascent from the abstract to the concrete and the historical method. Among the special methods the comparative analysis was used. Selection of scientific information sources is based on the principles of scientific objectivity.

Research Results

Terrorism as a phenomenon has deep roots, it has been known since ancient times. As a rule, terrorism rises during the period of major socio-political disasters such as revolutions, civil wars, interfaith and interethnic conflicts, aggressive protest movements and their suppression. In one way or another all such conflicts were followed by terrorist attacks and terror against the population.

Terrorism was actively used during the Cold war as part of the bipolar confrontation. It was a period when at the end of the 20th century the well-known Taliban and Al Qaeda terrorist groups were founded. Al-Qaeda emerged at the end of the war in Afghanistan in 1988. The United States regarded the entry of Soviet troops into Afghanistan in 1979 as a case of Soviet aggression. The US supported and began sponsoring Al Qaeda to fight against the Soviet troops. After the Soviet troops' withdrawal, al-Qaeda leaders decided that their next enemy would be the United States, which lay claim to world political and economic domination.

At the turn of the 20th century, the transformation of terrorism from a means of power struggle at the country level to a global threat took place.

The studies show that terrorism spread to over 100 countries in 2019. Table 1 presents the ranking of countries on the impact of terrorism (ranks 138 countries) (Global Terrorism Index 2006-2020).

TABLE 1 : Ranking the nations of the world according to terrorist activity

Ranking	Country	Index
1	Afghanistan	9.60
2	Iraq	9.24
3	Nigeria	8.60
4	Syria	8.01
5	Pakistan	7.89
6	Somalia	7.80
7	India	7.52
8	Yemen	7.26
9	Philippines	7.14

10	Democratic Republic of Congo	7.04
11	Egypt	6.79
12	Libya	6.77
13	Mali	6.65
14	Central African Republic	6.62
15	Cameroon	6.62
16	Turkey	6.53
17	South Sudan	6.32
18	Thailand	6.03
19	Colombia	5.91
20	Sudan	5.81
21	Kenya	5.76
22	the USA	5.69
23	Niger	5.60
24	Ukraine	5.55
25	Mozambique	5.54
26	Myanmar	5.51
27	Burkina Faso	5.42
28	the UK	5.41
29	Ethiopia	5.35
30	Saudi Arabi	5.24
31	Bangladesh	5.21
32	Palestine	5.18
33	Burundi	5.10
34	Nepal	5.09
35	Indonesia	5.07
36	France	5.01
37	Russia	4.90

Among the countries with a zero index of terrorism are Belarus, Cuba, Turkmenistan, and the Democratic People's Republic of Korea.

At the same time, the methods and means used by terrorists have undergone significant changes.

Along with the obvious benefits, the world information technology revolution has created fundamentally new threats.

The rapid development of new technologies has significantly expanded the ability of terrorist organizations to manipulate the people’s mind engaging them in terrorism.

We use the Islamic State of Iraq and the Levant (ISIS), also known as the Islamic State (IS), as an example. The rapid expansion of this terrorist group and its large-scale actions, the new technologies and mechanisms of ideological and informational work of ISIS allow us to conclude the transition of terrorism to a qualitatively new level of development.

A small and relatively unknown terrorist group that emerged as an al-Qaeda affiliate in Iraq in 2003 ten years later managed not only to proclaim the concept of a worldwide caliphate, but also to create a quasi-state with laws, territory, tax and monetary systems in real life. The total area of ISIS-controlled territory

as of 2014 was estimated at 40-90 thousand km² with an estimated population of 8 million people (Tarasov, 2014).

The use of different modern information technologies by the Islamic State fundamentally distinguished it from other previous terrorist groups. Terrorists daily posted on the Internet professionally shot and carefully choreographed videos with public executions, the destruction of cultural monuments, military operations, interviews with their warlords, radical preachers and activists, photographs of trophies and killed opponents. This terrorist organization had its own professional studios. The created videos were posted by the terrorists on video platforms such as YouTube. The terrorists of the Islamic State also actively used social networks; they created accounts on the most popular social networking sites (Facebook, Twitter, Instagram, Friendica, VKontakte and Odnoklassniki, etc.), and used them for distribution of information about the Islamic State and recruiting new members. According to some reports of Shanghai Cooperation Organization Regional Anti-Terrorism Structure, more than 45 thousand Islamic State accounts were registered on Twitter alone.

Analyst and publicist J. Berger described the Islamic State media campaign as 'very organized', noting that the terrorist organization 'uses misleading methods and demonstrates a deep understanding of the principles of social networks'.

We can conclude that there is a special information and communication strategy of terrorism, which makes it different from rebel or sabotage actions. Cyber terrorism is not just aimed at harming the interests of certain states, but also at growing the political, economic, and ideological influence of international terrorist groups in the world community.

It makes the information counter measures against terrorism one of the main tasks of the fight against terrorism. However, in practice, the information aspect of counter-terrorism is often limited by the use of protective measures (Minakova, Parkhomchuk, Golovin and Bukreeva, 2018). The implementation of effective measures of anti-terrorist information campaigns is not specified in the official legal documents. It is necessary to point at some main measures of information counter-terrorism:

- information support of counter-terrorism activities through the media and other information channels;
- forecast terrorist threats, its roots and causes, as well as the conditions for manifestation;
- search, collection and analysis of up-to-date information on the actions of terrorist groups and their accomplices;
- public awareness campaign among the population, increasing vigilance, moral and psychological stability, cohesion, discipline and personal responsibility;
- prepare the population for acts of terrorism, provide first aid training, material and moral support for people affected by terrorists;
- maintain persistent information pressure on terrorists, their accomplices, leaders, inspirers, and international terrorist organizations;
- create organizational, legal, scientific, technical, personnel, financial and other favorable conditions for effective information support of counter-terrorism activities.

The most targeted activities on the information counter-terrorism in the Russian Federation are carried out by the National Antiterrorism Committee established on February 15, 2006 by decision of the President of the Russian Federation aimed to improve public administration in the field of counter-terrorism. The Committee is chaired by the Director of the Federal Security Service of the Russian Federation. The main tasks of the Committee are: develop antiterrorism measures, participate in international cooperation, and prepare proposals to the President of Russia on shaping national policy and improving legislation in this area, as well as organizing informing the public about the emergence and neutralization of terrorist threats.

The most important direction of information counteraction to international terrorism is the development of cooperation among the CIS countries. In particular, informational counteraction to terrorism is one of the priorities of the Collective Security Treaty Organization (CSTO). The measures implemented in this area involve promoting the establishment and strengthening the potential of collective informational counteraction against terrorism, drug trafficking and other challenges in the CSTO space (Armenia, Kazakhstan, Kyrgyzstan, Russia, Tajikistan and Uzbekistan).

In this regard the Organization is building up international relations, finding supporters and allies in the most influential media, engaging writers, scientists, cultural figures, and organizing work so that truthful materials on counter-terrorism, fight against extremism and the ideology of violence, anti-drug topics appear on screens and printed pages.

Thus, the informational fight against of terrorism implemented by the Russian Federation and the regional structures of the CIS includes the comprehensive realization of measures for the prevention and detection of terrorism through the collection and analysis of information about terrorist groups and their neutralization using information resources, primarily the media.

It is worth to strengthen the efforts of international anti-terrorism cooperation within the CIS and the CSTO (Minakova, Bukreeva, Masalov, Galchenko and Kharlanova, 2019). The efforts of the international community can be focused on the following directions: development of international legal mechanisms to protect the information space of partner-states from spreading the ideology of terrorism and radicalism, promotion of violence; improve the national legislation aimed at increasing social responsibility and media ethics; thwart by partner-states all kind of terrorist and extremist propaganda on the Internet, given that only national prohibitive legal regulations is ineffective in view of the creation and registration of terrorist sites in other countries; coordinate partner-states' activities of public, cultural and other humanitarian resources in countering the ideology of terrorism and extremism and provide the population with reliable and objective information (RG, 2013).

Conclusion

Analysis of media technologies used by ISIS shows that contemporary terrorism has gone through transformation and actively penetrated the social media space. Contemporary terrorism has a developed media infrastructure and demonstrates a high level of proficiency in advanced technologies, including skills in navigating social platforms. It is actively involved in information wars along with the world's great powers.

The study of existing practices and trends in the development of information counteraction to terrorism shows different approaches to preventing and neutralizing threats of terrorism.

Effective solution of this problem requires coordination of efforts based on public exchange of information on achievements in the field of information security both for individual States and for the world community as a whole. This is due to the fact that modern globalization implies both the globalization of terrorism and, accordingly, the globalization of information counteraction to it.

Abstract

The purpose of the article is to assess the importance of business analysis in the context of new IT initiatives. The authors analyze challenges of IT systems implementation and the role that business analyst can play to mitigate the risk and enable smoother adoption. An example of efficient application of business analysis techniques is given using a case study of CRM implementation. The article proposes the analysis of six techniques including their description, goal and benefit for the examined project. It also includes an action plan elaborated based on the analysis results and its positive impact on the company.

Keywords: Business Analysis, Business Analyst, IT Systems Implementation, CRM.

Introduction

The increasing role of information technology not only in daily operations of companies but also in its products and services drives frequent implementation of new IT systems. In particular, Aghabaghery el all (2020) write about this. The process of software design, development and delivery often takes from several months to several years based on the complexity and balance between bespoke and off the shelf elements. During that time significant number of people from different disciplines is collaborating on the project (development, project managers, enterprise architects, business analysts, product managers and other business stakeholders). Some people will leave the company before the end of the project and new employees will take their place. Without the proper planning and documentation, the project risk to become a never-ending working group without structure or deadlines. Organization of the project lies within the responsibility of the project manager, but another important element is consistent documentation of requirements and other artifacts that is part of business analysis field of study. It enables the transfer of knowledge between different parties in the project and ensures easier handover.

New IT Systems Implementation Challenges

Leaving aside the questions of efficient software design and infrastructure, another main challenge is systems set up and adoption. In every big project the period of hyper-care is introduced in the price and planning representing in average 10-20% of the duration of the project. During that time dedicated personnel helps users to transition from legacy software and create processes around the new one. But in smaller-scale project the hyper-care is often neglected, and users are left with half-configured systems and lack of knowledge to ensure its correct use. This is when business analyst intervention is particularly valuable to create missing processes and train staff on them.

Role of a Business Analyst

Business analysis is a relatively new field of study that emerged as a practical discipline responding to direct need to create an additional layer between technical IT specialists and wider business. As a bridge between IT and business, business analyst plays a role that has two main aspects:

1. Translator from IT to business language and backwards. In order to be efficient in this function, business analyst needs to have a double competence: technical IT systems to be able to communicate with development and thorough knowledge of the company and industry to have a good understanding of business processes. Depending on the organization of the function, business analyst will have to have different proportion of IT vs Business centricity, that can vary from 50:50 to 80:20 (Yayici, 2013, p. 12).

2. Organizer. Depending on whether there is a project manager involved in the project or not, business analyst will take more or less organizational responsibilities. But either way it will be an important part of the job to organize the cooperation of multiple stakeholders. Many of the issues and obstructions to the successful implementation and subsequent usage of the systems stem from absence of structure and communication. Stakeholder infrastructure is not a self-organizing system and need thorough planning and management. Simple activity like having all relevant stakeholders gathered in one meeting to discuss the challenges with the clear plan with actions assigned to relevant people can help resolve quite a few issues. Some issues acquire exaggerated complexity just due to the lack of common understanding and fragmented knowledge of the subject scattered between different actors.

Business Analysis Body of Knowledge

Three main sources of knowledge in business analysis can be distinguished:

1. The main and probably best-known standard for practice of business analysis is the BABOK Guide (A guide to the business analysis body of knowledge) published by the IIBA (International Institute of Business Analysis) (2015). The long handbook was first published in 2006 and has been improving with new techniques and approaches having its 3rd and current edition published in 2015.

2. Other less formal books like Emrah Yayici's "Business analyst's mentor book" (2013) that are also useful in understanding the role.

3. But main source of knowledge in business analysis being a new and applied field is, of course, presented in the internet sources. One of the most popular ones is Roman Pichler's blog (www.romanpichler.com) that has an extensive complex of articles in product ownership and business analysis written by the recognised practitioner.

Business Analysis Techniques

BABOK guide has a description of 50 different Business analysis techniques. To show an example of its application bringing benefits to the business, let's examine a simple case study. A new system (CRM - Customer Relationship Management) being implemented in a firm without a proper methodology resulting in the inability of staff to properly use its functionalities. This has already been written, Ullah, Iqbal and Shams (2020) or Gavval and Ravi (2020) for examples of the banking industry. Previously, we examined the business consequences of increasing the VAT rate in Russia by 2 points (Soboleva, Terenteva, and Kurtseitova, 2019). Company managers could have calculated these consequences in advance, as the government announced VAT reform in 2018. These effects can be calculated in advance, including using CMR.

Table 1 below represents different techniques that can be used to perform business analysis in the case of implementing CRM.

Table 1: Business analysis techniques applicable in CRM implementation case study

Technique	Description	Goal	Benefit (case study)
Stakeholder analysis	Several techniques can be used to identify relevant stakeholders: 1. Stakeholder lists. 2. Stakeholder maps (stakeholder matrix, onion diagram or RACI matrix). 3. Personas: archetype that exemplifies the way a certain kind of users interact with the system.	To identify the stakeholders that can be influenced by the changes in the system, are decision-makers or need to be informed.	RACI matrix is used to ensure that all the requirements are captured and to develop the communication plan to mitigate the risk of fragmented knowledge about the usage of the system.
Root cause analysis	Fishbone diagram (pic. 1) is most widely used along with the five Whys technique (repeatedly asking Why question).	Enables to identify the deep cause of the issue in order to correct the problem itself rather than its effects.	The analysis revealed multiple root causes, ex.: lack of accountability of the vendor, lack of motivation of the IT staff caused by historically ungratifying relationship with marketing.
Document analysis	Consists in going through the documentation about the current solution making relevant notes.	Better understand the current implementation and processes around it, concentrating on discovering inefficiencies.	Analysis of user guides revealed that they were written by users not fully familiar with the solution and contain omissions or long-winded workarounds.
Process modelling	Visual representation of the workflow in a graphical model, usually performed using a diagramming application like MS Visio.	Define the current and future workflow, actors, alternative paths and exceptions.	Visually presenting the process flow enables to simplify the task of streamlining the activities as well as providing documentation for the future reference.
Gap analysis	Analyses the difference between business requirements and current capabilities and consists in the description of current state, future state, gap between them and possible solutions.	To deduct a course of action to bring the current state closer to the desired one.	Analysis showed the necessity to set up additional functionalities in the CRM to be able to perform the full range or required tasks.
Business case	A document consisting of the following elements: 1. Needs assessment: identifies the problem or potential opportunity. 2. Desired outcomes: describes the future state if the need is fulfilled, should be measurable. 3. Alternatives: assessment of each alternative solution (technology or process) in	To provide justification and course of action for the implementation of additional software or process change.	The implemented of a third-party software enabled more streamlined and timelier upload of data in the system.

Technique	Description	Goal	Benefit (case study)
	terms of its scope, feasibility, assumptions and risks as well as implementation cost. 4. Recommended solution: describes the best solution, its cost and duration to implement it.		

Source: based on BABOK guide.

Conclusion

The conducted business analysis in the described above case study enabled to determine the course of actions to improve the efficiency of the CRM usage. Document analysis combined with root cause analyses helped identify the following issues: lack of understanding of the system by the direct users (marketing team) due to a number of reasons: incomplete set up from on vendor's side, lack of training and lack of coordination and support from the IT team. Process modelling via a flowchart helped to change parts of the existing workflow to streamline and simplify it. The proposed solutions during gap analysis were the following: business analyst to step in as a facilitator of the relationship between IT and marketing team, an external consultant to be invited to finalize necessary set up and conduct training for the team. The analysis also revealed the technical challenge around data flow between CRM and other systems that is to be resolved by introducing the third-party tool aimed to partly automate data uploads. Business case is created to obtain the sign-off of the budget for the implementation. The use of business analysis tool as well as the involvement of the business analyst helped to automate a list of marketing-related tasks ensuring time-saving benefit, increased efficiency of marketing campaigns as well as improved morale and relationship between IT and the business.

Abstract

This study investigates the effects of Technological and Human Factors for Big Data Analytics (THFFBDA) on Technological Improvements of (BDA) towards improving decision making by top management in Saudi Higher Education. In this study, Technological factors revolve around Big Data Analytical Tasks (BDATs), where Human factors focus on Big Data Analytics Performers (BDAPs). This paper seeks to enhance our understanding of how these factors impact on the implementation of big data analytics to improve the decisions by exclusives in Higher Education Context. The study draws on the Socio- Technological Theory to define and investigate social technical components for BDA, and the Delone & McLean IS Success Model to highlight the technological improvements of BDA. The study hypothetically presents a model on the potential effects of THFFBDA on decision making among universities' top management, and proposes a mixed methods approach to study the above phenomenon.

Keywords: Technological, Human Factors, Big Data Analytics, Saudi Arabian Universities

Introduction

Developing countries realize the benefits of new technologies for gaining business Values. Saudi Arabia is one of these developing countries that investing in new technologies such as Internet of Things, Artificial Intelligence, and Big Data Analytics to meet the country vision 2030, Communication and Information Technology Commission (CITC, 2016).Big data analytics is one of emerging technologies in Saudi Arabia especially in educational firms, which could enhance value realization for organizations (Günther et al. 2017).Earlier studies have shown how big data analytics can convert and create business values in public and private sectors (Gupta and George, 2016).Although, big data analytics (BDA) researches prove the benefits of big data analytics in various fields, few studies focus on the importance of BDA for supporting decision making in Higher Education in Saudi Arabian Higher Education context (Mukthar and Sultan 2017).

Like other IT and IS instances, BDA is a socio-technical system, which could be shaped by social and technical forces (Günther *et al.*, 2017). To overcome the challenges associated with BDA, we could therefore consider technological and human factors in the implementation and use of BDA. The technological factors revolve around the big data analytics tasks (BDATs) such as storing, analyzing, and visualizing which are inevitably essential for gaining the value of big data analytics and improving decision making in Higher Education Context (Al Ghamdi and Thomson, 2018). To achieve BDA tasks mentioned above, we need to consider the human component, conceptualized in this study as big data analytics performers (BDAPs). BDAPs in the proposed research model include IT academic and non-academics staff who are responsible for the security and privacy of BD for improving decision making in institutions context.

Given the issues discussed above, this research paper presents a model on the effects of Technological and Human Factors in Big Data Analytics (THFFBDA) for improving executive decision making basing on perspectives from the Saudi Higher Education Institutions . The following section discuss the theoretical perspectives on technological and human factors in IT supported environments and the improvement and success of such developments.

Theoretical Background

While there are rapidly expanding literature on big data analytics for improving business performance, there is limited researches empirically grounded on Information System theories that merge social and technological factors(Gupta and George, 2016).Thus, this research paper draws from two important theories. First is Socio-technical theory. Second is Delone & Maclean Information System success model. Besides, we might begin with the socio-technical theory which we named it in this study as big data analytics tasks (BDATs).

Socio-technical Theory

This research paper mainly built on socio-technical theory. This theory is closely connected and supportive of the arguments of this study. Socio-technical theory has been founded by Cherns (1976) and his theory pointed on how the implementation of a new information system can be merged with human factors such as tasks, rules, and culture to achieve organization objectives (Wyatt, 1981). Therefore, in this study, we select components from socio- technical theory that merged technological and human factors which we conceptualized it as big data analytics tasks (BDATs).

Recently, big data analytics has attracted academics and researcher to establish further investigation on the benefits of applying socio-technical theory in big data analytics. One of those studies is reinforced on a suggestive case study, the researcher investigates the actualization of four BDA affordances at an automotive manufacturing company to explain how organizational actions conduce to actualizing BDA affordances. The study concludes that socio-technical perspective, which frames actualization as the process of a recursively shaped on social and technical entities (Dremel *et al.*, 2018).

Delone & Mclean IS Success Model

Delone and Mclean IS success model is the second theory for this research paper. This model was first developed in 1992 as a multidimensional model with interdependencies between the different success categories (Grover *et al.*, 1992). In this research paper, we select those factors which consists of system quality that includes big data security& privacy, as mediating components. We then, shaped these factors as big data analytics technological improvements (BDATI). Thus, these components can assist successful implementation of big data analytics in Higher Education system in Saudi Arabia. Additionally, One of Previous studies that used Delone and Mclean in BDA discussed how is the quality dynamic in big data environment linked with enhancing business value and firm performance (FPER). The study indicates that system quality and information quality are important factors for improving performance aspects (Ji-

fan Ren *et al.*, 2017). Hence, this study aims to investigate on big data technological and human factors for big data analytics in education firmss. Eventually, THFFBDA conceptualized framework of the current study will be discussed in the next section followed by research model and research propositions.

Research Conceptual Model on THFFBDA

Based on reviewed literature, this model is developed based on socio- technical and Delone and Mclean IS success model. The proposed model for this study contains four categories. Big data analytic tasks (BDATs), big data analytics performers (BDAPs), big data analytics technological improvements (BDATI) for successful implementation of big data analytics in Saudi higher education (mediator), and the outcomes of applying these factors, which is improving decision making by top management in Saudi Arabian universities.

Figure 1: Proposed Research Model

Propositions for Emerging Research

The propositions presented in this paper aimed at technological and human factors along with technological improvements for BDA to improve decision making by top management in Saudi Higher Education.

Technological Factors (Big Data Analytics Tasks - BDATs)

Storing Big Data

Big data is characterized by high volume, high velocity, and high variety which posits serious implications on the firm's ability to create sufficient storage that can support quick access to different forms of data (Watson, 2014). Ability to store big data from various sources could support decision making by top managements teams (Alghamdi, 2016). The increasing need to manage a huge volume of data has seen multiple advances in big data systems to fulfil organisational need for scalability and availability which lead to improve the decisions by top management (Siddiqa *et al.*, 2016).

Analysing Big Data

Storing big data and analyses it often go hand in hand. Firms not only store big data, but they are increasingly doubling their big data management tools to support data integration and analysis for better information outcomes (Magdanz, 2014). For instance, universities in Saudi Arabia are considering the possibilities for analyzing stored data for supporting decision making.

Visualizing Big Data

Data visualization is the next big step in big data analytics tasks as firms increasingly adopt different business intelligence and data visualization tools to enhance the management and use of big data. Visualization "has proven effective for not only presenting essential information in vast amounts of data but also driving complex analyses"(Keim et al. 2013, p. 20). Unlike BD storage and analysis, BD visualization is the ultimate step towards enhanced decision making. **Proposition 1a-c**: BDATs (i.e., storage, analysis and visualisation) will be positively related to system quality.

Human Factors (Big Data Analytics Performers – BDAPs)

Academic and non-Academic Information Technology Staff

Other studies argue that the security of information system affected by IT staff (Betz, 2016). Besides, BD systems like other IT systems are prone to the effects of the IT staff that use and maintain these systems (Russom, 2011). In this research academic and non-academic staff is crucial human factor for securing big data within universities in Saudi Arabia as well as ensuring the privacy of BD is taking place. The security and the privacy of BD performed by the system quality. **Proposition 2a-b:** BDAPs will have a positive effect on system quality.

Technological Improvements in Big Data and Improved Decision Making

System Quality

System quality in our research paper is the main theme for BDATI. Besides, system quality is measures as system reliability, accessibility, adaptability, integration, response time and privacy(Ji-fan Ren *et al.*, 2017).However, in this study, system quality measured by allowing big data tasks such as storing, analyzing, and visualizing as well as BD security and privacy, which will ultimately improve decision making.(Siddiqa et al. 2016; Cavallo et al. 2019)

Security of BD

Information security is crucial factor not only in IS failed, but also important for securing BD (Jung, 2017). Data integrity improved decision making, leads to effective decisions and ultimately supports organization planning and control process (Cavallo et al. 2019). Similarly, data available creates efficiency in the organization's decision making process.

Privacy of BD

The role of BD privacy cannot be underestimated. Recently, various researches have discussed the value of BD privacy which allow organizations to gain business values and competitive advantages(Oussous *et al.*, 2018). Therefore, **Proposition 3a-b:** system quality (i.e., System security, privacy) will have a positive impact on improving decision making by top management.

Improving Decision Making by Top Management

The outcomes of the current proposed model is Improving the decision making by top management. Now a days the quality of decision made by top management allow them to improve firm performance. Therefore, the decision made by analyzed data allow Saudi universities to gain business vales (Elgendy and Elragal, 2016).

Research Methods

For the current study, both quantitative and qualitative methods of research will be used to examine the hypotheses and prove the underlying central theme of the proposed research model. First method is quantitative method where data would be collected from IT staff in Saudi Universities which include academic and non-academic through closed-ended surveys (Creswell et al. 2003).Second method for data collection is qualitative method with the purpose to validate/endorse quantitative results. Additionally, qualitative method would be gathered through semi-structured interviews with the top managements and IT managers in Saudi Arabian universities.

Conclusion

This research paper investigates on the effect of technological and human factors that enables the creation, facilitate the process of big data analytics for improving decision making executives in Saudi Arabian Higher Education through big data analytics tasks BDATs and human factors. A conceptual framework is created via extensive research literature that allows the creation of technological and human components that support the implementation of BDA. To conclude, technological and human factors through technological improvements are crucial aspects for improving decision making in Saudi Universities, to achieve it successfully within the organization, human factors which we named it big data analytics performers must include skill full IT staff to gain the business values of these mentioned factors.

ICT Potential of Enterprises Within Industry 4.0 Requirements in New EU Member States

Elzbieta ROGALSKA

University of Wamia and Mazury in Olsztyn, Olsztyn, Poland
elzbieta.rogalska@uwm.edu.pl

Abstract

The article concentrates of the problem of ICT usage by enterprises within the context of Industry 4.0 challenges. The main objective of the paper is to analyse heterogeneity in ICT utilisation by enterprises in the Central and Eastern European countries that joined the EU after the year 2004. The research is done for the years 2010-2018 and it is based on the Eurostat data. The presented scientific problem is considered as a multi-criteria phenomenon. Thus, in the analysis a taxonomic approach was applied based on zero unitarization method. The method enabled to obtain a synthetic measure of development for the analysed phenomenon in the case of group of the countries under consideration. Based on the obtained measure a ranking of the countries was proposed. In the next step the natural breaks method was applied to group the countries into three homogenous subsets. On the one hand, the research confirmed relatively high dynamics of the phenomenon, especially in the group of the less developed economies. On the other hand, it also showed significant disparities between the countries, which are still present. The research can be applied for forming the guidelines and assessing the effectiveness of the national and the EU structural policies, which should aim at supporting utilisation of the Industry 4.0 potential and the conditions for fulfilling this objective.

Keywords: Industry 4.0, ICT usage, multi-criteria analysis, zero unitarization method, natural breaks method, Central and Eastern European countries, New UE members

Introduction

The emergence of Industry 4.0 concept and standards has significantly influenced the modernisation strategies of Central and Eastern European economies (Simionescu et al., 2017; Kuc, 2017; Jasinska & Jasinski, 2019). It has been not only considered as strictly technological phenomenon (Balcerzak, 2016a; Romeo et al., 2020; Asim et al., 2020), but it has resulted in the growing importance of higher quality management of human capital both at micro and macro level (Hariharasudan & Kot, 2018; Mačerinskienė & Survilaitė, 2019; Markhaichuk & Zhuckovskaya, 2019; Stankevičienė et al., 2019). It has created new challenges for entrepreneurs and policies requirements for supporting entrepreneurship (Pietrzak et al, 2017; Rogalska, 2018; Virglerová, 2018; Bartosik-Purgat & Ratajczak-Mrozek, 2018). It has also created new managerial and organizational standards at corporate level (Pisar & Bilkova, 2019). These issues are of special importance for Central and Eastern European Union countries that still face the problem of closing their development gap and increasing international competitiveness of the economy, as the ability to use the potential attributed to Industry 4.0 can give a new impetus in the process of modernization (Braja & Gemzik-Salwach, 2019; Bilan et al., 2019). On the other hand, in the case of ineffective public policy, the challenges already pointed, can also lead to "Industry 4.0 underdevelopment trap" (Ślusarczyk, 2018; Nimeczyk et al., 2019; Prause & Atari, 2017).

Within this context it is needed to provide current common understanding of the main issues relating to the concept of Industry 4.0. Since the emergence of the idea at the 2011 Hanover Fair in Germany, the term Industry 4.0 has been related to the comprehensive digitisation of industrial production that transforms all aspects of production processes based on new technological achievements, including digitalisation and robotisation, artificial intelligence and the Internet of things (IoT), new materials and biotechnology (Krykavskyy et al., 2019; Vasin et al ., 2018; Buhr & Stehnken, 2018).

Taking into consideration the above given arguments it is obvious that a basic condition to be able to utilise the potential of Industry 4.0 phenomenon and to avoid its threats is to build effective ICT infrastructure (Lechman, 2018). It is currently unquestionable that the infrastructure is the first condition for effective utilistaion of cyber-physical systems, the internet of things, cloud computing or finally cognitive computing and artificial intelligence.

As a result, the main objective of the article is to analyse heterogeneity in ICT potential of enterprises in the Central and Eastern European countries that joined the EU after the year 2004. The research was done at the aggregated national level. Based on the availability of crucial Eurostat data the research was done for the years 2010-2018. In the research zero unitarization method was used for proposing the ranking and obtaining the data for grouping the countries with application of natural breaks method.

Methodology

In order to reach the objective of the research zero unitarization method was used, due to fact that the problem under research was considered as a multi-criteria phenomenon (see Kiseľáková et al., 2019; Piersiala, 2019; Liu et al., 2019; Balcerzak, 2020). The current research should be considered as a preliminary study, therefore, the applied method was mostly chosen due to its simplicity, its high recognition among researchers within social sciences, and common empirical applications in economics and management sciences (Kukuła & Bogocz, 2014). In the case of economics the application of the method can be found for multi-criteria studies on fiscal activities of the countries (Balcerzak, 2016), innovation activities of enterprises at the national level (Zygmunt, 2017), analyzing the entrepreneurial potential (Rogalska, 2017, 2019) and quality of information infrastructure within the context of knowledge-based economy at regional level (Wierzbicka, 2018), or research on obtaining the aims of Europe 2020 plan (Balcerzak, 2015).

In the case of current study the zero unitarzation method was applied for a dynamic research. As a result a constant reference point for the whole analytical period was applied here (Kukuła & Bogocz 2014; Wierzbicka, 2017). In the case of multi-criteria analysis the set of potential diagnostic variables should be analyzed with respect to the taxonomic information effectiveness criteria. The variables should be characterized with low correlation, high space variation and information significance (see Cheba, 2017; Szopik-Depczyńska et al., 2018, 2019). Then, a set of diagnostic variables should be shared classified into two groups: stimulants and dis-stimulants. The stimulants are considered as variables that improve the situation of analyzed object. The dis-stimulants describe the aspects that hamper the position of the object (Hellwig, 1972). In the case of current research only stimulants were selected for the research. Therefore, based on the assumption of keeping constant reference point the stimulants are normalized with application of equation 1.

$$z_{ijt} = \frac{x_{ijt} - \min\limits_{it}\{x_{ijt}\}}{\max\limits_{it}\{x_{ijt}\} - \min\limits_{it}\{x_{ijt}\}} \; (i = 1, 2 \ldots n); \; (j = 1, 2 \ldots m); \; (t = 1, 2 \ldots l), \; N(x_{ijt}) \in [0, 1] \quad (1)$$

where: x_{ijt} is a diagnostic variable for a given country in a given year.

After normalization procedure the synthetic measure (SMD_{it}) describing analyzed phenomenon can be obtained with application of equation 2.

$$SMD_{it} = \frac{1}{m}\sum_{j=1}^{m} z_{ijt} \quad (2)$$

$$(i = 1, 2 \ldots n); \; (j = 1, 2 \ldots m); \; (t = 1, 2 \ldots l); \; SMD_i \in [0, 1]; z_{ij} \in [0, 1]$$

where: SMD_{it} is a synthetic measure of development for the analyzed phenomenon in a given year.

In the next step, the obtained data on *SMD* was used for grouping the countries into three homogenous subsets. For this purpose natural break method was used. The method is based on the procedure of minimization of variance for objects from the chosen subsets and maximization of variance between the subsets (Jenks, 1967; Balcerzak & Pietrzak, 2016).

Results

In the current research the new member states of the EU were analysed in the years 2010, 2014 and 2018. In the preliminary stage of the research the analysis for the whole EU countries was done with application of Ward method, which indicated that the Central and Eastern European countries are similar enough to concentrated on. Additionally, the analysed group of countries is characterized with relatively similar level of socio-economic development, which makes them comparable. The research was done based on Eurostat data. The set of diagnostic variables was chosen based on the literature review (see Balcerzak & Pietrzak, 2017; Wierzbicka, 2018; Ozcan, 2018; Batkovskiy et al. 2019; Pogodina et al., 2019) and mostly restricted by data availability for the whole panel of countries. Due to this reason such data as cloud computing services or applications of social media with use enterprise's blog or microblogs or the data on the development of e-administration could not be included in the research. Due to special importance of small and medium sized enterprises for development of the analysed countries (Kljucnikov et al. 2016, 2018; 2019; Meyer & Meyer, 2017; Patora-Wysocka, 2018; Haviernikova et al., 2019; De la Hoz-Rosales et al., 2019; Succurro & Costanzo, 2019), when it was only possible (based on data availability) the diagnostic variables devoted to small and medium sized enterprises were added. It should be also stressed that it was assumed that the research concentrates on the real economy, as a result the data on enterprises without financial sector was applied here. The set of diagnostic variables applied in the research is given in table 1.

Table 1: Diagnostic Variables

ICT Usage in enterprises	
X_1	E-commerce purchases - enterprises having purchased via computer mediated networks (Percentage of enterprises)
X_2	E-commerce purchases - small enterprises (10-49 persons employed) having purchased via computer mediated networks (Percentage of enterprises)
X_3	E-commerce sales - Enterprises having received orders via computer mediated networks (Percentage of enterprises)
X_4	E-commerce sales - small enterprises (10-49 persons employed) having received orders via computer mediated networks (Percentage of enterprises)
X_5	Value of e-commerce sales - Enterprises' total turnover from e-commerce (Percentage of turnover)
X_6	Value of e-commerce sales - small enterprises (10-49 persons employed) total turnover from e-commerce (Percentage of turnover)
Employment based on ICT	
X_7	Use of computers and the internet by employees - Persons employed using computers with access to World Wide Web (Percentage of total employment)
Connections to the internet within Industry 4.0 standards	
X_8	Enterprises with broadband access (Percentage of enterprises)*
X_9	Small enterprises (10-49 persons employed) with broadband (Percentage of enterprises) *
Websites and functionalities	
X_{10}	Enterprises with a website (Percentage of enterprises)
Integration of internal processes	
X_{11}	Enterprises who have ERP software package to share information between different functional areas (Percentage of enterprises)

*Note: * Data for the year 2017 was used due to availability of data for 2018; ** Data for the year 2019 was used due to availability of data for 2018.*
Source: own work.

The obtained rankings of the analyzed countries for the years 2010, 2014, 2018 and the dynamics of the synthetic measure of development for the years 2010-2018 is given in table 2.

Table 2: Synthetic Measure of Development (SMD) based on zero unitarisation method for EU-13

Country	SMD_{i2010}	No.	SMD_{i2014}	No.	SMD_{i2018}	No.	Dynamics in the years 2010-2018 in %
Czechia	0.6079	1	0.8881	1	0.8965	1	47.47
Lithuania	0.5510	3	0.6065	4	0.7804	2	41.62
Slovenia	0.4711	5	0.6292	3	0.7542	3	60.09
Estonia	0.4439	6	0.5684	6	0.6618	4	49.08
Malta	0.4910	4	0.5899	5	0.6554	5	33.50
Croatia	0.5540	2	0.7025	2	0.6454	6	16.51
Slovakia	0.3305	8	0.5442	7	0.6117	7	85.11
Hungary	0.3358	7	0.4697	9	0.5604	8	66.88
Poland	0.2583	10	0.4335	10	0.5512	9	113.39
Latvia	0.2079	11	0.3906	11	0.5484	10	163.78
Cyprus	0.2819	9	0.5419	8	0.5372	11	90.57
Romania	0.0906	12	0.2802	12	0.3182	12	251.26
Bulgaria	0.0536	13	0.2466	13	0.3107	13	479.28

Source: own estimation based on Eurostat data: https://ec.europa.eu/eurostat/data/database.

Finally, the natural breaks method was used for grouping the countries into three homogenous subsets based on SMD values in the years 2010, 2014 and 108. The results are given in figures from 1 to 3.

Fig. 1: Grouping of the countries based on natural breaks method in the year 2010

Fig. 2: Grouping of the countries based on natural breaks method in the year 2014

Fig. 3: Grouping of the countries based on natural breaks method in the year 2018

The conducted analysis confirms relatively high stability of the obtained results, where the Czech Republic, Slovenia and Baltic countries with exception of Latvia can be considered as the leaders. The mentioned countries were generally grouped in class 3, which is characterised with the highest level of ICT utilisation by enterprises. On the opposite side, in the class 1, groping the countries with the lowest level of SMD, in the first and last year of the research we have Bulgaria and Romania, additionally in the year 2010 Poland and Lithuania could be found here.

Poland as the biggest economy of the region was rated at the 10th position in the years 2010 and 2014 and moved to 9th position in the year 2018. This result can be considered as negative not only from the perspective of Polish society, but also from the perspective of the competitive position of the whole Central Europe as one region.

The dynamics of the SMD measure starting with the Czechia with 47% growth and finishing with Bulgaria with the growth of almost 480% confirms quick modernisation process of the analysed economies. Especially, the results obtained by Bulgaria and Romania as the least developed countries can be considered as very positive. But still the distance between these two relatively big economies

and the leaders is very high, which confirms relatively high heterogeneity between the counties and it shows the scale of challenges in building basic infrastructure for utilising the Industry 4.0 potential in the region.

Conclusions

The aim of the article was to assess the heterogeneity in ICT usage by enterprises in the Central and Eastern new EU member states in the years 2010-2018. In the research zero unitarization method with dynamic approach and natural breaks methods were used for obtaining the rankings of the countries and grouping them. From the empirical perspective the conducted research provides the following new information to the literature in the field: First of all, the study has confirmed relatively high dynamics of the phenomenon. What is especially important the speed of positive changes for two least advanced economies Romania and Bulgaria were especially high. However, the research also confirms that in spite of this dynamic changes the high heterogeneity between the countries is still present, which can affect negativity to potential for closing the development gap.

This research should be applied for monitoring the countries or regions, therefore for forming the guidelines and assessing the effectiveness of their national and regional modernisation policies, and finding good benchmark examples. The suggested methodology of the multi-criteria analysis can be easily modified, it is replicable and can be adjusted to the specific detailed analytical aspects of the phenomenon or to more regional research under condition of data availability, which is crucial for obtaining the current information on that complex issue.

The author is aware, that the presented research can be considered as preliminary and is not free form important limitations, which should be stressed here. First of all, the main limitation of the current research can be attributed to general critics addressed to all kind of multi-criteria studies in social sciences, which are usually affected by the normative approach of the researchers and therefore possibilities of affecting composite indicators. This issue was very well analyzed by Kuc (2019) and Kuc-Czarnecka et al. (2020). Then the objective problem of data availability significantly affects the information quality of the research.

Abstract

The phenomenon of social exclusion brings many negative consequences not only from the microeconomic perspective affecting individuals, but also it is of crucial importance from the macroeconomic perspective of social stability and policies affecting long term growth. Within this context the current research aims to provide deeper inside into relationships between social exclusion, life satisfaction, trust in institutions and households income in Poland. As investigated phenomena are mostly unobservable and multidimensional ones, which are significantly affected also by psychological factors, we decided to apply the Structural Equation Methodology (SEM). The analysis was run based on the data for Poland taken from the Fourth European Quality of Life Surveys (EQLS 2016). The research confirmed some negative factors such as an increase in social tensions, and negative attitude of Polish society towards an increase in income disparities and participation in benefits form economic growth. The obtained empirical outcome can be used in the process of building national and regional strategies supporting sustainable long term growth not only for Poland, but they can be used as benchmark results for other Central and Eastern European Economies.

Keywords: social exclusion, Poland, European Quality of Life Surveys (EQLS), Structural Equation Modeling (SEM) .

Introduction

The article concentrates on the issue of social exclusion in Poland. At the beginning of the 1990s, Poland began its political transformation. The institutional reforms carried out and Poland's accession to the structures of the European Union has resulted in systematic socio-economic development (see Simionescu et al., 2017), which to some extent supported the process of reducing the level of social exclusion. In the last three decades, in the case of Poland and other Central and Eastern European countries undergoing rapid economic modernization, among the macroeconomic factors influencing positively the level of social exclusion one can find institutional changes in economies resulting in improvements in quality of institutors, development of the digital economy with its benefits and threats for social exclusion (see Pietrzak & Ziemkiewicz, 2018a, 2018b; Balcerzak & Pietrzak, 2017), an increase in the level of innovation (see Szopik-Depczyńska et al., 2018a; 2018b), and improvement in the labor market (Hadaś et al., 2016; Dmytrów & Bieszk-Stolorz, 2019; Bieszk-Stolorz & Dmytrów, 2019; Tatarczak & Boichuk, 2018; Landmesser, 2019). It should be emphasized that strong economic convergence processes has been observed in Poland and Central Europe since 2004, which is a consequence of the country's membership in the EU structures and the abilities of Polish economy, and the whole Central European region to benefit from the processes related to globalization (see Kuc, 2017; Hadaś-Dyduch, 2016; 2018; Jankiewicz, 2018a; 2018b; 2018c; Hadaś-Dyduch et al., 2019). Despite these positive processes, the phenomenon of social exclusion both in Poland and other Central and Eastern European countries is still a threat to the persistence of long-term sustainable growth.

Therefore the main objective of current article is to provide deeper inside into relationships between social exclusion, life satisfaction, trust in institutions and households income in Poland. To reach that objective SEM model is used. It seems that the structural equation modeling (SEM) method can be a good alternative in research on social exclusion (Hajdu, 2003; Sam & Bayram, 2017; Temporin, 2019).

Literature Review

In the current research the empirical contribution concentrates on Poland as a country that can be considered as an example of relatively successful transformation from central planned to market economy. It should be emphasized, however, that the phenomenon of social exclusion itself is not a problem concerning only post-transformation Central and Eastern European countries. It is also a very serious policy problem on a whole European Union basis. From the time when the Lisbon Treaty was launched, social exclusion, or rather counteracting its occurrence, has been a critical element of the EU's sustainable growth policy. The European Pillar of Social Rights proclaimed in 2017, together with Europe 2020 strategy and EU Youth Strategy are a policy response to this problem (Balcerzak, 2015).

Form the theoretical perspective the phenomenon of social exclusion is the subject of special interests for social science researchers specialising in political sciences, sociology, psychology and economics (Atkinson & Davoudi, 2000). Notwithstanding, researchers agree that social exclusion is a multidimensional phenomenon that can be observed both in an economic and socio-cultural context (Charavarty & D'Ambrosio, 2006; Jehoel-Gijsbers & Vrooman, 2007; Levitas et al., 2007; Mathieson et al., 2008; Sam & Bayram, 2017). The most popular approach in the analysis of social exclusion is to understand it as an exclusion mainly from consumption goods and services (Jankiewicz & Pietrzak, 2019; Pietrzak & Jankiewicz, 2019), and from the labour market or social relations. The last element is strongly connected with the households or individuals income, allowing to determine how deep the poverty of the analysed entity is (Böhnke, 2001; Moffatt & Glasgow, 2009 Jankiewicz, 2018b; Novo-Corti et al., 2019). It would seem, therefore, that this is an individual problem, while in fact, social exclusion affects both the quality of life of individuals and the equity and cohesion of society as a whole (Lee, 1999; Nowak, 2018; Miłek, 2018; Bernard et al., 2019; Cyrek, 2019; MacLeod et al., 2019; Pourahmad et al., 2016; Power, 2001).

Due to its character, social exclusion is typically analysed as a set of separate indicators or as a composite indicator (Pietrzak, 2019; Giambona & Vassallo, 2014; Mathieson et al., 2008). However, the growing criticism of composite indicators (Kuc-Czarnecka et al., 2020; Kuc-Czarnecka, 2019; Muller, 2018; OECD & JRC, 2008; Romer, 2015) encourages the application of other research approaches. These factors were the main determinant of the choice of the methodological approach applied in empirical part of the article, which is presented in the next section.

Research Methodology

Due to the complex and multidimensional nature of social exclusion, we decided to use the SEM approach as an analytical tool (Derevianko, 2019; Pietrzak. & Balcerzak, 2016). In short, the SEM model is the effect of a merger between confirmatory factor analysis and the causal models built on its base. The variables are not measurable in a direct way as they represent a set of observed variables strongly correlated with each other. They are hypothetic conceptual structures and are treated as potential determinants that influence the category that is under consideration. In general, the SEM model consists of two parts (Balcerzak & Pietrzak, 2016a; Pietrzak et al., 2018):

1. internal model – describing the casual dependencies,
2. external model – which is used to measure endogenous and exogenous latent variables.

An internal model can be described as:

$$\overline{\eta} = B\overline{\eta} + \Gamma\overline{\xi} + \overline{\zeta}, \quad (1)$$

where: $\overline{\eta}$ - vector of endogenous latent variables,
$\overline{\xi}$ - vector of exogenous latent variables,
B - matrix of regression coefficients at endogenous variables,
Γ - matrix of coefficients at exogenous variables,
$\overline{\zeta}$ - vector of disturbances.

While the external one:

$$\overline{Y} = \Pi_y \overline{\eta} + \overline{\varepsilon}, \quad (2)$$

$$\overline{X} = \Pi_x \overline{\xi} + \overline{\delta}, \quad (3)$$

where: $\overline{Y}$ - the vector of observed endogenous variables,
$\overline{X}$ - the vector of observed exogenous variables,
Π_y, Π_x - matrices of factor loadings,
$\overline{\varepsilon}$, $\overline{\delta}$ - vectors of measurement errors.

Usually, the models are fitted by maximum likelihood, and likelihood ratio tests can be used to compare the fit of nested models. Among the measures of goodness-of-fit of the SEM model the most crucial are: IFI, TFI, RFI, NFI, CFI and RMSEA. The detailed description of assumptions and procedures of SEM modelling can be found in the world literature (Bollen, 1989; Byrne, 2010; Goldberger, 1972; Kaplan, 2000; Kline, 2010).

In our paper, we used Eurofound's European Quality of Life Survey (EQLS) data from 2016 wave. The EQLS database provides a means to monitor and assess outcomes of social progress, also about social exclusion. The EQLS provides responses to 104 questions from which we have selected only those issues related to social exclusion. The data set selected by us contains the following latent variables:

- Y_1 – the quality of public services – including seven sub-factors, such as quality of health services, education system, public transport, child care services and state pension system.
- Y_2 – perceived social exclusion – including four sub-factors assessing persons's feelings about given statements: 'I feel left out society', 'Life has become so complicated today that I almost can't find my way', 'I feel that the value of what I do is not recognised by others' and 'Some people look down on me because of my job situation or income'.
- Y_3 – life satisfaction – including eight sub-factors, such as general life satisfaction, satisfaction with education, job, standard of living, family life, local area
- Y_4 – life optimism – including four sub-categories – optimism about own future, optimism about children's and grandchildren's future, sense of meaningful existence and sense of freedom.
- Y_5 – social tensions – including five sub-factors: tensions between poor and rich, management and workers, men and women, different racial groups, different religious group.
- Y_6 – trust in institutions – including seven sub-factors, for example, trust in parliament, the legal system, police, government, municipal authorities or banks.

The estimated model also includes four quantitative variables, i.e.:

- X_1 - equivalised monthly household income in PPP euros,
- X_2 - social exclusion index,
- X_3 - WHO-5 mental wellbeing index,
- X_4 - average satisfaction with public services.

The choice of these factors has support in the literature. The first latent variable describing the quality of public services can be used as a proxy of the conditions in place in a region, and as research shows, social exclusion depends on these factors (Di Cataldo & Rodríguez-Pose, 2017). Moreover, social exclusion is influenced by institutional quality (Di Cataldo & Rodríguez-Pose, 2017; Balcerzak & Pietrzak, 2016b; Balcerzak, 2020), since those are perceived as drivers of effective social development policies. Moreover, regions with effective and accountable governments, the efficient rule of law and low corruption have been more able to establish measures to control social exclusion than regions with a worse government quality (Di Cataldo & Rodríguez-Pose, 2017). Variables denoted as latent variable Y_2 capture the sense of connectedness and sense of barriers to participation in broader society (*Third European Quality of Life Survey Quality of life in Europe: Impacts of the crisis*, 2012). According to the previously mentioned research, the perceived social exclusion has a moderate negative correlation with measures of subjective well-being.

We have also decided to include factors concerning life optimism and life satisfaction in our research as social exclusion is associated with lower mood, self-esteem and sense of meaningful existence (Bayram et al., 2012; Fuhrmann et al., 2019; Robila, 2006), and committing a suicide that can be perceived as the worst form of social exclusion (Pohlan, 2019). Social exclusion decreases peoples' perceived strength of belonging to one's immediate neighbourhood (Appau et al., 2019), which directly translates into a feeling of security in the immediate environment and influences subjective wellbeing (Pena-Lopez et al., 2017). Figure 1 shows the structural equation model estimated based on the variables presented above.

Fig. 1: SEM model for social exclusion.

Source: Authors' study.

In our research, we focus on estimating hypothetical structural path coefficients on the one hand and testing their significance on the other.

Empirical Analysis

Based on the data and model presented in section 2 of this article, the following parameter estimates were obtained (Table 1).

Table 1: Parameter estimation results – the structural part of the model

Dependence	Standardised estimate	p-value
Y2 ← X1	0,036	0,311
Y1 ← X1	0,024	0,511
Y5 ← X1	0,079	0,020
Y6 ← X1	0,077	0,021
Y3 ← X1	0,186	~0,00
Y4 ← X1	-0,072	0,042
X2 ← X1	-0,033	0,298
X4 ← X1	0,045	0,151
X3 ← X1	0,156	~0,00

Source: Authors' study.

The results obtained for the structural part of the model, contained in Table 1, indicate that not all dependencies are statistically significant. It turned out that based on the analysed sample, equivalised monthly household income in PPP euros (variable X_1) does not have a statistically significant impact on perceived social exclusion (Y_2), the quality of public services (Y_1), social exclusion index (X_2) and average satisfaction with public services (X_4). Statistically significant parameters estimates for variables Y_3, Y_5, Y_6 indicates that there is a weak increase in social tensions, trust in institutions and life satisfaction caused by the increase of the equivalised monthly household income in PPP euros. On the other hand, the negative impact of household income growth on life optimism of the respondents is surprising. However, it seems that it should be combined with an increase in income disparities in society. For the reason that, in general, society does not participate evenly in economic growth. Table 2 contains the results of the confirmatory factor analysis. The first column contains dependencies between the observed variable and latent variables.

Table 2: Results of the confirmatory factor analysis

Latent variable	Standardised estimate	P-value	Latent variable	Standardised estimate	P-value
Y1			**Y5**		
Y1_1	0,547	---	Y5_1	0,669	---
Y1_2	0,691	~0,00	Y5_2	0,633	~0,00
Y1_3	0,648	~0,00	Y5_3	0,583	~0,00
Y1_4	0,709	~0,00	Y5_4	0,645	~0,00
Y2			Y5_5	0,74	~0,00
Y2_1	0,677	---	Y5_6	0,725	~0,00
Y2_2	0,718	~0,00	Y5_7	0,734	~0,00
Y2_3	0,661	~0,00	**Y6**		
Y2_4	0,616	~0,00	Y6_1	0,851	---
Y3			Y6_2	0,746	~0,00
Y3_1	0,843	---	Y6_3	0,628	~0,00

Y3_2	0,817	~0,00	Y6_4	0,593	~0,00
Y3_3	0,556	~0,00	Y6_5	0,847	~0,00
Y3_5	0,823	~0,00	Y6_6	0,634	~0,00
Y3_6	0,624	~0,00	Y6_7	0,467	~0,00
Y4					
Y4_1	0,784	---			
Y4_3	0,664	~0,00			
Y4_4	0,652	~0,00			

Source: Authors' study.

The results obtained for the latent variables, contained in Table 2, indicate that all loading factors are statistically significant. Almost all of the 'standardised' values contained in Table 2 are close to 0,70, confirming a proper identification of the latent variables.

The next table (Table 3) summarises goodness-of-fit measures of estimated models. The IFI value of the estimated SEM model is 0.631, which provides information about the correct fitting of the estimated to empirical data. However, RMSEA for the default model is slightly too high (desired value for a good fit is around 0,08).

Table 3: Goodness of-fit-measures

Model	NPAR	CMIN	CMIN/DF	IFI Delta2	TLI rho2	CFI	NCP
Default	110	6584,075	11,863	,631	,604	,630	6029,075

Discussion

The obtained empirical results are consistent with other previous studies in the field, which were obtained both with application of different methodological approaches and concentrated on different perspectives towards the issue. The result is consistent with the empirical research done for the year 2011 by the Central Statistical Office, which was based on the survey concentrating on the multivariate aspects of the quality of life recommended by the Stiglitz-Sen-Fitoussi Report (See: Central Statistical Office, 2013).

The presented analysis is also in line with the contribution provided by Owen et al. (2016) who indicated that social inclusion improvements are the result of a complex set of factors on the demand and supply side, which include macro-level institutional reforms and changes to local service delivery for inclusion of vulnerable groups, mobilization and capacity support, and strategies for local employment generation.

Conclusions

The issue of social exclusion is of high importance from the perspective of long term sustainable growth both for individual countries and the European Union as a whole. Therefore, it must be the subject of constant monitoring and research. In current empirical proposal, which has been done for Poland, the social exclusion is considered as a multi-criteria phenomenon that is described with latent variables. Therefore, in the research the Structural Equation Methodology was applied. The research was based on the data Fourth European Quality of Life Surveys (EQLS 2016). Form the methodological perspective the article confirms the high usefulness and applicability of Structural Equation Modeling in the process of analysis of social exclusion.

From the empirical perspective the obtained results provide new information in the field with respect to the social tensions in Polish society, which can be present during relatively good economic conditions of the research. To be specific the research confirmed some negative factors such as an increase in social tensions, and negative attitude of Polish society towards an increase in income disparities and the fact that in general, society does not participate evenly in economic growth.

The outcome of the research is not fee from limitations, which are mostly related to the latent character of the phenomenon under evaluation. Therefore, the value of the contribution is significantly affected by the choice of the diagnostic variables and availability of data. Additionally, it must be remembered that the phenomenon of social exclusion can be affected by cyclical factors that cannot be included in the current study.

The outcome of the research can be used in the process of forming national and regional strategies aimed at improving the welfare of society and supporting sustainable long term growth not only for Poland, but they can be used as benchmark results for other Central and Eastern European Economies.

Abstract

The paper proposed approach for demand assessment of retailer in residential zone. Implications made for on one of the consumer's zone. Accordance with the algorithm for determining the boundaries of the area servicing the retailers, the service zone was established. On the next stage the urban trading area of service was determine, 11 retailers were found and underline, the zone was divided into 10 districts. A origin-destination matrix of distances from the zone of households to the retailer was calculated, also, in this section the factor of non-linearity and slope factor were estimated. Limitations consist of data used in experiment. Further, the probability of visiting retailers was estimated. The regression models of parameters of purchase process were established. The aim is to developed an approach for demand assessment of retailer in residential zone considering end-consumers, retailers and their surrounding.

Keywords: Consumers, end-users, zone, service, non-linearity factor, slope factor.

Introduction

The market is currently based on competition. Manufacturers of goods and services, shops, shopping centers, cities and countries compete among themselves. Thanks to this, the end-users receives a better product, at a lower price for similar products (Birkin, Clarke, Clarke, 2017).

In order to increase customer loyalty and sales growth, modern trading enterprises offer many additional services, becoming centers of socialization and leisure activities. The International Council of Shopping Centers studies have shown that in general the concept "live, work, shop, play" is interesting to more than half (56%) of the adult, and the availability of retailers, cafes and restaurants near the place of residence directly affects people's satisfaction with the quality of life (Mixed-Use Properties: A Convenient Option for Shoppers, 2019). The prospects of the proximity to retail stores were also appreciated by other service sector participants, especially travel agencies and hotels. Moreover, according to results from the University of Wisconsin and Center for Community Economic Development, in this case the benefit is mutual, since shopping is an important component of tourism activities (Sharma, Chen, Luk, 2018).

It becomes important for the enterprise to evaluate the unknown capabilities of competitors, predict their actions and analyze the degree of competitive threat. In this regard, the analysis of the competitive environment sets the following main goals and objectives: determining the type of competitive market; identification of actual and potential competitors, determination of the number, type and size of competing firms; calculation of market share occupied by competitors; characteristics of the intensity and direction of competition; identifying strengths and weaknesses, strategies and evaluating the competitiveness of their competitors' products; analysis and forecasting of competitor's behavior in the market, his reaction to various marketing actions (Halkin, et al., 2019).

Many years of practical experience using geomarketing research proves that geography plays a key role in business success. In the retail sector, for which the national science uses Anglicism «retail», choosing a place for a new business is a fundamental decision, since even a small mistake in this matter can multiply the financial risks. In the 80-90s, most retailers around the world, when choosing the location for the construction of a new outlet, relied on the methods of «intuitive choice» (Reilly, 1963; Nakanishi & Cooper 1974), «checklist» (Colomé, Lourenço, Serra, 2003) and the «method of analogies» (Huff, 1964). An intuitive choice, considered the simplest method of spatial analysis, consists in making decisions by the company manager primarily on the basis of intuition, after visiting potential sites for construction (Louviere, Hensher, Swait, 2000). Despite its apparent simplicity, this method should not be underestimated, since the intuition of an experienced manager, supported by experience, is a significant factor in making decisions (Fotheringham, Brunsdon, Charlton, 2000). In economic geography, this method is well known as «peer review». However, it is obvious that this method is subjective and time-consuming, as it is often complicated by contradictions that arise among decision-makers, as well as an increase in the number of factors affecting the choice of site (Galkin, 2018).

The checklist method, which is most suitable for preliminary selection of potential sites for the construction of a shopping facility, is a set of procedures for assessing the location of a shopping facility relative to specified parameters, such as, for example: structure and size of a potential shopping area, traffic density, ease of access, competitors proximity, etc (Shubenkova, et al., 2018). To decide on the most successful, according to experts, sites, potential variants are evaluated by weighing the parameters and further ranking the objects by weighted parameters (Colomé, Lourenço, Serra, 2003). An analog approach is to calculate the possible sales volume of a new property by comparing (analogy) with another retail facility, often of the same retail network, having similar characteristics, location and trading area (Halkin, 2020). Experts, by conducting surveys of visitors or regression modeling, find out the factors affecting the profitability of the outlet which is the object of comparison (Oruc and Tihi, 2012). Potential sites for building a store are then compared based on

identified factors (Hernandez & Biasiotto, 2001). The success of such a method largely depends on the ability to find a similar object for comparison.

Certain parameters of existing models and methods do not provide a systematic approach to determining retailer visiting probability according to integration of end-users factors, retailer factors and enviromental factors. Therefore, purpose of study is: development of the approach for demand assessment of retailer in residential zone including geographical, demographic of the service area and the economic, technological parameters of the retailers.

Methodology

Modern forms of retail include three main types of retailers: hypermarkets, supermarkets, and discount stores, while the traditional form of retail is called «home shopping» (Galkin, et al., 2019b). The form of retail forms the parameters of retailers: area, time of service, range, number of cash desks, etc. To relate the change in price and volume of demand in one indicator, using relative changes in prices and quantities that are independent of their units of measurement, is possible using elasticity of demand.

Elasticity shows how many percent one variable changes when another changes by one percent. The degree of influence of individual parameters of the product can be determined only in stable conditions of the external and internal environment. The more significant are changes in the environment, the sharper is the dynamics of demand, the more active factors associated with end-consumer properties work (Galkin, et al., 2018).

The area of service based on marketing approaches (Popa, 2015). The retailer service area has formed under influence on individual end-consumer behavior parameters (Verroios, Efstathiou & Delis, 2011), geographic characteristics of the territory (Russo & Comi, 2012), tech. Considering the influence of these parameters will allow adjusting the limits of the retailer's service area, which will more accurately evaluating the demand. The presented zone is the basis for gathering socio-economic information about the service area (Halkin, 2020; Galkin et. al, 2019a). Taking into consideration the influence of these parameters will allow to adjust the boundaries of the service area. In order to estimate the boundaries an algorithm is used, which consists of 5 stages, described at fig. 2.

Figure 2: The method of the boundaries of the store's service area setting

For calculations, the zone of the first level (residential type) was chosen. The study was conducted for a retailers in Kharkiv, Ukraine. The received research area is the primary service area (fig. 3).

Figure 3: Adjusted trade area:

1 – microdistrict; A – stores; ★ - retailer

The supermarket "Posad" was chosen as a retailer, located at the following address: Valentynivska street 26, Kharkiv. The next stage was to determine the service zone, the retail outlets in the chosen zone were considered too, and the zone was divided into 10 districts. Also, in the first section, a matrix of distances from the neighbourhood to the retailer was calculated, also, in this section the factor of non-linearity and slope factor were estimated (Schlosser, et. al., 2019).

Retailers of different ownership and legal forms, as well as individual entrepreneurs who use different forms of trade organization (formats) are considered in the model.

Presented trading zone analysis (Fig. 3) indicates a large cluster of retailers in it – 11 units. 25 retailers are not included in the trading area, "waived" after correction. According to this it is possible to determine: the area; quantity of inhabitants; end-user income and behavior; distances from buildings and stations of urban passenger transport to retailer (places of gravitation); calculate the time of movement to each retailer. In the table 1 are distance from the zone to the stores by air and along the way.

The trip-based approach was used for customer movement calculations (Galkin et al, 2019a). Multi-objects purpose of buyers, when the attends several shops not considered in the paper.

Table 1: Origin-Destination distance matrix from zone of households to stores

Store	Consumer's zone							
	1	2	3	4	5	6	7	8
ATB	0,796	0,6	1,2	1,15	1,08	1,51	1,59	1,99

Results

For an hour, namely from 18:00 to 19:00, in the retailer under consideration there was a certain number of packages sold for delivering goods home. The chart below (Figures 4-5) shows the total number of packages sold per hour. The largest number of packages was sold with a carrying capacity of 5 kg, the lowest number of packages was sold with a carrying capacity of 30 kg.

The above diagram characterizes the dependence of the total volume of sales on the package carrying capacity. As can be seen from the diagram, most of the number of purchases is delivered to the place of consumption in packages with 10 kg carrying capacity.

At the next stage, field studies were carried out, as a result of which information was obtained on the flow of customers and the volume of sales for a certain time.

After an analysis of sales volumes during the operation of the trading facility, data were obtained on the average sales per hour, namely 777 kg, and the average sales per person – 6.4 kg.

Figure 4. Chart of the purchase frequency of packages of different carrying capacities

Figure 5. Diagram of changes in the total number of purchases depending on the «carrying capacity» of the bought packages

For the study, different days of the week and time of day were selected. This made it possible to determine the distribution of purchases during the day. It was found that in the morning, the volume of purchases is minimal compared to other periods, its fluctuations occur in the range below the average hourly per day. Starting at 2 p.m., the hourly average volume of purchases is observed. The growth in sales throughout the day is observed from 4 p.m. and lasts until 8 p.m. The «peak» of purchases is observed from 5 p.m. to 7 p.m. This is due to the fact that at this time most part of the population of the region goes home from work. In subsequent periods of time, purchases are reduced. Observations showed that the number of buyers who make purchases changes similarly to the volume of purchases (Fig. 6-7).

Figure 6: The graph of changes in the volume of sales during the day

The graph below shows the dependence of the volume of sales on the time of day obtained from the survey. Based on these data, one can accurately determine the «rush hour» of shopping at the presented retail outlet. In the morning, the sales volume is low and suggests that at this time the level of purchasing power is low. After 11 hours, the volume of sales of products increases, as the number of customers per given period of time increases. It can be established that at lunchtime the level of sales at a given retail outlet is average, so the main flow of people is made up of pensioners, schoolchildren and young mothers who do not care about shopping time. In the evening, namely during the period from 5 p.m. to 7 p.m., there is a «rush hour», during which the sales volume is rapidly increasing, more than twice as much as the average sales per hour (770 kg). This phenomenon is caused by an increase in the flow of buyers, since it is during this period that the majority of people leave work and need to make purchases. After a rapid increase, there comes a moment of decrease in the volume of sales to the very minimum. The maximum value of sales was recorded in the evening (18–19 p.m.) – 1870 kg and the maximum in the evening (8–9 p.m.) – 310 kg.

Figure 7: Graph of changes in the number of customers per day

This graph shows the dependence of the number of customers on the time of day. The resulting dependence is very similar to the previous one, since the volume of sales depends on the number of customers. There is also a tendency to increase and decrease in purchasing power depending on the time of day. This is influenced by a lot of factors, for example: the working hours of consumers of retail goods, the age category of consumers, social status and their needs. During the lunch period, more school-age consumers, young mothers, and people of retirement age were recorded, since at this time of the day various walks and returning home from work are carried out. This is precisely what influenced the increase in consumer flow during these hours. «Rush hour» also falls on the period from 17 to 19 hours. Then a rapid decline to a minimum. The maximum number of customers during rush hour is 237 people, and the minimum is 56 people. Knowing the total number of customers during the work of the shopping point (1,608 people) and its average daily sales (10,200 kg), the average sales volume per person was 6,4 kg.

The probability of visiting retailers was estimated. The regression models of parameters of purchase process were established. The probability of a retailer visit depending on the slope factor:

$$P_{j\omega z} = 0,0013568 \cdot (\frac{k_{\omega jz}}{\overline{k_z}}), \quad (1)$$

where j - is the store; w-residential district of end-user; z – urban zone; $k_{\omega jz}$ - slope ratio from retailer to the urban zone; $\overline{k_z}$ - the average value of the slope factor from the end-user to the urban zone.

Depending represented the price and non-price factors of the purchasing process, which allows more accurately identify the behaviour of end-user. There graphs of the influence of the probability of visiting a retailer on parameters changes in the service area have been constructed (fig. 8 – 11).

$k_{\omega jz} / k_z$

Figure 8: Probability of retailer selection depending on the slope factor from the retailer to the urban zone

The increase of slope factor value of the leads to an increase in the time and distance of movement to the retailer, thereby reducing the radius of the trade zone.

The probability of retailer visiting depending on the average distance to the various retailers in urban zone:

$$P_{j\omega z} = -0,002452(\frac{L_{\omega jz}}{\overline{L_z}}), \tag{2}$$

$l_{пов}^{ijz}$ - distance from household to retailer, km; $\overline{l_{пов}^{ijz}}$ - the average distance from the household to the retailer in the urban zone, km.

Fig. 9: Probability of retailer selection depending on the distance to them

The probability of retailer visiting depending on the average quantity of residents in urban zone:

$$P_{j\omega z} = 5,38327 \cdot 10^{-7}(\frac{N_{\omega jz}}{\overline{N_z}}), \tag{3}$$

$N_{\omega jz}$ – quantity of residents in urban zone, consumers.; N_z – the average quantity of residents in the urban zones, consumers.

Figure 10: Probability of retailer choice depending on the quantity of residents (households)

The probability of visiting retailers depending on their parameters and parameters of competitors:

$$P_{j\omega z} = -9,03447 \cdot 10^{-7} (\frac{S_{\omega jz}}{\overline{S_z}}), \quad (4)$$

$S_{\omega jz}$ – shop area, m^2; $\overline{S_z}$ – the average size of retailers in the urban area, m^2.

Figure 11: Probability of retailer selection depending on their parameters and parameters of competitors

The probability of retailer visiting, depending on the average consumer's expenses for the purchase of goods:

$$P_{j\omega z} = 0,0000452464 (\frac{Q_{2jz}}{\overline{Q_{2z}}}), \quad (5)$$

$Q_{2\omega jz}$ – cash cost the consumer to purchase a product, UAH; $\overline{Q_z}$ – average cash expenses of the consumer for the purchase of goods, UAH.

Figure 12: The Probability of retailer choice depending on the average end-consumer expenses for the purchase of goods in current retailer

Modelling allows to make the next conclusions:

1) The greater ratio of the slope factor leads to the smaller the probability of visiting the retailer (Fig. 8). This is explained by the fact that it is easier for people to move along the slopes, and this affects the reduction of overall fatigue and the reduction of the total cost of the buyer.

2) Analysing the received timetable for changing the probability of a retailer visit, depending on the increase in the distance to the retailer (Fig. 9), one can conclude that the larger the distance from the household to the retailer, the less probability of its visit, since in this case the rates of such factors as the value of the buyer's time and hence the total costs of the buyer at the retailer.

3) With the increase in the quantity of inhabitants in the district, the probability of visiting the retailer will increase (Fig. 10), since this indicator affects the quantity of potential end-consumers of certain goods of a certain type, which positively affects the probability of its visit.

4) With the increase in the ratio of the retailer’s size, the probability of visiting the retailer will be increased (Fig. 11). This is due to the fact that when shopping in a large store, people spend more time and energy on finding and purchasing goods, which increases the cost of the buyer's time when visiting the shop.

5) Analysing the received timetable for changing the probability of visit a retailer, depending on the increase in the cost of purchasing goods (Fig. 12).

Based on the calculations, we will study the laws of changing the characteristics of demand and their impact on the likelihood of choosing a retailer in the service area. The general view of the model of the probability of choosing a retailer in the service area is:

$$\begin{aligned} P &= 0,0013568 \cdot k_{to\ shop} + 5,38327 \cdot 10^{-7} \cdot N - 0,002452 \cdot L_{sky} - \\ &-9,03447 \cdot 10^{-7} \cdot S + 0,0000452464 \cdot Q_2 \end{aligned} \tag{6}$$

Where $k_{to\ shop}$ - slope ratio from retailer to urban zone; N - residents quantity, people.;

L_{sky} - distance from household to retailer, km; S - retailer size, m^2; Q_2 - expenses of the consumer for the purchase of goods, UAH.

Obtained models can be used for finding market probability for set up variation range. Presented is variation range values are cover data all-over Ukraine and most east Europe countries. Obtained data allows to define limitations of the trade zone, volumes of retailers visiting and been origin demand: average check, retail network sales volume and other parameters.

Results of the study are limited by the range of the data variation range. The results are valid for the selected range of data variation. Data not included in the variation range require further study and calculations. Further research could extend the data and application of the model. However, expanding the range data will not change the results (obtained patterns). It will change the efficiency of calculation of specific option.

Conclusions

In connection with the ongoing shifts in the structure of the population, it is important to take into account the level of economic activity, employment and unemployment, which affect the nature of purchases, the working hours of trade objects, their location, transport accessibility, and other factors. Of great importance is the grouping of households by the number of members employed in the social

production, which, combined with the data on the size of the household can find an important indicator – the coefficient of economic burden on a working family member (household), which also allows to address the issue of targeting the services offered, maximizing the use of scarce household resources, taking into account objective criteria that make it possible to choose between different alternatives.

Obviously, such a wide variety of households and significant differences in their way of life, traditions, birth rates, and living standards that occur in individual regions require a differentiated approach to the implementation of various programs by market entities based on a complex and comprehensive description of the object of study.

Due to competition in the market, end-consumers receive a wide selection of quality same-type goods at different prices. The influence of the average cost of the goods on the market and the value of the goods within the retailer under consideration influences the likelihood of visiting the retailer, and accordingly the volume of demand in it.

The paper is been continuation of previous research (Galkin et. al, 2019a) In the proposed approach, demand generation in transport systems, which, unlike established, uses the geographical, demographic of the service area and the economic, technological parameters of the retailers.

Proposed model can be used for evaluating efficiency according to external consumption system data. Give practical advice for improving retailer operations according to consumer's choice and behavior. Implications made for on one of the consumer's zone. Limitations consist of data used in experiment. Extend range of data could provide new regularities and update found one. Obtained patterns give opportunity to better reacting on consumer's choice and behavior and tune retailer system according to it. For the first time the model of the probability of visiting retailers was presented, which the total expenses of consumers were used.

Abstract

The purpose of the article is to identify the possibilities of implementing social innovations in municipal housing management. A review of the literature pointed to the existence of potential and needs to search for innovations within the relations of tenants of municipal housing, other city residents and jointly inhabited urban space. The article identifies the special role that can be played by the entity managing municipal premises in the process of implementing social innovations. The network of municipal premises scattered throughout the city creates a special environment in which the needs for social innovation can meet with the creativity of research communities or social activities in finding them. The publication presents the results of research on a representative group of 531 respondents in the area of their interest in activities related to improving the quality of common space, developing neighbourly bonds, creating a network of neighbourhood aid scheme and willingness to participate in such assistance system. The obtained results for the questions above confirm the special role of the entity managing the municipal housing in implementing innovations and their positive reception by respondents. Conducted research allowed for examination of municipal housing's needs, managed by ZGM TBS in developing solutions that are the tools for the formation of civil society

Keywords: Social Innovations, Municipal Premises Management, Urban Space.

Introduction

The municipal housing creates an environment with great potential for seeking and implementing social innovations. This is due to the investment gap regarding the housing stock and the fact that these apartments are inhabited by the economically weakest group of the city's citizens. The combination of the lack of funds and the economic and social problems of residents, results in a number of problems requiring an innovative approach in order to their solution, these are the phenomena of vacancy, housing poverty and energy and social exclusion.

Thus, the purpose of the article is to identify the potential for implementing social innovations in the area of municipal premises, tenants and the surrounding urban space. The considerations will include the special role of the premises management entity in the process of searching for innovations, their implementation and coordination of social and research environments in the implementation of this process.

The article presents the results of research conducted on a group of 531 respondents. The obtained results confirmed that the municipal resource manager has significant potential to implement social innovations. The implementation of the obligation to meet the housing needs of tenants and care for the shared space of the city, requires the implementation of social innovations in terms of the quality of the common space, combating social exclusion or use of available housing resources in the best

way. The examined activities of the ZBM TBS manager in this area met with a positive assessment of the respondents.

Social Innovations

Social innovation is understood as the process of implementing new solutions in the field of products, services and action models aimed at satisfying social needs, building social bonds and cooperation models. The purpose of social innovation is to increase the quality of life, improve the general physical and mental state of people, or strengthen the ability to act of social groups and the individuals that are part of them (EU Commission Guide to social innovation, 2013; Eichler G.M. and Schwarz E.J. 2019). Social innovation is characterized by the will to meet social needs neglected or poorly implemented by traditional public and private forms of social services (Harris, Albury, 2009).

Social innovations should place an emphasis on solving the problems of excluded people (e.g. the poor, the unemployed, the disabled) and increase social and ecological resilience (Westley, 2009, Gasparin M., Green W. et al. 2020). They should lead to better integration of excluded groups and individuals in various spheres of social life at different spatial scales (Brendzel-Skowera, 2019). Social innovation is associated with social integration processes, but also with the opposition against conservative tendencies that help to strengthen or maintain social exclusion (Brendzel-Skowera et al., 2016). That is why social innovation explicitly refers to ethical social justice (Moulaert et al., 2005). Therefore, social innovations should not be assessed on the basis of economic criteria, and the measure of their quality should be the creation of real social value (Phills et al., 2008).

Social innovations are characterized by high dynamics and interdisciplinarity, as they cover practically all areas of human activity, i.e. activity at home and family, in professional work in the sector of production of goods and services, in administration and public institutions (Olejniczuk-Merta, 2013). Stimulating the activity of citizens and local NGO communities in order to create a knowledge-based society has become the basis of the "Europe 2020" strategy (EU Commission Guide to social innovation, 2013).

The definition of social innovation for the needs of the research program "Social Innovation" has been prepared by the National Centre for Research and Development. "Social innovations, in the sense of this Programme, mean solutions which simultaneously respond to social demand and cause a lasting change in given social groups. These solutions may be associated with innovative products, services or processes that enable different solutions to typical social problems." (Social Innovation Programme of the National Centre for Research and Development, 2012).

For the purposes of the programme, a catalogue of good practices for supporting social innovation has been identified, which includes:

– promoting sustainable education,
– promoting sustainable transport,
– promoting active and healthy aging,
– supporting the activation of people with disabilities,
– supporting the activation of the unemployed,
– supporting the financing of innovative investments,
– supporting innovative architectural and communication solutions (Social Innovation Programme of the National Centre for Research and Development, 2012).

Implementing Social Innovations in The Process of Managing the Municipal Housing Stock

The basic unit of local government in Poland is the municipality. The role of the municipality is to meet the collective needs of its residents, including the basic need to provide housing to members of the local community. The obligation to conduct a policy conducive to satisfying the housing needs is

guaranteed by both The Polish Constitution of April 2, 1997 r. in art. 75(1) as well as ordinary legislation - in accordance with art. 7 item 1 point 7 of the Act of 8 March 1990 on local government, satisfying the collective needs of the community is one of the municipality's own tasks, in particular these own tasks include matters of municipal housing construction. Furthermore, in art. 4 of the Act of June 21, 2001 on the protection of the rights of tenants, the municipal housing stock and the amendment to the Civil Code, the legislator provided that creating conditions to meet the housing needs of a local government community is one of the tasks of the municipality (sec. 1), the municipality, under the rules and in cases provided for in the Act, provides social and substitute housing, and also satisfies the housing needs of low-income households (sec. 2).

In order to implement tasks related to satisfying housing needs, the municipality creates the commune's housing stock. The stock may include premises owned by the municipality, municipal companies (excluding Social Housing Associations), and premises in the independent possession of the indicated entities. The implementation of the above task is also possible by means of renting premises from other owners by the municipality and sub-letting them to persons whose households achieve low income. The Act allows the municipality to charge a lower rent from sub-tenants than the one that pays itself (Chaciński, 2019, Doliwa, 2015).

Municipalities can also create social housing associations (hereinafter abbreviated as SHA, in Poland - TBS), whose purpose is to build apartments for rent. SHA may carry out repairs and modernization of facilities intended to meet housing needs on a lease basis, as well as rent commercial premises located in the association's buildings (Doliwa 2015). The rent for TBS residential premises is regulated, allowing it to be paid by people on average incomes (Dziadkiewicz and Pabian, 2017).

In practice, the entity which manages municipal premises on behalf of the municipality can administer the following premises:

– social – i.e. of very low rent intended for people unable to maintain housing due to poverty,
– regular municipal – serving the purpose of meeting the housing needs of people who, due to the economic situation, are unable to buy or rent real estate on the free market,
– premises within the Social Housing Association, provided that it was created by the municipality – the premises that are occupied by better-off people who are yet unable to meet the housing needs of a similar standard on the free market,
– the so-called private – some of the social and municipal premises are located in real estate owned by the commune in its own right (leading to the acquisition of property through acquisitive prescription), these real estate have unexplained ownership situations and are often refundable to heirs.

For the purposes of this article, these premises will be called municipal premises.

The above-mentioned premises usually cover the entire city surfaces, achieving higher accumulation in areas requiring regeneration (neglected city districts).

In the process of managing municipal premises, there have been opportunities to implement social innovations. The entity managing municipal premises may play a special role in this respect. The management of municipal premises raises a number of possibilities for the managing entity to initiate processes of creating social innovations (see Fig. 1). These possibilities result from the fact that municipal premises are spread in the urban fabric, the manager makes direct decisions regarding the quality of life in the space surrounding municipal premises, forced by the essence of direct business activity and frequent contact with residents of the managed premises.

Fig. 1: Social innovations model

On the other hand, the housing stock manager needs the creativity of many environments where ideas with the potential of social innovation arise; it is about confronting different points of view, insights and practices, a kind of departure from the same old pattern (Kowalewski M., 2014, Nicolopoulou, K et al. 2017).

The needs for social innovation regarding municipal housing are further increased by the problems faced by local governments striving to meet the housing needs of the economically weakest group of residents – these are in particular issues of social exclusion, economic or energy exclusion, (a significant proportion of tenants remain in the so-called debt spiral), or the existence of the phenomenon of vacancies in city centres (Wronka-Pośpiech, 2015, Hiteva, R. et al. 2017.).

Research Methodology and Structure of The Research Group

Based on in-depth literature studies and the results of actions taken by the Department of Housing Management - Social Housing Association (*ZGM TBS*) in Czestochowa, a concept of research was developed among residents to identify activities whose implementation will contribute to shaping the civil society. This assumption allowed to define the research group, among which, the survey questionnaires were distributed. The only criteria used in order to select the respondent was their status – residents of the Department of Housing Management - Social Housing Association. The prepared study took the form of a questionnaire, consisting of a research part and the respondents' particulars. The research part of the survey consisted of 22 questions and 7 questions constituting the respondents' particulars. The questionnaire contained 22 main research problems related to various aspects of the quality of life in the city of Czestochowa.

All obtained data came from the residents of six branches of *ZGM TBS* in Czestochowa, among which the questionnaire was distributed via internal communication channels in August and September 2019. Due to the low percentage of returns, shaped at the level of only 100 correctly completed questionnaires, the study period was extended (late October - November) and used the method of direct interview (PAPI). The final sample size was n = 531 correct answers.

The first stage of the research was to conduct pilot studies among the residents of the *ZGM TBS* housing stock in order to identify any inaccuracies that may hinder the understanding of the questions by the respondents and clarify any ambiguities. The next step was to conduct a study directed at 550 people. When choosing the study using the representative method, the authors attempted to minimize the sample size while maintaining the required certainty and accuracy of further inference. While estimating the probability of success p in the general population, the minimum sample size was calculated on the basis of the formula for the sample size for a very large population:

$$N_{min} = \frac{N_p\ (\alpha^2 * f(1-f)}{N_p * e^2 +\ \alpha^2 * f(1-f)} \approx 384$$

where:

N_{min} = minimal sample size,
Np = population size,
α2 = confidence level for results,
e2 = assumed maximum error,
f = size of the fraction

For population size the number of polish population was adopted (37,98 mln). As the calculations show, the minimum sample size, with an accepted confidence level of 1-2 = 0.90 and the maximum estimation error e = 5%, should amount to 384 questionnaires. Due to the fact that 531 questionnaires were qualified for the study, it can be assumed that this condition has been met and the sample obtained meets one of the assumptions of the representative method.

The nature of the answers to individual questions took the form of an answer on the 4-point Likert scale. The scale used in the study consists of 4 categories of answers (4 - yes, 3 - rather yes, 2 - rather not, 1- no), which are arranged in the correct order. The 4-point Likers scale was chosen because in this case, the respondents expressed their own opinions and experience about the issues being the subject of research. The authors also, decided to use this kind of Likert scale, in order to avoid an excess number of "I do not know" answers. The analysis of the measurement data using the Likert scale involves comparing and interpreting the points counted for individual items or for individual respondents.

Structure of the Research Group

In total, 531 survey questionnaires have been returned, and all of them have been classified for further analysis. Descriptive statistical results (table 1), showed that in the structure of the research group, 57% were female and 43% were male. Almost half of the respondents (46%) were between 40 and 59 years old, followed by seniors in the second place (29%), and young people between 25 and 39 years of age in the third place (25%). The smallest percentage were very young people between 18 and 24 years old (4%).

Table 1: Descriptive analysis results

Factor		Frequency	Percent	Cumulative percent
Gender	Female	302	57%	57%
	Male	229	43%	100%
Age	18-24 years old	19	4%	4%
	25-39 years old	134	25%	29%
	40-59 years old	222	42%	71%
	60 and above	156	29%	100%
Education	Higher education	162	31%	31%
	Secondary / technical	193	36%	67%
	Vocational	132	25%	92%
	Primary school	39	7%	99%
Marital status	Single	77	15%	15%
	Married	245	46%	61%
	Widowed	86	16%	77%
	Divorced	59	11%	88%
	Separated	22	4%	92%

	Partnership	37	7%	99%
Status	Housing Association member	204	39%	39%
	Tenant	313	61%	100%

Source: Own work.

With regard to education, the highest percentage of people were people with secondary / technical education (36%), followed by people with higher education (31%) and a quarter of respondents (25%) with vocational education. Only 7% of respondents indicated primary / lower secondary education. The respondents were also characterized by a fairly high diversity in relation to their marital status, but the vast majority were married (46%), there were almost as many widowed (16%) as lonely people (15%), and fewer were divorced (11%). However, the smallest percentage were people in partnerships (7%) and those who were separated (4%). In case of the number of persons living in a given household, the largest number of respondents indicated only one person (30%), followed by households with two persons in the second place (26%), followed by three persons (21%). Subsequently, there were households with four people (18%), five people (3%), six people (1%) and only one household with eight people. 61% of the respondents were ordinary tenants of the *ZGM TBS* municipal housing stock, and 39% were members of the housing cooperative.

Interpretation of the findings

For the purposes of this article, the authors have interpreted issues related to the level of interest of the respondents in activities implemented in their living space, the development of neighbourly bonds, creating a network of neighbourhood aid scheme and willingness to participate in such aid schemes. The answers obtained to the above issues will allow to examine to what extent the *ZGM TBS* housing stock meets the conditions of a civil society and to examine the level of need to develop a solution constituting a tool for the formation of the civil society.

First, the type of activities in the living space was identified, the implementation of which aroused the greatest interest of the respondents (table 2).

Table 2 : Evaluation of average ratings for activities implemented in the living space

	Average	Dominant	Percent	Standard Deviation
Allocating a friendly space for animal owners	2.98	4	43%	1.17
Creating "pocket parks" - small green areas	2.97	4	44%	1.22
Promoting care for the cleanliness of yards and green areas	3.16	4	50%	1.14
Promoting cleaning up after dogs	3.19	4	55%	1.20
Allocating parking spaces for residents	3.04	4	49%	1.21
Creating playgrounds for children	3.02	4	47%	1.24
Designing a friendly space for seniors	2.86	4	41%	1.28

Source: Own work.

Actions in the form of promoting cleaning up after dogs (3.19) were definitely the highest marks, which is connected with the second most important action - promoting care for the cleanliness of yards and green areas. This shows that awareness of the appearance and condition of the nearest residential space is growing among its residents. Further on were the activities in the form of allocating parking spaces for residents (3.04) and creating a playground for children. In addition, parking spaces are the result of a growing number of cars owned by the residents, and the desire to further create playgrounds for children indicates that the number of existing playgrounds is insufficient. The respondents also showed great interest in activities in the form of allocating animal-friendly space (2.98) and creating the so-called pocket parks in the form of small green areas. This indicates a high awareness of the needs of animals that must not be unleashed in the general living space as well as a desire to "green" the nearest living space, which can be a respite from the hustle and noise. In addition, the allocation of such space can also result in an improvement in air quality and an increase in the sense of comfort in common space. The last place was taken by designing a friendly space for seniors. But this may be due to the belief that the implementation of the previously indicated activities will also contribute to the comfort of living for older residents.

Subsequently, the authors analysed the structure of average ratings for activities to develop neighbourly bonds (table 3). The obtained results indicate that in this aspect the most important activity for the respondents was the resignation from the fencing of areas in favour of creating public space (2.76). This shows a change in the inhabitants' attitudes, since in recent years there has even been a trend of fencing from one's neighbours. However, as the obtained results show, this "trend" is in the reverse. In the next place were actions in the form of allocating common space (senior clubs, tenant clubs or clubrooms) and co-designing space by the residents (2.69). On the one hand, the choice of these activities may indicate a certain level of involvement of the residents, but on the other hand, provided that the dominant answer was "rather yes", this level of involvement is still not very high.

Table 3: Evaluation of average ratings for activities to develop neighbourly bonds

	Average	Dominant	Percent	Standard Deviation
Resignation from fencing areas in favour of creating public space	2.76	4	35%	1.17
Allocation of common space, e.g. senior clubs, tenant clubs, clubrooms	2.69	3	30%	1.18
Attending meetings aimed at getting to know neighbours	2.48	3	30%	1.17
Co-designing space by the residents	2.69	3	31%	1.20

Source: Own work.

The last place was taken by attending meetings that are aimed at getting to know one's neighbours (2.48). The fairly low rating of this action indicates that the stock's inhabitants are not interested in establishing and maintaining contacts with their nearest neighbours. These results confirm the fact that close relations with neighbours are rather a thing of the past. Besides, people living next door are not interested in each other.

Then, the authors analysed the structure of average ratings of the level of interest in the neighbourhood aid scheme by the inhabitants of the housing resource (table 4). The highest score was given to the form of assistance provided in case of illness (2.79), followed by the form of assistance provided when looking after a sick or disabled family member (2.56). The respondents also showed interest in the form of neighbourly help in running a household (2.53).

Table 4: Evaluation of average ratings for the development of the neighbourhood aid scheme

	Average	Dominant	Percent	Standard Deviation
Help in case of illness	2.79	4	35%	1.20
Help in the household (e.g. shopping, repairs, writing applications, dealing with official matters)	2.53	3	28%	1.21
Help with caring for a sick / disabled family member	2.56	3	30%	1.22
Care for the household during someone's absence	2.43	3	28%	1.20
Help using the expertise of neighbours	2.41	3	28%	1.23

Source: Own work.

The last two places included: taking care of the household during someone's absence (2.43) and getting assistance using the expertise of neighbours (2.41). At the same time, it is worth noting that only in case of help in the event of illness, the respondents most often chose the answer "yes", while in the remaining cases the most frequently chosen answer was "rather yes", which indicates a not very high level of involvement of respondents in participating in the neighbourhood aid scheme.

The last examined issue was the question about the level of the respondent's interest in providing assistance as part of the neighbourhood aid scheme (Table 5).

Table 5 : Assessment of average ratings for the level of interest in providing assistance under the neighbourhood aid scheme

	Average	Dominant	Percent	Standard Deviation
Help in case of illness	2.73	3	31%	1.19
Help in the household (e.g. shopping, repairs, writing applications, dealing with official matters)	2.53	3	32%	1.20
Help with caring for a sick / disabled family member	2.53	3	31%	1.20
Help with childcare (e.g. when parents are absent, doing homework, tutoring)	2.40	2	29%	1.21
Care for the household during someone's absence	2.45	3	29%	1.19
Specialist help resulting from your education / profession	2.33	3	29%	1.21

Source: Own work.

The obtained results regarding this issue clearly indicate that the respondents are least interested in providing assistance under the social assistance system. The overwhelming majority of the responses were "rather yes", indicating a lack of determination in this matter. The highest rated activity was in the form of providing help to a sick neighbour (2.73), but the respondents would also be eager to provide assistance in running a household and taking care of a sick or disabled family member (2.53). The respondents also declared their willingness to take care of the household in the absence of the owners, but they would be least willing to help with childcare (2.40) and to provide specialist assistance related to their education. In case of help with childcare, the most often indicated answer was "rather not".

However, taking into account the structure of average ratings for all the indicated activities, it is clear that the respondents showed the greatest interest in developing the neighbourhood aid scheme (Table 6).

Table 6: Structure of averages for particular areas

Group of activities	Average level
Level of commitment to living space management	3.03
Level of interest in developing neighbourly bonds	2.65
Level of interest in developing a neighbourhood aid scheme	3.18
Level of interest in providing assistance under the neighbourhood aid scheme	2.50

Source: Own work.

On the other hand, the respondents showed the least interest in providing help by themselves, which may indicate that they are more willing to use assistance than to offer it. Next, there is the level of commitment to managing the living space, which indicates the inhabitants' growing awareness of their impact on the nearest residential environment. The respondents also showed some interest in developing neighbourly ties, but this is not a key issue for them.

Discussion

The conducted research on contemporary housing resource management processes has clearly indicated the need to implement social innovations that, not only, contribute to improving the quality of life of residents but also affect the formation of civil society. Social innovations not only create, renew and transform social relations in such a way that they shape civil society, but social innovation also favors transformation on a regional scale, which in turn contributes to socio-ecological development. However, as indicated by K. Castro-Arce and F. Vanclay (2020), the shaping of social innovations is influenced by the residents of a given area, in other words social innovations are developed by using management mechanisms from the bottom. Social innovations are triggered by local interests and context at a specific time and place. However, when social innovation deals with more than just urgent issues and actively seeks new paths for sustainable development, it contributes significantly to social transformation. The target research group was selected due to the fact, as pointed out by M. Angelidou (2020), the residents who have deep knowledge of the specific needs and resources of their own area; they experience these needs personally and are able to suggest simple and practical solutions. What's more, appreciating them as facilitators of innovation implementation processes will increase their commitment to both innovation implementation and civil society shaping. According to research by F. Fug and O. Ibert (2019), innovations implementation is a process in which the gradual development and consolidation of new solutions goes hand in hand with the emergence of a new local professional community. Thus, the implementation of social innovations also increases the professional activity of the society. E. D'Amario and G. Comini (2019), on the other hand, propose a scale consisting of 23 elements that classify and identify social innovations, and the scale itself can be a tool stimulating social entrepreneurs or new market participants to work to better allocate their resources or draw attention for the needs of specific social groups. The use of this scale in further research will contribute to a deeper understanding of social innovation but also to better identify the needs and expectations of society. Whereas there are several types of social innovations, such as: socio-juridical, socio-cultural, socio-political, socio-analytical, eocio-ecological, socio-technical, socio-organisational, socio-economic, socio-ethical and socio -ideological (Wigboldus, 2016), subsequent research should focus on identifying social needs in specific areas and then developing and implementing appropriate solutions. This will significantly increase the likelihood of the process of transformation of society into civil society.

Conclusions

Contemporary housing management processes should assume the implementation of social innovations whose main task is to satisfy social needs, strengthen social ties and create new models of cooperation. The role of the housing stock manager plays a big role in implementing social innovations. Thus, he/she fulfils the obligation to meet the collective needs of the local community. In addition, the housing manager has appropriate resources and has the ability to effectively manage, which in turn will increase the level of supply of social innovations such as the development of social entrepreneurship, reducing the level of homelessness as well as social and digital exclusion, will improve the image and perception of the city's brand but above all will contribute to improving the quality of life of the local community. The results of the research presented in the article, which aimed to identify the activities that shaped the civil society, allowed the following conclusions to be drawn:

- the respondents pay a lot of attention to cleanliness and care for their immediate surroundings, which is manifested in the implementation of measures to promote cleaning up after animals and caring for yards and green areas,
- the respondents also show high awareness of meeting the needs of animals,
- more and more people prefer to create common spaces for everyone, thus giving up fencing,
- while the respondents are not very interested in getting to know their neighbours, they have shown great interest in various forms of neighbourly assistance.

However there is a limitation of the study. The conducted study was conducted in Czestochowa municipality only, thus limiting its generalizability. Thus in order to obtained more reliable results in this area, the further research regarding the social innovation will be carried out among the other polish municipalities.

To sum up, the obtained results indicate that the studied community is seeking to become a civil society, however, only in the aspect of creating a common space and caring for it rather than developing neighbourly bonds. Therefore, it can be assumed that appropriate actions should be taken to increase the level of interest/commitment in matters regarding their living space or developing interpersonal relationships. One of the proposed solutions is the Municipal Social Services Platform, whose main goal is, among others, promoting civic attitudes leading to the creation of civil society and rebuilding social and interpersonal ties.

Sealing the Tax System in Poland

Joanna NAKONIECZNY

Department of Finance, Banking and Accountancy, The Faculty of Management,
Rzeszow University of Technology, Rzeszow, Poland
j.nakonieczny@prz.edu.pl

Abstract

Sealing the tax system is the priority, and at the same time a major challenge for financial policy in many countries. In the European Union and Poland, numerous actions are taken to reduce the tax gap. The activities of businesses in the so-called shadow economy, their involvement in the fictitious turnover under the carousels of VAT abuse, and tax optimization associated with tax avoidance or evasion are considered the main reasons of the tax gap. Measurement of the scale of irregularities provides information on the effective functioning of tax regulations. The purpose of the paper is to determine the tax gap in Poland and European Union Member States (EU-28). The basic research method is to identify the activities of the tax administration aimed at limiting the loss of tax revenues in Poland, as well as to review the literature in this area. Based on the research, one can notice an improvement in that tax collection efficiency in Poland. This implies the need to continue reforming the activities of tax administration, which are crucial for the development, security of companies and credibility of economic processes.

Keywords: tax system, tax gap, tax revenues, legislative changes.

Introduction

Tax system leakage causes particularly dangerous consequences for the public finances of each state. In recent years, the issue of the tax gap has become the subject of numerous international political and media debates. First of all, the level of the VAT gap is widely commented. The reason is that the calculation of the gap in the income tax of natural or legal persons is a much more difficult process than estimating the gap in the tax on goods and services.

The issue of the tax gap is extremely important not only from the point of view of the state budget, but also for companies which run reliable business, and which experience the indirect implications of its occurrence. The leakage in the state tax system contributes, among others to distort the principle of fair competition, reduces the supply of public goods or intensifies the state's actions regarding documentation and reporting obligations (Polish Economic Institute hereinafter: PIE 2019a). Estimation of the tax gap is a sort of control measure in the process of public finance management. It provides information on the scale of compliance of business entities with tax regulations, the effectiveness of the functioning of the state in terms of obtaining tax revenues, or the allocation of resources in order to reduce the scale of irregularities.

The development of fair tax systems in individual countries in the face of globalization is an international, not a national challenge. Actions taken internally to combat tax fraud can only be a temporary solution, due to the fact that criminal activities will penetrate other sectors of the economy or other countries with more favorable legal or organizational conditions under the influence of legislative changes. When fighting undesirable practices of businesses, states uses various procedures and benefits from the back-up of advanced IT solutions that support tax

administrations. In Poland, in the last decade, a number of coordinated efforts have been made to adopt modern legislation, consolidate tax authorities and establish cooperation with the IT and banking sectors, which resulted in an increase in tax revenues to the state budget and, as a result, a significant reduction of the tax gap.

The purpose of the paper is to determine the tax gap in Poland and European Union Member States (EU-28). The basic research method is to identify the activities of the tax administration aimed at limiting the loss of tax revenues in Poland, as well as to review the literature in this area.

The analysis conducted has become the basis to identify and formulate the strengths and weaknesses as well as opportunities and threats of measures to seal the tax system in Poland. The choice of topic is dictated by the desire to speak in the current debate on the shape of the tax system in the country. The first part of the article presents the concept of the tax gap and the factors determining its emergence (2). The gap estimation and solutions introduced by the Polish tax administration are discussed in parts 3-5.

Literature Review

The tax gap is an integral part of every economy. It is described as the difference between tax revenues that should be achieved and the amount of revenues actually obtained (KE 2016b, OECD 2017). The US Internal Revenue Service (IRS 2019) defines the tax gap as the amount of tax liability that is not repaid voluntarily and on time. In other words, it is the difference between tax revenues actually collected on an annual basis and the amount that should have been collected assuming timely payment by taxpayers (Olson 2009). The literature on the subject gives the definition developed by the Financial Policy Institute of the Ministry of Finance of the Slovak Republic according to which the tax gap is the difference between the tax actually paid and the tax that should be paid if all natural and legal persons declared their activities and transactions in the right way in accordance with the law and intention of the employer. When calculating the tax gap, it also considers the costs of tax control by the tax administration (Novysedlak and Palkovicova 2012).

In Poland no official definition of this phenomenon has been developed yet due to the relatively short history of research in this area. One of the first reports prepared on request of the Scientific Foundation of the Institute for Structural Research was developed in 2013 by PwC and concerned the identification of phenomena leading to budget losses in the field of VAT. The first report, in which an attempt was made to comprehensively determine the gap in CIT, is the report of the Polish Economic Institute from 2019. Undoubted reasons to recognize the issue of the tax gap are also the following analyzes: CASE (2017a, 2017b), PIE (2018, 2019a, 2019c), which are related to the budgetary revenues of the tax on goods and services, CASP REPORT (2019) that describes the structure of CIT tax revenues in the context of sealing the tax system or the results of NIK audits regarding aggressive tax optimization in the field of CIT (NIK 2019).

The tax gap definitions presented by some researchers assume its division into three basic components, such as (Plumley 2005): failure to file a return, under-reporting of income and overstating of deductions and also under-payment. Some approaches are based on the concepts of shadow economy and hidden income not disclosed to tax authorities. In this context, the tax gap is recognized as the amount of hidden income multiplied by a specific tax rate (Giles 1999). However, such an approach may create a number of methodological problems related to, e.g. determining the components of hidden income (Dobrovič et al., 2019; Gemmell and Hasseldine 2012).

The analysis of issues from such a scope indicates a number of factors affecting the existence of the tax gap. The most frequently mentioned are (Khlif and Achek 2015; PwC 2014, Quintano and Mazzocchi 2015, Skalická Dušátková et al., 2017):

- activities of business entities hidden from the tax administration (tax evasion), which includes the occurrence of so-called shadow economy and tax fraud,
- business activity aimed at reducing the amount of liabilities using legal means (tax avoidance), the so-called tax optimization,
- errors in the method of determining the tax assessment by taxpayers themselves, unnoticed by the tax institution,
- low efficiency of the tax institutions in controlling and collecting taxes due,
- taxes not recovered as a result of bankruptcy of business entities,
- low effectiveness of state authorities in the field of comprehensive support for socio-economic processes,
- lack of well-organized cooperation and exchange of tax information in the conditions of intensified international trade.

According to Raczkowski and Mroz (2018) these are not all determinants of the emergence and expansion of the tax gap. In their view, it should also include the cross-border nature and mobility of the informal economy, which skillfully uses the opportunities offered by the development of new information and communication technologies to expand into new markets, as well as the dominance of neoliberalism in previous decades, which may indirectly undermine the willingness of entrepreneurs to meet their tax obligations.

Generally, the premises for the occurrence and the size of the tax gap can be grouped into several segments: macroeconomic, demographic, institutional and relational, which is closely correlated with the confidence of entrepreneurs in state bodies (Szczypińska 2018).

The studies on the identification of mechanisms underlying the international process of tax avoidance and tax evasion, and determining the loss suffered by individual countries are the subject of numerous publications. This is due to the importance and enormous scale of this phenomenon (Allingham and Sandmo 1972; Beer et al. 2018; Liu et al. 2017; Markle 2016; Merz and Overesch 2017; PIE 2020; Tørsløv et al. 2018). The studies on the compliance with tax regulations, taxpayers' behavior and the ones indicating the use by public administrations of behavioral techniques in improving tax collection in Poland (Hernandez et al. 2017; PIE 2019d) and worldwide (Basrowi 2020; Kirchler 2009; Kirchler and Hoelzl 2017; Slemrod 2001) seem to be interesting aspects. Andreoni, Erard and Feinstein (1998) believe that the compliance with tax regulations is a matter of public finances, tax law enforcement, the tax authority's organizational structure and tax ethics. According to them theoretical canons developed to explain the complex problem of tax compliance were not fully used in empirical research.

The analytical literature on measuring the tax gap can be broadly divided into two approaches. The first one includes micro methods that comprise control and audit studies based on a large sample of taxpayers, and where the results are generalized for the entire population (Gemmel and Hasseldine 2012). This type is used, inter alia, in the US tax gap research by the IRS (GAO 2017). The second group are macro methods (Giles 1999, Raczkowski 2015). According to Raczkowski (2015), this is an indirect approach to measure the tax gap. The disadvantage of this approach is primarily the high level of aggregation of macroeconomic variables which reduces the accuracy of the size of the tax gap for individual taxes. Currently, CASE reports (2019) are the basic source of information and reference point regarding the size of the VAT gap in EU Member States. They are based on the so-called “top-down method”, whose basic assumption is to use data from the

national accounts of each EU Member State to determine the theoretical VAT liability and compare it with the actual collected VAT revenue.

Tax system in Poland

The tax system determines the formation of a strong and fair economy for each state. The obvious task of taxes is to finance expenditure, and therefore the expenditure of a given country determines the degree of fiscalism. Poland, together with Spain, Slovakia, Luxembourg, the Netherlands, belongs to the group of countries with an average level of public expenditure in relation to income (41.6%). France (56.0%) and Finland (53.1%) have the highest level of public sector spending among EU-28 Member States, while Ireland has the lowest level with a 25.4% ratio (fig. 1).

Fig. 1: Share of public sector expenditure in GDP in 2018 (%)
Source: author's own study based on Eurostat

In the perspective of the years 2008 - 2016, a decreasing trend of the share of public expenditure in GDP in Poland could be seen (fig. 2). According to the authors of More for Less Report: What tax system for Poland (CASE 2017b) this situation was related to the excessive deficit procedure in force since 2009. 2016 was the beginning of the reform of tax administration and legislative changes. A slight increase in the ratio of government expenditure to GDP in 2018 by 0.5 pp. compared to 2016 was caused by the high absorption of EU funds from the financial perspective for 2014-2020, an increase in spending on social benefits (e.g. Family 500+, Good Start, benefits paid by SII (the Social Insurance Institution) and ASIF (the Agricultural Social Insurance Fund) and the government's aid program for farmers associated with limitation of drought damage (Program Konwergencji 2019).

Fig. 2. Share of public sector expenditure in GDP in Poland in 2008-2018 (%)
Source: author's own study based on Eurostat

Tax revenues in Poland constitute a significant part of the total revenues of public finances. When analyzing the structure of tax burdens in EU countries, it should be noted that, contrary to popular belief, Poland is not among the most taxed economies. Taking into account the degree of fiscalism, Poland ranks 12th from the end (fig. 3). Compared to other EU countries, taxes in Poland are rather average. The aggregate index calculated by Eurostat includes, among others, taxes on production and imports, social security contributions and taxes on income. According to Case (2017b), the inclusion of contributions in the ratio is important due to political decisions regarding the choice of financing social benefits from taxes or contributions.

Fig. 3: Level of fiscalism in the countries of the European Union in 2018.
Source: author's own study based on Eurostat

In 2018, tax revenues (including social security contributions) in relation to GDP in Poland amounted to 36.1%, which means an increase of 1.1 pp. compared to the previous year, and an increase of 4 pp. compared to 2009. A growing trend in this respect is characteristic, especially since 2016, which is the result of a number of measures to seal the tax system (fig. 4). In the entire European Union, this ratio amounted to 40.3% in 2018.

Fig. 4: Share of tax revenues in total in GDP in Poland (%)

Source: author's own study based on Eurostat

Of the four basic central taxes (VAT, CIT, PIT, EXCISE), tax on goods and services is one of the most important sources of tax revenues in the EU Member States as it generates about one-sixth of total tax revenues. In Poland, VAT plays an equally important role (22% in 2018), therefore the volume and stability of revenues from it is of the key importance from the point of view of public finances. Revenue from VAT is characterized by the greatest volatility resulting from the implemented reforms of the tax administration. In the entire analyzed period, the share of VAT revenues in GDP was at a high level of 6.8-8.3%. The share of basic taxes in the country's GDP is presented in fig. 5.

Fig.5: Share of basic central taxes in GDP in Poland (%)

Source: author's own study based on the data from the Ministry of Finance and the Central Statistical Office

Research indicates a significant improvement in VAT collection. In 2016, the VAT gap in EU countries was nearly EUR 150 billion in total, of which EUR 7.7 billion in Poland. According to the data presented by CASE (2019), in 2017 Poland was 8th from the end among EU countries in terms of the VAT gap, with a value of EUR 5.7 billion. This means that the country was two places lower than a year earlier and had 6.4 pp. less. This is the greatest success in the fight against VAT fraud among the Member States. A higher gap was recorded in Hungary, Latvia, Slovakia, Lithuania and Italy, Greece and Romania (fig. 6). According to preliminary estimates of the Ministry of Finance, the VAT gap in 2018 once again narrowed to 12.5% (Program Konwergencji 2019). It should also be noted that the revenues from VAT in 2016-2018 grew faster than the dynamics of GDP growth and the dynamics of turnover in the economy constituting the taxable basis (PIE 2019c). Revenue from VAT increased by 38.2%, while GDP by 17.5%.

Fig. 6: VAT gap in EU countries (% of theoretical revenues) in 2017

Source: CASE (2019). Study and Reports on the VAT GAP in the EU-28 Member States: 2019 Final Report. Access: https://ec.europa.eu/taxation_customs/sites/taxation/files/vat-gap-full-report-2019_en.pdf

Strong economic situation and measures implemented in the country to close the VAT gap have been reflected in limiting tax avoidance also in the area of CIT and PIT. In 2018, revenues from corporate income tax recorded a very high level of PLN 44.3 billion, i.e. 2.1% of GDP. According to forecasts for the first half of 2019, this share amounted to 2.6% of GDP. It is estimated that CIT revenues for 2019 will be 15% higher compared to 2018. According to the authors of the CASP SGH report (2019), activities related to private consumption (caused by the 500+ program) and manufacturing of semi-finished products commissioned by international corporations account for 92% of this increase. The data on the CIT gap were prepared only for 2015-2017 as there were no detailed data and specific standards. According to analysts of the Polish Institute of Economics (PIE 2019b), the CIT gap in 2017 was in the range from PLN 11 to 21.4 billion, which translates into 0.55% -1.08% of GDP. The maximum gap in 2017 decreased by 57.2% compared to 2015.

Taxation of the natural persons' income funded the state budget in 2018 by PLN 110.8 billion, i.e. 11% more than in 2017 and 24% more than in 2016. This had been the largest increase for ten years. Apart from the good economic situation, the low level of unemployment and the inflow of foreigners to the Polish labor market are the factors which improve the condition of the state budget and the budget of the Social Insurance Fund.

The decrease in the share of excise tax revenue is explained by the very structure of this tax and the systemic change in excise tax rates for electricity (CASE 2017b). According to the report of the Supreme Audit Office (NIK 2020), this situation was also affected by an inadequate analysis of personnel needs and the failure to adapt the organizational structure of the newly established units of the National Tax Administration to the tasks assigned to them, which resulted in a reduction of the amount of excise duties outstanding by 51.5% in 2018 compared to 2016.

The analyzes indicate an exceptionally high percentage of indirect tax revenues to the state budget, which is considered a modern structure (PIE 2019c). Such a share of revenues in the state's revenues makes Poland a leader among European Union countries.

Legislative measures sealing the tax gap in Poland

The strategy of sealing the tax system in Poland is basically based on three areas of interconnected activities, which include: reform of the tax administration, legislative activities closely related to the appearance of specific irregularities, and cooperation with business (PIE 2019a).

As part of administrative operations, with a view to improve the state's public finances and combat the so-called VAT carousel, it was decided to conduct a comprehensive reorganization of the tax system. The National Tax Administration was established, which cumulated the operations of the tax administration, tax control and the Customs Service (Act of November 16, 2016). The reform carried out on such a large scale resulted in a change in 156 applicable regulations. The end of the second decade of the new millennium can be described as a period of revolution in business taxation. A rapid increase in the tax gap after 2008, up to 24.2% in 2015 (PIE 2019c) forced government institutions to introduce a series of sealing measures that are both temporary and innovative system solutions.

One of the main reasons of the significant increase in irregularities was the crime in liquid fuels trading. The report prepared by Ernst & Young showed that in 2013 the state budget losses due to VAT fraud in the fuel industry had ranged from PLN 4.3 to 5.8 billion (NIK 2017). The fuel and transport packages implemented contributed to a strong growth trends in the legal sale of liquid fuels and reduced significantly the shadow economy. These solutions sorted out the right to trade in fuel in Poland and ordered digital registration of transport. According to the analyzes of the Ministry of Finance, in 2018 compared to 2016 there was an increase in legal consumption of motor gasoline by 12% and diesel oil by 15% (MF 2019a). This is one of the most spectacular successes of NRA (the National Revenue Administration) as an institution to combat VAT carousels.

Provision of the tax administration with innovative analytical tools allowed the introduction of the obligation to report VAT registers in the Standard Audit File for Tax (SAF-T) format (Act of 13 May 2016). The JPK file is a package of structured information on purchases and sales, which is provided only in an electronic version, which results from VAT records. This construction of the file allows detecting irregularities as quick as possible. According to the data from the Ministry of Finance, after the first public JPK collection, 85,000 suspicious invoices for PLN 105 million were detected. In the accounts for 2018 and the first half of 2019, discrepancies worth PLN 1.7 million were identified (MF 2019a).

Also one of the first mechanisms aimed at reducing the tax gap was the VAT reverse charge, initially introduced only for trading in scrap metal, then gradually extended to, among others, trading in certain steel and copper products, supply of electronics, and services within rights transfer for greenhouse gas emissions, or construction services (Act of 11 March 2004, Act of 26 July 2013, Act of 12 June 2015). The application of this mechanism meant that the taxpayer was the buyer of the reverse-charged goods. However, the analysis of the functioning of this solution showed that the mechanism, although focused on eliminating carousel fraud, might in the long run cause new types of irregularities and, as a result, the growth of the shadow economy. As the catalog of goods and services covered by it expanded, irregularities were moved to those types of products in relation to which the mechanism was not applicable (Ćwiąkała – Małys and Piotrowska 2016; Omidi et al., 2017; Pustylnick et al., 2017). This philosophy of combating VAT

scams did not result in counteracting these phenomena and did not solve the problem in a wider dimension.

Due to the disadvantages of the reverse charge, it was replaced with a split payment which allowed tax authorities monitoring cash on VAT bank accounts and overseeing their release. The purchaser's payment for goods or services is made to two entrepreneur's bank accounts, with the net value of sales going to the supplier's bank account and payment of the VAT amount to a special VAT account. The funds accumulated on the VAT account are the property of the seller, but their disposal is limited (Szymankiewicz 2019). In order to seal better the tax system in Poland, from November 1, 2019 the legislator introduced two models of the split payment: optional and obligatory, which differ in the prerequisites for their application. The method the of split payment was developed by the European Commission (2016a) as one of the alternative methods of improving the functioning of VAT. In addition to Poland, this mechanism has been introduced, among others, in the Netherlands, the Czech Republic, Romania and Italy, and it should be noted that these mechanisms significantly differ from each other in the catalog of items and services covered by the regulation and the VAT account formula (Kowalski 2019).

Parallel to the implementation of the obligatory split payment, some changes were made to the joint and several liability of the purchaser for the supplier's VAT obligations, expanding the catalog of goods and services covered by this mechanism from 24 to 65 items in Appendix 15 to the VAT Act.

The effect of cooperation between the National Tax Administration and the banking sector was the implementation in 2018 of the STIR ICT program (Act of November 24, 2017). Its task was to limit the possibilities of using the financial sector for tax fraud. The measurable result of the operation of this system was the blocking of bank accounts of 39 entities in 2018 for the amount of PLN 10.2 million and 311 bank accounts belonging to 71 entities for the total amount of approx. PLN 35.2 million in the period from January 1 to August 31, 2019 of the year (MF 2019a).

In order to limit the risk of cooperation with dishonest contractors, the legislator gave the taxpayer an opportunity to verify them during transactions, in the form of an electronic list of entities, the so-called whitelist of VAT payers (Act of April 12, 2019). At the same time, these provisions impose an obligation to make payments only on the bills from the list. The use of the integrated register of entrepreneurs means in practice to introduce high transparency of transactions and enables control of financial flows in business transactions.

Also the regulations introduced in May 2019 regarding online cash registers, used for recording sales to natural persons who do not run a business (Act of 15 March 2019) are the key tool to fight the shadow economy. This is a new category of fiscal devices that communicate with the Central Register of Cash Registers maintained by the Head of the National Tax Administration. The task of new cash registers is to send information that allows determining the amount of sales and amounts of tax due, VAT rate, type of goods or services, and the place of installation of the cash register. The obligation to purchase and use cash registers is gradually introduced for individual groups of entrepreneurs. Thanks to real-time data transfer, current taxpayer control and monitoring are possible. According to the Ministry of Finance, the introduction of a new type of cash registers is also dictated by the need to modernize the existing cash register system, which has been functioning in Poland for over 20 years in an unchanged form, and to use new technological solutions (Justification of April 28, 2018).

An introduction in Poland of a number of regulations regarding transfer prices related to the documentation of transactions between related entities (Act of February 15, 1992; OECD 2015) was undoubtedly, an important breakthrough in the area of tax optimization. The need for legal regulations in this respect resulted from the assumption that the enterprises, for which the effects of economic activities, i.e. revenues, become joint, may transfer income between themselves without using market prices in mutual transactions, and thus generate income in the entity that is subject to lower level of taxation (NSA of May 21, 1998). The solutions implemented affected significantly the functioning of small, medium and large businesses, and imposed numerous documentation obligations on them. Poland, as one of the first countries decided to adapt national regulations to international standards.

Another activity aimed at reducing aggressive tax planning was the introduction of provisions obliging units to inform the tax administration about the MDR (Mandatory Disclosure Rules) tax schemes (Act of August 29, 1997, Act of October 23, 2018). This is an additional reporting obligation that provides information on how to optimize tax entrepreneurs. The implementation of the provisions resulted from Council Directive (EU) 2018/822 of 25 May 2018, but the scope of the Polish provisions is broader and relates to reporting of both cross-border and domestic schemes. From the very beginning this mechanism aroused numerous controversies and doubts among entrepreneurs, which were compounded by the amount of penalties for a failure to provide information on the tax scheme.

The provisions on mandatory reporting are part of a larger change process which include separation of operating and capital income, a change in withholding tax rules, and the introduction of so-called minimum CIT on commercial real estate or exit taxation (Program Konwergencji 2019).

Tax regulations and obligations implemented in previous years aimed at further sealing of the tax system will be continued and expanded in 2020. System activities are planned within taxation of digital enterprises, sealing of the recycling fee, excise tax rate indexation or limiting the tax wedge (Program Konwergencji 2019). The VAT rate system will be also changed by an introduction of the so-called VAT matrix. A new institution named Binding Rate Information will be constituted, and a VAT and JPK_VAT declarations will be combined into one document (Rączkiewicz 2020).

Conclusions

Starting from 2015, tax authorities introduced a number of coherent legislative solutions in Poland aimed at counteracting tax fraud and, as a result, increasing revenues for the state budget. The solutions implemented in the Member States of the European Union, such as reverse charge mechanism, joint and several liability, transfer prices or tax schemes, or innovative regulations developed on the domestic basis, such as the split payment mechanism. A thorough reform of the tax administration was also conducted. The reform resulted in the establishment of the National Tax Administration. Modern analytical tools were used, and an electronic form of financial statements were implemented.

Against this background, an attempt was made to synthesize the activities carried out in the area of sealing the tax system in Poland. Selected groups of factors influencing the assessment were analyzed, while identifying legal, administrative and socio-economic conditions. The legal conditions took into account the number and stability of tax regulations and their transparency. Administrative factors include: compliance of customs and tax administration reforms with regulations, the scale of IT solutions in the field of taxpayer control tools, time and efficiency of tax audits, speed of analyzes of taxpayer data and the data on the state budget. However, from the

point of view of socio-economic conditions, it is necessary to take into account the amount of tax receipts, costs of implemented reforms, as well as cooperation between the National Tax Administration and entrepreneurs.

Undoubtedly, the strengths of sealing measures include reducing the tax gap and increasing tax revenues to the budget, as well as reducing the shadow economy, which determined greater stabilization of state finances. Sealing measures allowed reducing the VAT gap to 12.5% and revenues from VAT increased by PLN 52 billion in 2018 compared to 2015. Income tax revenues also went up. It is worth noting that the number of fiscal controls was reduced by more than half from 55,793 in 2015 to 26,102 in 2018. It is estimated that in the first half of 2019 the number of inspections was 10,116. The effectiveness of inspections also increased during this period from 84.15% to 91.34% (MF 2019b). A certain specialization of tax authorities is also characteristic, which consists in checking specific transactions related to specific tax benefits. Implemented IT tools significantly reduced the time of analyzes. An undoubted advantage of administrative activities was also conducting numerous educational and information campaigns regarding, among others, JPK_VAT reporting and security of business transactions. A number of explanations and tax warnings can also be found on the website of the Ministry of Finance. Numerous tools were made available to help the taxpayer avoid the possibility of becoming entangled in the so-called tax carousels and checking the reliability of contractors. A black and gray list of unfair market practices was published. In order to build good relations between tax administration and key entities in the market, a Key Entities Service Center and the National Tax Information Center were created.

Considering the weaknesses of tax administration reforms, it should be noted that they resulted primarily in significant production and volatility of tax regulations. The measurable effect of these activities were 362 pages of amendments to tax laws in 2018 and 152 pages of provisions up to the third quarter of 2019 (Grant Thornton 2019; Sejm RP). It reduced their transparency. The attention should also be paid to the short time allocated for consolidation of the tax apparatus and the related underdevelopment of regulations regarding tasks in the area of excise tax and limitation of the efficiency of centralized debt collection in the initial period of administrative reform, as well as the controversial nature of personnel formation. The Supreme Audit Office (NIK 2020) also negatively referred to the lack of gathering information on the costs of ongoing reforms and the costs of processes related to it.

Considering the continuation of activities of tax authorities, opportunities and threats of undertaken actions should be indicated. They should be seen primarily in the possibility of development and implementation a coherent tax policy in all EU Member States aimed at reducing the transfer of earned profits in individual countries to tax havens and a definite reduction in the activity of countries applying unfavorable tax optimization. On the other hand, the threats include the risk of an increase in harmful tax competition between Member States and intensification of activities aimed at expanding the base of economic instruments of international corporations supporting tax optimization strategies.

The instruments used to combat criminal practices in VAT and other activities aimed at sealing the tax system in Poland, from the point of view of the overall activities, should be assessed positively, as they have brought measurable effects. Both actions taken by tax authorities to reduce the scale of irregularities and good macroeconomic situation contributed to the reduction of the general government deficit in 2018 to 0.2%. GDP. This is the lowest result since Poland's accession to the European Union in 2004. The Budget Act adopted by the Government for 2020 envisages the first budget without deficit since 1990. The public finance sector deficit is expected

to be 0.3% of GDP, which seems to be the most important considering the 3% threshold in force in the EU (MF 2019c).

Application of the Concept of System Product in the Management of Cultural Institutions in Poland

Magdalena SOBOCIŃSKA

Wroclaw University of Economics and Business, Department of Marketing Research, Wroclaw, Poland, E-mail: magdalena.sobocinska@ue.wroc.pl

Abstract

The purpose of the paper is to show the possibility of implementing the concept of a system product in the sphere of management of cultural institutions. The study is based on literature studies and the results of quantitative empirical research that was performed on a sample of 451 people managing cultural institutions in Poland. The implementation of the formulated goal required identification of the attributes of the system product on the basis of the literature analysis, as well as to determination of their relationship with the offer created by cultural institutions. The analysis of the results of empirical research aims to present the approach to the implementation of the system product concept in cultural institutions through the prism of the role of product attributes in various areas of marketing of cultural institutions. Moving in the analysis from the quantitative to qualitative approach to the discussed issues, the idea of a system product in the sphere of culture is presented on the example of the functioning of the cultural institution of New Horizons Cinema. Consequently, the conducted research procedure allowed to formulate the conclusion that creation of system products that serve the satisfaction of not one, but the whole bundle of culture needs experienced by the consumer is one of the trends of development in the management of cultural institutions.

Keywords: System Product, Marketing, Marketing In Culture, Cultural Institutions

Introduction

The discourse regarding the functioning of the sphere of culture shows the need of managing cultural institutions, while taking into consideration the achievements of marketing and its various paradigms. This is related, among others to the need of increase in the level of participation in culture, changes in lifestyles, as well as the development of new media.

At the same time, it should be noticed that development of marketing is multidirectional. This is reflected in the emergence of new marketing concepts, including the concept of a system product, which was created by L. Żabiński. The essence of system products is the fact that by purchasing them, the buyer simultaneously acquires many values without the need to compose them themselves. It should be emphasized that system products support satisfaction of not one, but a whole bunch of needs felt by the consumer, which belong to many levels of needs. What is more, further features of system products also include the fact that they often have an innovative character and are distinguished by a high level of technological advancement. Intangible resources, including information and knowledge, play an important role in creation of system products. It should be added that also consumption of system products requires knowledge and skills from the consumer. Networking, perceived both through the prism of co-designing of this type of products by active users while applying new media, as well as in the context of the functioning of entities creating system products within networks created with entities in the market environment is an important distinguishing feature of system products. It cannot be neglected either that system products are distinguished by brand and have a global or glocal character (Żabiński 2012).

In this context, there occurs a question about the need and possibilities of using the concept of a system product in the management of cultural institutions. Formulating the answer to this question, which is goal of the paper, required literature studies and reference to the results of empirical research.

Adequacy of the system product concept for the sphere of culture

The specific character of the sector of culture means that using the marketing approach (Vitkauskaitė 2015) in this sphere requires taking into consideration the function of culture. The role of marketing in culture is often expressed in finding appropriate audience for the works that are the result of artistic activity (Mokwa, Dawson, Prieve 1980). In the case of cultural institutions, application of marketing does not mean that the artist must create a work while adapting to the tastes of the consumers. Marketing in culture consists in reaching market segments that may be interested in the artwork and meeting their needs. The forms of artwork promotion and distribution, as well as pricing policy should be adapted to the types of consumers and their differing behaviours. Shaping the tastes of the recipients and sensitizing them to culture, and not just satisfying the currently felt needs is also the role of marketing in culture is also (Apostolakis, Jaffry 2018; Colbert 2007; Diggles 1986; Leko-Šimić M., Štimac H., Mikrut M. 2018; Varbanova 2013, Wróblewski, Dacko-Pikiewicz, Cuyler 2017). It should be added that marketing in the sphere of culture focuses its interest both on the consumer and artist, as well as on their artwork, and also ensuring contact between creators and consumers (Wróblewski 2017).

The adequacy of the assumptions of the concept of system product from the point of view of the specificity of the sphere of culture results from the fact that culture products can perform many functions and thus enable the consumer to satisfy not one, but a wide range of needs. Among the permeating and jointly occurring functions of cultural goods that make a culture consumer receive, as in a system product, many values at the same time, especially, it is necessary to indicate the aesthetic, impressionist, cognitive, didactic, ludic and therapeutic function, as well as to the communication and integration function (Szczęsna 2002; Zimnica-Kuzioła 2003). The fulfilment of the aesthetic function by products belonging to the sphere of culture is associated with enabling the consumer to achieve satisfaction resulting from contact with an attractive form of the artwork. This is possible if the consumer adopts the aesthetics proposed by the creator. In turn, through the impressive function, cultural products affect the recipient, causing an emotional response, and sometimes also changing their attitudes. On the other hand, satisfying the cognitive needs by the products of cultural sphere results from the fact that they are a source of historical or ethnographic knowledge for example. The presented systematic character of the cultural sphere product also results from the fact that, beside the functions already discussed, it also often has a didactic function, because films or books, showing models and negative examples of characters, contain some kind of guidelines on proper conduct. It should also be stated that fulfilling functions presented above by culture products does not mean that they do not serve, as in the case of the ludic function, to provide entertainment to consumers. It is also associated with their therapeutic function, which is reflected in the fact that participation in culture can also be a form of relaxation, and through entering the world created and shown by the artists, the recipient has the opportunity to forget about their own problems. Another group of needs satisfied by culture products results from their communication and integration function, consisting in creation of the sense of community of culture participants with artists and other recipients.

When analysing the assumptions of the concept of a system product in relation to the specificity of the sphere of culture, reference should also be made to the category of innovativeness, which may apply to both the very work, as well as the forms of its distribution and promotion. Among the factors facilitating the creation of innovative solutions, the use of an interdisciplinary approach in the process of generating ideas should be indicated. It is illustrated by the "Medici effect" who brought representatives of the world of science and culture, including philosophers, poets, painters, sculptors and architects to their hometown. While establishing relationships with each other, the creators, began to develop new concepts at the intersection of the areas they were dealing with. This formed the basis for the development of the Renaissance as one of the most innovative eras in the history of the European culture. The skill of associative thinking, questioning the status quo, observing, experimenting as well as establishing contacts that consists in building relationships with people representing various environments, cultures and having different points of view are especially important from the point of view of development of innovativeness (Dyer, Gregersen, Christensen 2011).

The analysis of the attributes of the system product indicates that they are strongly interrelated, and they permeate with each other. his is illustrated by the relationship observed between innovativeness and the innovative nature of the system product and networking. On the one hand, networking is a feature of the

system product, whereas on the other hand, creation of valuable relationships within the network of connections between creators and cultural institutions with various market entities can be the source of innovation. This is proved, among others, by the example of creative clusters (e.g. Hollywood cluster). They enable creation of target teams, whose participants represent complementary skills that are necessary for a given venture to succeed. The open and changing network of interpersonal relations, which should contribute to individual development and personality enrichment performs an important function in the development of creative clusters (De Propris, Hypponen 2008; Mikołajczyk, Kurczewska, Fila 2009). Cooperation within creative clusters can translate into the introduction of innovations, because within these types of structures it is relatively easy to exchange ideas, knowledge and experiences of many creative people who can inspire each other. It should be emphasized that the so-called artistic buzz consists of ideas and concepts that are not only the result of relationships between artists, creators, but also culture consumers, art critics and representatives of science and business (Szultka 2012).

The adequacy of the concept of the system product for the sphere of culture also results from the fact that creation of such a product, as well as its distribution and promotion is increasingly based on new technologies. Relationships between new technologies and the sphere of culture are manifested, among others in the use of drones that enable taking shots that could not be made with the use of other techniques. The fundamental change resulting from the development of digital techniques also applies to visual effects. Virtual reality, which is defined in the context of a computer-generated three-dimensional environment, allowing the user of this technology to interact with virtual artefacts also has the potential (Guttentag 2010). In addition, technologization of the culture is associated with the development of streaming platforms. It is also worth noticing that, on the one hand, technological progress makes the artworks available on the Internet, and on the other hand, it increases the possibilities of deepening relationships, e.g. between film and museum, which is reflected in the artworks presented in the exhibition space, which are part of the media art, as well as film exhibitions, which create a repertoire of emotions and sensations unavailable elsewhere. These types of activities, aimed at expanding the cultural offer, well reflect the possibilities of implementing the concept of a system product into the sphere of culture. Considering the fact that knowledge plays an important role in creating a system product, it should also be emphasized that professionalization and specialization are progressing in the sphere of culture.

Transmedia projects associated with network creation of value should also be approached as system products in the sphere of culture. Their essence is the artwork functioning on many levels because a story presented in one medium is developed in other media (Jenkins 2006). They are often distinguished by a strong brand, which is an attribute of a system product. At the same time, it should be noticed that in the modern world cultural institutions are becoming brands that well promote cities, regions and countries. The analysis of the processes of management of cultural institutions also allows to state that cultural products increasingly more often have a global or glocal nature. It is associated with the development of the Internet, television formats, international distribution of cultural products and it requires culture managers to solve standardization problems and adapt their offer to the local market in the conditions of growing internationalization.

Methodology of Own Research

Aiming to implement the goal of the paper, reference should be made to the results of conducted quantitative empirical study. Its features include objectivity, verificationism, quantifiability, coherence, as well as the use of statistical data analysis (Leavy 2017). The questionnaire survey was conducted on a Poland-wide sample of 451 cultural institutions selected in a probabilistic manner. From the point of view of groups of respondents, the survey included general directors, artistic directors and managers, managers of marketing, promotion and sales departments, as well as owners of cultural institutions. Random layer selection was used as the basic method for selection of entities for the study. The layers were separated according to the type of cultural institution and the study comprised museums, art galleries and salons, theatres and music institutions, cinemas, cultural centres, as well as publishing houses as the key entities from the point of view of the development of the book industry. The number of entities surveyed within individual groups was proportional to the number of institutions operating in individual areas that are found in the created database of cultural entities. The surveyed market entities represented all voivodships in Poland.

Considering the scope of the quantitative research and the type of respondents as well as the nature of their work, the technique of computer-assisted telephone interviewing (CATI) was chosen (Hague, Cupman, Harrison, Truman 2016; Burns, Veeck, Bush 2016). The choice of research technique was also determined by the need of standardisation of the interview process and minimisation of the interviewer's effect. This technique also enabled flexible adaptation of the interview time to the respondent's preferences. Technical performance of computer-assisted telephone interviews with the use of a standardized questionnaire took place in the CATI studio of the ARC Rynek i Opinia research institute in Warsaw, which is equipped with professional equipment and software ensuring the proper execution of the study (Sobocińska 2015).

Implementation of the formulated goal of the paper required focusing the analysis of the results of empirical research on obtaining answers to the following research questions:

- Is increasing the diversity of the offer as the feature of a rich program of cultural institution perceived as a stimulus for the development of the cultural market? (P1)
- Do cultural institutions in Poland create and operate within a network of relations with culture consumers, other cultural institutions, creators, artists and universities to achieve their goals,? (P2)
- What role does the Internet play in the processes of management of the value for a culture consumer? (P3)
- What is the position of the brand among the instruments that cultural institutions in Poland compete with? (P4)
- What is the position of the introduction of innovation in the offer among the priorities of managing cultural institutions in Poland is the? (P5)

Answering the above questions will allow researchers to present the approach observed in cultural institutions in Poland to the implementation of the system product concept through the prism of implementation of the assumptions of the concept in the sphere of various marketing areas of the functioning of cultural institutions.

Implementation of the concept of system product in cultural institutions in Poland in the light of the results of quantitative research

Striving to show the scope and determinants of the implementation of the system product concept in cultural institutions in Poland, the attitude of people managing cultural institutions towards increasing the diversity of the offer should be analysed. This is even more important because increasing the diversity of the offer is immanently associated with features of system product as the complex nature and performance of many functions, which translates into a broader and more varied bundle of consumer needs satisfied by cultural institutions. The analysis of the results of conducted quantitative research allows to state that increasing the diversity of the offer of cultural institutions seems to stimulate the development of the culture market in Poland. This factor reached an average value of 6.04 on a seven-point scale, on which one represents a little important stimulant of the development of the culture market in Poland, and seven means a very important stimulant. It is also important that increasing the diversity of the offer, that allows cultural institutions to meet a broad range of consumer needs, is accompanied by attaching great importance to the increase in the quality of the offer. Among the stimulants of the development of the culture market in Poland, the respondents attributed the value of 6.02 to increasing the quality of the offer. The obtained results are the basis for giving a positive answer to the first research question (P1). It should be added that there is a relationship between perceiving the increase in the offer diversity by surveyed decision-makers in cultural institutions in Poland and experiencing by them of the need to increase the scope of marketing activities (Kruskal-Wallis test: χ^2=14,146, df=2, p-value=0.000). This means that the implementation of the concept of a system product by cultural institutions is in line with the adoption of market orientation by them, which is manifested in the implementation of marketing principles.

It is also characteristic that there are also correlations between high ratings given to such determinants as: increasing the quality of the developed cultural offer and increasing the diversity of this offer (Spearman's rank correlation coefficient of 0.710) and increasing the scope of cooperation between

cultural institutions (Spearman's rank correlation coefficient of 0.527). In this context, it is important to answer the second research question (P2) regarding the functioning of cultural institutions in Poland within the network of relationships created with entities in the environment.

It should be emphasised that 98.9% of the decision-makers in cultural institutions claim that in order to achieve the assumed goals, they must create and function within a network of relationships with culture consumers, other cultural institutions, the media, schools and other entities in the market environment. 63.4% of the respondents strongly agree with this opinion, and 35.5% rather agree with it. Therefore, the results of the conducted quantitative research indicate that for people managing cultural institutions in Poland, networking is especially important, which is an important attribute of the system product. The fact that that definitely more decision-makers in cultural institutions perceive relationships with other cultural institutions through the prism of cooperation, not competition complements the image that expresses the specificity of the sphere of culture. 33.7% of respondents believe that the relationship between the cultural institution they represent, and other cultural institutions is based on pure cooperation, whereas 49.7% of respondents claim that these relationships are based on cooperation with elements of competition. By way of comparison it can be added that only 16.6% of respondents indicate that relationships between cultural institutions take the form of competition with elements of cooperation (13.1%) or pure competition (3.5%).

The analysis of functioning of cultural institutions through the prism of networking needs a holistic view of the entities with which cultural institutions establish relationships. Considering the multitude of entities with which cultural institutions create relationships to meet their needs and expectations, it seems important to recognize the importance attributed to specific groups of stakeholders. The results of the performed study show that people managing cultural institutions attach great importance to meeting the needs of culture participants. This is because almost 98% of respondents included culture consumers in one of the four most important groups of entities that the cultural institutions they represent are currently focused on in terms of meeting their needs and expectations. The high position of culture consumers in the ranking of groups of recipients of cultural institutions is proved by the fact that a relatively large percentage of respondents (88.5%), while including culture recipients in one of four priority stakeholder groups, almost always put them in the first place in the ranking. The employees, including creators and artists occupy the second place in the hierarchy of the importance of entities that cultural institutions focus on in terms of satisfying their needs. Media and representatives of municipal, regional and central authorities are found in successive places in this hierarchy of importance of entities. On the other hand, such entities of the environment as sponsors, reviewers and critics, as well as the owners of cultural institutions and volunteers were less often included in the priority groups.

Moving in the analysis towards identifying subsequent features of the network of the relationships established by cultural institutions, it should be emphasized that these institutions are oriented on building permanent and trust-based relationships with various entities in the environment and, according to the decision makers participating in the study, they have such relationships. This is proved by the fact that the average rating of relationship durability for most groups of the environment is over 4 points on a seven-point scale. At the same time, the respondents also highly evaluate the relationships of cultural institutions they represent with the entities in the environment in terms of the level of trust. In this case, the lowest average rating was 3.31 (with research agencies) and the highest was 5.92 points (with culture consumers).

Conducted statistical analysis, aiming at identifying the features of the network of relationships built by cultural institutions, allows to observe that together with the increase in the duration of the relationships between cultural institutions and individual groups in the environment, there is a growing trust in these entities. In all cases, the Spearman rank correlation coefficient reached a positive value between 0.471 and 0.661. The strongest correlation occurred in the case of relationships between cultural institutions and cooperating people, including creators and artists, as well as universities (Spearman's rank correlation coefficient = 0.661, p-value = 0.000). This means that the higher the decision-makers in cultural institutions rated relationships with these entities in terms of durability, the higher they also rated the level of trust in these relationships.

Summing up the considerations regarding various aspects of the functioning of cultural institutions within the network of relationships, in the light of the analysis of collected empirical material, a positive answer to the second research question should be formulated (P2).

Relationship with new media are another important dimension of a system product related to networking. While analysing this attribute of the system product, the role of the Internet in the processes of management of the value for the culture consumers should be shown. It is worth noting that almost all surveyed cultural institutions (97.8%) have their own website, which is the heart of marketing activities conducted on the Internet. The response of cultural institutions to the development of functions and the evolution of the Internet is the fact that slightly over 82% of the surveyed cultural institutions use social media in marketing activities. This is reflected, among others, in the fact that 77.4% of the entities on the culture supply market, included in the survey, have a Facebook profile, and 64.5% of the surveyed cultural institutions that have a Facebook profile believe that the scope of its use should be expanded, while in every third it is stated that nothing should be changed in this respect.

Conducted quantitative research also shows that the managers of the studied cultural institutions perceive creating the image of cultural institutions and shaping relationships with culture recipients as the main purposes of using social media. They are indicated among the three main goals by 71.2% and 51.3% respondents respectively. Advertising cultural institutions (44.9%) is found on the third place in the hierarchy of goals of using social media. In the studied cultural institutions social media support the sale of cultural goods and services (30.9%) and obtaining information for the needs of management in a cultural institution (30.4) to a lesser extent.

Considering that social media can support engagement of consumers in the process of value creation, it should be emphasized that only every third of the surveyed cultural institutions that conduct activities based on social media includes co-creation of the offer with culture recipients among its three main goals. Furthermore, even a smaller percentage of cultural institutions (17.2%) recognise using social media as the opportunity to obtain the ideas concerning changes in the offer. This may prove that managers of cultural institutions notice many negative consequences associated with departing from the classical division of roles into professional creators, artists and recipients. Thus, the obtained results correspond well with the view presented in the literature on the subject that even though all Internet users can enrich its resources, entities belonging to the music, film and television industry, as well as the press and publishing industries that introduce to the network the content created both before its emergence and new ones are still the key providers of messages (Mrozowski 2020). However, this does not mean that the Internet is not used by cultural institutions in the process of management of value for culture consumers. A relatively broad scope of applications of the Internet in the functioning of cultural institutions is demonstrated by the fact that over 68% of them sell their cultural goods and services online. Furthermore, a larger percentage of cultural institutions (85.4) use the Internet to advertise their offer. When formulating the answer to the third research question (P3), it should be emphasized that the Internet is more used to distribute and communicate value than to engage recipients to define and shape it at the stage of artwork creation.

From the point of view of the features of the system product identified on the basis of the literature analysis, which also includes the brand, it should be noticed that it occupies a high position among the instruments that cultural institutions in Poland compete with (see Figure 1). On the basis of conducted empirical study of quantitative character, it can be stated that among competition instruments, cultural institutions attach the greatest importance to having a unique offer and to having a reputation and brand. The instruments are indicated as the three most important ways of competing by respectively 72.5% and 50.6% of the decision-makers in cultural institutions in Poland. This is also closely related to having a professional team of employees, creators and artists, which is indicated by 47.5% of respondents. In comparison, it needs to be emphasised that having low prices of the offered products was indicated as one of the three most important competitive factors only by 22.4% of respondents. While interpreting obtained research results, it is worth stating that they confirm that the specificity of the culture sector is expressed by high uniqueness of cultural goods. In addition, it should be noticed that economic determinants,

including the level of prices of cultural goods and services in relation to income, constitute a barrier to participation in culture only for people who feel cultural needs and want to increase the scope of participation in culture. The main problem related to low cultural activity is largely not caused by economic determinants, but by the absence of cultural needs or low position of these needs in the hierarchy of life values, or low interest in participation in culture (Kotler, Scheff 1997).

The results do not add up to 100%, because the respondents could indicate three answers.

Fig. 1: Brand position among the ways of competing in cultural institutions

Source: Own study

Answering the fourth research question (P4), it should be stated that on the culture market in Poland, non-price methods of competition, especially those related to creation of a unique offer in terms of artistic experience, as well as having a strong brand are applied to a much greater extent.

While aiming to determine the extent to which cultural institutions in Poland implement the assumptions of the system product concept, the analyses should include the aspect of implementation of innovations. 45% of the surveyed decision-makers in cultural institutions in Poland perceive the implementation of innovations in the offer as one of three management priorities. For comparison, it is worth indicating that a similar percentage of respondents (45.5%) include care of the high artistic quality of the offer among three main areas on which managers of cultural institutions should focus. This is illustrated in figure 2.

It should be positively assessed that such categories as building long-term relationships with culture consumers and gaining culture recipients occupy the highest places in the hierarchy of management priorities in cultural institutions in Poland. They are indicated as the three most important aspects of management respectively by 55.4% and 50.1% of people managing cultural institutions in Poland. The image of the way of assessing the priorities in managing cultural institutions that emerges from the analysis of the results of the study allows to state that introduction of innovations in the offer is an important aspect of management in cultural institutions. Referring to the respondents' answers, it is worth noting that the introduction of innovation in the offer ranks fourth among eight determinants that can be perceived as priorities in the management of cultural institutions. This constitutes the answer to the fifth research question (P5).

The results do not add up to 100%, because the respondents could indicate three answers.

Conclusions

Conducted research procedure allows to state that the concept of a system product well reflects the changes taking place in culture management. The emergence of an increasing number of system products appears to be one of the trends of development in the management of cultural institutions. Considering the fact that the essence of a system product is that the consumer acquires many values at the same time and has the opportunity to meet different needs, the trend that cultural institutions provide recipients with many impressions in one place and in a relatively short time should be indicated. This is reflected, among others, in organizing concerts and film shows by museums, fine art exhibitions by theatres or separating recreational and cafe spaces in cinemas. This leads to blurring of boundaries and disappearing of divisions into firmly separated fields of art through combining various areas of art within the framework of activity of one cultural institution. The attractiveness of such solutions for culture consumers results from the insufficiency of free time, as well as a large number of cultural events. Therefore, culture consumers often choose such cultural events that enable them to acquire many values as well as feel many sensations and impressions in the same place and time (Szlendak, 2010). On the basis of literature studies and the results of empirical research, it should be stated that also other attributes of the system product are quite strongly observed in the management of cultural institutions.

Moving from the general to the specific, in accordance with the deduction method, the possibilities of implementing the idea of a system product should be shown in the conclusions on the example of the cultural institution of New Horizons Cinema. The method of creating system product attributes by this culture entity is shown in Figure 3. This example also confirms the attractiveness of the concept of system product for the sphere of culture and indicates the legitimacy of its implementation.

Fig. 3: New Horizons Cinema as a system product

Source: Own case study.

The analyses performed in the paper indicate the need for further research in the field of discussed issues. It would be especially reasonable to extend the scope of empirical research and to include cultural institutions from other countries. Recognizing the level of satisfaction of culture consumers using various system products created by cultural institutions could be another trend of research.

Indicators and Measures of Thermal Energy Poverty in The Shaping of The National Energy Security Policy, Based on The Example of Poland

Katarzyna ŚWIERSZCZ

Military University of Technology in Warsaw, Warsaw, Poland
katarzyna.swierszcz@wat.edu.pl

Abstract

The aim of this paper is to present a proposal to use indicators and measures of thermal energy poverty of households and an attempt to develop, based on the indicators and the measures, a definition of the thermal poverty phenomenon, which such a definition shall enable a proper shaping of the national energy security policy. The main motive for addressing this subject is, first of all, the lack of this deprivation's unambiguous determinants and the lack of this deprivation's unambiguous measures covering all households that experience the deprivation; secondly, the lack of an unambiguous definition of the thermal poverty phenomenon - which such definition would be recognised by all experts specialized in this subject, as well as by various public policies dealing with the elimination of this phenomenon. The research problem will focus on three issues: the attempt to define the concept of the household thermal energy poverty based on an international literature review; the discussion on the household thermal energy poverty phenomenon in Poland and the presentation of the research methodology in determining indicators and measures of household thermal poverty. The research problem addressed in the article is theoretical and empirical. For a deeper presentation of the problem, the following methods were used: analytical and synthetic methods, inference and also quantitative and qualitative methods.

Keywords: Security; Thermal Energy Poverty; Thermal Poverty Indicators; Thermal Poverty Measures.

Introduction

Polish households are among those, which are characterized, among other European Union countries, by one of the highest ratio of expenditure on thermal energy. They amount to 11% and constitute the basic part, i.e. 2/3 of all energy expenditure. To heat a flat or to heat meals, households use various types of thermal energy carriers, depending on the type of heating installation in a flat. The largest share is held by expenditure on hard coal (21%), followed by natural gas (17%), municipal gas (17%) and central heating (16%) (Świerszcz 2017b). The Czech Republic (13%), Slovakia (14%) and Hungary (17%) have a slightly higher share of expenditures on thermal energy than Poland (Bouzarovski 2018). However, it should be noted that a high share of these countries is characteristic for almost all Central and Eastern European countries. This shows that the thermal energy expenditure burden in this part of Europe is much higher than in other European countries.

The high share of thermal energy and the consequent high expenditures on it have long been a serious challenge for households, consisting of difficulties in maintaining the thermal comfort and ensuring healthy existential and living conditions for their inhabitants. It can be said that the care to maintain optimal heat in households is one of the basic activities for those inhabitants. Ensuring these standards is at the same time a fundamental element of social security systems, as well as the subject of strategies and policies for energy security developed both on local and on national level in all developed countries. The United Nations HABITAT Agenda, which deals with the sustainable development of housing estates worldwide, in its "The Right to Adequate Housing" document it highlights, inter alia, the need for households to have access to energy for cooking and heating; to be

protected against cold, humidity and heat; and to be protected against other health and structural risks (The Right 2009). Despite this fundamental need and necessity to have access to thermal energy and the possibility to provide optimal thermal standard to household residents, the issue of setting unambiguously the limit of deprivation of these needs is not fully defined at present. There are no clear deprivation's indicators and deprivation's measures covering all households that experience it. One of the manifestations of this phenomenon, referred to as thermal energy poverty, until now has not been clearly defined in a way that would be recognized by all experts specialized in this subject, as well as by various public policies whose task is to eliminate this phenomenon (deprivation).

The aim of the paper is therefore to present a proposal to use indicators and measures of household thermal energy poverty and an attempt to develop - based on them - the thermal poverty phenomenon definition enabling the proper shaping of the national energy security policy.

The research problem addressed in the article is theoretical and empirical. For a deeper presentation of the problem, the following methods were used: analytical and synthetic methods, inference and also quantitative and qualitative methods. Polskie europejskich.

The concept of household heat energy poverty based on an international literature review

Thermal poverty, which is the element of energy poverty (fuel poverty, energy poverty), is currently a disturbing phenomenon in social life, which is experienced in Poland, as well as in other low- and high-developed countries of the European Union and even in the world. Among the member-countries of the European Community, it is estimated that the problem of energy poverty affects between 50 and 125 million people, particularly in the countries of Central and Eastern Europe, as well as in the countries of Southern Europe. In Poland, however, this phenomenon is experienced by about 12% of households in winter and 27% in summer, especially in large voivodships with an increased number of single-family houses, such as: Wielkopolskie, Mazowieckie, Podkarpackie, Małopolskie and Lubelskie; as well as in less developed voivodships, such as: Warmińsko-Mazurskie and Opolskie. This rate is higher than the European average of 9.8% in winter and 18.1% in summer (Owczarek and Miazga 2015; Howard 2015); (Sánchez-Guevara Sánchez, Mavrogianni and Neila González 2017). This is shown in Figure 1.

Fig. 1: The level of household energy poverty in winter and summer, in individual European countries in 2018.

The studies show that these figures can increase continuously as energy prices rise. The scale of the energy poverty experienced indicates that this phenomenon is not something new in human (social) empiricism, but nevertheless it has only nowadays been conceptualized and studied as an autonomous problem. Due to its scale and importance, this problem is particularly visible in the aspect of the thermal poverty phenomenon. At this point it should be noted that this concept, in its wording, is not

present and used both in Polish law and in all-Poland public policies. It is also not directly articulated in the subject literature, both domestic one and foreign one. However, aspects and traits of this concept can be found in this literature. They can particularly be seen in the statements of subject's experts examining the energy poverty phenomenon, the scope of which is much broader, because it also includes electricity.

Referring to the thoughts shown in a national literature, it is worth noting the definition by D. Owczarek and A. Miazga, in which one can find aspects concerning thermal poverty. They can be seen when, as the authors say, households' inhabitants experience two difficulties in terms of energy needs. The first one is the problem to maintain a certain thermal standard, which allows to adequately satisfy the basic needs of a biological and social functioning of household's inhabitants. At this point it should be emphasized that the thermal standard in Polish flats, determined by law, allowing you to experience the sense of comfort, is the temperature of 21oC and in other occupied rooms is 18oC (Świerszcz 2017a; Owczarek and Miazga 2015). The second difficulty are problems to purchase thermal energy for a reasonable price in a place of residence (Szpor 2016; Scarpellini, Sanz Hernández, Llera-Sastresa, Aranda and López Rodríguez 2017). A significant complement to the understanding of the thermal poverty phenomenon can be found in the definition of energy poverty developed in the Research Paper by A. Stępniak and A. Tomaszewska. Speaking of the various aspects of the problem they are discussing, the authors draw attention to such aspects as: experiencing by household members the problem to maintain a comfortable thermal level (temperature), the lack of funds to pay bills for heating or to repair a non-functioning system or heating device; the inability to buy and install a new system or device; and, finally, the inability to adequately modernise their heating system. Another, very important element defining the thermal poverty phenomenon in the discussed problem of energy poverty is the constant experiencing by the inhabitants not only the coolness, but even the cold, and related humidity of the air and walls, as well as fungus of walls, whose natural consequence are frequent diseases of the inhabitants and mental discomfort. Thermal poverty means also a difficulty to heat up utility water, which is needed by inhabitants in their everyday lives (Świerszcz and Osial 2019; Stępniak and Tomaszewska 2013).

The issue of thermal poverty and an attempt to define it in the context of energy poverty can be found not only in the subject literature dealing with this issue in the scientific aspect, but also in government documents. The example is the "the Draft of the Energy Policy of Poland until 2050" proposed in 2014. In this document, the thermal poverty phenomenon considered in the context of energy poverty is understood as the situation, in which households are exposed to a reduction in energy consumption to the spheres and level absolutely necessary for them to function on daily basis (Projekt Polityki 2014).

In the foreign subject literature, the authors from the Great Britain are the precursors of the scientific approach to the thermal poverty phenomenon discussed in the context of energy poverty. Among these authors, B. Boardman deserves special attention, who, undertaking a thorough examination of energy poverty, based on her experience and specificity of the phenomenon in her country, which is Great Britain, specifies the definition, from which elements concerning the thermal poverty phenomenon can be extracted. These elements refer to a situation in which, as the author notes, households - in order to achieve a sufficient level of heating, i.e. a temperature of 21oC in main rooms and 18oC in other rooms - are forced to spend more than 10% of their income. These expenditures relate both to costs incurred for heating and to the costs of water heating, cooking, lighting and the use of electrical equipment. In other words, these expenditures relate to all types of energy, including thermal energy, and vary depending on types of flats (Bordman 2012; Pye and Dobbins 2015; Hilbert and Werner 2016). In this definition, the author draws attention to two issues: hypothetical expenditures on energy and the threshold for household income, which is 10%. It should be stressed that this definition has, for a long time, been the basis to shape public policies not only in the UK but also in other countries experiencing the thermal poverty problem.

A complementary definition - functioning in parallel - is the Low Income High Costs (LIHC) definition, developed in the UK in mid-2013. This definition, specifying the energy poverty phenomenon, uses two criteria to determine the state of thermal poverty, which are: low financial

income of household members (Low Income) and high energy expenditures (High Costs). Considering these criteria, this definition is referred to as Low Income High Costs (LIHC), i.e. high costs and low income (The UK Fuel Poverty Strategy 2008). It should be stressed that the above-mentioned definition of energy poverty, which includes elements of thermal poverty, was until recently the only formally adopted and preferred definition of the phenomenon. Therefore, most of the research and statistics done so far, have been and are still being carried out on the basis of this definition.

A major contribution to a more precise definition of thermal poverty discussed in the context of energy poverty is the definition by J. Hills of the London School of Economics, which the UK Department for Energy and Climate Change (DECC) adopted in 2013 as officially binding (Fuel poverty 2013; Bakirtas and Akpolat 2018; Zalewski 2015). In this definition, the author, referring to the thought B. Boardman and Low Income High Costs (LIHC) methods, more precisely specifies this phenomenon, taking into account two aspects. The first one concerns the situation where the thermal energy costs borne by the household members exceed the average value for a given type of household. The second one refers to the situation where the costs incurred shift the remaining income of the household below the official poverty line (Fuel poverty 2013). The above two definitions authored by B. Boardman and J. Hills, as well as the developed LIHC method, are currently one of the best developed definitions that allow to determine, in a reasonably accurate manner, the level of thermal poverty and groups of addressees of relevant public policies in individual countries of the European Union.

A slightly broader definition of thermal poverty can also be seen in the definition of energy poverty proposed by A. Asher. According to him, this phenomenon means the situation, in which the inhabitants of households experience certain disadvantages, such as: the difficulty to maintain a comfortable temperature of a flat (house), i.e. warmth in winter and coolness in summer, difficulty to pay energy bills, difficulty to repair a non-functioning heating system, or difficulty to modernise it or install a completely new one due to lack of funds and finally experiencing humidity in a house (Asher 2016). Another noteworthy aspect, despite the less precise concepts, is the definition drawn up by the European Economic and Social Committee in the context of an international project. Their 2009 European Fuel Poverty and Energy Efficiency Project (EPEE) report on energy poverty also reveals elements of the definition of thermal poverty. This term is understood as a situation where a household experiences difficulties or is completely unable to provide an adequate level of heating at an affordable, fair and affordable price to ensure comfort and healthy living, working and other forms of everyday life for its residents (EPEE project 2009). The quoted way of understanding thermal poverty is a general concept of its understanding. However, due to the lack of a clear focus on the concepts contained therein, it is difficult to take it as a reference point for setting criteria for supporting households as groups experiencing this phenomenon or sensitive to it, within public policies. However, being aware of the dynamics of phenomena affecting the nature and state of energy poverty, in 2011 the European Economic and Social Committee proposed that their definition should be adapted to the national conditions of each of the Member States of the European Community and that the problem of energy poverty should become a new social priority (EPEE project 2009).

An attempt to define thermal poverty can also be found in the definition of energy poverty in the UN-HABITAT Agenda for the Sustainable Development of Housing Estates in the World. In The Right to Adequate Housing, this phenomenon is defined as a state of experiencing difficulties in meeting basic household needs at the level of free access to the energy needed to heat rooms and cook food. It is also a condition in which households experience difficulties to protect against cold, moisture and heat. In other words, it is the situation that constitutes the serious barrier to the exercise of the fundamental right to adequate housing and creates the obstacle to the sustainable development of settlements and communities (“he Right to Adequate Housing 2009).

The analysis of both domestic and foreign literature on energy poverty leads to an attempt to define the own concept of thermal poverty phenomenon of households. Therefore, thermal poverty can be defined as the state of experience in a longer period of time, the state of difficulties in integral

satisfaction of basic needs of thermal energy - affecting the state and existential and living level (health, development, education) of households - both in terms of quality and price, inaccessible to its inhabitants, which results in difficulties in adapting to the requirements and standards in terms of thermal energy and, as a consequence, results in social exclusion.

The definitions of thermal poverty given above, due to their content, in which they draw attention to various aspects and aspects of this phenomenon, and which complement each other, can be ordered and thus divided into specific types (kinds) of thermal poverty. The first type that emerges among the definitions of the studied phenomenon are the definitions of thermal poverty in economic terms. They point to the deprivation of access to basic material goods and resources, which is experienced by the inhabitants of households, among whom heat energy is mentioned as a significant good. It should be stressed, however, that the understanding of thermal poverty in economic terms cannot be equated with economic poverty, even though it coexists with it. This is all the more important because the measures taken to protect against the loss of thermal poverty can never be complete when using instruments to counteract economic poverty (Sałach and Lewandowski 2018).

The second type of definition of the studied phenomenon are the definitions of thermal poverty in absolute terms. This type of definition, speaking about the essence of thermal poverty on the one hand, draws attention to the unavailability by households in a given country (region), at a given time (year, quarter, month), to a given, abstract and minimum (necessary) set of a basket of goods, among which there are thermal energy resources and related values. They consist of basic products and services necessary to satisfy the needs to maintain an optimal standard of household heat and to satisfy other needs requiring such heat, necessary to maintain biological functions (reduced to a minimum of existence or extreme poverty), or to satisfy basic biological and social needs (reduced to the so-called social minimum threshold). On the other hand, these definitions draw attention to the criterion of the necessary thermal energy expenditures (energy costs) in reference to a type of dwellings (buildings), in terms of their surface area, which such expenditures are borne by the inhabitants of households in order to meet their thermal needs. This criterion is the affluence of their budgets, and more precisely the exceeded 10% threshold of household budget expenditures (Deniszczuk, Kurowski and Styrc 2007; Maj 2018). It should be noted that this assumption is arbitrary, but is nevertheless considered optimal by many countries.

The third type of definition of the analysed phenomenon are the definitions of thermal poverty in relative terms. These definitions, when referring to "basic thermal needs" and "reasonable price", refer to average (mean) expenditures of the entire population (country, region), with which a given household is compared. In other words, these expenditures are related to the income of households in the population (country, region) (Owczarek and Miazga 2015; Wojnarowska-Szpucha 2019). Thermal poverty in this respect is therefore a variable value and refers to the average standard of living in a given population (country, region), which is most often measured by the amount of average income (expenditures). In this approach, these definitions generally understand thermal poverty as 50% of the average monthly expenditure of all households, taking into account the equivalence of the OECD (Świerszcz and Osial 2019; Świerszcz 2019; Gawlik-Kobylińska 2018) These definitions assume that if, per household member, energy expenditures are higher than average expenditures in the population (country, region), it is very likely that the costs of thermal energy will constitute a significant burden on the budget of the household, and thus it can be assumed that this household will be exposed to the experience of thermal poverty. Definitions of thermal poverty in relative terms, draw attention to two aspects, such as: data on high (hypothetical) expenditures on heat per household population and data on low incomes of a household. In these data, they simultaneously indicate the threshold of expenditure for energy purposes (which is more than the mediana of equalized energy expenditure) and the threshold of economic poverty (which is less than 60% of the mediana of equalized income per capita of the household) (Węglarz, Kubalski and Owczarek 2014; Domalewska and Bielawski 2019).

Presenting above three types of approach to the concept of thermal poverty, i.e. economic approach, absolute approach and relative approach, it seems that at present the most appropriate and precise way to understand this concept and phenomenon is the last approach, i.e. relative approach.

Nevertheless, also this way to capture the thermal poverty raises some doubts and reservations. These doubts and other doubts show that in practice, in order to credibly and reliably determine the thermal poverty phenomenon in a given area, one should not use a pure relative approach. It may lead to the promotion of inefficient and irrational use and wastage of thermal energy. Moreover, there is a risk that those people (the poor) who save heat will not be considered poor in heat energy because, in their case, the percentage of expenditures they incur will always be lower. To sum up, it can be said that despite the great interest in the issue of energy poverty, especially in the scientific aspect, expressed in numerous attempts to define this phenomenon, no reliable, unambiguous, coherent and universal content has been developed so far - both in scientific and sociological terms, as well as for the needs of public policy instruments. The reason for this seems to be the nature of the phenomenon of energy poverty (the phenomenon of thermal poverty), which on the one hand is characterised by relativity and on the other hand by dynamism.

Another, also important reason resulting from the first reason is the difficulty to select appropriate measures (indicators). It results from the lack of an unambiguous definition of energy poverty (thermal poverty), which allows to precisely determine the level and scope of the analysed phenomenon. This issue will be discussed in more details in the next subsection (The measures of thermal poverty and their imperfections). Considering this fact, it is still valid to make recommendations on the need to conduct further research on this phenomenon, which has not yet been sufficiently recognised in our country, in order to develop a definition of energy poverty, including thermal poverty, together with the indication of clear criteria allowing to qualify people to the group of poor in energy terms (also in terms of heat), as well as to estimate the scale of this phenomenon in Poland, taking into account the geographical division. The challenge of the need to adjust public policy to the scale and characteristics of this phenomenon is also up to date, as well as a reliable assessment of the appropriateness of reaching and effectiveness of the hitherto applied aid (shielding) instruments in alleviating energy poverty (thermal poverty), thus implementing a policy model based on knowledge (evidence) rather than intuition. Moreover, it seems advisable that the final shape of the definition of thermal poverty of households - if it is to be the basis for shaping public policy instruments - should be constituted in a broad public debate on the scope and forms of support for the inhabitants of households affected by thermal poverty.

The phenomenon of thermal energy poverty of households in Poland

Thermal energy poverty in Poland is little known and therefore little researched, although it is experienced and felt in practice. Its manifestations can be seen in various aspects of the existence of Polish families and their households. They are most often expressed in the following forms: lack of access to central heating - 16% of households; at least once a year late payment of utility bills - 14% of households; flats not heated up in winter - 11.5% of households; spending more than 10% of one's income on energy - 9.6% of households; lack of hot running water - 4.0% of households; late payment of energy bills - 2.5% of households. The situation is shown in Figure 2.

Fig. 2: Lack of meeting basic energy needs of households in Poland in 2018.

Preliminary studies show that to some extent every fourth or fifth household has difficulty to close its home budget, and the share of thermal energy expenditure is becoming a dominant position in the necessary expenditure. The cost of thermal energy used by household inhabitants is influencedby its price and consumption, as well as the technical condition of buildings, their energy efficiency, thermo-modernization, awareness of efficient use of energy and many other factors. As shown in Figure 3.

Fig. 3: Schematic representation of the energy expenditure generation mechanism in Polish households.

Based on the research conducted by the Central Office of Statistics (GUS, 2018) in 2016-2018, households (about 14 million) consumed on average about 2100-3000 kWh (kilowatt hours) of thermal energy within the year. This energy is used mainly for room heating, water heating and food preparation. This is shown in Table 1.

Table 1: Household thermal energy consumption by type of use

The areas of use	2016	2017	2018
The heating of rooms	71.3%	70.2%	68.8%
The heating of water	15.0%	14.4%	14.8%
Preparation of meals	7.1%	8.2%	8.3%

Comparison of the results of the amount of thermal energy consumed with the expenditures allocated to it in the total household budget - which, according to the definition, may be a criterion for determining the poverty of thermal energy - shows that in 2016-2018 the share of expenditures on thermal energy carriers themselves remained at the same level, i.e. 20.1%.

The price of electricity for households increased on average by more than 3% annually between 2016 and 2018. This price increase caused the share of expenditures to use a flat or a house and energy carriers to slightly increase within this period. According to Eurostat data, in 2016-2018 on average about 22% of the Polish population, i.e. about 8.6 million people, were not able to cope with the costs to heat up their flats in winter to a degree that would ensure thermal comfort. In the same period, less than 17% of the population, i.e. about 6.4 million people, had problems to timely pay their electricity bills. These arrears to energy companies were as follows: in 2016. - 3.9%; in 2017. - 4.3%; in 2018. - 4.7% of all households (Pachauri & Jiang, 2008); (Sovacool 2013). Therefore, as can be seen, the level of energy poverty among households is constantly increasing, which clearly indicates that the problem of energy poverty in Poland is of significant importance.

The results of the conducted analyses showed that the level of energy poverty in our country in 2018 was 17.1% (6.44 million Poles). Particularly vulnerable groups include, inter alia, multi-generational or multi-children families, farmers and villagers, pensioners and residents of single-family houses or flats ranging in size from 91 to 120 m2. Taking into account the technical condition of buildings, studies show that the highest percentage of energy poverty was observed in buildings between 1946 and 1960, and the lowest in buildings put into service after 2006 and new buildings, i.e. those built between 2000 and 2018. This fact clearly illustrates the existing link between the occurrence of this phenomenon and the low energy efficiency of buildings, e.g. the lack of appropriate insulation, or the leakage of windows and doors.

As socio-economic reality shows, the level of energy poverty depends to a large extent on, inter alia, the price of energy and the volume of its consumption. The latter, in turn, depends on the factors such as: the degree of energy efficiency of the building, the use of expensive heating sources, inadequate management of temperature in a flat, the use of other energy-using devices and many others.

However, these two criteria (energy price and consumption) do not provide a clear indication of the existence of energy poverty. Not every household will suffer from inconvenience as it pays high costs for energy and consumes a lot of it. This fact indicates that also in this case, an appropriate criterion for determining energy poverty should be an income criterion - however, in relative terms (relative income) in relation to the income of households in the population. Such a criterion is relative economic poverty. Thus, if a household has a higher energy expenditure per population and at the same time has lower income than the average in the population, then there are grounds to believe that

the household is experiencing or at high risk of energy poverty (Owczarek and Miazga 2015; Bouzarovski and Petrova 2015).

Research methodology in determining indicators and measures of thermal poverty of households

The existing definitions of thermal poverty are not sufficiently precise in both domestic and foreign literature. In their content, they do not clearly define the limit of deprivation of basic needs, the exceeding of which gives rise to the thermal poverty phenomenon. The lack of an unambiguous conceptualisation of this phenomenon means that the way it is understood is not clear both among experts and in public policy on energy security, which sets the priority to reduce this deprivation.

The possibility to achieve this objective, therefore, raises the need to define appropriate indicators and indicate the thermal poverty measures, which will allow for a more precise definition of this phenomenon and show its scale both in the national and local aspect, depending on the needs.

Referring to the hitherto developed definitions of thermal poverty, two types of indicators of this phenomenon can be distinguished: the measure in absolute terms and the measure in relative terms. They are two separate types of measures that require adjustment (appropriate adaptation) to the appropriate conditions of households in a given country, in this case in Poland.

The first type of measure of thermal poverty is the type in absolute terms, talking about the 10% threshold of expenditures on thermal energy. This type of measure requires the identification of two issues. The first issue is to determine the indicator, which is a basket of goods (i.e. the determination of specific, basic energy needs) and its value (i.e. a reasonable price), which includes products and services necessary to maintain biological functions, i.e. life support (limited to the level of extreme poverty / minimal existence) (Deniszczuk et al. 2007; Dębicka and Mitkow 2015) or, alternatively, the satisfaction of basic biological and social needs (defined as the social minimum threshold) by the inhabitants of households. The second issue is to determine the indicator of the threshold for expenditure on heating relative to household income, which should be considered reasonable and necessary in the household budget. This determination is all the more necessary because it makes it possible to determine whether and to what extent a household can afford to maintain its flat of its own type and nature. Taking into account the different types and characteristics of the flats of the households, criteria such as, for example, the biological type of the household; the type of person in the household; the type of child in the household; the types of socioeconomic groups; the type of surface area of a flat; the type of year in which a building is constructed; the type of ownership of a flat and others should be taken into account.

The amount (threshold) needed to fulfil these functions and needs is calculated for the household per capita by applying the equivalence scale established by the OECD each year. It should be noted that the data thus obtained on the amount (threshold) of the household surveyed (converted per capita) are objective in nature. This data is calculated on the basis of the actual purchasing power of the household in a given place and at a given time. The construction of this indicator is therefore simple, it assumes an objective value of the defined basket of goods consisting of thermal energy. Fulfillment by a household of this indicator (criterion) of extreme poverty (existence minimum) or social minimum depends exclusively on financial resources and current prices of goods (thermal energy), which are necessary for it to maintain biological functions (life) or possibly to satisfy basic social needs (Świerszcz 2016a; Owczarek and Miazga 2015).

Using this type of measure of thermal poverty, it should be stated that in 2018 this phenomenon affected about 46% of Polish households (about 19 million people). Among them, the most vulnerable are people from single-person households (59%), people living on disability benefits (57%), people living on social benefits (49%), and also married couples with one child (23%). The problem of thermal poverty is most visible in the eastern and southern part of Poland, in the following voivodships: Podkarpackie (48%), Świętokrzyskie (47%), Lubelskie (45%), Małopolskie

(40%) and Podlaskie (39%). The reason for this phenomenon in these areas of Poland is low household incomes. These are also predominantly rural areas, where thermal poverty affects more than 50% of households, while in cities with more than 500,000 inhabitants, it affects only 12%.

The second type of thermal poverty measure is a type in relative terms, which refers to the definition of thermal poverty defined as Low Income High Costs (LIHC), defining the conjunction of two independent criteria (indicators), which are: low household income (Low Income) and high energy costs (High Costs). This type of meter also requires two steps within each criterion.

Under the first criterion, which is "High Costs" (HC) - the first step is to determine two uncertainties, which are two indicators (criteria) of thermal poverty, which are: hypothetical (model) data on household thermal energy expenditure per capita (person) in the household and data on financial income of this household. When talking about the model energy expenditure of a household, it is necessary to take into account its specific characteristics, such as e.g. the type of buildings, the period of construction of the building, its character, the method of heating, insulation of the building and many others, in order to satisfy the standard needs for heat. The standard expenditure on thermal energy is 60% of the mediana of the actual expenditures on thermal energy. The obtained model thermal energy expenditures constitute the sum of the model expenditures, which the household spends to purchase heat and hot water. The methodology to calculate the model expenditures is shown in Table 1.

Table 1: The mediana of the model expenditures and equivalization rate in proportion to the number of people in the household

Number of persons in the household	Mediana of heat expenditure (PLN)	Equivalization rate in Poland	Equivalization rate in UK
1	220,59	0,96	0,82
2	230,35	1,00	1,00
3	235,16	1,02	1,07
4	273,27	1,19	1,21
5 and more	435,91	1,89	1,32

The next task taken within this first step, under discussion, is to carry out the equivalization, taking into account the number of persons in a household. The aim of this action is to make it possible to compare household expenses regardless of the number of members. This equivalization consists in dividing the expenditure the household spends on thermal energy by the appropriate coefficient, which is shown in Table 1 above. The next task taken within this first step is to divide the model expenditures by the resulting equivalization rate. This action makes it possible to take into account the impact of energy expenditure diversification, which is the effect of the size of a given household. The actions described in step one and the data derived from them are also necessary because they help to eliminate those households that spend too little or too much money on heat.

The second step is to determine two indicators of thermal poverty, which are: the threshold of expenditure on thermal energy and the threshold of financial income per capita in the household under research, using the scale of equivalence, in relation to the mediana or average income, which is in the country (region), at a specific time (year, quarter, month). At this point it is worth noting that for Poland - the Main Statistical Office (GUS, 2018) sets the threshold of 50% of average household expenditure, while for Europe - Eurostat sets the threshold of 60% of the mediana of household financial income (Świerszcz and Grenda 2018; Mitkow 2018).

When taking the second step, a number of tasks needs to be carried out. The first task is to determine the mediana of equivalized energy expenditures for the whole population. This mediana divides the collection of households into two equal parts. The first part consists of households whose expenditure

on thermal energy is above the mediana and thus meets one of the first criteria of the Low Income High Costs (LI-HC) definition, i.e. high energy costs (HC). To this end, a variable has to be created which will divide the set into households that meet and do not meet this criterion. Therefore, if a household is characterised by higher equivalent model expenditures on thermal energy per number of inhabitants in a given household - in relation to the mediana in the population (which is the criterion of high thermal energy expenditures) and at the same time has lower equivalent financial income than an average household in the population (i.e. it has less than 60% of the median income in the population) (which is the criterion of low financial income - the relative poverty threshold adopted by Eurostat for the EU) then it can be said that the household experiences thermal poverty (Owczarek and Miazga 2015; Szyłkowska 2019b). It can be assumed that the costs incurred by a household will be a serious burden on its home budget.

It should be noted that in this case, the thermal poverty indicator (criterion) is relative one. It is based on a ranking (comparison) of the income situation (average expenses, items) of a given household in relation to other households (average expenses, items) in the country (region) in a given period of time. In other words, this comparison relates to the “basket of basic energy needs” of the household and the “reasonable price” incurred for this good which is thermal energy, against the background of households in the country (region) at a given time.

Within the second criterion (indicator) which is “Low Income” (LI) - the first step is to calculate the Low Income criterion of a household by using the variable which is disposable income. For this purpose, the value of disposable income shall be reduced by all expenditures which include the costs of the accommodation - which gives rise to a income variable after deducting the expenditures for accommodation. This action makes it possible to determine the actual resources available to households after all the necessary expenditures has been made, which are always intended to be incurred. The deduction of costs related to the accommodation also eliminates from the analysis the impact of expenditures made on accommodation (which depend on the size of a flat, technical condition, location, etc.), on the resources of the household.

The second step in the "Low Income" criterion is to equivalize the household income on the basis of a previously received variable. It is the disposable income obtained after accommodation expenses are made due to the number of people in the household. The aim of this step is to be able to compare this income with each other regardless of the number of households. This equivalization is carried out on the basis of the OECD coefficient, which is shown in Table 2.

Table 2: The OECD equivalence ratios used in the calculation of disposable household income

Number of persons in the household	Equivalence ratio
The first adult in a household	0,58
The subsequent adults in a household	0,42
Children under 14 years of age	0,2

This conversion consists in dividing (quotient) the disposable income obtained, after accommodation expenses are made (IAHC), by the OECD rate.

The third step in the "Low Income" criterion - after the above calculations - is to determine the income poverty threshold. This action requires the four tasks to be taken. The first task - within the determination of the income poverty threshold - is to determine the mediana of equivalized disposable income after deducting accommodation expenses. The second task is to calculate 60% of the value above the calculated mediana. The third task is to determine the income threshold of households by adding equivalized energy expenditures in individual households to the value calculated in the second task - i.e. 60% of the mediana of disposable equivalized disposable income after deducting accommodation expenses. This task makes it possible to obtain an individual income threshold for each household. Moreover, it also allows for a result to be obtained in which the income

threshold is higher for households that have more expenditure compared to households that have less expenditure. The fourth task is to create a variable that qualifies households below or above the income threshold (Owczarek and Miazga, 2015).

Bearing in mind the above mentioned measure of thermal poverty, which is the relative Low Income High Costs (LIHC) measure, one can say that a household is poor in thermal energy when it simultaneously meets two criteria described above: high energy costs and low financial income. In other words, a household has model equivalized energy expenditures above the median in Poland and at the same time has equivalized disposable income after deducting accommodation expenditures below the economic poverty threshold (determined by the sum of 60% of the median equivalized energy expenditures of this household). The situation can be summarised as follows:

Thermal poverty = Low Income criterion met + High Cost criterion met

The analysis of this measure clearly shows that its construction, in comparison to the first measure, is more sublime and assumes the necessity of a difference in the wealth of individual households. In other words, some households must always be less affluent than others in order to be able to determine the existence and level of thermal poverty of a household. It should also be noted that the adoption of the above type of measure in relative terms, in defining the concept of thermal poverty and determining its level and scope, makes it impossible to eliminate thermal poverty understood this way. For, as it has already been pointed out, households with lower income than others are always considered poor in heat (Świerszcz 2016b; Szyłkowska 2019a).

Using this type of thermal poverty measure, it should be stated that in 2018 this phenomenon affected about 19% of Polish households, i.e. 8 million Poles experienced thermal poverty.

In addition to the presented two types of thermal poverty measures that adapt the UK definitions of energy poverty, other alternative versions of thermal poverty measures, based on other alternative definitions of heat poverty, may also be used. These alternative versions are the modifications of the original versions of the UK definitions. In this study we will focus our attention on the methodology to determine variant versions of energy poverty measures (thermal poverty measures) based on the modification of the original definition of energy poverty "Low Income High Costs" (LIHC). The first part of the alternative version of the modification of the energy poverty (thermal poverty) measure of households concerns the modification of the "Low Income" (LI) criterion. The modification consists in setting other income thresholds under which households can be classified as energy poor households.

The first possibility is to set an income threshold of 50% of the average. In this case, the same steps are taken in developing the Low Income Criterion (LI) as in the original version of determining measures of the Low Income High Costs definition (LIHC) - changing only the income threshold. The "High Costs" (HC) criterion remains unchanged here. Therefore, in the alternative (modified) version, the following steps are taken when developing the "Low Income" (LI) criterion. The first step is to determine the average of the disposable income available for sale, after deducting the expenditure on accommodation, and then to calculate 50% of this value. The second step is to add, to the threshold thus set, the equivalized energy expenditures in individual households to determine the individual threshold for each household. As the third step, a two-tier variable should be created to classify households below or above the individual thresholds. The fourth (last) step is to qualify the household as the energy poor one in the aspect of heat - by applying the conjunction of the criteria "Low Income" (LI) - 50% threshold and "High Costs" (Owczarek and Miazga 2015; Włodarczyk 2018).

The second possibility to determine the income threshold concerns the determination of the income threshold on the basis of poverty determined by law. The poverty limit determined by law (understood as the limit of social intervention) is determined by the Ministry of Labour and Social Policy on the basis of household income, which is converted per capita in the household. Income

below this threshold entitles the holder to financial benefits from social assistance institutions. In this case, the following steps are taken when developing the "Low Income" (LI) criterion. The first step is to set the poverty threshold, determined by law, based on the number of people in a given household. It should be noted that the social intervention threshold is modified every 3 years (Owczarek and Miazga 2015; Gawlik-Kobylińska 2018b).

The second step related to adding - to the poverty threshold determined by law - real, i.e. not equivalizated, energy expenditures that are incurred in individual households. This action will allow for the setting of an individual threshold for each household. The third step relates to the calculation of whether the real, i.e. non-equivalized disposable income derived from accommodation expenditure, is above the threshold determined. To this end, a two-tier variable should be created which qualifies households below or above these individual thresholds. The fourth (last) step relates to the determination whether a given household is energy poor (heat poor) through the application of the conjunction of the "Low Income" criterion (understood as the threshold of poverty determined by law) and "High Costs" criterion.

The second part of the alternative version of the energy poverty (thermal poverty) indicator concerns the modification of the "High Costs" (HC) energy expenditure criterion. Instead of equivalization of the model energy expenditures per person, based on the OECD equivalence rate, the determination of average energy expenditure per m^2 of a flat occupied by a household may be used based on the model energy expenditures. In this case (alternative) used, expenditure for energy is more linked to the technical aspect of the household building and less to the number of inhabitants. The next tasks to be performed when creating the "High Costs" (HC) criterion are the same as in the original version of the LIHC definition. Thus, the mediana of the model energy expenditures per m^2 of an occupied flat is determined.

Results and Discussion

The adopted indicators and measures of thermal poverty defining this phenomenon and determining its scope in a given area, when confronted with subjective measures of households assessing the thermal comfort experienced by them, turns out to have a negligible degree of coverage. This is evidenced by the research conducted in 2018, where among the residents of households declaring that they live in buildings of low technical quality and damp walls, as much as 24% were qualified to the group poor in thermal energy, using the relative "Low Income High Costs" (LIHC) measure. However, as regards the inhabitants talking about experiencing the cold because of failing to heat up their flats during winter, 19% of them were classified as poor in heat energy. This small degree of overlap, between households that declare a lack of thermal discomfort and those that are low in thermal energy, can have a dual source. The first one may be the subjective character of the respondents' statements, the second one may be the relatively high income of households declaring the thermal discomfort of their flats. Research shows that people who talk about experiencing the cold or moisture in their homes may have relatively high expenses, but for some reasons they do not decide to warm or dry their homes. Therefore, the low degree of overlapping of thermal poverty with the measures adopted so far clearly shows the lack of an unambiguous conceptualisation of both the phenomenon of thermal poverty in households and the lack of the unequivocally adopted indicators and measures of this phenomenon (Świerszcz 2017a; Bakirtas and Akpolat 2018; Acharya and Marhold 2019).

The existing measures of thermal poverty, i.e. absolute and relative measures, use as the basis the model expenditures of households on thermal energy. The absolute measure adopts a 10% threshold of expenditures on thermal energy in relation to household income, while the relative measure of the threshold of expenditures on thermal energy is subject to additional verification, which consists of three criteria: income criterion of a given household, equipment criterion (in relation to expenditures on thermal energy and income of individual households) and income criterion verified by fixed accommodation expenditures (e.g. rent, credit instalments, mortgage loans), which decrease disposable income of a given household. Moreover, the empirical distribution used in this respect is

consistent with the assumed correlates of thermal poverty, which consists of subjective measures of experiencing difficulties in maintaining the thermal comfort in a given household. It should also be noted that the applied criteria modifying the thermal poverty threshold indicates a moderate correlation coefficient between thermal poverty and economic poverty. It also shows that the phenomenon of thermal poverty is a phenomenon separate (specific) from economic poverty, i.e. it requires the use of other instruments and security policy to eliminate this phenomenon. This is not the case with absolute measurement, which points to the large link between thermal poverty and household economic poverty, and therefore proposes a different conceptualisation of the phenomenon and a different way of solving the problem. However, the accuracy of this measure is verified by reality, which shows that the financial assistance from the state to the people poor in energy does not solve the problem of thermal poverty in their households (Świerszcz, 2016a; Pino-Mejías, Pérez-Fargallo, Rubio-Bellido and Pulido-Arcas 2018).

The different methodologies used in both measures to determine the thermal energy poverty threshold, as can be seen, give different concepts of how to understand this phenomenon, as well as different results of the range of its scale. Using an absolute measure, it turns out that almost half of the Polish population is subject to this phenomenon. Similar results are also found in other European countries, such as: Estonia, Bulgaria, Romania, Latvia, the Czech Republic, Slovakia or Hungary. However, such a result does not seem to correspond to reality. Therefore, currently the most accurate and objective measure of thermal poverty, which allows to determine the definition of this phenomenon and its scope, seems to be the relative measure. This measure, however, is not final in its shape, and it also requires constant improvement. This is indicated by a number of important facts. The first fact is the continuous evolution of the phenomenon of thermal poverty, which may be caused by new factors over time. The second fact is the perception of the phenomenon of thermal poverty mainly among households living in rural areas (34% in 2018), single-family houses heated locally - which results from low precision of this measurement. Meanwhile, reality shows that the phenomenon of thermal poverty also occurs in urban areas, especially among households living in communal, social and small poor housing communities. This is evidenced by the fact that in 2018 about 14% of households were not connected to the central heating system. It should also be taken into account that about 9% of flats in cities are municipal flats with a very low level of energy efficiency. The third fact is the failure to notice thermal poverty in small flats - which results from too low model expenditures assigned on thermal energy, which after the equivalization relating to a number of persons living in a given household, less frequently exceed the threshold of energy expenditures higher ones than the mediana in the population in a given area. In other words, there is less chance to meet the High Costs (HC) criterion. The fourth fact is the failure to notice thermal poverty also among wealthy households, which most often occupy larger flats requiring bigger expenditures on thermal energy. In this case, these households meet both criteria, both the High Costs (HC) criterion (high costs of thermal energy) and the Low Income (LI) criterion (high expenditures for thermal energy), because their income is reduced by rent and mortgage loan, which households are often burdened with (Świerszcz and Osial 2019; Świerszcz and Grenda 2019).

The presented analysis of the hitherto applied indicators and measures of the thermal poverty phenomenon in households continues to show their various shortcomings and imperfections. The conducted research also shows that the lack of existence of developed perfect measurements of this phenomenon has its consequences in the absence of an unambiguous conceptualisation of the thermal poverty phenomenon, as well as an unambiguous determination of the scale and scope of this phenomenon in Poland, other European countries and even in the world. Despite these imperfections or deficiencies, the theoretical analysis of domestic and foreign literature on the subject, as well as the analysis of numerous pragmatic research conducted among scientists on behalf of various governmental and non-governmental institutions, bring a lot of hope at the same time. The relatively advanced indicators developed at the present stage of research, which define the criteria of thermal poverty and the method of its measurement (the LIHC measure), make it possible to define this phenomenon relatively accurately and to outline its scale and scope to some extent. In addition, they open up a new space for analysis primarily in Poland and other European countries.

However, bearing in mind the need for a more efficient and effective fight to reduce or even eliminate thermal poverty among households, there is still a need to conduct intensive research to develop the most universal, unambiguous indicators and measures of thermal poverty, and thus to develop an unambiguous definition of thermal poverty. Responsibility for conducting research lies with both people (entities) of the world of science and entities representing governmental and non-governmental administration offices, as well as various types of companies involved in the production, distribution and sale of thermal energy. These needs and related activities are all the more important and even urgent as they are the basis not only for the already mentioned proper way of describing and conceptualising thermal poverty, but also for the proper development of policies and strategies in the area of energy security, both locally and nationally, in both micro and macro-social terms. In other words, the point is to select the most effective and efficient instruments that would counteract this phenomenon, namely to direct social assistance towards the most needy households. How the household thermal poverty phenomenon will be understood and what thresholds of thermal poverty and related indicators and measures of thermal poverty will be determined and applied - will have an impact on which groups of households will be qualified as poor in thermal energy - whether they will be households with many children or households of pensioners and disabled pensioners; whether they will be rural households or households from urban areas, whether they will be small households or households living in large areas; etc. This choice, as can be seen, is the political decision. Aware of this, it is therefore necessary to continue to systematically pursue research using a variety of methodological instruments, both quantitative and qualitative, in order to reach those most in need with effective help. The current level of knowledge that we have about the household thermal energy poverty phenomenon may already constitute a certain foundation for shaping public policies (e.g. housing allowance, energy allowance), which are aimed at meeting this challenge. Nevertheless, their inadequacy resulting from the imperfections of the currently used indicators and measures of thermal poverty and the related definitions of this phenomenon - not only in Poland, but also in other European countries - is still the challenge topical for all people.

Conclusion

As it results from the presented analysis of the currently applied indicators and measures of the household thermal energy poverty phenomenon, many imperfections and related deficiencies can be observed in them. The lack of unambiguous measurements of this phenomenon leads to consequences being the lack of a developed unambiguous understanding of the phenomenon of heat poverty, as well as an unambiguous determination of the scale and scope of this deprivation both in Poland and in other European countries, and even in the world. This fact is distressing, because it depends on him how to properly develop policies and strategies in the field of energy security of households, both locally and nationally; in micro- and macro-social terms. This is about using the most appropriate instruments to counter this phenomenon, targeted at the most needy households. The way, in which the household thermal energy poverty phenomenon will be understood and which indicators and measures will be applied to it, will have an impact on which groups of households will be qualified as poor in thermal energy.

Despite existing imperfections or shortcomings, the theoretical analysis of international literature on the subject, as well as the analysis of numerous pragmatic research conducted among scientists, also bring a lot of hope. The relatively advanced indicators and measure of thermal poverty developed at the present stage of research seem to be an inspiration and a new space for analysis, first of all in Poland, but also in other European countries, in search of new solutions, in the development of the most universal, unambiguous indicators and measures of thermal poverty, and thus in the development of an unambiguous definition of thermal poverty, which such indicators and measures enable to take a more efficient and effective fight to reduce or even eliminate the phenomenon of thermal poverty of households. Responsibility for this fact lies with both people (entities) of the world of science and entities representing governmental and non-governmental administration offices, as well as with various types of companies.

Abstract

This article presents the index-factor approach in management of material resources turnover, including inventory. It allows managers to identify a current problem, which affects the final financial result, during the management process. Thus, submitted practically oriented approach of index-factor method for calculation of the cost intensive turnover index and average level of distribution costs enables financial managers to develop reduction reserves of commercial and trading companies, to monitor the inventory turnover, helping to determine amount of released or the additionally attracted monetary assets as commodity stocks are frozen funds unavailable for using.
The purpose of the study is disclosure of the analytical methodological approaches descriptive character of index method and showing a practically oriented approach in management process relying on relative and absolute values of activity cost, considering an example of commercial trading company and monitoring the average level of distribution costs that influence the sum of distribution costs of certain productive groups and the assortment structure of trade turnover.

Keywords: Assets, Inventory, Inventory Management, Distribution Costs, Turnover, Assortment of Goods, The Cost of Turnover.

Introduction

In economic practice the assets of companies are listed as a complex economic category, which prediction aspects are not systematically investigated in the scientific works of economists [3]. Assets are the most turning funds of trading and commercial companies, including cash, accounts receivable, raw materials, finished goods, work in progress, stocks of goods. Inventories are less liquid in short-term assets of these asset, as the funds are considered to be absolutely liquid, which can be invested in any assets and generate income, and the sooner they are released from the inventory items the more profit the company will receive.

The point of management process of inventories is providing commercial and trading companies with the optimum size and diversification of stocks satisfying customer demand of certain territorial segment, as well as providing them with funding.

In trade, the commodities circulation process continuity is provided by mass of goods, consisting of food, non-food products, household chemicals, products of a complex range (audio-video equipment, cell phones), and others. [2]. Most often independent on desire to guide trade and commercial companies there is growth of stocks on large enough sum, that in turn [1] increases selling and administrative expenses, that, ultimately, can lead to a loss that is not profitable nor leadership or employees or contractors trade and commercial companies. The impact on the final profit depends on volume of sales, its structure, price policy, prime cost, administrative and commercial expenses (selling costs), current assets turnover, the attractiveness of the brand and the property complex of trade and commercial companies [5]. As a rule, the selling (retail) price of inventories includes the direct costs for the purchase of goods (cost - purchase price), expenses (costs) for sale connected with the location of the goods in the scope of circulation (advertising, public relations, sorting, storage, freezing). The more time (days) a product is in the form of inventory, the bigger amount of the costs, the higher the selling price of it.

As a result of said above distribution costs structure analysis and evaluation of factors influence on distribution costs sum change by separate elements and in whole acquires increased importance for financial managers and all management staff.

Material and Methods

One of the most important and challenging stages in inventory management is the calculation of the optimum size for current reserves main groups. Methods of inventory values management are proposed by A. M. Kovalev, M. A. Chaplygina, A. I. Zolotarev, O. I. Rashidov and others. These economists recognize different models and the most common is the «Model of economically reasonable order size» based on optimization of all company's operating expenses on purchase and storage of inventory. However, experts do not pay enough attention to such economic factors as the absence of highly developed market, high inflation, an unstable stock market, currency restrictions, especially the tax system in different countries. Thus, it is obvious that the commodity-material values, management practices need to be improved for effective use in various economic situations. World practice of inventory management at an enterprise by economists I. A. Blank, U. Brighaym, Van Horne J. C. shows stocks growth should be a bit behind the demand.

Results and Discussion

In the aspect of analytical and methodological approaches of the index method imagine an index-factor model (Formula 1) of circulation costs changes dependent on the average level of distribution costs, the level of costs in the reporting period, cost intensive turnover.

The quantitative effects of these factors is determined by the following system of interrelated indexes:

$$\boldsymbol{I}_{\text{average level of distribution costs}} = I_{\text{distribution costs in the reporting structure of commodity circulation}} = \boldsymbol{I}_{\text{the cost of turnover (the impact of the structure of turnover on the dynamics of the average level of distribution costs)}} \quad (1)$$

It has its own separate index calculation formula (formula 2,3,4)

$$I_{\text{average cost}} = \frac{\sum Y_1 T_1}{\sum T_1} : \frac{\sum Y_0 T_0}{\sum T_0} = \bar{Y}_1 : \bar{Y}_0 \quad (2)$$

$$I_{\text{distribution costs in the reporting structure}} = \frac{\sum T_1 Y_1}{\sum T_1 Y_0} \quad (3)$$

$$I_{\text{the cost of turnover}} = \frac{\sum Y_0 \ (P_0 q_{1:} \sum P_0 q_1)}{\sum Y_0 \ (P_0 q_{0:} \sum P_0 q_0)} \quad (4)$$

The data borrowed from statistical reports of investigated organizations was substituted in these indexes. The practical results are presented in Table 1.

Table 1: Baseline data for calculating indices level of distribution costs of commercial and trading company «LLL»

Product Groups	Percentage of distribution costs, in the selling price of the goods		The sum of distribution costs, thousand roubles.		Revenues from sales, thousand roubles.		Structure of revenues from sales, in %		The amount of distribution costs per 100 rubles sales revenue	
	2018 year basis	2019 year report	2018 year basis	2019 year report	2018 year basis	2019 year report	2018 year basis	2019 year report	Base period	Conditional
designations	Y_0	Y_1	U_0	U_1	T_0	T_1	d_0	d_1	$Y_0 d_0$	$Y_0 d_1$
Non-food products groups	73.6	77.1	4565	4780	6200	5387	25.1	21.4	1847	1650
Food productsgroups	76.7	78.3	15014	15499	18472	19786	74.9	78.6	5744	6028
In total	79.3	80.5	19579	20279	24672	25173	100	100	7591	7678

In the above shown factor model formula substitute the data from Table 1.

The index of the average level of distribution costs

$$I_{\text{average cost}} = \frac{\sum Y_1 T_1}{\sum T_1} : \frac{\sum Y_0 T_0}{\sum T_0} = \bar{Y}_1 : \bar{Y}_0 = 80{,}5 : 79{,}3 = 1{,}015 * 100 = 101{,}5\ \% \quad (5)$$

The index of cost treatment in the reporting structure:

$$I_{\substack{\text{distribution costs in} \\ \text{the reporting structure}}} = \frac{\sum T_1 Y_1}{\sum T_1 Y_0} = \frac{20279}{19786 \bullet 0.767 + 5387 \bullet 0.736} = 1.004 * 100 = 100{,}4\% \quad (6)$$

Index of turnover cost intensive:

$$I_{\text{the cost of turnover}} = \frac{\sum Y_0\ (P_0 q_1 : \sum P_0 q_1)}{\sum Y_0\ (P_0 q_0 : \sum P_{0 q_0}} = \frac{7678}{7591} = 1{,}011 * 100 = 101{,}1\% \quad (7)$$

Consequently, the level of distribution costs in the reporting period in 2019 amounted to 80.5%, in the base period in 2018 to 79.3%, as a whole the average cost level of the index in two groups of products (food and non-food) amounted to 1,015 or 101.5%. Distribution costs changes calculated by the formula 6 in the reporting structure reached 1,004 or 100.4%. Cost intensive turnover index (turnover structure influence on the dynamics of the average level of distribution costs) amounted to 1,011, or 1011%.

Increase of the average level of distribution costs by 1.2% led to an increase in the absolute amount of distribution costs by 302.1 thousand roubles. The effect of this factor is determined by the formula 8:

$$\frac{(Y_1 = Y_0) \bullet \sum T_1}{100} = \frac{(80{,}5 - 79{,}3) \bullet 25173}{100} = 302{,}1\ \text{ths. rub.} \quad (8)$$

The calculated increase was due to growth of the distribution costs level for foodstuffs by 1.6% and nonfood products by 3.5%, also the changes of assortment structure towards reduction of nonfood products by 3.7% and towards growth in food group of goods by 3.7%

The absolute amount of distribution costs increased by 700 thousand roubles (20279 - 19579) occurred due to the growth of distribution costs level for individual product groups.

Since cost intensive turnover increased by 1.1%, then the expense of 100 rub. turnover increased by

0.87 rubles. (7678 - 7591), and the entire turnover by 2.1 thousand roubles (20279 * 0.87)
Therefore, the actual overrun in the amount of 702.1 thousand roubles (700 + 2.1) is obtained because of average level raising of distribution costs during the reporting period, which is caused by increasing of distribution costs levels for individual products (700), and overrun, that is a result of turnover distribution costs increase (2,1).

Performing calculations allows to notice a direct correlation of the final financial result (profit) of the distribution costs average level, the level of costs in the reporting period, distribution costs of trade turnover, which should be reduced.

Continuing the research in finding a cost-cutting reserves, pay attention to inventory turnover.

Table 2: Predictive data immobilization of funds in the turnover or the release of funds from the turnover of commercial and trading company «LLL»

Indicators	2017 report	2018 report	2019 report	2020 forecast	Change in 2020 of 2019 (+, -)	The relative deviation of 2020 At 2019, at%
Turnover , days T^{ov}	37.0	37.9	39.7	36	-3.7	x
One-day turnover (N^{r}_{od1}) ths. rub.)	67.44	68.53	69.93	69.93	x	100
Amount of funds immobilization or release of funds , $N^{r/i}$thousand roubles.	67.44 * = 1.2 - 80.92	68.53 * 0.98 = -69.93	69.93 * 1.7 = -118.8	69.93 * (-3,7) = 258.74	176.94	248.9

Table 2 estimated data allow to note that in 2018 the time of circulation of goods T^{ov} increased by 0.98 days, in 2019 by 1.7 days, which means a reduction of the inventory turnover velocity or slowdown of turnover, leading to overstock by the commercial - trade company «LLL», entailing the loss of turnover volume in 2018 in amount by 69.93 thousand roubles. and in 2019 in the amount of 118.8 thousand. rub.

As a result of the represented calculation, it can be clearly noted that there is a direct correlation between inventory turnover and revenue. In particular way inventory turnover slowdown leads to additional immobilization of monetary liquid assets and acceleration of inventory turnover positively influence on profit thereby releasing the resources from circulation to expand the assortment of inventory structure.

Prognostic information in the short term in 2020 (Table 2) allows to observe the release of cash from circulation in the amount of 258.74 thousand roubles., that were influenced by inventory turnover acceleration primarily for 3.7 days at a constant one-day turnover 69, 93 thousand roubles. Released funds can be sent into circulation for the purchase of a new range of inventory items, for the modernization of fixed assets, for the reconstruction and modernization of commercial equipment in their turn.

The quantitative effect of changes in the level of distribution costs for individual goods and a change in the assortment structure of commodity circulation in the forecast for 2020 with the established acceleration of the turnover of the commodity mass (Table 2) are shown in Table 3, which give grounds to identify the following effect:

Index of the average level of distribution costs:

$$I_{\text{average cost}} = \frac{\sum Y_1 T_1}{\sum T_1} : \frac{\sum Y_0 T_0}{\sum T_0} = \bar{Y}_1 : \bar{Y}_0 = 76{,}2 : 80{,}5 = 0{,}946 = 94{,}6\ \% \quad (9)$$

Index of distribution costs in the reporting structure:

$$I_{\substack{\text{distribution costs in}\\ \text{the reporting structure}}} = \frac{\sum T_1 Y_1}{\sum T_1 Y_0} = \frac{21090}{22152 \bullet 0.783 + 5538 \bullet 0.771} = 0{,}965 = 96{,}5\% \quad (10)$$

Index of cost intensive turnover:

$$I_{\text{the cost of turnover}} = \frac{\sum Y_0 \ (P_0 q_1 : \sum P_0 q_1)}{\sum Y_0 \ (P_0 q_0 : \sum P_0 q_0} = \frac{7806}{7678} = 1{,}017 = 101{,}7\% \quad (11)$$

Conclusions

Thus, in the forecast (Table 3) with an increase in turnover by 10% (27690/25173 * 100%) and an increase in distribution costs by 4% (21090/20279 * 100%) from the index system, we can conclude that in the reporting period compared with the baseline, the relative level of distribution costs will decrease on average by 5.4% (100-94.6), including due to changes in the relative level of distribution costs for individual product groups will decrease by 3.5% (100-96.5) but due to the increase in the cost-intensiveness of commodity circulation will increase by 1.7%.

As you can see, the reduction in the average level of distribution costs is associated with a decrease in the relative level of distribution costs for the group of food products and changes in the assortment structure of commodity circulation.

Table 3: Calculation of forecast values for calculating indices of the level of distribution costs for the planned 2020

Product Groups	Percentage of distribution costs, in the selling price of the goods		The sum of distribution costs, thousand roubles.		Revenues from sales, thousand roubles.		Structure of revenues from sales, in %		The amount of distribution costs per 100 rubles sales revenue	
	2018 year basis	2019 year report	2018 year basis	2019 year report	2018 year basis	2019 year report	2018 year basis	2019 year report	Base period	Conditional
designations	Y_0	Y_1	U_0	U_1	T_0	T_1	d_0	d_1	$Y_0 d_0$	$Y_0 d_1$
Non-food products groups	77.1	89.8	4780	4971	5387	5538	21.4	20	1650	1542
Food products groups	78.3	72.7	15499	16119	19786	22152	78.6	80	6028	6264
In total	80.5	76.2	20279	21090	25173	27690	100	100	7678	7806

A decrease in the average level of distribution costs 4% (76.2% - 80.5%) will lead to a decrease in the absolute amount of distribution costs (1191 thousand rubles).

The impact of the distribution costs level will be:

$$\frac{(Y_1 = Y_0) \bullet \sum T_1}{100} = \frac{(76{,}2 - 80{,}5) \bullet 27690}{100} = -1191 \text{ ths. rub.} \quad (12)$$

In the forecast for 2020, from a decrease in the level of distribution costs for individual product groups by 4% (in particular the food group of goods) and a growth in turnover by 10%, the absolute

amount of distribution costs will increase by 811 thousand rubles. (21090 - 20279) or by 3.99%
Since the cost of trade will increase, the cost of 100 rubles. turnover will increase by 1 rub. 28 kopecks (7806 - 7678/100), and for the entire turnover of 370 rubles. (21090 * 1.28 / 100).

Consequently, 811 + 370 = 1181 thousand rubles, due to the rounding error of 1191 thousand rubles. (formula 12), i.e., the actual cost overrun from the decrease in average levels of distribution costs in the reporting period is equal to the savings caused by the growth of individual levels of distribution costs for certain goods (811 thousand rubles), plus the savings resulting from the decrease the cost of goods turnover 270 thousand rubles. As a result of practice-oriented analysis with the use of index-factor model in the management of inventory turnover allows to identify reserves to reduce costs, marked in Figure 1

Fig. 1: Provisions cost reduction in the management of inventory turnover

In conclusion, we note that trading companies require strict control over stocks, ensuring minimum investment in them, as well as achieving a higher inventory turnover, which leads to a lesser likelihood of losses due to obsolescence of goods and their spoilage, which increase the liquidity of commercial and commercial companies.

Accuracy of the Beneish Model as Applied to Polish Enterprises Known to Manipulate Financial Reports

Edward WISZNIOWSKI

Wroclaw University of Economics, Wroclaw, Poland
edward.wiszniowski@ue.wroc.pl

Abstract

The paper presents the results of its author's original research into the capability of Beneish M-score to detect accounting fraud using data presented in earnings reports. The research performed is unique in that it uses a sample consisting of enterprises which vary by their legal status, are not listed in regulated markets, and whose managers were known to have been on trial due to suspicion of report falsification. Analysis shows that the Beneish model can detect accounting fraud, although the five-element model gives better results than the eight-element model.

Keywords: Beneish model, M-score, accounting manipulation, accounting fraud.

Introduction

The problem of low financial report credibility usually comes into light in the context of big financial scandals, such as the US cases of Enron or Worldcom. In Poland, recent famous cases include Amber Gold, Get-Back S.A. and the Wołomin Cooperative Bank. The effects of economic information manipulation are not, however, restricted to big corporations, banks or enterprise networks. Information manipulation, including accounting fraud where companies report earnings higher or lower than was actually the case, happens in smaller entities as well, and leads to bad investment decisions by other economic agents.

The International Accounting Standard 1, paragraph 15, states that a financial report presenting the situation, financial effectiveness and cash flow should be presented fairly, and this is only possible through faithfully presenting actual economic events. (IAS 1). Subject literature gives a lot of thought to methods of perpetrating and of detecting accounting fraud.

M. Kutera divides financial report falsification into several classes: overstating the value of company capital and property, manipulating the elements that shape the financial results, liabilities and reserves, and omitting some or all information about capital relations, contingent liabilities or balance liabilities on the company assets. (Kutera, 2016) Other authors, such as H. Schilit and J. Perler, concentrate on manipulation techniques (Schilit, Perler, 2010) or the motives for company image manipulation. (El Diri, 2018).

A practical approach to the problem of identifying report manipulation was proposed by Messod Daniel Beneish, of Indiana University, in 1999. Beneish noticed that changes in certain financial markers over time can be an indicator of possible accounting fraud. His research culminated in his statistical model, which calculates the probability of report manipulation by a company. (Beneish, 1999).

Research Methods and Analysed Material

Beneish based his idea on comparing changes in financial markers over time – markers that include positions which can change an economic image of an entity. These changes are not necessarily due to fraud; they may result from practices well within the boundaries of acceptable accounting. According to Beneish, relevant markers include: sales income, cost level and the relationships between the

various types of assets and their respective financing sources. Since it's difficult to ascribe fixed critical values to specific research areas or markers, Beneish decided to base his analysis on comparing the markers for the current year (*t*) with to the markers of one year back (*t-1*). Beneish created eight- and five-element algorithms for the purpose of this comparison, which follow the formulae below.

(a) the 8-element model:

$$M(8) - score = -4{,}84 + 0{,}92 \cdot DSRI + 0{,}528 \cdot GMI + 0{,}404 \cdot AQI + 0{,}892 \cdot SGI + 0{,}115 \cdot DEPI - \\ - 0{,}172 \cdot SGAI + 4{,}4679 \cdot TATA - 0{,}327 \cdot LVGI$$

(b) the 5-element model:

$$M(5) - score = -6{,}065 + 0{,}823 \cdot DSRI + 0{,}906 \cdot GMI + 0{,}593 \cdot AQI + 0{,}717 \cdot SGI + 0{,}107 \cdot DEPI$$

where:

DSRI (Days Sales Receivable Index) – the receivable to sales ratio over the t and t-1 periods. A disproportionate rise in receivables compared to sales income may be due to overstating revenue.

GMI (Gross Margin Index) – the sales margin in t period to t-1 period ratio. Dropping margins (below 1.0) may push the company management to manipulate income or sales costs.

AQI (Asset Quality Index) – the total current and fixed assets in t period to t-1 period ratio. If the AQI is over 1.0 and the DSRI marker shows growth while GMI remains unchanged, the company may have carried over some of its costs, thus improving its results.

SGI (Sales Growth Index) – sales over t period to t-1 period ratio. Expecting continuous sales growth may lead a company to manipulate its reported revenue.

DEPI (Depreciation Index) – depreciation to gross value of fixed assets in t-1 compared to depreciation to gross value of fixed assets in t. A drop of this marker may be a signal to lower depreciation rates, which would show better financial results.

SGAI (SG&A Expense Index) – a change in sales and administrative expenses to sales revenue ratio. Growing administrative costs and excessive activity in sales support may lead a company to manipulate its financial results

TATA (Total Accruals to Total Assets) – the marker shows total accruals of a company to total assets over the t time period. It defines total accruals as the difference between the net income and cash flow operations. Large differences between income and cash flow may suggest manipulating financial results.

LVGI (Leverage Index) – liabilities to total assets over the t and t-1 time periods. A large increase in this marker is a bad sign for investors, which in turn may lead a company to manipulate its stated liabilities in year t (for instance by changing its liability appraisal methods).

Both the eight- and five-element models indicate an M-score of -2.22 as their threshold. Surpassing this value (M-score higher than -2.22) classifies a company as likely to be a manipulator (MP) , while a lower value means a company is not likely to be a manipulator (N-MP). An undisputed advantage of the Beneish model is that it points to areas that are especially vulnerable to manipulation. In literature, such areas are called "red flags," or "green flags" if there are no manipulation symptoms. (Beneish, Lee, Nichols, 2012).

Table 1: Tresholds for variable values in Beneish model

Marker	Manipulators (MP)	Non-manipulators (N-MP)
DSRI	1.412	1.030
GMI	1.159	1.017
AQI	1.228	1.031
SGI	1.581	1.133
DEPI	1.072	1.007
SGAI	1.107	1.085
LVGI	1.124	1.033
TATA	0.049	0.015
Threshold value	*M-score ≥-2.22*	*M-score≤-2.22*

Source: Beneish, Lee, Nichols, 2012, p.33.

Research described in this paper was conducted on 10 economic entities of varying legal status (2 public limited companies, 6 private limited companies, 1 company owned by a natural person and 1 state-owned company) which followed the Polish accounting laws. These laws are in accord with the International Accounting Standards. The small research sample was due to difficulties in obtaining credible information about possible fraud and about the result of inquiries.

The companies represented such varied sectors as production industry food industry, agriculture, financial services and construction services. One can be classified as a "new technology" entity (website). The common factor was the fact that all the companies were declared bankrupt. In eight cases the company was under criminal investigation for economic offenses and accounting fraud. The reason for fraud was soliciting bank loans (seven cases) and presenting a false economic image due to stock exchange position of a master company (one case). In two cases, the management was suspected of deliberately bankrupting the company, but was not convicted of accounting fraud.

In three cases of information manipulation, experts have examined the reports and have not found significant irregularities. This was chiefly because companies have concealed debt of sales units while at the same time creating false invoices for sold product, and have sold fixed assets not owned by the company in question (operating lease).

Due to ongoing investigations, more specific information about the analysed companies is classified.

Research Results

Table 2: M-score and marker values

Legal status and marker	PLC	NP	Ltd.	Ltd.	Ltd.	PLC	Ltd.	Ltd.	Ltd.	SO
DSRI	2.06	1.86	3.01	1.98	1.56	0.98	1.18	3.25	5.69	1.33
GMI	1.48	2.33	1.56	1.21	0.95	1.02	1.50	2.67	-0.06	0.48
AQI	3.15	1.30	-0.63	1.12	1.02	1.18	0.89	-0.52	1.22	-0.82
SGI	0.50	1.44	0.39	0.51	2.58	1.05	0.83	0.55	0.15	0.74
DEPI	0.76	0.70	1.13	0.96	0.63	1.00	0.95	0.91	0.55	1.40
SGAI	0.80	0.49	2.08	1.86	1.11	1.17	1.22	1.19	1.33	1.57
TATA	-0.04	-0.27	-1.28	-0.17	0.06	-0,54	-0.89	-0.20	-0.19	-1.30
LVGI	0.75	1.41	0.91	1.52	0.97	0.96	1.66	1.03	1.19	2.08
M(8)-score	-0.94	-1.83	-7.65	-2.96	-0.35	-4.89	-5.73	-1.50	-0.44	-9.91
result	M	M	N-MP	N-MP	M	N-MP	N-MP	M	M	N-MP

M(5)-score	-0.72	-0.54	-2.15	-2.20	-1.39	-2.77	-1.68	-0.79	-0.54	-4.34
result	M	M	M	M	M	N-MP	M	M	M	N-MP

Source: original research.

In the table above, M stands for "manipulator" and N-MP for "non-manipulator." The grey colourmarks the values that exceed the thresholds for manipulatory companies as stated in Table 1 (reg flags). Abbreviations for the legal status of companies: PLC – public limited company; NP – company owned by natural person; Ltd. - private limited company; SO – state-owned company.

Results Evaluation

The five-element model pointed unerringly to those companies that were not manipulators. The eight-element model was wrong three times.

An analysis of the specific markers shows that DSRI is the most credible, rightly pointing to both manipulator and non-manipulator companies. GMI gave slightly worse eresults, being wrong twice. Interestingly, exceeding the GMI threshold also meant a growth in the DSRI marker for all analysed companies. The least credible results were offered by SGI, DEPI and TATA, which resulted from their values being below the threshold. The Sales Growth Indexes were low because the companies have been winding down their activities and were in high risk of bankruptcy. Low DEPI values were due to selling fixed assets, while the TATA indexes were low due to negative values for equity and working capital, also caused by high risk of bankruptcy.

Conclusions and Recommendations for Further Research

Weaknesses of the Beneish model include a wide range of the value thresholds for indicating manipulators (or non-manipulators). For instance, the TATA marker admits a value range of 226.7%, the SGI marker – 39.5% and DSRI – 37.1% (other markers admit from 2.0% to 19.1% - see Table 1). Thus, using the model requires not only precise calculations, but also a narrow definition of the methods used to calculate each marker from the accounting point of view.

Research shows that the Beneish model is not widely used to detect accounting fraud in Poland, because it is simply not known. This in turn means that evaluating the credibility of its results for Polish companies is difficult. Polish law does not require publishing information about manipulated financial reports, which is another obstacle to importing the Beneish model to Poland.

Therefore, we can conclude that action is needed to change the relevant laws, since revealing information about manipulatory companies is necessary for creating a model fully effective in local conditions – one that would aid in detecting accounting fraud and thus help develop Polish accounting in general.

Transgressions of Concepts by Michel Foucault Discipline – Supervision – Safety

Aneta KRYSOWATY

Military University of Technology, Warsaw, Poland

aneta.krysowaty@wat.edu.pl

Abstract

The concept of power, discipline, supervision and their relations with safety undoubtedly constitute the object of interest of social sciences, including the science of safety. Michel Foucault, being an undisputed theorist of the mechanisms of power, presents a wide range of its concepts. One of them concerning the analysis of power and discipline based on the concept of prison – Panopticon, by Jeremy Bentham, confirms that the concept of panopticism is still up-to-date in modern scientific thought. In particular, it concerns research on mechanisms of supervising and using opportunities they provide by the state for the purpose of ensuring safety to the entities.

Keywords: Supervision, Discipline, Safety, Disciplinary Society.

Introduction

It seems that in the discourse concerning dependency and supervision, Michel Foucault[1] is a fundamental thinker and his publication entitled *Discipline and Punish. The Birth of the Prison* (Foucault, 2009) constitutes an essential source of a new transdisciplinary areas of research over supervision which is specified especially in his work entitled *Safety, Territory, Population* (Foucault, 2014). The concept of disciplinary power by Foucault makes reference to the rules of panopticism modelled after excellent visibility machinery, i.e. *Panopticon*[2], a model of a perfect prison used to discipline „soul and body". Discipline and concern for safety are connected with supervision over units and all the societies and the reason for legitimacy of such actions consists first of all in the need to ensure safety by influencing behaviours and actions of people and organisation of their life.

However, review of opinions on the functioning of the French philosopher in contemporary scientific analyses indicates that reinterpretation of his theory of panoptic power took place.

The purpose of this article is to answer the question whether the concept of disciplinary power by Michel Foucault referring to the principles of panopticism is up to date in relation to contemporary times and can be used to describe contemporary supervision and its association with safety?

Striving at the response to the aforementioned question, the following detailed research problems should be considered:

- What were assumptions of the concept of disciplinary (panoptic) power from the perspective of Michel Foucault?
- How the concept by Foucault based on the principles of panoptic visibility changed?
- Can the concept by Michel Foucault and other concepts developing his ideas be used to describe contemporary supervision and its connection with safety?

Disciplinary power in a thought by Michel Foucault

Along with the advent of 17th-century administrative countries of western Europe acting on behalf of regulations and discipline, there has been an increase in the use of power techniques. They were other

than those known from the feudal times, where punishment had a form of bloody tortures, the description of which was provided by M. Foucault in his work *Discipline and Punish.* It also contains an interpretation of the original theory of disciplinary power and mentions changes in the method of exercising power (and penalties) that came up along with the development of capitalism and the commencement of administrative and bureaucratic country. The old model of punishment adopted in public execution became impossible to be performed in the developing capitalistic society. Bloody and public spectacles of absolutist Renaissance country gave place to long-lasting and idealised procedures taking place behind the walls of new institutions called prisons. It became necessary to find methods of dealing with criminals and developing in them (an in the remaining part of the society) the qualities such as submission, obedience, punctuality etc. Discipline was to serve these purposes as a modern instrument of management of the society, defined by Foucault as „a certain type of power, method of exercising power" which produced (..) subordinated and trained entities, 'prone' entities'" (Foucault, 2009, p. 209; pp.133-134). Discipline was a type of power, containing a whole set of mechanisms, techniques and levels of application, and was manifested in the assessment, forecast, modification or socialisation. It was interested mainly in individual that did not meet social norms, entrenched and monitored in specialised closed institutions, such as prisons, barracks or youth detention centres, the aim of which was to establish and maintain order as well as control and normalise the entity so that it behaved in a desirable and consistent manner, in compliance with the system of values and norms. As a result, in addition to its external impact, self0-discipline arose, as Foucault would say – self-subjugation. This was also the assumption regarding the exercise of disciplinary power so that it would not manifest its strength and repressiveness but was exercised without coercion and with the use of self-discipline (self-control). Foucault called the operation and exercises used by the authorities, and performed unrestrained by individuals – „self-technologies", constituting the art. of governing people in our societies. Speaking of them, he defined them as „a different type of techniques that allowed individuals to carry out a number of operations on their own bodies, their own souls, their own thoughts, their own behaviour using their own means in a way that transformed, changed themselves" (Foucault, 1985, p. 367).

The task of the disciplinary authority was to influence individuals which was to be effected by way of separation to resemble arrangement of prisoners in wards. Foucault used this analogy in his considerations included in *Discipline and Punish*. He used the design of a perfect prison – Panopticon. A conceptual architectural diagram proposed, also called a *House of Supervision,* comprise a ring-shaped construction with a centrally located tower with large windows facing inside and outside part of the building where a single caretaker could watch many prisoners, while remaining invisible: „here everyone closed in the ward is in one's place: the caretaker can watch them from the front, while the walls effectively prevent them contact with comrades. He is visible but he himself cannot see; it is the subject, not the object of information" (Foucault, 2009, p. 195). Uniqueness of Panopticon was due to the ideal form of its mechanism and construction properties: wards were separated with thick walls and windows were placed in such a way that the wards could be seen through. The project was an excellent visibility machinery using only optics and architecture. Specific arrangement of the Bentham prison established a hierarchical relationship between observers and observing parties thanks to „the power of gaze" observers. Thanks to this, the visibility of individuals allowed complete transparency of their lives, in opposition to the anonymity of power, transforming „entire social body into a field of perception (…) registering (…) the way of life, attitude, possibilities, suspicions – permanent balance sheet of human behaviours" (Foucault, 2009, p. 208). Panoptic „device" – as Foucault would like it – *dispositiff*[8], allowed the supervision to be exercised unintentionally and incessantly, constituting a trap of visibility into which all prisoners were caught, being subject to regular control of the observer-caretaker. In fulfilling the assigned role, it became necessary to gather knowledge concerning individual and their behaviour, which was to be achieved through „detailed techniques of recording, registering, creating files, entering into columns and tables" (Foucault, 2009, p. 229).

Foucault used Panopticon as a metaphor describing disciplinary society. Disciplinary (panoptic) authority used technique of spatial break down of individuals using separation, ordering, ranking and increased supervision. Visible (observed) individuals were to be described and classified later and evaluated – depending on the result – awarded or punished and corrected. In the Foucault's opinion, institutions such as prisons were undeveloped surveillance systems the aim of which was to influence

behaviour of individuals (normalise them), rather than control them only. These places were to transform prisoners, not just serve the purposes of punishment. Controlling the body and „soul training" were to change both behaviours and its motives, in line with words: „who has been placed in the field of vision and knows about it, accepts restrictions imposed by the authorities: voluntarily allows them to be influenced, fits into relations of power where he plays both roles – becomes the principle of self-subjugation" (Foucault, 1995, p. 198).

Foucault's disciplinary society is a society in which panoptical mechanisms in form of the observer's ubiquity, invisibility, regular observation and universal visibility of the observed are used, in the conditions of repression, coercion, but also restraint and self-discipline.

Contemporary researchers of Foucault's thoughts have taken up the problem of recognizing the features of a disciplinary society. According to the professor of philosophy, Szymon Wróbel, it can be assumed that this is a society „which provides few people, and even in an extreme version - one person, with an immediate insight into the great mass of people" (Wróbel, 2002, p. 239). In turn, a historian - Maciej Ożóg, claims that „a disciplinary society modelled after Panopticon is a society without private space: order applies to everyone and does not tolerate any exceptions to the general principle of visibility. Unattended areas are a challenge and a threat that should, or even must, be removed in the name of system consistency" (Ożóg, 2018, p.18). A similar opinion was expressed by Zygmunt Bauman - a world-famous sociologist and philosopher - claiming that the ideal version of Panopticon did not allow non-transparent privacy - as he called it - and uncontrollable space. Hence, the ruled were to live in the belief that the ubiquitous eye of superiors would always reach them and punish them for an offense committed even in secret. This was to serve discipline to be maintained under constant threat of punishment (Bauman, 2000, p. 60). The historian and sociologist, Bartłomiej Błesznowski interpreted this issue slightly differently. According to him, the disciplinary society „enters (the unit) into the network of supervisory relations, where it is subjected to constant tests, examinations, interrogations - it is a carrier of information" (Błesznowski, 2009, p. 88).

Evolution of panoptic vision

The slogan of rejection of the concept of Panopticon to describe contemporary surveillance practices of that time is invoked more and more often. Instead, complete cessation of references to Foucault in research on surveillance is proposed and preparation of post-Foucault theory of supervision. The tendency is reflected, among other things, in the statements by David Lyon - sociologist and co-founder and theoretician of studies on the Surveillance Society: „people who have been dealing with serious surveillance studies, Panopticon appears to be a fantastic idea. It is a theory describing surveillance and at the same time, on a different level, a tool that enables to put it alone in the history of modernity (…). Among those who devoted a little more time to study surveillance, there very mention about Panopticon often causes annoyance" (Bauman and Lyon, 2013, p. 79). Lyon, calling Panopticon „a child of his times", emphasizes at the same time the idea of an invisible observer with reference to contemporary times. As an example, he gives monitoring cameras that, like panoptic eyes, closely observe the surrounding space, extort specific behaviour of individuals, and acquire and save data to resemble registers kept by the disciplinary authority. Lyon, however, draws attention to the restrictions arising from the use of the Bentham scheme to analyse contemporary reality, mainly due to technological development and social structural transformations. According to him, the situation changed primarily together with computerization, which created connections and information flows, which researcher of supervision calls „leaking tanks" (Ożóg, 2018, p. 25) and points at a difference in comparison to the Foucault society: „supervisions tanks were properly isolated. It happened rarely that the thing that happened in one sector had impact on the other sectors. Today, the situation is changing, because the tanks have become more permeable. Supervision practices and data flows are penetrated more easily by different sectors" (Lyon, 2001, p. 37). The division of Panopticon led to the segregation and separation of units, as a result of which the supervisory institutions did not permeate, constituting closed and independent spaces with specific resources of acquired information. Today, in virtual communication and information systems, the situation is quite different, for instance due to the decentralization of supervision, which is no longer closely related to the authorities, as it was in the reality of modernism. Currently power is dispersed and control is one of the functions of exercising it

over citizens, but also citizens over the authority. Z. Bauman speaks in a similar tone; in his opinion in today's system of global and extraterritorial area of freedom, security and justice, those exercising power „can melt in the air at any time - become inaccessible and unreachable" (Bauman, 2006, p. 17). Bauman is critical of the Bentham project, which in his opinion, thanks to Foucault, has grown into the „arch metaphor of modern power". He even claims that today's challenges do not pretend to accept the use of unflagging enthusiasm - as he emphasizes – of „orthodox panoptical strategies" (Bauman, 2000, p. 61). According to Bauman, today's reality is post-pan-optical. Its metaphorical figure ceased to be a universal model and set dominant strategies for action in the modern world, which is described as „liquid modernity". In this world, supervision is not very transparent, which is mainly due to technological progress, the information flow system and confidentiality issues in the security sector.

The development of new techniques of power enabled it - thanks to the progress of the mass media - to remain in the shadows in a more sophisticated way than it did in the Panopticon. There has been a reversal of the panoptic view, the transformation of a situation in which few observe many, into a situation where many observe few. This thesis became the basis for Thomas Mathiesen to develop the concept of *Synopticon*[4]. Here peeping (seeing) and supervision are no longer reserved for selected observers and does not result directly from exercising power. At the same time Synopticon is of a global nature, in opposition to Panopticon entrenched in a local environment where the governing bodies remained „immobilised". In the model by Mathiesen everyone can join the extraterritorial network in which many can observe few without coercion, and to the contrary: (Synopticon) „is tempting for the people to watch". According to Z. Bauman, it is a „panopticon used for self-implementation and use (…) modified significantly, based on the supervision deprived of caretaker" (Bauman and Lyon, 2013, pp. 103-104). At the same time, it points to the fact of voluntary sharing of data and images of the private life of Synopticon participants, which indicates a completely new (unknown for panoptic surveillance) type of supervision – some form of exhibitionism[5]. A similar narrative was adopted by Maciej Ożóg who claiming that it was associated with „voluntary participation in the procedure of universal surveillance (…) which prompts many authors to announce the arrival of the participatory era of Panopticon (…) consisting in constant, universal, horizontal, mutual observation" (Ożóg, 2018, p. 30), carried out on account of being interested in the life of others, curiosity and the need to appear in the information space. The Finnish researcher - Hille Koskela is also inclined towards this perspective; Koskela speaks of „exceeding panoptical logic" (Koskela, 2009, p. 42), effected due to new techniques of looking, presenting and distributing images. The author challenges the Foucault connection of power with visibility, arguing that deliberate presentation or exposure is not tantamount to subordination to the operation of power. To the contrary, to be visible does not need to be weaker (here: subordinated to authority). The former power-observer ratio has been questioned. The objective consists no longer in strengthening control, but in blurring and undermining its borders.

The fall of the walls of Panopticon, as described by the French post-modernist philosopher Gilles Deleuze in his *Post-scriptum about control societies*, marked the end of oppressive supervision, while becoming the beginning of its transformations, qualitative changes and uncontrolled spread. The author describes this process with the term ′rhizome′ meaning 'rootstock' and referring directly to his rhizome theory. According to her, „rootstocks of power" have a wide range of impact and are themselves techniques of supervision (Deleuze, 1990).

The opening of former Panopticism is clearly marked by the atrophy of supervision procedures and tools, and the overriding goal is no longer discipline and the establishment of „submissive bodies". The centres of power, creating this decentralized order, have limited knowledge, but due to their constellation arrangement, they possess large data resources. All this contributes to the emergence of a new social structure, referred to by Manuel Castells in *Rise of the network society*. In opposition to the panoptical figure, he proposes the concept of a new spatial form, characteristic of social practices that dominate in a network society and shape them: it is the space of flows. Thus, network societies are no longer characterised by disciplinary power, but by power that is realised through conducted control in an immanent and unsupervised manner in the context of revolution of the information technology (Castells, 2008).

Remaining at the analysis of information flows, a similar pattern can be found at Mark Poster[6], who, referring to Panopticon, wrote that „today's communication flows replace old walls, shutters and other architectural instruments supporting electronics with the controller's constant look, thus creating a superpanopticon" (Poster, 1990, p. 71). The authority at Poster disciplines his subordinates, but only to participate in electronic communication systems. They, by providing huge amounts of information, stored in databases, constitute a voluntary factor in the supervision process. In the author's opinion, this type of control mechanism took on an even more common and oppressive character than that using a panoptic look.

Didier Bigo also addressed the issues related to computer databases in his concept, describing the operation *'Ban-opticon'*[7] consisting in device-related supervision, a contemporary 'dispositiff'[8]. However, this supervision has a different form than Panopticon, because its tools are based on information technology and digital. It allows to „produce" knowledge and image – staring from a suspect to (un)judged, enabling reconstruction of all stages of its transformation. It delivers messages concerning threats, information flows and traffic controls – he monitors the future. It is used for hazard profiling for the purpose of preventive selection and isolation, and exclusion of unwanted units. The thing that definitely distinguishes Ban- from Pan-optics is the need to ensure security, as opposed to discipline characteristic for Panopticon. For Didier Bigo the purpose of its device and instrumentation is to „follow everything in motion: goods, information, capital and people" (Bigo, 2008, p. 109)[9].

Supervision vs. safety – Mutual Relations

Supervision itself is nothing bad, and the consequences of its operation depend on who and for what purpose it serves. Hence, the mechanisms of its operation can be considered in various aspects. The first concerns the use of supervision tools[10] by state institutions appointed for the purpose of protection and defence against threats[11]. Today in a technologically advanced world, surveillance aims at anticipating threats and prediction of events based on the information collected and processed. The attack on the World Trade Center was an impulse and a contribution to the introduction of a wide range of surveillance tools in the name of improving security. Safety is often a pretext, a flagship, explicitly exposed goal that is to cover other, less spectacular or ideological goals. The formula „for security reasons" functions in every area of life as a keyword and serves to impose a narrative on the need to justify the actions of various institutions, not only state institutions[12].

Modern forms of electronic supervision introduce a new, preventive and a future-oriented control measure, used by the authorities to distribute and redefine knowledge about the individual. Thanks to new technologies[13], gathering information has become a routine, obscure intention and at the same time a highly automated operation. Data on the past, presence and future of each individual are collected on a continuous basis. For this reason, the state follows the Internet communications, administers public databases, sets up cameras and scanners, uses biometric systems, etc. All this contributes to the lustration of human life in almost every aspect and at every level. It seems that the boundary between the level of supervision necessary for security and maintaining the human rights guarantee in this regard has been crossed.

The new supervision also included everyday experiences and interpersonal relationships of almost every individual and social group. It changed the mentality and has become (and in particular its observational form) a way of life for many people. D. Lyon aptly defines this process in his latest work: „supervision is not only 'done to us' - it is something that we do in everyday life. We surrender to supervision believing that 'we have nothing to hide'. Or we try to protect our privacy or negotiate terms under which others have access to our data. At the same time, we participate in supervision to supervise children, monitor other road users, and protect our property. Social media allow us to follow others, including strangers, as well as one another. This is a culture of supervision. Observation has become a way of life" (Lyon, 2018). It is not only about observing others but also about observing oneself (self-supervision) and monitoring one's own health, how fat one's wallet is, capabilities and competence in various fields of activity using commonly available technological tools. According to the author, today we should pay special attention to supervision in everyday life, and less so on the global intelligence and police network. Z. Bauman speaks in a similar tone. Speaking about „smooth supervision", he finds

the lack of its oppression, what's more, makes it a desirable phenomenon that provides the supervised with interesting experiences, mainly due to active stay in the virtual world (Bauman, Lyon, 2013). That is why a part of the society is under surveillance by free choice. In this context Mark Andrejevic talks about *'Lateral Surveillance'*, otherwise known as „peer-to-peer" monitoring using surveillance tools used by individual units to keep people from its immediate surroundings under surveillance (Andrejevic, 2004). This is done through media shows such as 'reality show', where the observed person has a chance to „appear" in the media market, by exposing his or her own life (exhibitionism), but also by exercising voyeurism. Consequently, it is about a certain fashion, recognition and the need to present yourself.

The tools used by state institutions and the interested parties themselves - based on new technologies, indisputably contribute to the improvement of security on an individual and national scale, as well as contribute to the improvement of the quality and functionality of everyday life on an individual basis. However, there is no doubt that these tools affect human rights and freedoms. Therefore, it seems that their use can contribute to creating opportunities for improving safety, but also to the occurrence of threats related to excessive control and limitation of human rights. It is therefore important to feel responsible for one's own choices, preferring the subjectivity and freedom of each individual in his quest for independence, wisdom and ensuring security without focusing only on the custody provided by the authorities.

Summary

A society based on disciplinary power took a different, open form of networking, and, as post-Marxist philosophers Antonio Negri and Michael Hardt wrote in their Empire, „transfer of control to the society in no way means the end to discipline (…) it is characterized by the intensification and dissemination of normalizing disciplinary instruments, which stimulate our ordinary everyday practices from inside, but unlike discipline, this control extends far beyond the structured areas of social institutions" (Hardt and Negri, 2005, p. 350, pp. 38-39). Hence the figure of Panopticon as a metaphor of power and the foundation of a disciplinary society, although it undoubtedly requires reinterpretation, is clearly outlined in today's reality: panoptic model of power did not stay behind the walls of barracks, hospitals or schools, but began to spread, affecting our daily lives, spreading in every area as a pattern that symbolically describes the society of flourishing capitalism - a society of the age of security.

The concepts referred to in this study allow us to state that the discourse of Panopticon is replicated with varying intensity and in various areas of life. It manifests its unrelenting conceptual weight in scientific reflection and undoubtedly, it is a reference point for understanding contemporary supervision. It can even be considered, following Hungarian philosopher - Imre Lakatos that Panopticon is the hard core of scientific research programs for supervision, control and security.

Nevertheless, in modernized versions that develop the ideas of Michel Foucault's panoptic theory, the object and purpose of surveillance is no longer to shape „submissive bodies" by means of discipline. Now sophisticated forms of supervision, on the one hand, serve the purposes of state institutions, such as ensuring security and keeping order. On the other hand, supervision is a more or less conscious choice of individuals that meet their numerous needs, often created by virtual reality. (Self) supervision has nothing to do with disciplining the spirit or body. Not only that - it seems to increase the sense of security, freedom, choice and participation in the act of consumption of various goods and services. A human being, therefore, lives today in an amorphous world, where surveillance has become invisible and dispersed, and its negative connotations have at least weakened.

Footnotes

[1] Michel Foucault (1926-1984) – a French philosopher deemed to be one of the most eminent, inspiring and influential contemporary thinkers. Author of numerous publications, using extraordinarily valuating and highly rhetoric language.

[2] See: (Bentham, 1995). The idea to create *Panopticon* (Greek *pan 'everything'; optikos 'see'*) was taken by its author, Jeremy Bentham – a philosopher and social reformer from his younger brother Samuel who designed, upon the order of a Russian prince, a circle shaped factory where workers (especially those not accustomed to work) were to be observed (controlled) from the central unit located in a factory tower.

[3] See: (Błesznowski, 2009). The concept of '*dispositiff*' ('device', 'machine') is an expression of Foucault's thought about technology in the 70s and in this context it refers to the forms of social control (discipline, panopticism).

[4] Synoptykon – is a model of inverted Panopticon (many are watching the few), proposed by the Norwegian sociologist - Thomas Mathiesen.

[5] See: (Koskela, 2009). Exhibitionism in this context means a form of empowerment - liberation from shame and hiding: „when you show" everything", you become „free".

[6] Mark Poster was a professor of history and media studies at the University of California, Irvine. His *Superpanopticon* is an electronic prison without specialized architecture, in which databases work constantly and systematically while collecting information about individuals.

[7] Ban-opticon is a neologism derived from two words: banishment and opticon. The first term means the penalty of exile and exclusion, while 'opticon' from Greek means 'to see.' The author of this formulation is Didier Bigo, a sociologist and professor at King College in London.

[8] In this context '*dispositiff*' means all discourses concerning risk and threats, norms and rules of conduct (legal and administrative measures), institutions and architectural forms (concrete buildings and places e.g. airports – areas where preventive detentions take place).

[9] See: (Marx, 2015, online). There are many more concepts based on the principles of panopticism. It is impossible to refer to all of them but it is worth recalling some of them by name: *Dataveillance* by Clarke, *Telematic Society* by Bogard, *Techno-Policing* by Nogal, *The Maximum Surveillance Society* by Norris and Armstrong, *Surveillant Assemblage* by Haggert and Ericson, *Post-panopticon* by Boyne, *Global Panopticon* by Gill, *Myoptic Panopticon* by Leman-Langlois or *Oligopticon* by Bruno Latour.

[10] Modern tools that are equipped with cameras, sensors, GPSs, RFID, used for surveillance include: biometric and biomimetic systems, video monitoring, wearables, unmanned vessels, predictive systems, positioning systems and others.

[11] It is about police institutions and other security and public order forces, special forces, armed forces.

[12] Supervisory practices work just as well in the private sector, helping to better manage the requirements, tastes and preferences of customers.

[13] The market of new technologies is shaped by a modern product, i.e. advanced technology that is used in supervision. This market offers a variety of advanced devices for access control, monitoring, espionage, logging, eavesdropping, etc., cooperating separately or integrated in the network.

Abstract

In recent years, there have been many problems in information integration among key pharmaceutical supply chain players in Saudi Arabia. This issue has resulted in problems such as medication shortage, lack of coordination among healthcare stakeholders, product wastage, and lack of demand information. However, blockchain, as a distributed digital ledger technology which ensures transparency, traceability, and security, is showing promise for easing some supply chain management problems. Local and global government, community, and consumer pressures to meet sustainability goals prompt us to further investigate how blockchain can address and promote supply chain sustainability. This study aims to explore the impact of blockchain technology implementation on the sustainability of the pharmaceutical supply chain. The objectives of this study are to identify the current information system infrastructure in the pharmaceutical supply chain of Saudi Arabia; to examine the barriers and challenges of blockchain adoption; and to examine the barriers and challenges of blockchain implementation. The result of this research is expected to contribute to the explore the role of blockchain in sustainability efforts. In addition, it will help managers, practitioners, consultants and decision makers who are interested in a deeper understanding of blockchain and its implementation and will evaluate its influence on sustainable supply chain management.

Keyword: Blockchain, Sustainability, Supply chain, Pharmaceutical, Saudi Arabia. IT Integration.

Introduction

Two topics have gained more importance in recent years in supply chain management (SCM). Firstly, sustainable supply chain management (SSCM), which has already received significant attention by many researchers. Secondly, information technology (IT) has been progressively considered as a key efficiency factor in supply chains. IT contributes to the sustainable development of supply chain operations, which is considered as one of the most important sectors where high quality logistics management is needed (Walker & Jones 2012). A sustainable business is defined as business with a long-term goal of maintaining economic, environmental and social well-being (Hassini, Surti & Searcy 2012). SSCM relates to a growing awareness of environmental and social responsibility across all areas of the supply chain (Wu, Zhang & Lu 2018). Thus, coordination among supply chain players is vital in order to meet sustainability goals.

The use of supply chain technologies can facilitate organisations decrease their lead time, lower the product life cycle, improve efficiency, and enhance ultimate customer satisfaction (Khan, Ahmad & Abdollahian 2013). Adoption of suitable supply chain technologies in organisations ensures timely and accurate information availability for their decision-making process. One of the most important factors to maximise the efficiency of all key players in any supply chain is the adoption of appropriate IT tools

in the SC (Khan, Ahmad & Abdollahian 2013). New technology adoption may require new infrastructure and nascent skills. Therefore, researchers need to investigate the factors affecting the adoption of technology for an entire organisation (Jela 2013).

Healthcare services have been given high government priority in the Kingdom of Saudi Arabia (KSA) (Almalki, FitzGerald & Clark 2011). However, due to the insufficient number of healthcare practitioners and the lack of technology applications, the e-health system in the country has been lagging behind the developed countries around the world (Alyami 2018). These shortages have resulted in problems such as medication shortage, lack of coordination among healthcare stakeholders, product wastage, and lack of demand information (Alruthia et al. 2018; Kapoor, D, Vyas & Dadarwal 2018; Privett & Gonsalvez 2014). Hence, many of these prevalent issues will be addressed in this research.

There are five major health authorities in KSA: the Ministry of Health (MOH), the Medical Services of the Armed Forces (MSAF), King Faisal Specialist Hospital and Research Center (KFSH&RC), the Ministry of National Guard Health Affairs (MNGHA), and the Security Forces Hospitals (SFH). These health authorities provide healthcare services in KSA; however, there is a lack of IT integration among them (Alsulame, Khalifa & Househ 2016). Additionally, Khalifa (2014) state that insufficient electronic data exchange and poor integration among different Saudi hospitals' IS modules and other electronic systems has been identified as another barrier to implementation and use of IS in hospitals. Furthermore, Alsulame, Khalifa, and Household (2016) also claim that some of the health IS modules used in KSA hospitals are coming from different vendors and have not yet been integrated and synchronised. Therefore, the study will assist practitioners to identify the role of blockchain adoption in the sustainability of the pharmaceutical supply chain in KSA, which would increase information sharing among them, making their supply chain agile and results in less human errors.

The real root cause of the above issue is not related to the availability of technology, as IT and IS are becoming available to many countries worldwide. The main reason is the lack of technical support during and after implementation of these systems (Khalifa 2013). In addition, according to Amatayakul (2010), health care sectors usually face a lack of financial resources for inevitable costs such as information systems implementation and relevant training courses for the users.

The pharmaceutical industry holds an important position within the Kingdom's Vision 2030. Therefore, the regulator and local industry players as well as international pharmaceutical manufacturers have recognised the importance of this vision and have begun to promote and develop KSA's domestic pharmaceutical industry. According to Saudi vision (2019), the Ministry of Health (MOH) seeks to preserve the environment by relying on technology to implement internal transactions and provide services to citizens in electronic form, which means electronic paperless services provided to the beneficiary everywhere. The MOH aims to preserve the environment, and strives to achieve sustainability in all its electronic services (Ministry of health 2019). Thus, one of the most significant goals of KSA vision is to adopt and implement of modern technology in order to serve the society and collect enough basic data to allow proper development planning (Saudi vision 2019).

Furthermore, there are several IT applications which can be used to organise whole records in health care facilities. Electronic Data Interchange (EDI), Enterprise Resource Planning (ERP), and Radio Frequency Identification (RFID) are some of the potential IT applications (Georgise, Klause-Dieter & Seifert 2014). Additionally, blockchain (BC) is one possible technology to enhance integrity, authenticity, and consistency of stored and exchanged medical records. BC offers a shared and transparent history of all the transactions to create trust, accountability, decentralisation, transparency, and immutability applications. Moreover, BC addresses security issues associated with a deployed distributed patient records database that could be managed by different advisories such as caregivers, hospitals, pharmacies, insurance companies, regulators and the patients (Alhadhrami et al. 2017). BC is also an appropriate solution when it is required to document a patient's health record or to secure medications' movement through the supply chain (Sadiku, Eze & Musa 2018).

The challenges faced by supply chain sector can be reduced or even avoided by using blockchain technology, and sustainability can be greatly improved (Tijan et al. 2019). However, BC and

sustainability integration have been somewhat neglected in academic research; therefore, more studies should be conducted to investigate the potential use of blockchain in the area of sustainable supply chain (Queiroz, Telles & Bonilla 2019; Schmidt & Wagner 2019).

The number of available KSA e-health studies remains low. Data is limited to a few organisations and does not necessarily reflect the breadth and depth of the current and potential use of e-health for healthcare organisations in the region (Alsulame, Khalifa & Househ 2016). Therefore, this study will explore the impact of blockchain implementation in the pharmaceutical industry in the context of KSA. To be more specific, the study will explore the potential impact of BC on the quality of supply chain practices. It also provides suggestions to decision makers and system implementers on proper plans and actions to overcome potential implementation challenges.

Literature Review

This chapter focuses on the literature pertaining to sustainable supply chain management (SSCM), information technology (IT) and blockchain (BC). It especially discusses the study's theoretical basis, the concept of SSCM, IT, and the barriers and challenges that impede successful BC's implementation.

Overview of sustainability and supply chain management

For the past decade, sustainability and supply chain management have been of great interest to academia and practitioners (Hassini, Surti & Searcy 2012; Rasool, Ahmad & Nazam 2016). While various research efforts have been dedicated to evaluating the sustainability of supply chains, few have taken into account all three dimensions of sustainability (Galal & Moneim 2016). In fact, integrating sustainability into the supply chain practices plays an important role in ensuring that certain social, economic and environmental benefits are achieved (Alzawawi 2014). Silvestre (2015, p. 166) states that indeed integrating sustainability into supply and value chain management is not "a destination", but an "endless journey characterised by trajectories of progress" as a result of the dynamic, radical, and emerging nature of the issues.

Sustainability

Sustainability has three main pillars, namely: environment, economic and society (Gopalakrishnan et al. 2012). Collectively, these three sustainability elements are called "triple bottom line" or 3BL. The environmental dimension refers to the involvement in practices that will not compromise future generations' environmental resources (Alhaddi 2015). The social aspect relates to empowering minority groups, diversity and inclusion, and healthy social living (de Carvalho 2018). The economic aspect refers to improving living standards and economic well-being (Abdullah et al. 2018).

Businesses are paying increasing attention to sustainability issues (Ahi & Searcy 2013). A major challenge for an organisation, however, is to integrate and balance the three sustainability aspects in a responsible manner that maintains financial stability and competitiveness while incorporating ecological and social demands (Abdullah et al. 2018).

Supply chain management

Growing interest in SCM has led to various definitions being created to describe it (Ahi & Searcy 2013). SCM identifies all the activities involved in delivering a product from raw materials to the end consumer. These activities are manufacturing and assembly, warehousing and inventory tracking, order entry and order management, supplier management, distribution across all systems, delivery to the customer, and the information systems required to control all of these activities (Habib 2011). In addition, research by Baah and Jin (2019) describes SCM as materials and services flow, supply chain partners collaboration, and sharing of information. Therefore, sharing information is a well-advocated way for improving SC efficiency (Choi, Wallace & Wang 2016).

The SCM sector was initially created to manage the flow of information, products and services across a network of consumers, business and supply chain partners (Felea & Albăstroiu 2013). SCM trends such as business markets globalisation, shorter product life cycles, digitalisation, and multi-faceted customer expectations, along with innovations such as resource scarcity, more restrictive regulatory requirements, and a longer-term emphasis, have led to the development of highly complex supply chains (Saeed & Kersten 2019). In fact, as the development of new forms of organisations such as virtual enterprises, global manufacturing and logistics evolve, coordination in the supply chain has become strategically important (Arzu Akyuz & Erman Erkan 2010).

For many companies SCM excellence has become a crucial differentiator (Kyengo 2012) and a key competitive advantage. In fact, a SCM's main objective is to improve organisational effectiveness and efficiency (Alzawawi 2014). As a result, a number of studies emphasises SCM's criticality as a means to ensuring organisational success (Habib 2011).

Sustainable effort in supply chain management

Sustainable supply chain management (SSCM) has attracted considerable interest among academics and practitioners. According to Dubey et al. (2017), there is a growing body of SSCM-related literature. SSCM can be defined as the planning, managing, regulating and organising of a supply chain to make it truly sustainable, while ensuring that there is no harm to economic, environment and social systems over a longer period of time (Pagell & Shevchenko 2014). Also, SSCM is the expansion of the traditional concept of the supply chain, by adding social, economic and environmental elements of sustainability (Wittstruck & Teuteberg 2012).

Unlike other business and management fields, because of its direct impact on sustainable development, SCM has long been associated with the sustainability discourse. In the supply and value chain sector, an evolving point of view is that "a company is no more sustainable than its supply chains" (Krause, Vachon & Klassen 2009, p. 19). SSCM is perceived to be the emergence of a new era that combines environmental performance, social efficiency, and economic contribution (Ansari & Kant 2017). Therefore, the economic, environmental and social aspects of sustainability must be taken into account by a truly sustainable organisation (Ahmadi, Kusi-Sarpong & Rezaei 2017). Today, it is no longer enough for companies to be profit-oriented; businesses must reduce their negative environmental effects and be responsible for child labour, health, safety, and pollution (ÖZÇELİK & ÖZTÜRK 2014). Therefore, SSCM focuses on the environmental effects throughout the supply chain (Rasool, Ahmad & Nazam 2016).

SCM practices not only play a vital role in achieving business goals, but they also have the potential to tackle sustainability concerns. The SCM's strategic role and its potential for significantly contributing to sustainable development is evident from academic research on the topic (Touboulic & Walker 2015). However, there is a limited number of studies on sustainability development in developing countries (Eitiveni, Kurnia & Buyya 2017; Khuntia et al. 2018). Hence, in order to address this gap in the literature, the current research has been conducted.

Pharmaceutical supply chain

The current pharmaceutical supply chain system is complex (Katuwal et al. 2018; Schöner et al. 2017; Suhail, Pandey & Hong 2019) and outdated (Haq & Esuka 2018; Shrikant 2019); it does not allow producers and regulatory authorities visibility and influence over the delivery of drugs, and it cannot overcome the challenge of cyber security in the 21st century (Shrikant 2019). In addition, many health systems and hospitals have difficulties in achieving a high level of service as they have not addressed how to manage, supply, and use medicines to save lives and improve health (Uthayakumar & Priyan 2013). A strategic feature of any health system is access to medicines (Kapoor, Devesh 2018). This feature depends on sustainable financing, comprehensive information systems, reliable supply systems and essentially on coordination and collaboration, either between internal supply chain partners or global supply chain partners (Benazzouz, Charkaoui & Echchatbi 2019).

Improper use of essential medicines may be costly in terms of wasted resources and preventable disease and death (Uthayakumar & Priyan 2013). In fact, for all healthcare industries, a high level of medical supply service is a primary objective (Uthayakumar & Priyan 2013). However, many hospitals in KSA do not have well-functioning supply management departments (Alruthia et al. 2018). Hence, more studies are needed to improve the pharmaceutical supply chain in developing regions (Privett & Gonsalvez 2014) such as KSA.

Pharmaceutical sector in KSA

The pharmaceutical sector in KSA is still in a phase of development (Alruthia et al. 2018; Alsaddique 2017). In fact, it is important to have an efficient and transparent system whereby the pharmaceutical supply chain can maintain accurate records of its pharmaceutical supplies in terms of expiry dates and accessible quantities through a computerised program (Alruthia et al. 2018). Blockchain is one technology that improves the integrity, authenticity and coherence of medical records that have been preserved and shared (Alhadhrami et al. 2017). Furthermore, blockchain can be an effective solution when tracking a patient's health record or moving drugs through the supply chain (Sadiku, Eze & Musa 2018). Therefore, this study will explore the technology of blockchain in the pharmaceutical supply chain in the context of KSA.

Blockchain definition and characteristics

Although an accepted definition of blockchain has not been agreed upon, according to Seebacher and Schuritz (2017, p. 3), a blockchain is a distributed database, which is shared among and agreed upon a peer-to-peer network. It consists of a linked sequence of blocks, holding timestamped transactions that are secured by public-key cryptography and verified by the network community. Once an element is appended to the blockchain, it cannot be altered, turning a blockchain into an immutable record of past activity.

Blockchain technology varies from most information systems by including four key characteristics: non-localisation (decentralisation), security, auditability, and smart execution (Saberi et al. 2019). Indeed, the underlying information technology architecture and its 'unbreakable' data chain which is provided for secure and open transactions is the key promise of blockchain (Randall, Goel & Abujamra 2017).

Through reducing the need for multiple intermediaries, blockchain can simplify supply chains by eliminating some transaction costs (Montecchi, Plangger & Etter 2019). Additionally, blockchain, in memory computing, data leaks etc. can contribute to increased data availability at the point of use (Pflaum et al. 2018b).

Blockchain Evolution

Leslie Lamport created the core ideas behind blockchain technology in the late 1980s and early 1990s (Dylan Yaga & Scarfone 2018 cited in ; Leslie 1998). In 2008, Satoshi Nakamoto developed digital ledger technology as the basis for the digital cryptocurrency known as Bitcoin. Cryptocurrencies like Bitcoin, Litecoin, and Ethereum are the foundations in blockchain. They function in a distributed ledger to track transactions (Alhadhrami et al. 2017; Sadiku, Eze & Musa 2018).

The detailed technical foundations of blockchain technology are outside the scope of this research. However, it is essential to shed light on some blockchain concepts, features and terminology to enable understanding of how blockchain is applied to solve healthcare problems. Technically, blockchain refers to either a distributed data infrastructure or a method for recording data using a crypto-analytic hash function (Wang, Han & Beynon-Davies 2019). An important element of the technique that maintains the blockchain's strength is hashing (Dylan Yaga & Scarfone 2018). The new block's hash contains the previous block's hash. This makes falsifying new or existing parts of the blockchain

extremely difficult, as the hash of a previous block determines the hash of future blocks. In order to change one block, the whole blockchain should be rewritten (White 2017).

Today, many sectors have introduced blockchain technology for using its benefits in their respective fields (Gupte, Gupta & Sinha 2019). Therefore, in recent years, blockchain technology has gained significant popularity with increased interest in various fields, including the healthcare industry (Angraal, Krumholz & Schulz 2017). While Internet of Things (IoT) technologies like radio frequency identification (RFID), low-power wide area networks (LPWA), wireless sensor networks (WSN), cyber-physical systems (CPS) etc. enable the vertical integration of information and material flows in supply chains, blockchain technology gains importance as far as the horizontal integration of information systems between companies is concerned (Pflaum et al. 2018a).

Although the benefits of blockchain are obvious, such as integrity protected data storage and process transparency (Wüst & Gervais 2018), there are concerns about efficacy and efficiency, which emerge for any new technology as well as its application (Randall, Goel & Abujamra 2017). Despite blockchain's potential to improve all kinds of supply chains, the literature about blockchain technology in the SCM field is in its infancy (Queiroz, Telles & Bonilla 2019).

Blockchain Types

There are two types of blockchain: public and private. Public blockchain are cryptocurrencies such as Bitcoin, enabling peer-to- peer transactions. Private blockchains use blockchain-based platforms such as Ethereum or Blockchain-as-a-service (BaaS), running on private cloud infrastructure. A private BC is an intranet, while a public BC is the Internet (Sadiku, Eze & Musa 2018). Although the technology of blockchain was originally intended to be truly public and distributed (i.e. public blockchain), private blockchains have also been developed. Private blockchains are controlled by one or more entities. Otherwise, public and private blockchains do not differ from one another (Kurki 2016).

Blockchain technology in pharmaceutical supply chain

Blockchain's decentralised form is more trustworthy, transparent, and traceable within business processes, whereby all the transactions are constant, saved, immutable, and distributed among all network nodes (Sinclair, Shahriar & Zhang 2019). In fact, both scientists and business representatives are considering the possibility of adopting the basic idea of Bitcoin technology in the context of supply chain management because of the disruptive role of blockchain in financial applications (Pflaum et al. 2018a).

Operating costs in the health sector must be reduced more than ever, as patient care and safety are improved (Bevilacqua et al. 2013). Safe, secure, and scalable (SSS) data sharing in the field of health care is extremely important for successful decision-making (Siyal et al. 2019). Pharmaceutical supply chains are very different from typical supply chains, starting with the raw materials extraction and after a few production phases continuing with shipping to stores and selling to end customers (Kurki 2016). This is because any disagreement in the healthcare supply chain might have an effect on patients' wellbeing (Clauson et al. 2018).

Medicines move through a supply chain with several key players such as manufacturer, wholesaler and retailer, who participate in the production, transportation, distribution, and sale of these products (Bryatov & Borodinov 2019). As counterfeit medicines have become one of the world's most complicated and challenging issues (Evans 2018), blockchain allows the tracking of medicines at every point of the supply chain (Clark & Burstall 2018). Previous studies have also focused on the safety of medicine distribution, lack of drugs, matching medicines' price in the market, and accessibility to the standard recorded temperature, which are summarised in Table 1. In fact, blockchain may be an ideal technology to improve performance and reduce the risk of the above-mentioned issues (Kurki 2016; Siyal et al. 2019). However, there is a lack of studies on the influence of blockchain on the sustainability of the pharmaceutical supply chain. Therefore, considering this research gap and the overall scarcity

of blockchain research, this study conceptually evaluates the effect of blockchain implementation on pharmaceutical supply chain sustainability.

Benefits and challenges of blockchain implementation

Blockchain has numerous benefits, including decentralisation, persistency, anonymity and auditability (Zheng et al. 2018). Perhaps the most evident and popular feature of blockchain is that it removes the need for a centralised trusted third party in distributed applications; in other words, it allows two or more parties to conduct transactions without a centralised authority in a distributed environment (Agbo, Mahmoud & Eklund 2019).

Another benefit of blockchain implementation is the establishment of a national registry of patients' medical information. This will make research and development of new medicines easier, cheaper, and faster (Plotnikov & Kuznetsova 2018). Therefore, it is expected that by implementing blockchain some challenges in the supply chain can be reduced or even avoided, such as delays in delivery, loss of documentation, unknown source of products, errors, etc. (Tijan et al. 2019).

Although blockchain has numerous benefits that can help organisations achieve their goals, the implementation of blockchain faces many challenges:

Firstly, due to the nature of blockchain, data stored or transferred out of the chain is not securely confidential (Alhadhrami et al. 2017). Since transactions are public, traceable clues may still be used to disclose users' identities and personal information (Gao, Hatcher & Yu 2018).

Secondly, blockchain implementation consists of bringing together all the relevant parties, which can in many cases be a difficult undertaking (Kshetri 2018). Participants need to agree on the terms of a transaction or a contract. This requirement will be one of the bigger barriers in the coming few years to the broader implementation of blockchain applications. Once the rules are in place, blockchain systems could automate many sustainability processes that professionals struggle to manage manually, allowing them to run much more efficiently (Clancy 2017).

Table 1: Summary of previous studies about using blockchain in the pharmaceutical supply chain.

Author (S)	problems	context	Solution using blockchain
Bryatov and Borodinov (2019)	Counterfeit Drug	Russia	The details collected on the identity of drugs manufactured by the plant and their movements throughout the supply chain in blockchain will accurately determine the authenticity of pharmaceutical products on pharmacies' shelves.
El-Din (2019)	Matching medicines price, lack of drugs	Egypt	BC can help address the undercurrents problem in Egypt. This causes the deaths of hundreds of children due to lack of milk cans and the death of hundreds of people with chronic diseases due to lack of medicines and import problems.
Erdenebold, Rho and Hwang (2019)	Counterfeit Drug	Worldwide	The primary goal and demand for using blockchain is to validate drug originality, increase transparency, inspect medication history, keep drugs secure, improve interoperability performance, provide protection against falsification and save costs within the supply chain. This can potentially save thousands of lives, as well as benefiting drug manufacturers and consumers financially.
Jamil et al. (2019)	Counterfeit Drug	Worldwide	BC has shown the ability to transform the traditional supply chain system into a secure, digital, transparent, continuous, audible, and decentralised supply chain. Using blockchain technology increases the performance in terms of throughput and also minimises the latency of the system proposed by utilising less resources.
Kumar et al. (2019)	Counterfeit Drug	India	The main benefit of the BC-based supply chain network is transparency of transactions, drug traceability by auditing and the ability to track any attempt to tampering of data.
Menezes et al. (2019)	Safety of medicine distribution	Worldwide	BC uses a decentralised system which help to checks the temperature, humidity during transport using sensors and drug manufacturing area.
Nayyar et al. (2019)	Falsified and substandard drugs	USA	BC ensures the provenance of data from the drug supply chain and can potentially detect the infiltration of fake medicines.
Pashkov and Soloviov (2019)	Counterfeit Drug Operational costs	Europe	Use of BC technology in pharmacy could provide reliable legal protection for the supply and tracking of pharmaceutical products. It also ensures transparency of delivery and reduction of logistics costs.
Raj, Rai and Agarwal (2019)	Counterfeit Drug	Worldwide	BC helps to build a transparent and open traceability system, allowing the logistics industry to track the goods in real time. BC helps to develop a proof of ownership concept whereby only the authorised party can pass ownership to another.

Shrikant (2019)	Counterfeit Drug	India	BC helps to track the medications from its manufacturing until its delivery to patient. After the use of a drug, its impact on patient will be recorded to a database for future statistics.
Zhang et al. (2019)	Temperature records	USA	BC helps to reduce lags between temperature measurement and timely corrective action in internal processes.
Boulos, Wilson and Clauson (2018)	Counterfeit Drug	USA	BC implementation can help to monitor the materials used in production and detect substandard or falsified medicines.
Chavali et al. (2018)	Counterfeit Drug	Worldwide	As the BC platform ensures drug identification tracing verification and notification, trust and transparency among parties in the course of ownership changes of the supply chain, BC can be seen as an answer to the illegal drug problem. BC allows genomic data to be recorded that can combat counterfeit drugs and protect intellectual property rights.
Clark and Burstall (2018)	Counterfeit Drug	Worldwide	BC has great potential for revolutionising the pharmaceutical companies' own anti-counterfeiting and enforcement efforts. BC also offers greater potential to engage and educate customers about the risks of counterfeits and provide the ability to verify whether the products they have purchased are genuine.
Evans (2018)	Counterfeit Drug	USA	BC helps to ensure safety and identify potential safety risks for supply chains. It even builds consumer confidence. The use of BC will also allow pharmaceutical companies to avoid counterfeit drugs by giving consumers the right to alert the company in case they are purchased.
Jochumsen and Chaudhuri (2018)	Counterfeit Drug	USA	BC may also make tracking and tracing redundant by IoT devices, as it has the ability to track products throughout every party in the supply chain and the product life cycle.
Katuwal et al. (2018)	Counterfeit Drug	Worldwide	BC offers primitives such as data integrity and provenance that can be used to build solutions to prevent drug counterfeiting.
Soundarya, K, Pandey and Dhanalakshmi (2018)	Counterfeit Drug	Worldwide	BC technology is used, through the supply chain, to identify the ownership specifics of each product. Therefore, even if the RFID tags can be cloned, b the ownership of each product cannot. BC is immutable, transparent and secure which will help in avoiding many misconducts in the supply chain.

Plotnikov and Kuznetsova (2018)	Counterfeit Drug	Russia	BC can ensure information cannot be falsified. It can exclude the selling of substandard or counterfeit drugs by regulating all elements of the drug production, logistics and distribution chain.
Radanović and Likić (2018)	Counterfeit Drug	Worldwide	BC could be used for tracking pharmaceutical movement throughout the supply chain and also for its authentication. Produced items could be labelled with a unique code, and blockchain could be used to verify the code and product authenticity. This could be a big step in the ongoing fight against the easy availability of counterfeit drugs.
Scott et al. (2018)	Counterfeit Drug Contamination of medicines	USA	Providing pharmaceutical traceability via the supply chain is a suitable use case for implementing BC.
Bocek et al. (2017)	Temperature records operational costs	Europe	BC allows pharmaceutical supply chains to monitor temperature and humidity during medical product transport.
Mackey and Nayyar (2017)	Counterfeit Drug	Worldwide	BC stands out as a potential revolutionising technology platform to better ensure a modernised and 'digitised' drug supply chain that is more trustworthy, accountable, transparent, and protected from fake drug infiltrations.
Rabah (2017)	Counterfeit Drug	USA	Traceability of drug product offers where each transaction between drug manufacturers, wholesalers, pharmacists and patients can be tracked in order to verify and secure information important to address issues like counterfeit medicines.

Thirdly, blockchain provides constant data integrity. The clear drawback of this is that, as the number of transactions continues to grow, blockchain size will increase accordingly (Gao, Hatcher & Yu 2018). The consequence of this continuous growth is not only higher storage costs, but also the decrease in blockchain distribution speed over the network. In addition, scalability is a difficult issue and must be taken into account in the design of blockchain applications (Gao, Hatcher & Yu 2018).

Fourthly, not all countries are ready to participate in blockchain-based solutions due to the need for a high level of computerisation. Many supply chain partners in developing and least developed countries are often far from willing to embrace blockchain. Without their involvement, the full potential of blockchain in the supply chain is difficult to realise (Kshetri 2018). However, KSA has made great progress in implementing blockchain in different ministries such as SAMA, Customs, and Municipalities. These achievements demonstrate that the Kingdom is in the midst of implementing blockchain technology. The KSA implementation of blockchain technology is considered an important development because it supports its goals to become a digital country, and this transforming technology naturally integrates with the Saudi's vision 2030 (Saudi Press Agency 2018).

Modern applications of blockchain have to adapt to certain technical challenges and drawbacks that blockchain technology requires. For example, security, privacy, throughput, size and bandwidth, performance, usability, data integrity and scalability are just some of the attributes required to implement blockchain in high quality (Koteska, Karafiloski & Mishev 2017).

Theoretical foundation of the study

Transaction Cost Theory

Transaction cost theory (TCT) has been described as the cost of the resources used to define, establish, maintain, use and change institutions and organisations, and to describe the problems to be solved by these institutions and organisations (Marshall 2013). Furthermore, TCT focuses on transferring services or products between two parties, and transaction costs are any costs incurred during the transaction's implementation process (Prasad & Shivarajan 2015). Therefore, from a TCT point of view, addressing the concept of uncertainty could provide further insight into the value of information sharing among organisations (Yigitbasioglu 2010). The adoption of blockchain can reduce supply chain uncertainty because of the high information flow among key players, which can lead to low transaction costs, less opportunistic behaviour of supply chain members, high visibility in supply chain, and good governance, thus helping achieve supply chain sustainability.

Organisation Culture

Scholars define organisational culture in different ways. Jones and George (2014) suggested that organisational culture is the shared values, rules, behavioural norms, and expectations that affect the interaction and cooperation between individuals, organisations, and teams in the process of achieving organisational goals. Al Saifi (2015) indicated that organisational culture is a complex entity of values, beliefs, behaviour norms, meanings and practices shared by personnel within an establishment.

Moreover, organizational culture seems to be a crucial factor for the success of every organisation (Attar & Kang 2018). According to Tuan and Venkatesh (2010), organisational culture affects the extent to which innovative solutions are encouraged, supported and implemented. In a supply chain scenario involving multiple participants, where each participant still has autonomy and its own organisational identity, however, it seems that as long as cultures are compatible, the culture of each organisation in the supply chain could differ with successful outcomes (Cadden, Marshall & Cao 2013).

Blockchain and sustainable supply chain

Supply chain management (SCM) plays a variety of vital roles in different sectors or industries (Elango 2018). Thus, the benefits of integrating SC with blockchain are: increased sustainability; decreased errors and delays, reduced transportation costs, faster issue identification, increased consumer and partner trust, and improved product transportation process and inventory management (Tijan et al. 2019).

Blockchain technology as distributed, immutable, transparent, and trustworthy databases shared by a community can also affect sustainable supply chain networks (Saberi et al. 2019). BC can be a useful tool in tackling certain sustainable development issues (Lund et al. 2019). Therefore, by removing third party intermediaries, BC could minimise transaction costs as the trust becomes more process-based than characteristic or institutional-based (Avital et al. 2016; Schmidt & Wagner 2019).

Although sustainability has gained increasing interest in SCM research, there is limited research in management information system to explore the contribution of IT resources to help firms develop sustainability capabilities (De Medeiros, Ribeiro & Cortimiglia 2014). In future research, sustainability dimensions can be used to study blockchain-enabled SC effectiveness (Saberi et al. 2019). These arguments result in this study's propositions, which serve as the foundation to investigate the impact of blockchain implementation on pharmaceutical supply chain sustainability in the context of KSA.

In addition, triple bottom line (TBL) sustainability has three major areas which focus primarily on interplay and overlap of the social, environmental and the economic factor (Brandenburg et al. 2014). Thus, these dimensions have been described in the following sections.

Economic Dimension

The economic dimension refers to raising living standard and economic well-being (Abdullah et al. 2018). SC faces significant challenges in the economic area of sustainability including procurement contract, insurance claims, increased financial transaction costs, sustainability monitoring cost , and investment (Chandan, Potdar & Rosano 2019). Therefore, firms are likely to get benefit from BC technology adoption and its SC from a number of business aspects that influence its economic performance.

Environmental Dimension

The environmental dimension relates to the practices that do not influence future generations' environmental resources (Alhaddi 2015). Sustainability can be improved throughout the SC by sharing information that will help in resource planning and policy-making, which in turn can lead to a decrease in the consumption of natural resources (Kouhizadeh & Sarkis 2018). Therefore, BC technology has the ability to contribute to the environmental aspect of the supply chain sustainability.

Social Dimension

The social dimension refers to the empowerment of groups previously considered to be minorities, diversity and inclusion, as well as a society with a healthy lifestyle (de Carvalho 2018). The stabilisation and immutability of information is one way to build SC's social sustainability (Saberi et al. 2018). However, there are few studies discussing social issues (Brandenburg et al. 2014; Galal & Moneim 2016; Rajeev et al. 2017). Moreover, there is not clear evidence yet that shows the impact of the use of IT applications in social aspect of supply chain sustainability (de Camargo Fiorini & Jabbour 2017; Thöni & Tjoa 2017). Thus, researchers should attempt to explain how value is created, captured and distributed in a blockchain-enabled social supply chain (Wang, Han & Beynon-Davies 2019).

The Research Model

The proposed research model will establish a relation between blockchain adoption and sustainability (see Figure 1). From the wider literature review it seems relevant to consider sustainability for SCM because sustainability is necessary in the case of environmental, social, and economic disruptions. The model has been developed based on transaction cost theory, with literature from the triple bottom line approach of sustainability in the supply chain, organisational culture and blockchain. There is evidence that KSA's pharmaceutical supply chain is vulnerable to environmental, social, economic non-compliance; in such a situation the proposed research model (see Figure 1) has been developed for the sustainability of the pharmaceutical supply chain of KSA.

Fig. 1: conceptual framework

Expected contributions of the study

Theoretical contributions

The first theoretical contribution of this research is to explore the role of blockchain in contributing to sustainability efforts. By integrating variables from supply chain, blockchain and organisational culture, the study will provide a clear picture to better understand the influence of these factors on the sustainability of the supply chain. The second theoretical contribution of this research is discovering and diagnosing the barriers and challenges of blockchain implementation in the pharmaceutical supply chain in the context of KSA.

Practical implications

This study has important implications for managers, practitioners, consultants and decision makers who are interested in a deeper understanding of blockchain, its implementation, and its influence on SSCM. This research will provide some outcomes and recommendations that may assist them in making a more informed decision.

Conclusion

This paper presents a conceptual model to study the impact of blockchain implementation on pharmaceutical supply chain sustainability. We pointed out the issues in current pharmaceutical supply chain management and explained how blockchain can be used to solve these issues as well as how blockchain can address and promote supply chain sustainability. Although blockchain technology is certainly in its infancy, we are already seeing progress regarding its implementation in everyday life, mainly the financial one and the pharmaceutical especially. Nevertheless, this is an ongoing work, and we plan to make it more efficient and robust.

Table 2: present issues in the supply chain concerning sustainability dimensions and how blockchain can solve these issues.

Sustainability issues	Solution using blockchain
Economic issue	BC may result in SC disintermediation where fewer tiers result in transaction and time costs reduction, reducing the supply chain's business waste (Saberi et al. 2018). BC utilisation may lead to more secure payment possibilities through the use of cryptocurrencies and tokens (Kouhizadeh & Sarkis 2018). BC reduces time delays, miscommunications, and fraud, while eliminating third party oversight (Ally & Wark 2019).
Environmental issue	BC accurately helps to track substandard products and detect further products' transactions which may help to reduce rework and recall (Saberi et al. 2018). BC also has the ability to improve transparency and traceability in SC, which leads to improved environmental sustainability (Chandan, Potdar & Rosano 2019). BC could help in the monitoring and regulation of climate-altering gases by tracking emissions against targets and limits (Sulkowski 2018).
Social issue	BC technology makes it easier for supply chain key **players** to bring transparency, trust, security, reliability in SC which can potentially lead to social sustainability (Chandan, Potdar & Rosano 2019). BC helps customers to feel safe, comfortable in using the product because they can transparently trace the product flow (Parung 2019). BC helps governments to retrieve the working hours of workers from a blockchain network to judge whether companies are violating the overtime limits and whether living wages are paid to workers on time (Venkatesh et al. 2020).

Abstract

The specific nature of medium-sized business requires an understanding of its nature and criteria for distinguishing these entities from other companies. One of the problems of the slow development of small and medium-sized businesses in transitive economies is the lack of coherence between the business development programs implemented by local authorities and the real needs of business entities. This result was confirmed on the basis of a survey of small and medium-sized businesses (150 respondents) on the example of one of the local communities of Ukraine. It is proved that the low efficiency of entrepreneurship development programs is due to the methodological flaw that persists in the formation of strategies of community development at different levels. Building the analysis of existing problems and the choice of community development priorities on the methodological principles of environmental analysis, including SWOT analysis, further adjusting strategies using dynamic strategic analysis and balancing of the territorial community project portfolio are not carried out, as a result of which programmatic indicators of goals achievement are usually not achieved. This is based on the example of an analysis of five topical development strategies that have been developed using a common methodology, each of which supports entrepreneurship as one of the priority operational goals. In order to increase the efficiency of local business development with the support of the authorities, it is proposed to combine the methodology of strategic community development management and the methodological principles of project management. To this end, criteria and an algorithm for making decisions on adjusting the community development strategy and keeping it up to date are developed, which are based on the results of the environmental assessment. Approaches to strategic management of "weak signals" (I. Ansoff) to the specificity of strategic planning in territorial communities are adapted and developed.

Keywords: Project Management, Strategic Analysis, Territorial Community, SWOT-Analysis, Strategic Management.

Introduction

The stimulation of the development of small and medium-sized enterprises (SMEs) at the regional and local level is mainly through a program-based management mechanism, which underlies the whole model of state management. This approach is enshrined in the Constitution of Ukraine, and the essence of the program-target method and its application at different levels of the budget process is defined by the Budget Code. The implementation of state programs of economic and social development is foreseen on the basis of projections in the respective sphere of their use in planning projects at different levels of the state sphere of influence (VRU, 2012).

In the field of entrepreneurship development at different levels of government and local self-government, two-year or three-year programs are approved. However, the effectiveness of such programs is very low, since their implementation in most cases does not lead to systematic changes in entrepreneurial activity. According to the State Statistics Service of Ukraine, the volume of sales of small enterprises in Ukraine increased from 2010 to 2018 by only 20% (SSU, 2020) despite having an extensive network of state, regional and local small business development programs. Such growth does not meet the needs of the national economy, which by value of GDP per capita is the poorest country in Europe after Moldova. In some regions, in 2018, the volume of sales even decreased. In 2016, Ukraine and the EU concluded the Deep and Comprehensive Free Trade Area (DCFTA), but as the statistics show, it also did not become a stimulus for dynamic development of small business.

One of the main reasons for the slow development of small businesses is the lack of coherence between entrepreneurship development programs implemented by local authorities and the true needs of business entities. This can be confirmed by the results of a survey of SMEs(150 respondents) in Rivne, conducted with the participation of the authors within the project "Research of the quality of services of local authorities for SMEs" (2019). It has been found that entrepreneurs consider credit reduction (23% of all responses) as a priority area of financial support for business (Fig. 1).

Figure 1: Priority areas for SMEs financial support

Source: *own computations*

However, such an instrument did not become a key in the SMEs Development Program in Rivne for 2018-2019, which is why only 2 entrepreneurs received partial compensation for interest on bank loans in 2019, and in 2018 no such compensation was made. Such inconsistencies can be observed in the area of business infrastructure development and information support. Therefore, the projects and activities through which the overall goals of local business development are to be achieved do not have a significant impact on business development processes.

Another problem is that most business support programs are out of sync with regional and territorial development strategies, including their expected results. Programs at different levels are just a tool for achieving the strategic and operational goals of the strategies. In the absence of such a link, the value of both strategic planning, the results of which become declarative and of the program-management system, disappears. This system consumes resources aimed at obtaining products of projects and programs (outputs), the totality of which does not produce the proper outcomes of projects and programs (outcomes), without which it is impossible to change the state of the system (impact), which is why strategies and programs are develop.

The substantiation of methodological approaches to the integration of strategic and project management in the systems of regional and local governance is an important scientific and practical task to which this research is directed.

Literature Review

Conceptually, the integration of strategic and project management is simple enough. It is quite understandable and logical that the results of the projects must ensure the achievement of the goals of the programs, which should lead to the realization of the goals of the strategies that have been developed in order to move the system from one state to another. This approach is embedded in the results-based management approach, used by the United Nations.

This approach is based on the UN principles (UN, 2017):

- Establishment of strategic vision and goals, the achievement of which should be focused on all management activities and the management system;
- Causality and the results chain, hierarchically combining inputs, outputs, outcomes and impact (which is the ultimate goal of management);
- Systems operation and strategic management, according to which openness of systems and permanent influence of environmental factors on them requires constant monitoring of such factors and management of the system according to their influence.
- Performance measurement, when indicators are defined in terms of quantity, quality and time dimensions, or in a SMART (specific, measurable, achievable, relevant and time-bound), which provides the necessary information basis for making informed decisions.
- Monitoring and evaluation, providing (a) progress towards results, (b) the validity of the results chain and causal assumptions, and (c) the contribution of the organization towards long-term goals.

This approach formed the basis of the EU Recommendations for Project Cycle Management (European Commission, 2004), which is offered as a Handbook for EU projects preparation (Papadimitrov and Nikolovski, 2017).

The practical implementation of this approach requires the application of a wide range of methods and tools, different combinations of which create different strategic and project management mechanisms. They are evolving under the influence of a constant increase in the turbulence of the environment, with the emergence of new information technologies, whose volume is also hyper-dynamically increasing (Bilan et al., 2019). Therefore, static methods of strategic analysis (such as SWOT analysis, PESTLE analysis widespread in the practice of strategy development) lose their value and need to adapt to new conditions. In today's world, it is virtually impossible to make long-term predictions about the behavior and condition of complex socio-economic systems and build rigid strategic plans on the basis of information known at the time of forecasting. Therefore, the ideas of Ansoff, H. I. (1975) on "management on weak signals" are taking on a new meaning and becoming a paradigm of modern strategic management in various complexity and size of socio-economic systems (Ansoff et al., 2019; Holopainen and Toivonen, 2012; Raišienė et al., 2019;).

Since the environmental factors affecting the system are probabilistic in nature, and therefore the impact on the system in terms of both strength and content may change over time, it is necessary to track such changes. This requires, in addition to qualitative assessments, a more intensive use of

quantitative ones, which will allow to track the speed of change, the combination of different trends, and to respond in advance to any likely changes in the external environment. In this context, Gasparini and Bianco (2011) suggest a quantitative assessment of strengths and weaknesses in the SWOT analysis, which are noteworthy.

The methodology for addressing internal and external problems as well as internal and external strengths has been thoroughly described today, as in Brad and Brad (2015), Nazarko et al. (2017), Delafontaine et al. (2015). This approach is the basis for the development of projects of different levels – the development of the enterprises themselves (Abosede et al., 2016; Bilan et al., 2017; Mishchuk et al., 2016), the need to develop knowledge for project purposes (Januska, 2017 Krayneva et al., 2017; Sułkowski, 2019; Poór et al., 2018), as well as to identify and implement development priorities as an integral mechanism of entrepreneurship in public administration (Fyliuk et al., 2019; Mazouz et al., 2016; Shvets et al., 2013; Valickas et al., 2017).

Method and Data

The key in the processes of strategic and project management integration is understanding the cause-and-effect chain "Input-Output-Outcome-Impact", which shapes the hierarchy and logic of expected results. Well-known international institutions provide excellent interpretations of some of these terms (OECD, 2002;European Commission, 2004;UN, 2017).

Each type of result should be measured using indicators. By the term "indicator" we understand the "quantitative or qualitative factors or variables that provide a simple and reliable means to measure achievement, to reflect the changes connected to an intervention, or to help assess the performance of a development actor or intervention" (OECD, 2002, p.25;UN, 2017, p.48). The results indicators are also hierarchical and characterize the degree of achievement of the results at different levels. In the context of strategic and project management integration, it is advisable to follow the objectives and outcomes of the various levels and indicators:

1) *Impact indicators* characterize the achievement of strategic goals and describe changes in the properties of the system or part of it. Achieving their targets will signal the achievement of the vision outlined in the strategy. In the context of the SMEs development, such indicators can be the number of employees, their income level, export volumes, ease of doing business, etc.
2) *Outcomes indicators* show the degree of achievement of operational goals and targeted programs aimed at achieving them. They characterize the changes that have occurred in the target groups as a result of the intervention. Therefore, the methods of evaluating such indicators should take into account the ability to receive feedback from these target groups. Such indicators may include investment volume, availability of business support infrastructure, quality of services provided, etc.
3) *Outputs indicators* may correspond to Critical Success Factors (CSFs). They characterize the time and number of facilities created that the beneficiaries or target groups can use. In entrepreneurship development projects, such CSFs include the number of administrative services provided.
4) *Inputs indicators* correspond to individual Key Performance Indicators, (KPIs) programs or projects that achieve the expected outputs and outcomes. Such are not of value to the target groups, but are necessary to create the conditions for obtaining higher results. These indicators include the number of SMEs, the amount of financial support, the number of activities carried out, etc.

A properly designed system of indicators should correspond to the condition that the target value of the upper level indicator can be obtained only when all the target values of the lower level indicators are reached. The system of indicators will be flawed if at least one of the following conditions occurs between any levels of the hierarchy:

1) *The upper-level indicator value can be reached if the target value of one or more lower-level cause-and-effect indicators is not reached.* This means that one or the number of lower-level rating objects are unrelated or insufficiently related to higher-level scores. If such cases are identified at any stage of the strategy, program or project implementation, these indicators should be modified

or the possibility of change of the list of projects or individual activities carried out within them should be considered. Otherwise there are risks of inefficient use of resources for project activities.

2) *If the target values of all lower level indicators are reached, the target level of the higher level cannot be achieved.* This may indicate the imperfection (imbalance) of the project portfolio and its inconsistency with the strategic or operational goals and the ability to provide project activity resources. In this case, it is advisable to start the process of optimizing the project portfolio, and if the problem cannot be solved, it is worth initiating the process of revising the operational and strategic goals.

To build a flexible and integrated strategic management system that will cover both program and project management processes and respond quickly to environmental disturbances, it is advisable to carry out an axiom-based strategic analysis that no opportunity ($O_{(i,\,t)}$) or threat ($Th_{(i,\,t)}$)can exist on their own. It is the result of the action of one or a certain set of environmental factors (events, phenomena, processes) that may occur at different periods that precede the occurrence moment of opportunity or threat:

$$X_T \rightarrow \left\{ \begin{matrix} Th = \{Th_{(i,\,t)}\} \\ O = \{O_{(i,\,t)}\} \end{matrix}, when\ t > T \right\} \quad (1)$$

where i – the sequence number of the opportunity or threat, t – the period of time when the opportunity or threat may arise.

That is, a set of threats and opportunities for a particular system at each discrete time point will be unique in content or probability of occurrence. It follows that in a turbulent, high uncertainty environment, any strategy with a fixed list of operational goals, objectives and projects for the entire period of its implementation will not be viable. Instead, a set of time-shared and coordinated strategic alternatives that are updated as new threats or opportunities emerge will have greater dynamic resilience.

Strategic goals are achieved through a program-target management mechanism that requires the application of quality project portfolio management. We will use the term portfolio management in the context of The Standard for portfolio management (PMI, 2017).

To ensure the integration of strategic and program-target management, it is advisable to apply the methodology of value-based approach implemented in the Japanese standard for management of innovative projects (P2M, Program Management for Enterprise Innovation) (PMAJ, 2001).

The methodology for comparing actual results against identified strategic indicators of achievement of goals for finding opportunities to balance the SMEs portfolio of development projects has been tested by us as an example of the analysis of socio-economic development strategies of five regions of Ukraine, which were first developed in Ukraine using the EU strategic planning methodology.

Results

Based on the above methodological framework, a conceptual model of integration of strategic and program-target management in conditions of environmental turbulence at the regional and local level was developed (Fig. 2).

Figure2: Conceptual model of strategic and program-target management integration under the conditions of environmental turbulence

Source: own elaboration

Since open socio-economic systems are constantly influenced by environmental factors, strategic alternatives ($SA_{(i,t)}$) are periodically reassessed. In order to decide whether it is appropriate to move from one strategic alternative to another and to rebalance projects, a quantitative indicator should be used to characterize the integral state of the internal and external environment.

The practice of strategic analysis using the SWOT analysis method is widely used to quantify threats and opportunities based on the determination of their probabilities and the impact on the system (European Commission, 2004). However, such assessments are generally made only during the strategy development period and are no longer reviewed despite changes in the environment.

For example, the Sumy Region development strategy up to Year 2020 is the only one among the studied regions where quantitative assessment of the priority of threats and opportunities was carried out during the SWOT-analysis. However, after the change in the environment, such an assessment was not carried out again, and the identified strategic alternatives did not meet the real conditions of activity. For example, the weakness of "Excessive export orientation of enterprises in the region to the Russian Federation", which had a high level of importance in 2014, lost its influence in 2017, which is why a reassessment of strategic alternatives should have been made in the formation of the

project portfolio for 2018–2020. Instead, the emergence of new opportunities is not considered in the strategy. Particularly, the state program of the Entrepreneurship Development Fund will significantly influence and create great opportunities for the development of small business for year 2020. The application of the proposed method of dynamic strategic analysis would make it possible to see such "weak signals" and to envisage appropriate measures to ensure the active participation of the entrepreneurs of the region in this program.

Considering that each threat or opportunity depends on one or a certain set of events related in time and content, quantitative assessment of the aggregate level of threats (opportunities) can be determined by the formulas:

1) The probability of occurrence of a certain opportunity ($p^{O}_{i(T)}$) and threat ($p^{Th}_{j(T)}$)within the period *T* will be determined by the product of the probability of occurrence of all interrelated events, processes or phenomena (p^{x}_{it}andp^{x}_{jt}respectively):

$$p^{O}_{i(T)} = \prod_{t=0}^{T} p^{x}_{it} \ , \qquad (2)$$

$$p^{Th}_{j(T)} = \prod_{t=0}^{T} p^{x}_{jt} \qquad (3)$$

2) The quantitative assessment of the state of the external environment of the system ($ThO_{(t)}$) can be carried out with the following dependencies:

$$O_{(t)} = \sum_{i=1}^{n} \vartheta^{o}_{i(t)} \cdot p^{o}_{i(t)}, \quad (4)$$

$$Th_{(t)} = \sum_{j=1}^{m} \vartheta^{Th}_{j(t)} \cdot p^{Th}_{j(t)}, \ (5)$$

$$ThO_{(t)} = O_{(t)} - T_{(t)}, (6)$$

where$p^{o}_{i(t)}, p^{T}_{j(t)}$are the probabilities of occurrence of *i-th* opportunity and *j-th* threat in the period *t*; $\vartheta^{o}_{i(t)}, \vartheta^{T}_{j(t)}$ are the forces of influence of the *i-th* possibility and the *j-th* threat in case of their manifestation on the state of the system in period *t*.

3) The state of the internal environment of the system in period *t*($SW_{(t)}$) can be calculated by the following dependencies:

$$S_{(t)} = \sum_{i=1}^{n} \vartheta^{s}_{i(t)} \cdot p^{s}_{i(t)}, \quad (7)$$

$$W_{(t)} = \sum_{j=1}^{m} \vartheta^{w}_{j(t)} \cdot p^{w}_{j(t)}, \ (8)$$

$$SW_{(t)} = S_{(t)} - W_{(t)}, (9)$$

where$p^{s}_{i(t)}, p^{w}_{j(t)}$ arethe probabilities of maintaining the *i-th* strengths and *j-th* weaknesses of the system in period *t*; $\vartheta^{s}_{i(t)}, \vartheta^{w}_{j(t)}$ is the magnitude of the influence of the *i-th* strengths and *j-th* weaknesses on the system; $S_{(t)}$, $W_{(t)}$isrespectively quantitative assessment of the strengths and weaknesses of the system within period *t*.

4) The feasibility of moving from one strategic alternative to another can be determined by analyzing the intensity of the dynamics of the environment by using indicators of changes in the levels of the dynamics for each factor, in particular by the chain rate of change, which can be determined by the formulas:

$$T_t^{SW} = \frac{SW_{(t+1)}}{SW_{(t)}} \cdot 100\%, \quad (10)$$

$$T_t^{ThO} = \frac{ThO_{(t+1)}}{ThO_{(t)}} \cdot 100\%, \quad (11)$$

where T_t^{SW}, T_t^{ThO} – the rate of change of state according to the internal and external environment.

Based on the rate of change of the internal and external environment, it is possible to calculate the predicted rate of their change during the analyzed period, which will give a general characteristic of the dynamics of the environment and can be used as one of the criteria for determining the strategic behaviour of the system:

$$\overline{T}_{SW} = \sqrt[n-1]{T_1^{SW} \cdot T_2^{SW} \cdot T_3^{SW} \cdot \ldots \cdot T_{n-1}^{SW}}, \quad (12)$$

$$\overline{T}_{ThO} = \sqrt[n-1]{T_1^{ThO} \cdot T_2^{ThO} \cdot T_3^{ThO} \cdot \ldots \cdot T_{n-1}^{ThO}}, \quad (13)$$

Where n – number of periods analyzed.

The degree of strategic uncertainty and risk of open poorly structured organic systems, to which communities belong, can be estimated as a business development environment by analyzing entropy, a characteristic of disorder (chaos).

The entropy of the project at the conceptual stage of the life cycle $E_{SWOT(t+1)}$)can be estimated by such dependencies:

$$E_{SW(t+1)} = \frac{S_{(t+1)} - W_{(t+1)}}{S_{(t)} - W_{(t)}}, \quad (14)$$

$$E_{ThO(t+1)} = \frac{O_{(t+1)} - Th_{(t+1)}}{O_{(t)} - Th_{(t)}}, \quad (15)$$

$$E_{SWOT(t+1)} = \frac{E_{SW(t+1)} + E_{ThO(t+1)}}{2}. \quad (16)$$

Not only the absolute level of entropy of the project is subject to evaluation (not all forms of entropy are evaluated), but only its one aspect is related to the dynamics of factors of the project environment and the uncertainty of system behavior(the first form of entropy),accordingly. The influence of the amount of information and other factors on the degree of entropy is not investigated in the study.

For value$E_{SWOT(t+1)}$>1,the entropy of the system is expected to increase over the period [t: t + 1], which will require adjusting the components of the strategy or plan of its implementation. If the entropy of the project is in the range $0 < E_{SWOT(t+1)} \leq 1$and goes to 0, the strategy implementation environment is sufficiently concentrated and understandable and with positive metric values$SW_{(t+1)}$and $OT_{(t+1)}$, it can be expected that the strategy will be implemented as planned. In accordance with the above models, a mechanism for balancing the project portfolio was constructed (see Figure 3).

The recommendations developed in this study can be applied to assess the quality and level of integration of five regional development strategies that have been developed on a methodological basis and have the same planning horizon (Year 2020). In particular, within the framework of the EU project "Support for Regional Development Policy in Ukraine" in 2014, strategies were developed in Ivano-Frankivsk, Kyiv, Poltava, Rivne and Sumy regions (relevant data are available on the official sites of regional state administrations of each region). Each of these strategies contained a strategic objective aimed at developing the region's economy and a corresponding small and medium-sized business objective (Table 1).

Table1: Strategic and operational goals of regional development strategies in individual regions of Ukraine

Region	Cipher and name of operational target	Type of indicator	Number of indicators by hierarchy of results, items				Overall number of indicators
			Impact	Outcomes	Outputs	Inputs	
Kyiv	1.3. Creating conditions for the priority development of SMEs	Result	0	1	2	2	**5**
		Indicator	3	1	0	3	**7**
Poltava	2.2. Strengthening of SMEs	Result	1	1	4	1	**7**
		Indicator	2	0	3	2	**7**
Ivano-Frankivsk	1.2. Stimulating SMEs development	Result	1	1	3	0	**5**
		Indicator	0	1	3	2	**6**
Rivne	1.2. Stimulating SMEs development	Result	3	0	1	0	**4**
		Indicator	0	2	3	1	**6**
Sumy	1.2. Stimulating SMEs development	Result	1	2	4	0	**7**
		Indicator	2	0	4	1	**7**
Total, by regions		**Result**	**6**	**5**	**14**	**3**	**28**
		Indicator	**7**	**4**	**13**	**9**	**33**
Structure of indicators, in %		**Result**	**21,4%**	**17,9%**	**50,0%**	**10,7%**	**100,0%**
		Indicator	**21,2%**	**12,1%**	**39,4%**	**27,3%**	**100,0%**

***Source**: own computations according to regional development strategies for 2015-2020*

As it can be seen from Table 1, none of the areas has a balanced structure of the expected results and the corresponding indicators. Most expected results (67%) are low. In addition, 27.3% of indicators are at Input-level. And the strategies of Ivano-Frankivsk and Rivne regions have no Impact indicator.

Figure3: Mechanism of project portfolio balancing in a turbulent environment
Source: *own elaboration*

This structure of indicators leads to the fact that project portfolios will also be focused on achieving low level results. This, in turn, is the reason that, despite reporting of responsible persons on successful implementation of programs and projects, their results do not lead to systematic changes in the field of entrepreneurship.

The analysis of the project portfolios of the study areas showed that none of them applied the prioritization of projects and did not balance the portfolio in terms of both strategic and operational goals. Although the vision of each region is based on the expectation of economic development, the goals related to the development of SMEs are hardly funded (see Table 2).

Table2: State of financing of projects aimed at the development of SMEs

Region	Estimated cost of projects, thous. UAH										Total, for2015-2020 (plan)
	Realization plan for 2015-2017						Realization plan for 2018-2020				
	2015	2016	2017	Total		Plan implementation, %	2018	2019	2020	Total, (plan)	
				Plan	Fact						
Rivne	16,4	8,8	5,2	30,4	7,6	25%	15,1	18,2	21,2	**54,4**	**84,8**
Kyiv	1,5	1,0	0,2	2,7	0,0	0%	21,4	34,1	0,4	**55,9**	**58,6**
Ivano-Frankivsk	2,4	4,4	4,4	11,2	0,0	0%				**0,0**	**11,2**

Total	**26,1**	**21,8**	**15,3**	**63,2**	**9,5**	15%	**38,7**	**58,8**	**27,5**	**124,9**	**188,1**

Source: *own computations according to reports of regional state administrations departments*

For example, according to the Report on the state of implementation of the Ivano-Frankivsk region Development Strategy, by 2017, there had been no project related to the operational objective of SMEs development that would have been implemented, is being implemented or is about to be implemented. In addition, projects related to other objectives were funded during this period to the amount of 148.8 million UAH. Due to the lack of a system of priorities set in the strategy and in the project portfolio, the regional commissions annually determine the projects to be financed, the selection of which is often of a political character.

Conclusions

Summarizing the results of these studies, it can be argued that the problem of the slow development of small and medium-sized businesses in transitive economies is the lack of coherence between entrepreneurship development programs implemented by local authorities and the true needs of business entities. The poor effectiveness of such programs is due to the methodological flaw that persists in the formulation of community development strategies at various levels. Based on the analysis of existing problems and the choice of priorities of community development, the methodological principles of environmental analysis, the SWOT-analysis in particular, are not further adjusted to the strategies using dynamic strategic analysis and balancing of the territorial community project portfolio. As a result, programmatic goal achievement indicators are generally not achieved. In order to increase the efficiency of local business development with the support of the authorities, it is proposed to combine the methodology of strategic community development management and the methodological principles of project management. Their implementation in methodology of regional development strategic planning both with estimation of efficiency of such approach in strategic goals achievement belong to future research directions.

Abstract

The transformation from the traditional to sustainable business model causes the reorientation of the enterprise's management system. Nowadays the enterprises tend to take the first places in the rating lists not just from the economic or financial dimensions, but to increase the demand for own product in the frame of the green economy. On the one hand, the management system should consult all stakeholders' interests, while on the other, provide the minimization of risks including the environmental ones. Given the above, it becomes relevant to reorient the whole enterprise management system including risk management. Since the modern market environment has been changed, the risk management model which needs the transfer from isolated to integrated control has been changed. It should be noted that the management complex (ERM) is considered to be the system directed to maximize the positive effects and to minimize the negative ones regarding the unforeseen events. Moreover, using ERM provides opportunities for enterprise efficiency improvement. Generally, ERM is considered to be the combination of three following blocks: factors in ERM; ERM impact on enterprise efficiency; risk management mechanisms in certain organization conditions. Thus, this study is aimed to establish the relation between ERM implementation and enterprise efficiency. In view of this, the list of following factors which influence the enterprise efficiency has been formulated: environmental uncertainty, market competition, company size as well as company complexity. In turn, the above-mentioned factors formulate the external environmental impact on entrepreneurship and internal enterprise resistance to uncertain actions. In accordance with the obtained results, it has been established that the effect from one factor differs from another for each business entity. Furthermore, each group of factors included separate variables. For analysis, the investigated enterprises were divided into two following categories: the etalon enterprises which were highly efficient and the general enterprises. Thus, highly effective enterprises were used as a landmark to define the relation between ERM and as variables in emergencies. Based on the obtained results, the existence of the relationship between the results of enterprise performance and ERM implementation was established. However, the several following limitations, which demand the future investigation could be detected: chosen variables on the base of the interpretation method of existent literature as well as the short analysis period of environmental uncertainty factor. In view of this, the determined limitations are the prerequisite for future investigations.

Keywords: Enterprise Risk Management, Market Environment, Enterprise Efficiency, Variables, Environmental Uncertainty, Sustainability Of Enterprise.

Introduction

The great support for sustainable development programs and green focus by enterprises has become increasingly popular (Sokolenko et al. 2017; Vasylyeva et al. 2014; Vasylyeva et al. 2019a; Lyeonov et al. 2019; Stankevičienė et al. 2014). This trend affects not only the enterprises' activity but also consumers. Under the influence of the eco-education popularization, the increasing trend of eco-products consumption and healthy lifestyles, consumers are increasingly willing to pay more for products and goods that do not hurt the environment (Nielsen report, 2018; Bilan et al. 2018a; Kalinowski 2017; Rutkauskas et al. 2011; Jelinkova et al. 2015; Kendiukhov et al., 2017; Shuquan, 2018; Ryabchenko et al. 2017; Lyulov et al., 2019).

Some authors have identified a list of ways in which products can be made more environmentally friendly. Thus, according to A. Prakash (2002), products will be more environmentally friendly if they are produced in such a way that they can be repaired, restored, re-manufactured, reused, recycled, produced with minimal risks. One of the most effective ways to prevent negative consequences is to prevent them. Therefore, it becomes relevant to use a method of risk reduction in the production of products. For this purpose, a risk management system is used by enterprises since they form an objective and inevitable factor of any economic activity (Grytsenko et al. 2010; Ganushchak-Efimenko et al., 2018).

Risk management should be aimed at maximizing the positive and minimizing the negative effects of unforeseen events. However, changing the paradigm of risk management in today's market environment requires a transition from isolated to integrated management (Kozmenko et al., 2011, Djalilov et al. 2015, Vasilyeva et al. 2019b, GrenÄ Ã-kovÃ¡ et al. 2019). At the same time, an important prerequisite for enterprises should be to take into account the basic principles of organic production (Vysochyna et al., 2015, Mentel et al., 2018, Bilan et al. 2018b, Androniceanu et al. 2019), such as:

- focus on long-term goals;
- expansion of product range in the perspective direction;
- obtaining additional competitive advantages;
- access to a new highly profitable segment of developing consumers;
- compliance with standards and additional quality control;
- creating a positive image in the eyes of consumers, shareholders, investors and other stakeholders, etc.

Literature Review

Noted, that issues on environmental risks analysed by the scientists as the key instruments to increase the profitability of the company. In this case, most of the scientists defined the positive impact of environmental risks management on the company's profitability. Besides, the sustainable business model could not operate without such a system. The most of the scientists proved that environmental risks could be declined by implementing the green energy projects (Cebula et al., 2018; Chygryn et al., 2018; Yevdokimov et al., 2018; Chigrin et al., 2014; Lyulyov et al., 2015)

Enterprise Risk Management (ERM) has become a well-known and widespread concept in the world. This is a new concept that should be addressed by individual businesses and industries. A comprehensive approach to risk management is commonly referred to as enterprise risk management (Karpishchenko et al. 2014; Myroshnychenko et al. 2019; Kwilinski, 2018; Belas et al., 2015; Belas et al., 2018; Tommaso et al., 2019; Pechancová et al., 2019).

However, despite the growing need and interest in risk management, there is no generalized approach to ERM implementation. One of the major problems is the difficulty to develop a reliable measure for the ERM design.

Scientists identify three areas of ERM research. One block of studies examine factors that influence ERM (Beasley et al. 2005; Kleffner et al. 2003; Liebenberg and Hoyt 2003; COSO, 2004; Ong, et al., 2018). Other studies concern the impact of ERM on work efficiency (Beasley et al., 2008; Gordon et al. 2009; Andersen & Roggi, 2012; Abdullah et al. 2019). Another block of research examines risk management mechanisms in specific organizational settings (Mikes 2009; Paape & Spekle, 2012; Kuznetsov et al., 2019; Garayeta-Bajo et al., 2017).

The scientists in the paper (Beasley et al., 2005) focuses on factors related to the implementation of the ERM system to understand why some businesses respond to changing risk profiles using ERM while others do not. This study provides initial empirical evidence that demonstrates the organizational features related to the degree of ERM implementation at various US and international enterprises. As a result, it was found that the ERM implementation is positively influenced by the presence of a certain list of positions, such as risk manager, auditor, legal entities in various fields at the enterprise.

This study has been continued in (Beasley et al. 2008), where the reaction in the securities market when appointing individuals to oversee the risk management processes of an enterprise, was considered. It was found that the unambiguous reaction to the market was not significant. However, regression analysis showed that there was a relationship between the value of the securities market and certain specific features of the enterprise.

This article (Kleffner et al. 2003) observes the use of corporate risk management (ERM) by Canadian companies. The results of this study show that 31% of enterprises selected for analysis have adopted the ERM system. The main reasons for it included the risk manager's influence (61%), the encouragement of the board of directors (51%) and the observance of the rules of the Toronto Stock Exchange (37%). The article also notes that although about a third of enterprises have applied the ERM approach, the rest of the companies are also moving in this direction.

A study (Liebenberg and Hoyt 2003) indicates that ERM enables companies to take an integrated risk management approach that shifts the focus of the risk management function to an increasingly offensive and strategic one. The study found that businesses with greater financial leverage are more likely to appoint a risk manager. This finding supports the hypothesis that enterprises appoint risk managers to reduce incomplete information about the current and expected risk profile of the enterprise.

Mikes (2009) presents evidence of two large banking organizations that suggest that there are systematic differences in the practice of ERM management in the financial services industry. The following examples illustrate four types of risk management and show how they form the combination of risk management within an organization. The obtained results indicate the coexistence of alternative ERM models.
The study (Paape and Spekle 2012) describes the factors that influence the implementation of ERM - regulatory environment, internal factors, ownership structure, firm and industry features. The paper also notes that perceived risk management effectiveness is related to the frequency of risk assessment. The study (Gordon et al. 2009) confirmed the argument that the enterprises' activity result ratio using ERM depends on the relevant relationship between ERM and certain variables. In particular, it was found that for a group of high-performing enterprises, all variables have a significant effect on ERM effectiveness. The only variable that did not significantly affect ERM was environmental uncertainty. For non-high-efficiency enterprises, none of the emergency variables had a significant impact on ERM. Based on these calculations, it was concluded that highly efficient enterprises perceive emergency variables more seriously than other enterprises in their ERM implementation.

In spite of the authors' approaches diversity to ERM implementation, they all agree that ERM can improve enterprise efficiency (Mura et al., 2018; Brychko et al., 2018; Ryabenkov et al., 2013; Vasylyeva et al., 2015; Savčuk, 2007).

The main aim of the study is to define the dependence of ERM implementation on enterprises and their productivity. The study is based on the fact that ERM is considered as a correlation of external environmental factors for the enterprise, and the sustainability factors of the enterprise itself.

Methodology and Research Methods

To check the hypothesis, the article proposes to use the models (Gordon et al. 2009) given in equations (1) and (2).

The subjects of the analysis are the processing industry enterprises of Ukraine. There are two categories of enterprises: high-efficiency and medium-efficiency. The division into categories is based on the net income of the enterprises (Bondar et al., 2015; Bilan et al., 2019; Belás et al., 2015; Jarošová et al., 2019; Horská et al., 2019; Grigorieva et al., 2019; Shevchenko et al., 2016).

The coefficients in equation (1) are calculated in turn. First, for high-efficiency enterprises that serve as standard-sample-enterprises and have the highest efficiency in risk management, and then for medium-sized enterprises. Based on the reviewed literature (Gordon et al. 2009, Paape and Spekle 2012, Pakhnenko et al. 2018) and the specificity of the environmental risk, several factors that affect enterprise efficiency have been proposed:

1) environmental uncertainty;
2) the level of innovation;
3) competition in the industry;
4) firm size;
5) the complexity of the firm.

$$ERM = \beta_0 + \beta_1 EU + \beta_2 IN + \beta_3 CI + \beta_4 FS + \beta_5 FC + \varepsilon, \quad (1)$$

where ERM – efficiency of risk management in the enterprise; EU – environmental uncertainty; IN – the level of innovation; CI – competition in the industry i; FS– firm size; FC – the complexity of the firm; β_i – parameters of the model, i = 0 – 5, $\mathcal{E}$ – term of the error.
Model (2) considers the relationship between the activity results of the enterprise and the corresponding coincidence. Equation (2) is based on the analysis of residuals according to which the absolute residual values (ARES) of the model (1) affect the activity of the enterprise.

$$P = \beta_0 + \beta_1 ARES + \varepsilon, \quad (2)$$

where P – enterprise productivity; $ARES$ – the absolute value of model residues (1); β_i – parameters of the model, i = 0 – 1; ε – term of the error.

Table 1 demonstrates the main constituents of each represented factor and the principle of their calculation.

Table 1: an information base to form the data to analyze the factors influencing the enterprise ERM system

Factor	Constituents	Database
Environmental uncertainty (EU)	The efficiency of the country's environmental policy	Environmental Performance Index (EPI)
	The number of emergencies and dangerous events	The Ukrainian Civil Protection Research Institute (UkrCPRI)
Level of innovation (IN)	Introduction of innovation at the enterprises	State Statistics Service of Ukraine

Competition in the industry (CI)	Sales volume of an individual enterprise	Stock market infrastructure development agency of Ukraine(SMIDA)
	Sales volume of the industry	State Statistics Service of Ukraine
The complexity of the firm (FC)	Number members of Board of Directors	Stock market infrastructure development agency of Ukraine(SMIDA)
The size of the firm (FS)	Average total assets of an individual enterprise	Stock market infrastructure development agency of Ukraine(SMIDA)

Source: Compiled by the authors.

At the first step, the normalization was done as the parameters have different economic nature and measurements. For the eliminating such differentiation of the parameter, the approach to normalize of criteria (Glänzel et al., 2019):

$$f_j = \frac{f_j(X) - f_j^{min}}{f_j^{max} - f_j^{min}}, \quad (3)$$

where f_j- the normalized value of the j criteria according to the variant under study;
$f_j(X)$ - the current value of the j criteria according to the variant under study;
f_j^{min}; f_j^{max}- relevant min or max value of analysed parameter.

The main goal of any business entities is to be profitable which allow developing of the company. The value of the profit is the main indicator which characterized the company's capacity to stable development. The stakeholders use the profit as the key indicator for making decisions. Besides, the normalized parameters "net profit" allow comparison of the different type of companies.

Environmental uncertainty is calculated as the change or variability in the external environment of the enterprise. The danger is the probability that an event with specified parameters occurs over a period of time. The effects of the same danger will have different impacts on individual entities.

The environmental uncertainty in this study is planned to be measured in the combination of two indices:
- effectiveness of the country's environmental policy;
- the number of emergencies and dangerous events;
It is proposed to calculate the total index and individual indices by formulas (4) – (6).

$$EU = log(\sum_{k=1}^{2} CV(X_k)), \quad (4)$$

$$CV(X_k) = \frac{\sqrt{\sum_{t=1}^{5} \frac{(z_{k,t} - \bar{z}_k)^2}{5}}}{|\bar{z}_k|}, \quad (5)$$

$$z_{k,t} = (X_{k,t} - X_{k,t-1}), \quad (6)$$

where $CV(X_k)$ – uncertainty change coefficient, from 1 to 5 years; $X_{k,t}$ – uncertainty k in the year t; k – the uncertainty index related to the country's environmental policy effectiveness and to the number of emergencies and dangerous events; t – the period from 1 to 5 years; $\bar{z}_k$ – the average value of changes over 5 years of uncertainty.

An absolute value $\bar{z}_k$is used as a denominator$CV(X_k)$, to avoid the case when the negative $\bar{z}$ transforms the uncertainty situation into certainty ones.

The level of innovation is seen as the process of development, implementation, exploitation of production, economic and socio-organizational potential, which is the basis of innovation (Zakharkin et al. 2019; Olefirenko 2015). Innovation is, on the one hand, in contradictions with everything conservative, aimed at maintaining the existing state, and on the other - aimed at significant

improvement of the technical and economic efficiency of the organization (Masharsky et al., 2018; Peresadko et al. 2014).

In order to calculate this index, we use the natural logarithm of the number of new technological processes implemented in the country per year.

$$FS = ln\, T\, P_i, \quad (7)$$

where TP – number of new technological processes in the country in the year

Industry competition is based on the calculation of the Herfindahl-Hirschman Index (HHI). The index is a conventional concentration indicator in the market. It measures concentration in a particular industry and is calculated from the sum of the squared market shares of all enterprises in the industry (8). According to (Krishnan, 2005), HHI is considered to be the best index of competition intensity as it combines information on the number of enterprises in the market and their size distribution.

$$HHI = \sum \left(\frac{V_i}{V_j}\right)^2, \quad (8)$$

where HHI – Herfindahl-Hirschman Index; V_i – sales volume of the i-enterprise; V_j – sales volume of the industry.

Since less industry concentration is required to increase sectoral competition, sectoral competition is measured as a minus HHI (9).

$$CI = 1 - HHI, \quad (9)$$

The size of the enterprise is the dimension of its development scale. One of the main terms related to the development of the enterprise's property and financial position is the concept of assets. Given this, the study proposes to calculate the enterprise's size as a natural logarithm of the average total assets by the formula (10).

$$FS = ln\, A_i, \quad (10)$$

where A_i – the volume of assets of i-enterprise.

The assessment of the enterprise's complexity is based on the analysis of organizational structure and management segments. It means that the more management segments, the more difficult the enterprise is. In order to determine the complexity of the enterprise, it was proposed to calculate this index as a natural logarithm of the number of enterprise's shares issuers.

$$FC = ln\, I\, S_i, \quad (11)$$

where IS_i – number of shares issuers of the *i*-enterprise.

ERM is generally devoid of any quantitative specificity. (Gordon et al. 2009) transforms this indicator into an index (ERMI) based on COSO goals (COSO, 2004). The study will calculate ERMI based on achievement of strategy, operations and goals compliance (11).

$$ERMI = \sum_{i=1}^{n} Strategy_i + \sum_{s=1}^{n} Operation_i + \sum_{i=1}^{n} Compliance_i, \quad (12)$$

where $Strategy_i$ – strategy goals for i-company (13); $Operation_i$ – operations goals for i-company (14); $Compliance_i$ – goals for operating within the legislations of i-company (15); n – numbers of the companies.

$$Strategy_i = \frac{V_i}{\sum_{i=1}^{n} V_n}, \quad (13)$$

$$Operation_i = \frac{V_i}{A_i}, \quad (14)$$

$$Compliance_i = \frac{I_i}{A_i}, \quad (15)$$

where I_i – net profit of i-company, where V_n – sales volume of the analysed companies.

Results

For analysis, the panel data was compiled from the 10 Ukrainian companies of the processing industry. The data was obtained from the open database Smida.gov.ua. All companies were divided related on the net profit into two groups in the 2017 year: high and medium net profit companies. The companies were chosen as follows:

PJSC "Arcelormittal Kryviy Rih", PJSC "Zaporizhzhya Metallurgical Company "Zaporizhstal ", PJSC" Motor Sich", PJSC" Zaporizhzhoks ", PJSC " Interpipe NTRP", PJSC" Zhytomyr Company "Fences, Built Works, PJSC PJSC "Kyiv Plant of Experimental Structures", PJSC "Ladyzhyn Repair and Mechanical Company", PJSC "Kharkiv Hardware Company". Thus, high net profit group involved the companies with net profit was higher 100 million UAH. Other companies were involved in a group with medium net profit companies.

Table 2 showed the findings of summary statistics for high and medium net profit companies. Comparison analysis of two groups companies proved the huge differences among indicators as follows: ERMI, FS, FC. Thus, the average level of ERMI for high net profit companies was less than for medium net profit companies – 0.26514. Such dynamic showed that the management of environmental risks become complicated with the increasing of the company's size. The average level of parameters FS and FC for high net profit companies were higher than such parameters and for the medium net profit companies corresponding 7.266 та 0.418.

Table 2: summary statistics of ten analysed companies, 2013-2017 years

High performing firms

	(0.0580)	(0.8525)	(0.0000)		
FC	-0.4465*	0.1504	-0.1056	0.3715*	1.0000
	(0.0012)	(0.2971)	(0.4655)	(0.0079)	

Source: authors' calculations based on the SMIDA data, estimated with Stata 14.0.

The findings in Table 3 proved the statistical significance at 1% for direct correlations between parameters FC and FS (Pearson correlation coefficient - 0,3715 with p-value < 0.01), an inverse correlation between indicators FC and ERMI (Pearson correlation coefficient = -0,4465 with p-value < 0.01), FS та CI (Pearson correlation coefficient = 0,5796 with p-value < 0.01). The findings on regression analysis of panel data of both groups of the analysed companies were presented in Table 4.

Table 4: regression analysis of the panel data of chosen companies

High performing firms				The other firms			
ERMI	Coef.	Std. Err.	z	ERMI	Coef.	Std. Err.	z
EU	-.023324	.0321232	-0.78	EU	-.1309702	.0886497	-1.44
IN	-.2490416	.19754	-1.26	IN	-.0205641	.1330803	-0.15
CI	-0.2866	365.2348	-0.46	CI	-0.2558	198.6757	-2.64
FS	-.0363354	.0410832	-0.88	FS	-.2309702	.0946497	-2.44
FC	-.3452366	.1667117	-2.07	FC	-.1655006	.0639743	-2.59
_cons	171.5348	365.4226	0.47	cons	529.4945	199.6689	2.65

Source: authors' calculations based on the SMIDA data, estimated with Stata 14.0.

Considering the results the statistically significant impact on ERMI had indicator FC for high net income group. Thus, the increasing by 1 point of FC lead to decreasing of ERMI by 0,34 points. At the same time, for the medium net profit group, the statistically significant impact at 1% on ERMI had indicators CI and FS. The increasing by 1 point of CI lead to decreasing of ERMI by 0.25 points, FS – by 0.16. Besides, the statistically significant impact at 5% level had the indicator FS. Thus, the increasing of FS by one grade lead to decreasing of ERMI by 0,23 points.

Conclusions

The paper deals with the linking between ERMI implementation in the companies and their productivity. ERM was considered as a correlation between external environmental factors and companies sustainability parameters. The study was based on (Gordon et al. 2009) and the proposed regression model for the determination of ERMI. The analysis was conducted for 10 Ukrainian processing industries. For the analysis of the companies, the parameters were chosen and modified considering the Ukrainian economy.

Thus, a study (Gordon et al. 2009) found that the average ERMI for high-performing enterprises was -0.067, compared to 0.061 for other businesses. Besides, the values of all other emergency variables of highly efficient companies on net profit were not statistically different from those of medium-performing ones.

For Ukrainian companies, a comparative analysis of the averages of the two companies groups showed significant differences in the ERMI, FS, FC indicators. Regression analysis of panel data for high-net income companies revealed only one FS indicator (0.038) for ERMI, competition for medium net profit companies (0.008), size of the company (0.015), and company complexity (0.010). Increasing each of these indicators would reduce ERMI while increasing the likelihood of risk for the companies.

However, the negative value of the coefficients for each indicator indicates that for these companies the inflow of these factors would be insignificant.

It should be noted that the results of the study identified several limitations that need further consideration and improvement – the variables selected based on the method of interpretation of existing literature, the study covers a short period of analysis, analyzed companies in only one industry.

Abstract

The process of planning transport processes is one of the most important tasks performed in transport companies. The aim of the publication is to improve the transport process by creating a generalized model of planning the transport of goods in Europe, together with the decision-making model for the problem under investigation. In the field of research methods, observation methods of transport service providers were used. As a result of the analysis, a generalized model of the transport planning process has been created, on which an example of transport planning is presented and the optimal solution for selecting a transport option is presented. From the developed model of the decision-making process it can be concluded that if transport is by road and sea route with hired means of transport can be eliminated. The optimal result of the decision analysis can be if the transport is carried out using an external forwarding company, the choice of the transport process and the determination of the type of transport remains unknown. Thanks to the applications contained in the article, both transport companies and manufacturing companies can simply and transparently make a decision on the choice of international freight transport services

Keywords: Decision-Making Model of Transport Process, International Transport, Forwarding, Planning Process

Introduction

Transport process planning is one of the most important tasks carried out in transport companies. Proper organization and planning guarantees that the company can achieve its goals, such as: profit or further development. Proper planning of transport processes is to serve primarily to minimize the mistakes made. This will result in lower costs incurred by forwarding companies and increased customer satisfaction.

When planning transport processes it is important to remember that all accepted orders should be fulfilled. At the same time, an important issue during the realization of transport processes is to minimize the costs arising during the process. Enterprises are looking for experts who deal with rational transport planning. The point is to combine at the same time the expectations of customers, which are:

speed, price competitiveness, safety of transported goods, with the goals of transport companies, which strive to maximize profits (Ding, 2020).

When organizing transport processes, important factors to take into account are (Masłowski, Kulińska, Kulińska, 2019: 309–319):

- proper selection of a vehicle and a driver for a given transport task,
- determining the best route for the carriage of goods or passengers from point A to point B.

Such problems can be easily eliminated if you have the appropriate technical facilities, in the form of one or two vehicles, with multiple orders during the week. The situation becomes more complicated if the company has just entered the market and does not have a large technical background. Then good route planning is a priority, but it becomes complicated and time consuming.

The aim of this publication is to improve the transport process by creating a generalized model for planning the transport of goods in Europe, together with a pre-determined decision-making model for the problem under investigation. An example of the process of planning the transport of dangerous goods from Opole to Stockholm is presented. To verify the objective, theoretical research tools were used, such as analysis, synthesis, generalisation and comparison. In terms of practical methods, observation methods of companies providing transport services were used. Realization of each transport process of hazardous material implies a certain risk of an unwanted(accident) event, caused by scattering (effusion, shedding, etc.) of burden, with the consequences related to the nature of the hazardous material that is being transported. By mentioning all of these risks, the transport safety is a very important and responsible task. In the case of an accident, the consequences can be very large and can cause damage to people and their environment, namely, death, diseases of human beings, plant and animals, pollution of environment, destruction of natural and national resources, damage of industrial buildings, traffic communications and their respective facilities. Potential danger, on one hand, and the need for transport of hazardous materials, on the other hand, both lead to the necessity of setting specific requirements related to risk reduction and attempts to increase the safety in the transport of hazardous materials. With the growth of ecological consciousness, there is also a growing demand for reduction of transport risks, but also in handling, in general, hazardous materials. Because of these reasons, numerous countries, institutions and organizations have different regulations and other regulatory measures in order to manage the safety of these transport processes (Noureddine, Ristic, 2019: 66-85).

The Essence of The Transport Process

Almost all aspects of early preparation are taken into account when planning a transport. The most important factors influencing the organisation of the transport process are: drivers' working time, costs of transport charges, loading and unloading dates, determination of the maximum time for transporting cargo.

The transport planning process is related to forwarding, which organizes the cargo movement for profit as a substitute for the principal and performs related activities, except for the physical transport itself (Marzec, 1996: 23). The article presents the basic forwarding activity, i.e. planning and organization of physical transport process.

The Transport Process

Transport is an activity consisting in the provision of services against payment. It involves the movement of people and/or cargo from the starting point to the ending point and the enrichment of activities with auxiliary services closely related to transport (Rydzkowski, Wojewódzka-Król, 2007: 1). However, each industry has its own specificity. In transport, factors such as punctuality, quality, reliability, reliability, confidentiality and brand are of paramount importance. Gaining the trust of a new customer is often a difficult and time-consuming process (Wojtynek, i in., 2016: 357-372). The transport process, on the other hand, according to the Polish standard no. 72, is a series of interrelated transport operations, performed in a fixed order on a given route and at a given time (PN – 72/ M –

78000). Therefore, it is necessary to consider which operations during the planning of the transport process are most important for the effective transport of goods or services. The following activities can be distinguished in the transport process: organizational, executive, and commercial. Activities in the transport process are responsible for various aspects of transport organisation. Examples of organizational activities can be planning routes or preparing proper transport documentation. The executive activities may include activities directly related to physical transport. They are key elements of the transport process. The process also lists the commercial activities that regulate the charges for transport services (Stajniak, i in. 2007: 10). In practice, the transport process includes the following phases (Kulińska, Masłowski, Wojtynek, 2018: 40-60):

- preparation of the transport concept,
- preparing the cargo for transport,
- the organization of the transport process,
- physical movement of the cargo,
- handling commercial activities,
- analysis and evaluation of the completed process (costs, time, quality, complaints).

They condition the transport process and its efficiency. The article presents in detail the first phase, i.e. preparation of the transport concept.

International Transport

International road transport in general, as well as in accordance with Article 4, point (a), (b), (c) and (d). 2 of the Road Transport Act of 6 September 2001 is understood as transporting cargo beyond the borders of one country (Dz.U. 2001 Nr 125 poz. 1371).

In transnational corporations, building an international supply chain is important to achieving the organization's goals. One of the main reasons for building international supply chains is for companies to reduce costs. It concerns both the costs of transport, servicing of logistics centers and transaction costs (Izdebski, Jacyna-Gołda, Jakowlewa, 2019). In addition, they allow you to reduce the time of transport and storage of materials, goods and semi-finished products and reduce inventory. The transport of dangerous goods concerns many economic sectors, as materials and objects meeting these criteria are present in almost every industry. Dangerous goods are not only used as raw materials in the production process, but are also used in other areas, e.g. to assist in conducting analytical tests or as means of keeping machines and equipment in the production line clean (van Heeswijk, Mes, Schutten, 2019: 469-491). Dangerous goods must be transported in accordance with the requirements set out in the relevant regulations before they can be placed in the company. Meeting the guidelines in this area guarantees safe transport, which ensures protection of human health and life, protection of the environment and property by eliminating the risk of accident, incident or emergency. Transport of dangerous goods is carried out by road, rail, air, inland waterway and sea (Noureddine, Ristic, 2019: 66-85).

A prerequisite for the admission of dangerous goods for transport is to comply with ADR regulations, laws, procedures, preparations and the provision of appropriate technical resources. In the transport system, an object or substance having the characteristics of a dangerous good must be identified, classified and named with a unique and standard name, used in ADR regulations. Dangerous goods are classified by comparing their physicochemical and biological properties with the classification criteria specified in the ADR agreement. In case when a good may pose more than one hazard, allocation to a given class is made on the basis of the "dominant hazard" criterion. (Akhmedov, i in., 2019: 133-141) When planning the route for a vehicle on which hazardous materials will be placed, particular attention should be paid to roads with the best possible surface and low traffic. Due to the potential threat to the environment as well as human health and life, roads running near active leisure centers as well as sports or built-up areas of the city should be excluded (van Heeswijk, Mes, Schutten, 2019: 469-491). In the management of international transport, it is important to follow the regulations in force in the given country. However, an important factor in their implementation is the appropriate integration of

many aspects such as: time, cost, transport capability (Romanova, i in., 2019: 537-541). Therefore, regardless of whether it is the transport of dangerous goods or other types of goods, the transport process should take place on the main decision-making principles, constituting problems in the provision of services.

Generalised Transport Process Model

In practice, the transport process creates serious obstacles for planners in companies due to its complexity and the lack of structured activities. Figure 1 shows a generalized model of the transport process presented as a block diagram.

Fig. 1: Generalised transport process model [own study]

Thanks to its construction, the transport planners in companies can easily read out the activities that follow in order to complete a transport order. Unfortunately, the whole transport process is much more complicated and intricate, so it cannot be fully systematized and modelled. The proposed model does not take into account, for example, such issues as document flow, time of execution of individual tasks, or some important assumptions when planning transport by other means of transport than road transport.

Decision Boards

Decision boards are used to document and analyze the system, which are complementary to the classic schemes of modification and solution search. The basis for the construction of decision boards is the condition: "If ..., then ...", which is why they allow the construction of automatic information processing diagrams. Decisionboards consist of a set of rules that are designed to describe what set of conditions must be met in order for the proper scope of activities to be undertaken (Partyka, 2001: 31, Paszek, Partyka, 2014: 209-215). Table 1 presents a standard decision-making table.

Table 1: Example of a decision table [own study based on Partyka, 2001: 31]

Name of the table		Rules of decision R_1, R_2, R_3, … R_n
Set of conditions	W_1 W_2 W_3 … W_n	Set of conditionality indicators
Set of activities	C_1 C_2 C_3 ... C_n	Set of activity indicators

The set of conditions defines the expressions "If...", which define the variables that have the greatest impact on the decision-making system. The set of actions describes the expressions "to...", which contain all possible actions. The set of condition indicators is based on the symbols T (Yes), N (No) and "-". (nothing) that specify whether or not a given condition is met or whether or not it influences decisions. A set of activity indicators is described in the same way as a set of condition indicators.

Sample Cargo Transport Plan

This chapter presents a sample plan for the transport of 220 m^3 of dangerous goods (ADR) from Opole to Stockholm. The transport process has been created on the basis of the generalized model proposed in the article.

The provisions of the Act on the Transport of Dangerous Goods of 19 August 2011 and the restructured European Agreement on ADR impose an obligation on an entrepreneur who performs road transport of dangerous goods or loading or unloading related to such transport to appoint, at his own expense, a safety advisor for the transport of dangerous goods (www.doradca-adr.pl/…).

After analysing the possibilities, the following types of transport were identified:

- road-sea transport with hired means of transport
- road-maritime-rail transport

Road-sea transport with hired means of transport

The route was planned in 3 different variants:
- Option 1 contains 3 transport stages: the total length of the route: 1507 km
  - Stage 1: Opole (PL) - Rostock (DE) - 657 km - land road
  - Stage 2: Rostock (DE) - Gedser (DK) - 49 km - seaway
  - Stage 3: Gedser (DK) - Stockholm (SE) - 801 km - overland road
- Option 2 contains 3 transport stages: total length of the route: 1129 km
  - Stage 1: Opole (PL) - Gdansk (PL) - 542 km - land road
  - Stage 2: Gdansk (PL) - Nynäshamn (SE) - 529 km - seaway
  - Stage 3: Nynäshamn (SE)- Stockholm (SE) - 58 km - land road
- Option 3 contains 3 transport stages: total length of the route: 1819 km
  - Stage 1: Opole (PL) - Frederikshavn (DK) - 1252 km - land road
  - Stage 2: Frederikshavn (DK) - Gothenburg (SE) - 90 km - seaway
  - Stage 3: Gothenburg (SE) - Stockholm (SE) - 477 km - land road

Fixed costs for road and sea transport:
- fuel (ON) as of 9.12.2019 (www.e-petrol.pl/notowania): Poland - 4.96 PLN/l, Germany - 5,46 PLN/l, Denmark - 6.31 PLN/l, Sweden - 6.17 PLN/l. The average of 5.73 PLN/l was used for calculations,
- the driver's salary (www.pracuj.pl/praca/..., www.postawnaswoim.pl/kariera/…): 341 PLN for a driver in individual transport and 295 PLN/day for one driver in two-person transport,
- renting a means of transport (www.automilan.pl/…): tractor - 6000 PLN net/month (burning 25 l/100km empty, with load +0.3 l), tank - 7000 PLN net/month (gross capacity 38200 36200 net), for loading 220 m^3 6 road sets are needed, where the cost of driving with an empty tank is 127.5 PLN/100 km, while the cost of driving with a loaded tank is 180 PLN/100 km,
- ferry crossing (www.aferry.pl… , www.freightlink.pl…): Rostock-Gedser, Gedser-Rostock: 3475.6 PLN, Gdańsk-Nynäshamn: 1 driver - EUR 928.75, 2 drivers: 1046,35 EUR, Nynäshamn - Gdansk: 1 driver: 661,48 EUR, 2 drivers: 1 driver: 661,48 EUR: 779,09 EUR, Frederikshavn - Gothenburg: 1 driver: 1914,6 PLN, 2 drivers: 2115.8 PLN,
- road tolls (www.viatoll.pl…): Opole - Olszyna: 60.75 PLN, Opole - Gdańsk: 70.99 PLN,
- cleaning of the tank (www.b10.com.pl/wash-price.html…): 1 set - 440 PLN, 6 sets - 2640 PLN.

Calculation of the cost of the road driven:
- variant 1: Opole - Stockholm: stage 1: 657 km - cost 1182.6 zł, stage 2: ferry trip, stage 3: 801 km - cost 1441.8 zł, Stockholm - Opole: stage 1: 801 km - cost 1021.28 zł, stage 2: ferry trip, stage 3: 657 km - cost 837.68 zł,
- variant 2: Opole - Stockholm: stage 1: 542 km - cost PLN 975.6, stage 2: ferry trip, stage 3: 58 km - cost PLN 104.4, Stockholm - Opole: stage 1: 58 km - cost PLN 73.95, stage 2: ferry trip, stage 3: 542 km - cost PLN 681.29,
- variant 3: Opole - Stockholm: stage 1: 1252 km - cost PLN 2253.6, stage 2 - ferry trip, stage 3 - 477 km - cost PLN 858.6, Stockholm - Opole: stage 1: 477 km - cost PLN 608.18, stage 2 - ferry trip, stage 3: 1252 km - cost PLN 1596.3.

Working time of drivers:
variant 1: for 1 driver: departure on Monday at 00:00, return on Thursday at 7:43. The transport time is: 3 d 7 h 43 min, for 2 drivers: departure on Monday at 04:00, return on Thursday at 15:43. The transportation time is as follows: 2 d 11 h 43 min,
variant 2: for 1 driver: departure at 09:00 on Monday, return at 7:32 on Thursday, for 2 drivers: departure at 10:00 on Monday, return at 10:32 on Wednesday,
variant 3: for 1 driver: departure at 08:00 on Monday, return at 15:45 on Friday, for 2 drivers: departure at 20:00 on Monday, return at 01:55 on Friday.

The cost analysis shows that the most advantageous option for own transport organisation is option 2, with 2 drivers employed. The cost of such transport is PLN 71353.12.

Road, Sea and Rail Transport

The route was planned on different sections: Opole - Gdańsk: 617 km (rail transport), Gdańsk - Gdańsk Port: 11 km (rail transport), Gdańsk Port - Nynäshamn: (sea transport), Nynäshamn - Stockholm: 58 km (road transport). Fixed costs as for road and sea transport with the following differences:

- container-tanker rental (www.tws-gmbh.de/wynajem-kontenerow-typu-cysterna…): 6000 PLN net/month (capacity 26000 gross 24700 net), for loading 220 m^3 9 transport sets are needed,
- ferry crossing for 1 driver (www.aferry.pl… , www.freightlink.pl…): Gdansk - Nynäshamn EUR 928,75, Nynäshamn - Gdansk EUR 661,49,
- railway journey at a rate of up to 620 km (www.pkpcargo.com/media/100869/…): 5858 PLN (including 30% of the fee for dangerous goods): additionally, there are correction coefficients: load capacity over 22 t and length of the container, costs lower than 6.15 m are 4979.3 PLN (coefficient 0.85 of the price), additionally the ADR fee should be paid: 6473.09 PLN (coefficient 1.3 of price). On the way back from Gdańsk the costs will amount to PLN 4979.3 (0.5 price coefficient),
- road tolls (www.viatoll.pl…): Opole - Olszyna - PLN 60.75, Opole - Gdańsk - PLN 70.99,
- HDS services (www.pkpcargo.com/media/100869/…): 100 PLN/h, loading/unloading the car (www.pkpcargo.com/media/100869/…): 200 PLN,
- loading of goods on the railway in Opole (www.pkpcargo.com/media/100869/…): 400 PLN,
- cleaning of the tank (www.b10.com.pl/wash-price.html…): 1 set - 440 PLN, 6 sets - 2640 PLN.

Calculation of the cost of the road driven:
- transport by rail: Opole - Gdańsk: 1 set - PLN 6473.09, 6 sets - PLN 58257.81, Gdańsk - Opole: 1 set - PLN 2929, 6 sets - PLN 26361,
- road transport: Gdańsk - Gdańsk Port, Nynäshamn - Stockholm (69 km): 1 set - PLN 552, 6 sets - PLN 4968,
- sea transport: 1 set - PLN 6885.74, 6 sets - PLN 61971.65.

Drivers' working hours for 1 driver: departure on Monday at 04:00, return on Thursday at 7:43. The transport time is: 2 d 19 h 43 min. The cost analysis shows that this type of transport is for one set PLN 19299.83, while for 6 sets the cost is PLN 173698.46.

Transportation Commissioned to An External Company

External companies calculate the following transport costs: the rate per kilometre (www.della.pl/price/international…) from Europe to Poland is 3.65 PLN/km, from Poland to Europe - 4.15 PLN/km, average rate: 3.9 PLN/km. The additional charge for dangerous goods is from 15 to 25%. In the case of some transport companies, the rate should be doubled (www.della.pl/price/international…). Calculated costs for the case under consideration:
- option 1: 1458 km - 1 driver: 1 set: 17562.48, 6 sets: 105374.9, 2 drivers: 1 set: 17562.48, 6 sets: 105374,9,
- option 2: 600 km - 1 driver: 1 set: 12941,74, 6 sets: 77650.44, 2 drivers: 1 set: 13960.16, 6 sets: 83760,93,
- option 3: 1729 km - 1 driver: 1 set: 20538.04, 6 sets: 123228.2, 2 drivers: 1 set: 20856.84, 6 sets: 125141.

Summarising the costs for external transport, it can be seen that the lowest rate would have to be paid for Option II if one driver was employed.

Use of decision boards in the transport process

Decision boards belong to algorithmic schemes of information circulation. From the presented block, economic and decision-making analysis it results which elements are priority and which can be presented in a queue sense (Partyka M., 2001, p. 30). The decision-making model describes the choice of the type of transport of hazardous materials on the route from Opole to Stockholm. Five decision-making rules have been proposed:

- **Regulation 1:**

If transport is by road and sea route with hired means of transport, the first option concerns Opole - Rostock - Gedser - Stockholm.

- **Regulation 2:**

If transport is by road and sea route with hired means of transport, the second option concerns Opole - Gdańsk - Nynäshamn - Stockholm.

- **Regulation 3:**

If transport is by road and sea route with hired means of transport, option three concerns Opole - Frederikshavn - Gothenburg - Stockholm.

- **Regulation 4:**

If transport is by road, sea and rail, then option four concerns Opole - Gdańsk - Gdańsk Port - Nynäshamn - Stockholm.

- **Regulation 5:**

If the transport is carried out using an external forwarding company, the choice of the transport process and the determination of the type of transport remains unknown.

Table 1: Decision-making model for transport process selection [own study]

Preparation of transport documentation	X	X	X	X	X
Carriage of goods	X	X	X	X	X

The presented structure of the decision board corresponds to the structure of the decision boards. The lines describe the conditions for the transport of dangerous goods and activities related to the transport process. The rules are described in columns R1÷R5. As a result of the analysis, it was obtained by associating logical values of meeting or not meeting the conditions of required actions for the realization of the transport process. It can be seen that the conditional and action parts of these rules are multi-elemental.

Fig. 1: Example of the endings of the deniers from the decision board [own study]

The presentation of the numerical taxonomy for the decision boards allows the introduction of stages with different levels of detail. The above issue corresponds to the emergence of the so-called partial needs, which are connected with the implementation of the solution to the problem under investigation. The hierarchical approach corresponds to the structure of the process of designing the transport of hazardous materials (Partyka M., 1998, p. 43). Various examples of possible endings of dendrite are

presented above. According to the decision analysis, rule 3 was eliminated, while rule 5 is the optimal result of the decision analysis.

Conclusions

The competition on the forwarding market is very high. Currently, transport companies are obliged to use a range of different methods in order to keep the customer and acquire new ones. The most important factors taken into account when choosing a forwarding company are: punctuality, costs, quality and reliability.

In order to meet customer requirements, forwarding companies must first of all operate quickly, efficiently and, of course, offer attractive prices. The most important determinant of a forwarder's actions is time. The first steps that determine whether the customer chooses a given transport company are the duration of the analysis of the forwarding order. This process must be shortened to a minimum.

The decision to choose a forwarding company usually falls on one of the first submitted offers. That is why it is so important to systematize the knowledge of freight forwarders about transport conditions in Europe. The presentation of a generalised transport model is aimed primarily at shortening the time of preparation of a forwarding offer and faster and more efficient execution of subsequent transport procedures.

Each forwarder analyses the given transport model, knows what steps need to be taken for the transport order to come into effect. The analysis of the transport process included in the article also allows to verify and select the most advantageous transport method. The information contained in this article is intended to help people planning international transport of goods to organise transport processes more efficiently.

The presentation of the numerical taxonomy for the decision boards allows the introduction of stages with different levels of detail. Various examples of possible endings of dendrite are presented in the paper. From the developed model of the decision-making process it can be concluded that rule 3 (If transport is by road and sea route with hired means of transport) can be eliminated. The optimal result of the decision analysis can be rule 5 (If the transport is carried out using an external forwarding company, the choice of the transport process and the determination of the type of transport remains unknown).

Thanks to the applications contained in the article, both transport companies and manufacturing companies can simply and transparently make a decision on the choice of international freight transport services. The competitiveness of companies in the field of forwarding services makes the choice between own and foreign transport simple enough to make the choice of the price factor directly affect the decision and not the organization of transport by means of own vehicle fleet.

Abstract

Loyal consumers seem to be a group with the greatest potential for innovative companies who want to create new product solutions based on customer expectation. As heavy users, they have an idea of any advantages and shortcomings of a brand offer and a part of them is likely to get involved in the innovation process. Taking into account that the profile of innovators (according to Rogers theory) is connected with looking for adventure and benefits and in that with lower level of loyalty potential, the question arises, how innovative potential affects typical loyalty effects like price sensitivity, recommendation inclination, stable future purchasing Demonstrating or not innovative potential for the brand has become the basis for the analysis of loyalty behavior of young consumers. The purpose of the article is to describe profile of loyal young adults who show the innovative potential in comparison to young consumers, who lack the innovative idea for a brand. The survey method was used on the sample of 459 students in Poland. It has been concluded that level of innovativeness has a slight impact on loyal consumer behaviour and that the loyal consumers should be considered as a source of innovation

Keywords: loyalty behaviours, user-driven innovation, innovative potential, young adults.

Introduction

Consumer loyalty is an issue that has gained the interest of both business practitioners and researchers in management science for a long time. Already in the 1960s, Theodore Levitt drew attention to the so-called "marketing myopia" and the fact that focusing on customers' needs and creating value for them in the long run is crucial for long-term success (Levitt, 1960). By providing consumers with arguments to repeat purchasing decisions, their loyalty can be buid up. However, it is worth being aware here that the relationships between the client and the brand are not analogous to interpersonal relations, and what is called loyalty in marketing, it is a phenomenon slightly different from friendship and faith. I is a consistent supportive behavior regardless of conditions what constitute the premise of loyalty in interpersonal relationships, and therefore a man loyal to a friend is prone to altruism and even sacrifice. When considering loyalty towards authorities, this phenomenon manifests itself in devotion, service, and acting in accordance with the will of the authorities. (SJP PWN, 2020). An important feature associated with loyalty is therefore the credibility of the attitude, which when translating into behavior, affects its predictability. (Dick and Basu, 1984). Translating loyalty into the relationship between the consumer and the brand, then a feeling of support or allegiance is no longer as strong, selfless and enduring (Dziewanowska, 2012), due to the transactional nature of the relationship, it is based on economic benefits (from the perspective of enterprises) as well as economic and psychological (from the perspective of consumers). A consumer, as a market entity, is interested in receiving products suited optimally to his or her needs (at an acceptable cost). His or her loyalty does not therefore result from a sense of responsibility, faith or even altruism. On the contrary, it can be assumed that the basis of brand loyalty is posed by consumer egoism associated with desire to ensure satisfaction of needs at a expected level in the long term

(which can give reasons for repetition of purchases) as well as with building social acceptance for their own decisions and simultaneously reducing dissonance buying behavior (premise for recommendations) (Wiśniewska, 2014).

It is in the interest of consumers to communicate their needs, ideas for satisfying them or even engaging in the process of creating new products. A loyal consumer seems to have adequate knowledge not only about the product category, but also about the brand that is the object of loyalty. Their support for the brand may therefore translate into the fact that they will be an attractive source of ideas for innovation for a given brand. On the other hand, openness to innovations may be associated with gathering experience with various brands and thus with reduced brand attachment. Therefore, it is worth considering how the innovative potential of loyal consumers affects the loyalty effects indicated in the literature such as repeatability of purchases, recommendations as well as price sensitivity. (Dick and Basu, 1984).

The purpose of the article is to conduct a comparative analysis of loyalty behavior of young consumers divided into two groups due to the different degree of innovation potential. The analysis will be carried out in three dimensions: recommendations, price sensitivity and the likelihood of future re-purchase.

This article focuses on the young adults group. These are consumers who are in the early stages of a customer's life cycle - in the phase of customers starting shopping repetition. It is the time when, while gaining direct experience with various products and based on collected information about the experiences of other users (indirect experience), cognitive and affective components of attitude are built that will ultimately affect the long-term propensity for certain decisions and purchasing behaviors and translate into real market behavior (learning process) (Zanna, Olson and Fazio, 1981; Dick and Basu, 1984). On this occasion, it is worth noting that one of the techniques that stimulate consumer loyalty (based on the principle of influence identified by Robert Cialdini - Commitment and Consistency (Cialdini, 2006)) is building experience by brand engagement, which can be implemented through the user-driven innovations concept.(Rajala, Westerlund and Möller, 2012; Zajkowska, 2017).

Related Literature

As previously mentioned, consumers are interested in receiving products that are optimally suited to their needs (at an acceptable cost). Their decision-making process is determined by consumer egoism, which arises from the concept of homo-oeconomicus (Schopenhauer, 1994) and should be treated as a natural feature of the consumer (Wiśniewska, 2014). By optimizing his or her decision-making process, the consumer strives to choose the best (in their perception) solution from many that are available (according to their knowledge), he or she also wants to feel the sense of independence of the decision (Kieżel, 2004). It is worth paying attention to the fact that consumer egoism, which provides the basis for the phenomenon of loyalty, is associated not only with the desire to meet the needs directly related to the product core (the basic function of the product), but also the needs associated with different levels of the Maslow Pyramid , including the need for respect, recognition, cognitive needs, aesthetics and transcendence (compare: (Maslow, 2006)). The desire to ensure continuous satisfaction of needs in the long run, while minimizing the risk of disappointment, translates into a phenomenon that can be described as loyalty (Wiśniewska, 2014). Definitions of loyalty generally ignore the issue of consumer egoism, however, emphasizing benevolent attitude towards brand and / or repeated shopping (Dick and Basu, 1984; Oliver, 1999; Solomon *et al.*, 2006; Karasiewicz, Trojanowski and Dziewanowska, 2008; Urban and Siemieniako, 2017), at the same time, do not exclude it directly. Therefore, it can be assumed that consumer loyalty is a type of consumer strategy aimed at ensuring continuous achievement of benefits by repeating proven (safe) decisions, which in practice is manifested in the form of repeated purchases and benevolent attitude.(Wiśniewska, 2014; Wiśniewska and Liczmańska-Kopcewicz, 2019).

The paper focuses on three basic dimensions of loyalty: price sensitivity, propensity to recommend and stability of purchases. These factors positively affect the predictability of demand and the company's stable market share in the long run.

Price sensitivity is associated with consumers response to a change in price. The literature indicates that loyal consumers are resistant to price changes, thanks to which it is possible to generate higher revenues by enterprises with regular customers (Dick and Basu, 1984; Donio', Massari and Passiante, 2006). Reduced price sensitivity occurs in a situation of monopoly or monopolistic competition. This means that the product / brand provides the consumer with a differentiated value for which there is no substitute (compare: (Dixit and Stiglitz, 1977).

Recommendations are a form of brand promotion that is cheap from the perspective of enterprises and reliable from the point of view of consumers. They constitute an argument for the attractiveness of the transaction for potential customers (social proof as a technique of influence indicated by Robert Cialdini (Cialdini, 2006). Many authors in the literature indicates that building brand awareness (recommending), as well as creating a positive brand image in the community (word-of-mouth) are typical behaviors of loyal consumers (Rudawska, 2005; van Doorn *et al.*, 2010).

Repetition of purchases is indicated by many authors as the basic effect of loyalty (Dick and Basu, 1984), which at the same time is insomuch expected benefit from the perspective of enterprises that it is often the parameter that defines the phenomenon of loyalty. Despite the quantification of this parameter (compared to qualitative nature of benevolent attitude towards a brand), a strong criticism of this approach is present in the literature (Uncles, Dowling and Hammond, 2003; Dziewanowska, 2012). Notwithstanding the different approach to defining consumer loyalty, predictability of consumer purchase can be considered as a positive result of this phenomenon and in that treated as one of the principal dimensions of it.

Due to rapid changes in the competitive environment, enterprises focus on high innovation and at the same time seek effective sources of innovation (Pypłacz and Liczmańska-Kopcewicz, 2018). In such conditions, users got in the sphere of interest of manufacturers (Marczewska, 2014; Plawgo and Klimczuk-Kochańska, 2015) as those whose needs are to be met on the one hand and those who have knowledge of the product on the other. Consumers test products in everyday use and are able to tell in what direction products should develop and what they lack, and then evaluate prototypes (Bagozzi and Dholakia, 2002; Lettl, 2007; Mahmud, Aryanto and Hasyim, 2017). It is worth noting that consumers are more loyal to brands with a high level of innovativeness and simultaneously they are also more indulgent to product innovations, which is also confirmed by research results (Henard and Dacin, 2010). At the same time loyal users are strongly motivated to support brands in the innovative process (Lettl, 2007). They are likely to participate actively in the community around the brand (engaging, seeking information), and advising the brand (suggesting ideas for offer development and product innovations) (van Doorn *et al.*, 2010).

Research assumptions – Method and A Theoretical Model

Taking into account the expectations of loyal consumer behavior described above, the authors of the article decided to ascertain how customers who meet two conditions behave:

- they are at the beginning of their loyalty relationship with the brand (the so-called young adults),
- they show a higher level of innovation potential (they have an idea for product innovation for brand).

The adopted research model is based on three dimensions related to consumer behavior: the level of price sensitivity, propensity to recommending and stability of purchases (Figure 1). Each of the dimensions is successively a variable explained by the level of innovation potential within the loyalty appearance.

Figure 1: Research model

Source: the authors' elaboration

Due to verifiability, the model assumes that consumer loyalty is a phenomenon determined by repeated purchases of the same brand as the only one or as one of the evoke set. It was assumed that for easily accessible products, repetition of purchases is associated with a positive attitude towards the brand. Consumer loyalty is a boundary condition for a study in which only consumers declaring repeated purchases of the same brand are taken into account.

The research model consists of three submodels, in which, in turn, the function of the explained variable is assumed by:

- price sensitivity, measured by the level of willingness to keep buying at the current level after a price increase
- recommendation potential - measured by the propensity to recommend the brand and simultaneously the fact of recommending the brand in the past
- stability of purchases - measured by the declaration of consistency in futer purchases and a negative reaction to competitors efforts

In the area of consumer loyalty, the explanatory variable is constitute by the level of innovation potential defined as brand engagement that translates into generating an idea for product innovation for the brand.

Based on the literature review, the main threads of which are presented in this article, the following research hypotheses were established.

H1: young adults with a higher level of innovation are more sensitive to small price increases.

H2: young adults with a higher level of innovation are more sensitive to significant increases.

H3: young adults with a higher level of innovation are more willing to recommend the brand.

H4: young adults with a higher level of innovation are characterized by a higher level of brand recommendation.

H5: young adults with a higher level of innovation are characterized by lower stability of purchases in the long run.

The distribution of answers to the question about an idea for product innovation for a brand against which the respondent declares to repeat purchases, is presented in Table 1

Table 1: Distribution of answers to the question about an idea for product innovation for a brand towards which the respondent declares to repeat purchases

	respondents' declarations	
group 1 – respondents with an innovaitive idea for the brand	129	28,10%
group 2 – respondents without any innovaitive idea for the brand	330	71,90%
total	459	100%

Source: the authors' elaboration based on the survey results, N=459.

The cosmetics market was adopted as a reference point. The data have been collected at three Polish Universities with a print questionnaires. The findings from pilot studies showed that diverse motivation and antecedents may be related to different product categories on this market (body care or make-up cosmetics). Therefore, only body care cosmetics were taking into account in the survey. All respondents indicated a medium or lower price brand in the research.

For the purposes of the study, it was assumed that young adults is a group of people aged 18-25 (Phau and Cheong, 2009; Pich, Armannsdottir and Spry, 2018), often without income, displaying his lifestyle through shopping decisions (O'Cass, 2000; Lim and O'Cass, 2001; Phau and Cheong, 2009), demanding, but at the same time willing to building relationships with the brand (Ndubisi and Nataraajan, 2018), inclined to risk and acceptance of innovation(Rogers, 1962).

The research sample consists of 349 female and 110 male respondents. The distribution of the age variable is presented in Table 2.

Table 2: The characteristics of the research sample

sex / age	female	male	total
20	21	3	24
21	100	26	126
22	87	34	121
23	55	16	71
24	58	20	78
25	28	11	39
total	**349**	**110**	**459**

Source: the authors' elaboration based on the survey results, N=459.

Most of the respondents did not admit the idea for the cosmetic brand, which buying is repeated, but the 28.1% group is large enough to consider engaging young loyal consumers in the innovation process at least as a source of innovation. In the further part of the study, while verifying the hypotheses, the differences between these two groups will also be determined. For the purposes of analyzes, it was assumed that a group of young adults with an innovative potential is identified by having an innovative idea for the brand and is marked as group 1 hereinafter, whereas the gruop without such a potential (without such an idea) is signed as group 2.

Research Findings and Discussion

To verify the first and second hypothesis regarding the price elasticity of demand of young loyal consumers with a small (H1) and a significant (H2) price increase, the respondents' answers are presented in Figures 2, respectively.

Figure 2: Distribution of answers to the questions: "I will buy this product of this brand even after a slight increase in price (by 5 -10%)" and "I will buy this product of this brand even after a significant increase in price (by 40 -50%)"

Source: the authors' elaboration based on the survey results, N=459.

74.29% of respondents claim that they would not give up buying products of the brand towards which they are loyal in the situation of a slight price increase (total answers: agree and rather agree). It should be noted, however, that in the survey no respondent indicated that the care cosmetics brand towards which they are loyal is from a higher price range. This may mean that a 5-10% price change is not a high nominal value, and this in turn may translate into the lack of significance of such a change among decision-making factors, especially in view of the strategic benefits that consumers attribute to using a brand they know. All in all, young loyal consumers are not sensitive to small price increases. However, the percentage of such consumers drops dramatically when they are faced with the decision to stay with the brand, whose price increases by 40-50%. Only 11.55% of respondents admitted that they would buy a product towards which they are loyal, even at a high price increase. The distribution of answers is not surprising. Young consumers are characterized by lower income or are still dependent on their families, therefore the real income effect and substitution effect will work here. Smaller resources at the consumer's disposal will change their purchasing decisions. At the same time, the above results lead to the hypothesis for research in the future that loyal consumers, regardless of age, accept small price increases, but significant increases in result in seeking other brands to meet the needs.

Analyzing the data in more detail, it can be seen that consumers with innovative potential are slightly more sensitive to price change, as shown in Table 3.

Table 3: Distribution of respondents' declarations regarding continuation of purchases with low and high price increases in groups of respondents with and without innovation potential

	Would you by the product if the price increased by…	
	…5-10%	**…40-50%**
	difference of relative values (gr2 - gr1) in percentage points	**difference of relative values (gr2 - gr1) in percentage points**
definitely not	0,23pps	3,59pps
rather not	-1,08 pps	**-12,28pps**
neutral	**-10,84** pps	**7,72pps**
rather agree	**15,40** pps	2,38pps
definitely agree	-3,72 pps	-1,42pps

Source: the authors' elaboration based on the survey results, N=459.

As can be seen while analyzing the structure of responses in both groups, for a 5-10% price increase the percentage of affirmative answers in a group with innovative potential (1) is higher with neutral responses for a 5-10% increase and with negative (rather not) responses with a rise by 40-50%. At the same time, price increases seem to be slightly less significant for respondents without innovation potential. The percentage of answers in this group (2) is higher than in group 1 with answers indicating the continuation of brand purchases with a slight increase in price and indecision with a 40-50% increase. The above conclusions allow to adopt the H1 and H2 hypothesis for the examined respondents, taking into account the non-representativeness of the research sample, which may, however, be the basis for conducting further research in this area.

One of the benefits of having loyal customers is the Word of mouth phenomenon, including brand recommendation. Young consumers' declarations regarding the intention to recommend the brand in the future and the fact that the brand has been recommended in the past are presented in tables 4 and 5 respectively.

Table 4: Intentions of future brand recommendation

	Answers (number and %)		**Difference of relative values (gr2 - gr1) in percentage points**
definitely not	0	0	0
rather not	6	1,31%	1,82%
neutral	104	22,66%	-8,38%
rather agree	221	48,15%	-4,19%
definitely agree	128	27,89%	10,75%
total	459	100,00%	0

Source: the authors' elaboration based on the survey results, N=459.

Table 4: Fact of brand recommendation in the past

	Answers (number and %)		**Difference of relative values (gr2 - gr1) in percentage points**
never	119	25,93%	-7,07%
once	91	19,83%	12,48%
several times at least	171	37,25%	8,69%
very often	78	16,99%	-14,10%
total	**459**	**100,00%**	0

Source: the authors' elaboration based on the survey results, N=459.

Respondents rarely declare that they would not recommend the brand (only 6 indications), while the intention to recommend the brand reports over 76% (total answers: rather agree and definitely agree). At the same time, when analyzing responses to previous ones, it can be seen that only 25.93% of young consumers have not recommended their brand before, the others have happened at least once (of which it is even several times). This corresponds roughly to the number of people who are hesitant or negative about future recommendations. This may be related to both the specificity of the cosmetics market and the openness of young consumers to exchange of experiences, including care. Comparing response structures in groups with and without innovation potential (1), it can be seen that the second group more willingly than the first declares its intention to recommend the brand in the future, which means that the H3 hypothesis is rejected. In terms of real behavior, however, consumers

with innovation potential most often recommend the brand (accumulation of answers "I recommend it very often"), However, Young adults without innovation potential also show activity in recommending, although a single consumer recommends less often, but accumulation of answers "at least once" and "at least several times "is higher than for consumers with a higher degree of innovation. Based on the conducted research, the H4 hypothesis cannot be positively verified.

Finally, the time has come to analyze the declarations of young consumers regarding their future brand behavior, independent of price. The study findings are presented in Table 5.

Table 5: Respondents' declarations regarding future purchases of the indicated brand (multiple choice possible)

I buy and use this brand's product ...	**Answers (number and %)**		**Difference of relative values (gr2 - gr1) in percentage points**
… and I intend to continue using it without considering offers from other brands	162	35,29%	25,37pps
… but I follow other brands' offers and if I find something better, I will change the brand	193	42,05%	-25,62pps
… until other brand makes an effort and provides me with a better offer	148	32,24%	-22,00pps
… until I get bored with the current brand - then I will look for a different brand product	175	38,13%	-6,27pps

Source: the authors' elaboration based on the survey results, N=459.

Less than half of the respondents declare that they are not considering switching to another brand. At the same time, most respondents assume that they will buy another brand in the future. As much as 42% actively observes competitive offers. 38% of respondents suggest that young adults will look for another brand when they get bored. Comparing the distribution of answers within a group of consumers with innovation potential (1) and without (2) it is clearly seen that in the first group respondents declare openness to the offer of competitive brands more often than in the second group, in which the share of answers indicating long-term loyalty is by over 25 points higher percentages, which in turn confirms the H5 hypothesis.

Conclusions and Research Limitations

The results of the study confirmed three out of five hypotheses. Before summarizing, however, basic restrictions should be reminded and pointed out. First of all, the research sample is not representative of both size and selection procedure. This means that the verification of hypotheses can only refer to the sample or population (students of three universities). Nevertheless, the findings may become an inspiration for further research on the behavioral profile of young consumers showing loyalty behavior in terms of repeating purchases and innovation potential.

After verifying the hypotheses, it can be summarized that (with earlier restrictions) young adults are not very sensitive to small price changes, however, this situation changes significantly with high increases. This is probably the result of a relatively short relationship between the client and the brand, which means that enterprises that aims this target group should adjust their pricing strategy accordingly. Consumers with a higher level of innovation are more sensitive to price increases than young consumers who do not think about the new solutions for their preferred brand. Although they all are likely to recommend brands the study shows, that consumers of lower level of innovative potential are more willing and active in this. Thus in turn may confirm the higher level of expectations of the innovative consumers and some kind of difficulties with satisfying them. Young adults seem to be a little bit less loyal and companies should take into account, that this group monitors the market and competitive offers. Thus stems their knowledge and creativeness for innovations on the one hand but simultaneously it results with less confidence of their future

patronage behavior on the other hand. All in all, this profile seems to be fairly consistent with what Rogers said about innovators (Rogers, 1962).

It is worth remembering that everything that the consumer does, should bring him or her sense of economic, psychological and image benefits. This means that even an acquired customer should be cared for by providing him with arguments to keep them in positive relations with the company (Dziewanowska, 2012). The loyalty of young consumers has a chance to grow stronger over time. Companies should take advantage of their innovative potential to provide this consumers in the future with arguments to stay with a brand that meets their demanding expectations.

Abstract

The subject of the article concerns the issue of the development of financial globalization in the European Union. In order to measure the level of financial globalization processes, the index of financial globalization, which was developed by the Swiss Economic Institute, was used. The main goal of the article is to analyze changes in the development of financial globalization in the EU countries in 1993-2018. A special attention is given to the degree of Poland's similarity to other member countries in terms of the level of financial globalization. The Wavelet Dynamic Time Wrap (WDTW) model was used for the research, where the Dynamic Time Wrap (DTW) measure is used as part of the wavelet analysis. The DTW measure allows to assess the similarity of two time series by finding the optimal path, with the lowest total cost criterion, measured by the cumulative distance between these series.

Keywords: Financial Globalization, European Union, Dynamic Time Wrap (DTW), Wavelet Dynamic Time Wrap (WDTW).

Introduction

Globalization is a progressive process. Its development was influenced by many factors. However, the development of the Internet, telecommunications and IT had a decisive impact on accelerating globalization processes (Dresher, 2006; Balcerzak & Pietrzak, 2017; Hadaś-Dyduch, 2016; 2017; Pieterse, 2019). Therefore, there is no single definition of globalization. The changes brought about by globalization affect entire economies. They affect the functioning of the national capital markets (Bekaert and Wu, 2000; Meluzín et al., 2017; Pietrzak et al., 2017; Strýčková, 2017; Zinecker et al., 2017), they lead to an increase in the level of international cooperation and foreign trade (Łapińska, 2013; 2016; Cieślik et al. 2019; Cieślik & Hien Tran, 2019), the similarity of countries and social processes (Kuc, 2015; 2017a; 2017b; Jankiewicz, 2018a; 2018b; 2018c; 2019; Kuc-Czarnecka et al., 2020), influence on the national labour markets (Bieszk-Stolorz & Dmytrów, 2019), result in the new patterns of spreading innovation and technology (Cheba, 2015; Balcerzak, 2016; Cheba & Szopik-Depczyńska, 2017; Szopik-Depczyńska et al. , 2017; 2018a; 2018b; Kijek & Matras-Bolibok, 2019; Jakimowicz & Rzeczkowski, 2019a; 2019b), and the process of duplication of institutional solutions (Balcerzak & Pietrzak, 2016; Balcerzak, 2020).

However, the greatest impact of globalization is recorded on the financial and capital markets, where a long-term systematic increase in financial integration (financial globalization) is recorded (Meluzín et al., 2018a; Meluzín et al., 2018b; Meluzín et al., 2018c; Zinecker et al., 2018a; 2018b; Gaigaliene et al., 2018; Legenzova et al. 2019; Skalická et al., 2019a; Skalická et al., 2019b; Stavytskyy et al., 2019; Shkolnyk et al., 2019). Financial integration is usually understood as a real or 'actual' increase in capital flows between countries (or the potential of these movements), strengthening links between economies (see Schmukler & Abraham, 2017). As the world moves towards deeper financial

integration and the potential for arbitration disappears, the return of identical assets in international trade should be the same in different markets, which means that the markets are indeed integrated (Prasad et al. 2007; Kose et al., 2009, 2010; Łapińska, 2016; Litavcová et al., 2017; Jaklič & Svetličič, 2019).

The essence of global financial diversification is that a country is able to transfer some of its income risk to global markets (Edison, 2002; Rodnik & Subramanian, 2009; Obstfeld, 2009). Since most developing countries are rather specialized in their production and equipment structures, they can theoretically get even greater profits than developed countries through the international sharing of consumption risk, i.e. effectively selling their share of domestic production in exchange for participation in global production (Sánchez-López et al., 2019).

The aim of the article is to analyse changes in the development of financial globalization in the EU countries. A special objective of the paper is to determine the degree of Poland's similarity to other member countries in terms of the level of financial globalization taking into account long-term trends. To determine the degree of similarity of countries due to the adopted criterion, the Dynamic Time Wrap measure was used (DTW) (Keogh & Ratanamahatana, 2005; Hadaś-Dyduch, 2019).

Development of the globalization process and financial globalization in the world and in the EU countries

Globalization processes have such strength and range of influence that they cannot be resisted by a single country or even a group of countries. Hence, in addition to the positive effects of globalization, it carries a high risk of unpredictable crises and severity (Skare & Porada-Rochoń, 2019a, 2019b; Wajda-Lichy & Kawa, 2018). Figure 1 shows the changes for the globalization index in the years 1970-2018, where we define globalization to be the process of creating networks of connections among actors at multi-continental distances, mediated through a variety of flows including people, information and ideas, capital and goods. The values of globalisation index are given after Swiss Economic Institute. In the entire period, the globalization index increased annually on average by 1.03%, in the years 1980-2018 it increased annually on average by 1.08%, and in the years 2000-2018 by 1% (a detailed analysis of the globalization process changes was presented in the works of Hadaś-Dyduch, 2016, 2017, 2018, 2019).

In the article, the authors concentrated on the issue of the development of financial globalization. For this purpose, the index of financial globalization was used, which was developed by Swiss Economic Institute. Figure 2 presents changes in the value of the financial globalization index in the years 1970-2018. Over the period under review, the global financial globalization index increased on average annually by 1.14%. A strong increase in the level of globalization processes in the nineties of the last century is visible. Based on the visual analysis of Figure 2, it can be concluded that the processes of financial globalization in Europe and countries with the highest level of income have slowed down or even decreased in recent years.

Fig. 1: Intensity of globalization index

(Source: own study based on data from the Swiss Economic Institute)

Fig. 2: Graphic Financial globalization index

(Source: own study based on data obtained from the Swiss Economic Institute)

In the next step, the authors assessed the level of financial globalization in the EU member states in 1993-2018. The year 1993 was chosen due to the dynamic increase in the level of globalization processes in the early 1990s and the beginning of transformation process in Central and Eastern European countries. The values of the financial globalization index in 1993 for the 27 member countries are listed in Table 1. Next, the countries were assigned to four classes according to the level of financial globalization using the natural breaks method (Pietrzak et al., 2017b). The percentage changes in the financial globalization index in the years 1993-2004 and 2004-2018 were also calculated. The year 2004 was chosen as the accession year of some Central and Eastern European countries to the structures of the European Union.

The first class with the highest level of financial globalization was created in 1993 only by the countries that joined the EU before 2004. The following countries have been assigned to class 1: Ireland, Luxembourg, Belgium, Netherlands, United Kingdom, Denmark. In class 2 with a high level of financial globalization in 1993, there were four countries of the so-called old Union: Sweden, Austria, France, Finland and two countries that joined the EU in 2004: Malta and Cyprus. In class 3 with an average level of financial globalization in 1993, selected countries of Southern Europe and

Central and Eastern Europe dominate. The following countries have been assigned to class 3: Germany, Portugal, Italy, Hungary, Spain, Bulgaria, Poland, Czech Republic. In class 4 with a low level of financial globalization in 1993, apart from Greece, there were only new EU member states. In the case of the countries that joined the European Union, the following were assigned to class 4: Slovenia, Estonia, Latvia, Croatia, Lithuania, Romania. The very low values of the financial globalization index should be noted for two countries: Lithuania and Romania.

Table 1: Changes in the level of financial globalization in the EU from 1993 to 2018

Country	1993	Class	1993-2004	2004-2018	Country	1993	Class	1993-2004	2004-2018
Ireland	86.96	1	11.88%	0.84%	Italy	52.78	3	35.93%	9.31%
Luxembourg	86.2	1	14.98%	-0.12%	Hungary	51.62	3	53.61%	13.39%
Belgium	83.04	1	14.08%	-0.35%	Spain	51.48	3	56.39%	10.22%
Netherlands	80.44	1	20.12%	2.11%	Bulgaria	41.02	3	76.23%	7.66%
United Kingdom	79.18	1	17.24%	0.17%	Poland	40.08	3	60.05%	19.66%
Denmark	78.04	1	9.76%	9.40%	Czech	40.01	3	75.52%	20.07%
Malta	73.08	2	30.18%	4.50%	Greece	38.05	4	58.39%	36.59%
Sweden	71.59	2	26.06%	4.38%	Slovenia	36.7	4	63.55%	47.46%
Austria	68.89	2	24.88%	8.68%	Estonia	36.67	4	127.70 %	7.22%
France	67.01	2	25.85%	8.38%	Latvia	33.99	4	112.44 %	26.16%
Finland	64.75	2	34.62%	6.42%	Croatia	31.18	4	102.72 %	19.71%
Cyprus	60.28	2	46.40%	13.82%	Lithuania	22.53	4	152.79 %	40.26%
Germany	54.78	3	54.48%	5.02%	Romania	15.72	4	219.82 %	26.65%
Portugal	53.64	3	57.71%	5.49%	-	-	-	-	-

(Source: own work based on Swiss Economic Institute)

When analysing the dynamics of changes in the financial globalization index, it should be stated that the period of 1993-2004 was subjected to a much larger increase in financial globalization processes compared to the period of 2004-2018 (Table 1). In both analysed periods, the largest percentage growth of the value of the financial globalization index were recorded in the case of countries assigned to the 4th class. For most of the countries in this class, there were two-fold percentage increases in the financial globalization index: Estonia (127.70%), Latvia (112.44%), Croatia (102.72%), Lithuania (152.79%), Romania 219, 82%). The situation is completely different for countries assigned to class 1, where for most countries the index increase did not exceed 20% in the period 1993-2004, and in the period 2004-2018 one can speak of a slowdown in the development of financial globalization processes. In the case of two countries, there was even a decrease in the value of the financial globalization index in the period 2004-2018: Luxembourg (-0.12%) and Belgium (-0.35%). In the case of countries assigned to class 2, the increases in the index value in the period 1993-2004 did not exceed 50%, and for countries in class 3 the increases ranged from 40 to 53%.

Table 2 presents the values of the financial globalization index for the 27 member countries in the selected years: 1993, 2004 and 2018. The countries were again assigned to four classes due to the level of financial globalization using the natural breaks method. However, in this case the year 2018 was taken into account. In 2018, Cyprus, Malta, Luxembourg, Ireland and Belgium were assigned to the class with the highest level of financial globalization. Class 1 was increased by Cyprus and reduced by the following countries: Netherlands, United Kingdom, Denmark. Apart from Latvia, only the countries of the "old" EU were assigned to the second class with high level of financial globalization: Denmark, Austria, United Kingdom, Finland, France. The following countries have been assigned to class 3 with a medium level of financial globalization: Hungary, Estonia, Portugal, Germany, Spain, Slovenia, Czech Republic. Class 3 was extended in 2018 to Estonia, while three countries: Italy, Bulgaria and Poland were assigned to class 4 with the lowest level of financial globalization. In 2018, in the last class, there were two countries of southern Europe: Greece and Italy and new member countries: Lithuania, Bulgaria, Poland, Croatia, Romania.

Table 2: Values of the financial globalization index in the EU in selected years

Country	1993	2004	2018	Class	Country	1993	2004	2018	Class
Cyprus	60.28	88.25	100.45	1	Estonia	36.67	83.49	89.51	3
Malta	73.08	95.14	99.42	1	Portugal	53.64	84.6	89.24	3
Luxembourg	86.2	99.11	98.99	1	Germany	54.78	84.62	88.87	3
Netherlands	80.44	96.63	98.67	1	Spain	51.48	80.51	88.73	3
Ireland	86.96	97.29	98.1	1	Slovenia	36.7	60.03	88.52	3
Belgium	83.04	94.73	94.4	1	Czech Republic	40.01	70.22	84.31	3
Sweden	71.59	90.24	94.19	2	Greece	38.05	60.27	82.32	4
Denmark	78.04	85.66	93.71	2	Lithuania	22.53	56.96	79.89	4
Austria	68.89	86.03	93.5	2	Italy	52.78	71.74	78.42	4
United Kingdom	79.18	92.83	92.99	2	Bulgaria	41.02	72.3	77.84	4
Finland	64.75	87.17	92.77	2	Poland	40.08	64.15	76.76	4

Hungary	51.62	79.29	89.91	3					

(Source: own work based on Swiss Economic Institute)

Analysis of Poland's similarity to other EU countries in terms of financial globalization

The purpose of the article is not only to analyze financial globalization in EU countries, but also to determine which countries Poland is most similar to in terms of financial globalization, taking into account long-term trends. The article uses the Wavelet Dynamic Time Wrap (WDTW) model to determine the Dynamic Time Wrap (DTW) measure for various components obtained on the basis of wavelet analysis (Hadaś-Dyduch, 2019).

The obtained DTW measure values enable the assessment of the similarity of two time series by finding the optimal path allowing to align these series at the lowest total cost measured by the cumulative distance between these series (see Keogh & Ratanamahatana, 2005). The DTW measure

allows for flexible shift of the timeline to match sequences that are similar, but not in the phase, as shown in Fig. 3. A detailed description of the algorithm for determining the DTW measure is given in the works of Keogh & Ratanamahatana (2005) and Hadaś-Dyduch (2019).

Fig. 3: Graphic comparison of Euclidean measure with DTW measure
(Source: Keogh & Ratanamahatana, 2005).

Based on the assumed goal, the DTW values for pairs of objects were determined, where the first object was Poland and the second object was selected from other EU countries. The analysis was performed again for 27 member countries, excluding Slovakia. The calculations carried out were based on the index of financial globalization in the period 1970-2018, which allowed for taking into account long-term trends. The obtained values of the measure for selected country pairs at the level of decomposition corresponding to long-term trends are presented in Table 4. The similarity of Poland to selected countries determined in this way will mean a lasting relationship between countries in terms of the development of financial globalization processes.

Table 3: Degree of similarity between Poland and other EU member states

Country	DTW value	Class	Country	DTW value	Class
(Luxembourg, Poland)	959.82	1	(Italy, Poland)	746.08	2
(Malta, Poland)	958.17	1	(Latvia, Poland)	715.67	2
(Cyprus, Poland)	946.44	1	(Portugal, Poland)	711.32	2
(Netherlands, Poland)	912.69	1	(France, Poland)	709.35	2
(United Kingdom, Poland)	903.02	1	(Greece, Poland)	698.03	3
(Belgium, Poland)	894.61	1	(Spain, Poland)	647.68	3
(Germany, Poland)	879.58	1	(Czech Republic, Poland)	626.73	3
(Sweden, Poland)	865.29	1	(Lithuania, Poland)	545.83	3
(Denmark, Poland)	837.64	1	(Hungary, Poland)	363.72	4
(Austria, Poland)	807.6	2	(Bulgaria, Poland)	345.25	4
(Ireland, Poland)	789.5	2	(Romania, Poland)	297.99	4
(Finland, Poland)	788.32	2	(Slovenia, Poland)	283.33	4
(Estonia, Poland)	752.73	2	(Croatia, Poland)	147.83	4

(Source: own study based on calculations in the Matlab program)

Class 1 has been assigned to countries with which Poland has the lowest degree of similarity due to the level of financial globalization. In class 1 there were Luxembourg, Malta, Cyprus, Netherlands, UK, Belgium, Germany, Sweden, Denmark. In the group of countries mentioned above, only Malta and Cyprus represent new members of the EU. This class is made up of countries which, unlike

Poland, were characterized by a high level of financial globalization processes in the period 1993-2018 (Table 2). Class 2 is made up of countries in relation to which Poland has a low degree of similarity in terms of financial globalization, but it is at a higher level than in the case of countries in Class 1. The following countries belong to this class: Austria, Ireland, Finland, Estonia, Italy, Latvia, France. In 2018, with the exception of Estonia and Italy, these countries were assigned to class 1 and class 2, characterized by a high level of financial globalization (Table 2).

In the class 3 there has been assigned countries in relation to which Poland shows a moderate degree of similarity in the development of financial globalization processes. Class 3 includes the following countries: Greece, Spain, Czech Republic and Lithuania. Class 4 was created by the countries to which Poland is the closest in terms of the level of development of financial globalization. The group of these countries included: Hungary, Bulgaria, Romania, Slovenia and Croatia. Class 3 and class 4 were created by countries that in the period 1993-2018 had medium or low levels of financial globalization.

Conclusions

In the article the issue of financial globalization in the EU was considered. This phenomenon is becoming a significant exogenous factor affecting the efficiency of national economic policy and affects risk management processes at the microeconomic level. Therefore, the analysis of financial globalization processes is an important issue for domestic macroeconomic decision makers and is becoming an important element of risk management related to the functioning of financial and capital markets. As the experience of the recent global financial crisis has shown, the internationalization of capital market shocks can lead to the collapse not only of weak capital players, but also of global financial entities with the greatest access to liquidity in international financial markets, which may result in the collapse of entire national financial systems. The article uses financial index of financial globalization, developed by the Swiss Economic Institute.

The article analyses the changes in the level of financial globalization in the EU member states in the period 1993-2018. A significant difference between the so-called old EU countries and new member countries was confirmed. With the exception of Malta and Cyprus, the countries that joined the EU before 2004 were characterized by a high level of financial globalization. Poland and other selected countries of Central and Eastern Europe were characterized by the lowest level of financial globalization. Additionally, the degree of Poland's similarity to other member countries in terms of the level of financial globalization was examined using the WDTW model, taking into account long-term trends. Based on the results obtained, it was found that Poland is the most similar in terms of financial globalization processes to Hungary, Bulgaria, Romania, Slovenia and Croatia, Greece, Spain, Czech Republic and Lithuania. These countries were mostly characterized by the lowest level of growth in financial globalization in the group of EU member countries. Additionally, in the period 1993-2018, only slight changes were found in the membership of countries in obtained classes. This fact proves the high stability of financial globalization processes in the long term. Despite the free movement of capital, EU Member States create classes of countries with different levels of financial globalization.

Abstract

The present study deals with the problem of evaluation of employee behaviors in the workplace. The basic aim was to check whether in the sector of small and medium-sized enterprises there occur behaviors qualifying as counter-ecological. The article is of the empirical character. The respondents in the sample (working students) are educated groups compared to the general level of education in the country. Their insights could help to formulate effective initiatives to perfect the sphere related to environmental protection in the workplace. The conducted research indicates that in SMEs there appear a series of counter-ecological behaviors. The results show that there are differences between factors influencing pro-environmental behaviour in the workplace. This paper analyses the determinants of workers' behaviour towards environmental protection using structural equation models with observed and latent variables. Small and medium-sized enterprises should pay special attention to effectively functioning system of control.

Keywords: Workplace Behaviors, Counter-Ecological Behaviors, Small And Medium-Sized Enterprises, Structural Equation Model

Introduction

Works in the field of sustainable development have highlighted the importance of integrating economic, social and ecological systems. Economy is a tool and sustainable development is an overarching goal. Considerations have been guided by the need for new thinking about the role of enterprise for society end environment.

Organizations undertake to carry out various actions in the sphere of environmental protection (Chodyński, 2008; Mazur-Wierzbicka, 2013; Śmiechowski et al., 2017; Valcárcel, 2014). Focusing the attention on ecology, in the above-mentioned meaning, protection of environment can be understood as minimizing the negative influence exerted by the company on natural environment and also as communicating with stakeholders on behalf of pro-ecological actions (Chodyński, 2008; Jabłoński et al., 2010; Leoński, 2016; Olejniczak, 2013; Rybak, 2007). In a broader sense, this refers to not only actions, but also to neglect on the part of the management and their subordinates in this respect. There is extensive literature on the subject of green workplace behaviors (Francoeur et al., 2019) and environmental counterproductive workplace behaviors (Ciocirlan, 2017). There has always been debate over how to manage human resources for environmental sustainability and how individuals can contribute to the achievement of environmental sustainability (Ones, Dilchert, 2009; Ones, Dilchert, 2012).

Bearing the above in mind, the authors concentrated their research attention on questions connected with environmental workplace behaviors. The aim of the article is to present the problem of environmental workplace behaviors in small and medium-sized enterprises. Structural equation modeling was used to find the significant influence factors on environmental protection initiatives. Many

studies find an association between educational attainment levels and concern for the environment (De Silva, Pownall, 2014; Meyer, 2015). While preparing the present work, the diagnostic survey among students of WSB University in Opole was used.

Bottom-Up Approach

The bottom-up approach is best exemplified by the quality circle. The conception of forming the so-called quality circles appeared in Japan in the 1960s. By means of the model, Joseph Juran, the founder of the idea, expected to have each worker in individual departments activated to engage in controlling their actions and - in consequence - to improve the quality of products.

In practice, managing sustainable development in a company is founded on the top-down approach. Engagement of the management is one of the key factors in the company's sustainable development. The top management establish sustainable development to be their strategic target and the management of the lower level determine how this aim is to be put into life. The voice of common workers is rarely taken into account, whereas successful elimination and prevention of counter-ecological behaviors depends on involvement of all employees. There arises therefore a need for conducting research which will help define different aspects of employees' involvement.

Definitely, common workers can greatly contribute to the company's sustainable development in, at least, three ways, that is as implementers, ambassadors and recipients of corporate sustainability practices (Süßbauer et al., 2019). Employees possess tacit knowledge that can be used to introduce changes in the organization (Boiral, 2009; Buhl et al., 2016; Fernández, 2013; Wolf, 2013). Employees' pro-environment-oriented initiatives in many cases derive from this kind of knowledge which is not stipulated in any procedure and is not known to the management of the middle and higher levels. Common workers hold a strong influence on how the company is perceived by the environment, since they interact with external groups of stakeholders (clients, suppliers), as well as with the local community (Hasu, 2015). The workers are also receivers of internal means of sustainable development, which aim to secure good working conditions (Süßbauer, Schäferet, 2019).

It needs considering in what way employees should be engaged in order to successfully eliminate counter-ecological behaviors in organizations pursuing sustainable development. The bottom-up process connected with increased engagement of common workers in transformation processes targeting sustainable development offers a chance for enterprises.

Similarly, O'Donohue and Torugsa (2016) recommend application of Green HRM concept. This idea is understood as taking up activities within HRM, in compliance with targets of sustainable development. Relevant actions are meant to serve the development of skills, motivation and involvement of workers in supporting goals which are connected with, among others, protection of environment on the level of the company. Results of research on the sector of small enterprises show that Green HRM has a positive influence on the relation between proactive environment management and the company's financial results. What is more, they confirm the assumption that a high level of Green HRM increases financial profits from proactive environment management in comparison with a low level of Green HRM. Thus, it becomes evident that Green HRM provides an added value to the enterprise in the case when it is used as a factor in proactive management of environment. The extant literature has stressed the influence of human factors on companies' environmental policies. For example, Ramus and Steger (2000) assessed the relationships of environmental policy with supervisory support behaviors and employee environmental initiatives. Also Fernández et al. (2013) maintained that ecological initiatives very often emerge from creative ideas supplied by employees in the lowest ranks.

One may formulate the following hypotheses:

Hypotheses 1 (H1): *Reason of counter-ecological behaviors has a significant influence on environmental protection initiatives.*

Research Method

The diagnostic survey was carried out among students of WSB University in Opole between 15 July and 15 August 2019. The first stage of the research consisted in sending out information on the intended research to students of the following majors: management, management engineering, logistics, finances and accountancy, administration and internal security. The request to fill in the Internet-based questionnaire (CAWI) was addressed to students in employment, representatives of small and medium-sized companies. The examination was of the pilot character. Participation in it was voluntary and anonymous.

The first research hypothesis (H_1) let to the formulation of the following sub-hypotheses:

Hypotheses 1a (H_{1a}): *Economic factors of counter-ecological behaviors have a significant influence on environmental protection initiatives.*

Hypotheses 1b (H_{1b}): *Approval of counter-ecological behaviors on the part of organization have a significant influence on environmental protection initiatives.*

Hypotheses 1c (H_{1c}): *Lack of support on the part of organization have a significant influence on environmental protection initiatives.*

In order to test the hypotheses regarding the relationships between the variables considered, structural equation modelling was adopted. A total of 342 questionnaires was used for analysis using SmartPLS (Ringle et al., 2015).

The study is limited by its non-random sample, reducing the study's power.

Analysis of Respondents' Opinions

The applied CAWI survey covered 342 students of WSB University in Opole. The respondents (262 women and 80 men) were in employment, at different ages and varying length of employment and work experience. Over 90% of them live and work in the area of Opole Voivodship (south-western Poland), the largest number of them (over 50%) ranging between 24 and 38 years of age. Nearly 60% of the questioned declared over 5 years of work experience. This is connected with the specifics of the University - study courses in WSB University are designed for people who are professionally active, ones who want reconcile working and studying.

It is most worrying that as many as 68% of the examined have witnessed taking rubbish to a forest, dumping rubbish on "wild landfills" or pouring hazardous substances straight into the regular sewerage (Table 1). The survey revealed that 24% of the respondents declared not reporting problems or instances of abuses of environment which were observed in the place of work, and 21% - not complying with recommendations and internal procedures with respect of environmental protection. Then, 47% of the respondents indicated the cases of not sorting rubbish, 17% - burning of leaves, grass and tree branches and 31% - burning of rubbish. Another 31% observed wasting of food in their places of work, 68% - using greater amount of material than it was necessary, 9% - intentional dirtying the place of work, 37% - leaving lights on in unused rooms, 24% - using old-type, non-energy-efficient electric bulbs, 21% - using obsolete, non-energy-efficient household appliances in social rooms, 41% - overusing the standby mode of electrical/household appliances (instead of switching them off completely), 9% - using disposable ball-pens; 37% - using plastic cutlery, styrofoam food containers, polystyrene mugs, etc.

Table 1: Do you notice in your place of work any of the behaviors against the environment which are listed below?

	Yes, definitely	Yes	Rather yes	I do not know	Rather no	No	No, definitely
Wasting food	33	33	39	32	73	63	69
Using greater amount of material than it is necessary (e.g., wasting paper through unnecessary printing)	74	69	91	18	51	24	15
Intentional dirtying the place of work	9	3	20	43	82	84	101
Leaving lights on in unused rooms	22	30	74	18	68	68	62
Using old-type non-energy-efficient electric bulbs	15	32	36	55	51	81	72
Using obsolete, non-energy-efficient household appliances in social rooms	14	31	27	61	71	84	54
Overusing the standby mode in electric/household appliances (instead of switching them off completely)	33	36	70	39	44	78	42
Not sorting rubbish	47	50	63	21	33	65	63
Burning of leaves, grass, tree branches	15	18	25	18	24	76	166
Burning of rubbish	33	33	39	32	73	63	69
Taking rubbish to dump it in the forest, dumping rubbish secretly on “wild landfills”, pouring hazardous waste into the sewerage system	74	69	91	18	51	24	15
Using disposable ball-pens	9	3	20	43	82	84	101
Using plastic cutlery, Styrofoam or plastic food containers or mugs, etc.	22	30	74	18	68	68	62
Not reporting problems or abuses of environment in place of work	15	32	36	55	51	81	72
Not complying with recommendations or procedures connected with environmental protection	14	31	27	61	71	84	54

Decidedly, it is both employees and the organization who bear the responsibility for the occurrence of behaviors which are detrimental to environment (Table 2). Still, as it follows from the survey, 6.1% of the respondents blamed solely the employee who uses negative forms of conduct for the occurrence of behaviors which are harmful to natural environment. On the other hand, 4.4% of the questioned declared that it was exclusively the organization who are responsible for this.

Table 2: Who, in your opinion, bears the responsibility in your place of work for the occurrence of behaviors which are harmful to environment?

	Frequency	%
Exclusively the organization	15	4.4
Only the worker who uses negative conduct	21	6.1
Both the worker and the organization	306	99.5

36.3% of the respondents observed that the majority of workers and superiors happen to behave in a way that is harmful to environment. On the other hand, 11.7% of the questioned put the blame chiefly on workers (irrespective of the sex) (Table 3).

Table 3: Who, to the greatest extent in your place of work, commits acts of behavior which are detrimental to environment?

	Frequency	%
Co-worker (woman)	9	2.6
Co-worker (man)	15	4.4
Superior (woman)	3	0.9
Superior (man)	12	3.5
Most workers and superiors happen to behave like that irrespective of their sex	124	36.3
Most workers happen to behave like that irrespective of their sex	40	11.7
Most superiors happen to behave like that irrespective of their sex	9	2.6
I do not know, hard to say	130	38.0

The examined most often listed the following among the reasons for the occurrence in the place of work of conduct which is harmful to environment: personality (41.2%), acceptance of behavior detrimental to environment on the part of co-workers in the organization (31.6%), colleagues' idleness (30.4%), approval on the part of the organization/superiors of the occurrence of negative behaviors (27.5%), poorly functioning system of supervision/control over workers (25.4%), economic reasons connected with the lack of financial means (24.6%), superiors' idleness/inactivity (20.8%).

The survey proved that 28.4% of the respondents are aware of the fact that the company which employs them prevents behaviors which are harmful to environment. In the relevant open question, the examined indicated the ways of the preventative measures. Among them there were found the following: workers' trainings, introduction of relevant procedures, punishing for acts that are detrimental to environment, promotion of pro-ecological approach towards environment on the

Internet, installation of anti-smog shields on stacks, introduction of sorption mats, exchange of equipment, exchange of electric bulbs, running actions with regard to protection of environment required by the law, control of substances emitted into the atmosphere, instructing personnel on the necessity of switching off the light, requiring workers to develop pro-ecological actions (sorting rubbish, switching off lights and appliances), prevention of utilization of waste in an inappropriate manner, placing containers for used batteries (e.g., in both offices and production halls there should be enough bins to collect segregated specific types of rubbish), launching the platform of Near-Miss Incidents (NMI). One of the respondents stated, "We take all possible measures in every possible direction." Unfortunately, as many as 71.6% of the questioned admitted that they did not know whether their companies prevented in any way behaviors which are harmful to environment.

According to the respondents, the effectivity of preventative actions with respect to environmental protection can be raised through external financing obtained from sources which come from pro-environmental enterprises realized by the company outside it (44.2% indications), effectively functioning internal system of control (38.9%), effective execution of punishments for negative behaviors (31.9%), as well as active external system of control (19.9%). The examined pointed to the great significance of education in the sphere of actions preventing the occurrence of behaviors which are harmful to environment ("People should be kept aware of green issues, which must constantly be repeated loudly everywhere", "A set of principles of pro-ecological conduct in the company must be formulated and a system of rewards for abiding by them ought to be introduced", "Education. People have to understand first that by harming the environment they harm themselves. Pro-ecological behaviors must be first developed privately at home, and it is not until then that they will become a norm also in the professional life", "First of all, it is superiors who must be made interested in pro-ecological actions").

Lastly, 65.8% of the respondents were of the opinion that their current work environment created a possibility for them to freely express their views on pro-ecological actions and on those which are harmful to environment, while 20.5% did not have their opinion on the issue). At the same time it needs drawing attention to the fact that 39.5% of the questioned claimed that there exists a possibility of choosing variants of realization of tasks at their work stations, taking into account pro-ecological actions. This creates a possibility of limiting counter-ecological behaviors in many enterprises.

There are four components of the concept of the environmental protection (PROT): external financing (PROT_1), effectively functioning internal system of control (PROT_2), effective execution of punishments for negative behaviors (PROT_3), and active external system of control (PROT_4). Each of the latent variables ECO, ORG, LACK are measured using an appropriate set of empirical indicators (see Table 4 for these indicators). In order to test the hypotheses regarding the relationships between the variables considered, structural equation modelling was adopted (Figure 1).

A path coefficient estimate is considered as statistically significant different from zero at a 5% significance level. The influence of economic reasons (ECO) and protection (PROT) was found to be significant, but influence was weak (Figure 2). It may be hypothesized that firms improve financial performance at the expense of environment. It is worth mentioning that, because the initial model tested (Model 1) did not satisfy any of criteria of goodness-of-fit. In consequence, it was decided to consider alternative models.

Figure 1: The theoretical model proposed (Model 1)

Table 4: What are the reasons behind the occurrence in your place of work of behaviors which are harmful to environment?

	Frequency	%
Economic reasons connected with limiting costs of activity of the organization (e.g., instead of utilizing waste which is paid for, the organization disposes of it illegally) (ECO_1)	45	13.2
Economic reasons connected with the lack of financial means (e.g., purchase of new energy-efficient appliances) (ECO_2)	84	24.6
Poorly-functioning system of supervision/control over workers (ORG_1)	87	25.4
Approval on the part of organization/superiors of occurrences of negative conduct (ORG_2)	94	27.5
Acceptance on the part of co-workers in the organization of behaviors detrimental to environment (ORG_3)	108	31.6
It happens that superiors themselves make their inferiors commit acts of negative behavior (ORG_4)	15	4.4
The feeling among the colleagues that since they have undertaken to do positive acts for the organization, in consequence of which the organization has profited, this entitles them to commit negative behaviors (LACK_1)	25	7.3
Lack of support on the part of superiors (LACK_2)	58	17.0
Lack of support from co-workers (LACK_3)	34	9.9

Personality (e.g., lacking in the sense of responsibility, inclination towards breaking norms) (LACK_4)	141	41.2
Idleness of superiors (LACK_5)	71	20.8
Idleness of colleagues (LACK_6)	104	30.4

Figure 2: Estimates of the Parameters in the Model 1.

The model 2 presented in Figure 3 satisfied the acceptance criteria ($R^2 = 0.204$; $d_{ULS} = 0{,}756$; $d_G = 0{,}182$). Reason of counter-ecological behaviors has a significant influence on environmental protection initiatives (H_1 was supported; H_{1a} wasn't supported; H_{1b} was supported; H_{1c} was supported). Small and medium-sized firms should pay special attention to system of supervision (ORG_1, ORG_2, ORG_3) and employee behavior (LACK_4, LACK_5, LACK_6), in order to increase the chances of attaining environmental protection. The results have been consistent with the literature. Effective environmental sustainability requires crucial contributions from HRM (Govindarajulu, 2004; Rothenberg, 2003). This could occur, for example, in the form of a bottom-up process, as described by Dangelico (2015) or Ramus and Steger (2000). The initiatives to implement sustainability consisted in creating a favorable business environment with high levels of environmental orientation, providing employees with the appropriate training to improve environmental competences and awareness of employees and providing extensive support from managers to employees in environmental issues.

Figure 3: Estimates of the Parameters in the Model 2.

Conclusion

In SMEs protected area of the environment is neglected and there occur a series of counter-ecological behaviors. In respondents opinion, it is both employees and the organization who bear the responsibility for the occurrence of counter-ecological behaviors. It is worth noting that more than 70% of respondents admitted that they did not know whether their companies prevented in any way behaviors which are harmful to environment. It seems that in many enterprises, it is the duty of workers "to do" and the duty of managers "to think". In order to increase the chances of attaining environmental protection, small and medium-sized firms should pay special attention to employee behaviors. This could occur, for example, in the form of a bottom-up process. Stronger worker involvement at all organizational levels can make unique and valuable contributions. Nearly 40% of respondents perceived that there exists a possibility of improvements, taking into account pro-ecological actions. Enterprises should pay more attention for effectively functioning system of control and effective execution of punishments for negative behaviors. This creates a possibility of perfecting the sphere related to environmental protection.

In the opinion of the authors, applying the Japanese model of quality circles in enterprises (in particular in SMEs), it is first of all “environmental circles” that should be taken over and assume the form of team work. In connection with the above findings, the authors recommend carrying out experiments by researchers who might be interested in this problem area. The last stage of the experiment could thus aim to verify whether the state of environmental protection is better in the given enterprise in comparison with the base period (when the environmental circles were not in operation yet). Apart from improving the sphere of the company’s environmental protection, there can arise such assets in connection with the functioning of the environmental circles as increasing the knowledge of the work environment by workers/participants and increasing the use of their potential, including the hidden knowledge.

Shaping Decision-Making Competences of Managers in The Area of Logistics Using Thermoactive Diagnostics

Radoslaw MILEWSKI, phd,

The General Tadeusz Kosciuszko Military University of Land Forces, Wroclaw, Poland
Radoslaw.milewski@awl.edu.pl

Abstract

The tendency to make decisions in certain circumstances is due to human personality, which in turn is due to heat regulation, neuroregulation and neuropsychomatics. When seeking sources of decision-making processes resulting from human personality, the problem of systemic thermoregulation should be considered. Practice proves the effectiveness of diagnostic methods using psychometric tools. The article is an attempt to assess the possibility of using scanning thermoregulatory diagnostics - STRD in the process of examining the competences and predispositions of managerial staff in logistics.

Keywords: Logistics competences, decisions, neuroplasticity, thermoregulatory diagnostics

Instrumentary for decision analysis

Well-known personality types (temperaments) classified by Hippocrates, i.e. sanguine (*lat. sanguis - blood*), choleric (*gr. chole - bile*), melancholic (*gr. mélanos - black + chole - bile*) and phlegmatic *(gr. phlegma - phlegm*) are an insufficient classification in the assessment of human predispositions, competences or decision-making inclinations.

In scientific and research practice, a number of psychometric tools are used to study and describe personality. They facilitate diagnosis and differentiation, as well as allow you to monitor changes in equal aspects of personality. Commonly used tools of this type include: Minnesota Multidimensional Personality Inventory MMPI-2, Personality Inventory NEO-FFI, Eysenck Personality Questionnaire EPQ-R, and Cattel 16PF Personality Questionnaire [Hall, Lindzey,1990].

The latest research by scientists from Northwestern University confirms that four types of personality can be distinguished in humans. These are: the reserved type, the type recognized as a role model, the non-average type and the self-centered type [Roberts, 2008]. So far, the most popular and widely used personality test was the Myers-Briggs test (MBTI), which is an extended concept of Carl Gustav Jung. The psychologist noted that people have some tendencies regarding energy management (extraversion / introversion), the way information is collected (cognition / intuition), decision making (thinking / feeling) and dealing with the surrounding world (judgment / observation). The personality type is determined by the preferences in each of these four dimensions. According to modern psychologists, a more reliable tool than the researcher's observational sense is the analysis of data sets. According to L. A. Nunes Amaral, Big Data is the perfect tool for collecting and processing "personality data" and combining it with existing psychological knowledge.

Analyzing huge data sets in terms of repetitive regularities, the so-called Big Five. This model includes five personality factors such as: neuroticism, extraversion, openness to experience, agreeableness and diligence. These dimensions are treated as operational regulators defining the basic personality type, and in the context of research in the area of decisions determines the predispositions of potential decision makers [Nunes Amaral, 2018].

The Importance of Thermoregulating Diagnostics

When seeking sources of decision-making processes resulting from human personality, the problem of systemic thermoregulation should be considered. The human thermal regulation center consists of several separate centers located in the striatum (*lat. corpus striatum*), visual thalamus (*lat. thalamus opticus*) and gray tumors (*lat. tuber cinereum*).

Nervous system and centrifugal stimulations increase and decrease body temperature, which in turn is due to metabolism. Thermoregulation is therefore one of the most important processes of homeostasis. Through changes in temperature regulation, we can observe energy changes and responses to the stress stimulus of organs, systems or even entire systems under study. To understand thermoregulatory diagnostics well, it is important to understand what we study. The temperature distribution in the human body is layered and depending on the type of tissues and the depth of their distribution, so we distinguish the cortical and medulla part [Krupka, 2018].

Fig. 1: Areas of interaction of neurotransmitters in the human body

Source: own study based on: K. Krupka, Fundamentals of neuropsychosomatics, Basic set of information needed to work with the neuropsychosomatic process in the leadership project, training materials (unpublished), Krakow (Poland), 2018.

Research by G. Heim's team on thermoregulatory diagnostics, conducted at the Institute of Social Medicine and Occupational Medicine of the University of Heidelberg in 1978-88 provided a lot of evidence in the field of radiation thermography (in other words: thermoregulatory diagnostics according to the Heidelberg Model), which uses infrared radiation of the skin resulting from from giving away body heat in the form of heat radiation to maintain homeostasis. Earlier, in the early 1950s, E. Schwamm justified the thermoregulatory diagnostics together with J. Reeh. They developed a measuring instrument for capturing human infrared radiation. From then on, he called his method regulatory thermography as opposed to existing thermoregulatory diagnostics. These studies resulted in the development of radial thermometers based on the principles of Planck radiation. As a result of these studies, thermoregulation diagnostic methodology based on STRD devices was developed. This

method currently provides a reliable basis for assessing competences and predispositions regarding personality types.

Figure 1 presents four neurotransmitters found in the human body (acetylcholine, dopamine, serotonin and GABA / γ-aminobutyric acid), whose interaction has a direct impact on human nature, behavior, predispositions and competences, and in the context of this work on making decisions with varying degrees conservatism or even refraining from having to make a decision

STRD tests the body's response to a stressor and analyzes them for the effects of neurotransmitters on the body. Complementing the study with the Braverman test and Plutchik's emotion diagram, the research has become a reliable instrument for assessing managers (managers, commanders) in recent years in terms of making decisions [Plutchik, 1980].

Analysis of logistic competences supported by STRD

Logistics as a special flow-oriented management area requires extraordinary performance. The 7R (right) rule is based on the fundamental pillars of the place, time, customer, assortment, costs, quantity and quality of the product. Therefore, the logistics manager is a person who is required to have a specific set of professional competences.

These competences, according to research conducted by the interdisciplinary research and development center of the organization, are a vector result of the expectations of employers of the logistics sector and competences acquired as a result of education at the high school level and academic centers extended by the acquired professional experience [6].

Research conducted in 2015 shows that the area of competence expected from managers in the logistics sector includes in particular: knowledge of the industry (in particular about transport), honesty, concern for quality, conscientiousness, ability to design logistics processes, knowledge of law and selected IT systems. There is also a group of soft competences which include: initiative, goal orientation, organization of own work and ability to cooperate. In addition, features such as self-development, innovation, cognitive abilities and empathy (including intercultural) are also increasingly mentioned.

Fig. 2: Competence matrix (relationship between competences acquired in the education process and expectations of employers) in the logistics industry

Source: Report of the Interdisciplinary Center for Research and Development of University Organizations, Jagiellonian University, Krakow, november 2015

In recent studies based on the method of thermoactive scanning, dominant features resulting from the predominance (concentration) of specific neurotransmitters have been determined over the last few years. This knowledge is currently the foundation for the development of the theory of neuro-leadership, and the desired ability to lead and lead a group, the ability to make collective decisions or conceptual network thinking are now not only part of building artificial intelligence but constitute a virtual model of the neuroliner in particular areas of social life.

In determining professional competencies, a competence matrix presenting the place of individual competences in its space is increasingly used.

Figure 2 presents the competence matrix as a result of the expectations of employers in the logistics industry and the professional competences obtained in the process of education.

The matrix shows that the majority of these competences are (according to Plutchik's theory of emotions) a neurotransmitter called dopamine (focus on development, learning, cognitive ability, self-development and compliance with the law). These competencies are mostly concentrated in the second part of the matrix (dominate). In other parts, there are no more visible competences that could be assigned to a specific neurotransmitter. The ability to cooperate (cooperation) or concern for quality are characteristic for the neurotransmitter - GABA, but the initiative and ability to cope with stress are characteristic for serotonin.

Fig. 3: Classic "dopamine type" (manager-specific profile with a tendency to make decisions in high-risk conditions)

Source: own study based on: K. Krupka, Fundamentals of neuropsychosomatics, Basic set of information needed to work with the neuropsychosomatic process in the Leadership project, training materials (unpublished), Krakow, 2018

From the above analyzes, the image of a manager emerges - logistics with a dominant dopamine profile with features (competences) in the area of GABA and serotonin. Figure 3 presents a graphic visualization of the manager's profile in the logistics industry, whose professional competence is focused in the area of dopamine impact. This area was diagnosed using thermoactive scanning using a STRD scanner.

Scaniging Method In Decision Making Processes In Logistics

Decision making as a proces is the result of other complex processes in the human mind. It is a consequence of the processes of expansion, condensation, coherence and mobilization. The result of these processes is process transformation (the ability to smoothly transition between all of the above processes). This process depends on the balance between all neurotransmitters. The natural (biological) foundation of the whole is neuroplasticity (the ability of nerve tissue to create new connections aimed at their reorganization, adaptation, variability and self-repair as well as learning and memory processes).

Decision making is determined by the need to achieve the objectives, perform tasks, in logistics, planning and distribution of resources, coordination of flows, hence it becomes so important to determine the personal characteristics of the decision maker (logistics, manager, commander). Thermoregulatory scanning determines the impact of dominant neurotransmitters on behavior (including propensity to decision risk, conservatism, or decision regression). Research (conducted on military listeners) shows that when acetylcholine and GABA are in equilibrium, the brain is focused on exploration and cognition (including creative problem solving). In the case of the dominant effect of acetylcholine, there is a sense of success, while GABA's dominance creates a sense of need to improve. Disturbance of this balance causes an excessive search for novelty (stimuli, impressions), contacts with other people. According to pilot studies conducted on a population of over 2,000 people, the predominance of dopamine was visible in entrepreneurs with a tendency to make decisions under risk conditions (possibility of material losses). This is due, inter alia, to the fact that dopamine triggers a strong sense of motivation in achieving goals. The predominance of serotonin triggers a sense of help and interest in the problems of others. With the subordinate role of logistics, this is a very important aspect of staff evaluation and selection. With imbalance dopamine - serotonin; there is a strong suppression of any action (including decision-making), the decision-maker is afraid of challenges, he avoids all actions leading to possible loss.

Summary

The conclusions result from research carried out under the project "Balance of competences of the Krakow scientific center" in the transport and logistics industry in southern Poland and constitute a knowledge base in the context of planned and implemented investments, development of the city and the region, and implementation of its strategy. Research is extremely important for companies that deal with the transport of goods by road, their storage and storage, and activities related to supporting this process (excluding rail, air and human transport). As part of the work, on the basis of the analysis of job offers and in-depth interviews with opinion leaders and company representatives, verification was carried out in the area of selected competences expected from university graduates, having various significance for the development of the industry. These competences have been divided into four areas: specialist knowledge and skills (11 competences), business knowledge and skills (9 competences), soft skills (11 competences) as well as language skills and other requirements (13 competences). In the next steps, quantitative research on the demand for competences was carried out (the analysis took into account the results of 20 companies in the transport and logistics industry employing a total of over 1,200 employees), which were then compared with the results on the supply of competences as part of the balance sheet.

Appropriate selection of human resources in an organization (including functional divisions) is a key part of organizational health, which is an important driving force, e.g. perception of the organization, e.g. by shareholders, NATO allies or other organizations outside. At the same time, it determines the effectiveness of actions. Organizations that want to focus their efforts on priorities such as role modeling, quick decision making, defining visions and shaping leaders should increasingly use 'niche' methods to assess the competences and predispositions of managerial (commanding) staff, not only in decision making. Therefore, it is reasonable to strive to develop a holistic personality model on the basis of which neuroplasticity changes can be interpreted, and the method of such research is scanning thermoregulatory diagnostics - STRD.

Abstract

In the procesess of teleinformatic (r)evolution in logistics, the ability to selectively approach the "information noise" also takes on the significance of the instrumentarium and software supporting it. Considering the information as a set of data, is possible to conclude that the primary element of any information is data that requires proper ordering, because in all other cases they do not matter, despite the fact that they can be stored (eg in the form of writing to disk) . A large part of the records requires only formal gathering for records, others are "the need of the moment" and are treated as "information waste". The article is an attempt to present causal relationships in the data - information - decision - relationship in making logistic decisions for which the management background is the infology background, and the criteria included costs.

Keywords: Infology, IT Systems In Logistics, Decision-Making Processes, Material Identification, RFID, Logistics Costs.

Introduction

Traditionally in IT, data is understood to mean numbers, concepts or orders presented in a manner that is convenient for sending, interpreting or processing by manual or automatic methods. The basic unit of information in the binary system is bit. It means one of two values 1 or 0. This is the smallest amount of information needed to determine which of two equally probable states has adopted the system. A larger unit is a byte, defined as the shortest addressable bit sequence treated by the computer as an indivisible whole in the processing and storage processes and sending information. Most often, the byte consists of 8 bits (possibly plus a control bit)[Ash,1990].

In the infinitive interpretation, data are elements of the message and are referred to as "a slice of reality adapted to represent another slice of reality". Such a term covers various types of data: character recordings, analog representation, speech, images, sounds, schemes, films, etc. Signs - data and information are the basis of the path in key logistics areas.

Infology in Communication Standards

The infological information concept was already presented in the 1970s. by B. Sundgren [Sundgren, 1973] and B. Langefors [Langefors, 1995] assumed that the U-observer dealing with a certain segment of the surrounding reality causes that a specific image is created in his / her mind (image) this slice. This mapping can be treated as information about R. Information is therefore a binding relation U and R. This relation can be treated as an informative R model in the U message. This model is created as a result of the received description of the analyzed reality using the current knowledge and experience of the observer U. Possessed by U the knowledge and experience of Sundgren and Langefors are called the frame of reference. These resources can also be called the observer's thesaurus. Analysis of the selected segment of R surrounding reality means the separation of specific objects O, their characteristics X (attributes) and relationships (relations) between them. In general terms, and according to Sundgren [Sundgren, 1973], the description of each distinguished object O can be presented in the form of an arrangement:

$$K: = < O, X, t > \quad (1)$$

where:

K - message;
O - object belonging to the analyzed reality R; in this case, O can mean any material object, process, event, abstract concept, property of another object, etc .;
X - a feature of object O or its relation to other objects also belonging to R;
t - time at which the object O is considered due to the X feature.

In summary, the information approach treats information as the content provided by the K message. It can also be considered as a relation binding elements (data) of the K message. One of the consequences resulting from the adoption of such an approach is a clear distinction between the two concepts - data and information: data are only building blocks of information [Stefanowicz, 2004]. Therefore, a very important role in improving the decision-making process, due to the data provided and information play complex systems based on information, i.e. information systems [Milewski, Stankiewicz, 2015].

The information system is thus a multi-level structure that allows the user of this system to transform specific information entering the desired exit information using appropriate procedures and models. As a result of obtaining this information, specific decisions are made. The essence is technical means of sending and processing information. They are IT and non-IT devices used in the enterprise to acquire, collect, process and send information. In the structure of decision trees - information is a key element of decisions at specific levels

Identification of Resources in Logistics

An important element in modern logistics is identification. The term commonly defines a univocal recognition of a given object by a human or a suitable electronic device. You can also distinguish the third, currently the most popular, way of identifying, which is a combination of both techniques - it is called semiautomatic identification.

Automatic identification is considered one of the cheapest methods of recognizing objects primarily thanks to the use of barcodes. Logistic processes have been saturated for many years in the field of identifying material flows in logistics chains and networks. The concept of traceability becomes more and more important [www.unglobalcompact.org.]. It refers to the ability of an information system to be traceable, detectable or readable. Colloquially this idea is designed to "track" the location of resources in the circulation of matter (people).

The benefits of automatic data identification are primarily: reducing the time of object recognition, supporting all available services, increasing security, reducing service costs, simplified work, help in obtaining information in real time. In logistic processes, automatic identification allows you to quickly determine the location of all materials / goods in the warehouse, and above all allows you to instantly check current data on, for example, the location of products, the quantity of materials in warehouses at a given moment and the quantity of goods distributed and sold. The key purpose of automatic identification in many cases is to track the flow of materials and goods throughout the entire logistics supply chain, including also internal flows in its individual links.

The technology used, using the possibility of remote, contactless reading of large amounts of data, allows for quick and reliable identification of any element and control its status and location in the logistics chain system. One the technology used more and more often is based on the transmission of electromagnetic (radio) waves of RFID (Radio Frequency Identification technology)[Wieczerzycki, 2012].
In 1948, H. Stockman published a work that gave rise to the development of passive RFID tags. In the 1950s and 1960s, scientists conducted research into the use of radio waves to identify objects. The first commercial projects of RFID technology mainly concerned systems that were designed to protect products against theft. In 1972, T. A. Kriofsky jointly with L. M. Kaplan patented the induction system of the transmitter - receiver, and in 1973 M. Cardullo received a patent for passive RFID tags with

writeable memory. In the 1970s, Los Alamos National Laboratory, commissioned by the US Department of Energy, developed a nuclear tracking system. A few years later, the system was used in commercial solutions, including road travel payments. In the early 1990s, IBM developed a high frequency RFID system. During this period, a great number of enterprises were established that developed standards, technologies and concepts related to RFID [Figurski, Niepsuj, Ząbkowski, 2012]. Radio Frequency Identification is a technology that uses to identify radio waves at a specific frequency. The ability to read miniature systems using radio waves allows for many innovations and practical applications. Currently, the dominant area of their applications is the TSL sector (Transport - Shipping - Logistics).

Transponders (RFID tags) operating with the use of radio waves are the identification technology sometimes called the radio bar code, which was still in the research and development phase in 2005. The essence lies in the fact that a radio wave at a specific UHF frequency excites a chip antenna, which implies a radio data transmission from the memory of the chip to the reader and then to the computer. RFID tags (transponders) have many uses. They are used, among other things, for marking products or transport units, but they are also used, among others, for marking animals. They are built of two main elements: an electronic system that is responsible for data storage and the antenna. The tags are read remotely by readers (manual or stationary). The information stored in tags can be changed many times (but it requires the use of specialist software), as well as stored for a period of 10 years.

Scenario Analysis Using A Decision Trees

Implementation of the assumed objectives in the international approach requires knowledge of the conditions limiting the assumed functions of the objectives (separated from the bundle of goals). From the point of view of heuristic, you can consider the so-called heuristic models, which in addition to optimization and simulation models are an effective tool for forecasting and implementing complex logistics processes (including transport). In many cases, the heuristic analysis methodology requires IT support resulting from mathematical simulation, benchmarking or good ex post practices [Golebska 2007, Mlinar, 1992]. In international logistics it is possible to use scenario analysis developed on the basis of decision variants. Therefore, it is possible to use decision theory in the construction of decision trees based on the probabilities of individual scenarios and transport costs. Transport costs seem to be a particular problem, which in the article presented in the article determine logistics decisions. The assumed thesis is based on the statement that logistic decisions in the field of transport services for military entities should result from a deep cost analysis based on scenario analysis methodology, i.e. no costs should result from ineffective decisions, but rather ex ante decisions should be preceded by cost analysis of options scenarios.

Heuristics of Scenario Methods

The scenario method is one of the heuristic methods of decision making. The ability to detect (Greek heurisco) new facts and find connections between facts, especially using hypotheses, is based on the assumption that events (in the future) can not be predicted with certainty. It is therefore necessary to foresee and develop various scenarios for the development of the current situation, and for each variant to develop a way of behaving in case it turns out to be real. In the event of failure resulting from the implementation of the most likely option, alternative solutions are used.

In the modeling of logistic processes, which are influenced by strong turbulent factors, attention should be paid to the approach that functions successfully in the management sciences (eg quality) of the so-called process mapping, which is a mapping of existing objects and relations between them. The key to developing the process model is observation with observance of perceived relationships and regularity, which is important, with particular emphasis on knowledge resulting from practical activities in a variable spectrum of aspects. In creating a process model (integrated processes) it is necessary to define preliminary criteria (general assumptions) and outline the directions of actions (goals) for the needs of scenarios in the decision-making model. Among the many criteria taken into account in the work dominates the problem of transport costs related to the simulation of the transport process associated with legislative and legal reasons for logistic responses outside the country and the

right selection of infrastructure elements (existing and possible to create - in accordance with the location theory)[Krawczyk, 2011].

The notion of probability is the key issue in building a decision-making model. In the classic theory of von Naumann and Morgenstern, the probability was introduced into the theory from outside as part of the decision analyzing apparatus. The struggle with paradoxes has shown that one must first show how the decision maker attaches probabilities to the possibilities he considers.

There are several philosophical approaches to probability. Generally, they can be divided into objective ones, referring to such properties of the world, as the frequency of events of a certain type or dispositional property of events, and subjectivistic, referring to the property of beliefs whose contents are possible states of affairs. Both approaches to probabilities have advantages and disadvantages, but rather applications in which they perform better or worse. In searching for the basis of human subjectivity, it is natural to turn to the properties of beliefs. However, in this respect, there is a significant difference between the epistemological concept and the subjectivist conception in the proper sense. According to the epistemological concept, the probability is the same as the degree of justification for the right belief [Dąbrowski, Schumann, Woleński, 2014].

The Essence of Epistemology in Logistics

The epistemological approach raises two problems difficult to solve, because of which they have turned towards subjectivism. The first problem concerns the calculation of the degree of belief. In this matter there are a number of purely logical ideas, referring to the degree of embedding beliefs among other beliefs, the relationship of belief in the set of beliefs (determining its relative strength), a relation of relevance is needed.

In most cases, the term relevance is defined by the concept of probability. It seems that one can talk about probability even when stating some uncertainty, we only collect the data used to determine its measure. This does not mean that such uncertainty has no measure; in fact, something is assumed about it, for example, that it is not very close to 1 or very close to 0 [Gärdenfors, 1990].

The subjectivist theory of decision formulates the conditions for the rational construction of a certain set of beliefs about possible states of things. The probability here is the uncertainty of the mind included in a rational system of uncertain judgments, which, after being ordered, turn into judgments about uncertainty (subjective estimates of uncertainty). L. Savage proved that rationally ordered preferences are consistent with subjective probabilistic judgments, in which the concept of probability is consistent with the universally accepted axiom of A. Kolmogorov for the theory of probability. Thus, he created the basis for thinking about the human subject as being capable of this type of construction [Hacking, 2001].

In the classic theory of decision, the subject is where the theoretician of the decision is - it is not expected that the persons who speak about the theory would actually perform the deliberative activities provided for by this theory, but only that they would behave as if these activities were performed. The problem, then, is to develop the concept of an entity that is constructed when the person actually embodies the norms of rational decision making into his natural mechanism of reflection.

One of the most frequently used unreliable heuristics concerns the probabilistic component of our preferences and consists in ignoring the base probability, i.e. the frequency of occurrence of S in the considered set of states of affairs. The necessity to take this probability into account results from the Bayes rule [Tversky, Kahneman, Slovic1982]:

$$P(A/B) = [P(A) \times P(B/A)]/P(B) \qquad (2)$$

In order to assess the probability that some event A occurred because an event B occurred, multiply the base (independent) probability of occurrence A (the frequency of its occurrence in the considered

population of events) by the conditional probability that B will occur if A occurs and divide by probability, that there will be B with no relation to A, ignoring the basic P (A) and focusing only on P (B | A), which we usually do, we systematically violate this rule. We are prone to this error in the assessment of probability, because P (A) seems irrelevant to us. According to Peterson, Bayes' rule well characterizes the process of acquiring scientific knowledge [Peterson, 2009].

Premises of decision tree construction in logistics

The essence of a decision tree is a graphic representation of the structure of elements of the decision process using vertices (nodes) and edges (branches) for the whole so-called learning sample. Moving along the branches of successive elements of the test by nodes in which decisions are made as to the selection of branches is a key action scheme. The criterion of the division performed in a given node is common (same) for all elements of the learning test that are included in this node.

Formally, the decision tree is defined as any consistent directed acyclic graph with a vertex with one incoming edge and an outgoing edge number of 0 or greater than 1. Nodes, branches and tree leaves correspond to: tests performed on attribute values of the examples, possible test results and category labels [Cichosz, 2000].

According to J. Koronacki, the classification tree is built to allow the classification of future observations, which we do not know to which classes belong. In this case, the conditions of division must take the form of conditions imposed only on the values of the observation vector, and not on (known to the elements of the learning sample) belonging to these classes [Koronacki, Ćwik, 2005].

From the point of view of the conducted research on the logistic system of international logistic service of military contingents, the effectiveness of the system itself is important, as it is expressed in the expenditure of resources for rational effects of all subsystems and processes taking place within them. The assumption that high costs of logistics services (mainly transport) are determined by the time of property delivery is too much a simplification of the problem and should not justify excessive costs generation and increasing the budget of the Defense Ministry budget to the detriment of the functioning of current operations. The justification of this type of activity leads to the duplication of not quite rational solutions in the field of logistic management in the armed forces of many countries participating in reacting outside their own countries, and as a result, the consolidation of bad habits, whose possible changes require deep reengineering not only in the area of structures but also in the sphere cognitive changes.

Decision Trees for Selected Scenarios

The issue of military supply chains is based on assumptions resulting from state commitments assumed by the state in terms of participation in operations abroad, and, consequently, in an executive act expressed in the actual movement of specific property and personnel at a given distance. The time spectrum can be divided into phases depending on the development of the situation on the international arena. Regardless of the number of phases, all actions for a specific mission are based on the stage: initiation (commencement of the operation of the mission), maintenance (regular and cyclical transports, constant supply of material resources, staff turnover, and other) and termination of operations (return of people, equipment, financial and material settlement) (Fig 1).

In the development of the decision tree (T), it is assumed that the set of nodes is marked by NT, and the set of leaves as LT, the set of examples P is limited to one, and the subsets marked as n, for which tn will be a test. In the oval symbols of nodes (as a rule) there are corresponding tests, while rectangular symbols denote their category labels. Test results are marked with the symbol r.

Fig. 1: The main processes and the chain of ailments of international military logistics
source: personal study.

Using the data contained in the attachment, we can develop several decision trees or one complex (with limited assumptions). One of the decision problems is the transport cost, taking into account the limitations in the use of means of transport depending on the distance (range) and potential diplomatic consent. A simplified decision tree for such a variant is shown in the Figure 2.

For shipment variants, where delivery time is not a priority, we can use sea transport (low cost and long range) for land transport or S4 scenario to use sea transport to a possible (substantiated port) and then apply a solution in line with scenario S3 and reload the means of supply by air. Determining the potential intermediate (or several) base using the network method allows you to estimate cost variants with a certain probability of an event (based on historical data) and consequently, choose the lowest-cost scenario.

Assuming the cost criterion and assumed probability (eg using a logistic intermediate base), the scenario for which the lowest level of total displacement costs was observed is S3 scenario. In a situation where they are not the only criterion there is a need for solutions based on multicriteria methods. These criteria should consider variants of purchase of means of transport in the context of their long-term use, which is related to economic reasons for depreciation of fixed assets and spreading fixed costs over time (Fig 3). It is also important to consider the sensitivity of solutions correlated with variants (scenarios).

Fig. 2: Cost decision tree (for coverage criteria and diplomatic approval)
source: personal study

Based on historical data, it is possible to develop several scenarios for future solutions. The idea of supplying military contingents over the years does not differ significantly from the reference SCOR supply chain model, however, functioning in a highly turbulent environment, a deficit in the means of transport and a strong need of the recipient in meeting the needs in a timely manner (resulting from the specificity of activities) scenario models should include sensitivity analysis and the probability of failure of selected "paths".

Fig. 3: Decision tree (according to the transport cost criterion)
Source: personal study.

High uncertainty regarding the predictability of results (resulting from a shortage of material and transport resources, maladjustment of the rules of conduct to cooperate in the international system) is what distinguishes modern logistics processes occurring in the area of military logistics.

Research Methodology - Test of Assumptions Simulation

In the quantitative research methodology, it is important to use total R events sets to search for the function with the highest desired value. For this purpose, it is possible to use the point estimation method, also known as the maximum likelihood method. Suppose we have a function:

$$f: K \rightarrow R, \text{ where } K \subset R$$

where: R is a fixed set. We say that this function takes the largest value at $x \in K$ if:

$$f(x) \leq f(x), \text{ for each } x \in K$$

Of course, the largest value can not be determined for all functions, but with some additional assumptions it can be concluded that such a value exists. From a practical point of view, we are interested in determining the point x, in which the function takes the largest value.

A derivative is a very important tool here. The problem is to calculate the derivative and solve the equation:

$$f'(x) = 0$$

Very often it happens that our problem written in the form of an equation has exactly one root and that it is easy to check that the largest value can not be accepted at the ends of the range of specificity - in this case it is this solution that is the only point where the function takes the largest value . In the method of highest credibility, it is helpful to use the SOLVER function. Next, it is necessary to calculate the probability with the indication of the value for which the calculated probability is the highest. This methodology is helpful in developing multi-variant scenarios with probability estimation at particular stages of the decision tree.

Conclusions

In the scenario analysis, it is important to define the objective function and define restrictive conditions. After developing the above, simulate theoretical assumptions to test the assumptions made. Assumptions of the cognitive model (variables) depending on the situation determined by turbulent factors may change and specify criteria (priorities). At the initial stage, this may be the criterion of delivery time, and in the option of completion (settlement) and maintenance - e.g. Transport cost. Developing the test will allow you to make a decision (choose one or several of the total available), e.g. What type of transport to use for a given mass of cargo meeting the criterion of delivery time or what mode of transport can you use to perform the transport service with the assumed financial resources. This can be done by testing accepted hypotheses in positive and negative scenarios (e.g. Increasing the likelihood of minimizing transport costs as an expected value). Choosing the right scenario is designed to help you develop auxiliary calculators (usually you don't need the right software). Information and communications technology (ICT) support for logistics processes based on codification and material identification are very helpful in this area.

As a result of the conducted tests, the necessity of making decisions based on decision support systems, cost analysis and infological support (radio frequency identification - RFID) for individual operating options was verified. Implementation of logistics (transport) processes in international terms requires:

- in-depth economic analysis using decision trees;
- knowledge of the basics of probability in estimating probability;
- skills in constructing and modeling decision scenarios;
- knowledge of the construction of decision trees and target trees;
- knowledge of IT tools supporting the decision-making process;
- need to test simulated assumptions.

Testing hypotheses (assumptions) in a positive and negative approach will maximize the objective function in the form of reducing the costs of logistics (transport) processes.

The globalization of logistics processes requires precise codification (labeling) of matter, which is: goods, products, goods and cargo. This also applies to the intangible area, i.e. services. Infology as a science of communication includes the data (information) exchange subsystem, which focuses on the industry Big Data. The better this system is ordered, the more likely it is to determine deterministic or indetermistic relationships (relationships) (regardless of whether they are ontological, epistemological or methodological).

The Entrepreneurial Intention of the University Students in the Context of Emerging Entrepreneurial University Environment (Research in progress)

Diana-Manuela LINA

„Alexandru Ioan Cuza" University of Iași, Iași, Romania

lina.diana@gmail.com

Abstract

The study of entrepreneurial intention is a subject of interest for the sphere of entrepreneurship. The purpose of the proposed research is to determine to what extent the characteristics of the entrepreneurial university along with the behavioral traits of the university students exert an influence on the entrepreneurial intention of the university students. The study is based on the Theory of Planned Behavior (TPB) model, but proposes the inclusion of a construct that measures the influence of the entrepreneurial university environment on the entrepreneurial intention of the students. The target group of the empirical study is represented by students from the Faculty of Economics and Business Administration within "Alexandru Ioan Cuza" University in Iași, Romania.

Keywords: Entrepreneurship, Intention, Entrepreneurial University

Introduction

Why is entrepreneurship intention important generally and particularly within the context of entrepreneurial university? Some arguments in support of this study:

- The analysis of students' entrepreneurial intention can explain their behavior towards entrepreneurship
- Can provide information on the stages / path of the decision to become an entrepreneur
- It can reflect elements related to the functions and structure of the organization that result in the formation of the entrepreneurial intention (entrepreneurship courses, initiatives to support entrepreneurship among students and academic staff, the university-business relationship)

The literature within the field presents several research results regarding models of entrepreneurial intention formation. The foremost popular are: The TPB (Theory of Planned Behavior) model developed by Ajzen (1991), Entrepreneurial Event model (Shapero and Sokol, 1982) and also the Entrepreneurial Action model (McMullen and Shepherd, 2006). These models analyze individual perceptions of the feasibility and willingness to start a business.

There is a broad array of opinions among researchers within the field of entrepreneurial intentions on considering that TPB offers a consistent framework for predicting entrepreneurial intention, taking into account both the personal factors and the social ones (Autio et al., 2001; Iakovleva and Kolvereid, 2009; Rueda et al., 2011).

In the entrepreneurial context, the entrepreneurial intention shows the effort that a person will make to adopt the entrepreneurial behavior. The motivational factors that influence the intention are: attitude towards behavior, subjective norms, perceived behavior control. In this model for the formation of the entrepreneurial intention, both the psychological and the behavioral variables are important.

Study objective

The objective of the research is to test the causal links between the predictor variables of the entrepreneurial intention and also to what extent the predictor variables influence the entrepreneurial intention of the university students, based on TPB model. The starting point is that certain characteristics of the entrepreneurial university contribute to the configuration of a favorable context for the formation of the entrepreneurial intention among the students.

Methods

The research method is quantitative analysis, based on surveys administered to 200 undergraduate students from the Faculty of Economics and Business Administration within "Alexandru Ioan Cuza" University in Iași, Romania. The proposed analysis model is illustrated below:

Fig. 1: The analysis of entrepreneurial intention of students based on TPB

For defining the construct we used a conceptual model of entrepreneurial university, result of the literature review. We formulate this framework (Tab.1) to substantiate the analysis model of the students' entrepreneurial intention (together with the TPB model, as we mentioned above).

Table 1: Entrepreneurial university analysis model (own construction)

Perspective for analysis	Elements of analysis	Indicators	Role in the analysis model of Entrepreneurial Intention
Institutional	Promoting, rewarding	Motivation system	**perception regarding institutional perspective** Motivation system for students with entrepreneurial incentives

Perspective for analysis	Elements of analysis	Indicators	Role in the analysis model of Entrepreneurial Intention
Knowledge and Innovation	Entrepreneurial culture	Number of programs/curriculum for entrepreneurial education	**perception regarding received support for knowledge and innovation** - entrepreneurship education courses - existing innovation and technological transfer infrastructure
Strategic management	Regional, national and international networking	number of partnerships with public institutions / institutions and private companies, number of participation in research networks, number of participation in entrepreneurship networks, clusters	**perception regarding support for strategic management** - entrepreneurship networks, Student Entrepreneurial Societes, clusters

The construct proposed for Entrepreneurial University Environment is including:

•Perception regarding institutional perspective, measured using the motivation system for students with entrepreneurial incentives
•Perception regarding received support for knowledge and innovation measured using:
- Entrepreneurship education courses
- Existing innovation and technological transfer infrastructure
•Perception regarding support for strategic management, measured using:

Entrepreneurship networks, Student Entrepreneurial Society, clusters
The hypotheses we want to test are:

- ✓ H1 The attitude towards entrepreneurship positively influences the entrepreneurial intention
- ✓ H2 The subjective norms positively influence the entrepreneurial intention
- ✓ H3 Perceived behavioral control positively influences entrepreneurial intention
- ✓ H4 The environment of the entrepreneurial university positively influences the entrepreneurial intention
- ✓ H5 The environment of the entrepreneurial university positively influences the attitude towards entrepreneurship

Survey Tools

The questionnaire comprises four intermediate scales: the attitude towards entrepreneurship, subjective norms, the perceived behavior control and the environment (characteristics) of the entrepreneurial university. All items are measured on a Likert scale from 0 to 7.
We will use the items from the table below.

Table 2: Items to be used for the analysis

Nr.crt.	Indicator	Affirmation	References
1.	A1	Being an entrepreneur for me means more advantages than disadvantages	Liñán and Chen (2009)
2.	A2	If I were an entrepreneur I would have great moral satisfaction	Liñán and Chen (2009)
3.	A3	If I had the necessary resources I would prefer to become an entrepreneur	Liñán and Chen (2009)
4.	SN1	My family thinks I should become an entrepreneur	Yakovleva and Kolvereid (2009)
5.	SN2	My friends think I should become an entrepreneur	Yakovleva and Kolvereid (2009)
6.	SN3	The opinion of my close ones regarding the choice of entrepreneurial career is important	Yakovleva and Kolvereid (2009)
7.	PBC1	I believe that I have acquired the knowledge necessary to become an entrepreneur	Yakovleva and Kolvereid (2009)
8.	PBC2	I believe that the entrepreneurship education courses from my university have contributed to the formation of my entrepreneurial skills.	Adaptation (Schwarz et al., 2009)
9.	PBC3	I am confident that I will be able to set up my business	Adaptation Liñán and Chen (2009)
10.	PBC4	If I had opportunities to start a business I am confident of its success	Adaptation Liñán and Chen (2009)
11.	I1	I'm seriously thinking about setting up a firm in the near future	Liñán and Chen (2009)
12.	I2	I am determined to set up a firm in the near future	Liñán and Chen (2009)
13.	I3	I intend to set up a company within 5 years after completing my university studies	Adaptation Liñán and Chen (2009)
14.	I4	My professional goal is to set up a firm	Liñán and Chen (2009)
15.	EUE 1	My university has a system of recognition and reward for students with entrepreneurial incentives	Own form

Nr.crt.	Indicator	Affirmation	References
16.	EUE 2	My university offers entrepreneurship education courses that provide me with the information needed to start a business	Own form
17.	EUE3	My university has an infrastructure that stimulates entrepreneurship (technology transfer center, business incubator, student entrepreneurial society)	Own form
18.	EUE4	In my university the infrastructure that stimulates entrepreneurship is underdeveloped	Own form
19.	EUE5	My university encourages faculty activities and initiatives that stimulate entrepreneurial capacity	Own form
20.	EUE6	My university organizes networking events between students and entrepreneurs (eg workshops, presentations, round tables, etc.).	Own form
21.	EUE7	My university organizes various competitions for students in order to stimulate entrepreneurship (eg competitions of business ideas, contests of business plans, etc.).	Own form

Expected Results

We expect our research to contribute to predicting students' entrepreneurial intentions related to characteristics of emerging entrepreneurial university environment.

The Government Regulation of The Economy in Russia At the Present Stage

Victor N. POTEKHIN

Candidate of economic sciences, The Urals State Agrarian University,
Ekaterinburg, Russia, e-mail: vnp1@ya.ru

Abstract

The article discusses the main concepts and approaches to government regulation of the economy in Russia at the present stage. There are three approaches: 1) liberal – non- interference of the government , 2) command-administrative, 3) public-private partnership. For the first time, the author offers a set of necessary and sufficient basic interdisciplinary methodological tools for studying the objective limits of government participation (government regulation) in a particular area (sphere) of the economy.

Keywords: Economy, Social Production, Government Regulation Of The Economy, The Law Of Conservation Of Full Capacity.

Introduction

The government regulation of the economy is the most important prerequisite for success or failure in the development of each person, business entity and the economy as a whole.

The approaches to government regulation of the economy in Russia at the present stage

Historically, the first idea of the role of the government in the economy was the theory that was reflected in the work of A. Smith (1723-1790), “An Inquiry into the Nature and Causes of the Wealth of Nations” [14], in which he argued that “the free play of market forces creates harmonious device. " Proponents of this trend proceeded from the fact that the government should guarantee property rights and inviolability of contracts, protect economic freedoms of citizens by establishing laws. They believed that government intervention in social production harms economic activity and inhibits economic growth [14; 15].

The second point of view is presented by supporters of socialist ideas, the command-administrative system of economic management and proceeds from the need for an active role of the government in managing social production [9; 11; 13; 15].

In the XX century, as a result of building socialism in the USSR and the spread of socialist ideas, the need to combat the Great Depression in foreign countries under the influence of Keynesian theory, the limits of government participation in the economy were expanded: the public sector was expanded, public work programs appeared (construction and repair of highways, highways, canals , bridges, public buildings), special compensation funds have been created, government spending on education and health has increased, government pension systems have been introduced, etc. Social assistance programs, subsidization of certain categories of goods. By and large, these transformations in public administration were the result of a high degree of specialization and cooperation of the social and international division of labor, which, from the standpoint of maintaining the socio-economic independence and sovereignty of the national government objectively imply the need to coordinate the life of the country's population by economic levels, ensuring continuity of reproduction and stability development.

At the end of the twentieth century, as practice has shown, the socialist system of economic management, as a result of destructive decisions by individuals in the country's leadership, was compromised, and the processes of "liberal-democratic perestroika" and "restoration of the government-monopoly system" led to the destruction of the great country - the USSR.

In modern conditions, the socio-economic functions of the government are largely predetermined by the concepts of “imperfection of the market system” that prevail in theory and practice. The socio-economic functions of modern governments cover almost the entire spectrum of economic relations in any society, directly or indirectly, regardless of which country we are considering: the USA, Germany, China or Japan. The exception is Russia, where the government has largely eliminated the full implementation of socio-economic functions.

The World Bank report on “The State in a Changing World” [2] states that only the government can influence economic policy, social services and infrastructure, protect vulnerable groups of the population, and protect the environment.

As a result, the question of government intervention in the economy and the question of the economic functions of the government remains the most acute, as in past centuries. The absolutization of one of the opposing points of view cannot lead to a constructive solution to this issue. The main reason for this is the lack of an objective scientific base among public administration and market institutions of society, simpler and more accurate scientific and practical tools that allow the government to carry out its socio-economic functions at the economic level in the internal and external spheres of life.

Today, the third point of view is coming to the agenda in the Russian Federation and becoming more and more relevant, involving joint partnership between the government and other participants in social production in the implementation of the socio-economic functions of the government. Such cooperation is called public-private partnership.

A broad interpretation of public-private partnerships implies constructive interaction between government and business, not only in the economy, but also in politics, culture, science, etc. These include, first of all, projects on infrastructure, urban transport, urban construction, real estate projects, roads and railways, seaports, airports, energy systems, pipeline transport, utilities: gas, water, electricity, heat supply to cities , enterprises, population [1; 15; 16]. In addition, the “Open Government” system has also been created and is functioning in Russia, within the framework of which new mechanisms are created for Russia to interact with the expert community, civil society structures and authorities [3].

The author's approach to government regulation of the economy at the present stage

In determining the degree of influence of the government on the economy, the key value, from our point of view [4], should be taking into account the law of conservation of full power, which involves the assessment of each type of activity-consumption of any business entity, including government, any form of "partnership" of participants in social production from the standpoint of the utility of cost-results for a person, society, government. The ranking of the obtained estimates in this regard and in the objective indicators of a single system of dimensionality of physical quantities (useful, useless, harmful, loss of cost-results and reserves of cost-results for development according to the same structure) for all participants in production in dynamics and from reproductive positions will reveal the most effective structures and forms of the mechanism of interaction between business entities performing these socio-economic functions, the most rational forms of public-private partnerships, as well as the optimal degree, depth and forms of government participation in the economy in a particular historical period, taking into account the level of development of productive forces, production and superstructure relations (see Table 1).

Table 1: Table of socio-economic utility of the types of consumption-activities carried out by the government, its links and other participants in social production*

№№	Types of activity-consumption by level of management	Participants in public production (government bodies, government-owned enterprises, business entities, etc. participants in public production, including in the form of public-private partnerships)	Cost-benefit structure				
1.	TA-C_1	P^n	UR_1^n	ULR_1^n	HR_1^n	Lo_1^n	R_1^n
2.	TA-C_2	P^n	UR_2^n	ULR_2^n	HR_2^n	Lo_2^n	R_2^n
3.	TA-C_3	P^n	UR_3^n	ULR_3^n	HR_3^n	Lo_3^n	R_3^n
4.	TA-C_4	P^n	UR_4^n	ULR_4^n	HR_4^n	Lo_4^n	R_4^n
5.	TA-C_5	P^n	UR_5^n	ULR_5^n	HR_5^n	Lo_5^n	R_5^n
…	…	…	…	…	…	…	…
i.	TA-Ci	P^n	URi^n	$ULRi^n$	HRi^n	Loi^n	Ri^n

Note: UR, ULR, HR, Lo, R - quantitative characteristic of useful cost-results, useless cost-results, harmful cost-results, loss of cost-results and reserves for the development of cost-results of each participant in social production - P^n, including the government, its bodies and enterprises, each form of public-private partnership for each type of activity-consumption and the level of management TA-$C_{1\text{-}i}$.

Thus, the objective limits of government participation (government regulation) of a particular area (sphere) of social production become clear, as well as the possibility of achieving a synergetic effect with a plus sign by all participants in social production. As a result, scholastic disputes will run out, but discussions will arise that are practical and constructive in nature.

Abstract

In this research, significant components of organizational behavior in a commercial company were investigated and studied. In order to perform this task, we analyzed a business case where a structured questionnaire was applied into the company. We assessed that the success of the company is influenced by factors such as motivation, job satisfaction, emotions and decision making, with the indication that perception factors and attitudes are in need of reinforcement. In addition, recommendations for intervention of organizational behavior are also presented, with the perspective of reducing the negative impact that these findings might have on the results obtained.

Keywords: Organizational Behavior, Human Behavior, Psychological Factors.

Introduction

Organizational behavior (OB) theory researches the effect of human behavior within an organizational environment, focusing on improving organizational effectiveness by reducing behavior such as absenteeism and staff turnover (Robbins and Judge, 2013; Organ, 2018), which affect negatively organizational performance.

OB theory is a multi-faceted discipline with a major contribution from behavioral sciences and evidence-based practices. OB uses the measurement and analysis of human behaviors to maximize employee productivity and maximize the performance of human resource development and management organizational systems (Luthans, 2011; Chams-Anturi, Moreno-Luzon and Escorcia-Caballero, 2019; Pangil and Nasurdin, 2019).

The application of OB theory using systematic methodologies results in a more accurate prediction than those based on intuition, which is necessary to generate management solutions adjusted to each organizational needs, instead of general solutions (Griffin and Moorhead, 2011; Robbins and Judge, 2013). Therefore, OB has become a critical aspect of organizational success if properly applied within the organization (Bateman and Crant, 1999).

Then, the purpose of this research is to study a current organizational behavior case, highlighting the theoretical foundations of organizational behavioral research, measuring and analyzing the behavior of

the individuals while facing changes in the environment, and defining practical implications for the entrepreneur.

Theoretical Framework

Organizational behavior (OB) is defined as the field of study that investigates the behavior of individuals within an organization, aiming to learn about their perceptions, values, and cognitive capacity in working environments (Davis and Newstrom, 2002; Chiavenato, 2009; Robbins and Judge, 2013; Mcshane, 2018; Mullins and Mclean, 2019). Chiavenato (2009) states that OB distinguishes an organization from other, even in the same economic sector. Also, stays that each person is subject to different influences, both external and internal, that affects his behavior in exclusives ways, and therefore his interaction with other people in the organization.

Psychological constructs such as attitudes, motivations, job satisfaction, perceptions, emotions, and decision making are popular ways to describe and analyze what goes into OB (Heath and Sitkin, 2001; Miner, 2003). As follows, we present a brief description of each.

I) Attitudes are statements of favorable or unfavorable evaluation of objects, people, or events. These reflect how a person feels about something. Attitudes are mainly composed of three components: cognition, affection and behavior (Breckler, 1984). The cognitive component of an attitude describes the belief of how a person sees things, for example, “my boss is unfair”. The affective component is based on the emotional part of an attitude, for example, “I dislike my boss”. Moreover, the behavior component of an attitude refers to a person’s intention to behave in a certain way towards someone or something, for example, “I will look for another job, because my boss does not listen to me”. These components are closely related, which denote a negative attitude towards the boss.

An individual has many attitudes, but regarding organizational behavior the number of attitudes at work is limited, these are positive or negative evaluations that employees have about various aspects of their work environment (Moreno-Luzon, Chams-Anturi and Escorcia-Caballero, 2018). Organizational behavior researchers have focused on three attitudes: work involvement, job satisfaction and organizational commitment (Brooke, Russell and Price, 1988). Other attitudes considered by researchers are organizational support and dedication of employees.

II) Job satisfaction is defined as the positive feeling resulting from personal work accomplishment (Robbins and Judge, 2013). Enjoying work highly correlates with greater intensity with high levels of satisfaction. The jobs that generate and provide their employees with greater training and independence satisfy most workers (Barling, Kelloway and Iverson, 2003). Employees prefer stimulating jobs that pose challenges versus a predictable and routine one.

Evidence also indicates that employees who are satisfied with their jobs increase customer satisfaction and loyalty (Schneider and Bowen, 1985). Satisfied workers are more friendly, optimistic and responsible, they are also less likely to change jobs, these are advantages appreciated for the client who receive a more familiar and experienced service (Bitner, Booms and Mohr, 1994).

III) Motivation affects the intensity, direction, and persistence of the effort exerted by a person to achieve a goal. Intensity refers to the energy applied by a person in reacting to events, which requires direction to get favorable results. Finally, persistence is the time in which the individual maintains the effort. Those people that are motivated remain on a task until their goal is achieved (Robbins and Judge, 2013; Pinder, 2014).

In the decade of the 50s, several concepts on motivation were developed, and four specific theories were formulated. (1) Theory of the hierarchy of needs, by Abraham Maslow, who raised the idea that each person has a hierarchy of five needs: physiological, safety, social, esteem, and self-realization (Maslow, 1954). (2) Theories X and Y, by Douglas McGregor, who proposed two visions of human

beings. A negative or X vision where the employee dislikes his work and must be directed, and another positive or Y vision where the employee likes his job and is self-responsible for it (McGregor, 1960). (3) McClelland's theory of needs, by David McClelland, focuses on three needs: achievement (based on the urge to excel and fighting for triumph), power (based on the need to make others behave according to a specific way) and affiliation (desire to have friendly and close relationships) (McClelland, 1961). And, (4) the theory of the two factors or theory of motivation and hygiene, by Frederik Herzberg, who states that the individual-work relationship and the attitude adopted to meet any work challenge, are fundamental to determine the success or failure of the job (Herzberg, Mausner and Snyderman, 1959). Although these theories are widely known, there are several arguments regarding their validity.

Recently, OB researchers have developed new contemporary theories of motivation, such as (5) The theory of cognitive evaluation, which introduces extrinsic awards for doing work that previously had intrinsic rewards (De Charms, 1968). (6) The theory of goal setting, which states the importance of establishing goals to increase performance (Tubbs, 1986). (7) The theory of personal effectiveness, or social cognitive theory or social learning theory, which refers to a person's belief in carrying out a task (Bandura, 1997). (8) The theory of reinforcement, which states the importance of reinforcement to get a desired behavior (Komaki, Coombs and Schepman, 1996). (9) The theory of equity, which encourages people to compare their work results (Ronen, 1986). (10) The theory of expectations states that a good evaluation of the employee performance will lead to a better performance, requiring organizational awards, such as salary bonuses (Robbins and Judge, 2013).

IV) Perception is the process in which people interpret the impressions they have of a situation to get a meaning of what happens in the environment. There are some factors that can distort the perception of people such as the recipient (e.g., motives and expectations), the object (e.g., news), and the situation (e.g., time) in which the perception unfolds.

There are also some valuable simplifications that allow subjects to get a quickly and accurately perception (Robbins and Judge, 2013): (1) Selective perception, useful when we highlight some stimuli to assimilate everything we see. This characteristic highlights a person, object or event to what is perceived. (2) Halo effect, which is when an impression of a person is outlined based on a characteristic such as appearance. (3) Contrast effect when evaluating and comparing characteristics of people. In addition (4) Stereotyping, where someone is judged based on the perception of the group on which they belong.

V) Emotions are defined as those feelings direct toward someone (Fridja, 1993) and usually transitory. Some examples of emotions are anger, fear, sadness, happiness, and surprise, accompanied by facial expressions and caused by specific events (Ashkanasy, Hartel and Daus, 2004).

The founder of modern philosophy, René Descartes, identified six primitive passions - astonishment, love, hate, desire, joy, and sadness - arguing that they compose all other emotions (Descartes, 1989). Charles Darwin took a broader approach, who suggested that emotions developed to help solve problems. Emotions motivated people to take actions to survive.

VI) Decision making occurs when an individual chooses between two or more alternatives. There are different ways to decide. (1) The rational model occurs when choices are made by maximizing value within constraints (Simon, 1986). These choices follow a method by first defining a problem, identifying the decision criteria, weighting the criteria, developing and testing alternatives, and finally selecting the best alternative. Several assumptions support this model, including that all information is available in order to choose a good alternative (March, 1994). (2) Bounded rationality, where the individual responds to the problem by reducing it to a level easier to understand (Kahneman, 2003); and (3) intuition, which although is considered to be the least rational of the options, is the most usual, this is an unconscious process formed from experience (Gilovich, Griffin and Kahnemann, 2002).

Before starting with the decision-making, it is important to know how to reduce biases and errors. Focusing on the goals facilitates the elimination of options that contradict interests, nullify excess of confidence, do not give meaning to random eventualities, and increase decision alternatives by developing a wide range of different elections.

Research Methodology

We analyze the organizational behavior using a case study in a retail store that offers consumer goods and operates nationwide in Colombia (referred as ABC company). To obtain the information, we worked with a structured questionnaire of 44 questions following the Robbins and Judge (2013) method. All items were measured using a Likert scale with values ranging from 1 (totally disagree) to 5 (totally agree). The questionnaire was applied to the ABC company interest group, which included commercial directors of each category, customs agency, international cargo agent and operators. The total population is equal to 65 participants. In order to calculate a proper sample size, we used the following calculation:

$$n = \frac{Z^2 * \mathrm{N} * \mathrm{p} * \mathrm{q}}{e^2 * (N-1) + Z^2 * p * q}$$

Where:
n: sample size
Z: degree of confidence
N: population
p: probability of success
q: probability of failure
e: estimation error

Replacing values;

$$n = \frac{0.95^2 * 65 * 0.5 * 0.5}{0.03^2 * (65-1) + 0.95^2 * 0.5 * 0.5}$$

$$n = 52 \text{ participants}$$

Then, our study was carried out on 80% of the total population (i.e., n= 52). The observation of the individuals and their specific behavior within the organization prevailed. Therefore, content analysis and participant observation are considered as a key part of the process.

We based our research on the six basic principles of qualitative validity (Robbins and Judge, 2013). (1) Credibility or internal validity, where different methods were combined such as the observation of the process, questionnaires and analysis of written documents. In addition, the research was carried out by people who are not part of the area under investigation, which reduces biases and guarantees the credibility of the study. (2) Transferability or external validity, although the results of the present investigation are not extrapolated to other organizations, the methodological experience can be applied to other commercial establishments. (3) Reliability, where studies developed with respect to the object of analysis were taken into account. (4) Confirmation, where the investigation was configured by the triangulation of methods, analysis of document content, observation and surveys. The data collected are analyzed by the researchers, which guarantees the objectivity of the research. (5) Integrity, where the identification of informants is reserved, maintaining relationships of trust with them. Finally (6) Consistency, where research seeks to respond to a need evidenced by researchers in one of the most important commercial chains in the country, in order to provide a solution to the problem described.

Results

We measured individual factors to study the organizational behavior of the ABC company using a survey questionnaire for the 52 participants. The results are as follow:

Demographic Information

From the 52 of responses obtained, we gather the following information:

1. 44% belong to senior management, 37% to middle managers, and 19% to professional and operational staff.
2. 44% of respondents are female. 56% are male. As for the average age, it is approximately 38 years old.
3. 88% of respondents have professional training in the postgraduate modality, which shows a high level of skills in specific areas within the process.
4. On average, the personnel surveyed are more than 3 years old in the ABC company. All of them know the strategy of the organization at each corresponding level.

Analysis of Results

Below are the results obtained for each of the factors - attitudes, motivations, job satisfaction, perceptions, emotions, and decision making - of the ABC company, accompanied by a behavioral analysis or a diagnostic description and a series of recommendations for each one.

Figure 1: Survey results

Attitudes

The results show that the individuals in the business process of the ABC company are not completed satisfied with their assigned work and their involvement in the organizational decisions. Results show low levels of organizational commitment and a perception of low organizational support and recognition.

Table 1: Attitude

AVERAGE	FINDINGS	PROPOSALS FOR IMPROVEMENT
3,6	✓ It is considered that immediate bosses and co-workers are friendly, organized and flexible. ✓ No significant features of irony or injustice on their part are denoted. ✓ Attempts to adapt to new team situations are evident. ✓ The staff is considered important for the ABC company, and they are committed to the quality of their work. ✓ Sometimes employees feel that their boss is unfair.	✓ Generate spaces for interaction with employees to forge effective communication and facilitating their social function. ✓ Promote the participation of employees in the changes that affect their work. ✓ Define communication actions that illustrate clarity in the process, both in the tasks and in the planned objectives, generating work empowerment.

Motivation

The individuals involved in the business process in the ABC company show a good level of motivation which involves intensity, direction, and persistence of the individual's effort towards achieving a goal.

Table 2: Motivation

AVERAGE	FINDINGS	PROPOSALS FOR IMPROVEMENT
4,2	✓ The employees consider that their leaders are aware of their skills. ✓ They also consider that their cognitive capacity has increase as an effect of the training processes received at the ABC company. ✓ Staff can ask questions and suggest modifications to the traditional way of doing things without any fear. ✓ There is a feeling of commitment, but sometimes the staff does not feel aligned with the direction of the ABC company. ✓ Recognitions and incentives are received for their actions, exalting their growth in the ABC company. ✓ Workers do not feel at all heard, but this gap is compensated with the training process, a respectful work environment, and remuneration according to the profile.	✓ Establishment of spaces to improve organizational communication, in which workers can express their feelings and meet their social needs.

Job Satisfaction

This factor involves several elements such as: activities, compliance with internal labor regulations, relationship with managers and colleagues, and performance criteria. This sample does not illustrate absenteeism or employee turnover.

The results show a good level of job satisfaction among the employees of the ABC company. The staff is satisfied and speak positively about the organization, help others, exceed the expectations of their job, and strive beyond their duty.

Table 3: Job satisfaction

AVERAGE	FINDINGS	PROPOSALS FOR IMPROVEMENT
4,2	✓ Employees are interested in the well-being of their colleagues. ✓ The leader of the process effectively directs his subordinates and gives them confidence in their work. ✓ Workers share that wages are proportional to what other companies offer. ✓ Staff can count on their bosses, feel their support, and consider that they are properly directed. ✓ They feel satisfied with their current work and have confidence to consult doubts and concerns, and cooperation from their peers. ✓ They believe that work is a good opportunity to grow and improve. ✓ The tools provided to perform their job require improvement.	✓ Generate interactive spaces between work teams, to encourage communication that is more effective. ✓ Design a formal mechanism for the evaluation of job satisfaction, considering alert indicators that allow constant monitoring of this variable.

Perception

The perception factor shows that personal involved in the business process in the ABC company are not correctly perceiving and interpreting the different situations presented at work.

Table 4: Perception

AVERAGE	FINDINGS	PROPOSALS FOR IMPROVEMENT
3,8	✓ The work area is adequate to perform daily functions. ✓ The workplace induction process is clear and adequate. Team work is encouraged at all stages. ✓ Leaders avoid rumors to arise. ✓ It is difficult for the group to work with people with weak work habits. ✓ Not everyone agrees that their work contributes to the institutional objectives.	✓ A performance evaluation system is suggested. A critical factor to evaluate is the impact generated by the achievements of workers in meeting the objectives of the ABC company. ✓ It is suggested to work on skills as resilience at the workplace to minimize unwanted behaviors among the employees while a new process is implemented.

Emotions

Emotions at the ABC company are properly shown among the employees.

Table 5: Emotions

AVERAGE	FINDINGS	PROPOSALS FOR IMPROVEMENT
4,0	✓ Employees are constantly encouraged to improve their cognitive capacity and skills. ✓ Employees consider that the ABC company has played an important role in their life and they feel proud to belong to it. ✓ Employees show properly manage of their emotions. ✓ Open communication channels are present. ✓ It is not easy for them to discuss their fears, or clearly demonstrate their joys and feelings. ✓ The employees are comfortable receiving compliments.	✓ Promote participation of employees in the planning of organizational changes. ✓ Generate interactive spaces between work teams, to encourage communication that is more effective.

Decision Making

The results show that employees in the ABC company are skillful in decision making. They are good at analyzing the situation, staying bias alert, combining rational analysis with intuition, and maintaining high levels of creativity.

Table 6: Decision making

AVERAGE	FINDINGS	PROPOSALS FOR IMPROVEMENTS
4,3	✓ Staff feel supported by their bosses. ✓ Problems are analyzed and alternatives for their solution are identified, verifying the possible risks and benefits. ✓ Creativity is a factor that helps new solutions, and participants feel responsible for them. ✓ Time and organizational alignment are obstacles in their performance.	✓ A performance evaluation system is suggested. A critical factor to evaluate is the impact generated by the achievements of workers in meeting the objectives of the ABC company. ✓ It is suggested to work on skills as resilience at the workplace to minimize unwanted behaviors among the employees while the new process is implemented.

Conclusions

According to the results, the success of the ABC business process is influenced by favorable characteristics of organizational behavior as motivations, job satisfaction, emotions, and decision making. In contrast to characteristics as perceptions and attitudes, which require a prompt intervention from the company to reduce their negative impact in current and future projects.

Then, some recommendations for intervention are:

(1) Design a communication plan for all levels of the organization for implementation of current and future projects.

(2) Open spaces of communication must be designed to promote integration, personal and professional development, and employee's recognition, in order to generate favorable changes on the organizational behavior of workers involved in the process.

(3) Implement positive reinforcement motivation strategies. This reinforcement must be supported by specific achievements, which must be previously arranged and communicated. Also, these should be aligned with the goals of the organization. Productivity results can be also considered.

(4) Designing and implementation of an intervention for the control of emotions, especially in those who have the responsibility to negotiate with external suppliers and internal clients. An important section of the success in the performance of the process corresponds to the purchase price of the products imported and the management of the inventory.

(5) Considering that the information generated by the process is shared, it is necessary to reconcile the entire structure to favor and potentiate these advantages. We suggest to improve communication down and up into the organizational levels. Establishing interdisciplinary teams to make strategic decisions that would allow to measure the performance with the suggested motivation strategy.

The study of organizational behavior provide to managers challenges that can be considered as opportunities for business growth. It can improve employee productivity, as it teaches managers how to treat their staff, understand how to implement change programs, and helps employees to balance the different conflicts between work and their lives (Robbins and Judge, 2013; Wagner and Hollenbeck, 2014; Mullins and Mclean, 2019). In addition, organizational behavior offers managers a useful guide to create a healthy work environment by stimulating the innovation of their employees. We believe that the described intervention recommendations will generate positive results into the organizational behavior for the ABC company and will be key to contributing on its increase of productivity.

pawel.baran@usz.edu.pl

Abstract

The main goal is to evaluate the accuracy of intra-Community trade data. An additional goal is to assess whether there is a structural difference in the quality of data reported by the 'old' and the 'new' Member States. The data on international trade are stored in the form of mirror data. It appears, however, that the data collection processes in different EU Member States are incompatible and that is why mirror data often do not match. The discrepancies between recorded values may cause numerous problems in various macroeconomic analyses. Fortunately, there exist ways to spot data inconsistency and to partially resolve the problems arising. The Authors used methods of testing the accuracy of the data on international trade found in the literature and their own. We used data from the COMEXT database provided by Eurostat. Data regarding intra-Community trade in 2016, 2017 and 2018 were used. We calculated data discrepancy indices for individual Member States and for groups of countries and performed Kruskal-Wallis tests to confirm the differences between them. The study reveals a significant, structural difference between the 'old' and the 'new' Member States in respect to intra-Community trade data accuracy. Some 'new' Member States, however, quickly adopted the high data quality standards which we also pointed out. In the latter part of the work a comparison of the data on ICA and their mirror ICS was done for the EU Member States divided into groups of 'old' EU15 countries that were members before 2004 and the 'new' EU13 countries. The results of this research can be used by both public statistics and tax administrations. They can also provide a value to researchers conducting macroeconomic analyses in a broader sense.

Keywords: Official Statistics Data Quality, Mirror Data, Intra-Community Trade, EU.

Introduction

On a country level INTRASTAT is a system for collecting, aggregation, control and processing of data on trade in goods shipped between EU member states (known as intra-Community trade). On the EU's level it is rather a system of public statistics on intra-Community trade. Eurostat performs data aggregation from files collected in all member states and disseminates the data in the form of Comext database.

The details of data collection procedures differ between member states, hence mirror data on the intra-Community supplies (ICS) and on the intra-Community acquisitions (ICA) are not fully compatible. Mirror data are information on the same transactions as recorded in official statistics of both countries of dispatch and acquisition (Fig 1). Differences in declared values of transactions between partner states measure the accuracy of data collected which is a dimension of overall data quality (Markowicz and Baran 2019b).

Fig. 1: Mirror data in intra-Community trade

The aim of the analysis presented below was to assess the accuracy of data on intra-Community trade in goods within the old fifteen Member States and the new thirteen Member States as well as between these groups, and to indicate which directions have affected the observed inequalities between mirror data the most.

The authors have put a hypothesis that countries of the old fifteen (EU15) as a group are different from the new thirteen (EU13) according to quality of statistical data on intra-Community trade in goods. Another hypothesis was that the differences in mirror data between said groups should be decreasing over time which would lead to an appropriate decrease in data quality index levels.

Dividing the EU into the 'old' and the 'new' Union is straightforward from the point of view of the time of accession. It seems safe to assume that the 'old' 15 countries provide better data quality based on their long lasting experience in monitoring and correcting typical errors that exist in country-level INTRASTAT databases (since they're in INTRASTAT system from 1993). We verify this statement in our study.

Literature Review

Data on foreign trade, including intra-EU trade in goods, are of a bilateral nature and are called mirror data (Eurostat 1998). A synthetic review of the proposed methods of analysing mirror data is presented in a research study by Markowicz and Baran (2020).

According to Guo (2010), the first researchers to observe and describe data asymmetries in foreign trade were Morgenstern (1963) and Tsigas et al (1992). Morgenstern studied differences in data on world exports and imports. In Tsigas et al (1992) the appropriate balance between declared export and import values resulting from differences in the treatment of transport and insurance costs by the declarants is raised. The CIF/FOB ratio was also described by Carrère and Grigoriou (2014).

The methods of studying differences in mirror data proposed in the literature are used to study different relations (between two countries or between a country and a group of countries). Proposals for methods and studies for pairs of countries are described by Morgenstern (1963), Parniczky (1980), Ferrantino and Wang (2008), Guo (2010), Hamanaka (2012), Carrère and Grigoriou (2014), HMRC Trade Statistics (2014), Bogdanova et al (2017) and Eurostat (2017b). Some surveys focus on the analysis of data differences between a country and a group of countries, i.e. in one-to-many relations (Federico and Tena 1991; Hamanaka 2012). The methodological proposals mainly concerned the intensity index and when aggregation was used, it concerned goods or countries, but the values of exports and imports (and not the differences) were added up.

Data and Methodology

For the survey COMEXT data for 2016, 2017, and 2018 were collected through Eurostat's bulk download facility. All three datasets contain values (in EUR) of dispatches and acquisitions for every EU Member State collected from individual trade transactions with all other EU member states. In our survey data quality is represented by data accuracy and the level of data accuracy depends on the

differences between declared supply and mirror acquisition (recorded in a partner country).

In the survey two types of indices were used to measure the quality of data on intra-Community trade in goods; these are individual and aggregated indices described below (Markowicz and Baran 2019a).

Comparison between Eurostat's data on ICS and their mirror ICA for all pairs of EU Member States was made with the use of the individual index of data quality (sometimes referred to as relative asymmetry (Eurostat 2017a)), defined as follows:

$$W_E^{AB} = \frac{E_{AB} - I_{BA}}{K} \tag{1}$$

where:

E_{AB} – declared dispatches (supply) from country *A* to country *B*,

I_{BA} – declared acquisitions by country *B* delivered from country *A* (mirror data),

$K = \frac{E_{AB}+I_{BA}}{2}$ or $K = I_{BA}$ or $K = E_{AB}$.

Data on trade between single countries and groups of 15 'old' Member States or 'new' 13 Member States were compared with the use of indices (ZW) of data quality (asymmetry), given by:

$$_{Z}W_E^{A,EU} = \frac{\sum_{i=1}^{n} \left| E_{AB_i} - I_{B_iA} \right|}{K} \tag{2}$$

where:

E_{AB_i} – declared dispatches (supply) from country *A* to country B_i (EU member state),

I_{B_iA} – declared acquisitions by country B_i delivered from country *A* (mirror data),

$K = \sum_{i=1}^{n} \frac{E_{AB_i}+I_{B_iA}}{2}$ or $K = \sum_{i=1}^{n} I_{B_iA}$ or $K = \sum_{i=1}^{n} E_{AB_i}$.

In the survey the values of *K* in formulas (1) and (2) were computed the first way, i.e. as the sum of exports and mirror imports divided by two, i.e. as the mean value of supply and mirror acquisition (which can be treated as a hypothetical value of supply). Such a policy let the authors avoid favouring one of the sides.

An individual index of data asymmetry (1) takes values from −2 to 2. Its positive value means that declared supplies were greater than declared acquisitions in the partner state. Aggregated indices of data quality can take values from 0 to 2. Use of the absolute values of differences between supply and acquisition protects us from compensating those differences of different signs.

Research Results

In the first part of the survey we analysed the quality of data on trade between every pair of EU countries. We hypothesised that the level of data inaccuracy, measured with index (1) absolute values will be smaller in the group of 'old' Member States on average which could be explained with the long lasting experience of both businesses and statistical offices in these countries. To verify the hypothesis, we computed all the individual indices of data quality and divided them into four groups: the 'old' Member States compared with their own group (O-O), the 'old' Member States compared with the 'new' Member States (O-N), then the 'new' Member States compared with the 'old'(N-O) and within their own group (N-N). Part two of the survey refers to the analysis of data quality in the trade between a country and groups of the 'old' and the 'new' member states. This time we used aggregated indices (2) which are preferred in mirror data asymmetries aggregation (Markowicz and Baran 2020). The third part of the survey is a formal verification of the hypothesis that the 'old'

EU15 countries differ significantly from the 'new' EU13 according to quality of INTRASTAT data. We used Kruskal-Wallis' (1952) and Dunn (1964) post-hoc tests to verify hypotheses that that distributions of individual indices vary between groups of the 'old' and the 'new' EU Member States.

The lowest calculated values of index (1) were shown in Fig 2, in which we presented five values of the index in every group of directions (namely the 'old' EU15 to EU15, the 'old' EU15 to the 'new' EU13, the 'new' EU13 to EU15, and EU13 to EU13). The subsequent values from top to bottom, either positive or negative, indicate the pairs of countries with the best quality of mirror data in each of the groups of directions. The lowest of the observed index values is for the Lithuanian ICS sent to Latvia (LT-LV 0.000014). However, considering the four groups of directions, the best quality of data is characteristic to transactions between the 'old' EU15 countries (top-most group in Fig. 2 and 3, cf. also Fig 12). Latvia and Romania are the two of the 'new' Member States that have a number of low values of index which can be interpreted as the highest overall quality of data. We consider these countries as the early adopters of the highest standard of INTRASTAT data collection.

Fig. 2: The lowest indices of mirror data quality among pairs of EU member states in 2018

In Fig 3 the highest values of these indices were presented (again every group of directions is represented by 5 indices). Among these four groups the highest (i.e. the worst) values are for transactions between the 'new' EU13 countries, the highest two being for trade between Cyprus and Hungary (CY-HU; –1.9049), and Malta and Estonia (MT-EE; –1.7969). Two countries with the lowest data quality are Cyprus and Malta according to our survey.

Fig. 3: The highest indices of mirror data quality among pairs of EU member states in 2018

In the second part of the survey the aggregated indices of data quality (2) have been used to measure the quality of data on ICS of a specific country against aggregated mirror data from all partner countries of the 'old' EU15 or the 'new' EU13 group. Figs 4-5 present the values of such indices calculated for every country in the 'old' EU15 group against all the countries in EU15 and in EU13. Figs 6-7 show the values of the appropriate indices calculated for every country in the 'new' EU13 against all the EU15 and the EU13 groups' members, respectively. The actual values of declared ICS and mirror ICA are also shown in these charts in order to prove that the values of data quality index are not correlated with the amount of goods traded by the countries. In the 'old' EU15 trade it's Germany occupy the first position (Fig 4) both in terms of data quality index and in trade turnover. However, the second position according to the quality of data belongs to Austria, which is ranked eighth in terms of trade turnover. The values of indices for this group of countries are relatively low, from 0.0486 (Germany) to 0.1857 (Greece). In the trade between EU15 and EU13 countries the prevalence of Germany's trade is even more explicit (Fig 5), but Belgium has the best quality data. Indices are from 0.0534 to 0.6151 (Luxembourg, which is an outlier accompanied by Ireland). Within the group of 'new' Member States their ICS are dominated by Poland (Figs 6 and 7). However the quality of Polish data tops the ranking within the group only, with Bulgaria being the country with the highest quality of data on trade with the 'old'EU15. The values of data quality index are not high except for those of Malta and Cyprus – in the case of the trade within the 'new' EU13 group they even exceed 1 which indicates low quality of statistical data.

Fig. 4: Aggregated indices of data quality for ICS – EU15 in 2018

Fig. 5: Aggregated indices of data quality for ICS – EU15 to EU13 in 2018

Fig. 6: Aggregated indices of data quality for ICS – EU13 to EU15 in 2018

Fig. 7: Aggregated indices of data quality for ICS – EU13 in 2018

We calculated the aggregated indices in all groups of countries for 2016, 2017, and 2018. The charts (Figs 8-11) show that the quality of data in 2016 was slightly higher than in 2017 and 2018. In most cases the values did not exceed 0.2, and the most equal values can be observed for the trade within the group of the 'old' Member States. In all the charts containing indices calculated for directions to od from the 'new' Member States there are evident outliers, i.e. there exist countries with lower quality of data – in Fig 9 it's Ireland and Luxembourg, in Figs 10 and 11 it's Malta and Cyprus.

Fig. 8: Aggregated indices of data quality for ICS – EU15 in 2016-2018

Fig. 9: Aggregated indices of data quality for ICS – EU15 to EU13 in 2016-2018

Fig. 10: Aggregated indices of data quality for ICS – EU13 to EU15 in 2016-2018

Fig. 11: Aggregated indices of data quality for ICS – EU13 in 2016-2018

To check whether data quality varies between the 'old' EU15 and the 'new' EU13 we utilized a following approach. Countries were divided into two groups, then individual indices of data quality fell into four groups: O-O (ICS direction: from the 'old' to the 'old' Member States; 210 indices were grouped together), O-N (the 'old' to the 'new'; 195 indices), N-O (the 'new' to the 'old'; 195 indices), and N-N (the 'new' to the 'new'; 156 indices). For such groups of indices Kruskal-Wallis test was performed to investigate the differences between the aforementioned four direction groups. Then we performed post-hoc analysis using Dunn test (with Bonferroni correction for multiple comparisons) to show for which pairs of groups the differences are significant.

We chose the Kruskal-Wallis for its flexibility; the distributions of the variables do not have to be normal, the groups do not have to be either of equal size nor of equal variance. Observations in a group should be independent. Identified groups include the same countries, which may suggest that the data were generated in a similar process. However, in an individual country, data are generated by

obliged entities that export or import goods. As transactions in particular directions are usually carried out by different entities, they are independent. No formal test was carried out to check this property.

INTRASTAT data from the Comext database are not complete. This is the reason for the authors' research on their quality. The available dataset contains gaps and errors, therefore we treated them as a sample. In Fig 12 individual indices' distributions are shown concerning transactions within groups described above. The least varied are indices for the trade within the first group (O-O). Other groups are characterized by a huge variance. Table 1 presents the results of Kruskal-Wallis and Dunn tests. It turns out, there are significant differences in data quality between groups of the 'old' and the 'new' Member States divided into four ICS direction groups. Analysis of all pairs of direction groups shows no evidence of significant difference between N-N and N-O (i.e. ICS from the 'new' member states), between N-N and O-O (ICS within groups) as well as between O-N and O-O (which renders to ICS from 'old' member states altogether). Significant differences exist between directions in groups of N-N and O-N, N-O and O-N, as well as between N-O and O-O. And this confirms the existence of systematic differences in quality of data on trade in goods between the 'old' and the 'new' EU Member States. The greater variance in all direction groups originating or ending in the 'new' Member States indicates a lower quality of data on transactions of the 'new' EU13 group. Medians and quartiles of indices in O-N, N-O, and N-N groups are of higher absolute values than for O-O group (Fig 8). This means that errors and data gaps which affect the index value appear more frequently in the mirrored declarations of the EU13 traders and their trade partners.

Fig. 12: Distributions of data quality index in four groups of directions (containing all directions of dispatches between the 'old' and the 'new' EU), 2018 data

Table 1: The results of Kruskal-Wallis and Dunn tests

Kruskal-Wallis Test		
EU – 4 groups of directions combined		$\chi^2 = 41.3925$ (**)
Dunn Test		
N-N	N-O	$Z = -1.3840$ (–)
N-N	O-N	$Z = 4.2029$ (**)
N-N	O-O	$Z = 2.5056$ (–)
N-O	O-N	$Z = 5.9257$ (**)
N-O	O-O	$Z = 4.1579$ (**)
O-N	O-O	$Z = -1.8766$ (–)

*significance level 0.05; ** significance level 0.01

Conclusions

Our research was conducted with the use of Eurostat's COMEXT data of 2018. The level of quality of data on trade in goods among EU member states is a consequence of differences between declared supply and mirror acquisition (recorded in a partner country).

The most important conclusions from the study can be stated as:

- The quality of data on intra-Community trade in goods for EU can be assessed with the use of INTRASTAT data (declared ICS and ICA values confronted with their mirror data) using data quality indices (relative asymmetry indices).
- EU15 countries are characterized by more level values of data quality indices and on average share a higher data quality than EU13 countries.
- The least varied are indices for trade within first group (O-O). Other groups are characterized by huge variance.
- It is possible to separate countries of definitely lower data quality; these are Malta and Cyprus within EU13 or Ireland and Luxembourg within EU15.

Such an analysis can help monitoring of the country-level INTRASTAT data quality; it can also be useful in finding and tackling anomalies that appear in intra-Community trade.

Marketing Tools in The Process of Building The Relationship Between The Cultural Institutions And Citizens of The City Divided by The Border

Lukasz WROBLEWSKI

WSB University, Faculty of Applied Sciences, 41-300 Dąbrowa Górnicza, Poland
E-mail: lwroblewski@wsb.edu.pl

Abstract

The concept of relationship on cross-border cooperation in sphere of culture has been recognised as very important in global strategic documents of European Union for more than a two decades. It is also increasingly reflected in the cultural polices of particular states, and-very importantly-cultural managers who are responsible for shaping the cultural offer in euroregions are becoming more interested in this concept. Despite the increasing attention being paid to this topic among both practitioners and theoreticians of management, in none of these documents or other works can we find content that is directly related to the cities divided by the border. This gap was the direct impulse for taking up research in this field. Based on in-depth interviews carried out with fifty experts from the Polish and Czech side of the city divided by the border (Cieszyn PL - Czech Cieszyn CZ) the possibilities of marketing tools in the process of building the relationship between the cultural institutions and citizens of the city divided by the border were recognized. The conducted research shows that Polish and Czech managers of cultural institutions differ in terms of the key tools of the marketing. In their opinion they should have a primary application at the stage of establishing and strengthening relationship, connecting cultural institutions with Polish and Czech citizens of the city divided by the border. According to Polish experts the key tool for building relationships (establishing and strengthening relationship) is marketing communication, whereas in the opinion of Czech respondents these will be activities related to shaping the product.

Keywords: Relationship Marketing, Marketing Tools, Cultural Institutions, Citizens, City Divided By The Border, Cross-Border Market.

Introduction

Changes taking place in the cultural sector (growing competition, the virtualization of consumption, development of new technologies, and globalization) clearly show that cultural institutions in the cities divided by the border must create long-term relationships with citizens of both sides of border in order to secure their future existence. The traditional concept of marketing is increasingly being criticized. The cultural institutions in the cities which use classic marketing primarily focus on acquiring as many new customers or donors as possible, often neglecting their present, often most valuable customers. The concept of relationship marketing enables us to take a modern look at the nature of the interactions and relationships between the cultural institution and the various segments of citizens located in the city divided by the border (Grönroos 2004, Palmatier et al. 2008, Peck et al. 2013, Sobocińska 2017).

The main goal of this paper is to explaining the significance and weight of marketing tools (product, price, place, promotion and people) used by Polish and Czech cultural institutions in the process of building relationship with citizens (recipients of their offer) on both sides of the border.
In this article, a research hypothesis was adopted according to which it is assumed that: Polish and Czech managers and employees of cultural institutions located in the cities divided by the border from marketing tools such as product, price, place, promotion and people find product as the most

important instrument in the process of establishing and strengthening relations with Polish and Czech citizens - recipients of cultural offer. The product, which according to the assumptions of cross-border cooperation, should be tailored to the needs of recipients on both sides of the border. In order to verify the adopted research hypothesis for the purposes of the article, interviews were conducted in the form of individual in-depth interviews (IDI) with fifty experts - directors of cultural institutions, creators, animators, heads of communes, officials, organizers of cultural projects on the Polish-Czech border (twenty-five experts from the Polish side and twenty-five experts from the Czech side of the small city Cieszyn- Czech Cieszyn).

The Process of Forming Relationships - The Theoretical Approach

Relationship marketing is a marketing concept which has been developing since the early 1980s and is currently considered to be the dominant paradigm in this field, gradually displacing the concept of transaction marketing (Egan 2008, Hollensen 2015). Relationship marketing in cultural sphere is a philosophy that developed out of the need for maintaining a base of current customers (citizens of the city divided by the border) who are committed to the cultural institutions. In relation to the services market, the change in marketing towards building lasting relationships with customers came in 1983 when Berry (1995) first described the whole concept of relationship marketing as a concept for the management of a services company. He distinguished five strategic elements of the application of relationship marketing, which today represent the theoretical basis of the concept: developing core services, adapting the offer to the expectations of the individual customer, enriching the core service with special benefits (added value), pricing to stimulate consumer loyalty, and undertaking intensive marketing activities in regard to one's own employees. According to Berry (1995) it involves strengthening relationship with current customers and retaining them rather than acquiring new ones. The logic underlying relationship marketing in cultural sphere is that customer relationship should be approached on a long-term basis such that customers acquired are retained (Dibb and Meadow 2001). Shani and Chalasani (1992) assert that a long-term relationship with customers enables the cultural institutions to add value to its offerings. Accordingly, relationship marketing is an "integrated effort to identify, maintain and build networks with individual consumers and to strengthen continuously the network for the mutual benefit of both sides, through interactive, individualized and value-added contacts over a long period of time" (Shani and Chalasani 1992, Hollensen 2015). This definition buttressed the existence of interpersonal relationship built between exchange partners through continuous interactions. Such interaction between exchange partners is a necessary precondition for strengthening relations between exchange partners and a predictor of long-term relationship (Kim et al. 2004, Peck et al. 2013). Citizens' expects a positive outcome in the form of value and convenience in their interpersonal relationship with service provider just as cultural institutions' desire sustainable relationship. Thus, confirming Ndubuisi (2007) assertion that the concept of relationship marketing in cultural institutions growth strategy is possible to reach through a mutual and symbiotic relationship that guarantee a clear understanding of the customers' needs such that superior value is created and deliver. In other words relationships are achieved by mutual symbiosis and fulfillment of promises.

Building long-term relationships by cultural institutions located in the city divided by the border is a continuous process and does not end when a citizen is persuaded to participate in an cultural event. Forming lasting relationships goes beyond a single transaction and is cyclical in nature. This means that the cultural institution located in the city divided by the border and citizens (consumers of the cultural offer) pass through successive, repeated stages. If the course of a given cycle of the relationship is undisturbed, the partners in the exchange start a new cycle. Passing through subsequent cycles is a prerequisite for the continuation of the relationship (Furtak 2005, Claycomb and Martin 2013). The process of cultural institutions building long-term relationships with the citizens (consumers of cultural offers) is presented in Figure 1.

Fig. 1: The process of forming long-term relationships by cultural institutions with the citizens of the city divided by the border

In the process of building long-term relationships, we can distinguish two main phases: the initial phase - the creation of a relationship (this phase ends when a citizen of the city divided by the border is persuaded to participate in a cultural event) - and the main phase of strengthening of the relationship (which is a closed cycle and continues for a longer time). The main objective of the initial phase is for the cultural institution to establish ties with selected Polish and Czech citizens of the city divided by the border (consumers of the cultural offer). This phase can be divided into three stages: the first stage consists of identification of target citizens, the second stage of offering value to potential customers (the main benefit), and the third stage of acceptance of the cultural institution's offer by the citizens (or its rejection) and their decision to purchase the cultural services. The initial phase of building a relationship is therefore synonymous with the classic marketing process.

A characteristic feature of the main phase is the cyclical implementation of subsequent stages of relationship marketing: creation and delivery of value, re-offering value, accepting value, creation of and delivering value, etc. This is the basis on which the relationship is continued and deepened. In this phase, the citizens (consumers of the cultural offer) beside the main benefits are offered additional benefits by the cultural institution, such as a loyalty programs for Polish and Czech citizens. Breaking this cycle means breaking the relationship between the cultural institution and the citizen. Therefore, it is important to constantly monitor the process of relationship marketing, and not only the achievement of the objectives of the cultural institution, but also to constantly monitor the so-called critical moments, such as the rejection of the value offered by the institution (Kinard and Capella 2006). The inclination of the consumer of the cultural offer is determined by their beliefs and emotions regarding the Polish and Czech cultural institution and has been shaped by the previous interactions. Therefore, the creation of long-lasting relationships in cultural institutions requires a departure from the traditional way of doing business. The basis of such a system is to create exceptional values for the citizens (consumers of the cultural offer) rather than maximizing profits.

Materials and Methods

The field of research in the article is a city, which after the end of World War I, was divided into Cieszyn on the Polish side of the border (about 36,000 inhabitants) and Czech Cieszyn (Czech Republic, with approximately 25,000 inhabitants). It is a system of cities that, in 2007, entered the so-called Schengen Area, i.e. a visa-free movement without border checks (Figure 2).

Fig. 2: Location of the border cities Cieszyn (PL) – Czech Cieszyn (CZ)

Despite the opening of borders the functioning of cultural institutions both on the Polish and Czech side of the city are still intertwined with the past history. That is, not only the most recent history, but that going back hundreds of years. The cultural offer of both cities is being developed by numerous cultural entities whose offers are not limited only to the consumers on one side of the border (Wróblewski 2017, Wróblewski et al. 2017). Despite the relatively small size, the city as a whole has two theatres. The Polish side has the Adam Mickiewicz Theatre, and the Czech side has a theatre with a double, Polish and Czech, stage. What is particularly interesting, the Polish stage located in Czech Cieszyn is financed by the Czech marshal's office without subsidies from Polish sources. Two large cultural centres operate in the city, important cultural spots include also the Municipal Library in Cieszyn, the Municipal Library in Czech Cieszyn, the Avion Reading Room and Literary Café Avion, the internationally known Cieszyn Castle, involved in the area of design, the Museum of Cieszyn Silesia, as well as the Cieszyn Old Library, having many unique publications spanning over the last five hundred years. Cultural offer for both cities also includes the activities of associations. The most prominent ones include the Olza Association for Regional Development and Cooperation, the Polish Cultural and Educational Association, the Polish Congress in the Czech Republic, the Culture on the Border Association, the Man on the Border Association, the Polish-Czech-Slovak Solidarity and the Education Talent Culture Association in Czech Cieszyn. We should also not forget about the more or less significant initiatives and places held in private hands. Such places also enrich the cultural offer of this unique city. These include the Kornel i Przyjaciele Literary Café, the Laja Tea House, the Dziupla Club or events like the series of charity concerts called Aktywuj Dobro. The above group is enriched by activities in the social sphere, undertaken by 3rd sector organisations, for example, the Być Razem Association for Mutual Assistance (Wróblewski et al. 2018).

Individual in-depth interviews with representatives of the Cieszyn cultural institutions (25 interviews) and Czech Cieszyn cultural organizations (25 interviews) were carried out from August to December 2018. The list of people interviewed included the directors of all Polish and Czech local cultural institutions, heads of cultural departments in the city Cieszyn and Czech Cieszyn, cultural organisers and employees of cultural institutions. The questionnaire of the interview (in Polish and Czech)

contained a total of seventeen questions, of which nine were short projecting questions based on associations and supplements, while the next eight questions were open-ended deep questions, based additionally on the seven-point Likert scale. The studies were preceded by consultations with employees of cultural institutions operating in the Euroregion Cieszyn Silesia. The purpose of the consultation was to check the accuracy of the research assumptions along with testing the prepared research tool. Discussions in the relevant forums have allowed the refining of the final version of the guidelines for the interview, as a result it was possible to start proper research.

Results

The first topic concerned the impact of marketing tools such as product, price, place, promotion and people on establishing and strengthening relations of cultural institutions with the citizens of their own (national) side of the city Cieszyn-Czech Cieszyn. The experts were asked to distribute 100 points between individual marketing instruments. The results are presented in Figure 3.

Fig. 3: The impact of marketing tools on establishing and strengthening the relations of cultural institutions with the citizens of their own (national) side of the city Cieszyn-Czech Cieszyn

The answers obtained from Czech experts show that it is a product (cultural offer) of a cultural institutions - its further development, modification in order to better match the needs of recipients that plays a key role in establishing and strengthening the relations of cultural institutions with recipients (citizens) of their own (national) side of the city Cieszyn-Czech Cieszyn. However Polish experts have recognized that it is not a product, but better marketing communication (promotion) which is important for establishing (34.2 points) and strengthening relations (30.3). Polish experts stated that the product offered by their cultural institutions is well suited to the needs of recipients from the own (national) side of the city and does not require significant changes or modifications, but it is necessary to use more advanced based promotion instruments, such as social media and new technologies. The experts also stated that cultural institutions are combined with strong, lasting

relations with recipients of the offer from their own (national) side of the city. Forty four experts gave such answers, which included 21 respondents from the Polish side and 23 from the Czech. Justifying their opinion, they pointed to: large attendance at organized cultural events, a growing number of book borrowed from the library, a large number of visits of the official website of the institution, frequent expressions of fondness shown on the occasion of the anniversary celebrations, a large number of likes on the posts or photos published on the official social profile of the institution, high interest in organized competitions or meetings, and the growing number of volunteers who willingly joined the organization of cultural events.

Importantly, the statements of both Polish and Czech experts show that at the phase of strengthening relationships, the price of the product, as well as activities related to its promotion lose (compared to the phase of establishing relationships). On the other hand, the product is gaining in importance (product quality or activities making up the extended product), as well as the activities of the personnel of the cultural institutions (its professionalism, empathy, kindness or enthusiasm).
The experts were asked also about the impact of marketing tools such as product, price, place, promotion and people on establishing and strengthening relations of cultural institutions with the citizens of other (foreign) side of the city Cieszyn-Czech Cieszyn. Similarly to the previous practice, the experts had to split 100 points between individual marketing mix instruments (product, price, distribution, promotion and staff). The results are presented in Figure 4.

Fig. 4: The impact of marketing tools on establishing and strengthening the relations of cultural institutions with the citizens of the other (foreign) side of the city Cieszyn-Czech Cieszyn

In the opinion of Czech experts cultural institutions wishing to establishing and strengthen relations with the recipients from the other side of the border should first focus on the product, which in their opinion, in its current shape, is not well suited to the needs of residents from the neighboring country

(e.g. libraries do not have book collections in Polish and Czech, cinemas display films only in one language version - no subtitles in the other language). This instrument (product) obtained the highest number of points (57.1). However, Polish experts, unlike the Czech experts, decided that this promotion should play a key role in the process of establishing and strengthening relations with citizens from the other side of the city Cieszyn-Czech Cieszyn. In their opinion, in order to strengthen ties with the recipients on the other side of the border, it is first necessary to reach those recipients with properly prepared information about the cultural offer that is available in the neighboring country. The offer, in the opinion of Polish experts may be in its current shape equally, and maybe even more attractive than that of the one available abroad.

Discussion and Conclusion

Interactions, cultural institutions–citizens of the city divided by the border, in early phase of development they are generally transactional form. For relationships to migrate from this state in a positive manner, stronger relational bonds must develop through increased commitment and trust (Morgan and Hunt 1994). In the other hand, repeated interactions and positive evaluations of reciprocal behaviors build long-term relationships (Cannon, Achrol, and Gundlach 2000; Heide 1992). Performance likely improves in step with stronger relational development, representing significant value creation through sales growth, for example. Jap and Anderson (2007) define this pattern of change as an exploration relationship migration mechanism, because the customer explores the value creation potential of the relationship and demonstrates a willingness to share rewards and costs as their relational bonds strengthen.

Identifying value-creating opportunities and building norms to share value between cultural institutions and citizens in the city divided by the border are both key to exploration migration and the continuation of the relationship beyond arm's-length, one time transactions. Considering that initial phase of building long-terms relations refers to the search, trial and compare (Dwyer and LaGace 1986; Brown and Hayes 2008) cultural offer which is available in the city divided by the border, with the goals such as uncertainty reduction and an assessment of the potential value of continued interactions (Jap and Anderson 2007), two strategies such as strategy of product and strategy of marketing communication could be an effective for facilitating the exploration mechanism.

Strategy of product fulfills the trial aspect of exploration (initial phase) by capturing the cultural institution's offer and the variety of desirable products available to meet Polish and Czech customer needs (Dwyer and LaGace 1986; Brown and Hayes 2008). Because trials may include extended periods of testing and evaluation, an appropriate strategy of product provides an avenue through which value of the cultural offer may develop and build the relationship (Vitkauskaitė 2015). Marketing communication refers to the amount, frequency, and quality of information shared between Polish and Czech cultural institutions and citizens of city divided by the border (Mohr, Fisher, and Nevin 1996), such that it facilitates the search aspect of exploration. The flow of information from the cultural institutions reduces customer uncertainty as well as facilitates the search and identification of value creating opportunities (Mohr, Fisher, and Nevin 1996). In addition, communication helps establish the goals and relational norms needed to manage the exchange on the cross-border market (city divided by the border) and ensure an equitable division of value, which in turn increases confidence about investing for further value creation (Jap and Anderson 2007).

Strategy of product and strategy of marketing communication directly address the primary roles of the exploration mechanism (search and trial), which provide to increase the likelihood that a relationship migrates from a less developed to a more developed relational state. From initial phase to the main phase of strengthening of the relationship (which is a closed cycle and continues for a longer time). Both product and marketing communication are relatively low-risk, high-reward strategies compared with relationship-specific investments, which can be costly and ineffective when deployed without due diligence to identify needs or value-creating opportunities (Brown, Dev, and Lee 2000).
Transitional relationships working toward the long-term relationship between Polish and Czech cultural institutions and citizens of city divided by the border must continue to develop trust,

commitment, and relational norms to persist in strengthening relational bonds. In contrast with exploration of initial phase, relational norms are already present at sufficient levels to depth develop cultural institutions–citizens interactions in semi advanced relationship states of this type (Dwyer, and LaGace 1986; Heide 1992). The crucial state variable to migrate to the most developed relationship is dependence, which can lock in a cultural recipients and prevent switching. It arises when the Polish or Czech cultural institutions can offer, or endow, customer benefits that would be difficult to procure from other sources (Hibbard, Kumar, and Stern 2001). This endowment migration mechanism induces stronger relationships, with a great increase in dependence (Dwyer and LaGace 1986; Jap and Anderson 2007).

Given that relationship endowment (i.e., expansion or exploitation) refers to the continual increase in benefits obtained by exchange cultural institutions with citizens of the city divided by the border and to their increasing interdependence (Dwyer and LaGace 1986, Brown and Hayes 2008), author believes two strategies from extant literature are most effective for facilitating the strengthening of the relationship: seller and customer relationship investment. Research conducted by Palmatier et al. (2007) indicate the key role of relationship investments, or "time, effort, spending, and resources focused on building a stronger relationship". These investments leverage cultural institution' value-creating capabilities by providing the resources necessary to exploit opportunities identified during the exploration mechanism (De Wulf, Odekerken-Schröder, and Iacobucci 2001) and thus increase exchange performance and benefits accrued from the relationship. Although a cultural institution can invest resources to induce a more effective cultural offer through traditional means, such as accurate citizens segmentation in the city divided by the border, targeting, and positioning to inform the development of its product line, Kahn (1998) states that these resources do not necessarily improve the customer relationship.

Relationship investments are very effective strategies for increasing the dependence of an exchange partner because the difficulty of redeploying resources to other exchanges mitigates concerns of opportunism and signals ongoing support for further investments (Heide 1992; Scheer, Miao, and Palmatier 2015, Maciejewski et al. 2019). Considering that our context deals with a single, relatively powerful seller such as cultural institution and many relatively weaker customers (citizens of the city divided by the border), author states that cultural institution investments to have a greater impact than customer investments in inducing positive migration because the "[customer] perceives such investments as a credible pledge" to the relationship (Jap and Anderson 2007). This perception results in greater relationship strength, in that the Polish or Czech recipient of the cultural offer knows that the cultural institution will sustain economic consequences if the relationship ends (Anderson and Weitz 1992). Moreover, author expects a positive interaction between cultural institution and customer investments. Reciprocal action theory suggests that when both partners provide resources, the opportunity to create synergistic value and self-reinforcing interdependence increases (Kozlenkova, Samaha, and Palmatier 2013). Therefore, cultural institution investments, and then customer investments, should have the greatest impact in terms of enhancing the endowment mechanism by providing the necessary resources to exploit opportunities and build a protective shield of interdependence. The result of these actions is a long-term and strong relationship that is communal in nature.

The in-depth individual interviews carried out in the city Cieszyn-Czech Cieszyn show that Polish and Czech managers of cultural institutions differ, for example, in the tools of the marketing. According to Polish experts, the key instrument for establishing and strengthening relations is promotion, in the opinion of Czech respondents it will not be promotion but product. Therefore, the hypothesis that the Polish and Czech managers and employees of cultural institutions located in the cities divided by the border from marketing tools such as product, price, place, promotion and people find product as the most important instrument in the process of establishing and strengthening relations with Polish and Czech citizens - recipients of cultural offer is not confirmed. The cultural institutions in the cities divided by the border should balance the views on the cultural offer, including claims that it should be modified and adapted to the needs of the recipient from the neighbouring country, and the views that the cultural offer should be addressed primarily to residents

of their own (national) side of the city and the recipient from the other side of the border should be obtained only through properly conducted promotional activities.

Of course, the above considerations do not exhaust the problem, rather, they are only a modest contribution to further research. Cities divided by the border in Europe constitute a very heterogeneous category, which is internally diverse in many respects. In many cases, the only element connecting them with each other is the fact that there is an international border dividing the city into two parts. Therefore, the results and research conclusions presented in the article cannot be generalised to all cities divided by a border. They may, however, be a good starting point for building long-term relationship connecting cultural institutions with citizens of the cities, which are located in the European Union and the Schengen Area. The next step is to conduct similar research in the cities located on the external border of the European Union. The examination of various case studies and viewpoints should contribute more fully to the explanation of the phenomenon described.

Abstract

Green marketing has been an important academic research topic for at least three decades but few studies have focused specifically on green branding. A green brand identity is defined by a specific set of brand attributes and benefits related to the reduced environmental impact of the brand and its perception as being environmentally sound. A strategy of green brand management should provide benefits to environmentally conscious consumers and sustainable. Therefore, the present manuscript focuses on green marketing and green consumers, with the intention of contributing preliminarily to a greater knowledge of this marketing segment in the management of companies' brands. From a theoretical perspective, the present study intends to assert itself as instrument to aid future studies and development of green marketing strategies at the business level. The preliminary results seem to show the growing recognition and the high importance that this market segment presents for organizations (for profit and non-profit).It employs an interdisciplinary perspective, with contributions to management (of green marketing products or services) and marketing (i.e., segmentation). In order to further this study and facilitate the comparison of results, it should be extended to other specific sectors (e.g., tourism). This study intends to contribute to the development of scientific knowledge in the area of green marketing, consumer behavior and brand management.

Keywords: Green Marketing, Green Consumer, Brand Management, Consumer Behaviour

Introduction

Environmental concerns and consumer demand for environmentally friendly products have led to the emergence of a new marketing philosophy called green marketing. The great forces behind the green marketing are the demand for green products coupled with concern for the environment (Hartmann et al., 2005). On the other hand, companies seek to balance their sales and profit objectives with social and environmental concerns (Peneda de Oliveira & Sousa, 2020). Academic investigation of green marketing has a long and rich history. Some papers from multiple disciplines have examined various stages in the green purchase decision making process (e.g. Peneda de Oliveira & Sousa, 2020; Ferreira & Sousa, 2020). Nowadays, the decision-making power is in the customer: it is the consumer who chooses where to buy and how to pay and, from internet searches, finds information about the product

that he wants to acquire and solves his doubts (Silva et al., 2019). Green Marketing must focus on minimizing environmental damage, and not necessarily to eliminate it. For this reason, Green Marketing appears as a way of adding value to products and services whose consumers respect the environment and value companies that also do so, adopting programs that look out for the protection of the environment. From a theoretical perspective, the present study intends to assert itself as an instrument to aid future studies and development of green marketing strategies at the business level. The preliminary results seem to show the growing recognition and the high importance that this market segment presents for organizations (for profit and non-profit). It employs an interdisciplinary perspective, with contributions to management (of green marketing products or services) and marketing (i.e., segmentation). In order to further this study and facilitate the comparison of results, it should be extended to other specific sectors (e.g., tourism). This study intends to contribute to the development of scientific knowledge in the area of green marketing, consumer behavior and brand management.

Literature Review

Green Marketing

The concern with the environment mobilizes the global market, which affects organizations that want to continue in the current business market, however, it is essential to add social responsibility, the economic situation and sustainability to provide services and products required by consumers and the Green Marketing appears as a tool that can facilitate and inform the issues that are decisive for conscious consumption. The term Green Marketing came up in the year 1970, when AMA discussed the impacts of marketing on the environment. At that time, the term was defined as the "study of the positive and negative aspects of marketing activities in relation to pollution, energy depletion and non-renewable resources."

Polonsky (1994) wrote an article considering that Green Marketing consists of all activities aimed at producing and facilitating the commercialization of products or services, with the aim of satisfying human needs and desires, so that they occur with minimal impact on the environment. This second point is important for consumerist humanity by nature and that plays a harmful role to the environment. Thus, Green Marketing must focus on minimizing environmental damage, and not necessarily to eliminate it. For this reason, Green Marketing appears as a way of adding value to products and services whose consumers respect the environment and value companies that also do so, adopting programs that look out for the protection of the environment (Vieira et al, 2005). Kotler (1995) defined Green Marketing as a movement for companies to create and place on the market products that are environmentally responsible in relation to the environment. Green Marketing incorporates a wide range of activities, including product modification, changes in production processes, changes in packaging, as well as changes in advertising. These activities should aim to guide, educate and create desires and needs in consumers, with the aim of causing less environmental impact, in addition to achieving the organizations' marketing objectives. According to Ottman and Jacquelyn A. (1994) and Polonsky (1994), Green Marketing is exercised by the efforts of organizations to satisfy the expectations of green consumers that determine lower environmental impacts throughout their life cycle. According to Gonzaga (2005) the activities of Green Marketing should be aimed at the development of ecologically oriented products that are less aggressive to the environment, that use less energy, produce less waste, consume less raw material, are easier to maintain, have more packaging be distributed without risk and allow disposal without waste. According to Valério (2006), Green Marketing can be defined as an activity that aims to focus on the needs of ecologically conscious consumers and contribute to the creation of a sustainable society. Dias (2007) defines Green Marketing as "a set of communication policies and strategies designed to obtain a competitive advantage for the products or services that the company offers in relation to competing brands, thereby managing to increase its market share, consolidating competitive positioning." In this context, Green Marketing is a very important tool, as it establishes ecological and competitive consumption patterns. According to Valério (2001) when using Green Marketing strategies, the organization can increase its credibility and legitimacy, define its personality, area of operation and image, in addition to adding value to the brand with the various buyers. However, this will only be a consequence of all the effort and investment in improving the quality of its products and in the concern for the environment and sustainability. In short, Green Marketing is characterized by a strong sustainable influence within organizations, involving all sectors

until it arrives as a product or service for consumers, explaining its real intention of preserving the environment, attracting and satisfying the target audience, and acting as a strong competitive variable. Companies have never been more concerned with the environment. There are several reasons proposed to explain the growing use of Green Marketing by companies. Five possible reasons are presented:

1. "Organizations perceive environmental marketing as an opportunity that can be used to achieve their goals" (Keller, 1987; Shearer, 1990); 2. "Organizations believe that they have a moral obligation to be more socially responsible" (Davis, 1992; Freeman & Liedtka, 1991); 3. "Government agencies are forcing companies to become more socially and environmentally responsible" (Naag, 1990); 4. "The business environment and competing companies put pressure on organizations to use green marketing activities" (Naag, 1990); 5. "Cost factors associated with waste disposal, or material reductions, force companies to change their behavior" (Azzone and Manzini, 1994).
According to Peneda de Oliveira and Sousa (2020), market orientation and market segmentation are two aspects that marketers should pay close attention to. The growing number of organizations that enter the green market leads to a need of adapting these strategies (Paco et al., 2009). For the aforementioned authors, segmentation is the selection of a set of variables or characteristics used to assign homogeneous groups to individuals. These segments can be defined by reference to descriptive characteristics as easily observable as geographical location or demographic characteristics. The "greener" segments should be studied since they present characteristics very different from other segments. They must study how they will attract and position themselves for these consumers (Peneda de Oliveira & Sousa, 2020). The main challenges for green marketing are awareness of environmental causes, increased consumer demand and selectivity, and increased competitiveness. Companies that do not respond to the "green challenge" with safer products for the environment are running the risk of losing some credibility in the eyes of consumers most concerned about environmental issues. In addition, companies that use green marketing strategies can take advantage of the many opportunities presented by environmental consumerism (Paco et al., 2009).

Green Consumer Profile

Quality of life is called into question when day-to-day habits start to interfere with the environment, compromising a citizen's future (Silva et al., 2019). Thus, the concern with the environment has led to a change in the consumer's profile and in his choice of a product or service on the market. "Consumers must be the first to change their consumption habits, that is, without their participation and understanding, the‘ culture ’of current consumption is unlikely to change. The most important thing is that consumers have the perception that we live in a global world and that the application of sustainability habits must be a priority in their decisions for the good of all "(Caetano et al., 2008). In other words, the green consumer is detected from the moment he associates the purchase or consumption of products with environmental preservation. The individual believes that it will make a difference when investing and using pro-environmental actions that will be effective in combating environmental degradation. He is aware that he has the purchasing power and choice in his hands, understanding that from the moment he begins to reject certain products that are not ecologically correct, he can decrease or even end the production of products that help in environmental degradation, thus contributing to the sustainable development of the planet.

In the 60s and 70s it was often accepted that to protect the environment it was only necessary to consume less, thereby saving energy and natural resources. Scientific and technological developments have excused excesses from consumption, as it has become possible to produce clean energy and control pollution at the source. However, in recent years, as mentioned by Paço (2005) "consumers, despite continuing to want to see their needs met, now feel that they must take a more active role in protecting, preserving and conserving the environment" and as that environmental concerns, the scarcity of natural resources and the need to protect the planet have gained importance, instead of limiting consumption, consumers have sought to find and purchase environmentally friendly products, replacing conventional ones. Thus was born the green consumer, that is, the consumer with environmental awareness (Schlegelmilch, Bohlen and Diamantapoulos, 1996), which aims to meet the needs of current consumers without forgetting the needs of future generations (Antonides and Van Raaij, 1998).

More and more individuals are expressing their environmental awareness through the products they buy (Sousa et al., 2020). Thus, the green consumer is one whose daily behavior is influenced by environmental concerns, which are reflected in the moment when he needs to decide which product to buy, and who bases his purchase decisions, at least in part, on environmental criteria (Hartmann and Ibáñes, 2006), which is concerned with the production process, in terms of consumption of scarce resources and with the waste produced and its deposition (Zinkhan and Carlson, 1995).Paço (2005) also mentions that the green consumer is one who is concerned with purchasing products that in the whole production process are less harmful to the environment and do not threaten or adversely affect the health of people and countries; on the other hand, he is a type of consumer who is concerned with life on earth, with others, with the search for less destructive economic development and with the desire for a more just world.

Another definition of green consumer is presented by Shrum, McCarty and Lowrey (1995) who define him as that individual whose purchasing behavior is influenced by environmental concerns. For Banerjee, Gulas and Iyer (1995), being a green consumer implies having a lifestyle that causes a minimal harmful effect on the environment. These consumers are willing to pay more for green products such as food, because they believe that they are more tasty and healthy, and to buy appliances with less energy and water consumption, because they associate this act with their own benefit, whether for more health or savings (Ginsberg and Bloom, 2004). Vermillion (2010) states that although consumers are concerned about the environment, this concern only translates into the purchase of green products if they obtain an immediate benefit that goes beyond the argument of environmental protection. He also argues that many consumers buy green products in an individual attempt to be more environmentally friendly.
Mujumdar and Zhang (2009) argue that, in addition to what the market has offered to consumers, that is, goods and services that seek to improve their well-being, a market for social recognition of environmental behaviors should be chosen and developed. An individual will not behave in an environmentally friendly manner if he is not aware that he will be recognized for it. However, if the behaviors depend on rewards or punishments, in the long run they will not be maintained. On the contrary, social recognition is durable; more than creating laws, creating a market based on recognition can save natural resources and the environment.

Green consumers are consumers who prefer products that are not likely to endanger human health or damage the environment (Tekade & Sastikar, 2015). In this study, green consumerism is conceived as a broader concept than green consumers. Green consumerism includes a broader social awareness of green consumer behaviors, where green consumers are the main drivers of green consumerism (Peneda de Oliveira & Sousa, 2020). Almeida et al. (2012) present the consumer behavior as the reaction of people or groups before, during and after, buying products, goods and services. According to Peneda de Oliveira and Sousa (2020), it is a process that occurs for several reasons, of an internal or environmental nature that interfere with the purchase decision. It is part of the human condition because it seeks to satisfy humankind needs, from the most basics to the most superfluous. The study of consumer behavior makes it possible to understand the day - to - day routines of consumers and their daily lives as well as how they relate to products and services.

Green Marketing Communication

Entrepreneurs recognize the creation of an ecological market that arises from the will of consumers, which combines with the appearance of new parties, legislation as well as citizen movements. It has also stimulated the appearance of new companies with “environmentally friendly” behaviors and products and others that have reversed their course. Zenone (2006) says that in recent years, investments made by companies in environmental activities have been getting more and more attention, both by the media and by society in general.

For Caetano et al. (2008) the performance of marketing was initially limited to operationalizing the marketing mix, that is, the 4 P's (Product, Price, Place, Promotion) through the product, price, distribution and communication, but the importance of the customer was quickly perceived and this

being followed up in the after-sales phase. The importance of the product was supplanted by the attempt to understand the needs of the market, the competition and the target audience to whom to direct the positioning strategy. However, several P's were being added to the original marketing mix, the P of Participation being noteworthy, that is, participation and consumer power, which allows you to choose between brands, sales channels, prices, to speak well or badly about the brands and companies / organizations that share the same market, etc.

Kotler and Keller (2006) believe that modern marketing is required not only to create quality products at a good price and make them available on the market, but also to communicate with current and potential interested parties and the general public. In this way it becomes clear that communication is essential: knowing who to communicate with, what to communicate with, what means and objectives is essential for the success of the entire Marketing strategy.

The importance given by the media to the theme of ecology, sustainability has led to a growing concern among the population. This concern leads to greater environmental awareness, which ends up influencing the purchase, that is, they verify whether a product is ecological and sustainable. Consequently, companies need to act immediately to respond to this demand, which can use this factor as being differentiating and competitive. In this sense, Gonçalves (2009) refers that communication professionals increasingly feel the challenge of integrating messages focused on corporate responsibility in their communication strategies, in a serious and creative way. New forms of communication have been modified and developed, in a world where information is made available in record time, it is important to know how to communicate and how to do it in a transparent way. Kotler (2009) states that in this context of change, marketers must understand the fundamental elements of effective communication, tailor campaigns to specific segments, niches or even individuals and use new technologies to encourage consumers to seek information and products.

Environmental communication is currently used as a differentiation strategy and at the same time as innovation by companies and certain products, which, according to Alves (2005), adds emotional benefits to products, while reinforcing the primary benefits associated with environmental attributes, thus increasing the value perceived by the consumer. In environmental terms, the companies' communication is directed to the stakeholders, so that they perceive the company's effort and its contribution to the creation of a more sustainable society. According to Pietro Nigra "the secret of a successful marketing campaign is to guide it to the right person, with the right message, through the right channel".

According to Peneda and Sousa (2020), one of the main reasons why organizations bet on Green Marketing and other actions for the environment is to improve their image. However, for these authors organizations should also encourage environmental education and practices more clearly because environmental initiatives favor positively relationships with consumers and thus create such a competitive advantage and improved image. A consumer can only value the ecological attributes of a product when he knows them well (Meyer, 2001). For example, Paiva & Proenca (2011) see the consumer with some difficulty in the analysis of information, this means that they cannot clearly distinguish whether a product is environmentally friendly or not. This is one of the reasons why communication should be able to inform consumers about the product and its use and confection (Paiva & Proenca, 2011). For Eidt et al. (2017) organizations are not only required to improve the efficiency of their environmental measures, but also to improve their communication. The organizations that adopt Green Marketing strategies put in their communication actions sustainability messages, showing the market the value of their brand and its products (Granero & Couto, 2014). The credibility of the message is one of the most important points of communication (Paiva & Proenca, 2011).

Socio-Environmental Responsibility Of Companies

With the growing interest of citizens in getting to know better the agents that operate in the market and their business activities, in addition to production and commercialization, public opinion over time has been forming and sharing ideas about the performance of these entities at a social level. Being “socially responsible” has become a necessity, which can help to strengthen the credibility of companies.

According to Caetano and Gouveia (2009) “companies, in particular, are expected to adopt strategies, policies and organizational processes that transversally implement a culture of sustainability, choosing it as a goal of continuous improvement, not only internally, but also of propagation of this culture to its entire area of influence, particularly suppliers and customers ”. Thus, it will not be a way to look good in society, but a commitment to Sustainable Development, as a possible way to ensure, in the medium and long term, leadership in responsible competitiveness and the creation of value for all stakeholders. Marketing has a social responsibility that translates into seeking to direct consumer needs and desires towards products that are less harmful to the environment (Sousa & Silva, 2019). There is a growing number of companies that engage with green marketing strategies as part of a more comprehensive social responsibility plan.

Pranee (2010) states that marketers perceive green marketing not only as an opportunity to achieve business goals, but also as a way to fulfill a moral obligation - to be socially responsible. The European Commission defines corporate social responsibility (CSR) as “a concept according to which companies, on a voluntary basis, integrate social and environmental actions in their activity and in their interaction with their stakeholders. They are companies that decide to go beyond the minimum requirements and obligations resulting from collective agreements in order to meet the needs of society. Through CSR, companies of all sizes, in cooperation with stakeholders, can help to reconcile economic, social and environmental ambitions”. In response to “the growing public expectations regarding the impact of business activity on society and the environment”, in the Green Paper - Entrepreneurship in Europe - presented in 2003, by the Commission of the European Communities, it was mentioned that many companies had adopted formal strategies of responsibility social "which implies the voluntary inclusion of social and environmental aspects in the respective operations and in its relations with stakeholders". Gonçalves (2005) states that whenever a company seeks better ways to induce citizens to adopt socially responsible behaviors, it develops social marketing programs, corporate citizenship, community relations, global citizenship or corporate social responsibility. These initiatives, decided by free will, benefit not only the internal public of companies, but society in general. Companies can also use green marketing in an attempt to address issues related to costs or profits. The Elimination or reduction of damages to the environment, such as those generated by the release of oils that are contaminating the environment are becoming increasingly expensive and, in some cases, very difficult. Therefore, companies that can reduce harmful waste can incur substantial cost savings. In trying to minimize waste, companies are often forced to reexamine their production processes. In these cases, companies often develop more effective production processes that not only reduce waste, but also reduce the need for some raw materials. Caldwell (1999) reports large savings incurred by a CocaCola bottler in Mexico after implementing a reverse logistics management system. These gains came from a better coordination between promotions and expected peaks in the return of bottles, reducing the need to produce new bottles and reducing the production of non-returnable bottles.

Another example is from giant AmBev, a beverage manufacturer that reduced the volume of water needed for beer production by almost 20%. In addition, it sells practically everything that remains from the manufacturing process, where the malt bagasse becomes animal feed, the yeast is transformed into spices and the glass is recycled to give rise to new bottles. In 2009, the sale of these by-products represented an extra revenue of R $ 78.8 million (Barrucho, 2010). This serves as a cost savings, since both waste and raw materials are reduced. In other cases, companies try to find solutions after the production process, instead of reducing waste. In these situations, companies try to find markets or uses for material waste, where the waste produced by one company becomes a necessary input for the production of other companies. A Brazilian example of this is companies that collect demolition waste and transform it into by-products for civil construction. It is a vision of improving environmental quality as a result of control (John, 2000). Behind the investments in sustainable business there is the certainty that products with less environmental impact promote more wealth for companies and become stronger and more competitive in the market.

Conclusions and Future Research

Until recently, Green Marketing, also known as Environmental or Ecological Marketing, was not in the plans of most companies. Nowadays, companies already see it as a strategic opportunity to

communicate and promote their services or products.The implicit demand by consumers has led many companies to explore this change in a sense of business opportunity. However, this does not mean that all companies are committed to environmental activities and that they really improve their behavior with the environment. In some cases, many companies "cheat" consumers in an attempt to gain market share. Some companies embark on the green movement without precisely considering their strategy in the future. In an attempt to avoid these problems, several regulations were created to ensure that all information was adequate for consumers so that they can assess the environmental claims used by companies' marketing campaigns.

However, communication / advertising continues to be valued, given that, despite the fact that the environmental appeals communicated elude more than they inform, they are not willing for the ads to disappear. Television remains the main source of information, possibly due to the role, still very important, that it continues to have in family life in Portugal. Green Marketing should be used in order to reconcile consumers' short-term desires, such as their long-term well-being. This strategy serves to create a dividing line between those companies that will be able to obtain a competitive advantage over competitors and achieve long-term survival and those that have tried to react late to this increasingly growing change and may not exceed that moment. The world has changed and so have people and companies, they need to continue to implement change if they want to remain in the market successfully. Companies that do not respect the environment are subject to fines by the state, however there is still a long way to go, however, this has negative effects and may end up losing its customers and without customers a company cannot survive.

For future research, the ethnographic experience of the researchers allowed them to understand the phenomena of brand attachment with the green products and the consequent effect on satisfaction and loyalty. These conclusions are based on the researchers' perception derived from the ethnographic research. Future research might also profitably concentrate on the further development of the several constructs, particularly the emotional dimension of green brand associations. The method used could be combined with others, such as semantic differential scaling, which should in turn result in a better assessment of dimensions (Peneda de Oliveira & Sousa, 2020). This will in turn result in improved understanding of the relationships between the considered constructs and other variables - particularly involvement, which is considered a fundamental moderator of attitude formation processes in revised models. Involvement with environmental issues constitutes an essential factor in environmental behavior. Future studies should aim to develop standardized instruments for measuring the perceptual and attitudinal effects of alternative green positioning strategies, which finally should lead to the development of more competitive green branding initiatives. Therefore, future studies can set forth toward the longitudinal study to find out the differences of green brand image, green satisfaction, green trust, and green brand equity in the different stages of the environmental regulations in the world.

Importance of Risk Assessment for Running Events Organization On the Example of Half Marathons in Poland. Case Study

Jacek ŁUCZAK

Poznań University of Economics and Business in Poznan, Poznań,al. Niepodległości 10, 61-875 Poznań, Poland
E-mail: jacek.luczak@ue.poznan.pl

Abstract

Research Question: The aim of the research was to determine and assess Polish long-distance running events' (half marathons') risk factors (the timespan of runs was limited to 2017 and 2018).
Research Methods: Ten major half marathons held in 2017-2018 in Poland were considered. Ten experts carried out the multi-stage risk factor identification for the organization of a large-scale run with the use of the Delphi method, while 21 practitioners - representatives of the ten events' organizers conducted risk assessment. Furthermore, the Cronbach's alpha statistics was applied to establish the questionnaire's reliability. The analysis was concluded with the factor analysis of the most significant risks. **Results and Findings**: In the context of the outcome and probability of a given risk factor the following risks appeared to be dominant: financing marathons, organizational issues (including the start date), the acceptance of the event by local community, the organization of the finish line, delayed start, cyber security, disclosure of personal data and problems with the measurement of time.
Implications: The risk assessment results proved to be ideal input data for efficient sport events' risk management, especially in the context of mass runs. Professional risk management based on the risk factors database created on the basis of the research most frequently leads to providing the highest possible safety and satisfaction levels for all stakeholders (primarily: participants, organizers, local society).

Keywords: Risk Management, Risk Management in Sport, ISO 31000, Safety Management, Satisfaction.

Introduction

Not only is recreational running a physical activity but also amounts to the modern lifestyle model for a significant portion of the society. It is relatively inexpensive, as it does not require any special sports facilities (Petridis, 2015).

Relevant data suggest that 58% of amateur runners in Poland are willing to participate in professional running events (Raport Polska Biega, 2014). Such participation needs the implementation of training plans and significant time spending of both runners and their families. It also contributes to the growing sport tourism and the emergence of new risks (Hitchings & Latham, 2017).

In 2010 almost 800 different runs were registered in Poland, while in 2015 we could observe an increase of nearly 132% in comparison with 2010 (1,856 events). More than 2,500 runs were registered in Poland in 2018 (www.maratonypolskie.pl). 74,971 runners participated in the largest 12 Polish half marathons in 2019 (the number excludes the participants who did not complete the run). It is a 2% decrease in comparison with 2018 (76,598).

The decreasing number of finishers accompanied by the growing number of runs on the sport market encourage their organizers to better the quality and efficiency of the events by implementing professional management tools (Leopkey & Parent, 2009a).

Professional management is a necessary element for the efficient attainment the objective of proper organization the run (Piekarz, Jenkins, & Mills, 2015). Threats to the safety of participants and viewers, the risk of a terrorist attack, and the need to protect personal data are increasingly important nowadays (Lamont & Kennelly, 2012). An early understanding of the risk level, various risk issues, complexity and uncertainty related to risk management supports the determination of the project scope and the eventual success of the running event (Nohr, 2009).

Formal management of the project, which is the organization of a sporting event in compliance with a recognized methodology, is not implemented by 51% of sports events' organizers in Poland. 78% of them do not formally estimate the risk of organizing their events (Miśniakiewicz & Łuczak, 2014). It is likely that organizational decisions are not made in the optimal manner, no significant risks are identified and, consequently, they cannot be properly mitigated (Hanstad, 2012). As a result, a sports event will probably not produce the expected benefits and its course may be significantly disturbed (Helms, 2011; Reid & Ritchie, 2011). Such disturbance can lead to further risks linked with damages to the organizer's reputation and participant dissatisfaction (Nohr, 2009; Moyle, Kennelly, & Lamont, 2014). Major incidents and deaths in top runs have obviously contributed to exaggerated public worries about their safety and made their organizers avail of professional risk management (Bjarnason & Cannell, 1999).

There are no significant mandatory legal requirements for risk management in large-scale runs today but it surely allows for the identification, assessment and mitigation of risks (Ammon & Brown, 2007).

The possible answer the question of the extent running event organizers can provide a safer environment for the participants and manage the risk of their events certainly amounts to a significant research challenge.

Literature on Risk Management of Running Events Organization

Risk can be seen as "any future incident that will negatively influence the event" (Bowdin, Allen, O'Toole, Harris, & McDonnell, 2006), whereas risk management as a tool for "minimizing liabilities and maximizing opportunities" (Silvers, 2008).

Sporting events occur in conditions of uncertainty caused by both internal and external factors (DSDM Consortium, 2010). Sometimes risk and uncertainty are considered synonymous (DSDM Consortium, 2010, p.12). The ISO 31000 standard defines risk as the effect of uncertainty in pursuing a set goal (ISO 31000, 2018) and emphasizes the management of diversified risk. Context determination, risk assessment (including risk identification, analysis and assessment) and risk treatment are essential parts of risk management (ISO 31000, 2018).

According to relevant literature risk management is a proactive process, as it aims at controlling the effect of unforeseen issues or incidents taking place during the event (Hanstad, 2012; Ammon & Brown, 2007; Łuczak & Miśniakiewicz, 2011).

Risk management in large-scale sporting events gains importance and should be examined from different angles (Emery, 2010; Moyle et al., 2014). Most papers on risk management and reports on sport event risk notably come from the US, Canada and Australia (Helms, 2011; Nohr, 2009; Masteralexis, Carol & Hums, 2014). In Europe the problem of the organization of large-scale running events and their risk assessment have been rarely researched (Łuczak & Miśniakiewicz 2014; Kose, Argan & Argan, 2011).

Researchers have focused on injuries (Hespanhol, Pena Costa, & Lopes, 2013; Linton & Valentin, 2018), security and crowd control (Giulianotti & Klauser, 2010), effect of terrorism (Toohey & Taylor, 2008; Giulianotti & Klauser, 2010), facility management (Preuss, 2007), actual losses caused by an event (Crompton, 1995), spectator aggression and hooliganism and lack of organizational planning (Getz, 2002). The overall impact of a sporting event on stakeholders (Leopkey & Parent, 2009a), risk

management strategies by stakeholders (Parent & Séguin, 2007), as well as practices (manager profile, skills required and critical success factors) in sporting events (Emery, 2010) have also been highlighted.

In addition, professional literature identifies risk issue categories by stakeholder groups. Research have provided the list of 15 risk issue categories significant when coping with risk management in sporting events: environmental, financial, human resources, infrastructure, interdependence, legacy, media, operations, organizing, participation, political, relationship, visibility and human resources. The present research in the assessment of risk management in large-scale running events originates from these considerations (Leopkey & Parent, 2009a).

Researchers mostly have analyzed sporting events of international importance embraced in the social, economic, promotional or planning context (Boo & Gu, 2010).

Methods

This paper was preceded by the preparatory research (1) of 2017 and the proper research (2) conducted in 2017-2018. They aimed at assessing risk and analyzing data in the context of determining the type of managerial decisions within half marathon organization. The research resulted in: (1) the identification of risk factors related to organizing 21K runs, (2) the assessment of risk factors along with factor grouping and prioritization (table 1).

Table 1: Characteristics of preparatory and proper researches

	Preparatory research	Proper research
Research method, analyses	Delphi method	Reliability analysis, risk assessment; cluster analysis, factor analysis
Research instrument	Discussed questionnaire	Questionnaire
Size of sample population	10 experts	31 representatives of 10 21K Runs
Duration	2017	2017-2018
Research objective	Identification and grouping of risk factors related to organizing marathons. Preparation of the proper research	Risk assessment and analysis in reference to organizing marathons
IT tools, form of research realization	E-mail contact, meetings	e-risk app

I created a list of risk factors on the basis of the relevant professional literature (Leopkey & Parent, 2009a), own experience and legal requirements in Poland and classified them with the use of the Ishikawa diagram (Łuczak, Matuszak-Flejszman, 2007). Next, the list was discussed by experts (via Internet). Most of the experts exchanged remarks several times (5-9), which resulted in the modification of the factor list. These actions became the basis of the research questionnaire. The risk factors were assessed within the proper research on the scale ranging from 1 to 4 according to their significance and likelihood (table 2).

Table 2: Characteristics of selected values in the proper research.

Scale	Likelihood		Significance	
1	Marginal and little (0-30%)	• Risk will not occur or will occur occasionally • Expected number of occurrences within a period: fewer than 1 time in 5 editions.	Insignificant	Difficulty in realizing a sporting event, which influences its course and objective realization in an insignificant way

2	Medium (31-60%)	• Risk occurrence is real but does not exceed 60%. • 1 occurrence in the last two editions.	Medium	Clear and tangible impact on the organization and course of a sporting event as well as objective realization
3	High (61-80%)	• There are rational premises that the risk will materialize. • It occurred once in the last edition.	Large	Significant impact on the organization and course of a sporting event as well as the realization of objectives, including the ones related to health, large impact on an event's reputation
4	Very high (81-100%)	• There are rational premises that the risk will almost surely materialize. • In the last edition it occurred at least 2 times.	Very significant	Related to health and life of participants, the necessity to terminate the event, no objectives are achieved.

The research was supported by the e-risk IT platform (e-risk.pl). It allows for multi-dimensional configurability in the context of methodology and risk factors. All 21K runs were held in cities on flat or moderate terrain in Poland. The events were similar in many aspects, e.g. climate conditions, participant profile, the declared standard of organization, legal regulations relevant to the organization process. The factors analyzed in the paper led me to the conclusion that each expert's assessment should be treated individually and not a concrete half marathon.

Risk assessment aims at determining priorities related to additional security measures, which reduce risk to an acceptable level. These priorities were established in the statistical analysis of factors with tagging the major ones.

Reliability analysis (Cronbach, 1951) was applied with the use of the Cronbach's alpha statistics to confirm that the research instrument's (a questionnaire prepared during the preparatory research) adequacy (Cronbach, 2005).

The factor analysis was used to distinguish risk factor groups. This method is considered unobjective, nevertheless, it is very important while exploring the structure of varied data (Balicki, 2013). It allowed for categorizing observations in an adequate way so as the groups were coherent due to variables (internally cohesive), but, at the same time, dissimilar to others (i.e. characterized by external isolation – Walesiak & Gatnar, 2016).

At the stage of selecting variables I decided to examine the impact of factors of the highest risk. Therefore, variables were grouped on the basis of the arithmetic average of risk assessment, and then I applied both scree plot and the minimal risk value criterion at level 4 (in order to distinguish the risks larger than minimal probability and consequences).

I also deemed the selection of insignificant variables is an incorrect approach as it may hinder the emergence of a coherent or relevant class difference within the set. The variables were then standardized (with the average and standard deviation) (Wilk, Pietrzak, Bivand, & Kossowski, 2015).

The factor analysis aimed at distinguishing a new set of variables – a set, which is less numerous than the original one, but can expose its variability. These factors should retain a significant portion of information included in the original variables (Walesiak & Gatnar, 2016).

Risk Assessment Results and Discussion

The research led to determining 75 risk factors grouped into nine sets: Safety (G1), Budget and finance (G2), Information (G3), Comfort and satisfaction of participants (G4), Other organizational aspects (G5), Start package (G6), Recovery and energy support (G7), Reputation (G8), Environment and force majeure (G9). Within the factor groups the specific risk factors were indicated.

Table 3: Groups and risk factors – the result of the preparatory research

G1. Safety	G2. Budget and finance	G3. Information
1.1. A serious accident on the route 1.2. An intrusion of a third party onto the running route 1.3. A participant of insufficient health condition 1.4. A collision between people, people and objects, etc. on the running route 1.5. A terrorist attack 1.6. Intentional pollution of food/beverages available along the route/in the finish zone 1.7. Insufficient medical support	2.1. Insufficient income from participant fees 2.2. Insufficient funding from sponsors 2.3. Insolvency 2.4. Lack of profit at the planned level 2.5. Time overlapping with another rival event 2.6. Large participation fee	3.1. Obsolete news on the website 3.2. Lack of/insufficient contact with potential participant 3.3. Insufficient promotion/information on external web sites 3.4. Unintended disclosure of personal data 3.5. Personal data theft 3.6. A cyber attack – modification, blocking of the website 3.7. Lack of a clear, interactive map of the route 3.8. Lack of early information about the result
G4. Comfort and satisfaction of participants	**G5. Other organizational aspects**	**G6. Start package and medal**
4.1. Lack of free accommodation 4.2. Poor organization of the deposit office 4.3. Difficulty in reaching the start of the marathon 4.4. Lack of parking space near the start 4.5. Inability to receive start packages on the day of competition 4.6. Mass start (not in waves) 4.7. An inappropriately narrow route, narrows 4.8. Lack of/unclear information about the covered distance 4.9. An unattractive route 4.10. An unattractive export, a poorly-located expo 4.11. Lack of access to showers after competition	5.1. Inappropriate running route identification 5.2. Insufficient access to toilets 5.3. Unattractive catering at the finish 5.4. Impossibility of gathering spectators in the start and finish zones 5.5. Inappropriate organization of the run – jams after the start 5.6. Inappropriate organization of the finish 5.7. Lack of the appropriate atmosphere during the event 5.8. Problems related to organization, time of the event etc. with the local community and the administration 5.9. Delayed start 5.10. A smaller than usual number of nutrition points 5.11. Inappropriate organization of nutrition points 5.12. An insufficient number of volunteers 5.13. Lack of volunteers' engagement 5.14. Faulty time measurement	6.1. An unattractive start package 6.2. An unattractive design of the medal 6.3. An insufficient number of medals 6.4. An insufficient number of start packages

	5.15. Lack of established procedures 5.16. Limited human resources 5.17. Incompatibility of the running route capacity with the number of participants	
G7. Recovery and energy support	G8. Reputation	G9. Environment and force majeure
7.1. Lack of access to massage in the finish zone 7.2. Lack of appropriate hydration of participants 7.3. An insufficient amount of water at recovery points 7.4. An insufficient number isotonic drinks at recovery points 7.5. An insufficient number of energy gels, fruit etc. at recovery points 7.6. Random choice of nutritional products at recovery points and the finish 7.7. Low health quality of the offered nutritional and recovery products 7.8. Lack of nutritional awareness of participants 7.9. Lack of nutritionists' support 7.10. Lack of/insufficient number of cooling points along the route	8.1. Unfavorable media information on the national scale 8.2. Unfavorable media information on the local scale 8.3. Lack of information about the event in the national media 8.4. Lack of information about the event in the local media 8.5. An insufficient number of participants 8.6. A rival local event	9.1. Downpour 9.2. Strong wind 9.3. An overly low temperature 9.4. An overly high temperature 9.5. Difficult conditions of the running route 9.6. Traffic in the direct vicinity of the event 9.7. Force majeure

Experts highlighted the significance of factors linked with the physical safety of participants and organization. They also underlined risks relating to accidents on the route, bad health condition of participants, as well as terrorist and bioterrorist threats. Moreover, personal data protection, especially compliance with GDPR were considered significant. Experts clearly noticed the risk of not assuring participant satisfaction, as they took account of issues linked with start packages, start organization, route attractiveness and deposit organization. Finally, the risk factors resulting from the preparatory research were used in risk assessment conducted in the proper research. The grouping was arbitrary and then discussed with experts. The Cronbach's alpha statistics result reached the level of 0.933 (21 positions). In light of the classical interpretation the coefficient should have the minimum value of 0.6, whereas the preferable value of the coefficient is approx. 0.9. Therefore, the internal cohesion of the research instrument was confirmed.

The presentation of the proper research results concentrated on the classical approach to risk assessment – the statistical analysis of risk factors' average values accompanied by tagging the ones of the highest risk and largest frequency.

The scree plot led to the emergence of 5 risk factor groups: (i) the most significant (15) – the average value from 5.10 to 6.23, (ii) less significant (21) – the average value from 4.14 to 4.94, (iii) neutral (18) – the average value from 3.14 to 3.90, (iv) of little significance (9) – the average value from 2.48 to 2.95, and (v) insignificant (13) – the average value from 1.33 to 2.24.

Respondents stressed the risk related to financing a 21K run (insufficient income, profit at an unsatisfactory level, insolvency), organization (limited human resources, inappropriate organization,

delayed start, incompatibility of the running route capacity with the number of participants), safety issues related to terrorist threats, cyber safety and participnt's health condition (table 4).

Table 4: The most significant risk factors of organizing a 21K Run

Code	The most significant risk factor	Average	Range	Standard deviation
2.2.	Insufficient funding from sponsors	6.23	7.53	2.50
5.16.	Limited human resources	6.03	5.00	1.56
5.8.	Problems related to organization	6.01	7.50	2.35
9.7.	Force majeure	5.97	6.00	1.96
2.5.	Time overlapping with another rival event	5.93	3.00	0.92
5.6.	Inappropriate organization of the finish	5.92	6.00	1.67
3.4.	Unintended disclosure of personal data	5.79	6.75	2.39
5.14	Faulty time measurement	5.77	7.50	2.55
2.1.	Insufficient income from participant fees	5.71	5.89	1.86
6.3.	An insufficient number of medals	5.71	4.50	1.45
2.4.	Lack of profit at the planned level	5.27	7.00	2.13
3.6.	A cyber attack – modification, blocking of the website	5.26	6.75	2.34
5.9.	Delayed start	5.26	3.44	1.00
5.17.	Incompatibility of the running route capacity and n° participants	5.17	5.50	1.69
2.3.	Insolvency	5.10	7.78	2.69

The selected factors with the average value of risk at 4.1 or higher (36 most important factors) were standardized. The cut-off reflected the factual evaluation. The declining graph of averages of specific variables may be treated as a scree plot. Hence, I could omit the variables whose importance was marked as marginal and which might have influenced the grouping after standardization (Guyon & Elisseeff, 2003).

The results suggested that emphasis be placed on specific factors while making organizational decisions. Problems with funding and organization (limited human resources) are critical. For participants and spectators, it is a festival, however, sport events disturb the life of local communities. Furthermore, the large number of events and the limited season frequently lead to a decrease in the number of participants due to rival runs organized at the same or similar time.

Respondents deemed the factors related to the half marathon budget and achieving objectives the most probable along with the ones linked with physical safety (an intrusion of a third party onto the running route), data protection (a cyber attack, disclosure of personal data) and organization (start and finish, issuing start packages).

It should be noted that I use factor analysis so as to structure data and identify specific interrelations. Within the analysis 7 components were identified, which explained 91% of data variability (table 6).

Table 6. Identification of components within the factor analys

	Total sum of squared loadings after rotation		
	Total	% variance	% accumulated
1	7.105	20.896	20.896
2	6.628	19.495	40.390
3	4.776	14.048	54.438
4	4.355	12.807	67.246
5	2.988	8.789	76.034
6	2.712	7.975	84.010
7	2.273	6.686	90.696

The risk factors explained by specific components were identified. The first factor mostly refers to issues directly linked with the route – its identification, time measurement, capacity, start packages, access to water (recovery) and weather. The second and third factors relate to budget issues and sports-unrelated questions, which may occur during the event – a terrorist attack, personal data theft, an intrusion of a third party onto the route, or problems with the deposit office (in competition). The fourth factor is associated with health problems of participants and competing with other running event (organized at the same time). The remaining factors include variables such as unintended personal data disclosure, or issues of too little interest from potential participants (table 7).

Table 7: Risk factor groups

Factor 1	Factor 2	Factor 3	Factor 4	Factors 5, 6 and 7
3.3. Insufficient promotion/information on external websites	1.5. A terrorist attack (an explosion, shooting, ramming)	1.1. A serious accident on the route	1.3. A participant of insufficient health condition	3.4. Unintended disclosure of personal data
5.1. Inappropriate running route identification	2.4. Lack of profit at the planned level	1.2. An intrusion of a third party onto the running route	2.5. Time overlapping with another rival event	8.5. An insufficient number of participants (too little interest)
5.6. Inappropriate organization of the finish (e.g. inability to finish freely)	3.6. A cyber attack – modification, blocking of the website	2.2. Insufficient funding from sponsors		8.6. A rival local event
5.8. Problems related to organization, time of the event etc. with the local community and the administration	5.16. Limited human resources	2.3. Insolvency		
5.12. An insufficient number of volunteers		3.5. Personal data theft		
5.13. Lack of volunteers' engagement		4.2. Poor organization of the deposit office		
5.14. Faulty time measurement		4.7. An inappropriately narrow route, narrows		
5.17. Incompatibility of the running route capacity with the number of participants		5.5. Inappropriate organization of the run – jams after the start		
6.1. An unattractive start package		5.9. Delayed start		
6.3. An insufficient number of medals				
7.3. An insufficient amount of water at recovery points				

9.1. Downpour				
9.4. An overly high temperature				
9.7. Force majeure				

It should be stressed that factor analysis aims at describing and arranging data. Factor analysis also helps the process of alternative risk factor grouping completed as a result of the preparatory research.

Conclusions and Future Research

The presented paper pioneered the systematic and methodological risk assessment of organizing Polish half marathons. The research allowed for creating a database of risk factors of long-distance running (75). It should unquestionably be continued in the context of taking mitigation actions as well as examining their efficiency.

The follow-up research has already begun. I plan to verify the efficiency of mitigation actions and study the estimation result in this light. Moreover, the research allowed for verifying the applied methodology (including the e-risk application). The study may be used as the source of methodology for any running event organizer.

The emerging industry of large-scale running events, as the example of Poland shows, needs a mature approach to risk management. Risk assessment from organizers' point of view seems to be a step in the right direction. From mass running event organizers' perspective, the analysis and assessment of relevant risks can help to develop more effective ways to minimize threats. It surely increases the security of mass running events and the level of confidence of both organizers and participants.

Abstract

Since Poland's accession to the European Union in 2004, the Polish labour market has changed. Activities of labour offices aimed at economic activisation of the unemployed and reduction of structural mismatches on the labour market have increased. Costly implementation of such measures is connected with carrying out evaluation studies and research on their effectiveness. To assess the effectiveness of the implemented forms of economic activisation, the cost of participation in the form of activation, employment and cost effectiveness coefficients are determined. The aim of this article is to assess the effectiveness of using, by poviat employment offices, funds from the Labour Fund in the years 2008-2018 for financing basic forms of professional activisation. The evaluation of the effectiveness of programmes was based on the map: cost effectiveness - employment effectiveness. The study pointed to the differentiation of effectiveness of the use of funds in individual voivodeships. In Poland, after 2011, the effectiveness of labour offices' activities related to economic activation of the unemployed improved.

Keywords: Forms Of Professional Activisation, Cost Of Participation, Cost And Employment Effectiveness.

Introduction

In order to mitigate the effects of unemployment, a variety of tools are used to influence its duration. Labour market research indicates that increasing unemployment benefits and extending their duration has an impact on the duration of seeking employment (Moffitt, 1985; Katz & Meyer, 1990; Hunt, 1995; Card & Levine, 2000; Hahn et al., 2001; Lalive, 2007). This in turn can lead to long-term unemployment. Therefore, various programmes are introduced to increase the economic activity of people seeking employment. Big expenses connected with leading active labour market policy make necessary to perform research on effectiveness of their instruments and evaluation studies. These analyses are to a high degree based on the scientific output of the Nobel Memorial Prize in Economic Sciences laureate, James Heckman (Heckman et al., 1999). Due to different situation on the labour markets in the United States and European countries, research on effectiveness focussed on different aspects of the labour market policy. In the USA usually the income effects of active employment programmes are analysed. On the contrary, in the European Union the employment effects are usually analysed. After accession of Poland into the European Union, the scope of professional activisation of the unemployed persons increased. The main aims of the amendments are: increase of the professional activisation of persons in difficult situation, extending access to labour market services, promotion of the life-long learning and modification of the system of unemployment benefits. One of main goals of these changes is increase of motivation for job seeking. These activities increase the probability and intensity of finding jobs by the unemployed persons (Bieszk-Stolorz, 2017). Applied by the labour offices instruments affect the two sides of the labour market: supply and demand. The following instruments can be considered as supply-oriented: on-the-job training, traineeships and professional preparation. Intervention works, public works, socially useful works and means for the unemployed to take up business activity and for equipping the job for the unemployed person constitute a group of demand-oriented instruments – the subsidised employment (Wiśniewski & Maksim, 2013). From the

social point of view it is important to employ as many looking for job persons as possible. On the contrary, from the point of view of institutions financing the active programmes of support the essential is evaluation of disbursement of funds. To this end, the effectiveness of the actions taken is examined. This is an important tool for measuring performance. In theory of economics we can distinguish the two aspects of effectiveness. The first is to strive for maximum efficiency, i.e. to achieve the highest possible result from a certain amount of inputs. The second is related to the saving of resources, which means achieving the specified results with the lowest possible outlays (costs) (Knapińska, 2015). The active labour market policy in Poland brings positive effect consisting of only on temporary reduction of unemployment (Rękas, 2013).

The goal of the article is the assessment of effectiveness of forms of professional activisation in Poland with respect to voivodeships. In the first stage of the analysis the three indicators were compared: cost of activisation of the unemployed person, cost and employment effectiveness for Poland. Next, using the map: cost effectiveness – employment effectiveness the effectiveness of forms of activisation in particular voivodeships was compared.

Registered Unemployment in Poland

The labour market in Poland after 2004, i.e. since the accession to the European Union, has been undergoing significant changes. Figure 1 presents the unemployment rate in Poland and the countries of the European Union in the years 2004-2018 for people aged 20-64. Initially, it was equal to 19%, while the average unemployment rate for the European Union countries was 9%. In 2008, both these rates came closer (7% - Poland, 6.7% - EU). Then, as a result of the financial crisis, both unemployment rates increased until 2013. Starting from 2013, the unemployment rate in Poland decreased and was lower than its average level in the EU (Fig. 1).

Fig. 1: Unemployment rate in the European Union and Poland in the years 2004-2018 in the age group 20-64, based on Eurostat data

The registered unemployment rate is determined on the basis of data provided by labour offices and is generally lower than the unemployment rate reported by Eurostat. It includes persons aged 18-64 registered in county labour offices. In 2004, this rate was 19% and in the following years it decreased to 9.5% (2008). Then as a result of the global financial crisis it increased to 13.4% (2012). It remained at the same level in 2013 and then decreased to 5.8% in 2018. The number of registered unemployed people changed similarly (Fig. 2).

Fig. 2: Registered unemployment rate and the number of registered unemployed (in thousands) in Poland in the years 2004-2018

Fig. 3: The registered unemployment rate in Poland by voivodeship in 2018

Numerous studies indicate the spatial diversity of unemployment in Poland (Murawska, 2016; Tatarczak & Boichuk, 2018; Woźniak-Jęchorek, 2015). This may be due to the fact that the Polish labour market is strongly distorted by annual fluctuations of other macroeconomic economic factors (Hadas-Dyduch et al., 2016). The registered unemployment rate varied from one voivodeship to another. In the years 2004-2018, the highest unemployment rate was in Warmińsko-Mazurskie Voivodeship, and the lowest: in Wielkopolskie Voivodeship (2007-2008, 2010-2018), Mazowieckie Voivodeship (2004-2005, 2009) and Małopolskie Voivodeship (2005-2006). It is obvious that the number of registered unemployed people depends on the number of people living in a given voivodeship. The largest number of registered unemployed persons was in the Mazowieckie Voivodeship and the smallest in the Opolskie Voivodeship (2004-2016) and Lubuskie Voivodeship (2017-2018). In the analysed period the number of the unemployed on all markets changed cyclically in the same direction, but the changes in the number of the unemployed, both in a decreasing and increasing trend, were the biggest on metropolitan markets and the smallest on peripheral markets (Rembeza & Klonowska-Matynia, 2017). Figure 3 presents the unemployment rate in voivodeships in Poland in 2018.

Basic Forms of Professional Activisation

The amount of expenditures on the implementation of programmes for employment promotion in Poland in the years 2005-2018 varied. Figure 4 presents the amount of these expenditures in current and fixed prices from 2018. In the years 2005-2010 expenditures increased rapidly. This increase was justified by the ongoing economic slowdown, which resulted in limited demand for labour. At that time, the unemployed had much less chance of finding employment on the labour market. In 2011, there was a noticeable sharp drop in these expenditures in relation to 2010 (by about 64%). This was associated with the need to reduce the expenditures of the public finance sector. Poland was subject to the excessive deficit procedure and, in line with the Ecofin Council recommendation (of 7 July 2009), was obliged to correct the general government deficit below 3% of GDP by 2012. The procedure included a reduction of expenditure from the Labour Fund, which is part of this sector. Between 2010 and 2015, expenditures increased and decreased again between 2016 and 2018. In Poland, registration of the unemployed and their activisation takes place in poviat labour offices. There are 340 of them. Earlier studies by the authors indicate that due to their large number and large variety of economic conditions, better results are given by analyses based on the division into voivodeships (Bieszk-Stolorz, Dmytrów 2019). The amount of expenditures for the implementation of programmes for employment promotion in 2008-2018 varied in particular voivodeships (Figure 5). They were the largest was in the Mazowieckie Voivodeship, and then in the Śląskie Voivodeship, and the smallest in the Opolskie Voivodeship (2008-2014) and Lubuskie Voivodeship (2015-2018). This amount depends, inter alia, on the size of the voivodeships and the number of registered unemployed.

Fig. 4: Expenditure on the implementation of programmes in the years 2005-2018 in Poland (million PLN, current and fixed prices from 2018)

Fig. 5: Structure of expenditure on implementation of programmes in 2018 by voivodeships (%)

The catalogue of basic forms of professional activisation is determined by the minister in charge of labour matters. In the years 2006-2018 this catalogue evolved. Due to the auxiliary character or insignificant share in expenditure incurred on a national scale, in years 2006-2018 some forms of

support did not become the basic forms of professional activisation (for example activation allowance, scholarships in the period of continuing education, reimbursement of travel and accommodation costs, reimbursement of social security contributions to farmers made redundant from work, training loans). Table 1 presents the basic forms of professional activisation in years 2006-2018.

Table 1: Basic forms of professional activisation in Poland in years 2006-2018

Basic forms of professional activisation	2006–2009	2010–2013	2014–2018
trainings	+	+	+
employment in intervention works	+	+	+
employment in public works	+	+	+
internship with an employer	+	+	+
granting the unemployed one-off funding for business start-ups	+	+	+
granting employers reimbursement of costs of equipment/supplementation of workstations for the unemployed who are directed to those places of work	+	+	+
carrying out socially useful work	+	+	–
preparing adults for the profession in the workplace	+	–	–

Figure 5 presents the number of the unemployed persons participating, ending participation and employed after graduating participation in activisation programmes. The largest number of persons participated in trainings and internships and the least – in reimbursement of costs of equipment/supplementation of workstations.

Fig. 6: Number of unemployed persons participating, ending participation and employed after graduating participation in activisation programmes in years 2006-2018

Assessment of effectiveness of forms of professional activisation

In order to assess the effectiveness of realised programmes, the cost of participation in the form of professional activisation and coefficients of cost and employment effectiveness were calculated. These coefficients are calculated for basic forms of professional activisation.

The employment effectiveness is the indicator allowing for assessment of chances of finding employment after finishing participation of in the form of professional activisation. It is calculated by means of the following formula:

$$EE = \frac{number\ of\ persons\ employed\ during\ or\ after\ ending\ participation}{number\ of\ indicated\ persons\ who\ ended\ their\ participation} \cdot 100\% \qquad (1)$$

Cost effectiveness allows to assess the cost of leading the unemployed person to employment. It is calculated by means of the following formula:

$$CE = \frac{amount\ of\ expenditure\ from\ the\ Labour\ Fund}{number\ of\ persons\ indicated\ as\ employed} \qquad (2)$$

Cost of participation in the form of activisation informs about mean cost of activisation of one person. It is calculated by means of the formula:

$$CP = \frac{amount\ of\ expenditure\ from\ the\ Labour\ Fund}{number\ of\ persons\ who\ participated\ in\ the\ given\ form\ of\ activisation} \qquad (3)$$

Persons, for who in given year the expenditures from the Labour Fund are incurred are considered as participating in a given form of activisation, regardless of the period of activisation and multiple participation in the same form of activisation.

Persons, who ended their participation in a given form of activisation are these ones, who in given year ended their participation in the given form of activisation financed from the Labour Fund, including persons, who ended their activisation started in previous years.

Persons, who were employed were these ones, who during or in the period of 3 months after ending their participation in a given form of activisation took a job and had worked for at least 30 days – with accordance to the data obtained from the Social Insurance Institution.

Due to the change of methodology of calculation of the employment effectiveness for basic forms of professional activisation in 2015, it is not possible to directly compare this coefficient for the year 2015 and previous years. The change of methodology referred mostly to the change of definition of ending participation and change of definition of employment (MRPiPS, 2016).

The research was based on the statistical data referring to the cost and employment effectiveness, published by the Ministry of Family, Labour and Social Policy (www1).

In years 2006-2018 there are visible significant differences between the percentages of persons participating in various activisation programmes and persons ending their participation and employed afterwards (table 2). In the analysed period on the average slightly over 93% of persons starting their participation in programmes ended it, but only about 59% of them found employment. In the year 2011 the percentage of persons ending their participation in various programmes is over 100%. It results from the fact that large number of persons started their participation in the year 2010 and ended in 2011.

Table 2: Percentage of persons ending their participation and employed after ending participation in programmes in years 2006-2018

Year	Percentage of persons	
	ending their participation (%)	employed after ending participation (%)
2006	95.54	52.44
2007	96.30	55.58
2008	93.11	52.13
2009	95.12	50.61
2010	96.27	52.13

2011	126.58	70.48
2012	88.38	53.80
2013	99.45	63.00
2014	93.29	71.13
2015	74.44	56.49
2016	81.97	64.55
2017	81.06	66.45
2018	86,44	73,44

In connection with these differences, cost effectiveness is much higher than the cost of participation of one person in a programme (figure 7). In years 2006-2010 high increase of the cost effectiveness (from ca. PLN 6.5 thousand to ca. PLN 13 thousand) was accompanied by relatively constant employment effectiveness on the level of about 55% (figure 8). In 2011 in comparison with the previous year, the cost effectiveness decreased significantly from ca. PLN 13 thousand to ca. PLN 9 thousand. This was related to a decrease in expenditure on the implementation of programmes for the promotion of employment (by about 64%) due to the excessive deficit procedure. Inclusion under this procedure entailed a reduction in expenditure from the Labour Fund, which is part of this sector. Next both types of effectiveness had increasing trends. Since 2015, the cost-effectiveness has started to decrease. It proves better use of funds for professional activisation of the unemployed in 2011-2018.

Fig. 7: Cost of participation, cost effectiveness of the activisation programmes in Poland in years 2006-2018

Fig. 8: Employment effectiveness of the activisation programmes in Poland in years 2006-2018

In order to compare the costs of participation and cost effectiveness of the activisation programmes the absolute and relative differences between them were calculated (figure 9). In years 2006-2010 the absolute difference between the costs of activisation and the cost effectiveness increased. However, the relative difference was on similar, but high level (almost 2 in 2009). In year 2018 the absolute difference was equal 2,731.76 PLN, or the cost effectiveness was by 36% higher than the cost of activisation of one person. In the same year the employment effectiveness was 82%. It proves slightly better, but still high cost of leading the unemployed person to employment.

Fig. 9: Absolute and relative differences between the cost of participation and the cost effectiveness of the activisation programmes in Poland in years 2006-2018

In order to group voivodeships with respect to the effectiveness, the maps: cost effectiveness – employment effectiveness for basic forms of professional activisation for years 2008-2018 were made. The studies of the Ministry of Family, Labour and Social Policy do not include data for 2006-2007 concerning cost and effectiveness for voivodeships. It allowed for separation of four groups of voivodeships due to their location in relation to average effectiveness: cost and employment. Figure 10 presents the exemplary map for the year 2018. Horizontal and vertical axes constitute mean cost and employment effectiveness for Poland, respectively. These axes divided voivodeships into four groups. The best ones are in group IV, where lower value of the cost effectiveness corresponds with higher value of the employment effectiveness. The worst situation is in group II, where the cost effectiveness is high and the employment one – low. Good standing with respect to the employment effectiveness is in the group I (both types of effectiveness are high) and with respect to the cost one – in the group III (both types of effectiveness are low). However, from the point of view of the social policy the employment issue is more important, therefore better situation is in the group I. Designated groups are presented in table 3.

Fig. 10: The map: cost effectiveness – employment effectiveness in 2018

Table 3: Division of voivodeships with respect to the forms of effectiveness against Poland (2008–2018)

Voivodeship	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018
Dolnośląskie	I	I	I	I	I	I	I	IV	I	I	I
Kujawsko-pomorskie	III	III	III	II	III	III	III	II	III	III	III
Lubelskie	II	II	II	I	I	IV	IV	IV	IV	III	III
Lubuskie	IV	IV	IV	IV	III	III	I	IV	IV	II	IV
Łódzkie	I	IV	I	I	I	I	I	IV	I	I	I
Małopolskie	II	II	II	II	II	II	II	III	II	III	III
Mazowieckie	II	II	II	II	II	II	I	I	I	IV	I
Opolskie	IV	III	III	III	III	III	IV	IV	IV	IV	IV
Podkarpackie	II	II	II	II	I	IV	IV	II	I	I	I
Podlaskie	IV	II	III	I	IV	IV	IV	IV	I	IV	IV
Pomorskie	IV	IV	IV	IV	IV	III	IV	IV	IV	IV	I
Śląskie	IV	IV	IV	II	III	II	II	II	II	II	II
Świętokrzyskie	II	I	I	II	I	III	II	II	II	II	III
Warmińsko-mazurskie	II	II	II	II	II	II	II	II	III	II	II
Wielkopolskie	IV	IV	IV	IV	IV	IV	IV	IV	IV	III	III
Zachodniopomorskie	IV	IV	IV	III	IV	III	II	I	IV	I	I

With respect to accepted criteria, in the whole analysed period the best situation was in Wielkopolskie and Pomorskie (except for the year 2013) voivodeships and the worst – in Warmińsko-Mazurskie (except for the year 2016) and Małopolskie (except for the years: 2015 and 2017). Taking into account the social aspect of professional activisation, the main goal is finding a job by the unemployed persons. Therefore high value of the employment effectiveness is desirable even when the cost effectiveness is

high. In years 2008-2018 such situation was in Dolnośląskie and Łódzkie voivodeships, which in the analysed period belonged mostly to the group I. The largest number of the unemployed persons is registered in the Mazowieckie voivodeship and therefore this voivodeship holds the largest resources designed for their activisation. However, in years 2008-2013 both types of effectiveness took the least favourable values (group II). The situation improved only after the year 2014. Authors' earlier research proved that voivodeships, in which the largest amounts of resources were destined for activisation generally used them worse and vice versa (Bieszk-Stolorz & Dmytrów, 2018).

Conclusions

Performed analysis indicates that in years 2006-2018 the effectiveness of use of funds for financing the basic forms of professional activisation of the unemployed persons was gradually improving. The funds entrusted were best managed by the Wielkopolskie and Pomorskie voivodeships and the worst – by Warmińsko-Mazurskie and Małopolskie voivodeships. Also the Dolnośląskie and Łódzkie voivodeships should be viewed as positive. Despite high values of the cost effectiveness, the employment ones were high as well. In the year 2011 the funds destined for professional activisation of the unemployed persons were used the worst (the largest number of voivodeships was in the group II). In years 2006-2018 the percentage of persons starting and resigning from participation in selected forms of professional activisation was not high and (about 7%). However, percentage of persons who found employment was also quite low (60%). In the analysed period the increase of the cost effectiveness was accompanied by the increase of the employment one. As long as the increase of the cost effectiveness should be considered as the negative phenomenon (from the point of view of public finances), it should be noticed that at the same time the relative difference between this effectiveness and the cost of activisation of the unemployed person decreased. All this proves that the effectiveness of activities of labour offices connected with professional activisation of the unemployed persons improved.

Influence of Weights in TOPSIS And TMAL Methods on Time of Order-Picking - Simulation Analysis

Krzysztof DMYTROW

University of Szczecin, Institute of Economics and Finance, Szczecin, Poland
E-mail: krzysztof.dmytrow@usz.edu.pl

Abstract

In shared storage, the product is often located in many different (often very distant) locations. When completing an order, one of them (or several if visiting one will not cover the demand for the product) should be selected. Locations can be selected according to different criteria: distance from the I/O point, from other locations to be visited during the picking process, degree of demand satisfaction or according to product storage time. One or all of the criteria listed above may be used. For this purpose, multi-criteria decision-making methods can be used. One of the methods used to select a location is TMAL (Taxonomic Measure of Location's Attractiveness) based on Hellwig's Composite Measure of Development, and the other is the well-known TOPSIS method. The aim of the article is comparison of results obtained by both of these methods. Both methods have been compared in terms of the total distance the picker will have to travel during order-picking and the total picking time. Obtained results showed that the shortest order-picking route and time was obtained when the highest weight was put on the degree of demand satisfaction. Also, generally the TOPSIS method generated better results than the TMAL method although only for the order-picking time results were statistically significant.

Keywords: Taxonomic Measure of Location's Attractiveness, TOPSIS method, warehouse management, simulation analysis

Introduction

On average, warehouse management accounts for about 20% of total logistics costs in a company. Order-picking is the most labour- and cost-intensive element of warehouse management, accounting for about 55% of its total costs (De Koster et al., 2007). The most cost- and time-consuming element of picking is the travelling of the picker. Therefore, it is extremely important to optimise the organisation of work in the warehouse. Nowadays, due to the technological development, intelligent systems supporting the process of managing an enterprise such as ERP, this goal is much easier to be achieved. There are many ERP software systems, such as open-source (for example Adaxa Suite, Apache OFBiz, ERPNext and many others) or proprietary ones (for example SAP ERP, Microsoft Dynamics ERP or Oracle ERP Cloud and many others). Additionally, automated *product-to-picker*, AS/RS, S/R or VLM (Le-Duc, 2005) systems can be used. Despite the existence of these advanced systems, a large majority of companies still use classic *picker-to-parts* systems (Napolitano, 2012), so from the point of view of order picking time it is important to optimise the route the picker travels, as it is the one that determines the total time of the picking process. The picker's working time schedule during picking is shown in Table 1.

Table 1: Distribution of picker's working time during picking (%)

Activity	% of order-picking time
Movement	55
Searching	15
Download	10
Documentation and other activities	20

Source: Bartholdi and Hackman (2019)

It can be seen that the most can be gained by optimising the route the picker travels. For this type of issue, the optimal route to be taken by the picker can be determined with the help of the modified travelling salesman problem, presented by Ratliff and Rosenthal (1983). However, the path set by such an approach, although it optimises the distance covered, has several disadvantages that may disqualify it in practice (Le-Duc, 2005):

1. The route may seem illogical for the pickers, which often makes them deviate from it.
2. The optimal route depends largely on the location of the I/O point.
3. Determining the optimal route can be a heavy burden on the company's IT system, as it has to be done for each order, and with a large number of locations to visit, the calculation algorithm is very labour-intensive.
4. The optimal route does not take into account the organisation of pickers' movement around the warehouse, so it can cause downtime on aisles.
5. The optimal method does not take into account that changing the direction of movement and changing the aisle can be time consuming.

All the above mentioned drawbacks of the optimal picking route method result in the use of heuristic methods such as *s-shape*, *return*, *midpoint*, *largest gap*, *composite* or *combined* (Le-Duc, 2005). These methods, especially *s-shape* and *return* are commonly used in the classic *picker-to-parts* systems. However, in order to apply any of them, we need to have selected locations that are to be visited by the picker.

Theoretical Background

It should be noted that the problem of designating the route taken by the picker is secondary to the problem of choosing the location to visit. Which locations to choose depends on how the products are stored. Basically, there are two main storage systems – *dedicated* and *shared storage* (Bartholdi & Hackman, 2019). The first type means that a given product is only stored in one location and a given location is assigned to store one product. In the latter case, a given product may be stored in different, often very distant locations and many different products may be stored in a given location. Both storage methods have their advantages and disadvantages. The most important advantage of dedicated storage is its simplicity, and its disadvantage – poor use of storage space. The shared storage is free from this disadvantage, but it often results in a large dispersion of products in different locations in the warehouse and even for small warehouses – the need to use an IT system that supports warehouse management. If dedicated storage is used in a warehouse, the choice of location is unambiguous, while in the case of shared storage, the product can be taken from different locations. Which location to take a product from depends on a number of criteria – this may be the storage time, the distance from the I/O point, the level of demand satisfaction or the distance from other locations where the other products in your order are located. One or more criteria may be taken into account. Hitherto performed analyses in this field did not specified the methods of locations' selection in the shared storage systems explicitly. In general it can be assumed that when the decision maker has to select locations, when the shared storage system is applied, it is generally connected with certain trade-offs (Bartholdi & Hackman, 2019). The selection of least-filled locations can help emptying and replenishing them, but increases travel time. On the other hand, selection of the most convenient location (the closest to the I/O point or fully satisfying the demand) saves time and labour, but result in small quantities of a product remaining in the locations. There are several possible take-out strategies that can be applied when choosing the locations to be visited by the picker (Gudehus & Kotzab, 2012):

- FIFO (*First-In-First-Out*) – units will be picked accordingly on their arrival to the warehouse;
- priority of partial units – locations with the lowest content of the product will be accessed first, even if it increases labour;
- quantity adjustment – the picker retrieves the product from the locations where the requested quantity is fully satisfied even if it generates additional low amounts of products in the locations;
- taking the access unit – if the amount of the product on a given location exceeds or is equal to the requested quantity, the complete unit is taken after the excess quantity is removed.

As seen in the above-mentioned list, there are several criteria mentioned. The first strategy considers the storage time. The second and third one considers the amount of products in the location, however, each does it the opposite way. The fourth strategy is similar to the third one, but also prefers locations with complete units of products. The decision-maker can consider one or several criteria at the same time. In the latter case, multi-criteria decision-making methods such as TOPSIS (Hwang & Yoon, 1981) or TMAL (Taxonomic Measure of Location's Attractiveness) (Dmytrów, 2018a, 218b) can be used. The use of multi-criteria decision making methods requires the weighting of decision criteria. The aim of this article is to examine whether the system used will affect the length of the road covered by the picker and the total picking time. Simulation methods will be used for this purpose and comparisons will be made on two planes:

a) Each method (TMAL and TOPSIS) will compare the results obtained for different weighing systems,
b) the results generated for both methods will be compared.

Methodology

Each location where the completed products are found is described using three criteria:

x_1 - distance from the location to the I/O point (measured in contractual units, which are the width of the rack),
x_2 - degree of demand satisfaction,
x_3 - number of other completed products in the proximity of analysed location (locations lying in the same aisle are assumed to be the proximity).

The first criterion is a "loss" type criterion. It measured in contractual units, which are the width of the rack.

The second criterion – degree of demand satisfaction – is the "profit" type one. It is calculated by means of the following equation:

$$x_2 = \begin{cases} \frac{l}{z}, & \text{if} \quad z > l \\ 1 & \text{if} \quad l \geq z \end{cases}, \tag{1}$$

where l – number of units of the picked product in the analysed location and z – demand for the picked product.

The term "proximity" can be understood in different ways. It can be the same rack, the same shelf, the same aisle or even the same sector in the warehouse. Selection of the appropriate approach is very important because if we set this proximity very narrowly (as the same rack or the same shelf), it may happen that in most situations there will be no other picked products in the proximity of the analysed location, so in most situations this criterion will not differentiate locations. On the other hand, if we set the proximity too widely (as for example the whole sector), there might be in most cases the situation that almost every location will have all other products in the proximity, thus this criterion will also not differentiate locations. In the research, the proximity of the analysed location will be all locations placed on the shelves within one aisle.

Decision criteria should be weighted appropriately. There are several possible methods of assigning weights to the criteria. Popular methods of assigning weights to the criteria are based on the Shannon's entropy (Lotfi & Fallahnejad, 2010) or the AHP method (Brunelli, 2015). However, application of the Shannon's entropy would cause that for every order and every product in the order there would be different weights. Also, setting weights for each order would be a lot of work and be time-consuming and it would be difficult to notice any regularity. Application of the AHP method, on the other hand, would cause that the expert (or experts) would set the weights that would be the same for every order, every warehouse, every storage assignment, etc. Moreover, there would be no guarantee that obtained weights would assure optimal (e.g. minimal) picker route length and order-picking time. Therefore in the research several combinations of weights were assumed and their performance were assessed by means of the simulation methods. The following combinations of weights were adopted:

Table 2: Weighting of decision-making criteria

Combinations	x_1	x_2	x_3
C1	0.333	0.333	0.333
C2	0.5	0.25	0.25
C3	0.25	0.5	0.25
C4	0.25	0.25	0.5
C5	0.4	0.4	0.2
C6	0.4	0.2	0.4
C7	0.2	0.4	0.4

The first combination, where all weights are equal, is used as a reference. The combinations C2, C3 and C4 are the combinations, in which one criterion is twice as important, as the other two and, at the same time, its impact on the final decision is the same as total impact of the remaining two criteria. The last three combinations indicate that two criteria are twice as important as the remaining one. The reason for such approach is to analyse, if any criterion should be more important than others in order to decrease the order-picking route and the order-picking time.

One of the steps in the construction of a synthetic variable is to normalise the variables. As all criteria are measured on the ratio scale, every normalisation formula can be used. The study used the quotient transformation given by the following formula:

$$z_{ij} = \frac{x_{ij}}{\sqrt{\sum_{i=1}^{n} x_{ij}^2}}, \tag{2}$$

where:

z_{ij} - standardised value of the *j*-th criterion in the *i*-th alternative,
x_{ij} - the actual value of the *j*-th criterion in the *i*-th alternative.

The reason for choosing this method of normalisation was the desire to maintain differences in the average level of variables and their volatility. Moreover, this approach was used by Hwang and Yoon for the TOPSIS method (1981). Also, the quotient transformation preserves the ratio scale, on which all criteria are measured.

The stages of construction of the Taxonomic Measure of Location's Attractiveness are as follows (Dmytrów, 2018b):

1. After the distance has been converted into a 'profit' criterion by determining its inverse, the variables have been normalised using the equation (2).
2. The maximum standardised values of the criteria forming the so-called "perfect alternative" were set.
3. Euclidean distances between the values of the criteria in a given location and the "perfect alternative" were calculated.
4. The criteria were weighted.
5. The pattern was calculated.
6. TMAL values have been calculated.
7. A ranking of locations from the highest to the lowest TMAL value was drawn up.
8. Locations with the highest positions in the ranking were selected until the demand was satisfied.
9. The above steps were repeated for all products in the order.

The stages of construction of the composite variable in the TOPSIS method are as follows (Hwang & Yoon, 1981):

1. The criteria have been weighted.
2. Normalised by equation (2) values of the criteria are multiplied by their weights.

3. For each criterion, a *pattern* and *an anti-pattern* were determined. For criteria of the "profit" type, the pattern is the maximum standardised values of the criteria, and the anti-pattern is the minimum values. For criteria such as "loss" it is the opposite.
4. Euclidean distances of each decision variant (location) from the pattern and anti-pattern were determined.
5. The similarity of each location to the pattern was calculated using the formula:

$$q_i = \frac{d_{i0}^-}{d_{i0}^- + d_{i0}^+}, \tag{3}$$

where:

d_{i0}^- - Weighted Euclidean distance of the i-th alternative (location) from the antipattern,
d_{i0}^+ - Weighted Euclidean distance of the i-th alternative (location) from the pattern,
qi - value of a synthetic variable specifying the similarity of the i-th alternative (location) to the pattern.

6. A ranking of locations from the highest to the lowest similarity to the pattern was made.
7. Locations with the highest positions in the ranking were selected until the demand was satisfied.
8. The above steps were repeated for all products in the order.

The results generated by both methods for all combinations of weights were obtained using simulation methods. The research of the order picking process with the use of simulation tools was carried out by Tarczyński (2012) or Jakubiak and Tarczyński (2012), among others. The following simulation experiment was used in the study:

1. A simple rectangular warehouse with 400 locations was established. The warehouse had one main aisle and eight aisles between the shelves. There were 25 locations in each shelf.
2. The distribution of products in the warehouse is purely random (chaotic warehouse).
3. Each order consisted of 10 products.
4. Each product was available in four locations.
5. The available product quantities at each location ranged from a single unit to a quantity covering double demand.
6. For each location selection method and each combination of weights, 100 orders were generated.
7. For each order, the locations to be visited were selected using the TMAL and TOPSIS methods.
8. After choosing the location to visit, the order was completed using the *s-shape* method.
9. The picking time was the sum of the time of the picker's movement and the time of taking products from the location. It was assumed that the time to cover a unit of distance (shelf width) was 2 seconds and the time to retrieve the product from the location was 10 seconds (Dmytrów, 2018b).
10. For each method, the *H* Kruskal-Wallis test (Aczel & Sounderpandian, 2009) examined whether the routes travelled by the picker and picking times were equal. The choice of the test was due to the fact that the distributions of both road lengths and picking times were not normal. If the null hypothesis had to be rejected, the *post-hoc* analysis was done using the Dunn's test of pair comparisons (Aczel & Sounderpandian, 2009). Samples differ if the inequality is satisfied:

$$\left|\bar{R}_i - \bar{R}_j\right| > \sqrt{H_\alpha} \cdot \sqrt{MST} \cdot \sqrt{\frac{1}{n_i} + \frac{1}{n_j}}, \tag{4}$$

where:
H_α – critical value of the Kruskal-Wallis test,
MST – the average sum of squares of deviations of ranks from the average of all ranks,
$\bar{R}_i$, $\bar{R}_j$ – average ranks in samples i and j,
n_i, n_j – size of i-th and j-th sample, respectively.

11. The results obtained for both methods for each weighting combination were compared with the Mann-Whitney *U* test (Aczel & Sounderpandian, 2009).

Results and Discussion

Selection of locations by means of the TMAL method

The results of the Kruskal-Wallis test for total route lengths and order-picking times are shown in Table 3.

Table 3: Medians, mean ranks and results of the Kruskal-Wallis test for the total route lengths covered by the picker and picking times after applying the TMAL method

Description	C1	C2	C3	C4	C5	C6	C7
The total distance travelled by the picker							
Median	208	205	200	216	200	213	222
Mean ranks	341.94	336.76	308.17	386.12	311.69	385.33	383.51
H	17.629						
p-value	0.00289						
Picking time (seconds)							
Median	560	553	539	575	544	565	577
Mean ranks	338.44	345.90	285.81	400.20	304.33	397.71	381.12
H	29.651						
p-value	0.00002						

Both for the total length of the road the picker travels and for the picking time, the zero hypothesis that all populations have the same distribution should be rejected. The Dunn's test was carried out for both variables. For the total distance travelled by the picker, the right-hand side of the equation (4) was 100.94 and for the picking time – 101.46 (in both cases the significance level $p = 0.05$ was assumed). The results of the Dunn's test are shown in Table 4.

Table 4: Results of the Dunn's test for the total route lengths covered by the picker and picking times after the application of the TMAL method (significant differences are bolded)

	C2	C3	C4	C5	C6	C7
The total distance travelled by the picker						
C1	5.185	33.775	44.180	30.255	43.390	41.565
C2		28.590	49.365	25.070	48.575	46.750
C3			77.955	3.520	77.165	75.340
C4				74.435	0.790	2.615
C5					73.645	71.820
C6						1.825
Picking time (seconds)						
C1	7.460	52.635	61.760	34.110	59.270	42.675
C2		60.095	54.300	41.570	51.810	35.215
C3			**114.395**	18.525	**111.905**	95.310
C4				95.870	2.490	19.085
C5					93.380	76.785
C6						16.595

In the case of the total distance travelled by the picker, although the Kruskal-Wallis test showed that the samples came from different populations, the Dunn's test did not show significant differences between the pairs, so it can be said that the weighting system used did not affect the length of the distance travelled by the picker during the picking process, if the locations were selected using the TMAL method.

The total picking times for the K3 scale combinations were significantly different from those for C4 and C6. Thus, when selecting locations using the TMAL method, it turned out that they are the shortest when the degree of demand is most important (variable x_2). The longest one is when the biggest weight is given to the variable x_3 and when x_2 has less weight than other variables.

Selection of locations by means of the TOPSIS method

The results of the Kruskal-Wallis test for total route lengths and order-picking times are shown in Table 5.

Table 5: Medians, mean ranks and results of the Kruskal-Wallis test for the total route lengths covered by the picker and picking times after the TOPSIS method

Description	C1	C2	C3	C4	C5	C6	C7
The total distance travelled by the picker							
Median	202	204	200	221	200	227	220
Mean ranks	345.37	332.14	286.90	411.02	268.80	422.86	386.43
H	52.605						
p-value	0.00000						
Picking time (seconds)							
Median	548	556	528	582	524	610	583
Mean ranks	338.48	353.08	245.03	431.85	246.22	458.18	380.68
H	100.972						
p-value	0.00000						

Both for the total length of the road the picker travels and for the picking time, the zero hypothesis that all populations have the same distribution should be rejected. The Dunn's test was carried out for both variables. For the total distance travelled by the picker, the right-hand side of the equation (4) was 100.91, and for the picking time - 101.46 (in both cases the significance level $p = 0.05$ was assumed). The results of the Dunn's test are presented in Table 6.

Table 6: Results of the Dunn's test for the total route lengths covered by the picker and picking times after the application of TOPSIS (significant differences in bolded)

	C2	C3	C4	C5	C6	C7
The total distance travelled by the picker						
C1	13.230	58.470	65.645	76.575	77.485	41.055
C2		45.240	78.875	63.345	90.715	54.285
C3			**124.115**	18.105	**135.955**	99.525
C4				**142.220**	11.840	24.590
C5					**154.060**	**117.630**
C6						36.430
Picking time (seconds)						
C1	14.595	93.455	93.365	92.260	**119.700**	42.195
C2		**108.050**	78.770	**106.855**	**105.105**	27.600
C3			**186.820**	1.195	**213.155**	**135.650**
C4				**185.625**	26.335	51.170
C5					**211.960**	**134.455**
C6						77.505

In the case of the total distance travelled by the picker, the results for combinations C3 differed significantly from the values obtained for combinations C4 and C6, and the results obtained for combinations C5 – from the results obtained for combinations C4, C6 and C7. Thus, using the TOPSIS method for location selection resulted in the picker going the shortest way if high weight is given to the variables x_2 and x_1.

In the case of total picking time the results obtained for combinations C3 and C5 differed significantly from those obtained for combinations C2, C4, C6 and C7. Additionally, the results for C6 combinations differed significantly from the results for all other combinations except those for C4 combinations. When choosing locations to visit, it pays off most to give a high weight to the variables x_2 and x_1. It is in accordance with the comparison of results obtained for various combinations of weights and selected take-out strategies, when the ABC-class storage system was applied. The best results (shortest order-picking routes and times) were obtained for the quantity adjustment strategy when the variable x_2 (degree of demand satisfaction) had the highest weight (Dmytrów, 2018b).

Comparison of results obtained using TMAL and TOPSIS methods

The results generated by both methods were compared with the Mann-Whitney *U* test. The results are shown in Table 7.

Table 7: Results of the Mann-Whitney *U* test comparing the total length of the roads covered by the picker and the total picking times after the application of TMAL and TOPSIS methods (significant differences are bolded)

Description	C1	C2	C3	C4	C5	C6	C7
	The total distance travelled by the picker						
z	–0.0135	–0.2726	–0.8043	–0.7421	–1.6358	–1.2524	–0.0393
p-value	0.4946	0.3926	0.2106	0.2290	0.0509	0.1052	0.4843
	Total picking time (seconds)						
z	–0.3153	–0.0086	–1.7023	–0.7308	–2.4602	–1.8946	–0.1356
p-value	0.3763	0.4966	**0.0443**	0.2324	**0.0069**	**0.0291**	0.4461

There were no significant differences between the total roads driven by the picker during the picking process, if the locations were selected using the TMAL or TOPSIS method. Such differences existed for total picking times and differed for combinations C3, C5 and C6, whereas for combinations C3 and C5, i.e. for those in which the degree of demand satisfaction (x_2) and the distance from the I/O point (x_1) were most important, Shorter picking times could be achieved by selecting locations using the TOPSIS method, and for combinations C6 (i.e. when the variable x_2 has less weight than other decision variables) better results (shorter picking times) were achieved if locations were selected using the TMAL method. The superiority of the TOPSIS method lies in the fact that obtained by its means composite variable – formula (3) takes into consideration distance of each alternative (location) from both the pattern and antipattern.

Conclusions and Directions for Future Research

The following conclusions can be drawn from the analyses carried out:

1. With chaotic distribution of products in the warehouse, when choosing the location to visit, the different weights assigned to the decision criteria resulted in significant differences in both the length of the route travelled by the picker and the total picking time.
2. It is advantageous to assign high weight to variable x_2 which is the degree of demand satisfaction and the distance of the location from the I/O point.
3. As far as the total distance travelled by the picker is concerned, the results obtained using the TMAL method did not differ significantly from those obtained using the TOPSIS method.
4. The use of TOPSIS method to select the location to be visited by the picker allowed to shorten the order picking time.

The next stage of research in this area will be:

a) the use of *return* heuristics for chaotic distribution of products in the warehouse;
b) conducting the analysis for distribution of products according to ABC classes using *s-shape* and *return* heuristics;

c) to carry out the analysis for a different layout of the warehouse (for more than one main aisle) and for a different placement of the I/O point.

The Potential of Cost Internalisation in Strategies Related to Management of Maritime Security/Safety Systems in Poland

Ryszard K. MILER

Associate professor, WSB Gdańsk, Faculty of Management and Finance,
Head of the Baltic Centre of Applied Logistics, Al. Grunwaldzka 238 A, 80-266 Gdańsk, Poland,
rmiler@poczta.onet.pl

Abstract

Operational management of maritime security/safety systems comes as one of the key responsibilities of maritime administration of coastal states. In Poland, the scope of the above-mentioned responsibilities is implemented under the National Maritime Security/Safety System (NMSS) [*Krajowy System Bezpieczeństwa Morskiego, KSBM*], the beneficiary and operator of which is the Maritime Office in Gdynia. The implementation of NMSS has taken place with a considerable amount of EU funds, furthermore further maintenance and management does not include internalisation of the maintenance costs, indicating the state budget as a founder. In the light of the growing operational costs, necessary modernisation, current depreciation of the morphological structure of NMSS and highly probable limitations to the obtaining of EU funds in the subsequent financial perspective (a change in the EU budget priorities in the perspective 2021–2027, Brexit, Covid-19), the question related to the internalisation of the NMSS costs should be seriously considered, along with the strategy of transferring them to the end-users of the system. The aim of the article is to present an attempt at a holistic analysis of the systemic premises related to the concept of a new safety surcharge which could provide external funding to the operation, development, modernisation and depreciation of the NMSS structures. In the article, the assumed working hypothesis stated that there are identifiable premises for the internalisation of the NMSS costs in Poland has been positively verified. Using a social and economic analysis of the NMSS as background, three potential strategic options of calculation and implementation of the suggested safety surcharge have been identified. The safety surcharge procedure is of universal nature and it can be implemented under any system of maritime security/safety management in any country.

Keywords: Maritime Security/Safety Management, NMSS [KSBM] (Poland), Internalisation Of The Costs Related To The Operation Of The NMSS, Security/Safety Surcharge.

Introduction

Facing global competition, maritime transportation with all associated port operations, according to Neider (2015), take place under extremely high technological and operational regimes and also under extreme time pressure. Moreover, an imperative of reducing costs and the most important current principle, namely: providing the above-mentioned operations with the highest level of security and safety must be also considered as stated in Makowski (2000). The growing value of vessels and their cargo, their significance in economic processes of modern civilisation and increasing congestion cause an increase in threats both to security (terrorism, piracy) and to safety (maritime accidents, collisions, growing anthropogenic impact – environmental loss). Hence, security, safety and freedom of navigation, which have been the constitutional right of all coastal states for ages,[1] become some of the main determinants of economic efficiency for maritime transport processes as stated in Rydzkowski (2007), especially when their external results are taken into consideration. Therefore, according to Miler (2016) the problem related to providing safety and security to maritime navigation and to more broadly understood maritime transport through efficient counteraction against the above-mentioned threats becomes of key importance to all coastal states, including Poland.

Within the domain of security and safety of navigation in the maritime territory of the Republic of Poland, the National Maritime Security/Safety System (NMSS) [KSBM] has been implemented. The NMSS [KSBM] comes as a sensory platform (acquisition of data from the monitoring), an analytical and decision-making platform (intelligent decision-making algorithms) and an effector platform (transferring decisions to the particular stakeholders of the system with the use of telematics tools). The main aim of the development of the concept and of the subsequent implementation of the NMSS [KSBM], as it is stated in study by Krystek (2009), is to provide relevant bodies of maritime administration with an innovative tool to increase efficiency of maritime security/safety management (and of all associated port operations), to counteract pollution of marine environment in the maritime areas belonging to the Republic of Poland and to provide information and operational support to the SAR service.[2]

Defined in such a way, the tasks clearly indicate that in its fundamental operational aspect, the system supports current processes (operations) undertaken to provide safety and security to maritime navigation (transportation) and to the handling of vessels that enter Polish sea ports of the primary importance to national economy (Gdańsk, Gdynia, Szczecin, Świnoujście). The implementation of the advanced telematics technology (including the optical fibre trunk line) considerably supports (integrates, streamlines and simplifies) the response of maritime administration to potential maritime accidents and disasters, pollution and acts of asymmetric nature (including acts of terrorism) which may appear in the area of the south-eastern Baltic Sea (as an area of the maritime administration's responsibilities). According to Miler (2016) at the same time, it generates relatively high operating and managerial costs. The NMSS [KSBM] provides the continuity and reliability to the exchange of information through the Maritime Safety Information Exchange System (MSIES) [*System Wymiany Informacji Bezpieczeństwa Żeglugi, SWIBŻ*][3] under the HELCOM and it also offers a possibility to redistribute sensitive data from the system to the authorised institutions (such as SAR, the Regional Unit of the Maritime Border Guard, the Navy and the NATO) in order to increase efficiency of security/safety management, as considered from a more holistic point of view (including the regional and European levels as indicated in Krystek 2009).

As an example of maritime security/safety systems applied at the national level, the NMSS [KSBM] may become a subject of scientific research in the field of the potential related to the internalisation of its operational and management costs, including a possibility of drawing generalised conclusions.

Methodology and identification of the research field (NMSS, Poland) [KSBM]

Apart from other numerous determinants, the implementation of all the functionalities of the discussed security/safety management system on the Polish maritime areas has required a clear conceptual and investing policy with allocation of its funding sources. The field of financial management (starting from the project plan, through its implementation and maintenance, to its current operational management) becomes the key research field. The analytical tool is a social and economic analysis (including the *Total Social Cost/Total Social Benefit TSC/TBS* categories) with consideration of external outcomes and a calculation method applied in the category of the research results (in order to assume an algebraic formula of the suggested external fee for the exploitation of the system, namely: a safety surcharge).

In the years 2010–2020 (the current period of the main implementation and operation of the NMSS [KSBM]) the funding of initiatives related to the Integrated Maritime Policy for Poland, aplied to maritime areas indicated in Act of Maritime Areas (1994), has been possible under the funds allocated to the programme for further development of the integrated maritime policy as stated in Ordinance of the EU Parliament… (2011). Hence, in order to implement the strategic assumptions of the NMSS [KSBM], at least at the investment stage, it has been decided that the available (domestic and foreign) funds dedicated to investment operations shall be involved. The domestic funds have been obtained from the public sources (the state budget through the Ministry responsible for maritime economy and infrastructure); the foreign funds have been allocated from the EU funds of the financial perspective 2007–2013 and the financial perspective 2014–2020 (from the European Maritime and Fisheries Fund (2011) and the Cohesion Fund). There have not been any private

funding sources involved in the programme related to the implementation of the subsequent stages of the NMSS [KSBM] (at the strategic level).[4]

The above-mentioned example confirms the statement that the investment into the infrastructure of security/safety systems – by definition (in most cases) – comes from the state budget because providing maritime safety and security is one of the prior and inalienable functions of the State. It largely contributes to restrictions imposed on the use of private funds for supporting the improvement of economic efficiency and potential economisation processes; it also refers to the lack of any possibilities to use internalisation of operating and managerial costs in the complete perspective of the life cycle of an implemented security/safety system (*Life Cycle Assessment* – LCA), despite the fact that in the pragmatics of investment and project behaviour, numerous examples of the potential related to the application of funds other than state funds used for the above-mentioned purposes can be mentioned.

Therefore, it is possible to formulate the following working hypothesis stating that there are identifiable and objective premises for the internalisation of operational and managerial costs in maritime security/safety systems, which are universal for all coastal countries and which can be verified based on the pragmatics of the operation of the NMSS [KSBM] in Poland.

Premises of the internalisation of operational and managerial costs in the National Maritime Security/Safety system (NMSS [KSBM], Poland)

Defining the demand for the results of the NMSS project (I and IIA) in the social categories (social demand) is of specific nature. As it has already been mentioned, it results from the fact that according to the general security/safety doctrine of the Republic of Poland, providing maritime safety and security is not a commercial task but a responsibility undertaken by the state services. This principle is directly translated into the budgeting process and the high share of EU funds (85%) in the total value of the NMSS [KSBM] project, with no funding sources other than the state budget indicated for management and operation of the already implemented system. According to Raport z przebiegu…(2011), the implementation of the NMSS [KSBM] has taken place in two stages:

- National Maritime Security/Safety System, stage I (NMSS I) [KSBM I],
- National Maritime Security/Safety System, stage IIA (NMSS IIA) [KSBM IIA].

The data referring to both stages of the project are presented in Table 1.

Table 1: Basic information referring to the financial aspect of the NMSS [KSBM] implementation strategy [Beneficiary: Maritime Office in Gdynia]

Basic data of the project	NMSS I [KSBM I]	NMSS IIA [KSBM IIA]
Type of the project	Individual project	Individual project
Priority	VII – Environmentally friendly transport	VII – Environmentally friendly transport
Action	7.2 – 6 Development of maritime transport	7.2 – 6 Development of maritime transport
Date of the agreement	28th Feb. 2011	20th Dec. 2012
Total value of the project	111 665 386 PLN	85 584 014 PLN
Amount of the EU funds in the project	86 078 346 PLN (Cohesion Fund)	72 250 000 PLN

Share of the EU grants in the eligible costs	85%	85%
Scope of the project	development of a monitoring and controlling system for uniform safety/security management in the maritime areas of the Republic of Poland carried out by maritime administration and for the exchange of maritime safety/security information with cooperating domestic and foreign institutions	design and construction of the Pomeranian Data Transmission Trunk Line in the form of an optical fibre pipeline between Gdynia and Świnoujście
Contractor entity (a contractor selected by tender procedures)	Alcatel – Lucent Polska Sp. z o.o. Indra Sistemas S.A.	Wasko Sp. z o.o.

Source: the Author's own study based on the information provided by the Centre for EU Transport Projects https://www.cupt.gov.pl/?id=1522; http://www.cupt.gov.pl/?id=933 [Retrieved March 24, 2015].

The NMSS [KSBM] and the MSIES [SWIBŻ] as its sub-system come as excellent examples of efforts undertaken by the particular countries of the Baltic Sea Region (BSR) and of the EU in order to achieve an acceptable level of risk and to provide security/safety to all the processes involved in maritime transport in the areas they are responsible for (as coastal states). Unfortunately, such efforts are largely determined by the specific character of the particular countries, including their wealth, significance to maritime transport in pursuit of economic goals, access to advanced technologies and techniques and the level of determination to provide maritime safety/security. Additionally, despite integration and unification efforts, such decisions are largely made individually by the particular countries (with consideration of their own national interests, however often with a large share of regional – European funds).

Another argument for incurring considerable investment expenses to increase maritime safety/security through implementation of innovative management systems is a systemic social and economic analysis in the categories of social costs TSC/TSB: Total Social Cost/Total Social Benefit, determining the indication of considerable social benefits resulting from the implementation of the above-mentioned systems.

A social and economic analysis of the state maritime security/safety system at the national level (NMSS [KSBM], Poland)

While carrying out a social and economic analysis[5] of the NMSS I [KSBM I] project, it is necessary to make, after KSBM etap I… (2007), the initial simplifying assumptions:

- the Maritime Office in Gdynia (Beneficiary) obtains its own funds (own contribution) for the implementation of the project from the Ministry of Infrastructure; during the implementation of the investment under the Infrastructure and Environment Operational Programme, Action 7.2 – Development of Maritime Transport, the own funds account for 15% of the eligible costs obtained in instalments in the years 2009–2012; in this way, the contribution of the EU grants is 85% of the eligible costs;
- the launching of the NMSS I took place in 2011 and, in this way, the surge in the costs related to the maintenance of that system during that year can be justified;
- for the purpose of the costs-and-revenues analysis, the prices of materials and services from the second half of 2007 are accepted; the analysis has been carried out in real prices, without any consideration of the inflation impact;

- considering the fact that the project can be treated as a project in the IT field, for the purpose of projecting the economisation processes, a period of 17 years of the project operation has been assumed, starting from the year in which the investment is to be completed, that is until 2028; the assumed period indicates the cyclicality in the replacement of the IT equipment and radars (operational costs do not change during the projection period);
- for the purpose of the financial and economic analysis, the value of the discount rate has been assumed as d = 6%, as the value recommended for the analysis of costs and benefits of the investment projects in the IT and transport sectors;
- the VAT has been treated as the non-eligible cost.

According to the operational principles of the Maritime Office in Gdynia (Beneficiary) and the specificity of the project, the only revenues obtained by the Office come from the state budget and they should cover all the costs related with the operation of the system (without depreciation) as indicated in Analiza kosztów… (2012).

The operational costs of the project are the costs resulting from the launch and exploitation of the new NMSS I [KSBM I] (and subsequently the NMSS IIA [KSBM IIA]) and from the increased number of employees (25 new employees). Furthermore, it has been assumed that during the exploitation of the system the replacement of some structural elements of the system (radars, computers, servers)[6] will take place in the 5-year and 10-year cycles.

There has not been any calculation of the financial evaluation indicators (the financial internal rate of return – FIRR, the financial net present value – FNPV) for the project, in a situation when the project does not generate the assumed revenues and the modernised National Maritime Security/Safety System is not depreciated (Beneficiary does not obtain any revenues which are derived from depreciation from the state budget). It results directly from the form of the calculation made for this type of investment mentioned in KSBM etap I… (2007):

$$\mathrm{FIRR} = f\left(-\mathrm{N};+\mathrm{D}\right) \tag{1}$$

where:

N – is the capital expenditure;
D – is the revenue resulting from the project = 0 (Beneficiary's operational costs are covered directly from the state budget).

The analysis of the social and economic efficiency of the NMSS I [KSBM I] project has been provided from the perspective of the state interests (Poland) and the perspective of the regional interests (BSR), through the calculation of the economic internal rate of return (EIRR) and the economic net present value (ENPV), with the analysis of C/B (TSC/TSB), assuming that the system will prevent only one maritime catastrophe with the participation of one large tanker (the total loss in the final year of projection: 2028; the estimated value of the vessel with the cargo: 441 647 500 PLN,[7] excluding the costs of search and rescue operation and potential environmental loss as stated in KSBM etap I… (2007).

The value of the EIRR for the own contribution and the value of the total investment have been calculated with the use of the following equation:

$$\mathrm{ENPV} = 0 = \sum_{t=0}^{t=n} \frac{\mathrm{K}_n}{(1+\mathrm{EIRR})^n} + \sum_{t=0}^{t=n} \frac{\mathrm{NCF}_n}{(1+\mathrm{EIRR})^n} + \mathrm{RV}_n \tag{2}$$

where:

t = 0, the initial year of the investment (2007);

$t = n$, the final year of the projection (2028);
K_n – is the amount of the own contribution of the Maritime Office to the total investment;
NCF_n – is the value of the net cash flows generated by the project in a particular year;
i – is the assumed discount rate (6%);
RV_n – is the residual value calculated with the use of the equation W_n/i where W_n is the value of the operational costs in the final period of the projection (2028).

The values of the indicators of the economic internal rate of return (EIRR) calculated for the NMSS I and indicated in KSBM etap I… (2007) project are:
- of the total investment (EIRR/C): 7.5%[8]
- of the own contribution (EIRR/K):15.3%

The values of the ENPV of the equity capital and of the total investment have been calculated with the use of the following equation:

$$\mathrm{ENPV} = -\sum_{t=0}^{t=n} \frac{\mathrm{K}_n}{(1+i)^n} + \sum_{t=0}^{t=n} \frac{\mathrm{NCF}_n}{(1+i)^n} + \mathrm{RV}_n \tag{3}$$

As described in KSBM etap I (2007) the values of the economic net present value (ENPV) calculated for the NMSS I [KSBM I] project are:

- of the total investment (ENPV/C): + 14 701 955 PLN
- of the own contribution (ENPV/K): + 67 738 291 PLN

In accordance with the accepted assumptions for the funding the NMSS [KSBM] operation, the society must incur additional expenses to maintain full operational readiness of all the structures of the National Maritime Security/Safety System. The above-mentioned expenses are presented in the financial analysis as the operational costs of the system and they form the TSC category. Most components of the TSB category are difficult to quantify because they include:
- potential decrease in the number of maritime accidents and failures;
- potential decrease in environmental loss resulting from maritime disasters and failures;
- better and more efficient coordination of search and rescue operations at sea;
- decrease in risk related to threats against maritime security (piracy, terrorism, asymmetric threats);
- fast and more efficient information exchange in the field of maritime transport security and safety (including the international aspect – EU).

Meeting the assumptions identified above, the implementation of the NMSS [KSBM] indicates its efficiency also in the TSC/TSB categories. It is a strong reason to discuss the problem of the internalisation of the NMSS [KSBM] operational costs in the further perspective of its exploitation and management. Therefore, Maritime Offices, as the entities responsible for the management and operation of the NMSS [KSBM], might be directly interested in searching for other available funding sources for the current operation of the system, especially in the light of Centrum Unijnych Projektów… (2015) findings. The following concept comes as one of the potential possibilities to obtain other funding sources through the internalisation of the operational and managerial costs of the current maritime safety/security system.

The concept of a safety surcharge as the potential of the internalisation of the operational costs of the maritime security/safety system (NMSS [KSBM], Poland)

All the calculation elements of the social and economic analysis of the NMSS [KSBM] assume that it is actually possible to prove the causal relationship between the operation of the system and a decrease in the number of maritime disasters (failures, disasters, including environmental disasters). Another argument is the fact that providing funds from the state budget does not usually foster

financial rationality and pressure towards economisation. Furthermore, after the end of the implementation stage, which has been financed from the EU funds, all other costs are covered exclusively from the state budget, hence they burden the society (the TSC category). Considering the growing operational costs, all indispensable modernisation, current depreciation of the fixed assets (elements of the morphological structure of the system), highly probable restrictions imposed on the co-financing of the investment with the use of the EU funds in the subsequent financial perspective (2021–2027) caused by some probable changes in the priorities and the budget expenditure axis[9] and the impact of Brexit, it is necessary to analyse the question related to the internalisation of such costs through the implementation of the strategy in which the costs of the current maintenance of the system are transferred on the end-users of the NMSS [KSBM] (the strategy of cost internalisation). For this stage of the research, the Author assumes three potential strategic options of the suggested solution:

- internalisation limited exclusively to the operational costs resulting from the exploitation of the NMSS [KSBM] – the strategy of limited internalisation of costs;
- internalisation of depreciation costs and intended modernisation of the NMSS [KSBM] – the strategy of partial internalisation of costs;
- internalisation of all the costs related to the maintenance of the system after the EU funding of the NMSS [KSBM] is finished (operational costs + depreciation + modernisation) – the strategy of full internalisation of costs.

The potential implementation of the above-mentioned solution shall require some considerable legislative amendments which would make it possible to transfer (internalisation) the operational costs of the NMSS [KSBM] to its end-users (ship owners) in the form of an additional port fee (following the example of the fee for the ISPS security system – a security surcharge). It shall also require precise calculation of such a surcharge for each of three strategic options. The amount of the discussed surcharge (the suggested name: a safety surcharge – the S-surcharge) should be calculated for the subsequent years based on the data provided from the previous years, with the consideration of the following equation:

$$\text{S-surcharge} = \sum_{i-n} \frac{\mathrm{W}_n}{\mathrm{N}} \tag{4}$$

where:

W_n – is the value of the following costs:

1) operational costs,
2) depreciation + modernisation,
3) operational costs + depreciation + modernisation in the previous period (previous year); the costs of modernisation should be spread over the whole period between the subsequent stages (in 5-year and 10-year cycles),

N – is the number of vessels handled at all the sea ports in Poland in the previous period (previous year).

Considering the above-mentioned data referring to the operational costs and intended modernisation of the NMSS [KSBM] (in the 5-year and 10-year periods until the end of the LCA, that is namely: 2028) and the statistical data presenting the number of calls at the sea ports in Poland, it is possible to calculate the amount of the S-surcharge for 2020, using the equation presented above. It will include the following amounts for each strategical option respectively:[10]

- approximately 180 PLN/a vessel for the option of the limited internalisation of costs;
- approximately 250 PLN/a vessel for the option of the partial internalisation of costs;
- approximately 320 PLN/a vessel for the option of the full internalisation of costs.

Despite the fact that the amount of the discussed fee (the suggested S-surcharge) seems to be relatively low,[11] its impact on the competitiveness of the Polish sea ports should be taken into consideration, especially taking into account other overlapping potential determinants related to the limitation of the above-mentioned competitiveness (e.g.: establishment of the SECA in the BSR) and the multiplication of costs for ferry ship owners and ship owners who provide regular line connections on the Baltic Sea. Therefore, the potential decision about the implementation of the S-surcharge should be made based on a comprehensive profit-and-loss analysis with consideration of all the aspects, including the costs of S-surcharge collection and issuing a relevant legal act (legislation).

Conclusions and Recapitulation

Provided in the article, a limited and estimated analysis of the social and economic efficiency of the NMSS [KSBM] (as a real system operated at the national level) presents complicated phenomena related to the potential of the economisation of integrated systems dedicated to maritime transport safety/security and the strategic options for the internalisation of their operational costs which can be implemented. In conclusion, it is possible to state that the economisation of the NMSS [KSBM], understood as a process of improving the economic efficiency of the system, can be a viable and efficient process if it is considered in its broadest (holistic) dimension, including external costs and benefits (social TSC/TSB) – despite some restricting mechanisms (budgeting, lack of competitiveness, maritime security/safety as the responsibility of the State). The suggested fee (the S-surcharge) imposed on vessels calling Polish sea ports would allow the interested parties to provide continuous operation of the system, also in a situation in which the current funding sources would be seriously limited (being based mainly on the prevailing contribution of the EU funds).

Hence, the discourse presented in the article allows the Author to state that in order to become independent from the budget funding in the fields of the NMSS [KSBM] operation, its operational costs, depreciation and modernisation (especially, considering the fact that the investment is made into information technology of a short life span – LCA), it may be necessary to implement an additional safety surcharge, based on the principle referring to the internalisation of the operational costs of the maritime transport security/safety systems (in this particular case: the NMSS [KSBM]). The calculation method for the surcharge suggested above is of universal nature. Hence, based on the research he has carried out, the Author believes that it is possible to apply the obtained results and conclusions in a wider population (other coastal countries which operate similar systems).

Endnotes

[1] In one of his contemporary studies, *Europe and the Sea – Making of Europe,* Michel Mollat du Jourdin discusses widely freedom of the sea and a necessity of providing objective regulations to maritime transport; see more [in:] Makowski A., *Siły morskie współczesnego państwa*, Impuls Plus Consulting, Gdynia 2000 – the Author's note.

[2] The Polish maritime zone of the responsibility for search and rescue (SAR) operations does not correspond to the Polish state borders (TTW) and its area is defined by the Act on Maritime Areas and Maritime Administration of the Republic of Poland (Journal of Laws,1994 No. 32, item.131 with later amendments) – the Author's note.

[3] The Maritime Safety Information Exchange System (MSIES) [SWIBŻ] and its data transmission infrastructure was developed by the Maritime Office in Gdynia with the financial participation of the European Union (the Sectoral Operational Programme – Improvement of Competitiveness of Enterprises 2004–2006; Priority 1: Improvement of entrepreneurship and innovation through enhancement of institutions in business environment; Action 1.5 Development of a system providing *entrepreneurs* with an access *to* information and public services online*)* – the Author's note.

[4] Tasks of public administration and public entities will not result in any additional expenses in the public finance sector because they will be funded under the restrictions imposed on the expenses defined in the State Budget Act, in the relevant parts of the state budget – the Author's note.

[5] According to *The Analysis of costs and benefits of the European Structural Fund – EFRD Cohesion and ISPA,* the guidelines provided by the Unit for Evaluation of Regional Policy, the economic analysis is to provide an evaluation of the way in which the project contributes to the economic growth of the particular region or country (improvement of welfare). It is provided with the consideration of the interests of the population of a particular region or country, through the calculation of the economic internal rate of return (EIRR), the calculation of the economic net present value (ENPV) and the C/B(TSC/TSB) analysis – the Author's note.

[6] According to the project documentation, the first year of the increased operational costs was 2011 – the Author's note.

[7] In order to provide a consistent way of calculation, the prices from the initial period of the projection (2007) have been assumed – the Author's note.

[8] The high value of the EIRR indicator for the total investment means that if the NMSS I [KSBM I] prevents even one maritime catastrophe during the projection period, it is still profitable in terms of social and economic efficiency, considering its maintenance and modernisation costs – the Author's note.

[9] Working on the EU budget perspective 2021–2027 was initiated in 2018, in accordance with the procedures. In May 2019, the European Commission submitted a proposal in which the cohesion policy, under which popular grants are provided as financial aid, would obtain EUR 330 billion. It would be about EUR 20 billion less than in the budget defined for the years 2014–2020. Poland is to obtain EUR 64 billion – approximately 20% less than in the current financial perspective. See more: https://businessinsider.com.pl/finanse/fundusze/budzet-ue-na-lata-2021-2027-ile-pieniedzy-dla-polski/swq0594 [Retrieved February 20, 2020] – the Author's note.

[10] It has been calculated on the basis of the modernisation schedule (5-year and 10-year cycles) the analysis of the operational and managerial costs of the NMSS [KSBM] in the perspective to 2028 (according to *KSBM Etap I, Studium wykonalności*…, p. 210 and the subsequent documents) and the data provided by the Central Statistical Office referring to the number of calls at Polish sea ports (in 2017, 19 488 commercial vessels called at all the Polish sea ports, excluding passenger vessels and ferries) – in: *Rocznik Statystyczny Gospodarki Morskiej*, Statistical Office in Szczecin, Warszawa-Szczecin 2018, pp. 171, 339 – the Author's note.

[11] The suggested amount of the S-surcharge can be compared to the gross tonnage fee; for example, in the Port of Gdańsk it is 1,07 PLN/1 GT for a container vessel, so for a container vessel of 50,000 GT x 1.07 PLN = 53,500 PLN. See more: https://www.portgdansk.pl/port/charges/Taryfa-2020.pdf – the Author's note.

Abstract

the article outlines the essence of the problem, which indicates the need for recovery measures in relation to the Syrian economy. In the course of the study, the regions of the state are divided into several sectors, each of which has its own set of goals and priority measures in the framework of economic recovery. The importance of investment, including the role of public-private partnership for the recovery of the Syrian economy, is highlighted. Effective investment schemes that are best suited to the current conditions in Syria are proposed.

Keywords: Economic Recovery in Syria, Economic Recovery Mechanism, Investment in Syria, PPP In Syria.

Introduction

Due to a durable military conflict in Syria lasting from 2011 to the present day, the national economy of the country has undergone a number of negative changes. The main macroeconomic indicators have low or negative values (GDP, production growth, unemployment, inflation, etc.). In addition, a number of objects were destroyed during the course of military operations in Syria: from historical places to infrastructure and residential areas. The people who lived in conflict zones were forced to move to safer places in search for social support that is currently needed. Therefore, the fulfillment of social obligations is now a priority for the Syrian government, as well as the restoration of the national economy in order to replenish the country's budget.

These facts determine the relevance of the research. The search for the most effective mechanisms for restoring the country's economy is considered a particularly acute issue. This is the purpose of the given study.

The main indicators of the Syrian economy's development within 2010-2018 are represented in Table 1 (Economic indicators of Syria).

Table 1: The main economic indicators of Syria

Indicator	2010	2011	2012	2013	2014	2015	2016	2017	2018	Abs. m.
GDP, %	3,4	4,7	-26,3	-26,3	-14,7	-6,1	-4	1,9	2,4	-1
Unemployment rate, %	8,6	14,9	14,5	14,4	14,4	14,6	15	15,2	14,9	6,3
Inflation rate, %	3,8	5	15	52	19	-27	46	39	1	-2,8

The table shows fairly stable indicators of the Syrian economy in the pre-war period (up to 2011): a positive GDP growth rate, the average unemployment rate, and acceptable inflation parameters. Since 2012, there has been a sharp change in the country's GDP – a significant decline in production until 2017. The unemployment rates reached 14-15% until the end of 2018. The inflation rate varied significantly from 2012 to 2017. Thus, the Syrian economy has been inefficient for six years and has been subject to many negative impacts.

A significant resource for the recovery of the Syrian economy is the labour potential. However, according to the UN, the number of refugees in the country reaches 3% of the total population of Syria. Fig. 1 shows the dynamics of Syrian refugees registered since 2013 (U.N. statistics).

Fig.1: The number of registered Syrian refugees, people

The data show that the number of refugees from Syria reached its peak in 2017 equaling almost half a million people. Moreover, more than 70% of Syrian refugees remains in the country, which implies the state's obligation to provide them with adequate living conditions and pay benefits, according to the country's social policy.

In order to restore the economy and solve national problems, the Syrian government should use special mechanisms. Modern mechanisms of economic recovery in the world are quite diverse, but in most cases the following measures are used (Chernenko, V. A., 2019, p. 84):

1) increase in government borrowings;

2) increase in the state's budget deficit;

3) softening of monetary policy and stimulation of investments in the country.

The first two options are classic methods that are easiest to implement, but they imply a short-term effect, rather than establishing stability in the country's economy.

By resorting to external borrowings, the government is aware of the fact that it is committing itself to the international community or international organizations. Creating a negative credit history, the state may lose the trust of foreign partners in all economic relations for a long time. Moreover, international funds and organizations may refuse to lend. Therefore, this mechanism of economic recovery is not considered highly effective.

Increase in the state's budget deficit is used when spending exceeds income significantly, social programs for the country's development are usually cut, and most of the money supply is directed to the economy. If the state of the economy does not have a protracted crisis, then this mechanism takes place in a short period of time. But with long-term processes of destabilization of the economy, this method of its restoring will only aggravate the situation: the country may default leading to its bankruptcy in the future.

Softening of monetary policy and the development of the effective investment policy is the mechanism for restoring the national economy considered to be the most acceptable solution for most world countries.

To determine a more precise scheme of the mechanism of economic recovery in Syria, the country should be divided into several sectors. This is due to the fact that such a mechanism must have a point nature and a target orientation. Not all regions of Syria are affected by destruction and negative consequences of the military conflicts. Some of them continue their performance as usual, that is why the government has received a positive rate of GDP growth in recent years. Therefore, the mechanism of economic recovery should be applied intensively to the regions suffering from a difficult economic situation.

Syria's regions are divided into sectors based on their losses from military and terrorist events. Thus, the division can be represented as follows (Map of military operations in SAR):

– Sector 1 – the regions of Syria where the destruction of the infrastructure and economy reaches 90% (for example, Palmyra or Homs);

– Sector 2 – the regions of Syria where the degree of destruction of the infrastructure and economy ranges from 30 to 70% (for example, Aleppo or Damascus);

– Sector 3 – the regions of Syria where the level of losses from military conflicts reaches 30%, i.e. the potential for the economic development has been preserved (for example, Idlib);

– Sector 4 – the regions of Syria that have suffered insignificant losses during military conflicts (for example, Latakia or Tartus).

Accordingly, the Syrian government should apply a sufficient mechanism for economic recovery to the regions of each sector depending on the goals and tasks set. The goals and measures aimed at the economic recovery for various sectors of Syria are represented in Table 2.

Table 2: Goals and measures aimed at the economic recovery in various sectors of Syria

Sector	Goals and tasks	Priority measures
1	Goal: the recovery of the region's economy after military destructions	– to restore the landmarks and historical values; – to ensure the population's safety; – to restore the infrastructure and communication lines; – to restore destroyed enterprises; – to organize the construction of new enterprises.
2	Goal: the recovery of certain sectors of the economy after military destructions	– to restore the landmarks; – to restore the infrastructure; – to create new enterprises in attractive industries.
3	Goal: the elimination of negative consequences of the crisis caused by military destructions	– to restore the enterprises of attractive industries and equip them with new technologies; – to conduct an active marketing campaign to attract foreign investments; – to develop channels of communication with potential investors, etc.
4	Goal: to increase the attractiveness of the industries reduced due to military destructions	– to use new technologies in the activities of the enterprises; – to attract investors for joint construction of large enterprises; – to conduct an active marketing campaign to attract foreign investors.

The given table shows the main differences in goals and priority actions that are common to different sectors of Syria.

The goals differ as follows. The goals for Sectors 1 and 2 include the usage of modern mechanisms for restoring the national economy in the regions located in the area of military conflicts. They are aimed at restoring sectors of the economy and peace in the region. To determine the sector to which this or that region of Syria belongs in this case, it is necessary to evaluate two types of impacts by their strength:

– direct impact, i.e. fire, physical destruction of buildings, structures, facilities and infrastructure in the region of Syria;

– indirect impact, i.e., a decrease in investment and tourist flow, a decrease in the production rate of the economy, a decline in social and economic growth indicators in the region of Syria;

The goals for Sectors 3 and 4 include the usage of modern mechanisms for restoring the national economy in the regions partially or indirectly affected by the military events in the country. They are aimed at improving the efficiency of the affected sectors of the economy and developing new industries. To determine the sector to which this or that region of Syria belongs in this case, it is necessary to measure the impact of the following indicators:

– production rate;

– state of fixed assets;

– average salary of the population;

– investment activity;

– the level of the population and business credit, etc.

It is also necessary to note the different orientation of the mechanisms for restoring the national economy based on the sectors of Syria:

– Sectors 1 and 2 are characterized primarily by providing social assistance to the population of the country – housing, jobs and social benefits. Afterwards, the strategically important sectors of the economy are restored for a particular region (for example, regarding Syria, it is predominantly oil or the tourism industry). To increase attractiveness and attention of the international community to the country's problems, historical values and landmarks are also restored. For example, many cultural heritage sites were destroyed in the center of Aleppo (part of the ancient neighborhoods from the UNESCO world heritage list). Moreover, it is important to restore the infrastructure and eliminate negative consequences in certain sectors of the economy that take the largest share of GDP;

– Sectors 3 and 4 are characterized by support and development of the most profitable sectors of the economy, the improvement of functioning enterprises due to their technical and innovative renewal, and increasing investment attractiveness.

In other words, the mechanism for restoring the national economy of Syria in Sectors 3 and 4 will be applied to the world countries suffering from crisis, while the mechanism in Sectors 1 and 2 – to the states affected by military conflicts and terrorist attacks. Therefore, the priority is given to the most urgent social and economic problems, the solution of which depends mostly on the further independent development of the state.

It is also worth noting that Table 2 shows that the content of the measures included in the national economic recovery mechanism varies by sectors.

The regions of Syria belonging to Sectors 1 and 2 have been significantly damaged by military conflicts: landmarks, cultural and religious sites, roads, railway stations, water supply systems, and other infrastructure have been affected. The standard of living in these locations has significantly decreased due to a high outflow of refugees from these regions. As a result, the purpose of the national economic recovery mechanism is to restore at least one profit-generating industry, since the tasks of the government include a lot of other actions.

In addition, it is necessary to form a high Committee for Syria's cooperation with UNESCO and other international organizations that are engaged in preservation of cultural heritage sites, which will help restore destroyed historical areas of the country. Therefore, it will renew the interest of tourists, increasing the level of usage of services and products offered by the Syrian enterprises.

The regions of Syria belonging to Sectors 3 and 4 have certain opportunities for self-recovery, but they still require additional government support. In such regions of Syria, the enterprises and the infrastructure are preserved, and the social status of the population is higher, which allows them to continue to lead their usual way of life, including crediting and small business development. The crisis of the enterprises in such regions is related only to the financial component caused by the loss of customers and investors due to the nationwide problems.

The mechanism for restoring the national economy of Syria is based on the investment component.

The main areas of investment activity are displayed in Fig.2.

Fig.2: The main areas of investments in Syria

These areas of investment should be distributed across regions based on the degree of disruption.

Sector 1 (the regions that have been damaged significantly).

Period of the investment projects implementation: long-term strategies, over 5 years.
Investment objects: places of interest, infrastructure, and strategically important sectors of the economy.
Investment sources: international organizations, state budget, PPP, foreign investors, private investors of SAR.

Sector 2 (the regions with an average degree of destruction).

Period of the investment projects implementation: long-term (over 5 years) and medium-term strategies (3-5 years).
Investment objects: places of interest (above five years), infrastructure, and strategically important sectors of the economy and large enterprises (3-5 years).
Investment sources: state budget, PPP, foreign investors, private investors of SAR.
Sector 3 (the regions with insignificant degree of destruction).

Period of the investment projects implementation: medium-term strategies (3-5 years) and short-term strategies (1-3 years).
Investment objects: the reconstruction and implementation of innovations at existing enterprises, the construction of new enterprises in efficient sectors of the economy.
Investment sources: PPP, foreign investors, private investors of SAR.

Sector 4 (the regions that have not suffered from military actions in the SAR).
Period of the investment projects implementation: short-term strategies (1-3 years).
Investment objects: the construction of new enterprises in efficient sectors of the economy.
Investment sources: PPP, private investors of SAR and other countries.

The main investment sources depending on Syria's region sector are represented in Fig.3.

Fig.3: The main investment sources depending on Syria's region sector

A public-private partnership (PPP) is of particular interest among these investment sources. This mechanism of economic recovery is the most advanced now.

The international organization "The United Nations Economic and Social Commission for Asia and the Pacific" in its researches defines PPP as the conclusion of a contract between state agencies and business in order to improve the quality of provision and performance of various infrastructure services [6]. The state and business enter into a legally executed cooperation agreement designed to share responsibility in the future joint project. PPP is based on the principle of competence of participants, clear allocation of resources, separation of interests and risks, as well as responsibility and receipt of monetary compensation.

A typical PPP scheme is provided in Fig.4.

Fig.4: A typical PPP scheme

It can be concluded that PPP is the conclusion of an agreement between two parties, where one participant is a representative of the state structure, and the other is a businessman or private person. The purpose of the agreement is to implement the infrastructure project. In its turn, the state offers business support and risk sharing, while business agrees to contribute its existing experience to the development and management, and will act as a tax payer in the future. The project is financed by the state and business with the shares indicated in the agreement, and the future profit is also distributed according to the agreed terms.

The existing forms of PPP, as well as tools for their implementation, which are most frequently used, are represented in Table 3 (Konovalova, M. E., 2019).

Table 3: Forms and tools for the PPP implementation

PPP tools	Explanation
1. Creation of special economic zones (industrial, tourist and recreational, technical, port)	PPP in this area occurs due to the accumulation of financial resources by the state from private structures on favourable terms. This form of partnership is implemented only in certain territories of the state.
2. Investment fund of the state	The form of implementation of PPP at the expense of the state's investment fund is as follows: the state offers business on a competitive basis to make investments in projects that are of public importance. Part of the funds for the project are allocated from the state investment fund, the remaining part is allocated by the winners of the competition (the private sector).

3. Concession	This form of PPP is implemented by transferring state-owned facilities (utilities, real estate, road sections, power grids, etc.) to the private sector. The purpose of the transfer is repair and reconstruction, modernization, management and commercial service on the terms and conditions stipulated in the contract.
4. National projects	This is another interesting form of PPP that involves participation of private business in the development and support of key areas.
5. Formation of integrated structures	This form of PPP involves the creation or expansion of functioning holdings that operate in socially important sectors on mutually beneficial terms – for the state and business.

Several effective investment schemes can be proposed to the Syrian government in order to restore the national economy (Yuzvovich, L. I., 2018, p.212). Fig.5. represents the ring scheme of the PPP implementation.

Fig.5: The ring scheme of investments in the national economy of Syria

The given scheme shows that the state serves as the main investor in the ring scheme of the economic investment. This is determined by the fact that the goal of implementing such a scheme is to find funds to restore the economy of the regions affected by military actions (Sectors 1 and 2). Individuals are not interested in investing in such projects, because they are concerned about the payback periods and profitability. Investment projects for Sectors 1 and 2 have long payback periods. External investors also do not take much interest in this kind of investments, only in terms of increasing political significance and influence on the global scale.

The essence of the ring scheme is as follows:

– Stage 1 – the state directs funds to invest in projects in the regions belonging to Sectors 3 and 4;

– Stage 2 – the funds are returned;

– Stage 3 – as a result, the funds received from investments are transferred to the development of the regions belonging to Sectors 1 and 2;

– Stage 4 – at the end of the payback period, the funds are returned to the state again.

Fig.6. shows the usage of cross-investment scheme of the Syrian economy in the framework of PPP.

Fig.6: Cross-investment scheme of the Syrian economy in the framework of PPP

The given investment scheme for the Syrian economy is suitable for the implementation of the projects in several types of regions simultaneously. The essence of the scheme depending on the stages is represented below:

– Stage 1 – at this stage, the state and private partners join together to invest in destroyed and strategically important enterprises for the Syrian economy, as well as to restore existing enterprises. Such projects are located in the regions belonging to Sectors 1 and 2, as well as partially to Sector 3. This measure is the goal of the state. In this case, the private partner pursues the ultimate goal to invest in the construction of new facilities with full right to manage profitability;

– Stages 2 and 3 – direction of investment funds on the part of the state and private partners to restore existing and destroyed enterprises;

– Stage 4 – the receipt of a return on the investments;

– Stage 5 – the state transfers the right to full management of newly created efficient enterprises on the basis of PPP;

– Stage 6 – the investments in the construction of new profitable facilities (with the participation of a certain share of the state specified in Stage 1 in contractual cooperation with private partners).

The importance of PPP for the Syrian economy is as follows:

1) the state attracts investments to those sectors of the economy that are strategically and socially important on mutually beneficial terms, namely, the risks of projects are reduced due to the usage of the market procedures for selecting participants;

2) the quality of infrastructure facilities is improved automatically affecting the growth of investment attractiveness;

3) the infrastructure facilities operation costs are reduced due to the effective performance, management and innovative technologies applied;

4) the technological component of the economy grows, it is necessary to develop innovations and innovative companies due to the scale of PPP projects;

5) PPP allows charging the users of the infrastructure facilities, while creating additional budget revenues. In addition, by improving the efficiency of infrastructure facilities, PPP makes additional financial funding available;

6) the financial return from the operation of the infrastructure facility is increasing due to the private sector's interest in it. Consequently, the amount of income and tax payments increases.

Summing up, the essence of the mechanism for restoring the national economy of Syria includes the measures to change the monetary and investment policy of the state (with a bid to attract investment) and the distribution of the regions of Syria due to the degree of destruction of the economy caused by military actions. This is necessary for pinpointing goals, objectives, and priority investment activities. In addition, the proposed mechanism for restoring the national economy of Syria includes the choice and application of the most effective investment schemes, comprising those based on PPP. It is also important to stress the state's focus on the priority of economic recovery: in some regions attention should be paid more to strategically significant industries and infrastructure, while in others – to profitable and efficient activities.

Abstract

The paper deals with analyses of the approaches to define green intellectual capital. The results of analyses proved that green intellectual capital is a part of intellectual capital. At the same, developing of green intellectual capital in the tendency of the greening economy is becoming increasingly important to companies due to customer and stakeholders needs. The main goal of the paper is to analyse the tendency in the scientific literature on green intellectual capital to identify future research directions. For the analysis, the tools of VOSviewer and Scopus were used. This study reviews 5501 papers from Scopus and Web of Science. The time for analysis were 1991-2019. Using the Scopus analyse tools showed that in 1997 the numbers of paper which focused on intellectual capital issues began to increase. At the same time, in 2014, the focus of investigation moved from general issues of the intellectual capital to green (environmental, sustainable) issues of intellectual capital. The most significant share of the scientists which investigated issues on green intellectual capital was from the USA, Great Britain and Spain. In 2018 the number of papers which focused on analyses of green intellectual capital increased in such journals with high impact factor as Sustainability and Journal of Intellectual Capital. The results proved that the theme of green intellectual capital is in the ongoing trends green or sustainable economy. The findings from VOSviewer identified 11 clusters of the papers which investigated intellectual capital from the different points of views. The first most significant cluster merged the paper which contains the keywords as follows: agent theory, business model, multinational companies, informational asymmetry etc. The second biggest cluster contained such issues as follows: sustainability, green intellectual, green human resources, green innovation, green intellectual development etc. The third biggest cluster focused on: trust, values creation, added value, return on equity, intangible assets, profitability etc. Such tendency allows concluding, that green intellectual capital is a part of intellectual capital and the improvement of green intellectual capital allows to create added value for different groups of the stakeholders.

Keywords: Capital, Intellectual Capital, Sustainable Development, Green Economy, Green Entrepreneurship, Green Human Capital.

Introduction

The ongoing tendency on extending the sustainable future lead to a reorientation of the human and business activities from the overconsumption behaviour to green/sustainable behaviour which supported by the indicative Sustainable Development Goals. Besides, the rapid increase of green consumers and stakeholders' needs provoke the rapid transformation of companies' activities considering green aspects. In this case, the quality changes in this direction could not be achieved without effective management of intellectual capital, considering the green/sustainable features of development. Thus, at the first stage, the definition, principals and features of green intellectual capital should be defined. Traditionally green intellectual capital analysed as a part of intellectual capital. However, the massive range of scientists in the papers (Amrutha et al., 2019; Mousa et al., 2020; Fawehinmi et al., 2020) analysed of green intellectual capital as a part of green human recourses management which influences on employee green behaviour. Vice versa approach had the authors in the paper (Yusoff et al., 2019) and proved that green intellectual capital contained green human capital, green structural capital and green intellectual capital. Mostly, the concept for developing of green intellectual capital implement the companies which try to promote their activity as green or eco-responsible.

Literature Review

The scientists in the paper (Zainol et al., 2018; Hajduk, 2018) proved that human capital is a core element of intellectual capital in small business. Besides, Lentjushenkova et al. (2019) and Akpoviroro et al. (2019) underlined that intellectual capital was an essential part of a company's value. At the same time, in the papers (Zainol et al., 2018; Mačerinskienė et al., 2019; Mercado et al., 2019; Rajan, 2019) the scientists proved that the efficiency of intellectual capital management influence on the company's performance. A similar conclusion was made by the authors in the paper (Poór et al., 2018; Sotnyk, 2012), investigating the efficiency of human resource management.

The results of the analysis showed that range of scientists investigated the intellectual capital as a key force of country's social progress, the creative economy and macroeconomic stability (Bilan et al., 2019b; 2019d; 2019e). Thus, scientists proved the linking between social progress and economic efficiency (Rui et al., 2019; Abaas et al., 2018; Bilan et al., 2019a). From the other side, companies should invest in the development of intellectual capital through education (Pryima et al., 2018).

The authors in the paper (Alani et al., 2018) analysing the linking between strategic orientation and product innovation identified that knowledge management was the core elements of intellectual capital. The authors made similar conclusions of the positive impact of intellectual capital on innovation development of the company in the paper (Abdi et al., 2018). Besides, in the paper (Wendra et al., 2018) proved that improving intellectual capital leads to increasing of innovation performance.

Using direct evaluations, the scientists in the papers (Demidova et al., 2019; Sokolenko et al., 2017) proved that intellectual capital had an impact on economic security.

Slinták K., Briš P. and Jurigov Z. analysing of the sustainable business model of Czech company Linet justified that intellectual capital should develop considering the core elements of green/sustainable economy (Slinták et al., 2018). Thus, the sustainable business model bootstraps the innovation development of the company. Ginevicius R. (2019), Razminiene K. (2019), Kendiukhov et al. (2017), Meyer et al. (2017), Sotnyk et al. (2014) and Miguel et al., (2019) underlined that developing of any socioeconomic system could not realising without considering the principals of sustainable development. In the paper (Chitsaz et al., 2019) the scientists analysed the human and social capital as a key part of intellectual capital which had a positive statistically significant impact on the company's performance.

The scientists (Žižka et al., 2018; Lušňáková et al., 2019; Fitri et al., 2019; Bilan et al., 2019f) analysing of the impact of the cluster on the innovation development of companies concluded that intellectual

capital had an impact on the innovation development of the company. Abu-Hamour H. M. J. (2018), Ślusarczyk et al. (2014), Myroshnychenko et al. (2019) and Pohludka et al. (2018) emphasised the role of intellectual engagement in developing company's sustainable business model. The similar results were obtained by the scientists in the papers (Ulewicz, et al., 2018; Lyulyov et al., 2017). They proved the linking between sustainable development and intellectual capital from the stakeholders' point of view. Using hierarchical regression analysis, the authors in the paper (Androniceanu et al., 2019) proved the positive relationship between organisational performance and parameters of human resources management.

Gumelar M. Sutisna and Herwany A. (2018) analysed the intellectual capital as a proxy of intangible assets. The scientists in the paper (Fogarassy et al., 2018; Zámečník, 2016; Boutti et al., 2019) underlined the necessity of considering the green assets, including intellectual capital during environmental accounting. At the same time, that process could be realised without corresponding legislation regulations. Thus, Marikina M. (2018) and Sutopo et al. (2018) proved the necessity of developing the mechanisms of green assets' assessment.

The scientists Mikalauskiene A. and Atkociuniene Z. (2019) highlighted that the intellectual capital of the company could be transformed into the sustainable competitive advantage of the company. Palaščáková et al. (2019) analysed the human capital as a core element of intellectual capital. Besides, the authors underlined the necessity of government supporting intellectual capital through investment policy. In this case, the government investment policy should consider the green policy of the company and if the company develop green intellectual capital. In the papers (Ma et al. 2018; Sotnyk et al., 2013), the scientists proved that green intellectual assets were a core force to develop eco-innovation. Noted, that development of green intellectual capital in the sustainable business model could not be realised without effective financing system (Lyeonov et al., 2019; Chygryn et al., 2018; Bilan et al., 2018a; Bilan et al., 2019c).

Besides, the scientists who investigated the innovations in green energy proved that the rapid growth of renewable energy could not be achieved without powerful green intellectual capital (Cebula et al., 2018; Yevdokimov et al., 2018; Vasylyeva et al., 2014; Bilan et al., 2018b; Vasylieva et al., 2019a; Mental et al., 2018).

Atkociuniene Z. O. and Mikalauskiene A. (2019) proved that the efficiency of intellectual capital had a significant impact on implementing sustainable development principals in the company. In the paper (Masharsky et al., 2018; Alam et al., 2019; Kasztelnik et al., 2019) the scientists proved that implementation of green innovations could not be realised without developed green intellectual capital.

The findings proved that despite massive range investigations of intellectual capital from different points of views, the green intellectual capital had not analysed yet considering different aspects of green activities, sustainable development, green assets etc. In this case, the aim of the paper was analysed of the tendency in the scientific literature on green intellectual capital to identify future research directions.

Methodology

The aim of investigation is cheeking the increasing tendency on analysing of green intellectual capital issues by the scientists. For this purpose, the investigation was done in the following scheme:

1. Identifying the quantity tendency of the papers which focused on the analyses of green intellectual capital issues.
2. Allocating the main subject areas under analyses of green intellectual capital issues.
3. Identifying the most citation papers and Journals which contained the papers on green intellectual capital.
4. Clustering the papers on the main directions for investigations with the purpose to identify the further options for analyses.

For the analysis, the following keywords were chosen: green human capital, green capital, green intellectual capital, intellectual capital, green human, sustainable capital, green human resource management, sustainable human resource management. That keywords were chosen as bullet part of intellectual capital and green capital.

This study reviewed 5501 papers from Scopus and Web of Science. The abovementioned scientific databases are two biggest worldwide scientific databases, contain the scientific papers of worldwide scientists. Considering it, those databases were chosen as the base of analysis. The time for analysis were 1991-2019. The analyse was done by using the software of VOSviewer and Scopus analyse. Thus, VOSviewer allows to allocate and visualize the network of definitions which used and co-citation during the investigation of green intellectual capital. Scopus tools allowed to analyse the publication towards different parameters: affiliation, journal, citation, number of the papers, funding, the subject area and citations. Thus, in the network visualization of VOSviewer allow to allocate and visualize the scientific direction which has strong relationships. The closer keywords are located to each other, the stronger their relations.

Results

The findings of analysing proved that in 1997 the numbers of paper which focused on intellectual capital issues began to increase. Besides, in 2014 the focus of investigation moved from general issues of the intellectual capital to green (environmental, sustainable) issues of intellectual capital. It could be justified by extending the climate problems in the world among society and scientists. In 2019 the number of papers which analysed green intellectual capital was increased by 45.6% compared with the 2014 year (figure 1).

Figure 1: The number of documents in Scopus which contain the green intellectual capital issues

Sources: compiled by the authors using data from Scopus

The findings proved that the green intellectual capital was analysed in the framework of the subject area as follows: Business and Management– 33.5%; Social Sciences – 19.1%; Economics, Econometrics and Finance – 9% and others (Computer, environmental, energy etc.) – 38.40%.

Figure 2: The subject area in Scopus for analysing the green intellectual capital issues

Sources: compiled by the authors using data from Scopus

The analysis by country showed that mostly the scientist with the USA, Great Britain and Spain affiliations investigated the green intellectual capital issues. The top 20 countries' affiliation of the scientists which investigated the green intellectual capital issues showed in Figure 3.

Figure 3: Top 20 country's affiliation of the scientists which investigated the green intellectual capital issues

Sources: compiled by the authors using data from Scopus

Besides, considering the findings from Scopus in 2018 the high ranked Journal such Journal of Intellectual Capital, Journal of Knowledge Management, Sustainability began to publish more papers on green intellectual capital issues (Table 1).

Table 1: The top 5 Journal which published the papers on green intellectual capital

Title of the Journal	Covered by Scopus	CiteScore 2018	SJR 2018	SNIP 2018	Numbers of the papers
Journal of Intellectual Capital	2000 to 2019	5.79	1.29	2.06	587
International Journal of Learning and Intellectual Capital	2006 to 2019	1.11	0.33	0.64	172
Journal of Knowledge Management	1997 to 2019	5.63	1.29	2.07	91
Knowledge Management Research and Practice	2006 to 2019	2.02	0.40	0.88	59
Sustainability Switzerland	2009 to 2019	3.01	0.55	1.17	53

Sources: compiled by the authors using data from Scopus.

Thus, 5 from 10 the most cited papers were published by the high ranked Journals. The most cited papers were published by the scientists Renwick D.W., Redman T., Maguire S. in 2013 in International Journal of Management Reviews. In 2008 Chinese scientists published the paper "The positive effect of green intellectual capital on competitive advantages of firms" which cited 155 and proved that green intellectual capital created the added values for the company.

The findings from VOSviewer identified 11 clusters of the papers which investigated intellectual capital from the different points of views (Figure 4).

Figure 4: The network visualization of the co-citation of the papers on green intellectual capital

Sources: compiled by the authors using the data from Scopus and VOSviewer tool.

The first most significant cluster (red cluster) merged the paper which contained the keywords as follows: agent theory, business model, multinational companies, informational asymmetry etc. The second biggest cluster (green cluster) contained such issues as follows: sustainability, green intellectual, green human resources, green innovation, green intellectual development etc. The third biggest cluster (purple cluster) focused on: trust, values creation, knowledge management, added value, return on equity, intangible assets, profitability etc. Noted, that two clusters green (green intellectual capital) and red (intellectual capital) located close to each other. The closer location of the abovementioned cluster to each other proved the stronger their relations. Such tendency allows concluding, that green intellectual capital is a part of intellectual capital and increasing efficiency of green intellectual capital allows to create added value for different groups of the stakeholders.

At the same time, the findings proved that green human resources management, as part of intellectual capital, has been investigated by the massive range of the authors. At the same time, green intellectual capital which involved green human resources management is new directions of investigation. Thus, considering the findings from Figure 5, the green intellectual capital relates to corporate social responsibilities, sustainable development, competitiveness and green human resources management.

Figure 4: The network visualization of the co-citation of the papers on green intellectual capital with close areas

Sources: compiled by the authors using the data from Scopus and VOSviewer tool.

Thus, at the next stage, with the purpose to do an in-depth analysis of the co-citations on green intellectual capital, the second biggest cluster from Figures 3 and 4 were analysed in detail. The

keywords were chosen as follows: green intellectual capital, green capital, green assets, green innovations and development. The findings showed in Figure 5.

Figure 5: The network visualization of the co-citation of the keywords on green intellectual capital, green capital, green assets, green innovations and development

Sources: compiled by the authors using the data from Scopus and VOSviewer tool.

Considering the results, 6 clusters. The biggest was red, green and blue. In this case, the blue cluster contained keywords as follows: green intellectual capital, green human capital, intellectual capital, competitive advantages, manufacturing and performance. Thus, the findings proved the research hypothesis that from 2018 the quantity of the papers which analysed the green intellectual issues are increasing – the increasing tendency on analysing of green intellectual capital issues by the scientists. At the same time, the most related areas with green intellectual capital were corporate social responsibilities, sustainable development, competitiveness and green human resources management, green capital, green assets, green innovations.

Conclusion

The results of the analysis proved that green intellectual capital is a new direction for investigation which formed in separate scientific school. Besides, the quantity of paper become increased from the 2018 year. The findings from VOSviewer allow allocating 11 clusters. Three among 11 clusters have a close relationship. The first most significant cluster merged the keywords as follows: agent theory, business model, multinational companies, informational asymmetry etc. The second biggest cluster merged the keywords as follows: sustainability, green intellectual, green human resources, green innovation, green intellectual development etc. The third biggest cluster focused on: trust, values creation, added value, return on equity, intangible assets, profitability etc. Such tendency allows concluding, that green intellectual capital is a part of intellectual capital and increasing efficiency of green intellectual capital allows to create added value for different groups of the stakeholders.

Discussion

For further investigation, it would be necessary to analyse the most significant time of analysing. Besides, the findings focused on a strict combination of keywords. In this case, it would be necessary to check the other options of keyword combinations. The cluster authors analysis would allow visualising and identifying scientific schools and scientists' cooperation in further analysis.

Funding

This research was funded by the grant from the Ministry of Education and Science of Ukraine (Nos. g/r 0118U003569)

Abstract

The study of social protection of employees of small and medium-sized enterprises was conducted on the example of a local labour market (one of the regional centres of Ukraine). The survey included 526 respondents, including 170 business owners and 356 employees. This made it possible to compare social security performance assessments from both sides, as well as to identify the basic patterns of social protection ties as a tool for corporate social responsibility (CSR) and the economic success of businesses. As a result, it has been found that in the labour market of a country with the transition economy and the slow adoption of CSR standards, social protection for workers has numerous problems. In particular, even minimum protection standards, such as working time, holidays, wages below the minimum and inflation-related indexation, do not meet the norms. We conducted the grouping of enterprises by the level of their economic performance on several characteristics (growth of assets, sales volumes, productivity, profit availability) allowing to state that social protection of employees can be an effective tool for business development. Thus, in enterprises where the basic standards of social protection are best fulfilled, the growth of assets and volumes of sales is mostly observed (exceptions are only the guarantees in remuneration with the highest indicator in enterprises with decreasing sales volumes). Weak social protection links are only available with profitability indicators. Instead, by comparing the level of social protection of employees at enterprises with the productivity growth, a linear dependence was obtained, which proves the effectiveness of such a CSR tool as a lever for improving gross economic performance and, consequently, increasing profitability over the long term. Entrepreneurship as a form of economic activity plays a significant role in enlargement processes, integration and competitiveness improvement policies of the European Union.

Keywords: CSR, social protection, labour market, small and medium-sized enterprises (SMEs), economic efficiency.

Introduction

The social protection of employees in Ukraine is formally subject to the minimum legal guarantees. However, the crisis in the system of state social protection of the population is manifested in low financial capacity to provide a decent standard of living, especially in periods associated with the onset of certain social risks. In this regard, there is increasing public attention to corporate social

responsibility (CSR), in which social protection can be a tool not only to formulate a positive social enterprise policy and to strengthen the employer brand with relevant social consequences. Business practice has confirmed that CSR can be a factor in improving the economic efficiency of the business.

The positive links between the use of social security instruments and the economic success of enterprises have been substantiated by numerous empirical studies. For example, a sample of SMEs from different countries found out that the increase of their (employees') social security coverage experiences a revenue gain and a profit gain (Lee, and Torm, 2017), improving social protection in conditions and safety leads to an overall increase in enterprise productivity (Dumitrescu and Deselnicu, 2018). Responsibility for workers' social protection as an integral component of CSR has a proven positive impact on increasing competitive performance in both developing and highly developed countries (Madueno et al., 2016), reducing bankruptcy risks – especially noticeable in SMEs (Gangi, 2018)

We agree that despite the proven business practices, the positive economic effects of enhancing social protection for workers, nevertheless, the relationship between social protection and enterprise performance is debated in the literature (Torm, 2019). This discussion has led scientists to pay considerable attention to the continuation of relevant research and to identify those components of responsible employment behavior that are most relevant to the interests of both business owners and employees in order to balance positions and achieve the best socio-economic outcomes.

Business opportunities to implement a range of social protection measures for employees depend on a number of factors that can be divided into objective and subjective. Objective factors that determine the level of social responsibility of the business to the employees, are related to its financial capabilities, while subjective – to the worldview approaches of business management to understanding the expediency of social protection as a motivational component of staff and formation of their own competitive advantages therefore. In Ukraine, whose social protection of SMEs employees is the subject of this study, business operates in the conditions of dynamism, uncertainty, spreading of risks in all spheres of management. This leads to the formation of objective prerequisites for reducing business initiatives for social protection of employees. At the same time, a large proportion of employers in Ukraine are not mentally prepared to show social responsibility. This is due to the fact that the social protection of employees is often considered by business management as a vector of additional business expenses rather than investment in human capital. Moreover, a significant proportion of domestic entrepreneurs in line with such an outlook, not only does not implement social protection programs for workers on their own initiative, but also does not fulfil the statutory social norms and guarantees. This makes it necessary to study the features and problems of social protection of workers in Ukraine.

Given the aforesaid, the overall objective of our paper is research on social protection of employees as a tool of social responsibility and economic efficiency of business.

To achieve the goal of the study, appropriate hypotheses were formulated. First, social protection of employees is an indicator of the level of social responsibility of a business, which is defined by a number of objective (outcomes of business performance) and subjective (business management outlook) factors. Secondly, there is a link between the level of corporate social responsibility and the efficiency of business activities. Meanwhile, account that the official statistics do not reflect the real trends and problems in the field of social protection of workers due to the considerable level of shadowing of the national economy. Therefore, in order to conduct relevant research, it is advisable to rely on the results of sociological monitoring.

To achieve this, we used the results of a sociological survey of labour market actors. In particular, we have tested our own methodology of sociological monitoring of features and problems of social protection of workers at the local level. Such research was commissioned by the authorities of one of the regional centers of Ukraine (Rivne) to analyze the observance of decent work standards, where a number of issues touched upon social protection issues.

Literature Review

Social protection of employees as an integral part of the CSR of a business is aimed at preserving the development of the most valuable asset of enterprises – human resources. However, CSR practices are not always simply implemented in the business environment, especially in SMEs, which in many countries have a specific mode of financial regulation. Due to this, the costs of social programs for workers in the form of compensation benefits / employee benefits are not uniform in all countries, and state guarantees are often so different that the usual standard of social protection for one country, such as maternity leave in Ukraine, is a particular privilege or benefit in other countries that requires a proper justification for terms and payments (Dahl et al., 2016; Raute, 2019; Stumbitz et al., 2018).

Despite the differing positions of entrepreneurs and national social protection systems for workers on many issues, not only the types and duration of vacations, CSR as a particular manifestation of civilized business relations and other stakeholders of relevant communities, provides more scientific evidence and empirical justification for economic rather than social expediency.

It is argued that the development of CSR practices contributes to increasing competitive performance both directly and indirectly, through the ability of these organizations to manage their stakeholders (Madueno et al., 2016); CSR is an important driver mechanism for companies to be more innovative, efficient and effective (Martinez-Conesa et al., 2017).

A study of 2480 firms in 51 countries shows that both CSR engagement and corporate governance mechanisms can be an effective tool to mitigate conflicts among stakeholders as well as have a significantly negative impact on the firms' risk of financial distress (Gangi, 2018), to cause the growth of financial performance of companies (Myšková and Hájek, 2019; Akimova et al., 2018).

Accordingly, designing a work environment to meet the needs of employees and job requirements is a fundamental factor for improving productivity (Dumitrescu and Deselnicu, 2018). If such studies are conducted on the example of overall performance in terms of sales, then it is also proven that CSR activities related to the workforce are crucial to avoid sales decline (Stoian and Gilman, 2017).

If we examine the impact of social protection on the direct financial performance of enterprises, such links are also confirmed with a rather noticeable effect on the example of countries that are just beginning to actively implement CSR and are in a similar stage of development in Ukraine. Thus, following the work of Lee, and Torm (2017), it is proved that Vietnamese firms that increase their social security coverage by 10 per cent experience a revenue gain of 1.4–2.0 per cent worker and a profit gain of up to 1.8 per cent. In a similar study in Indonesia using census data from 2010 to 2014, it was found that increased social security spending of 10 per cent is associated with a per-worker revenue gain of up to 2 per cent. Moreover, profits did not decrease due to the increased social protection coverage, suggesting that increasing worker benefits may be a worthwhile business investment (Torm, 2019).

Understanding the benefits of CSR at the state level, reducing the burden on state social funds, there are specific requirements for CSR in individual countries. Yes, there are examples of countries actively initiating social and environmental programs, which normally involve a contribution from businesses. Also, there is growing pressure on export-oriented SMEs from international markets, which demand exporting companies to be responsive to society's needs (Aras, 2016).

At the same time, not only an external regulatory instrument, but also the influence of entrepreneurs' mental, cultural attitudes on economic behavior, including the use of CSR, is very significant. For example, it has been proven that foreign institutional investors domiciled in countries with social norms supportive of strong environmental and social commitments are the ones that impact firms' environmental and social performance (Dyck et al., 2019), in addition, a decisive influence on responsible decision making has the education and culture of the entrepreneurs themselves (Virglerova et al., 2017; Vveinhardt and Andriukaitiene, 2017).

In addition to direct positive effects in the form of productivity gains, profits, reduced occupational injuries and related financial costs of enterprises (Oliinyk, 2017), reducing the financial risks of CSR practitioners, including social programs to employees, indirect effects in the form of increasing motivation of employees are also important (Aliekperova, 2018; Grishnova, 2019), involvement in active social life (Bilan et al., 2017; Stacho, 2019), development of inter-institutional collaboration (Raišienė et al., 2019). Thus, employees who envisioned working in a firm that was active regarding CSR activities reported greater pride and organizational embeddedness (Ng et al., 2019).

At the country level, satisfaction with the social protection system, which is formed at the enterprise level and supported by active state regulation, is manifested in migration sentiment through overall satisfaction with the level of comfort (Mishchuk and Grishnova, 2015; Holovatyi, 2015), the sense of fairness of income distribution (Bilan et al., 2020; Mishchuk et al., 2018; Mishchuk et al., 2019). Thus, positive microeconomic effects have a macro-effect in the form of changes in countries' competitiveness, their sustainable development and social well-being, as demonstrated in many papers (Bánociová and Martinková, 2017; Bilan et al., 2019; Klymenko, 2016; Koisova, 2018; Mostenska and 2018; Bilan, 2015; Shvedovsky et al., 2016).

Method and Data

Based on the results obtained by other researchers, in our study, the relationships of social protection of employees are analyzed with the results of the enterprises that characterize the economic success of the business: increase in sales, assets, availability of revenues. In order to carry out such an analysis, as well as to assess the social protection of workers in general and in terms of the key social guarantees identified in Ukraine, we conducted our own sociological survey of representatives of small and medium-sized businesses in one of the local labour markets – the regional center of Ukraine (Rivne). The authors' sociological survey was conducted using questionnaires of target groups of respondents. The peculiarity of this sociological monitoring is the parallel cross-examination of workers and entrepreneurs (employers). This approach revealed the relationship between workers' social protection responses and employers' social responsibility and business performance. Despite this preference, obtaining such results was accompanied by some difficulties in providing impartial responses on both sides, despite the assurances of their anonymity.

The survey included 526 employees, including 170 business owners and 356 employees. The survey was conducted in June – September 2018. The standard sampling error does not exceed 3.5% for SMEs owners and 2.6% for employees with a 95.4% confidence level.

The analysis was made with the grouping of enterprises according to the characteristics of economic success of the activities described above. The social protection of employees is analyzed in two directions: (1) – to assess the achieved level of social responsibility of business owners of different groups on the economic results; (2) – to find links between subjective assessments of the effectiveness of workers' social protection and the prerequisites for achieving the above economic results. Such prerequisites are increased productivity (as a partial factor in overall productivity) and possible staff turnover due to dissatisfaction with social protection.

In the analysis of the links between social protection and changes in labour productivity, a grouping of estimates of employees into 6 homogeneous groups according to the integrated level of social protection was made. According to this distribution of assessments, the enterprises where the respondents are employed are selected and the entrepreneurs' responses as to the growth of labour productivity are grouped. Thus, we obtained 6 classes of enterprises out of a total of 170 SMEs surveyed, which determined the average values of changes in labour productivity and social protection. Further processing of the obtained estimates was performed in Microsoft Excel, which resulted in econometric dependence of changes in labour productivity on the level of social protection of employees.

Results

One of the manifestations of employers' social responsibility to employees is their legal employment. After all, the negative consequence of illegal employment of employees is their stay outside the system of compulsory state social insurance, and therefore the lack of guarantees of insurance payments in case of occurrence of social risks. Based on the survey results, it can be stated that within the local labour market, 24% of employees work illegally.

Unfortunately, the practice of deliberate non-compliance with the established legislative norms has become widespread in the national labour market. According to the results of sociological monitoring (Fig. 1), the minimum social wage is the only social guarantee whose level of compliance is close to 100%.

Fig. 1: Level of implementation of certain social protection instruments of workers, defined by law,% of respondents

Source: own research

At the same time, an extremely threatening problem, which shows that even legally defined social security instruments are violated by businesses, is a low level of compliance with pay standards (only about 39% of employees indicated that employers comply with such pay standards as nighttime pay and overtime, weekends and holidays, for defective products). The guarantees in remuneration, such as annual leave, business trips, during the performance of public duties, in the case of professional development, are fulfilled by business only in relation to 53.4% of employees. Such an important tool for social protection of workers in inflation, such as wage indexation, is accessible to less than half of the surveyed workers (45.5%), and providing annual leave of at least a minimum duration of 50%. Obviously, the results obtained are extremely disappointing, as they show a low level of business responsibility for social protection of workers, even in the part of the so-called basic component of the social package, which is legally defined. At the same time, a higher level of implementation of the social protection instruments defined by the legislation demonstrates unprofitable business (the exception is only the indexation of wages). Particularly, wage guarantees among profitable business entities are fulfilled only at the level of 50.9%, while among the unprofitable ones – at the level of 78.1%. A similar pattern is observed in the implementation of pay standards – 38.3% against 43.8%; in granting annual leave – 49,4% against 56,3% respectively.

The analysis of the implementation of the legally defined instruments of social protection of employees by the volume of sold goods, works and services (Table 1) by business reveals that the business, which by its own estimations has the highest economic success in the growth of the sales volumes (more than 20%), shows a relatively lower level of performance of statutory social protection instruments. Higher level of compliance is observed in business entities in which sales growth did not change or had a moderate increase (not exceeding 20%). Regarding the observance of guarantees in the pay, the criterion of responsible social protection was better for the enterprises that had a decline in sales compared to the previous year. These results can be explained by the fact that high-growth business is focused mainly on maximizing its own profits (without taking into account the social interests of employees). However, a business with little or no increase in sales volumes, to a greater extent, demonstrates social orientation when implementing a business strategy.

The pattern of change in assets shows the opposite pattern: higher level of compliance with statutory instruments of social protection for workers is observed among those entities in which there is an increase in assets. Such a difference in results is difficult to explain unambiguously. However, one possible argument for explaining such a divergence in the performance of statutory social protection instruments on profitability and sales dynamics, as well as asset dynamics, is lower level of shadowing and the impact of the market environment on the value of assets relative to profit and sales. That is, a significantly growing business is demonstrating a long-term strategy of expanded reproduction, which is not possible without proper social motivation for staff.

Table 1: Level of implementation of legally defined instruments of social protection of employees by the business depending on changes in sales volumes and assets

	Payment of wages not lower than the minimum level	Pay guarantees	Norms in wages	Indexation of wages	Granting annual leave of at least minimum duration
Change in sales volume					
Increase in sales volume, incl. in %	97,0	50,2	38,2	44,5	48,8
50% or more	96,3	51,9	37,0	25,9	48,1
20% to 49%	97,3	46,8	23,4	40,5	39,6
up to 20%	98,3	56,7	50,8	54,2	58,3
Constant volume of sales	88,0	64,0	40,0	56,0	56,0
Reduction in sales	96,6	69,0	37,9	41,4	51,7
Change of assets					
Increase in assets, incl. in %	95,5	54,9	39,2	45,0	54,4
50% or more	91,7	62,5	41,7	45,8	58,3
20% to 49%	97,1	43,5	34,8	40,6	39,1
up to 20%	95,8	82,5	39,2	50,8	58,3
Decrease in assets	93,0	49,6	40,3	44,2	48,1
Permanence of assets	93,0	49,6	40,3	44,2	48,1

– maximum level of implementation of the relevant social protection instrument

Source: own research

It is important in the social protection of employees that the implementation of minimum social norms and guarantees may not necessarily be associated with an overall high or low level of social protection. An important role in this aspect is played by the additional social protection programs often provided by enterprises, as well as the subjective comparison of the adequacy of certain programs and measures to personal needs and interests. Having received the appropriate answers from the respondents, it was found that the distribution according to their level of general social protection is rather ambiguous. Overall, 47% of employees rate their social protection in the workplace quite high (76 to 100%). Also, about 24% of the surveyed employees gave the appropriate assessment in the range from 51 to 75%. At the same time, almost one third of employees estimated

their level of social protection at the level less than 50%. In general, the results of the relevant survey confirm that social protection for workers is not without many disadvantages.

Saving on employee social protection programs is not just a violation of the law, but, as we have found, is contrary to the economic motivation of the business owners themselves. Thus, having an effect in the form of cost savings on the social protection of their personnel, entrepreneurs lose other opportunities for their development and formation of a stable basis for economic efficiency. This effect is caused by the direct links we have identified to self-assessment of the level of social protection and productivity gains at the same enterprises where employees with an adequate level of satisfaction with social protection work. The methodology for grouping estimates and matching them on both sides (employers and employees) is described in the Method and Data section, and the results are presented in Fig. 2. As we can see, the growth rates of labor productivity are higher in those business entities whose level of social protection of employees is also higher.

Fig. 2: Diagram of the scattering and regression equation between the level of social protection of workers and the increase in labour productivity

Source: own research

In addition, the correlation analysis of the link between employers' valuations of the success of their efforts to attract employees and retain skilled workers, and the success of their own efforts to protect workers' social protection, also indicates that there is a direct close relationship between them. That is, social protection of employees contributes to the formation of a positive employer brand in the labour market, generates employee loyalty to business, which ultimately leads to an increase in productivity and can be a powerful driver of growth in overall results - sales and assets of the enterprise. Such links are clearly undervalued by business owners today.

In addition, the results of the survey suggest that the higher the share of employees satisfied with their level of social protection, the lower the level of staff turnover and vice versa (Fig. 3).

Fig. 3: Relationship between the level of employee turnover and their distribution regarding the level of their own social protection in the business environment

Source: own research

That is, an adequate level of social protection for employees is a factor in reducing their turnover. At the same time, a high level of staff turnover leads to significant business losses in the need to find, adapt and test new employees. Therefore, such links can also be seen as a manifestation of the potential for improving the economic efficiency of the business as a result of the development of employee social protection programs.

Acknowledgements

The data used in this work were obtained in the process of a sociological study of the development of small and medium-sized enterprises on the compliance of employment with the criteria of decent work, commissioned by the Department of Economy of Rivne City Council in June - September 2018 (contract # 3 of June 1, 2018).

Conclusions

The social responsibility of business in providing social protection for workers, as revealed in our study, is characterized by numerous problems. There is a significant level of shadowing of employment (24%) and wages, which leads to a significant decrease in the level of social protection of workers in the compulsory state social insurance system. A particularly acute problem, which is evidenced by the low level of social responsibility of the business, is the low level of implementation of even the legally defined instruments of social protection of employees. The relatively higher level of compliance with social norms and guarantees, which are legally defined, is observed only in business entities that have positive economic dynamics in the form of asset growth. At the same time, there is a weak link between the level of corporate social responsibility for employees and its results in the form of profitability and dynamics of sales volumes.

Thus, the conducted researches prove that in Ukrainian realities the factor of successful business activity is not a factor of its high level of social responsibility and vice versa. The level of social responsibility of business in the national economy is to a greater extent determined by such subjective factors as the worldviews of business management on the necessity and expediency of social protection of employees, and therefore by the social orientation of the business strategy. However, research has convincingly shown that social protection of employees should be seen as an effective business investment tool in human capital development, which will ultimately have a positive

economic impact on the financial performance of the business. After all, a high level of corporate social responsibility for employees is a factor in the growth of their productivity and decrease in turnover, and consequently a decrease in business losses and increase in profits and profitability in the long run. Therefore, the transformation of business management's outlook approaches towards awareness of the feasibility of developing social protection tools for employees should be a priority vector of activity in building a socially oriented market economy in Ukraine. Given the considerable range of problems in the field of social protection of workers in the national economy, the prospects of further scientific exploration will be to continue monitoring of the level of social responsibility of business in the context of the volatility of the external and internal environment and the choice of adequate tools to stimulate the increase of CSR of the business, especially given the positive links with productivity and potential reduction in turnover.

Abstract

After regulations changes, in Polish small and medium-sized cities a new approach to revitalization has been implemented. Currently the revitalization became one of the key instruments of public governance as a crucial response to the processes of social, economic, spatial and environmental degradation. These crisis processes result the special impact on urban space in cities. One of their effects is the phenomenon of shrinking cities, which has a very varied background in Poland, among others: migrations and the loss of economic functions by cities. The article analyses and evaluates individual mechanisms of social and economic changes introduced by revitalization processes managed by the local authorities as one of their tasks, thanks to the cooperation with local communities and other stakeholders. The conclusion is that revitalization processes can be a tool to effectively manage a local development, thanks to using the innovative mechanisms presented in the paper. It should be also included in public policies and strategies as a crucial direction of socio-economic changes in self-governments.

Keywords: Public Governance, Revitalization, Self-Government, Urban Shrinkage, Local Development.

Introduction

The aim of this article is to analyse and evaluate the possibility of using the local revitalisation programme as a management instrument at the regional level to counteract negative socio-economic changes in city areas, including the process of urban shrinkage.

In the context of the research objective of this article, the revitalisation process has been analysed from the point of view of such management processes in cities which may affect the solution of their shrinkage. The qualitative analysis includes documentation concerning 7 revitalisation programmes for small cities (up to 30 thousand residents) such as: Żywiec, Cieszyn, Pyskowice, Kalety, Sułkowice, Brzeszcze, Baranów Sandomierski. The author personally participated in the development of revitalisation programmes for these areas. The study analysed factors influencing the process of urban shrinkage. They have been classified in terms of direct or indirect impact on the analysed problem and this impact was assessed based on interviews with persons responsible for the implementation of revitalisation programmes in mentioned cities.

The analysis has been conducted in the social, economic, spatial-functional, technical and environmental spheres. The research has been conducted in 2019 and the conclusions from it are presented in the further part of this article.

Revitalization - the theoretical approach in the public management context

As we know, the management of local development should be based on a strategy leading to the desired changes and enabling to solve key problems in a given area (Fitzgerald, Leigh, 2002). Nowadays, one of the most important challenges is the socio-economic revitalisation of these cities, which are losing their functions, where we can observe an exodus of residents, processes of population ageing, progressing degradation of some neighbourhoods degradation (Campbell, 1996) and other phenomena being symptoms of a crisis (Hoff, 1998). This poses new challenges at government level, regional level, but also in self-governments, especially in cities, where these processes are most visible.

Poland in recent decades has done a lot to get closer to the level of the most developed EU countries. Nevertheless, this development is still very diversified in terms of territory. Some regions and cities have adapted more to global development trends and others (mainly small and medium-sized cities) are increasingly marginalised. These developmental discrepancies accelerate depopulation processes. A forecast of the Statistics Poland indicates that the population of Poles will systematically decrease and in 2035 will reach about 35.9 million people. This loss is associated with low fertility rate and emigration, mainly economic. A special situation occurs on the borderlands, where migration processes overlap with trends in cross-border cooperation (Bohm, Kurowska-Pysz, 2019).

Mainly young people emigrates from less developed regions, often from small and medium-sized towns. One of the challenges facing these cities is therefore to counteract urban shrinkage, associated with multi-directional migration. The urban depopulation has a strong regional dimension, particularly in the east, north and south of the country. Intensive migration, including women in reproductive age, a decrease in the number of births, as well as an increasingly higher life expectancy, are exacerbating negative demographic trends, i.e. the progressive ageing of the Polish nation. It is estimated that in 2035 the number of deaths in Poland will exceed the number of births by 180 000. Depopulation and negative demographic trends are directly related to the difficult housing situation, especially in the sector of municipal rented housing. The economic sphere is also an important factor of developmental disproportions. Many small and medium-sized cities are in a state of stagnation (higher unemployment rate, lower rate of economic development compounded by unfavourable demographic trends, low level of productivity and innovation of local enterprises). The extremely low air quality is another factor that discourages people from living in cities, especially in the small and medium-sized ones, where the so-called near-ground emissions are intense. According to WHO data from 2016, 33 out of 50 the most polluted cities are located on Polish territory; according to 2017 data from the European Environment Agency (EEA), Polish cities, apart from Bulgarian ones, dominate the ranking of the most polluted cities in the Union. About 45 000 Polish citizens die prematurely every year due to air pollution. Poland has the largest share in the emission of the majority of harmful substances into the atmosphere - according to the 2017 report of the European Environment Agency. A very important problem in the efficient functioning of cities is the limited institutional capacity of self-government administration, which often does not carry out regular diagnoses and analyses of the local situation, enabling identification of key development problems and challenges. In many cities, strategic documents do not exist or are of poor quality (Koliba, Meek, Zia, Mills, 2018). There is a lack of coordination and cooperation between public institutions and other entities responsible for the implementation of these documents, as well as limited participation of different stakeholders in the decision-making processes is observed (Remenova, Jankelova, 2019). Therefore, cities need support to improve their strategic documents.

A consequence of the high concentration of these problems is the marginalisation of cities. The revitalisation processes currently being carried out are intended to support self-governments in limiting the scale of crisis phenomena, such as, for example, urban shrinkage (Cristea, Grabara, 2019).

Understanding the concept of revitalisation requires an interdisciplinary and comprehensive approach to the various areas of urban life. Traditionally it is combined with the protection and revalorisation of historical monuments, but nowadays it is also used in relation to many spheres of city functioning.

The revitalisation issues are most often analysed in a spatial, economic, social or geographical context. In the countries of Western Europe or the USA revitalisation has been carried out for many years and there is a lot of literature on this subject, whereas in Central and Eastern Europe this issue has become more important in recent years only (Boryczka, 2016).

Regardless of the considerations about the essence of revitalisation carried out on scientific grounds, in practice this process is currently carried out in Poland on the basis of the Act of 15 October 2015 on revitalisation (Journal of Laws 2015, item 1777). According to this legal act (Article 2), revitalisation is the process of bringing degraded areas out of the crisis state, carried out in a comprehensive manner, through integrated actions for the benefit of the local community, space and economy. These activities must be territorially focused and cover a maximum of 20% of the municipality's area and must be carried out by revitalisation stakeholders on the basis of the municipal revitalisation programme. Up to 30% of the city's population may be directly affected by revitalisation processes, while indirectly, much more revitalisation stakeholder groups may be identified. These are primarily residents of the revitalisation area and the remaining residents of the city as well as owners and users of properties located in the area, e.g. housing cooperatives, business enterprises, non-governmental organisations, self-government units and other entities operating in the area (Kurowska-Pysz, 2017).

The revitalisation gives priority to the removal from the crisis state of areas with a dominant housing function and, at the same time, these where social problems, such as unemployment, exclusion, professional and social inactivity, criminality, low level of education of the residents, economic and educational migrations or low social capital, are most strongly felt. It is precisely such social problems that contribute to the outflow of residents from the areas covered by them and leads to the loss of the existing functions by these cities. Today we can talk about four fundamental dimensions of the revitalisation process: social, economic, spatial and cultural. Each of them is connected with the problem of urban shrinkage discussed in this article and has the instruments to counteract this negative phenomenon:

- social revitalisation concerns various activities related to improving the socio-economic situation of city residents, increasing their active citizenship, social participation and involvement in the process of urban co-management; it is aimed at combating all inequalities and discrimination;
- economic revitalisation is aimed at rebuilding the economic base of the city, stimulating local entrepreneurship and leading to effective restructuring of economic entities (Godlewska-Majkowska, 2008), thus providing a pool of attractive jobs in the city and improving the profitability of local business, which will translate into tax revenues, the level of investment and consumption in cities, as well as the availability of goods and services;
- spatial revitalisation refers to transformations of urban composition, architecture and its special qualities, as well as to the improvement of the quality of the city space and its optimal management, and also to the introduction of spatial order and the elimination of development barriers related to the insufficient provision of the areas with technical infrastructure (transport, water, energy etc.);
- cultural revitalisation is focused on activities aimed at maintaining and developing traditions, protecting the cultural and material heritage of city's degraded areas so it will be possible to "resurrect" the spirit of the city and stimulate the involvement of its residents e.g. around the cultivation of common values, traditions, cultural heritage.

Urban revitalisation is not an end in itself, but the process is intended to lead to multidimensional, beneficial changes in the socio-economic situation of its residents as well as to the economic (Porter, 1997), social and cultural revival of degraded fragments or entire cities (Ross, 2000).

It is commonly noted that urbanised areas are becoming more and more similar to each other (Gibas, 2015). Such unification reduces the competitiveness of cities, while cultural values rooted in the mentality of local communities are some of the potential grounds for gaining a competitive advantage.

All analyses concerning planned revitalisation transformations should refer to the specificity of the area concerned. Each revitalisation process should be carried out individually and directed at solving the diagnosed problems of a particular city and its residents, as well as using the unique potentials that are there.

The revitalisation process is extremely complicated and comprehensive and therefore requires adequate time for its implementation. In the short term the first greater effects of transformation can be observed about 5 years after the start of the process. In the long term, permanent changes are noticeable after at least 25-30 years and in such a time horizon the revitalisation process should ultimately be carried out. For this reason, revitalisation is considered in relation to the overall city development policy and the objectives of its performance are highly varied.

The Revitalization Process in Poland – Key Elements Regarding the Public Governance

The new approach to revitalisation objectives comes also with a number of consequences for local development management. The idea is to prevent urban areas from losing their functions or making life in cities less attractive. In a broader context, these activities are within the responsibility of the government administration, as well as regional and county self-governments, but to the greatest extent - municipality authorities. As it results from the above-mentioned Act on revitalisation, this is a process carried out jointly by local authorities, local community and other participants (entrepreneurs, investors, institutions, users of the area). Revitalisation is therefore an element of the development policy created and implemented by self-government units (Skalski, 2009, p. 182-210). Municipal self-governments are responsible for diagnosing socio-economic problems, delimiting areas to be revitalised and then developing revitalisation programme, their implementation, control and evaluation. The implementation of projects included in revitalisation programme is one of the processes aimed at effectively counteracting the diagnosed problems. The aim is to make cities more attractive places to live, work and rest, and thus counteract the phenomenon of their shrinkage. The key management problems in the revitalisation process (Noworól, 2010) are:

a) determination of the specificity of the area and type of its degradation (environmental, post-industrial, residential, etc.);
b) delimitation of the revitalised area and determination of the scale of its degradation;
c) recognition of demographic resources as well as trends and nature of migration from cities;
d) recognition of the quality of life in a crisis area, including social exclusion, possibilities of eliminating disclosed deficits, identification of revitalisation beneficiaries;
e) identification of stakeholders responsible for animating revitalisation, cooperation of social and economic partners in the revitalisation process (public, private and from the so-called third sector);
f) promotion of socio-economic development instruments, e.g. in terms of improving the attractiveness of urban areas;
g) identification of potential areas of public intervention related to stimulating socio-economic life and shaping spatial order of the city, especially in the revitalisation area.
Although the management of the revitalisation process is concentrated in municipalities, its effectiveness depends to a large extent on two factors related to and resulting from relations with the environment:

- abilities to create at the municipality level institutional and organisational networks of cooperation between authorities, beneficiaries and partners of revitalisation processes, including public institutions of various levels, civil society organisations, business environment institutions, informal beneficiary groups, local leaders, etc.;
- decentralisation of the revitalisation process and compliance with the principle of subsidiarity, i.e. provision of mechanisms for the participation of the local community in revitalisation decisions.

An example of using social relations in revitalisation processes is local community participation at the stage of creating and implementing a revitalisation programme. It enables a dialogue between the

authorities, administration and residents based on three forms (levels). These three forms of social participation in the revitalisation process are presented below.

Figure 1: Levels of public participation in the revitalisation process

Source: own elaboration

Another factor determining the proper management of the urban revitalisation process is the professional knowledge and experience of the officials responsible for the process. As a rule, the management process is based on three elements:

- the legislative structure (municipal council);
- the supervision structure over the unit responsible for revitalisation (the head of the municipality, the mayor, the president of the city and the city treasurer);
- the executive structure (revitalisation officer and his/her subordinate staff).

Professional implementation of the revitalisation process requires the use of a broad knowledge of strategic management, which makes it possible to link revitalisation with a comprehensive development policy. In particular it is important to:

- integrate socio-economic and spatial planning;
- implement in programmes and projects of the management system revitalisation a full cyclical process of strategic planning, organisation, motivation and control;
- apply innovative design solutions in the field of urban, architecture and spatial planning;
- use a variety of financial instruments, including both public and commercial funds;
- have a mutual partnership that gives better opportunities to implement revitalisation processes than if each partner will act separately;
- use social media to communicate with the stakeholders of revitalisation;
- motivate the stakeholders of the revitalisation processes to maintain high dynamics of cooperation.

Currently, the most of revitalisation programmes in Poland are at the initial stage of implementation. For this reason, it is difficult to identify and assess the concrete results of these processes, and even more so to assess ex-post the quality of revitalisation process management in municipalities. However, it is worth quoting statistical data concerning the initiation of revitalisation processes in municipalities through the adoption of appropriate programmes. According to the Statistics Poland (the statistical data on revitalization at the level of municipalities, Warsaw 2018) in 2017 53% of

municipalities had independent revitalisation programmes. Urban municipalities were much more interested in revitalisation than rural ones. Out of 2478 municipalities 1357 had designated within their territory a revitalisation area, i.e. an area in which priority intervention activities in order to get the zone out of a state of crisis were undertaken. In 2017 the total area of all revitalisation zones in Poland was 10.0 thousand km² (the area of Poland is 312 679 km²). The revitalisation areas of the municipalities which carried out this process were inhabited by 20% of their residents. On average, the revitalisation area covered 6.3% of the municipality. The municipal revitalisation programme in force in 2017 included 33 thousand undertakings. On average, there were 28 undertakings per 1 revitalisation programme. A greater number of undertakings were contained in revitalisation programmes drawn up for cities than for rural municipalities. The thematic structure of the basic undertakings planned in the independent revitalisation programmes in force in 2017 were dominated by undertakings from the social area (about 36%), i.e. those carried out in particular in the area of unemployment, poverty, crime, low level of education or social capital, as well as insufficient participation in public and cultural life. Subsequently, numerous interventions included activities in the spatial-functional (27%) and technical area (22%) were carried out. The smallest number of undertakings were of an economic (8%) and environmental nature (7%). Apart from municipalities which played a fundamental role in the implementation of revitalisation processes, the most frequently mentioned stakeholders were housing communities (about 40%), other public sector units (about 30%), NGOs (about 20%) and leaders from outside of the public sector (about 10%). In total, in all revitalisation programmes in force in 2017, undertakings were planned for the amount of PLN 73725.5 million. These projects were financed from the self-government's own resources as well as from EU, government and private funds. The most funds in the revitalisation programmes were allocated to undertakings of spatial-functional nature (38% of the planned expenditure), followed by the funds planned in technical and social areas. The least funds were allocated to the environmental area of intervention.

The Revitalization Programme as A Tool Supporting the Local Problems Solving – The Case of Counteracting Urban Shrinkage

For the success of the revitalisation process and for combating the diagnosed problems it is essential that the key elements of the revitalisation programme will be properly developed, as it is shown on the figure below.

Figure 2: Determinants of the revitalisation programme

Source: own elaboration

The key issue is the correct delimitation of the revitalisation area with the highest intensity of crisis phenomena (no more than 20% of the municipality area, inhabited by no more than 30% of the municipality population). An exemplary illustration of the spatial intensity of the problem concerning the degradation of municipal infrastructure in a city for the purpose of delimiting the revitalisation area is presented on figure 3 and an exemplary delimitation of the revitalisation area is presented on figure 4.

Figure 3: Spatial intensity of social problems for the purpose of delimitation of the revitalisation area - the city of Żywiec (map 23)

Source: Revitalization Programme for Żywiec city, 2015

Figure 4: Example of delimiting a revitalisation area – Brzeszcze city

Source: Revitalization Programme for Brzeszcze city, 2015

Despite these limitations, it must be assumed that the causes and effects of the revitalisation process go beyond the directly designated area and have a broader social and territorial context. Rational, objective selection of the revitalisation area results in appropriate selection of revitalisation objectives. They should be specific, measurable, achievable, relevant and possible to reach within scheduled time. In order to achieve properly defined objectives, it is necessary to plan appropriate activities (projects) and corresponding results. In order to confirm the

correctness of actions at the stage of planning and implementation of revitalisation processes an evaluation of the programme shall be carried out, also taking into account the changing socio-economic situation of the city. As a result of the evaluation it is possible to make a decision to continue the implementation of revitalisation projects in a fixed shape or to correct: the area of revitalisation, revitalisation objectives, scope of projects or expected results.

Figure 5: Logic of interventions as part of a local revitalisation programme

Source: own elaboration

Revitalisation is an element of a development policy created and implemented by the local authorities (Skalski, 2013). They are responsible for diagnosing the socio-economic problems and for designating areas for revitalisation and subsequently for preparation of local revitalisation programmes and their implementation, control and assessment. Performance of projects included in a local revitalisation programme should counteract the diagnosed revitalisation problems. It is meant to make the cities more attractive places for settlement, work and leisure, and thus counteracting their shrinkage. One of the key managerial challenges refers to guaranteeing, by the local government, of proper financial and organisational potential for this purpose. Unfortunately, numerous revitalisation programmes are not implemented after preparation and many projects included in them cannot be realised in practice. This indicates a common mistake, which is maladjustment of goals and expected outcomes to the actual potential of local governments which are responsible for the revitalisation process.

The process of developing a local revitalisation programme is carried out in two essential stages. The first one is connected with the delimitation of the revitalisation area and the second one is directly connected with the development of the local revitalisation programme. The integral tasks involved in the implementation of both stages are presented in the tables below.

Table 1: First stage of development of the local revitalisation programme

Name of the stage	Tasks to be implemented
Delimitation of the revitalisation area in order to develop a local revitalisation programme	1. Determination of quantitative and qualitative data, necessary to define the area of revitalisation, in the following spheres: social, economic, functional-spatial, technical and environmental. 2. Designation of spatial units (territorial units) for the purpose of delimiting areas at the level of neighbourhoods, streets, grids, etc. 3. Collection of as much quantitative and qualitative data as possible broken down into established spatial (territorial) units. 4. Participation activities (e.g. workshops, social research, consultation meetings, research walks) to deepen the diagnosis in order to determine the area of revitalisation. 5. Delimitation of the revitalisation area boundaries. 6. Public consultation. 7. Approval of the revitalisation area boundaries.

Source: own elaboration

Table 2: Second stage of development of the local revitalisation programme

Name of the stage	Tasks to be implemented
Development of the local revitalisation programme	1. Participation activities (e.g. workshops, meetings, debates) connected with the analysis of the main problems and potentials of the area to be revitalised in terms of defining its revitalisation needs, vision of revitalisation, setting its strategic goal and operational objectives. 2. Collection of proposals of revitalisation projects. 3. Analysis and assessment of project proposals in terms of their impact on solving problems in the revitalisation area and their compatibility with the expectations of the local community and revitalisation objectives. 4. Determination of the method of financing and the schedule of project implementation. 5. Determination of links of the revitalisation programme with other municipality strategic documents as well as with other investment and non-investment projects carried out in a given area. 6. Determination of result indicators of the local revitalisation programme. 7. Determination of the way the programme has been implemented and the conditions for its monitoring, evaluation and updating. 8. Public consultation. 9. Assessment of the local programme by entities and institutions whose scope of activity is related to the implementation of this document. 10. Adoption by the self-government of a resolution to implement a local revitalisation programme.

Source: own elaboration

As shown in Table 1 - delimitation of the revitalisation area boundaries determining the key spatial scope of intervention to solve revitalisation problems is preceded by the collection of various quantitative and qualitative data. This is a direct premise for the designation of the revitalisation area.

In the context of the aim of this article, 7 revitalisation programmes for small and medium-sized cities have been analysed and factors have been identified (in at least 4 programmes) whose impact can be linked to the process of urban shrinkage. Employees responsible for the implementation of revitalisation programmes in municipalities assessed the impact of these factors on the processes of urban shrinkage (the type of impact has been determined based on the majority of indications - at least 4). In this way, it has been identified which factors contribute directly or indirectly to the process of urban shrinkage. The results of these analyses are presented in the table below.

Table 3: Factors contributing to the intensification of urban shrinkage

No.	Factor type and name	Number of indications	Impact on urban shrinkage	
1	**SOCIAL FACTORS**		Direct	Indirect
1.1.	High level of crime in the city	7		✓
1.2.	High level of alcoholism among residents	6		✓
1.3.	High level of long-term unemployment	6	✓	
1.4.	Poor vocational and academic education offer	5	✓	
1.5.	Low quality of educational services for children and teenagers	5	✓	
1.6.	No possibility of self-realization	5	✓	
1.7.	Insufficient access to health care	5	✓	
1.8.	Large number of residents under the care of social services	5		✓
1.9.	Not a very attractive leisure offer	4	✓	
1.10.	Low level of social capital	4	✓	
1.11.	Low level of integration with the local community	4		✓
1.12.	Lack of mechanisms of co-management and social participation	4		✓
1.13.	Weak offer for seniors	4	✓	
2	**ECONOMIC FACTORS**			
2.1.	Insufficient employment	7	✓	
2.2.	Low salaries	6	✓	
2.3.	Low purchasing power of residents resulting in the lack of a diversified	5		✓

	offer of goods and services in the city			
2.4.	Nuisance of tourist traffic	4		✓
2.5.	Insufficient support for business start-ups	4	✓	
2.6.	High prices of real estate rental for business activities	4		✓
3	**SPATIAL-FUNCTIONAL FACTORS**			
3.1.	Low level of security in public sphere	7	✓	
3.2.	Poor state of public transport	7	✓	
3.3.	Low public space aesthetics	5		✓
3.4.	Lack of parking spaces	4		✓
3.5.	Availability of liquor stores and gambling outlets	4		✓
4	**TECHNICAL FACTORS**			
4.1.	High level of infrastructure degradation	7	✓	
4.2.	Shortage of council housing for rent	6	✓	
4.3.	Poor coverage by water, sewage, heating and gas networks.	4	✓	
4.4.	Low level of road safety	4		✓
5	**ENVIRONMENTAL FACTORS**			
5.1.	Pollution by near-ground emissions	7	✓	
5.2.	High prices for utilities (e.g. waste, water)	4		✓

Source: own elaboration

The data contained in Table 3 indicate that social, economic and spatial-functional factors are of key importance for the process of urban shrinkage of cities undergoing revitalisation. They constitute the largest part and most of them have been recognised as factors directly influencing this process. The authorities' awareness of the impact of these factors on the functioning of cities, including the process of urban shrinkage, is the first step towards initiating changes that can be achieved through revitalisation processes involving various stakeholder groups and using different methods and forms of public participation.

Discussion and conclusions

Currently, about 60% of Poles live in cities, but there is a clearly visible decrease in the number of residents, mainly in large cities, with over 100000 citizens, although more and more often also in small and medium-sized ones, which have weaker defensive mechanisms against the loss of their functions. It is widely recognised that the key causes urban shrinkage includes a decline in the birth rate and rising migration. From the other side, at the same time, a number of cities can be identified in Poland, which successfully attract new residents, mainly young people starting work or education there. The unfavourable changes resulting from negative demographic trends and migration (most often foreign) have been minimised in these cities by improving the quality of life of the residents, creating new jobs and an attractive educational offer (Murgas, Bohm, 2015). It is also noted that leaving the cities does not necessarily have to be due to negative factors. The reason for this is more and more often the enrichment of Polish society and the desire to move from housing estates (blocks of flats, skyscrapers) to cottages with a garden in the countryside. This is the result of sustainable development and the desire to live in accordance with nature as well as signalling a change in our material and social status.

We cannot also ignore the aspect of the loss of function by cities, which were associated with typical industrial monocultures implemented and developed during the communist time (Wróblewski, 2014). These were cities connected with large companies specializing in coal mining, metallurgy, chemistry or textile industry (Gąbek, Biały, Livenskaya, 2019). Following Poland's opening up to global competition, some of these companies became bankrupt or have been privatised and now operate on completely different conditions.

The shrinking population results from the migration caused by the worsening possibilities of career development in cities combined with the lack of inflow of new residents. This kind of situation occurs in the majority of Polish cities, but above all, it is severely felt in small towns, which do not have sufficient potentials and resources to counteract such negative trends. Especially for such cities,

the Polish government had implemented the Act on revitalisation, thus creating mechanisms and making public funds (Andonov A., Hochberg Y. V., Rauh J. D. 2018), both EU and national, available for the implementation of revitalisation projects.

One of the objective factors influencing the process of urban shrinkage is the ageing of the population. Although at the moment the number of deaths and births is not yet highly different, but when the post-war baby boom generation will start to pass away, there is no chance that it will be replaced by children born now.

According to the scientific research (Szukalski, 2014), apart from natural factors influencing the population shrinkage in cities, the attractiveness of the place itself is also of great importance. People who have changed their place of residence and moved out of cities admit that this decision was most strongly influenced by the situation on the labour market, the level of earnings and the cost of living (Kotulic, Adamisin, 2012) But access to goods and services is equally important in order to consume at a level commensurate with earnings. Therefore, as a place of residence, we are looking for locations where a high quality of life can be felt. In this aspect, the revitalisation process is an action to improve the quality of life in the city in order to:

- keep existing residents;
- attract new residents, investors, entrepreneurs, but also people coming to the city for shopping, offering them the possibility of using various types of services (e.g. personal, educational, health),
- taking advantage of the cultural or sport and recreation offer, but also finding a job, and as a result stay or frequently visit the city.

The conclusions from Table 3 prove that the greatest impact on improving the city's attractiveness is caused by limiting the impact of negative social factors which determine the residents' quality of life. In crisis areas in cities requiring urgent revitalisation, the residents are particularly disturbed by the situation in their surroundings, a large representation of people who are professionally and socially inactive, often living on social benefits, the long-term unemployed, shaping an unattractive image of the neighbourhood or a major part of the city, not interested in active inclusion in the life of the local community. This is most often accompanied by an increased level of crime and alcoholism, which causes many residents to fear that they may become victims of crime, especially robbery. Usually, the occurrence of the phenomena described above are combined with the insufficient number of jobs on the local market, or a mismatch between the structure of jobs and the professional competences of the residents. In many Polish cities, a natural consequence of the fall of communism was economic restructuring. Cities still struggle with its effects, among others, in the form of so-called structural unemployment. In many towns, the so-called employer's market still dominates, dictating working conditions, often with almost minimum wages, especially in case of people with low professional qualifications. Low incomes do not encourage residents to self-develop, get involved in the problems of the city or develop their passions. Thus, they suppress many activities that are typical for better earners. In this situation, it becomes a natural need for many people to get out of the circle of poverty and helplessness, and above all out of an environment where there are no professional or personal prospects. For young, ambitious people, many of whom want to start their own business, the lack of support from business environment institutions (Pierzyna, 2019) and from the state is another argument in favour of changing their place of residence (Bartniczak, 2014). In recent years, many such people have not only moved out of cities saturated with crisis phenomena but even left the country and are living abroad. This is for every city a loss of valuable social capital, which should be counteracted by successful revitalisation processes. Thus, the availability of jobs, the possibility of obtaining a salary to cover the cost of living, but also to provide appropriate conditions for education, settling (especially for young families), living and working in a safe place (not marked by crime) are the basic factors in maintaining the attractiveness of a city from the point of view of the effect of revitalisation processes. The availability of public transport and affordable housing is also important factor in this context.

The quality of life in the city is for the residents one of the basic determinants of its attractiveness. This group of residents, who have an income at a level that meets their basic needs, primarily due to

appropriate qualifications and adequate wages, expects that city will give them more opportunities to meet their consumption needs. It is not just about providing a diverse range of shopping and service offerings, as this is shaped by the market itself, if there is only sufficient purchasing power. It is also important to offer residents attractive opportunities to spend their leisure time, based on the cultural or sport and recreation offer, as well as to provide them with an appropriate level of health care, pre-school care or care for seniors. The conditions important for the quality of life in the city include also the broadly understood aesthetics of public sphere, well-maintained housing estates, squares and parks, modern and resident friendly communal infrastructure. These conditions, as well as the environmental requirements described in Table 3 (especially clean air) can be considered as one of the factors increasing the attractiveness of the city. From the point of view of revitalisation processes, it is therefore necessary to act to strengthen such elements in cities.

The third group are integration factors, which primarily build the emotional connection between the resident and the city. Cities in which the authorities conduct a dialogue with the residents and where social consultations and participatory activities enable citizens to co-decide on the directions of the city's development or the way of solving its problems are considered particularly attractive. In this way, the residents' consciousness draws a picture of the city that is friendly to the realization of professional, personal and social ambitions, developing its social capital based on individual citizens' activity and their commitment to the local community.

The above considerations lead to the conclusion that through skilful management of the revitalisation process, a local authority can reduce the scale and number of crisis phenomena in a city or in some parts of it, which contributes to improving the attractiveness of the city and can also contribute to reducing the scale of urban shrinkage. A synthetic approach to this thesis is presented in the figure below.

Figure 6: City attractiveness factors in the context of counteracting urban shrinkage

Source: own elaboration

The implementation of revitalisation processes aimed at solving problems (especially social ones), and thus reducing the scale of crisis phenomena in the city, can be directly related to the need of creating a city attractive enough to reduce or eliminate migration phenomena related to employment, education or

seeking better living conditions. Effective management of the revitalisation process in a way which ensures that the attractiveness of the town will be maintained or strengthened must be carried out in an orderly manner. First of all, intervention should take place where the level of crisis phenomena is the highest, that is in the area of revitalisation. Secondly, the intervention must be based on properly diagnosed crisis phenomena (an example of such phenomena is shown in Table 3). Thirdly, it is necessary to develop and implement the revitalisation programme in a professional manner, with the involvement of all stakeholder groups and the extensive use of participatory methods. Fourthly, the revitalisation process should be carried out in an orderly manner, based on a revitalisation programme. It should begin by triggering changes which are aimed at generating the basic attractiveness factors of the city as described on figure 6. Only when the evaluation of the revitalisation process has brought about positive changes it is possible to move on to the next level of activities which are aimed at triggering factors strengthening the attractiveness of the city. Achieving these two levels in the revitalisation process can be considered as an action ensuring an appropriate level of attractiveness of the city or neighbourhoods threatened by the risk of urban shrinkage, while activation of integrating factors will complete the process of building the attractiveness of the town sphere. The city will begin to be treated by its residents as their common good, over which they have influence and for which they bear responsibility. Creating a sense of local community and building an emotional relationship between the residents and the city, with the prior establishment of the basic and strengthening factors, should be regarded as a success of the revitalisation process, which can essentially reduce urban shrinkage as well as other local problems. In order to achieve this success, it is necessary to carry out revitalisation activities in accordance with a programme which can be considered as a public management instrument and the execution of which may counteract the processes of urban shrinkage.

Abstract

The introduction of the sanctions regime in relation to the Russian banking market by a number of Western states entailed significant risks. They resulted in a restriction on the freedom of movement of financial capital, increased competition in the financial segment. In the interests of economic growth of the Russian economy, the task was set to ensure liquidity and stability of commercial banks.
The banking market in the regions determines the features of the development of the banking system of the country as a whole. The development, maintenance and improvement of the level of development of regional banks is an important aspect that characterizes the level of development of the national banking system as a whole.This study is devoted to the analysis of regions in terms of the potential development of the banking business. The authors assessed the dynamics and volumes of loans issued and deposits attracted by credit institutions. The authors identified trends that determine the path of development of the banking sector in an unstable environment and the active introduction of digital technologies. It is noted that the modern banking business will be competitive when it adopts a strategy of rejecting excess profits and is adaptive to new business conditions.

Keywords: Digital Economy, Banking, Banking Innovation, Regional Banking System

Introduction

The stability and efficiency of the banking sector creates the basic conditions for the stable development of the national economy. The current state of the banking sector is characterized by a significant dependence on external factors. They are caused by international sanctions and trade restrictions on Russia. There is also a specificity of banks in the national financial services market.

The conditions of an unstable external environment create difficulties in the conduct of the banking business. The transition to the new international financial reporting standard (IFS9) is expected, which will require the formation of reserves based on predicted losses not incurred. According to experts, the introduction of the standard may lead to a change in volatility in terms of profit and equity. This will entail a change in key indicators of the financial performance of banks [2, 5].

In the near future, Basel IV standards will be introduced, which establish stricter rules for assessing risks in bank assets. According to McKinsey & Co agency for European banks, the introduction of new rules will entail the need for additional capital in the amount of about 120 billion euros.

Analysts note that the main goal of the national banking sector is to maintain a competitive position and ensure its reliability [6, 7, 9]. The stability of the banking system is determined by the stability characteristics of individual banks. Therefore, research on the functioning of regional commercial banks is very relevant.

Analysis of the dynamics and level of development of the national banking system.

A study of the statistics of the Central Bank of the Russian Federation shows clear imbalances in the development of the regional banking system [8].

The decrease in the number of credit institutions in the Central Federal District was 15%, in the Northwestern Federal District - 5%, in the Southern Federal District - 29%, in the North Caucasus Federal District - 30%, in the Volga Federal District - 6%, in the Urals Siberian and Far Eastern Federal Districts - 12%. The largest decline was noted in the Central Federal District. More than half of credit institutions (56.2% as of January 1, 2019) are located in the Central Federal District. The three leaders (but with a significant lag behind the Central Federal District) include the Volga and North-West federal districts (13.8% and 8.4% of credit organizations, respectively). It is noteworthy that 50% of credit organizations are registered in Moscow.

The sample of regions with the largest number of credit organizations in 2018 demonstrated the following. As of 01.01.2019, the leader in the number of credit organizations is Moscow (239 credit organizations). In general, in the whole country only three regions (not taking into account the leader) have more than 10 operating credit organizations:

- in the North-West Federal District - this is St. Petersburg, in which there are 28 credit organizations;
- in the Southern Federal District - the Republic of Tatarstan (16 credit organizations) and the Samara Region (10 credit organizations).

Consider the subjects of the Russian Federation by the potential of regional banks. We will carry out an assessment using two indicators: the volume of assets and the volume of total profit. The largest volume of assets is concentrated in the Central Federal District, as the number of credit organizations is 56% of the total Russian.

In terms of total profit, the top three are as follows:

- Central Federal District (1,598 billion rubles);
- North-West Federal District (11.5 billion rubles);
- Ural Federal District (10.3 billion rubles).

Two federal districts (Volga and Far East) show a cumulative loss as a result of the total activity of credit organizations.

Important indicators characterizing the development of the banking system are placed and attracted funds in a regional context. Consider the quantitative characteristics of deposits attracted by credit institutions (deposits) from business entities (table 1).

Table 1: Dynamics of deposits attracted by credit organizations

Ural'skiy	383,5	1402,9	503,9	1546,4	647,9	1665,2
Sibirskiy	228,1	1582,0	290,9	1775,8	294,1	1714,4
Dal'nevostochnyy	163,4	796,2	166,9	873,8	209,2	1077,4

From 2016 to 2018, the total amount of deposits of both legal entities and individuals made in rubles increased:

- deposits of legal entities increased from 6966.7 billion rubles. up to 12106.7 billion rubles, i.e. 73%;
- deposits (deposits) of individuals increased from 18,471.9 billion rubles. up to 22348.4 billion rubles, i.e. by 21%.

At the same time, deposits in foreign currency and precious metals in the Russian Federation as a whole amounted to:

- as of 01.01.2017, legal entities 4,597.2 billion rubles, individuals 5831.4 billion rubles;
- as of 01.01.2019, 5565.9 billion rubles, individuals 6229.4 billion rubles.

Growth is observed in all federal districts without exception. The leader among the federal districts in attracted resources is the Central Federal District: 9,240.7 billion rubles. - deposits of legal entities and 10,001.9 billion rubles. - deposits of individuals.

It is necessary to highlight Moscow, which is the leader in this indicator. Thus, the volume of deposits of legal entities amounted to 8760.5 billion rubles, i.e. 72% of the total deposits of legal entities in the Russian Federation, and the amount of deposits of individuals amounted to 6356.9 billion rubles. (30% of the total deposits of individuals).

Table 2 presents data on loans granted.

Sibirskiy	2303,3	872,2	2220,3	1112,5	2282,9	1383,1
Dal'nevostochny y	688,2	352,7	844,5	440,5	1099,5	740,0

The volume of funds provided to legal entities and individual entrepreneurs demonstrates growth both in Russia as a whole and in federal districts. The growth of loans to individuals amounted to 72% in 2018 compared to 2016.

As of January 1, 2019, the largest volume of loans granted to legal entities and individual entrepreneurs was concentrated in the Central Federal District (59%). Also, the largest amount of funds provided to individuals is concentrated in the Central Federal District. The growth of loans for individuals amounted to 65%, for companies - 36.6% in 2018 compared to 2016.

Funds to companies and individuals are provided, as a rule, in rubles. The share of loans issued in foreign currency and precious metals accounts for about 0.7% of the total borrowing.

The company overdue debts as of 01.01.2019 on loans amounted to 2099.6 billion rubles, i.e. 4.7% of the total volume of loans issued; for individuals - 757.6 billion rubles, i.e. 6.1%.

Modern trends in the development of banking

An important trend is a decrease in margins in the banking sector, which follows a decrease in inflation to 4%. The consequences of easing monetary policy, manifested in the constant control of inflation and lower key rates, lead to lower interest rates on loans.

An analysis of the nominal level of rates in the context of the main types of banking assets and liabilities shows that banks are currently not able to restore a margin of 4-5%, as it was before the crisis of 2014. Before the crisis, net interest income amounted to more than 70% of operating income in the banking sector as a whole. Now banks have lost a third of the margin and profitability has decreased by more than 20%.

Of the significant problems, one should point to the deterioration of the demographic situation in Russia. This entails a change in demand and structure for banking services, in particular for mortgage and consumer loans.

The structure of the economy, its focus on the commodity model, also has an impact on the banking sector, change its profitability and focus on servicing export-oriented sectors.

Another important trend is the global processes of networking and digitalization, which, according to experts, will grow and change the architecture of economic systems at all levels [1, 3, 4]. These processes are actively used in banking. Digital technologies are being introduced into banking offices: blockchain, contactless payments, Internet of things, cybersecurity systems. Widespread electronic payments, remote customer service systems, digital applications. New electronic money and payment methods with their use, cryptocurrencies are appearing. Traditional banking services are being replaced by new, competitive services based on artificial intelligence technologies. New banking products are present in the virtual space, among them: Internet banking, blockchain service, cryptocurrency mining and storage, creation of digital assets, development of smart contracts.

Conclusions and Recommendations

Thus, regional banks will have to look for their place in building a new model of investment business development for the future. For successful competition in a high-tech environment, a traditional banking business needs to adapt to a changing market. Modern banks are able to survive by applying a strategy of abandoning excess profits and demonstrating flexibility and high adaptability to new business conditions.

Abstract

Small and medium-sized businesses play an important role in the development of the modern economy, which directly affects the standard of living of the population in particular, as well as ensuring the stability of modern society as a whole. To perform their significant functions for the economy as a whole, and for the population in particular, small and medium-sized businesses need credit security. The main role in this issue is assigned to banks, which are one of the largest participants in the financial market. It should be noted that the share of small and medium-sized businesses in the structure of lending by banks is insignificant. The main reasons for this situation are: low profitability of lending to small and medium-sized businesses for banks; difficulty in assessing the real financial condition of the subjects under consideration; high risks of non-repayment of the loan. Based on this, the relevance of the study is due to the need to identify the degree of development of lending to small and medium-sized businesses, which is especially important at the regional level. To analyze the state of lending to small and medium-sized businesses, the volume of loans issued to legal entities and individuals in the territorial context was analyzed; their share in the total volume was determined; their comparative analysis was carried out; and the types of economic activities where the largest volumes of loans for the development of small and medium-sized businesses are concentrated were also identified.
Conducted in the study, on an actual topic, allowed us to draw conclusions about the state of development of lending to small and medium-sized businesses, as well as to offer recommendations for improving an important aspect of the country's economy.

Keywords: Small and Medium-Sized Businesses, Credit Organizations, Banking Sector, Lending to Small and Medium-Sized Businesses

Introduction

According to experts, in the current conditions of instability , effective development and transformation of the Russian economy is possible with the active development of one of its important sectors – small and medium-sized businesses [1; 6, p. 57; 15, p.100].

Small and medium- sized businesses play a huge role in the development of the country's economy in General and the regions in particular. Small and medium- sized businesses are a guarantor of competition between the main market participants, which promotes the introduction of technologies, provides a return on investment, and is aimed at eliminating problems related to employment and unemployment [9, p. .86].

The development and successful functioning of small and medium sized businesses depends on how well entrepreneurs are provided with long term and short term financial resources. For small and medium- sized businesses, lending provides a wide range of opportunities to expand and improve their business activities. With the help of Bank financing, small and medium-sized businesses have the opportunity to improve their performance (increase in liquidity and profitability, financial security,

compliance with regulations and legal requirements). Despite the development of credit instruments for business, the necessary economic growth rates are not provided. To solve existing problems, both on the part of borrowers (high requirements to the borrower; lack of quality collateral; long-term loan application review process; predominance of short-term lending; high rates; large volume of documents requested by banks) and on the part of creditors (non-transparency of borrowers; high risks; banks ' unwillingness to work with small and medium-sized businesses; high operating costs when considering applications) it is necessary to analyze the state and dynamics of lending to small and medium-sized businesses, primarily at the regional level [8, p. 34].

Research on the level and dynamics of loans to small and medium-sized businesses in the Federal districts of the Russian Federation

The mechanism of lending to small and medium-sized businesses, it is necessary to start with the study of its features:

- assets of small and medium- sized businesses are limited in size, and the specificity of their structure,
- the life cycle of small and medium-sized businesses is short- term, which does not allow them to build a reputation in the financial market,
- instability to the volatility of the external environment (orientation to local markets, limited number of partners)
- there is little need for the volume of debt financing of small and medium- sized businesses, which is a consequence of increased costs for lending
- low indicators that characterize the efficiency of the company (profitability, profit
- lack of specialists in financial and economic activities.

Therefore, small and medium-sized businesses have a certain specificity, which leads to the presence of a certain credit mechanism.

Let's consider the main quantitative indicators that characterize the level of lending to small and medium- sized businesses. The Central Federal district is the leader in terms of financing loans to individuals and legal entities (figure 1).

Fig. 1: The volume of loans issued to legal entities and individuals in the territorial aspect for 2018, billion rub.

The Central Federal District accounts for 54% of the total volume of loans issued to legal entities and individuals. Thus, more than half of the volume of loans granted to individuals and legal entities issued to the Central Federal District.

A significant share of loans is also provided to business entities (legal entities and individuals) of the Volga Federal District (11.7%) and the North-West Federal District (10.5%). The same volume of lending to business entities is in the Southern, Ural and Siberian Federal Districts (about 6.4% per district). Outsiders in this indicator include the Far Eastern Federal District (3.2%) and the North Caucasus Federal District (1%) [4, p.94].

A study of the structure of loans issued by districts made it possible to note that in the structure, in all federal districts, most of the loan was granted to legal entities (more than 50%). However, in 2018, the North Caucasus Federal District is characterized by the fact that the largest volume of loans was issued to individuals (53.4%).

The largest volume of loans for individuals is concentrated in the Central Federal District (as of 2018, more than 32%). This trend is observed throughout the period under review. The smallest amount of loans to individuals is provided in the North Caucasian (2.46%) and Far Eastern (5.94%) federal districts.

The situation with loans to legal entities is similar. More than 50% of loans granted to legal entities are concentrated in the Central Federal District (as of 2018, more than 60%). The smallest amount of loans to legal entities is provided in the North Caucasian (0.59%) and Far Eastern (2.44%) federal districts. The central (32.3%) and Volga (17.8%) districts are leaders in terms of the volume of loans issued.

A comparative analysis of the volume of loans granted to individuals and legal entities by districts of the Russian Federation for 2018 indicates the following (figure 2).

Fig. 2: The volume of loans issued to individuals by federal districts for 2018, billion rub.

The Far Eastern District (740037 million rubles or 5.9% of the total) shows low indicators for the number of loans issued to individuals North Caucasus Federal District (3,306,990 million rubles, or 2.5%). The undoubted leader in this indicator is the Central Federal District (4,017,116 million rubles or 32.3%).

As a leader in this indicator, we will identify the territorial directions of loans to individuals by the Central Federal District. The largest volume of loans issued to individuals by the Central Federal District is concentrated here (33.2%). A significant amount of loans issued was also directed to the Volga (7.8%), North-West (12.3%) and Siberian (11.2%) districts of the Russian Federation.

An analysis of the dynamics of loans granted to legal entities in federal districts shows that the leading positions also belong to the Central Federal District (27145782 million rubles, or 60.3% of the total). The three leaders include the Northwestern Federal District and the Volga Federal District (each district about 10% of the total). Outsiders on loans granted to legal entities include: the Far Eastern Federal District (2.4%) and the North Caucasus Federal District (0.5%).

The largest amount of credit funds was provided to the Central District (23747931 million rubles) or 60% of the volume. Such districts of the Russian Federation as North-West and Volga constitute 10% of the volume of credit funds for legal entities. The leaders among the regions in terms of loan funds are Moscow and the Moscow Region; St. Petersburg; Republic of Tatarstan. The largest amount of credit in the Central Federal District was presented to wholesale and retail enterprises (5177198 million rubles). Also a common activity for lending in the Central Federal District are manufacturing enterprises, transport and communications, real estate operations [11, p.141].

The problem of lending to small and medium-sized enterprises in the modern economy is important, and measures are needed to minimize them in the future. The factors limiting the lending process for small and medium-sized enterprises include:

- the lack of a resource base that provides loans for the long term;
- priority and profitability of working with large borrowers compared to borrowers of small and medium enterprises;
- the presence of high risks and non-transparency of the activity of small and medium enterprises.

An analysis of the existing problem of lending to small and medium-sized enterprises of various researchers made it possible to combine them into several groups: short-term or lack of credit history [7, p. 157; 13, p. 156; 5, p. 32; 3, p. 376; 2, p.5861]; opacity and the presence of high risks for small businesses [7, p. 157; 12, p. 67; 5, p. 32]; lack of collateral; short-term loans [[7, p. 157; 12, p. 67; 5, p. 32; 3, p. 376; 2, p.5861]; groundlessness of the high volume of loans for small businesses [10, p. 156; 5, p. 32; 16, p. 158].

Conclusion

The territorial analysis shows that the leading position in all indicators of lending to small and medium-sized enterprises belongs to the Central District, whose share is 54% of the total volume of loans issued to legal entities and individuals. A significant share of loans is also provided to constituent entities of such districts of the Russian Federation as Volga (11.7%) and North-West (10.5%). Most of the loan was granted to legal entities (more than 50%). However, in 2018, the North Caucasus Federal District is characterized by the fact that the largest volume of loans issued was provided to individuals (53.4%). The largest amount of credit in the Central Federal District was presented to wholesale and retail enterprises (5177198 million rubles). Also a common activity for lending in the Central Federal District are manufacturing enterprises, transport and communications, real estate operations. Therefore, the three leaders in the territorial context are represented by the following districts: Central, Volga, North-West. Outsiders in terms of the volume of loans are Far Eastern and North Caucasian Federal Districts.

Thus, it is possible to single out the main activities that will contribute to the improvement of the activities of commercial organizations in various territorial entities in the field of lending to small and medium-sized businesses: strengthening diversification by lending industry, with the aim of gradation of target segments of small business; the use of mechanisms aimed at reducing risk in lending to small businesses in order to minimize credit risk; transition to in-line lending technologies in order to reduce costs; reduction of time for processing a loan application, i.e. automation of the lending process; improving the quality of customer service; development and implementation of new loan products focused on the needs of small businesses in terms, objectives and collateral.

Sustainable Energy – Definitions, Scope and Areas

Alicja M. GRACZYK

Wroclaw University of Economics and Business, Wroclaw

Poland, alicja.graczyk@ue.wroc.pl

Abstract

The energy transition consisting in a change in the management model and a shift from brown to green economy has been observable in the EU since the beginning of the first decade of this millennium. The climate policy established by the EU authorities prioritises resource-efficient, low-carbon and sustainable technologies. The notion of sustainable energy is one of the terms that emerge in the relevant literature in connection with the energy transition. However, it has not been specified yet and its origin, sense, scope, area and components have not been discussed properly. Therefore, the aim of this paper is to define the notion of sustainable energy, its scope and area, beginning with the determination of the essence of sustainable management and ending with the identification of components of the sustainable energy paradigm. The first part of the paper specifies and defines the notion of sustainable management taking place in the sustainable economy. Subsequently, according to the iterative method subsequent components of sustainable energy are defined, such as sustainable energy development or sustainable energy system. The final part presents the scope and area of the sustainable energy as well as its paradigm. The leading research method applied is the iterative approach, methodology of systemic analysis and multi-level, multi-aspect and – at the same time – holistic approach to problems observed.

Keywords: Sustainable Energy, Energy Paradigm, Sustainable Economy, Sustainable Management, Energy System

Introduction

Due to the increasingly more acutely perceived climate changes, the necessity for the transition from an economy based on fossil resources and resource-intensive and pollutant technologies to a resource-efficient, environment friendly and low-carbon economy is the superior goal of the EU energy policy. Green economy is such economy, within which such technologies as renewable energy sources (RES), being part of sustainable energy (SE), are distinguished.

The relevant literature includes various terms that combine the notions of sustainable development and energy: sustainable energy, sustainable energy system, sustainable energy development (Osipova and Kharlamova, 2019; Chouinard, Ellison, and Ridgeway, 2011, A Guidebook, 2019). However, they are rarely defined. The few attempts at defining this thematic area were made by Hycner, Bugajczyk and Duda (2002), Borys (2014), Poskrobko (2011), Rogall (2009) and Prandecki (2014). Sustainable energy is a new notion in economics. It belongs to the research area of heterodox economics - economics of sustainable development (ESD, sustainable economics). Economics of sustainable development is a science that has been developing since the beginning of the new millennium.

The paper aims to create and structure basic definitions related to sustainable energy, which will permit the delineation of its area and scope. Furthermore, the place of sustainable energy will be indicated in the context of such notions as sustainable economy or green economy. The author will also identify the components of the primary process being the beginning of formation of sustainable economy: sustainable management. The paper will also present the sustainable energy paradigm along with its main components. Few studies concerning this topic have been prepared in the literature so far and certainly none cover the notion of sustainable energy comprehensively.

Sustainable energy permits the achievement of the primary goals of the EU climate policy until 2030 being the reduction of greenhouse gas emissions by at least 40% (relative to the 1990 level) and the increase in the energy efficiency by at least 32.5%. An important goal is the at least 32% share of energy from renewable sources in the total consumption of final energy in the EU by 2030 (Clean Energy, 2016; 2030 climate, 2020). A new strategy - European Green Deal speaks of the delivery of clean, affordable and safe energy (A European Green, 2019). This document is a roadmap for making the EU's economy sustainable.

Methods

In this paper the iterative approach is adopted method. It allows elaborate a step-by-step definicions, scope and sustainable energy area. The analysis is conducted in the society-economy-environment macrosystem in the field of sustainable economics. For the evaluation of research problems, the methodology of systemic analysis is adopted, which offers a multi-level, multi-aspect and – at the sametime – holistic approach to problems observed.

Sustainable Management and Sustainable Economy

One of the earliest definitions of sustainable management was developed by Polish economist B. Prandecka already in early 1990s, in her books titled: "Nauki ekonomiczne a środowisko przyrodnicze" (1991) or "Interdyscyplinarne podstawy ochrony środowiska przyrodniczego" (1993). According to that author, management consists in the use of resources of the natural environment and the protection thereof, which proves the rational activity of the human. B. Prandecka pointed to the interdisciplinary nature of the issues related to the environment and to the problems that cannot be solved by the neoclassical economics in the context of the human use of the environment. She noticed that the protection of natural environment was an important part of economic sciences and was directly related to the satisfaction of "individual and collective needs of contemporary societies and future generations" (Prandecka, 1991, p.23). She underlined that "the humans manage their planet ineptly" (Prandecka, Współzależność, 1985, p.16), providing the example of the failure to take into account in the present management the possibility to fulfil the requirements and goals of future generations and the failure to give them any choice in the future management process (Prandecka, Cele, 1985, pp.661-662). Moreover, B. Prandecka highlighted the changing approach of the human to the use of the environment, from extremely egocentric to moderately anthropocentric, with the emphasis that the primary goal of management was the development and survival of the human race (Prandecka, Współzależność, 1985, p.18). This may be regarded as early implications for the formation of a new discipline: economics of sustainable development.

Management in sustainable economics (sustainable management) differs considerably from management in neoclassical economics, where the maximisation of own benefit from consumption as well as profit were the primary motivation. Such management takes place in the society-economy-environment macrosystem. This means the strive for integrated governance and for balancing of the dimensions (areas) of sustainable development: social, environmental, and economic, which implies their simultaneous incorporation in the decisions concerning the whole process. In light of the above discussions, it may be assumed that sustainable management is a process aimed to ensure the sustainability of existence of the present and future generations, at the same time preserving the boundaries of nature's tolerance. This guarantees the materialisation of the principle of intra- and inter-generational justice. The criterion of justice means that the contemporary management of resources that facilitates strong human environmental impact in the form of environmental pollution and depletion of environmental resources should not lead to the loss of possibility to manage these resources by the present and future generations. Important features of sustainable management are the principle of strong sustainability, social participation and the principle of subsidiarity (Fig.1). Sustainability, understood according to the principle of strong sustainability, means the transfer of resources to the successors in the quantity and quality not worse than those used by the present generation. Only substitution within the same type of capital is permitted (Graczyk, Gospodarowanie, 2019, p.222). Operationalisation of sustainable management is related to the implementation of sustainable development.

Fig. 1: Sustainable management: elements and area

Source: own elaboration

Sustainable management takes place in sustainable economy. Sustainable economy is defined by E.S. Goodstein and S. Polasky (2014) according to the approach to sustainable development presented by J. Pezzey (1992). They refer to such a management method that leads to the achievement of an equal or a higher living standard by the members of the future generation in comparison to the members of the present generation. This means that the life usability should not be worse for a typical member of the future generation. Apart from incorporating the criterion of justice in the activities, the primary goals of such management are civilisation development that reduces the human environmental impact and is in line with the protection of natural environment.

Sustainable Energy, Sustainable Energy Development, Sustainable Energy System

Definitions of sustainable energy are created often based on the idea of sustainable development and the most popular definition from Brundtland. W. Patterson (2009) defines sustainable energy as energy consumption and supply that satisfy the parents' needs without compromising the children's capacity to satisfy their own needs. International Energy Agency – IEA (2001), OECD organisation, defines sustainable energy as long-term energy generation with the global reach, guaranteeing environmental protection, economic viability and competitiveness as well as social responsibility. W. Patterson's definition does not convey the essence of the notion fully as it refers selectively to sustainable development aspects, underlines the principle of inter-generational justice. Although the IEA's definition stresses the sustainability of development, it does not take into account all considerations of sustainable development dimensions. Sustainable energy is such a sector of sustainable economy in which sustainable energy development takes place. A sustainable energy system is an important component of sustainable energy.

Sustainable energy development is a notion related to the implementation of the sustainable development in energy generation, and is a process occurring in sustainable energy. The fundamental principle of sustainable energy development - is treating economic and social development and environmental protection as strongly correlated tasks and taking care that economic development does not contribute to the degradation of the natural environment. This requires the compliance with the following conditions in the energy management process (Lorek, 2007, pp.163-176):

- take into account the scale and strength of impact of energy production and consumption on the natural environment, including know the effects of such management and the preventive measures possible to be taken,
- provide integration of all dimensions of sustainable energy management at each stage of decision-making as regards directions of energy generation systems, including energy planning;
- account for the interest of future generations in the taken measures so that the measures are prudent, economically viable and socially acceptable now and in the future.

The aim of the sustainable energy development will be energy-related well-being concerning both the society and the individual. It means such use of energy sources that does not reduce energy management for future generations, does not cause permanent depletion of the natural environmental capital, remains in compliance with the adopted local and national law. The goal is also the lack of energy poverty, the fair distribution of energy resources, the equal access to energy sources for the society and its individuals.

Energy generation is one of the economy sectors one of the components of which is the energy system. It may be defined as a combination of various technologies of acquisition, generation, processing and use of energy and heat. A sustainable energy system should have the following features (The Political 2010; Voβ, 2020; Wach, 2008):

- give rise to the growth of economic potential of energy service provision for future generations,
- provide energy services with the minimum use of resources, including mineral resources and other natural environment resources,
- release only so much substances related to energy acquisition, generation, processing and use to the environment as not to exceed the assimilative capacity of the environment to neutralise them,
- the occurring hazards to human health related to energy production must be lower than the avoided natural hazards thanks to delivery of energy services,
- internalise external costs,
- strive for the use of new technologies in the field of generation and management,
- use renewable energy sources,
- put emphasis on achievement of long-term economic and environmental goals,
- act in competitive markets, including international markets, with equal rules of competition.

Scope and Areas of Sustainable Energy

The sustainable energy consists in management in the society-economy-environment macrosystem. Sustainable energy management is a process performed in the sustainable energy development in the sector of sustainable economy being sustainable energy. Thus, sustainable energy is one of the sustainable economy sectors (Fig.2).This refers primarily to green energy technologies but not only. Also other low-carbon technologies and those characterised by increased ecology standards belong to it, e.g. biomass co-firing with coal. Management of renewable energy sources (RES), in turn, is an inextricable component in the sustainable energy consumption or production process, natural environment friendly sources, supporting the socio-economic development. This process takes place as part of sustainable energy and green economy simultaneously (their common component and subset of each of them).

Fig.2: Relations between sustainable economy, green economy, sustainable energy and renewable energy sources management

Source: author's own research based on Graczyk, A.M. (2019) 'Gospodarowanie odnawialnymi źródłami energii w ekonomii rozwoju zrównoważonego. Teoria i praktyka', Polish Scientific Publisher (PWN), Warsaw. p.182.

The scope of sustainable energy should be considered broadly, i.e. in terms of processing, generation, transport, distribution and consumption (see Fig.3). For this reason one should bear in mind the whole energy system, which will affect local markets up to global relations. This system operates in two primary areas: sustainable production and consumption of energy. Sustainable energy consumption should be understood as (Graczyk, Gospodarowanie, 2019):

- change in the energy consumption model to a resource- and energy-efficient one,
- reduction of demand for primary energy thanks to the increase in the efficiency of appliances that use energy,
- increase in the energy efficiency of the appliances used,
- thermal upgrade of non-building structures and buildings, industrial and home use installations, local district heating networks and local heat sources,
- use of energy-efficient construction and eco-friendly transport,
- use and recovery of waste heat thanks to recuperation,
- use of appliances generating energy from renewable sources.

Sustainable production of energy according to G. Boyle, B. Everett, J. Ramage (2004) should use such energy sources the use of which does not cause big threats to health and considerable degradation of environment and reinforcement of social injustice. Such sources should not be subject to considerable depletion through their long-term use. This definition embraces numerous alternative sources: renewable energy sources, co-firing, hydrogen use, etc. However, it is renewable energy that is called the "driver" of the green and low-carbon economy. The use of solar energy or heat pumps to increase the energy efficiency of buildings, investments in local biomass-fired CHP plants, biogas plants or other renewable installations in municipalities are increasingly more popular. The renewable energy sector belongs to the market of innovative green technologies. RES contribute to the reduction of the greenhouse effect and to energy efficiency. Energy generation in local sources and energy source diversification strengthen the energy security.

Fig.3: Scope and areas of sustainable energy

Source: author's own research based on Graczyk, A.M. (2019) 'Gospodarowanie odnawialnymi źródłami energii w ekonomii rozwoju zrównoważonego. Teoria i praktyka', Polish Scientific Publisher (PWN), Warsaw. p.188.

Sustainable energy covers areas related to sustainable use of energy in transport and construction, and thanks to the use of biomass and energy crops for biofuels it even partly concerns sustainable agriculture. The areas and sectors of operation include also industry, services and trade related to green energy, including energy consulting as well as local energy production and consumption, including prosumption. A prosumer is an end consumer who purchases electricity under a master agreement but at the same time generates electricity for its own needs, unrelated to the economic activity. This definition refers to electricity generation from RES in micro-installations (A.M. Graczyk, A. Graczyk, Żołyniak, 2020, pp. 160-162).

The Paradigm of Sustainable Energy

The paradigm of sustainable energy sets the directions of energy management and is of crucial significance for the contemporary social processes in environmental protection and in the political and institutional sphere. A.M. Graczyk (2019, Gospodarowanie, pp. 327-323) was the first in Poland to define the paradigm of sustainable energy. Those investigations were also presented on the 34 IBIMA conference in her article *The Formulation of Fundaments and Form of Paradigm of Sustainable Energy* (2019, The Formulation, pp. 12827-1289*).* The paradigm of sustainable energy originates from the paradigm of sustainable development and from the paradigm of sustainable development economics, hence it must refer also to the primary features of the new development concept (durability, sustainability and balance) (Fig.4). In general, the sustainable energy paradigm is build on intra- and inter-generational justice, moderate strong rule of durability. The reasons for the use of moderate strong durability principle is to maintain parity between the three orders (social, economic and environmental) and to meet the requirement of intergenerational justice in RES management. Its axiological basis must be at least moderate anthropocentrism. The quintessence of the paradigm of sustainable energy is the new concept of a managing human - human managing energy – *homo energeticus*.

Fig.4: The paradigm of sustainable energy

Source: author's own research based on Graczyk, A.M. (2019) 'The Formulation of Fundaments and Form of Paradigm of Sustainable Energy', Proceedings of the 34 th International Business Information Management Association Conference (IBIMA), ISBN: 978-0-9998551-3-3, 13-14 November 2019, Madrid, Spain, p.12828.

Conclusions

The determination of the primary definitions, scope and areas of sustainable energy has not only a theoretical but also a practical dimension. At present, the priority of the EU energy and ecology policy is sustainable energy, which includes the development of RES. Renewable energy sources on the international arena are called a "win-win-win" solution. Energy generation is perceived as a strategic sector by the governments of member states. Therefore, it is very important to manage the energy in a sustainable manner. Sustainable energy provides citizens with permanent, stable, secure and effective supplies of energy and enables consumers to generate energy on their own. Permanence is related to the guarantee of supplies, which creates a sense of security of satisfaction of one of the primary needs of the management process. Efficiency of energy supplies involves the use of modern appliances which reduce energy consumption.

The author is convinced that sustainable energy and the RES belonging to it, operating within green economy, is an introduction to a new paradigm of development and a new business model. The return to the brown economy is no longer possible due to the escalating human environmental impact that causes environmental and health threats deteriorating the life quality and causing the loss of biodiversity.

Abstract

The article presents studies on selected aspects pertaining to the private rental market of housing stock, operating on the principles of sharing economy. Detailed studies were carried out on rental offers that are filed in Asian countries, with respect to which the type of rental was identified, rental prices and their structure, amenities offered in the premises, ratings given by clients and popularity. Purpose: The aim of this article is to measure and analyze prices of short-term B&B rental in Asia, as well as to parameterize housing attributes, to assess the image and popularity of the resources on offer. Research Methodology: The research of the market of B&B rental was carried out for 14 capital cities of countries lying in Asia. All in all, there were 1,400 offers studied. Results: It can be concluded that the studied capitals of Asian countries are characterized by considerable differences as regards the prices of B&B rental offers. A comparison of the housing resources can also be made from the point of view of their amenities and furnishing, as well as their image and popularity of the rental market functioning on the basis of co-sharing economy. Novelty: The research may serve as a good example for conducting further theoretical studies in the sphere of housing rental market which functions on the basis of co-sharing economy. The results which were obtained can also be of practical use, since they determine prices and features of the resources on offer. Finally, parameterization of the studied attributes can indicate the place of this type of housing rental in the market, especially that of hotel services.

Keywords: sharing economy, real estate, rental housing, peer-economy, price level, Asian B&B.

Introduction

Booking accommodation is very easy; it is enough to visit a website, search for and choose one among thousands of offers, contact the owner of the property and determine the detailed terms of rental with the owner. Thanks to the use of peer-to-peer technology described above, the activity is not limited by geo-location aspects, foreign exchange rates and, due to the fact that the presented offers are presented in several language versions, linguistic barriers. New technologies and new business ideas contributed to the emergence, in 2008, of a new community on the rental market of residential premises. The largest community of this type brings together over 60 million guests and has, in its' databases, rental offers from over 34,000 cities which are located in 191 countries. This community, which makes use of the sharing economy, is a significant competitor and a challenge for the hotel industry and theories and models applied in it. The new rental service, in this article known as one-day rental or B&B rental, is a dynamically growing market, which makes and will continue to make changes in the classic models of business activity (in particular in the hotel industry).

This study presents the parametrisation of the Asian B&B rental market. The parametrisation was made by determining the preferred type of rented premises (entire house, private room), determination of prices which have to be paid for rented premises, defining the components of the final price (rental, cleaning fee, service fee), defining the equipment and amenities offered in the rented premises. For the purpose of carrying out a comprehensive analysis of B&B rental market, the quality of offered premises was additionally examined and their popularity was measured in the countries covered by this analysis. The evaluation of quality was carried out by verification of ratings given by clients who rented the premises, whereas the examination of popularity consisted in checking the occupancy calendar of individual premises offered for rental.

Analysis of literature on B&B rental platforms and sharing economy

The analysis of the literature of the subject was carried out, concentrating on the thematic range of the conducted study, that is the latest research in the sphere of sharing economy. Also the problem of one-day accommodation rental, which is directly connected with the former, was examined accordingly. The analysis of the literature focused on aspects concerning the impact of sharing economy on the economic system and on creating business models which are relevant to it. Works were presented which have the form of guidebooks or contain recommendations in the sphere of sharing economy, showing lines of development of this type of economy. Also, the possibility of applying sharing economy in the socioeconomic, legal and sociological dimensions was indicated. Additionally, the analysis of the literature focused on the dilemmas of measuring the level of trust and reputation existing on the B&B rental market. Studies which determine price-setting factors as well as price convergence in selected localities were presented, too. In his research, Martin (2016) stresses that peer-to-peer technology makes it possible to provide services which base on the assumptions of sharing economy, at the same time pointing to possible directions of the development of economic reality that take into account the principles of sharing economy, therefore changes in economic models from sustainable development through economy based on the principles of neo-liberalism. The described studies cast light on the possibility of a threat being posed to contemporary economic systems, which consists in the decreasing role of the state as the regulator of economy. Dyal-Chand (2015) defines the philosophy of sharing economy as an alternative to capitalism. In another study, Daunorienė et al. (2015) make an attempt at elaborating on a business model which goes in line with the principles of working of sharing economy. Simultaneously, they indicate the durability of this model and its impact on sustainable development. Still another work dealing with sharing economy is that by Guttentag, Smith (2017), who point to a real threat

to the traditional business model, since in the hotel industry it is not adjusted to the philosophy of working that is based on sharing economy. There are also publications which are a peculiar type of guidebooks or which offer recommendations to managers – they advise on how to apply sharing economy in business (cf. Habibi at al. 2017) and show possible lines for the development of future research in the sphere of economy of this type (Cheng 2016). Lastly, in recent years, sharing economy has been widely-described in the literature with reference to the socioeconomic (cf. Wu, Zhi 2016; Kung, Zhong 2017; Frenken, Schor 2017), legal (cf. Frenken, Schor 2017; Koopman at al 2015; Ranchordas 2014) and sociological dimensions (cf. Gregory, Halff 2017; Böcker, Meelen 2016).

Considering sharing economy in the framework of Airbnb platform, we can indicate studies which describe and measure the level of reputation and trust in services of the peer-to-peer type, as regards the aspect of the renting which is taking place (Ert at al. 2016). In other research, we find also an answer to the question of the impact of sharing economy on the employment market, with particular taking account of the tourist industry (Fang at al. 2016). The studies by Wang, Nicolau (2017) attempt to determine the factors which influence the level of prices of one-day accommodation facilities. On the other hand, in their work, Liang at al. (2017) investigate the validity of the rating system by clients who take advantage of the rental and their influence on the functioning of the one-day renting market. An analysis of convergence of ratings for three localities was executed. It consisted in analyzing offers on Airbnb service (cf. Brochado at al. 2017). In other studies, which are worth mentioning, the authors Varma at al. (2016) discuss the question whether the use of sharing economy via Airbnb is a new wave of innovativeness or only a temporary fad. It also needs observing that – like in the case of every object of an economic analysis – there appears criticism of the functioning of economic systems based on the principles of working of sharing economy (cf. Cockayne 2016; Kathan at al. 2016) here as well.

Research Assumptions and Research Methodology

The analysis of Asian rental market was carried out in the capitals of Asian countries, i.e.: Abu Dhabi, Ankara, Bangkok, Beijing, Doha, Hanoi, Jerusalem, Kuwait City, Manila, New Delhi, Seoul, Singapore, Tokyo and Vientiane. Data on the basis of which the study was performed constitutes offer data pertaining to the rental of B&B type premises, which may be found on the largest website of this type, i.e. www.airbnb.com. The offers were searched for the period between 22.03.2019 and 24.03.2019; in the search criteria, it was specified that the search referred to 2 persons. In total, 1.400 data related to rental offers were collected. Based on the collected data, a study was performed, which allowed for detailing the knowledge on the B&B rental with respect to:

- preferred type of rental depending on the examined country;
- total price of rental and its' structure divided into type of rental (price of rental for one night, service fee, cleaning fee);
- provision of rented premises with typical hotel attributes and additional ones;
- ratings given by guests and pertaining to rented premises and their owners;
- occupancy (popularity) of rented B&B premises in the examined countries.

Summing up, the performed study allows for measuring and evaluating the prices, residential attributes, image and popularity of private residential premises intended for short-term rental. Bearing in mind the dynamic growth of business interest in the management relying on the principles of sharing economy and, in particular, the increasing interest in B&B-type rental, the received results will offer significant support in undertaking the actual decision-making processes, both in the area of individual and business activity. Paragraph: use this for the first paragraph in a section, or to continue after an extract.

Analysis of Study Results in the Area of Asian B&B Rental

Within Asia, it is possible to differentiate a group of countries where rental of entire residential premises is predominant, as well as a group where the popular mode is rental of private rooms. In line with the performed studies, the first group includes such cities as: Manila, Hanoi, Bangkok, Seoul and Jerusalem. On the other hand, the second group covers the following capitals: Vientiane, Singapore, New Delhi, Kuwait City, Tokyo, Beijing and Abu Dhabi. The capital of Turkey, Ankara, is the place where rental offers of entire premises and rental offers of private rooms are on a similar level (this is evidenced by the structure indicator oscillating around 49% - 50%) - cf. fig. 1. It should also be noted that as many as 93% of rented premises in the capital of Philippines belong to the category of entire house. More than 70% of rented premises in Hanoi, and Bangkok constitute the category of entire house. In the examined region, cities such as Vientiane, Singapore and New Delhi have, within their structures, over 60% share of private room rental.

Fig. 1: Structure of types of rented premises (entire house vs. private room). Source: own study

A question arises: what causes such differences? It may definitely be examined on multiple dimensions (social, technical). In the economic aspect, this may be the criterion of price, and in the technical one, the availability of accommodation, whereas in the social dimension - cultural determinants. Due to the fact that this study relies on offer data pertaining to the market of short-term rental, an analysis of formation of prices of residential premises was performed in the next step; it is divided into the type of rented premises, along with a description of the component structure of the final price (prices expressed in USD) - cf. Table No. 1.

Based on the data contained in Table No. 1 (in left sub-columns named Entire house), it may be noted the cities of Abu Dhabi, Kuwait City, Singapore, Jerusalem and Tokyo are above the average of the total price calculated for all the analysed places. Among the examined cities, Abu Dhabi is definitely the most expensive. In this city, rental of an entire house by two persons for two nights costs USD 439. Exactly 100 dollars less is to be paid in Kuwait City. On the other hand, the cities of Seoul, Beijing, Ankara, Vientiane, New Delhi and Hanoi are below the average. Among the examined cities, lowest prices are in the capital of the Philippines (on average, USD 72) and in the capital of Vietnam (on average, USD 76). Total rental prices of the entire house for all examined countries are presented in Table No. 1 (in left sub-columns named Entire house). This table also shows the components making up the total price of rental. It should also be noted that there is a great diversity in the cleaning fee category. The highest cleaning

fees are charged in the capital of Japan (USD 32), whereas smallest, i.e. only USD 1 on average, in the capital of Laos.

Table 1: Total price, price structure: rental of entire house / private room rental

City	Total price for 2 persons for 2 nights		Price for 1 night		Payment for service		Payment for cleaning	
	Entire house	Privat room	Entire house	Entire house	Entire house	Privat room	Entire house	Privat room
Abu Dhabi	439	192	183	80	60	27	13	4
Kuwait	339	186	137	72	49	27	16	15
Singapore	273	146	108	60	39	21	17	6
Jerusalem	223	141	84	56	32	20	23	8
Tokyo	170	110	57	42	25	16	32	11
Seoul	124	86	48	36	18	13	10	2
Beijing	121	79	49	32	18	12	5	3
Ankara	121	77	50	32	17	11	4	1
Vientiane	97	72	41	30	14	11	1	2
New Delhi	95	69	39	25	14	10	3	9
Bangkok	83	65	31	27	12	10	10	1
Hanoi	76	60	30	24	11	9	4	3
Manila	72	53	28	21	11	8	6	2
Total average	142	102	56	42	20	15	10	4

Source: own study

Table No. 1 also presents (in right sub-columns named Privat room) the average offer prices that are to be paid for private room rental. The most expensive offers are in Abu Dhabi, Kuwait City, Jerusalem, Singapore and in Tokyo (in these cities, the offers on average exceed the value of USD 100). Offers with lowest rental prices of private rooms are to be found in Hanoi, Bangkok and New Delhi (prices in these cities are on the level of USD 52, USD 62 and USD 65, respectively).

Table 2: Differences in prices pertaining to a private room and entire house and savings

City	% of the private room's price in relation to the entire house	Savings ($)
Abu Dhabi	44%	247
Singapore	52%	132
Kuwait	55%	153
Seoul	64%	45
Tokyo	65%	60
Jerusalem	66%	77
New Delhi	69%	30
Hanoi	70%	23

City	% of the private room's price in relation to the entire house	Savings ($)
Ankara	71%	35
Bangkok	73%	23
Beijing	74%	31
Vientiane	78%	21
Manila	96%	3

Source: own study

Table No. 2 presents differences in prices between the rental of an entire house and rental of a private room. Two persons renting a private room for two nights have to pay USD 247 less than in the case of renting the entire house. The rental price of a private room in Abu Dhabi constitutes 44% of the rental price of the entire house in this city. Apart from Abu Dhabi, the difference in the rental price exceeding USD 100 is also encountered in such cities as Kuwait City and Singapore. It should be noted that in the capital of Laos, there is practically no difference in the rental price of individual types of premises. The rental price of a private rooms makes up as much as 96% of rental of an entire house.

The next part of the article presents an analysis of equipment and amenities in the rented premises. Table No. 3 contains attributes of residential premises marked in the paper as hotel attributes. Such attributes include: parking space, 24-h gate keeper service, access to a swimming pool, possibility of ordering breakfast and presence of attributes directly related to the rented premises, i.e. air-conditioning, hair-dryer, bed linen, towels and personal care products. The most free parking spaces are available in Kuwait City (74% of premises have a free parking space). Every second rental offer in the cities of Abu Dhabi, Ankara, Bangkok, New Delhi and Vientiane offer free parking spaces. The worst parking situation is in Tokyo and in Manila, where respectively 4% and 6% of places have a free parking space. The second examined attribute is air-conditioning. The worst situation is in the capital of Turkey. In Ankara, only 22% of owners declare that they have air-conditioning. On the other hand, over 90% of premises are provided with air-conditioning in Abu Dhabi (98%), Bangkok (95%), Beijing (95%), Hanoi (95%), Manila (95%), Singapore (97%) and Tokyo (98%). The next examined attribute is provision with personal care products.

Table 3: "Hotel" attributes of rented premises.

City	Parking	Air- cond.	Towel, personal care products	Coat hangers	Hair-dryer	TV	Breakfast	24h gate services
Abu Dhabi	58%	98%	84%	80%	40%	68%	15%	10%
Ankara	54%	22%	89%	76%	76%	79%	27%	12%
Bangkok	52%	95%	97%	89%	84%	85%	11%	13%
Beijing	19%	95%	96%	90%	90%	56%	11%	13%
Hanoi	45%	95%	100%	89%	94%	69%	10%	8%
Jerusalem	32%	63%	99%	76%	46%	43%	14%	3%
Kuwait	74%	89%	81%	44%	30%	93%	11%	4%
Manila	6%	95%	95%	83%	41%	89%	3%	20%
New Delhi	58%	96%	96%	85%	56%	73%	45%	13%
Seoul	21%	89%	99%	94%	93%	51%	26%	7%
Singapore	30%	97%	87%	91%	86%	74%	22%	10%
Tokyo	4%	98%	94%	76%	97%	46%	9%	1%
Vientiane	59%	83%	87%	68%	34%	66%	40%	4%

Source: own study

Provision of personal care products, towels and bed-linen is a standard in the majority of offered premises. They are offered, depending on the examined city, in 81% up to 100% of the examined premises. Provision of coat hangers is a standard in 94% of rental offers in Seoul and 91% in Singapore. A definitely worse situation is in Kuwait City, where the owners declare that their premises are provided with coat hangers in 44%. The next four attributes are commonly treated as standard attributes of classic hotel accommodation. Only 30% of premises in Kuwait City and only 34% of premises in Vientiane are provided with hair-dryers. The best, in this respect, are Tokyo (97%), Seoul (93%), Hanoi (94%) and Beijing (90%). Only 43% of premises in Jerusalem and only 46% of premises in Tokyo are provided with TV. The last two attributes is the possibility of ordering breakfast and gate-keeper services. Only 3% of premises in Manila have the possibility of buying breakfast and only every tenth offer from Tokyo (9%). 45% and 40% premises in New Delhi and Vientiane offers accommodation with breakfast, respectively. Gate-keeper services are also not a very popular option in B&B type premises. Most offers with gate-keeper services are in Manila and the value amounts to 20%. One out of 100 offers in Tokyo includes gate-keeper services (1%).

Another group of examined residential attributes are the so-called additional attributes, typical for B&B premises. Such attributes include: adjustment of the facility for children's use (children-friendly), access to the gym and swimming pool, access to the equipped kitchen and possibility of using a washing machine and iron - cf. Table No. 4. Least attention to make the rented apartment adjusted to children's needs is paid in Kuwait City (only 22% of premises), whereas premises best adjusted to children's needs is located in Hanoi (75%). Presence of subsequent two attributes is closely correlated (Pearson's correlation coefficient amounts to 0.96). Amenities such as the swimming pool and gym are most often encountered in Manila (as many as 80%), then Bangkok (44%) and Abu Dhabi (42%). One out of 100 offers has access to the swimming pool in such cities as Tokyo, Jerusalem and Beijing. None of the offers in Seoul and New Delhi included access to a swimming pool.

Table 4: Additional attributes - typical for B&B premises

City	children-friendly	gym	swimming pool	equipped kitchen	washing machine	iron
Abu Dhabi	39%	47%	42%	78%	79%	64%
Ankara	56%	5%	3%	84%	77%	71%
Bangkok	53%	45%	44%	65%	69%	59%
Beijing	43%	5%	1%	77%	85%	44%
Hanoi	75%	1%	2%	86%	65%	66%
Jerusalem	50%	2%	1%	86%	67%	49%
Kuwait	22%	19%	26%	89%	74%	41%
Manila	56%	54%	80%	87%	26%	61%

A very important parameter making up the marketing image of the rented premises are ratings given by the users. Every client renting the premises may, after the end of stay, assess the rented property in five dimensions, i.e. accuracy, communication, cleanliness, location and check-in. Table No. 5 presents average ratings obtained in individual cities for the above-listed aspects. The column entitled below average contains the number of aspects for which the calculated values were below the average (e.g. the value of 5 means that all five aspects were evaluated below the average). The clients evaluated the premises in Hanoi, Beijing, Seoul and Singapore the best (all examined components were evaluated above the average value). On the other hand, the situation is worst in the capital of Japan (all average ratings are below the average). Most maximum ratings were recorded in Beijing, which is to be considered the best evaluated by persons using B&B premises. The last examined parameter is the popularity of B&B type premises in the analysed cities. An assumption was adopted that B&B premises are popular in cities where the so-called booking schedule is greatly occupied. The popularity/ occupancy rate of rental of private B&B premises operating on the principle of sharing was assessed by checking the number of booking requests filed in the month following the month for which the rental offers were searched. Table 6 present the structure of occupancy in the examined cities. The least popular are Abu Dhabi, Kuwait City and Ankara. In these cities, in the examined period 72%, 89% and 84% of premises, respectively, had no day booked in the rental schedule. Most popular B&B premises are in Tokyo, Jerusalem and Seoul. In Tokyo, 6% of premises had 26 - 31 days booked.

Table 5: Evaluation of rented premises (rating scale from 1 to 5)

City	Accuracy	Communication	Cleanliness	Location	Check-in	Below average
Hanoi	4.90	4.96	4.75	4.85	5.00	0
Pekin	4.83	5.00	4.83	5.00	5.00	0
Seoul	4.85	4.92	4.74	4.79	4.94	0
Singapore	4.87	4.89	4.87	4.76	4.95	0
Jerusalem	4.76	4.96	4.70	4.89	4.98	1
Manila	4.78	4.97	4.69	4.77	4.88	2
Abu Dhabi	4.80	4.95	4.25	4.60	4.85	3

Conclusion

Making use of offers presented in on-line B&B databases pertaining to the rental of Asian private residential premises, the type of preferred rental was determined, depending on the examined country and the total rental price was calculated, as well as its' structure (rental price per one night, service fee, cleaning fee). What is more, provision of rented premises with attributes typical for hotels and additional ones was also defined (i.e. equipped kitchen, washing machine, etc.). A verification was also made on how the B&B rental type service is rated by the persons using it. A supplement for the study was assessment of popularity of rental relying on the principles of sharing economy in Asian countries. The most important conclusions from the study include:

- 93% of rented premises in the Philippines belong to the "entire house" category, whereas 75% premises in Laos are rented as private rooms.
- Most expensive rental prices of entire house and private rooms are in the United Arab Emirates.
- The greatest difference between the rental price of entire house and private room is in the United Arab Emirates, Kuwait and in Singapore.
- In Ankara, only 22% of owners declare that they have air-conditioning. On the other hand, over 90% of premises are provided with air-conditioning in Abu Dhabi (98%), Bangkok (95%), Beijing (95%), Hanoi (95%), Manila (95%), Singapore (97%) and Tokyo (98%).
- Only 30% of premises in Kuwait City and only 34% of premises in Vientiane are equipped with hair-dryers. The best, in this respect, is Tokyo (97%), Seoul (93%), Hanoi (94%) and Beijing (90%).
- Only 3% of premises in Manila allow for purchasing breakfast.
- One out of 100 offers in Tokyo includes gate-keeper services.
- One out of 100 offers has access to the swimming pool in such cities as Tokyo, Jerusalem and Beijing. None of the offers in Seoul and New Delhi included access to a swimming pool.

- The clients evaluated the premises in Hanoi, Beijing, Seoul and Singapore the best (all examined components were evaluated above the average value). On the other hand, the worst ratings are for the capital of Japan.
- The least popular are Abu Dhabi, Kuwait City and Ankara. Most popular B&B premises are in Tokyo, Jerusalem and Seoul. New paragraph: use this style when you need to begin a new paragraph.

The concept of Collaborative Innovation with Customers and its significance for creating innovations in the food sector

Katarzyna LICZMAŃSKA-KOPCEWICZ

Nicolaus Copernicus University in Toruń, Faculty of Economic Sciences and Management, kliczmanska@umk.pl ORCID: 0000-0001-6548-055X

Abstract

Contemporary corporate environment is characterized by a high level of complexity and customers' growing requirements force the implementation of innovations, which are necessary to gain and maintain competitive advantage. The results of conducted research indicate that interaction with customers has a positive effect on the success of implemented innovations, and is gaining increased interest in subject literature. Creating successful innovations requires a combination of knowledge from different perspectives, including especially the customers' knowledge, since they are the most appropriate for the purpose of revealing their needs and expectations. The body of research presented in this article was motivated by the question whether and how can the success of interaction with customers be increased in the context of developing innovations. The research objective was to diagnose the use of concept of collaborative innovation with customers in food sector companies and its significance for innovation outcomes. The questionnaire technique was used in CAWI and CATI methods to collect data. As a result, 80 observations were taken into account. The research has demonstrated that there is a positive relationship between orientation toward cooperation by food sector companies, their involvement in creating innovation in cooperation with customers and the degree of realizing the objectives concerning product innovations.

Keywords: Innovation, Product Innovation, Collaborative Innovation With Customers,

Introduction

In recent years, scientists and practitioners have regained their interest in development of innovations, which are considered the key source of competitive advantage in the increasingly competitive environment (Dess, Picken, 2000; Crossan, Apadyin, 2010; Zastempowski 2019). It is thus obvious that managing staff is very interested in detecting the ways which would allow for development of successful innovations (Dyduch, Bratnicki, 2018). The localization of innovative processes is to a large extent moving from a company's external environment into inter-organizational domain. The decreasing benefits of scaling in research and development encourage companies to cooperate (Chesbrough 2010), and the expanding relations between them goes as far as to change the nature of competition and cooperation, (Lichtenthaler 2011, Czakon 2012, Czakon et al. 2018). Constant competitive advantage can be achieved by integrating the relations between manufacturers and their environment (Buganza, Verganti, 2009; Zakrzewska-Bielawska, 2016; Chang, 2017). Significant benefits for companies oriented towards innovations stimulate their readiness to anticipate the customers' needs and react before their competitors identify such opportunities (Siguaw et al., 2006; Liczmańska, 2016). A literature review indicates that a decreased number of failures and increased return of the funds invested in their development are determined mostly by those innovations' ability to satisfy customers' needs and expectations (Moore 1982; Martin, Bush 2003). An increasing number of companies are actively identifying and anticipating customers' needs, using the knowledge on expectations and solutions, and then responding to them appropriately, creating greater value for the buyers (Liczmańska, 2016; Liczmańska-Kopcewicz, Wiśniewska, 2019). More and more frequently, the concept which may improve the efficiency of innovation by including customers into the process of its creation is employed. Entrepreneurs involve customers at various stages of creating product innovations (Gruner, Homburg, 2000; Fang, 2008). An analysis of the influence of customer interaction

on the efficiency while developing a new product may provide important data on management. Whether a given product gains acceptance on the market is determined by the consumer, who plays a fundamental role in each of the stages of designing a product, both in terms of initiation of the creative process, testing, and implementation, and then sale. Customers can provide relevant information, which reflects their desires and wishes, as well as information about solutions which are manifested by concrete suggestions concerning improvements and ideas for using. Processes of product development based on cooperation with users can be more efficient than those which did not involve users' participation (von Hippel, 2005). Cooperation with customers can thus be viewed as a bridging strategy, which ensures access to the most important information about customers' needs (Gruner, Homburg, 2000).

Much of the previous research was concentrated on the results related to innovative actions, such as the number and type of innovation, and there are also analyses of positive and negative consequences of being oriented towards innovation (Olson et. al., 2005; Siguaw et al., 2006), and towards customers (Helfat, Peteraf, 2003; Prahalad, Ramaswamy, 2004, Liczmańska et al. 2018), or conditions related to knowledge management (Glińska-Neweś, 2007; Stańczyk-Hugiet, 2007; Sopińska, 2008). In the existing literature there is, however, a noticeable gap concerning the involvement of food sector companies in realizing the concept of collaborative innovation with customers and its significance for the realization of innovation strategy. The gap requires further studies on the ability to realize the innovative goals of those companies who create innovations in cooperation with their customers.
The aim of the study is to diagnose the relationship between the realization of concept of Collaborative Innovation with Customers and its significance for the innovation outcomes of food sector companies. In particular, the factors diagnosed were the companies' openness to cooperation, realizing the concept of including customers into the process of developing innovations and the importance of this concept for the realization of goals concerning product innovations.

Innovations and Innovativeness - Theoretical Background

In today's intensely competitive environment, where all innovative activity is a crucial source of long-term success (Rosenbusch et. al, 2011), it is hardly surprising that innovations have become a key objective for all companies (Lipit, 2006). Competitiveness in the field of innovations boils down to introducing an innovative strategy of operation, openness to cooperation, openness to new ideas from customers, shaping pro-innovation attitudes of management and staff (Bełz, Cyfert, 2017; Pypłacz, 2017; Klimas, Czakon, 2018; Liczmańska-Kopcewicz et al., 2018, Zastempowski, 2019).

Innovation defined as "successful implementation of novel and useful ideas to create new products, processes, services, business models and structures" (Amabile, 1988) is currently believed to be the key source of competitive advantage (Klincewicz, 2011). Schumpeter (1960) defined innovation as a discontinuous enterprise involving new combinations of efficiency factors. Innovations may take various forms, from new products to management-supporting processes. According to the methodology from Oslo (OECD, 2008), innovation is the introduction of a new or significantly improved product (product innovation), new or significantly improved process (process innovation), new marketing method (marketing innovation) or a new method of organization in terms of business practices, workplace organization or relations with the external environment (organizational innovations). More and more frequently, researchers emphasize a direct relation between innovation and a company's competitiveness (Guan, Ma, 2003; Hernández-Espallardo et al, 2005; Perdomo-Ortiz et al., 2009; McAdam et al., 2010; Yam et al., 2011). Companies eagerly engage in innovative activities in order to build their market position (Talke et al., 2011; Yang et al., 2012) and note high accomplishments. The reasons for developing and introducing innovations are focused mainly on: improving quality, entering new markets, expanding the offer, lowering costs, optimizing the use of materials, decreasing energy usage, adaptation to the existing norms or meeting legal regulations. The ability to create and implement innovative solutions is currently the primary measure of a company's efficient functioning on the market. Innovative ability is defined as continuous improvement of a company's abilities and resources in order to explore and use the possibility to develop new products necessary to meet the market's expectations (Forsman, 2011; Boly, Morel 2014).

The idea of innovation is closely related to the term of innovativeness, which reflects a company's tendency and ability to introduce and support new ideas, experiments, practices and processes, which might generate innovative products, services or techniques (Qian and Li, 2006; Du et al., 2016). Innovativeness can be understood as the ability to create, implement and absorb innovations, which is connected with active participation in the innovation processes (Zakrzewska-Bielawska, 2018).

The aforementioned definitions of innovativeness focus on various aspects of innovative activity, whose result are product, process, organizational or marketing innovations. In the case of product innovation, the attention is focused on the examples of company's innovativeness, whose final result are product innovations, meaning completely new or improved products or services. Product innovations allow companies to maintain growth, distribute market risk, increase the company's value and increase competitiveness (Sojkin, 2012). Product innovations are of key importance, as the contemporary field of competition concerns new products, and their successful introduction into the market is a condition for development of a company which functions on a competitive and demanding market. Changing market trends and consumers' expectations result in the functioning products soon losing their attractiveness and products' lifecycles being shorter, which forces companies to immanently create innovations.

Innovations have ceased to be exclusively an outcome of systematic, often very costly, research. At present, they have become combinations of resources of many units, entities or teams which represent various fields of knowledge. Each innovative change may be initiated by a company's internal sources (endogenous) or external ones (exogenous). Due to the reason for the creation of innovations, they can be divided into demand-driven (initiated by the market), and supply-driven (initiated by science and technology).

At present the localization of innovation processes is to a large extent moved from the inside of a company to the inter-organizational space (Zakrzewska-Bielawska, 2016). Open innovation means that a given entity creates formal and informal networks and involves external stakeholders at various stages of the innovative process (Chesbrough, Schwartz, 2007; Song, Thieme, 2009; Sopińska, 2013). It is highlighted in literature that the primary source of inspiration for innovative activity in companies should be the market. The basis for innovation is knowledge, which is why in order to obtain it companies build relations with entities which could be their customers, suppliers, general partners, communities, local authorities etc. (Zakrzewska-Bielawska, 2016; Klimas, 2019).

The subject of further analysis will be innovations developed in collaboration with consumers. Companies which are involved in innovative activities are increasingly concentrating on cooperation with customers undertaken for the purpose of participating in the creation of value (Thomke, von Hippel, 2002; Prahalad, Ramaswamy, 2004). Some scholars analyze in what way customers can contribute to spreading innovations (Biemans, 1991; Lynch et al., 2016; Liczmańska et al., 2018), but do not put special emphasis on customers' complete integration in the whole process of innovation. Customers are one of the key sources of knowledge, and their ability to be integrated at all stages of the innovation process is considered a major component of innovation capacity (Danneels, 2002).

The concept of Collaborative Innovation with Customers

Development of companies' innovative potential is based on many pillars, among which the key position is held by cooperation with the environment, which by means of exchange of information contributes to an increase in the company's value and shaping its competitive advantage in the market. According to the demand-based approach, the factor of special significance for the emergence of innovation are the users who participate in its process of development. From a consumer's perspective, the aim of shopping decisions is the urge to satisfy one's own needs and ensuring oneself the desired benefit and maximum satisfaction (Karasiewicz et al. 2008; Wiśniewska, 2014). Thus consumers and their knowledge significantly contribute to creating innovations characterized by a high degree of adaptation to the market. Research conducted in recent years confirm the strategic importance that customers may have in the increasing innovativeness and adding benefits for buyers (Bagozzi, Dholakia, 2002; Liczmańska-Kopcewicz et al., 2018).

Companies, striving for satisfaction, and thus loyalty of buyers, as well as sustainable development, aim to provide new solutions in order to meet the explicit and implicit, as well as future, needs of their customers (Prahalad i Ramaswamy 2000; Skaggs and Youndt 2004; Blocker et al.., 2011; Sudolska, Lis, 2017; Liczmańska-Kopewicz et al., 2019). Researchers and business practitioners involved in company development strategy more and more frequently concentrate on cooperation with customers, aimed at collective creation of value (Thomke, von Hippel, 2002; Chesbrough 2003; Prahalad, Ramaswamy, 2004; Prandelli et al. 2006; Chesbrough, Appleyard 2007). Contemporary trends related to consumers' behaviors and needs set the directions for development of product innovations, as well as new technologies to produce them. Thus, an increase in consumers' ecological awareness forces food sector companies to start producing ecological goods. On the other hand, and increase in consumers' awareness in terms of healthy lifestyle suggests looking for products with lower dose of sugar, fat or fillers. For many years, one can observe demand for ecological food, which is attractive to the senses and has high nutrition value, is safe for one's health and requires small amount of time and work to prepare (Sojkin, 2012). Collecting information on consumers' behaviors and including them into the process of collective creation of innovations is the basis for creating innovative solutions which will be adopted by the market.

The concept of Colaborative Innovation with Customers (CIC) is one of the main streams of open innovation (OI) (Gianiodis et al. 2010), which has been defined as "systematic exploration of knowledge, keeping and using it within and organization and beyond it in the process of innovation (Lichtenthaler 2011). The concept of CIC generally includes incoming, outgoing and combined processes, as well as the flow of knowledge (Gianiodis et al. 2010; Lichtenthaler 2011). Chang and Taylor (2015) conclude that involving customers into the idea and process of creating product innovations improve the financial outcomes of new products both directly and indirectly by accelerating their market entry. At the stage of creating an idea, companies involve customers to obtain relevant knowledge, evaluate the potential of new ideas on innovation and define which ones can be selected for further analysis. At the stage of product development customers can provide knowledge such as technological know-how or design skills. At the implementation stage, customers are often invited to test prototypes in the conditions of actual usage (Chang, Taylor, 2015). As part of prototype testing, market testing and introduction to the market, customers give their opinions on the product's usability, its efficiency, potential problems with the prototype or the manner of positioning (Grunner, Homburg, 2000). In literature, the term "collective creation with a customer" is often treated as a synonym for "customer's involvement".

Implications of collaborative innovation with customers are significant, as there has been a noticeable shift in the paradigm and companies are learning from customers and go towards more open forms of innovation (Prahalad and Ramaswamy 2000; Chesbrough 2003; Skaggs and Youndt 2004; Prandelli et al. 2006; Chesbrough and Appleyard 2007). Individual customers often possess specialist knowledge which can improve product designs, emphasizing the preferred features or design flaws (Nonaka and Konno 1998). They can also be a source of hidden knowledge, especially in relation to using and designing a product (Prahalad and Ramaswamy 2000; Selden and MacMillan 2006), hence they can effectively supplement the knowledge of internal experts (Magnusson 2009). Manufacturers' or suppliers' ability to learn from their customers and engage in CIC depends on the quality of relationships with customers (Payne et al., 2008). Learning from customers and suppliers was presented as mutual interactions which are connected to relationships that are potentially influential on future CIC. With even greater mutual co-dependence, companies may view their customers as the key participants of their general research and development strategy. A customer a s a source of information provides a company with numerous benefits, implementing innovations, with ideas showing a greater degree of novelty and compatibility. Strict cooperation with customers at all stages of the innovation process is a key factor in ensuring efficiency of the process measured in users' acceptance (Liczmańska-Kopcewicz, Wiśniewska, 2019).
Such integration allows a company to make sure that it responds appropriately to the market's expectations, and thus allows to avoid potential losses caused by imperfections of the offer (Danneels, 2002). The innovation process carried out in cooperation with a customer allows to better meet the consumers' preferences, with many companies adopting the design processes and customer-oriented

guidelines to reach the highest possible level of realization of goals concerning product innovations (Franke, Piller, 2004; Kristensson et al., 2004; Franke et al., 2006; Elofson, Robinson, 2007).

Bearing in mind the above aspects, the following hypotheses were put forward:

H 1. There is a positive dependence between orientation towards cooperation and involvement of food sector companies in collaborative innovation with customers
H 2. There is a positive dependence between orientation towards cooperation and the degree of realization of goals related to product innovations
H 3. There is a positive dependence between the involvement of food sector companies in collaborative innovation with customers and the degree of realization of goals concerning product innovations

Research Methodology

For the purposes of the research objective, a literature review was carried out and used mind mapping. Cognitive methods were supported by our own research. The aim of this study was to diagnose the involvement of food sector companies in the concept of collaborative innovation with customers and its significance for innovation-related outcomes.

Representatives of the management of companies operating in the food sector were invited to take part in a survey conducted in the period from January 2016. Until February 2017, sample selection was intentional. One of the techniques of non-random study is nonprobability sampling. It involves the selection of those entities which are the source of the most valuable information concerning a given phenomenon. In this case, it meant companies which demonstrated innovativeness in the filtering question. The study included those companies that were assessed by their management boards as innovative. Another qualifying criterion for participation in the study was the introduction of new products in the last three years. Considering the research objectives and purposefulness of the sample, decided to use the interview method implemented via the Internet (CAWI) as a method of gathering information. If contact with the respondent was problematic, the computer-assisted telephone interview (CATI) method was used. In each case, the same interview questionnaire was used. The study was conducted using the questionnaire method. Although this article presents partial results of empirical research, it allowed to evaluate the use of the concept of Collaborative Innovation with Customers by food sector companies and the significance of the concept for the outcomes of product innovations. In total, 80 observations were taken into account. Table 1 shows the characteristics of the test sample.

Table 1: Characteristics of the enterprises surveyed (N = 80)

The questionnaire elements	Volume	Participation in %
Enterprise size:		
- small (10 - 49 employees)	39	40.75
- medium (50 - 249 employees)	28	35.00
- large (over 250 employees)	13	16.25

Source: elaborated by the authors based on the results of the study conducted.

The food industry as the area of business activity which fulfils the population's basic needs is one of the most common and diverse branches of industry in the world. It operates in every country and holds a high position in terms of employment, turnover, value added and investments. In Europe, it is one of the most important and most dynamic sectors of the economy. It consists of over 300 thousand companies which employ 4 million people, with their annual turnover exceeding 900 billion euro (Date & Trend 2017). Its importance for the Polish economy is evidenced by the sales revenue at the level of 150 billion PLN and over 3.5% share in the country's GDP. It employs 10.5% (1720 thousand) of all employees of the industrial sector (Rocznik Statystyczny, GUS, 2019). Poland is one of the leading producers of fruit (apples, raspberries, blackcurrants, blueberries), meat (poultry, pork) dairy products and champignon mushrooms. However, the sector remains susceptible to risks related to consumer habits, changing market trends or changing prices of goods. Companies operating in the food sector contribute to the improvement of the whole economy, stimulate local and regional development, and support the functioning of large companies.

Most of the wide range of products in the food sector in question have similar characteristics. These are branded, unstable products, sold in unit packaging, offered at low prices and purchased in large quantities (Landschützer, Ehrentraut, Jodin, 2015).

Statistical analyzes were carried out using the IBM SPSS Statistics version 24 software package. In total, 80 observations from enterprises operating in the food sector were considered as innovative. Table 2 presents descriptive statistics of the studied variables.

Table 2: Descriptive statistics of the variables examined (N = 80)

Variable	Range	Min.	Max.	Mean	Median	Mode	Standard deviation	Variance
Level of realization of goals related to product innovations	6	4	10	7.89	8	9	1.676	2.810
Level of involvement in collaborative innovation with customers	5	5	10	8.11	9	9	1.607	2.582
Orientation towards cooperation	6	4	10	7.78	8	9	1.583	2.586
Number of new products introduced	26	4	30	11.19	10	10	5.988	35.850
Number of improved products intoduced	35	5	40	11.44	10	10	6.842	46.806

Significance of the concept of Collaborative Innovation with Customers for the realization of goals related to implementing product innovations- conclusions drawn from the study

The studied variables were evaluated on a 11-grade scale, with the Cronbach's Alpha reliability indicator for the whole group being 0.723, and the Cronbach's Alpha based on standardized positions being 0.914. The result indicates internal cohesion of the analyzed factors.

Firstly, in order to verify the existence of the mentioned dependence and answer the question about the extent of influence of orientation of companies towards cooperation on their involvement in collaborative innovation with customers, and thus confirm the validity of the adopted research hypothesis H1, a statistical analysis was conducted of the dependencies occurring between the studied variables. Spearman's rank correlation was used, with the obtained values being presented in Table 3.

Table 3: Correlation between orientation towards cooperation and companies' involvement in collaborative innovation with customers

			Involvement in collaborative innovation with customers
Spearman's rho	Orientation towards cooperation	Correlation coefficient	0.926**
		Significance (two-sided)	0.000
		N	80

*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the authors.

The obtained values of Spearman's rank correlation coefficient indicate a positive and statistically significant relationship. The positive nature of the correlation means that an increase of individual factors connected to orientation towards cooperation is accompanied by increased involvement in collaborative innovation with customers. The correlation coefficient is 0.926**, which indicates a very strong dependence.

Next, in order to answer the original question and confirm the validity of the research hypotheses H2 and H3, a statistical analysis was conducted concerning the dependencies that occur between the variables: orientation towards cooperation, companies' involvement in collaborative innovation with customers and the realization of goals concerning product innovations. Spearman's rank correlation coefficient was used, with the values obtained being presented in Table 4.

Table 4: Correlations between orientation towards cooperation and companies' involvement in collaborative innovation with customers and the realization of goals concerning product innovations

Spearman's rho			The degree of realization of goals related to product innovations
	Orientation towards cooperation	Correlation coefficient	0.959**
		Significance (two-sided)	0.000
	Involvement in collaborative innovation with customers	Correlation coefficient	0.954**
		Significance (two-sided)	0.000

*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the authors.

As mentioned, the analyzed factors are correlated with the evaluation of the degree of realization of goals related to product innovations by a positive and statistically significant relationship. The positive nature of those correlations means that an increase in both orientation towards cooperation and involvement in the concept of Collaborative Innovation with Customers is accompanied by an increase in the degree of realization of goals related to product innovations. When analyzing the strength of correlation for r, it should be noticed that in the case of both factors there is a very strong relationship (0.959** and 0.954**).

The next step was to assess the relationship between the number of new products and the number of improved products introduced by the studied companied during the last 3 years, and the evaluation of the degree of realization of goals related to product innovations using the Spearman rank correlation coefficient (Table 5).

Table 5: Correlation between the number of new products and improved products introduced by the studied companies during the last 3 years and the evaluation of the degree of realization of goals related to product innovations

Spearman's rho			The degree of realization of goals related to product innovations
	The number of new products introduced	Correlation coefficient	0.736**
		Significance (two-sided)	0.000
	The number of improved products introduced	Correlation coefficient	0.464**
		Significance (two-sided)	0.000

*** Correlation significant at 0.01 (two-sided).*
Source: elaborated by the authors

The correlation coefficient between the number of new products introduced by the studied companies in the last 3 years and the evaluation of the degree of realization of goals related to product innovations is 0,736**, which indicates a fairly strong dependence. On the other hand, the correlation coefficient between the number of improved products introduced and the evaluation of the degree of realization of goals related to product innovations is 0,464**, which points to moderate dependence.

Conclusions

Contemporary food market is characterized by a relatively high level of innovativeness, which is a consequence of increasingly varying expectations of customers in relation to food products, as consumers now expect food to satisfy not only their hunger, but also their hedonistic needs (tasty products), to help them keep slim (*light* products), to provide them with or increase their vitality (energy drinks), to save their time during food preparations (ready-made products) or to help preserve the natural environment (ecological food). It should be noted that innovative companies from the food sector are very willing to engage in collaborative innovation with customers, since they experience more rigorous competitive pressure, as well as stronger organizational culture oriented towards implementation of new products.

The presented findings provide no grounds for rejection of hypotheses H1, H2 and H3. The implications of this study indicate that there is a positive relationship between orientation towards cooperation, involvement if collaborative innovation with customers, and the degree of realization of goals related to product innovations. It is thus justified to claim that involving customers into creating innovations at every stage of the innovation process brings tangible results, especially in terms of the degree of realization of goals related to product innovations. In the course of further studies, it is worth to think how to make customers more willing to get involved in such cooperation.

The impact of the concept of Collaborative Innovation with Customers on innovative activity of companies is a complex and multi-dimensional problem, which is why its analysis requires a multi-aspect approach and constant research in this field. It seems reasonable to agree with the conclusions from the conducted research which indicate that collaboration with customers is of key importance for the development of effective product innovations. A kind of limitation of the conducted research, however, may be nonprobability sampling, which included only companies that defined themselves as innovative.

Abstract

Economic security - a guarantee of the country's independence, the condition of stability and effective life of society, to achieve success. Therefore, economic security is one of the most important national priorities. At the present stage of development of Russia objectively present both external and internal threats to the economic security of the state. The greatest danger to Russia are its internal threats. Taking place for a long time and the economic security of the continuing internal threats to Russia make it vulnerable to external influence. Crime in the economy stands today as one of the manifestations of the internal threats to economic security in Russia. Economic crime stands today as the most powerful negative factor, undermining the economic and, consequently, the national security. Economic crime occurs in areas where there is the opportunity to compete with the legal economy. In this case, the crime in this area cause more economic harm to citizens, society and the state than any other criminal acts.

Keywords: National Safety, Economic Security, Internal Threat, Economic Crime.

Introduction

By the end of the twentieth century. National Security category has taken a special place among the system-wide categories that characterize the state of society. The reason for this are profound changes in the whole system of international relations. Today, globalization is leading to greater interdependence and interaction of national economy, it is one of the key processes of the international community. In a globalized world the borders of national economies are no longer important, the world economy is gradually acquiring a common basis. Globalization is accompanied by complex and contradictory processes, the growth of global development imbalances. The question of nationality, in particular economic, security in this world is particularly acute. National security - a state of defending the vital interests of the nation against external and internal threats. Each country has its own national interests, due to the totality of its needs. Economic security is also an integral part of, and the basis of national security. Without downplaying the importance of addressing security issues in all areas and fields of activity, it is necessary to emphasize the basic role of the economy, as the production, distribution of wealth and consumption are primary for each of them, determine the livelihoods and the viability of the company.

maintenance problems of economic security of Russia and attract more and more attention of politicians, scientists, most of the general population. Such attention is not accidental. The scale of the threats and even the actual damage caused by the economic security of the country, push the mentioned problems to the forefront of public zhizni.Ekonomicheskaya security of the state is recognized as the object of scientific attention, both in Russia and abroad. Study on the economic security issues has been widely discussed, developed a significant number of concepts and theories. The fundamental nature of economic security research works have such foreign scholars as K. Woodruff, S.Dzhonson, D.Kaufman, E.de Soto, T. Watkins, F. Schneider and others.

Domestic economic science the theoretical aspects of economic security issues most actively started to be developed since the mid-1990s. Questions of economic security of the state are in LI studies Abalkina, LV Afanasyeva, IJ Bogdanova, VA Bogomolov, SY Glazyev, Senchagova, VL, TY Tkachev Tambovtseva, LP Goncharenko and others. In the works of these scholars studied in detail the threat of economic security in a period of transformation and disclosed mechanisms to identify, prevent and neutralize these threats.

Investigation of economic crime as economic security threat given sufficient attention. Constantly in the field of view of professionals and problemsthe impact of economic crime on the economic security of the state. She, in particular, have been devoted to the work of scholars such as Dadalko VA, Protasov KA, Chekmarev VV (Dadalko VA et al. 2014). Certain issues related to combating economic crime in the system of economic security were considered VY Tsiklauri, LV Afanasyeva, N. S. Belousovoj, SA Markina, TY Tkacheva et al. (Tsiklauri VY and soavt.2018). Proceedings of these authors are of great scientific and practical importance, however, do not cover all aspects of the problem.

Results and Discussion

Under the economic security of the state is to be understood of the economic system, ensuring its independence, helping to maintain normal living conditions of the population, to ensure the sustainable development of the national economy and consistently implement national and state interests. Economic security - a guarantee of the country's independence, the condition of stability and effective life of society, to achieve success. Therefore, economic security is one of the most important national priorities. The economy is the most complex system has thousands of parameters describing its condition. Because of the diversity and scale of manifestations of threats, a set of indicators characterizing the economic security of the country, is very significant.

From the perspective of globalization processes should distinguish between internal and external threat to the country's economic security. Under the internal threats to the country's inability to understand self-preservation and self-development, due to the state of its economy. External threats are geopolitical and foreign economic factors, as well as global environmental processes that undermine national sovereignty.

Today, when the world was on the verge of great conflict, when Russia itself is on the complex and controversial stage of development, the state stands identity problem and the protection of national interests. The question is whether Russia will remain in the global economy as an independent sovereign state or become only the territory, have the resources and human capital. In the current climate of falling prices for energy resources, development of the Ukrainian conflict, the imposition of tough economic sanctions on the role of ensuring the economic security of Russia is only strengthened. Ensuring the economic security of the state - one of the priority and the priority of internal problems of the Russian Federation, as reflected in the National Security Strategy of the country.

Today, the greatest threat to Russia are its internal threats. Taking place for a long time and the economic security of the continuing internal threats to Russia make it vulnerable to external influence. Crime in the economy stands today as one of the manifestations of the internal threats to economic security in Russia. Economic crime stands today as the most powerful negative factor that

undermines the economic and, consequently, the national security. It should be noted that the scale of economic crimes, representing a major threat to democratic and economic development, are growing today in all countries of the world. No state currently can not be completely free of this socio-economic phenomenon. Modern scientific literature gives a wide variety of approaches to the definition of economic crime. In this context, we can talk about some vague ideas about economic crime, its essence, borders, the nature of threats to the national economy, which does not allow to fully appreciate the impact of this phenomenon on the economic security of Russia. However, given the impact of economic crime on all aspects of life of both the state and society and the individual, the study of this effect seems though difficult, but extremely important. that does not allow to fully appreciate the impact of this phenomenon on the economic security of Russia. However, given the impact of economic crime on all aspects of life of both the state and society and the individual, the study of this effect seems though difficult, but extremely important. that does not allow to fully appreciate the impact of this phenomenon on the economic security of Russia. However, given the impact of economic crime on all aspects of life of both the state and society and the individual, the study of this effect seems though difficult, but extremely important.

A key feature of economic crime are capitalizing on the anonymity of victims, there are two entities, substantial damage, multiple character, redistribution of wealth, long systematic harakter1. Economic crime occurs in areas where there is an opportunity to compete with the legal economy. It should be noted that economic crime reflects the state of the legal economy: the worse the state of the second, the bigger one.

Despite the adopted legislative and administrative measures, economic crime continues to signs of a large-scale threat to national security. According to the auditing company Pricewaterhouse Coopers (PwC) on the basis of "Global Economic Crime Survey for 2017". (The Global Economic Crime Survey), 37% of organizations in Russia were victims of economic crime (Table 15).

Source: World Economic Crime Survey. Center of Humanitarian Technologies.

Note that the increase in crime in almost all sectors of the economy

Everyone knows that the offenses in the economic sphere are distinguished by their species diversity, high latency, algorithm identification and documentation (in most cases the need for judicial and economic expertise: financial, economic, accounting, finance and credit, nalogovedcheskih). In this case, the crime in this area cause more economic harm to citizens, society and the state than any other

criminal acts. Also, this type of crime has a high tendency to modification and transformation depending on the prevailing economic, social and political situation in the country.

Dynamics of registered crimes of an economic nature is shown in Figure

According to official statistical reports in 2018, compared to the same period the amount of economic crimes increased by 4.2%. It is noted that in just 2018 revealed 109.4 thousand. Economic Crimes, whose share in the total number of recorded crimes is 5.5%.

Figure 1: Dynamics of registered crimes of an economic nature

Economic crime damages as a national security state and its well-being and prosperity (as reduced revenues to the state budget), and the interests of individual citizens.

Table 2 - Dynamics of registered economic crimes and caused them material injury in the Russian Federation in 2011-2018.

Source: crimestat.ru/offenses_table

More clearly the dynamics of economic crimes and damage them is shown in Figure 2.

Figure 2: The dynamics of economic crimes and damages on them in 2011-2018.

Starting with 2012, the number of economic crimes is significantly reduced, this is due to:

- with the implementation of public policies and the improvement of the normative-legal regulation in the economic security;
- the implementation of the Russian Interior Ministry of joint measures with the General Prosecutor's Office of the Russian Federation, Russian Federal Tax Service, the FSB of Russia, Central Bank of Russia, Rosprirodnadzor, Federal Financial Monitoring Service, Federal Customs Service of Russia on strengthening the fight against economic crime;
- dissemination of information on suspicious transactions containing elements of economic crime;
- complexity of the nature of economic crime and the emergence of new forms of illegal activities with the use of information, communi-
munication and high technology;
- the improvement of detection methods, detection and prevention of crimes.

However, it is increasing the size of the material damage. The amount of damage is one of the key issues arising in the case of economic crimes. In 2018, 41% of Russian companies reported that they were victims of economic crime, as a result of which they suffered direct financial loss. Note that resolution losses of less than 100 thousand. US dollars, and that below the global figure (45%).
At the same time 22% of respondents in Russia as a result of economic crimes suffered losses of more than 1 mln. US dollars, while around the world the same damage amounted to 19%.

Dynamics of registered economic crimes in the total population in the territory of the Russian Federation in 2011-2018 years. is provided in tables 3,4.
Analysis of the structure economic crimes total population presented in Table 3 shows that the highest numbers have grave and especially grave crimes. They make up 59.2% of total offense.A positive trend is worth noting their decrease in comparison with 2011 by 40.5%, as well as reducing corruption crimes by 52.6%. It is for these kinds of criminal acts characterized by a high level applied to the state economic losses and special social danger.

Analysis of the structure of economic crime provided in Table 4 demonstrates the dominance group economic crimes (31%). Their total number of prevalent offenses such as fraud. Fraud, from 2011 to 2014. There has been a positive trend to a decrease in the number of these crimes by 58.8%. But since 2015, the trend is very negative, the number of crimes increased by 24.1%.
A positive trend is worth noting the decrease in illegal acts qualified as serious and very serious, and corruption-related crimes associated with bribery and commercial bribery. It is for these kinds of criminal acts characterized by a high level applied to the state economic losses and special social danger.

Offenses in the sphere of economic activity account for 27% of the total number of reported crimes. Law enforcement agencies are often recorded and investigated the facts of manufacturing, storage, transportation or sale of counterfeit money or securities. Nevertheless, the number of crimes decreased by 34.9% compared to the year 2011. There is decrease in the criminalization of foreign

economic activity, which is expressed in the smuggling of resources by 94%. Just reduced the number of crimes related to bribery by 35.3%. This is due to a decrease in the number of crimes of petty corruption.

The largest number of economic crimes in 2018 accounted for the Central Federal District. Leadership belongs CFA during the period analyzed. Of course, of great importance belongs megacities Moscow in the statistics, in the same way as inNorthwestern Federal District- Saint-Petersburg. Nevertheless, the basic number of economic crimes is localized in the Central, Volga and Siberian federal districts.

The most numerous economic crimes in 2018 in the following regions: Moscow, Krasnodar, Moscow region, St. Petersburg. Chelyabinsk region and Sverdlovsk region.

Conclusions

In conclusion, I would like to note that, despite the results of our analysis of official statistics Ministry of Internal Affairs Russia, testifying to the annual improvement of the situation in the area under consideration, reducing the number of crimes and reducing the number of persons who have committed them, it is still necessary to consider that this type of crime has high latency (90%), and contains a principle discretionary, according to which on certain types of crime (articles 146, 159, 159.1, 159.2, 159.3, 159.5, 159.6, 160 CC RF) energized criminal proceedings I do not except to a person or organization that causes property damage.

The situation in the socio-economic sphere shows that so far, despite the measures taken, the level of economic security of our country is at a dangerous point. The high level of economic crime in the country gives rise to two sets of interrelated problems that affect the economic security of Russia. On

the one hand, Russian businesses need protection both from criminal attacks, and from unreasonable (from the legal and economic point of view) of the state. On the other hand, the state, society and individual citizens need to be protected from both inefficient and criminalized business. Delaying the decision considered the problem worsens very state of economic activity threatens the economic and national security of Russia.

Ensuring economic security of Russia, among other things, involves solving the economic problems of crime through the formation of a new policy of national security. Cupping and improvement in economic crime require a whole range of state-legal action, economic, administrative and other measures. To ensure the stable development of the economy and strengthening the rule of law to law enforcement authorities need to make full use of all available and provided by the law means and opportunities (including the results of Investigative activities) in order to timely prevention, detection and suppression of offenses committed in the economic sphere. The effectiveness of these measures will depend on the activity and competence of law enforcement. However, focusing attention only on the methods of force impact on economic crime is not enough promising. The first step is the formation of a system of values common to all social strata of society, contributing to the inclusion of self-organization mechanisms and spiritual revival of society, contributing to the reduction of the social base of crime, including economic. Among the most important components of the fight against economic crime and strengthening the economic security of the country can be called a reduction of the tax burden, improving the economic legislation, improving the protection of the effectiveness of all forms of ownership, strengthening the legal advocacy of economic and criminal law.

Ensuring the economic security of the state - offensive system task and at the same time an integrated approach. Of course, the economic block unit MBD Russia will not be able to cope with this task alone. Therefore, to date, the main work to be undertaken and already underway, - improving the efficiency of inter-agency cooperation.

For example, in part to counter criminals in the credit and financial sphere is - cooperation with the Bank of Russia, Federal Tax Service, Federal Financial Monitoring Service and the Agency for Deposit Insurance, whose main task is the rapid response to the committed wrongful acts in order to prevent possible crimes and minimize the negative effects.

ORCID ID: 0000-0002-3857-8946

Abstract

The paper attempts to investigate the role of motivating in human resource management on the example of a selected enterprise. The point of departure was to present the essence of motivating employees and to determine the factors motivating employees according to the national and international literature. This allowed to assess the current state of knowledge on motivating as one of the functions of efficient human resource management, taking into particular consideration selected factors of motivation. The verification of the hypothesis and the realisation of the stated goal was made on the basis of a critical analysis of the source literature and the case study. The following hypothesis was put forward in the paper: motivation, especially non-remuneration incentives, plays a crucial role in human resource management. The paper aims to present the issues of motivating as a function of human resource management as well as a rank of factors motivating employees for work in the investigated enterprise. The paper attempts to assess the current factors and indicates solutions that would be beneficial both for the employees and the organisation.

Keywords: HRM, Human Resource Management, Motivation, Organisation, Work.

Introduction

Motivating for work is one of the most important, yet one of the most difficult, functions of human resource management in the enterprise. It involves influencing employees' behaviour with such stimuli that they will convert into action in line with the goals of the enterprise.

The issue of motivating for work is becoming more and more crucial in the period of social and economic transformation that has occurred on the Polish labour market. It has been proved that an enterprise attains its robust and strong position and competitive edge thanks to people. Therefore, they should be treated as valuable capital, which can be multiplied by raising its value. A well motivated employee is satisfied with their job, identifies with the company, which in turn satisfies their needs: not only economic needs, but also the so-called higher needs, for instance the need for self-actualisation. Such an employee is efficient – their work brings considerable benefits to the enterprise. In other words, there is feedback, which is of benefit for both sides – the enterprise and the employee.

The paper attempts to investigate the role of motivating in human resource management on the example of a selected enterprise. The point of departure was to present the essence of motivating employees and to determine the factors motivating employees according to the national and international literature. This allowed to assess the current state of knowledge on motivating as one of

the functions of efficient human resource management, taking into particular consideration selected factors of motivation.

The verification of the hypothesis and the realisation of the stated goal was made on the basis of a critical analysis of the source literature and the case study. The following hypothesis was put forward in the paper: motivation, especially non-remuneration incentives, plays a crucial role in human resource management.

The paper aims to present the issues of motivating as a function of human resource management as well as a rank of factors motivating employees for work in the investigated enterprise. The paper attempts to assess the current factors and indicates solutions that would be beneficial both for the employees and the organisation.

Literature Review

Kopaliński (1999) defined motivation as stemming from Latin word motus and English word move, which means "change from one position to another, bring into motion, encourage, influence someone and drive them to take action". As a general notion, it is well expressed as "willingness, desire, intention, interest in something". Penc (1997) claims that all those feelings evoke in a human being the readiness to achieve specific aims. Therefore, motivating employees means making effort to achieve them or, as Sajkiewicz (2002) states otherwise, motivation is a force that evokes, directs and maintains human behaviour. On the other hand, Sikorski (2004) noticed that motivation occurs as an impulse to unfulfilled needs and Penc (1997) specifies that it covers a set of factors concerning the psychic, philosophical and mental human nature, which trigger and organise the human behaviour for achievement of a specific goal. In connection with this, Maciejewska (2000) emphasised that motivation can be regarded in terms of mathematics as a function of expectations that certain actions, behaviours and activity will bring about the expected result and achievement of a specific goal. As Kalimullah et al. (2010) suggested, a motivated employee has goals that are parallel to those of the organisation. As a result, motivation is a term of many meanings and has an effect on various forms of behaviours – beneficial or adverse for a given person or organisation (Boon et all, 2018). A lot of various definition makes pinpointing what motivation actually impossible. However, it might be stated that effects of motivation are better visible for instance in the form of internal change of a person or a change in the situation of a person (Belenzon & Schankerman, 2015).

As Borkowska (1985) notices, motivating involves deliberate and intentional interaction with the motifs and behaviours of subordinates at work by providing them with conditions and opportunities for actualisation and using such stimuli that will meet the employees' expectations so that the goals of the organisation can be met. Given that organisation employees are an added value and that they are the main and most valuable resource of the enterprise (Graham & Weiner, 1996) both in terms of their own abilities and in terms of competitive edge (Pfeffer, 1994). Motivating to work is to encourage employees to specific behaviours, according to the intention and interest of the organisation. However, what is needed are management skills and ability to make an organisation, a competitive edge generator, out of the human capital (Lado i Wilson, 1994; Pfeffer, 1994).

Motivation used in the organisation can push the employee, with various force, towards fulfilment of both the goals of the organisation and their own needs. It requires properly selected motivators and using them to shape behaviours of subordinates according to the assumed, not always stable, goals of the organisation (Delery & Roumpi, 2017). The concept of enterprise motivation system, which includes all major parts of the enterprise, includes for instance the systems developed by: Borkowska (1985), Stoner and Wankel (Kozioł, 2002), and Stabryła (1996). Building a motivation system (Stoyanov, 2017) is undoubtedly a complex task requiring reasonable preparation, introduction, supervision and updating (Winston, 2016). Nevertheless, one must not forget that employees are the most valuable capital of the organisation and that creation of such a system is indispensable for keeping them in the enterprise and motivating them to work effectively (Kanfer, Frese and Johnson, 2017). What is most important in that process is to identify employees' needs and allocate proper motivators (motivating factors) to them.

Motivators are management instruments aiming to ensure high level of motivation of the employed personnel. The most important motivators are presented in Table 1.

Table 1: Classification of incentives

Criterion	Division
impact scope	– internal (respect, prestige, development, independence, sense of accomplishment) – having a long-term and deep impact on the behaviour of employees – external (pay, promotion, position in the professional hierarchy, sense of security) – having an instantaneous impact on the behaviour of employees, the effects of which are not always long term
form	– remuneration (pay, awards, bonuses) – generally having the strongest impact on the behaviour of employees, motivating to effective performance of work – non-pay (oral praise, good working conditions, courses, trainings, having a company phone or car, holiday trips) – making the work itself being a sad necessity and instead becoming the source of contentment and an opportunity for personal development
impact direction	– positive (awards) – strengthening desirable behaviours – negative (punishments) – motivating to avoid undesirable behaviours
impact type	– individual – related to fulfilment of individual aspirations and needs – team-oriented – related to work in groups and teams, where employees, without the enterprise's assistance, form relations between each other that are based on mutual help and support, friendship and solidarity, responsibility, reliability, etc.
fulfilment of needs	– factors fulfilling the basic stimuli (vital needs) – factors fulfilling higher stimuli (social, aesthetic and moral needs)

Source: own study based on Czempliński, et al. (1994).

A lot of problems concerning motivation are strategic and long-term in nature. When an enterprise has a motivation strategy, it excludes any random activities and extends the time horizon, so it makes the decisions taken in that respect more rational.

Methodology

The paper used surveys as the main investigation technique of investigation (researching). They were pilot in nature and are an introduction to further, more in-depth investigations. A questionnaire of the survey was development and then pilot investigations were conducted in the selected enterprise. The enterprise was PKP Cargo S.A. Zakład Przewozów Towarowych (Cargo Carriage Enterprise) in Szczecin, which consented to participation in the investigation and participate in it highly committed. This is the largest logistic operator in Poland (second largest in the EU) in the field of railway cargo carriage. The investigated Enterprise is one of 21 units comprising PKP Cargo S.A. The investigations lasted from September to November 2019 and were conducted in the registered office of the company, among its administrative employees. 112 people participated and 100 questionnaires, duly and completely filled in, qualified for further investigation. As a result, 39% of administrative employees were investigated.

The investigation results were the basis for an analysis of the issues at hand, with application of a case study, and allowed to determine the rank of employee motivating factors in the investigated enterprise. Out of 15 motivating factors specified in the questionnaire, the respondents were asked to choose up to ten they deem most important and most effectively motivating for professional commitment and effective and high-quality work. Subsequently, the respondents assessed them from 1 to 5, 1 being the lowest and 5 the highest score. Only such motivating factors were selected for the investigation that were actually applied in the examined enterprise. As a result, each employee could assess the stimuli known to them. For the purposes of the investigation, the analysed motivating

factors were classified as pay and non-pay. In addition, a specification is provided of assessment of given motivating factors along with employees' expectations as to their magnitude.

The paper mostly used secondary data collected during the questionnaire-based investigation and primary data from the internal documents of the examined enterprise. Investigation results were drawn on the basis of results of own studies and inductive and deductive reasoning. The results are presented in tables.

Motivating Employees in The Enterprise – Case Study

Pay-Related Factors

In the Cargo Carriage Enterprise (Zakład Przewozów Towarowych w Szczecinie) in Szczecin, the terms of remuneration are specified by the so-called Enterprise Collective Bargaining Agreement for the Employees Hired at PKP CARGO S.A. The remuneration for the employees is determined so that it corresponds to the type of work performed, qualifications required for its performance as well as the quantity and quality of provided work.

The position classification of a given employee is determined according to the so-called Table of Positions, Qualification Requirements and Employee Position Classifications, which specifies position names, qualification requirements in terms of education, exams and seniority as well as employee position classifications. Appointment to a given position requires that an employee complete professional preparation, sit the required exams and have proper qualifications as specified in the position table. For the performed work, an employee is entitled to monthly base remuneration based on their position classification and the rate of monthly base remuneration corresponding to that classification.

Apart from the base remuneration, the employees hired at the investigated enterprise are eligible for the following allowances:

- functional allowance for employees in managerial positions,
- seniority allowance,
- overtime allowance,
- onerous or harmful working condition allowance (e.g. when operating electronic visual displays),
- compensatory allowance (when an employee is transferred to another job and their remuneration is reduced).

An employee is also entitled to statutory bonus – their employer allocates means to bonuses out of their remuneration resources. This is a regular pay component, which aims to motivate employees to perform tasks correctly, effectively and on time. Another type of bonus is discretionary bonus, which is an award for the best employees for extraordinary work results. An employee hired in the railway business is also eligible for long-service benefit.

The above variable remuneration components supplement the base remuneration. The respondents assessed the remuneration components presented in Table 2.

Table 2: Assessment of pay-related factors at the investigated enterprise

Item	Factor type	Indicated stimulus value*
1	base wage	3.3
2	statutory bonus	3.1
3	discretionary bonus	3.0
4	long-service award	3.2

5	overtime allowance	2.9
6	pension and disability pension severance pay	3.4
7	position allowance	3.0
Average score		3.1

** The respondents assessed the examined factors in the scale from 1 to 5, 1 being very low and 5 – very high.*
Source: own study based on conducted research.

The examined pay-related factors were assessed by the employees at a similar level. The monthly pay is constant, so it is not a good working motivator; even though the respondents assessed the base remuneration as good, i.e. 3.3, compared to other pay-related factors. The statutory bonus, despite high stability and clarity of criteria, is a stimulus the motivating value of which was assessed as moderate (i.e. 3.1), which resulted from the lack of link with work effectiveness assessment. It is commonly accepted that it is a negative stimulus, it is due for proper fulfilment of obligations and there is possibility of excluding the bonus or its part as a result of failure to observe the working discipline.

The value of the discretionary bonus, which should promote commitment and extraordinary achievements, was assessed at 3.0. This is not a regular remuneration component and employees do not know what its value is, they receive it rarely and it is treated as a prize. The long-service benefit was also of low motivating merit for the respondents, i.e. 3.2. This is a benefit given every 5 years and is a considerable amount. Such a low assessment results from the period for which that prize is given. The employee generally does not remember about that stimulus as it is quite a rarely occurring motivating factor. For overtime, employees most often receive time off, not so much remuneration: hence the low score (2.9).

The earning function of pay was assessed poorly because as many as 81% of respondents declared that the received remuneration suffices for the basic needs only and the remainder stated that it allows an average standard of living. Despite that, few respondents, i.e. ca. 5%, accepted additional work to improve the living standards of their families.

Non-Pay Factors

Apart from the pay-related factors, the Cargo Carriage Enterprise in Szczecin motivates its employees using various non-pay motivating factors. In this group, the respondents assessed satisfaction from the performed work the highest, i.e. at 4.1. Assessment of all investigated non-pay factors is presented in Table 3.

Table 3: Assessment of non-pay factors at the investigated enterprise

Item	Factor type	Indicated stimulus value*
1	Rewarding work	4.1
2	Independence at work	4.0
3	Recognition by the supervisor	4.0
4	Acceptance by co-workers	3.9
5	Full benefit package	3.8
6	Access to trainings	3.6
7	Stable and reliable employment	3.3
8	Access to promotions	3.0
Average score		3.7

** The respondents assessed the examined factors in the scale from 1 to 5, 1 being very low and 5 – very high.*
Source: own study based on conducted research.

Most respondents (46%) admitted that they started to work out of passion and traditional families were the cause for employment of 38% of respondents. Few owe working in the railways to luck (16%). Such high assessment of satisfaction from the performed work that is not so well paid (according to employees) resulted from independence at work, which was assessed at 4.0. According to 65% of respondents, decisions to perform work are imposed by managers only in very important matters. In turn, an employee having a problem could consult their superior or discuss it with co-workers at any time.

The respondents underlined that they can personally, at any time, suggest their superior new solutions concerning the work provided by them. It turned out that managers often implement good ideas of their subordinates. In the investigated enterprise, current performance evaluation is performed. The evaluation is fair according to 46% of respondents, sometimes fair according to 38% of respondents and unfair according to the remaining 16%. The respondents cherish recognition by their superior, both oral and written, as much as independence at work. In 2019 21% of employees declared receiving a praise in writing along with a monetary bonus and 33 of employees received oral praise.

The respondents quite highly (3.8) assessed the benefit package offered by the employer, which was an additional set of motivating factors for them, created on the basis of the Employee Benefit Fund Act (Table 4).

Table 4: Assessment of level of motivation of benefit package

Item	Benefit type	Incentive value	Employees' access to
1	Christmas vouchers	3.8	All
2	Non-refundable allowances	3.6	Employees in special need
3	Residential home loans	4.2	Applicants for a loan
4	Financing of holidays and summer	4.5	All
5	Trips and team-building events	3.7	All
6	Books of tickets for a swimming	3.2	All
Average score		3.8	

Source: own study based on conducted research.

The attractiveness of the benefit package at the enterprise results from increased deductions and additional reinforcement from the profit of the benefit fund. The package is extended compared to typical benefits and applies not only to employees in special need, but to all employees. Grant of some benefits is conditional upon fulfilment of the income criterion. Those benefits, thanks to their interesting range and measurable monetary value, are a reinforcing stimulus.

Among the non-pay motivating factors, the respondents assessed access to promotions the lowest (3.0). The Cargo Carriage Enterprise applies to types of promotions:

- vertical, consisting in offering the employee a higher tier position in the specific professional group,
- pay promotions based on pay raises.

The vertical promotion is based on the several-tier structure of positions for the given profession, e.g. specialist, senior specialist. The pay-based promotion is applied for the best employees, but there are no specifically determined promotion criteria and conditions. The company has also admitted that it does not take care of development of individual professional careers of employees, instead applying the "invisible hand" strategy which consists in the best employees taking care of themselves and proving their worth. Participation in the implementation of the most important projects as well as high level of commitment give the opportunity to stand out and be noticed. The application for promotion is submitted by the manager/personally by the employee. However, 73% of respondents believe that promotion options in the company are available only to a narrow group of persons. The

respondents stated that promotion should depend mostly on the possessed competences proper for the given position (62%) as well as very good assessment of work performed so far (54%).

It must be added that the studied enterprise has also a specific catalogue of penalties in the form of partial or full deduction of the statutory bonus as well as the penalty of admonition or reprimand it applies to its employees. Those are penalties provided for in the Labour Code. These penalties are rarely applied, although 10% of the respondents had their bonus partially deducted in the last two years, 5% received reprimands in the said periods and the penalty of admonition for failure to observe OHS regulations was imposed on 3% of them. This implies that the catalogue of penalties is not restrictive but reduces the inadmissible behaviours at work on the basis of reinforcement.

The Cargo Carriage Enterprise appreciates the role of trainings and professional development, believing that it is the obligation as well as common interest of the employee and employer to improve qualifications and professional skills of the employee continuously. The purpose of the trainings is professional development of the employee which is to guarantee quality and effectiveness of work. However, only 30% of respondents consider the subjects of the trainings sufficient, 28% of them believe it is rather sufficient, whereas 36% - sometimes sufficient and 6% - not sufficient. The employee can turn for assistance to the Instructor at any time to have issues causing difficulties in performance of work explained.

In addition to internal trainings, the Cargo Carriage Enterprise finances in full the trainings in dominant entities of PKP CARGO S.A. for its employees, e.g. in marketing. It also provides partial financing for such forms of education as foreign language courses, higher studies or post-graduate studies. In general, the respondents awarded the score of 3.6 to the access to training. The low score may result of the limited access to external trainings and inability to commence studies at universities due to low earnings as the company covers the costs of employees' education only partially.

Motivating Factors Expected and Assessed by The Employees

The motivating factors expected and most valued by the respondents are presented in Table 5 with comparison to the scores the respondents awarded to the factors applied in the company to motivate them for work. Juxtaposing of the awarded and expected scores allow to determine the differences between them. Thus, the employees indicated which pay-related factors should be reinforced in the scope of motivating factors applied by the studied enterprise.

The motivating factor most valued and expected by the respondents is a stable and reliable job. All respondents granted the highest score, i.e. 5, to this factor. This results from the fact that the average age of the enterprise employees ranges from 40 to 50. At this age, the employees already have great professional experience in their industry and what they mostly expect is stability. Most employees fear potential change of their jobs, new tasks or necessity to learn or gain new skills or qualifications.

High and reliable earnings are the next most valued factor according to the respondents' assessment (score: 4.9). The respondents assessed their real earnings low - 3.7 (the difference is 1.2) which proves that the level of remuneration is not fully satisfying for them.

Table 5: Indicated and expected value of non-pay factors according to the self-assessment of the studied employees

Item	Types of non-pay factors		Non-remuneration factor types		Difference (Indicated stimulus value → Expected stimulus value)
	Factor type	Indicated stimulus value	Factor type	Expected stimulus value	
1	rewarding work	4.1	stable and reliable employment	5.0	0.4
2	independence at work	4.0	high and reliable earnings	4.9	0
3	recognition by the supervisor	4.0	recognition by the supervisor	4.8	0.8
4	acceptance by co-workers	3.9	acceptance by co-workers	4.8	0.9
5	full benefit package	3.8	access to trainings	4.7	0.4
6	high and reliable earnings	3.7	access to promotions	4.7	1.2
7	access to trainings	3.6	rewarding work	4.5	1.1
8	stable and reliable employment	3.3	full benefit package	4.2	1.7
9	access to promotions	3.0	independence at work	4.0	1.7

Source: own study based on conducted research.

Acceptance of co-workers and appreciation of the superior (score: 4.8) is another important motivating factor for the respondents. The difference between the value of the indicated and expected score is 0.8. Employees appreciate the efforts of the superiors who praise them but, along with the praise, they would like to receive pay raises (77% of respondents) and monetary awards (69% of respondents) as a form of appreciation for their effective work.

Another factor the respondents assessed highly, i.e. 4.7, is the access to promotions and education opportunities. The employees see the sense in improving their qualifications, but the company finances their education only partially. The respondents would also like to participate to a greater extent in external trainings and have a better access to promotions which would confirm their suitability for work, improve their value and self-esteem.

Another factor distinguished in the research is rewarding work (score: 4.3), i.e. a job that gives the sense of value of the performed work. The person feels needed in the organisation, sees sense in performance of daily duties. Here, the difference between satisfaction with performed work and expectations of the respondents is minor and is 0.4. The conclusion is that the respondents like their work and if the employment establishment could meet the expectations of the employees at least partially, the satisfaction with performed work would be even higher.

On the other hand, the score granted to independence at work was 4.0, the same as for the expectations regarding this factor. The explanation for this could be that freedom of action in the enterprise is fully satisfying for the respondents or that the employees do not really want the freedom of action as it is easier to follow instructions than to make independent decisions on important matters.

Conclusions

Motivation makes the person aim consistently at the set goal. To achieve this, such a person overcomes multiple obstacles, concurrently drawing satisfaction from the performed work. Surely, every employer dreams of strongly motivated subordinates. Knowledge and motivation are key development factors in the contemporary world, as is manifested, inter alia, in the increase in competitiveness of enterprises.

The presented study results allow to put forward the research thesis that motivation plays a significant role in human capital management in modern organisations and, in particular, the pay-related and non-pay incentives allow to draw the conclusion that employees of the studied enterprise would first like to have their need for security and stability as well as physiological needs satisfied at the workplace, thus: they want stable and reliable employment, high earnings and, a bit further in the order of priorities, a full benefit package. They want to guarantee life in decent conditions for themselves and their families, without the necessity to take up addition work. Next, they would like to have their social needs satisfied: they want to enter into close, cordial relations with other people. The manager can contribute to satisfaction of these needs, admitting social interactions and reinforcing the sense of association with the team in the employees. Then, they want respect, appreciation, i.e. gaining appreciation in their own eyes as well as the eyes of other people.

To conclude, economic motivation for work is of basic significance in the enterprise. Well-designed motivating solutions contribute to order in the work processes, incentivise the employees to demonstrate positive and desired approach to work, allow to fulfil the set goals and tasks, both at the level of the entire enterprise as well as particular positions. The existence and development of the company, its efficiency and effectiveness of operation depend on its employees, their skills and motivation to work, technological changes and advances. It is them who use the technology and corporate resources to process them into the final goods and it is them who participate in the life of the company. The implementation of the concept of the company's operation and growth depends on who the employees are, on their knowledge potential and the way they use it for the benefit of the company.

In general, the results of the study showed that employees of PKP CARGO S.A. Cargo Carriage Enterprise in Szczecin value their work, are loyal to the employer and most of them work in the railway industry out of passion and family traditions. Despite the currently good situation on the Polish employment market where low unemployment and increase in demand for work are observed, many respondents would not make an immediate decision on transfer to another enterprise should such an opportunity arise, 69% of employees would have to think about it and 31% stated that they are not interesting in changing their job at all.

Acknowledgements

The project is financed within the framework of the program of the Minister of Science and Higher Education under the name “Regional Excellence Initiative” in the years 2019 - 2022; project number 001/RID/2018/19; the amount of financing PLN 10,684,000.00.

Abstract

This study was inspired by the interest in examining the impact of innovative modern technologies associated with Industry 4.0 upon the competitive advantage of companies. This approach resulted in formulation of a new paradigm of competitiveness, as an innovative contribution to the theory and practice of strategies of competitiveness. The postulated paradigm represents a holistic construct characterized by clear departure from the established of knowledge in this segment of studies. The original character of observations and findings presented in this study is evidenced in the following:
- challenging the established view by M.E. Porter which holds that, at any given time, a company may in principle adopt only one of the available three strategic approaches, namely: low cost strategy, quality strategy, or the strategy of concentration (exploitation of market niches).
- demonstrating that the application of modern and innovative Industry 4.0 solutions (artificial intelligence, advanced robotics, the Internet of things, 3D printing, nanomaterials) will allow for concurrent realization of all four strategic approaches described below.
- formulating a new paradigm of competitiveness holding that, under the conditions of Industry 4.0, it may be possible to pursue a holistic approach to competitive strategies of companies, involving production of items described by: low cost; high quality; adjustment to the requirements of individual consumers (mass customization);
The study belongs in the realm of futurology and is largely based on the use of predictive analytic techniques, synthesis and induction. It based on the selective literature of the subject and is the result of desk research.

Keywords: Competitiveness, Industry 4.0, Technological Progress

Introduction

Competition is one of the most important mechanisms of development in a market economy. It is based on the rivalry of entities seeking to achieve similar goals, and the participating entities can be competitive or not competitive, i.e. able to accomplish the intended objectives or not meeting that criterion. Competitiveness can be considered on these levels (Gorynia, 2009):

- micro-micro, i.e. individual persons;
- micro, i.e. enterprises;
- meso, i.e. related to branches, sectors and industries in the economy;
- macro, regarding individual national economies;
- regional, meaning a group of countries located in a given geographic region, occasionally connected by integration links of varying strength;
- global, comprising the world economy.

The considerations in this article address the issue of competitiveness on the level of a company. The authors propose and verify the thesis that the ongoing sequential progress in the production processes,

i.e. the subsequent industrial revolutions, constitute a continued process of development in the techniques and technologies of production, leading to a change in the paradigm of competitiveness. At the presently commencing stage of the industrial revolution Industry 4.0 this means abandoning the traditional, represented by M. E. Porter, approach to competition which assumes the possibility of an effective implementation by a company of essentially just one kind of strategy, namely that of costing or differentiating, or the concentration strategy. A new paradigm means that a company is able to use at the same time all three strategies, thus its strategy of competitiveness has a holistic nature.

The Concept of Competitiveness

There exist many definitions of competitiveness which probably results from the fact that this phenomenon is usually analysed from a practical as well as scientific viewpoint (Liu, 2017). The most general and concise definition of a company's competitiveness is expressed in the statement that "it is a company's ability to achieve success in economic rivalry against other companies' business' (authors' own definition). A more elaborate version says that "competitiveness means a permanent ability to design, make and sell products (services) whose price, quality and other features mean that they are more attractive than the respective products (services) offered by domestic and foreign competitors' (Kisiel, 2005). According to Buckley et al., "a company is competitive it is able to make and sell products and services of a higher value at the costs lower than its domestic and foreign competitors. Competitiveness means that in the long term the company makes a profit and can pay wages to its employees, and provide its owners with an above-average income' (Buckley, Prescott, Pass, 1998). The definition of competitiveness assumed in the official British document, *White Paper* (Edmonds, 2000), is given as follows: "a company's competitiveness is the ability to make appropriate goods and services at the right time. This means satisfying customers' needs in a more effective way than other companies'. The above quoted definitions and many others suggest that the essence of competitiveness rests in the achievement of competitive advantage when realising the same and similar objectives compared with other companies.

Economic development in modern times has been marked by changes in the form of competing and the implemented instruments, the transition from free competition to the monopolistic and oligopolistic variant. The fundamental changes in the instrument of competing have been gradually altering and will radically transform the processes of creating value resulting in the change of the competition model and companies' competitiveness. All these processes are described as an industrial revolution, Industry 4.0.

Evolution of an Industrial Revolution

The essential role in the development of industrial culture, and in economic as well social culture in general, is played by breakthrough inventions, on the basis of which are derived hundreds and thousands of others. These allow us to distinguish four basic periods in the modern history of industrial development of societies, which are referred to as industrial revolutions (Extreme, 2016; Cimini, Pinto, Pezotta, Cavalieri, 2019; Benazzouz, 2018; Petrillo, De Felice, Zomparelli, 2018). The first industrial revolution dates back to the latter part of the 18th century and the first half of the 19th century. The fundamental role in its development was linked to the use of the steam engine, above all in transport, metal and textile industries. Coal and crude oil became the main sources of energy, quickly replacing the power of human and animal muscle. The second industrial revolution took place in the period 1870-1914. The development of production in industry was based above all on a new source of energy, i.e. electricity, which took on the role previously played by steam. Its characteristic feature was the automatization which enabled the mass production of standard goods in the system of an assembly line introduced by Ford and Taylor. The subsequent, i.e. third industrial revolution, also referred to as 'digital' commenced in the 1980s and is still continuing (Extreme, 2016). The passage from the analogue, electronic and mechanical appliances to digital technology constitutes its essence. The ubiquitous computer, the Internet and ICT (*Information and Communication Technology*) decide about development not just in industry but in almost all areas of life of both individuals and societies.

The fourth industrial revolution, or Industry 4.0, is a consequence of technological development which determined the nature of economic and social processes in the past, classified into three time brackets and described as the first, second and third industrial revolutions, however it differs from them in (Schwab 2016):

- speed caused by the complexity and profoundness of connections in the modern world;
- extent and depth; it is based on the previous digital revolution and combining numerous technologies, which resulted in the unprecedented changes occurring in the economy, business, society and in individual lives;
- systemic impact, i.e. transforming the entire systems existing in enterprises, industries, societies and countries, as well as between them.

These can be defined as development processes based on combining breakthrough technologies which leads to eliminating differences between the physical, digital and biological spheres in industry, services and other areas of human activity.

Megatrends of Industry 4.0

K. Schwab, a founder of the World Economic Forum and a pioneer in research on Industry 4.0, distinguished three megatrends which power revolutionary changes in the modern world, namely physical, digital and biological. The physical megatrend is most apparent because of its tangible character. The most important technologies it comprises are:
- advanced robotics;
- autonomous vehicles;
- 3D printing;
- new materials.

Advanced robots are the appliances which operate autonomously almost completely or partly, and possess the capacity to interact physically with people and networks of other robots, and are able to modify their behaviour on the basis of information transferred from the 'cloud' (Impact 2017). The usage of advanced robots and smart automatization will become the key factor of companies' competitiveness practically in all branches of industry and services, including medical, leisure, telecommunication, household and financial. In particular, the advanced robots will be able to (Manufacturing, 2011; Gronau, 2015; Impact, 2017; Freeman, 2018; Ghobakhloo, 2018):

- perform actions relying on their mobility;
- act in an unorganised and uncertain environment;
- interact with their environment via electronic contact, sound, gestures and physical contacts with other robots and people;
- achieve the desired effect without the need for the full reprograming of the particular set of actions required for this purpose;
- safely perform tasks when in close contact with humans or in highly dangerous conditions.

Their great speed of acting, faithful reproduction, precision in execution, dexterity, flexibility, mobility and interactivity, combined with the ability to use external and internal resources of knowledge in order to make autonomous decisions, will allow entrepreneurs to respond to the demands of the rapidly growing competition in a more efficient and cost-effective way.

The first autonomous vehicles, i.e. those not requiring human participation, will be passenger cars, soon to be followed by lorries, drones, planes and ships. The development of artificial intelligence and the widespread use of sensors will further increase their capabilities and commercial usage. The potential advantages will be linked above all to an increase in road safety, and therefore eliminating the vast number of accidents resulting in human casualties, damage to equipment and insurance costs. Traffic flow will be easier, which will result in saving time needed to arrive at work (no traffic jams), avoiding delays and reducing tiredness caused by travel. There will be a growing tendency to suburbanisation, which will result in the improvement of living conditions in cities through their deglomeration. Human mobility will be on the rise, which in turn will reduce the shortage of manpower

in some regions. All this will increase effectiveness of companies in terms of transport and logistics, and lower their costs, thus raising the level of their competitiveness.

3D printing, also called additive production, is based on creating three-dimensional physical objects through putting on subsequent layers of material in accordance with their digital image or model (Ramya, Vanapallis, 2016; Hannibal, Knight, 2018; Rayna, Striukova, 2016). This technology requires the usage of a computer, modelling software, mechanical equipment and material for the layers. It finds its use in the production of a wide range of appliances such as parts for cars, planes, machines, equipment, implants, prosthetics, food, clothing and leatherware, optical equipment and weapons, etc. Its advantages are the ease of making highly personalised products (customisation), the possibility of introducing changes in the production process, lower labour-intensity than when applying traditional methods, quicker realisation of products, greater precision of their execution, higher quality and lower costs. It is expected that this technology will shorten global supply chains and thus replacing by reshoring (Di Mauro, Frattocchie, Ones, Sartor, 2018; World Investment Report, 2017; Wiesmann, Snoei, Hilletofth, Eriksson, 2017). Nowadays there is ongoing work on the technology of the process of 4D printing, creating new generations of products capable of self-regulation, and the appropriate response to changes in the environment such as temperature or humidity. They will find their use primarily in the textile and shoe industries, as well as producing medical items such as implants. Being able to outrun one's partners in implementing this technology will undoubtedly increase the competitive advantage of a company.

New materials comprise a wide range of characteristics which positively distinguish them from traditional materials. This regards, among others, their weight, resilience, size, suitability for recycling and adaptability. One can mention here such smart materials as self-repairing and self-cleaning nanomaterials like graphene which is 200 times harder than steel, stronger than diamond and a million times thinner than a human hair (Pitkethly, 2004; Isaiach, 2015), metals with memory which enables them to return to the original shape, some crystals and ceramics, in which when subjected to mechanical stretching, the electric current is strengthened. Parts made from such materials are longer-lasting and allow to avoid costs connected with repairing breakdowns of machinery, whereas self-cleaning materials are capable to remove from their surface impurities and bacteria. The scope for inventions in this area is simply fantastic, yet at the same time real. The above mentioned and the still undiscovered features of new materials will make it possible to produce goods which are extremely durable, material and energy-effective, environment-friendly, renewable, high-quality and also cost-effective, and they will certainly provide their producers and companies using them with competitive advantages.

The technologies representative for the digital megatrend include:

- artificial intelligence;
- Internet of Things;
- *blockchain*.

Artificial intelligence means the ability of devices to copy human intelligence, i.e. being able to undertake rational actions in order to achieve a periodic objective; they are capable of (Shabbir, Anwer, 2015; Fabrik, 2016; Dhillon, Metcalf, Hooper, 2018):

- recognizing images and sounds;
- recognizing speech and interlocutors;
- gaining knowledge and applying analysis techniques;
- learning to plan and make their own decisions based on the data they already have and obtain from their environment;
- self-improvement of their actions.

There is a concept of 'weak' artificial intelligence such as that used only for performing specified tasks, and a 'strong' one which could exceed human intelligence in practically all areas. Therefore, this leads to the concern that super-intelligent machines can eliminate human civilisation. Artificial intelligence differs greatly from automatic robots which take on manual tasks performed by humans. The tasks

performed by devices equipped with artificial intelligence are far more complex. It is possible for them to continuously analyse and improve the parameters of the performed actions, consequently the products made match precisely their models, are of high quality and use little material. Artificial intelligence is even capable of improving models without any human input, gather new data and create smart products. It can be applied at all stages of creating value, including that of research and development, ensuring the advantage for business entities implementing it, in terms of quality, cost and market niche.

Internet of Things refers to a virtual (Internet) web of people, processes, devices and products, in which information is gathered, processed and sent in order to manage the environment in a smart, automatic way. This environment can be located in industry, transport, consumer services, as well as medical, financial and others, also in agriculture and in commerce. It can comprise smart homes, factories, cars, machines, devices for the remote monitoring of the state of health, smart car parks, appliances monitoring the localisation and route of cargo transport, as well as those monitoring conditions for farming, credit rating of banks' clients, etc.

Appliances which generate and process information on a regular basis are the foundation for the digital transformation of the value creation chain. The IT combination of smart transport, storage, production and distribution through the platforms of the Internet of Things ensures the availability of information on the course of these processes in real time, enabling their monitoring and improvement of their effectiveness (Impact, 2017), which undoubtedly has a positive impact on the competitiveness.

Blockchain is a technology which enables online transfers of digital coded assets such as contracts, documents of financial transactions, currencies, certificates, and financial reports, from one entity to another/others without the participation of an intermediary, using a decentralised scattered system of accounting (Swan, 2015; Casey, Vignal, 2018; Upadhyay, 2019). In this system there is no need for a central administrator to confirm the authenticity and control transactions because every participant of the system can look at any transaction and together decide about its legality. All the participants of that network have their own identical copies of digital books of accounts, which almost immediately record changes which took place as a result of introducing another coded block of information. Each subsequent block of information contains an abbreviated version of the previous one, in this way creating their chain (*blockchain*). This system is more resilient to hackers' attacks because instead of just a single database they would have to attack simultaneously all the copies of it. *Blockchain* can be and certainly will be in common use in companies and institutions, in industry, commerce, banking, insurance, financial and investment management, etc., contributing to cuts in transaction costs and time required for transactions, elimination of errors, reduction of risk of forgeries and attacks by hackers, and thus improving their competitiveness.

Biological megatrend is above all linked to synthetic biology, which constitutes a union of biology with engineering. Within this field there are being developed such disciplines as genetic engineering, biotechnology, molecular biology, molecular engineering, biophysics, chemical and biological engineering, computer engineering, systems biology, industrial automatics and evolutional biology. The conducted research aims at building artificial biological systems and modifying the existing ones. This concerns not only flora and fauna but also humankind. It will be possible to produce better varieties (as already happens in respect of plants), more resilient to external threats, and also able to produce pharmaceuticals and other forms of medication. Artificial human organs will be also possible to obtain through combining technologies 3.0 with genetics. Nowadays it is already possible to 'print' skin, bones, heart cells and blood vessels.

Revolutionary innovations linked to synthetic biology have, and will have, a direct impact on the effectiveness and competitiveness of business entities whose activity is connected with the production of plants and animals, pharmaceuticals and other aspects of medicine, and research and development in these areas. An indirect if positive influence may occur in all the spheres of the functioning of society and the economy through the improvement of the mental and physical capabilities of human organisms, the slowing down of the ageing process and extending both the productive age and lifespan in general.

Traditional and innovative strategy of competitiveness

The way of competing used by companies during the first three industrial revolutions was based on choosing one of three strategies:

- production at a cost lower than for competitors;
- production of higher quality (differentiation);
- concentration, in other words the implementation of the former or the latter way of competing in a market niche in regard of a particular group of clients, a segment of the product range or a geographic market. According to M. E. Porter, a classic theorist of company strategies and their competitiveness, it is rarely possible that a company is able to successfully employ more than one of these strategies (Porter, 1992). In the conditions of Industry 4.0, the instruments for realising competitive advantage on a company level undergo a drastic change, which means that the company implementing them is able to realize simultaneously all three strategies. This leads to the emergence of a new paradigm of competitiveness, i.e. a holistic way of its realisation. In order to achieve competitiveness in conditions of Industry 4.0, companies have to introduce significant changes to their model of running a business, which has to be totally oriented on satisfying the increasing individualisation of their customers' taste (Kinder, et al., 2014). This idea should dominate over the entire chain of creating company value, starting from research and development, through design, purchase, storage, production, distribution, customer services and recycling. Through the union and interaction of people, smart machines and appliances, there are created dynamic cyber-physical systems in the form of self-organising digital networks of creating value, optimal from the viewpoint of the criteria of cost, quality, time, space, customisation and functionality.

The digitalisation of the value creation chain enables:

- concentrating on the segments with key importance for creating added value;
- minimising costs;
- eliminating breakdowns;
- flexibility and standardisation of flows of material assets and information;
- transparency of their flow;
- improvement in planning and managing production processes;
- customisation of products;
- reducing redundancy.

There will exist excellent coordination between the individual segments of the value creation, and any possibility of turbulence will be immediately automatically eliminated. Purchasing will be synchronised with the stages of the production process which will lead to eliminating costs of storage and the related losses. Not only purchasing but also distribution will be appropriately correlated with the process of production, which will mean that customers will receive the required product almost straightaway and directly into their own hands. The supplies of consumer goods will be cyclically renewed at the clients' place according to a previously set programme, and the equipment will be serviced and repaired.

In the factory of the future, production processes will be fully automated and realised by smart robots which will carry them out with extreme precision, impossible to achieve with the use of other technologies. Smart robots will select the most appropriate materials and their composition, with maximum savings in their usage. This will ensure the highest possible quality of the manufactured products and services provided by companies, meeting to the highest degree the criteria of durability, reliability, functionality and aesthetics. The robots will be able to use constantly their own resources and data, obtain them from a cloud, prevent failures and reprogram their own operations.

The use of 3D printing will enable the automatic production of three-dimensional objects based on digital designs or models. Thus products can be produced in a short time, at low cost, high quality and in small series or even as one-offs. They may be created based on *peer-to-peer* contacts between producers and clients who directly supply a model or description of the required design. In this way

there will be fulfilled simultaneously the criteria of competition on the basis of the price, differentiation and market niche.

The supplied products will differ significantly from the present-day ones, not just because of their relatively low price, high quality and customisation but also their functionality, changing automatically depending on the conditions in which they are used. Smart products equipped with alarms, sensors and processors will react to changes of temperature, rainfall, wind, atmospheric pressure and other weather conditions and threats posed by other objects in their surroundings.

Payments for the supplied goods will be affected using a virtual, scattered cryptocurrency, safer, resilient to attacks by hackers, solid and trustworthy, and will not require a central institution to regulate its use and exchange. Even today the value of the cryptocurrency Bitcoin in circulation is estimated at over 3 billion USD and approximately 100 thousand traders accept it (Kelly, 2017). The blockchain technology which provides the basis for the functioning of cryptocurrencies, will enable the automatic conducting of decentralised transactions between companies and private individuals with the use of a chain of blocks which will eliminate several middlemen, make the transactions transparent and safe, generate high levels of trust between partners in business, and as a consequence will significantly lower transaction costs.

Creating high-quality products at an attractive price and 'made to measure', i.e. adapted to the specific requirements of clients, will certainly rely on the deepening and strengthening of network connections not just within the corporations but also between them and their clients. Competition and cooperation, or the so-called coopetition, will become a common phenomenon in the companies of Industry 4.0. Electronic platforms will be a highly useful instrument for its realization, used by many different stakeholders such as designers, suppliers, producers, service providers and customers (Reuber, Knight, Liesch, Zhou, 2018). They will become a kind of business ecosystems which through providing the combination of complementary capabilities will facilitate and speed up R&D, design, implementing innovations, production and distribution of customised high-quality modern products and services.

Conclusions

The presented revolutionary changes in production processes, and the combination of the physical, digital and biological dimensions will have not merely an economic effect but also vast social consequences, which are not the subject of this discourse. However, in the sphere of competition they will cause a change of its paradigm and, as was already said above, will allow companies the simultaneous effective use of the strategy of low costs, of differentiation and of concentration, which was practically unattainable in the traditional economy. Already today one can observe the introduction of innovative techniques and technologies of production, as well as ways of managing the chain of creating company value and the systems of creating value such as the coordinated value chains of cooperating companies, which in comparison with traditional ones have a revolutionary character and lead to their creative destruction. These comprise the automation of production processes, installation of advanced robots which replace human labour, 3D printing, usage of new materials (nanomaterials), 'weak' artificial intelligence, the Internet of Things, *blockchain*, cloud technology, enhanced reality and elements of synthetic biology. The gradual introduction of these innovative solutions is accompanied by intensive research aimed at minimising the costs of their implementation and industrial use. It is expected that they will become reality over the next ten or so years. Apart from their undisputed advantages described in this article, they will be also connected with various threats such as unemployment, deepening social divisions, cyberattacks and with the domination of the human race by artificial intelligence, which for some belongs to the domain of *science fiction*. For companies pioneering in the introduction of the elements of Industry 4.0, this will mean the achievement of a significant competitive advantage over others through applying a holistic strategy of competition. The future research should concentrate in particulary in the determinants, barriers, promoters and a course of the implementation processes of industry 4.0 in the individual companies and the influence them on their competitiveness.

Acknowledgment

The project is financed by the Ministry of Science and Higher Education in Poland under the programme "Regional Initiative of Excellence" 2019 - 2022 project number 015/RID/2018/19 total funding amount 10 721 040,00 PLN

Abstract

The article is part of a series of publications on virtual supply chains. The first part characterizes determinants defining virtual supply chains. There were identified nine areas affecting virtual supply chains. This study presents risk factors affecting virtual supply chains. The research is complemented by FMEA risk analysis for virtual supply chains. The research was conducted at the turn of 2019 and 2020. The purpose of the publication is to show aspects where the risk related to virtual supply chains is the greatest.

Keywords: Virtual Supply Chain, Supply Chain, Risk, Risk Factors

Introduction

Over the past few years, artificial intelligence has become an integral part of the modern world. People, companies, organizations benefit from the benefits of IT, technology and digitization on a daily basis. In addition to supplying basic next-generation applications and other digital products, artificial intelligence is able to transform industry activities, including the supply chain and logistics, into new stages of operation. In fact, companies are already using AI resources. According to the 2017 Vanson Bourne survey, it can be seen that operations and supply chains are the most important processes in which companies increase revenues through investing in artificial intelligence. The flow of goods in the contemporary world is becoming faster and easier, by arranging companies in global supply and logistics teams. In order to avoid delivery delays, inefficient management of inventory or flow of goods, and to eliminate bottlenecks, it becomes necessary to manage large data sets and to analyze them.

Aside from data management in the supply chain, the issue of communication and information flow is becoming extremely important. The physical flow of goods no longer exists without digitization and virtual supply chain support. The collection, verification, storage and analysis of data in the supply chain becomes a necessary element to function in the age of globalization but is also the first step to the risk of business operations and the exchange of data and information (Avetta 2019, p. 4). The digitization of logistics processes and supply networks is designed to help achieve huge savings and competitive advantage by supporting new thinking and management methods. Data and information processing in the cloud computing enables greater freedom and mobility of supply chain management. The use of cloud computing makes it possible to cope with the growing speed of change in unstable economic and political conditions. The virtual sphere not only allows for easier, faster and more precise management of the growing amount of data and information, but also enables creation of digital supply chains. The most important element of managing digital supply chains or the physical flow of goods using IT solutions is cooperation with each link in the supply chain in real time. Optimization and digitization of logistic and economic processes can help business entities achieve significant savings and competitive advantage. The efficiency of the entire supply chain also

increases, and the utilization of enterprise resources is improving (Lee 2013, pp. 35-48; Raj, Sharma 2014, p. 2).

The virtual supply chain is a more complex creation than the "traditional flow of goods". According to J. T. Mentzer, the virtual supply chain is based on physical transport, management processes, execution, reporting, and control of these processes, creating a matrix with a horizontal time axis and an operational flow as a vertical axis (Degen, Janssen, Da Cruz Caria, Hermans, Sweerts 2016, p .2). The activities of the virtual supply chain are also based on the ability to create temporary cooperation and dependence on short business opportunities. Cooperation is based on temporary consortia or alliances of companies created to share costs, skills and take advantage of rapidly changing market opportunities. The virtual supply chain is primarily geared to driving the use of innovation and innovative digital, ICT and system solutions, along with the distribution of knowledge. In order to design effective cooperation in the virtual sphere, there must be a workflow and information flow, conditioned by well-defined decision-making process and internal process coordination (Samdantsoodol, Cang, Hongnian 2012, pp. 1-2).

The research methodology is based on the analysis of virtual supply chains in terms of the impact of risk factors. Virtual supply chains have been analyzed. The research carried out in this article is part of the analysis of determinants affecting virtual supply chains and the conclusion of the research carried out in the form of FMEA risk analysis of virtual supply chains. This article deviates from the classic form because the main part of the research are risk factors for virtual supply chains developed in the form of a table. Presenting risk factors for virtual supply chains is necessary to understand which area the factors affect and what the consequences are. As already mentioned due to the extensive research, the considerations have been divided into three parts and each of them supplements the given article (Kersten, Blecker, Ringle 2018, pp. 30-67; Pires, Bremer, 2010 pp. 297-311).

Risk factors shaping virtual supply chains

The vast scope of the term risk means that it is necessary to categorize and divide it. Correct risk classification helps to answer the questions of how, when and where the risk may occur. Different types of risk can be grouped according to many criteria (Dendera-Gruszka, Kulińska 2017, s.5–22; Staniec, Klimczak 2015, s.23–36).

Virtual supply chains are the main source for agility and responsiveness, becoming market sensitive, enable to synchronize supply with demand and achieve shorter cycle times. However, virtual supply chains, despite their many advantages, also pose a threat to the functioning of the organization. In the era of globalization and progressive digitization, it is necessary to characterize the risk factors that are responsible for the virtual sphere and to determine the risk (Samdantsoodol, Cang, Hongnian 2012, pp. 2-3). There are many considerations about the risk of virtual supply chains, while none of them defines risk factors taking into account their areas of impact and so far no compendium of knowledge about risk factors affecting virtual supply chains has been presented in such a detailed way. The results of other authors' research on a similar topic are also included in the table below. The table below sets out the determinants that characterize risk in virtual supply chains.

Area	Determinants of virtual supply chains	Risk factors corresponding to virtual supply chains
Technological	- technological progress - development of technology	- no current system updates - lack of adequate technical equipment - lack of adequate software
	- the growing role of telecommunications	- no access to the telephone network - the low range of the telephone network - no telephone network synchronization with IT systems - lack of funds for ICT
	– access to a fast internet network	- no access to a fast internet network - high costs of implementing a fast internet network
	– access to new technologies	- lack of access to new technologies - unfair competition - theft of know-how - high costs of implementing new technologies - dynamic changes on the IT market - no interest in new technologies - loss of license - patent refusal - no rights to use individual technologies - poor decision-making regarding new technologies - lack of suitably qualified workforce responsible for implementing new technologies - lack of modern equipment - barriers on the given market - lack of properly equipped laboratories - distrust in the dissemination of research on new technologies - theft of technological knowledge
	- access to information - quality of information flow - quality of information transfer	- bad information flow - no access to information - lack of access to public information - no access to documents - refusal to share information - poorly secured access to information - failure to meet the deadline - long circulation of information - disruptions in the flow of information - information noise - lack of information flow model and procedures - loss of information media - loss of information - excess or lack of information - information is outdated - lack of credibility of information - no link between information and the given environment
	– development of interactive media	- no communication - hacking into a computer or Internet network - hacking into the telecommunications network - creating a new reality - previewing and eavesdropping on

		conversations, video conferences and audiovisual broadcasts - addiction to interactive media - sharing too much information using interactive media - lack of control over the transmission and transmission of information using interactive media - no verification of all interactive media users - ease of losing data and information
	- IT competences - IT and media competences - interaction between the user and the virtual environment	– lack of relevant contractual provisions guaranteeing security
	- database - capturing sensitive information	- data loss - database corruption - virus - data theft - hacking into the database - data sales - public sharing of data - failure to obtain appropriate licenses - - inappropriate data processing - unfair competition - downloading data from foreign portals - IT crimes - violation of the rules of personal data processing - hacker attack - no detection of violations - unauthorized physical access to an important room with processed data, - flooding - fire, - physical failure of data carriers - wiring failure
	– *cloud computing*	- no availability - possibility of rapid change of business model by cloud service providers - complicated recovery procedures - possibility of single failure points - loss of data confidentiality - disclosure of data to third parties - deleted company data can still be stored in the cloud - insufficient authentication methods - it is not possible to audit the service - conflict of laws - lack of continuity of service - link failure - low quality of services offered
	- *phishing*	- unconscious or accidental sharing of information
	- networking	- cyberterrorism - criminal networks

	- virtualization - data and information exchange platforms	- poor performance - cyber hacking - high security costs - illegal downloading of source code from a file server - threats from other systems on which our resource is based
	- immediate access to knowledge and information - high level of knowledge and information flow - use of homogeneous or compatible digital, information and IT technology - disinformation of individual industry groups	- poor data security on digital media - lack of interest and funds for innovation - IT system failures - too much information flow - fake news - use of pirated software / pirated content inside the organization - absence of the administrator
	- increase in investment expenditure on the latest technologies, servicization and digitization of entities	
	- ICT services	- eavesdropping - interference - operator errors
	- *link manipulation*	- URL control vulnerability - sending confidential data - user manipulation
	- *whaling*	- hacker attacks on people in important positions
	- artificial intelligence - machine learning	- lack of relevant legal regulations - taking control of the systems by inappropriate people - lack of defined total possibilities of artificial intelligence - unlimited possibilities
	- computer simulations	- data entry errors - lack of full reflection in reality
	- computer generated environment - interaction between the user and the virtual environment	- theft of data carrier - illegal modification or damage of website content - inability to process source code
	- backups - saving information	- loss of data
	- internet of things - using mobile devices -dependence of industrial and security systems on a common internet network - digital transformation	- weaknesses in authorization and authentication systems - insecure web interfaces - software gaps and errors - cloud computing failure - uncontrolled surveillance of people - taking control of devices - theft of access passwords - modification of system software by third parties - eavesdropping - illegal copying of device contents without the user's knowledge and consent - problems with the object software update - DoS (Denial of Service) attacks - user errors - no data transmission encryption

		- power failure, - loss/theft of equipment containing relevant data, - immobilizing parts of the IT system caused by malware, - sale of equipment (e.g. hard drives) without proper, permanent deletion of data - disclosure of confidential information
	- Ransomware-as-a-Service	
	- Malware-as-a-Service	
	- DDoS-for-Hire	
	- broadband access - increasing the efficiency of technological and IT processes - lack of support for technological transformation - lack of understanding of technology - technological and technical innovations	- delays in implementation - lack of adequate infrastructure - high financial outlays - lack of funds for the investment - theft of know-how - badly allocated financial resources - theft of idea - rejection of the project - no allocation of funds
	- electronic banking	- loss of funds on bank accounts - contracting financial obligations by third parties on user accounts - hacking into electronic banking - insufficient protection of the electronic bank account
Time	- development of emerging markets	- less competitive in terms of costs and time in relation to the eastern markets
	- technology development - development of IT techniques - development of cybernetics	- not keeping up with technological, technical and IT progress
	- quick response to customer inquiries and wishes	- too late response or lack of response to customer inquiries and wishes
	- development of competition	- more attractive competition offers
	- flow of information - communication	- disruptions in the flow of information and communication - delays in the flow of information
Localization	- reduction of spatial barriers - deterritorialization - integration - limitation of state sovereignty	- impact of globalization - transferring production to Asian markets - free flow of information - changes in economic conditions in international markets - increase in the share of Asian economies
	- transport network density - transport infrastructure - communication network density - port automation - lack of port integration with customs systems - lack of coordination of the ministry of transport, industrial development, communication and finance - spatial mobility	- lack of adequate transport or communication network - lack of properly synchronized IT network
Mark	- development of telework	- lack of supervision over employees

	- non-standard forms of employment - changes in existing forms of education - new jobs related to intelligent work, - requirements for new qualifications and information and information technology as well as communication and media skills - changes in work styles	- no contact with the employer - overtime - dependence on technical means - limiting social and professional contacts - disturbed family life - delegating official duties to third parties - secondment of employees - lack of control over the flow of information - lack of qualified labor force - lack of human capital - staff shortages - decrease in employment
	- impact of the virtual world on global stock exchanges - situation of global markets - volume of foreign exchange turnover - average customs duties - market regulation mechanisms - stock exchange quotations - exchange rates - cryptocurrency quotes - inflation - turmoil in energy markets - economic situation - liberalization of markets - economization of politics	- market changes - changes in interest rates - fall of stock prices - exchange rate fluctuations - changes in customs duties - embargo - turbulence on global stock exchanges
	- no jobs for people without proper IT skills	
	- limitations of resources	
	- e- services	
	- limited access to financing	
	- focusing on the needs of large producers	
	- digital economy	
	- dual economy	
	- no tax deductions to support technology implementation	
	- balance of payments charges	
Political and social	- no legal regulations regarding digitization, computerization and virtualization - lack of exchange of information in the international environment of law enforcement agencies - inability to respond to cyber crimes - no cyber security strategy on the national and international arena	- ineffectiveness of law enforcement in tracking and enforcing crimes in the virtual sphere - lack of properly trained specialists in the area of internet crimes
	- lack of law enforcement agencies operating exclusively in the virtual world	
	- lack of structures for cyber resilience, cybercrime and defense operations	
	- no exchange of information between the private sector and national entities	- new possibilities for online crime
	- no insurance policy against cyber attacks	- high costs
	- international legal and social relations - international tax regulations - assistance received from public funds - policy of state authorities towards enterprises - volatility of legal regulations	- complicated international legal regulations - high tax rates - incorrect interpretation of legal acts - non-compliance with national and international law - lack of economic freedom

	- legal regulations regarding the freedom of establishment	- restriction of economic freedom - unfavorable tax system reforms
	- effectiveness of corporate governance mechanisms - economic freedom - changes in economic conditions - tax rates - fiscal policy of the state - condition of the public finance sector - effectiveness of state control bodies - export value - value of state investments - changes in the political and economic structures of the state - limitations of political and economic sovereignty - tax system reforms	- changes in the purchasing value of money - fashion - changing customer preferences - checks at border crossing points - border crossing blocks - inefficiency of state regulatory authorities
Economy	- increase in the efficiency of business entities - increase in innovation of business entities - increase in the competitiveness of business entities	- economic backwardness - decrease or low economic growth rate - price / wage gap - lack of innovation development
	- lack of cooperation between research centers and business entities	- increasing opportunities for online crime
	- reluctance to share information - business complexity of entities - limited competition - political restrictions - failure to recognize the country's industrial context - lack of public cooperation	- lack of cooperation between entities - lack of economic confidence - unfair competition - high costs of information flow
	- lack of coordinated supply chain strategies - system incompatibility between entities	- delays in implementing logistics processes - the need to implement more than one IT system - duplication of data and information - high service costs
	- standardization - geopolitical cyber attacks - unification - integration - fragmentation - formalization - institutionalization - innovation of the economy - level of economic growth - uncertainty about market position - uncertainty about market identity - economic volatility - volatility - leveling prices / wages - price/wage level - number of international corporations and branches – share of intra-company flows - concentration of production	- lack of access to international markets - bad information flow - unfavorable business relations - too many changes - lack of market orientation - lack of industry orientation - no focus on the range produced - lack of opportunity or desire to develop a business entity on the international stage - no product presence on international markets - no additional production capacity - no export possibilities - product and assortment stability - too much product variety - no investment projects - unemployment - lack of new jobs - adapting public administration to digitization

	- export rate - share of production value in global production - level of foreign direct investment - investment projects - consolidation / transformation of the industry - implementation of strategic transactions - changes in company structures - increase in costs - demand and supply changes - competitiveness policy - enhanced competition policy - business relations with clients - uninterrupted communication - commitment to the implementation of orders - flow of information - payment transactions - customer insolvency - payment deadlines - international flow of capital, goods, services and knowledge - export value - value of international investments - internationalization of the company - number of contractors / foreign branches - fragmentation of production - export capacity - international division of labor - changes in production structures and product offer - enlarging sales markets - new jobs - access to international raw materials, capital and production resources - access to the global labor market and sales market	
	- digitization of logistics services	- theft of confidential data
	– disinformation in virtual reality	
	– economic fraud	
	– impersonating public institutions	
	– phishing confidential business data	
	– phishing data from public institutions	
	– creating common logistics functions	
Social	– social exclusion	
	- global society	
	– automation and robotics society	
	– constant supervision and control over society	
	– conditions of exceptional social competition	
	– decrease in the prestige of traditional social forms	
	– no control over content posted on the internet	
	– interdependence of the spoken and printed word with digitalism and interactivity	

	– consumerism	
	– commercialization of social relations	
	– increasing employee rights	
	– instability of life	
	– depleting cultural diversity	
	– commercialization of consumer culture	
	– instability of life	- lifestyle changes
	- deterritorialization of culture	–
	- links with the cultural, territorial and professional community - social disintegration - changing social structures - change of social functions	- lack of appropriate education and experience of people in managerial positions - lack of adequate education and experience of people in state administration - increasing pay gap
	- transfer of qualifications to cyberspace and the virtual world - change of existing authorities - the impact of the virtual world on socio-educational activities - access to knowledge and information as a determinant of social status - digitization which is the basis for the functioning of every family and institution - accelerating the development of intellectual and social capital - the impact of technology on social relations - social manipulation	- society's desire to exist only in the virtual world - attractiveness of unreal patterns - knowledge from unverified sources - access to unverified and false information - addiction to modern technologies
	- bad habits of employees	- too much time spent using modern technologies
	- increase in social activity	- decrease in social activity
	- fees for social and social benefits	
	- demand and supply of qualified labour	
	- minimum wage	
	- increase in labour costs	
	- knowledge of foreign languages	- lack of language skills
	- population movements	- migrations
Globalization	- transformations and movement of civilization waves - the importance of information and knowledge in the globalization process - industrialization - no retreat from digitization - the growing role of non-state, non-elective and undemocratic economic power centers - lack of control over cyberspace - concentration of power resulting from superpower - separating the world of finance from the real economy - increase in differences between individual market segments - uncontrolled privatization of the sector and public space - centralization of political and economic decisions taken - globalization of social pathologies - social threats and terrorism - universalization	

Environmental	- ecological disasters - natural disasters

Fig. 1: Risk factors corresponding to virtual supply chains

Maj I. 2015, s. 51-57; Marczyk M. 2018, s. 59-72; Rot A., Blaicke B. 2017 pp. 188–198; Pires, Bremer, 2010, pp. 280-282;

Risk factors that characterize virtual supply chains relate to nine areas that have been characterized in detail in the table above. The most important risk factors for virtual supply chains relate to the technological area. Due to the close connection of technology and new technologies with the virtual sphere, these factors are becoming the greatest threat to virtual supply chains. Attention should also be paid to the social aspect, which significantly determines the functioning of not only real supply chains, enterprises, but also every community. The table also shows that there is no turning back from progressing digitization. This is undoubtedly a risk factor perceived in plus and at the same time in minus. The specificity of the term risk is an opportunity and at the same time a threat to the functioning of organizations, social groups, introducing new products to the market, etc. The same applies to risk factors for virtual supply chains. Some of them are definitely perceived and cataloged as a threat and something negative and dangerous, while some may prove to be an opportunity and influence the development of a given organization or supply chain. In addition to risk factors relating only to elements of digital, IT infrastructure or virtual networks, there are also elements regarding natural disasters or physical flow of goods. Currently, the virtual world is closely related to the physical flow of goods and it is impossible to strictly isolate only virtual factors without analysing physical elements. Based on the above table, the FMEA risk analysis will be presented in the further course of the research. Based on the above table and the data contained therein, a further analysis of the FMEA risk will be presented in the further cycle of the research (Veynberg, Koslova, 2020, pp. 2-7; Reliham, 2020, pp. 23-30)

The limitations of the conducted research is constantly changing reality, in particular virtual reality. In the era of globalization and progressing digitization, it becomes extremely important to know the risk factors affecting virtual supply chains. At the same time, globalization processes and the transfer of more and more services into the virtual sphere contribute to the emergence of more and more dangers and threats in sending data or information via the Internet. Therefore, the factors that have been cataloged in the above table may not be sufficient in the near future. Due to the dynamics of changes taking place in virtual supply chains, the authors relied on the opinion of experts in this field, in relation to the maximum year preceding the publication of this publication.

Summary

Access to the internet and ubiquitous digitization enables fast and flexible flow of goods and services. Currently, to become competitive in a given market, speed of response to customer inquiry and flexibility is becoming the paramount feature. Without access to the Internet and the use of specialized computer software, achieving a market leadership position would be impossible. However, virtual supply chains, which are primarily oriented on the Internet, carry some danger and risk. The determinants presented in Table 1 are the first stage to analyse the risk of virtual supply

chains. Based on the distinguished determinants, it is possible to determine which elements have the greatest impact on risk in virtual supply chains, and which particular attention should be paid.

The Role of The UN Security Council in The Collective Security System

Wawrzyniec KOWALSKI

Military University of Technology in Warsaw, Warsaw, Poland
wawrzyniec.kowalski@wat.edu.pl

Abstract

The aim of the article is to present the issue of differentiation of legal collective security systems, with particular emphasis on the role of the United Nations Security Council. The article indicates that despite the existence of various collective security systems, including The European Union or the Council of Europe, currently the United Nations system still allows the most effective institutionalization of the legitimacy of collective response procedures. The text emphasizes the special role of the Security Council in maintaining or restoring international peace and security, resulting from the content of art. 42 UN Charter. Finally, it has been shown that the military and political competences of the Security Council, although unprecedented in legal and international dimension, have not yet been able to make the Council an effective guarantor of global security. The research problem raised in the article has both a theoretical and practical dimension. The research methods used in the work include analysis, synthesis, inference and reference to the position of representatives of the doctrine of international law. In the practical part, the author referred to the effectiveness of the UN Security Council in cases of armed conflict in countries such as the Syrian Arab Republic or Libya.

Keywords: Collective Security System, UN, Security Council, Global Security, Syria

Introduction

There is no doubt that among modern systems of collective security resulting from the existence of such international organisations as the North Atlantic Treaty Organisation, the Council of Europe, the European Union or the United Nations, it is the global system of collective security of the United Nations that has a special role to play both in shaping and guaranteeing modern international relations and global governance. Historically, it should be remembered that the creation of the United Nations was the aftermath of the nightmare of the Second World War, so it is not surprising that Article 1 of the United Nations Charter already indicates expressis verbis that the most important task of this organization is: "To maintain international peace and security, and to that end: to take effective collective measures for the prevention and removal of threats to the peace (...)" (UN Charter). The impact of the United Nations system on international security, especially in terms of political and military threats, is undoubtedly a key issue from the point of view of the representatives of the doctrine of international law, but due to the volume and formula of this work, the author has decided to limit himself to showing the impact of the importance of the Security Council on the effectiveness of the UN collective security system.

It will be a truism to say that within the UN it is the Security Council that plays a special role. It is the guarantor of the still most effective institutionalisation of the legality of collective response procedures under the UN Charter. The author shows the special role of the Security Council in maintaining or restoring international peace and security, resulting from the content of Article 42 of the United Nations Charter. The aim of the work is also to try to assess to what extent the military and political competences of the UN Security Council, although unprecedented in legal and international terms, are paradoxically unable to make the Security Council an effective guarantor of

collective security. The author refers to the practical dimension of the effectiveness of the UN Security Council, mainly in terms of civil wars in the Syrian Arab Republic and Libya.

The impact measures by UN Security Council - selected aspects

As the author pointed out in his earlier deliberations, referring to the issue of differentiation of legal systems of collective security, Article 51 of the United Nations Charter "enables the institutionalization of the legitimacy of collective response procedures". (Kowalski 2019). The Council's responsibility is derived both from Article 51, which states that: "Measures taken by Members in the exercise of this right of self-defence shall be immediately reported to the Security Council and shall not in any way affect the authority and responsibility of the Security Council under the present Charter to take at any time such action as it deems necessary in order to maintain or restore international peace and security" and Article 42 of the UN Charter, which includes the competence of the Council to use the formula for military intervention (UN Charter). Ian Hurd points out that " (...) the Council has an unassailable position atop the international legal hierarchy. The Charter grants it the authority to decide what situations constitute threats to international peace and also the right to determine what, if anything, should be done about that. This includes the right to order military intervention against a UN member, and the domestic sovereignty of a target state is no impediment. In signing the UN Charter, all UN members are committed in advance to carrying out the Council's decisions" (Hurd 2014). A similar view in legal doctrine is also expressed by Boubacar S. Diallo, pointing out the key role of the Security Council in the security system that is represented by UN (Diallo 2018). With regard to the specific role of the Security Council in maintaining or restoring international peace and security, it should be stressed that the Council prioritises the use of peaceful means over military ones. The obligation to settle international disputes peacefully follows directly from the content of the Charter and applies not only to the Security Council but also to the Member States of the organisation see Article 2 sec. 3 (UN Charter).

The UN Charter contains a specific mandate for the Security Council's peacekeeping and security activities, making this body a depositary of powers to draw on the vast military resources of UN Member States. However, there is no doubt that in the face of further challenges to be faced by the Council, these military resources, while allowing for potentially effective interventions, are often of an abstract nature. Both the international community and UN Member States are increasingly reserved about potential opportunities to address further threats to the international order. Suffice it to recall that the current bloody civil war in the Syrian Arab Republic is entering its ninth year and that the conflict in Libya, which has been going on since 2014, has already been called 'Second Civil War'. (Ilardo 2019). Therefore, the bloody conflicts indicated above and selected from among others, cast a shadow over the long criticised effectiveness of the Security Council. This criticism is reinforced by the fact that in both cases, the implications of these conflicts, especially the unrestrained waves of refugees resulting from the humanitarian crisis in these countries, directly affect the level of security in Europe. The scale of the problem is illustrated by the data. For example, according to data, presented by United Nations High Commissioner for Refugees, on the consequences of the Syrian conflict, which are referred to by Human Rights Watch: "Years of relentless fighting left 6.6 million displaced internally and 5.6 million around the world" (hrw.org).

The sanctions available to the Council for possible violations of international peace and security include numerous peaceful measures, in particular the adoption of resolutions, the imposition of economic sanctions, the sending of observation missions and the possibility of military sanctions. The latter can be implemented by Member States' armed forces, but under the aegis of the United Nations. It should be borne in mind, however, that the Council's functionality in this area is in practice not due to the scale of human rights violations, for example in the cases of internal conflict referred to above, but rather, (...) from both de jure and de facto voting in the Security Council'. (Kowalski 2019). The armed conflicts in the Syrian Arab Republic and Libya are therefore a kind of *vote* of no confidence in the effectiveness of the Security Council as the key body of the most important collective security system in the world. Therefore, it is not surprising to criticise the Council's conduct in the context of the above-mentioned challenges.

Effectiveness of the Security Council in the context of the armed conflict in the Syrian Arab Republic

The example of armed conflicts, especially the one in the Syrian Arab Republic, shows both the complexity of contemporary international relations and the specificity of the powers' influence on the parties to the civil war. Anne Barnard and Karam Shoumali analyzing the ongoing proxy war in Syria between the United States and the Russian Federation, pointing out that supplying arms to the parties in the civil war: "have raised morale on both sides of the conflict, broadening war aims and hardening political positions, making a diplomatic settlement all the more unlikely" (Barnard, Shoumali 2015). The result of the involvement of the powers in this conflict is the formation of regional alliances aimed at achieving both military and political objectives. The participants of the alliances are both state and non state actors, see the Russia-Syria-Iran-Hezbollah axis (Khouri 2018). The cooperation between the United States and the Syrian Democratic Forces (Balanche 2018), which runs until 2019, should also be mentioned.

These realities mean that the rival powers, whether regionally - Middle East or nationally - Syria, do not in practice seek to ensure effective cooperation at the United Nations. This, in turn, raises problems of international law enforcement in relation to the fundamental principles of international law, especially respect for state sovereignty. Furthermore, it should be stressed that this issue concerns the involvement of the permanent members of the Security Council who have a veto right under the Charter of the United Nations. So it makes the whole situation almost paradoxical. It would be naive to think that the powers with the power to impose sanctions and with the right of veto would be subject to self-restraint.

It is not surprising, therefore, that some researchers are pessimistic that the starting point for a more effective use of the potential available to the Member States of the United Nations is now to focus on the procedural changes enshrined in the United Nations Charter. This means reviewing the Charter *de iure* and *de facto* Matuš Štulajter points out that: “However, due to the current power structure within the United Nations, it is only possible to argue about proposed innovations and changes. Current events in Ukraine and Syria clearly indicate that it is necessary to envisage the amendment of the UN Charter, its sanctions and enforcement mechanisms (…)” (Štulajter 2017). It is also a problem to bring motions for resolutions to the Council's deliberations, in particular by its permanent members, in an instrumental manner, in full knowledge that the motion will be rejected by the countries that are the adversaries on the matter. This view is presented in the doctrine of, among others, Muharrem Eksi, indicating that the powers deliberately bring issues related to the Syrian civil war to the Security Council, in full knowledge that other permanent members of the Council will oppose such initiatives (Eksi 2017). In this way, individual countries are trying to create a picture of their opponents as not interested in solving the humanitarian crisis in Syria. Similar conclusions are reached by Hafeez Ullah Khan and Waseem Khan, stressing that not only the countries of the region but also the major powers are to blame for the nightmare unfolding in Syria (Khan, Khan 2018).

It is significant that the rivalry shown above between the permanent members of the United Nations Security Council takes place within a body that often sees itself as the hub of values emanating from the United Nations Charter. Although the Council does not deny the effective exercise of the function of a kind of global legislator - for example Council Resolution 1373 of 28 September 2001 on combating international terrorism (S/RES/1373(2001)), as well as imposing certain obligations on Member States (Kowalski 2019), paradoxically, the greatest difficulties are generated in the Council by its permanent members denying the adaptation of legal, both legal and substantive competences to the present day. In the light of the findings so far, it should be clearly stressed that the greatest obstacle to reviewing the content of the United Nations Charter beyond the will of the States forming the United Nations system is, paradoxically, the very construction of the Charter. This unique piece of legislation, which is unique in international law, obviously contains a procedure for amending the content of the Charter, see Articles 108 and 109 (UN Charter). After all, both the ordinary procedure for amending the UN Charter by means of amendments - Article 108 - and the special procedure for the revision of the Charter - Article 109 - must be unanimously ratified by all the permanent members of the Security Council for the amendments to enter into force. At present, it seems reasonable to

assume that the change in the content of the Charter expected by some Member States, in particular the number of permanent members of the Security Council with a right of veto, will not take place in the coming years. It is worth noting that this issue is part of a dispute that has been going on for decades, during which some researchers raise arguments about the lack of representativeness and the lack of democratic character of the Security Council (Talmon 2005).

Conclusion

In conclusion, it should be noted that the long-standing armed conflicts in Syria and Libya are milestones that show that, on the one hand, the UN and the international community are not able to use effectively the enormous potential for influence, including military influence, of the Member States. On the other hand, the mechanism currently in place to legalise the use of force on the basis of decisions of the Security Council based on Article 42 of the Charter of the United Nations has led Council members, especially steel members, to often put particular issues before the responsibility of the Security Council for maintaining international order. These problems can be emanated, for example, by the results of the votes in the Security Council relating to the adoption of certain resolutions concerning Syria. For example, the well-known Security Council proposal for a resolution on the humanitarian disaster in Syrian Alleppo in 2016, vetoed by the Russian Federation (S/2016/846), should be mentioned. On the other hand, it should be noted that the Council, as a kind of emanation of the international community, often manages to adopt resolutions which have a significant practical impact in reducing the intensity of certain conflicts. In the context of the Syrian conflict, it was important to adopt unanimously (sic!) on 27 September 2013 Resolution 2118, which enabled the dismantling of the Syrian chemical weapons arsenal (S/RES/2118). This success, however, cannot conceal the problem of the instrumental treatment of the right of veto by permanent members of the Council.

This problem is in line with the need to reform the Security Council, which has been postulated for many years by both states and representatives of the doctrine of international law. In particular, the issue of extending the number of permanent members of the Council with a veto right should be addressed. This problem is pointed out by many researchers according to whom the key to the effectiveness of the collective security system is the International Security Law system (Nasu 2011). Eugenia Lopez - Jacoiste underlines that the problem of the delimitation of the Council's competences in Chapter VII of the United Nations Charter is not a new challenge, but an impediment to the exercise of the Security Council's powers. “The debate on the scope of the Council's powers in particular has been ongoing since the establishment of the United Nations. As alreadysaid, the Council's powers under Chapter VII are quite broad, but neverthless are also subject to limitations” (Lopez – Jacoiste 2010). According to Longin Pastusiak: “One way to strengthten the Security Council would be to establish new equitable representation. The question of equitable representation in, and an increase in the membership of the Security Council is of utmost importance to the future of the United Nations and its role in maintaining international peace and security” (Pastusiak 2010). There is a clear convergence between the material and legal powers of the Security Council under the UN Charter and the lack of response by the international community in situations of armed conflict. It seems reasonable to assume that until the UN Charter is amended, the effectiveness of the Security Council's work will continue to be criticised. It should be remembered that the power structure between the then powers in 1945 does not translate into today's reality. The fundamental principles of the United Nations' collective security mechanism, which have remained unchanged for 75 years, need to be enriched with new ways of addressing the challenges to international order and peace, especially as the challenges to the international community continue to evolve.

Abstract

The abuse and illicit trafficking of narcotics in Indonesia from year to year are increasingly agitating. Currently, the drugs penetrating students' circle. The purpose of this study is to analyze the self-management of high school and vocational high school students in drug-prone areas, so they are not exposed to drugs. This research employed descriptive quantitative research methods and surveys with questionnaires. The results showed that students' self-management is determined by age, living with parents, extracurricular activities, smoking activities, brawl/fighting activities, academic/non-academic achievements, drug consumption, and drug socialization.

Keywords: Drug-Prone; Narcotics; Self-Management; Student.

Introduction

The abuse and illicit trafficking of narcotics in Indonesia from year to year are increasingly agitating (BNN, 2018). Data from the Indonesian Child Protection Commission (KPAI) revealed that during 2017, there were around 22 cases of children who became drug couriers. Still, in the same year, there were about 46 children who were victims of drug abuse (KPAI, 2018). Student problems related to drugs have an impact on the sustainability of the school. Drug user students will experience mental health disorders and commit criminal acts (Maynard, Salas-Wright & Vaughn, 2015). Drug use in school-age children often occurs because of a lack of knowledge about these substances. The prevalence rate of narcotics abusers in Indonesia is 1.77% of the total population (BNN, 2018). The high prevalence rate of narcotics abuse in Indonesia is a form of threat to the current educated young generation.

Depok city has been declared drug-prone with the potential of drug trafficking and drug abuse. The number of drug abusers among students at all levels of the school in Depok city is 3.1%, which is quite high. Parents play an essential role in preventing drug use and related dangers among adolescents. Childcare interventions are also identified as crucial components of effective prevention programs (Thornton *et al*., 2018). Aside from parents, schools must be able to prevent school-based prevention by conducting comprehensive supervision (Midford *et al*., 2014). Furthermore, the self-management of students is also required to prevent drug abuse at schools. There is no research focused on drug-prone areas in Depok City yet. Specifically, high schools and vocational schools in drug-prone areas have the potential to be exposed to drugs.

Methods

This research has been conducted at Senior High School (SMA), and Vocational High School (SMK) in the drug-prone areas of Depok City, Pancoran Mas district has been selected among 11 districts within Depok City. The study utilized a qualitative method with student surveys. The sampling

technique was non-probability sampling, using convenience sampling. The sample of the study is 5% of the population, which is 129.5 or about 130 respondents from five high schools and six vocational high schools in Pancoran Mas district. Respondents filled out questionnaires, and the data has been tested for validity and reliability using the IBM SPSS application.

Result and Discussion

The valid questionnaires obtained from 150 respondents out of 162 total respondents who participate in the research. The rest of the respondents (12 respondents) did not complete the questionnaire. All respondents were from three high schools and five vocational schools in Pancoran Mas district, with different numbers of respondents in each school, as shown in Table 1.

Table 1: Questionnaire distribution of high school (SMAS) and vocational school (SMKS) students in Pancoran Mas district

NO	SCHOOL NAME	STATUS	RESPONDENTS COUNT
1	SMAS Muhammadiyah 1	Private	14
2	SMAS IT Nurrurahman	Private	26
3	SMAS PSKD VII	Private	8
4	SMKS Setia Negara	Private	18
5	SMKS Baskara	Private	37
6	SMKS Fajar Depok	Private	35
7	SMKS Kesehatan Bhakti Insani	Private	7
8	SMKS Galang Farmasia	Private	5
TOTAL RESPONDENTS			150

Characteristics of respondents from five vocational schools and three high schools in drug-prone areas were 65% female students, and 35% were male students. Physical characteristics of men and women can influence self-management, including aggressive behavior (Santrock, 2007). The results showed that women were wiser in doing things compared to men (Siegel & Spiegel, 2011). Women are more likely to be gentle, affectionate, and sympathetic compared to behaving aggressively. Thus, it means that the possibility of women aggressively behaving is less than men (Hasan, 2014).

The survey results showed that only 3% of respondents admitted that they did not live with their parents. Two out of five respondents explained that they lived with their siblings, and the rest did not explain their situation. This condition can be concluded that high school and vocational school students in drug-prone areas are not easily exposed to drugs because 97% of them have an intact family. At such a young age, students require direction and attention from their parents to provide comfort and guidance (Wang & Fredricks, 2014). Hirschi & Gottfredson, (2017), in their theory of social control, says that delinquency arises when social ties are weak or absent. It takes attachment of parents in controlling a child's emotional factors, especially during the adolescent phase. Children do this attachment with parents, school, and peers, including parental supervision, communication quality, togetherness, parents' understanding of their children's friendship and beliefs (Breslau, Miller, Joanie Chung, & Schweitzer, 2011; Dockery, 2012).
Respondents who live with their parents certainly feel more comfortable while getting more intense supervision than those who do not live with parents. If parenting patterns of adolescents involve adolescents' warmth and control, then parental efforts to control adolescents may experience collisions with adolescent desires for autonomy (Papalia, 2015). Some parenting patterns also offer

warmth to adolescents, so parents can communicate their intentions and goals in controlling adolescent behavior well.

Parents can help protect their children from any possibility that may happen in the future (Yap, Cheong, Zaravinos-Tsakos, Lubman, & Jorm, 2017). Family conflict causes divorce and separation, which affects the stability of family and children. Further research shows that students from unstable family backgrounds are more likely to abuse drugs than those who have stable family backgrounds (Barasa, 2013).

Survey results show that 62% of students attend extracurricular activities in their schools, while the 38% remaining do not participate in extracurricular activities. The above findings are under one of the social bond theories developed by Hirschi & Gottfredson (2017), namely involvement. Children's involvement is related to how much time a child spends interacting with other individuals in an activity. If the right interaction with an activity or a person, such as sports, arts, and other activities that are predominantly carried out by the children, the possibility of performing delinquent behavior will be even less. Conversely, if improper interactions and activities such as skipping class, fighting, conflict with parents, stealing, etc., are things that children experienced often, then delinquency will be more easily formed.

The data reveals that 20% of respondents have smoked. Students explained that they had smoked since elementary school age because their peers influenced them. Many will continue to use tobacco even during abstinence from other drugs and alcohol, which often leads to smoking-related illnesses (Marsiglia, Wu, Ayers, & Weide, 2019). Campaigns and outreach on smoke-free laws can support helping to create a smoke-free environment (Thrasher *et al*., 2011).

The survey indicates that 77% of respondents are never fighting or caught brawling, while as many as 23% of respondents were involved in fighting or brawling. Respondents who had fought were respondents who came from SMK (STM) and were dominated by male students. Drug-user students will experience mental health disorders and commit criminal acts (Maynard *et al*., 2015). In addition, there are 57% of students who have received achievements. The teachers who always acknowledge the students' presence at school are a form of concern from the teacher for the sustainability of the students' academic achievement. Regular student attendance can reduce the severity of the crime and drug abuse (Nardi, Cunha, Bizarro, & Dell 'Aglio, 2012). There are 36% of respondents who have taken drugs without a doctor's prescription. Some respondents explained that the drugs they took without a doctor's prescription are drugs that are sold freely, such as paracetamol and sort of.

The survey explains that 49% of respondents had participated in the socialization of the dangers posed by drugs. One of the efforts to prevent drug abuse in schools is by continuously socializing the risks of drugs for students by conducting various methods such as training, lectures, discussions/ talk shows, film screenings about drugs, leaflets and performing arts (Das, Salam, Arshad, Finkelstein, & Bhutta, 2016). It also collaborates with research conducted by Das *et al*., (2016), which found that among smoking/ tobacco interventions, schools have been conducting school-based prevention programs. Family-based intensive interventions usually address family functions that are effective in reducing smoking. Students are part of young people who have a great desire in social interaction in the school environment and outside the school environment, namely the community.

Conclusion

The result findings are 65% of respondents are female students, 97% of students have intact family, 62% of students attend extracurricular activities in their schools, 80% of students never smoke, 77% of respondents never fight/brawl, and 49% of students have participated in drug socialization. Thus, there are several determining factors of self-management, namely age, living with parents, extracurricular activities, smoking activities, brawl/fighting activities, academic/non-academic achievements, drug consumption, and drug socialization. In addition to self-management, schools are

also encouraged to play a multidimensional role in tackling the problem of drug abuse among students. Anticipation of the school against drug abuse among students is absolutely necessary.

Material Supplies to Companies in The Metal Industry

Ewa STANIEWSKA

Czestochowa University of Technology, Czestochowa, Poland
ewa.staniewska@pcz.pl

Abstract

The paper presents the results of research on the supply of companies in the metal industry in terms of creation relations in supply chains. The research was carried out using a proprietary survey questionnaire and covered companies operating in Poland. The issues examined included: assessment of the impact of effective cooperation with suppliers, actions taken to increase the effectiveness of supply tasks, estimated share of supply costs in total costs, the number of suppliers, actions taken in cooperation with suppliers, factors conducive to effective cooperation, elements of supply risk and methods of its reduction, supplier assessment criteria, and causes of conflicts in the area of supply.

Keywords: Material Supplies, Metal Industry, Cooperation with Suppliers, Supply Risk

Introduction

The basic objectives of supply resulting from the general objectives of companies, i.e. to achieve competitive capacity in the market and a certain level of profitability, are related to the significant economic importance of supply and its impact on costs, but also on efficiency, quality, and reliability of deliveries. This forms the basis for viewing supply as an important function in companies with a significant impact, but above all as an area with considerable potential for changing competitiveness. It can result from creation of market links with partners that are durable, reliable, flexible, and capable of continuous development within integrated supply chains. Supply in today's market economies is therefore of a strategic nature, which requires adaptation to the business strategies of buyers and management of the structure and culture of relations within the functioning supply chains. The tasks related to supply are carried out on all levels of management, from operational to strategic, covering entire supply chains. Such an integrated approach is the basis for a change in the approach to task performance in the direction of teamwork and sharing of experience and knowledge. Supply in companies should therefore constitute a comprehensive system adapted to the type of activity and industry, the scope of the tasks performed, and the nature of the relations with suppliers. The research was conducted in order to identify and evaluate the implementation of supply-related tasks in production companies in Poland’s metal industry. The motivation to undertake the research is the significant share of costs of materials in the general costs of businesses in the metal industry and the need to identify areas where there is potential for broadly defined improvement in the area of supply, as well as to identify limitations and barriers to creation of relationships with suppliers.

Literature Review

According to K. Lysons (2004), the factors that determine the role of supply in businesses are the impact of supply on the expenditures of businesses and the importance of its effectiveness for the competitiveness of businesses. As stated by C. Bozarth and R Handfield (2007), supply involves a number of activities related to identification of needs, identification and selection of suppliers, negotiation of terms, etc. Cost is not the only relevant factor to be taken into account. The goods and services purchased can have a major impact on various dimensions of performance, including quality, reliability of deliveries, and the ability of companies to exploit new technologies. The role of supply purchases from the point of view of companies has changed and evolved from a typically transactional function to a strategic function. As stated in P. Fung (1999), purchases include strategic purchases, alignment of the performance of suppliers with the business strategies of the buyers, management of

the supplier base, management of the structure and culture of the relationships with suppliers and cost-effective organization of deliveries, and creation of flexible organizational structures supported by effective information systems. An important aspect of such a strategic approach is the sharing of management experience throughout the supply chain. However, in order to achieve such a goal, it is necessary to undertake, as indicated by Ch. Ellegaard and Ch. Koch (2014), internal integration measures which constitute the first stage of improvement. They consist in mitigating the conflict of objectives in functional units and help avoid suboptimization. The next stage is shaping of the relations with business partners as a potential for improvement of the broadly defined quality and increase of the value offered to the final customer through optimal use of financial resources, reduction of the funds invested in stocks, and ensuring the continuity and reliability of deliveries (cf. M. Haensel, E. Hofmann (2018)).

The structure of expenditures related to purchases of supply goods depends on the type of activity and the industry. The supply organizations in different companies should constitute a comprehensive system adapted to the type of activity and industry, the scope of the tasks performed, and the relations with suppliers. In the case of companies in the metal industry, due to the significant share of supply costs in total costs, this plays a strategic role, as indicated by W. Waszkielewicz et al. (2005) and E. Staniewska (2007). The primary purpose of supply is to ensure availability of materials, which contributes to the achievement of the assumed level of customer service, optimization of planning and use of resources and costs incurred, and as a consequence, to increase the market value and the profit of the company. As indicated by A. Agrawal (2014), active management of sourcing of materials can increase the value of the supply chain. At the same time, the consequences of a failure to quickly respond to market signals, especially in the case of strategic materials, are indicated by G. Gaustad et al. (2018), E. Alonso et al., and Kirchain R. (2007).

The basic decision affecting the competitive advantage, in the opinion of J. Rezaei et al. (2016), is to define the strategies for the selection of the supplier, which may take into account different assessment criteria. An important role can be played by outsourcing which, according to H. Wee et al. (2010), depending on the industry, may be crucial to ensure the competitiveness of the company. In many cases, an advantageous solution may be a reduction in the number of suppliers, which, according to D. Song et al. (2014), may provide a basis for improving the effectiveness of cooperation with suppliers. However, it requires the establishment of long-term relationships with suppliers based on partnership principles. An additional advantageous consequence of creation of relationships with suppliers may be their involvement in the process of development of new products, as indicated by K. Petersen K. et al. (2005). As pointed out by A. Agrawal et al. (2014), one of the important opportunities for acquiring knowledge in the area of supply can be the implementation of the concept of a sourcing center proposed by the authors, which is a center of cooperation between the company, its suppliers, and the suppliers of raw materials.

In the area of supply, risk management has been an important issue that has been very widely discussed in recent years in the literature on this subject. A detailed and comprehensive review of work in the area of risk management in a supply chain has been presented by, e.g. Ho et al. (2015), Tang and Musa (2011), and Rao, Goldsby (2009). The need to implement the risk management concepts in the supply chain stems in particular from the globalization of operations, the implementation of the lean management concept, and the need for flexibility. Many authors have attempted to identify the risk factors in the area of supply, e.g. Zsidisin and Ellram (2003), Kull and Talluri (2008), Chopra and Sodhi (2004), Gaudenzi and Borghesi (2006), Wu et al. (2006), Tummala and Schoenherr (2011), Samvedi et al. (2013). The risk factors in the area of supply include: demand volatility, quality and flexibility assurance, dependence on a supplier, supplier's market power, limited number of suppliers, risk related to the choice of supplier, lack of price competitiveness, monopoly, outsourcing, risk of a supplier's bankruptcy, one supplier, lack of integration with suppliers, problems related to the implementation of contract terms and conditions, lack of compliance with delivery requirements, low technical reliability, lack of timely deliveries, errors in deliveries, sudden increase in costs, lack of cooperation transparency, the supplier's opportunism, low technological competitiveness, and management problems.

Cooperation in the supply chain, as pointed out by Speier et al. (2011), requires a detailed threat analysis and a focus on actions intended to mitigate and limit the possible effects of risks, as well as initiatives such as process management, information sharing, partner/supplier relationship management, and enhanced trust in relationships, as indicated by Christopher and Lee (2004). However, this requires managing the relationships with partners through integration, as indicated by Wiengarten et al. (2016), as an important factor for productivity gains resulting from implementation of effective risk management practices.

Research Question

The research objective is associated with the following research questions:

- What was the assessment of the level of influence of cooperation with suppliers on the effectiveness of the entire supply chain?
- What is the estimated share of supply costs in total logistics costs?
- How many suppliers do companies in the metal industry cooperate with and what are the main criteria for their assessment?
- What factors are conducive to effective cooperation with suppliers?
- What are the risks of cooperation with suppliers and what are the methods that help mitigate them in business practice?
- What are the root causes of conflicts in the area of supply?

Answers to these questions made it possible to assess the role of supply in achievement of the objectives of businesses, as well as to identify the factors that influence the assurance of effective cooperation in supply chains.

Research Design and Methodology

The research that formed the basis of this paper was carried out by means of a proprietary survey questionnaire, which comprised questions concerning the characteristics of the surveyed companies: the size and the scope of operations, the capital engaged, the industry, the organizational maturity, and the research problems undertaken. The survey questionnaire contained closed-ended questions with the possibility of extending or supplementing some answers. The survey questionnaires were completed by the target respondents, who were people in management positions, mainly from the area related to logistics, supply chain management, or other related areas (e.g. procurement, production). The results obtained were subjected to a quantitative and qualitative analysis and formed the basis for conclusions.

The selection of the study sample was intentional and targeted at companies in the metal industry, covering the broadly defined metalworking sector, i.e. production and processing of steel and steel products. The research was conducted in 50 Polish companies (did not include micro-businesses) in 2017-2019. The detailed structure of the surveyed businesses in terms of size, type, scope of operations, ownership, engaged capital, and length of existence in the market is presented in Figure 1.

Fig. 1: Characteristics of the surveyed businesses

A majority of the surveyed businesses were mature enterprises present in the market for 6-20 years (50%) and longer (40%). In terms of type of operations, the largest group was manufacturing companies (88%). In terms of range of operations, 66% were companies operating in the international market. The basis for financing of 60% of the surveyed companies is Polish capital.

Results

The first of the examined issues concerned the impact of selected aspects related to running a business on the increase in the effectiveness of supply chains. Factors such as sales and customer service issues, internal integration of activities, flexibility, innovation, logistics processes, knowledge management, the importance of outsourcing, etc. were taken into account. To the 17 factors indicated in the questionnaire, the respondents assigned ratings using the 5-point Likert scale, on the basis of which the results were elaborated using the ranking method. Based on the results obtained, it can be concluded that the assessment of the factor *Effective cooperation with suppliers* is an important element of value creation in supply chains. This factor ranked second (after the sales growth factor) as one of the most important factors in the opinion of respondents from metal industry companies. The detailed result of the assessment is shown in Figure 2. Another factor rated highest in the ranking was the creation of customer relations. This confirms the important role of supply in this type of operations and the relations with business partners as the basic elements of value creation in supply chains.

Fig. 2: Assessment of the impact of effective cooperation with suppliers in value creation

The importance of supply results from the significant share of raw materials and materials in the total costs of companies in the metal industry. In the research conducted, the respondents were asked to estimate the cost of raw materials and materials. The results indicate that it represents on average 59% of total costs of the surveyed metal industry companies.

Another piece of information obtained as a result of the research was the number of suppliers with which the companies cooperate. The main factors that determines the number of suppliers are usually the size and scope of the company's businesses. The number of suppliers with which the surveyed metal companies cooperate is shown in Figure 3.

Fig. 3: Number of suppliers

The number of suppliers most frequently indicated by the respondents is in the range of 26-50. Few (8%) companies cooperate with more than 250 suppliers and this is especially true for very large metallurgical companies.

An important issue in creation of relationships is the choice of supplier selection criteria. The research included more than 20 assessment criteria, which were evaluated by the respondents using a 5-point scale and the results formed the basis for the ranking of the criteria. The most important criteria for the evaluation of suppliers in metal industry companies are: quality, price, reliability of deliveries, comprehensiveness of the offer, and positive cooperation to date. Next in the ranking were such criteria as service level, supplier's length of presence in the market, timeliness of deliveries, payment terms, service provision, way of dealing with disputable issues, good financial condition of the supplier, willingness to cooperate in the long term, technological flexibility, and provision of delivery transport. The criteria whose importance in the evaluation of suppliers was rated by the respondents as the lowest include: brand, audit results, ISO14000 certificate, informal contacts, possession of approvals, possibility to test the products, ISO 9001 certificate, and distance from the supplier.

Another aspect of the research was to determine the nature of relations with suppliers, taking into account the type of contracts concluded and their time range. The results of the respondents' indications lead to the conclusion that in 58% of metal industry companies relations with suppliers are characterized by long-term nature and refer to long-term cooperation, while in 34% of companies short-term agreements with suppliers were indicated. Only 4% of the companies are supplied on the basis of regular buy-sell transactions and another 4% indicated a lack of relations with suppliers.

The scope of cooperation with suppliers and the creation of relationships depends on factors that determine the scope of cooperation, including such strategic aspects of material supply as share of materials in total costs, regularity of demand for materials, and risk related to supply. The use of the ranking method and of assessment with the use of a 5-point Likert scale was the basis for the conclusion that the importance of materials for production is the basic determinant of the choice of strategic business partners, followed by the share of material costs in total costs and regularity of demand, while the risk related to the availability of materials was assessed by the respondents as the lowest.

Another element in the evaluation of relationships of metal industry companies with suppliers was the assessment of factors that are conducive to cooperation and creation of lasting relations. The use of the ranking method and the 5-point Likert scale made it possible to rank the factors which positively influence the creation of relationships, in the following order of importance:

1. Previous experience of cooperation.
2. Common objectives and points of view.
3. Common competitors.
4. Common end-users.
5. Possibility of exclusive cooperation.
6. Similar values.
7. Similar bargaining power.
8. Similar organizational culture.
9. Similar philosophy and managerial techniques.
10. Physical proximity.

Another issue concerning the analysis of cooperation with suppliers was the actions undertaken in relationships with suppliers. The results obtained are shown in Figure 3.

Fig. 3: Integration activities undertaken in relationships with suppliers

One of the activities in the area of supply in metal industry companies most frequently indicated by the respondents is analysis and assessment of the supply risk. It is also important to reduce the number of suppliers, which may indicate an awareness of the important role of creation of relationships with suppliers based on lasting relationships and partnerships. At the same time, only 26% of respondents indicated that they created partnership relationships with suppliers, while only 16% indicated that they were involved in decision-making. Figure 4 shows the methods and concepts related to cooperation with suppliers and used in metal industry companies.

Fig. 4: Concepts used in relationships with suppliers

The surveyed companies most often indicated use of the Just in Time philosophy in their relationships with suppliers (36%); at the same time, it can be noted that 28% of metal industry companies use the CPFR technique, which enables improving the quality of forecasting and cooperation of companies in supply chains. The Single Sourcing model is used in 20% of the companies.

An important element of cooperation with suppliers, as indicated in Figure 3, is the proper preparation for disturbances. This primarily involves identification of risk elements. The results of the assessment of the role of the selected risk elements on the performance of the process of supply in cooperation with suppliers are shown in Figure 5.

Fig. 5: Risk elements in relation to suppliers and their role in terms of consequences

The assessment of risk elements using the ranking method allows to rank the indicated risk factors from the most important ones and to indicate the most important elements of supply risk, which include quality problems, increase in material prices, and information flow problems.

Another element of the assessment of cooperation with suppliers was the risk assessment methods used by the surveyed companies. The results of the respondents' indications are shown in Figure 6.

Fig. 6: Supply risk reduction methods

The most frequently indicated ways of reduction of the supply risk in the surveyed metal industry companies are numerous sources of supply, long-term contracts with suppliers, extensive selection system, certification and evaluation of business partners, and development of plans for responding to disturbances. At the same time, one of the least frequently indicated methods is risk reduction through stock building.

Further analysis of cooperation with suppliers concerned the causes and the frequency of conflict situations and the results obtained are shown in Figure 7.

Fig. 7: Causes of conflicts with suppliers and their occurrence

The most frequently indicated cause of conflicts and problems is delays in deliveries (34 indications in total). The frequency of their occurrence was also assessed by the respondents as the highest. Although the high number of indications concerned problems with the quality of deliveries, the frequency of occurrence was assessed as very rare. It should also be emphasized that a significant number of the respondents (depending on the cause of the conflict), indicated that conflict situations do not occur or did not indicate their frequency (66-74%).

Discussion

Changes in the environment determine the actions aimed at increasing competitiveness and ensuring an appropriate level of safety of the processes performed. Gaining an advantage in the market does not involve competing with individual companies but with entire supply chains or even supply networks. As M. Hugos (2011) states, one of the biggest challenges, and at the same time one of the biggest opportunities to stimulate the growth of companies is to build sustainable and efficient supply chains that can gain competitive advantage in their markets. The aim of cooperation is to benefit all the links in the supply chain as a result of optimization of the processes taking place in it, which is different from traditional cooperation between companies where the aim of the actions taken is to achieve individual benefits. Other features of cooperation in a supply chain include a larger scale of cooperation, a longer time horizon, and more partners than in the traditional approach. The benefits of cooperation in a supply chain include the possibility of improvement, whereby the first stage of improvement, referred to as internal integration, consists in mitigating conflicts of objectives in functional units and helps avoid suboptimization. The second stage concerns external partners, i.e. relationships in the supply chain, and consists in the implementation of joint projects to improve common processes in the supply chain. These activities form the basis for sustainable and, above all, stable supply chains, the aim of which is to ensure the safety of the implemented processes and to create value for the customer. The basis for ensuring stability is identification and analysis of the risk in order to counteract emerging problems resulting from the cooperation and the processes. Awareness of the role of partners in the supply chain and identification of risks and factors that determine relationships is important in this respect.

Study Limitations

The results of the research presented in the paper are limited to cooperation with suppliers. An important element in the analysis of customer value creation and cooperation within supply chains is the assessment of cooperation with customers. In a free-market economy and in a highly competitive environment, it is important to assess cooperation with customers, but above all to analyze risks and assess the possibility of establishing long-term stable relations with them that affecting the safety of entire supply chains and their individual links. It is important and justified to complement the research with results concerning the broadly defined cooperation of companies in the metal industry within their supply chains. The analysis of relations in the supply chain has been limited to the connections between contractors/links in the chain, however, social and environmental aspects are also worth considering. An important aspect of the functioning of supply chains is risk analysis, which, however, has been limited in the study to risk factors in terms of relations with contractors.

Conclusion

Supply is a basic function of businesses and one of the functional areas of businesses that is responsible for the effective flow of supply goods from suppliers to their recipients. The relationships between businesses and their suppliers provide a potential for increase in the value for partners but also for the end customers as a result of cost reduction and optimal quality shaping to ensure continuity and reliability of deliveries.

On the basis of the research concerning the execution of the supply function in metal industry companies, it can be concluded that the surveyed businesses see an important role of effective cooperation with suppliers in creating value. This is mostly due to the significant share of raw materials and materials in the total costs of companies in the metal industry. These companies most often cooperate with a significant number of suppliers, while at the same time almost a half of the respondents indicated that they take measures intended to reduce the number of suppliers. Positive experiences from cooperation and common goals are the basis for creating relationships with suppliers. In the surveyed companies, an important role is played by risk analysis in the area of ensuring continuity of supplies and implementing methods and concepts aimed at eliminating the risk. These actions may reduce the occurrence of conflict situations in the area of cooperation with suppliers.

Management of Available EU Funds and The State of Municipal Waste Management In Poland

Ewa BIEŃ

Czestochowa University of Technology, Czestochowa, Poland

ewa.bien@pcz.pl

Abstract

Municipal waste, although it accounts for less than 10% of all the waste produced in the EU in a year, is a very high-profile issue, and managing it in an ecologically rational way can be a huge challenge due to its non-homogeneous composition. The current activities of the European Union aim towards a circular economy. Consequently, the member states are required to implement specified measures and prioritise prevention, reuse and recycling activities over landfilling and incineration. The recycling and landfilling targets set for the next years represent an ambitious path for a better municipal waste management in Europe. The aim of the publication was to examine whether the available EU funds in the current EU budgeting period 2014-2020 are fully used for investments, thus showing effectiveness or ineffectiveness of management in economic entities, and how these activities impact the state of municipal waste management in Poland. Quantitative methods, including classic descriptive statistics and taxonomic methods based on a linear ordering of objects, were used for the research. The effectiveness of EU funds management was examined in a general way as well as within an environmental dimension through result indicators , broken down into categories by regions. The obtained values of the indicators at the current stage of the conducted analysis are not satisfactory, and that indicates a low level of effectiveness of management and illustrates the fact that much more remains to be done to improve the state of municipal waste mamagement.

Keywords: Management, Effective Fund Management, EU Funds, Municipal Waste Management

Introduction

The quantity of generated municipal waste depends mainly on a society's consumption model and environmental awareness. Prevention of food waste alone makes a significant difference for the environment (Gentil et al., 2011). Each of us produces a large amount of waste, which we usually forget about once we throw it away. However, we should avoid perceiving waste in this way and remember that it can be reused. The best ways of managing waste problems through recycling, incineration, landfilling and other processes were addressed extensively in a book by Trevor Letcher and Daniel Vallero (2011). However, waste management activities can be hindered by a problem no less grave that waste itself, namely costs. Economic entities' awareness of the sources of financing environmental investments and appropriate use of such resources provide a chance for changes, and consequently improvement of the state of the natural environment. Thus, it should be pointed out that the current system of financing waste management undergoes constant changes as a result of the transformations taking place in the country's economy. Lack of sufficient own funds significantly blocks the possibilities of undertaking necessary investments. This is the reason for continued importance of EU funds, which received as subsidies do not constitute an additional burden on local communities benefiting from the effects of such investments. The aim of the publication was to examine whether the available financing system based on EU funds functions in an efficient way, allowing necessary municipal waste management investments to be implemented in order to improve the state of the natural environment in Poland and whether the available EU funds allocated for such activities are fully used in the current budgeting period 2014-2020 by economic entities, thus showing effectiveness or non-effectiveness of the way they operate.

The State of Municipal Waste Management In Poland and The European Union

The main purpose of waste management is to protect the life and health of population as well as the environment. According to the waste law, whoever undertakes activities that cause or are likely to cause the generation of waste should carry out such activities in a way that prevents waste generation, and if waste could not have been prevented it should be recycled (Journal of Laws 2019, item 701). Despite catchy slogans connected with circular economy, a lot of waste is still not reused and ends up at landfill sites. One can thus conclude that waste separation and management continue to be the most important challenge today. Nevertheless, both the current EU perspective, which is reaching an end, and the new one clearly state that what can be financed in the area of waste management is everything that makes us closer to an economy based on rational use of resources and reduction of the negative environmental impact of manufactured products, which should stay in circulation as long as possible. This mainly involves activities aimed at raising the level of recycling and investments in infrastructure such as for example biogas installations. What's important, a circular economy is not meant to end economic growth. Its aim, as the EU Commissioner for the Environment Janez Potočnik put it in the introduction to a 2013 report by Ellen MacArthur Foundation, is to restore harmony in nature and prosperity in a world of limited resources.

The waste management policy is governed by relevant national laws and EU directives (Directive 2008/98/EC, Directive 1999/31/EC). The waste management principles currently applicable in Poland were laid down in the waste law of 14 December 2012 and closely related law of 13 September 1996 on maintaining cleanliness and order in communes. Communes, which represent the lowest administrative level, but at the same time the most important one in the environmental management structure, are obliged to maintain cleanliness and order within their territories and to ensure the construction, operation and maintenance of regional installations for municipal waste processing (Journal of Laws 2019, item 2010). Municipal waste is waste generated in households as well as in economic entities and public institutions with character and composition similar to that of the waste generated in households (Polish Monitor 2016, item 784). The quantity and morphological composition of such waste depends to a very large extent on where it was created, including on the wealth of a society, level of the consumption of goods, as well as the season. Moreover, the annual per capita amount of collected waste is strongly correlated with the economic condition of the different regions of a given country (Polish Monitor 2016, item 784).

Statistical data for the period 2014-2018 in Poland show a clear upward trend in collected municipal waste, and, what's important, indicate a faster growth rate of separately collected waste. Nevertheless, the average annual amount of collected municipal waste per capita in Poland was over 300 kg, and recorded a significant growth. Still, it is one of the lowest indicators among European countries. The average amount of generated municipal waste per capita for the EU-28 is almost 500 kg per year, with Denmark, Germany, Cyprus, Malta and Luxembourg recording much higher amounts (Energy, transport and environment statistics, 2019). Table 1 presents data on collected municipal waste in Poland in the years 2014-2018.

Table 1: Municipal waste collected by fractions in Poland

	Municipal waste generated		Mixed in thous. tonnes	Collected separately in thous. tonnes
Year	in thous. tonnes	kg per capita		
2014	10330	268	8280	2050
2015	10864	283	8326	2538
2016	11654	303	8712	2942
2017	11969	312	8729	3240
2018	12485	325	8877	3608

Figure 1 presents data on the amount of municipal waste generated per capita in European Union countries in 2016.

Fig. 1: Municipal waste generated (kg/capita) in 2016
Source: own study based on data from Energy transport and environment statistics 2018

What is important, EU Member States approved a set of ambitious measures to make EU waste legislation fit for the future, as part of the EU's wider circular economy policy. The new rules, based on Commission's proposals part of the Circular Economy package presented in December 2015, will help to prevent waste and, where this is not possible, significantly step up recycling of municipal waste. Commissioner for Environment, Maritime Affairs and Fisheries, Karmenu Vella said that the new recycling and landfilling targets set a credible and ambitious path for better waste management in Europe (Brivio & Petsa, 2018). Recycling targets for municipal waste were fixed at: 55% by 2025, 60% by 2030 and 65% by 2035. In turn by 2035, according to assumptions, the amount of municipal waste landfilled must be reduced to 10% or less of the total amount of municipal waste generated (Bourguignon, 2018).

Thus, an important element of the assessment of the current municipal waste management is the level of recycling and share of municipal waste landfilled. In 2016, 2 312 million tonnes of all waste in the EU were treated, of which 45.7% was landfilled, and 37.8% was recycled. The EU members vary greatly in terms of waste treatment methods used. For instance, in 2016 some member states recorded a very high level of recycling (Italy and Belgium), whereas others preferred landfilling, e.g. Bulgaria, Romania, Greece, Sweden and Finland (Eurostat, Waste statistics 2016). Landfilling is almost non-existent in countries such as Belgium, the Netherlands, Denmark, Sweden, Germany, Austria and Finland). Here incineration plays an important role alongside recycling. The practice of landfilling remains popular in the eastern and southern parts of Europe. Twelve countries landfill almost half or more of their municipal waste. In Greece, Malta, Cyprus and Romania this is more than 80%. In Bulgaria, Croatia, Latvia and Slovakia this is more than 60%, while it is also more than half in Spain, Portugal, the Czech Republic and Hungary (Waste management in the EU, 2018). As far as the rate of recycled municipal waste in Poland is concerned, over the years 2015-2018 it stood at 26-27%, compared to 21% in 2014. Worryingly, there was an increase in landfilled waste, which amounted to thousands of tonnes, especially in 2016 and 2017. This was despite the decrease in the number of active landfilling sites accepting municipal waste. Their number in 2018 was 286, down by 108 compared to 2014, and their total area decreased from 1927 ha to 1700 ha (Environment 2014, Environment 2019). Table 2 presents data on collected municipal waste by management method in the years 2014-2018.

Table 2: Municipal waste collected according to the treatment operations in Poland

	Municipal waste in thous. tonnes designated for:			
Year	**recycling**	**composting or fermentation**	**incineration**	**landfilling**
2014	2180	1154	1560	5437
2015	2867	1750	1439	4808
2016	3244	1890	2266	4255

The situation looks somewhat differently when analysing individual voivodeships in Poland. As data for the years 2014 to 2018 show, there was a significant increase in the amount of landfilled municipal waste per capita in the Lower Silesian Voivodeship, Lubusz Voivodeship and Kuyavian-Pomeranian Voivodeship. In contrast, the Podlaskie Voivodeship and the Silesian Voivodeship recorded a significant decrease. As far as the municipal waste recycling rate per capita is concerned, it grew in the period under analysis for all of the voivodeships, especially in the Silesian Voivodeship and the Lesser Poland Voivodeship. Table 3 presents data on collected municipal waste in the different voivodeships by treatment method over the years 2014-2018, as a result indicator.

Table 3: Municipal waste collected according to the treatment operations in individual voivodeships in Poland – as a result indicators

Thanks to national and EU funds, Poland has a chance to improve the state of the natural environment, in particular a chance to take actions that will get us closer to a circular economy. However, there is still a long way to go, and that's why it is so important to effectively manage available sources of financing municipal waste management.

Available EU Funds For Municipal Waste Management Purposes

A chance for improving the state of the natural environment in Poland through waste management is provided by European Union funds allocated under various programmes. One of them is the Infrastructure and Environment Operational Programme for the years 2014-2020. This programme defines national objectives in the area of sustainable development while maintaining coherence and balance between investments in necessary infrastructure and support for selected areas of the economy. An amount of EUR 27,4 billion was allocated to this programme, the biggest one at national level, with EUR 301,2 million allocated to waste management activities under priority axis 2, action 2.2 Municipal waste management (Programming of the financial perspective 2014-2020). Action 2.2 supports projects following competitive and non-competitive procedures that aim to reduce the amount of landfilled municipal waste by rationalising the waste management system. The purpose of the projects is to ensure appropriate infrastructure for waste management, including that which enables the use of the material characteristics of waste and energy characteristics of mixed municipal waste through thermal treatment with energy recovery (Detailed description of the OPI & E priority axes 2014-2020). Beneficiaries of this measure include local government units and their associations, organisational units acting on their behalf, entities providing public services as part of the fulfilment of the obligations of local government units as well as entrepreneurs. In the case of public entities, the EU can finance up to 85% of eligible expenditure at the level of a particular project, whereas in the case of entrepreneurs - not more than 50% (Detailed description of the OPI & E priority axes 2014-2020).

As far as operational programmes are concerned, the largest allocation of EU funds, i.e. EUR 31.2 billion, went to a total of 16 Regional Operational Programmes (ROP) (Programming of the financial perspective 2014-2020). These programmes play an important role in financing endeavours that significantly improve the state of the natural environment and are adjusted to the specificity of given regions, representing a response to local needs. Almost EUR 2.0 billion from the European Regional Development Fund was earmarked for environmental protection activities under 16 Regional Operational Programmes for the years 2014-2020, with EUR 314.8 thousand earmarked for waste management activities (Web-1). Crucial data on potential beneficiaries, project types and the amount of subsidy is presented in the detailed descriptions of the priority axes of the individual 16 Regional Operational Programmes. Potential beneficiaries of waste management measures include local government units and their associations, organisational units of local government units, entities providing waste management services as part of the fulfilment of the tasks of local government units, housing co-operatives and communities, entrepreneurs and private partners in cooperation with public entities in the case of public-private partnership projects. The types of projects implemented as part of such programmes concern infrastructure that is necessary for ensuring a comprehensive management of municipal waste in regions, planned in accordance with the hierarchy of waste handling. The maximum EU co-financing rate for projects not covered by public aid is 85% (Web-1).

The Methodology of Studies

The own research conducted previously on factors influencing an improvement of the natural environment condition showed that the accessibility of the EU funds is the most important factor for implementation of ecological investments (Bień, 2007).

The purpose of current research was to determine to what extent the availability of EU funds makes entities to apply for financial contributions for ecological purposes and activities. Specifically speaking, to what extent the entities are effective in obtaining the EU funds and how the received resources have affected the condition of the natural environment in the area of municipal waste management in the analyzed period, as seen through the mechanism of achieved result indicators.

As part of the adopted research methodology, one determines the level of effectiveness of entities in particular voivodeships in obtaining EU funds, indicated by a successfully completed procedure finalized with signing of contracts enabling a commencement of necessary ecological investments. The value of the effectiveness was calculated on the basis of the amount of resources formally

approved for environmental investments in ROPs and OPI&E, seen in relation to the value of indicative allocations received as part of ERDF and CF financing.

In order to explore the theme and measure to what extent the implementation of investments undertaken with the share of the EU funds resulted in development of municipal waste management in particular voivodships, one of the taxonomic methods was used. The methods are taken advantage of in many fields of modern research (Młodak, 2006). The currently used method allows a linear ordering of objects based on introducing of standards and patterns that were presented by Z. Hellwig in 1968. It involves an analysis of complex phenomena described by at least two features. In the analyzed case, a set of diagnostic variables was based on the result indicators in terms of municipal waste management specified in Table 3: level of achieved recycling municipal waste in % of total collected (x1); level of landfilling municipal waste in % of total collected (x2). Importantly, the first variable was stimulant and the second was destimulant. In the case of non-uniform variable character, they required unification.

The construction of the Hellwig's development measure is (Młodak, 2006):

a) standardization of variables: $z_{ij} = \frac{x_{ij} - \overline{x_j}}{s_j}$, x_{ij} - observation of the j-th variable for the object i, $\overline{x_j}$ - arithmetic mean of observation j-th variable, s_j - standard deviation of observation j-th variable;

b) coordinates of the standard: $z_{oj} = \max_i \{z_{ij}\}$ for variables of booster character;

c) the distance of objects from the standard: $d_{io} = \sqrt{\sum_{j=1}^{m} \left(z_{ij} - z_{oj}\right)^2}$;

d) variable values: $q_i = 1 - \frac{d_{io}}{d_o}$, wherein: $q \in [0;1]$; $d_o = \overline{d_o} + 2s_d$; $\overline{d_o} = \frac{1}{n}\sum_{i=1}^{n} d_{io}$; $s_d = \sqrt{\frac{1}{n}\sum_{i=1}^{n}\left(d_{io} - \overline{d_o}\right)^2}$.

After the standardization of variables, an abstract object was determined, i.e. a so-called standard with the best values for each variable - a hypothetical voivodeship with the best result indicators in 2018. Testing the similarity of objects, i.e. similarities between specific voivodeships and the best abstract object, consists of a process of determination of the Euclidean distance of each object from the standard. The distance was measured both for 2014 (the year beginning the EU budgetary period 2014-2020) and for 2018. During the next stage of the research, development measures with properties were determined for each object (voivodeships): the higher the measure, the higher the level of the phenomenon. This allowed to establish the ranking for the level of effectiveness of investments Effectiveness of managing EU funds under the OPI & E and ROP for municipal waste management activitiespart of municipal waste management.

Effectiveness of Managing EU Funds Under The OPI & E And ROP for Municipal Waste Management Activities

Effectiveness is seen as one of evaluation criteria used for measuring the action quality. Lack of the effectiveness or resourcefulness can easily negate the sense of foreseen undertakings. The activity may be called successful when it is purposeful and leads to achieving set objectives and targets (Kotarbiński, 1969). Proved willingness to obtain the chosen goals and doing one’s best to reach the destination point means that the taken action and introduced activities had been efficient (Sobolewski, 1998). Generally speaking, in the currently described situation, the effective

management defines that kind of activity that within available EU funds leads to the achievement of certain goals and to creating appropriate conditions for improvement of municipal waste management systems in particular areas.

The Infrastructure and Environment Operational Programme plays an important role in financing municipal waste management projects. According to data at the end of 2019, nine calls for proposals following a competitive procedure were issued under measure 2.2 Municipal waste management. This accounts for 8.9% of all the contests announced in that period under the Infrastructure and Environment Operational Programme. The first call was issued already in 2015, and the most calls were announced in 2016 and 2019, i.e. 3 in each year (Web-2). In the period under analysis, 56 contracts were signed, with the amount financed from the Cohesion Fund being EUR 231.2 million (Web-3). This means that only 28.1% of the allocation to measure 2.2. under the Infrastructure and Environment Operational Programme, as measured by contracted funds, was used (Web-4). Not a single contract was signed in the period under analysis in the Opole and Świętokrzyskie Voivodeships. The most contracts were signed in the Pomeranian Voivodeship, with the amount co-financed being EUR 101.7 million, whereas the least contracts were concluded in the Silesian Voivodeships, with the amount co-financed being EUR 1.3 million. Figure 2 presents data on the funds contracted as part of measure 2.2 under the Infrastructure and Environment Operational Programme by voivodeship.

Fig. 2: The number of signed contracts and financial resources allocated for their performance as part of Measure 2.2 II Priority Axis of OPI & E as at 31.12.2019, in euros

Source: own study based on data from Web-3 and Web-4

Looking at the number of investments completed by 2019 as part of Measure 2.2 Municipal waste management under the Infrastructure and Environment Operational Programme, it accounted for only

29% of all the contracts signed. The amount from the Cohesion Fund to co-finance these projects was EUE 17.6 million. In three voivodeships: Lublin, Łódź and Varmian-Masurian, not a single project was completed by 31 December 2019. Figure 3 presents data on completed projects and the amount of subsidy from the Cohesion Fund by voivodeships.

Fig. 3: The number of completed investments and financial resources allocated for their performance as part of Measure 2.2 II Priority Axis of OPI & E as at 31.12.2019, in euros

Source: own study based on data from Web-3 and Web-4

According to data at the end of 2019, under 16 Regional Operational Programmes for 2014-2020, a total of 395 contracts for waste management activities were signed following a competitive procedure with a total value of EUR 277.7 million and EU contribution from the ERDF amounting to EUR 171.2 million. This constitutes around 54.4 % of the total indicative allocation for the years 2014-2020. Within the 16 voivodeships, the most contracts, i.e. 90 (22.8%), for the total amount of EUR 17.4 million in co-financing was signed in the Lesser Poland Voivodeship, while the least contracts, i.e. 3 (0.8%), for the total amount of EUR 0.8 million in co-financing, were signed in the Lubusz Voivodeship. It should be noted that not all investments contracted in the Lesser Poland Voivodeship concerned municipal waste management, but only 54 projects for the total of EUR 13.7 million in co-financing from the ERDF. A similar situation was in the Lublin, Podlaskie and Silesian Voivodeships. What is important is that in the period under analysis, municipal waste management investments were undertaken under 16 Regional Operational Programmes in all of the voivodeships. Figure 4 presents data on EU funds contracted in the individual voivodeships.

Fig. 4: The number of signed contracts and financial resources allocated for their performance in ROPs as part of municipal waste management as of 31.12.2019, in euros
Source: own study based on data from Web-3 and Web-4

By December 2019, 54.9% of municipal waste management projects under 16 Regional Operational Programmes were completed. The amount from the ERDF to co-finance these investments was EUR 55.3 million. Figure 5 presents data on the number of completed projects and the amount in ERDF co-financing for such projects in the individual voivodeships at the end of 2019.

Fig. 5: The number of completed investments and the use of ERDF resources for activities connected with municipal waste management as of 31.12.2019, in euros

Source: own study based on data from Web-3 and Web-4

Analysis of the funds officially allocated for waste management investments from 16 Regional Operational Programmes in relation to the indicative allocation under the ERDF shows that such funds have not been yet allocated in most part through signed contracts. The 54.4% rate is too low given that the EU budgeting period 2014-2020 is coming to an end. This may indicate ineffectiveness in securing EU funds under Regional Operational Programmes for such a purpose. At the end of 2019, the Lublin Voivodeship recorded the highest amount of funds allocated from the ERDF for co-financing waste management activities, which accounted for almost 100% of the indicative allocation for this purpose. EU funds were also effectively used in the Pomeranian, Masovian and Kuyavian-Pomeranian Voivodeships, with the use of EU funds at around 80%, and in Opole Voivodeship (slightly over 90%). Ineffective use of the ERDF funds was recorded in seven voivodeships, where it was below 40% of the allocation assigned to waste management activities. This data is presented in Figure 6.

Fig. 6: The use of ERDF resources as part of ROPs for activities connected with waste management as of 31.12.2019, in %

Source: own study based on data from Programming of the financial perspective 2014-2020, Web-3 and Web-4

Analyzing the impact of EU funds invested in development in the framework of municipal waste management of particular voivodeships, based on the measured result indicators, it should be stated that it is generally positive but not satisfactory. The distance of voivodeships from the reference object in the analyzed period decreased in a small of the cases, i.e. in 6 out of 16 analyzed objects. Nevertheless, the value of the development measure located the Silesian Voivodeship in first and the West Pomeranian Voivodeship in second ranking position in 2018. A significant improvement occurred in the Podlasie and Lesser Poland Voivodeships. Moreover, ambiguous information can be obtained from analyses of relations between the area in which projects supported by EU assistance were implemented and the change in the level of development. There was no correlation between the value of EU co-financing for municipal waste management in a given voivodeship and the measure of its development. Data regarding the level of development of voivodeships in 2014 and 2018 as part of municipal waste management and the values of EU co-financing, regarding completed investments, is presented in Table 4.

Table 4: Development level of voivodeships as part of municipal waste management in 2014 and 2018

Voivodeship	2014			2018			Value of EU co-funding in thous. Euro
	di	qi	rank	di	qi	rank	
Lower Silesia	0,6041	0,8949	1	2,6423	0,4893	3	14 153,00

Summary

The more complex the system for financing municipal waste management, the bigger the possibilities of financing pro-environmental projects. The high cost of investments, which usually do not generate profit, is difficult to borne in full by economic entities from their own funds. This is why EU funds continue to play an important role. Only an appropriate use of such funds can lead to completion of necessary projects and improvement of the state of the natural environment. The analysis of the use of EU funds under the Infrastructure and Environment Operational Programme 2014-2020 showed that at the current state of the assessment only 16 projects were completed, and the rate of the use of the allocation for measure 2.2 Municipal waste management at the end of 2019 was 28.1%. Given that the EU budgeting period 2014-2020 is coming to an end, it is a very low rate. Similarly, the rate of the implementation of waste management activities under 16 Regional Operational Programmes at 54.4% of the indicative allocation from the ERDF is unsatisfactory. Especially that calls for proposals were organised in 2019 in only ten out of sixteen voivodeships. It is thus important to effectively organise more calls for proposals in 2020, so that the available EU funds allocated under these programmes are fully used. Due to the fact that municipal waste management investments were undertaken in most cases only in the final part of budgeting period 2014-2020, it is difficult to assess their impact on the current state of waste management in Poland. Studies in this area require further analysis and will be continued. Nevertheless, it should be borne in mind that although there are many available sources of financing waste management, EU funds are the main form of non-repayable financing that does not put any burden on society benefiting from the effects of pro-environmental investments, and efficient management of such funds contributes to the improvement of the state of the natural environment.

The Use of Social Media in Recruitment Processes In Polish Armed Forces

Paulina POLKO

WSB University, Dabrowa Gornicza, Poland
ppolko@wsb.edu.pl

Abstract

Polish Armed Forces, as the menaces and forces established to secure Poland's interests and to defend the country, are an element of the defense system designed for the effective implementation of security policy. Despite this special status, as an institution, they are subject to human resource management processes similar to other organizations, including the search for personnel capable of carrying out statutory tasks. In the modern world, this means using all available recruitment channels, including social media. The aim of this study was to analyze the use of social media in the recruitment processes conducted by Territorial Military Administration Units. The paper presents the results of qualitive analysis Facebook profiles of this units. The obtained results indicate that however almost all of them use Facebook, mostly for recruitment and promotion of military service, the quality of that use is rather poor and needs strategic improvement to be able to gain results. Conducted studies were the first in Poland regarding the analyzed topic.

Keywords: Social Media, Armed Forces, Recruitment, Media Strategy, Military Administration

Introduction

After the end of the Cold War, armed forces around the world had to develop new competences in both conducting operations and gaining public acceptance for them (Foster, 2006). Like other public institutions, they became subject to the rules of the Old Public Management model, market values (New Public Management model) and e-democracy (New Public Service model) (Deverell et al., 2014). According to M. Fredriksson and J. Pallas (2013), these factors caused that armies began to include in their communication strategies the need to open to the public and to inform about their activities (democratization processes) as well as to put more emphasis on using modern means of communication to build own image (Polko, 2016; Wæraas, 2008), visibility and - in situations where military service ceased to be an attractive workplace - to recruit new members of the organization.

There is no doubt that social media still can be seen both as a risk and an opportunity by armed forces. Even if research shows how armed forces can be reinforced with strategic narrative (Hellman et al., 2016), they are still seen by commanders and their political superiors as a potential source of problems. Military decision-makers all over the world are still more to avoid communication with society about their operations than to clarify their decisions, motivations and circumstances of action. Of course, awareness of the inevitability of presence in these communication channels is growing, and the example of military leaders (Israeli Defense Forces, US Army) in using social media to communicate about army activities is closely monitored around the world and successfully copied in many places (example of communication strategies used in Poland by Territorial Defense Forces).

As noted by R.L. Stein (2012), social media are contradictory to the military institution. Any army is a closed organization, and usually it keeps its secrets and operational details inside. And new media works on the opposite. The military language is very strict. There's a lot of abbreviations; it has very specific

intonations. And the new media is exactly the opposite - a lot of emotions, a lot of questions, informality. However, finding a compromise between the nature of social media and the interests of organizations such as the military is necessary for the continued functioning of armed forces around the world.

Social media and recruitment processes in organization

Kaplan and Haenlein (2010) define social media as a group of Internet based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of user-generated content. The term Web 2.0 was introduced in 1999 to describe web sites that use technology beyond the static pages of earlier web sites. A Web 2.0 site allows users to interact and collaborate with each other in a social media dialogue as creators of user-generated content in a virtual community, in contrast to websites where people are limited to the passive viewing of content. (Broughton et al., 2013:1).

According to A. Kaplan (2012), mobile social media applications can be differentiated among four types:

- Space-timers (location and time sensitive): Exchange of messages with relevance mostly for one specific location at one specific point in time (e.g. Facebook Places WhatsApp; Foursquare)
- Space-locators (only location sensitive): Exchange of messages, with relevance for one specific location, which is tagged to a certain place and read later by others (e.g. Yelp; Qype, Tumblr, Fishbrain)
- Quick-timers (only time sensitive): Transfer of traditional social media mobile apps to increase immediacy (e.g. posting Twitter messages or Facebook status updates)
- Slow-timers (neither location nor time sensitive): Transfer of traditional social media applications to mobile devices (e.g. watching a YouTube video or reading/editing a Wikipedia article)

T. Aichner and F. Jacob (2015:259) provide more wide classification, indicating:

- Blogs (e.g. The Huffington Post, Boing Boing)
- Business networks (e.g. LinkedIn XING)
- Collaborative projects (e.g. Wikipedia Mozilla)
- Enterprise social networks (e.g. Yammer, Socialcast)
- Forums (e.g. Gaia Online, IGN Boards)
- Microblogs (e.g. Twitter, Tumblr)
- Photo sharing (e.g. Flickr, Photobucket)
- Products/services review (e.g. Amazon, Elance)
- Social bookmarking (e.g. Delicious, Pinterest)
- Social gaming (e.g. World of Warcraft, Mafia Wars)
- Social networks (e.g. Facebook, Google+)
- Video sharing (e.g. YouTube, Vimeo)
- Virtual worlds (e.g. Second Life, Twinity)

Characteristics of the most popular social media is presented in table no 1.

Table 1: Types, characteristics and popularity of chosen social media (Clement, 2019; Broughton et al., 2011)

Social networking sites and tools	Characteristics	Number of users (in millions)/country of origin
Facebook	a social networking service where users create personal profiles, add other users as friends and exchange messages, including automatic notifications when they update their own profile. Additionally, users may join common-interest user groups, organized by common characteristics (e.g. workplace).	2,375 USA
YouTube	a (Google-owned) video-sharing website on which users can upload, share, and view videos. A wide variety of user-generated video content is displayed, including film and TV clips as well as amateur content such as video blogging.	2,000 USA
WhatsApp	A freeware, cross-platform messaging and Voice over IP (VoIP) service owned by Facebook. It allows users to send text messages and voice messages, make voice and video calls, and share images, documents, user locations, and other media.	1,600 USA
Facebook Messenger	a messaging app and platform developed by Facebook. Users can send messages and exchange photos, videos, stickers, audio, and files, as well as react to other users' messages and interact with bots. The service also supports voice and video calling. The standalone apps support using multiple accounts, conversations with optional end-to-end encryption, and playing games.	1,300 USA
WeChat	a multi-purpose messaging, social media and mobile payment app developed by Tencent. Has been described as China's “app for everything” because of its wide range of functions.	1,112 China
Instagram	A photo and video-sharing social networking service owned by Facebook. The app allows users to upload photos and videos to the service, which can be edited with various filters, and organized with tags and location information. An account's posts can be shared publicly or with pre-approved followers. Users can browse other users' content by tags and locations, and view trending content. Can also like photos and follow other users to add their content to a feed.	1,000 USA
QQ	an instant messaging software service and web portal which offers services that provide online social games, music, shopping, microblogging, movies, and group and voice chat software.	823 China
QZone	a social networking website which allows users to write blogs, keep diaries, send photos, listen to music, and watch videos. Users can set their Qzone background and select accessories based on their preferences so that every Qzone is customized to the individual member's taste.	572 China
TikTok	a video-sharing social networking service owned by ByteDance, a Beijing-based company. It is used to create short lip-sync, comedy, and talent videos. The app allows users to create short music and lip-sync videos of 3 to 15 seconds and	500 China

	short looping videos of 3 to 60 seconds.	
Sina Weibo	a microblogging (weibo) website.]	465 China
Twitter	a microblogging service enabling its users to send and read publicly visible messages called tweets. Tweets are text-based posts of up to 140 characters displayed on the user's profile page. Users may subscribe to other users' tweets.	330 USA
Reddit	a social news aggregation, web content rating, and discussion website. Registered members submit content to the site such as links, text posts, and images, which are then voted up or down by other members. Posts are organized by subject into user-created boards called "subreddits", which cover a variety of topics.	330 USA
Baidu Tieba	a communication platform hosted by Chinese search engine company Baidu. It is an online community that heavily integrates Baidu's search engine. Users may search for a bar, which will then be created if it does not exist already.	320 China
LinkedIn	a business-related social networking site mainly used for professional networking. Users maintain a list of contact details of people with whom they have some level of relationship, called connections. This list of connections can then be used to build up a contact network, follow different companies and find jobs, people and business opportunities.	310 USA
Snapchat	a multimedia messaging app, where pictures and messages are usually only available for a short time before they become inaccessible to their recipients. It also allows users to keep photos in the "my eyes only" which lets them keep their photos in a password protected space.	294 USA
Pinterest	a social media web and mobile application company. It operates a software system designed to enable saving and discovery of information on the www using images and GIFs and videos. Users can upload, save, sort, and manage images—known as pins—and other media content through collections known as pinboards. Content can also be found outside Pinterest and similarly uploaded to a board or be implemented by a webmaster directly on the website.	265 USA
Viber	a cross-platform voice over IP (VoIP) and instant messaging (IM) software application operated by Japanese company Rakuten. Users are registered and identified through a cellular telephone number, although the service is accessible on desktop platforms without needing mobile connectivity.	260 Israel
Discord	a proprietary freeware VoIP application and digital distribution platform designed for video gaming communities, that specializes in text, image, video and audio communication between users in a chat channel.	250 USA

Social media usage is one of the most popular online activities. In 2018, an estimated 2.65 billion people were using social media worldwide, a number projected to increase to almost 3.1 billion in 2021. Social network penetration is constantly increasing worldwide and as of January 2019 stood at 45 percent. The average time per day spent on social media varies greatly by country. Whilst U.S. users spent approximately one hour and 57 minutes using social media each day, the Philippines ranked first in terms of user engagement. The average time per day spent on social media in the country amounted to four hours and one minute, twice the amount of time spent by U.S. users. (Clement, 2019).

The use of social media as a recruitment tool is providing opportunities and challenges for employers. Social media potentially offers speed, efficiency and the ability to target and attract specific, particularly apposite candidates in the recruitment process. It can provide a useful additional source of information on potential job candidates, especially since some data (at the personal as well as the professional level) may not be generated for the purpose of recruitment, and therefore may provide candid supplementary information on the applicant. For candidates it potentially offers multiple sources of information about the employer and the possibility of contact with existing employees to gain a more realistic job preview. (Broughton et al., 2013:4-5)

According to Smith and Rupp (2004), e-recruitment has a number of important advantages compared to more traditional forms of recruiting:

- It allows companies to shorten hiring times through an increase in information flow and an acceleration of recruitment processes.
- It can help reduce recruiting costs, hiring times and employee turnover as processes are generally job-specific and offer computer assisted screening interviews and statistical predictions.
- It gives employers the opportunity to hire staff both locally and globally, significantly extending the reach of more traditional staff recruitment.
- It offers companies and prospective employees a number of important features and specific abilities such as: (1) the ability to initiate interview requests and order back ground checks; (2) unlimited cost information tracking for all activities associated with the hiring process; (3) customised e-mail notification of recruiters for both active and passive candidates; (4) Improved integration of recruiter-specific communications activities; (5) Dynamic creation of an employer's job page; (6) Multiple language support with candidate accessibility for US and global partners; (7) Extensive ability to personalise the candidate experience by allowing employers to tailor the candidate and recruiter interfaces.

However, there are a number of issues that need to be considered. According to R. Landers and G. Schmidt (2016: 3), although social media are increasingly used in the employee selection and recruitment process, some significant challenges remain. First, reliability and validity is unknown. Second, even if reliable and valid, social media data may not be practical. Third, even if practical, the use of such information may not be legal. Fourth, even if legal, their use may not be ethical. Fifth, even if ethical, it is unclear how to optimally include them in existing systems.

Social Media Nature and Military Forces Priorities

Across the world defense forces are using social media platforms most effectively for educating the populace about their job content so as to entice them in joining the organization. Social Media has the ability to reach sections of society where traditional media in unable to do so due to logistical constraints (Malhotra, 2016: 19). They have been in use in armed forces since the Kosovo crisis in 1999 (Nissen,

2015:8). The increasing use and importance of social media, alongside intensifying debate about the reliance on communication for successful operations tends to put more attention on that developing tool. Researchers have paid little attention to how armed forces beyond the US and the UK have dealt with the social media (e.g. UK: Bjerg Jensen, 2011; Maltby et al., 2015; and Jones and Baines, 2013; UK, US, Israel: Rid and Hecker, 2009). Research has mainly focused on whether or not armed forces have been harmed by or have managed to exploit social media, whether they have tried to control social media and to what degree they have allowed personnel to communicate freely via social media. (Hellman et al., 2016)

For the Army's audience of potential recruits, social media is especially important. Young adults use social media at higher rates than other groups. Technology use is prevalent among this population, with more than 90 percent of 18- to 29-year-olds owning a smartphone (USA data). About the same proportion use social media. (Smith, 2017, Perrin, 2015). The widespread use of technology suggests that internet and social media use are the norm among potential Army recruits and also among the adults who might influence potential recruits. (Wenger et al. 2019:1).

Although different platforms target different audiences (e.g. Facebook is the most popular among users after 35, while younger users are more likely to spread their time across a wide variety of platforms, including Twitter and Pinterest), all technological changes allow individuals and organizations to communicate information to one another in new and creative ways and on a nearly real-time basis.

Research on the relationship between the use of social media by the armed forces and the increased interest in performing service in these formations (their recruitment abilities) do not give an unequivocal answer as to the existence of the relationship between these two factors. From the RAND report published in 2019 (Wenger et al. 2019: 1), which examined three online sources of information about the USArmy: GoArmy.com; the GoArmy Facebook account; and the @GoArmy Twitter account, it follows that:

- In general, visitors are likely to view pages containing career-related information and, to a lesser extent, about procedures and requirements to join the military.
- The number of visitors is positively correlated with contracts, but the relationship is very small.
- People living in densely populated areas and those living in places with higher proportions of minority groups and immigrants appear to use GoArmy.com more intensively than others. In some cases, there are more contracts than would be expected in these areas.
- @GoArmy's Twitter is a good source for building awareness of Army culture, but the platform is less effective in producing contracts.
- GoArmy's Facebook page has an audience made up of the general public, soldiers, veterans, military families, and potential recruits.

The present trend points to a growing number of armed forces all over the world imbibing social media for a variety of functions such as recruiting soldiers, gathering intelligence, spreading propaganda and even communicating with their own and other military groups. The situation has come to the fact that the broad spectrum of social media is identified as the newest international military battleground with its inbuilt challenges.

In the year 2015 the British army created its own special force known as the 77th Brigade for social media warfare. It is based in Berkshire and comprises reservists and regulars with journalistic skills who are social media savvy (Malhotra, 2016: 26). According to The Career Transition Partnership (CTP) (the Ministry of Defense working with Right Management) the British Army recruits up to 20,000 people each year. Their target audience is 14-24 years old's, who are statistically the most comfortable with social media, often using it as their main communication tool.

Facebook is the main channel for recruitment as research has shown that 89% of the Army's target audience are users. Their Facebook site "Army Jobs" has over 55,000 followers. The site:

- Links to online and telephone recruitment offices.
- Allows potential recruits to ask general and specific questions about life and training in the British Army.
- Shows videos of serving soldiers and officers who talk about aspects of army life and training.
- Increasingly uses online gaming to attract candidates, as it allows people to demonstrate skills they may not have realized they have which are relevant to the Army.
- Links gaming experience to the British Army website to show type of jobs available that match demonstrated skills. (CTP, 2020)

The British Army also uses Twitter to engage with its target audience, through "Digital Pioneers" programme, which enables potential recruits to communicate with serving personnel.

Israel Defense Forces (IDF), one of the world's most active armies in social media, became famous for its historic precedent set by announcing the launch of Operation Pillar of Defense (in mid-November 2012) on Twitter (Shavit, 2016:7, Polko, 2016:153) (see figure 1). For several years, it has been successfully using social media to implement the IDF mediatization strategy described by M. Shavit. (Shavit, 2016:8).

On 14 November 2012 at 6.29 AM the spokesperson of the Israel Defense Forces published on Twitter the following post: „The IDF has begun a widespread campaign on terror sites & operatives in the #Gaza Strip, chief among them #Hamas & Islamic Jihad targets". Fania Oz-Salzberger, Israeli historian and writer, commented the information: "the first war ever declared on Twitter has just begun". In the evening spokesman announced: "Ahmed Jabari: Eliminated."

Fig. 1: IDF Twitter offensive

Given the above, it seems reasonable to analyze the use of social media in Poland to conduct recruitment processes for the needs of the Polish Armed Forces.

Methodology

The research conducted in this work was aimed at checking how facebook is used by Army Recruiting Command (WKU) to recruit new army members. All WKU profiles in Poland were analyzed (86 units). The Army Recruiting Command is a unit of military administration dealing with the administration of

personnel reserves in the area under its responsibility. WKUs perform the executive role of the Minister of National Defense, they are directly subordinated to the Provincial Military Staff. They implement defense issues and military administration in the administered area. The tasks of the Army Recruiting Command are:

- cooperation with Poviat Starosties in the field of national defense policy,
- cooperation with the Civil Defense,
- **securing the mobilization of military units,**
- **appointment of reserve soldiers to active (contract) military service,**
- **appointment of reserve soldiers for military exercises,**
- applying for the appointment of reserve soldiers for military ranks,
- **recruitment of candidates for military schools,**
- **conducting collection together with government administration offices,**
- **military records of persons subject to universal defense,**
- **adjudging on granting conscripts postponement of basic military service,**
- **designation of conscripts for basic military service,**
- applying for the performance of personal and material benefits for national defense purposes,
- creating a positive image of the Polish Army in the area of its own operations.

As can be seen from the above list of WKU tasks, most of their activities should focus on providing the Polish Armed Forces with sufficient personal resources, i.e. recruitment, service calls and mobilization. It is therefore reasonable to examine to what extent these tasks are carried out with the help of selected social media. The main research problem raised in this study was whether, and if so, how (in qualitative and quantitative terms) the army recruitment commands use Facebook for recruitment purposes for the needs of the Polish Armed Forces. Therefore, the figures on the following areas were collected:

- profile coverage (number of likes / number of views);
- period of their activity;
- number of published posts;
- percentage of recruitment posts,

which have been quantified. This data is presented in Table 2.

In further stages of research, a qualitative analysis of the discussed profiles was carried out in terms of:

- consistency of the message of individual branches with the general information line of the Polish Armed Forces
- the relationship of own materials of WKU units or their direct superiors (Provincial Military Staffs) to materials made available from other profiles;
- content that includes WKU's own materials;
- content implementing Real Time Marketing (RTM)
- making use of the Facebook platform's communication capabilities, such as: creating groups, events, surveys, competitions, live broadcasts, watching movies together.

The research was conducted in the period 20-29 February 2020.

Table 2: Numerical analysis of the activity of individual WKU on Facebook accounts (as of 29.02.2020)

WKU	Date of joining	Number of likes / number of followers	Number of recruitment posts	Number of all posts	Percentage of recruitment posts	Number of posts per day (average for the whole period)

Results and findings

Quantitative and qualitative analysis of WKU profiles

The vast majority of WKU Facebook profile likes are in the range 350-800. However, there are profiles that have over 2000 fans. The most likes were collected by WKU in Białystok (2796), the least - 181 – by WKU in Rzeszów. Figure 2 presents distribution of the number of likes of FB profiles of WKU units.

Fig. 2: Number of WKU FB profile likes (source: own research)

Most WKU unit profiles were founded in the fourth quarter of 2017. This was related to the decision of the Chief of the General Staff to support the promotional processes of recruitment to the Territorial Defense Forces and other forms of service in the Polish Armed Forces. 8 oldest profiles were founded in 2011 (the oldest - WKU Poznań: 25.01.2011). However, the activity of these profiles in the first years after establishment is low, it increased in 2016 or 2017, i.e. when WKU began to use Facebook massively

for promotional activities for military service and recruitment processes. Three units (WKU Gliwice, Kielce and Sandomierz) do not have profiles on FB to this day. WKU Kołobrzeg has the youngest profile (27/02/2019). Figure 3 presents distribution of dates of establishing WKU unit profiles on FB.

Fig. 3: Date of establishment of FB profiles of WKU units (source: own research)

On average, WKU units publish one post every two days, which, however, is not the same as the frequency of status updates. Usually, even a dozen or so posts per day are published (when there are announcements of military units with qualifications), after which the status is not updated for several days. In addition, all profiles are significantly hyperactive in 2019 compared to previous years. Six units publish on average more than 1 post per day (most - WKU Włocławek). Figure 4 presents the average number of posts per day published by WKU units on FB.

Fig. 4: Number of posts per day (average for the whole period) (source: own research)

Recruitment posts constitute a significant part of the content published on the FB profiles of WKU units. As a percentage, the majority of profiles in this area are in the range of 58-79 percent, which means that on average about 200 to 450 posts with this content were published. WKU Gdynia (2001) published the most of such materials. In percentage terms, WKU in Lublin had the most recruitment posts - they accounted for over 97 percent of all presented content. Figure 5 presents distribution of the number of recruitment posts and percent of these posts on the profiles of WKU units.

Fig. 5: Number and percentage of recruitment posts on the profiles of WKU units (source: own research)

Therefore, as can be seen from the above analysis, the profiles of the 83 WKU units surveyed show quite high convergence in the area of Facebook activity. Indeed, the majority in individual areas is about 10 percent of units. Recruitment is the key activity that WKUs undertake through their profiles in the analyzed social medium. Although the profiles belong to different units, the presented content is similar or even the same. This is largely due to the fact that the content is usually published by sharing posts of others (e.g. military units) or materials prepared centrally by the Ministry of National Defense. Especially in the last two analyzed years: February 2018 - February 2020, the coordination of the topics of published posts can be seen through references to such central promotional campaigns of the Polish Armed Forces as: become a soldier of the Republic of Poland, military challenge, parade: strong in alliances, academic legion, holidays with the army. Own posts, if they appear at all, present: reporting on participation in public holidays and promotional campaigns, organizational information regarding the functioning of the unit, occasional wishes.

In addition, a qualitative analysis of posts indicates:

- low responsiveness of WKU profiles tracking. The most-liked post, published by WKU Gdynia, had 39 of them. Most posts remain unresponsive (sharing, liking, commenting). This means that even employees and well-wishers of this institution do not respond to posts from their own organization.
- sharing the same content multiple times;
- sharing many posts in one day (limiting the reach of your own posts);
- little local content about the WKU administration area;
- little content relating to important safety issues in the area of responsibility of the WKU;
- poor quality of photos and graphic materials in own posts;
  little information about the army's activities as such (presentation of the Polish Armed Forces);
- no Real Time Marketing posts.

Discussion

Analyzing Facebook activity of WKU one should remember about some factors:

- Decision about the use of Facebook and other social media to promote and recruit to the army was taken centrally, at the level of the heads of these units. There was no substantive, personal or financial support following this decision. There is no doubt that this lack of support had a strong impact on quality of activity of these units on FB;
- In WKU units, especially smaller ones, apart from voivodship cities, there are no separate posts / employees responsible for recruiting and promoting the army through social media. These tasks are performed by employees who also are responsible for other duties;
- Persons who are responsible in WKU for communication via social media are usually not sufficiently prepared for these obligations. Social media management training is not a standard covering all units;
- Slightly more than two years of using social media (on average) by WKU units should be considered as an introductory period, which should be subject to evaluation and development of changes, with the financial and substantive support of superiors.

Conclusions

It cannot be denied that WKU units use Facebook and carry out recruitment tasks assigned to them in the Polish Armed Forces through it, which is a part of the global trend. This demonstrates the understanding of the importance of social media for the promotional purposes of the institution. However, in many areas, the way in which WKU units use this tool demonstrates an approach typical of older types of media (reporting) rather than new ones - building relationships, animating activity. There is also a change to be made from reproduction to creating one's own content. This should be changed by good practices in this area (both foreign and Polish, e.g. activity in social media of Territorial Defense Forces), strengthening of WKU units on the part of supervisory institutions and by time. Therefore, it is reasonable to repeat similar research in the future to analyze the quality of using social media for recruitment purposes to the Polish Armed Forces.

Abstract

The article is devoted to one of the most pressing problems in the field of criminal liability for illegal impact on the critical information infrastructure of the Russian Federation - determination of estimated signs of illegal impact on the critical information infrastructure of the Russian Federation. The relevance of the selected topic is dictated both by strategic priorities and official views of state authorities in the field of national security in the information sphere. Together with the trend of large-scale proliferation of computer crimes, issues related to criminal liability under the offences provided for in Chapter 28 of the Criminal Code of the Russian Federation, including under Article 274.1 of the Criminal Code, are of particular importance. Given the increased public danger of encroaching on the critical information infrastructure of the Russian Federation. Modern problems of legislative formulation of certain characteristics of the crime provided for in article 274.1 of the Criminal Code of the Russian Federation have been identified. Legislative initiatives have been proposed in the field of determining the evaluation characteristics of the offence provided for in article 274.1 of the Criminal Code of the Russian Federation, which are necessary in the absence of established law enforcement practice.

Keywords: Critical Information Infrastructure, Criminal Liability, Serious Consequences, Harm, Evaluation Signs, Critical Infrastructure, Categorization, Administrative Responsibility.

Introduction

The intensification of criminal activities, together with the development of information technologies, has made the phenomenon of crime more complex, as reflected in the introduction into its structure of cybercrime (computer crime), which is transnational and organized. According to the data of the General Prosecutor 's Office of the Russian Federation for January - December 2019, the law enforcement agencies of the Russian Federation registered 294,409 (+68.5%) crimes committed using information and telecommunication technologies or in the field of computer information [1]. The study of the dynamics of crime in the sphere of high technologies shows its twenty-sixfold growth in the last seven years (in 2013 there were 11 thousand cybercrime). At the same time, computer crime is characterized by hyperlatence, which is explained by a number of factors: According to E.A. Russkevich, the main factor is the high level of tolerance of the victims themselves, who either attempt to address data loss in alternative ways or are slow to report it to the police, Because they do not want to spend their own time on proceedings, do not believe in the ability of law enforcement agencies to

capture intruders, do not want to publish any compromising information when examining the prior virtual activity of the victim himself on the Internet, etc. [2].

Intensive improvement of the means and methods of using information and telecommunication technologies for illegal purposes forms new threats to the security of Russia in the context of globalization of advanced information systems based on borrowed software with vulnerabilities in the field of management of production and technological processes.

The National Security Strategy of the Russian Federation [3] (hereinafter referred to as the Strategy), acting as an officially recognized system of strategic priorities, goals and measures in the field of domestic and foreign policy, reveals the concept of national security of the Russian Federation, the fundamental component of which is information security. Paragraph 43 of the Strategy states as the main threat to State and public security the violation of the security and sustainability of the operation of the critical information infrastructure of the Russian Federation (hereinafter referred to as the CII). The Doctrine of Information Security of the Russian Federation, which is a system of official views on ensuring the national security of the Russian Federation in the information sphere, in paragraph 8 provides as national interests in this field for the sustainable and uninterrupted functioning of the information infrastructure, especially the CII [4].

Standard legal support of information security CII is carried out now by a number of normative legal acts among which predominating role is occupied by the backbone act which came into force since January 1, 2018 - the Federal law of 26.07.2017 № 187-FL «About safety of critical information infrastructure of the Russian Federation» (further - Federal Law 187-FL). The need to legitimately consolidate the said legislative act, according to the legislator, is due to the direct dependence of «stability of social and economic development of the Russian Federation and its safety on reliability and safety of operation of information and telecommunication networks and information systems» [5].

At the same time as the adoption of Federal Law 187-FL aimed at creating a legal and organizational basis for the effective functioning of the security system of the critical information infrastructure of the Russian Federation, amendments were made to the Criminal Code of the Russian Federation by Federal Law № 194-ФЗ of 31 July 2017 in order to ensure the sustainable functioning of the Criminal Code, concerning the criminalization of unlawful effects on the CII of the Russian Federation (Criminal Code, art. 274.1).

Results

According to the fair opinion of I.G. Puchtin and V.E. Novichkov, article 274.1 of the Criminal Code of the Russian Federation, in addition to the fact that it combines the key objective and subjective characteristics of the compositions of crimes provided for in articles 272-274 of the Criminal Code of the Russian Federation, integrates the difficulties inherent in the process of legal qualification of the criminal legal structure under consideration when establishing the of the main and qualified characteristics [6]. The specificity of the composition under consideration is due to the increased degree of criminal legal protection, as well as the features of the object of encroachment – objects of CII.

The absence of a well-established law enforcement practice of bringing persons to criminal responsibility for committing an illegal act that consists in unlawfully influencing the CII of Russia is due to the presence of gaps in the criminal legal structure of article 274.1 of the Criminal Code of the Russian Federation:

- the absence of an indication of the scope and significance of the social consequences of criminal attacks on objects of the Scientific Research Institute - damage caused to objects and serious consequences;

- the design of part 5 does not provide for the possibility of bringing to criminal responsibility a person who has committed a wrongful act provided for in the article under consideration in the event of a threat of serious consequences.

An equally important omission of the legislator in the design of the article 274.1 of the criminal code is ignoring the criteria for the categorization of objects, CUES, rules for determining which installed a Government Decree from 08.02.2018 № 127. According to item 7 of the above-mentioned rules, all objects of CII are divided into three categories - highest - first, lowest - 3 [7]. Article 7 of Federal Law 187-FL specifies the criteria used in categorization: social importance, political importance, economic importance, environmental importance and importance for security.

Despite the fact that, in fact, the category of the object of the CII indirectly reflects the public danger of criminal attack on a certain object of critical information infrastructure, the text of the Criminal Code does not reflect this in any way [8], and the qualifying characteristics are damage (part 2, part 3 of article 274.1 of the Criminal Code of the Russian Federation) and serious consequences (Part 5 of Article 274.1.

It should be noted that Part 4 of article 274.1 of the Criminal Code of the Russian Federation provides for forms of complicity (committed by a group of persons by prior conspiracy or organized group) and the commission of a criminal act by a person using his official position, but within the framework of the subject under consideration it is not necessary to study the above-mentioned characteristics.

The nature and extent of the consequences are essential categories in determining the degree of social danger of the crime. However, in modern criminal law there are no uniform scientific recommendations on the criteria of the degree of social danger, although considering this characteristic is a statutory obligation of the court articleы 60, 64, 73 of the Criminal Code of the Russian Federation) [9].

The analysis of the crimes provided for in chapter 28 «Computer crimes», makes it possible to state that in articles 272-274 the damage caused by the commission of a criminal act is specified, which is reflected in the note to article 272 of the Criminal Code of the Russian Federation: «major damage in the articles of this chapter is recognized damage, the amount of which exceeds one million rubles» At the same time, with regard to article 274.1 of the Criminal Code of the Russian Federation, the prerogative in determining the extent of the severity of the harm belongs to the judicial system, which allows it to independently determine both the threshold of the extent of the minor importance of the harm caused and the maximum damage caused to the objects of the CII.

Turning to the systemic interpretation of domestic criminal legislation, A.Y. Reshetnikov A.Y. and E.A. Russkevich conclude that the destruction, blocking, modification, copying of information contained in the critical information infrastructure, neutralization of means of protection of the specified information or failure of hardware and software tools ensuring the operation of the critical information infrastructure should be considered as harm [10]. On the one hand, the above-mentioned interpretation of harm is justified on the basis of the concept of CII facilities provided for in article 7 of Federal Law 187-FL (information systems, information and telecommunication networks, automated management systems of critical information infrastructure entities); on the other hand, the nature of the damage may be both material and technological and operational, for example, in the form of violation and termination of the operation of the CII facility.

Associate Professor of the Department of Criminal Law and Criminology of the Altay State University, Candidate of Legal Sciences, N.V. Tydykov, based on the absence of a legitimate definition of harm, suggests that «it should be only one rule: it should not be minor» [11]. As a counter-argument to the author 's point of view, the increased importance of the CII, expressed in ensuring the stability of the functioning of society and the State in conditions of digitalization, and the attack on the facilities of the CII can lead to disruption of the smooth functioning of the information infrastructure.

At the same time, the question arises as to the qualification of the act in a situation where the person exercising the objective side of part 2 of article 274.1 of the Criminal Code of the Russian Federation has failed to cause harm to the CII, for example, as a result of the successful operation of anti-virus software or the action of employees responsible for information security. If you qualify what you did according to part 3 of article 30, Part 2 of article 274.1 of the Criminal Code of the Russian Federation, a number of questions arise, as in this case some impact on the software code was carried out,

accordingly, the damage to the CII object was caused and immediately eliminated by restoring the initial algorithm of software functioning. The most dangerous consequence of malware attack is the disruption of supervisory control and data acquisition systems (SCADA) and other computer systems used to control technological processes, machines, mechanisms and other industrial equipment [12].

Considering the problems of qualification of actions of person under article 274.1 of the criminal code of the Russian Federation with infringement of the credit-financial sphere, E. A. Soloviev believes that «the harm should not necessarily be expressed in causing property damage to owners of KII of the Russian Federation, in this case is an evaluation category that will be set by the court each time the classification of the offence, taking into account the opinion of the victim» [13]. In terms of determining the opinion of the victim, a number of questions arise: if the owner of the object of the CII is a legal entity or an individual entrepreneur, the calculation of the damage will be made from the value costs incurred by the subjects of the CII as a result of a computer incident, or from the costs necessary to restore the functioning of the object, or damage caused to citizens, the state ? What is the expression of non-material harm and how it should be compensated, etc.

Investigating the features of criminal prosecution of CII subjects, the list of which is defined in paragraph 8 of Federal law № 187-FL, the auditor of the Department of information technologies of Moscow V. Komarov notes: «since damage to the «critical infrastructure of the Russian Federation» is prescribed, and not «computer information», the amount of damage is easily calculated by the investigator and proved in court» [14]. Supporting the author 's point of view, it should be noted that the determination of the property characteristic of the harm should be based on the cost of ensuring the effective functioning of the automated system, information system, information and telecommunication network used in the sphere of health, science, transport, communications, energy, banking and other spheres of the financial market, fuel and energy complex, in the field of nuclear energy, defence, rocket and space, mining, metallurgical and chemical industries, that is, applied at the facilities of the CII, as well as lost profits, for example, as a result of the disruption of the production process of a particular enterprise.

Mikhail Koptenkov, Head of the Audit and Consulting Department of the Competence Center for the IP of Technosthe Company, states that «on average, the cost of meeting all mandatory requirements for the protection of CII facilities starts from 10 million rubles (for organizations with a small number of significant objects of the third category) and can reach several hundred million rubles (for large organizations operating in different regions of the Russian Federation and having many significant objects of CII of different categories) » [15]. Considering the average indicator, it seems that the property characteristic of the harm in the considered composition of the criminal act amounts to at least a quarter of the specified minimum costs for the fulfillment of all mandatory requirements for the protection of the facilities of the CII.

On the basis of the above, we consider it necessary:

(1) Replace «harm» with «major harm» in parts 2 and 3;

(2) The note to article 274.1 shall read as follows:

«Note. The acts provided for in this article are considered to have been committed on a large scale if the amount of costs for ensuring the safety and sustainable and uninterrupted functioning of the critical information infrastructure exceeds two million two hundred and fifty thousand rubles»;

(3) Paragraph 2 of the notes to article 272 shall read as follows:

«2. Major damage in the articles of this chapter, with the exception of article 274.1, shall be considered damage the amount of which exceeds one million rubles»

The evaluation characteristic, which is particularly qualified and placed in part 5 of article 274.1 of the Criminal Code of the Russian Federation, - «serious consequences» includes in its content more

dangerous consequences than «harm» of the CII, enshrined in part 2 and part 3 of this article. A distinctive feature of this category is the scope of its application - in addition to the objects of the CII, serious consequences are considered with regard to the activities of the subjects of the CII.

As S.D. Brezhnik rightly points out, in the assessment of the serious consequences of computer crimes, there are two approaches: proponents of the first approach understand by them the loss of extremely irreplaceable information, the availability of which ensures the operation of means of automated processing of computer information or is necessary for the functioning of a natural or legal person; Most scientists treat the grave consequences as «loss of life, injury to health, disruption of production in the enterprise or industry, complication of diplomatic relations with another State, emergence of armed conflict» [16]. In addition, a third approach, formed with the adoption of the rule under study, is identified - serious consequences mean improper impact on information resources of strategic importance related to ensuring public and State security.
